    - Combined rolling bid/ask: $0.50/$1.10 ($0.80 at the midpoint)
- **Price Guidance:** Using a **limit order**, split the bid/ask and aim to receive a net credit of at least $0.80. As prices change, realize that you should complete the roll by March expiration; if you don't, you will be assigned shares of Wells Fargo stock. You have some time to complete this rolling trade, so don't feel that you need to rush, but keep an eye on the time value of the March $52.50 puts – the closer it gets to zero, the more likely you are to be assigned.

What We're Thinking

Since our last recommendation to roll our written puts on Wells Fargo, the company has reported fourth-quarter 2015 earnings, recent U.S. economic data has increased the likelihood of further Federal Reserve rate increases, and the stock has experienced some more volatility, reaching as low as $44.50 per share (almost 10% less than the current price) on Feb. 11.

Nonetheless, with our puts in-the-money by about 6%, and with some members already seeing assignment on their written puts, we're forced to either roll our puts or accept assignment on new shares of Wells Fargo.

Our take is similar to last time: While we're OK with the idea of being assigned new shares of Wells Fargo, we're more content to simply roll our puts out to May, collecting some additional income as we wait for more clarity on the interest rates and business momentum. Wells will report first-quarter 2016 earnings sometime in April, and we will receive the "earnings uncertainty premium" for rolling to a date that's beyond the earnings report.

We wrote January puts for $1.10 per contract (your mileage may vary depending on when you wrote yours), and our roll out to March provided us with a credit of $1.16 per contract. So with the additional $0.80 from rolling our March puts out to May, our new effective buy price on additional shares of Wells Fargo would be $49.44, slightly above the current price and 14.8% below our $58 fair-value estimate.

We'll reevaluate our written put position in May. If our puts are still in-the-money, we'll decide whether to accept shares of stock or roll further; if they're not, we could let our position expire and look to reinitiate our income strategy on Wells Fargo shortly thereafter, depending on market conditions.

More That Matters

- **Maximum loss:** For the current iteration of the put strategy (which includes the January and March recommendations), our risk is the same as share ownership starting at about $49.44, or about 0.2% above the current price.
- **Maximum gain:** On this rolling trade alone, our maximum gain is the rolling credit. At $0.80, that's a 1.6% yield on the current share price in 80 days.
- **Follow-up:** In May, we'll buy shares at a net $49.44 (about 1.46 times current book value) if the stock is below our $52.50 strike price, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts (or pursue a different strategy) for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 3.6% allocation first — Wells Fargo's shares are a Buy First. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1.5% of your portfolio, then just buy 1.5% in stock directly *if and when Pro* does so through these puts (we'll alert you).
- **Were your March puts assigned?** You could:
  - Write May 2016 $52.50 covered calls on your assigned shares, which is a functionally equivalent trade to our May 2016 $52.50 written put position.
  - Sell the shares that you bought via assignment and write May 2016 $52.50 puts alongside us, aligning you precisely with *Pro*'s official position. Both choices are functionally equivalent, although writing May covered calls may mean you'll take a different course of action than *Pro* does, depending on what happens with the share price as we approach May expiration.
- **New to the position and didn't write puts last time?** You can:
  - **Match *Pro*** by writing May 2016 $52.50 puts at a 1.5% look-through allocation. Recognize that these puts are in-the-money and have a higher risk of assignment than puts that are at-the-money or out-of-the-money.
  - **Be slightly more conservative, if you prefer, and reduce your risk of assignment** by writing May 2016 $50 puts. Recognize that your effective yield will be higher than that of *Pro*'s rolling trade and your potential buy price will be lower, but you will not be aligned with *Pro*'s official position. You can also look at weekly puts at various other strikes, depending on what you like best. If you choose this route, be aware that *Pro*'s course of action may diverge from yours, depending on what expiration and strike you choose, and depending on the stock-price movements of Wells Fargo.

Pro Can Help

- **Want more on this strategy?** See our guide to writing puts.
- **Questions?** Please ask, Fools! Drive your stagecoach over to the Wells Fargo discussion board.

Pro Video Chat, March 2016

Published Mar 1, 2016 at 12:09PM

Fellow Fools,

We've gathered your questions, and today we're ready to answer as many as we can in an hour! **Our live video chat will be streamed on this page from 3 to 4 p.m. Eastern today.** We're also trying out a new way for members to get involved:

1. Visit this link, or go to slido.com (https://www.sli.do/home) and enter code #ProChatMarch.
2. Ask a short question or post a quick comment (there's a 160-character limit). Once it's approved, you and everyone else in the sli.do chat will see it and can vote it up the list if they like it; that will help us know which topics will be most useful to address.
3. Note that **there is a limit** to the number of participants in the sli.do chat. That limit is 1,000; our chat participation is generally less than that, but as this is our first time trying this format, we of course can't know for sure. If we do go over the limit, we will decide whether and how to increase it for next time.

Want to practice? Go to the sli.do chat page and ask a question or submit a comment. Ellen, as the moderator, will approve a few before 3 p.m. so members can practice voting and get used to the interface. **The majority of questions and comments will not be approved except during the hour of the chat, 3 p.m. to 4 p.m. Eastern** -- otherwise we could end up with so many questions that they're impossible to address.

If you didn't get your question in before the deadline last Friday, it will be included in next month's list. And if your question isn't answered in today's chat, please be patient -- we had a great many submissions this time! Thanks, Fools.

Transcript

JEFF FISCHER:

…*Motley Fool PRO* live chat. Here we are in real time. J.P. Bennett joins me along with Billy Kipersztok who is on Skype. Billy, how are you doing?

BILLY KIPERSZTOK:

Doing well, Jeff. How about yourself?

JEFF FISCHER:

Great. Great to have you, here. J.P., it's good to see you.

J.P. BENNETT:

Glad to be here.

JEFF FISCHER:

So as PRO members know, we collected questions. Ellen Bowman, our editor-in-chief of *Motley Fool PRO* and *Motley Fool Options,* is behind the scenes helping us. We collected questions in the last week from you — we have about 60 questions — and we're hoping to answer as many of them as we can.

And because we are gluttons for punishment, we have a live sli.do page open. You should have received the email about it today telling you to go to the slido.com site and there you can enter ProChatMarch2016 (I believe it was something like that) and it gets you into our sli.do page. There we'll be taking your questions, as well, assuming we have time. I've seen a list of them there already, J.P., that we can jump on quickly and answer.

I'm going to screen through the sli.do chats, first, and then we'll get to the questions from this past week. And if I answer quickly, it's because I'm trying to get to as many as possible. It's not because it's a curt answer. It's just there are a lot of questions and we want to get to them.

And again, we're experimenting. We'll see how this works, J.P. Taking your questions in, we were then writing answers out, ourselves, one by one. We thought maybe we should take written questions and then publish written answers, rather than making people wait an hour to hear them through a chat, that we'd then transcribe. So there may be a combination in the future — we take your questions, we write out answers, and we have a live sli.do tied-in chat for real-time questions.

I'm going to fly through some of these sli.do questions. One comes from Paul S. who writes: *It seems like the latest correction came and went. Do we have any strategies to deploy cash more quickly when something like this happens in the future?*

Maybe a so-called correction came or went. We don't know. What we focus on are valuations at the time, and we didn't see anything that we wanted to buy quite yet. We were getting close, but we didn't see anything that we wanted to buy already. We're pretty fully invested, minus our hedges and shorts. We have about 20% cash, which is about the minimum we want given where valuations are right now. But when we see things we want to buy, we'll act on them no matter where the market is.

J.P. BENNETT:

I would say there's no rush. It's not like we pull back from fair valuations to extremely cheap. It was more like maybe we're getting a little bit ahead of ourselves. I know J.P. Morgan published some research not too long ago noting that the market's back to average on a forward-valuation basis. It's not like it was the time to just go in and buy whatever you could find. We're still at a point where it pays to be disciplined.

JEFF FISCHER:

I agree. If you look at the past year (and even the past 18 months to two years) it's difficult to find stocks that have gone up. Maybe one or two out of 10 have done well. So as we said at the start of the year (and all of last year) we want to be careful and only buy something when we have very strong conviction in it.

BILLY KIPERSZTOK:

And I'll add something there, too. Remember that anything we add to the portfolio has to be more compelling to us than what we already have. If that's not the case, then we'll just add to our existing holdings. Something to keep in mind is that we have active written put positions on Wells Fargo and Gentex, both of which were established or rolled during the market correction. Those are still outstanding and may be exercised just to stock.

JEFF FISCHER:

That's true. We also had earnings happening — a few of them we're still going through — and we considered adding to Skyworks, but we own Apple and Skyworks. We looked at Gilead to add to that, possibly, but the lack of growth, there, makes us comfortable with our current allocation. We did add some positions to *Motley Fool Options*, of course, but we'll act when we are really compelled to for PRO.

The second question. Lon is asking: *Updates for those of us who still own Tupperware*. I posted on the Tupperware board today, in fact, that it's still a sell. The stock is around the price where we sold it. Earnings looked tepid this last quarter. They weren't well-received, either. We have stronger companies that we're considering, so Tupperware is still a sell.

Some kind thoughts that you can see if you're in sli.do, as well. Thank you for those thoughts. Gary says: *You have a lot of representation of tech in Pro (Apple, Skyworks, Facebook, Oracle). What's our current take on these holdings given current events?* J.P., do you have any thoughts?

J.P. BENNETT:

I would say we still like where we stand. If you look at it on a case-by-case basis, we all cover different stocks. I cover Apple. You cover Skyworks. My opinion on Apple is that it's still undervalued and that the market doesn't appreciate the competitive position. Yes, it's not going to grow as fast as it did back when the iPhone came out, but it's because we're talking about a much bigger business in the order of billions. It can't grow that fast unless it's going to become bigger than the U.S. economy. I still think that Apple is attractive and meets what we're looking for in PRO.

JEFF FISCHER:

It's funny how during the last two phone cycles the stock seemed to have a quiet year in between new models, and then the new model excitement (as the iPhone 7 comes out later this year) will probably kick in. I would also say Facebook is more of a social network than a tech stock — an advertising-based business. But we are still heavily weighted in technology and financials, and we still find them attractive.

One more question from sli.do. Adrian asks: *My option account limits me to covered call writing only, yet most of the options in PRO are writing puts. Can you have more calls, please?*

I'll say unabashedly go to *Motley Fool Options* where we'll have more covered call writing. In PRO we're trying to own compounding-machine companies. We really believe we'll do well in the next three to five years and longer. We don't typically want to cap their upside in most cases. We'll write some covered calls in PRO, but not as many as you'll see in Options and not as many as we will write puts in Options.

Let's move on to the questions that we collected earlier from all of you, and thank you for sending these in.

J.P. BENNETT:

We got a lot more than we got last time.

JEFF FISCHER:

We did and I'll go to Billy, first. From SavingForHiking: *I'm curious about under what conditions PRO extends exposure to long positions. There's a decent cash position* — we touched on this a little bit, already — *in the PRO portfolio and we saw a recent dip, yet PRO didn't go longer on any positions. In fact, it added a short. I'm curious what the rationale is and when the right time is.*

BILLY KIPERSZTOK:

That is a good question. Knowing the right time to extend long exposure is a difficult decision. I don't think that PRO is going to try to anticipate short-term market movements, but what we are going to do is keep an eye on valuations and we're going to keep looking at the opportunity set that we have from new stocks. Then when the market comes down and we see a correction, that opportunity set gets bigger.

Then similar to what I was saying earlier, anything that we add to the portfolio has to be more compelling to us than our existing holdings. We're always looking at new opportunities, but then we always have to compare opportunity costs to what we already have. I don't think we ever feel compelled to make decisions quickly. This means that sometimes we lose out on opportunities when they come and go really quickly, but we prefer to focus on having high conviction in our ideas rather than acting quickly and maybe making a mistake.

JEFF FISCHER:

I agree. I think two times out of three, at least, we're going to be kind of boring, but I hope our results will play out in the way that a very considerate investor would hope them to play out over the long term. J.P., let's get to our newest short.

J.P. BENNETT:

[00:09:18]

JEFF FISCHER:

We have two or three questions about shorting John Deere. Various Fools said we were betting against Warren Buffett. Does that makes sense? The stock had already fallen a fair amount and we have to pay a dividend. These things were all addressed in the short report. Was that okay with us? How will low fuel costs affect farm income and thus John Deere's income?

J.P. BENNETT:

Where do we start? Let's start with the fuel costs first. Yes, that was something that we did consider. I think some studies estimate it's around 15% of total costs for farmers, but it's important to realize it's not a case where suddenly they're not being hurt as much on the cost side of things. Just because their fuel is cheaper doesn't mean they're going to go out and buy more tractors. That's not how it works.

Something you need to keep in mind with a short is that how the industry is currently doing is playing into our thesis, but our thesis is, in many ways, a byproduct of what has taken place … that kind of bubble … in that people went out and purchased new tractors or replaced their old tractors at what is essentially a rate that was unprecedented.

Go back as far as you want — we had never seen anything like that — so now we're at a point where the average age of the fleet is extremely young. Farms are becoming more productive and so naturally you're going to see the need for new equipment go down.

What we're saying here is that yes, farmers are in a tough spot. That's part of it. But at the same time the side effect — the way that the equipment industry is going to have to find a more normalized level going forward — is going to lead to a situation where people think Deere is going to have one or two rough years and then they're going to bounce straight back. Our opinion is materially different. We're trying to find the "new normal" level and the new normal level is probably where we are right now.

I know there were some questions about how we feel about the short. I can't speak for you guys, but I'm not losing any sleep over it. You need to have the right mindset when shorting. It's not a huge position. We're only down a little. I know we addressed some of these issues with some posts on the message board.

If you have a long position and it pops 10% soon after you buy it, do you immediately think, "Oh, that's money in the bank. The position's going to work out for the rest of time. I don't have to think about it anymore." Of course not. That's not the way you think.

But with shorting, it can be very tempting. It seems to elicit a strong response if it moves against you right away and you start questioning yourselves. If you look at Five Below, that thing popped against us. I forget the exact percentage. We were down pretty big, but we continued to look at the thesis. The thesis was on track as far as the business performance was concerned, and we were able to close it for a 20% profit. That's how I think about Deere right now.

JEFF FISCHER:

And keep in mind that Deere is also a hedge against Valmont Industries. It made it much easier for me to keep that stock. I was really on the fence about potentially selling it for something better or just to raise cash, actually, for the time being. But once J.P. formulated his short of John Deere, we talked about it, and the whole team liked the analysis. It made it easy to say, "If we're shorting John Deere, we can keep Valmont and keep DGS or emerging markets exposure, because these two really hedge each other out pretty well." So far, Valmont is up more than John Deere, and they're both equally sized positions, so that's a net win.

Warren Buffett — he's not always right. In fact, he's wrong a lot, and he's the first to admit that it's a handful of stocks that have made him the vast majority of his wealth over the many years. He's been wrong just as frequently on airline stocks. On IBM, lately. On American Express, lately.

J.P. BENNETT:

There's one other point that we haven't touched on. Someone mentioned: *It's already taken a tumble. Why now?* I think this is a reflection of our process where we're not trying to call bottoms with longs. We're not trying to call tops with shorts. You can do a lot of damage if you try and time those and get it wrong. We'd much rather see a great business that's doing great and then just continue to ride along those coattails, or find a business that's already currently struggling and then just ride it down as it continues to struggle. That's what we think we have, here, with Deere.

I think it was Chanos — it was one of the most famous short sellers — where in one of his first analyses he put out a short recommendation (he was just an analyst at the time) for Baldwin Pianos. What happened? The stock tripled in his face after he put out that recommendation. It ultimately went bankrupt, but I personally don't have the nerves of steel to stay short something when it moves up 300% against me, so why try and call the top? Let's just sit back and wait until we see it struggling and we think times are going to get worse. We thought that it was a good time to continue pursuing this as a potential short for us.

JEFF FISCHER:

And the S&P is up nearly 10% since that short, so the market was at a point where it seemed like it was going to make a big move one way or the other. It did, but that's as temporary as any move. So again, especially in the context of our whole portfolio, the short is perfectly fine and we believe in the thesis as much as we did a couple of weeks ago. It's all good.

What I'm going to do, now, is fly through five questions or so that I have earmarked, and while I'm doing that, if each of you would get a couple of your own questions ready, then you can go through those. That will be more efficient.

J.P. BENNETT:

We're already off track with the time, aren't we Jeff?

JEFF FISCHER:

We are. We're a little off our one-question-per-minute goal — we're not hitting that — but I think I can make up for some lost time right now. Alex wrote: *Love you guys. Thanks for doing the video answers format. I like it a lot.* That's good to hear.

Some options are done to hedge risk. Others are to generate income. Some are to gain an entry point into a stock. What I want to know is have you done an analysis of how much the PRO portfolio is dependent on options for performance? How much difference would a portfolio like PRO have if it didn't use options over the long term?

In the last two years we've made about $24,000 extra from option income, so not that much. That's about 1% of the current portfolio in two years. We haven't targeted that much option income yet, though. We're mainly focused on stocks and stock appreciation.

The past year, or so (and I'm pretty slow-moving) it's looked like stocks were less likely to keep going up so much, so we stated we do want to make option income every month and we're pretty close to that goal. So over subsequent years, when the market is not really going anywhere, we should be making more option income, but so far, options have added a small amount to the portfolio.

If we do have a greater focus on option income, we'll try to put in there more alternative trades. Spreads. Covered calls that you can do in IRAs. There are at least alternatives that you can consider.

Bob asks: *As a new Fool, I have entered the Starter positions (*the Buy First, I guess*). How do I do the next moves?*

Bob, I would just focus on the Buy stocks and buy them incrementally. You can just go right down the list and buy in full or half-allocations and then a quarter or two later buy the other half. Just keep moving gradually. Almost everything in the portfolio is ready to buy, except for one position, so you can gradually move into those.

I can do two more. Bruce asked about the *SPY* put ratio spread with the April strikes. He has an IRA, so he can't do it, so he would like more IRA attention. In that report at the bottom are two alternative trades that are IRA friendly. So do check out the SPY report. You'll see the IRA-friendly alternative trades in there. As for us, we haven't placed our trade yet. We have to by Friday. As the report says, we will adjust our strikes to the current conditions and then place the trade. That way we can let you know Monday what we did.

If you set up the initial trade, you can roll that up, at that point, or keep it and set up a new hedge at these higher strikes, if you want. The market is up about 9% since that alert went out, and it went up really quickly, which is why we couldn't do our trade. And no harm, no foul. Not a big deal, so far.

You can keep your existing hedge, if you want, and set up a new one at higher strikes or you can roll your existing one for a profit up to higher strikes, but we'll have details of what we set up this Friday, which is the 30-day mark where we have to set it up. Frankly, I would wait for the market to fall before setting it up, but we don't have the choice of 30 days and it's fine. Billy or J.P., as you ready to answer?

BILLY KIPERSZTOK:

I've got a question from Patrick. He says: *I've been building up my retirement portfolio with Stock Advisor recommendations for about 15 years and now I'm ready to start withdrawing. But after all of these years of letting my runners run, I'm great at buying but it kills me to sell. What do you think of an options strategy that forces me to sell; that is, I set up covered calls on a selection of my holdings, focusing on the ones with good upside, perhaps looking for a strike price about 10% or above. Not all trades will be executed. It may kill me when one is, but the ones that are executed will give me cash for withdrawals.*

A good question, Patrick. Congratulations, first of all, on the success of your portfolio and transition to withdrawals. I think covered calls are a great way to force yourself to sell. I use options, all the time, as a decision-making tool, because they force you to make decisions in advance of when the action will actually occur. So definitely consider setting up covered calls on some of your positions.

One thing you say is focusing on the ones with good upside. Maybe not focus on the ones with good upside, because with a covered call you're selling the upside. Perhaps think about focusing on the stocks that have limited upside, or that you see maybe don't have large appreciation potential.

To use examples from PRO, maybe consider writing covered calls on a company like Broadridge and avoid writing covered calls on a company like Facebook, which is a high-growth company that could experience a lot of appreciation. That's question one.

Another question from Bill: *Has anyone ever done a statistical study of how options affect the market either positively or negatively?* That is an interesting question. Yes, people have done studies. There are lots of studies available. If you just Google search the effect of derivatives on markets, that will give you several research studies to take a look at.

Also CBOE (the Chicago Board Options Exchange) — part of their website is called "3rd Party Research." It's under the Institutional heading on their website, and there's a ton of different research reports about the effect of derivatives on markets. As far as the conclusions from those studies, as you might expect, they're somewhat inconclusive. It depends on what you mean by "whether they affect the market positively or negatively."

I've seen studies that show that derivatives or futures either increase volatility of the underlying asset, or they decrease volatility of the underlying asset, or they have no effect on the volatility whatsoever. I've also seen that derivatives use has increased U.S. real GDP by permitting greater extension of credit to the private sector and by improving firms' ability to undertake capital investment.

Check out those studies. There's lots of studies and you'll learn a lot from reading them, so good question. Another question from Jim: *What is your view of the chances that the U.S. would enter a recession in the next 10 to 12 months?*

A timely question. I wrote a memo a couple of weeks ago about the likelihood of a recession, taking a look at a couple of indicators, and my assessment was that the likelihood of a recession in the near term is quite low based upon job growth, based upon wage growth, based upon a pickup in retail sales.

But, again, there's a caveat. A recession can happen at any time. The data you have available to you is only looking backwards in time, and whatever is happening right now, and whatever is happening in the near future we don't have data for. We'll have to keep an eye on it and we'll see what happens as it comes in. It's hard to say, but as of what we know right now, the likelihood of a near-term recession is somewhat low.

JEFF FISCHER:

Thanks, Billy. J.P.?

J.P. BENNETT:

Jpro asked: *I heard or read rumors that AmTrust is going to have a hard time covering workers compensation issues coming up. In fact, there may be some shorts on AmTrust regarding this. Any concerns? Are the rumors unfounded?*

Part of the issue when you're dealing with workers comp insurers is that workers compensation is a long-tail policy. It's not like auto or something for your house where the incident happens, you put in a claim, and you're paid out right away.

Workers compensation can take years to play out, so you can study the business and feel like you have a good grasp of what's going on, but then four years down the road, you find out that what you thought were adequate reserves were nowhere close to what was really needed because of some development that you really couldn't have seen coming.

It's hard to say with 100% certainty that there's nothing wrong with AmTrust, but you can't really say that about any company. We've done our homework. We still feel comfortable with the position, but time will tell. You have to see how those markets develop. AmTrust is a big player in California, and California has run into issues in the past as far as workers compensation is concerned. It's one to keep a close eye on, but as of right now we're comfortable with our position.

JEFF FISCHER:

What I like about AmTrust, too, is they've telegraphed over the last couple of years that the workers comp business is slowing down. It's getting more competitive, right now. It does cycle, and because of that (and because it's part of their company ethos) they have been searching for other growth opportunities elsewhere.

As with any insurance company or any financial stock, you have to believe in management and you have to watch how they run the business over many years, which we have done with AmTrust. So long term I still believe in it. It's still a small company. I think there's plenty of long-term potential ahead of it, so we're keeping it, right now, as our second-largest position.

J.P. BENNETT:

You first started following it as soon as it IPO'd, right?

JEFF FISCHER:

Yup. It was 2005 or 2006.

J.P. BENNETT:

Another company-specific question. *What keeps Apple from being valued at its true worth?* Well, it's pretty hard to tell what the market is thinking at times. The market isn't always efficient. Like Jeff said, there seems to be a bit of a cycle that goes on in terms of thinking the company is going to do great and continue to grow. Then it's like, "Oh, boy. This phone isn't all that we thought it was going to be, so this company is going to be liquidated within two years." Then they see something they like again, and so the stock starts to ebb back up.

At the current valuation, I feel pretty comfortable with it. I think there's an attractive risk-reward ratio for the company because I do believe it is more than just a going concern. I think it's going to continue to do well. I think the market definitely underappreciates the staying power and really what the company's trying to achieve.

Yes, the hardware industry has been littered with companies that were kings and then two years later something came out, completely dethroned them, and they could never recover. But Apple is definitely trying to do something a little bit different in terms of their services businesses — keeping people hooked into their hardware — and almost using their hardware as a platform to develop other businesses and keep people interested in their products over time. I can't tell you exactly why the market doesn't seem to like Apple, right now, but I know that we still do.

JEFF FISCHER:

And now as we wrap up earnings, we're going to talk about all of our positions, what we see ahead for the next year or so, and probably reconfigure many of our Buy Firsts and Buy Stocks. Apple's one that may move to Buy First. We shall see.

I can jump on a couple of questions. Several PRO Fools asked about our shorts, namely the FAZ and SRS shorts, which are small. Combined, they're 0.7% of the portfolio. Then the [Euro 00:26:37] which is 2%. So that's 2.7% of the portfolio as a whole. Members asked: *What is the plan? Why do we still short these? Is it worth it after fees?* Yes, if you short in Interactive Brokers, there are fees. If you short at TD Ameritrade, there are no fees, which is really nice.

But we, of course, want to make sure that these positions are making money after fees, as we pay the fees. We're at Interactive Brokers. SRS is down 11% the past year, and it's down 39% the past two years. FAZ — even with the recent market hit to financials — is down 7% the past year and 39% the past two years. The [Euro 00:27:19] short is down 21% the past two years. It's up a bit the past year and that one's cheap to short.

The first two are more expensive to short, and they're returning much more than the fee, if the fee is 4-6% a year and they've returned almost 20% annualized the past two years. So we're making money on them, and they're small enough (but not so small) that they're still worth keeping in our opinion. As long as we believe they can fall more than the fees, then we'll stay short.

One concern I have is that they're so difficult to short now that yes, new members are not getting into them, and if the market really runs against us, we may get called out at the worst time. We didn't see that happen in January, so that's reassuring, but that's on the front of our minds when we look at these shorts.

I would say in the life of these shorts we're much closer to closing them and moving on to something else than we are to keeping them twice as long as we already have. We've had them two to three years, already, so we're getting toward the tail end of these, I would think, although you never know. If they get easier to short, we might short more FAZ.

BILLY KIPERSZTOK:

Jeff, a quick question for you. Are there alternative trades that people can do utilizing options for those shorts?

JEFF FISCHER:

There is. There have been in the past on FAZ. There are LEAPS, so I know many members have a synthetic short set up on FAZ, and that's fine. You can keep that going. We could consider that next time, too. Even though the cost of shorting is factored into the options, still, that's one way to approach it. And SRS really has no options worth trading. That little ETF is almost small enough to be delisted, practically. A good question, Billy.

These shorts worked out so well that we'll continue to look at ETFs that are leveraged, because that creates the chance for compounding disintegration of their value. That's what we've seen here. Even with the market down, where you think these inverse shorts should be up (like FAZ), it isn't, because the compounding works against it. That's part of the reason why we've kept the shorts as we have so far. J.P., do you have another question?

J.P. BENNETT:

Max asks: *What's the best risky investment for a five-year time horizon? (And the best way to play oil?)*

That's a loaded question. I would say for starters that as most people know, we are generally not interested in dealing specifically with commodities. We don't want direct exposure. We don't want to try and find the drillers and things like that. So right off the bat I would say you can toss that back-end part of the question out of the way, because we're not looking at those types of companies.

The first part of the question — the best risky investment for a five-year time horizon — there's two thoughts I have for that. The first is that approach, to me, seems more suited for *Rule Breakers*. I think in investing it is very important that you know what you do well and what you're good at, and what you don't do well and you're not good at.

Our approach is not the *Rule Breakers* approach. We don't adopt that venture capitalist philosophy, where you're going to find some companies. Some of they may go bust, but some of them are going to turn out amazing and that's how you're going to make your money. That's really not what we do in PRO. I think we need to be true to ourselves and not try and stretch ourselves to adopt that mentality.

The second one just gets to a little bit of a rub I have with traditional finance theories where the general notion is you need to take more risk to make more money — that the only way is if you increase your risk, the potential return increases, as well. I don't think that's necessarily the best way to look at it, especially for what we're doing (we're not specifically finding a company that's a risky bet, but we're going to make a lot of money, here, so let's put our chips on the table).

Yes, we look at risk. We analyze the businesses. We consider the downside, but we don't specifically say that our portfolio needs more risk, so let's go find a risky company and hope that it works out for us.

JEFF FISCHER:

We've got Skyworks, which is nicely volatile. And Gilead Sciences is surprisingly volatile and concentrated on one drug, right now. But that's a good point, J.P.

I can jump on sort of a related question. Steve says: *Alphabet or Google is recommended by many other Motley Fool services, yet not in PRO or Options. I want to buy it, but with the down market I have no cash. Would a syn long be the best method to hold a position, and why haven't PRO or Options made the recommendation?*

A syn long mirrors stock ownership. If you don't have any cash, though, you're taking a risk. You're basically buying the stock on margin or future margin, at the very least. You're using leverage — you're leveraging your equity — so be careful before you do that. But a syn long is one way to have stock exposure without putting cash out on day one.

Why haven't we recommended it? It's funny. We've been talking about Google or Alphabet for quite a while — several months, now. We all generally like it, but we do feel like we have the better company in the space, right now, which is Facebook, which is taking more mobile ad dollars and growing much more quickly. And I think it really has more traction with its user base, too, as far as engagement (time spent on the site) and the data that they're collecting from those users. As great as Google is at collecting data, Facebook is, I think, even a step above them.

Facebook is our largest position, and it makes almost all of its money from online advertising, just like Google, so they're similar in that way. We have considered Alphabet, and we may add it to the portfolio at some point if we're really compelled to. What has stopped us, so far, is the valuation. Since it went above $700, the valuation is not that compelling for us in this environment right now.

Someone asked if we could walk through the exposure calculations on the Recommendations page on the website. Rather than try to do that right now vocally, I would say go the Recommendations page and under the exposure table there's a little link that says what these terms mean. Click that link and it will define each term for you. Hopefully that will help. Then we can circle back to that question. It's time for a memo that explains those, again, to members who have joined since November or so.

J.P. BENNETT:

And to piggyback off of that, I also saw a question that was asking about our performance versus the North Star. That information is also contained in that little part of our page, there, at the bottom. That's the best place to go to see how we've done. What is it? Annualized since inception, past three years, and then year-to-date return for the PRO and North Star. We also have the S&P 500 and the MSCI World Index.

JEFF FISCHER:

That's all on the Recommendations page.

BILLY KIPERSZTOK:

I've got a question about Papa John's.

JEFF FISCHER:

Great.

BILLY KIPERSZTOK:

Coming from sli.do. *Papa John's has been stuck in the doldrums, if not dropping lower in price. Do you see it as a candidate for writing puts?*

I don't know about writing puts on Papa John's, because for much of the stock's history, it has been a little bit overvalued relative to our fair value estimate. Right now with the recent drop in price, (which was related to not this most recent earnings, but the earnings report beforehand, where the stock dropped about 12% on the day of the release) that contributed to a decline in the stock price and then the recent market volatility contributed even more to a decline in the stock price. That brought Papa John's stock price back closer to where our fair value is.

If you look on the home page of our website, I recently posted an update of Papa John's Q4 and full year 2015 earnings, and I updated the fair value, there. If you read that report, you'll get a sense of what we think about Papa John's and what we expect from it moving forward.

The upshot, there, is that we do think Papa John's is going to be able to provide North Star-like returns over at least the next three years moving forward from this price, but it's still just a bit above our newly updated fair value estimate and I would be a little careful increasing your allocation to that position.

Now, if you don't have a full allocation to the position and you haven't matched us yet, then sure, writing puts may be a good way to increase your allocation and bring it up closer to where we are. But if you're already at a full allocation, I may not be too enthusiastic about writing puts.

JEFF FISCHER:

Just looking at it right now, it's worth pointing out that Papa John's is down 8% the past one year, while the Russell 2000 is down 12.5%. So it's been a rocky road for small-cap stocks, in general, and Papa John's has done better than the average stock. It's up this year a little bit year to date. The past five years, of course, it's up 280%.

I think the story of Papa John's, as with Domino's, as Billy writes so well in his reviews, is still one about growth, and really international growth, as well. Those are both well-run businesses with growing profits so, as Billy said, we still like the next three years.

And it's expected that stocks will take a year, or even two, and really tread water as the valuation catches up. This is exactly what you could expect to see, at some point, after a long run in the market. You never know where the market's going to finally stop expanding value multiples, but at some point it will and the stocks will take a few years to catch up and for their valuation multiples to come down as the business grows and then resume appreciating.

And that's how it looks with some of our stocks. Papa John's may be one of them. It comes with investing. Hopefully you always have some positions that perform, while others are catching up.

I have a question about the SPY hedge, again, from RickN336. He says: *Hey, guys. Really enjoy the PRO service*. Thank you. We really appreciate that.

My question is in regard to the SPY hedges you set up. Most pay a small credit. They don't create a drag on the portfolio. Why are you only hedging 10% of the portfolio instead of your whole 70% long exposure? From what I can see, things really only break down if the market trades far under our sold puts. Even in that case, we get assigned or buy new options in the market at an attractive price.

This is all true, but it's all about the downside exposure and our desire to not be too volatile and still achieve steady returns over the long term. If we were to hedge 70% of the portfolio with puts — and say SPY did fall 20-30% — our hands would be tied. There wouldn't be much else we could do at all, even if we were to buy calls in SPY instead of the stock itself. We'd feel so exposed, but that's all we could do.

So we're keeping it to a hedge amount that we're comfortable with if the market really does fall. There's a Warren Buffett saying that I like quite a bit. He's seen a lot of people blow up by risking money that they needed to make money they didn't need. We don't want to take big risks for money that we don't necessarily need and risk the money that we have and do need. We want to sensibly grow the money that we have and need.

It's a good question, though. We've hedged up to 20%, or so, through put ratio spreads and we probably will again. Lately we've just been doing 10% because we like our positions, and we have about 20% cash, as it is.

J.P. BENNETT:

I've got a question, here, from RockyTopBob.

JEFF FISCHER:

RockyTopBob in Illinois.

J.P. BENNETT:

His question is: *Since PRO and other no-new-money portfolios must sell, at times, to generate capital for especially good opportunities to buy, what methods do you use, and what can you teach members about the art of selling? Just holding a lot of cash loses to inflation in the current cash investment market. Regards, Bob.*

This is something we can't hope to answer in the limited amount of time that we have, here, so I think it's probably something we should spend a memo talking about. I know that there have been some criticisms against The Motley Fool as being a company that really doesn't teach about selling or doesn't stress selling enough. It's always been the approach of find great companies, buy those companies, and then over time the winners will outweigh the losers. But we need to be cognizant that not everyone has that luxury, especially the people that might be attracted to PRO. So just a couple of things to keep in mind.

Obviously, the first one is rebalancing. You need to know where your comfort zone is with that. We want to let our winners run, but it gets to a point where I think it's prudent capital management to consider trimming them. We all have different triggers. For me, it's around 7% or so. I think for Jeff — you said it's like 10%?

JEFF FISCHER:

It depends on the business.

J.P. BENNETT:

If you really like the business. So when it gets to 7%, I feel almost a strong need to at least bring up the conversation. That doesn't necessarily mean that we're going to trim it, but I think you need to have a point that you consider like a starting point where you at least have to consider it so you just don't let it run mindlessly forever.

BILLY KIPERSZTOK:

J.P., what was the allocation of AmTrust when we trimmed it?

J.P. BENNETT:

I feel like it was around 7%. It was bouncing up above that. It was below it. I'm pretty sure right around that was the trigger for the discussion to begin as far as writing covered calls on it are concerned.

Some of the other things to consider, obviously, are if you've got a huge winner and you sell it, there's obviously big tax implications, there, if it's held in a taxable account. You need to consider that. When you're looking at a position to sell and replace it with something else, you should also keep in mind and make sure that your conviction in that new idea is such that it will not only outperform the position that you're selling, but it will do so by a magnitude that will more than offset the taxes that you will need to pay, because there's some opportunity costs there.

And I would say the one thing to keep in mind — and you touched on it in your memo, too, Jeff — is the idea of how conviction plays into how lenient you are with how the stock trades in comparison to what you think the stock is worth. If you look at something like Starbucks, where it moves well above our fair value estimate (and you look at the business and it's firing on all cylinders and all unanimously agree that it's got a bright future if they continue to execute), then we're going to be a little bit more lenient.

We don't want to risk potentially selling and paying taxes for those who hold it in a taxable account and then sitting on the sidelines and praying that it gets hit so we can get back in it before it runs up again. So we're going to be a little bit more lenient, there. Where if you take something more like The Buckle or Tupperware, even if it's trading below our estimate, and we look at the business and the conviction isn't there anymore, it might be time to consider replacing it with something else.

JEFF FISCHER:

That's true and well said. Unless you're like an opportunistic trader (or trying to be) — someone who's active (and I would say maybe overly active at trading) — you're going to find that over the years you sell less, especially outright of an entire position. PRO will probably sell less frequently over the years than it has, so far, because hopefully you get better at what you do. You buy better.

J.P. BENNETT:

Hopefully.

JEFF FISCHER:

If you buy smart, you rarely need to sell is the hope. But it's a great question. We've done a fair amount of selling and I think it's instructive to see that we sell The Buckle for these reasons, or Tupperware for these reasons. We sold the Vanguard Energy Fund several years ago for various reasons that we should revisit — one of which was we don't know where commodity prices are going next. Oil was I think around $80-90 a barrel back then. There are certain positions that are more readily smart to sell, but we're trying to buy positions that will compound over many years.

J.P. BENNETT:

I'm not sure what The Buckle is trading for, right now, but I've paid attention to some of the same-store comps since we've sold it and they've been really ugly, down into high-single digits/double digits. And that's the type of business where even if you have a loss, don't just get in the mindset where you're going to wait until it gets back to even and sell it. If you really have lost conviction in it, put that money elsewhere (at least that's my opinion) and try and harvest those losses to offset some of your gains going forward.

JEFF FISCHER:

I'll answer a few more questions that are on sli.do, because I love that members have embraced sli.do. This is our first chat that uses sli.do, as well. It's kind of fun because if you're watching a tape of this, or not in sli.do right now, you can go in there, ask any question you want and then other people on the site can thumb up your question. Then the most popular questions rise to the top — and that's what we'll jump on first. Bob asks: *How do we find out about Fool events that PRO and Options members can attend?*

The answer is you should hear about that from The Motley Fool. They should email all members ahead of time telling you when this event is, where it is, and how you can get there. The next one that I know about is the annual FoolFest and that's in mid-May. I don't want to give the wrong dates.

J.P. BENNETT:

Don't look at me. I don't know.

JEFF FISCHER:

May 19 and 20?

BILLY KIPERSZTOK:

May 19 and 20.

J.P. BENNETT:

Thank you, Billy, for saving us.

JEFF FISCHER:

Here in Alexandria, Virginia. You should be getting a notice about that soon from The Motley Fool.

The next question. Larry asks: *Do you think Ford is a good stock for a dividend player?* Larry, I would say yes. Ford yields more than 4% and I think the dividend is safe. I think the business is on stable footing. I don't know that you'll see that much appreciation with it for long periods of time. At points you will see some appreciation. But yes, I think it's a good dividend stock most likely. It's difficult to use options on it, although we have tried, because the options don't pay that much.

You hear all this talk, right now, about peak sales of autos and I think that's kind of silly. I don't think cars are anywhere near peak sales. They might be near a short-term peak, but five years from now I'd be shocked if auto sales were not much higher than they are right now.

BILLY KIPERSZTOK:

I'll go ahead and jump on another question that was sent in earlier from [M. Stick 00:47:27]. *Do you think that the U.S. will see negative interest rates (as is occurring in Japan and Europe), the possibility of Canada adopting negative rates in the next couple of years, and what of deflation becoming an issue for the U.S. economy as it is for Europe?* I decided to pick up this question because I am the PRO macro guy, as J.C. likes to call me.

As far as the U.S. seeing negative interest rates anytime soon, I highly doubt that. I think U.S. policy is trending toward increased rates, the reason being (which ties into the end of your question) because core inflation, which is inflation excluding food and energy, is actually rising and is getting closer to the Fed's target of 2% inflation.

There's common rhetoric around deflation concerns, and whatnot, but a lot of that is related to the decline in the price of energy, which has a disproportionate impact on the inflation number as it's recorded without any adjustments. But when you look at what we call "core inflation," which is obviously the more [fundamental] item, it is actually going up.

In the United States, I think the trend is more towards slight inflation, and with that happening, I don't think that the United States is going to change course, change its policy, and go towards negative interest rates. I think we're more likely to see interest rate increases slowly in the future (the pace of which is to be determined). Anytime you try to speculate what's going to happen with the Federal Reserve and central bankers, you find out that you're going to be wrong more often than not. So it's one of those things where you may have an idea as to what you think might happen, but let it unfold and then you go from there.

As far as Canada adopting negative rates, I really have no idea. I don't follow Canada as much as I follow the United States or other global markets, so I don't have much to add there.

J.P. BENNETT:

Get Gillies on the phone.

BILLY KIPERSZTOK:

Yeah, that's a good point. Let's get Jim in here.

JEFF FISCHER:

Thank you, Billy. I can fly through a couple of more questions in the time we have left. One from BBDOC. You guys get any ready, too, and we might actually get most of these, at least in one form or another. We're not reading all the questions out, but we've grouped together ones that are similar.

BBDOC says: *You make many recs and the net debit or credit many times is not near the price that you first recommended. I'd like more of a plus or minus range I can work with and then at least a follow-up a few days after your rec.*

I think you're thinking mainly of *Motley Fool Options* lately, but also some positions in PRO. We almost always give an initial limit order guidance. That's updated at the last moment that we possibly can before we send the trade, which is usually about an hour before the trade goes out given the time it takes to publish. Then alongside that we give a minimum. We do give a range, in most cases, of first try to get this and, if not, then try to aim for this, so there's usually some flexible guidance in there. And we know the prices will change, so we usually work that into the trade, too.

Then every Friday in *Motley Fool Options*, there's Trades You Can Make, which provides updated price guidance, especially on new trades. So every Friday that's there. And then every Monday in *Motley Fool PRO* there's Catch-Up Trades, which will also update price guidance on recent recommendations.

So we are trying to cover all these bases and maybe you just weren't aware of where that was happening. That's happening in those Catch-Up Trades and Trades You Can Make, but also in the alerts, themselves, there's price flexibility.

From Bruce: *I have a mental block. I cannot tell if I'm making money on my calls. If I sell a put and it expires, I'm in the money?* Yeah, you made money, but the put is out of the money. *If my calls show up negative on my TD Ameritrade am I losing money?*

Whenever you sell a call or a put, it shows up as a negative in your account, and if it goes to zero, or some amount smaller than the amount that it initially started at, then you're making money. One way to maybe understand this better is to look at your gain-loss ledger in your TD Ameritrade account at your past trades, and that will show you how those gains and losses add up.

One more, and then Billy, I'll give it to you. We still have four minutes, so we're doing okay. A member asks: *In the last interview, one of the speakers said that the stocks chosen for a put-sell strategy aren't stocks that should be in a portfolio. Why recommend such a strategy using such a stock?*

They're talking about Nile, which is a *Motley Fool Options* position. I want to address this one, because it's incorrect. Anytime we do recommend selling a put option, we would be happy to take the stock in the portfolio, and I know that's the case with Jim, as well, and with Blue Nile, which he has taken shares of in *Motley Fool Options*. So it remains true. Anytime we recommend selling put options on a stock, even if it is for income, you still need to be ready to buy the stock and own it for the longer term.

BILLY KIPERSZTOK:

I'll add, also, that with Nile, I think a lot of Jim's thesis, there, was that the stock has a tendency to just trade flat. The company is using all its free cash flow to buy back shares, so there's somewhat of a floor underneath the stock price and the volatility premiums are good on that stock, so Jim likes to write puts.

And remember. When you're writing puts, it's actually a neutral strategy. It doesn't necessarily imply that the stock has to go up. So if the stock treads water, which is what his thesis is for Nile, then writing puts is actually a good strategy.

JEFF FISCHER:

Good point, Billy. J.P., do you have any others?

J.P. BENNETT:

Here's a question on silver. From RSS: *Do we buy a miner/producer, a large consumer of silver that will have increased profits from low prices and raw coin?* That gets back to what we said previously about our natural aversion to commodity-based companies, so I can say that we're not actively looking at miners or producers right now.

It looks like he's got another question here. I think he's talking about Flint, Michigan and the water scare and he's asking: *Do we consider buying companies that produce bottled water, filtration systems, chemicals, etc.? Many think Michigan is just the beginning.*

It's something we've considered in the past — just looking in that space — because obviously water is something that a lot of people need and it's really not available in a consumable form in many places in the world. One of the first companies I looked at when I joined PRO was A.O. Smith. We obviously never ended up going with it and we should have because it was in the mid-$40s and now it's in the $70s.

It's an interesting space that we may revisit at some point, but my ultimate conclusion, after looking at some of those companies, is that it's hard to find a PRO-type company in that space. There were some things that I really liked about A.O. Smith, but there were also some things that gave me some pause.

What I will say to this question, though, is we're not going to overreact to a scare or something like that. I know when we had the Ebola scare, some companies went on a monster tear because it was like, "Oh, my gosh. This is the new reality." Then the new reality wasn't the new reality and the stocks got slashed back down to earth. Obviously it's really unfortunate what happened there, but we're not going to overreact to that and make a really big decision that materially impacts our portfolio just based on one event like that.

BILLY KIPERSZTOK:

I'm going to add something, there. The company that J.P. is referring to with the Ebola crisis is Lakeland Industries. Go ahead and look up their stock chart. They had a huge size increase in September of 2015 due to the Ebola crisis and now the stock has hit the floor. Just an example.

JEFF FISCHER:

It's a good one and I like the perspective of thinking long term despite even short-term concerns like that or shocks to the system. It reminds me a little of the '70s or '80s, where there were all these cries that there were going to be giant food shortages for the whole world, and then, of course, oil was going to run out. Of course, those things didn't prove true. Now there are a lot of concerns — and I think they're legitimate — that water will become a scarce and fought-over commodity. It's possible, but is it probable? I don't know yet. It's too early to say.

What we have to do is analyze companies. We have looked at the water space and continue to go back to it periodically, as J.P. said, and find a really strong company. And I think it's so early in the world of monetizing water — Pepsi and Coca-Cola aside — that it's early to say. But this country also has a giant infrastructure problem, and needs to update its water systems severely, so that's a place we've been looking at, too. That's such a giant project, though. It touches so many different companies.

J.P. BENNETT:

Plus a lot of the direct exposure to water, here in the U.S., are regulated entities, so they're not going to be huge home-run-type hits because the returns that they can earn are capped by the government.

JEFF FISCHER:

One more question in sli.do and then we'll wrap up. Someone asked: *Given that PRO has been a portfolio for years, do you think that the current allocations are valid for a new PRO member, given the past gains in the positions?*

The answer is yes. Every day we look at the portfolio and make sure that we're comfortable and happy with the allocations we have, because we know that's our reality. That's what we own today and that's what new members are going to buy, as well.

So in a way, as Billy likes to say (and J.P. has said it, too), every day you're either choosing to buy a stock or not at your current allocation. If you don't take an action on it, you're choosing that current allocation again right now.

And that's what we're doing. We're happy with Facebook as our largest position. And O'Reilly is up there. And AmTrust. So yes, we like our allocations and we do think about them regularly. Thinking about adding to positions or trimming, but the allocations that you see, right now, are comfortable to us.

And with that, we're past our time, but I think we answered most questions. When you get a chance, let us know on the boards how you like this format. We appreciate you being here and sending in your questions ahead of time. Sending in questions on sli.do, as well. We appreciate that, as it helps us a lot. Sli.do was fun to try, too.

We'll be back next month with another format — maybe this one or maybe we can improve upon this one. Meanwhile, we'll see you on the boards, in new trade alerts, and in our weekly column, of course.

Thank you, Billy, for being here.

BILLY KIPERSZTOK:

Thank you, Jeff.

JEFF FISCHER:

Thank you everyone behind the scenes. Thank you, Ellen. Thank you, J.P., and thank you, most of all, to members who make this possible. Thank you, Fools. Have a great afternoon and thanks for joining us.

J.P. BENNETT:

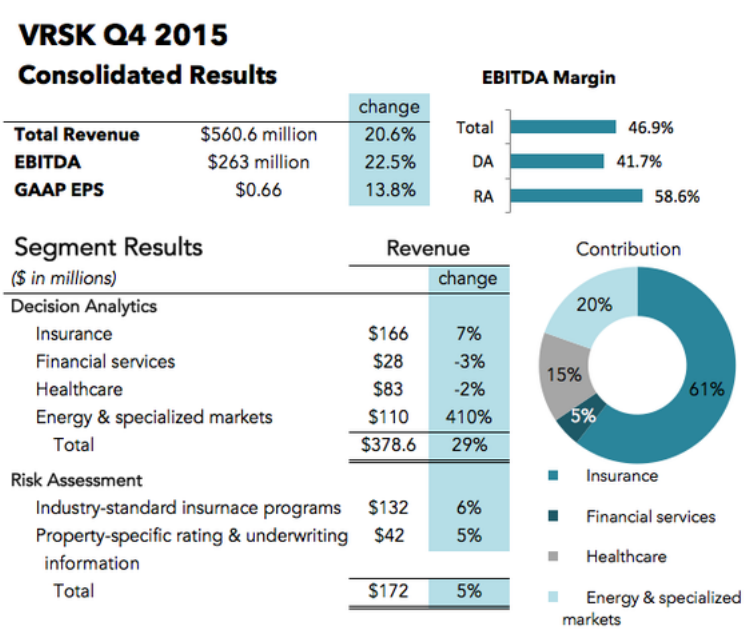
See you next time.

[End]

Verisk's Numbers Look Solid

Published Mar 1, 2016 at 11:28AM

Fourth-quarter results at our data-analysis expert, **Verisk Analytics** (NASDAQ: VRSK), weren't all that different from what we saw in the third quarter, but the market's subsequent reaction most certainly was. The stock took a meaningful haircut after last quarter's earnings call disappointed investors, but things went a lot smoother this time around. The stock price reacted positively to results that were respectable given what's currently taking place in the energy and health-care spaces.



Updated Guidance and Valuation

- **Updated guidance**: Buy (no change)
- **Recommended allocation**: 2.1%
- **Fair-value estimate**: $80 (no change)

Health Care

Verisk continues to find itself in a sticky situation with its health-care division. On the one hand, management has acknowledged that changes in the industry landscape since it first entered have made health care less attractive. Verisk loves proprietary data and processes, but as CEO Scott Stephenson noted during the earnings call:

> ... when you look at the vast majority of the data that we've got inside of the insurance vertical; the financial services, retail banking vertical; and the oil and gas, metals and mining vertical, a lot of what we've got is very, very unique. The nature of regulation and industry structure in the healthcare world in the United States makes it relatively harder to have distinct data assets ... So it's not that we don't have data. We actually have a lot of data, but we very much want Verisk to be a highly distinctive, very differentiated partner to our customers.

This means Verisk likely won't hesitate to sell the business if the price is right. But everybody now knows this, and that fact in and of itself makes it harder for Verisk to extract a favorable price.

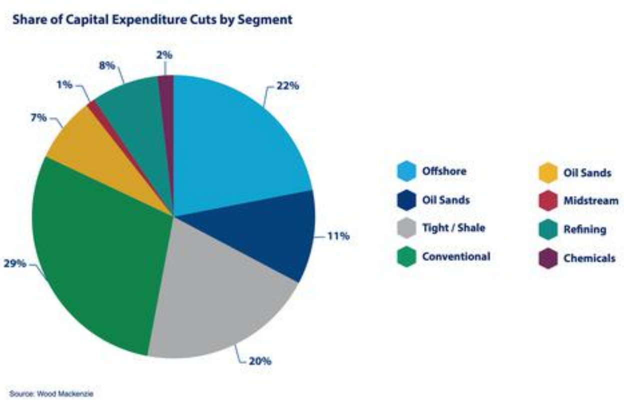
On the other hand, just because management is contemplating whether to sell the business doesn't mean it's in terminal decline. After removing the temporary impact of accounting changes, health-care revenue increased by 6.2% this year; management expects faster growth and improved margins in 2016 as the commercial side of the business starts to ramp up, offsetting some of the seasonality of the Medicare Advantage business.

So what do we think Verisk should do? Our hope is that management remains disciplined, because the appropriate course of action all depends on what offers they get for Verisk Health. As of right now, a dollar invested into the health-care division likely generates a lower return than a dollar invested in say, the insurance section of the decision analytics business. So if someone offers Verisk a fair price for this business, it makes sense to sell it and reinvest those proceeds into areas that will generate higher returns. But that's only if the company is offered a fair price.

This brings us the question of what, exactly, a fair price would be. I could just throw out some random revenue or EBITDA multiple, but given the lack of granularity surrounding the business, my honest answer is that I'm not exactly sure right now. I would, however, expect the multiple to be less than what Verisk as a whole is trading for, given that the prospects for its other segments currently appear brighter. It's also worth noting that the recent market turbulence likely didn't do management any favors as they explored selling the business. Regardless, this is something we continue to monitor closely, and management should have more to say next quarter.

Energy

The rest of 2016 will likely be more telling with respect to how 2015 acquisition Wood Mackenzie and the rest of Verisk's energy division will hold up during the contraction and (hopefully) trough of an energy cycle. But it's hard not to be pleased with what we've seen thus far. Organic growth for the quarter and full year was 4.3% and 5.1%, respectively, with WoodMac up 5% for the year (in British pounds) despite a slight 1% decline this quarter. Verisk also reported that the annual contract value of signings was up in 2015, impressive considering that the oil and gas industry was simultaneously slashing capital spending by $145 billion across all parts of the industry and deferring more than $200 billion worth of future projects.



With the current price of oil, another round of sizable reductions in industry capex seems like a foregone conclusion for 2016. This means that Verisk's new growth initiatives for WoodMac will likely be the primary reason the company meets management's 2016 forecast of positive growth (if it's able to do so). WoodMac recently entered into a commercial alliance with Thomson Reuters to give its Eikon platform subscribers access to some of WoodMac's data. Now, this deal in and of itself doesn't really move the needle, but it is one of the first big signs that Verisk has begun delivering on its strategy to increase the number of WoodMac clients, which is one of management's biggest priorities right now.

During the Q&A session, management all but confirmed my prior suspicion that WoodMac is offering some pricing concessions in order to retain customers. At first this might sound like a bad sign, but I actually think *slight* pricing concessions are a smart business decision. The company could conceivably hold the line or even slightly raise prices without much near-term customer attrition, thanks to the contractual nature of its offerings. But in managing the business for the long term, it makes sense for WoodMac to try to work with its customers in order to strengthen those relationships, which could position the company to win a disproportionate amount of any increases in capex once the energy industry begins to turn. This is why we think it's a great sign to hear Verisk reporting that through the first six weeks of 2016, it continues to see strong year-over-year growth in research subscription clients and data portal usage.

Financial Services

The inherent lumpiness in the Argus (financial services) division, the result of the relatively young age of the business, was the culprit behind the 2.6% decline in revenue this quarter. We'll likely see below-average growth and margins in the first quarter as well as we lap additional one-off projects that had above-average margins, but this is very much still a secular growth story. Argus posted 20.5% growth for the full year in 2015, and we expect to see similarly strong full-year growth in 2016 as well.

Insurance

Verisk's insurance business was similarly uneventful (in a good way). The risk assessment division continues to deliver revenue growth in the mid-single digits with extremely strong margins, while the decision analytics insurance business is growing faster but with lower margins. Given the pricing power of Verisk's insurance offerings and the fact that the company is constantly developing new solutions (often by finding ways to repurpose existing data), we expect to see similar results going forward.

The *Pro* Bottom Line

After seven months in this position, we're currently hovering around breakeven. This may be lagging the North Star, but we're content with this performance given that the S&P 500 is down 8% since we first recommended buying shares and down 6% since our followup recommendation. Meeting our absolute-return objective definitely becomes much more difficult when the overall market stops cooperating, but we still have confidence that Verisk will be able to help our portfolio do exactly that going forward. That said, we're opting to keep our fair-value estimate unchanged until we receive additional color next quarter on the likely outcome for Verisk Health.

Pro Catch-Up Trades: Bonus Leap Day Edition, Feb. 29, 2016

Published Feb 29, 2016 at 3:30PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **American Tower** (NYSE: AMT), buy up to 3.5% in stock
- **Gentex** (NASDAQ: GNTX), buy up to 2.7% in stock
- **Gilead Sciences** (NASDAQ: GILD), buy up to 3.3% in stock

Continue building your portfolio with our Buys, including these highlighted today:

- **AmTrust Financial** (NASDAQ: AFSI), buy at least half of our 5.3% stake to start
- **Apple** (NASDAQ: AAPL), buy up to 3.7% in stock
- **Parexel** (NASDAQ: PRXL), buy up to 3.2% in stock
- **Visa** (NYSE: V), buy up to 2.5% in stock

Our most recent hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): If you haven't set up the new put ratio spread yet, the index is much higher now. Lately, you can set up the April 15, 2016, hedge by buying to open $190 puts and selling to open two $182 puts for a credit. The spread is smaller than the $12 one we initially recommended, but with the market going up, lower-strike puts don't pay as well; we need to move our strikes higher and decrease our spread. *Pro* will set up its new hedge using **these modified strikes** as soon as this week -- unless prices change again, in which case we'll adjust accordingly. If you're already in the April SPY hedge position, you can stick with it (let it be), or close it for a small gain now and set up this new one, at these higher strikes, instead.

And our most recent short:

- **Deere & Company** (NYSE: DE), as a hedge against the market and our investment in **Valmont** (NYSE: VMI): Short 2% of DE per our recent recommendation

---

Gilead Sciences, Cash-Flow Machine

Published Feb 29, 2016 at 1:08PM

Gilead Sciences (NASDAQ: GILD) achieved a record 2015 with revenue up 31%, to $32.6 billion, and income of $11.91 per share, up from $7.35 the year prior. Non-GAAP diluted earnings per share (EPS) were up 56% to $12.61. After two years of strong growth, the company is guiding for slightly lower results in 2016.

Up 54% year-over-year, Gilead's Hepatitis C (HCV) drugs accounted for 58.5% of sales last year ($19.1 billion), while everything else achieved $13 billion in revenue (up 8%). As the early surge in HCV sales tapers off, the company needs to find new growth avenues. However, much like Apple, Gilead could still create North Star-topping value based on the stable free cash flow it uses to buy back shares, increase the dividend, and ideally acquire other companies (or drugs). Still, the challenge of continuing to expand after such strong growth is large. Hence, the stock trades inexpensively.

Status:	**Buy First**
Fair-Value Est. (no change):	$120
Recent Price:	$88
Current Allocation:	3.3%
Dividend Yield:	2%

Key Thoughts

- More than 770,000 people have been treated with Gilead's HCV drugs since their launch, and in November the FDA approved Harvoni for expanded use in patients with genotype 4, 5, and 6 chronic HCV.
- Gilead is maintaining dominant market share in Hep C treatment, with more than a 90% share of 2015's 250,000 patients. Its drug is safer and more effective than competing medication, and providers are increasingly considering that as they prescribe for patients.
- Even with nearly 400,000 Americans treated so far, more than 3 million people in the U.S. are estimated to be infected with HCV, only about half of whom have been diagnosed.
- Gilead is "confident in the long-term sustainability of HCV markets worldwide." This year, shorter durations of treatment, price volume deals in Europe, and payer contracts in the U.S. may keep revenue flat even as more patients are treated.
- An estimated 360,000 U.S. patients are being diagnosed with HCV and coming into treatment each year, and treatment levels are lower than that at around 250,000.
- As noted, the most recent data suggests about 1.5 million HCV patients diagnosed in the U.S.; that's compared with 1.6 million when Sovaldi was launched in 2013. So, despite Gilead's having treated nearly 400,000 Americans, the number of patients out there is nearly flat: Meaning, there are nearly as many newly-diagnosed patients as ones who've been through treatment, so the pool of patients remains large.
- Gilead has 70% to 80% market share in HCV in Europe. Management anticipates patient growth in 2016, but lower revenue per patient because of pricing deals and shorter treatment periods. The company is doing what's right for the patient while still being paid fairly.

- Gilead's HIV sales reached $3 billion last quarter, up 5% year-over-year, with two-thirds of that in the United States. Seven of 10 U.S. HIV patients use Gilead treatments, but that has been whittled down a little by competition.

The Numbers

Market Cap	$118.5B
Cash	$14.6B
LT Investments	$11.6B
LT Debt	$21.2B
EV/EBITDA	5.5
P/FCF	8.2
P/E	7.4
P/E NTM Est.	7.2
TTM OCF	$20.3B
TTM Cap Ex	$747M
TTM FCF	$19.5B

Summary

Gilead's shares look inexpensive trading at just more than 7 times earnings -- even if earnings are only flat over the coming few years. The challenge for Gilead is in finding new growth avenues, because HCV pricing will likely continue to drift lower in 2017 and beyond, even if the patient base remains stable in numbers. Its pipeline is healthy -- including 30 clinical studies in oncology, with 10 in phase III, and the deepest number of candidates ever in its total pipeline -- but even so, acquisitions are likely key to meaningful future growth. Gilead has a history of making smart acquisitions.

This year, management projects $30 billion to $31 billion in revenue, down a bit from last year. Management has authorized, or is in the process of authorizing, $20 billion total in share buybacks (16.8% of the current market value). The company is increasing the dividend by 9.3% this year.

==============

What We Think Now: *Gilead Sciences has seen surging free cash flow thanks to its market-leading Hepatitis C treatments, which accounted for nearly 60% of 2015 revenue. As sales growth tapers, the stock is cheap, and we believe management can find future growth opportunities through acquisitions. Meanwhile, Gilead has a large pipeline of drug candidates targeting deadly diseases including oncology, but for the coming few years, it's our belief in a stable Hepatitis C market and good use of its growing capital that makes the stock worth owning in Pro.*

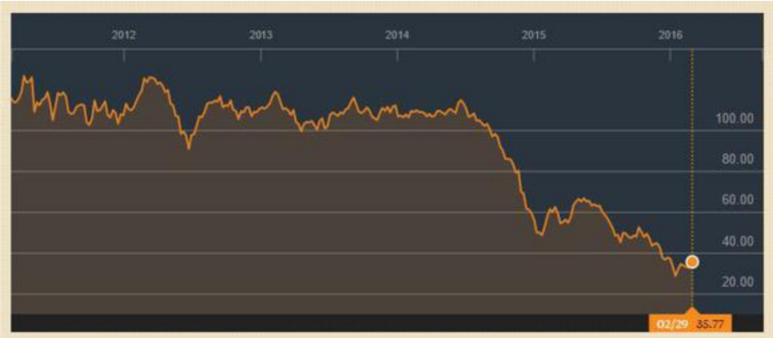
Is the U.S. Headed for an Economic Recession?

Published Feb 29, 2016 at 12:44PM

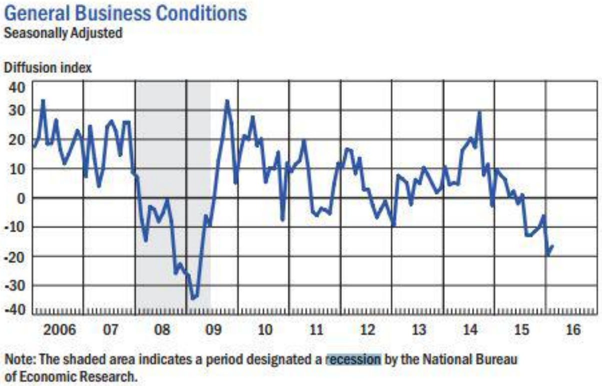
Dear *Pro* Fools,

It's no secret that the stock market has suffered in 2016; its first 10 trading days were the worst of any year. Crude prices continue to hover near their lows, with oil currently at $35.77 per barrel, down nearly 70% from 2014 highs:



Source: Bloomberg

The U.S. manufacturing sector isn't doing well, with the New York Fed's Empire State Manufacturing Survey index in negative territory. The January figure is as low as the index has been since the 2007-2009 recession:



Source: Federal Reserve Bank of New York

All of this negative sentiment has led to a growing concern among investors and financial media that a U.S. recession may be on the horizon. However, after looking at some important data points, it's my opinion that the likelihood of a near-term U.S. economic recession is low. In this Memo, I'll present three data series that support my view.

1. Job Growth Is Solid

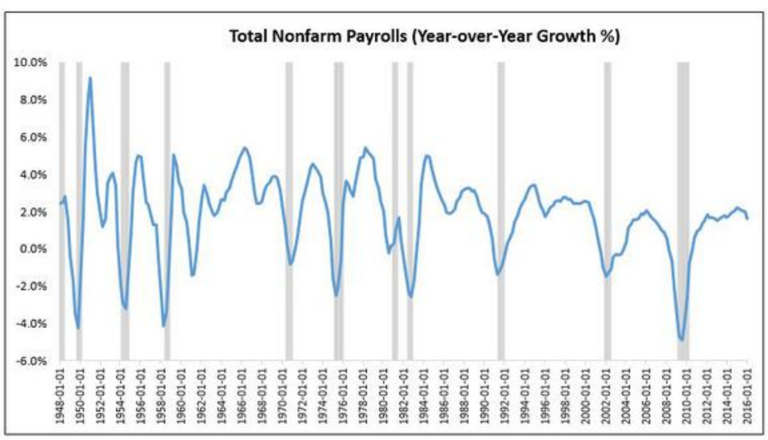
Higher unemployment rates are one of the most widely recognized indicators of a recession. For example, in December 2007, the national unemployment rate was 5%, and it had been at or below that rate for the previous 30 months. At the end of the recession, in June 2009, it was 9.5%.

As of the most recent reading, the U.S. unemployment rate is 4.9%, the lowest it's been since the end of the recession:

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2006	4.7	4.8	4.7	4.7	4.6	4.6	4.7	4.7	4.5	4.4	4.5	4.4
2007	4.6	4.5	4.4	4.5	4.4	4.6	4.7	4.6	4.7	4.7	4.7	5.0
2008	5.0	4.9	5.1	5.0	5.4	5.6	5.8	6.1	6.1	6.5	6.8	7.3
2009	7.8	8.3	8.7	9.0	9.4	9.5	9.5	9.6	9.8	10.0	9.9	9.9
2010	9.8	9.8	9.9	9.9	9.6	9.4	9.4	9.5	9.5	9.4	9.8	9.3
2011	9.1	9.0	9.0	9.1	9.0	9.1	9.0	9.0	9.0	8.8	8.6	8.5
2012	8.3	8.3	8.2	8.2	8.2	8.2	8.2	8.1	7.8	7.8	7.7	7.9
2013	8.0	7.7	7.5	7.6	7.5	7.5	7.3	7.3	7.3	7.2	6.9	6.7
2014	6.6	6.7	6.7	6.2	6.2	6.1	6.2	6.2	6.0	5.7	5.8	5.6
2015	5.7	5.5	5.5	5.4	5.5	5.3	5.3	5.1	5.1	5.0	5.0	5.0
2016	4.9											

Source: Bureau of Labor Statistics

Not only is the unemployment rate low, but job growth continues to be strong, averaging about 1% to 2% growth year-over-year since 2011:



Source: Bureau of Labor Statistics

As seen by the shading in the graph, recessions are strongly correlated with declining job growth. You'll note that the January job-growth reading shows a slight decline, perhaps a reason for concern. But January's jobs report is often noisy, with the largest seasonal adjustment factor of all months, and this month's report included some one-off categories that are not indicative of economic problems (including a significant decline in jobs in the private-education market). All in all, job growth continues to look strong, and we've never seen a recession when the job market is growing at a healthy rate.

2. Wage Growth Is Accelerating

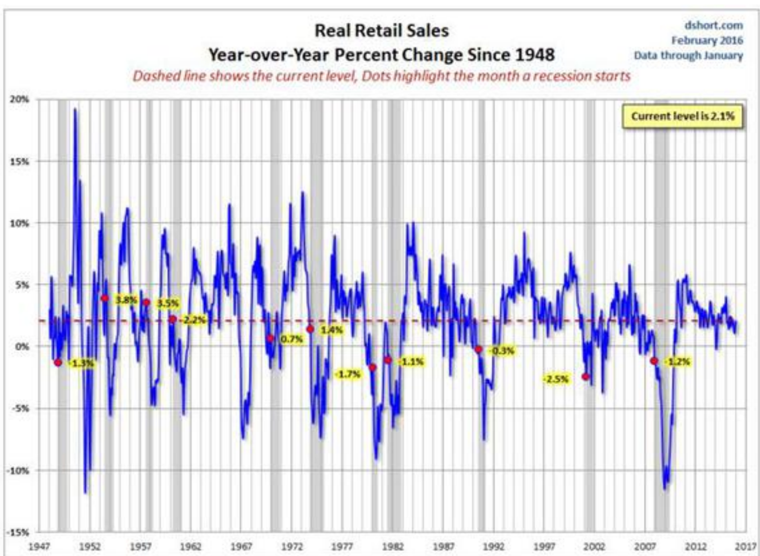
Decelerating or falling wages are another strong indicator of a recession. (Note that this graph shows *nominal* wages, not adjusted for inflation.)

Source: Federal Reserve Bank of Atlanta

Again by looking at the shaded areas, we can see that wage growth often declines in a recession. However, lately wage growth has been accelerating, at a three-month moving average of about 3.1% in December. In 2015, inflation was between -0.20% and 0.73%; as of January 2016, it was 1.37%, , making this real wage growth all the more encouraging.

3. Retail Sales Have Picked Back Up Lately

Yet another sign of a recession is slowing retail sales:



Source: advisorperspectives.com

As you can see in the graph above, retail sales have been in a downtrend for a couple of years. However, as of data compiled through Feb. 20, the year-over-year change in weekly shopping center retail sales has bounced back up to about 3%, suggesting an improvement for overall retail sales in the months ahead.

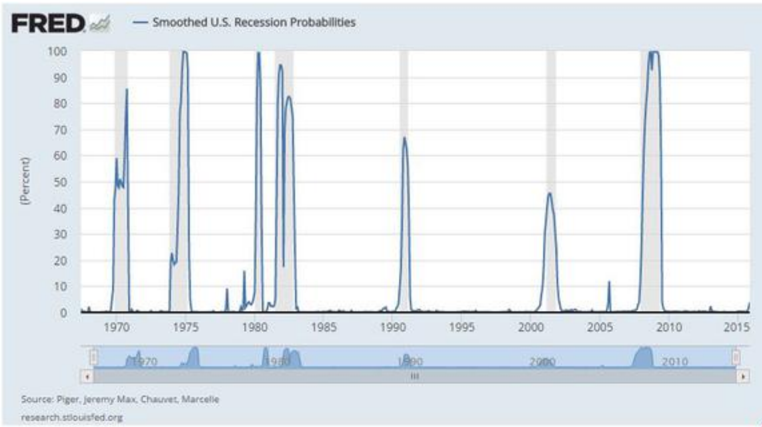
Source: Morningstar

The *Pro* Bottom Line

The turbulent market so far in 2016 has many investors worried about the likelihood of a U.S. economic recession. In this Memo, I've explained three reasons why the economy seems to be on solid footing. While the current economic situation is not high-octane, it's not bleak, either. Given low unemployment, solid job growth, growth in real wages, and an uptick in retail sales, there is reason to be optimistic about the state of the U.S. economy as we continue further into 2016.

Of course, this data is a look back at what recently happened, and although trends look healthy, what's happening now -- or about to happen -- could change that. But if there's a recession ahead, recent data doesn't suggest that it's starting to unfold yet.

I'll conclude this Memo with a final graph that uses a technical model* to show the probability of a U.S. recession, with the vertical axis scaled between 0% and 100%. The most recent reading in November showed a probability of 3.84%.



Fool on!

-- Billy (TMFBillyTheKid)

*The model utilizes a dynamic-factor markov-switching model applied to four monthly coincident variables: non-farm payroll employment, the index of industrial production, real personal income excluding transfer payments, and real manufacturing and trade sales. This model was originally developed in Chauvet, M., "An Economic Characterization of Business Cycle Dynamics with Factor Structure and Regime Switching."

A Day in the Foolish Life: Investing, the Market, and Beyond

Published Feb 26, 2016 at 8:00AM

Several hundred *Motley Fool One* members met in San Diego a few weeks ago to talk about investing, our finances, and life.

We hold these gatherings for *One* members several times a year. They're truly one of the highlights of being part of our Foolish community.

The event included talks from Tom Gardner, Jeff Fischer, Andy Cross, Google executive Suzanne Frey, longtime Fool LouAnn Lofton, myself, and many others.

We learned lessons that day that can help every Foolish investor, so I want to share with you a video of the highlights. Watch below, then keep reading for a few of my favorite takeaways from the event — and how you can watch the full event.

{% video %}

In his opening remarks, Tom listed four traits of successful investing. This one struck a chord with me:

> Now, **rule of the road No. 1 is I believe that everyone should buy 15 to 30 Motley Fool recommendations at a minimum.** I know it can be tempting to dip in and buy one or two and see if they work, or three or four, but really if you want to replicate the kinds of market-beating returns that we've gotten at The Motley Fool for more than 20 years, you need to own 15 to 30 business that we've recommended.

This is so important, because we meet members who have most of their portfolio in a handful — sometimes just one or two — stocks. Remember that we know and expect that a percentage of our picks won't work out over time. That's normal. Extreme concentration in just a few stocks increases the odds of massive disappointment if your holding ends up being an inevitable loser.

Next, *Pro* and *Options* advisor Jeff Fisher talked about setting your expectations *before* the market declines:

> The only anchoring I do — and we all anchor — I anchor to the high-water mark, whatever it was of my portfolio, and I assume it's 20% lower, because I know at some point it's going to be at least 20% lower.
>
> So if you're going to anchor, anchor in that way, and **then the volatility is part of your expectation,** or you try to internalize that it's going to happen.

Inside Value advisor Rich Griefner gave a good talk on the power of business moats — the most important trait Warren Buffett looks for. Here are his thoughts on Moody's:

> Do you guys know Moody's? They're one of the largest credit-rating organizations. They rate debt and the companies that issue that debt. Moody's did a really bad job of rating debt in the 2007-2009 time frame, and it nearly caused the destruction of the global economy.
>
> But even so, Moody's is still strong today. Still earns 30% return on capital and they still have a 40% market share. How did that happen? Why has nobody come in to compete with Moody's? The answer is to become a nationally recognized statistical ratings organization, you have to jump through all kinds of hoops. It's really hard to become qualified to compete with Moody's. **So even though they almost destroyed the entire global economy, Moody's is still earning 30% return on capital and are converting 30% of their revenue to free cash flow.** That's what it means by "30/30 club."

Finally, Google executive Suzanne Frey talked about the power apps play in our life. By saving everyone time, they have become the great equalizer:

> I'm going to talk about an unusual commodity today. Most people may not call it a commodity, but when you think about **the most precious commodity we all have... well, of course, it's time. It can't be traded. It can't be bought and sold.** Whether you're Elon Musk, you're Warren Buffett, or you're someone just trying to make ends meet, we all have exactly the same amount of time ... 24 hours a day, seven days a week. It is the grand equalizer and it's something that we take quite seriously in everything we do.

Video transcript:

Morgan Housel: The stock market's down 10% since last summer and it makes a lot of people nervous. It's so important to realize, though, the reason ... the specific reason ... that stocks do well over long periods of time is because they're risky in the short term.

Jeff Fischer: I'll add that one way that I think a lot of us measure volatility is we think of the high-water mark of our portfolio, or our assets, on the absolute best day that it ever had. It was worth this much and now it's worth this much. That's how we see volatility. But that's asking for perfection. Life isn't perfect. A relationship isn't perfect.

The market — you don't expect it to be perfect. The only anchoring I do (and we all anchor) I anchor to the high-water mark, whatever it was of my portfolio, and I assume it's 20% lower, because I know at some point it's going to be at least 20% lower. So if you're going to anchor, anchor in that way.

Tim Hanson: I think people should be focused on just being self-aware. If the recent market movements have stressed you out in a very meaningful way, odds are that you should be looking for something in your portfolio that would be diversifying ... that is to say different from what you already own.

Sara Hov: Under Armour has no qualms about selling athleisurewear, so this trend of people dressing up as if they're going to run or do yoga and they end up just sitting around all day or shopping...

Alex Scherer: Or going to Whole Foods...

Sara Hov: ... or going to Whole Foods or Starbucks...

Alex Scherer: It's my contention that Kinder Morgan is really a port in the storm and is trading at rock-bottom prices.

Rich Greifner: MercadoLibre is the eBay of Latin America. It's also the PayPal of Latin America and in some ways it's the Amazon.com of Latin America, as well.

Tim Hanson: Limit orders are an example of a tool that's been created to give you the opportunity to get really cute about some aspect of your investing — which is to say, "Hey, I'm willing to buy this at $11.99, but I am not willing to buy it at $12.00."

Robert Brokamp: The way I describe asset location is basically which eggs should go in which baskets, because some investments are more tax efficient than others. Some accounts have built-in tax benefits.

Suzanne Frey: We think about time very, very differently. We are, frankly, obsessed with it. And once you understand this, you're going to understand everything we do at Google.

Morgan Housel: If you can't outsmart other people, then the way that you get ahead is by doing something that they're not willing to do, which for investors (we repeat this a lot) is to have a longer time horizon than them. That's how you can find your edge in today's market.

LouAnn Lofton: So I go up to Buffett and I just tapped him on the shoulder and said, "Mr. Buffett, my name is LouAnn Lofton and I said you invest like a girl." And he immediately stood up and gave me a big hug and big guffaws. And that is not an act. He really is that guy that you see and that you hear about. He is that down-home. And he was telling everyone around us, "Oh, she wrote this book that says I invest like a girl."

And so, of course, I had to get a couple of pictures, which I'll share. So this is the first one. Now this is funny to me because this is something that Buffett apparently likes to do. He likes to do the photo where you act like you're stealing his wallet. He literally said to me, "I'm going to hold it and you act like you're taking it."

Pro Catch-Up Trades: Feb. 22, 2016

Published Feb 22, 2016 at 3:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **American Tower** (NYSE: AMT), buy up to 3.4% in stock
- **Gilead Sciences** (NASDAQ: GILD), buy up to 3.4% in stock
- **Wells Fargo** (NYSE: WFC), buy up to 3.5% in stock

Continue building your portfolio with our Buys, including these highlighted today:

- **AmTrust Financial** (NASDAQ: AFSI), buy at least half of our 5.5% stake to start
- **TD Ameritrade** (NASDAQ: AMTD), buy 2.4% in stock
- **Visa** (NYSE: V), buy up to 2.5% in stock

Our new hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): If you haven't set up the new put ratio spread yet, the index is much higher now. Lately, you can set up the April 15, 2016, hedge by buying to open $190 puts and selling to open two $182 puts for a credit. The spread is smaller than the $12 one we initially recommended, but with the market going up, lower-strike puts don't pay as well. We will set up our new hedge using modified strikes (like these) as soon as this week, and let you know what we set up. If you're already in the April position, you can stick with it (let it be). We might recommend a second hedge later.

And our most recent short:

- **Deere & Company** (NYSE: DE), short 2% per our recent recommendation

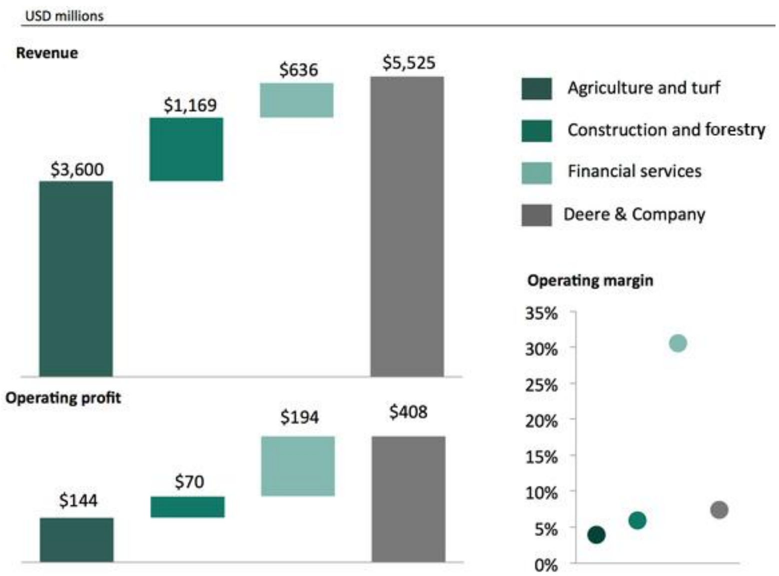
---

Deere in the Headlights

Published Feb 22, 2016 at 1:40PM

Fellow Fools,

After **Deere & Company** (NYSE: DE) released its first-quarter 2016 results this past Friday, one of the first headlines I saw was that the company beat bottom-line estimates. This may technically be true, but the results themselves and subsequent management commentary revealed that the situation is far less rosy than this headline would suggest.



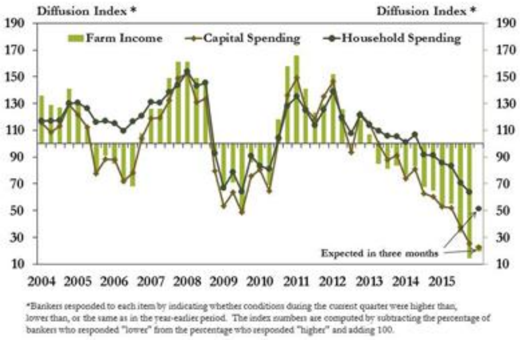
Source: Company filings.

Equipment sales fell 15% in the first quarter of fiscal 2016, 18% in the U.S. and Canada. Lower shipment volumes were the primary culprit, but adverse currency movements also hurt the company to the tune of 4 percentage points. Helping offset some of this weakness was a 2-percentage-point rise in realized prices as Deere continues to charge more for its products despite the current state of the industry and increased competition. Lower volumes also meant that the duality of operating leverage was once again on display despite the company's efforts to control costs. Equipment operating margins contracted once again as the decline in operating profits outpaced the decline in revenue growth. The agriculture and turf and the construction and forestry divisions saw operating profits fall by 46% and 52%, respectively.

	Revenue	Operating Profit	Net Income
Agriculture and turf	-12%	-46%	
Construction and forestry	-23%	-52%	
Financial services	-2%	-17%	
Deere & Company	-13%	-37%	-34%

Source: Company filings

One of the bright spots for Deere this quarter, relatively speaking, was its financial-services division. Revenue and operating income there fell by just 2% and 17%, respectively, and the company continues to manage its reserves based on a belief that credit losses will remain in line with its historical averages. But given the continued weak industry outlook — the latest update from the Kansas City Fed saw spending continue to decline, credit conditions continue to deteriorate, and farmland values fall in the fourth quarter — we're somewhat skeptical of this assumption. We wouldn't be surprised if future results for this division start to mirror the declines seen in Deere's equipment business.



Source: Kansas City Fed

With much of the writing already on the wall for this quarter, focus turned to Deere's outlook for the rest of 2016. Lowering your full-year guidance after just one quarter is never a good thing (except for those who are short the stock), but that's exactly what Deere did. The reason for the sudden change of heart, according to management, is that their prior estimates contained some embedded optimism about improvement in the back half of the year. Management has a recent history of jumping the gun when calling the bottom of the cycle, so this didn't come as much of a surprise to us.

	2016 Guidance	
	New	**Previous**
Net Sales	-10%	-7%
Agriculture and turf	-10%	-8%
Construction and forestry	-11%	-5%
Net Income	$1.3 billion	$1.4 billion

Source: Company filings

The company also tapered its rate of share repurchases this quarter, reducing the outstanding share count by just 0.4% (the smallest sequential decline since the second quarter of 2013). When asked during the earnings call about the pace of repurchases going forward, management noted that buybacks are more of a residual use of cash -- higher priorities include ensuring Deere maintains its current debt rating, investing in organic and inorganic growth, and maintaining the dividend. Chief Financial Officer Rajesh Kalathur also noted that Deere will only repurchase shares if the stock trades at a discount to management's estimate of intrinsic value, but if we're perfectly honest, this came across to us as nothing more than lip service. The best time for cyclical companies to repurchase their stock is on the downswing of the cycle, when the stock is getting hit. But this is when most companies (including Deere) taper their repurchases, because their operating cash flow becomes strained.

Pro's Take

Since peaking in the third quarter of 2013, quarterly revenue and net income have fallen by 49% and 77%, respectively. But in and of itself, this doesn't mean that the bottom of the cycle is just around the corner or that Deere's financial results will soon skyrocket back up. Rather, these numbers are a byproduct of what is happening within the industry, not the other way around -- it's the industry, not the numbers, that determines when the real bottom is found. We believe conditions will remain muted in the agricultural sector and that farmers will postpone the purchase of new equipment because they've already made recent upgrades, so there's no reason to expect a rapid recovery in sales anytime soon.

Management continues to stress the fact that all of Deere's operations currently remain profitable, something the company struggled to achieve during prior downswings in its industry. While negative earnings would certainly be a boon to our thesis, we don't believe that the success of our position is dependent upon them. Cyclical companies like Deere are often valued based on mid-cycle earnings, to avoid the dangers of valuing a business at either extreme. We continue to believe that most Deere investors have unrealistic expectations about what the company's mid-cycle earnings power truly is, as well as about the speed with which the industry will bounce back after the unprecedented growth in tractor sales that took place this past cycle. Simply put, 19 times forward earnings is only cheap if the company will be able to return to pre-2015 levels in a reasonable time frame.

We can't afford to get complacent with any of our positions, but right now Deere appears to be exhibiting a favorable risk-reward trade-off. Given the current state of the industry, our primary risk appears to be a change in investor sentiment. But moods are fickle, and we believe that continued poor financial results will ultimately drive the stock price lower.

Why Does Pessimism Sound So Smart?

Published Feb 17, 2016 at 11:15AM

Morgan Housel is Motley Fool One's expert on the intersection of investing, economics, and human nature. He studies the impact of big-picture issues on individual investors' lives — making us better Fools along the way.

Context: *No investor is an island, and Morgan sets out to help you understand how things outside your control that can affect your financial future.*

"For reasons I have never understood, people like to hear that the world is going to hell," historian Deirdre N. McCloskey told the *New York Times* recently.

It's hard to argue. Despite the record of things getting better for most people most of the time, pessimism isn't just more common than optimism, it also sounds smarter. It's intellectually captivating; pessimists are given more attention than optimists, who are often viewed as oblivious suckers.

It's always been this way. John Stuart Mill wrote 150 years ago: "I have observed that not the man who hopes when others despair, but the man who despairs when others hope, is admired by a large class of persons as a sage." Matt Ridley wrote in his book *The Rational Optimist:*

> If you say the world has been getting better you may get away with being called naïve and insensitive. If you say the world is going to go on getting better, you are considered embarrassingly mad. If, on the other hand, you say catastrophe is imminent, you may expect a McArthur genius award or even the Nobel Peace Prize.

In investing, a bull sounds like a reckless cheerleader, while a bear sounds like a sharp mind who has dug past the headlines — despite the record of the S&P 500 rising 18,000-fold over the last century. Wharton Professor Jeremy Siegel is often chided as a perma-stock-bull, blindly cheering for a higher market every time he goes on TV. But he's done it since the early 1980s, a period in which the market increased in value 40 times over. Alas, few care about past results when someone else is warning about The Next Great Depression.

This goes beyond investing. Harvard professor Teresa Amabile shows that those publishing negative book reviews are seen as smarter and more competent than those giving positive reviews of the same book. "Only pessimism sounds profound. Optimism sounds superficial," she wrote.

Why?

There's clearly more at stake with pessimism. Daniel Kahneman won the Nobel Prize for showing that people respond stronger to loss than gain. It's an evolutionary shield: "Organisms that treat threats as more urgent than opportunities have a better chance to survive and reproduce," Kahneman once wrote.

Here are a few other reasons I've observed for why pessimism gets so much attention.

1. Optimism appears oblivious to risks, so by default pessimism looks more intelligent.

But that's a wrong way to view optimists. Most optimists will tell you that things will get ugly, that we'll have recessions, bear markets, wars, panics, and pandemics. But they remain optimistic because they set themselves up in portfolio, career, and disposition to endure those downsides. To the pessimist a bad event is the end of the story. To the optimist it's a slow chapter in an otherwise excellent book. The difference between an optimist and a pessimist often comes down to endurance and time frame.

2. Pessimism shows that not everything is moving in the right direction, which helps you rationalize the personal shortcomings we all have.

Misery loves company, as they say. Realizing that things outside your control could be the cause of your own problems is a comforting feeling, so we're attracted to it.

3. Pessimism requires action, whereas optimism means staying the course.

Pessimism is "SELL, GET OUT, RUN," which grabs your attention because it's an action you need to take right now. You don't want to read the article later or skim over the details, because you might get hurt. Optimism is mostly, "Don't worry, stay the course, we'll be alright," which is easy to ignore since it doesn't require doing anything.

4. Optimism sounds like a sales pitch, while pessimism sounds like someone trying to help you.

And that's often the truth. But in general, most of the time, optimism is the correct default setting, and pessimism can be as big a sales pitch as anything — especially if it's around emotional topics like money and politics.

5. Pessimists extrapolate present trends without accounting for how reliably markets adapt.

That's important, because pessimistic views often start with a foundation of rational analysis, so the warning appears as reasonable as it is scary.

In 2008, environmentalist Lester Brown wrote: "By 2030 China would need 98 million barrels of oil a day. The world is currently producing 85 million barrels a day and may never produce much more than that. There go the world's oil reserves."

He's right: We'll run out of oil in that scenario. But that's not how markets work. A shortage pushed up oil prices, high prices incentivized producers to come up with new drilling techniques, and now we have more oil than we know what to do with. World oil production last year was 96 million barrels — already way above what he thought was the high mark. Failing to account for markets' ability to adapt is the cause of death of most pessimist forecasts.

Should you ever listen to pessimists? Of course. They're the best indication of what's unsustainable, and thus probably about to change, and thus the soil of what's to be optimistic about.

Pro Catch-Up Trades: Feb. 16, 2016

Published Feb 16, 2016 at 3:00PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **American Tower** (NYSE: AMT), buy up to 3.4% in stock

Continue building your portfolio with our Buys, including these highlighted today:

- **Facebook** (NASDAQ: FB), buy half of our 6.1% allocation to start
- **TD Ameritrade** (NASDAQ: AMTD), buy 2.3% in stock
- **Visa** (NYSE: V), buy to 2.4% in stock

Our new hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): If you haven't set up the new put ratio spread yet, as ever, do so only after you close your Feb. 19, 2016, put ratio spread sometime this week. Then set up the new one near the current SPY price. Currently, with SPY at $188, you would "sell to open" two April 15, 2016, $174 puts, and "buy to open" one April 15, 2016, $186 put. Lately, you can do this for a debit of about $0.50 (the rebounding market actually makes these hedges harder to set up for a credit). Follow last week's rolling trade alert for allocation guidance.

And our most recent short:

- **Deere & Company** (NYSE: DE), short 2% per our recent recommendation

Why Most Investors Fail, and How We Avoid That

Published Feb 16, 2016 at 2:06PM

Today, we're revisiting one of our very favorite Memos, this one first published in 2011. For many here, this will be new, and it remains as true as ever! We hope the fact that these words are still just as relevant five years on helps underline our message of steadiness and persistence.

Dear *Pro* Member:

Reliability and steadiness are essential to any successful career, whether you're a teacher, a doctor, an engineer, or a barber. That's because these qualities are directly tied to long-term performance. You won't achieve success over the years if you don't stick to your principles, if you fail to learn from your mistakes, or if you regularly change your approach without good reason. We know this to be the case in our working lives, but when it comes to investing, studies show that a majority of individual investors are just the opposite: They unreliably change course all the time, and not surprisingly, the results are dismal.

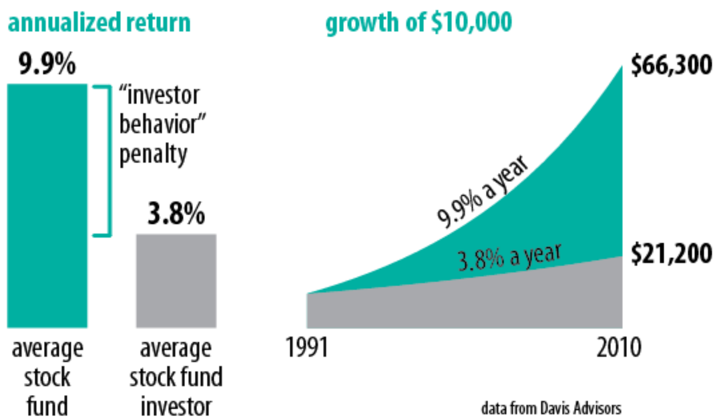
Missing Most of the Upside

The best-performing mutual fund from 2000 to 2010 was the CGM Focus Fund (CGMFX), which returned more than 18% annualized despite a flat S&P 500. The fund's outstanding track record would have turned $100,000 into more than $500,000 over those 10 years. The only problem? According to Morningstar, the average investor in the fund actually *lost* 11% annually over those same very successful 10 years. That is not a typo: The fund gained 18% annualized, but its average investor lost 11% annualized. You're not crazy to ask how that is even possible.

The answer is that many fund holders tried to time the market. For example, the fund soared 80% in 2007, so hordes of investors poured money into it in 2008 — only to see it fall 48% that year. That decline led investors to pull money out in 2009, taking losses soon before the market doubled from its low. Investors were making emotional decisions based on recent events, changing their stance repeatedly, and as emotion would have it, at the most inopportune times. Could this be happening with some investors now, too?

Not Just One Fund; It's Universal

According to an investing study from Davis Advisors, the average stock-holding mutual fund returned 9.9% annualized from 1991 to 2010, but the average fund owner earned only 3.8% on average per year.



Not pretty, especially when we translate this performance into dollars. By trading in and out of funds, the average fund owner increased a $10,000 investment to just $21,200 over nearly two decades — while the average *fund* turned that $10,000 into $66,300. Now imagine the continuing effects of compound returns on both of those amounts and the growing difference between them over a lifetime. Feel the pain. Remember it next time you're tempted to make a rash trade. Davis also finds that the less trading a fund itself does, the better the fund's results tend to be. What's true for individuals is true for funds.

Successful Investing Includes Many Bad Years

All great investors suffer years of poor results, bar none. It's just how the market is. Warren Buffett's partner, Charlie Munger, has an outstanding lifelong record, but his annual results lagged the S&P 500 index 29% of the time. An impatient investor would have left Munger during some of his down years and missed riches later.

And Munger is far from alone. According to Davis Advisors, investors who achieve the strongest records aren't always at the top of the performance list. Not even close. Over a 10-year period, Davis studied 192 large-cap money managers who had previously ranked in the top 25% for performance. They found that:

- A full 93% of them spent **at least one three-year period in the bottom half** of all performers.
- Sixty-two percent of them spent at least one three-year period among the **lowest 25%** of all performers.
- And 31% of the best money managers spent at least three of 10 years among the **very worst 10%** of all performers!

In other words, over this 10-year period, you could expect most of the best investors to be ranked among the *very* worst about one-third of the time.

This data clearly illustrates why impatient investors lose out: They go from vehicle to vehicle seeking results based on recent performance. They sell when one asset is down, only to buy another asset that may be up recently, but is just as likely to go down next — because nearly *all* investments and *all* investors have weak periods. As we showed above, chasing performance by looking in the rearview mirror can turn a 9.9% annualized return into 3.8%. Sitting tight would be so much better.

Stay the Course

Steadiness and persistence are necessary for successful investing. But don't take that to mean you'll always do well. There will be years in which your results disappoint you, and years in which your successes are far greater than you thought possible. That's why it's vital to invest in ways that make you comfortable, so you don't lose faith during rocky periods.

Even now (especially now!), investing is a lifelong pursuit. At *Pro*, we own companies we believe will increase in value over the next three years and beyond. We hedge and short, too, because volatility is a given. But we continue to believe that good companies will drive most of the profits we generate in the coming years, and we look forward to the value we'll generate together by staying the course.

Thoughts or questions on this Memo? Please bring them to our [Memo Musings discussion board].

Foolishly,

— Jeff Fischer (TMFFischer)

Roll Your Put Ratio Spread on the SPDR S&P 500

Published Feb 11, 2016 at 1:43PM

Is this for you? Please read the full alert to see if and how it applies to you, and take action sometime before market close on Feb. 19 if it does. Anyone who has a Feb. 19, 2016, put ratio spread on SPY (as we do) or who wants to set up a new hedge should follow this alert. Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $180,000.

How You Participate

- **Action:** First, if you have our Feb. 19, 2016, put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY), that spread is in-the-money, and should be closed before expiration a week from Friday. When you're ready, "Sell to close" all of your Feb. 19, 2016, $200 puts, and "buy to close" all of your Feb. 19, 2016, $190 puts. We have a partial profit on this spread; that profit currently grows when SPY goes up (up to $190, our maximum profit point) and shrinks when SPY declines (below $180, the spread becomes a loss). Nobody knows what the index will do over the coming five market days, but higher prices would at this point increase the profit in our spread, and lower prices could eliminate our profit. Either way, we want to close the spread by expiration.
- **Second action (or newcomers' only action):** Once you have closed your Feb. 19 spread, set up a new one. Buy to open April 15, 2016, $180 puts, and sell to open twice as many April 15, 2016 $168 puts.
- **Allocation:** About 10% of your total portfolio value, measured on the look-through value of the $180 puts you're buying (each put represents $18,000 in hedge value). Set up one 2:1 put ratio spread for every $180,000 or so you manage and want to hedge; hedging 10% of its entire portfolio (9.7% to be precise), *Pro* will sell 24 puts and buy 12.
- **Trade:**
  - **Use a spread order to simultaneously ...**
  - Write ("sell to open") **two** April 15, 2016, $168 puts, and
  - Buy ("buy to open") **one** April 15, 2016, $180 put. Click "view all" at your broker to see all strikes.
- **Price Guidance (Noon ET):**
  - Sell to open **two** April 15, 2016 $168 puts: Lately $3.57 x 2 = $7.14 credit
  - Buy to open **one** April 15, 2016, $180 put: Lately $7.07 debit
  - **Net credit:** Lately about **$0.07** credit (or higher) per spread, but this price will change; as that happens, just aim to set this up for virtually no cost using a limit order.
  - **Potential adjustment:** If SPY's price has changed much by the time you set up your trade, you may want to move your two strike prices down or up accordingly (as much as SPY has moved), while still aiming for a credit or no cost. We will make just such an adjustment ourselves if need be, and tell you about it.
  - **SPY price:** $182.30

What We're Thinking

A hedge on a market index is simply a hedge against a lower market. We generally don't care about declines of 5% or less, but when *Pro* is functioning as desired, declines of about 10% or more should result in some of our positions, like bear spreads, becoming profitable. In today's volatile market, our February spread on the SPDR S&P 500 has lately bounced around its full profit level ($190 on SPY); as of now, it has fallen below it, giving us only partial profits. (To see how profits on the February spread will work out in the end, reference our table from the [old trade alert].)

As with any near-the-money option, there's nothing we can do to control the outcome as expiration nears; we're at the mercy of the short-term market gods. As we go to close our February spread sometime in the next five market days (noting that Monday is a holiday), we hope we can do so on a day SPY is running up, the closer to $190 the better. But if we need to close while SPY is lower, we will, missing out on some or much (or all) of the spread's profit. Setting up put ratio spreads that don't cost us anything -- they pay us a credit -- but come with the risk of missing gains, and having downside exposure, if the market falls too much. We're on that cusp now. Those who merely set up bear put spreads, the alternative trade, have achieved the full profit (you can close the whole spread for close to $10 each, or five times your cost of $2).

But we're far from upset with our put ratio spread. We're in the ballpark of our desired results -- as of this writing, we've earned about one-fourth of the full potential profit -- and we're now in a good position to roll it, setting up a new spread at lower strikes, in case the market keeps falling. Once again, this new put ratio spread will:

- Be harmless to us if the market goes higher (it won't harm our returns)
- Be cash-free to set up (it will even pay us a small credit)
- Have a relatively low probability of loss

What's the trade-off? As with any written put, we need to be ready to buy the underlying investment; for today's trade, that means being prepared to buy shares of SPY via this hedge if the market falls too sharply. In this case, if the index falls more than 14.4% from today's price, this new hedge becomes a liability, with SPY falling below our breakeven point. If that happens, we would roll, close, or plan to buy long-term call options on SPY instead of shares, saving most of our cash in the process. See below for details on that.

To help you grasp how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2,233,000
- 10% of that value: $223,300
- April 15, 2016, spread:
  - Buy to open $180 puts. Twelve contracts representing 100 shares each = $18,000 x 12 = $216,000 in look-through exposure, or a 9.7% hedge on our current portfolio value, cash included.
  - Sell to open $168 puts, 24 contracts, half of which become a potential obligation, currently a 9% possible stake.
  - Following along, you would buy one $180 put and sell two $168 puts for approximately every $180,000 in portfolio value you want to hedge ($18,000 look-through put value divided by $180,000 = 10%).

Return Details

SPY Price at April 15 Expiration	Value of 1 Purchased April 15, 2015, $180 Put	Value of 2 Written April 15, 2016, $168 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Recent $182.30
$180 or higher	$0	$0	$0.07 gain per spread, or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 1.3%
$178	$2 x 100 = $200	$0	$200	(2.4%)
$176	$4 x 100 = $400	$0	$400 (max profit per spread)	(3.5%)
$174	$6 x 100 = $600	$0	$600	(4.6%)
$172	$8 x 100 = $800	$0	$800	(5.7%)
$170	$10 x 100 = $1,000	$0	$1,000	(6.7%)
$168	**$12 x 100 = $1,200**	**$0**	**$1,200 (maximum profit per spread)**	**(7.8%)**
$166	$14 x 100 = $1,400	($2) x 200 = ($400)	$1,000	(8.9%)
$164	$16 x 100 = $1,600	($4) x 200 = ($800)	$800	(10%)
$162	$18 x 100 = $1,800	($6) x 200 = ($1,200)	$600	(11.1%)
$160	$20 x 100 = $2,000	($8) x 200 = ($1,600)	$400	(12.2%)
$158	$22 x 100 = $2,200	($10) x 200 = ($2,000)	$200	(13.3%)
$156	**$24 x 100 = $2,400**	**($12) x 200 = ($2,400)**	**$0 (breakeven)**	**(14.4%)**
$154	$26 x 100 = $2,600	($14) x 200 = ($2,800)	($200)	(15.5%)

Our maximum profit is earned on this April spread if SPY declines another 7.8% from its current level of $182.30 (noting that it's already down 12.7% since our last spread was set up in November). From there, the spread will help us a little on a decline all the way to about 14.4% lower than today's price; beyond that, our short puts turn into an obligation that's in the red.

Follow-Up

Assuming we set this spread up for a credit, it will result in a small profit even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $168 put obligation if SPY is below that price by expiration.

If that does happen, our action may be to close our puts and buy long-term SPY calls (or something we like even better, whether calls or stock) instead of buying the ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY itself. So, our potential 9% or so stake in SPY shares will only cost us about 2.5% of our cash if we buy calls instead (though keep in mind, our portfolio value will be lower, too). We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases.

How It Fits Into *Pro*

Pro hedges in attempts to lower our market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market will make a difference. Even small gains add up over the years, especially if those gains are reinvested in depressed stocks. This hedge fits well with our goal of hedging in a cost-efficient way. It does require regular upkeep, though, opening new positions as old ones expire.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $180,000:**
  - For a cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, as we are, "buy to open" April 15, 2016, $180 puts and "sell to open" *an equal number* of April 15, 2016, $170 puts. Recently, this will cost you about $3 ($300) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $10 ($1,000) per spread on a decline to $170 or any lower price, but you should be prepared to lose your $3 per spread if SPY doesn't decline below $180 by expiration.
  - Have the alternative bear put spread from last time? Great! You can close it for close to $10 per spread, or nearly a 5x profit.
- **To lower your market exposure while following our official trade (and make the position possible in some IRAs):**
  - Set up the original put ratio spreads as recommended, but also "buy to open" puts (with the same months of expiration as our two spreads) at strike prices *well below* $168. Buy *half as many* as the number of $168 puts you wrote. When you do so, all of your $168 puts will be "covered" (half by your $180 puts, and half by the other puts you choose to buy at a much lower strike; choose how much you want to pay to select your lower strike price). You will only need cash in your account to cover the difference between your two lowest strike prices, and your risk is capped, making this potentially IRA-friendly. Lately, you can buy the April 15, 2016, $148 puts for about $1.05, meaning your only risk (and necessary cash reserve) is now $20 per share on half of your $168 puts. And this makes the total cost of your hedge about a $1 debit.

Pro Can Help

- **Need a refresher on ratio spreads?** Our guide can help.
- **Want to talk about SPY?** We have a discussion board for that.

Pro's First Video Chat

Published Feb 11, 2016 at 11:42AM

Fellow Fools,

We love our monthly check-ins with members, but as previously announced, we wanted to try something new this time around. Members submitted questions ahead of time via email and we answered them on camera; check it out below! It's also vital for us to know whether this new format works for you, so please bring your thoughts on that to the Member Suggestions board.

Topics include: *Pro*'s options recommendations; corruption on Wall Street; our financial companies in this interest-rate environment; TD Ameritrade vs. Interactive Brokers; sizing your hedges; health insurance stocks; how *Pro* protects its capital; and more. To download an mp3 of the audio from the chat, click here.

Run time: 28 minutes 8 seconds.

Transcript

Ellen Bowman: Hello, Fools. I am Ellen Bowman. I'm the editor of Motley Fool Pro and this is our inaugural video live chat. This is JP Bennett over here and Jeff Fischer, as you know, over here. We collected some questions from you all. I'm just going to get started. The first one is: Pro talks a lot more options. Education, weekly trade ideas, et cetera, than it actually does. I know timing can be tricky, but it seems a good many opportunities go begging in this very important value adding element of Pro. Can we expect more trade recommendations in this area?

Jeff Fischer: More options trades in pro?

Ellen Bowman: Yes.

Jeff Fischer: We can certainly expect them. It's true, although we had about the same number of trades last year as we've-

Ellen Bowman: We did?

Jeff Fischer: -had in prior years. It's felt a little less active the last, I don't know, 6 to 12 months maybe even. That's partly because we haven't found compelling things. Now, the market has fallen quite a bit as of this taping. The SMP is down, I think, 12, 13%. Nasdaq's down 15% this year. Anyway, as we see more opportunities, we'll have more trade ideas, definitely, including options. Do keep in mind that you get the option service as a compliment. A good amount of our time goes into that service and extra options ideas over there that compliment Pro ideas, especially on my side of the scorecard. Because I'm thinking of the 2 together.

Ellen Bowman: Simultaneously. Yeah. I know people don't always, necessarily, realize that, but options ... The service is an idea service, whereas Pro is, obviously, a portfolio service. If there are things that look appealing in options, they're, by no means, off-limits if you're following Pro.

Jeff Fischer: That's a good point.

Ellen Bowman: JP, I'll ask you this one. How do you get your hair so awesome? This is an actual member question.

Jeff Fischer: Who asked that question?

Ellen Bowman: We're not going to sell them out.

Jeff Fischer: We're not telling names.

JP Bennett: Lots of bleach.

Ellen Bowman: Do you do it yourself?

JP Bennett: No, because I wouldn't have any hair left if I did.

Ellen Bowman: You pay somebody to do it?

JP Bennett: Of course.

Ellen Bowman: Okay. Good to know. That's all you get to know today anonymous.

JP Bennett: I'm done now? I need a little bit more.

Ellen Bowman: You can go. Next up, what are Pro's opinions, or reactions, to the increase talk of corruption on Wall Street, corporate boardrooms, the largest banks? This seems to be picking up interest by the average American, witness the Sander's phenomena, and many books on the subject. I believe in equity investments, but it worries me that some kind of fix is in that places the retail investor at an extreme disadvantage.

JP Bennett: Oh, boy. That's a big one. I would say there's probably two things you'll want to take into consideration when you're thinking about this. The first is, yes, high-frequency trading, front running, things like that, they are an issue. Hopefully, over the long run, people can actually make changes that would mean this type of stuff doesn't really go on as much as it used to. The second thing is, all right, that's not going to change overnight. How can we deal with the situation that we're currently presented?

To me, I think the biggest advantage we have as retail investors is that we have a much longer time horizon than high-frequency traders and hedge funds and things like that. That time arbitrage, even though Pro in comparison to other foolish services, we, by necessity, have a shorter time horizon, but always making sure that even within that confined 3 year investing horizon, you have the ability to extend it, if circumstances arise that necessitate that, without a meaningful change to how you live and how you invest. I think it's important to take that perspective and then be okay with, maybe, losing a couple percentage points right off the bat, or something like that, and riding through it. Because if our thesis is valid, over a much longer time horizon, it will play out exactly like we want it to.

Jeff Fischer: I don't think I have anything to add to that except, probably, in many ways, the markets more regulated and companies are much more regulated since the 1970's, even. Let alone 1934. For the most part, as JP said, our one advantage is our time frame, and second, our ability to find really good companies. Then, ideally, keep them as long as they deserve to be held. We always watch for signs of management wrongdoing, or mistruths, or things that are really serious in nature so we can avoid those.

JP Bennett: Yeah. It's, basically, taking control of what we can actually control and worrying about high-frequency traders front running us to scout a couple basis points, or factions of pennies. That's not something that's in our control right now.

Ellen Bowman: Okay. That follows. I am going to identify our questioner here because it's Caron, and we all love Caron. Some of our stock BC's involve rising interest rates and there seems to be a lot of uncertainty. How much does our Pro success depend on the Fed and how can we stay smart about the positions effected by it?

Jeff Fischer: That's another great question. One thing to know about Pro is any position we buy has its own merits. We buy on its own merits, and extra things like interest rates, or if we were to buy commodities, commodity prices. That would be an extra thesis on top of it. We like Wells Fargo, the business, even if rates don't go up and the price right now. We like TD Ameritrade the same way, even if rates don't go up.

We still believe in them. The returns may not be nearly as strong as we had hoped, until rates do go up, but the return should still be respectable. I think that's true of almost any Pro stock that we buy.

Ellen Bowman: Yeah. I've never edited a thesis by you where you're like, "This will work out if this one thing happens." You're usually a little bit more-

Jeff Fischer: There's more to edit.

Ellen Bowman: A little bit yeah. JP, anything?

JP Bennett: To the extent that the Fed controls the market, all of our stocks are somewhat dependent upon what they do. Like Jeff said, all of our financial exposure, financial companies, they will benefit from an eventual increase in rates if we finally do get one, but we're not banking solely on that.

Ellen Bowman: That's not the whole thesis.

JP Bennett: We are, in many respects, entering into an unprecedented era where we had such influence by the Fed, and now we're trying to get back to a normalized rate environment. What is normal now? Given slower growth and things like that. They're trying to increase rates when inflation, half of the mandate, is nowhere near the 2% they want to target.

It's a very interesting time to be investing and it'll be really interesting to see how that develops. Because we really have no historical perspective, we can't rely, exclusively, on the interest rate argument for TD Ameritrade or Wells Fargo or something like that.

Jeff Fischer: I think, like many people, we are resetting our expectations right now to be even more conservative than before. I wouldn't expect rates to go up 3 or 4 times this year, as was previously anticipated. It may be a long time before rates go up meaningfully, given the deflation and commodities and lack of demand, especially overseas, apparently. It may be a long time.

We have to invest accordingly. That may make us much more hesitant to add to our financial exposure. We've been cautiously waiting to see how things would go, anyway, there. Anyway, we are always adjusting our expectations. Right now, we're dovish on interest rates going up. We don't really expect to see much this year.

Ellen Bowman: Okay. You both mentioned Ameritrade. We have a question here about it. Just curious if you considered interactive brokers when you recommended Ameritrade that has outperformed Ameritrade over Pro's ownership period. All without including diffidence, do you track Ameritrade against other companies in the same room?

JP Bennett: Billy covers that one. I will say that, yes, we've given consideration to it. We added it in options. Wasn't the best of timing, given how the market has behaved since we added it. Yeah. Whenever we follow a specific company, we're always looking at the industry, the competitors. Because it's core that we do that to make sure that when we pick one, and we are foolish on the industry in general. It's like, "Well, why is, one company that we're picking, why is it going to do better than everyone else?" Good question.

Ellen Bowman: Well said. All right. We have somebody who says "I set aside a portion of my portfolio to follow Pro and to build my long positions, according to the recommended allegation. For the short positions and options, especially the SPY Hedge, I feel that I could use, more or less, the size of the money I manage as the basis for the allocation. I want to hedge my entire portfolio, not just my Pro portfolio. Is this approach reasonable?"

JP Bennett: Yes. That makes good sense. You size any hedge to hedge the amount of assets that you would like to hedge, and not just the Pro portfolio. That said, when you're buying positions, you might be thinking the same way, too. If we, say, buy 2 1/2% Visa, if you have a Pro portfolio that, if you bought 2 1/2% in that portfolio, but it was only 0.5% of your total assets, you might want to rethink that to make it more meaningful.

Ellen Bowman: Our allegation is a reflection of how much we believe in the stock, right? You can assume that we're slightly more bullish on something, that we have a higher allegation to, and that you can probably take from that you could be, too.

JP Bennett: That's right. Especially at the start. When we issue the trade, it's how much we want to move into it right away. Overtime, as positions grow, we might believe in our largest positions as much as a position that is smaller. We're happy to have appreciation. Yep.

Jeff Fischer: I would just add to move it to more of a theory perspective. A lot of people, now, are advocating that you should think of your wealth in 2 buckets. There is the financial capital and then there's your human capital. Which, your human capital refers to the amount that you will earn over your lifetime. Whereas your financial capital is the things that you've already accumulated, like your stocks, your cash, things like that.

In that particular bucket, like Jeff said, you should think of it all in one bucket. Don't strip it out into certain things. From that perspective, if you wanted to hedge a larger chunk of that particular bucket, yes. You don't have to necessarily just think about, "All right. I have this Pro portfolio and I'm only going to hedge that." You should think about buying, selling, hedging, in terms of that kind of entire portfolio. Just make sure that when you do that, you're making sure you're still staying properly diversified.

If you're doing it in terms of shorts, don't rely on 1 or 2 shorts. As far as whatever portfolio, wherever you're holding those, make sure that you can stomach that volatility. You don't want to be getting margin calls because you basically just have a portfolio and you don't have a ton of excess cash in there. It's just almost exclusively used for shorting, and then all of your shorts start running against you really aggressively. That won't be a fun time.

Ellen Bowman: That's suboptimal. We avoid that. Okay. We have a long question here about healthcare. I'm going to try to shorten it a little bit. Some drug firms are saying they have minimized price hikes in recent months to avoid attracting attention. Bernie Sander's single-parent plan would, of course, decimate health insurance companies. Big pharma is, apparently, responding by being frightened of what a Clinton or Sanders presidency might do. What would be a good position on pharma, specifically health insurance stocks, that would take advantage of an unlikely, but potentially, devastating drop?

JP Bennett: That's all you Jeff.

Jeff Fischer: I haven't thought through that, yet. I don't believe it's going to happen. I wouldn't take a position out of political concerns. We'll continue to focus on businesses that we really believe will be strong, almost no matter what. If Capitol Hill, or the White House, changes drastically in that undercuts a whole industry, then-

Ellen Bowman: Then ...

Jeff Fischer: -there will be a lot of pain across that industry. Partly for that reason, we keep our exposure limited to every industry. We have, I think, 6% or so in healthcare, directly.

JP Bennett: I'd have to look.

Jeff Fischer: Even companies we believe in strongly, like MasterCard and Visa, that exposure is around 7% or so. Because we know regulations could always change, rules could always change. It's a good question. I don't want to dismiss it out of hand, but I think it's early to have that concern, or at least, it's early for me to be researching in relation to that concern. I don't have an answer.

Ellen Bowman: Makes sense.

Jeff Fischer: I like what we own, though. I like Medtronic and Gilead Sciences. Good question. These are all good questions.

Ellen Bowman: They are. Okay. Jeff said something about this being a year where we're working not to lose money. What is Pro's best strategy for protecting capital during bearish markets?

JP Bennett: I said that, I think on a post or in a memo, that there are times to make money in the market and times not to lose money. At least, as a focus right now, anyway. It may not last the whole year, but it seems more of a time to be cautious and try to minimize your losses. Obvious ways to do that are to hedge or short. Right now, we could use more of those, and we continue to research them.

Prices have changed so quickly over this year that a lot of ideas have fallen away from us. The opposite of rising away from us. We have some hedges. We have cash. The clearest way not to lose money in a falling market is to not make new investments, and we've been very slow to do that, thankfully. We're ready with a list of things to buy. Meanwhile, we've been minimizing our losses by not putting on more long exposure.

Ellen Bowman: Okay. You were talking about industries a minute ago, and this question comes from that, I think. What industries could we take positions in to defend our gains? Is our dividends more important now?

Jeff Fischer: To defend our gains, which industries should we buy into? Are dividends more important? I think where this question is going is should we look to add to the yield of the portfolio, increase dividends.

Ellen Bowman: Yeah. I think so.

Jeff Fischer: Unfortunately, the past year or so, high yield stocks have gotten crushed. You can see that in Motley Fool income investor, which just focuses on dividends stocks. The reason for that was people were expecting interest rates to go up. At which point, bonds and other instruments would compete more favorably with dividends, and so dividends stocks go down a little bit, at least. There's no overall, at all. A lot of it evens out in the end when rates are rising.

Dividends stocks are not as attractive when rates fall. They're more attractive. Over the long run, I think, just having a good mix of capital appreciation-type stocks and dividends stocks is the way to go. We try to have balance. We've generated about a 2% yield, dividend yield, on our invested assets, each of the past several years. Which in Pro is pretty good while we're not targeting dividends. If we can add at least a few more percent with option income, as we did last year, then you're getting a pretty good deal.

JP Bennett: I think another thing to add to that, too, is, I'm pretty sure I wrote about this in a memo at some point in the past.

Jeff Fischer: You write so much. You can't forget.

JP Bennett: Yeah.

Ellen Bowman: Maybe I'll remember it.

JP Bennett: Yes. That's the reason I forget, because I write too much. Anyways. Overtime, you're seeing the coloration of more assets move towards, one, when things are getting hit. The time that you want diversification, and even if you dive into equities and you just look at different sectors and things like that, we've seen ... If you go back 20, 30 years, the idea of basically cutting up your portfolio and making decisions based on industries and trying to create diversification that way, was a lot more beneficial than it is in 2 days market where, when you just look at the markets down. Pretty much everything is getting cut with varying degrees.

I would say that we don't specifically manage a portfolio, saying that we need to have a specific exposure to a give industry. I think, in 2 days kind of environment, that's the wrong way to go about it. You need to find awesome companies. Then after you've found a company you really like, make sure that, in terms of industry exposure, it makes sense in your portfolio. That will exclude us from going too heavily into a given industry. We may say that, "Hey. A sector and industry looks attractive right now. Let's see if we can find a company we want to invest in that we really like," but we won't go into it with this specific mandate saying "Oh, energy has been cut really bad, so we're going to find one." I think when you take that mindset, it leads you to come up with a investment that it's, primarily, based on the fact that you think you need to find something. Not that it's actually a good opportunity.

Ellen Bowman: You pick the stock first and build the thesis afterward?

JP Bennett: Exactly.

Jeff Fischer: I can piggyback on that comment by saying I think we've invested fairly defensively from the start in the type of companies that we seek, which is what JP just spoke to. One's with pricing power, one's with competitive advantages that are real, and that should be sustained. One's with growing market opportunities.

All the Pro criteria that we look for in a company, that has kept us defensive, in that, it's kept us out of commodity-based businesses, or out of loan margin, cutthroat-type of businesses. To companies that are doing well, even now, when things are a little challenged. Hopefully, if we keep that mindset, we'll stay defensive while still investing for returns.

Ellen Bowman: Not just preservation.

Jeff Fischer: Yeah. Where we've taken the most risk, probably, is in financials. Even in Wells Fargo and AmTrust and things of that nature. AIG in the past that we sold. We did that after the crisis when the dust had settled. We had strong businesses at really attractive prices. The good news is the those companies have stayed reasonably priced, so we still like them. We still like Wells Fargo. Then Technology, we bought Technology when it's inexpensive. We're trying to be defensive even as we invest to grow.

Ellen Bowman: Okay. On an even more defensive note from the same member, who says that he has lots of portfolio management questions. How much cash, in percentage terms, should we have on-hand?

JP Bennett: I guess it would all depend on the given person and how closely you want to mirror Pro, right?

Ellen Bowman: Right. You can go to our recommendations page, see how much cash we have, and go with that.

JP Bennett: Yeah. There's obviously an opportunity cost. This is one thing I know I did write about in a prior memo. There was an opportunity cost associated with holding cash. Yes, it is a huge benefit that it gives you flexibility when the market falls. You can invest and benefit from that bounce back to a disproportionate amount. At the same time, the benefit depends on where in your investing horizon that cut falls. If the market's going rally for 15 years before falling, a meaningful amount, then the benefit associated with holding cash isn't nearly as strong as a opposed to, right now I have 30% cash. The market falls by 50% tomorrow. I put it to work. Then the benefit is huge. That gets more towards portfolio theory and where you are in what's your time horizon and letting that, to a certain extent, dictate the type of investor that you are.

Someone younger, they probably shouldn't be sitting on a huge chunk of cash unless they are a very nervous individual. Whereas, and being fully invested, would lead them to make sub-optimal decisions at the exact wrong time, like selling at the bottom. Whereas, the closer you get to retirement, I know Jeff spoke about it previously, but cash is a great asset to retirement.

Jeff Fischer: Retirement? I spoke about retirement?

JP Bennett: No.

Jeff Fischer: Did I announce that?

JP Bennett: No. The importance of cash and diversification and hedging and things like that. It's not as sexy as shorts and hedges, right? It can be very helpful, as far as managing volatility and making sure you don't lose during the periods when you're focus should be on not losing.

Ellen Bowman: All right. We have somebody who would like to know about your thoughts related to energy socks, but I think we have shared them, so I will not as about that. Similar question about materials markets. Okay. I think it is important that-

Jeff Fischer: I like that. Ellen's like ... she's learning what is on the chopping block. Those guys are not going to buy materials or anything.

JP Bennett: No.

Jeff Fischer: Energy? We will look, in all seriousness. There are good businesses out there. I'm not speaking to Ellen now, I'm speaking to ourselves. We do look. If we find something we like enough, we'll go there, but it needs to have pricing power. It needs to have all kinds of catalysts.

JP Bennett: I think the one thing to think about those are naturally cyclical businesses. The key is what is the normalized environment going forward? This builds off of what we talked about with deer when we shorted it, right? It was basically, we think that byproduct of that boom in the agricultural industry lead to an unsustainable increase in tractor sales. The more normalized rate going forward, isn't nearly as high as what people think.

In the energy sector, yes, oil has gotten gutted. What's the normalized rate going forward? Obviously, supply and demand need to come back and balance. What we've seen is that Woodmack recently, actually, put out a study, I don't know if you've seen it yet, Jeff, where it's basically, despite this huge gutting of prices, actual production has been cut by .1%. The big difference is that people are pushing out expenditures to open new wells and things like that. That's where the big shift has been.

It's not like all right, oil has fallen so hard, people have just all of a sudden turned of the spigots, and so productions going to come down really fast. The rebound is going to be just as steep and we're going to get back to $100 a barrel. The key is, if you're going to invest in those businesses, what is the normalized rate and what type of multiples should those stocks get? I can't speak for Jeff, but I haven't done enough work to find some company where I'm comfortable enough to make that bet right now.

Jeff Fischer: You have to keep in mind, technology keeps improving, too. There are now oil shell ... what's the word? Oil shell.

Ellen Bowman: Drills?

JP Bennett: Wells?

Jeff Fischer: Wells, I guess. Wells in Texas where they can produce oil, profitably, at $20 a barrel. If it gets cheaper and cheaper to produce it ...

JP Bennett: Even the more expensive wells, they still aren't cutting production. Some companies are literally just going, "Please rise, oil. Please rise." The cost associated with turning off the well, or stopping production, and then bringing it back online, they're not really wanting to play that game.

Ellen Bowman: More like buckle down and wait a little bit and see.

Jeff Fischer: My bet is eventually Alpek will cry uncle and lower production and that'll help everybody. You can't invest on that thesis.

Ellen Bowman: Don't invest on that thesis anyone. All right. You guys are awesome. You answered a question I tried to skip over. You wouldn't let me. I think it is important that Jeff discuss balancing ones portfolio, even in the face of significant gains. The importance of diversification and of locking in profits. That's a big one. Do you want to just take the first part? Balancing in the face of gains.

Jeff Fischer: Yeah. I think, if you're winning positions get to become 10% or more of your portfolio, and that's just my arbitrary number, it can be 7% percent, it could be ... Then you have to really think about balancing, or selling it down a little bit just to spread your risk a little bit. It's a tough question because you don't want to cutoff your biggest winners. From my perspective, and I think David Gardner's too, anyone who started investing in the 1990's, their biggest winners became Amazon and Starbucks. If you had sold them early, now you're biased towards not selling at all.

Ellen Bowman: Oh, yeah.

Jeff Fischer: Actually, that's true over the history of the market, too. If you bought J&J in the 50's or Coca-Cola in the 80s up to this point, it's best that you've just held it. Selling your best performers, it should be done reluctantly, carefully. Only when you have far too much to make yourself comfortable and, or, you see something you like as much, or more, to put some of that money into-

Ellen Bowman: I was going to say what would be the stimulus that would make you decide? Is it just arbitrarily it crosses this number? I guess it is for some people, but otherwise, is there a reason-

Jeff Fischer: It is for some people, but it really depends on the business. We always are more likely to sell a less strong business, like the Buckhold, than we would be Starbucks or Visa. Even if Starbucks or Visa or O'Reilly, look overpriced for a while, we'll give it time. We know it may dip and we may have to wait it out, but in the long run, we expect more compounding. Where as cyclical business, or a retailer or something, that's not nearly as strong, that compounder, as much, we'll sell if it gets near fair value-

Ellen Bowman: That makes sense.

Jeff Fischer: -generally speaking.

Ellen Bowman: Okay.

JP Bennett: I think that's pretty much on the market. It's like, look at the business first. That should be the primary driver, but then you just always need to have it in the back of your head, this is the maximum threshold. Because it can be a great business, it can do great things, but at some point, if you think about it in terms of portfolio management, you're going to want to cap your maximum exposure to a company. Being a bit of a bear and putting a counterpoint to people who've started in the 90s or whatever, and those businesses became such great things.

What you're now seeing, if you look at the unicrans and stuff like that, businesses are going public at a much later time. It's, in theory, going to be, pretty much, impossible for Facebook, say, to deliver the returns of Microsoft just because of the evaluation that was currently attached to the business. That's just something of trying to keep your mindset in check in terms of, yes, you've seen these businesses go public and the returns are just astronomical. I wish I was investing in those companies at that point in my life, but I would say, for the most part, we're unlikely to see those type of mind-boggling return numbers going forward.

Don't just hold on to a company because you're just super infatuated with the business and you remember in historical context that something went public and just went absolutely gangbusters in the next 20 years. It's a balancing act.

Jeff Fischer: That's a great point. It is a balancing act. Time-frame becomes such a big part of it, too.

JP Bennett: Oh, yeah.

Jeff Fischer: If you need any money within 3 years, then you want a more balanced portfolio and you can't depend so much on just a few large positions., the closer you are to retirement, say.

Ellen Bowman: You guys are reminding me in 1997, when he graduated from high school, my father-in-law offered my husband, either, a new computer or $1,000 in Apple stock and he took the computer. That's why I did not marry a rich man.

Jeff Fischer: I think 95% of 18 year olds would take-

Ellen Bowman: Would have taken ... I know.

JP Bennett: I don't know. I was in to stocks at that point in my life. I may ...

Ellen Bowman: Yeah, JP is maybe a different one. I think that's going to wrap it up for Pro, for our Pro questions. Thank you to everybody who submitted one. We hope this new format has been good for you. We will let you know how it goes and stay tuned. Thanks.

JP Bennett: Thank you.

Jeff Fischer: Thank you.

Ellen Bowman: Cool.

Pro Catch-Up Trades: Feb. 8, 2016

Published Feb 8, 2016 at 4:10PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **Skyworks Solutions** (NASDAQ: SWKS), buy up to 3.2% in stock; or "sell to open" March 11, 2016, puts or later (at your choosing), if you wish to target a lower buy price

Continue building your portfolio with our Buys, including these highlighted today:

- **O'Reilly Automotive** (NASDAQ: ORLY), start by buying half of our 5.1% position (earnings are out Feb. 10)
- **Verisk** (NASDAQ: VRSK), buy up to 2% in stock
- **Visa** (NYSE: V), buy up to 2.4% in stock

And our most recent short:

- **Deere & Company** (NYSE: DE), short 2% per our recent recommendation

---

How Fellow Fools Approach This Market

Published Feb 8, 2016 at 12:03PM

Pro Completed Trades

- **World Acceptance** (Nasdaq: WRLD): We closed all of our remaining short shares, booking a 48.7% gain.
- **Deere & Co.** (NYSE: DE): We sold short a 2% position (600 shares for us).

Dear *Pro* member:

A few hundred Fools gathered in San Diego last week for a *Motley Fool One* member event. We shared two evenings and one full day together, meeting one another, talking about investing, hearing from speakers, panels, and fellow Fools, and enjoying food and drink outdoors in the kind, temperate climate. Much of the city around us was new, built in the last 10 years, and the buildings seemed to reflect the promise this young country still has.

However, the main event took place on Friday, when the stock market offered anything but promise. Technology shares were hit especially hard last week (and so far this morning, too), with **LinkedIn** (NYSE: LNKD) tumbling a hard-to-believe 44% Friday during our member event. The stock is popular across the Fool, a substantial holding in a few services, so many members felt the hit, but nobody seemed excessively downbeat about it, or about the market as a whole. Sure, many questions from the audience centered on volatility, macro concerns, and the market's near-term future, but panic or unhappiness were not a part of the day.

That must be because Fools know to only invest in stocks using cash that isn't needed for at least three years. We didn't plan to sell anything on Friday (or today), so the current prices are -- technically speaking -- not even relevant to us. Plus, we know investing returns are finite. A rising stock market steals from future returns, and a falling market promises higher future returns. This is inevitable math.

Still, it's never fun to watch the value of your portfolio decline sharply. We pointed out in last week's Memo that the average stock entered a bear market last year, falling more than 20% (that's the amount someone decided to define as a bear market). For many stocks, last year's drop is starting to look like a walk through the park, with declines pushing 40% or more this year. As for the indexes, the bear lurks there, too. As of 10:15 a.m. ET this morning, the Nasdaq was down 18.7% from its June 2015 high; the S&P 500 was off 13.6% from its May 2015 high; and -- representing small caps -- the **iShares Russell 2000** (NYSEMKT: IWM) is down a big 25.9% from its high. The vast majority of these losses happened since January 1. *Pro*, meanwhile, is down 10% this year (as of this morning). We're now at a point where we're considering significant new hedges to keep that number from getting worse, if we think that's likely. We don't want to decline so much that earning a net profit over the next year or eighteen months would seem unlikely.

So, what's going on?

The stock market follows a story, and the narrative has changed. For several years, the narrative was a recovering economy, growing employment, and higher earnings -- all supported by federal stimulus. Today's narrative is slowing growth in China; struggling emerging markets; tumbling commodity prices; stressed energy-company debt, with defaults growing; zero Fed stimulus in the U.S.; and new doubts that interest rates will increase much this year. (They probably won't. That would mean banks including **Wells Fargo** (NYSE: WFC) and brokerage houses including **TD Ameritrade** (NASDAQ: AMTD) will need to wait longer for the benefit of higher rates.) Today's edgy narrative points to the possibility of a recession, which is when GDP shrinks compared to the previous year. Should we fear a recession? In many cases, they're so shallow that they're ending just as we begin to realize they've started.

Meanwhile, stocks will ultimately trade on future earnings expectations. Once the narrative of fear begins to calm, and people have more faith in earnings estimates, stock valuation should become a focus again. If stocks get cheap enough, valuation *becomes* the new narrative. We've seen that happen how many times in a sharply falling market? Most of them (2001 and 2009 were exceptions, because earnings were so miserable). Trading at 1,847 this morning, the S&P 500 is valued at 14.4 times "normalized" 2016 earnings estimates of about $128 per share. That's right at the long-term median, according to Multpl.com. Half the time stocks trade lower, half the time they trade higher. So, if earnings hug that estimate, we're in historically neutral pricing territory. That should come as a small relief. (If everyone wanted to suddenly focus on earnings as reported, or GAAP rather than non-GAAP, then the index is at a 20 P/E multiple. So, accounting is one of the bigger risks we may face. But I don't believe Wall Street will move to ignore non-GAAP anytime soon.)

What are members doing in this environment? Rather than worrying too much about the unknowable (the big macro, for example), many in San Diego said they're buying more shares, targeting companies they know and love. Those who aren't adding more cash are simply riding it out, with no plans to sell in the near future anyway. Some are reassessing and selling positions they don't feel strongly enough about (falling markets often bring out the critic in us, which is not a bad thing when done rationally). One kind member didn't care to speak about today's market at all. He only wanted to share that writing options has allowed him and his wife to give to charity every year -- they give the options proceeds away. This was a touching conversation.

The bottom line for *you* is as personal as it was for every person in San Diego: What are you investing toward? What makes you comfortable? Is your portfolio behaving the way you hoped during yet another 20% market decline? (They happen roughly every four years on average.) Here in *Pro*, we've always said that having portfolio flexibility is key. If your portfolio is stuck now and your hands are completely tied because stocks fell, then you might grow more anxious than you otherwise would be. If you have portfolio flexibility to take positive actions in this negative market, then you can look at the current situation constructively and act accordingly.

That's where we are in *Pro* today. We have cash to consider new long investments at much lower prices, either stocks or calls. We can also consider offsetting new buys with more shorts. And we've been waiting for acceleration in the decline to set up a new hedge, because -- assuming we're using a put ratio spread -- pricing initially gets better, not worse, when setting up certain option spreads on a price decline. Or we could just keep waiting: Cash affords us that, too. But given our goals, that's not going to be our only action.

The point is to maintain portfolio flexibility. Assuming you care at all about near-term volatility, and taking action during it, you must keep some flexibility in your portfolio construction. Our long-term stock holdings have a rolling three-year outlook; but almost all of our other work (hedges, writing options, shorting) is about generating returns over much shorter periods of time. That's what we have the flexibility to do right now, whenever compelled. And that puts us in a better place. Please visit the Memo Musings board to share any thoughts or questions.

We'll be in touch soon!

-- Jeff (TMFFischer)

Broadridge Continues to Produce Steady Growth

Published Feb 5, 2016 at 4:40PM

Pro's Take: BR Q2-2016 Earnings

Broadridge Financial Solutions (NYSE: BR)

Q2-2016

Quarterly recurring fee revenue growth (Y-o-Y): +7.8% to $399 million

TTM Operating profit margin*: +158 bps Y-o-Y to 22.5%

Closed Sales** growth (Y-o-Y): -1% to $48.5 million

Quarterly EPS growth (Y-o-Y): +18.4% to $0.33

**Operating profit / Fee revenue. This removes the impact of distribution revenue, which is a pass-through cost and distorts the true economics of the business.*

***Closed sales were previously described by the Company as recurring revenue closed sales.*

Quarter Quick Take

Broadridge continued its solid sales momentum in Fiscal Q2-2016, posting reported revenue growth of 11% in the quarter. The company disclosed sales activity with some key clients in Fiscal Q2 2016 (including Barclays and Societe Generale) and generated $48.5 million in closed sales in the period, down 1% compared to last year's record quarter during Q2-2015. Margin pressure has started to alleviate, and the company reported lower SG&A expenses and higher operating margins as a result. The company continues to pursue its tuck-in acquisition strategy, acquiring QED Financial Systems for about $15 million in November, and acquisitions contributed 5% to growth in recurring fee revenue in the quarter.

The company has produced a solid start to Fiscal 2016, but they have a bit of work to do to meet or exceed management's guidance for the full year: recurring fee revenue growth of 10%-12% (YTD +8.8%), Closed Sales of $120-$160 million (YTD $66.5 million), earnings-per-share growth of 7-12% (YTD +13%), and free cash flows of $350 million-$400 million (YTD $5.7 million, though typically the vast majority of the company's free cash flow is produced in the seasonally strong Fiscal Q4).

Updated guidance: Buy (no change)

Recommended Allocation: 4.7%

Fair Value estimate: $56 (up from $54)

Current Price: $51.49

Based on management's guidance, at $51.49 per share, the stock is priced at about 18x projected 2016 cash flow and 20x projected 2016 GAAP EPS. Both of those metrics have declined a bit compared to the the past few quarters, providing investors an opportunity to buy shares at a bit of a better value compared to before the recent market correction. Broadridge still features stable cash flows, a steady growth profile, an increasingly strong competitive positioning, and higher margins to show for it. **Our Fair Value estimate increases to $56 per share (from $54), and Broadridge remains a Buy on our scorecard.** Now is as good a time as any to establish a position or fill out your allocation.

Our Thesis

Broadridge has a near monopoly in proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record and sound capital allocation policies make Broadridge a sturdy rock to build the Pro portfolio upon. We expect modest growth in fee revenue, slight operating leverage, plenty of free cash flow and a growing stream of dividends to help achieve North Star-like returns.

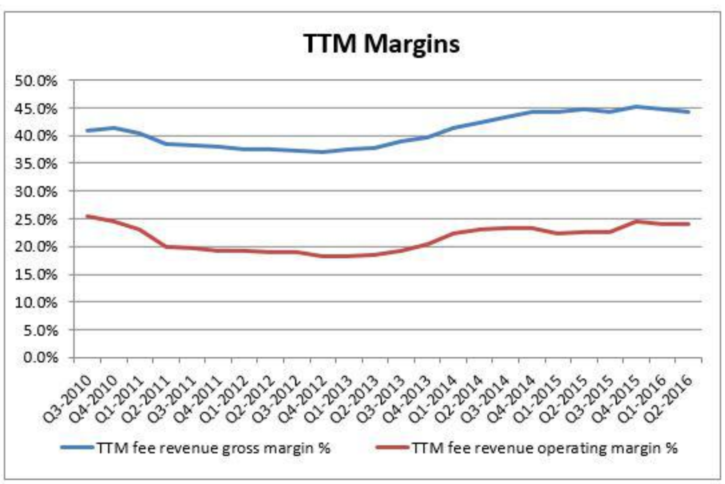
The Most Important Things

1) ***Closed Sales:*** This metric (previously disclosed as "recurring revenue closed sales") represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%+). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

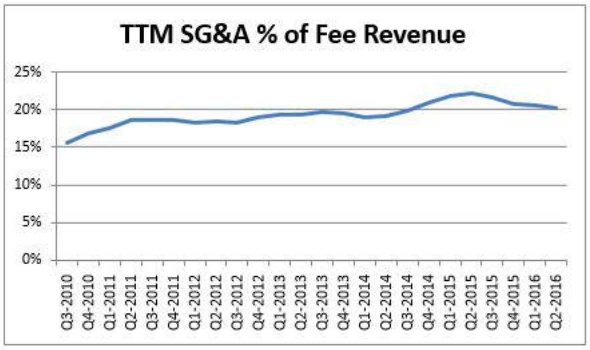
Lately, closed sales have taken a bit of a breather compared to Fiscal 2015, but that's because 2015 was an extraordinary year for closed sales. For the first half of Fiscal 2016 (Q1 and Q2), the company reported $66.5 million in closed sales, which is down about -19% compared to the first half of Fiscal 2015 ($81 million). But when we account for the difficult year-over-year comparison by comparing to the first half of Fiscal 2014, the two-year absolute growth comes in at 75% (a 32% CAGR). The three-year growth rate is similarly strong at 95% growth (a 25% CAGR).

The run-rate for closed sales for Fiscal 2016 implies full-year closed sales of $133 million, which is well within the company's guidance range of $120-$160 million. Additionally, Fiscal Q4 is historically the strongest sales quarter of the year, so the company may have room to reach the high end of its guidance for closed sales by the end of the year.

2) ***Fee Revenue Margin Performance:*** In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers) we prefer to look at trailing twelve months (TTM) margins to smooth out quarterly fluctuations. TTM fee revenue gross margins came in at 44.4% (down slightly from 44.7% a year ago), and TTM fee revenue operating margins came in at 24.1% (up from from 22.5% a year ago):



TTM gross margins declined slightly due to foreign currency fluctuations and revenue mix, and TTM operating margins expanded due to SG&A expense leverage as the company's SG&A expenses as a percent of revenue declined, offsetting the smaller impact of the gross margin decline. SG&A expenses have started to moderate after a year of increased spending (i.e. investments in the sales force to generate higher sales):



If the company can continue its outstanding performance in closed sales and healthy sales growth, then there may be room for continued margin expansion.

3) ***Capital Allocation:*** Although Broadridge is a slow grower, it generates a lot of cash and has low reinvestment needs. Management has a very clear plan to put that cash to work: it targets a 45% payout ratio, and it plans on using incremental debt capacity to pick up the pace of acquisitions (targeting $400-$600 million between FY2015-FY2017) and share repurchases.

On the dividend front, the company has paid out $1.14 per share on a TTM basis, good for a 48% payout ratio and about a 2.2% yield on the current price. On the acquisition front, the company is making good progress -- the company has spent $216 million on five acquisitions (Direxxis, Wilmington Trust, Thomson Reuters Fiduciary Services and Competitive Intelligence unit, TwoFour Systems, and most recently QED Financial Systems) since its capital stewardship priority update in December 2014. The company has an excellent acquisition track record (a 20%-plus IRR since Fiscal 2007), and they expect acquisitions to account for about 2% of growth in recurring fee revenue out to Fiscal 2017. In the first half of Fiscal 2016, the company has exceeded that goal -- acquisitions accounted for 4% growth in recurring fee revenue in Q1 and 5% growth in Q2.

As for share repurchases, the company has bought back $10.6 million in shares at an average price of about $53 per share in the first half of Fiscal 2016. As for debt, the company has added $66 million in debt during the first half of Fiscal 2016 via their revolving credit facility, which has a variable interest rate of LIBOR plus 112.5 basis points (and may be refinanced into a longer-term instrument at some point in the future). This is consistent with the company's longer-term strategy to run the business at a debt-EBITDAR ratio of 2:1 (based on my calculations the company is currently at about 1.7:1).

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

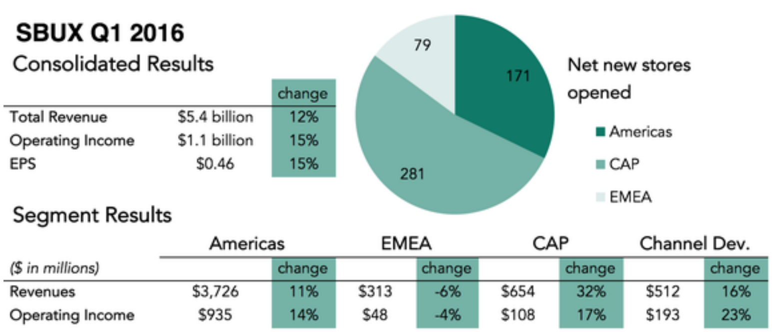
Starbucks Roasts the Competition

Published Feb 5, 2016 at 4:40PM

It's good to be the king -- or, in this case, the siren. **Starbucks**' (NASDAQ: SBUX) dominance was on full display once again this past quarter, as the company reported impressive comparable-store sales (comps) and saw its loyalty program gain further steam.



Source: Company filings

Updated Guidance and Valuation

Updated guidance: Buy (no change)

Recommended allocation: 3.8%

Fair-value estimate: $49 (up from $47)

Current Multiples

Multiple	Trailing	NTM

P/S	4.1x	3.7x
P/E	34x	28x
EV/EBITDA	17.1x	14.8x
P/FCF	31x

Investment Thesis

Starbucks offers a unique blend of sales drivers (domestic and international growth, food and beverage innovation, and channel development, just to name a few) and cost-reduction opportunities (payment innovation, European restructuring, expansion of consumer product margins). We believe the coffee is just a gateway for the company to repeatedly sell customers an experience rooted in comfort, quality, health, community, and conscience. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand into new products, new platforms, new times of day, and new brands. We expect new store openings across the globe to strengthen the company's brand and cost-based competitive advantages and improve profitability over time.

With a company as large as Starbucks, you might think there isn't much more room for growth. But you'd be wrong. As laid out during the company's most recent Biennial Investor Day presentation, management believes that within five years, Starbucks will increase its store base to more than 30,000 global locations (up from 23,571 today), achieve $30 billion in annual revenue (up from $19.7 billion TTM), and double its annual operating income. Given the global strength of the Starbucks brand, we believe that this is definitely possible.

Results

Comparable-Store Sales

	Q1 2016			**Q1 2015**		
	Sales Growth	Change in Transactions	Change in Ticket	Sales Growth	Change in Transactions	Change in Ticket

Americas

Starbucks has never been stronger here in the United States. Its Americas segment — which consists of the U.S. (81% of stores), Canada, and Latin America — delivered 11% revenue growth for the quarter and 14% operating income growth as margins expanded despite greater investment in partnerships and digital products. And Starbucks' comps continue to be some of the best in the industry. In fact, in the following chart you can see how Dunkin' Donuts U.S. comp has failed to eclipse either component of Starbucks Americas comp over the past few quarters.

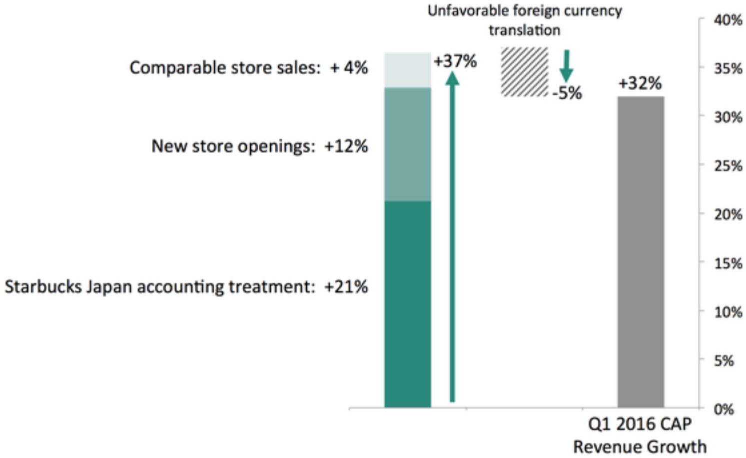
Source: Company filings, Bloomberg; calendar year quarters

The company's aggressive push into food initially elected a lukewarm reception from many, and while the world may not be making its dinner dates at Starbucks just yet, it's hard to argue with the results from an investing perspective. Food revenue was responsible for a third of the 9% U.S. comp as revenue rose 20% this quarter. Beverage innovation and Teavana handcrafted tea beverages also contributed 1 point each to the U.S. comp figure. And while it may seem that Starbucks is ubiquitous, new stores here in the Americas continue to deliver record profitability and return on investment.

With respect to the company's growing digital initiative, over 21% of all transaction in the U.S. were paid using the company's mobile apps, up from 13% last year. And more than 1 million customers in the U.S. used Mobile Order & Pay in December. Just as My Starbucks Rewards (MSR) members are more valuable to the company because they spend more, we expect that Mobile Order & Pay users will become increasingly valuable as the increased speed and convenience ultimately brings about more transactions. Not only that, but as the company perfects the app, we will likely see an increased rate in upselling ("do I want an extra shot in my Americano? Eh, why not?") and food attach ("How did the app know I love chocolate chip cookies? Heck yeah, I could go for one right now!"). At the end of the quarter, Starbucks was enjoying a run rate of 6 million Mobile Order & Pay transactions per month, a number we expect to continue to grow at an impressive clip.

China/Asia Pacific

Revenue for China and the Asia Pacific region, or CAP, was up 32% thanks to strong performance in the region and the change in ownership structure of Starbucks Japan. (Starbucks reported results for these stores using the equity method for five out of the 13 weeks in first-quarter 2015.) Here's what the breakdown of CAP's revenue growth looks like:



Source: Company filings

Also noteworthy: This quarter was the first to include the 1,009 recently acquired Starbucks Japan stores in its comps. This was likely at least partially responsible for the slowdown, as historical filings prior to the acquisition reveal that the transaction growth for this store base was well below what the CAP segment as a whole has historically achieved.

Similar to Apple CEO Tim Cook, Starbucks' CEO Howard Schultz has historically been dismissive when questioned about the impact of a China slowdown. This quarter was no different as Schultz affirmed once again that China is a huge opportunity for Starbucks, and while we share his long-term optimism to a large extent, this is something we'll continue to keep an eye on.

Europe, the Middle East, and Africa

The results this quarter for Starbucks' European, Middle Eastern, and African (EMEA) operations were very much in line with what we've come to expect, save for the negative impact of the tragic Paris terrorist attacks. The shift toward licensing stores continues to pay dividends, as the company reported that the licensed stores delivered comparable-store sales growth in the high single digits. As of the end of this quarter, 71% of EMEA stores are licensed.

Channel Development

Despite posting strong results last year, revenue and operating income for Starbucks' channel development division increased by 16% and 23%, respectively. With upwards of 80% of coffee occasions taking place outside of coffee shops, Starbucks' emphasis on expanding this business is well placed. It's the category leader in premium coffee and K-Cups, but Starbucks nonetheless continues to grow faster than these two markets and take additional share. In fact, the company recently surpassed Kraft to occupy the No. 2 spot in all coffee.

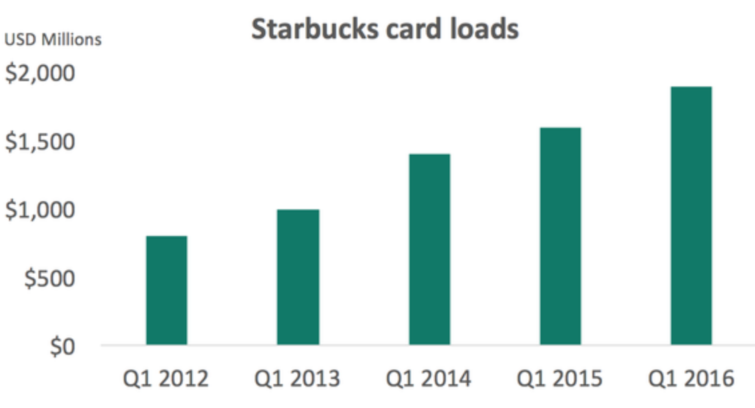
Product	Q1 Sales Growth	U.S. Market Share	Change
Premium Roast & Ground	10%	17.2%	+ 160 basis points
K-Cups	20%	27.3%	+ 100 basis points

Source: Company Q1 2016 earning call

This is primarily a U.S. growth story for now, but this won't be the case for too much longer. Starbucks reaffirmed once again that it is on track to begin distributing ready-to-drink beverages in China and Latin America later this year.

Loyalty

It's become an annual tradition in its own right for interested parties to respond in awe at the number of gift cards Starbucks manages to sell each holiday season. Clearly, I must have done something wrong in 2015, as I wasn't a recipient of the gift of choice for many Americans -- 1 in 6 U.S. adults received a Starbucks gift card, up from 1 in 7 last year. But as we all know, the true value of these cards to Starbucks far exceeds the amount loaded on them (which was up 19% this year to $1.9 billion). These gift cards are often the gateway drug, so to speak, that pulls consumers into the MSR ecosystem. MSR members were up 23% this holiday quarter to 11.1 million members.



Source: Company earnings calls

***Pro*'s Take**

Our cautious stance with Starbucks over the past year was almost exclusively because of concerns regarding the stock's valuation. The company continues to fire on all cylinders, and over the past few years, the market has justifiably responded by attaching a premium valuation to the stock. And when concerns over a stock's valuation turn out to be warranted, there are only two ways for the issue to be resolved -- either the stock price treads water until the company can grow into the valuation (i.e., valuation multiples drop if the stock price remains unchanged while the company continues to grow), or the stock price drops.

Prior to today's sell-off, the stock's decline since the October highs pretty much mirrored the decline in the S&P 500. So one could argue that the decline in the stock was more the result of luck than a reflection of our concerns over valuation. Either way, you won't hear us complaining. Before the decline, we were of the opinion that despite the generous valuation, Starbucks still had the potential to deliver North Star-matching returns. And with each percentage point decline in the stock price, our confidence only grows. Today makes for an attractive entry point for any member who has yet to mirror *Pro*'s 3.8% allocation.

Facebook's Cash Flow Surges, Driven by Richer Content

Published Feb 4, 2016 at 4:48PM

This earnings analysis comes to us courtesy of our friends at Motley Fool Million Dollar Portfolio.

Once again, **Facebook** (NASDAQ: FB) is crushing it, and the world's largest social network has plenty of reasons to celebrate the 12 candles on its birthday cake.

Revenue increased 52% year-over-year to an incredible $5.8 billion, driven largely by mobile advertising. Mobile now accounts for 80% of Facebook's total ad revenue, up significantly from 23% just three years ago.

	4Q 2012	**4Q 2013**	**4Q 2014**	**4Q 2015**
Total Advertising Revenue ($billion)	$1.3	$2.3	$3.6	$5.6
Ad Revenue from Mobile (%)	23%	53%	69%	80%

Alongside the revenue growth, Facebook reported its user base has now reached 1.59 billion (which is approaching the combined population of North America, South America, and Europe).

One of the most exciting metrics for investors was that Facebook's operating margin shot up to 44% — which is significantly higher than it was last quarter (32%) or a year ago (29%).

Facebook's rising margins are representative of their ability to simultaneously offer richer content and place additional ad impressions. Let's dig deeper into each of those.

Content Is King ... and Richer

Facebook's foundation has always been to get the world connected, which CEO Mark Zuckerberg took a chance to reemphasize on the conference call:

> *Our strategy here is to deliver better, more engaging experiences for our community, and to give people better tools for sharing different types of content with the different groups of people that they care about.*

Those engaging experiences and better tools are rapidly evolving. In its earliest days, Facebook offered advertisers the ability to place text-based, sponsored links. But the social network king now offers richer forms of content, such as pictures and videos. Richer content increases user engagement — which could improve conversion rates.

Examples of Text, Picture, and Video-based advertisements from The Motley Fool on Facebook.

Many companies are now building entire ad campaigns on Facebook. COO Sheryl Sandberg shared an example of how **Microsoft** (NASDAQ: MSFT) is offering richer content to a new audience:

> *To reach a large mobile audience for the launch of Halo 5, Microsoft Xbox used video optimized for Facebook and Instagram. They understood that people watch video differently and mobile News Feed than on TV. So they created videos to capture audience attention in the first 3 seconds even without sound. They drove over 380 million impressions and 49 million video views in key markets and increased purchase intent by 10 points in the U.S.*

Of course, Facebook doesn't give away that higher engagement for free. Richer content advertisements command higher prices, which has helped (along with the shift from PC to mobile) to drive Facebook's effective price per advertisement steadily higher.

	3Q13	4Q13	1Q14	2Q14	3Q14	4Q14	1Q15	2Q15	3Q15	4Q15
Total Revenue ($b)	$ 2.0	$ 2.6	$ 2.5	$ 2.9	$ 3.2	$ 3.9	$ 3.5	$ 4.0	$ 4.5	$ 5.8
Revenue Annual Growth Rate (%)	60%	63%	72%	61%	60%	49%	42%	39%	41%	52%
Effective Price per Advertisement (% increase/decrease)	42%	92%	118%	123%	274%	335%	285%	220%	61%	21%
Total ad impressions (% increase/decrease)	16%	-8%	-17%	-25%	-56%	-65%	-62%	-55%	-10%	29%

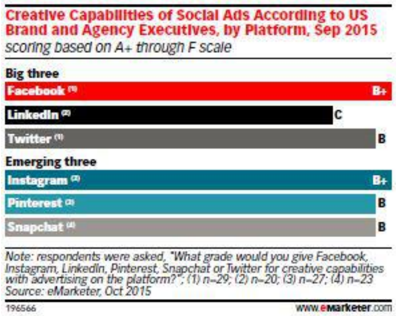
Numbers are as reported in Facebook's quarterly results.

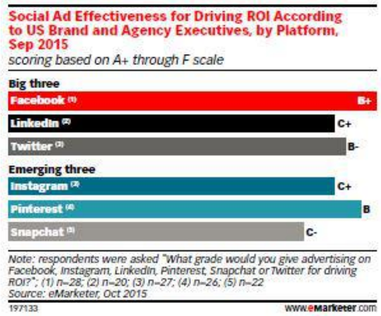
As content continues to evolve along the awesomeness continuum (from text-based to virtual reality, and all points in-between), Facebook will capture higher prices per ad impression.

Total Impressions ... Now More Impressive

The improvement in advertising content also brings another benefit to Facebook. In addition to carrying higher prices, cooler ads also improve the user experience. No one likes unrelated, annoying pop-up ads (which perhaps is what led to the demise of MySpace). But users have welcome the unobtrusive, creative ads offered on Facebook.

Senior ad buyers in the US consider Facebook industry-leading in its creative capabilities and its ability to drive return-on-investment (ROI). This gives companies the ability to craft marketing messages that are creative and effective, but also profitable.



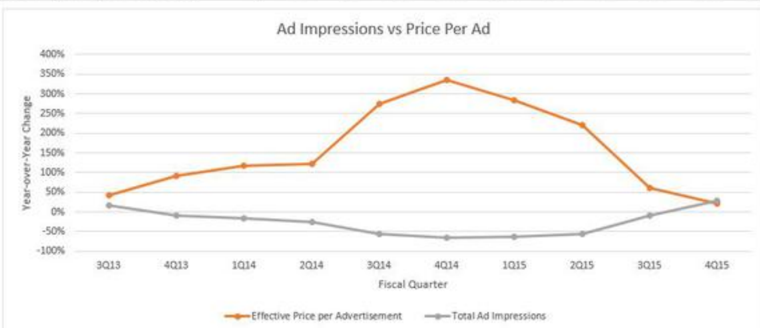


Source: eMarketer

Having the largest pool of users and giving advertisers a plethora of options to choose from makes Facebook hard to displace by competitors.

But let's look a little closer at that chart, which shows the trade-off between quality and volume:

	3Q13	4Q13	1Q14	2Q14	3Q14	4Q14	1Q15	2Q15	3Q15	4Q15
Total Revenue ($b)	$ 2.0	$ 2.6	$ 2.5	$ 2.9	$ 3.2	$ 3.9	$ 3.5	$ 4.0	$ 4.5	$ 5.8
Revenue Annual Growth Rate (%)	60%	63%	72%	61%	60%	49%	42%	39%	41%	52%
Effective Price per Advertisement (% increase/decrease)	42%	92%	118%	123%	274%	335%	285%	220%	61%	21%
Total ad impressions (% increase/decrease)	16%	-8%	-17%	-25%	-56%	-65%	-62%	-55%	-10%	29%



As we alluded to above, Facebook has spent most of the past two years transitioning to targeted mobile advertising. That meant fewer ads that could fit on a smaller screen, but they were the right ads at the right time. The total number of advertisements decreased (the gray line), but the price per ad skyrocketed (the orange).

But now, Facebook gets to have its cake and eat it too.

For the first time in more than two years, the number of ad impressions and the price per ad *both increased* over the previous year. Facebook isn't opening the floodgates and overwhelming users with too many advertisements (i.e. impressions shoot up while the prices falls). Instead, they're offering richer advertising content, which its 1.59 billion users is accepting without negatively impacting their experience.

In other words, Facebook is breaking down the long-established advertising trade-off of price vs volume. They're now getting both.

The impact of this is the rocketing cash flow. If the company can continue to incorporate its products like Instagram and Oculus into the daily routine of billions of people, we should expect operating margins to continue to march even higher.

The Bigger Picture ... Keeps Getting Bigger

With respect to that last line, it seems that every quarter, I find myself asking the same question: *How big can Facebook really get?* Said another way, how much advertising can we handle before it starts getting annoying?

The short answer appears to be that Facebook still has a zillion different ways it can monetize its platform (note that 'zillion' is not a technical term, and is purposely imprecise).

Ad load refers to the amounts of content that is sponsored by other parties. It's essentially the percentage of paid advertisements that appear on your site.

According to a study conducted in October, the ad load on Facebook's News Feed is only 3%. 27% comes from organic page posts (small businesses trying to link you to their Facebook pages), and 70% comes from your friends posting about politics, sharing pictures of their toddlers, or linking to cat videos (your mileage may vary).

Facebook is still only monetizing a fraction of what it could. The company has 2.5 million active advertisers and 50 million small business pages, but this is just a sliver of its users. Messenger now has more than 800 millon people. WhatsApp has more than a billion. Neither of those services is effectively being monetized today. We're just getting started.

Facebook also seems to always keep the bigger picture in mind. In their forward guidance, CFO David Wehner mentioned the company will be tripling its investment in its long-term areas of focus — including global connectivity, Oculus, and artificial intelligence. We expect each of those will translate into additional ad impressions and higher associated prices in the future.

The Foolish Bottom Line

Facebook still has plenty of room left to run. Even with 1.5 billion users and a $300 billion valuation, their global focus and highly scalable business model offer significant potential upside for investors.

Don't Fear the Great iPhone Slowdown

Published Feb 4, 2016 at 4:22PM

Revenue growth at **Apple** (NASDAQ: AAPL) for the first quarter of its fiscal 2016 was its slowest since the third quarter of 2013, a result of currency headwinds and a slowdown in iPhone unit sales. Perhaps in anticipation of this, Apple saw its market cap fall by about $227 billion over the past six and a half months. To put this in perspective, that's greater than the existing market capitalization of every position in *Pro* save for Facebook and Wells Fargo. We don't profess to have any insight into if or when the market's opinion on Apple will reverse course, but we do believe that Apple remains meaningfully undervalued at today's price.

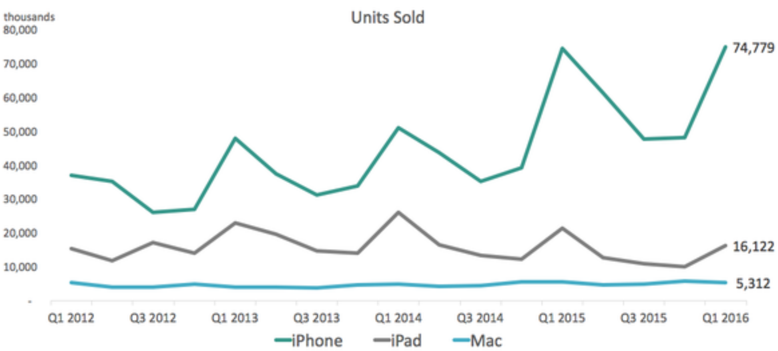
Updated Guidance

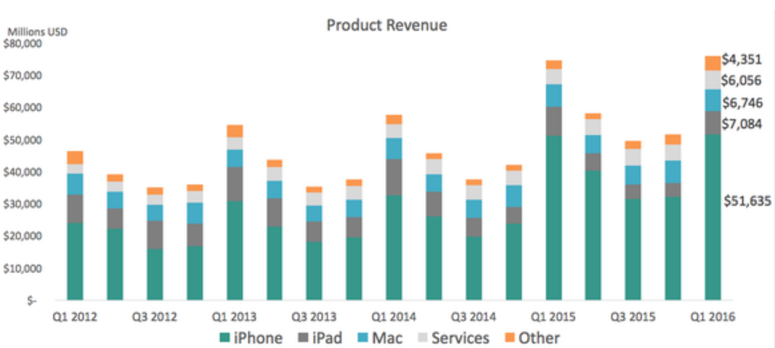
Updated guidance: Buy (no change)

Recommended allocation: 3.7%

Fair-value estimate: $122

The Results

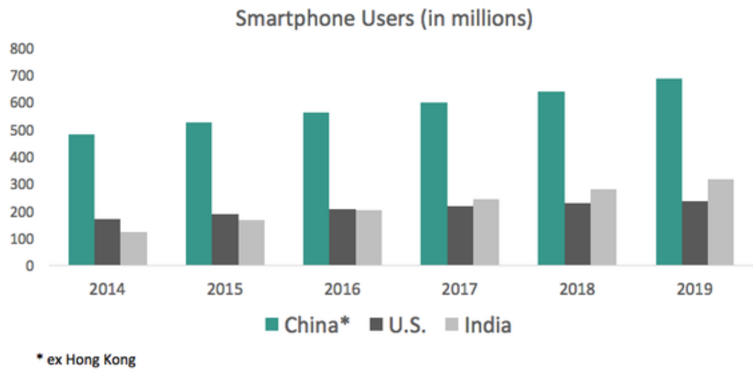




Source: Company filings

The great iPhone slowdown of 2016 has begun, with unit sales increasing by just 0.4 percent. But when you consider that the 46 percent growth Apple reported this time last year was its largest in quite some time, these results are far from the abject disaster that some media outlets have made them out to be. Our expectations for the rest of 2016 remain muted, but the market opportunities [we discussed last quarter] didn't just disappear into thin air. The company should have plenty of opportunities to increase its iPhone user base as long as management continues to execute.

When talking about iPhone sales in emerging markets, most of the time we like to focus on China -- deservedly so, given that it's quickly become one of Apple's largest end markets. But there are plenty of other opportunities. iPhone sales increased 76 percent this past quarter in India, a market that will soon become the second largest in the world for smartphones despite penetration that lags both the U.S. and China by a significant margin.



Source: eMarketer, 2015

And as Cook noted during the earnings call, the demographics appear favorable for a company like Apple:

> The population in India is incredibly young. The median age there is 27. I think of the China age being young at 36, 37. And so 27 is unbelievable. Almost half the people in India are below 25. And so I see the sort of the demographics there also being incredibly great for a consumer brand and for people that really want the best products. And as you know, we've been putting increasingly more energy in India. India revenue for us in Q1 was up 38%. We also had currency issues in India as everybody else did. Constant currency growth was 48%. And so it's a very rapidly expanding country. And I think the government there is very interested in economic reforms and so forth that I think all speak to a really good business environment for the future.

Moving on to the iPad: With 85 percent of tablets in the U.S. priced higher than $200, it wasn't all that surprising that the iPad continued to suffer from the same malaise that has befallen the entire industry. IDC estimated that the worldwide tablet market contracted yet again for the quarter, and even though the research firm referred to the iPad Pro as "the clear winner this season," overall iPad unit sales fell 25 percent (versus an estimated 13.7 percent decline for the worldwide market).

With the Mac, the situation is essentially reversed. Compared with the iPad, the Mac has a much smaller share of its market, meaning it has consistently been able to outperform the overall market for PCs. This quarter proved no different, but though unit sales outpaced the market as a whole, sales fell for the first time in nine quarters.

With respect to services, the usually secretive Apple actually decided to increase the amount of information it made available to investors. Management said this move was in response to investor demand, but from our perspective it seems likely that the company was at least partially motivated by a desire to change the market's habit of myopically focusing on iPhone unit sales. The added color was certainly appreciated, given the sheer size of the business. Excluding the gain from a patent infringement dispute, services revenue rose 15 percent this quarter to $5.5 billion, which is only $300 million less than fellow *Pro* constituent Facebook reported this earnings season. App Store revenue was up 27 percent thanks in part to a 18 percent increase in the number of customers, while Apple Pay continues to gain traction — the company saw a significant acceleration in usage in the second half of 2015, with a growth rate 10 times that of the first half of the year.

Pro's Take

In many ways, Apple will likely end up a victim of its own success in 2016. This is because we are now lapping the monstrous results delivered by the iPhone 6 and 6 Plus. Prior to 2015, the growth rate for iPhone unit sales had fallen for five consecutive years, but strong demand for the newly introduced larger version in 2015 resulted in an almost tripling of unit sales growth, to 37 percent. We're left to speculate on what type of products Ive & Co are currently dreaming up out in Cupertino, but we believe Apple's CapEx is currently being put to good use. And with an active installed base of more than 1 billion devices, Apple's services business appears poised to continue to deliver impressive results going forward despite muted iPhone sales in 2016.

Today's price makes for an attractive entry point by our estimate, as there appears to be a lot of pessimism currently baked into the stock price. We're lowering our fair-value estimate slightly to $122; that decision is based on foreign currency headwinds and potential struggles in certain end markets because of challenging macroeconomic conditions. However, shares firmly **remain a Buy** with a 3.7 percent allocation.

Close Your Short on World Acceptance

Published Feb 3, 2016 at 10:26AM

How You Participate

- **Trade:** Buy to close your remaining short **World Acceptance Corp.** (NASDAQ: WRLD) shares.
- **Allocation:** After previously closing half of our position, we are currently short 350 shares, or 0.4% of the portfolio.
- **Price Guidance:** ***Use a limit order*** and today aim to pay less than $28.50.
- **Price (as of 10:18 a.m.):** $27.02

What We're Thinking

Today, we're recommending that *Pro* members take advantage of World Acceptance's weak third-quarter results (and the stock's subsequent 23% haircut) to close out any remaining positions in the stock. After taking some time to re-survey the landscape, we believe the risk/reward ratio now favors ending this position.

Next month will mark the two-year anniversary of the Civil Investigative Demand (CID) that World received from the Consumer Financial Protection Bureau, or CFPB. When we opened our position in World last July after a long time on the sidelines, it was because we believed the CFPB was likely to reach a decision by the end of 2015. Most aspects of our thesis are playing out as planned, but it appears the CFPB is being even more cautious than we expected. This has been a headwind for our short case for sure, but we can't say that we disagree with the CFPB's measured approach; the outcome of this investigation could very well set a precedent for the entire industry, so it's critical for the agency to bring its A game right from the get-go.

At this point, though, even if the CFPB does try to bring the hammer down, it looks increasingly likely that this will turn into a long, drawn-out slugfest. World's financial results have been weak since we opened our position, in part because management has been making changes to its business practices over the past few quarters. For example, in the most recent quarter, the company disclosed that it has ceased all field calls to its customers' residences and workplaces, as well as stopping all phone calls to the latter. This move was likely in response to a compliance bulletin released by the CFPB this past December, but we can't tell for certain whether management is responding to direct requests from the CFPB or just taking preemptive measures in an attempt to reduce the odds of a death sentence. Either way, it appears as though World is making a more concerted effort to comply with the letter of the law, though not necessarily the spirit.

Neither of those factors would necessarily mean much if not for the high cost of borrowing shares to short. We've been fortunate that the fee for shorting World has come down some since we closed half of our position back in October, but it is still a meaningful headwind at 11.5 percent. The longer it takes for the CFPB to reach a decision, and the longer World drags out the process, the more these fees eat away at our returns.

It's all too easy to focus on how a stock will respond if your thesis plays out perfectly, but as investors, it's critical we remain cognizant of what might happen if things *don't* go our way. Let's consider a scenario in which the CFPB's actions bring World's earnings down by 75%, but World doesn't end up defaulting on its bonds. In this scenario, which is still quite bearish, the company would be trading for a little over 9 times earnings at today's price. That valuation is near the low end of the range of the past 15 years, if you exclude the financial crisis and the past eight months. With a current market cap of $245 million and a valuation of 2.3 times earnings and 0.68 times book value, it appears as though the market is currently betting that the CFPB will go for World's jugular.

We may agree with this sentiment, but we also believe the math simply doesn't favor maintaining our short as is. At 0.4 percent of our portfolio, our remaining position won't have much of an impact even if our thesis continues to play out as planned. The stock could fall by another 50% tomorrow, and it would affect our portfolio by just 21 basis points -- the same as if Facebook rose by 3.1%. We'd need to short additional shares to make this a meaningful contribution to the portfolio, and while we may be comfortable doing so at some point in the future, that time is not now.

How It Fits Into *Pro*

Shorting World has definitely been a wild ride, but our position has delivered from both a market-hedging and an absolute-return perspective. The stock has fallen 55% since we first issued the trade alert, and it's underperformed the market since the very beginning. Given World's small market cap and low trading volume, *Pro* was unable to get the same pricing as most members, but our position was nonetheless a resounding success. Closing it will increase our portfolio's long exposure, but this will be more than offset by our latest short. And, as always, we are constantly on the lookout for additional shorts to add to the portfolio.

Alternative Trades

- **If you set up a synthetic short, or simply bought puts:** We recommend that members who followed us using an alternative trade close their position as well.

Parexel Continues to Penetrate the Growing Pharmaceutical Development Market

Published Feb 2, 2016 at 3:21PM

Pro's Take: PRXL Q2-2016 Earnings

Parexel International (NASDAQ: PRXL)

Quarter Quick Take

Parexel reported a solid quarter in Fiscal Q2-2016. The company continued to win its fair share of new business, with a net book-to-bill ratio (an indicator of future business) of 1.24. Reported revenue growth came in at 3.9%, though it was affected by currency headwinds (revenue growth was 5.6% on a constant currency basis) and slower backlog conversion due to project mix. This slower backlog conversion may continue to pressure reported revenue growth in the near-term (and backlog growth should continue to outpace reported revenue growth), but as projects mature and milestones are met, revenue growth should eventually return to our 8-12% longer-term expectations.

In the meanwhile, the company's Margin Acceleration Program is beginning to show its benefits as improved labor productivity and cost management led to improved gross and operating margins. This margin expansion will likely continue as restructuring costs roll off and should be sustainable as the the company continues to improve its reported revenue growth over time. Margin expansion and share buybacks led to 4.9% GAAP EPS growth and 30.4% non-GAAP EPS growth (which excludes acquisition- and restructuring-related costs). The company's Fiscal Q3-2016 guidance implies 4% reported revenue growth and 29% EPS growth at the mid-point, and Q3 GAAP and non-GAAP earnings are projected to converge as one-time costs roll off.

....

Q2-2016

Sales growth: +3.8% (+5.6% in constant currency)

Gross profit margin: +143 bps Y-o-Y to 35.9%

Operating profit margin: -42 bps Y-o-Y to 10.5%, (+196 bps Y-o-Y to 12.5% excluding non-recurring restructuring costs)

GAAP EPS growth: +4.9% Y-o-Y

non-GAAP EPS growth: +30.4% Y-o-Y

....

Guidance Update

The business continues to track well against our thesis despite a competitive operating environment and currency headwinds. Parexel's largest business segment, Clinical Research Services (CRS), continues to win new business and prove that the biopharma industry is moving toward a strategic outsourcing partnership model. The company's Consulting and Informatics segments are growing more modestly, but longer-term margin expansion in these smaller segments is helping companywide results. **Our Fair Value estimate increases to $65 per share** (from $63) due to an update of biopharma R&D spending data and rolling forward our model. However, we may need to reexamine our assumptions for the company's Parexel Informatics (PI) segment if growth continues to remain below our expectations.

Updated guidance: Buy (no change)

Recommended Allocation: 3.4%

Fair Value estimate: $65 (up from $63)

Current Price: $62.78

Our Fair Value estimate implies a TTM P/E ratio of 26.4x (GAAP) and 21.2x (non-GAAP) and a TTM EV/EBITDA ratio of 13.9x. It also implies a forward P/E ratio of 21.2x (GAAP) and 18.6x (non-GAAP) based on expected Fiscal 2016 earnings. We believe these multiples to be reasonable given the company's growing industry, strong competitive position, ongoing margin expansion, strong ROICs (lately ~20% and increasing), and expected long-term earnings-per-share growth of 15-20%.

Members lacking a (full) position can feel comfortable initiating or adding to their position at current pricing (with shares about 3% below our Fair Value estimate). However, it may be wise to be patient in establishing a full allocation; Parexel shares have been volatile-customer concentration, lumpy quarterly results, and a high multiple make this likely to continue-so we may look to be opportunistic with options to generate current income.

Our Thesis

Because of its reputation, global reach, and technology prowess, Parexel International will win its fair share of the growing pharmaceutical development market. In addition, we expect the proportion of R&D dollars outsourced to contract research organizations to grow as large biopharma companies adopt the strategic partnership model and smaller biotechs become responsible for more drug discovery. Finally, as new business wins mature, the true earnings power and margin potential of the company's business will shine through.

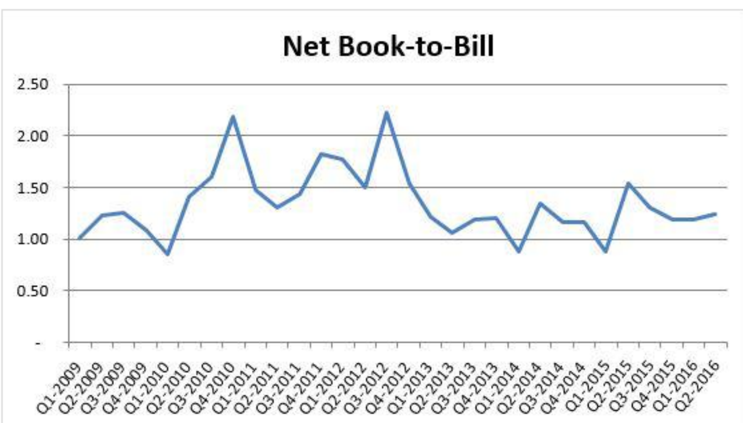
The Most Important Things

1) ***Penetration and Backlog*****:** Penetration refers to the proportion of biopharma R&D dollars that go to CROs versus being used in-house for development and increased penetration provides evidence that the biopharma/CRO partnership model is proving out. We can compare the growth of the biopharma industry R&D spend to the growth in Parexel's backlog to determine whether the CRO industry is experiencing continued outsourcing penetration.

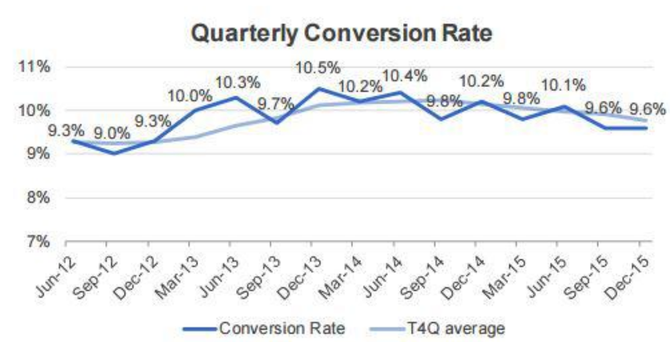
According to the most recently released industry data, biopharma R&D spend is expected to be flat from 2014 to 2015, and it is expected to grow at a 2-3% CAGR from 2014 to 2020. For comparison, Parexel's backlog growth in calendar year 2015 was 7.5% (9.6% in constant currency), so we can see that Parexel's backlog is growing at a rate higher than that of biopharma R&D spending. This indicates that the CRO industry -- and Parexel in particular -- is continuing to experience increased penetration of biopharma R&D spending.

We also monitor backlog trends to ensure Parexel is sufficiently adding future business – backlog that converts to sales usually represents ~80% of the sales in any given quarter, so strong backlog growth suggests strong future sales growth. In Fiscal Q2-2016, backlog grew 0.9% sequentially and 7.4% year over year (2.3% and 8.9% in constant currency).

The company's net book-to-bill ratio increased sequentially to a decent 1.24 due to solid increases in net new business. A net book-to-bill ratio above 1 indicates that the company is booking more business than they are recognizing, suggesting that future sales growth should increase:



However, revenue growth is affected not just by backlog growth, but also by backlog conversion (percentage of backlog recognized as revenue for a given quarter) and backlog cancellation (percentage of backlog that was cancelled in a given quarter). The cancellation rate in the quarter came in at 4.1%, well within historical norms of about 2.5%-7% (the cancellation rate fluctuates depending on the type of drugs and the type of studies being conducted). But lately, the company's conversion ratio has been lower than historical norms and it is trending lower (higher is better):



Management noted that this is due to increasingly stringent regulatory requirements and increasingly complex clinical trials, leading to projects that remain in the start-up stage longer than in the past. This may also be due to a shift in focus from biopharma companies into more complicated therapeutic areas (such as oncology, immune-mediated disorders, and rare diseases).

This decline in the conversion rate may persist in the near term, and it led Parexel to reduce its 2016 revenue guidance, but it may also actually bode well for Parexel in the future due to their global scale, data advantage (an example of which includes this recent data-sharing partnership with Optum), and expertise relative to smaller CRO peers, specifically in late-stage (Phase III and IV) studies. This should help Parexel (and the other "top tier", publicly traded CROs) win an increasing share of biopharma R&D outsourcing relative to smaller, less capable peers.

In any event, as the CRO industry picks up a higher percentage of biopharma R&D spending, we should see revenue and backlog growth outpace the expected 2-3% growth in R&D spending. With 5.6% growth in constant-currency service revenue and 8.9% growth in constant-currency backlog, that's what we're seeing, which provides evidence that our thesis continues to progress.

2) ***Margin Performance***: Company gross margin increased +289 bps sequentially and increased +143 bps year-over-year. The company's largest segment (representing 79% of total revenue), Parexel Clinical Research Services (CRS) increased gross margins to 32.6% from 30.4% a year ago, the highest it's been since 2011. The gross margin improvements were driven by strong cost management and savings from the company's previously announced Margin Acceleration Program. While the company is continuing to book restructuring charges due to this program, those charges should roll off by the end of the year and the company's gross margin should continue to improve.

As for the other two business segments, Parexel Consulting (PC) gross margins increased to 49.8% (up from 48.2% a year ago). The PC segment represents 8% of companywide revenue. Parexel Informatics (PI) gross margins declined to 46.7% (down from 50.5% a year ago). The PI segment represents 14% of companywide revenue.

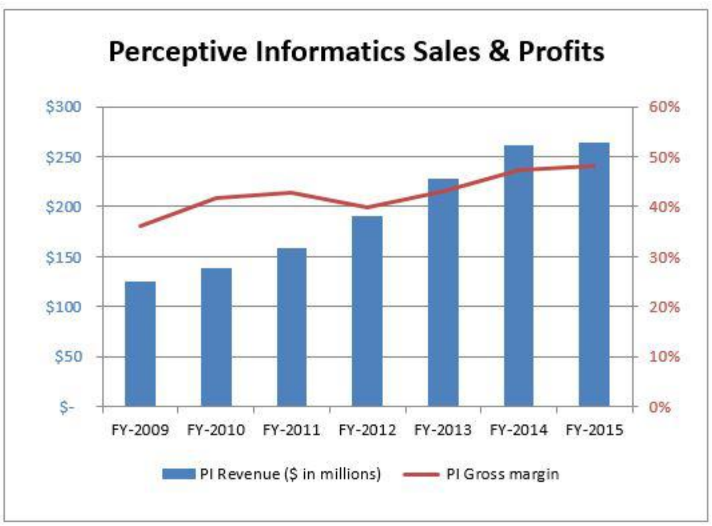
The main contributors to the gross margin expansion in the PC segment were favorable business mix and improved utilization. PI's gross margin declined primarily due to project mix.

3) ***PI Business Trends:***

Technology is a core competence for Parexel. The company's PI segment is the lifeblood of innovation for transforming the traditional clinical trials process into a more efficient, more effective, technology-driven one. We want to see this business perform well to ensure it remains a competitive differentiator for Parexel and helps it win business in its CRS and PC segments. Now reaching scale, we also expect PI to exhibit operating leverage and become a more meaningful portion of profits.

Revenue growth in this segment was solid at +7.8% year-over-year in constant currency, coming in at $70 million in revenue for the quarter. However, I've been disappointed by the trajectory of this segment of the business, as average revenue growth over the past 6 quarters has been just +1.5% compared to 17.5% average growth between 2011-2014.

Gross margins have declined since peaking at 50.5% in Fiscal Q2-2015 a year ago, and our expectations have been that this segment would continue to grow strongly and continue to improve its gross margins over time. Over the past year and a half, that hasn't happened (as you can see in the graph below):



I've mentioned in the past that our valuation expects PI to grow revenue by 10% annually and achieve 55% gross margins by 2020. These expectations were a significant aspect to our initial thesis, so I'll be watching this segment closely over the next few quarters to see if we need to ratchet down our expectations.

What We Think Now

Helping pharmaceutical companies get drug candidates to market, Parexel is poised to benefit as those companies gradually outsource more of this process to select CRO partners who can perform the work better, faster, and cheaper. We also expect margin expansion as recent investments and restructuring pay off and continued growth of the Parexel Informatics technology segment.

Pro Catch-Up Trades: Feb. 1, 2016

Published Feb 1, 2016 at 3:55PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually over time. Lately worth highlighting:

- **Gentex** (NASDAQ: GNTX), buy up to 2.5% in stock
- **Gilead Sciences** (NASDAQ: GILD), buy up to 3.2% in stock
- **Oracle** (NYSE: ORCL), buy up to 3.6% in stock
- **Skyworks Solutions** (NASDAQ: SWKS), buy up to 3.4% in stock, or "sell to open" May 2016 $62.50 puts (or others of your choosing) if you wish to target a lower buy price. These lately pay you $4.30 each, or 6.9% in 109 days. Sell one put for every 100 shares you would buy.

Build out your portfolio with our Buys, including:

- **AmTrust Financial** (NASDAQ: AFSI), buy up to 6.1% in stock; we usually suggest buying larger positions in halves or thirds over time.
- **Medtronic** (NYSE: MDT), buy up to 3.2% in stock
- **Papa John's International** (NASDAQ: PZZA), buy up to 2.4% in stock
- **TD Ameritrade** (NASDAQ: AMTD), buy up to 2.3% in stock
- **Verisk** (NASDAQ: VRSK), buy up to 2.1% in stock
- **Visa** (NYSE: V), buy up to 2.5% in stock

Members who still lack a stake in this more speculative call option can take note of this recommendation:

- **American Airlines** (NASDAQ: AAL): Buy to open 0.4% in January 2017 $35 calls

And finally, our recent short:

- **Deere** (NYSE: DE): Short 2% per our recent recommendation.

Pro's 2015 Results

Published Feb 1, 2016 at 11:38AM

Dear *Pro* Fools,

I hope you've started 2016 with a healthy heart, mind, body, and spirit -- and that you haven't let short-term market volatility ruin your day. True, the market had its worst start to a year *ever* -- but it declined more than this last summer, and last summer is already largely forgotten. Sharp declines are opportunities, so we're on the lookout for ways to capitalize while staying true to *Pro*'s approach and goals.

Before we leave 2015 entirely, let's review it. Reviews offer insights regarding how you invest, mistakes you make, and what you should do more of. Armed with information, you can adjust to keep improving your process.

2015 Redux: $178,000 Appreciation

Pro had a healthy 2015, helping maintain a strong three-year annualized return, per our goal. The *Pro* portfolio started 2015 worth $2.32 million, and ended up 7.5% at $2.49 million. On average, we were 67.7% net invested over the year, using cash, shorts and hedges to lower our exposure. Our returns were pleasing in a flat market, despite the last week of December knocking us below 10% and just beneath our North Star. We still succeeded overall while making very few new buys and avoiding new risks:

Investment	2015 Return	3-Year Annualized Return
Pro	7.5%	19.5%
North Star	8.2%	8.2%
S&P 500	1.4%	15.1%
MSCI World	(2.7%)	7.5%

Our gains were propelled by the likes of **Facebook** (NASDAQ: FB), up 34% last year on top of 2014's 43% gain; **O'Reilly Automotive** (NASDAQ: ORLY), up 32% on top of 2014's 50% jump; and **Broadridge Financial** (NYSE: BR), up a North-Star topping 16.3% before dividends.

Let's not forget our shorts. **Caesars Entertainment** (NASDAQ: CZR) started 2015 at $15.69 and ended the year at $7.89, losing almost 50%. Our trade alert to close half your position went out with the stock at less than $7. We issued a short on **World Acceptance** (NASDAQ: WRLD) on July 16 when the stock was above $60 and moved to close half last October for around a 43% gain, at $34. We still have half the short; lately, the stock is about $28. Our **CurrencyShares Euro Trust** (NYSEMKT: FXE) short fell 11% as the euro weakened sharply (as a reward, I went to Italy!). Finally, **Five Below** (NASDAQ: FIVE) started 2015 at $40.58, and we closed in December at $27.15, or 34% lower on the year. So, our shorts definitely helped.

Laggards for the year included our emerging-market ETF (I won't even name it here, but you know who you are, *DGS*) and **Tupperware** (NYSE: TUP), which started the year at $63; we sold for $55 at year-end. Meanwhile, **Valmont** (NYSE: VMI) started 2015 at $127 and closed at $106.02, down 16.5%; and **Oracle** (NYSE: ORCL) declined from $44.97 to $36.53, or 19%. Our small **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY) position also fell sharply as the market became choppy. Looking ahead, we continue to think in terms of rolling three-year periods as we assess the potential of our holdings.

Net Realized Gains: $94,751

We booked $94,751 in net realized gains last year, 71% of it long-term. This total gain is nearly identical to the realized gain we booked in 2014. Last year, just more than half of our realized profit came from selling a small partial stake in **AmTrust Financial** (NASDAQ: AFSI) and about half of our position in **Papa John's International** (NASDAQ: PZZA); selling **American International Group** (NYSE: AIG) and covering part of Caesars and World Acceptance also added sizable gains. Our biggest realized loss last year was Tupperware.

Adding Stocks in a Bear Market?

It's worth pausing to highlight that 2015 was a bear market for most stocks. Consider that 70% of stocks in the Russell 2000 fell 20% or more last year; 49% of stocks in the S&P 500 and 68% of Nasdaq Composite stocks did the same. That's a bear market. In fact, the median stock in the S&P 500 fell 22% in 2015. Lest you think it was only *suspect* stocks that fell, the reality is that most new stocks recommended by the Fool's monthly newsletters were down, because most stocks were falling, period. The numbers below reflect results through today.

Service	2015 Picks Up	2015 Picks Down
Stock Advisor	8	17
Rule Breakers	2	22
Hidden Gems	3	20
Income Investor	2	10

Nobody knew the year would unfold this way, but we have the luxury in *Pro* of *not* acting unless greatly compelled to. Seeing little to jump on, we only issued two new stock buys last year -- **Visa** (NYSE: V) and **Verisk** (NASDAQ: VRSK), both in the green today. Meanwhile, last year's one new call purchase on **American Airlines** (NASDAQ: AAL) is down sharply, with leverage making it really ugly. The point is: In some years, making money on new stock buys is nearly impossible. Some years, *most everything goes down*. If we continue to buy carefully, we might avoid buying too many new stocks during those years. We'll ideally buy after prices look more attractive.

But as a long/short portfolio, we never get a free pass! Why weren't we *shorting* more stocks last year? We should have. We definitely tried, but passed on many companies for various reasons, to the detriment of our returns.

Hedges: +$811 (up from a $34,673 loss in 2014)

Last year, we set up three put ratio spread hedges on the **SPDR S&P 500 ETF** (NYSEMKT: SPY). With a flat market overall, none paid off big, but we kept $811 in credits in the end. Getting paid to hedge is nice. The reason we collect that cash is that we agreed to buy SPY at a much lower price if it falls.

At the start of 2015, I said we wanted to greatly lower our costs for and losses from hedging, and we sure did. We had an $800 gain, compared with a $34,673 loss on our hedges in 2014, when we directly shorted SPY and other indexes. We continue to use put ratio spreads to hedge cheaply; if the underlying index falls enough that we're obligated to buy shares, we plan to buy calls instead, and keep most of our cash for other positions.

Dividends: $32,304 (up from $25,387 in 2014)

We received more than $32,000 in dividends last year, up 27% from 2014 and adding to our cash to the tune of 18% of our yearly gains. Our largest absolute payers included **The Buckle** (NYSE: BKE), **AmTrust** (NASDAQ: AFSI), Tupperware, Broadridge, and **Wells Fargo** (NYSE: WFC). With two of those now sold, our dividends are on pace to be a bit lower this year -- we'll see if new buys rectify that. Dividends added 1.4% to the portfolio's 2015 starting value.

Option Income: $16,774 (up from $7,581 in 2014)

We earned more than $16,774 in net income writing options in 2015, which was 121% more than the $7,491 earned in 2014. We wanted to improve upon 2014, and we did, but we would still prefer to earn *greater* annual option income. These net option proceeds amounted to 0.72% of the portfolio's 2015 starting value. Add this to the 1.4% in dividend yield we received, and our income hit a respectable 2.12% of the portfolio while we averaged 68% net long.

Most of our option income was earned by writing strangles on **Expeditors International** (NASDAQ: EXPD) and puts on **Gentex** (NASDAQ: GNTX), **Live Nation** (NYSE: LYV), and **Wells Fargo** (NYSE: WFC). We didn't buy any new shares via puts last year. (This income excludes the $800 or so we made writing put ratio spreads on SPY.)

Active, But With Low Turnover

We issued 43 trade alerts in *Pro* last year, or 3.6 per month. That's right in the middle of our usual trade volume: We had 34 trade alerts in 2014, 42 in 2013, and 55 in 2012. It's key that we don't sacrifice returns for activity.

We want to keep stock turnover low, so as in years prior, much of last year's activity was related to options and hedges. Still, we closed a handful of stock positions, namely The Buckle, Tupperware, AIG, and the two partial sales already mentioned. We ended the year with 21 core stock investments, and among those, our top 10 positions make up 42.3% of the portfolio.

Improving Further

So, Fools, we start 2016 hoping to again improve how we think and act when it comes to our investing, and thus improve our long-term results. Expecting a choppy market, this year we want to keep earning income, continue to add shorts and hedges, and jump on favorite stocks (or long call options) when we see buying opportunities. Many of you customize your Foolish portfolios; consider studying your results from 2015 to see where you did well and what can be improved. Post comments or questions on the Memo Musings board -- and thank you for being a *Pro* Fool with us! We enjoyed last year, and we look forward to another memorable year with you in 2016.

— Jeff (TMFFischer)

MasterCard Finishes Strong in 2015

Published Jan 29, 2016 at 6:19PM

MasterCard (NYSE: MA) finished a challenging 2015 with a solid quarter fourth quarter. The company managed to blow past analysts' earnings estimates by $0.10, thanks in part to disciplined cost controls and a lower than expected effective tax rate for the quarter. Currency headwinds and low gasoline prices remain a drag on gross dollar volume growth, but those effects should dissipate once we get into the second half of the year and begin to anniversary some of the largest FX and commodity price swings of 2015. Globally, the U.S. and European markets have maintained the strongest transaction volume and outlook going forward, while Brazil and China are both seeing slowing growth.

For the full year, MasterCard posted an 8% increase in net revenue and 18% EPS growth, ending management's 2013 to 2015 forecast period at a 19.2% compound annual growth (CAGR) rate for EPS. That result is just shy of the company's 20% EPS CAGR goal, but it's not bad considering the number would have been two percentage points higher without the recent currency fluctuations.

Growth Initiatives

MasterCard continues to gain acceptance of its MasterPass mobile wallet solution, adding 13 new markets this quarter and bringing the total to 29 new markets for the year. The company is also investing heavily in security and fraud prevention analytics to create additional value for customers. Merchants are moving ahead with the mandated transition to EMV (PIN and chip) card terminals, which means that future fraudster will begin focusing more on Internet transactions – similar to what happened in Europe when it made the same EMV transition a few years back. As a result, MasterCard has seen growing demand for Safety Net, its real-time fraud monitoring and cyberattack prevention solution.

MasterCard is also making progress with the roll out of its network in China, though everyone is still waiting for final regulations to be issued by the central government. At this point, the company is working with both Bank of China and ICBM (two of the five state-sponsored banks) to launch a mobile payment solution using MasterCard's tokenization technology and other cloud-based solutions. In the past year, MasterCard has also partnered with a number of other Chinese institutions to create a total of 32 single-branded programs.

Outlook For 2016

Management reiterated their recently announced 2016 to 2018 goals for low double-digit net revenue growth, mid-teens EPS growth, and a 50% annual operating margin --but they also acknowledged that the first quarter would start off at the low end of that range. After spending heavily on acquisitions in 2015, the company expects to focus its investment in the coming year on expanding in China, capturing a bigger share of the global digital wallet, and improving its portfolio of service solutions. The company also has $4.2 billion remaining under the current authorization which amounts to about 4% of MasterCard's current market capitalization.

Foolish Bottom Line

Overall, we're happy with how MasterCard has navigated a tough operating environment in 2015 and we remain confident in the company's competitive position and the long-term growth prospects of the business. However, MasterCard's shares are still richly valued, trading at over 26-times trailing free cash flow (FCF). Considering management's soft guidance for the upcoming quarter, continued uncertainty in China, and a volatile U.S. stock market, I'm leaving the current fair value estimate of $78 in place for the time being, which reflects a trailing FCF multiple of about 23-times. (For more detail on our thought process regarding MasterCard's valuation refer to my recent post on the MasterCard discussion board.)

Though shares are now trading considerably higher than our fair value following today's 6.4% jump, MasterCard retains a Buy rating because we believe long-term investors can still earn solid returns from this level.

Short Deere & Company

Published Jan 28, 2016 at 11:55AM

How You Participate

- **Trade:** Sell short **Deere & Company** (NYSE: DE)
- **Allocation:** 2%
- **Price guidance:** Use a limit order and initially aim to short above $75.50. As time goes on and prices change, newcomers may need to short below that.
- **Recent price:** $76.41
- **Availability at Interactive Brokers (Jan. 28):** 6 million shares
- **Current annualized shorting fee (Jan. 28):** 0.66%
- **Current dividend yield (Jan. 27):** 3.2% (we also need to pay this dividend while shorting shares)
- **Short interest (percentage of shares outstanding as of Jan. 29)**: 12.8% (per S&P Capital IQ)
- **Next earnings date**: Feb. 19

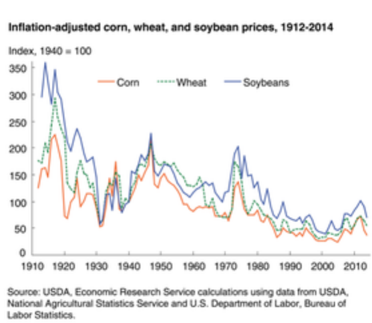
What We're Thinking

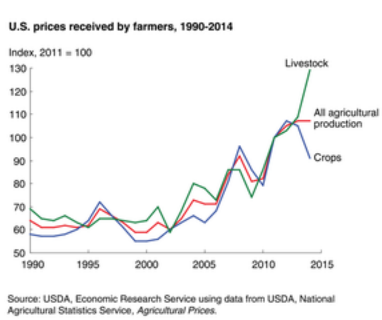
At its core, investing is about buying low and selling high. And perhaps nowhere is this more important than when investing in cyclical industries, including agriculture. Here in the U.S., the agricultural industry has seen spikes in demand thanks to wars, exports, and new uses such as biofuels, all of which have given rise to agricultural booms that eventually went bust.

We believe that the current cycle, which began in the early 2000s, resulted in an unsustainable increase in farm equipment sales. We also believe that this has positioned Deere & Company (henceforth John Deere), the world's leading manufacturer of agricultural and forestry equipment, to report disappointing results going forward as the industry works its way back toward equilibrium. We're shorting the stock, then, because we believe this gives us favorable odds of generating a North Star-like return. But this position is equally important to us as a macro hedge to reduce our portfolio's sensitivity to the strength of the global economy. We'd be less likely to short it without this added benefit.

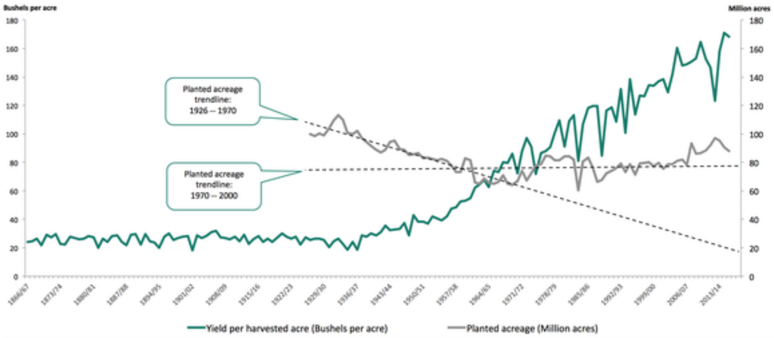
The Landscape

Things really started looking bright for U.S. farmers as a new agricultural cycle began in the early 2000s. An increase in crop demand, for human consumption as well as for biofuels, resulted in the longest sustained price rally since 1930. Farmers were also able to reap larger harvests thanks to productivity gains and (surprisingly) a greater number of planted acres for certain crops; before this, ever-better tech had long meant fewer necessary acres, a situation only somewhat stymied by agricultural exports (notice the difference in trendlines in the corn statistic chart).





U.S. Commodity Statistics: Corn (1966 -- 2015)



Source: United States Department of Agriculture

And as farm income rose, so did land values -- at a rates not seen since the 1970s in some places. For example, Iowa farmland saw double-digit growth every year from 2004 to 2012, save for a measly 2.2 percent decline in 2009. But it's called a cycle for a reason, and as the commodity adage goes, the best cure for high prices is high prices. The current landscape for farmers isn't nearly as rosy; it appears that prices will likely remain muted for the near future. The Federal Reserve Bank of Kansas City recently noted that production in the U.S. has expanded faster than consumption in the past few years. For example, U.S. inventories of corn, soybeans, and wheat have increased more than 100 percent since 2013, while use has increased just 7 percent over the same period. Globally, softening demand and growing competition (in part because of the strength of the U.S. dollar) are hurting U.S. farmers -- on average, exports decreased approximately 10 percent each month in 2015 compared with 2014.

With 10 consecutive quarters of farm-income and capital-spending declines in the Federal Reserve's 10th district, it appears as though we're firmly on the downswing of the latest cycle. So why have we decided to short John Deere now that the top has clearly passed? The key here is that our thesis isn't based upon commodity cycles in general, but rather a side effect of this one.

The Company

Unsurprisingly, the upswing of the most recent cycle was a great time to be a supplier to the industry. After falling 15% in fiscal 1999, John Deere's equipment sales rose 261% over the next 14 years. Net income bottomed out two years after revenue at -$64 million before rebounding to $3,537 million by the end of fiscal 2013. But since that peak, total revenue and net income are down 23.7 and 45.1%, respectively. In fourth-quarter 2014, management forecasted that its agricultural segment would bottom out in 2015, but ultimately had to backtrack as the weakness continued. In fact, the company now expects agricultural machinery sales in the U.S. and Canada to decline another 15 percent to 20 percent in 2016.

It's hard to say for certain whether 2016 will mark the bottom; we won't be surprised if it doesn't. But we do believe that the recent cycle has left investors with an artificially inflated perception of John Deere's true mid-cycle earnings power, as well as of the speed with which the agricultural machinery manufacturing industry will recover. That's because one of the things farmers did with their newfound wealth during this past cycle was, unsurprisingly, go out and spend it on farming equipment -- too much, we believe, at least based on farm productivity, planted acreage, and the lifespan of the active fleet.

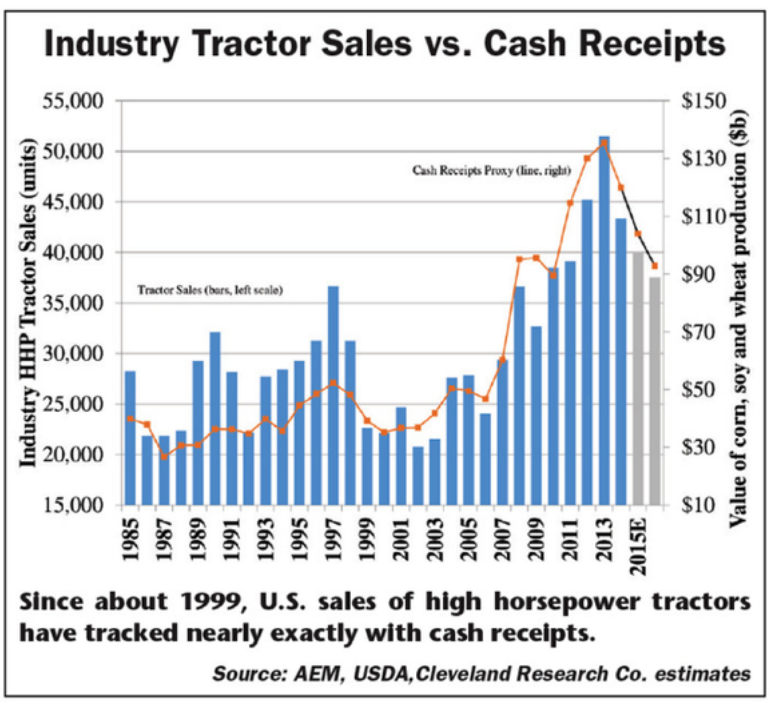


Image source: Farm Equipment Magazine, 2015

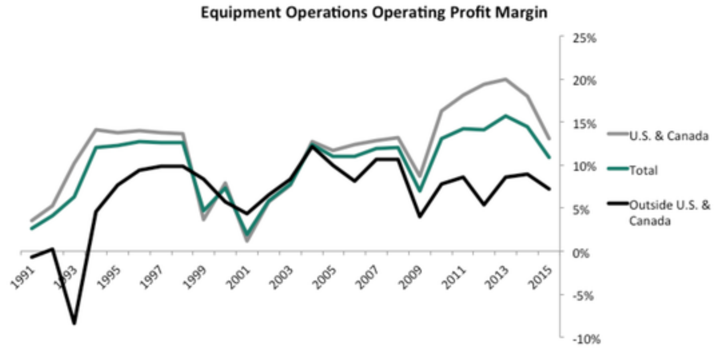
John Deere may have been able to snap right back after posting disappointing results in 2009, but this was likely thanks to an industrywide sales rebound. We believe the current environment more closely resembles what took place around the turn of the century, when industry sales stalled out for five years and compressed John Deere's equipment operating margins in the U.S. and Canada -- except results could be even worse this time around, because the rate of purchases near the end of the current cycle was unprecedented.



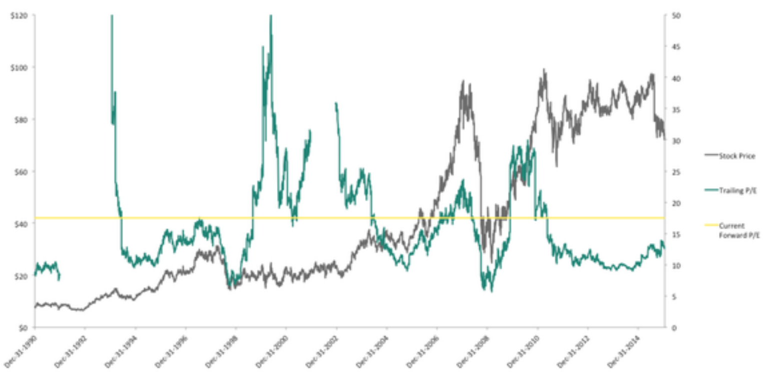
Source: Company filings

Margins are much higher than during prior weak points in the cycle, and the company has made additional investments to expand production capabilities in recent years. We believe margins are likely to compress further going forward, even though John Deere is admittedly a better-run business today. Operational leverage is a two-way street; it's a boon when times are good, but it increases the pain when times are bad.

You might think of John Deere as a manufacturer, and it is -- but it's a bank, too. Like houses, tractors are big-ticket items, often purchased using some type of loan. John Deere's loan book has steadily grown to its current level of almost $31 billion worth of financing receivables, of which agriculture and turf products account for 66 percent. This has been an excellent business for the company over the past 15 years, with operating margins steadily expanding to an all-time high of 37 percent in fiscal 2015. But there could be struggles going forward if conditions continue to worsen. The Federal Reserve Bank of Kansas City noted in its latest agricultural credit survey that repayment rates continue to decline as demand for renewals and extensions rises, but John Deere's provisions for credit losses as a percentage of the average owned portfolio are still well below the company's historical average.

The Valuation

As sell-side analysts on Wall Street have begun dialing in their expectations for the year, we calculate that John Deere currently trades for around 17.7 times 2016 earnings estimates.



Source: S&P Capital IQ

There's an old maxim that the time to buy stocks in cyclical companies is when they're expensive, because that's when they're actually cheap (because earnings are getting ready to bottom). You'd have to go back to 2011 to find the last time John Deere traded for today's trailing P/E multiple, but we don't think this is the bottom for the company's operating results or for its stock price. Moreover, that saying isn't an absolute; John Deere's stock looked "expensive" in 1998 and in the mid-'00s -- and this proved true both times, as the price was subsequently cut in half.

The stock has held up so well in spite of such poor results in part thanks to the massive buyback program begun in 2011, which has shrunk share count by nearly 15% over just the past two years. This has made for a frustrating short in recent years. But management's forecast for equipment operating cash flow to fall by 16% in 2016 will, by our estimates, result in an even larger decline in the company's previously stagnant free cash flow. Add in the fact that John Deere will need to pay upward of $800 million in order to maintain its dividend, and we believe management will likely taper the rate of repurchases in 2016. One adage that we do expect to play out: Massive buybacks are often the sign of a top in a cyclical industry, because that's when companies are flush with cash.

How This Fits Into *Pro*

The purpose of this position is distinctly twofold. It's intended to serve as:

1. a short with a favorable chance of generating profits and with company-specific headwinds to limit the likelihood of its moving sharply against us;
2. a low-cost macro hedge.

With respect to the latter, shorting John Deere will help reduce the impact on our portfolio of potential adverse developments in commodities, the U.S. economy, the global economy (both developed and emerging markets), and currency exchange rates. And with its large book of financing receivables, the stock also serves as a small counterbalance to our sizable exposure to the financial industry. John Deere certainly isn't buzzard-bait material, but we believe it fits our portfolio well given its current valuation and outsized exposure to the North American agricultural machinery manufacturing industry. Finally, shorting John Deere also helps partially hedge our long exposure in **Valmont Industries** (NYSE: VMI), a company that depends on farmers to drive sales in its irrigation business. That company is on Hold for review. With this hedge, we may be more likely to keep owning Valmont. But even if we ultimately sell it, we like the Deere short on its own merits for the portfolio and as a macro hedge.

Live Chat Update: We Want Your Questions

Published Jan 27, 2016 at 1:31PM

Fellow Fools,

We're doing something new with our live chats to kick off 2016. As longtime members know, we've held a live text chat every month for quite some time now. We've enjoyed these very much, finding them educational, funny, interesting, and a great way to get to know our fellow *Pro* Fools -- and we hope members have, too. But the format of those text chats was, shall we say, suboptimal, with many members finding it difficult to participate. So, to kick off 2016, we'd like to try an experiment: video chats.

Here's the idea: You send us the questions you'd like answered, addressing your emails to ProChatQuestions@fool.com. *Pro* team members answer them in a video a few days later; because we're able to see ahead of time which topics have a lot of interest, we know what's top of mind with our members and will be able to give one thorough answer for those topics instead of potentially seeing them repeated several times. More efficient all around!

Please send your questions -- either for or about the video chat -- to ProChatQuestions@fool.com. Any that arrive after midnight ET on Wednesday, Feb. 3, will be out of the running for this round. We'll film our answers soon after and will have the video available by the end of the next week.

And finally: This is a one-time trial to gauge interest in and the efficiency and usefulness of this format. If it works out, great! We look forward to this new way of connecting with members. If not, then we will figure out what comes next. No matter what, we value these regular check-ins with *Pro* Fools and will work to ensure they continue.

Best,

The *Motley Fool Pro* team

Pro Catch-Up Trades: Jan. 25, 2016

Published Jan 25, 2016 at 2:46PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually over time:

- **American Tower** (NYSE: AMT), buy 3.4% in stock
- **Gentex** (NASDAQ: GNTX), 2.5% in stock
- **Gilead Sciences** (NASDAQ: GILD), 3.6% in stock
- **Oracle** (NYSE: ORCL), 3.6% in stock
- **Wells Fargo** (NYSE: WFC), 3.5% in stock
- **Skyworks Solutions** (NASDAQ: SWKS), 3.4% in stock, or "sell to open" May 2016 $60 puts (or others of your choosing) if you wish to target a lower price. Sell one put for every 100 shares you would buy. Skyworks reports earnings this week.

Build out your portfolio with our Buys, including:

- **AmTrust Financial** (NASDAQ: AFSI), buy up to 6.1% in stock; we usually suggest buying larger positions in halves or thirds over time.
- **Apple** (NASDAQ: AAPL), up to 3.9% in stock. Note: Apple reports earnings Tuesday night.
- **Medtronic** (NYSE: MDT), 3.3% in stock
- **Papa John's International** (NASDAQ: PZZA), up to 2.5% in stock
- **Parexel International** (NASDAQ: PRXL), up to 3.5% in stock
- **TD Ameritrade** (NASDAQ: AMTD), 2.4% in stock
- **Verisk** (NASDAQ: VRSK), 2.1% in stock

And then there's our airline investment, down even though oil (its main cost) is plummeting. Members who lack a stake can take note of this recommendation:

- **American Airlines** (NASDAQ: AAL): Buy to open 0.4% in January 2017 $35 calls

---

Pro Quality Checklist: TD Ameritrade

Published Jan 25, 2016 at 10:55AM

Dear *Pro* Fools,

So far, we've run four of the companies in our portfolio through our *Pro* quality checklist:

- **American Tower** (NYSE: AMT) – 7.5/8
- **Oracle** (NYSE: ORCL) – 8/8
- **O'Reilly Automotive** (NASDAQ: ORLY) – 6/8
- **Valmont Industries** (NYSE: VMI) – 5.5/8

Today, we resume our checklist series with a look at **TD Ameritrade** (NASDAQ: AMTD), our online discount broker and one of our smaller allocations at 2.5% (the 19th largest position in the port). TD Ameritrade reported its fiscal first-quarter 2016 earnings last week, and now we check out how the company stacks up against our eight criteria.

1. A Sustainable Competitive Advantage

Yes. TD Ameritrade benefits from competitive advantages in two areas – brand and switching costs. The company's brand advantage stems from its strong reputation in the industry, achieved via award-winning platforms and a focus on quality in customer service. TD Ameritrade has consistently been recognized by industry commentators for the excellence of its products and services for several years running.

Additionally, all brokers benefit from switching costs. The logistical difficulty of switching brokers (paperwork, cost-basis tracking, tax tracking, etc.) deters clients from switching to other brokers. Once you sign up and bring your assets to TD Ameritrade, you're more likely to stay on as a customer than you are to leave.

2. Pricing Power

Yes. At $9.99 per trade, TD Ameritrade has the highest nominal commission rate among the largest online discount brokers. On an average-commission-per-trade basis, TD Ameritrade is also consistently higher than its peers. The company has positioned itself competitively in such a way that it's able to charge premium prices thanks to its value-added offerings (multiple trading platforms, commission-free ETFs, educational/research tools, and high-quality customer service). Despite the highest commission rates in the industry, TD's new-account growth (lately around 5% annually) is higher than the industry average (1.7% to 2.2%).

3. Dependent Customer Base

Sort of. Investors need a brokerage firm in order to match buyers and sellers in an efficient manner. However, any brokerage firm would suffice (they don't *need* to use TD Ameritrade). Then again, switching costs prevent customers from changing to another broker quickly and easily. So I'll give TD Ameritrade half credit for this one.

4. Predictable Revenue

No. This one is cut-and-dried – TD Ameritrade's revenue sources are volatile and unpredictable. The company derives revenue from three main sources: transaction-based revenue (trading activity), spread-based revenue (interest revenue), and fee-based revenue (fees on investment products).

All three revenue sources vary widely depending on market conditions. Trading activity is dependent on market volatility, interest revenue varies with interest rates, and fee-based revenue fluctuates alongside the market. For this category, TD Ameritrade gets a definitive "no."

5. Growing Free Cash Flow With Compounding Returns

Sort of. TD Ameritrade generates outstanding cash flow thanks to its asset-light model. Since the fourth quarter of 2007, the company has generated $0.24 of free cash flow for every $1 of sales, a 24% free-cash-flow margin. Free cash flow is also growing nicely as the company attracts more assets and is set to increase further in the coming years as interest rates rise per the Federal Reserve's projections.

However, TD Ameritrade doesn't have a lot of places to reinvest that cash. The company spends relatively little on capital expenditures (an average of 4.4% of sales since fourth-quarter 2007) and hasn't made a significant acquisition since thinkorswim in 2009. As such, TD Ameritrade has shown a willingness to pay a special dividend with its excess cash – it did so in December of 2012 and 2013. While we're OK with this shareholder-friendly management practice, we ideally prefer businesses that have ample opportunities to reinvest their cash in new projects with high rates of return. TD Ameritrade does not fit that category, so it gets half credit for this one.

6. Financial Resilience

Yes. TD Ameritrade has a very resilient balance sheet, with strong free cash flow (24% of sales, as mentioned above) and a net cash position (more cash and investments than debt). Additionally, its unique relationship with TD Bank allows the company to earn a satisfactory return on its float (client cash) without taking undue risk. The company has high credit ratings with "low default risk" and "excellent debt service capacity."

7. Expanding Possibilities

Sort of. In the 1990s, the rise of the Internet led to a rapid growth of online brokerages that were able to drastically reduce the cost of executing trades. This had the effect of lowering commission rates across the industry and led to a wave of consolidation. TD Ameritrade was one of the prime beneficiaries of this trend.

However, this growth avenue has slowed and the industry has reached a level of maturity in terms of its technological disruption of traditional full-service stockbrokers. The next frontier for brokerage firms is to provide new services with an asset-based fee structure. TD Ameritrade has done this via its fee-based revenue stream, which includes company programs like Amerivest.

Fee-based revenue has grown strongly since 2009 as the company has significantly increased the amount of fee-based assets under management. This area continues to grow at a faster rate than the rest of the company, and management expects ongoing strong growth from this segment.

8. The Three C's of Management (Clarity, Consistency, Capability)

Yes. TD Ameritrade's management team has done an excellent job navigating the changing landscape of the brokerage industry. The company was an early leader in the shift to low-cost online brokers, and management anticipated the importance of derivatives and futures trading for the retail investor, as seen with the well-timed acquisition of thinkorswim in 2009. Management also communicates well with the investment community, providing satisfactory clarity, detail, and data granularity in their presentations. I view management's history of capital allocation favorably, as evidenced by its successful acquisition strategy in the 1990s and 2000s followed by a period of lesser investment and special dividends when there were fewer investment opportunities.

The *Pro* Bottom Line

In sum, TD Ameritrade scores a 5.5/8 on our *Pro* quality checklist. The company is somewhat of an odd duck compared with our ideal of a predictable compounding machine. But despite TD's relatively low score, there is only one category in which it scores an outright "no" (Predictable Revenue).

The reasons TD Ameritrade doesn't score more highly on our list include its revenue volatility and the fact that it's more mature than our typical company, with less opportunity to reinvest its strong cash flow. However, in owning TD Ameritrade, we gain exposure to a profitable, shareholder-friendly company that will benefit strongly in a rising rate environment. The company's relatively low allocation of 2.5% is an indicator of its niche role in our portfolio.

Fool on!

-- Billy (TMFBillyTheKid)

TD Ameritrade Is Set to Benefit From Higher Interest Rates

Published Jan 21, 2016 at 4:09PM

Pro's Take: AMTD Q1-2016 Earnings

TD Ameritrade (NASDAQ: AMTD)

Quarter Quick Take

In fiscal Q1-2016, TD Ameritrade demonstrated solid earnings despite muted trading activity. This company does a great job of focusing on what it is able to control and preparing for what it can not, a testament to the company's defensible competitive position and strong management. Net revenue was down -0.9% (due to lower trading activity), client assets grew by +3.4% (and net new assets by +10.5%), and earnings per share grew by +2%. The company has been able to pay a well-funded dividend and steadily increase its core earnings power, and the company's interest-sensitive earnings are set to grow this year now that the Federal Reserve implemented a 0.25% rate hike in December. If volatility remains high, asset gathering momentum continues, and the Federal Reserve implements additional rate hikes this year, we could see strong earnings growth -- the high end of management's 2016 earnings guidance represents 17% growth relative to full year 2015 earnings. And even if the most optimistic scenario doesn't unfold, the company continues to produce steady cash flow and strong profit margins and should grow steadily as it continues to gather client assets.

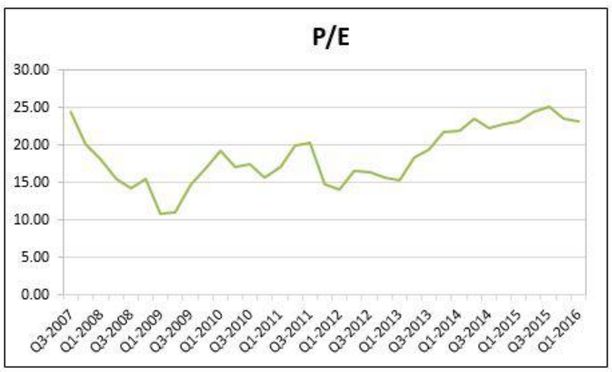
President and CEO Fred Tomczyk:

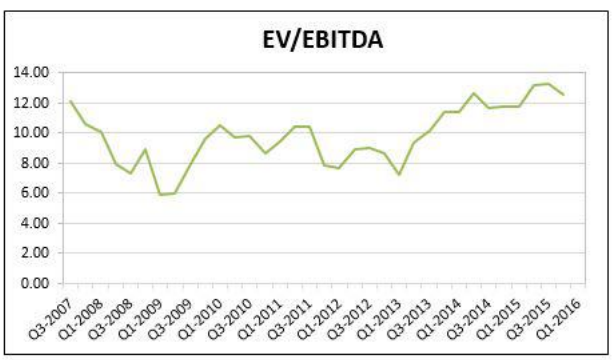
> "Our first quarter of fiscal 2016 was strong. Asset gathering is going particularly well, as we delivered our second best quarter ever – and a double-digit annualized growth rate. With the Federal Reserve raising interest rates for the first time in nine years and continued execution on our growth strategy going well, we are well-positioned for the current environment. We will continue along our path, investing thoughtfully in growth and building our long-term earnings power for the benefit of our clients, shareholders and associates."

Guidance Update

After incorporating this quarter's results into our model, our fair-value estimate remains unchanged at $35 per share. This valuation does assume a slow increase in interest rates over the next several years, so in the absence of that occurrence, the company may be challenged to grow earnings and the stock price may stagnate. Currently, the stock is about 28% below its 52-week highs as market volatility and investor speculation about the timing of future interest rate increases has led to increased volatility for companies that are interest rate-sensitive.

Given the recent market sell-off, TD Ameritrade's trailing twelve month (TTM) valuation multiples are lower than they've been in quite some time even as the company should finally start to realize some benefits from higher interest rates this year. At $27.95 per share, the company trades for 18.7x P/E and 9.9x EV/EBITDA. Here's what those multiples have looked like since 2007 (based on the quarterly average of the share price):





Updated guidance: Buy (no change)

Recommended Allocation: 2.5%

Fair-value estimate: $35 (no change)

Current price: $27.95

The Numbers

- Net revenue of $812 million (-0.9% year-over-year)
  - **Transaction-based**:
    - Funded accounts grew to 6.69 million (+4.9% year-over-year)
    - Trades per funded account of 4.13 (vs. 4.62 last quarter vs. 4.52 a year ago)
    - Average commissions and fees per trade of $11.90 (vs. $11.89 last quarter vs. $12.47 a year ago)
    - Totals up to:
      - 6,686,000 x 4.13 x $11.90 = **$328 million** in transaction-based revenue (-8.6% year-over-year)
  - **Spread-based**:

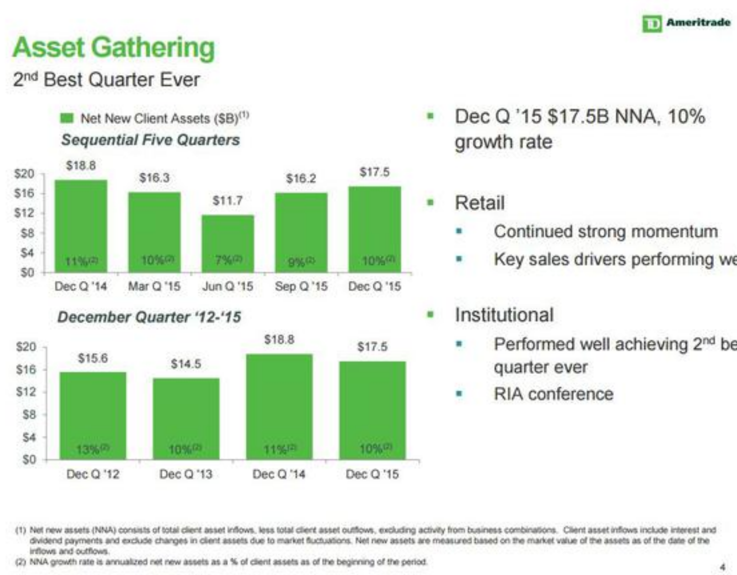
- Total spread-based revenue of **$381 million** (+3.5% year-over-year)
        - Average spread-based balance of $102.5 billion (+8.5% year-over-year)
        - Thus, Net Interest Margin (NIM) =
            - $381 million / $102.5 billion = 0.372% (quarterly)
            - NIM (annualized) = 0.372% x 4 = 1.49% (vs. 1.49% last quarter vs. 1.56% a year ago)
    - **Fee-based**:
        - Fee-based revenue of $92 million (+10.8% year-over-year)
        - Average fee-based balance of $152.9 billion (+1.5% year-over-year)
        - Thus, Investment Product Fee Yield =
            - $92 million / $152.9 billion = 0.062% (quarterly)
            - Investment Product Fee Yield (annualized) = 0.062% x 4 = 0.241% (vs. 0.209% last quarter vs. 0.220% a year ago)
- Total client assets of $695.3 billion (+3.4% year-over-year)
- Record interest rate sensitive assets of $110 billion (+9% year-over-year)
- Net new client assets* of $17.5 billion (10.5% annualized growth rate)
- Diluted EPS of $0.39 per share (+2% year-over-year)
- Trailing-12-month (TTM) average return on equity (ROE) of 16.7% (down from 17.4% a year ago)
- Capital management:
    - Paid $0.17 per share in cash dividends in the quarter (a 2.4% yield on the current share price)
    - Repurchased approximately 1 million shares of its common stock at an average share price of about $38 per share
    - Declared a $0.17-per-share quarterly cash dividend (an increase of 13% year-over-year), payable on Feb. 17 to all holders of record of common stock as of Feb. 3.

*excludes changes in client assets due to market fluctuations

Analysis

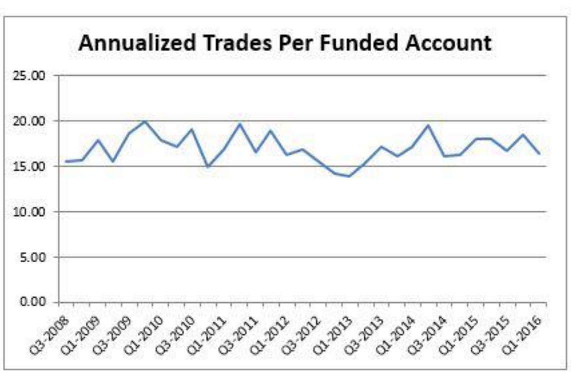
TD Ameritrade posted a strong quarter for asset gathering in its fiscal Q1-2016, with net new assets up $17.5 billion, a 10.5% annualized growth rate relative to total client assets at the beginning of the quarter. The company touted this quarter as its second best quarter ever for asset gathering, which is true if we're talking about the absolute amount of net new assets -- the only higher quarter on record is Q1-2015, when the company brought in $18.8 billion in net new assets.

But focusing on absolute amounts is misleading, since as the company continues to grow, it will need to generate higher and higher absolute amounts in order to achieve the same growth rate. Looking specifically at growth rates, there have been 9 quarterly periods since fiscal 2010 where the annualized growth rate of net new assets was higher than the 10.5% posted this quarter (but only one in the last two years -- the record Q1-2015 quarter). Nonetheless, it is still impressive that the company can maintain healthy growth rates even as it grows larger. The company's Fiscal 2016 and long-term goal is to grow net new assets at a rate between 7-11%, and this quarter is at the high end of that range, which is a very satisfactory result:



Source: TD Ameritrade December Quarter Fiscal 2016 Earnings Presentation

Trading activity declined in the quarter toward the lower end of the company's historical range as a more cautious investor sentiment took hold after a very volatile quarter in the prior period (which included the August 2015 market correction):



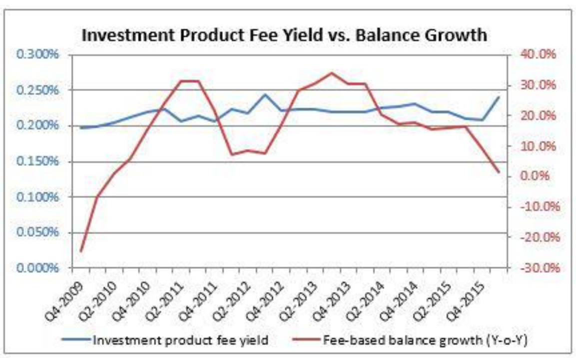
Source: Company filings and analyst calculations.

Average commissions and fees per trade came in at $11.90, which is flat sequentially and down -4.5% year-over-year. This metric remains at the lower end of the company's recent historical range, but this is not too much of a concern in terms of our assessment of the business, as my valuation assumes a steady decline in commissions and fees per trade. Management continues to focus on product mix to explain this pressure on commission rates, noting that a higher mix of futures (which is a lower revenue per trade product) and few contracts per option trade (due to a higher VIX) are to blame:

Source: Company filings and analyst calculations.

Due to the lower trading activity and lower commissions and fees per trade, transaction-based revenue declined -8.6% year-over-year, which explains why TD Ameritrade experienced flat companywide net revenue growth. We can likely expect to see growth in transaction-based revenue next quarter due to the significant volatility we've seen in markets to begin 2016 -- management mentioned that for January month-to-date, the company is averaging 579,000 trades per day, which is the highest on record, and even significantly higher than the previous record month of August last year (which came in at 537,000 trades per day).

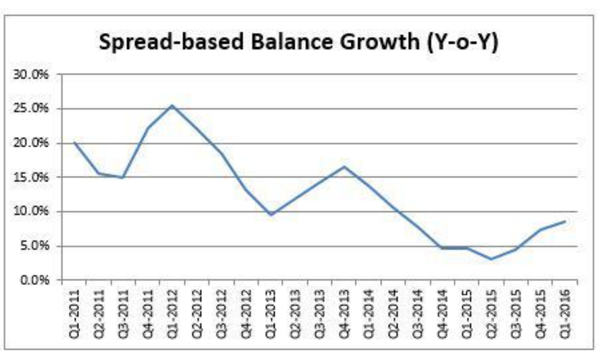
The fee-based segment of the business grew nicely in the quarter, with fee-based revenue up +10.7% year-over-year (compared to -1.2% growth last quarter and 15.3% growth a year ago). The increase in this segment is due to a sharp increase in the investment product fee yield, which increased measurably from 0.209% last quarter to 0.241% this quarter as there was a recognition of previously deferred revenue related to the company's Amerivest fee rebate promotion (which kicks in for clients if their Amerivest portfolios have two consecutive quarters of negative performance).



Source: Company filings and analyst calculations.

However, assuming the stock market doesn't rally strongly to close out the quarter, we should expect to see fee-based revenue decline next quarter since the average fee-based balance should decline alongside declines in the market.

As for the spread-based portion of the business, the rate of growth in the spread-based balance accelerated again this quarter:



Source: Company filings and analyst calculations

This portion of the business is the one that's sensitive to interest rate changes, so it's nice to see continued acceleration of growth in one of the company's key value drivers. We'll continue to watch this metric over time to make sure it's staying on track, especially now that the first Federal Reserve rate hike has occurred and future additional rate hikes are expected.

Management expects that the 25 basis point rate hike will result in a lift to 2016 revenues of $50 million to $80 million (1.5%-2.5% growth relative to 2015 full year revenue) and a lift to 2016 earnings per share of $0.06-$0.09 (4%-6% growth relative to 2016 full year EPS).

What We Think Now

TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and as interest rates increase, the company is positioned to grow earnings sharply.

If you have questions, post them on our TD Ameritrade discussion board.

Wells Fargo Has the Resiliency to Weather a Storm

Published Jan 20, 2016 at 11:47AM

Wells Fargo (NYSE: WFC)

Updated Guidance: Buy First (no change)

Recommended Allocation: 3.6% with a 1.6% look-through allocation in March 2016 $52.50 puts

Fair-Value estimate: $58 (no change)

Current Price: $47.25

What Happened?

- Diluted EPS of $1.03 per share (up 1% from Q4 2014)
- Revenue of $21.6 billion (up 0.9% from Q4 2014)
- Efficiency ratio of 57.4% (vs. 56.5% in Q3 2015 vs. 59% in Q4 2014)
- ROA of 1.27% (vs. 1.32% in Q3 2015 vs. 1.36% in Q4 2014)
- ROE of 12.23% (vs. 12.62% in Q3 2015 vs. 12.84% in Q4 2014)

Loan/deposit growth and credit quality:

- Core* loans of $864.6 billion (up 7.8% from Q4 2014)
- Average total deposits of $1.22 trillion (up 5.8% from Q4 2014)
- Net charge-offs as a % of total loans up to 0.36% (vs. 0.36% in Q4 2014)
- No reserve release** (vs. $250 million Q4 2014)

Capital allocation:

- Share buyback activity continued (diluted share count declined 15.9 million, or 0.3% of total shares outstanding, from last quarter)
- Quarterly common stock dividend of $0.375 per share (3.2% yield on the current share price)

Operating segments:

- Community Banking: Net income of $3.30 billion (down 3.8% from Q4 2014)
- Wholesale Banking: Net income of $2.10 billion (up 6.8% from Q4 2014)
- Wealth, Brokerage, and Retirement: Net income of $595 million (up 15.8% from Q4 2014)

*"Core" loans excludes the impact of the non-strategic/liquidating loan portfolio

**Reserve release represents the amount by which net charge-offs exceed the provision for credit losses

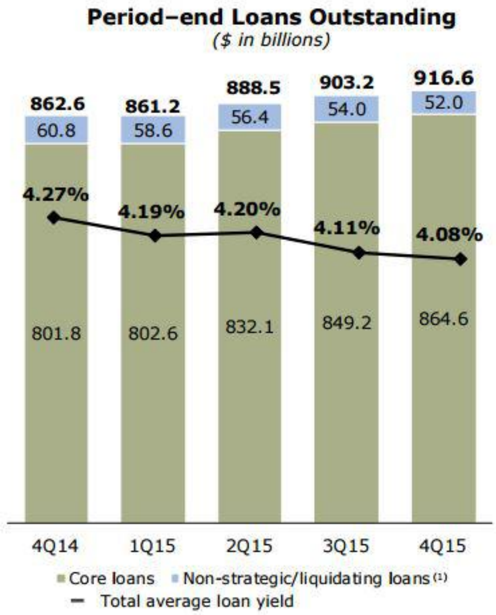
So What?

The 3 key items that I watch for Wells Fargo:

- Growth (or lack thereof) in core loans and deposits
- Trends in credit quality (as monitored via net charge-offs and reserving policy)
- Trends in the efficiency ratio and expense reduction

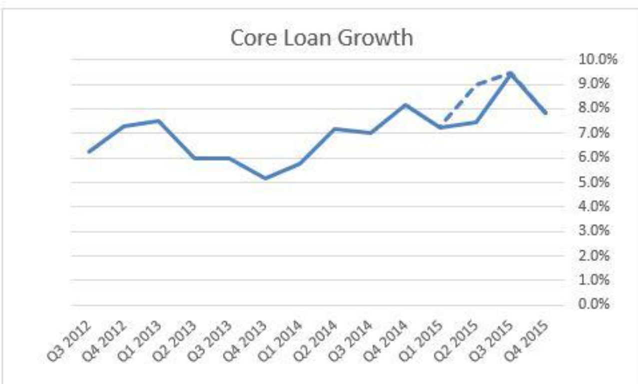
1) Growth in loans and deposits

I track core loan growth rather than total loan growth because this metric excludes the distortion from the small and shrinking non-strategic/liquidating loan portfolio (which is mostly a vestige from the Wachovia acquisition made during the 2007-2008 financial crisis):



Source: WFC 4Q15 Quarterly Supplement

Core loan growth for the quarter decelerated a bit compared to last quarter's excellent showing of +9.5% year-over-year, coming in at a still-healthy +7.8%, which is higher than the U.S. banking industry's average (recently in the 5.3%-5.9% range).



Source: Company filings, analyst calculations. Dashed line shows growth including the loans acquired from GE Capital (i.e. "inorganic" growth).

Since Wells Fargo is so large and so involved in many facets of the U.S. economy, the company's financial performance can provide some good information about general U.S. economic conditions.

Wells Fargo is the United States' largest commercial real estate and residential mortgage originator, and we can see that the real estate market continued to be an area of strength for the U.S. economy in the fourth quarter, with Wells' commercial real estate loan portfolio up 10% and core 1-4 family first mortgages up 8%. Additionally, the American consumer seems to be doing well, which is not surprising given higher employment, higher wages, and lower gas prices. In addition to strength in Wells' consumer housing portfolio, credit card balances were up 9% and automobile loans were up 8%.

Commercial and industrial loans have continued to increase at a healthy rate, even as industrial markets are struggling in the current environment due to low energy prices and a slowing of demand from China for goods and many commodities. Wells Fargo is continuing to loan to these markets (+10%), though at a decelerating pace.

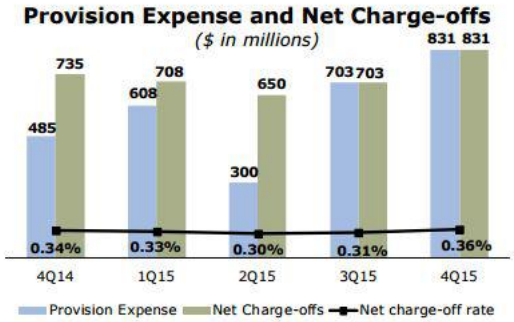
As for deposits, Wells continues to perform well. The company achieved 5.8% year-over-year growth in total average deposits, and 7.4% year-over-year growth in average consumer and small business banking deposits. Consumer and small business banking deposits comprise about 57% of total deposits. Funding costs remained stable at an ultra-low rate of 0.08%. Total average deposit growth decelerated a bit from last quarter's 6% growth, but deposit growth remains very healthy and nicely above the U.S. banking industry average of about +4.7% as per the latest FDIC summary of deposits survey.

The company's ability to grow deposits meaningfully at a very low cost is perhaps the company's biggest structural competitive advantage. Wells is able to do this by having a nationwide presence with significant geographic density in most markets, optimizing distribution via newer channels (mobile/technology), and strong customer relationship management and product cross-sell achieved via a consistent culture that has been a hallmark of the company for decades.

Net interest margin declined slightly, coming in at 2.92% vs 2.96% last quarter and 3.04% a year ago. The net interest margin is unlikely to meaningfully increase until long-term interest rates rise (who knows when that will happen).

2) Trends in credit quality

Credit quality showed a second straight quarter of sequential decline, with net charge-offs as a percent of total average loans increasing to 0.36% (from 0.31% last quarter and 0.30% the quarter before). Lower is better. Despite the slight increase, this charge-off rate is still very low, below the recent industry average of about 0.40% (which is quite low itself). Higher credit quality has been a consistent theme of the current credit cycle as banks have cut down on risk in response to the turmoil of the 2008-2009 financial crisis.



Source: WFC 4Q15 Quarterly Supplement

The reason for the sequential decline in credit quality is the company's exposure to the energy industry, which has been experiencing turbulence lately as the price of crude oil has declined to below $30 per barrel. Regarding Wells Fargo's exposure to potential defaults in the energy industry, the company provided excellent detail on its oil and gas portfolio.

First off, management mentioned that they have about $17 billion outstanding in energy loans (down about 6% vs. a year ago), and "most" of that portfolio is not investment-grade and in a senior loan position. Compared to $912.3 billion in total average loans, we can see that energy loans represent just 1.9% of the company's total loan portfolio. This is an important point, as it demonstrates the relatively small impact that prospective energy loan defaults would have on the company's overall loan portfolio.

Wells charged off $118 million in its oil and gas portfolio in Q4 2015, up $90 million from last quarter. Oil and gas nonaccrual loans (loans where the full and timely collection of interest or principal is uncertain) were $843 million, up $277 million from the third quarter, working out to about 5% of the company's total energy loan portfolio. However, as of year-end 2015, over 90% of the company's nonaccrual oil and gas loans were current on interest payments. The company has $1.2 billion of reserves on oil and gas loans, which based on a $17 billion portfolio works out to a 7% reserve rate. Management expects that if oil stays at or near $30 per barrel for the next year, then oil and gas losses will be higher, but they also believe that their $1.2 billion in reserves will be sufficient.

There was also an interesting exchange between an analyst and WFC's management regarding a potential economic "spillover effect" from the decline in the oil and gas sector:

Analyst Michael Mayo:

"Okay. And now let's just pull the lens back a little bit. John, you've been through many cycles. And I'm just wondering, is the decline in the oil and gas sector similar to other industry-specific declines that then spill over on the broader economy? In other words, what comes to my mind is 2002 TMT [ph], there you had Enron, WorldCom, you had a spillover effect, you had some market concerns, you had some losses. Or what other period does this seem similar to? Or is this stretching too much? This oil and gas thing, it's fine, it's going to blow over. Where do you stand?"

CEO John Stumpf

"Actually, Mike, it's a great question. I go back to 1985 or the early '80s when I ran the workout group and so I got to see our Denver-based energy business up close at that time. So I've -- and then we saw, of course, the one in -- there's been a couple of cycles since that time. And this one's different in a couple of respects. First of all, the economy in the U.S. is more diversified. So the communities in which energy plays a role is more diversified. Not true in every community, but -- and we look at that. Secondly, companies this time around reacted much more quickly. I think in past corrections, there was more hope and prayer going on for higher prices or a rebound. And so they reacted quickly. And I'd also say, this time around, the way companies financed themselves, there was -- there is more private equity and other debt that would be subordinate to the bank debt. So there has been -- there are differences. And I'd say the final thing is this is the mismatch between supply and demand at the world level is fairly narrow. So there's about 93 million barrels produced a day and about 92 million consumed. So it's a very narrow mismatch, and demand seems to still be increasing. So I'm not suggesting that's going to make this problem go away anytime soon. The Saudis are pumping like crazy, so are the Russians. And of course, with what's happened with tight oil here in the U.S., but -- so there are differences. And our people who run this portfolio for us have seen many or most of those cycles. So every one is different."

CFO John Richard Shrewsberry

"One thing I'd add is while there's certainly a plenty of give opportunity for market-related contagion when one industry is suffering and other industries are starting to -- or trying to borrow. But in this instance, the cheap oil has a net stimulative impact on U.S. growth. A WorldCom fraud is not beneficial for everybody else in the U.S. Telecom didn't get cheaper, but fuel is getting -- has gotten cheaper, which is good for consumers and good for other..."

CEO John G. Stumpf

"And Mike, I'll give you one other example. I was with a large builder in the Texas market not long ago, and they were talking about the fact that some of what's happening in oil and gas and the field services is making cement more available and workers and so forth that are important to housing. So I'm not suggesting it happens everywhere, but it's -- every one's different."

Regarding Wells Fargo's exposure to the energy industry, all in all I'm not too concerned about a significant impact to the business, based upon the data and commentary provided by management.

3) Trends in the efficiency ratio

The efficiency ratio (a measure of the bank's overhead costs as a % of its revenue -- lower is better) came in at 57.4%, up from 56.7% last quarter and down from 59% a year ago. The efficiency ratio is in the middle of management's target range of 55-59% (blue shaded area in graph).

Source: Company filings.

The company's expense ratio for the full year in 2015 was 57.8%, and management mentioned that they expect the efficiency ratio in 2016 to come in at the high end of their target range, unless interest rates increase faster than expected. The company continues to invest in compliance and risk management technology, including cyber-related spending. Additionally, they continue to spend on product development.

Now What?

All in all, Wells Fargo continues to perform well despite a fluctuating and uncertain macroeconomic environment. The company's diverse operating model shields it from difficulties in any one particular segment, and this revenue and profit diversity (alongside the company's hallmark conservatism relative to peers) helps Wells Fargo produce remarkably consistent results. Although revenue growth remains tepid, the company continues to steadily grow loans and deposits, and the company should benefit if interest rates continue to rise. In the meanwhile, if the economy worsens, the company has enough capital and resiliency to weather a downturn.

From our long-term view, underlying business results remain strong, the core earnings power of the business remains intact and is poised for positive operating leverage if and when interest rates and lending spreads rise, and the company's capital return program continues to benefit shareholders. After the recent market decline, at $47.25 per share, the company yields 3.2% and trades at 1.40x book value, as low as it's been since mid-2013.

Data and Guidance

- Current Price: $47.25
- Fair Value: $58 (no change)
- Market Cap: $241 B
- P/B 1.40

After incorporating this quarter's results into our model, our Fair Value estimate remains unchanged at $58 per share (representing a 1.72x P/B multiple), about 23% higher than the current price. Wells Fargo remains a Buy First on our scorecard with a 3.6% allocation and a 1.6% look-through allocation to March 2016 $52.50 written puts. Those who have yet to fill out their position in this long-term compounder should feel comfortable doing so at current price levels.

A note on our written puts: if you haven't yet written puts alongside us, you could also write the March 2016 $52.50 puts to match *Pro*'s position, although those puts are largely intrinsic value since the stock price is well below our strike price. If you want to generate a higher yield, you could lower your strike price to $50 (or look at various other weekly strikes, depending on what you like best). If you choose this route, be aware that *Pro*'s course of action may diverge from yours, depending on what expiration and strike you choose, and depending on the stock-price movements of Wells Fargo.

Fool on!

Assessing Pro's Landscape

Published Jan 19, 2016 at 2:46PM

Pro Guidance Changes

- **Skyworks Solutions** (NASDAQ: SWKS): The stock moves to Buy First on valuation.
- **Valmont Industries** (NYSE: VMI) and **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS) move to Hold as we make sure we want to keep our exposure to them (more details below).

Pro Completed Trades

- **Coca-Cola** (NYSE: KO): We sold to close our January 2016 $37 calls profitably, and let our $43 written calls and $37 written puts expire as full income. *Pro* is out of Coca-Cola now, while *Motley Fool Options* maintains a diagonal call position.
- **Expeditors International** (NASDAQ: EXPD): We set up a January 2017 $42 synthetic long, and sold to open a May 2016 $40 put, $45 call covered strangle, for a 3.5% total allocation.
- **Wells Fargo** (NYSE: WFC): We rolled our January $52.50 puts to March.

Foolish Summary: If you aren't investing yet in our Buy-rated stocks, now is a good time to get started. Read on for details!

Dear *Pro* Member:

After having yesterday off for the Martin Luther King, Jr., holiday, we didn't plan to run a Monday Memo today. But given recent volatility in the stock market, we wanted to touch base with you -- especially with members who have yet to invest, or have only invested a little bit.

Almost all of our stocks are cheaper than they were a few weeks ago, so if you're ready to buy, it's a good time to start. As always, we espouse the idea of moving gradually as you build your portfolio. Don't think you need to invest all your cash at once. Instead, master the art of gradual investing. If you plan to save and invest more money each year, you want to foster a steady approach, a strategy where you're always adding to great businesses over time. Each decision should be incremental, rather than monumental. If you're retired and not adding new cash, then having a steady disposition is still just as priceless, so you don't derail your portfolio at the worst time. You want to stay the course and make small adjustments as opportunities and risks change. Again, your moves should be incremental rather than monumental.

The Latest Market Flu

We're fortunate in that we don't own many stocks in *Pro* that are in the direct crosshairs of this downturn. Unprofitable technology companies, energy companies, and many recent IPOs have been cut down severely. But we're not here reassessing whether we should keep holding our debt-laden oil and natural gas drillers, for example, because we don't own any. And we're not rushing to buy into energy, either -- even now. If you can name an industry that has a more competition-filled worldwide landscape, less pricing power, and more emerging technologies challenging it, please share! We'd like to short that industry, just as we (arguably) should be short energy -- at least old energy.

On Hold

Our two stocks nearest to the devastating energy fire are **Valmont Industries** (NYSE: VMI), which has exposure to commodity prices and energy, and our **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS) fund. Valmont started a restructuring program last April, and management has an acquisition strategy for growth (and the balance sheet to support it), but low crop prices promise to dampen its irrigation-system sales, and infrastructure and utility spending is limping along both domestically and overseas.

Meanwhile, many emerging-market governments depend on oil proceeds, so when oil falls, those economies are threatened. If China's demand for commodities is slowing (and it surely is), that compounds the problem. Both Valmont and DGS are threatened by these factors; both moved to Hold last week as we reassess whether we want to keep the positions. Our exposure to each is small, at 1.7% and 1.6% respectively, but adds up to 3.3% of the portfolio -- far from meaningless. If we did sell, we would put the money somewhere we like better; we don't really want to lower our total long exposure right now (it's at 80%) except with hedges and shorts.

Why are we comfortable with this long exposure? Because overall U.S. companies appear healthy, we like what we own, and we have exactly the right time frame to grow our money in good stocks: three years and longer.

Buys

Some of our positions demand special mention, so they'll command much the rest of this Memo. **Skyworks Solutions** (NASDAQ: SWKS) moved to Buy First last week after it tumbled on concerns that **Qualcomm** (NASDAQ: QCOM) is partnering with an analog competitor, TDK, in a $3 billion deal to compete in radio frequency front-end (RFFE) modules and filters, a Skyworks speciality. This industry is expected to grow 80% by 2020, to $18 billion, and even if Qualcomm takes some market share, Skyworks is best positioned to benefit.

But Qualcomm's news, and fears that **Apple** (NASDAQ: AAPL) iPhone sales may be "light," have sent Skyworks shares much lower. Despite growing profit margins and bold earnings predictions from management, the stock trades at 8.6 times EBTIDA, down from 19 about a year ago, and at 10 times earnings expectations. Multiples like this are usually nothing to get excited about with most small chip companies, but Skyworks has the margins, balance sheet, growth rate, and market opportunity to merit our investment. The stock is a Buy First with a 3.1% allocation. The share price will likely remain volatile -- chip stocks often are -- but our three-year outlook softens that concern.

Other stocks worth a special mention include:

- **Apple;** it's a 3.7% position rated Buy. Earnings this month may help calm recent concerns or they may stoke the fire, but we believe that in the long run, Apple has more room to grow. Only an estimated 15% of the world has high-speed Internet access, and cash-heavy Apple is dreaming up the future behind closed doors.
- **Wells Fargo** (NYSE: WFC), **TD Ameritrade** (NASDAQ: AMTD), **Broadridge Financial** (NYSE: BR) -- our financial-related stocks are on the market's bad side on investors' hunch that the Federal Reserve won't raise interest rates as much or as quickly as previously thought, not with China slowing and oil falling; in addition, many smaller oil and gas companies are going to default on debt, hitting bank reserves (we'll have an update on this situation at Wells Fargo with our upcoming earnings coverage this week). These events present a price opportunity for dedicated owners; look at the allocations we have to these stocks and at least slowly start to average into them if you haven't.
- **American Airlines** (NASDAQ: AAL) doesn't hedge its fuel costs, and now oil is below $30 a barrel, but nothing suggests that airline ticket prices are going lower. The company should continue to rake in billions in profits, and its stock trades at just 4.1 times EBITDA and 5.5 times earnings. You can "buy to open" the same January 2017 $35 calls we own for about $8.20 each now. Only invest what you can afford to lose, since the stock only need slip below $35 by expiration for the calls to end worthless. On the flipside, if the market finally reprices American at something closer to industry average, the shares could about double, sending our calls up much more. If we have to play this out to 2018 or beyond, we will, rolling our calls if we can; it will wholly depend on how the business is doing.
- **Oracle** (NYSE: ORCL): The software giant has been thrown out with the bathwater. We've written plenty about it, and even though it only trades at 12.7 times expected earnings, it's going to require more patience as cloud revenue builds. For newcomers, though, now you can buy in at prices not seen since 2014 (and before then, 2011, though that's not a happy thought for us; this is definitely an investment that proves we have patience when the business seems to be tracking correctly).
- **Gentex** (NASDAQ: GNTX) is a 2.6% position. Despite automobile makers posting record sales, their shares are down, and Gentex with them, on concern we're nearing a top in car sales. We have faith in Gentex's ability to grow. If you don't own some shares, pick them up. Writing puts doesn't make great sense now because the $15 puts just generate mostly intrinsic value for you; but you could write June $12.50 puts for $0.60, or a 4.8% yield in about five months.
- **Gilead Sciences** (NASDAQ: GILD) is now at 8.4 times earnings and 7.8 times estimated earnings. The market is pricing in a steady decline in Gilead's Hepatitis C drugs; we believe that's less than likely, and management is not suggesting it. Plus, the business is worth more even with a slowdown. We have a 3.5% position; don't over-allocate, because even the best-looking investment can turn out wrong.

Upcoming Monday Memos

- A review of our 2015 results
- Our thoughts on "the macro" -- can you invest well for it?
- An analysis of our sell history

Overall, dear *Pro* member, look at our recommendations. As always, we'll be delighted to roll out new ideas this year (longs, shorts, options, and hedges), but we of course believe in our Buy-rated stocks as well, and we hope you're building positions across all of them as we manage them as a portfolio.

You're living very much in the moment as you read this; it's *right now*. But you're not investing for right now. You're investing for at least three years ahead. Odds are strong that when we revisit this column three years from now, most prices will be higher, if not considerably so. Even though energy prices are falling and China's economy reportedly grew "only" 6.9% last year, the world economy on the whole isn't shrinking, and most good businesses will increase value over time -- especially when starting from very reasonable valuations, as we see across many of our positions. This thesis may look incorrect for many months, or even a year, but eventually it should prove right. Meanwhile, I hope our decisions will continue to improve upon the past. Move incrementally and enjoy yourself.

See you on the boards!

-- Jeff (TMFFischer)

Sell Your January 2016 Calls on Coca-Cola

Published Jan 14, 2016 at 10:25AM

Is this for you? This is for *Pro* members with a 2016 synthetic long on Coca-Cola. *Options* members running a diagonal call on the company should continue to follow the advice in our sister service.

How You Participate

- **Trade:** Sell to close all January 2016 $37 calls (or other January 2016 calls) owned on **Coca-Cola** (NYSE: KO). Leave your January $37 puts and January $43 short calls alone to expire, assuming they stay out-of-the money on Friday, or just close them for pennies now.
- **January 2016 $37 call price (bid/ask):** $4.80/$5.10
- **Stock Price:** $41.85
- **Price Guidance:** Use a limit order that nets you intrinsic value (i.e., strike price + option price = current share price) plus a little time value (about a nickel), selling by Friday. Lately, this means targeting a sell price of about $4.90 or so. Realize the price will change with every change in the stock price.

In March 2014, **Coca-Cola** (NYSE: KO) shares dipped to $38, and *Pro* stepped in and recommended a bullish synthetic long. The shares are 9% higher since then -- not earth-shattering, and not North Star-topping, but a decent return on a low-risk position. Our own return is especially good considering our leverage. We were *paid* $200 to set up the synthetic long position (we paid no cash out), and it's worth $8,300 as of yesterday. We're also earning $1,522 by writing a $43 diagonal call that expires Friday. That brings our total gain to nearly $10,000, while we didn't use any cash to open or maintain the position.

We're selling to close our $37 calls on Friday, rather than letting them be exercised into stock. Coca-Cola isn't in a strong enough position to enter the *Pro* portfolio as a standalone stock today; earnings growth at this international giant is still slight, and soda sales continue to suffer. The stock will likely stay range-bound, so we prefer to continue an income position on Coca-Cola in *Motley Fool Options*, and focus *Pro* on more *Pro*-like companies that meet our company criteria, including healthy growth prospects.

Here's our current position snapshot:

Coca-Cola (KO)	Write (Sell) Synthetic Covered Calls	1/15/16	$43.00	-17	$41.72	-$1,522.00	-$68.00	+95.5%
Coca-Cola (KO)	Synthetic Long (Sell Puts)	1/15/16	$37.00	-17	$41.72	-$6,221.00	-$51.00	+99.2%
Coca-Cola (KO)	Synthetic Long (Buy Calls)	1/15/16	$37.00	17	$41.72	$6,016.00	$8,160.00	+35.6%

Alternative Trades

- **Would you rather exercise your calls into a long-term stock position?** That's your choice! Do nothing, and your calls will turn into stock over the weekend; you'll own 100 shares for every call you currently own. Your new stock will get purchased at your $37 strike price. Turning the calls to stock avoids a tax bill for now, until you sell the shares.
- **Own 2017 or 2018 calls?** You can go on owning those for the long haul if you like, independently.
- **Own 2017 or 2018 calls and writing diagonal calls on them?** So are we, over in *Motley Fool Options*. Keep following that advice there.

Pro Can Help

- **Have a question?** Pour it out on Pro's Coca-Cola board.

Close Your Covered Strangle on Expeditors International and Set Up a New One

Published Jan 13, 2016 at 10:46AM

Is this for you? This is for all *Pro* members with an existing income position on **Expeditors International** (NASDAQ: EXPD) expiring in January, and for all those who want to start this position now. (Those who want to own stock instead of a synthetic long, or use an IRA, should see the alternative trades at the end of this report.)

How You Participate

- **Actions:**
  - **Old position:** "Sell to close" your long January 2016 $40 calls, and "buy to close" your short January 2016 $46 puts. Your other options -- January 2016 $40 puts and $48 calls -- are set to expire Friday. You can let them be or, more safely, close them for pennies.
  - **New position:**
    - **Trade 1:** Set up a new synthetic long: Buy to open January 2017 $42 calls, and sell to open an equal number of January 2017 $42 puts.
    - **Trade 2:** Then write a new covered strangle: Sell to open May 2016 $40 puts and May 2016 $45 calls. Do this once for each synthetic long you set up.
- **Allocation:** Approximately 1.8% exposure on the synthetic long, and another 1.7% exposure through your short puts in the strangle, for 3.5% total exposure. Each synthetic covered strangle represents about $8,300 in exposure to the stock. So, for 3.5% exposure, set up one synthetic covered strangle (one each of all four options listed above) for every $235,000, approximately, that you manage. *Pro* will use 10 contracts of each option in the synthetic long, and then in the written strangle.
- **Prices (10 a.m.):**
  - **Stock:** $43.40
  - **Options:**
    - **Old position:** Sell to close January 2016 $40 calls at the going price, lately $3.50. Buy to close January 2016 $46 puts, lately $2.60. These prices will change. Using current prices to complete the trades by Friday.
    - **New synthetic long:** Sell to open January 2017 $42 puts (bid/ask): $3.70/$3.90. Buy to open January 2017 $42 calls (bid/ask): $4.90/$5.20. Combined splitting the bid/ask: **About a $1.25 debit.**

- New covered strangle: Sell to open May 2016 $40 puts (bid/ask): $1.25/$1.40. Sell to open May 2016 $45 calls (bid/ask): $1.85/$2. Combined splitting the bid/ask: **About a $3.10 credit.**

- **Price Guidance:** Close your old positions using limit orders at current pricing, and do so by Friday. For the new synthetic long, the price will change as the stock price changes. Just aim to pay almost no time value. Lately, there isn't any (the stock is $43.40 and the $42 synthetic long costs less than $1.40). Write the new strangle using a limit order of about $3.10 in credit. As prices change, ideally accept no less than $2.80, or 6.5% on the current share price in about four months to expiration.

What We're Thinking

Shares of our favorite overseas shipping facilitator, Expeditors International of Washington, have fallen on concerns that world trade volume will follow China down a path to economic malaise. Its stock is now trading at 9.5 times EBITDA, with lower value multiples on many measures than it's seen in years, even though the company is on track to increase earnings per share by more than 20% in 2015 and profit margins are trending higher as management prudently cuts costs.

Earnings are expected to moderate in 2016 -- the average analyst estimate has them ticking just 5% higher -- but that should be enough to keep our option income strategy going and, ideally, to keep the stock in a friendly price range. Overall, we believe this well-run business will continue to deliver respectful results, even if world trade volume slows marginally.

Asia accounts for about 50% of the company's revenue. In the nine months ended last September, air freight net revenue in North Asia was up 35%; the same revenue in South Asia increased 29%, both on higher tonnage and favorable spot-market buying opportunities. Ocean freight revenue was also up in Asia. Many of China's exports are of course shipped to countries with stronger economies (and cleaner air), including North America and Europe. This gives Expeditors' business some breathing room even when China's domestic economy (including imports) slows, as it's currently doing. Although this year could be choppy, that uncertainty adds to the option premiums we'll collect, aiding our income strategy, while we ultimately believe Expeditors will come through fine, too.

Why This Strategy?

Since starting this income position in August 2014, we have earned about a net $2,000 in profits (all option income) on the less than $600 in cash we originally deployed. Although this gain is much less than it was a few months ago, it still amounts to more than triple the value of the cash we invested, and it has brought us a healthy yield on the equity we set aside to hold puts open, too -- equity we wouldn't have invested elsewhere anyway, given the cash we have in the portfolio. Since August 2014, the S&P 500 is flat to down (depending on the day you measure from), so this income strategy has outperformed a poor market and still seems logical (we haven't missed great upside in Expeditors or in the S&P 500).

Meanwhile, although it's a highly profitable, expertly managed niche business in an attractive service space, Expeditors is not on the radar of the average investor. Its valuation is reasonable to us, and its options pay well. Not expecting a surge in revenue or earnings, we're content to keep covering the position with calls. Not expecting a great drop in the price, we're also comfortable writing puts. Why not just buy the stock to strangle instead of setting up a synthetic long? You may if you prefer. We are opting to keep our cash free to invest elsewhere as wished, and to use the leverage of a synthetic long to make the income we earn on this position much more meaningful compared to the modest capital we invest.

More That Matters

- **Maximum loss:** The same as owning at least 200 shares of stock (100 now, and 100 at $40), minus the option premiums received.
- **Maximum gain:** This new strangle caps our upside at $45, plus the option premiums received, so about $48. The most we can make on this strangle alone is the $3.10 or so in premium paid to us, which is earned if the stock stays anywhere between $40 and $45 by expiration.
- **Breakeven**: Our new synthetic long mirrors stock ownership that started at about $43, while this new short strangle in isolation has breakeven points at about $37 and $48.
- **Follow-up:** By our May expiration, we'll manage our covered strangle for more income, writing a new one as this one ends, or rolling if we need to. You'll hear via a trade alert!

Alternative Trades

- **If you're new to *Pro* and want to participate in the full new position:** Just follow the New Trades outlined at the top of this report.
- **If you just wrote covered calls last time and want to keep doing that:** The January 2016 $48 calls you wrote are expiring as income. Now you can write the May 2016 $45 calls with us, writing one for every 100 shares of stock you own and want to cover. They lately pay around $1.90 each.
- **If you just wrote puts last time and want to do so again rather than take shares:** The January 2016 $48 puts can be rolled to May 2016 $48 puts for about a $0.75 credit. They're deep in-the-money, so you're waiting for a recovery. This lets you keep more upside than we anticipate, but you never know how fast a stock can recover. That said, if you'd rather roll to a lower strike, roll down to the May $45 puts. That requires about a $1.10 debit.
- **If you're new and just want to write covered calls (the IRA-friendly alternative!):** Use a buy/write order to buy at least 100 shares of stock and sell to open the May 2016 $45 calls with us. Lately, this can be set up for a net debit of about $41.50 per share. You can do this with up to a 3.5% allocation.
- **If you're new and just want to write puts:** Write May 2016 $40 puts with us, selling one for every 100 shares you could buy, up to a 3.5% allocation. These currnetly pay $1.30, or roughly 3.3%, with just more than three months to expiration.
- **Want to strangle shares of stock instead?** Rather than set up the syn long, just buy stock in 100-share increments, and then sell to open the covered strangle on the stock.
- **Already been "put" some extra shares via Jan. 2016 $48 puts?** Keep them to strangle (rather than setting up a new syn long), while still closing your 2016 syn long. Or, sell the new shares to set up the 2017 syn long instead, and then strangle that syn long.
- **Already have a syn long that expires in 2017?** Set up this new strangle on it.

Pro Can Help

- **Want more on this strategy?** See our guides to covered strangles and synthetic longs. We're combining the two into a synthetic covered strangle.
- **Questions?** Please ask, Fools! Ship yourself on over to our Expeditors board. We can all help you, especially if you're new!

Roll Your Written Puts on Wells Fargo

Published Jan 12, 2016 at 11:36AM

Is this for you? Yes, if you're a *Pro* member following our option writing for income on **Wells Fargo** (NYSE: WFC), and if you (like us) have an in-the-money January option reaching expiration this Friday. You should roll before Friday's close. Note that Wells Fargo is scheduled to report fourth-quarter 2015 earnings on Friday morning. We don't know whether the stock will go up or down afterward, but we're choosing to roll beforehand in order to capture the "earnings uncertainty premium." (If you own 2018 calls on Wells Fargo from *Motley Fool Options*, leave those alone. They have nothing to do with this alert.)

How You Participate

- **Action:**
  - Buy ("buy to close") your previously written January 2016 $52.50 puts.
  - Write ("sell to open") March 2016 $52.50 puts.
- **Allocation:** Write the number of March puts equal to the number of January puts you buy to close. *Pro* will be rolling its seven contracts. The look-through allocation on the puts is about 1.6%.
- **Prices (11 a.m. Jan. 12):**
  - **Stock:** $50.80
  - **Options:**
    - Buy to close January 2016 $52.50 puts (bid/ask): $1.76/$1.84
    - Sell to open March 2016 $52.50 puts (bid/ask): $3.00/$3.15
    - Combined rolling bid/ask: $1.16/$1.39 ($1.27 at the midpoint)
- **Price Guidance:** Using a **limit order**, split the bid/ask and aim to receive a net credit of at least $1.20. As prices change, realize that you should complete the roll by Friday's close; if you don't, you will be assigned shares of Wells Fargo stock.

What We're Thinking

Not too much has changed with Wells Fargo's business since we wrote our puts in October, but some recent turmoil in the markets has knocked a few dollars off the stock price, forcing us to either roll our in-the-money January puts or accept new shares of stock.

While we're OK with the idea of accepting assignment on new shares of Wells Fargo, we've decided that we're more content to simply roll our puts out to March, collecting some additional income as we wait for more clarity on the business. Wells is scheduled to report fourth-quarter 2015 earnings this Friday, and we will receive the "earnings uncertainty premium" for rolling prior to the report.

We wrote our January puts for $1.10 per contract (your mileage may vary depending on when you wrote yours), so with the additional $1.20 from rolling the puts, our new effective buy price on additional shares of Wells Fargo would be $50.20, slightly lower than the current price and 13.4% below our $58 fair-value estimate.

We'll reevaluate our written put position in March. If our puts are still in-the-money, we'll decide whether to accept shares of stock or roll our puts out to a later month; if they're not, we could let our position expire and look to reinitiate our income strategy on Wells Fargo shortly thereafter, depending on market conditions.

More That Matters

- **Maximum loss:** For the current iteration of the put strategy (which includes the January puts), our risk is the same as share ownership starting at about $50.20, or about 1.2% below the current price.
- **Maximum gain:** On this rolling trade alone, our maximum gain is the rolling credit. At $1.20, that's a 2.3% yield on the current share price in 67 days.
- **Follow-up:** In March, we'll buy shares at a net $50.20 (about 1.5 times current book value) if the stock is below our $52.50 strike price, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts (or pursue a different strategy) for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 3.6% allocation first — Wells Fargo's shares are a Buy First. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1.6% of your portfolio, then just buy 1.6% in stock directly *if and when Pro* does so through these puts (we'll alert you).
- **New to the position and didn't write puts last time?** You can either:
  - **Match *Pro*** by writing March 2016 $52.50 puts at a 1.6% look-through allocation. Recognize that these puts are in-the-money and have a higher risk of assignment than puts that are at-the-money or out-of-the-money.
  - **If you prefer to be slightly more conservative and reduce your risk of assignment,** consider writing March 2016 $50 puts. Recognize that your effective yield will be higher than that of *Pro*'s rolling trade and your potential buy price will be lower, but you will not be aligned with *Pro*'s official position. You can also look at weekly puts at various other strikes, depending on what you like best. If you choose this route, be aware that *Pro*'s course of action may diverge from yours, depending on what expiration and strike you choose, and depending on the stock-price movements of Wells Fargo.

Pro Can Help

- **Want more on this strategy?** See our guide to writing puts.
- **Questions?** Please ask, Fools! Drive your stagecoach over to the Wells Fargo discussion board.

Don't Forget the Low-Hanging Fruit

Published Jan 11, 2016 at 12:40PM

This Week's *Pro* Expirations

- **Coca-Cola** (NYSE: KO): We plan to end this position with a trade alert this week, selling to close our January $37 calls and letting our short $43 calls (and short $37 puts) expire. We earned a positive return on Coke, but don't care to extend the position in *Pro* right now. (A diagonal call on Coca-Cola continues in *Motley Fool Options*.)
- **Expeditors International** (NASDAQ: EXPD): We will issue a trade alert in the next few days. We plan to simply roll our January 2016 synthetic long to 2017, and close our January $46 puts and then write a new covered strangle on our new synthetic long. Those with stock will get guidance, too.
- **Wells Fargo** (NYSE: WFC): We are rolling our January $52.50 puts to a later month. The trade alert will arrive to you soon!

Fellow Fools,

Investing is a tough business, and this is the time of year when we're reminded just how tough. Though 2015 was a solid year for the *Pro* portfolio, most professional fund managers didn't fare quite as well. Research firm HFR reported that hedge funds lost an average of more than 3% this year, while the market (including dividends) returned 1.4%. And according to Lipper, only 46% of actively managed mutual funds bested their benchmarks. The *Pro* portfolio posted a 7.4% gain for the year, but the purpose of this Memo isn't to gloat. Instead, I'd like to take a step back and try to put these gains into perspective.

Investing is a zero-sum game. There are a lot of incredibly talented, highly motivated investors in those funds mentioned above, all of whom are competing to generate alpha for their investors. It's important to remember that none of us is entitled to market-beating returns, regardless of our relative intelligence or success in other facets of life. The *Pro* team works hard to deliver consistent positive returns for our members, but even so, we know it's impossible to guarantee the same level of success from year to year. What we *can* guarantee is that there are a number of easier and higher-probability ways to increase your wealth than by relying entirely on your investing returns to do the heavy lifting.

Get a Plan

An investment portfolio is not the same as a detailed financial plan. Separate studies from [Morningstar] and [Vanguard] suggest that using financial-planning best practices can improve your portfolio's return by a (conservative) average of 1.5 percentage points. Examples of the strategies highlighted include diversified asset allocation, tax-efficient [asset location] and withdrawal strategies, annuity allocations, rebalancing, and lowering expense ratios and fees.

The authors of Morningstar's study labeled the added returns from these stategies as "gamma," pointing out that "unlike traditional alpha, which can be hard to predict and is a zero-sum game, we find that Gamma (and Gamma equivalent alpha) can be achieved by anyone following an efficient financial planning strategy." In other words, generating abnormal returns by investing is uncertain at best, but the added returns from smart financial-planning decisions are as close to a sure thing as you'll find. In a world where few investment managers consistently deliver any alpha at all, it would be foolish to overlook the opportunity to improve your portfolio's returns by a percentage point and a half with a high probability of success.

It's worth pointing out that neither study mentions tax-loss harvesting, which is considered a best practice by many but is, according to financial planning expert and blogosphere all-star Michael Kitces, [less of a no-brainer] than most people believe. The studies also don't account for a wide range of other financial decisions, including estate planning, evaluating insurance needs, [optimizing Social Security benefits], choosing the right college savings accounts, and Roth IRA conversions with the potential for added value creation.

Finally, a few caveats. When coming up with their estimates, both Morningstar and Vanguard compared their optimized returns to the returns of the average investor. The *Pro* community is likely already above average in this area, so the opportunity to add value may be smaller than advertised. And of course, not everyone can take advantage of all of these strategies. Even so, each of us could probably identify a few topics mentioned here that could use more attention; if you're not inclined to get into the nitty-gritty details, it might be worth hiring a fee-only financial planner or a good CPA to review your finances to make sure you're collecting as many of these easy wins as possible.

The Business of You

The easiest way to increase your financial wealth is to save more money. You can do this by cutting back on spending or by making more money while keeping your spending in check. Though the first option is certainly viable, I'd wager that the latter is more palatable to most people.

In many cases, investing in your own human capital is the highest-return prospect available, though the returns are less certain than those promised by financial-planning strategies. For most young adults, [the most valuable asset they possess] is their ability to earn. Sadly, though, human capital is a depreciating asset; it decreases in value with every year that passes, and the only way to maintain or boost its value is to increase your future stream of cash flow by working more and/or earning more money each year. Earning more usually requires learning new skills and finding ways to generate additional value for your employer or customers. Also, it's important to remember that this asset could be suddenly devalued by a layoff or a forced retirement, so in many cases your human capital will require constant reinvestment just to maintain the status quo.

Another way to invest in yourself is by taking care of your health. Since your body is more or less just a vehicle to carry around your brain, it would be a shame to waste all of the effort you put into improving your knowledge by neglecting its chariot. Studies suggest that regular exercise, good sleep habits, and maintaining a healthy weight are all associated with earning higher wages. Though most of these studies can't differentiate between correlation and causation, there's a fair amount of research to support the idea that these behaviors also result in improved brain function. Considering that a few side benefits of a healthier lifestyle include lower stress, a longer life span, a higher quality of life, and ultimately lower health-care costs, this is an investment opportunity that too many of us neglect.

What's a Relationship Worth?

It's easy to overlook things that are difficult to quantify, but I think most of us agree that social/emotional capital can be invaluable, especially in the event you ever need to spend it. I'm listing this investment opportunity separately because maintaining your social network often distracts from increasing the other sources of wealth mentioned above. Developing and nurturing relationships with friends, family, and business associates takes time, effort, and often money, but most people would agree that those relationships lead to a richer, more fulfilling life.

Too often, people forgo this investment while their trying to build their stores of financial and human capital, often missing out on the benefits that social and emotional capital can deliver along the way. There's no market that prices these connections in real time to let you know how much value you've accumulated. I think a reflection on the people you can call on during challenging times, whether in your personal or professional life, can give a good idea of where you stand and what areas could use some focus.

The *Pro* Bottom Line

If this Memo seems a little off-topic, know that there's some precedent for holistic financial thinking in *Pro*'s weekly communications. A couple of years back, Jeff penned a Memo called "[Are You Optimizing Your Life?]," which inspired the creation of the aptly named [Optimize Your Life discussion board]. I hope members out there who are concerned with anything I've mentioned above -- financial planning, emotional capital, investing in their own earning potential, and so forth -- will [use that board] to share a few tips for success.

Our ultimate goal at *Pro* is to help out members generate wealth, but that means different things to different people. We're all targeting a different combination of financial, human, and social capital to satisfy our goals. Before you devote the majority of your time (another crucial asset) to pursuing investment alpha, please consider whether you're picking off all of the low-hanging fruit that could help you reach these goals in a more efficient manner.

Best,

-- Jeremy (TMFTank)

Papa John's: A Steady Business but a Volatile Stock

Published Jan 7, 2016 at 12:30PM

Pro's Take: PZZA Q3-2015 Earnings

Papa John's International (NASDAQ: PZZA)

....

Q3-2015

Total revenue growth: -0.3% (vs. +12.7% in Q3-2014)

Operating profit margin: 7% (vs. 6.5% in Q3-2014)

EPS growth: +16.7% (vs. +19.3% in Q3-2014)

....

Quarter Quick Take

In Q3-2015, Papa John's continued to focus on what it does best -- "Better Ingredients, Better Pizza". In the first quarter of results since Pro trimmed its position by one-third via covered calls (selling at a net $68.40 per share), the company delivered another solid quarter, with North American restaurants increasing comps by +3% and international restaurants increasing comps by +8%. These growth rates suggest continued market-share gains at the expense of pizza industry rivals. Earnings per share grew 16.7% year-over-year, increasing due to higher operating margins and ongoing debt-fueled stock buybacks (the company's share count has reduced by 3.6% vs. a year ago). Free cash flow generation is starting to really kick into gear now that commodity costs have moderated and the company's point-of-sale system roll-out is complete. Papa John's generated $119.5 million in free cash flow over the trailing-12-month (TTM) period, up 109% compared to the year-ago period. Papa John's continues to focus on quality, consistency, and measured international expansion, and the company looks set to finish up a strong 2015 that exceeded management's initial guidance at the beginning of the year.

Guidance: Buy (no change)

Recommended Allocation: 2.6%

Fair Value estimate: $57.50 (no change)

Current Price: $51.37

But despite the strong operating results, the company's stock has been in a bit of a slump lately, declining 12.1% on the day of the earnings release, and down 35.6% compared to its 52-week high of $79.40 in July of 2015. Papa John's is a steady business but a volatile stock, and in Pro's history we've presided over other significant swings in the stock price (the stock declined more than 30% between March to September in 2014).

To take advantage of that share price volatility and the company's then-expensive valuation, we sold October 2015 covered calls that were assigned at expiration at a net $68.40, which so far has been a positive decision for us given where the stock price is today. Despite selling a part of our position in order to mitigate some valuation risk, we still believe in the business over the long term, and we think Papa John's should best the North Star over the next 3-5 years from the current share price (which is now about 11% below our Fair Value estimate). Low-to-mid single digit comps growth, modest store unit growth, operating margin expansion, and share repurchases should all combine to help the business grow earnings at a rate that at least challenges our North Star.

Given the recent decline in the company's share price, Papa John's is now more reasonably valued than at any point over the last two to three years, despite far less uncertainty regarding the trajectory and sustainability of the company's international expansion. On a TTM basis, at $51 per share, the company trades for 27x P/E (23x if we exclude the non-recurring legal expense recorded last quarter), 13.2x EV/EBITDA, and 18.4x EV/FCF. For context, **Domino's** (NYSE: DPZ) trades at 18.4x EBITDA and **Dunkin' Brands** (NASDAQ: DNKN) at 14.3x. As financial performance has improved (and the share price has declined), Papa John's trailing multiples have contracted as we expected. For those without a position, now is as good a time as any in the last few years to establish a position in this strong business with good operational momentum and a long international growth runway.

Our Thesis

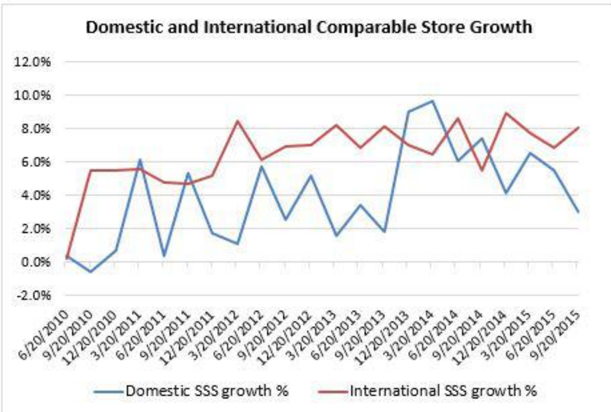
Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main quick service restaurant (QSR) pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only about 1,400 international restaurants the company has a long runway for growth (compare to Domino's which has over 7,000 international stores). Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

1) Store Performance*:* During Q3-2015, systemwide restaurant sales increased +3.9% (7% when excluding the impact of foreign currency). Domestic comps increased +3% while international comps increased +8%.

Domestic comps growth slowed this quarter (down from 6.5% and 5.5% in Q1-2015 and Q2-2015, respectively) as a result of "unpredicted, very aggressive pricing activity" within the category. For year-to-date 2015, the company is sitting at 5% domestic comps growth, at the high end of the company's recently raised 3%-5% domestic comps guidance for full year 2015. Given that Papa John's is the official pizza partner of the National Football League (NFL), management expects domestic comps to come in at the high end of guidance for the fourth quarter as we head toward the end of the NFL season.

As for international comps, the company continues to churn out mid-to-high single digit comps performance. At +8% for the quarter, this marks the 16th consecutive quarter of international comps above +5%. There was particular strength this quarter in the U.K. market with "double-digit" comps in that region, its third consecutive quarter of double-digit comps growth.

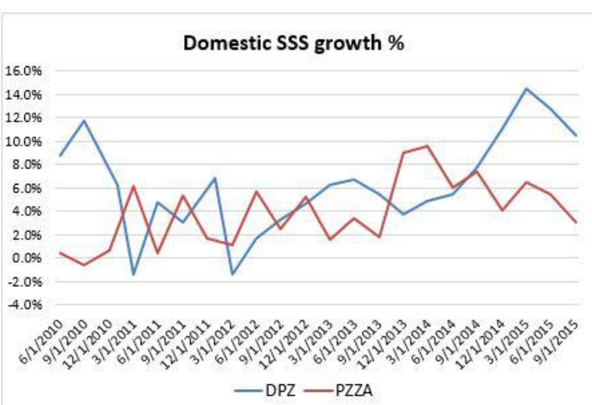


The company's measured expansion continued, adding 52 new restaurants (net) in the quarter -- 37 internationally and 15 in North America. The company successfully opened its 40th country in Bolivia and is fast approaching 1,500 international stores. Management recently updated its net unit opening guidance, indicating that it expects full year 2015 openings to come in at the low end of the 2015 guidance range of 220-250 restaurants. 220 restaurant openings for 2015 would represent +4.7% growth versus the existing store count as of the end of 2014. The company's pipeline remains healthy, with 250 domestic restaurants and 970 international restaurants, the majority of which are scheduled to be opened over the next six years.

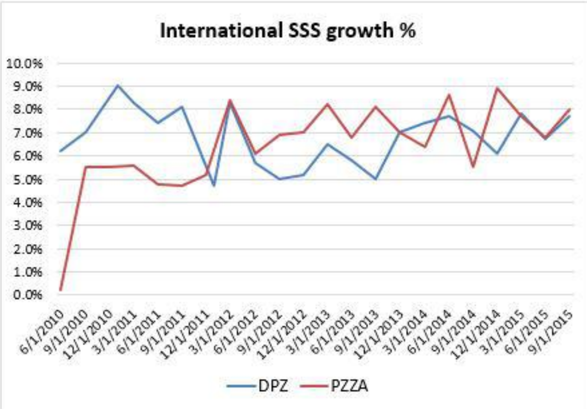
2) Brand: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantages and higher price per pie. Based on recent data, which includes store growth, the domestic pizza market was about flat and the international pizza market grew about 3%-4%. So Papa John's comps (which *exclude* store growth) suggest continued market share gains at the expense of competitors. This is likely due to the company's competitive advantages related to scale (efficient advertising/distribution) and an early lead in technology (digital ordering and loyalty programs).

As for PJ's strongest peer, Domino's domestic comps came in at an excellent +11.5% in the quarter, outperforming Papa John's meaningfully. This past quarter was the fourth consecutive quarter of double-digit domestic comps growth for Domino's, demonstrating excellent momentum. Domino's menu has a much wider assortment of items outside of pizza (pasta, sandwiches, chicken, and breads), and new menu initiatives at Domino's (including the new marbled cookie brownie) helps to explain some of the difference in comps. Additionally, Domino's is much more willing to compete on price than Papa John's which likely helped it earn share during a quarter of aggressive pricing.

But there's no denying that Domino's is on a roll domestically as they continue their marketing initiatives (including reimaging the existing store base), invest in technology, and add a new loyalty program. Domino's gained more U.S. market share than competitors as of the most recently available data (May 2015), increasing in share from 17.7% to 18.8%. Papa John's also increased its market share but to a lesser degree, from 11.7% to 12.2%. Little Caesar's market share increased from 14.4% to 14.7%, and Pizza Hut's market share declined by -1.7%, although they still have the largest market share at 25.1% of the segment. Domino's is more aggressive strategically than Papa John's, which can lead to higher growth when the company executes well. But it also exposes the company to more potential operational missteps and volatility, which is something that Papa John's has largely avoided over the last several years:

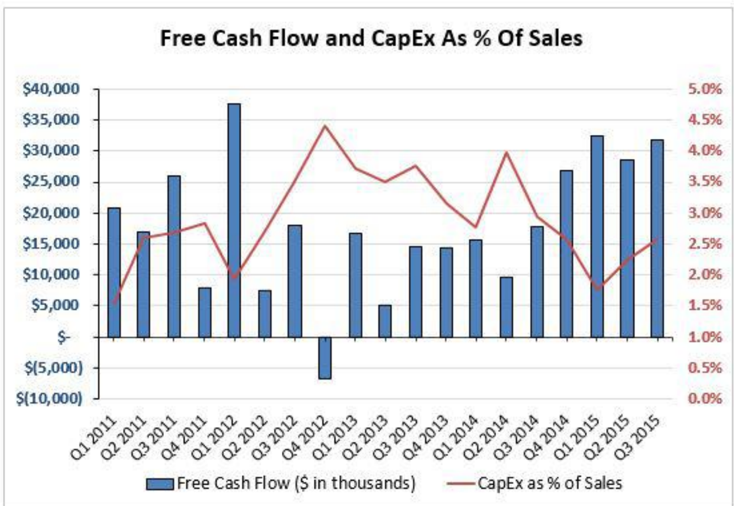


Papa John's and Domino's are neck and neck internationally, where most of future growth will occur. The strong international comps performance continues to suggest that the Papa John's brand and expansion strategy are translating in the higher-growth overseas markets:



3) Margins: We expect Papa John's capital light business model to eventually result in higher operating margins that propels free cash flow generation. From 2014-2015, the company dealt with depressed margins and free cash flow due to the roll-out of the company's new new proprietary POS system (FOCUS), which as of this quarter is now totally complete.

Now that the investment phase has passed, the company is enjoying higher margins and free cash flow generation, as favorable changes in working capital (related to FOCUS inventory levels) and lower capital expenditures have lifted free cash flow much higher. In this graph, note the inverse relationship between capital expenditures and free cash flow-when capital expenditures are elevated, free cash flow is depressed, and vice versa:



Trailing twelve month (TTM) free cash flow is $119.5 million, the highest in the company's history, and up 109% compared to the year-ago period. Note that free cash flow will likely decrease a bit in 2016 as the company has not yet paid the $12.3 million legal expense that it recorded on the financial statements last quarter. At the current price of about $51 per share, the company is trading at about 17.1x P/FCF, the lowest this metric has been since Q3 2012, and a far cry from the 50x multiple we saw a few times in 2013 amid elevated capital spending.

What We Think Now

Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. Near term headwinds (commodity prices and technology investments) have proven to be temporary and Papa John's should continue to deliver improved financial performance.

Here's all the latest on Fool-recommended companies, straight from the 2016 Consumer Electronics Show in Las Vegas

(This up-to-the-minute reporting is part of *Supernova 2016* — the FREE celebration leading up to the new-member opening of *Motley Fool Supernova* and the launch of the brand-new Odyssey 2 mission! Scroll down for a full schedule of events.)

Supernova only opens to new members once or twice a year. And it's set to open for a short time on Wednesday morning, January 13th...

And here's another reason your timing couldn't be better: Right now we're in the final stages of launching a brand-new real-money portfolio mission inside *Supernova* — you can get all of the details by clicking here.

Or you can simply bookmark this page and check back for all the latest from *Supernova* analysts scouring CES in Las Vegas for what they think will be the most meaningful investments and trends of 2016 and beyond ...

Tuesday, Jan. 5

Noon ET to 3 p.m.

- CES 2016 Trends to Watch
- Multi-Screen Strategies for Connected TV Technology and Content
- Fiber on Fire: Illuminating the IoT
- Smart Home Commerce: The Home Replenishment Revolution

4 p.m. ET to 7:30 p.m.

- Connected Health: Doctors without Wires
- Enterprise Technology: Today and Tomorrow
- YouTube: Unlocking the Power of Programming

Wednesday, Jan. 6

11:30 a.m. ET to 1 p.m.

- Keynote speech: Netflix CEO Reed Hastings

Noon ET to 3 p.m.

- VR/AR Think Tank: The Next Generation
- Future of TV: From Primetime to Multi-Platforms
- Cord-Cutting Brings New Content Opportunities
- Wearables: Healthcare, IoT, and Smart Home Use Cases
- Automated Driving

4 p.m. ET to 7:30 p.m.

- Reinventing the Phone-Car Connection
- Running Through Virtual Reality

3 p.m. ET to 8:30 p.m.

- Oculus Rift: The Family Friend
- The State of OTT Entertainment
- Robots in the Real World
- Keynote: YouTube Chief Business Officer Robert Kyncl

Imagine starting 2016 by seeing what's "next." And knowing exactly which David Gardner-recommended stocks should be in your portfolio and how much you should allocate to each position.

Supernova members who've followed the Odyssey 1 mission have started each of the past four years with this tremendous advantage, scooping up:

- Tesla in 2013 for 344% gains
- Sierra Wireless in 2014 for 96% gains
- Netflix in 2015 for 143% gains

Now here's the upshot in all this for you...

Right now you have the opportunity to climb aboard Odyssey 2 from the very beginning – all the details are a click away!

Pinpointing Your Meaning Markers

Published Jan 4, 2016 at 1:26PM

Pro Completed Trades

- **Tupperware** (NYSE: TUP): We closed our position, selling 1,000 shares at an average price of $55.54.

Fellow Fools,

It's been estimated that approximately 45 percent of Americans make a New Year's resolution each year. Setting goals is a commendable thing to do, but the stark reality is that only about 8 percent of those who come up with resolutions actually end up reaching their goal. There are multiple reasons for this, but chief among them is that these well-intentioned people never lay the appropriate foundation — something that's critical not just for houses, but for life in general. And, of course, for investing, too.

A key part of the foundation-laying process — in terms of setting goals, at least — is being able to identify the right motivational factors. Or as Shawn Achor says in a book called *Before Happiness,* you need to make sure your mental map is populated with the appropriate "meaning markers" — mental signposts that can be anything you consider important or valuable, any aspect of life you feel a deep emotional connection with. (Side note: Shawn's funny, fast-paced TED Talk is one of my favorites.) Obviously, this can be easier with some tasks than others, but the payoff is clear: Research has found that those who are able to identify their meaning markers, and make sure their mental maps are oriented around them, tend to be more engaged and productive, have higher levels of motivation, report greater job and life satisfaction, and the list goes on and on.

Being able to identify and remain cognizant of your investing meaning markers — the real reasons you invest — can also pay big dividends. And this process is not just important for what it contributes (e.g., motivation); it can also help you to avoid some of the pitfalls of investing.

For example, the financial industry is chock-full of extremely smart and talented individuals, yours truly notwithstanding. But many of these individuals also share another trait, one that's often the driving force behind their academic and initial career success: Many are extremely competitive. At first blush, you might think this is a desirable trait for successful portfolio managers. After all, investing is extremely difficult, and managers are in a sense competing with one another to attract funds and deliver the best results. But how beneficial is this trait, really, in the world of stock investing?

In his book *Dead Companies Walking*, portfolio manager Scott Fearon noted that he believes being ultra-competitive is actually the last trait you want to see from someone managing your money. And though it might initially sound somewhat heretical, given that one of the core values here at The Motley Fool is "competitive," I actually think he's on to something. The key, at least in my opinion, is moderation. What he's referring to is the danger of adopting an investment approach that's solely focused on winning. Looking into some of the more notable recent calamities in the world of finance, we find one thread that connects many of the culpable individuals: They really didn't need to (break the law, speculate baselessly, lie to investors) for monetary gains, at least not when they started out. What started them down the path was an intense desire to win.

In his book, Scott notes one trait he's most proud of, one that has played a big role in allowing him to deliver an annualized return of 11.4% after fees since 1991 with only one down year (at least as of the book's printing earlier this year): He's a great quitter.

> The fact that more companies fail than succeed means, as an investor, you're going to have to deal with losing investments. Excessively competitive people have a hard time accepting this reality. They overestimate their own abilities and own chances of success. Worst of all, they are reluctant to give up when things turn bad. That's the real danger of competitiveness. Remember the old saying: "It's OK to be wrong; it's not OK to *stay* wrong" ... They think that they can will their stocks to victory somehow, that things will come out well in the end if they just try hard enough. But that's just not how it works.

Loss aversion is a very real problem in investing, and those investors who are consumed by the notion of winning all the time tend to compound their mistakes by exhibiting confirmation bias and doubling down on their mistakes instead of accepting them and moving on. Unfortunately, it's far too easy to focus too much on winning nowadays, given that we have scorecards (stock prices, return metrics) everywhere we look. This is why I believe it is so important to identify your investing meaning markers and review them on a regular basis. Why is it that you invest? Is it for your kids' education, a comfortable retirement, because it's a lot of fun, or perhaps to donate to worthy causes? When making investment decisions, you should first and foremost be thinking about how those choices might affect your ability to reach those goals.

Our decisions to sell Tupperware and **The Buckle** (NYSE: BKE) are recent examples of this type of mindfulness in action. As Jeff said in the Tupperware sell recommendation, "we don't want neutral positions in the portfolio for years on end — we want to strongly believe in each company we own." Selling a position that's in the red by about 30 percent (Tupperware) or one that has struggled mightily over the past year (The Buckle) is neither fun nor easy, but reaching this decision was a lot simpler when we thought about in terms of how confident we were that these two stocks would help us achieve our North Star objective going forward.

Practicing mindfulness, in life or in investing, can seem like a waste of time when so many other matters need attention. But the busier we are, the more important it becomes to take a few minutes every now and then to slow down, take a few deep breaths, and focus on the "why" behind our actions.

Here's to a Foolish (and mindful) New Year.

— JP (TMFYossarian)

Write Puts on Gentex

Published Dec 22, 2015 at 10:01AM

Is this for you? Since we're looking to add 1.5% to our stake in this company, this alert should be applicable (now or perhaps later) to all *Pro* members, whether you already own shares of **Gentex** (NASDAQ: GNTX) or not. If you don't yet own shares, check out the Alternative Trades section at the end of the report.

How You Participate

- **Trade:** Sell to open March 2016 $15 puts.
- **Allocation:** 1.5% — write one put for every $100,000 you manage; *Pro* will write 25 contracts. In addition to our current 2.8% stock holding, this would bring our total allocation to about 4.3%.
- **Price Guidance:**
  - **Now:** Use a **limit order** to target $0.55 or greater to start (for a 3.7% effective yield in 87 days). **If we all use limit orders** and the stock price cooperates, we may be able to achieve $0.55 today.
  - **Later:** As prices and time to expiration change, those approaching the position should aim to get paid a yield on time value of at least 1% or so per month to expiration.
- **Prices (as of market open Dec. 22):** Stock: $15.72. Options: $0.50 bid / $0.60 ask. Guidance: $0.55. See current prices.
- **Stock Rating:** Buy First, 2.8% allocation; we're now adding 1.5% in additional exposure through these new puts.

What We're Thinking

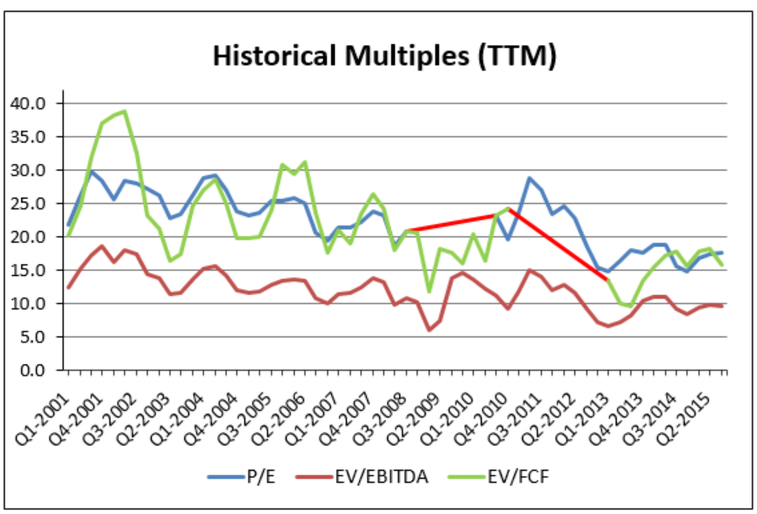
After the expiration of our December 2015 $15 puts last week, we've now run two successful rounds of written puts on Gentex, with both iterations expiring fully as income. We've essentially been running an income strategy on our Gentex position all year, having begun our first round of put-writing in January 2015.

In 2015 alone, we've earned nearly $3,300 in options income from these two written puts, and we've earned $1,452 from four dividend payments in January, April, July, and October. Based on our current ownership stake of 4,400 shares, that's income of $1.08 per share. That equates to a 7% yield on the current share price, which helps offset some of the stock-price weakness that Gentex has experienced throughout the year (as of today, the stock price is down 13% compared with the closing price on Dec. 31, 2014).

For many of the same reasons I've shared in previous alerts (and as we've hinted on the boards), we've decided to continue our income strategy by writing these new March 2016 $15 puts, targeting both income and the opportunity to buy shares at a lower price.

The company is historically cheap right now, and though we like its long-term prospects, we prefer to target income on our position alongside the potential to add to our stake at a lower price. With the income for this iteration of the strategy at $0.55, we'll have brought in a total of $1.86 per share (on a look-through basis) with our series of three written puts on Gentex, giving us an effective start price on assigned shares of $13.14. (Your mileage may vary depending on how much you collected in the first two go-rounds and your tax situation.) This is about 16% lower than the current level, and 27% lower than our fair-value estimate; we'd happily buy shares for this price.

At $13.14 per share, we'd be buying shares at 13 times trailing-12-month (TTM) earnings, 6.7 times TTM EBITDA, and 11.6 times TTM free cash flow, at the low end of historical ranges over the company's past 15 years. That includes the 2008-2009 period, when auto sales plunged and several automakers looked like they might go bankrupt:



Note: Red lines represent omitted outlier multiples that correspond to recession-depressed earnings and cash flow.

Given that Gentex has executed well this year and that the auto market has continued to demonstrate strength -- with seasonally adjusted annual sales of 18.1 million units in November, higher than the 17.5 million data point from July -- , we think those multiples are very attractive.

More That Matters

- **Maximum loss:** For this iteration of the put strategy alone, our risk is the same as share ownership starting at about $14.45, or 8.1% less than the recent price.

- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At a minimum of $0.55, that's a 3.7% effective yield in 87 days.
- **Follow-up:** Including the premiums from our previous put write, we'll buy shares at a net $13.14 if the stock is below our $15 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 2.7% allocation first — Gentex's shares are a Buy First. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1.5% of your portfolio, then just buy 1.5% in stock directly *if and when Pro* does so through these puts (we'll alert you if and when we do).
- **Want to write other puts?** Consider writing June 2016 $15 puts if the price on those options holds up better than the March puts after this alert is issued. Right now, the bid/ask on the June 2016 puts is $0.90/$1.00, good for a 6.3% effective yield in about six months.

Pro Can Help

- See our Options U guide to writing puts if you want more on this strategy.
- Check your mirrors and switch lanes over to the Gentex discussion board.

O'Reilly Automotive Shifts Back to Buy

Published Dec 21, 2015 at 3:34PM

Pro Guidance Changes

- **O'Reilly Automotive** (NASDAQ: ORLY) returns to Buy, and its fair value increases to $220. We have a 5.1% allocation, but we suggest newcomers move in at only about 1.7% at a time over several quarters.
- **Tupperware** (NYSE: TUP) moved to Sell, as we exit our position by year-end.

Pro Completed Trades

- **Expeditors International** (NASDAQ: EXPD): Per our trade alert, we bought to close our December 2015 $48 puts and sold to open new January 2016 $46 puts, rolling down. We did not write the January 2016 $48 calls yet, because the stock fell sharply before we could. We hope to write them on a rebound.
- See all of our Buys on our Recommendations page.

Programming Note: The *Pro* Memo will be taking next week off. Happy holidays, and we'll see you again on Jan. 4, 2016!

Dear *Pro* member:

This year has been challenging for many investors. As of Friday, the Russell 2000 is down nearly 7% year-to-date; the S&P 500 is down 2.5%, off 6% from its May high. That may not sound so bad at first, but it masks how many stocks have been clobbered harder than Yosemite Sam in a battle with Bugs Bunny. The energy sector has been a killing field, commodities have been pillaged, and big names have fallen: **3D Systems** (NYSE: DDD) has lost 70%, **Yelp** (NYSE: YELP) is down 50%, **GoPro** (NASDAQ: GPRO) is also down 70%, and our own **Oracle** (NYSE: ORCL) is almost 20% lower. There has been a bear market for many if not most stocks this year, except for a handful of leaders.

Future *Pro* Content

On a side note, *Pro* sold 3D Systems in 2013 for a 134% gain at prices three times higher than today's -- but why didn't we short it afterward?

We'll review our sell history and performance in an early 2016 Memo. We'll also review our 2015 results in early 2016.

And we'll have other new features rolling out, as well. Stay tuned!

O'Reilly Automotive (NASDAQ: ORLY) has been one such market leader; it's up more than 30% this year, helping the *Pro* portfolio gain 6.2% in 2015 as of Friday. We know we're performing considerably better than most long/short portfolios or hedge funds -- perhaps most portfolios, period -- but we're not content. We always know we could do better, and our North Star is now a bit ahead of us this year. That said, it's an inevitability that we'll have worse years, too, as we invest to win over a rolling three-year period.

This year, we've seen a gush of benefits (sorry) thanks to our lack of energy exposure. **Valmont Industries** (NYSE: VMI) is our main, if indirect, participant in the sector, and we've sidestepped the disasters befalling so many oil and gas stocks. How? We try to avoid buying companies that don't have pricing power or other incredible competitive advantages. Our guidelines help keep us away from most commodity producers.

Take It Slow With O'Reilly

Many past investing lessons helped to shape our *Pro* quality checklist for the companies we consider. As we move O'Reilly Automotive back to Buy after its recent price decline, let's run it through our gauntlet. First, we have a 5.1% allocation to the stock, making it our third-largest holding. We suggest new members begin to build a position by thirds, buying about 1.7% at a time over the coming quarters. You *could* buy a full allocation at once if you prefer, but the stock of the auto-parts retailer isn't cheap and is likely to be volatile, even though it's a boring business.

Competitive Advantage

With more than 4,500 retail locations in 46 states and more than 200 new stores being added per year, O'Reilly is there when you need auto parts and expertise. The industry is competitive, but O'Reilly is taking market share as customers become loyal. Same-store sales have grown by more than 7% each quarter this year, surpassing industry growth. O'Reilly credits much of its advantage to its customer service and the diversity of parts it has available. The former sounds trite, but as cars become more complex, so do repairs, and O'Reilly has the know-how to serve its customers and the parts they need. Of course, don't discount the value of store locations. With a large footprint of stores, wide parts availability, and reliable service, O'Reilly has built a name -- and an advantage -- for itself.

Pricing Power

O'Reilly can't continually raise prices and expect to keep customers, but it has steadily grown profit margins by focusing on improving its technology and distribution network, its administrative costs, and its offering of value-add services for customers (such as oil changes). Lately, it's begun selling store-branded parts. Since 2010, the company's EBITDA margin has grown from 16.6% to 21.7%, and margins are expected to continue to tick higher. So, although O'Reilly lacks pricing power in the traditional sense (auto parts prices typically go up with inflation, and hard-to-find parts have higher margins), like many strong businesses, it has been able to consistently increase profits at a greater clip than sales growth through several other means.

Dependent Customer Base

Customers can switch auto parts retailers easily. O'Reilly succeeds by offering top-notch customer service, wide availability of parts, and nearby locations. Still, most customers don't depend on this company alone. On this one, it misses the mark.

Predictable Revenue

Over the past five years, revenue has grown 8.1% annualized, while normalized net income was up by 16.7% annualized. In the third quarter that just ended, sales jumped 10.8%, and it was the 27th consecutive quarter of earnings-per-share growth greater than 15%. Same-store sales have increased consistently for years. O'Reilly doesn't have subscription revenue or naturally recurring revenue, but it has been able to demonstrate predictable revenue better than most any physical retailer we've seen. Even better, when inevitable bumps in the road do occur, we have faith they will prove temporary.

Growing Free Cash Flow, Compounding Returns

Even as it opens new stores, the company generated more than $800 million in free cash flow over the past 12 months -- and it's plowing some of that cash into opening new, highly profitable stores. O'Reilly has the economics of a compounding machine: Over the past five years, unlevered free cash flow has compounded at a rate of 37.4% annualized.

Financial Resilience

The company targets a debt-to-EBITDA ratio of 2 to 2.25; the current level is well below that, at 1.6. Smart leverage helps O'Reilly grow more quickly and profitably. Although O'Reilly carries low-cost long-term debt of $1.3 billion, financially it's strong, and we agree with using debt to grow more quickly rather than ceding markets to competitors. Free cash flow is robust, and use of capital has been smart.

Expanding Possibilities

After opening 205 stores this year, O' Reilly plans to open 210 in 2016, and plenty of acquisition opportunities remain. The company still has a modest presence in many parts of the country, and although competitors do lurk there, it can take market share as it enters new markets. O'Reilly also expands through higher same-store sales -- new customers arrive through word of mouth and steady marketing. As the job market improves, more commuters hit the road, and O'Reilly derives further benefit. Old cars staying on the road longer, and the fact that new cars are ever more complex, also play to O'Reilly's hands.

Three C's of Management: Clarity, Consistency, Capability

We've been following them since 2007, and management has an impeccable track record. They share a clear plan, execute on it, and appear capable of taking the business to the next level. Management respects employees, pays well, and drives higher results through bonus compensation. At the same time, executives are not excessively paid.

In Sum

O'Reilly scores well on six of our eight criteria, missing on pricing power and a dependent customer base, but it makes up for those misses through related qualities. All that said, the stock is trading at higher valuation multiples than it has in the past. Some of that is merited by greater business performance, but its price still makes us more conservative in our short-term expectations. We suggest newcomers move in slowly: Instead of buying our 5.1% allocation right off, buy about 1.7% up to three times over the coming quarters. Members with large accounts can consider writing near-the-money puts, too. The company's sales are helped by extreme hot or cold weather, which wears on cars, and so far this winter has been mild to say the least. We may also consider covered calls again for income; if so, we'll aggressively manage them. Over the long term, we believe O'Reilly has the team and business in place to keep compounding value, and that's what we seek.

Oracle Keeps On Keepin' On

Published Dec 18, 2015 at 9:04PM

This quarter's earnings release was mostly a non-event for **Oracle** (NYSE: ORCL) as management had already primed investors for a slow quarter before the momentum starts to pick up in the second half of the fiscal year. The company met earnings estimates, partially thanks to a lower tax rate for the quarter, and management's outlook for the year remains positive. As expected, currency volatility was a drag on the top line and the company is still transitioning to a cloud-centric business model, which continues to obscure the outlook for sales growth and profitability. Even so, Oracle's business remains on track and it looks to be strengthening as we move into the second half of the year.

Cloud Segment

Cloud (SaaS and PaaS) revenue was up 38% to $487 million for the quarter and management expects that growth rate to accelerate to 50% in the third quarter and then move even higher through the end the year. Infrastructure as a service (IaaS) growth slowed to 11% during quarter and management expect the growth to continue to moderate into the single digits through the end of the year. The IaaS hosting business is struggling to gain traction against stiff competition, but management claims that the company developed a next-generation data center which it believes will allow Oracle to become the lowest cost provider of IaaS.

Billings (a combination of new sales and the sequential change in deferred revenue) for the quarter grew by 68%. As always, management was sure to compare Oracle's success to its pure play cloud competitors, **Salesforce.com** (NYSE: CRM) and **Workday** (NYSE: WDAY), which grew billings at 21% and 41%, respectively.

Gross margin for the cloud business only improved modestly this quarter, growing to 43% compared to 40% last quarter, but margin expansion is just beginning to kick in for the young business. As the cloud business continues to scale, management expects gross margin to increase to 55% to 60% by the end of the year and then hit 80% by the end of fiscal 2017.

Oracle has spent heavily over the past few year to develop a full suite of SaaS applications and build the infrastructure and sales force necessary to support its cloud business. As growth accelerates there should be improved productivity and the ability to leverage many of those fixed costs. Management already dialed back on some of the capital expenditures this quarter, and margins are expected to increase from 43% to 80% over the next year and a half.

Licensing Segment

Though seems to be getting relegated to the back seat during the quarterly reports, Oracle's cash cow on-premises business continues to hold its ground. Despite all of the attention on cloud sales, this legacy business still generates 71% of the company's sales. New license sales dropped 18% this quarter on the back of a 16% decline last quarter, but software updates and product support revenue still increased 5%.

Management expects on-premises revenue to grow modestly for the year, showing that this business probably won't decline as quickly as many have feared. Though the business is no longer growing, it remains extremely profitable and generates a ton of cash that can redeployed into faster growing areas of the business.

Capital Allocation

As I mentioned above, management has begun to dial back on cloud infrastructure spending causing capital expenditures to declined by more than half for the quarter. The company has also significantly reduced its acquisition activity while it focuses on executing its cloud strategy resulting in a nice increase in free cash flow.

Over the past year, Oracle has generated over $11 billion in free cash flow and the company closed the quarter with a $10.4 billion net cash position on the balance sheet. During the quarter the company repurchased $3.25 billion worth of shares at an average price of just under $38 a share and paid dividends of $2.5 billion.

The *Pro* Bottom Line

There remains a divergence between how Oracle's business is performing and how the company's stock is performing – mostly because of uncertainty about the shifting business model. Oracle remains hugely profitable, generates enviable returns on capital, and creates a ton of free cash flow. At the same time sales growth has slowed for strategic reasons -- the company is emphasizing cloud sales which are recognized ratably over the life of a subscription instead of perpetual license sales where the majority of the sale is recognized upfront. As I highlighted two quarters ago, SaaS sales are expected to have lifetime economic value three-times larger than a traditional license sale. When combined with rapidly growing margins, these contracts give Oracle the potential to grow it profits at a much faster clip than with its legacy model.

In very short order, Oracle has built a cloud business that is expected to finish the year at about a $3.2 billion annual run rate. Still, that figure is less than 10% of the company's sales over the past year which is why the market values Oracle at just 3.9-times enterprise value-to-sales compared to pure play cloud competitors Salesforce and Workday which are assigned multiples of 8.4-times and 13.4-times, respectively. Keep in mind that those competitors are growing their top line much faster, but they also generate no profits and see less free cash flow in a year, combined, than Oracle often does in a single quarter.

As the cloud business scales and margins expands, I think we're getting close to an inflection point business where investors will begin to better understand the economics of the cloud business. When combined with more data regarding revenue per user and churn rates, analysts will become more confident gauging the business's value and the discount built into the stock price from uncertainty should dissipate. At some point I believe the market will start to value Oracle's cloud and legacy business as separate entities, and patient shareholders will be rewarded.

Sell Tupperware

Published Dec 17, 2015 at 11:46AM

Foolish Summary: For all *Pro* members who own **Tupperware** (NYSE: TUP), the stock moves from Hold to Sell as we harvest some losses for tax purposes. Another benefit: We can step away from this lagging position for a time, to analyze with fresh eyes whether we want to buy it back after 31-plus days or not. The stock went ex-dividend yesterday, so we will still receive the current $0.68-per-share dividend payment on Jan. 4, 2016. Sell all of your shares with a limit order at current pricing, ideally above $56.50.

How You Follow Along

- **Trade:** Sell Tupperware (NYSE: TUP)
- **Allocation:** Sell all shares. *Pro* is selling its 1,000 shares, representing 2.2% of the portfolio, and bringing our cash (excluding shorts) up to 20.1%.
- **Price Guidance:** Use a **limit order**, please, to sell at the going price, lately above $56.50.
- **Our Return:** On this batch of stock, obtained through options written in 2013, we have a 30.6% loss (excluding dividends and earlier option gains), the largest stock loss in the portfolio. Our original stock stakes in Tupperware, bought in 2010, were sold in 2013 for 42% and 80% gains; we've also made considerable income with options and dividends over all these years. So, overall, veteran *Pro* members have a win with Tupperware. More recent buyers have a loss.

What We're Thinking

The first thought to share is: ***Don't rush for the exits.*** Sell -- *calmly* -- if you agree with our thinking. We haven't suddenly turned tail on Tupperware; the long-term story remains intact, and the stock's valuation is more depressed than it has been in several years. However, the low valuation is taking its lead from subpar business performance, and that may not improve soon. We're selling to take some tax losses and reassess whether Tupperware deserves a spot in the *Pro* portfolio; to that end, let's talk through how well the business fits with the qualities we seek from *Pro* stocks.

Competitive Advantage

Tupperware's main advantage is its giant sales force (about 3 million strong) around the world. These devotees arrange sales parties that drive nearly all of the company's revenue, but this setup is also a potential weakness. Much of the sales force is not active at any given time, and when an economy improves, it can be more difficult for Tupperware to recruit and keep strong performers. Management often touts weak economies as a boon to its sales force, but we haven't seen that play out consistently in Europe and other affected areas in recent years. There is also considerable churn in the sales force. That said, local sales staff help Tupperware create new market-specific products that become big hits. Overall, we rank this business quality as a slightly positive to neutral factor at Tupperware.

Pricing Power

The majority of Tupperware's revenue gains (in constant currency) have come from price increases, so the company does command pricing power, and has done so for the years we've been following it. Many of its more popular items now are higher-priced kitchen tools, rather than simple storage containers. Tupperware wins on this quality.

Dependent Customer Base

The end customer is not dependent on Tupperware products; there are many ways to buy containers and kitchen tools. Members of the sales force, however, are dependent on selling Tupperware products for their income. Net-net, this quality ranks neutral.

Predictable Revenue

We have to say no. Sales vary widely by country each quarter, dependent on how many parties the sales force throws and how many incentives Tupperware offers. Revenue is not highly predictable and is dependent on a steady stream of parties from an engaged sales force.

Growing Free Cash Flow With Compounding Returns

Trailing-12-month free cash flow is flat with results in 2009, when Tupperware first cracked $200 million for this metric. Since then, the number has bounced around the $200 million to $250 million range, lately slipping to the low end as the strong dollar weighs on results. As for compounding: Rather than reinvesting great sums in growing the business, Tupperware aggressively bought back shares and increased its dividend in recent years. Both practices are in a holding pattern now, as is meaningful reinvestment in growth. Tupperware currently fails on this measure.

Financial Resilience

Though we don't have any immediate concerns, there are chinks in the armor. Tupperware's dividend payout ratio now rides a bit higher than the company's 50% target, at 64.8%. Should net income fall sharply, the nearly 5% dividend yield could come into question. Long-term debt stands at $609 million, climbing in recent years as Tupperware used low interest rates to raise debt and buy back shares. That decision (which we didn't like at the time) was ill-fated, as the stock has fallen considerably, and now Tupperware pays about $45 million in annual interest expense, up from $27 million in 2010. Tupperware's cash stands at $93 million. With long-term debt-to-capital at 59.7%, the company is not in danger of financial hardship around the corner as long as free cash remains steady, and it should. But financially, it's one of the weaker companies in the *Pro* port. We rank this quality neutral to lacking.

Expanding Possibilities

Tupperware cites billions of people in India, China, and the developing world as still mostly untapped markets for its products, and that's true. But recruiting and retaining its sales force is how the company turns possibilities of expansion into reality, and management concentrates far less on these initiatives than we'd like. The long-term growth story remains in place, but management does not seem to be executing efficiently to get there -- hence, results are choppy from market to market. Right now, we rate this quality at Tupperware as neutral (given lack of execution) to a slight positive (given massive populations in emerging markets).

Three C's of Management: Clarity, Consistency, Capability

Everyone makes mistakes, so we don't expect perfection. But management's use of debt to buy back shares, and its policy of jacking up the dividend whenever net income increased -- without leaving a cushion in case of a subsequent decline -- shook our confidence in their thinking. Management also passively backed away from its earlier sales-growth goals last quarter, unofficially knocking them down by a percentage point or two by saying, paraphrased, "That would still be a good result." We believe the management team does have long-term capability, but every quarter, they have excuses for why some markets dragged down results. It's rare that every market performs adequately at once, which eventually calls into question the worldwide management structure. We rate this quality neutral to a slight negative.

In Sum: Neutral

On our eight *Pro* qualities, we currently have one strong positive (pricing power), two strong negatives (predictable revenue and increasing free cash flow), and five neutral-to-modest leanings in either direction. Contrast this with an inexpensive stock yielding nearly 5%, and with the potential to provide fireworks when sales pop in some quarters, and you can see why it's a bit of a confounding position, and where our neutral rating comes from. But we don't want neutral positions in the portfolio for years on end -- we want to strongly believe in each company we own. So we are calmly selling our Tupperware shares with a limit order, and we'll see in the coming month and beyond whether we are drawn back to the position.

Alternative Trades

- If you wrote puts or covered calls, you can buy to close them en route to closing all Tupperware positions. If you'd rather let them go to expiration, you can consider that, depending on your strike and expiration date.

Roll Your Covered Strangle on Expeditors International

Published Dec 16, 2015 at 11:48AM

Is this for you? Yes, if you're a *Pro* member following our option writing for income on **Expeditors International** (NASDAQ: EXPD), and if you (like us) have an in-the-money December option reaching expiration this Friday. You should roll before Friday's close.

How You Participate

- **Action:**
    - **Old position:** Buy to close your December 2015 $48 puts, and either simultaneously buy to close your December 2015 $50 calls, or wait for those calls to expire on Friday, Dec. 18.

    - **New position:** As you close your December strangle, or as you reach Friday afternoon and can be certain your calls will expire: Sell to open January 2016 $46 puts and January 2016 $48 calls to complete your new strangle.
- **Allocation:** Sell one January strangle (one of each option) for every 100 shares of exposure you already have to the company, and for every additional 100 shares you could add. *Pro* has exposure to 1,000 shares through 10 contracts of a synthetic long, so we're selling 10 puts and 10 calls -- this potentially doubles our exposure, to a full 3.5% allocation.
- **Prices (11 a.m.):**
    - **Stock:** $46.95
    - **Options:**
        - Buy to close December 2015 $48 puts (bid/ask): $1.10/$1.30. Buy to close December 2015 $50 calls (bid/ask): $0.00/$0.10.
        - Sell to open January 2016 $46 puts (bid/ask): $0.80/$0.90. Sell to open January 2016 $48 calls (bid/ask): $0.75/$0.85.
        - Combined split of bid/ask: $1.25 to close, $1.65 to open.
- **Price Guidance:** Split the bid/ask and aim for a **combined credit of $0.40** to roll (if you're rolling all at once). As prices change, realize that you should complete the roll by Friday's close -- or, at least, buy to close your December $48 puts by then, unless you personally want to buy more shares or EXPD stock jumps above $48 by expiration.

What We're Thinking

Nothing at the business has changed in the last month, but Expeditors' stock has dropped a few dollars, forcing us to roll our in-the-money December puts. Targeting short-term income in December hasn't panned out (it's our first strangle on Expeditors in 16 months that didn't bring us income!), but we can roll to January for a credit. In January, we'll decide what to do with our profitable synthetic long on Expeditors and the position as a whole. Right now, this strangle remains an income position for another month. In brief: We are short puts and long calls to mirror stock ownership in Expeditors; we're writing these new puts and calls (a covered strangle) on that position for income.

Why This Strategy?

Since starting this position in August 2014, we have earned about $8,000 in income, and we have unrealized gains of about $7,000 on our synthetic long. That amounts to more than $15,000 in realized and unrealized gains on the less than $600 cash we deployed to start the position 16 months ago.

Our "income with upside" objective, which leverages our capital, is playing out nicely, but it's also nearing expiration! Our synthetic long on Expeditors expires in January, on the same day as the new strangle we're setting up on it today. Before that time, we'll decide what to do with our in-the-money $40 calls. We can either let them be exercised into stock and then continue to write strangles on the stock, or we can sell our long calls to either exit Expeditors entirely or next set up new options on it. (The former is our likely decision, as we have plenty of cash and we like this income position.) If we sell the calls, though, we'll generate a taxable gain in January for anyone in a taxable account. At any rate, we have some time before making this second decision by early 2016.

To potentially help your own planning, my current preference is to let our $40 calls turn to stock next month (for new members, we'd recommend just buying stock) and then continue writing strangles on the stock for income. This could change if the situation or portfolio changes much, but right now, this approach looks logical for an income position that delays taxes.

More That Matters

- **Maximum loss:** The same as owning at least 200 shares of stock (100 now, and 100 at $46), minus the option premiums received.
- **Maximum gain:** This new strangle caps our upside at $48, plus all the options premiums received. The most we can make on this strangle alone is the $1.65 in premium, which is earned if the stock stays anywhere between $46 and $48 by expiration.
- **Breakeven**: Our existing synthetic long mirrors stock ownership that started at about $40.60, while this new short strangle in isolation has breakeven points at $44.35 and $49.65.
- **Follow-up:** In January 2016, we'll decide whether to turn our synthetic long into stock, roll it forward, or close the position. You'll hear via a trade alert!

Alternative Trades

- **If you're new here and want to participate in the full position:** We suggest waiting less than one month to see what we decide to do with our whole Expeditors position as it nears its January expiration.
- **If you just wrote covered calls last time:** The January 2016 $50 calls we recommended last month are on track to expire as income; you can leave them alone to expire. Or, you can close them early if you want to write the new January 2016 $48 calls with us (rolling down for a larger credit of about $0.75).
- **If you just wrote puts last time:** The January 2016 $48 puts we recommended paid you around $1.15 last month. They're at about $1.80 lately, still sporting plenty of time value. You can continue to wait until expiration to see what we'll do in January.
- **If you're a veteran member doing the IRA-friendly/covered-calls-only trade:** If you simply bought shares of stock earlier and wrote the December 2015 $50 calls, they're on track to expire, and as they do, you can write the January 2016 $48 calls with us.

Pro Can Help

- **Want more on this strategy?** See our guides to covered strangles and synthetic longs. We're combining the two into a synthetic covered strangle.
- **Questions?** Please ask, Fools! Ship yourself on over to our Expeditors board. We can all help you, especially if you're new!

Pro Catch-Up Trades: Dec. 14, 2015

Published Dec 14, 2015 at 3:20PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are worth adding to your long-term portfolio:

- **American Tower** (NYSE: AMT), 3.4% in stock and 0.4% in January 2017 $80 calls
- **Gentex** (NASDAQ: GNTX), 2.8% in stock
- **Gilead Sciences** (NASDAQ: GILD), 3.6% in stock
- **Oracle** (NYSE: ORCL), 3.6% in stock
- **Wells Fargo** (NYSE: WFC), 3.7% in stock

There's also our Buys, including:

- **Skyworks Solutions** (NASDAQ: SWKS), buy up to 3.7%
- **Parexel International** (NASDAQ: PRXL), buy up to 3.3%
- **Medtronic** (NYSE: MDT), buy up to 3.1%
- **Papa John's International** (NASDAQ: PZZA), buy up to 2.8%
- **Pro Shares Short VIX ST Futures** (NYSEMKT: SVXY): Buy up to 0.8%

And then there's our airline investment, down lately even though oil (its main cost) is plummeting. We don't believe this incongruent situation will last. Members who lack a stake can take note of this recommendation:

- **American Airlines** (NASDAQ: AAL): Buy to open 0.5% in January 2017 $30 calls.

And our latest hedge can still be set up, now for an even larger credit.

- **SPDR S&P 500** (NYSEMKT: SPY): See our official late-November trade alert guidance.

Pro Quality Checklist: Oracle

Published Dec 14, 2015 at 11:30AM

Fellow Fools,

We've taken a few weeks off from our *Pro* quality checklist series while the team has been busy digesting earnings reports and welcoming new members to the *Pro* family. After reviewing **Valmont Industries** (NYSE: VMI) -- a position that was on Hold at the time -- in the most recent round, I thought I'd move to the other end of the spectrum for this week's Memo and feature one of our Buy First stocks. **Oracle** (NYSE: ORCL), in the *Pro* portfolio since 2009, has been a consistent performer until this year, when the company hit a rough patch as a shift to a cloud-based subscription model has weighed on the stock. Given all this, it's helpful to review why we still believe Oracle has one of the widest moats in the *Pro* universe and will likely continue to deliver North Star-like returns (or better) going forward.

1. A Sustainable Competitive Advantage

Yes. Oracle has long been the dominant player in the enterprise software market, offering one of the most comprehensive product suites in the industry. The company has considerable scale advantages over competitors, allowing it to invest heavily in research and development and fund a vast sales force that benefits from multiple cross-selling opportunities. Once Oracle makes a sale and moves a company onto one of its database management systems, there are significant switching costs (data migration, down time, and retraining) if that company wants to change platforms later. By locking customers into its platform, Oracle has also been able to sign long-term maintenance contracts that provide a steady stream of recurring income.

Oracle was slow to shift from its legacy perpetual-license business model to a cloud-centric strategy, but once it finally did change direction, the company has shown itself able to take advantage of its scale to rapidly expand its software as a service (SaaS) business. In a short period of time, Oracle has been able to leapfrog many of its pure-play cloud competitors despite their multi-year head start, proving that the company remains capable of defending its competitive moat.

2. Pricing Power

Yes, for now. The enterprise software industry is extremely competitive, and Oracle has been able to increase its gross margin for most of the past decade thanks to its reputation for leading technology and quality service. Its margin profile has changed slightly in the past year as sales of its cloud-based services ramp up; though the cloud portion of the business is currently a drag on margins, management believes it will ultimately drive higher margins than the legacy business.

Though I'm awarding Oracle a point based on past performance and management's predictions about the future, there's a risk that strong competition in the cloud business could erode some of the company's pricing power over time.

3. A Dependent Customer Base

Yes. Oracle provides software that is mission-critical for its corporate customers. Once Oracle installs its hardware and software, and a business migrates its proprietary data to Oracle's database, that customer isn't likely to change vendors for quite some time. And in its perpetual license business, clients not only make an up-front purchase but also pay Oracle to provide ongoing software updates and technical support.

By comparison, Oracle's cloud-based services have fewer frictional costs when it comes to to switching providers. That said, changing systems still results in lost productivity and retraining costs, neither of which most businesses want to deal with. To combat those who might, Oracle will have to shift its focus from customer acquisition to customer retention and invest more in continuously improving its applications and delighting its customers.

4. Predictable Revenue

Yes. It's a mature software business, so nearly half of Oracle's revenue is recurring. For most of its history, Oracle focused on a razor-and-blade business model in which a company would buy a software license up front for a set price and then sign a multi-year maintenance contract, which provided Oracle with high-margin recurring revenue.

The timing of the revenue recognition will shift as Oracle transitions to a cloud-centric business model, with more revenue coming in later years. That means less cash up front from a new sale, but it also means that the proportion of high-margin recurring revenue will continue to increase over time, and if retention rates stay high, each of those customers will have a greater lifetime value.

5. Growing Free Cash Flow With Compounding Returns

Yes. Over the past decade, Oracle has matured from a young growth company into a slower-growing yet incredibly profitable cash-printing machine. Over the past five years, an astounding 22% of Oracle's sales have converted to free cash flow (including acquisition expenses), and the company has increased that figure at an annualized rate of nearly 19%.

Today, Oracle has run into the high-class problem of generating more cash than it can reinvest in the business at similar rates of return. As a result, management has engaged in a steady stream of acquisitions and has also returned excess capital to shareholders via buybacks and a small but growing dividend .

6. Financial Resilience

Yes. Oracle has a fortress of a balance sheet, with almost $14 billion of net cash. The company makes smart use of low-rate debt to fund acquisitions and boost return on equity. Thanks to Oracle's predictable cash flow and growing base of recurring revenue, its interest coverage ratio sits at a healthy 11 times annual interest expense.

Even during the Great Recession, Oracle continued to increase sales and maintained a profit margin well in excess of 20%, showing that companies considered spending on the company's software a mandatory expense.

7. Expanding Possibilities

Yes. Though Oracle has the biggest piece of the pie in the enterprise software market, that pie continues to grow at a steady clip, and the company's global presence allows it to take advantage of faster-growing international markets that are quickly adopting technology. Oracle continues to develop new applications that it can cross-sell to existing customers, and the company's move into the cloud-based SaaS market allows it to sell to a more diverse client base. Importantly, Oracle has been able to maintain modest growth in its legacy perpetual-license business while it rapidly expands its cloud business, which suggests that the company isn't just cannibalizing its existing customer base.

8. The Three C's of Management (Clarity, Consistency, Capability)

Yes. Say what you will about eccentric company founder Larry Ellison and his exorbitant pay packages over the years, but it's hard to argue with his track record of creating value for long-term shareholders. Ellison remains the driving force behind Oracle's competitive business culture, which has allowed it to stay at the top of the corporate-software heap despite a constantly shifting technological landscape. Though Ellison relinquished the top leadership role in late 2014, he still serves as chairman and chief technology officer and has a heavy hand in charting the company's course. Based on his behavior during quarterly conference calls, when he consistently calls out competitors by name, he also remains as intensely competitive as ever.

Oracle's day-to-day operations are now led by co-CEOs Safra Catz and Mark Hurd, who are both experienced executives intent on maintaining the company's competitive edge and continuing to grow the business. Though some would argue that Oracle was slow to embrace the shift to the cloud, management has sent a clear message in recent quarters that expanding the SaaS business is now a top priority. It's still early in this pair's tenure, so it's difficult to award a check on all three Cs, but I'm confident investing alongside this management team as a whole.

The *Pro* Bottom Line

Altogether, I score Oracle an 8 out of 8 on our *Pro* quality checklist -- but as I mention in No. 2 above, we're going to keep a close eye on the company's pricing power in the cloud business. It's often difficult to get excited about a mature software company; most investors prefer the new, faster-growing start-ups. But then, it's often difficult to get excited about many *Pro* companies. We value predictability over next-new-thing sex appeal, and we're not willing to pay a premium for unproven businesses -- especially in the technology industry, where change is so rapid.

We view Oracle as a high-quality business with a deep moat, and though the company's stock has underperformed our expectations year-to-date, the business continues to quietly compound capital over time. Best of all, thanks to investor uncertainty surrounding its shifting revenue model, Oracle trades at an attractive price, earning it a spot as one of *Pro*'s Buy Firsts.

-- Jeremy (TMFTank)

Verisk: Investor Day, Pro's Takeaways

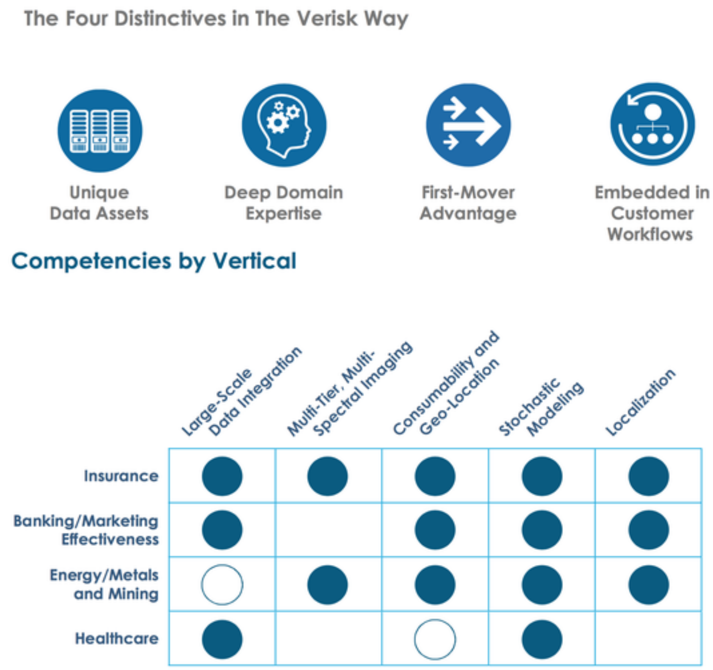
Published Dec 9, 2015 at 10:48AM

Verisk Analytics' (NASDAQ: VRSK) Dec. 1 investor day was definitely an important one, given the uncertainty surrounding the company's health-care and energy businesses in the aftermath of its third-quarter earnings call. It didn't take long for us to realize that management brought its A game this time, and while some questions still remain, the proceedings did reinforce our belief that we made the right decision to pick up additional shares after the stock sold off.

Verisk Health

Minutes before hosting its earnings call this past October, Verisk management publicly acknowledged for the first time that it's considering divesting its health-care business; further info was promised in the future. While there was no specific presentation about healthcare on investor day, if we view the company's opening presentation through the lens of potential reasons to sell Verisk Health, it's much easier to see why Verisk might opt to divest what's objectively a promising business. Management was also forthcoming on this topic during the investor day Q&A session.

To put it simply: The landscape has changed since the company entered the space back in 2003. Nowadays it seems as though countless companies are looking to grow simply for growth's sake, but Verisk is refreshingly disciplined. It has identified what it considers to be its four key "distinctives" -- categories that set it apart -- and five core competencies, and it's constantly reevaluating whether its current businesses and potential acquisition targets help it pursue the former and leverage the latter.



source: Verisk Analytics December 2015 Investor Day, slides 4 & 10

Management noted during the Q&A session that as time went on and the landscape changed (via the Affordable Care Act, for example), it became increasingly apparent that while Verisk Health was progressing nicely, it was ultimately unlikely to become "Verisk-like" enough. This isn't to say that the business is a bad one; it's simply that management is now questioning whether the health-care division will be able to take full advantage of what Verisk does best.

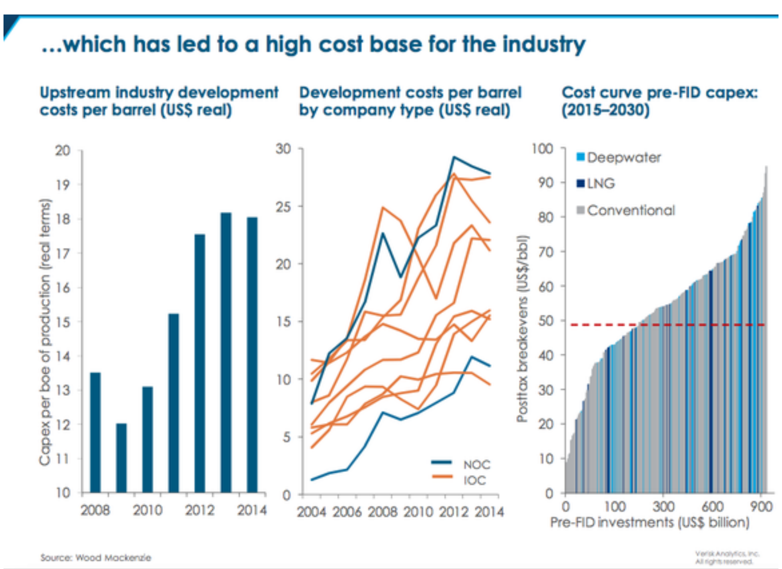
It also appears as though Verisk Health might not be fully aligned with the company's operational priorities for the future -- though, once again, this has more to do with changes in the business landscape than anything else. For example, international expansion will be a big priority for the company going forward, but Verisk Health will never be a global business because, as CEO Scott Stephenson cheekily put it, "the rest of the world does not want to do healthcare the way that we do it in the United States for all the obvious reasons."

Stephenson and the rest of the team frequently noted that there's no rush to divest the business, given that they still consider it a strong one. However, it struck me that this might have been to avoid coming across as forced sellers, in an attempt to get the best price possible. We believe that the odds are the business will be sold at some point and the proceeds will be used to fund additional acquisitions in the company's other three verticals: insurance, financial services, and energy.

Wood Mackenzie

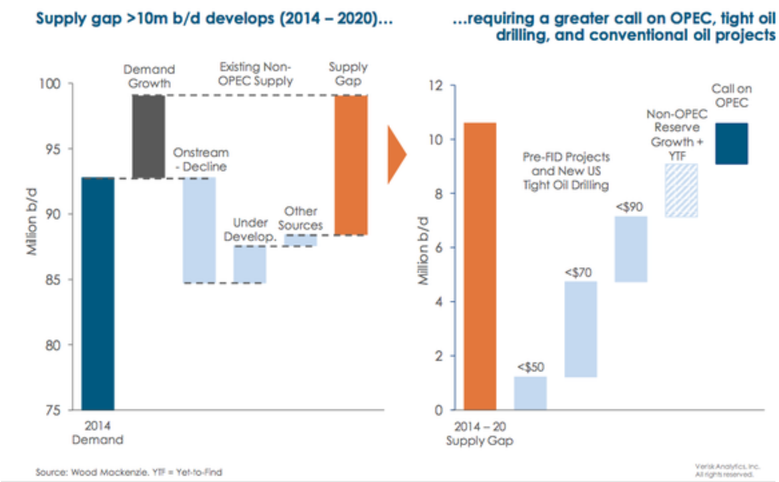
Verisk also delivered on its promise to provide investors with plenty of color on its recent acquisition of Wood Mackenzie, a global energy research and consultancy group providing data, analysis, and advice to clients worldwide. Almost half of the slide deck was devoted to WoodMac and the energy sector, and it was by far the topic management spent the most time on.

As with Verisk's other business divisions, much of what WoodMac offers becomes increasingly important to its clients when the industry it serves is under stress -- and it's hard to deny that's currently the case for oil and gas. Currently, projects that have yet to achieve the final investment decision (FID) needed for execution make up about $1 trillion worth of new investments, but half of those projects simply don't make sense right now given the current price of oil and the rise in development costs. (See the chart on the far right; the red line denotes the price of oil at the time the presentation was assembled.)



source: Verisk Analytics December 2015 Investor Day, slide 45

WoodMac recently estimated that close to $200 billion of spending on new oil and gas projects has been shelved across the industry for the time being, but it's important to note that the company expects a supply gap to open up over time thanks to continued demand growth and production declines from existing projects.



source: Verisk Analytics December 2015 Investor Day, slide 49

This drop in oil prices has put pressure on WoodMac's customers, but rather than obsessing about the near-term effects on top-line growth, WoodMac has been using the events of the past two years as an opportunity to deepen its relationships with current customers. It's also developing new solutions in order to benefit disproportionately during the future recovery (as far as capex spending is concerned). Things look very encouraging so far; the company has seen a 25% year-to-date increase in the number of clients using its online portal and a 34% increase in the number of "super users" (those who consume WoodMac's offerings constantly and are the critical drivers of renewal rates). WoodMac has also seen a 24% increase in the number of client-facing interactions, such as calls, meetings, and the like. Ultimately, we expect these investments to result in strong top-line growth, and we're already seeing promising signs. Client subscription renewal rates for 2014 and so far in 2015 are coming in at 98%, which is a great sign -- subscriptions have consistently accounted for 80%-plus of WoodMac's business over the past few years.

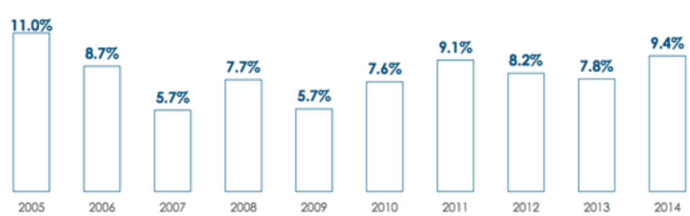
One of the things we like to look for when analyzing businesses is what I like to refer to as "easy wins": attractive opportunities for growth or improvement that don't really require a company to go above and beyond what it's currently doing. And I've become even more convinced that we have exactly that with WoodMac. Specifically, it looks as though the company's solutions were vastly undersold while private equity was in control of the business. As WoodMac CEO Stephen Halliday noted during the Q&A session, all you really have to do is ask yourself whether you believe there are only 900 entities (the number of WoodMac clients before its recent acquisition of The PCI Group) in the world who are interested in some aspect of energy, metals and mining, and/or chemicals. That number seems awfully low to me, and WoodMac agrees; management believes its client base could ultimately quadruple.

There are multiple reasons I believe we should see rapid growth in WoodMac's user base as long as the company is able to execute. For one, the amount a client spends on WoodMac's solutions is quite low as a percentage of overall spending. So the purchase decision depends more on the value WoodMac adds, not the price it charges. Relatedly, client account growth doesn't need to come at the expense of WoodMac's competitors; clients often initially work with multiple companies in WoodMac's line of work before ultimately paring down to just one or two. So, once again, it ultimately comes down to the quality of WoodMac's offerings. And since we believe WoodMac is one of the best in this space, we're quite comfortable with that. Moreover, though Halliday spoke positively of the company's previous private equity backers, he did note that WoodMac is able to think longer-term and make more investments in the business now that it's owned by Verisk.

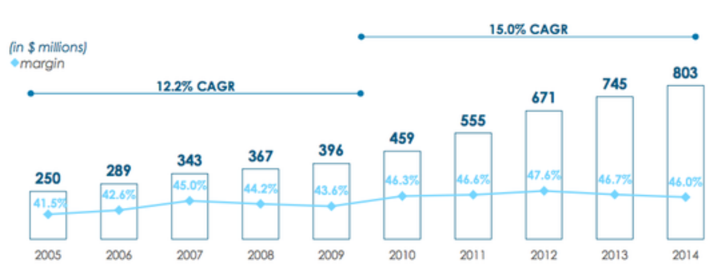
Verisk's Future

The work Verisk does may be complex, but its business model is attractively simple. The company looks to identify and create strong, steadily growing businesses with great (and defensible) margins, which then spin off a bunch of cash Verisk can use to acquire additional business units with similar characteristics. We appreciate this model not just because it's essentially what we're trying to do here in *Pro*, but also because it results in consistently impressive results.

Organic Revenue Growth



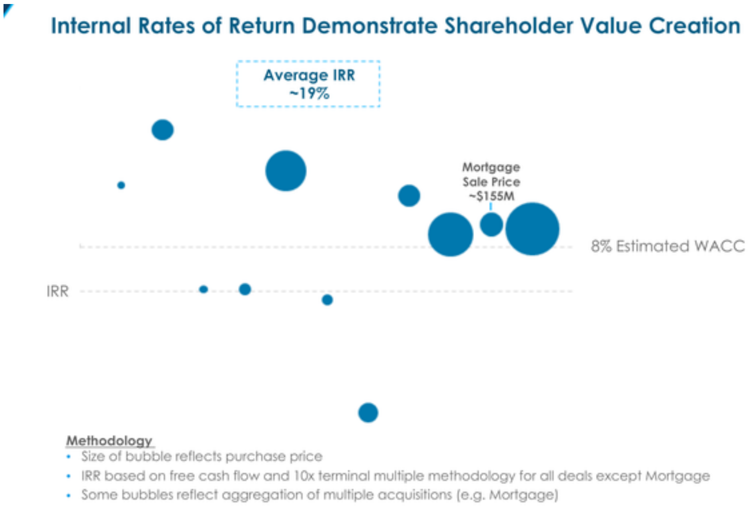
EBITDA



source: Verisk Analytics December 2015 Investor Day, slides 80 & 81

The fact that Verisk is consistently able to grow faster than the markets in which its clients operate speaks to the value customers place on its offerings. And because these end markets are becoming increasingly complex and more reliant upon data and analytics, we believe Verisk is poised to continue to deliver results like these for the foreseeable future. Management estimates that the company's addressable market is currently about $21 billion, of which Verisk still has less than 10%. This percentage is already quite impressive, but we expect it to grow over time.

Acquisitions are what drive overall revenue growth into the teens and higher, and management spent more time than normal discussing the company's track record -- likely because of questions last quarter about whether the WoodMac deal made sense. In the most informative slide from this part of the presentation, Chief Knowledge Officer Eva Houston noted that all of the company's large deals currently have an internal rate of return that's higher than the company's estimated cost of capital.



source: Verisk Analytics December 2015 Investor Day, slide 106

The *Pro* Bottom Line

Verisk's management team is clearly managing and investing in the business for the long term, and the company's board of directors recently authorized an incremental $300 million for its share repurchase program. As we noted in our original write-up, we fully expected the company to resume repurchasing shares before achieving its target post-WoodMac leverage; we believe the fact that it's done so is a signal that the underlying business is strong, not that Verisk Health will be sold off in the near future. Verisk's investor day presentation didn't completely dismiss the questions we had as a result of last quarter's earnings call, but it did reinforce our belief that we made the right decision to pick up additional shares after the stock sold off.

Digging Up Investment Treasure

Published Dec 7, 2015 at 3:00PM

Pro Completed Trades

- **Five Below** (NASDAQ: FIVE): We bought to cover all of our short shares, paying $27.15 to end the position with a 23.1% profit.
- **SPDR S&P 500** (NYSEMKT: SPY): We set up our hedge in the form of a put ratio spread, selling to open 26 February 2016 $190 puts and buying to open 13 $200 puts. We received a $0.31 credit. This can still be set up for a credit as of this morning.
- See all of our Buys on our Recommendations page.

Dear *Pro* member:

Simplification provides clarity, and that unlocks potential.

One of the greatest businesses in recent history, now worth more than half a trillion dollars, launched with one Web page hosting a single search box and one word: "Google." Now called **Alphabet** (NASDAQ: GOOG), the company's reputation still rests on sites and services that are clean and easy.

An investment thesis can – and perhaps should – be just as simple. In many cases, at its core, it is. We own **Visa** (NYSE: V) and **MasterCard** (NYSE: MA) on the belief that electronic payments will continue to replace cash and that these two payment networks are the strongest.

During quarterly earnings conference calls, I enjoy discovering snippets that help make the case for an investment all over again. Any investment argument must be supported by the financials, our knowledge of competitors and management, the business landscape, and so forth. But to boil the current situation down to a few key words, we're looking for something very simple: an insight that makes it all click.

Three Cases Stated

Skyworks Fireworks

One of the strongest investment cases I've seen lately comes from *Pro* holding **Skyworks Solutions** (NASDAQ: SWKS). Creating micro-processing technology that runs in smartphones, tablets, and Internet of Things devices, the chipmaker is riding the mobile revolution. But the key part that originally caught my attention was this: It has rising profit margins while capturing market share.

This was reiterated in the November conference call. As CFO Donald Palette said, "We continue to see our served market opportunity growing at a mid-teens pace for the foreseeable future, based on our ability to address more systems-level functionality and expand our footprint. Second, we are targeting continued gross margin expansion

..." As Skyworks takes market share, it increased revenue by 42% in the year that ended in October, to $3.26 billion, and management expects gross margins to move to 53% within two years, up from today's 50% -- and then to 55% over the longer term.

CEO David Aldrich added confirmation: "We are seeing fewer competitors, a definite consolidation of share, as we address each customer. ... [So] we continue to see increased content with each successive generation of design." Said another way: We are integrating more functionality as these devices get more complex, and we notice that fewer competitors are able to do it. As its technology becomes more complex, Skyworks is selling more of that technology for use in each phone or device, because fewer competitors can provide a complete solution the way Skyworks can. As a result, Skyworks is involved in the design process ever earlier, leading to more revenue visibility. And the more content it sells for a product, the more profit.

Skyworks now targets organic annualized earnings of $8 per share within six to eight quarters, which would put this Buy-rated stock at less than 11 times future earnings. And in the last few years, Skyworks has topped its own guidance.

Tupperware Capped

With two-thirds of its kitchen product sales occurring overseas, **Tupperware** (NYSE: TUP) has struggled for several quarters. The stock is currently on Hold while we decide our next move. Sometimes when a company struggles, you seek clarification in a conference call. You're already skeptical of the business, so you want to see reasons to give it more of a chance.

The best I found in Tupperware's recent conference call came from CEO Rick Goings: "The loss from FX [Foreign Exchange] of actually – over these last three years, [it's] almost 50% of our profit. It went from $5.43 [in earnings per share] then to $2.22. We were able to claw our way back ... almost up to $4.44. And if FX had been even, our EPS would be around $7.50 per share [right now]." So, currency exchange rates have kept Tupperware's net earnings about 50% lower than they would have otherwise been. The business is growing, but currency rates are eating it all.

We knew this was happening, but the magnitude can get lost until it's stated. Tupperware's results should trend much higher when the dollar weakens. The question is: When will that happen? With U.S. interest rates likely to increase, the dollar may strengthen further.

While we wait, Tupperware is increasing its base. As CFO Michael Poteshman said, "We've been growing over the last eight, nine, 10 years in the 5% to 9% increase range in local currency sales." That's a healthy organic growth rate for this business. With earnings growth traditionally higher than that, and a strong dividend, we would typically see a North Star return under this scenario (as we did on our first Tupperware stock position, which we profitably closed). But we need currencies to cooperate a bit. We'll have an update soon on our next decision.

A Changed American

Sometimes, conference calls lend perspective you may not otherwise have. Wall Street remains skeptical that airlines will stay profitable; one fear is that competing with discount airlines will harm the giants, which is keeping big airline stocks cheap. **American Airlines** (NASDAQ: AAL) CEO William Parker had a mouthful to say in the last conference call:

> The reality is Brent oil prices this year are going to average something around $55 a barrel. In 2005, Brent averaged $55 a barrel. The economic cycle for 2005, you guys decide, but it was a pretty good year in the economic cycle. So the two things that we, as airlines, that really affect our profitability that are outside our control, the economic cycle and fuel prices, were the same in 2005 or very similar in 2005 as they are in 2015. In 2005, this industry lost $28 billion. In 2015, we're going to make something close to $20 billion. This business is not the same. It's dramatically different. People that are worried that, oh my gosh, here, now that fuel prices are falling, here goes fares falling and... it's the old business again... [They] are missing the point and are missing what has happened. This business has dramatically transformed. Fuel prices fall, indeed it does make sense for some capacity to come in that does result in prices falling. But if you think this is the old business, you're just not paying attention.

Though we lack corroborating financial data (it isn't broken out), American challenged concerns related to competing with discount airlines. As president Scott Kirby said, "In these markets, once we've gone to matching prices, we've actually had performance that's been either in line or better than the rest of the system. And so we feel really good about it. Every single market that we are matching any low-cost carrier is profitable. They're nicely profitable. They're some of the most profitable markets in our system."

As shared in our Portfolio Positioning Report last week, you can "buy to open" January 2017 $35 call options on American, at about a 0.5% allocation.

Summed Up

Whether it's **Gilead Sciences** (NASDAQ: GILD) offering data to support our assertion that its key Hepatitis C drug sales should stay strong, or **Apple** (NASDAQ: AAPL) sharing that a minority of customers have upgraded to iPhone 6 (leaving plenty of potential), sometimes just one or two revelations shared per quarter can reinforce your investment case, add confidence to the financial estimates you're targeting, or debunk a common criticism. Those are some of the reasons we love digging through conference calls and quarterly SEC filings from our businesses.

Questions? Comments? Please visit our Memo Musings board! We'll see you out there. For now, have a great week!

-Jeff (TMFFischer)

Returns

Investment Vehicle	Annualized Return Since Inception	Annualized Return, Rolling 3 Years	Year-to-Date Return
Pro	14%	20.8%	10.3%
North Star	8.2%	8.2%	7.8%
S&P 500	12.3%	16.1%	3%
MSCI World	6.6%	8.8%	(0.9%)

Table returns are as of Nov. 30, 2015. Information is updated the end of every month. Start date for annualized inception return is the close of Oct. 6, 2008. *Pro* opened the morning of Oct. 7, 2008. The S&P 500 Total Return Index includes reinvested dividends and has zero fees (it is not investable). *Pro's* returns include all commissions and do not reinvest dividends.

Close Your Short on Five Below

Published Dec 2, 2015 at 2:35PM

Is this for you? This trade is **only** relevant for *Pro* members who are participating in our short on **Five Below** (NASDAQ: FIVE). New members lacking any Five Below exposure can ignore this trade alert.

How You Participate

- **Trade:** Buy to close (or cover) all of your existing short shares of Five Below.
- **Allocation:** Close your entire Five Below position. *Pro* will close its 900 short shares.
- **Price Guidance:** Use a **limit order**, please, to buy at the going price, lately around $28. Really. We mean it. *Use a limit order*. Please.
- **Price (as of 2:30 p.m. ET):** $27.64

Special Note! Take Heed! Five Below is scheduled to report earnings after the market closes tomorrow, Dec. 3. *We are looking to close our position **before** this happens.*

What We're Thinking

It may have taken more than a year, but it looks as though Wall Street is finally coming around to seeing our side of the story on Five Below. The stock is now flirting with a 52-week low after multiple downgrades over the past few weeks, and we find ourselves with a solid 20%-plus gain -- even though the S&P 500 rose by more than 6 percent during the life of our short. The prior quarter was one of the weakest we've seen since we first started covering the stock, and the initial reads for Five Below's all-important holiday quarter are mixed, so one could argue that we should continue to remain short. But given the current valuation, we believe the risk/reward dynamics of this position have shifted enough to warrant closing our position ahead of earnings tomorrow.

From the outset, we thought the market was being overly optimistic with its valuation of this particular discount retailer. Over the long run, we believe the industry's competitive dynamics will prohibit Five Below from reaching management's ambitious target of 2,000 stores and will ultimately compress margins. We also questioned whether the right management team was steering the ship, given that the founders' prior public company filed for bankruptcy. This latter point turned out to be prescient, as the senior management team experienced meaningful turnover (including a new CEO) after we initiated our position, but it's anyone's guess how long management will continue to claim that 2,000 stores are possible.

The company' current footprint (417 locations as of the end of last quarter) and geographic concentration suggest that, barring a major misstep, it will be able to continue to open stores at an impressive clip in the near term, which should drive above-average revenue and earnings growth. The nature of Five Below's offerings leads us to believe that comparable-store sales will remain muted going forward, but that's unlikely to deter management from opening new stores, given their target average payback period of just one year.

To be perfectly honest, we won't be all that surprised if Five Below posts disappointing results for the rest of the fiscal year. But with market sentiment having shifted somewhat, we believe the potential payoff for remaining short no longer outweighs the risks. When we began this position, management's blue-sky scenario was being accepted as the base case; now, both the short- and long-term prospects for the company have been called into question. Multiple reports have suggested that the holiday quarter could be weak for Five Below, and Goldman Sachs recently reduced its store-count estimates for the company. In the report downgrading Five Below to a sell, the authors stated that they now believe the company can achieve only 1,700 stores without competition or 1,400 stores with a new competitor. The latter is closer to what we initially envisioned as the base case for Five Below.

This newfound pessimism appears to be baked into the stock somewhat, given that it is now trading for less than 12 times EBITDA estimates (the lowest valuation it's had since going public). So if the company does end up positing disappointing results this quarter, the reaction may not be as violent as last quarter, when we saw a 9 percent sell-off in aftermarket trading after the earnings release. On the other hand, if Five Below *does* post solid results this quarter, we may get hit with a double whammy -- our investment thesis would take a hit, and market sentiment could shift back just as quickly. After considering these, and other, scenarios -- as well as the fact that we recently reduced our retail exposure with our sell of The Buckle -- we have ultimately decided to close our position in Five Below before the company reports earnings tomorrow, and we suggest you do the same.

To discuss this, please head on over to the Five Below message board.

Portfolio Positioning Report: Dec. 1, 2015

Published Dec 1, 2015 at 10:00AM

Welcome | Shorting in Short | Hedging ... in Short | Your Exposure | This Stuff Is Optional
Options Are Optional, Too — but Advised! | About This Report | The Positions Themselves (Shorts, Hedges, Options, All the Rest)

Join our live event at 1 p.m. Dec. 1

Dear *Pro* member,

Our first two Portfolio Building Reports gave you guidance on all of *Pro*'s Buy First and Buy stocks. This final report will do the same for our active short and option positions, many of which we use as hedges. For reasons we'll explain, we don't expect that many of you will initiate all of the positions in this report right away, or perhaps at all. And that's perfectly fine!

Hedging is about lowering your exposure to the risks of the market; to a lesser extent, shorting is as well. These additional investment tools tweak or adjust the risk profile of your *existing* portfolio, so if you're still building your collection of long-term stocks, concentrate on that for now. Stock investments are the core of the *Pro* portfolio, and by owning *Pro* stocks, you are positioned to compound your value over time. We know there's a learning curve for strategies that are new to you, so it's important you know there's no rush; you can incorporate the positions in this report when you're ready. We're here for you in the meantime.

Before explaining these positions, let's review how each strategy works. We'll begin with shorts — a sort of "anti-investment" that we believe will decline in value, adding profits to our portfolio in the process.

Shorting in Short

When you sell something short, you borrow shares from your broker and immediately sell them, collecting the proceeds. At various brokers, this trade action is called "sell short," "sell to open," or just "sell." In the future, you'll need to buy the same number of shares back to replace the ones you borrowed and sold. This second step is called "cover," "buy to cover," or "buy to close." You hope to buy the shares back at a *lower price* than when you opened the position.

The difference between your original sell — or short — price and the price you pay to buy back (and return) the borrowed shares is your profit. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock soars to $30, you've lost $10 per share when you buy it back. We use shorts in *Pro* because they're one good way to profit when the market or a company falls, but they come with their own risks — shares can be hard to borrow, fees are often involved, and a short can get closed on you (you're forced to buy it back) if the broker wants the shares back early. So, we need to size our short positions appropriately small.

Hedging ... in Short

A hedge is similar to a short because it gains value when prices fall, but it's different in intent; these positions are taken to *offset* the risk we have in another position or in our market exposure as a whole. So, when we sell short a market-index proxy like the **SPDR S&P 500** (NYSEMKT: SPY) ETF, we are hedging our exposure to the stock market as a whole. A hedge is a form of insurance — it only pays out when you need it, and usually it won't make money. We know a market-index hedge will go up in value whenever the market goes down. But most times, the market won't fall (or won't fall enough), and our hedge will go unused.

For this reason, we try to spend little to hedge, but there are sometimes still costs. We have to reconcile this with the fact that hedging lets us stay *more* invested than we otherwise would, give our goal of absolute returns. In other words, one key way we profit from our hedges is by using them to help us keep our long stock exposure higher! As with shorting, you should only hedge if you have specific market exposure you want to "hedge out." Recently, *Pro* issued a [brand-new hedge] using options on the SPDR S&P 500. That is our current market-hedge recommendation for anyone who wants to hedge out 10% of their long exposure, as we are doing (bringing *Pro* right now to about 70% net long).

Your Exposure

To know whether hedging is for you, it's helpful to think about your stock market exposure. This is simply how much of your total portfolio is invested in long stocks. Excluding options and shorts, *Pro* is about 83% invested in long stocks as we kick off December. That's high for an absolute-return portfolio (which is part of why we want to short and hedge!). But for new *Pro* members, two stocks — accounting for 7.4% of our exposure — are on hold. So if you bought all of our current Buys and Buy Firsts, you are only 75.6% invested in stocks. You have less reason to hedge and/or short right now; however, like many members, you may own other stocks beyond *Pro*'s. We're hedging the *Pro* portfolio down to about 70% market exposure, and you could (but do not need to) do the same.

The bottom line is: As you consider adding hedges and shorts to your portfolio, first know how much of your portfolio's assets are invested in stocks. That helps dictate how much shorting or hedging exposure you want to initiate to reach the *net* market exposure you desire. *Pro* has averaged around 72% net long exposure since January 2012, but that number will move up and down as our opportunities change. Our exposure is always shown at the bottom right of the Recommendations page.

This Stuff Is Optional

Not every *Pro* member is comfortable with shorting or hedging, and there are practical considerations to take into account as well. First, you need a margin account to sell short, so (unless you use options) you can't do it in an IRA. Second, you have to accept that shorts can run strongly against you, so you need cash to cover that risk. (See Billy's recent Monday Memo for a rundown on what happened to our short position on Boulder Brands.) Third, you'll usually pay an annualized fee of anywhere from 1% to 5% of the short's daily value to short something. Fourth, in many cases it's hard to borrow shares to short, period. That is the situation with some of our current shorts today. Finally, short shares can be bought away from you at the worst time, when they're up in price (a "forced buy-in"). If brokers can no longer find shares to borrow, you're forced to "buy in" at market prices to return your borrowed shares.

So what to do? You can use options to short in some cases -- we do, and we explain how to do so wherever appropriate. You can also consider opening a brokerage account that is particularly friendly to shorting. Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does, and does not charge a fee for shorting. You could also wait and see whether shares become available in your existing, traditional brokerage account, though note that at many brokers, certain shares are basically never available for shorting. Or, if you're not drawn to it, you don't need to short at all.

Options Are Optional, Too — but Advised!

Our options positions are also ... optional, but we strongly advocate learning to use options and following along with ours over time. Options are powerful tools for income, hedging, upside, and more. We know from experience they're well worth the time it takes to learn them, and we're here to help you. Options can make you a much more confident and versatile investor, and they can generate a whole new stream of income for you and your family. So, if you're new to options, you're in a great place! Use *Motley Fool Pro* and our sister service, *Motley Fool Options* (free for the life of your *Pro* membership!), to learn how to use these great tools. On a personal note, if you're going to learn just one simple strategy, I suggest learning how to write puts (link goes to *Motley Fool Options*) for income or to buy a stock lower.

About This Report

Let's return to the main show. This Portfolio Positioning Report and the special live text chat accompanying it today, December 1, at 1 p.m. ET, will (when you're ready!) help you short vehicles we believe will decline, hedge your portfolio, and generate returns from options. But keep in mind that this is just a start; we'll have many brand-new investment recommendations arriving to your inbox as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way!

On the other hand, if this looks overwhelming right now — or if you're still catching up with our core stock positions — that's perfectly fine. You don't need to start these positions now. As mentioned, long positions are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and often rewarding — aren't necessary to succeed with *Pro* in the long term, let alone immediately. As you learn these strategies and progress with us, just keep your exposure to the stock market in mind.

In closing, I'll stress again that you shouldn't feel pressured to act immediately. We will continue to make recommendations on an ongoing basis, including in our Monday Catch-Up Trades when we — and brand-new possibilities emerge regularly. That's part of the fun! So take your time, and make an investment only when you're ready. Finally, please bring any questions to our Making *Pro* Fit You discussion board.

Foolishly,

— Jeff Fischer, *Pro* advisor

The Positions Themselves

Shorts

- Caesars Entertainment (NASDAQ: CZR)
- CurrencyShares Euro Trust (NYSEMKT: FXE)
- Direxion Daily Financial Bear 3X Shares ETF (NYSEMKT: FAZ)

Hedge

- SPDR S&P 500 (NYSEMKT: SPY)

Options

- American Airlines (NASDAQ: AAL)
- American Tower (NYSE: AMT)

All the Rest

- Coca-Cola (NYSE: KO)
- Expeditors International (NASDAQ: EXPD)
- Five Below (NASDAQ: FIVE)
- Gentex (NASDAQ: GNTX)
- O'Reilly Automotive (NASDAQ: ORLY)
- Tupperware (NYSE: TUP)
- Wells Fargo (NYSE: WFC)
- World Acceptance (NASDAQ: WRLD)

Shorts

Caesars Entertainment (NASDAQ: CZR): Sell Short

The casino giant remains crippled by debt as it tries to shake free by placing a subsidiary in bankruptcy court.

Suggested Short Allocation: 0.6% to match us

How It Fits Into *Pro*

Pro is short shares of America's largest casino operator, **Caesars Entertaiment** (NASDAQ: CZR), which has put one of its units into bankruptcy proceedings. The stock is volatile -- we booked a 35% profit on half of our short this year, and our remaining short shares show a 32% profit of late. The outcome of this short position is partly dependent on the courts, but in the meantime, the business continues to suffer, lawsuits from large investors are weighing further on the balance sheet, and the parent company ultimately may need to file for financial protection, too. All of this makes us comfortable staying short and recommending that new members get on board with a small position.

For More

- *Pro*'s recommendation history (see Trade Alerts, bottom right)
- Talk about CZR on our discussion board

Availability

Shares of CZR are often available for shorting at various brokers; the annual fee is lately 1.6% at Interactive Brokers (with 700,000 shares lately available for shorting), and there is no fee at TD Ameritrade, when it has shares available.

Alternative Trade

If your broker does not have shares available for shorting, and you're trading in a margin account, you can instead set up a synthetic short. "Sell to open" January 2018 $10 call options on CZR, and to buy to open an equal number of January 2018 $10 put options. Lately, you can aim for a net credit of about $1.50 to set this up, but realize that will change as the share price moves. Each synthetic short represents about $850 in exposure, so don't allocate above our 0.6% or so.

CurrencyShares Euro Trust (NYSEMKT: FXE): Sell Short

Shorting the euro against the dollar is relatively low-risk insurance against disaster in Europe.

Suggested Short Allocation: 1.8% to match us

How It Fits Into *Pro*

We've been short the euro against the dollar since late 2011. We view this position as a quiet anti-investment; the risk to us is relatively known (and reasonable), and the profit potential remains worth pursuing. As the euro has declined to a recent $1.06 to the dollar from about $1.30, we currently have a 20% profit on the position.
But parity to the dollar is still a possibility, and it needn't stop there. With interest rates ready to increase in the U.S., and with Europe in the midst of a giant bond-buying program, the dollar may be preferred to the euro for at least a few more years, perhaps bringing the euro down to 0.90 to the dollar. And if Greece or other euro nations default, the euro could be badly punished. The vehicle we're shorting (it's called a trust, but trades like a stock) only holds physical euros, so it's a pure way to short the euro against the dollar in our U.S.-based brokerage account.

For More

- *Pro*'s recommendation history
- Talk about FXE on our discussion board

Availability

Shares of FXE are often available for shorting at various brokers; the annual fee is lately 1.8% at Interactive Brokers (with 1.6 million shares available for shorting), and there is no fee at TD Ameritrade.

Alternative Trade

If your broker does not have shares available for shorting, and you're trading in a margin account, you can instead set up a synthetic short. "Sell to open" January 2018 $104 call options on FXE, and to buy to open an equal number of January 2018 $104 put options (lately for about a $1.60 net debit, but that price will change). Just realize that you, like us, are short the vehicle at today's price, and you will see losses if FXE's price goes up. Also, only sell to open one call option for every $10,400 in FXE you can afford to be short, remembering that each option represents 100 shares. We have nearly a 2% short allocation, so to set up one synthetic short and keep it at just 2%, you would need an account value of about $500,000. If 100 shares via options is too large an allocation for you and you can't short fewer shares directly, then just sit this one out! There are no IRA alternatives at this time that are attractive enough to merit your retirement-account dollars, and it's unlikely the euro will plummet enough to make this a short you really lament missing.

Direxion Daily Financial Bear 3X Shares ETF (NYSEMKT: FAZ): Sell Short

Daily leverage keeps steady downward pressure on this bearish ETF.

Suggested Short Allocation: 0.3% to 1% (we are currently short only 0.3%,
as the position has shrunk nicely, but we may add to it opportunistically)

How It Fits Into *Pro*

This bearish ETF is meant to provide 3 times (300%) the daily inverse results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. By shorting this ETF, we're effectively 3 times long, on a daily basis, the U.S. large-cap financial sector, which includes the likes of **Wells Fargo** (NYSE: WFC) and **Visa** (NYSE: V), *Pro* holdings.

Leveraged, inverse ETFs like this one are flawed because they rebalance their derivative positions daily in order to maintain a constant leverage. Over longer holding periods, the costs involved with rebalancing eat away at returns, keeping downward pressure on the vehicle as a whole. Also, returns are compounded daily, which adds to tracking errors. As our original buy report details, we continue to believe that large-cap U.S. financials are cheaply priced — and we own several of them as a result. That belief makes shorting this flawed bearish financial ETF all the more attractive.

That said, shorting FAZ has become difficult over the years, and our position size has dwindled severely. We lately have a 77% profit on our short! But those profits should keep coming, and new short sellers like you are in a fine position as this inverse, short, leveraged ETF can keep going down. That said, new members can skip this position if shorting it proves difficult (or use options if you have a six-figure account). We own plenty of strong financial companies serving a similar purpose in the portfolio.

For More

- *Pro*'s recommendation history
- Talk about FAZ on our discussion board

Availability

This ETF is hard to borrow. Lately, only 50,000 shares of FAZ were available for shorting at Interactive Brokers at a 4.9% annual fee. Periodically, TD Ameritrade has shares available with no fee. Members have sometimes been "bought in" on their shares at Interactive Brokers, closing the short.

Alternative Trade

If you can't short shares directly, then you can set up a synthetic short in a margin account. "Sell to open" January 2017 $40 calls on FAZ, and "buy to open" an equal number of January 2017 $40 puts. Lately you will pay a net debit of about $1.50 to $2 to set this up. This makes you short FAZ with a start price of about $38, and sets you up to profit if FAZ declines in price. Only sell one call for every $4,000 in FAZ you are able to comfortably short. On a $400,000 account, one contract would be a 1% allocation. That's about as much as we recommend to start.

Eagle-eyed members will notice that *Pro*'s short position on FAZ is 0.3% of our portfolio. We're recommending 1% to newcomers because we know you'll be unable to short another position in the *Pro* portfolio, SRS (more on that later). There are no IRA-friendly alternatives for this short. If you can't short it at all, you could add 0.3% to 1% to one of our two financial companies — Wells Fargo or Visa — instead.

Hedges

SPDR S&P 500 (NYSEMKT: SPY): Set Up a Put Ratio Spread

With yesterday's trade alert on the SPDR S&P 500, *Pro* recommended a new put ratio spread to hedge market risk. Please revisit that report to learn how to set up a 10% portfolio hedge if your market exposure is high enough to merit it, as *Pro* has done. (We want net market exposure of around 70%.) The trade alert has IRA-friendly alternatives, as well as a low-cost spread for those lacking the equity required to hold open the official trades.

Options

American Airlines (NASDAQ: AAL): Buy to Open January 2017 $35 Calls

Allocation: 0.4% or so

These calls target long-term upside on what we believe is a resurgent, disciplined airline that will continue to enjoy profitable operations.

For More

- *Pro*'s original recommendation
- Talk about American Airlines on our discussion board

Early this year, we recommended *Pro* members buy to open January 2017 $35 calls on American Airlines. Now is a much better time to join this slightly speculative position. Although the stock trades at less than 10 times earnings, it's still speculative because Wall Street may not give the company a much higher valuation multiple anytime soon -- although we believe investors should. Following major consolidation in the U.S. airline industry, I believe the Big Three airline leaders are going to stay profitable. Persistently low oil prices would only help, and we don't believe energy is going to resurge in price anytime soon. Today, you can buy these call options for around $11, or less than half the price we paid almost a year ago. We still believe there is eventual upside in our position, and newcomers have much better odds for success at today's price. Realize we may write diagonal calls against these calls for income while we wait. But for now, get started with our original report. Note, again, that prices are lower now. Only invest what you can afford to lose in these calls!

American Tower (NYSE: AMT): Buy to Open January 2018 $80 Calls

Allocation: 0.5%

These calls target long-term upside on American Tower, adding to our existing stock holding.

For More

- *Pro*'s original recommendation
- Talk about American Tower on our discussion board

Pro owns January 2017 $80 calls because we bought them before the 2018 calls were listed. Newcomers should consider buying January 2018 calls (rather than the 2017 calls that *Pro* owns) in order to give the investment thesis more time to play out. *Pro* will likely roll its calls out to 2018 prior to 2017 expiration so long as the investment thesis doesn't change.

We're seeking leveraged returns if American Tower stock appreciates by 2017. To follow along, **use a limit order** to buy to open January 2018 $80 calls. Aim for a price near the midpoint of the current bid/ask spread. A 0.5% allocation at current prices most closely equates to buying one call for every $500,000 you manage. This is a small position by design, so be careful not to over-allocate to the calls; we may seek to add more to our position later if volatility provides us with lower prices. Members for whom one contract would over-allocate their portfolios can consider buying 0.5% more in stock, bringing your stake to 4%. Realize you won't benefit from the leverage the calls will provide, although you will have a better breakeven price and no expiration.

All the Rest of *Pro*'s Positions

As a *Pro* member with an especially keen eye (and great memory!), you will note that we haven't updated you on every position in the portfolio yet. Pricing opportunities being what they are and with expirations right around the corner, not all of our positions are primed for new action right now, and not all options positions are timely. Worry not. We will publish Catch-Up Trades when we see new *Pro* opportunities on existing positions. One by one, it won't take us long to get there. Here's the status on our remaining positions that are currently "on pause for newcomers" — either on hold or not timely.

Coca-Cola

Synthetic Long Ending Soon

Pro holds a synthetic long option position, with synthetic covered calls, on **Coca-Cola** (NYSE: KO), but it expires in January 2016 -- not far away. By then we'll have an updated strategy decision and advice for all members. We advise new members to wait. (Some of you started an option position on Coca-Cola with *Motley Fool Options* — that's a fine substitute for now and perhaps indefinitely, unless we get a great new opportunity.)

Expeditors International

Synthetic Covered Strangle

Shares of shipper **Expeditors International** (NASDAQ: EXPD) have run up sharply and provided a lot of income for *Pro* over the past 15 months. Our synthetic long expires in January, and we're not sure yet whether we'll turn it into stock. We advised newcomers looking for a short-term income trade to buy stock (in 100-share lots) and then write the new December 2015 $48 put/$50 call strangle with us. That's still viable. You can see that Alternative Trade guidance at the end of our recent EXPD report.

Five Below

Short on Hold

Discount retailer **Five Below** (NASDAQ: FIVE) is down 18% since we first recommended selling it short, so we're happy; but we'll see a new earnings report on Dec. 3, so volatility may be directly ahead. We want to see those results before deciding our next move,not to mention what we want new members to do with this short. Stay tuned!

Gentex

Puts on Track to Expire

Pro has written December 2015 $15 puts that, if exercised, would have us add about 1% in stock to our **Gentex** (NASDAQ: GNTX) position. The goal with these puts is to earn income and potentially add to our existing stock position at lower prices. Since this position is just a few weeks from expiration, we don't recommend that new members join us now. We'll likely write puts again whenever we see good pricing after these expire -- and at that point all members can join in.

O'Reilly Automotive

On Hold

We have a 5.2% stock position in **O'Reilly Automotive** (NASDAQ: ORLY), but it's on hold for new members as we review the valuation. We'll have an update with guidance this month!

Tupperware Brands

On Hold

Tupperware (NYSE: TUP) derives most of its revenue overseas, but the strong dollar has hit results, and called into question management's aggressive share buyback plans over the past few years. We're reassessing if we want to keep this admittedly cheap-looking stock or not. We'll have guidance for all members this month! Right now, we have a 2.2% allocation, but new members are advised to wait.

ProShares UltraShort Real Estate

Short on Hold

We have a small (0.3%) short remaining in the **ProShares UltraShort Real Estate ETF** (NYSEMKT: SRS). We enjoy watching its slow descent in price, but the ETF only has $32 million in assets now, making it too small to recommend to new members. Plus, outside of our broker (Interactive Brokers), it appears impossible to borrow shares to sell short now — and if you do find them, the annual percentage fee to short is high (recently 5.2% at IB). Instead, as shared above, we recommend that you sell short up to 1% in FAZ as a long-term alternate, or buy up to 1% in shares of the **iShares Dow Jones US Real Estate** (NYSEMKT: IYR) as a long-term hold instead. Or just sit this small position out.

Wells Fargo

Puts on Track to Expire

Our $52.50 written puts on **Wells Fargo** (NYSE: WFC) expire in January, and we've earned much of the income already. New members are advised to wait for a new put-writing trade to make with us after January expiration.

World Acceptance

Short on Hold

We shorted **World Acceptance** (NASDAQ: WRLD) this year and quickly booked a large 37% gain, closing half our short. Now shares of this questionable consumer lender are hard to find for shorting, and Interactive Brokers charges more than 21% a year for the honor. That's too expensive, so we're considering closing the rest of this position. New members can steer clear for now.

In Conclusion

We'll likely recommend many of these positions (except the SRS short) to new members once we reaffirm that there's sufficient opportunity to make up for the current risk, and/or when pricing improves or after expiration on our options. Just watch your inbox for trade alerts!

At the same time, we're not standing still. In this and our two previous Portfolio Building Reports, you have many great *Pro* investments -- all rated Buy First or Buy -- to move into. And of course, we'll continue to send brand-new investment recommendations to all members.

It's not vital that your portfolio be 100% identical to ours, but being closely attuned to it, especially with our core stocks, should position you to succeed well with *Pro* over the time frame that matters. Meanwhile, if you're new to shorts, hedges, and options, start to dip your toes in as your comfort allows. We're here to help, and we believe you'll see many, many great benefits as the years unfold.

Fool on!

— Jeff (TMFFischer) and the *Pro* team (Billy, JP, Jeremy and Ellen)

Boulder Brands: Process vs. Outcome

Published Nov 30, 2015 at 2:38PM

Pro Guidance Changes

- **Five Below** (Nasdaq: FIVE): This short moves to Hold as we await Dec. 3 earnings and contemplate our next move. Newcomers should wait.

Pro Completed Trades

- **Boulder Brands** (Nasdaq: BDBD): We covered (or bought to close) all of our 6,200 short shares at $10.93, ending the position.
- **Expeditors International** (Nasdaq: EXPD): We wrote a December 2015 $48 put/$50 call short strangle, collecting $1.25 per share combined.
- **Verisk Analytics** (Nasdaq: VRSK): We bought 100 additional shares at $73.90, bringing our allocation to 2%. The stock is a Buy.

Dear *Pro* Fools,

Last week, just a few days after we recommended writing covered puts intended to close our position, we found out that our largest short holding, **Boulder Brands** (NASDAQ: BDBD), had agreed to a buyout from **Pinnacle Foods** (NYSE: PF). Pinnacle intends to launch a tender offer to acquire all outstanding shares of Boulder Brands at $11 per share, valuing the entire company (including $265 million of net debt) at $975 million.

To avoid another, potentially higher bid, we recommended closing all outstanding positions on Boulder Brands after we saw the news, locking in our total return on the position. Our short position has an effective start price (including fees) of $8.89; this excludes the $1.10 we guided to in our covered put recommendation, since we weren't able to execute our trade before the buyout. Our total return on the position is a 23.2% loss; if we had been able to achieve guidance on our written put recommendation, our total loss would have been a 9.6% loss.

With the buyout announcement, the biggest risk to our thesis came to fruition. We knew a buyout was possible, but we underestimated its likelihood -- or more so, the price the acquirer was willing to pay.

While it's never fun to see an investment (long or short) go against you, investing mistakes have benefits. This is especially the case for shorts, which are more tactical in nature and tend to run their course much more quickly than longs. So with this as with any mistake, let's analyze what went wrong and attempt to benefit from this knowledge in the future.

Process vs. Outcome

I think this Boulder Brands position is an excellent example of the process-vs.-outcome dichotomy. Several years ago, before my time with *Pro*, I read a *Stock Advisor* article by none other than Jim (the Other) Mueller, TMFTortoise. The title was "Use Outcomes to Improve Your Process, Not to Judge It," and the crux of the article really stuck with me.

Jim's main point was that we tend to judge our performance based on outcomes, despite the fact that outcomes are totally outside our control. Instead, we should judge our performance based on *process*, which is completely within our control, to determine whether we could have done a better job preparing for the eventual, unknowable outcome. Jim presented this matrix from J. Edward Russo and Paul J.H. Shoemaker's book, *Winning Decisions*:

	Good outcome	Bad outcome
Good process	Deserved Success	Bad Break
Bad process	Dumb Luck	Poetic Justice

In this Memo, I'll run through each branch point in *Pro*'s position history with Boulder Brands and attempt to classify each decision into one of the four displayed in the matrix above.

March 23, 2015: Short Boulder Brands

Our initial action ("Decision 1") on Boulder Brands was a simple short of the company's stock. Our short thesis revolved around troubling management and governance, questionable earnings quality, and a poor balance sheet.

June 10, 2015: Boulder Brands Co-Founder and CEO Resigns

Less than three months later, Boulder announced in a press release that the co-founder and CEO had resigned, and the company provided updated guidance that disappointed the market. The stock fell more than 20% that day, closing at $6.91 per share, down 28% from our effective short price of $9.60 per share.

If we'd closed our position after the CEO resignation, then Decision 1 would have fallen squarely into the "Deserved Success" quadrant of the process vs. outcome matrix. The short thesis was spot on, with poor earnings quality leading to poor revenue growth, and troubling governance leading to a management departure. The outcome justified our good process.

However, ultimately, we decided *not* to close the position, eventually settling on:

June 22, 2015: Short More Boulder Brands and Buy Protective Calls

After further research, deliberation, and discussions among the team, we decided to press our (at that point) successful short, deciding to short more stock and buy protective calls at the same time in order to cap our risk. We'll call this second portfolio action "Decision 2."

We believed that the company's negative business momentum was likely to continue, and that all of the troubles leading to the CEO's resignation were still apparent and likely to persist. We felt that more downside was likely, and we even acknowledged the possibility of a takeout offer or merger in our write-up.

Aug. 14, 2015: Boulder Brands Stock Spikes on Buyout Hopes

On Aug. 6, Boulder Brands reported terrible second-quarter 2015 earnings, but it did announce "a range of strategic alternatives to enhance shareholder value." On the heels of the July 29 disclosure of a significant stake by activist investing fund Engaged Capital, this was enough to bring the stock up 17% on the day of the report.

If we'd closed our position here, Decision 2 would have fallen into the "Bad Break" category of the matrix. Our process was sound, and we were correct about the negative trajectory of the company's financials. We anticipated the possibility of an adverse outcome leading to a spike in the stock price, and we properly positioned ourselves to protect against it. If we had exited the position then, our overall position would have resulted in a 9.7% gain.

But again, we ultimately decided not to close the position, continuing to:

Sept. 2, 2015: Sell Your Protective Calls on Boulder Brands

After more continued discussion, we decided to sell our protective calls to reset our uncapped short position ("Decision 3").

In my evaluation, Decision 3 was the first in which our *process* was unsound. Our initial short thesis had been fulfilled, and the investment case for the company at that point was much different than the case that existed when we established our short. The presence of an activist investor and management's statements about "strategic alternatives" combined to create a higher likelihood of a negative outcome for our short position. Uncapping the short at that point was probably unwise.

Our reasoning was too simplistic -- we believed upside above $10 per share to be unlikely, and we thought that was enough justification to maintain exposure to continued operational miscues and negative financial performance. In the end, our estimation of likelihood was incorrect, and we didn't give enough credence to just how often management teams (like the one at Pinnacle) pay up for acquisitive growth with hopes of "synergy" and "cost savings." The tendency for managers to overpay for mergers and acquisitions is even something we've discussed before (see "Uses of Capital" in this prior Memo), so we shouldn't have discounted this possibility as much as we did.

Decision 3 certainly falls into the "Poetic Justice" quadrant of the matrix. Our process and reasoning weren't sound, and our position-level returns suffered because of it.

Nov. 20, 2015: Write Covered Puts on Boulder Brands

Eventually, Boulder Brands reported third-quarter earnings, and the results showed signs of financial and managerial improvement. After reviewing the quarter, we decided that maintaining our short was too risky (we were right!), and we recommended writing covered puts on the stock with the intent of closing our position entirely at expiration ("Decision 4"). However, just a few days later, Boulder was acquired, and the premium received for the puts was incinerated by the rise in the stock price.

This is where the judgment of process can get a bit murky. Conditionally, based on our reasoning from Decision 3 (i.e., that upside much above $10 was unlikely), Decision 4 would fit into the "Bad Break" quadrant. But on an absolute basis, Decision 4 was "Poetic Justice," as we probably should have closed our short before Decision 3.

This is an example of how errors can compound – a mistake in one part of a process can cause a ripple effect. Even if each subsequent decision is conditionally sound, if the decisions are based on faulty assumptions, the whole process falters.

When we decided to write puts rather than close immediately, we were also keeping in mind the fact that we run a portfolio service; we wanted to avoid significantly affecting the market price. But those concerns were dwarfed by the magnitude of the premium paid by Pinnacle to acquire all outstanding shares of Boulder. The correct decision here would have been to directly close the position.

Nov. 24, 2015: Close Your Positions on Boulder Brands

In response to Pinnacle's takeout offer, we recommended that members close all outstanding short shares or option contracts ("Decision 5").

Obviously, we haven't seen the outcome of this one yet. It's always possible that the acquisition could fall through, which would probably result in a significant stock-price decline, but there's no way of assessing the likelihood of that. Also, it's possible that another, potentially higher bid could come through to Boulder shareholders, adding additional risk to those with short positions. While we won't know what quadrant Decision 5 will fit into until the deal closes or other news is announced, in my estimation it is an example of good process.

The *Pro* Bottom Line

There is much to be learned from unsuccessful investments, both on the long side and on the short side. The fact that shorts tend to be more action-packed and short-term in nature helps us in our ability to analyze our mistakes. In this Memo, we talked about the difference between process and outcome, and how it's much more important to judge ourselves on our process (which is in our control) rather than by outcomes (which are not).

In conclusion, we probably suffered from thesis drift with this position. When our original thesis came to fruition, we should have marked the position a success and moved on cleanly. Instead, despite changes to the situation that affected the likelihood of bad outcomes, we continued to pursue further returns. Our assumptions and estimations of likelihood were wrong, and we ended up with a losing position.

In the future, we should be more careful in examining our assessment of probabilities, and we should lend more credence to the fact that managers often pay rich prices to achieve acquisitive growth. With this acquisition, Pinnacle Foods assumes that it will be able to increase Boulder's adjusted EBITDA by 50% over the next two years via "a combination of synergies and previously identified cost savings," resulting in a 2017 price multiple of 10 times EV/EBITDA when combined with $47 million in tax benefits. (For context, the current and unadjusted TTM EV/EBITDA for Boulder at $11 per share is 25.5.)

Those are some aggressive assumptions, and we won't know whether they're realistic or not until the future unfolds. But what we do know is that the valuation process in mergers and acquisitions is flawed. We should have been more aware that a premium price in this acquisition was possible, especially given that the possibility of being acquired was explicitly mentioned by management.

Thoughts? Bring them to the Boulder Brands discussion board. Fool on!

Hedge: Set Up a Put Ratio Spread on the SPDR S&P 500

Published Nov 30, 2015 at 1:01PM

Is this for you? At *Pro*, we use hedges to earn returns during a meaningful market decline. You don't need to hedge to succeed with *Pro*, but if you are at least 80% invested in stocks and want to hedge against a market decline, then consider following along. This 10% hedge will lower our market exposure to about a net 70%. Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $200,000.

How You Participate

- **Action:** Ideally, use a spread order or a ratio spread order to set up a put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF, as detailed below.
- **Allocation:** Ten percent of your total portfolio value, measured on the look-through value of the $200 puts you're buying (each put represents $20,000 in hedge value). Set up one 2:1 put ratio spread for every $200,000 you manage and want to hedge; hedging 10% of our entire portfolio of nearly $2.6 million, *Pro* will sell 26 puts and buy 13 (because 13 puts at a $200 strike = $2,600 x 100 shares per contract = $260,000 look-through put value = 10% of our portfolio value).
- **Trade:**
  - **Use a ratio spread order to simultaneously ...**
    - Write ("sell to open") **two** February 2016 $190 puts, and:
    - Buy ("buy to open") **one** February 2016 $200 put. Click "view all" at your broker to see all strikes.
- **Price Guidance:**
  - Sell to open **two** February 2016 $190 puts: Lately $1.85 x 2 = $3.70 credit
  - Buy to open **one** February 2016 $200 puts: Lately $3.45 debit
  - **Net credit:** Lately about **$0.25** credit per spread -- but this price will change. As it does, simply aim for a credit, or close to no cost, using a limit order.
  - SPY price: $209.50
  - **Potential adjustment:** If SPY moves in price before you set up your trade, you may want to move both of your strike prices down or up accordingly, as much as SPY has moved, while still aiming for a net credit. After our mandatory trade delay, we will make such an adjustment if need be, and tell you about it.

What We're Thinking

At *Pro*, we aim to have winners in down, flat, and positive markets -- and that means we need to address all three possibilities at once in our portfolio. A hedge on a market index is simply a hedge against a lower market. We generally don't care about declines of 5% or less, but when *Pro* is functioning as desired, declines of about 7% or more should result in some of our positions, like these spreads, becoming nicely profitable. At the same time, the put ratio spreads we use:

- Are harmless to us if the market goes higher (they don't harm our return)
- Are typically cash-free to set up (they can even pay us a small credit -- essentially income!)
- Have a relatively low probability of loss

What's the trade-off? As with any written put, we need to be ready to buy the underlying investment; for today's position, that means being prepared to buy into the S&P 500 index (through SPY) if the market falls too sharply. In this case, if the index falls more than 14%, this hedge becomes a liability, with SPY falling below our breakeven point. If that happens, we would plan to buy long-term call options on SPY instead of shares, saving most of our cash in the process. See below for details on that.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2,570,000
- Ten percent of that value: $257,000
- February 2016 spread:
  - Buy to open $200 puts. Thirteen contracts representing 100 shares each = $260,000 in look-through exposure, or about a 10% hedge on our current portfolio value, cash included.
  - Sell to open $190 puts -- 26 contracts, half of which are uncovered by long puts and thus become a potential obligation at a net $180, currently a 9.1% possible stake.
  - At home, you would buy one $200 put and sell two $190 puts for every $200,000 in portfolio value you want to hedge ($20,000 look-through value per $200 put divided by $200,000 = a 10% hedge).

Return Details

SPY Price at February 2016 Expiration	Value of 1 Purchased February 2016 $200 Put	Value of 2 Written February 2016 $190 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Recent $209.50
$200 or higher	$0	$0	$0.25 gain per spread -- or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 4.5%
$195	$5 x 100 = $500	$0	$500	(6.9%)
$190	**$10 x 100 = $1,000**	**$0**	**$1,000 (max profit per spread)**	**(9.3%)**
$185	$15 x 100 = $1,500	($5) x 200 = ($1,000)	$500	(11.7%)
$180	**$20 x 100 = $2,000**	**($10) x 200 = ($2,000)**	**$0 (break-even)**	**(14.1%)**
$175	$25 x 100 = $2,500	($15) x 200 = ($3,000)	($500)	(16.5%)

If SPY declines more than 4.5% from recent levels, this hedge starts to come into play. Our maximum profit is earned on the spread if SPY declines 9.3% from its recent level of $209.50 by our February expiration. The spread will help us a little on an index decline of as much as 14%; deeper than that, and our short puts turn into an obligation that's in the red.

Follow-Up

Assuming we set this spread up for a credit, it will result in a small profit even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $190 put obligation (starting with a net buy price of $180) if SPY is below $190 by expiration.

However, if that does happen, our plan would be to close our puts and buy long-term SPY calls (or something we like even better, whether calls or a stock) instead of buying the ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY shares. So, our potential 9% or so stake in SPY shares will only cost us about 2.25% of our cash if we buy calls instead. We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases.

How It Fits Into *Pro*

Pro consistently hedges to lower our invested market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market will make a difference. Even small gains add up over the years, especially if those gains on market declines are then reinvested in depressed stocks. This hedge fits well with our goal of hedging in a cost-efficient way, one that doesn't work against us if the market rises. It does require regular upkeep, though, opening new positions as old ones expire, and these spreads are time-sensitive, really only helping at or near expiration.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:**
    - For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, as we are, "buy to open" February 2016 $200 puts and "sell to open" *an equal number* of February 2016 $190 puts. Recently, this will cost you less than $1.70 ($170) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $10 ($1,000) per spread on a decline to $190 or any lower price, but you should be prepared to lose your whole $1.70 per spread if SPY doesn't decline to somewhere below $200 by expiration.
- **To lower your market exposure while following our full official trade (and make the position possible in some IRAs):**
    - Set up the original put ratio spreads as recommended, but also "buy to open" puts (with the same month of expiration) at a strike prices *well below* $190. Buy *half as many* as the number of $190 puts you wrote. When you do so, all of your $190 puts will be "covered" (half by your $200 puts, and half by the other puts you choose to buy at a much lower strike). Choose how much you want to pay to select your lower strike price. To us, the $180 strike or lower looks good, recently costing $1 or less. You will only need cash in your account to cover the difference between your two lowest strike prices (if you buy $180 puts, then $10 per share), and your risk is capped, making this potentially IRA-friendly. This makes the total cost of your hedge about a $1 debit, with no risk beyond that, and still $10 in potential ending value.

Pro Can Help

- **Need a refresher on ratio spreads?** Our guide can help.
- **Want to talk about SPY?** We have a discussion board for that.

Visa Announces a Solid Fourth Quarter and a Monster Acquisition

Published Nov 25, 2015 at 11:58AM

Visa (NYSE: V) finished its fiscal year with a strong fourth quarter despite persistent headwinds from currency volatility, sputtering international economies, and plummeting gasoline prices. Global payment volumes grew 12% in constant currency and net operating revenue increased 13% in constant dollars to $3.6 billion. Lower gasoline prices remain a 2% drag on U.S. payment volume, but that should moderate later in the year as we lap the early 2015 drop in oil prices.

The strengthening dollar has been a drag on profits thanks to both currency translation and decreased cross-border spending growth. Increased currency volatility has partially offset this headwind thanks to Visa's ability to profit from wider bid-ask spreads. Global cross-border volume growth, which tends to carry the highest margins, declined to 5% in constant currency from 8% growth the three preceding quarters. Management also shared that cross-border growth has slowed further to 3% through the first month of the current quarter.

Visa also announced another big customer win this quarter, stealing USAA from **MasterCard** (NYSE: MA) and ending a 30-year relationship between the financial service provider and the other payment processor on the *Pro* scorecard. The company also renewed it's it partnership with **Wells Fargo** (NYSE: WFC) which locks in 5 or the top 6 accounts through 2020.

In the fourth quarter client incentives were up significantly to 18.4% of gross revenue as the company signed several new renewals and announce a couple big wins. Though this will drive continued volume growth in 2016, management expects client incentives to remain at 18.5% through 2016, compared to the 17.1% run rate the company achieved in 2015. This is evidence that competition remains fierce, though management emphasized that the vast majority of the company's growth comes from the shift from cash to digital transactions rather than taking market share.

On the capital allocation front, Visa continued to return cash to shareholders, repurchasing nearly $3 billion of shares at an average price of just under $66 a share. The company now has $7.8 billion of repurchase authorization for fiscal 2016.

Visa Acquisition

The biggest announcement for the quarter is the planned acquisition of Visa Europe for $16.5 billion of cash and stock. Including the proposed $4.7 billion of earnout provisions, total consideration for the deal could hit $21.2 billion if the Visa Europe business achieves certain performance hurdles. The company plans to raise $15 billion to $16 billion in debt to fund the acquisition and to repurchase enough shares over the next year to offset the dilution from the convertible preferred shares issued to Visa Europe shareholders. These buybacks will be in addition to the company's normal repurchase activity.

Management also claims that they are attempting to create "a more efficient long-term capital structure". In other words, they're taking advantage of historically low interest rates (3% to 3.5%) to reposition the balance sheet and benefit from the tax shield provided by interest payments on debt. Visa's business model generates a ton of free cash flow, which can easily support additional debt without risking financial distress or the company's investment grade credit rating. Management is targeting a leverage ratio of 1.0 to 1.5-times EBITDA, which the company can reduce quickly if necessary.

Overall, this transaction isn't much of a surprise. The payment processing business is all about scale and this acquisition allows Visa to make a big jump in that regard. Europe will now represent 26% of Visa's combined transaction volume. Visa previously made the transition from the member-owned model to the commercial model before its 2008 IPO and these companies have been working closely for a long time, so the cultural transition shouldn't be too painful. Still, management expect the total integration process to take 3 to 4 years and cost $450 million to $500 million in addition to $150 million of one-time transactional closing costs. The technology integration will likely be the biggest cost savings, as the two companies merge platforms and eliminate redundancies. All-in-all management expect to generate $200 million in cost savings which amounts to a 30% reduction from Visa Europe's annual run rate.

2016 Outlook

Looking forward into next year, management expects payment volumes to grow faster than the 11% clip they've grown over the past two years. That increase should begin in the second quarter when we anniversary the big drop in gas prices and then accelerate in the second half as the USAA (a recent steal from MasterCard) and **Costco** (NASDAQ: COST) deals come online. Management expects currency to be a three percentage point drag on net revenue in 2016 – up from the 2.5 percentage point drag the company experienced this past year. As a result of a strengthening dollar, management also does not expect any meaningful improvement in cross-border transactions growth in the coming year.

Visa is also spending heavily in China to be ready to launch services once the government finalizes its new regulations later in the year. It's nearly impossible to make any estimates about how quickly that market will ramp, but it's a massive opportunity that's mostly being served by a single provider, UnionPay, so even a small market share win will move the needle.

The *Pro* Takeaway

Visa continue to perform well in a tough operating environment. The acquisition of Visa Europe seems a bit pricey, but it's a smart strategic decision and there's likely significant upside to current transaction volumes as the European economy improves and currency valuations mean revert over time. There's also room to improve yields through pricing, but management didn't want to share those plans for competitive reason.

Both of the payment processors in the *Pro* portfolio continue to benefit from the same tailwind and we think they have strong competitive advantages (brand, scale, network effect, etc.) that will allow them to continue creating value for shareholders. Even though Visa doesn't look cheap (it rarely does) at 27.8-times forward earnings and 17.7 times enterprise value-to-forward EBITDA we still think it will continue to generate North Star besting returns for the foreseeable future.

Close Your Positions on Boulder Brands

Published Nov 24, 2015 at 12:49PM

Is this for you? This trade is **only** relevant for *Pro* members who are participating in our short and any related positions we have on **Boulder Brands** (NASDAQ: BDBD). We are closing all Boulder positions with this alert -- new members lacking any Boulder positions can ignore this trade alert.

How You Participate

- **Trades:**
    - Buy to close (or cover) all of your existing short shares of Boulder Brands.
    - Buy to close all January 2016 $10 puts.
- **Allocation:** Close all existing Boulder short shares or option contracts. *Pro* will close its 6,200 short shares. (Unfortunately, we did not get to write the covered puts suggested last week, but we're glad many members did!)
- **Price Guidance:**
    - Use a limit order to close short shares for the going price, lately around $10.93 -- give or take pennies when you make the trade.
    - With a limit order, buy to close the January $10 puts for $0.05.
- **Prices (as of 10 a.m. ET):** Stock, $10.93; options, bid/ask: $0.00/$0.05

What We're Thinking

This morning, news broke that **Pinnacle Foods** (NYSE: PF) sees value in one of our short holdings, Boulder Brands, offering a buyout price of $11 per share, or $975 million including Boulder's debt. Just a few days ago, we took action to exit our short at a price near $9 by recommending $10 covered puts, but today that option is gone (literally and figuratively). Members who wrote those puts earned income, offsetting some of the stock's gain, and you can close the puts for a nickel to end that exposure.

It's now time to buy to cover, or close, our short shares of Boulder Brands. The stock is a bit below the $11 buyout price, and we don't want to wait for another, potentially higher bid. Instead, it's time we cry uncle (again, as we did a few days ago with our puts!) and leave this short. We're down 27% today, a loss made tenable by our small position sizing, now about 2.6%.

But the loss still smarts, we were still wrong, and we can learn lessons from this. At one point, we had a large gain on our short. We smartly (in hindsight) bought calls to protect that gain, even as we shorted more shares to bank on continued sales declines. But we later closed our calls for a profit and opened ourselves up to upside risk again.

Billy and I spoke about this position last week, along with our covered put recommendation, and (again, with hindsight) we now believe we should have covered the short when the CEO resigned and the stock was in a tailspin. However, sometimes a company continues to unravel after the CEO leaves. In this case, though, it turned out that a strong hand took the helm. And as we reported this month, the story started to get better -- leading to our choice to move to close our short.

Any way you look at it, we learned some lessons here that we can talk about together in future. Perhaps the next time a CEO resigns and a short is falling, we may close half or all of it. Each case is different, but we now have this experience to recall and add to our decision-making process. As we close our Boulder short, *Pro*'s short exposure decreases by 2.6%. We're seeking new shorts and hedges that should roll out in trade alerts in coming days and weeks.

Have a great Thanksgiving. With this short closing, now you can even enjoy some Boulder Brands foods at the table! (Provided it doesn't leave a bitter taste in your mouth.)

Alternative Trades

- **Did you set up a synthetic short instead of shorting shares directly?** Close that as well.
- **Did you buy puts instead of shorting?** You can "sell to close" your puts if they still have any value, dependent on the strike. Or you can simply keep them (they're probably near worthless) in case the buyout falls through and the stock falls.
- **Did you write different covered puts?** Whether December or February, buy to close those as well, both for $0.05. Why? Just in case the stock falls. We don't want you to be on the hook to buy shares.

6 Key Things to Learn From Pro

Published Nov 23, 2015 at 2:56PM

Pro Completed Trades

- **Boulder Brands** (NASDAQ: BDBD): We wrote 62 December 2015 $10 puts, covering all of our short shares. We were paid $0.55 each. [**Correction:** This trade did NOT get filled. We'll try again on Tuesday, at a lower limit if needed. The next two did.]
- **Expeditors International** (NASDAQ: EXPD): We sold to open December 2015 $48 puts and $50 calls, collecting $1.25 in premium (a 2.55% yield on the share price) with expiration in 25 days.
- **Verisk Analytics** (NASDAQ: VRSK): We bought 100 more shares at $73.90, bringing our total allocation up to 2%.

Please note: On these trades, we're receiving considerably poorer pricing than was listed in the Trade Alert in question (this usually happens!). But after our 24-hour waiting period, we have to make the trade if we reasonably can; we wanted to get these done, and we still believe in each even as pricing changes.

Dear *Pro* members:

It's great to see so many new *Pro* members on our discussion boards, asking questions, engaging in conversation with other members, and making investment decisions suitable to them as they move forward – whether that's mirroring the *Pro* portfolio exactly, or modifying it to suit individual needs.

When we launched *Pro* more than seven years ago, this type of robust community discourse between members wasn't possible. New members didn't know for certain what we were about. What was our style? How would we invest? Today, those questions are much easier for our veteran members to answer, so they can easily help new members get up to speed (thank you!). That said, we're still early in this endeavor to grow great value together over many years.

Today, we'll highlight some of the most important things for all members to learn from *Pro*. But before we do that, let's get some of the most common new-member questions out of the way:

- **Should I invest in an IRA or not?** That's up to you; many members do.
- **Should I only buy stock in 100-round lots?** That's not very important, especially if it takes you further from our allocation guidance.
- **Should I buy all of *Pro*'s Buy-rated stocks, or only the ones below our fair-value estimate?** Yes, buy all the ones that are rated Buy; that's why we rate them Buy! Fair value is a conservative estimate that goes up over time.
- **Should I sell all of my old stocks or not?** Sell your least favorites if you need to raise funds for *Pro*, but don't be shy about keeping stocks you love.

Those are important initial questions. But now that they've been answered, let's look at the bigger picture: What will help your investing *most* over the coming years? Here, in order of importance, we have ...

6 Key Things to Learn From Pro

1. The types of companies we buy.

If you only come away with one thing, it should be this: We buy companies with eight specific qualities (we spell them out in your Guidebook) that will ideally lead to long-term compounding. Rather than seeking small gains that don't really make a difference, we aim to buy companies that will steadily grow, reinvest their cash flow in more growth, and compound further for us as a result. To describe these businesses, we borrowed the term "compounding machines" from fund manager Chuck Akre; it fits so well, we didn't need to change it.

If you learn to target businesses with pricing power, predictable revenue, high returns on investment, and our other qualities, it should change your long-term investment success in a large way. This year hasn't been friendly to most stocks; energy, new tech, and a lot of retail stocks are down 40%, 50%, or more. Since inception, *Pro* has had very few losers because we work hard to target companies that are resilient in most any scenario. When we stray from our own criteria, we're more prone to lose. Take heed!

2. Our preferred time frame -- and patience.

If you're a Foolish investor, this one is easy. You already know that small gains are made in the short term and by trading (if you're lucky), but fortunes are made by holding great businesses for years. We don't sell our favorite businesses on short-term blips or minor valuation concerns. We're investing to compound. You should only buy a stock when you have a rolling three-year outlook, to start.

3. Portfolio construction.

If you internalize those first two factors, you should do very well over the rest of your investing life. But *how* you build and manage your portfolio will help determine the magnitude of your success, and the bumpiness you experience in getting there. How do you allocate your positions? Do you let winners run or keep trimming them?

What we hope you'll learn from your *Pro* service about portfolio construction and management is best gathered from at least a few years of following what we do. One constant you'll see is that we want flexibility in our portfolio. We want to be confident and have room to make new investments even when the market is in chaos. So, we seek to construct a portfolio that only holds businesses we believe in (that match our criteria), has cash for opportunities, and delivers steady returns despite market volatility -- with at least some positions winning no matter what the market is doing.

For some stats: Since January 2012, our portfolio has averaged 87% long and 15% short, meaning we've averaged 72% net long (or net invested in the market). Yet with less volatility and only 72% market exposure, we've outperformed the North Star and the S&P 500 -- thanks in part to the strong types of companies we own.

4. Using options for income.

If you're interested in going beyond stocks into options, arguably the single most valuable lesson you can learn here (and in our sister service, *Motley Fool Options*) is how to generate income by selling options. We talk about this so much across both services that I won't go into it more here (see [Options U] if you want to dive deeper), but suffice it to say that countless members have changed their investing lives -- and made retirement possible or better -- by learning how to generate income in their portfolios (while still holding stocks for upside!). Among our favorite strategies are written puts and covered calls, and we've made option income almost every month this year here in *Pro*. That remains our goal: Monthly option income on top of our stock investments.

5. How and why we hedge.

Carrying some cash is one way to soften the blow of falling markets; another way to do this is by learning to hedge the *Pro* way. We typically set up low-cost option hedges on major market indexes, such as the S&P 500 or Russell 2000. Many of our hedges don't cost us money out of pocket (instead, they often carry an obligation to buy shares of the index if it falls sharply, something we're fine with). Most hedge funds pay a large percentage of assets to hedge, but we usually don't. Not doing so has been important to our returns since inception. If you want to learn to hedge, follow our hedging trade alerts (most of which are very low-cost) and attend (or review) our Portfolio Positioning event on Dec. 1, which will address a new hedge or two we hope to issue by then, along with our options and shorts.

6. Shorting losers.

Finally, selling short companies isn't for everyone, but you can learn how to employ this "expert only" investing style in a way that won't put your portfolio at unreasonable risk – and should help in bad and even good markets. We seek to short companies that should struggle *whatever* the environment. Position sizing and risk management (including knowing when to close the position) are important, as is having a broker that allows you to stay short (we've had the best luck with TD Ameritrade and Interactive Brokers). Shorts are the final piece of the puzzle to learn here in *Pro*; we'll have more info on our existing shorts on Dec. 1, along with interesting, promising new shorts in the weeks to come. (If you can't make the Dec. 1 event, no worries; video and text will both be archived on the event page when it's over.)

It's All a Fun Process

Enjoy the process. Like anything good, it takes time. But if you enjoy it, before you know it you'll own great stocks, and enjoy owning them; you'll be calm, because you always think in rolling-three-year terms; you'll have a portfolio that is flexible and strong; you'll be generating regular income from options if you want; and you will be hedging and shorting as much or little as you wish, with confidence. These are the key things we hope you'll learn with us at *Pro* to make you a better investor for life.

Thank you for being here and for putting your trust in us. And to our American members, have a wonderful Thanksgiving holiday!

-- Jeff (TMFFischer)

Write Covered Puts on Boulder Brands

Published Nov 20, 2015 at 11:14AM

Is this for you? This trade is **only** relevant for members who are participating in our short of **Boulder Brands** (NASDAQ: BDBD), which is currently on Hold. If you've yet to establish a position on Boulder Brands, you can simply ignore this alert. The position is now on track to leave the portfolio.

How You Participate

- **Trade:** Sell to open January 2016 $10 puts.
- **Allocation:** 2.3%. Write one put for every 100 shares of Boulder Brands you are short; *Pro* will write 62 contracts. These in-the-money puts, if exercised, would see us close out our short position completely around a net $8.90.
- **Price Guidance:**
  - Based on the pricing in this alert, because the bid/ask spread is wide, **it is extremely critical that you use a limit order** to target $1.10 or greater to start (for an effective buy-in price of $8.90, and a 6.6% yield on time value in just less than two months). **If we all use limit orders** and the stock price cooperates, we can hopefully achieve $1.10 today. Be aware that as the stock price bounces around, the premiums will change, and the guidance in this alert may quickly become stale. If you can get a higher premium, go for it, **using a limit order** (are you sensing a pattern?) to at least split the bid/ask spread. As time goes on, it is more critical for you to execute this trade than to hold out for the guided price. We intend to use these puts to close our short, and with just two months to expiration, time value will drain from the puts relatively quickly, reducing their attractiveness. If *Pro*'s alert impacts market liquidity and guidance is immediately unachievable, see the Alternative Trades below. (But this won't happen, of course, because **everyone is going to use a limit order**. Right?)
- **Prices (as of 9:45 a.m. Nov. 20):** Stock, $9.53; options, $0.85 bid / $1.50 ask.
- **Scorecard Status:** Short (Hold), 2.3% allocation; we're now writing in-the-money puts with the goal of completely closing our position.

What We're Thinking

Shorting is a difficult business. Despite deteriorating financial results that are tracking almost perfectly with our short thesis, **Boulder Brands** (NASDAQ: BDBD) is trading right around the price it was enjoying when we established our initial short position in March of this year. Why? For one, the stock has become the target of an activist investor, and Boulder has announced that it is exploring "a range of strategic and financial alternatives to enhance shareholder value" -- corporate-speak for "we are looking to divest a portion of our business or be acquired." For another, Boulder's most recent earnings report showed signs of improvement in the company's operations (see our review of the quarter here for more). Additionally, the stock rose in value this week after **ConAgra Foods** (NYSE: CAG) announced that it will split into two companies. This has fueled further speculation about the prospects for corporate action from Boulder (will it split into two companies too? Or perhaps something else?).

All in all, after thoroughly analyzing the business and tying it back to our initial short thesis, we've decided that despite the stock's ugly valuation (146 times TTM GAAP earnings, 42 times TTM free cash flow), there's simply too much risk involved with keeping an active short position. Our initial short thesis relied upon poor management, a flawed business, *and* a pricey valuation. Now, with the change in management and an improvement in fundamentals, the short thesis would rely increasingly on valuation as the main pillar. With the potential for continued operational improvement and a possible corporate action (a spinoff, divestment, or buyout), this short has become much more risky than it was when we established it.

As such, we've decided that the proper course of action is to write in-the-money puts that, if exercised, would see us "buy to close" our short shares at prices that are more favorable than simply closing the short on the open market. Additionally, writing puts will likely put less pressure on the stock price than issuing a simple close. Since this is a small business with less liquidity than a typical *Pro* stock, we have to be careful about how our actions affect the stock price.

So we'll be pursuing a strategy we use often (written puts), but in a much different manner than is typical for us. Writing in-the-money covered puts will lower the effective closing price on our short and will result in less pressure on the share price than issuing a simple close.

Given the net start price on our two slices of short shares, plus the profit on our protective calls, less the drag of short fees, our effective start price on the position is $8.89 per share. If we can achieve the $1.10 guidance and our puts are assigned, then we'd be closing our short at a net $8.90, resulting in an essentially breakeven result on the total Boulder Brands position. If our puts are assigned in January, we'd have maintained a small amount of short exposure and reduced our correlation to long stocks for 10 months essentially for free, although we weren't able to earn an absolute profit on the position. And we've also earned some experience that shows just how difficult it is to be a successful short seller.

More That Matters

- **Maximum loss:** Our maximum loss on our overall covered put position (short shares + short puts) is theoretically unlimited if the stock continues to rise. This is the same as a regular short.
- **Maximum gain:** On these written puts alone, our maximum gain is the put premium. At $1.10, that's a 6.6% effective yield on time value in just less than two months.
- **Follow-up:** If our puts are assigned, we'll be buying back our short shares at a net price of $8.90 per share, about breakeven on our Boulder Brands position. If the stock price rises above $10 before expiration, we will likely write new puts at a higher strike, maintaining our intent to close the position.

Alternative Trades

- **Did you write a synthetic short instead of shorting shares directly?** You could either write covered puts that expire the same month as your synthetic short, or you could just close your synthetic short immediately.
- **Did you buy puts instead of shorting?** You can "sell to close" your puts if they still have worthwhile value.
- **Want to write other covered puts?** Consider writing December or February puts if the price on those options holds up better than those of the January puts after this alert is issued, aiming to at least split the bid/ask spread. Be aware that with a December expiration, your net buy-in price will be higher than the January puts, although you will have to wait less time to close your short. With the February expiration, your premium will be higher and your net buy-in price will be lower, but you'll have to wait more time to close your short, increasing the risk of adverse news.

Boulder Brands Shows Signs of Improvement

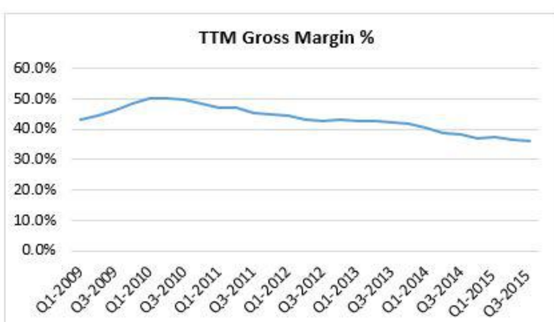
Published Nov 20, 2015 at 10:40AM

After uncapping our short position on **Boulder Brands** (NASDAQ: BDBD) back in early September by selling our protective calls, we've been waiting for the company to report its most recent round of earnings before making any decision on what to do with our position. Since we started the short in March, our short thesis has been complicated by a CEO resignation and subsequent reshuffling of management, speculation about a divestment or buyout, and the involvement of an activist investor. Let's dig into this quarter's numbers to see how the results stack up against our short thesis.

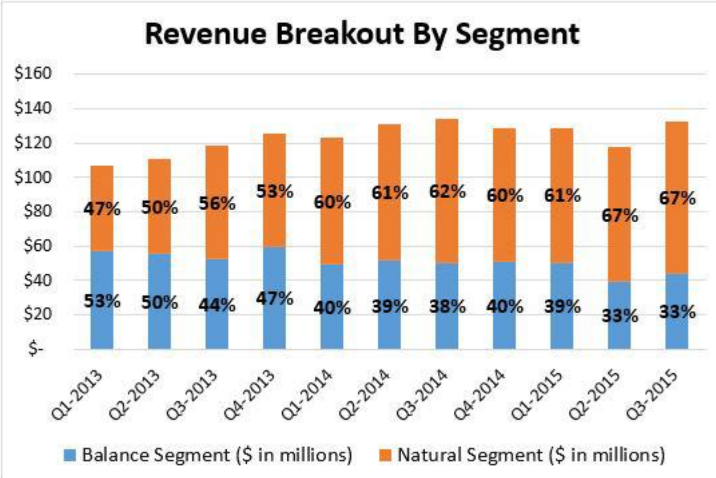
What Happened?

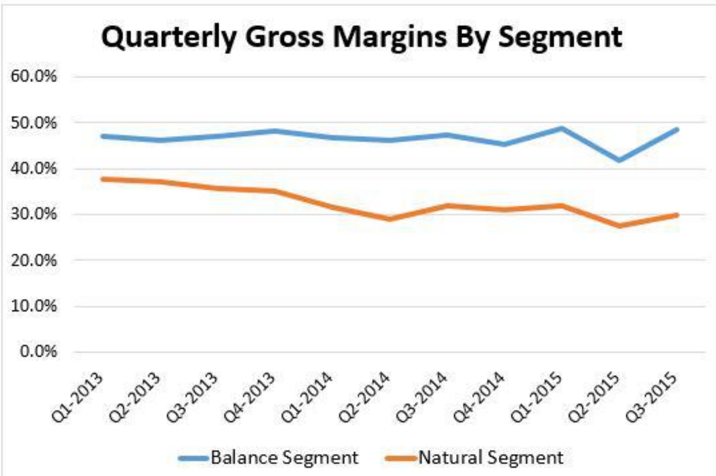
Boulder Brands reported a decent quarter that actually beat consensus estimates on quarterly revenue and adjusted EBITDA, reporting net sales of $132.9 million (a 0.7% decline compared to Q3 2014) and adjusted EBITDA of $19.6 million (a 6.2% decline compared to Q3 2014). Side note: As long-term investors, we generally don't place too much emphasis on Wall Street estimates, but they do have a tendency to affect short-term stock price movements. Given that short positions are more tactical and timing-dependent in nature, in this case it's useful to take note of how the business performed relative to near-term expectations.

The company experienced a significant sequential (quarter-over-quarter) increase in gross margin, reporting 36.1% compared with 32.4%last quarter. Despite this, companywide TTM gross margin (the rolling four-quarter average, which smooths out seasonality and provides a longer-term perspective) continued its decline, as this quarter's TTM gross margin was down compared with a year ago:



The primary reason for the year-over-year decline in gross margins is a higher proportion of sales from the company's faster-growing and lower-margin Natural division. Margins are also declining across this division because of yield losses at Udi's as the company focused on removing bread items with air pockets or holes from its production line:

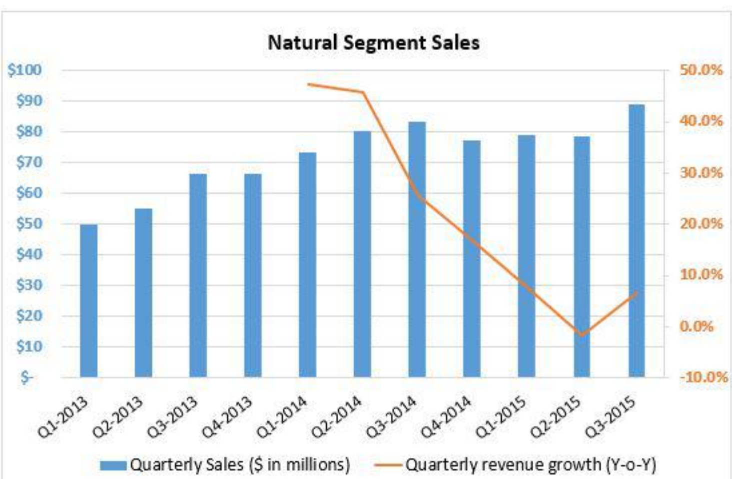




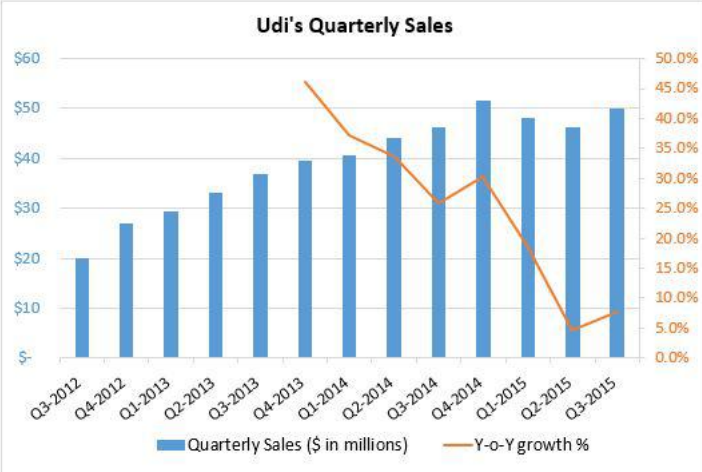
The day of the earnings release, the company's stock price bounced around as investors digested the report, swinging from a low of -5.9% to a high of +4.9%, eventually closing at $8.98 (up 3.3% that day).

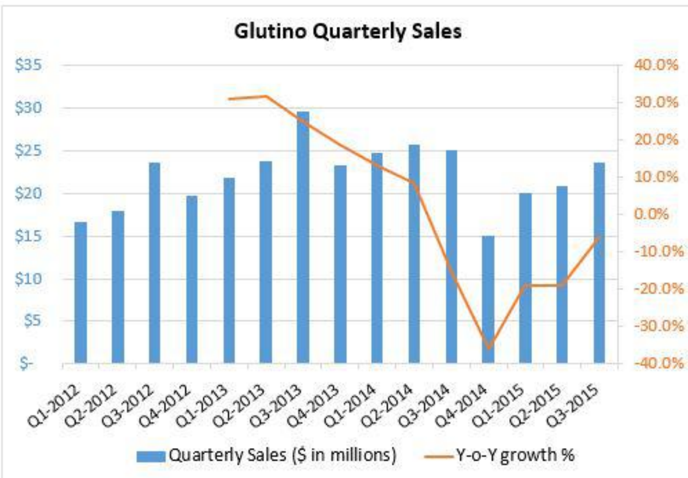
So What?

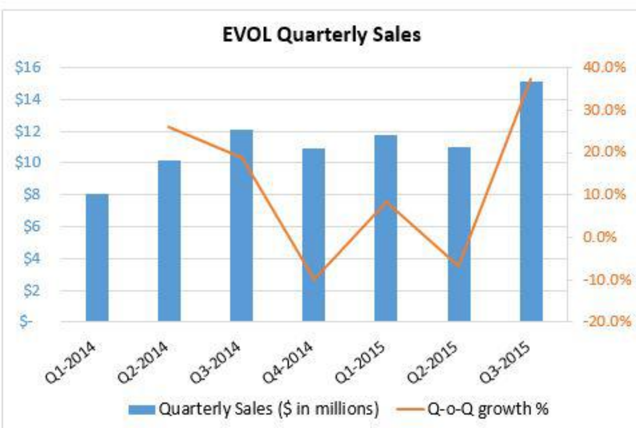
The key element to our short thesis is that the prior sales growth trajectory of the company's Natural business (composed of the newly acquired Udi's, Glutino, and EVOL brands) was misleading and was likely to slow. We can dig into the quarterly sales trends to figure out how that element of the thesis is tracking. In Q3 2015, the company was able to reverse the trend of declining sales in the Natural division, posting an acceleration of sales growth for the first time since year-over-year trends were available:



The Natural division posted year-over-year quarterly sales growth of 6.6%, vs. a decline of 1.9% last quarter. Breaking it down even further by looking at each individual brand, we can see which brands are responsible for the increases in sales:







We can see from the graphs that the declining growth trends for the company's key brands in the Natural division have turned around, with Udi's sales accelerating to 7.7% growth year-over-year (up sequentially from 4.6% last quarter), Glutino's sales posting a smaller decline of 5.9% year-over-year (vs -18.9% last quarter), and EVOL sales accelerating to nearly 40% quarter-over-quarter growth (from -6.7% last quarter).

Management noted that the increases in sales were dependent on different factors, with volume increases (via distribution and velocity gains) most strongly impacting the EVOL brand, and price increases most strongly impacting Udi's. The wording in the 10-Q on the composition of growth was devoid of numerical specifics, perhaps intentionally so.

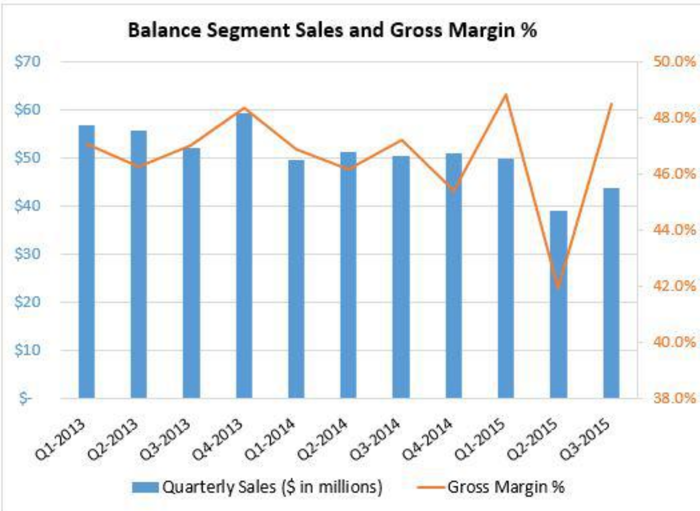
The composition of growth (distribution vs. velocity) is an important distinction, since our short thesis relies on our belief that initial distribution growth will eventually have to give way to end-user consumption (velocity) growth. Since EVOL is a younger and smaller brand (acquired two years ago, vs. three years ago for Udi's and four for Glutino), it's not surprising that it's showing higher distribution and velocity growth than the older, more mature brands. For example, in this quarter, the company launched EVOL cups in Target (NYSE: TGT), with 12 new SKUs. Sales of newly launched SKUs will obviously boost sequential sales figures compared to quarters when those SKUs didn't yet exist.

Additionally, EVOL targets a different market than Udi's and Glutino, focusing on consumers who desire simple ingredient lists without artificial ingredients or preservatives (vs. a focus on the gluten-free market for the other two brands). In my estimation, EVOL is probably the company's most strategically positioned brand, but since it is small (comprising just 17% of the company's Natural division sales and 11% of companywide net sales), it doesn't affect earnings as much as the other brands, although that may change if EVOL continues to grow.

Udi's makes up more than 56% of the company's Natural division sales, so trends for Udi's are disproportionately important to Natural's trajectory. This quarter, the company was able to generate growth in Udi's sales via price increases, but in a competitive industry, price increases are likely unsustainable, since they negatively impact demand as consumers can trade down to a lower-priced product. But if the company's brand strength is stronger than I anticipate, further price increases could continue to fuel growth. It'll be interesting to pay attention to management commentary regarding the growth trajectory (and growth composition) of Udi's sales over the next few quarters.

At Glutino, the pace of sales declines slowed significantly, although sales growth is still negative at -5.9% vs. the same quarter a year ago. Management noted that excluding co-pack sales and foreign exchange rates for the Canadian dollar, Glutino sales actually increased 3.7%. It appears that Glutino sales are starting to stabilize, and management stated on the conference call that it's because "we're focused on it."

As for the company's legacy Balance division, results were relatively strong compared to last quarter, which was the worst quarter for this segment in the company's history:



I wrote last quarter that "this segment may bounce back a bit next quarter as the Easter-related seasonal factor rolls off," and that's what happened, with the segment posting a year-over-year sales decline of -12.9% (vs. -23.7% last quarter) and a corresponding uptick in gross margins due to a favorable product mix within the Smart Balance portfolio. I was a bit surprised to see such a significant increase in gross margins, and it may be related to the company's focus on product renovation and reformulation to reduce costs.

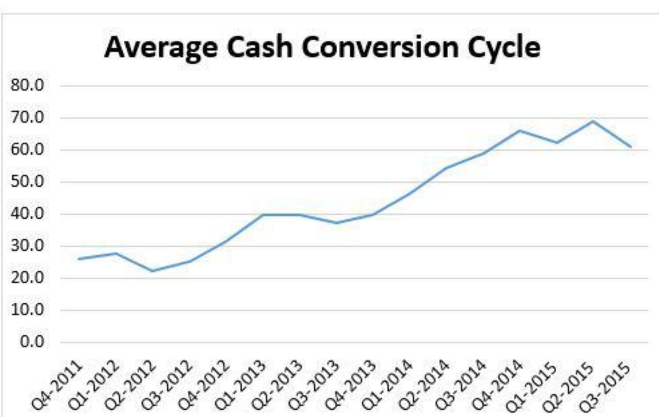
Now What?

All in all, based on the results from this quarter and the corresponding management commentary, it seems as though the new management team has a much better handle on competently and properly managing the company's supply chain, cost structure, and product portfolio. Management has already implemented a restructuring initiative by reducing salaried headcount by 15%, and they mentioned that the resultant G&A savings would be deployed into reinvigorating the company's marketing.

Low and ineffective marketing spend was another key element of our initial short thesis, so the company's turnaround in sales alongside new marketing initiatives provides another dent to the ongoing viability of our short thesis. Management made many comments on the conference call about how they plan to realign the marketing function, and the comments were well-reasoned and thoughtful.

Management also commented on their "fanatic discipline" on controlling costs. This is a sharp contrast from the previous management team, which seemed to be loose with corporate controls and spending. The company mentioned several initiatives focused on reducing costs, including the aforementioned headcount reduction (which helped provide a favorable impact to G&A expense of $1.8 million in the quarter), increased outsourcing to co-packers where it can create cost savings, improvements in supply chain efficiency, product renovation and reformulation to improve gross margins, and a SKU rationalization program to cut underperforming products from the company's portfolio.

We can already see some effects of the new team's strategies in the company's sequential gross margin improvement, reduced G&A expense, and improved sales trends alongside new marketing initiatives, as well as in an improvement in the cash conversion cycle, another key metric we have focused on with our short thesis:



The cash conversion cycle (the length of time it takes for the company to convert inputs into cash flows) declined this quarter, suggesting better working-capital and cash-flow management. The drivers behind the decline were a reduction in how long it took the company to collect on sales (Days Sales Outstanding) and an increase in how long it took the company to pay its creditors (Days Payable Outstanding). The company's Days Inventory Outstanding (how long the company takes to turn its inventory into sales, which for Boulder is probably the most important metric of the three) actually increased in the quarter to the highest level I have on record, which is a positive for our short thesis. But the magnitude of that increase was smaller than the magnitude of the effects of the other two metrics.

While the improvement in the cash conversion cycle is indicative of better management, the company needs to be careful in how it deals with customers and creditors. Boulder Brands generally has less bargaining power compared to its bigger and more powerful grocery, club, and mass-merchandise customers, so cracking down on receivables collection and extending payments to creditors may strain business relationships. The company's short-term need for higher cash flow should be balanced with a longer-term focus on strong relationships with its business partners.

Speaking of cash flow, the company's operating cash flow in the quarter was $400,000; management invested $4.6 million in capital expenditures, resulting in negative free cash flow of $4.2 million. We can see how short-term cash flow management is a concern for Boulder, as the company has only $23.8 million in cash on the balance sheet, struggles to generate free cash flow, and carries a significant long-term debt load of $287.7 million, which creates an annual interest expense of nearly $17 million.

Declining sales growth, significant interest expense, and consistent restructuring, acquisition, and integration costs (which have averaged $1.7 million per quarter since Q3 2011) have made increasing earnings a struggle. This will likely continue as management tries to balance the competing needs for its cash: to pay for capital expenditures, to spend on marketing and selling initiatives, to pay down principal on debt, and to pay its significant restructuring expenses. The cash crunch hampers management's ability to funnel resources where they are most needed.

For example, consider that over the past four quarters, Boulder has generated total operating earnings (defined as revenue less cost of goods sold less marketing, selling, and G&A expenses) of $21.6 million. In those same four quarters, the company has paid interest expense on its debt of $16.7 million, as well as $19 million toward the principal and $16.5 million in net capital expenditures. That's a net $30.6 million lost over the last four quarters for just those categories alone, which exclude the company's significant restructuring expenses.

While the new management team seems to have a better handle on how to optimize the company's product portfolio, they really have their hands full and will need to see continued sales and earnings growth if they want to dig themselves out of their significant debt load. Working capital management and other short-term investing gains (such as the company's sale of 35% of its stake in juice start-up Suja) are not a sustainable way to grow free cash flow, and Boulder needs its brands to produce sustainable long-term growth to justify its valuation multiples.

At $9 per share, the stock trades for 1.6 times TTM sales, 146 times TTM GAAP earnings, 26 times TTM operating income, 22 times TTM EBITDA (17.6 if adjusted for "non-recurring" goodwill / trade name impairments and restructuring/acquisition/integration-related costs), and 43 times TTM free cash flow (defined as operating cash flow less capital expenditures less acquisitions). While I recognize the improvements to operations this management team has made, I struggle to understand how this weak business can be worth those lofty multiples. The market must be expecting significant, continued growth in sales from the company's brands. That, or the market is valuing the company on a sum-of-the-parts basis as if it will be acquired.

With 33% of companywide sales coming from the Balance division (which is experiencing 10%-15% declines in sales), 18% from Glutino (which is experiencing 6%-20% declines in sales), and 37.5% from Udi's (which has seen a significant slowdown in sales growth until this quarter, when growth resumed thanks to price increases), I find it difficult to envision a scenario in which Boulder is able to meaningfully reignite companywide sales growth. This is especially true when considering the company's balance-sheet problems, which force it to choose between reinvesting into the brands via marketing and manufacturing efficiency initiatives, or paying interest and principal on debt.

Nonetheless, the involvement of Engaged Capital as an activist investor and the potential for a buyout has led to higher risk now than when we initiated our short. The new management team seems much more focused and capable than the previous managers, and given this fact plus signs of a turnaround in the company's financial metrics, we believe keeping our short active would be an example of thesis drift. Although the stock's valuation looks bad, if the business is going to steadily improve, the market may look past the price and keep bidding the stock higher -- and that's not to mention the potential for corporate action, such as a spin-off, divestment, or buyout. That's why we've decided to write near-the-money puts with the intent of closing our short. See this corresponding alert for more details.

Pro Portfolio Building Report No. 2: Nov. 19, 2015

Published Nov 19, 2015 at 10:00AM

Welcome, *Pro* Fool! This report details our current thinking on all of the Buy stocks in our portfolio. Once you've read this and the previous report detailing our Buy First positions, you're ready to start (or continue) building your *Pro* portfolio as swiftly or as slowly as you like.

We want our advice to be uncomplicated: Purchase our Buy Firsts first (again, taking your time according to your situation — there's no rush); purchase our Buys after that; match our allocations as closely as you can (but don't worry about needing to buy in 100-share lots — fewer is fine); and stay tuned for our Portfolio Positioning Event on Dec. 1, which will address our shorts, hedges, and options.

We're glad you're here, learning to become an investor who will come out on top in all markets. Bring any questions to the Getting Started & Help discussion board, and Fool on!

Best,

The *Motley Fool Pro* team

Table of Contents

Buy: AmTrust Financial Services (NASDAQ: AFSI)

This shrewd insurer looks to enter markets optimistically, when pricing is favorable because others are struggling.

Suggested Allocation: 6%, perhaps bought in two to three blocks over the next two or three months

For More

- [*Pro*'s original recommendation] (4/3/2009)
- [Most recent earnings update] (8/20/2015 — this quarter's update is on the way)
- [Talk about AFSI]

AmTrust Financial Services (NASDAQ: AFSI) was founded in 1998, making it one of the new kids on the block in an industry where many of its competitors have been around for 100 years or more. But this newbie insurer has some serious street smarts. AmTrust likes to compete in niche markets (for example, small, low-hazard workers' compensation policies), waiting until a rough patch demonstrates that the incumbents in a space have loosened their underwriting standards. It's then able to grab market share in an environment favorable to itself, as rivals attempt to cope with prior losses by raising prices.

Over the past 12 months, AmTrust has written $2.7 billion of workers' comp premiums, making it highly likely to finish the year as one of the top five workers' comp underwriters in the United States. But we don't think that means it's doomed to the glacial pace of growth common to many of the larger insurers. The company is moving into the commercial package insurance business (which includes workers' comp); SNL Financial estimated this as a $233.6 billion market in net written premiums as of 2013. AmTrust management believes its commercial package business can become its next billion-dollar platform, and we believe management will continue to find markets ripe for disruption.

Buy: Apple (NASDAQ: AAPL)

The leader in mobile computing products should see more long-term growth than anyone expects.

Suggested Allocation: 4.1%

For More

- [Pro's original recommendation] (2/14/12)
- [Most recent earnings update] (11/16/15)
- [Talk about Apple]

Led by its iPhone, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the smooth Apple operating system, iOS, which centers on the iTunes and App Store marketplaces, as well as the new Apple Pay. iTunes alone earns more revenue each year than two-thirds of the companies in the Fortune 500, while Apple itself is the most valuable company in the world, with more than $230 billion in annual sales. Yet it's still growing strongly, with earnings per share up 43% this past year. The company's integrated hardware and software make for a sticky consumer experience that provides disincentives to switch to a competitor, and as more people use multiple computing devices, Apple makes it easy to transition seamlessly from one of its products to another.

We expect the recently launched Apple Watch and Apple TV to help further entrench the Apple ecosystem into people's daily lives, all while Apple continues to work on developing its next major product and returning massive amounts of capital to shareholders through dividends and buybacks (almost $50 billion in fiscal 2015!). We're not counting on a revolutionary product anytime soon, but we are counting on record numbers of phones being sold to both existing and new customers over the coming years. We want to be in on that conference call.

Buy: Broadridge Financial Solutions (NYSE: BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 4.5%

For More

- [*Pro*'s original recommendation] (4/27/10)
- [Most recent earnings update] (8/17/15 — this quarter's update is on the way)
- [Talk about Broadridge]

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in its fiscal 2014, its platforms processed more than 80% of all shares in the United States. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider for managing investor communications.

The company's smaller segment, Global Technology and Operations (GTO), accounts for 26% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance this Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy: Facebook (NASDAQ: FB)

The world's leading social network — and most trafficked website — is managed for long-term growth.

Suggested Allocation: 5.8%

For More

- [*Pro*'s original recommendation] (9/18/12)

- Jeff on CNBC with "Four Minutes on Facebook" (11/5/15)
- Talk about Facebook

More than 1.5 billion people use **Facebook** (NASDAQ: FB) to connect with friends, families, companies, marketers, and celebrities each month. Incredibly, more than 1 billion people visit daily. Most traffic arrives through mobile devices, and with a strategic focus on mobile advertising platforms, the company is on track to earn more than $16 billion in annual revenue.

Meanwhile, Facebook also seeks to remain the leader in social media and its offshoots, including virtual reality. The company has the equity to acquire competing platforms and to build traffic while treating each channel (Facebook, Instagram, Messenger, WhatsApp) separately.

Facebook is spending aggressively on technology, but today's spending should be rewarded down the road, and the company's free cash flow remains strong. The long-term potential is bright. The Internet still only grabs a minority of the ad dollars spent around the world each day, but online marketing continues to grow rapidly, and social media is finally finding its way into the spotlight — largely thanks to Facebook. That said, of the 45 million businesses with Facebook pages, only about 2.5 million advertise so far, meaning this friend network has plenty of room to spread.

Buy: MasterCard (NYSE: MA)

Plastic — and digital — is pushing paper out as the world's way to pay, and MasterCard leads the charge.

Suggested Allocation: 4.6%

For More

- *Pro*'s original recommendation (9/8/11)
- Most recent earnings update (11/18/15)
- Talk about MasterCard

MasterCard (NYSE: MA) is among the most attractive businesses in the world. The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders, who are actually exposed to the card users' finances; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

Though MasterCard competes with a large number of well-heeled and (in some cases) innovative businesses, the company's profitability is growing nicely even though the global economy isn't. And that makes perfect sense, because when it comes to paying for stuff, the global market leader isn't **Visa** (NYSE: V), or PayPal, or banks ... it's cash. Cash is used for a still-astounding 85% market share of transactions, but it's slow and inefficient, and with no one managing its brand, it's quickly losing out to better alternatives — like MasterCard. We continue to believe in the stock for the long haul (*especially* for the long haul, in fact). With earnings out recently, expect a valuation and earnings update soon.

Buy: Medtronic (NYSE: MDT)

Operating in a complex, regulated industry that provides entrenched leaders a competitive moat, our medical-devices leader is moving into international markets.

Suggested Allocation: 3%

For More

- *Pro*'s original recommendation (7/1/2009) ...
- ... and our second buy recommendation (11/9/10)
- Most recent earnings coverage (8/10/15)
- Talk about Medtronic

A leading medical-device maker, massive Medtronic should reach $6.5 billion free cash flow this year — and management plans to continue to return about 50% of cash flow to shareholders through increased dividends and buybacks. The recent Covidien merger should lead to at least $850 million in cost synergies by the end of fiscal 2018, as well.

While Medtronic has touted itself as a play on international markets, growth in the U.S. has regained traction, too. This year, U.S. revenue is up 7% to represent 56% of sales. Emerging-market sales are up 11%, representing just 13% of sales. Management sees strong long-term potential in emerging markets.

Whether it's cardiac issues, spine injuries, knee problems, or one of four other key categories, Medtronic is a market leader in vital medical devices. The stock yields 2%, and the dividend has increased annually over the past 38 years, resulting in an 18% compounded annual growth rate (CAGR). Expect continued dividend increases, sales growth of about 4% to 6%, and earnings-per-share growth even higher than that — all of which should combine for North Star-challenging returns.

Buy: OpenText (NASDAQ: OTEX)

This company's information management software keeps the digital lives of businesses in order, and its exchange platform drives business transactions.

Suggested Allocation: 2.6%

For More

- *Pro*'s original recommendation (8/31/11)
- Most recent earnings coverage (8/10/15)
- Talk about OpenText

With about 65,000 cloud software customers, renewals in that space running at about 95%, and the cloud making up 33% of its sales, **OpenText** (NASDAQ: OTEX) is officially a cloud software company. But as with **Oracle** (NYSE: ORCL), it's not *just* a software company; it's really a hybrid. OpenText also sells software the old-school way — on-premises, on a license basis — and renewal rates on those sales are in the low 90% range. OpenText is not looking to replace license sales entirely with cloud sales, instead letting customers choose their preference.

A leader in Enterprise Information Management (EIM), OpenText offers customers (governments, universities, corporations) a full suite of data-related software solutions. The three areas of focus are data and information management; information exchange platforms within and across organizations; and analytics, where "big data" is used to gain insights and better run a business. OpenText helps customers go digital with their data, a market that should grow smartly (we estimate at least 10% annualized) for a long time. Last year, OpenText increased adjusted operating cash flow by 25%, and margins are expected to trend higher next year. The $45 stock trades at about 13 times expected non-GAAP earnings for the year ending June 2016.

Buy: Papa John's International (NASDAQ: PZZA)

Deliver a slice of the profit pie right to your doorstep.

Suggested Allocation: 2.6%

For More

- PZZA position review (5/23/14)
- Most recent earnings update (8/17/15 — this quarter's update is on the way)
- Talk about Papa John's

Papa John's International (NASDAQ: PZZA) operates and franchises more than 4,700 pick-up and carry-out pizza joints in more than 38 countries. For the past 30-plus years, Papa John's has been making pizza and building its brand around the "Better ingredients, better pizza" tag line. Bringing that unwavering focus to each pie has resulted in the company's perceived quality advantage over its big-chain pizza competitors, which allows it to consistently price a dollar or two higher and attract the best franchisees. Now that its brand advantage is sufficiently established in North America, Papa John's is turning its sights abroad, believing that delicious American pizza is a language every taste bud speaks.

As sure as a fresh pizza will be gobbled up by hungry kids, Papa John's delivers results. For 11 consecutive years, the company has recorded flat or positive North American comparable-store sales growth. Recently, international comps have been in the 5% to 8% range, offering lip-smacking evidence that Papa John's flavors travel well. The company has opened more than 200 restaurants over the past two years and expects 220 more this year, and because Papa John's is primarily a franchisor, it doesn't have to bear the cost of that expansion (it's taken on by the franchisees). Competing for a share of the global appetite is tough business, but Papa John's has been able to increase sales and profits at commendable rates over the past decade, which has resulted in plenty of cash generation. Management recently initiated a dividend in 2013 and has consistently bought back stock over the years.

We believe the company will maintain its brand positioning, modestly improve underperforming franchise locations, and continue to be an attractive entrepreneurial outlet for new franchisees abroad. Papa John's should also be able to take modest market share from mom-and-pop pizza shops in established markets as digital ordering continues to gain adoption; it's a tough hurdle for smaller players to overcome. With a little bit of menu innovation and new markets maturing, we believe 3% same-store growth is sustainable over the next five to 10 years. We rate shares a Buy and encourage members to do plenty of field research on this one.

Buy: Parexel International (NASDAQ: PRXL)

Parexel is poised to benefit as pharmaceutical companies gradually outsource more drug development work to select CRO partners who can perform the work better, faster, and cheaper.

Suggested Allocation: 3.5%

For More

- *Pro*'s original recommendation (12/23/13)
- Most recent earnings update (8/17/15 — this quarter's update is on the way)
- Talk about Parexel on our discussion board

Parexel (NASDAQ: PRXL) is one of the world's largest and most respected contract research organizations (CROs). Over more than 30 years, it has built a stellar reputation on helping drug makers navigate complex clinical trial processes quickly, which has enabled it to cement important relationships and have a role in developing more than 95% of the 200 top-selling drugs.

Based on industry data, from 2004 to 2015, outsourcing penetration — the number of development dollars outsourced to CROs — has increased by nearly 70%. Outsourcing is a cheaper alternative to the traditional high-fixed-cost model of staffing lots of white coats across various therapeutic specialties all around the globe. For large drug developers, letting CROs handle the development work — and those massive staffing needs — can boost profits and time to market, and for smaller drug developers who can't afford a huge staff, there is no other choice. As regulators require more efficacy data, larger patient participation, and increasingly global results, navigating the challenges of the 110,000-plus trials being conducted globally has become frustratingly complex, turning large, proven CROs with expertise and global capabilities into value-adding partners rather than transactional customers. We think Parexel will continue to benefit.

Buy: ProShares Short VIX Short-Term Futures ETF (NYSEMKT: SVXY)

Profit from the long-term nature of stock market volatility to revert to an average level after each spike.

Suggested Allocation: 1%

For More

- *Pro*'s original recommendation (11/25/14)
- Talk about SVXY

Buying shares in — let's make it easy and use the ticker, shall we? — SVXY is a recommendation for *Pro* members who are comfortable owning a small stake in a volatile position that we *may* add to during market downturns. *Pro* is a portfolio service, so all positions are meant for everyone, to the extent you can do them and wish to. But this position will be especially volatile, so only follow it if you're comfortable with high volatility in a holding.

This vehicle increases in value when stock market volatility — as measured by the CBOE Volatility Index (or VIX) — goes down or is range-bound. This ETF *sells short* futures contracts on the VIX that have one month and two months to expiration. Unless volatility in the S&P 500, as measured by the VIX, increases above and beyond the premium already baked into the futures contracts being shorted, the positions turn a profit and the ETF goes up in value. Helping further, VIX futures contracts are historically in a state of "contango" as much as 90% of the time. Contango means that future-month contracts are increasingly more expensive than earlier months' and than the current VIX itself (much like a call option has a premium above the current stock price). This is a tailwind for SVXY, and it exists most of the time. As long as volatility stays near its average overall, then just holding this small stake over the years should reward us very well. We recommend starting at 1%, and we may add more when the VIX soars — meaning when volatility in the market is high. We're ready for it! But even if we don't, our position should create value for us over the long term.

Buy: Skyworks Solutions (NASDAQ: SWKS)

This leading designer of semiconductors, antennae, and more for smartphones and connected devices is growing sharply.

Suggested Allocation: 3.6%

For More

- *Pro*'s original recommendation (8/5/14)
- Latest earnings coverage (8/10/15)
- Talk about Skyworks

Skyworks Solutions (NASDAQ: SWKS) makes technology that powers wireless connectivity in a wide variety of products: Apple and Samsung smartphones and tablets, **Medtronic** (NYSE: MDT) medical devices, **Google** (NASDAQ: GOOG) and **General Electric** (NYSE: GE) products, and the list goes on. In the "Internet of Things," billions of physical objects are going online, and Skyworks is uniquely positioned to benefit. Not only does it serve *all* of the top-tier mobile device makers, but the company is diversified across industries to total more than 2,000 customers.

Skyworks sells more than 2,500 high-performance analog semiconductors and related products, supported by nearly 1,000 patents. The product list includes amplifiers, attenuators, receivers, switches, diodes, modulators, GPS power and voltage regulators, and more, often sold together as components of a phone or connected device. Skyworks earns industry-beating operating margins of more than 30% by selling specialized solutions to giant customers with growing connectivity needs. Plus, as wireless complexity increases, fewer companies can deliver the integrated modules customers need, putting Skyworks in an even stronger position. The China opportunity is large as well. This can be a volatile stock, but its long-term outlook (which is the time frame we care about!) remains very compelling.

By 2016, the company is targeting $8 in earnings per share on a run-rate basis (the most recent quarter x 4). The $75 stock trades at only 9.3 times that projected result. The company expects its long-term total addressable market to increase by about 15% a year, and Skyworks is growing much more quickly than that.

Buy: Starbucks (NASDAQ: SBUX)

You only think you're there for the coffee — the ubiquitous java purveyor has big plans.

Suggested Allocation: 3.8%

For More

- *Pro*'s original recommendation (8/22/2012)
- Most recent earnings update (7/30/2015 — this quarter's update is on the way)
- Talk about Starbucks

You may not realize it, but "**Starbucks**" (NASDAQ: SBUX) is no longer a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense it's just a front. We *think* we go to Starbucks for the coffee, but those seasonal red cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

Starbucks began opening America's eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 23,800 stores in 65-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences to fill more than 70 million mouths and hearts each week. This company is continually finding new ways to reach customers; we're grabbing a latte and a cake pop and coming along for the ride.

Buy: TD Ameritrade (NYSE: AMTD)

Assets and investment fees are rising; earnings should surge when interest rates head higher.

Suggested Allocation: 2.9%

For More

- *Pro*'s original recommendation (7/11/13)
- Monday Memo on TD Ameritrade's business model (9/15/14)
- Talk about TD Ameritrade

Entrusted with about $670 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NYSE: AMTD) hosts around 460,000 stock, options, and futures trades on an average day, collects investment fees, and earns interest on billions in cash and interest-earning assets. Its partnership with **TD Bank** (NYSE: TD) (which owns 41% of the company) also gives it a unique position in its industry, allowing TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank; when the current record-low Federal Funds interest rate increases, TD Ameritrade will earn much higher interest income, all of it pure profit.

In the meantime, the company retains its focus on increasing client assets, providing top-notch customer service, and launching more investment products and features. The company has increased new client assets by at least 10% annualized for the last seven years and counting. For context, the S&P 500 (including dividends) has delivered about a 43% total return since 2008; client assets held at TD Ameritrade are up by 240% over the same period. Operating margins are strong, too, lately in the low-40% range.

We expect management to continue to be excellent stewards of capital, returning profits to shareholders and increasing investor value. All the while, we know higher interest rates will someday lead to much higher net income. But even as we look forward to that, we can admire the company's current results and be ready to enjoy healthy returns.

Buy: Valmont Industries (NYSE: VMI)

Providing irrigation systems and support structures, this industrial company benefits as agriculture needs increase and countries build infrastructure.

Suggested Allocation: 1.8%

For More

- *Pro*'s original recommendation (11/5/13)
- Most recent earnings coverage (11/1/2015)
- Talk about Valmont

Valmont Industries (NYSE: VMI) features four business divisions, each serving a growing need around the world. Founded in 1946, Valmont's engineered products division supplies steel and aluminum poles to infrastructure projects worldwide, including road and traffic lights, stadium and parking lights, and wireless communications poles and support towers. This division also sells highway safety products including barriers and road grating. In addition, because it sells steel and concrete support structures, Valmont profits as electrical grids are renovated or built out.

Then there's water, essential to the world's farmers. Under the name "Valley," Valmont's center-pivot irrigation systems are the world's leading brand. More than 80% of the planet's irrigated acres still use inefficient "flood" watering methods, rather than efficient mechanized irrigation, so there's lots of room to run.

To top it all off, the company provides hot-dip galvanizing (just like Mom used to make), anodizing, and other coatings to protect aluminum and steel from corrosion. One of the largest custom galvanizers in the world, Valmont expects continued growth because it still captures a small percentage of the total market. Overall, Valmont operates in more than 80 countries. This is a long-term investment in an exceptionally run, cyclical business that's currently in a downturn (which is when you usually want to buy!). We've started with a small position and will considering adding to it over time.

Buy: Verisk Analytics (NASDAQ: VRSK)

This prototypical Pro *holding provides us with exposure to powerful tailwinds within the financial, energy, and health-care industries, among others.*

Suggested Allocation: 2%

- *Pro*'s original recommendation (6/23/15)
- Most recent earnings coverage (11/11/2015)
- Talk about Verisk

Verisk Analytics (NASDAQ: VRSK) may not be a familiar name, but with a strong competitive advantage, high customer retention, robust and contract-based cash flows, a scalable business model, and large (and growing) markets, Verisk is in many ways a prototypical *Pro* holding. Verisk started as an information utility for the insurance industry, but nowadays, the company is a data and analytics powerhouse that provides customers with solutions in all sorts of arenas: raw data, tailored analytics, enterprise reporting systems, policy fraud detection solutions, competitive benchmarking, and legally tested policy language, just to name a few.

One way to invest successfully is to buy out-of-favor industries, and three to five years from now, we may look back and realize that Verisk did exactly that by entering into the energy industry (via its acquisition of Wood Mackenzie) in the midst of the current energy slide. We tend to shun commodity-based businesses here at *Pro*, but we believe Verisk's purchase of WoodMac was a good one — the latter is pretty much a copy of the former, but with a different end market. WoodMac is a leading provider of data analytics to the global energy, chemicals, metals, and mining markets, and it actually has higher margins and a greater percentage of subscription-based revenue than Verisk's other business units. We don't profess to have any insight into what the next six months have in store for WoodMac and Verisk, but we believe shareholders will be very happy with the results over the next three years.

Buy: Visa (NYSE: V)

With its mission to "accelerate the electrification of commerce," industry leader Visa has most of the world left to conquer.

Suggested Allocation: 2.5%

For More

- *Pro*'s original recommendation (4/28/15)
- Most recent earnings coverage (8/5/2015 — this quarter's update is on the way)
- Talk about Visa

The ubiquitous nature of credit and debit cards in America means that many of us can go through life rarely touching cash. Yet in the U.S., cash still accounts for approximately 40% of transactions, followed by debit cards at 25% and credit cards at 17%. And globally, cash is truly king: MasterCard estimates that 85% of all consumer transactions still take place with old-school paper and coins. But all of that is slowly changing as economies modernize and middle-income families proliferate, bringing more converts to the benefits of electronic payment. With its mission to "accelerate the electrification of commerce," industry leader **Visa** (NYSE: V) has most of the world left to conquer.

We like Visa for many of the same reasons we like MasterCard. And with the recent acquisition of Visa Europe, the company will be adding 500 million card accounts that resulted in 18 billion transactions totaling $1.6 trillion last year. Visa is valued at $190 billion, and given its tiny market share, its ceiling should be much higher than that. It fits into *Pro* as a recurring-revenue business that invests its free cash flow in more growth at still higher rates of return, making it a compounding vehicle.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund (NYSEMKT: DGS)

Diversification in emerging markets with some of the best small, high-yield companies you've never heard of.

Suggested Allocation: 1.7%

For More

- *Pro*'s original recommendation (11/22/10)
- Talk about DGS

At *Pro*, we like the idea of investing in emerging-market small caps to diversify and target higher growth. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) (the longest ETF name in the world!*). This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields around 3%).

For *Pro*, owning shares of this well-managed ETF offers exposure to up to 600 of the most promising international business that we couldn't easily buy in any other way! Serving as direct exposure to emerging markets, this is an excellent way to invest in small companies in locations where we don't have a discernible edge but where growth exists — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The benefits of diversifying outside our home market are equally important over long periods. Emerging markets have badly lagged developed markets for the last several years, but eventually they should take the performance baton again, and we'll be in good stead with this position.

*Statement may not be 100% "true"

Write a New Covered Strangle on Expeditors International

Published Nov 19, 2015 at 9:44AM

If you are new to *Pro* and new to this position: This trade alert shows you the type of detailed, timely guidance you can always expect from us as our time together grows. Today, though, new members don't need to start this position unless they're highly motivated to do so. This is an advanced strategy. At the bottom of the report, our Alternative Trades for new members suggest modified approaches to this income position if you want to join in now. If you want to use options as part of your *Pro* portfolio, but you're not quite ready yet, you can wait for our Dec. 1 Portfolio Positioning Report and live event for more guidance.

Is this for you? Yes, if you're a *Pro* member following our option writing for income on **Expeditors International** (NASDAQ: EXPD), and if you (like us) have November options reaching expiration tomorrow, Nov. 20. **But please read the Conditional Note below,** as there are some timely conditions to be aware of.

How You Participate

Conditional Note: With the stock lately at $49.45, our November 2015 $46 puts and $50 calls are due to expire as full income Friday, Nov. 20. This is a good thing, and it means we don't need to touch these options *unless* the stock rises above $50 on Friday. You have two choices in managing this position now; we're sending this alert today so you're prepared no matter which you choose.

1. You can buy to close your November $50 calls today for a small sum (currently $0.15) and write the new strangle detailed below. You would do this if you wanted to remove any chance that the stock could drift above $50 tomorrow and surprise you. Only write the new strangle after you're certain your November $50 calls are closed.
2. You can do what we're doing: Wait and see whether Expeditors stock stays below $50 tomorrow, letting your whole strangle expire for full income if it does. (You'll save some money by not buying back your calls!) Then, write the new strangle very late tomorrow or Monday after expiration becomes certain. Alternatively, if EXPD is above $50 tomorrow, you can buy to close the November $50 calls and then write the new strangle (again, only after you're certain they previous one is closed).

Pro must wait 24 hours, so we'll be acting as necessary on Friday afternoon.

- **Action:** As the circumstances above play out, use a strangle order to simultaneously sell to open December 2015 $48 puts, and sell to open December 2015 $50 calls.
- **Allocation:** Sell one strangle (one of each option) for every 100 shares of exposure you have to the company. We have 1,000-share exposure through 10 contracts of a synthetic long, so we're selling 10 puts and 10 calls, as we've done before -- this potentially doubles our exposure, to a full 3.5% allocation.
- **Prices:**
  - **Stock:** $49.45
  - **Options:**
    - December 2015 $48 puts (bid/ask): $0.70/$0.80
    - December 2015 $50 calls (bid/ask): $0.75/$0.90
    - Combined bid/ask: $1.55/$1.70
- **Price Guidance:** Split the bid/ask as best you can, aiming for a **combined credit of $1.60 or higher** to sell the strangle. If we all use **limit orders**, then $1.60 should hold for Day One. As prices change, aim to get paid at least 3% of the current share price to write the strangle, lately about $1.50, targeting 3% in yield on share price in one month to expiration.

What We're Thinking

Our global logistics buddy reported healthy earnings last quarter, with air freight volume up 3%, net revenue increasing 11%, and a 17% gain in adjusted earnings per share. With a tight focus on cost control and organic growth, Expeditors is a well-run company with a stock that has slowly grown less expensive as earnings have increased. Our strategy -- writing both puts and covered calls on our long position in the stock, which was set up as a synthetic long -- has led to strong income, as planned, while allowing for steady upside for the shares over the past year or so, too. We just kept writing strangles at higher strike prices.

While we don't yet know whether we'll need to close our November $50 calls tomorrow, we do know that either way, we're sitting pretty and about to earn most of our November income. And because this is an income position, we're ready to write new options right away again. We're looking to sneak in one more income trade in December, then one more in January, before deciding what to do with our synthetic long position at January expiration. We'll either turn it into stock or roll it a few years forward; in either case, our goal is to keep this position going as long exposure to this stable company, along with steady option income. That means newcomers can feel comfortable about joining in, too.

Why This Strategy?

Since since starting this position in August 2014 (and assuming our options expire tomorrow), we will have earned about $8,000 in income on it so far, and we have unrealized gains of about $8,600 on our synthetic long. That amounts to more than $16,600 in realized and unrealized gains on the less than $600 in cash we deployed to start this position last August.

So our "income with upside" objective that leverages our capital is playing out well. In fact, it's worth pointing out today that we would use a higher strike price than $50 for our December covered calls if possible, *but* the next strike price available is $55 and it pays little, so we're all but forced to write calls with a strike near the current share price to continue our income objective. (And that's the case even though Expeditors is doing well.)

More That Matters

- **Maximum loss:** The same as owning at least 200 shares of stock (100 now, and 100 at $48), minus the option premiums received.
- **Maximum gain:** This new strangle still caps our upside at $50, plus all the options premiums received. The most we can make on this strangle alone is the $1.60 in premium, which is earned if the stock stays anywhere between $48 and $50 by expiration.
- **Breakeven**: Our existing synthetic long mirrors stock ownership that started at about $40.60, while this new short strangle in isolation has breakeven points at $46.40 and $51.60, giving us a decent range.
- **Follow-up:** The current plan is to continue writing strangles to earn income and to roll our existing strangle up or down if need be. By January 2016, we'll decide whether to turn our synthetic long into stock or roll it forward.

Alternative Trades

- **If you're new here and want to participate in the full position right away:** A written covered strangle (especially on a synthetic long) is a complex trade. If you're feeling at all intimidated, it's OK to wait for our Portfolio Positioning Report and live event on Dec. 1 instead! But if you're rarin' to go, here's what we suggest:
    - Buy about 1.7% in stock itself, in 100-share round lots (with the stock near $50 per share, 100 shares is about $5000. So, buy $5000 in stock for every $290,000 in *Pro* money you manage), then sell to open the January 2016 covered strangle. To do this, sell to open one January 2016 $48 put and one January 2016 $50 call for every 100 shares of stock you buy, and every 100 additional shares you could buy at a lower price. This gives you a total 3.5% exposure to Expeditors. The January 2016 $48 put / $50 call strangle pays you about $2.40 combined, or $240 per strangle. In exchange, you are agreeing to buy more shares of stock at $48, or sell your existing shares at $50, if the stock hits either price by expiration and you don't roll the option first. We'll have guidance as the January expiration approaches; we chose January to avoid a sudden taxable event this December and give you more time to see how this works before you have to take action again.
- **If you're new to *Pro* and just want to write covered calls:** Just buy at least 100 shares and simultaneously sell to open January 2016 $50 calls, lately paying you about $1.25 each. Write one call for every 100 shares you buy, ideally using a buy/write covered call order to do it all at once. Make sure your shares are less than a 3.5% allocation. This is an IRA-friendly trade.
- **If you're new to *Pro* and just want to write puts:** Sell to open January 2016 $48 puts, lately being paid about $1.15 each. Sell one put for every 100 shares of the stock you'd be happy to buy if it falls below $48 by expiration.
- **If you're a veteran member doing the IRA-friendly/covered-calls-only trade:** If you simply bought shares of stock earlier and wrote November 2015 $50 calls, you can follow the same guidance in this alert, closing the calls if necessary tomorrow and writing the new December 2015 $50 calls (ideally for at least $0.85, although that price will change if the stock moves). Accept the going price in that case. Finally, if the stock rises above $50 by Friday, we believe you should roll your calls, rather than lose your shares -- hence today's report. Those wanting to avoid any excitement tomorrow can simply close the November $50 calls today, lately for about $0.15 -- or use a rolling order to close them and write the new December $50 calls, resulting in a net credit of about $0.70.

Pro Can Help

- **Want more on this strategy?** See our guides to covered strangles and synthetic longs. We're combining the two into a synthetic covered strangle.
- **Questions?** Please ask, Fools! Ship yourself on over to our Expeditors board.

Plenty To Like About MasterCard's Boring Quarter

Published Nov 18, 2015 at 12:27PM

MasterCard (NYSE: MA) posted another strong quarter, growing its global card count 8% to 2.2 billion and processing 13% more gross dollar volume (GDV), on a constant currency basis. The U.S. economy continues to be one of the few bright spots in the world, as emerging markets struggle and Europe tries to stage a recovery. In the U.S., GDV was up 8% for the quarter, a sequential increase of one percentage point. That's more impressive considering that there remains a two percentage point headwind from lower gasoline prices. Cross-border transaction volume increased by 16%, but cross-border fees only grew 11% as the result of higher intra-Europe travel and fewer international travelers to the U.S.

Security and the Digital Wallet

Other (non-processing) revenues grew by 15%, driven by MasterCard's growing suite of security products and recent acquisitions. The payment industry continues to evolve toward more digital options, like mobile wallets, and security remains a central focus for all parties. The U.S. is slowly shifting to chip-based EMV terminals, and management expects 60% of cards and 40% of terminals to be upgraded by the end 2016. Though the upgrade PIN and chip technology is "voluntary", starting in October the liability for fraudulent activities has shifted to whoever is using the least advanced security technology. If the merchant has a swipe terminal, but the customer is using a chip enabled card, then the liability rests on the merchant. The opposite is true of banks who have yet to issue new smartcards despite the availability of EMV terminals. If both the merchant and the bank have upgraded to EMV technology, the liability for any fraud rests with the credit card companies. MasterCard expect that all cards in the U.S. will be converted by 2017.

The latest generation of EMV enabled terminals also allow for near field communication (NFC) which should drive increased adoption of contactless payments. To address this, MasterCard continues to roll out its MasterPass technology which provides EMV-level security for shopping online and making in-app purchases. This tokenized service, which employees MasterCard's MDES technology, is also being used by Android Pay and Samsung Pay. (Tokenization is a security measure that uses an alphanumeric identifier in place of card numbers which can only be used for limited purposes and can't be copied and used at another merchant. It also allows merchant to store your card data in an encrypted form to prevent identify theft from intrusions.)

Other Developments

- As reported last quarter, MasterCard will be technically ready to process transactions in mainland China by the end of 2016, but they're still working on card issuance, vendor acceptance and other regulatory hurdles.
- During the quarter, MasterCard also announced that USAA was moving to Visa (NYSE: V), ending a 30-year relationship. This loss of a major client was certainly painful, but management stated that the terms of the deal became too onerous for them to match. Though we should be happy that management is maintaining pricing discipline, this is another indication that competition remain fierce. Combined with the recent **Costco** (NASDAQ: COST), Visa has shown that it is willing to cut margin to the bone to obtain high quality card holders.
- Further confirmation of the increasingly competitive environment is the slowly increasing cost of rebates and incentives. That trend is something we will definitely be keeping an eye on in coming quarters.

- Visa's recently announced acquisition of Visa Europe was also a hot topic on the conference call. In the short term, management believes that the integration of the two companies with different cultures will could serve as a distraction. Longer term, since Visa Europe was previously owned by its more than 3,000 member banks, it seems that MasterCard will end up with a more rational competitor in the European market once Visa and Visa Europe are reunited under one corporate umbrella.

Capital Allocation

MasterCard continues to generate a ton of cash, adding an additional $1.3 billion of cash flow from operations during the quarter. The company ended with $5.1 billion of cash and equivalents on the balance sheet and $1.2 billion remaining in its current repurchase authorization. During the third quarter MasterCard repurchased about 10 million shares for approximately $930 million and added another 1.5 million shares for $144 million so far in the fourth quarter. Between buybacks and dividends, the company is on pace to return about $4.2 billion to shareholders in 2015. That amounts to a 3.8% combined shareholder yield at today's market capitalization, which isn't bad for a company that has the ability to continue growing at a double digit clip for the foreseeable future.

Updated Outlook

During MasterCard's recent Investment Community Meeting in September, management updated their three-year performance targets which are set to expire at the end of this year. Though management's targets for low double-digit net revenue CAGR, Mid-teens EPS and 50% annual operating margin were projecting slightly lower growth, those are still exceptional numbers for a company MasterCard's size. The company will continue to benefit from the transition to digital payments and huge parts of the world, including China and India, remain largely untapped.

The Pro Bottom Line

Despite the recent pullback in the stock, MasterCard continues to trounce the market, delivering a 13.8% gain versus a market that is now slightly down for the year. With shares still trading at 26.5-times forward earnings and 17.5 times enterprise value-to-forward EBITDA, MasterCard hardly looks cheap. Still, we think this is one of the highest quality businesses in the *Pro* portfolio and it deserves a premium to the market. As we enter the fourth quarter and look forward into the next year, MasterCard should see easier quarterly comps as it laps the headwinds from currency volatility and falling gas prices. That should provide an opportunity for more positive surprises and continued outperformance in 2016.

If You're Gonna Learn, Learn From the Best

Published Nov 16, 2015 at 2:39PM

Fellow Fools,

Sometimes, smart people make incredibly stupid mistakes. If you decide to manage your own investment portfolio, odds are that at some point one of those mistakes will be your own. Though most of these mistakes are small and easily corrected, others can be costly and painful. I've always referred to that second variety of mistakes as "paying tuition," because they're usually lessons that you remember vividly and don't want to experience twice.

Though it's critical to learn from your own mistakes, I've found that the best way to keep your "tuition" bill to a minimum is learning from the mistakes of others. The recent drama surrounding **Valeant Pharmaceuticals International** (NYSE: VRX) looks like it provides one of those rare opportunities. I have no thoughts on whether Valeant will rebound quickly from its problems. I don't know the business well enough have an informed opinion. I also have no feeling of *schadenfreude* toward those investors, including a lot of Fools, who have lost money on their Valeant investments. Instead, I see a situation where some very smart people made some questionable decisions regarding portfolio and risk management, and the rest of us would do well to take note of those follies.

A Teachable Moment

In the weeks since Valeant began its precipitous decent, we've learned that several high-profile investors were burned by heavy allocations to the company's stock. As a media darling, Bill Ackman of Pershing Square Capital Management has probably received the most attention, but the example I think we can learn the most from is that of the esteemed Sequoia Fund.

Over the past four and a half decades, Sequoia has compiled an enviable track record, and it's long been considered the *crème de la crème* of the value investing world. When Warren Buffett closed his early investing partnership in 1969, he directed investors to this fund, which was started by William Ruane, a friend from Buffett's Columbia MBA program, and his associate Richard Cunniff. Though Ruane and Cunniff are no longer with us, their investment philosophy remains tightly engrained within the company's culture.

For that reason, I was fascinated by a *New York Times* article published last week that profiled the internal turmoil at the Sequoia Fund after its largest holding, Valeant, lost more than 70% of its value since the beginning of August.

Sequoia has been known to take concentrated positions in its highest-conviction picks, and earlier in the year, the fund's managers allowed its position in Valeant to balloon to nearly one-third of the fund's assets . When Sequoia's portfolio managers revealed that they'd added more to the position at a late-October board meeting, two of the company's independent directors, Vinod "Vinny" Ahooja and Sharon Osberg, resigned within five minutes of each other. Mind you, these were not folks who didn't understand the balance between risk and reward in the markets. Ahooja is a former partner at Goldman Sachs, and Osberg is a former Wells Fargo executive, a world-class bridge player, and one of Warren Buffett's closest friends.

This sort of public dissent is unusual for a mutual fund board, and it draws attention to Sequoia's risk-management strategy gone awry. In a portfolio, it makes sense to overweight your highest-conviction ideas, but it rarely makes sense to put yourself in a situation where an unforeseen or unimaginable event could have such a devastating effect on your portfolio -- and possibly limit your options at the worst possible time. In this case, the fund's managers have submitted to the remaining three board members and have agreed not to add any more to the existing position, even though this may end up being the best possible time to invest.

Manage Your Portfolio Like a *Pro*

Whether the drawdown in Valeant's stock ends up being a temporary situation or a permanent loss of capital remains to be seen. Either way, I think most people would agree that the Sequoia Fund's portfolio managers exposed their clients to an incredible amount of risk, and I doubt they would want a repeat of this situation.

The *Pro* team spends a lot of time thinking about how our portfolio is constructed, and how all of the pieces play together to help us achieve our goal of North Star-beating returns. Though we're big believers in letting our winners continue to compound over time, we're also very conscious of risk and the volatility that can arise from a highly concentrated portfolio. For that reason, we avoid allowing a position to grow too large, which is why we recently trimmed our position in **AmTrust Financial** (NASDAQ: AFSI) allocation by selling covered calls on part of it.

I know we've got a lot of new members who are still figuring out the lay of the land, so I thought I'd point everyone toward a few excellent resources to help understand *Pro*'s portfolio management strategy. If you'd like a comprehensive review of how Jeff thinks about building the *Pro* portfolio -- and why you're not likely to see a third of our portfolio invested in any one stock – you can't beat Jeff's Portfolio Construction presentation from FoolFest 2014. And for the overachievers in the crowd, here are a few other articles that are also worth your time:

- At FoolFest 2015, Jeff outlined four portfolio pitfalls – and how to avoid them
- Former *Pro* analyst Bryan Hinmon detailed how and why we manage volatility and risk.
- Billy looked at how our companies play together with an updated correlation matrix

The *Pro* Bottom Line

Things that have never happened before happen all the time. It's impossible to predict what those events will be, but it's not difficult to predict that at some point, something will likely happen to influence your investment in ways you didn't anticipate. Most investors will find that a surprising number of our successes and failures are the result of extraneous events we didn't consider when we originally began investing in the business. But that's the whole point of investing: If the future were easy to divine, then it would already be discounted by the stock price. The best we can do to moderate risk is to invest in a diverse group of high-quality, resilient businesses, and be sure not to put ourselves in a position where a surprise could limit our options or cause irreparable harm.

Again, welcome to all of the new Fools who are joining us in *Pro*. We're excited to have you here, and we look forward to hearing from you! Be sure to check out our first Portfolio Building Report published last week, and if you have any questions, please join the *Pro* community on our discussion boards.

Fool on!

-- Jeremy (TMFTank)

Pro Guidance Changes

- We're moving **Valmont Industries** (NYSE: VMI) from Hold to Buy. Valmont's end markets remain weak and we considered selling to harvest the tax losses, but recent news that Congress is making progress on a new highway funding bill leads us to believe it's worth holding onto this solid business for a bit longer.

Buy More Verisk Analytics

Published Nov 16, 2015 at 1:51PM

***Editor's note*:** A glitch in our CMS has this article displaying Nov. 5 as its publish date. It was first published Nov. 16, we promise.

Is this for you? *Pro* is increasing its allocation to **Verisk Analytics** (NASDAQ: VRSK) up to 2%. If you're following our portfolio closely, you will do the same. New members can buy up to 2% in Verisk today. Veteran members can add incremental shares to get to 2%.

How You Participate

- **Action:** Buy **Verisk Analytics**.
- **Allocation:** Buy shares to bring your allocation to 2% (up from 1.7%). *Pro* will be buying another 125 or so shares.
- **New *Pro* Members:** Buy up to 2% in VRSK now, to match us.
- **Scorecard Status:** Buy (click here to see our original buy report)
- **Fair-Value Estimate:** $80
- **Recent Price:** $72
- **Price Guidance:** Use a limit order and initially aim to pay less than $72.50. As prices change over time, this starting guidance will quickly lose relevance; as that happens, **our guidance will remain "Buy"** until we officially notify you otherwise.

The Business

With new members in mind, let's first review this company, which we bought for the first time in July. In our original report, we noted that Verisk is similar to current *Pro* holdings **Visa** (NYSE: V) and **MasterCard** (NYSE: MA), as well as prior holding **CME Group** (NASDAQ: CME), in that it was actually created by its customers. Major players in the insurance industry set up an "information utility" called ISO (now a Verisk subsidiary) in 1971 to help make the industry more efficient.

Nowadays, Verisk is a vertically focused data and analytics powerhouse that provides customers with solutions in all sorts of arenas: raw data, tailored analytics, enterprise reporting systems, policy fraud detection solutions, competitive benchmarking, and legally tested policy language, just to name a few. Verisk leverages its mass of proprietary data, industry expertise, and predictive analytics to serve hundreds of customers in all sorts of industries: financial services, including the top 100 U.S. property and casualty (P&C) insurers and 29 of the top 30 credit card issuers in North America, the U.K., and Australia; healthcare, including nine out of the top 10 health-plan providers; government entities; and professionals in the supply chain management and risk management businesses. And as of May 19 of this year, Verisk's clientele includes entities in the energy, chemicals, and metals and mining industries as well.

A strong competitive advantage, high customer retention, robust and contract-based cash flows, a scalable business model, large (and growing) markets -- all these traits make Verisk a prototypical *Pro* holding.

What We're Thinking

It's not very often that a mature, highly profitable company like this reports free cash flow growth of 50%, only for the stock to sell off meaningfully the following day. But that's what happened with Verisk two weeks ago.

The 50,000-foot view on earnings looked pretty decent, but the stock price declined after an uninspiring earnings call, uncertainty surrounding a potential divestiture of the health-care division, and a larger-than-expected decline in non-subscription revenue from recently acquired data-analysis business WoodMac. (We previously looked at the quarter in greater detail.) The idea of waiting until December before getting additional details on the performance and outlook of these two business divisions isn't appealing to those who have a small-f foolish short-term investing mind-set, so they sold shares. But we believe the situation isn't so dire.

At its core, investing is all about buying low and selling high. Three to five years from now, we may look back and realize that Verisk did exactly that by entering into the energy industry (via WoodMac) in the midst of the current energy slide, and potentially exiting the soaring health-care industry now while valuations are favorable. Incidentally, since reporting earnings, Verisk has actually acquired another company in the oil and gas space. One way to invest successfully is to buy out-of-favor industries, and this latest acquisition is yet another sign that management believes now is an opportune time to enter the industry. With respect to healthcare, M&A activity in this space has been robust of late; a company with characteristics similar to Verisk's health-care division finished its first day as a public company trading for a lofty 35 times EBITDA, which is, in our opinion, a very attractive valuation from a seller's standpoint.

Overall, core operations at Verisk remain strong, growing, and highly attractive. Whether they're insurance providers or energy leaders, customers rely on Verisk's data to make smart decisions. This gives Verisk pricing power, predictable revenue, growing free cash flow -- indeed, all the attributes we want to see from a long-term holding. As a little-known Warren Buffett investment, Verisk fits the bill for more of our money.

How This Decision Fits Into *Pro*

We've decided to increase our position size back up to 2%. Members should view this as both a portfolio management decision and an indication of our belief in the company. Following the post-earnings sell-off, we're continuing with our plan to methodically increase our position size over time. But with our original stake (from July) about flat with our original start price, we don't believe this is the time to be overly aggressive. By increasing our allocation by only a little, we leave ourselves positioned to take advantage of any additional sell-offs, yet we have enough invested in Verisk today to make a difference long-term.

Alternative Trades

- **Want to write puts instead?** Unfortunately, Verisk puts don't pay very well. But with the stock currently not far from the $70 strike price, members can capture about a 4% yield by writing the March $70 puts for about $2.80. Please do not over-allocate. Write one put for every 100 shares you're happy to potentially buy.

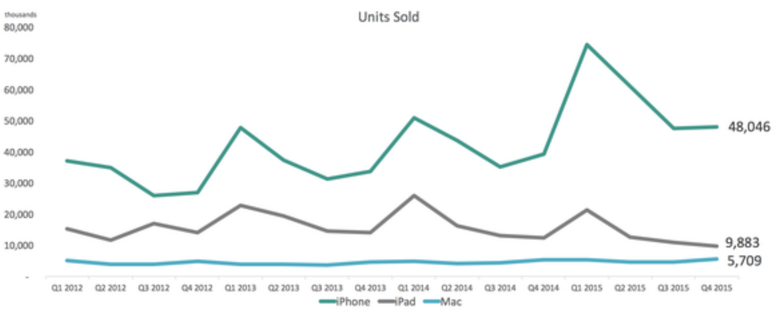
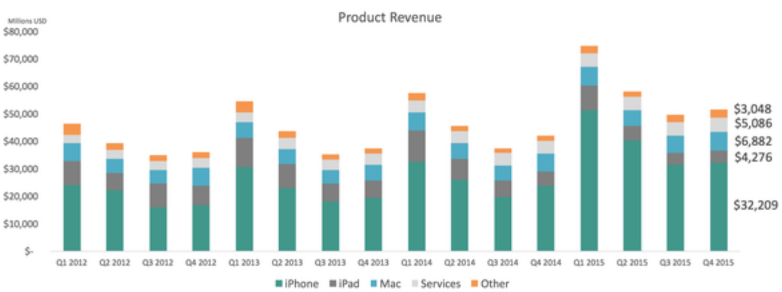
That's One Shiny Apple

Published Nov 16, 2015 at 12:47PM

Apple (NASDAQ: AAPL) once again posted strong results this quarter. Or as CEO Tim Cook noted on the call, Apple's growth this year was greater than the full-year revenue of about 90% of the companies in the Fortune 500.

The Results





Strong growth in multiple divisions resulted in fourth-quarter revenue growth of 22%, while an increase in company margins and the repurchasing of $14 billion worth of shares drove a 38% increase in EPS. Over the past year, it's become very evident that not all publicly traded companies' emerging-market operations are created equal, with multiple companies struggling in this market as well as being hurt by the U.S. dollar's gain versus the Chinese yuan. Apple's overall growth this quarter would have been 800 basis points higher if it weren't for unfavorable currency movements, but even so, it still posted an impressive 63% growth rate in emerging markets.

The company is also making strong roads in the enterprise market. The common perception is that Apple makes products for you and me, but its partnerships with IBM and Cisco are clear indications that management foresees this market as a meaningful source of growth in the years to come. Enterprise markets accounted for close to $25 billion in revenue (11%) this past year, which represents 40% growth over 2014.

Updated Guidance

Updated guidance: Buy (no change)

Recommended allocation: 4.1%

Fair-value estimate: $128

Pro's Take

The iPhone is still the cornerstone of Apple's business, so it's always worth asking just how big (in terms of sales) it can become. comScore's latest U.S. results peg smartphone penetration at around 78%. If you think about this in terms of the diffusions of innovations theory (sometimes referred to as a technology adoption curve in this context), this means that we are well into the late majority. (Below, the blue line is the adoption curve and the brown line is cumulative adoption.)

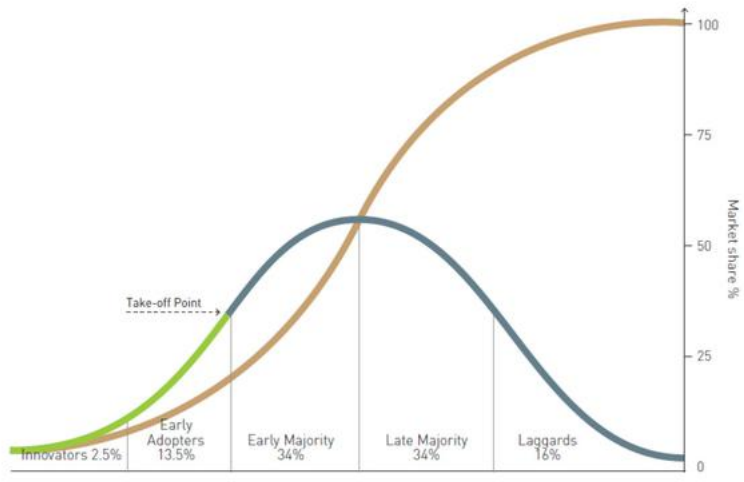


image source: http://slickercity.net blog

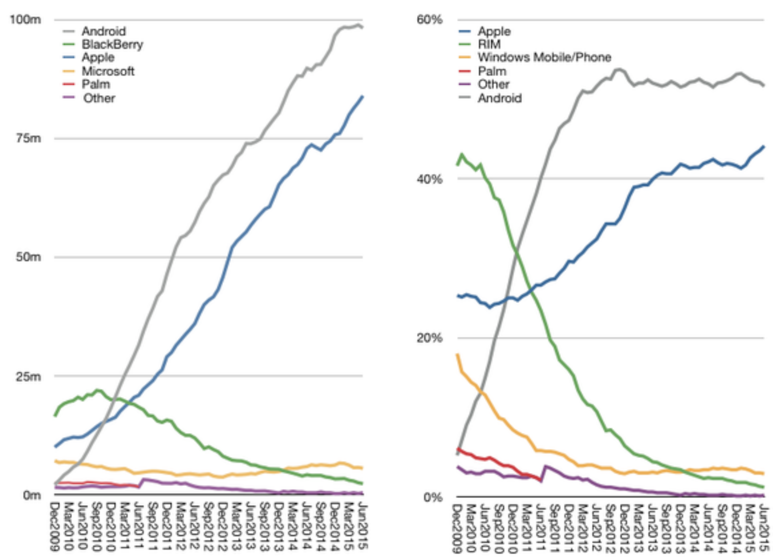
So a slowdown in U.S. unit sales growth shouldn't be cause for alarm; rather, we should expect it. But there are two important questions for this and every other market: "When will the market truly become saturated?" and "What type of market share will Apple ultimately command?" With regard to the first question, some experts believe that saturation might not start to occur until 90% penetration or beyond. Given how the smartphone appears to be weaseling its way into every part of our daily lives, this seems entirely possible. And it stands to reason that Apple will continue to capture a meaningful percentage of new users, meaning such sales should continue to be a source of growth for the company (albeit at a much slower rate than in many international markets, where the iPhone has just recently become available). For reference, comScore estimates that the U.S. user base increased by approximately 8.4 million from January to September 2015.

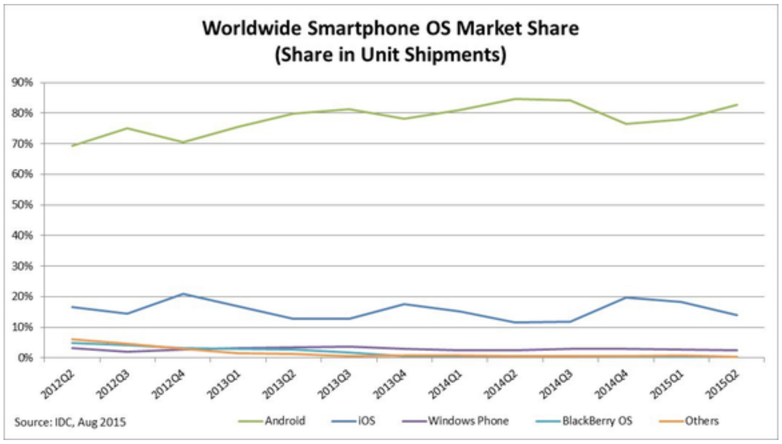
With respect to the market share Apple will ultimately be able to command, Cook noted on the call that the company saw the most people ever switching from Android to Apple this quarter (30% of new activations). To be sure, the company is losing some customers in the other direction, but it seems unlikely that Apple could increase its market share (up 230 basis points, to 43.6%, between January 2015 and September 2015, according to comScore) without being able to covert more customers than it lost.

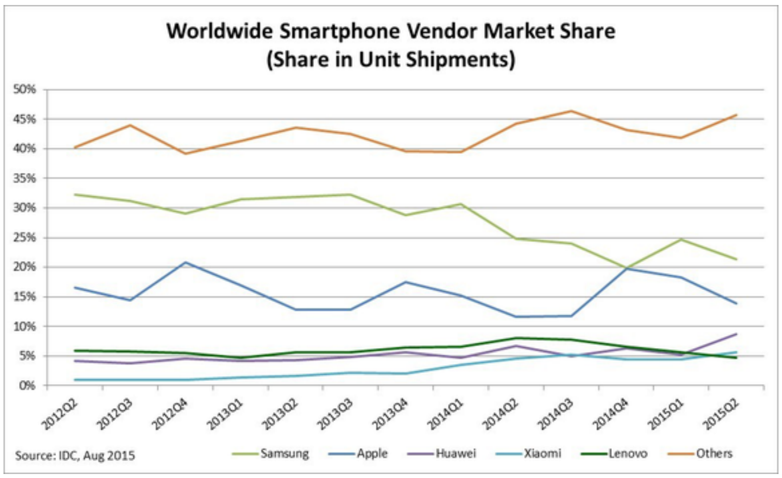


source: image-Horace Dediu, Asymco; data-comScore

One new dimension worth considering is the potential change in the upgrade cycle as carriers and Apple push customers toward upgrade programs. Given that these plans often allow customers to upgrade their phones annually for "zero cost," it stands to reason that we might see an uptick in the number of customers who upgrade each year. This would result in a slight, temporary bump in the unit growth rate here in the United States. Management also noted during the earnings call that only about a third of customers with phones older than an iPhone 6 have upgraded to a newer phone, which means Apple still has a sizable U.S. opportunity in terms of getting customers on a more regular upgrade cycle. When you take all this into consideration, we believe the U.S. will continue to be an attractive market for Apple, even as the company's growth rate continues to slow.

Globally, smartphone usage is, unsurprisingly, far less common. Estimates for global smartphone penetration tend to fall at about 28% to 30% , with the low-cost Android operating system still dominating the market.





Given the higher price point and the reasons people choose an iPhone (to get certain features, as a status symbol, etc.), it shouldn't be much of a surprise to see such a large disparity between Apple's U.S. and worldwide market share. Emerging-market growth continues to be very strong, but we believe it's hard to get a good feel for how Apple will land in a given market until it begins to mature; as cellular coverage in that market improves and more features become available, the iPhone becomes a more viable, attractive alternative. Apple's growth in China is a perfect example of this: iPhone sales were up 120% in mainland China this quarter, even though IDC has noted that China has started to exhibit a more mature growth pattern (like what we see in North America and Western Europe). China's smartphone market contracted for the first time in six years in the first quarter of 2015, and if you back out iPhone growth from the China numbers this quarter, you'll notice that the rest of the market actually contracted slightly this quarter as well.

Of course, the iPhone isn't just about how many units Apple can sell; it's also about the ecosystem, and the ancillary revenue that ecosystem can generate. Performance at the App Store was once again quite strong, growing 20%-plus per year while the number of transacting customers is up 18%. This last metric is one to pay attention to, as it's an important sign of healthy growth. (For some mobile gaming companies and others, growth can be solely dependent on generating additional revenue from the same subset of paying customers.) And Apple Pay's ability to achieve double-digit growth in transactions month after month is another great sign.

With respect to Apple's other sources of revenue, Mac sales continue to be commendable in a market that shrunk by about 11% (based on IDC's latest numbers). Apple Watch sales also appear to be quite strong, with revenue from "other products" increasing by 61% this quarter. The laggard of the group continues to be the iPad, even though it commands 73% of the U.S. market for tablets priced above $200 and appears to be bringing Chinese residents into the Apple ecosystem. (For 68% of the people who purchased an iPad in China, it was the first tablet they've owned, with 40% of those customers making this their first Apple purchase.) Nonetheless, both revenue and unit sales declined 20% this quarter.

From a valuation standpoint, Apple continues to trade like a slow-moving hardware company, at around 9 times free cash flow and 13 times earnings. In our opinion, that's too cheap for a company we believe will be able to remain dominant in technology for quite some time. Granted, it's still somewhat of a one-trick pony, with the iPhone accounting for more than 66% of total sales this year. But we believe Apple's ability to reinvest its robust free cash flow in projects to drive future future growth, while also maintaining a generous dividend and share repurchase program *and* growing its massive cash hoard (cash and short-term investments totaled $42 billion this past quarter!), leave Apple poised to deliver North Star-like returns over the next three years.

Lackluster Results at World Acceptance Corp.

Published Nov 12, 2015 at 1:10PM

Second-quarter results were very much in line with what we've come to expect from payday lender **World Acceptance Corp**. (NASDAQ: WRLD). Revenue and net income fell 7.9% and 9.8%, respectively. Interest and fee income, which accounted for 91% of revenue, fell 6.2% this quarter; this was thanks in large part to a decrease in the company's average earnings loans, as well as unfavorable movement in the dollars-to-pesos exchange rate.

Insurance commissions and other income fell by 22.6% as volume in the division dropped. The company also ended up needing to to repurchase some charged-off accounts it sold just two quarters ago, in the fourth quarter of fiscal 2015. We'd questioned the recovery potential for these accounts in the past, and we believe this move provides yet another reason for us to call the true value of the company's loan portfolio into question.

As followers of this position know, the Consumer Financial Protection Bureau (CPFB) is investigating World. In the 10-Q, we learned that the company submitted its response to the CPFB's Notice and Opportunity to Respond and Advise (NORA) letter on Aug. 28. At first glance, this submission appears to have come one week after the deadline, though it's more likely that the deadline was pushed back as the two entities engaged in discussion. Unsurprisingly, we didn't get any update on when we're likely to hear the outcome of the CFPB's investigation.

Perhaps this had something to do with the short squeeze we saw in the aftermath of the earnings release -- though admittedly, if that's the case, it doesn't make much sense to us. Odds are it will be the CFPB, not World, that will disclose the outcome of the investigation. And the CFPB doesn't owe it to World to try to time that disclosure favorably with the company's earnings reports. There's only one way we can see World announcing the conclusion to the saga, and that's if the CFPB finds nothing wrong with World's business practices. We don't expect this to happen, and we believe the possibility becomes even more remote as time goes on. But if we had to guess the reason for the post-earnings rally, we'd put our money on some shorts covering (specifically, those speculating that the hammer was about to come down), followed by a bit of a short squeeze.

The company's results weren't very pretty, but these results alone don't justify shorting the stock of a company trading for around 3.5 times earnings. The reason there are plenty of folks besides us Fools who are short World Acceptance is because everyone's thesis revolves around the same exact thing: a belief that the CFPB has World in its crosshairs. Our original expectation was that we'd hear something from the CFPB before the year is out. We may still, but the recent spike in the cost to short this stock has us rethinking our willingness to sit around (this was also a big factor in our decision to close half of our position with around a 40% gain).

This is also why we have decided to place the stock on hold for the time being. The risk-reward dynamic has admittedly shifted somewhat since we first shorted World, and because of this, we're not as keen for new members to jump right in and short the stock along with us at this time. But we are content to remain short our 0.5% exposure and suggest that those Fools who have been following along from the start do the same.

Invest Like a Pro: If You're Invested Elsewhere

Published Nov 12, 2015 at 10:00AM

How to build a *Pro* portfolio — investing gradually as you sell other holdings or accumulate funds.

If you're already fully invested, you may need to sell existing positions to add *Pro* picks. We recommend that you do this gradually and deliberately, and we've offered advice on how to approach this task.

Freeing Up Cash

List your existing positions in order from your highest-conviction holding to your lowest-conviction holding. If you own stocks from another Motley Fool service, you can use that service's guidance on those stocks in building your list. If you don't know why you own a stock, that's a good reason to sell it. When you're ready, incrementally sell your lowest-conviction stocks and use the proceeds to build your *Pro* portfolio.

Be mindful of your sector and geographic allocations. You don't want to unintentionally end up owning nothing but oil or European stocks just because they were your favorites. If you're struggling with what to sell, post to our discussion boards — the *Pro* team can't give you individual advice, but our community members can and frequently do weigh in with helpful guidance.

Building Your *Pro* Portfolio

Start Here: Portfolio Building Reports

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new *Pro* portfolio.

Part 1: Our Buy First Stocks
Part 2: Our Buy Stocks
Part 3: Our Buy Stocks, Continued
Portfolio Positioning Report
Important: A note on fair value

What's Next?

As you're building your *Pro* portfolio, participate alongside us with new trades if possible. If you don't have cash available, make the new trades the first ones you buy when the time is right. Each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want.

You may decide to modify the strategy we choose for a trade; for example, writing puts instead of buying a stock outright. If you choose to deviate from our recommendation, though, make sure you:

Uniquely *Pro*

If you're joining us from another Motley Fool service, it is critical that you understand what makes *Pro* so powerful. At *Pro*, we are building a portfolio, not simply offering investment recommendations. *Stock Advisor* and *Rule Breakers*, for example, offer stock recommendations from which members can pick and choose.

In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the *Pro* portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

1. Understand why we chose the strategy we did
2. Have a reason that the modified strategy better fits your portfolio
3. Exercise caution by sizing the position a bit smaller than you would otherwise

If you have any questions about our trades or making a strategy fit your investing goals, drop by our Making Pro Fit You discussion board, where the *Pro* team and community are happy to help.

You'll also receive the team's Monday Memo email every Monday afternoon, with commentary, news, and any updates to our guidance.

If You're Investing in an IRA

IRAs are tax-deferred accounts that usually don't allow shorting and allow only simple options strategies. If you're building your *Pro* portfolio in an IRA, you can follow our stock-buying trade alerts directly. Most IRAs allow you to write covered calls, so you can also follow those trade alerts (check with your broker to see if you have permission). For trades that go further afield, here are several points to consider:

Writing Puts: Some IRAs don't allow put writing (although many do, if they are cash-secured), so you should simply buy shares in these positions over time. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Other Options Trades: If you can't make a trade in your IRA, check our trade alert for a list of alternative trades. For example, when we write puts to try to buy shares of Stock X more cheaply, you might be able to simply buy shares of Stock X. (If there are no alternate trades, we'll say so.)

Shorting: Some inverse ETFs can be purchased in IRAs (purchasing an inverse of something is similar to shorting that thing). As with options, we'll mention suitable alternatives in the trade alerts.

As tax-deferred accounts, IRAs are well suited for income-generating strategies like covered calls, high-yield dividend stocks, and ETFs with large taxable distributions. If being unable to follow all our recommendations leaves a hole in your portfolio, you may be able to fill the gap with additional income-generating strategies — for example, by writing covered calls on *Pro* stocks you'd be willing to sell at your strike price.

Because IRAs do not allow the use of margin or shorting, you will likely find it difficult to follow along with most of our hedging strategies. If that's the case, we recommend keeping an eye on both your cash balance and *Pro*'s hedging strategies. When the *Pro* portfolio adds hedges, increase your cash balance; when we pull hedges off, reduce your cash balance by investing more in our Buy and Buy First stocks.

Finally, you may want to consider opening a separate, non-IRA account if possible. You can then manage both your IRA and non-IRA accounts as a single portfolio, with income-focused and shorter-term strategies in the IRA and more complex, speculative, and short trades in the second account.

If You Can't Trade Complex Options

You can still follow most of our trade alerts directly — except, obviously, those involving complex options strategies. In those cases, we offer simpler alternatives whenever possible, such as writing puts, writing covered calls, or buying or shorting a stock or ETF directly. If we issue a trade alert using an income-generating strategy you're unable to employ and there are no workable alternatives, consider using the strategies you do have at your disposal to generate income elsewhere in your portfolio.

If you want to expand your repertoire, you should continue to request higher options permissions from your broker every couple of months until they are granted. Account size is one factor brokers consider when making this decision, so to up your odds of success, consider consolidating accounts or moving funds to the account in which you wish to trade options.

In the meantime, don't lose sight of the big picture; remember that we're building a portfolio. If you can't make a particular options trade, you may be able to make an alternate trade or you may need to sit that trade out — either way, it's no big deal. That said, you'll want to pay particular attention to any trade alert in which we use options for hedging purposes (for example, a synthetic short or a ratio put spread on an ETF or an index). Trades like these are important to our integrated portfolio, so don't ignore them. If alternatives are available, we'll outline them. If not, you may want to take action elsewhere in your portfolio to meet similar goals. For example, one way to accomplish this would be to raise your cash position by trimming a few holdings. As always, we're available on the Making Pro Fit You discussion board to field your questions.

Hungry for more *Pro* goodness? Check out our strategy guide!

Pro Portfolio Building Report No. 1: Nov. 12, 2015

Published Nov 12, 2015 at 10:00AM

Welcome, Fool! We're glad you're here. This first report is meant to get you up to speed on our Buy First stocks — the companies in your *Pro* portfolio that we believe you should start purchasing first. But before we get to that, a few words about how best to use *Pro* ...

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that aims to generate winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, hedges, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* fit you.** We know not all investors are in the same situation! We can help you figure out how to buy *Pro* investments given your personal situation, including investing in an IRA or coming to *Pro* already fully invested. Check out our advice for every approach to *Pro*: Invested Elsewhere | "Free-Range" | Whoever You Are
3. **Catch up with our portfolio at your own pace.** Start with the stocks in this report, and follow along with our subsequent reports between now and Dec. 1. You can always see our Buy First, Buy, and Hold guidance (which is the most important -- more important than valuation estimates) on the Recommendations page, and you can get a succinct, up-to-date take on all of our stock positions on our What We Think Now page.

Bring any questions to the Getting Started & Help discussion board, and Fool onward!

-- The *Motley Fool Pro* team

Table of Contents

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 3.4%, plus 0.5% in bought calls

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Global mobile data traffic is expected to increase at a compounded annual growth rate (CAGR) of 57% between last year and 2019, and global mobile 4G connections are expected to grow from 459 million in 2014 to 3 billion by 2019 (a 46% CAGR). Communications site operator **American Tower** is well-positioned to benefit from this trend.

What It Does

AMT leases antenna space on more than 99,000 cell sites (towers, rooftops, and more) to wireless service providers across the globe. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, non-cancellable, and feature contractual annual price escalations. About 60% of AMT's properties are located in 12 different countries outside the U.S., including India, Brazil, Colombia, Mexico, Nigeria, and South Africa, and management is intent on expanding the company's international portfolio as it continues to build and acquire more towers.

How It's Working

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE (or, in Africa, from voice to data), or to increase coverage density. When they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; about 98% of AMT's customers up for renewal each year do so, and more than 70% of its current leases don't renew until 2020 or later.

What We Expect

Rental and management revenue is up 14.3% year-over-year in the most recent trailing-12-month (TTM) period, with the domestic division up 16.6%, outpacing the international side primarily because of the company's recent acquisition of about 11,500 towers from Verizon. We expect revenue to roughly double over the next five years through a combination of price escalations, new towers, and upgrades, and year-to-date 2015 results suggest that the company is well on its way.

After its 2011 conversion into a real estate investment trust (REIT), AMT is required to pay out 90% of taxable income from its qualified REIT subsidiaries to shareholders. It currently distributes $1.84 annually, a 1.9% yield, and management expects to increase the dividend by about 20% annually over the next five years. (Importantly, only the U.S. business and a small portion of the international business is organized as an REIT. For more, see *Pro*'s original recommendation.)

For More

- *Pro*'s original recommendation (5/6/13)
- *Pro*'s "Buy More" recommendation (3/17/14)
- *Pro's* "Buy Calls" recommendation (12/17/14)
- Talk about AMT

Management reduces taxable income though the use of net operating losses. And because the useful life of its tower properties in all likelihood exceeds the depreciation schedule, AMT also uses a depreciation shield, which reduces taxable income and understates the value of some assets on the balance sheet. Thus, typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

The *Pro* Bottom Line

We value AMT at about $115 a share. Today's price provides an acceptable margin of safety for a business of this caliber. The stock may experience volatility in the short term because of its tendency to trade alongside the interest-rate-sensitive REIT sector, but over the long term, the underlying strength in business fundamentals should shine through. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network. *Pro* owns January 2017 $80 calls because we bought them before the 2018 calls were listed. Newcomers should consider buying January 2018 calls (rather than the 2017 calls that *Pro* owns) in order to give the investment thesis more time to play out.

Buy First: Gentex (NASDAQ: GNTX)

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 2.8%

What It Does

For More

- *Pro's* most recent update (10/26/15)
- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex

In 1982, a small company in Zeeland, Mich., called **Gentex** made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands almost 90% of that market, and it sells eight times more units than its closest competitor.

How It's Working

In 2000, the company sold 6.8 million units; in 2014, it sold 29 million. That growth has been driven by an increased focus on safety, higher car sales, and greater market penetration (more car makers offering Gentex mirrors as a trim option). Gentex has turned these market dynamics into wonderful financial performance. Revenue has risen by nearly 20% annually since 1990, and over the past decade, the company's net margins have bounced around the mid- to high teens, recently increasing into the low-20% range. Those numbers are shockingly good for an auto-parts supplier, showing that its fancy mirrors are showing up in more and more new cars.

What We Expect

Currently, about one in every four cars made worldwide has an auto-dimming rearview mirror, and only 7% have auto-dimming exterior mirrors. For context, prior to 1987, those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher usage; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror (including the soon-to-be launched full display mirror), both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy First: Gilead Sciences (NASDAQ: GILD)

One of the strongest biotech companies on earth, Gilead is positioned to keep rewarding owners.

Suggested Allocation: 3.7%

What It Does

For More

- *Pro*'s original recommendation (4/30/14)
- Talk about Gilead

Gilead Sciences (NASDAQ: GILD) helps millions of people fight life-threatening diseases. Its HIV drugs are prescribed to 8 out of 10 new HIV patients and are already helping millions enjoy much better lives. Its HIV products represented the majority of Gilead's revenue until its Hepatitis C cures, Sovaldi and Harvoni, were approved last year. The most successful drug launch in history, Sovaldi topped $10 billion in first-year revenue, and Harvoni reached megablockbuster status this year as well.

An estimated 2.7 million to 3.2 million hepatitis C patients reside in the United States, and a whole 2.8% of the world (almost 200 million people) is thought to have this common blood-borne infection. That means tens of millions could conceivably benefit from Sovaldi or the newer single-pill version, Harvoni, and this would still leave plenty of room for competing drugs to do well, too.

How It's Working

Gilead is on track to increase earnings per share more than 50% this year on the strength of its new hepatitis C franchise, yet the $108 stock trades at less than 9 times expected 2015 earnings. The company's products have a healthy lead over competitors' hepatitis C drugs both in the U.S. and in other countries, and a key competing drug from **AbbVie** (Nasdaq: ABBV) has come under scrutiny for side effects. Gilead's Harvoni drug, approved in October 2014, is the first single-pill regimen for curing Hepatitis C, and competitors aren't likely to match it anytime soon. Meanwhile, the company's HIV franchise remains unparalleled, and Gilead has more than 200 compounds in clinical trials.

What We Expect

Following big growth in 2015, we expect robust sales in 2016 as Harvoni is prescribed to tens of thousands of new patients around the world. Beyond next year, countries will slowly approve the drug and its reimbursement over many years; Gilead expects the European market, for example, to expand for quite some time. Overall, it's estimated that Gilead will increase earnings by more than 15% annualized over the next five years. Meanwhile, we expect Gilead's refreshed HIV franchise and growing oncology franchise to help increase shareholder value. It's important to realize that the stock can be volatile at times; nonetheless, Gilead is one of the best biotechnology companies in the world, and we believe this inexpensive behemoth should be in your *Pro* portfolio.

Buy First: Oracle (NYSE: ORCL)

This old-guard tech giant at a low price has more room to grow.

Suggested Allocation: 3.7%

What It Does

Oracle (NYSE: ORCL) is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems** (NASDAQ: CSCO), **Dell**, and **Microsoft** (NASDAQ: MSFT) — Oracle's value has steadily risen (up 220% in 10 years) as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe. And when it comes to hardware, Oracle's own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

Combining hardware with boxed software and new, sprawling cloud services, Oracle is a full-service solution, one that's poised to enjoy long-term growth in free cash flow. The business is incredibly sticky — companies don't trust their data to just anyone, and it's risky to make a switch. To add to its massive recurring revenue base, Oracle cross-sells new products to existing clients and continues to rope in new customers with its comprehensive software and hardware solutions, whether on site or in the cloud. The company has also been known to make some (read: *many*) acquisitions to propel growth.

For More

- *Pro*'s original recommendation (9/17/09)
- Latest earnings coverage (9/18/15)
- Talk about Oracle

How It's Working

Leading software sellers can write a program once and sell millions of copies, then provide small but critical updates on a regular basis. These updates drive a subscription business model, which leads to recurring revenue. Most of Oracle's customers renew annual software contracts that represent more than 40% of its revenue. This is stability upon which Oracle grows. Even better, as more customers move to a cloud-based relationship (rather than licensing on-premise software), Oracle enjoys increasing monthly recurring revenue, even as customers save money because they no longer need to host their own software. For Oracle, economies of scale make hosting inexpensive.

What We Expect

At about $40, Oracle trades at about 14 times free cash flow, below the S&P 500's average, and management expects more operating leverage ahead and greater overall profits as cloud revenue steadily increases. We model about a 10% annualized return, which would pace our current North Star with relatively low risk. This is a good buying opportunity for a proven business that still has plenty of room to grow.

Buy First: Wells Fargo (NYSE: WFC)

At heart, banks are simple businesses, and Wells Fargo is one of the best of the breed.

Suggested Allocation: 3.7%

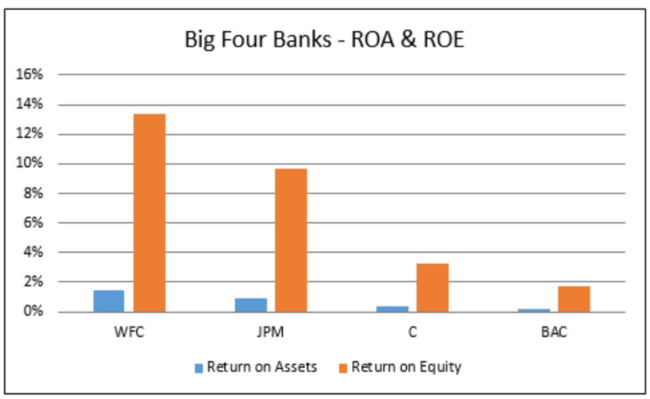
What It Does

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** (NYSE: WFC) is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 8,700 branches and 12,800 ATMs. It's the fourth-largest bank in America by total assets, it has a reputation for high customer loyalty and satisfaction, and it's the U.S. leader in mortgage and small-business lending.

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up roughly half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During tough lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

How It's Doing

CEO John Stumpf and team are truly the best of the breed. Return on assets and equity for fiscal year 2014 were rock-solid, at 1.45% and 13.4% respectively — great results given the low-interest rate environment and new regulations that require higher liquidity levels (i.e., less leverage) than before the financial crisis. A look at ROE figures for the other three big banks shows Wells Fargo's comparative excellence:



Source: Wells Fargo February 2015 Credit Suisse Financial Services Forum Presentation

Total revenue growth has been elusive, but expense reductions and improvements in credit quality have driven quarter after quarter of earnings growth, leading to higher earnings than before the financial crisis. Deposit growth has been tremendous (coming in at 8.1% in the third quarter of 2015), and as Wells Fargo grabs additional "wallet share," fee income increases as well. The credit quality of the loan portfolio is very strong, with net charge-offs at just 0.31% of total loans as of third-quarter 2015. All of this has contributed to a very well-capitalized balance sheet, allowing Wells Fargo to comply with the aforementioned capital regulation requirements well ahead of schedule.

More Resources

- *Pro*'s original recommendation (12/10/10)
- *Pro*'s "Buy More" recommendation (7/29/14)
- Talk about Wells Fargo on our discussion board

What We Expect

Wells Fargo's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. In a world of continued low interest rates, we should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But when the U.S. economy picks up steam, interest rates rise, and loan demand accelerates, Wells Fargo's real earnings power — bolstered by growth in fee-based revenue — will hit its full stride.

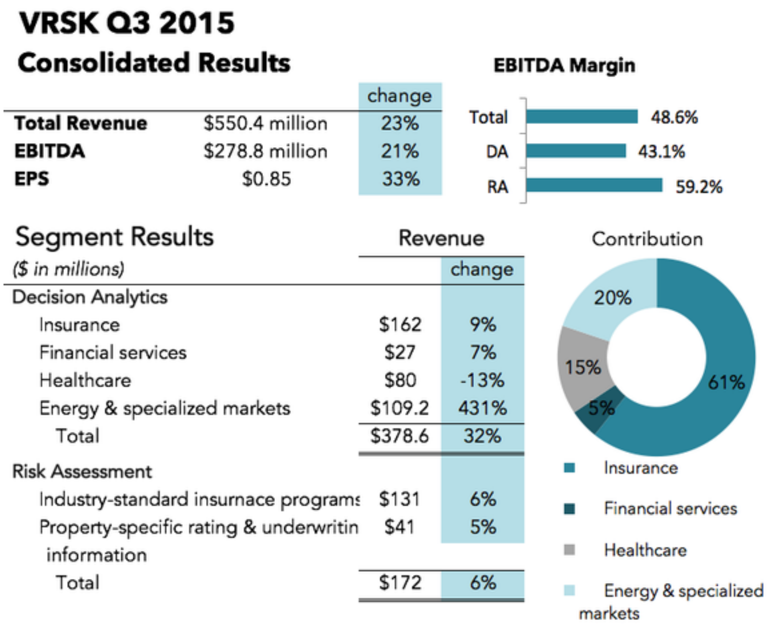
Shares are trading at less than our estimate of fair value, and they yield a growing 2.7% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. *Pro* has also used options in the past to generate even more income from this position, so try to invest using round, 100-share lots if it keeps you within half a percent (plus or minus) of our 3.7% allocation. If that's not feasible for you, share ownership alone is fine, too; with its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

- **Coming up:** Our next two Portfolio Building Reports will come your way Nov. 19 and Dec. 1! We'll email you when each is ready, and you'll find the links under the Guidebook tab.

Strong Results but New Questions at Verisk Analytics

Published Nov 11, 2015 at 4:13PM

This was an interesting quarter for **Verisk Analytics** (NASDAQ: VRSK). The 50,000-foot view looked pretty decent, but the stock sold off thanks to an uninspired earnings call, uncertainty surrounding the future of Verisk's health-care division, and a faster-than-anticipated decline in non-subscription revenue at recently acquired WoodMac.



VRSK Q3 2015
Consolidated Results

		change
Total Revenue	$550.4 million	23%
EBITDA	$278.8 million	21%
EPS	$0.85	33%

Segment Results
($ in millions)

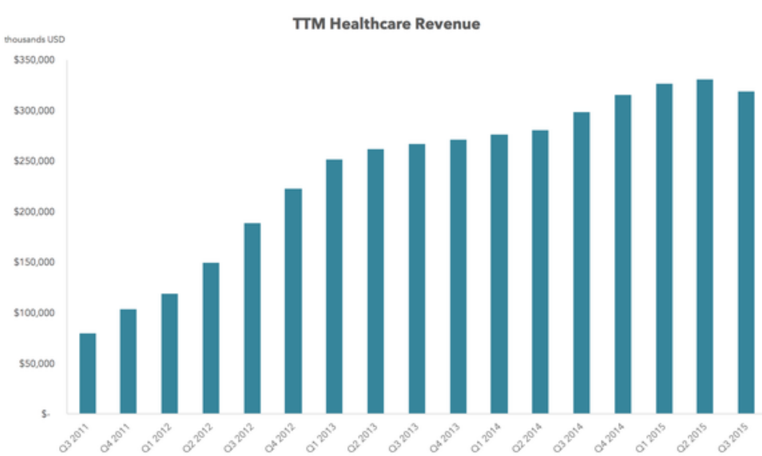
Updated Guidance and Valuation

- **Updated guidance**: Buy (no change)
- **Recommended allocation**: 1.7%
- **Fair-value estimate**: $80

Both the insurance and the financial-services divisions continue to be business as usual, so let's just jump straight to the two businesses that justifiably attracted the most attention during the earnings call.

Health Care

The big news here was that Verisk is exploring the possibility of divesting its health-care operations -- but let's start with the results first. Management has always noted that whenever it enters a new market, growth there tends to be somewhat lumpy as new clients start by putting one or two of Verisk's solutions through an isolated trial phase before scaling across the whole business and adding additional solutions. Even so, up until this past quarter, the health-care segment had been a steady performer for Verisk since it entered the space a few years back.



Now, management did hint during the first-quarter earnings call that the back half of this year could be challenging for the company, but given Verisk's track record, I don't think anyone was expecting a 13% decline this quarter. It's a scary headline number to be sure, but it's also somewhat misleading because of some changes in revenue accounting. Net of pass-through revenue (the revenue metric that really matters to us, since it excludes revenue that will be passed through to Verisk's clients) declined only 2% this quarter. Even so, we find these results to be a bit troublesome given that this business is still somewhat seasonal (most of the company's Medicare Advantage work takes place in the second half of the year).

These results may have raised some doubts about what we should expect from Verisk Health in the fourth quarter, but the biggest question is this: Why would management look to sell a business that has such a long runway, as long as the company is able to execute on its plans? The press release confirming the rumors that Verisk is exploring a possible divestiture seemed somewhat rushed, and management didn't give us a ton of color on the call (though they did note that additional details will be provided during their investor day in December). Here are some of the things management did allude to:

- International expansion opportunities, or lack thereof: In the aftermath of the WoodMac deal, the company has been very forthcoming about its desire to expand internationally. Since Verisk Health is destined to remain a domestic operation for the foreseeable future, management might view redeploying capital into this segment as a suboptimal use of shareholder funds.
- Striking while the iron is hot: M&A activity in this sector has been robust, with many businesses receiving attractive valuations.
- Doesn't fit as well with the other three verticals (insurance, energy, financial services): These other three can benefit from what is currently being done in other parts of the business more easily than the health-care division can.

It's hard to say right now whether selling Verisk Health is the right move; the answer will ultimately depend on how the company spends the proceeds. Management hinted that additional acquisitions and share buybacks will both be on the table, but without knowing for certain how this will play out, we'll reserve judgement for the time being. The company does have an impressive history of making smart deals, but our preference here in *Pro* is to evaluate each acquisition and divestiture on its own merits instead of simply giving management teams free passes because of their track record.

Energy

Verisk's newest business also received plenty of negative attention this quarter. Management reduced their expectations for this year's revenue from the recently acquired WoodMac (which does data analysis in the energy sector) by $15 million as the anticipated 2016 decline in non-subscription business was pulled forward into this quarter. Given that management had previously sounded confident in their 2015 projections for WoodMac, this was not something we were expecting to hear. As with Verisk Health, management noted that shareholders will receive an in-depth update on this division come December. Unsurprisingly, this was met with the same unenthused response from the analysts on the call.

It's never good when a company revises its revenue estimate downward not long after completing an acquisition, but it's important to keep things in perspective. Organic growth for Verisk's energy and specialized market was 5.6%, with WoodMac up 1% in British pounds this quarter and 7% year to date. This is quite impressive when you consider the severe pullback in capital spending in the oil and gas industry. Some experts have predicted that total capital spending in the U.S. energy industry will decline by more than 25% this year, and WoodMac recently estimated that close to $200 billion of spending on new oil and gas projects has been shelved for the time being.

The *Pro* Bottom Line

It's not very often you see a mature, highly profitable company report free cash flow growth of 50% only for the stock to sell off meaningfully the following day. But that's what we got with Verisk. The idea of waiting until December before getting additional details on the health-care and energy divisions isn't appealing to those who have short-term mind-sets, but we believe the situation isn't so dire. Investing is all about buying low and selling high, and three to five years from now, we may look back and realize that this is exactly what Verisk did by entering into the energy industry in the midst of some carnage and potentially exiting the health-care industry while valuations are favorable.

Questions? Comments? Bring them to the Verisk discussion board!

Pro Catch-Up Trades: Nov. 9, 2015

Published Nov 9, 2015 at 2:39PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

Pro's Buy First stocks for your core, long-term stock portfolio:

- **American Tower** (NYSE: AMT), buy up to 3.4% in stock
- **Gentex** (NASDAQ: GNTX), buy up to 2.8% in stock
- **Gilead Sciences** (NASDAQ: GILD), buy up to 3.7% in stock
- **Oracle** (NYSE: ORCL), buy up to 3.7% in stock
- **Wells Fargo** (NYSE: WFC), buy up to 3.7% in stock

There are also *Pro*'s Buy stocks, including:

- **Apple** (NASDAQ: AAPL), buy up to 4.2% in stock
- **Verisk Analytics** (NASDAQ: VRSK), buy up to 1.6% in stock

New members can start to buy now, or wait for our Portfolio Building Reports, which start to roll out Nov. 12. Welcome to *Pro*!

Prepping Pro Members for 2016

Published Nov 9, 2015 at 1:33PM

Greetings, *Pro* members!

Did you know that only 52 days remain in 2015? Excluding holidays, that means only about 35 business days left. Over that short time, we're going to conclude our current-quarter earnings coverage, welcome new members and start getting them up to speed with the *Pro* portfolio, and make more decisions to ideally position the portfolio well for 2016 and beyond.

We've had a very good 2015, with *Pro* up 11.7% as of October 31. That's ahead of our North Star at 7.2% and the S&P 500 at 2.7%. We want to continue doing what we're doing right, and get better at what we've done wrong.

As for what we do right, I'd say we find strong businesses that compound our wealth, and then hold our shares; use options sensibly for income, extra returns, and hedging; and "sell short" struggling companies to profit on falling stocks. We aren't overactive investors, though we're always engaged because we love what we do.

We've gone wrong -- and thankfully, they've been small mistakes -- when we've bought companies (or used options) in situations that didn't live up to *Pro* standards. We aim to learn from our mistakes and keep improving.

The good news: We've been investing in a *Pro* fashion for 15 years, and this service has been doing so for members since 2008. So we know it works, and we know *how* it works. Plus, we've learned more good lessons at this point than at any other, so it's a good time to be here.

We're going to keep plowing through earnings to get updates out to you, and then we expect new trade alerts in *Pro* and in *Motley Fool Options*. But first, we want to welcome new members to *Pro* this week, and help them get started.

Welcome, New Members!

New *Pro* members are advised to steadily build a *Pro* portfolio by following our Portfolio Building Reports. The first report, highlighting Buy First stocks, rolls out Thursday (we'll email you every time there's a new one). Our subsequent reports will outline the rest of the *Pro* stocks we believe you should invest in; after that, since you'll be largely invested, we'll have a Portfolio Positioning Report (and accompanying live chat) on Dec. 1, for those who want to short, hedge, and use options. With these tools, you can manage your market exposure or risk level.

We're so glad to see so many new members using the Pro community! Common questions include:

- **How do I meld *Pro* stocks with my existing stocks?** One approach is to treat *Pro* as a sleeve of your total assets; within that sleeve, follow the portfolio as closely as possible. If this is you, we still recommend that you eventually own as many *Pro* stocks as you are happy to own. Our portfolio is meant to *work as a whole*. If you're selling some stocks to get there, start with your least favorites -- the ones you believe in least -- to add *Pro* stocks. Take your time. We don't want you racking up giant tax bills by selling winning stocks you love. You can follow our portfolio and apply our hedging strategies to your own portfolio, too, while gradually moving into more *Pro* stocks over time. Ask related questions on our "Making *Pro* Fit You" discussion board.
- **Should I buy a full allocation of each stock today?** We're advising that you mirror our current allocation as shown on the Recommendations page. We make certain we like how our portfolio is constructed, and to guide you over the years, we can only know what your allocations are if you follow our own. That said, many members average into positions over time. If we recommend 4% in a stock, some of you may buy 2% to start, and 2% later. That's fine, and would be beneficial if prices slip -- as long as you finish the job later. Experienced options users sometimes "sell to open" puts to target lower buy prices on some of their shares.
- **Some stocks are above your estimate of fair value. Should I buy anyway?** If a stock is rated a Buy or Buy First, we believe it will still perform well over our time frame, meeting or beating our goals. Fair value is an estimate, and it's the price *from which* we expect our desired rate of return. If a stock is a bit above our estimate, that doesn't mean its promise is gone, by any means. Plus, keep in mind that a fair-value estimate steadily goes up as a business grows. We update them around twice a year.
- **How long will I own these stocks?** The Motley Fool has always said that you shouldn't invest money in stocks for anything less than three years. That's smart advice. We view all of our core stocks with a rolling three-year time frame.
- **Do I need to hedge, short, and use options?** The short answer is no. Many investors do great just owning stocks, and in *Pro*, our stocks alone should lead to success. But for those who want to use these dynamic tools for income, leverage and more, we'll help you incorporate them into your *Pro* portfolio starting with our Portfolio Positioning Report on Dec. 1.
- **How do I use *Motley Fool Options* alongside *Pro*?** *Pro* members receive *Motley Fool Options* free for the life of their *Pro* membership! *Options* provides individual options ideas and education; for members who want *additional* options positions in their portfolio, these are a perfect complement and return enhancer.

For other common questions, see our welcome note. (We've welcomed plenty of new members over the years, so much so that veteran members may have seen the note a time or two before.) And as you go through our Guidebook, enjoy the process! Investing is a marathon, never a sprint. If you make a little progress each week, you're headed toward the long-term magic of compounding, which can only happen over many years.

To our existing members, thank you for so kindly welcoming new *Pro* members to the service, and for all your help on the discussion boards!

To everyone, we expect a series of recommendations (in both services) as we go through the rest of the year. In *Pro*, we like to use the end of the calendar year to reassess and make adjustments. We have this in mind already as we guide new members.

But always think "marathon," never "sprint." Steady income from options aside, any money you can make in a day or week won't be enough to matter. The money you make over many years of being invested is what makes the biggest difference. We're glad you're here in *Pro*. Let's keep the conversation going on our discussion boards.

Fool on!

— Jeff (TMFFischer)

American Tower Keeps On Integrating Its New Assets

Published Nov 4, 2015 at 3:25PM

What Happened?

- Total rental and management (R&M) revenue of $1.24 billion (year-over-year core* growth of 27.4%)
- Domestic R&M segment revenue of $808 million (year-over-year core growth of 21%)
- International R&M segment revenue of $405 million (year-over-year core growth of 44%)
- Adjusted EBITDA of $779 million (year-over-year core growth of 26%)
- Adjusted funds from operations (AFFO) of $558 million (year-over-year core growth of 33%)

*Core growth reflects adjustments for foreign currency exchange rate fluctuations, pass-through revenue, straight-line revenue and expense recognition, and material one-time items

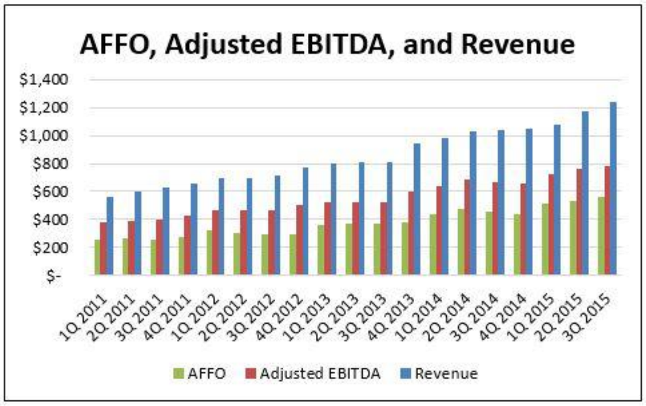
CEO Jim Taiclet:

> "Our nearly 14% growth in AFFO per Share in the third quarter was fueled by continuing exponential growth in mobile data demand in both the U.S. and in our international markets. We believe that this growth in demand will go on for many years to come, driven by a combination of lower cost smartphones proliferating around the world, additional spectrum being deployed for mobile data and the competitive imperative for mobile operators to steadily invest in their networks.
>
> Our strategic objective is to capture this long-term growth opportunity by building strong positions in the world's largest free market economies with attractive wireless industry structures. So far in 2015, we have made tremendous progress on expanding American Tower's global growth platform through our acquisitions of rights to the Verizon towers in the U.S., Telecom Italia's towers in Brazil, Airtel's portfolio in Nigeria and our recently announced Viom transaction in India. We expect that these strategically located assets will further lengthen and strengthen our AFFO per Share growth trajectory well into the future."

So What?

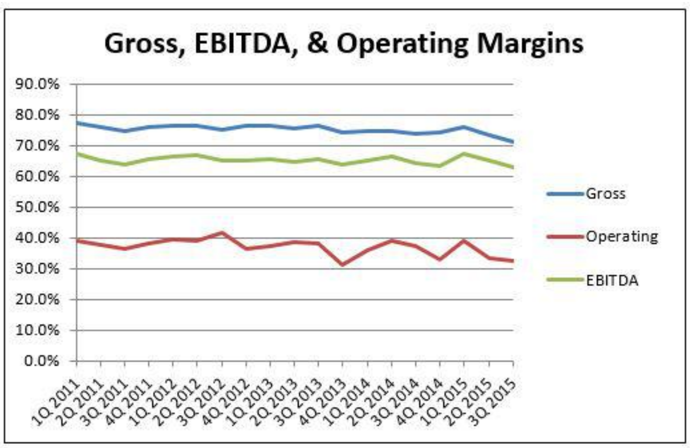
American Tower (NYSE: AMT) reported a bit of a noisy quarter in Q3 2015 as the company continues to experience significant foreign currency headwinds and work toward integrating a variety of newly acquired assets, including the Verizon assets in the U.S., nearly 4,700 towers in Nigeria, and over 1,000 additional sites in Brazil from the TIM acquisition that had yet to close as of the previous earnings report. Foreign currency fluctuations knocked off 8% from reported revenue, 9% from Adjusted EBITDA, and 11% from AFFO, which is the highest-magnitude impact I've seen since covering the company.

Nonetheless, the company continues to build on its strong business performance and compounding dynamics. The company continues to execute on its strategy of using cheap debt to consolidate a critical industry with growing end-markets and secure, recurring revenue characteristics. This has resulted in strong and consistent growth in revenue, EBITDA, and AFFO as growth in end-markets continues and new assets are integrated and leased up:



Two quarters ago, I noted that "we may see slower revenue growth and stagnant or declining margins in the coming quarters as [timing-related] factors dissipate and new acquisition-related assets (and their lower margin profiles) make up a larger portion of the company's revenue. But over time, we should see margins tick up as scale and incremental leasing activity on new assets take hold." That's what happened again this quarter, with margins continuing to decline sequentially, primarily due to the significant and immediate effect that the lower-margin Verizon assets have on domestic margins.

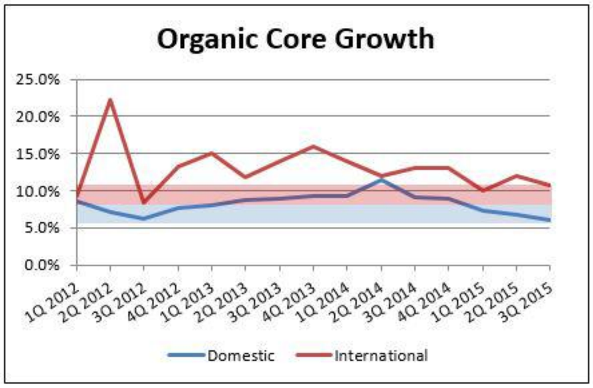
International margins actually increased on a year-over-year basis (international operating margins increased from 69.3% in Q3 2014 to 70.5% in Q3 2015) due to strong international organic growth, even despite the addition of new lower-tenancy towers in Brazil and Nigeria. But due to the disproportionate effect of the domestic portfolio on the overall company's financial results, margins continued to decline, exacerbated by the aforementioned foreign currency fluctuations:



Despite this, we should see margins start to increase over the next 6-12 months and beyond as American Tower begins to work its way through its application pipeline for the under-utilized Verizon towers. Management made some comments on the call regarding the progress of integrating the significant Verizon acquisition:

> **CEO Taiclet:** "*So on the Verizon towers, we've actually got almost 5,000 third-party applications on 11,500 sites. Now it's going to take months, and in some cases, a number of quarters to get those applications through. It's a mix of co-locations and amendments. It's all kinds of activity there. It will play out over literally the next 6 to 12 months as far as real revenue opportunities that flow from those many applications. But we already have commenced new business in process where we think we'll end the year with about $800,000 a month of incremental monthly revenue based on the new applications we will have processed by then. So that's a really great start. It's in line with our business plan, and we've got a huge pipeline of applications as we've kind of opened up these towers for business, so to speak.*"

Organic core growth (growth excluding revenue associated with new properties) continued to track well, with international organic core growth coming in at +10.7% (decelerating a bit from +12.7% last quarter) and domestic core growth continuing to slow (coming in at +6% vs +6.8% last quarter) as AT&T and Sprint maintain reduced levels of U.S. network investment activity relative to the same periods in 2014. AT&T and Sprint are expected to pick up their investment activity into 2016 and beyond as they launch their next-generation network plans, which should support higher domestic organic core growth. Organic core growth continues to track within management's target ranges (the shaded area on the graph below):



As for debt, the company's net leverage ratio came in at 5.4x, and management expects to reach 5x leverage or below by the end of 2016. The company has plenty of liquidity (nearly $2 billion), no significant debt maturations until 2018, and a weighted average debt tenor of nearly 6 years.

Yearly distribution growth continues to track ahead of management's 20% long-term growth target, coming in at 28% growth ($0.46 per share, a 1.8% yield on the current share price). 20% annual distribution growth continues to look like a more than reasonable target for 2016 and beyond.

American Tower's management team does a great job of trying to present new and compelling information on each conference call rather than delivering canned, stale information. This call provided some excellent information, specifically related to (1) the company's capital allocation process and priorities, and (2) the effect of technological developments on American Tower's future prospects. Here are my favorite excerpts:

> **On capital allocation between U.S. and international markets:** "*We have said a number of times in the past, we don't have a specific revenue split target for U.S. versus our international markets. But just as a reference, because of the size, the pricing structures, the strength of the contracts that Tom already mentioned, the U.S. still delivers 75% of the operating income of the company, right? So that's going to be a very big flywheel that itself grows over a long period of time and there's a smaller flywheel of international operating income that's going to grow faster for a longer period of time. And so those 2 things actually complement each other and we don't have a specific target of how the math ought to work in, say, year 5 or year 10. But what we will continue to do is look both in the U.S. and outside for investment opportunities that meet our investment criteria, right, which is meaningful AFFO per share, growth opportunity at asset prices that give us a good opportunity to also keep ROIC stable and rising over time as well, OK? That's how we make those investment decisions. The benefit of having the global aperture as we look at those investment decisions are, it gives us a lot more things to look at. Many of those things will meet our investment criteria. We'll go through them. A couple of those have happened already this year in the case of TIM, Airtel and now Viom. We also had that aperture open in the domestic side and we made a very significant agreement with Verizon, as everybody knows, earlier this year. And then there's a lot of things we don't have to do because we have the wide aperture. There's a couple of other carrier deals that didn't meet our asset pricing objective, and you didn't see us win those. There's many international deals because we have again both sides of the street to play on that we don't take because we don't think we have to take them to grow inorganically. So I think those are the benefits of having the global team in place, the track record, these multinational customer relationships. The diversification will naturally happen, because as you know, 60% of the sites and it will be greater next year, contingent on our Viom closing are outside of the U.S. and they're going to grow faster and longer. So this is naturally going to evolve over time, but there aren't any targets.*"
>
> **On technological developments and their effects on AMT (long, but worth reading for those concerned about technological disruption, important lines bolded for emphasis):** "*There are 2 facets of mobile network investment, which are depicted on the next slide. The first is known as the core side of the network. The fixed-line portion of the system, which consists of the switches, servers and related electronics; the fiberoptic cable and copper that connects all these major components together; and the software that makes it all work. The other side of the network is known as the RAN, or radio access network, and is made up of the widely distributed transmission or cell sites. Each cell then utilizes an airlink over radio spectrum to reach your device over the air. At American Tower, we play only on the RAN side of the network, and demand for our real estate goes up directly whenever more transmission equipment, such as antennas, is required for capacity or when new cell locations are needed for coverage. Moreover, our demand goes up indirectly when improvements in the core network reduce its cost of operation, potentially freeing up more capital and/or OpEx resources for the RAN and its many cell sites. Therefore, **it's crucial to view technology and industry developments as they relate to American Tower by asking 3 simple questions about each. First, does this particular technology significantly improve airlink capacity, and thus reduce the need for equipment on towers? Second, does this technology significantly increase the distance a high-quality wireless signal can travel, allowing sites to be positioned further apart? And third, conversely, does this technology reduce core network costs, which then would enable more resources to be deployed back into the RAN?***
>
> *So now I'll spend a few minutes on several emerging technologies which we believe are or will be incorporated into future mobile network deployments and address those 3 critical questions for each.*
>
> *First, let's start with self-optimizing networks or SONs and software-defined networks or SDNs. SONs allow networks to be more intelligent by dynamically managing traffic. This helps carriers reduce expensive truck rolls to make physical network equipment adjustments in the field. Meanwhile, SDNs provide carriers with a tool to add new network functionality and services through simple software upgrades, dramatically reducing time and cost. Both the SON and SDN therefore primarily enhance the efficiency of the core side of carrier networks and help operators reduce OpEx and CapEx there. So we view both of these technologies as neutral to positive for tower demand.*
>
> *Next, let's address cloud RAN or C-RAN technology, which enables carriers to centralize the base stations of several cell sites at a data center, instead of having dedicated ground-based equipment at each tower site. As a result, the carriers are able to reduce their base station costs and enhance the processing efficiency of the mobile core portion of their networks. While their ground space requirements at the base of towers can decrease with C-RAN in use, the amount of equipment on the towers themselves is unaffected, or in some cases, actually increases, as remote radio heads are installed on the tower. So for a tower operator, we also expect C-RAN to be typically neutral to net positive.*
>
> *As you can see on Slide 19, **it is our understanding that none of the technologies I just mentioned materially enhance airlink capacity or extend effective signal ratings. Conversely, when it comes to whether or not these innovations have the capability to decrease carrier operating expense on the core side of the network, the answer is yes. Over the long term, they should be a positive for the tower industry.***
>
> *Turning to the airlink side of the network. There have been technological improvements which over time have improved network capacity. For example, carrier aggregation has enabled mobile operators to deploy unpaired spectrum usually with high and low bands together all on one site. This adds network capacity in the short term as spectrum assets are more effectively utilized. But in the long term, we believe this will actually lead to increased cell site densification as the design requirements of the highest frequency band spectrum will dictate ultimate network density and overall design requirements. Our estimate is that over the last few years, capacity gains from new spectrum and higher spectral efficiency of LTE has absorbed roughly 20% to 30% of incremental network usage, leaving the 70% to 80% being solved through additional cell sites and equipment on our towers. As I have highlighted in past calls, the laws of physics govern the properties of RF signal propagation and thereby limit the impact that many changes in technology can have to the airlink*

portion of a mobile network. For example, in the largely suburban and rural areas served by our U.S. towers, antenna elevations of at least 75 feet above ground level are usually needed for effective signal transmission. And antennas that are upwards of 10-feet tall also continue to be required for the specific spectrum bands being used and the cell radius being served in these topologies. In addition, higher bandwidth data traffic requires more signal propagation locations to ensure sufficient signal strength and more equipment at those locations to process that signal as well. And these trends drive solid core organic growth that you've seen in our business year after year. ***Given the topographic and demographic characteristics of the United States and our international markets, we continue to expect the macro tower to be the predominant siting solution for carrier network deployments now and in the future.***

Additionally, the improvement of technology in the mobile core should enable the carriers to deploy relatively more capital on their radio access network build-outs to keep up with the demand. This may be especially relevant with the much higher throughput expected on future 5G networks and beyond. Moreover, our international operations continue to benefit from the increasing availability of cheaper, more advanced smartphones and the greater ability of many more people around the world to afford them. Mobile connectivity is revolutionizing communications, commerce and entertainment in the developing world, and we think that in many of our served markets, the modernization cycle is actually accelerating."

Now What?

This quarter's report yet again provides confirming evidence that our investment thesis (that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time) continues to play out. Despite short-term margin pressure related to acquisitions, the company's strong operating history, excellent management, and strong competitive position in a growing industry give me confidence that American Tower will continue to grow revenue and cash flow at high rates for a long time, providing strong returns on capital.

Data and Guidance

- Current Price: $102.44
- Fair Value estimate (unchanged): $115
- Allocation: 3.5% plus 0.6% in bought calls
- Market Cap: $43.8 billion
- EV/EBITDA (TTM): 20.7
- EV/EBITDA (2015 projections): 19.9

AMT remains a Buy First, with no change to our fair value estimate of $115 per share and an allocation of 3.5% plus 0.6% in January 2017 $80 calls. If you've yet to start a position or haven't yet bought calls, now is as good a time as any to match us. The stock may experience volatility in the short-term due to its tendency to trade alongside the interest rate-sensitive REIT sector, but over the long-term the underlying strength in business fundamentals should shine through.

Fool on!

-- Billy

Pro Quality Checklist: Valmont Industries

Published Nov 4, 2015 at 2:29PM

Programming note: *Our weekly Memo is two days late this week because of the annual TMF company meeting, which took place Monday and Tuesday.*

Fellow Fools,

In this second edition of our *Pro* quality checklist series, I've decided to dig into one of the companies that we recently placed on Hold, **Valmont Industries** (NYSE: VMI). Valmont has underperformed our expectations since we added it to the portfolio two years ago, but that's not reason enough to discard it immediately. And because most of Valmont's woes are related to a wide-ranging slowdown across the industrial sector, rather than any operational missteps by the company, this seems like a great time to review the qualities that drew us to Valmont in the first place.

1. A Sustainable Competitive Advantage

Yes. As the No. 1 or No. 2 manufacturer in the markets it serves (irrigation equipment, telephone poles), Valmont has the advantages of scale to reduce costs and create a barrier to entry for new competitors. The company's size relative to suppliers likely grants it negotiating power, and Valmont's intangible assets -- including brand recognition and a reputation for both quality and execution on large, complex projects -- have resulted in a long list of loyal customers. The company boasts extensive engineering expertise, and management invests heavily in research and development to create new, innovative products. Valmont's competitive advantage is evidenced by its ability to consistently earn returns on capital well in excess of its cost of capital, and its ability to generate healthy margins and maintain them over the business cycle.

2. Pricing Power

No. Though Valmont is an industry leader, the pricing of its products is largely driven by commodity input costs and the margin that competing bidders are willing to accept on their contracts. Valmont can usually pass through changes in material costs, and customers are often willing to pay a premium for Valmont's expertise and high-quality products. However, if the company *truly* had pricing power, management wouldn't need to spend time on earnings conference calls discussing the pricing discipline of its competitors. By comparison, **Apple** (NASDAQ: AAPL) pays little concern to how much competitors are discounting their phones when it comes time to launch a new iPhone.

3. A Dependent Customer Base

Sort of. The world contains a limited number of companies that are able to complete large-scale irrigation, infrastructure, and utility projects. For customers that require those services, maintaining a tight schedule and avoiding cost overruns is often more important than obtaining the lowest possible bid, so they prefer to work with a company like Valmont. Also, once a customer makes a large investment in installing Valmont's products, they aren't likely to switch to a competitor -- the convenience of using a single vendor for parts and maintenance often outweighs saving a couple of bucks on the initial purchase price.

Despite these positive attributes, I can't give Valmont full credit on this point, because the degree of customer dependency varies significantly across its businesses. Also, small-scale or less specialized projects usually come with tougher competition and smaller margins. For this type of business to earn a full point, I'd also like to see a higher proportion of recurring parts-and-services revenue.

4. Predictable Revenue

No. Valmont's business is about as predictable as you'll find for a cyclical manufacturing company, but it's still cyclical. Thanks to the company's exposure to multiple end markets (agriculture, energy, infrastructure, and mining), the peaks and valleys of the separate cycles usually combine to smooth out sales and profit growth. Unfortunately, over the past few quarters, we've seen what happens when all of Valmont's end markets enter a down cycle in tandem.

Over a longer time frame, we know that global economic growth will require infrastructure spending to support it, and Valmont provides a wide range of products to make that happen. We've been seeing reports for years now that our own country's roads, bridges, and electric grids are in dire need of upgrade and repair, which should provide a solid backlog of business in the U.S. over the next few decades. We are confident that Valmont will benefit from those trends, but the timing of those contracts isn't as certain as it is at our other recurring-revenue businesses.

5. Growing Free Cash Flow With Compounding Returns

Yes. Valmont has an impressive history of upping its free cash flow at a healthy clip, and even during the Great Recession, the company still managed to remain cash-flow positive. Though Valmont has paid a dividend for years, the company still retains around 85% of earnings to reinvest in the business. Management uses an economic value added (EVA) framework to inform capital allocation decisions, which focuses investment dollars on projects and acquisitions with the largest spread between the expected return on capital and the company's cost of capital. Over the past year and a half, the company has also repurchased shares when management thought they were undervalued, resulting in a 14% reduction in the diluted share count.

6. Financial Resilience

Yes. Like most industrial businesses that require heavy investments in plant, property and equipment, Valmont carries a significant amount of debt on its balance sheet. Though $767 million in total debt seems like a large number, it's only twice the company's annual EBITDA production, and even in a terrible year, the company brings in enough operating profit to cover its interest payments a comfortable six times over. This intelligent use of debt has allowed the company to leverage its assets and generate an average return on equity of nearly 18% for the decade ending in 2014.

In late 2014, Valmont's management took advantage of the company's investment-grade credit rating and the low-interest rate environment to refinance a portion of its higher-rate debt and raise additional capital. The company issued $500 million in 30-year and 40-year bonds, locking in interest rates at 5% and 5.25%, respectively. That was a serious vote of confidence in Valmont's long-term prospects from the capital markets.

7. Expanding Possibilities

Yes. Global population growth and the expansion of emerging-market economies are the key trends that will drive Valmont's future growth opportunities. As countries around the world become wealthier, they will need to invest heavily in infrastructure to keep their economies competitive and their populations happy. Valmont's irrigation division will also play an important role in improving farm productivity to feed a growing global population.

Valmont's global network of sales offices and production facilities positions the company to be a key beneficiary of international growth. Recently, a strong dollar and weak economic conditions in Europe, South America, and Australia have been a drag on Valmont's performance, but that volatility will also serve as a tailwind when those markets recover. Valmont will also continue to take advantage of its strong cash flow production to make opportunistic acquisitions and gain access to complementary products, unique capabilities, and/or new geographic regions.

8. The Three C's of Management

Yes. Over the years, Valmont has been a textbook example of operating efficiency -- maintaining profitability and healthy returns on equity even during economic slowdowns. The company is run by Mogens Bay, who has been CEO since 1993 and took over the chairman's seat on the board in 1997. Over the past two decades, Bay and his team have created an exceptional amount of value for shareholders, and their performance during the current industrial down cycle has proven that the team knows this business well. Valmont refinanced debt and shored up the balance sheet last year when the market first started to soften, and management has been surgical about cutting costs and streamlining the business since then.

So far, management has underpromised and overdelivered on its restructuring plan, recently increasing the annual savings expected from their efforts from $19 million to $30 million. Management also announced in its most recent earnings call that it intends to improve its communication with investors, and to hold its first investor day early next year. I believe management scores points on all three criteria, and thanks to their efforts, we'll be looking at a much stronger business when the cycle eventually turns.

The *Pro* Bottom Line

Altogether, I score Valmont Industries a 5.5/8 on our *Pro* quality checklist. It should be obvious from this checklist that Valmont's biggest weakness is the cyclical nature of its target industries, followed closely by tough competition for smaller-scale projects. Though the company's diversification across multiple industries usually reduces sales volatility, we should expect periods, like this one, during which the entire group moves in tandem and growth stalls. Valmont remains a high-quality business run by a strong management team, but we need to spend some additional time thinking about how this business's cyclicality works with the rest of the portfolio to help us achieve our North Star mandate.

Following our recent decision to move Valmont to Hold, we plan to have an update on our guidance in next couple of weeks, so stay posted. In the meantime, we'd love to hear your thoughts on the Valmont Industries discussion board.

Fool on!

-- Jeremy (TMFTank)

Valmont Industries Lays the Groundwork for a Recovery

Published Nov 1, 2015 at 4:36PM

As one of the few losing positions on the Pro scorecard, there's been a fair amount of hand-wringing about what we should do with **Valmont Industries** (NYSE: VMI) – and even more so as we head into the year-end tax-loss harvesting season. The market reacted positively to a "not-as-bad-as-it-coulda-been" quarter and management continues to deliver on their plans to streamline the business.

As we expected, sales and profits continued to decline, down 17% and 43% respectively thanks to a combination of soft demand, currency headwinds, and restructuring costs. These results are consistent with what many other industrial companies have been reporting. The energy, agriculture, mining, and construction industries are all in down cycles and there's little indication that demand will increase any time soon and recent reports of plummeting steel demand in China suggests that things could get worse before they get better.

In **Fastenal's** (NASDAQ: FAST) most recent earnings call, the company'sCEO declared that he believes were in an industrial recession. Considering that the company services 250,000 industrial customers a month, he probably has above average insight into market conditions. In previous cycles it was unusual for so many markets to slow all at once. As a result diversified industrials like Valmont didn't seem as volatile as what we're seeing today, but when combined with headwinds from a strong dollar, these market conditions are probably about as bad as it get for Valmont-short of a full-blown global recession.

Eyes On The Horizon

Despite this tough operating environment, one thing is clear: Valmont's management is playing the game like they've been here before. We've been impressed with their no-nonsense approach to managing the business during this down cycle. So far this year management has consolidated production into fewer, lower-cost facilities, centralized the production planning process across segments, and cut about 700 positions. Management claims that they have been able to achieve this reduction without limiting production capacity. The company has the same number of machines running and can add shifts as necessary to match an uptick in demand.

As a result of those and other actions, management now expects to generate $30 million in annual cost reductions beginning next year – well above their initial target of $19 million. Though the company has cut SG&A from around $13 million a quarter to $9 million, management emphasized that they intend to continue investing research and development to maintain their position as a market leader in each segment.

Segment Updates

- **Engineered Infrastructure Products** (41% of sales) –

There's still no sign that public infrastructure spending is picking up and with 25% of sales coming from the distressed energy and mining industries, the EIP segment continues to languish. Congress passed a three-week extension for the long awaited hihway bill, but we're still waiting for a multi-year extension which will hopefully come before the end of the year. Also, U.S. wireless carriers have pulled back on the infrastructure spending since the beginning of the year. This segment continues to suffer from the deleveraging effects of lower volume and currency headwinds.

- **Utility Support Structures** (26% of sales) –

The utility segment remains ultra-competitive and management intends to continue their disciplined strategy of not bidding on unprofitable business. Utilities have focused their capex on transitioning from coal fired plants to meet federal mandates and as a result they are investing less in large transmission projects. As a result the project mix this quarter was generally smaller in scale which was a drag on margins. Management has been focused on cutting costs in this segment and expect to generate two percentage points of operating cost improvement starting next year.

- **Irrigation Systems** (18% of sales) –

Irrigation spending is closely correlated to farm profits, which are expected to decline by 30% to 40% this year. There was significantly less storm damage this year which made for a tough quarterly comparison to a year ago. Management claims that competitors have remained fairly rationale about pricing which has allowed the segment to remain profitable despite falling production volume. It's nearly impossible to predict movement in crop prices into the future, but there's been some indication that a strong El Niño should disrupt global weather patterns, especially in the southern hemisphere, and influence the commodity food markets.

- **Coatings** (12% of sales)–

The coating segment remained strong in North America, but continued challenges in the Australia market has led to plant closures and impairment charges. Zinc prices have dropped significantly this year, but the industry has maintained pricing discipline.

Smart Capital Allocation

Valmont continues to generate a lot of cash-$54 million in basic FCF during the quarter – so, as you might expect after the decline in the stock this year, analysts are very interested in management's capital allocation strategy. According to management, their hierarchy remains, 1) reinvest in the business, 2) acquisitions, 3) pay out 15% of net income as a dividend 4) buyback stock. In the last quarter management cut back on #1, but checked off the other three boxes with the acquisition of American Galvanizing and a continuation of the share buyback program, repurchasing 247,000 shares for an average price of about $109.50 a share.

One encouraging point that management made about their acquisition strategy is that they claim Valmont is "an EVA-type company". The economic value-added (EVA) framework (which focuses on maximizing the return on capital that can earned over a company's cost of capital) establishes a companywide process that makes it more likely that capital will flow to its best use and that management will remain disciplined in their bidding strategy. When combine with Lean manufacturing processes, this can be a great value creator for capital intensive industrial businesses, like Valmont.

The *Pro* Bottom Line

With the cycle moving against them, all that Valmont's management team can do is ride out the storm and try to build a leaner business for the next recovery. When that eventually happens, Valmont should see an incredible amount of operating leverage from the restructuring initiatives completed this year and earnings per share should get a boost from the steadily shrinking share count. That combination leads me to believe that a five-year double from these levels isn't an unreasonable assumption. However, considering our goal of generating North Star returns over rolling three-year periods, we also need to consider the opportunity cost of keeping our capital tied up while we wait for the cycle to turn.

Valmont remains on Hold as we carefully consider how we'd like to manage this positions. Keep an eye out for the upcoming Memo where we'll run Valmont Industries through Jeff's updated checklist of what makes for an ideal *Pro* company.

Pro Welcome Video Transcript

Published Oct 29, 2015 at 7:50PM

Greetings, and welcome to *Motley Fool Pro*!

I'm Jeff Fischer, your lead advisor, and I want to briefly introduce you to everything this one-of-a-kind investing service has to offer. Plus, I want to show you how to get the most out of your experience with *Pro*.

As you know, our goal is to generate steady returns – in any market climate – with a sleek array of investment tools alongside tailored, step-by-step guidance. Used together, we believe our strategic deployment of shorts, hedges, ETFs, options, and long-term stock purchases can help consistently elevate your portfolio in ways few services can.

So how – and where – should you start?

Well, we know that every investor is different. And because of that, we've arranged an introductory set of investments – the first *Pro* trades -- you can make to suit your personal style and level of comfort.

On November 6th, you'll see the first part of this introductory series in the form of our first "Portfolio Building" Report. These are the stock purchases we recommend you to make first... as soon as you're ready.

But if you'd like a little more time to get your feet wet, hold off until November 13th when we release a second report that details our latest thinking on several of the other active recommendations in the *Pro* portfolio. There's also a third report coming November 20 that will include the rest of *Pro*'s stocks. So, you can start with us right away on Nov. 6, or you can wait until you've read all three reports – we're in this for the long haul, so there's no hurry. And, we're a full portfolio service. Ultimately, we want you to have a fail-safe portfolio, just like *Pro*'s. Some members copy our portfolio exactly, others partially. You'll find what suits you.

In the meantime, I highly recommend getting acquainted with how we do things in *Pro*. On our "Strategy Guide" page, you'll find critical information about our investment philosophy, as well as a specific list of traits we look for in a buying opportunity.

What's more, you'll learn about the *Pro* "North Star," our portfolio's target performance metric. We define our North Star as the inflation rate plus 7% annually. Multiplied out, a decade of reaching the North Star target would double your money – even after inflation!

Following the always-positive North Star with minimal volatility is what we're after here at *Pro*... and it's that mind-set that goes into every single recommendation we make.

That last point is particularly important. Because although some of our trades may be short-term in nature, the goal of the *Pro* portfolio as a whole is to achieve real, long-term gains. And that's why sticking tight to the North Star – and not jumping on risky short-term plays – is so important.

Another feature of *Pro* that we're proud to offer is full-access to our Motley Fool Options service, free for the life of your *Pro* membership. Of course, using options in your portfolio is completely your choice. In *Pro* and in *Options*, we give you all the tools you'll need, and vetted recommendations with a great track record – more than 92% of our options have ended profitably. Just click on the *Options* link, and you'll find ready-made trades (and guidance!) for all experience levels.

Everything you need to get started in *Pro* is available here in the Guidebook... including when you can expect updates, how to track your performance, help determine which trades are right for you, and much more. So take some time to look around. I'm sure it will make your experience in *Pro* much more enjoyable – and your portfolio will certainly thank you for it.

As always, if you ever need help or have questions about our service, our investments, or our strategies, please feel free to post on the message boards. There, you'll find the entire *Pro* team – myself included – as well as a friendly and knowledgeable community of fellow *Pro* members.

Once again, welcome aboard *Motley Fool Pro*. I'm excited to start profiting with you soon... and well into the future.

TD Ameritrade Continues to Grow Client Assets

Published Oct 29, 2015 at 10:54AM

Pro's Take: AMTD Q4-2015 and FY-2015 Earnings

TD Ameritrade (NYSE: AMTD)

Quarter Quick Take

In Q4 2015, TD Ameritrade yet again demonstrated its ability to deliver strong profits despite unpredictable value drivers. This company does a great job of focusing on what it is able to control and preparing for what it can not, a testament to the company's defensible competitive position and strong management. For Fiscal 2015, the company grew net revenues by 3.7%, client assets by 2.2% (and net new assets by 10%), and earnings per share by 4.7%. The company has been able to pay a well-funded dividend and steadily increase its core earnings power, and the company's interest-sensitive earnings are set to grow sharply during periods of rising interest rates (who knows when that will happen).

Nonetheless, despite the company's consistency, certain metrics (namely commission rates and growth in the fee-based portion of the business) seem to imply that competitive pressures have been heating up lately, so that's something we'll want to keep an eye on. In the absence of higher interest rates, if competitive pressures start to take a significant toll on the business, then the company may be challenged to continue to grow. Despite this, the company continues to produce steady cash flow and strong profit margins. We'll see over time how management is able to respond to the current competitive environment.

President and CEO Fred Tomczyk:

> "The story of 2015 is one of continued momentum and strength in nearly every area of our business. Strong trading and asset gathering have again helped us deliver growth in earnings, despite the continued low interest rate environment. We finished the year strong in trading, averaging a record 462,000 trades per day, as volatility returned to the markets in the fourth quarter. And, we gathered a record $63 billion in net new client assets, a double-digit growth rate for the seventh consecutive year. We will carry that momentum with us into fiscal 2016. We have a strong competitive position, an unrelenting client focus, and we remain well-aligned with the secular growth trends – which will serve to help us continue delivering strong organic growth and earnings."

Guidance Update

After incorporating this quarter's results into our model, our fair-value estimate remains unchanged at $35 per share. This valuation does assume a slow increase in interest rates over the next several years, so in the absence of that occurrence, the company may be challenged to grow earnings and the stock price may stagnate. Currently, the stock is about 10% below its 52-week highs as investor speculation about the timing of an interest rate increase has led to increased volatility for companies that are interest rate-sensitive. This volatility may continue depending upon market conditions.

Updated guidance: Buy (no change)

Recommended Allocation: 2.7%

Fair-value estimate: $35 (no change)

Current price: $35

The Numbers (for Q4-2015)

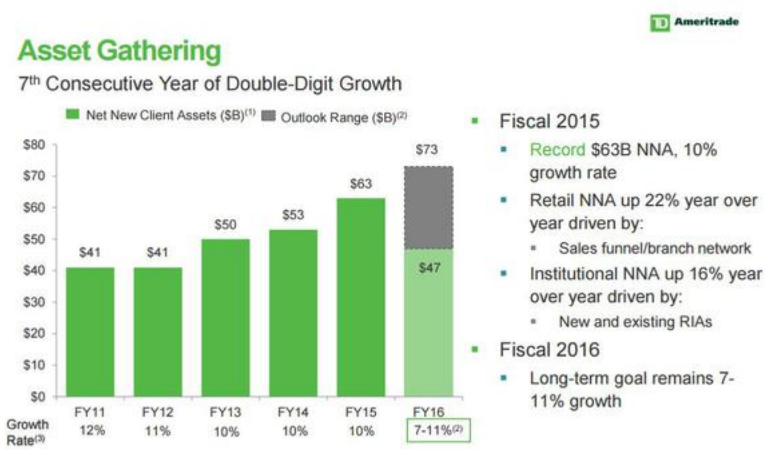
- Record net revenue of $831 million (up 4.5% year-over-year)
  - **Transaction-based**:
    - Funded accounts grew to 6.62 million (up 5.1% year-over-year)
    - Trades per funded account of 4.62 (vs. 4.17 last quarter vs. 4.06 a year ago)
    - Average commissions and fees per trade of $11.90 (vs. $12.01 last quarter vs. $12.97 a year ago)
    - Totals up to:
      - 6,620,000 x 4.62 x $11.90 = **$364 million** in transaction-based revenue (up 9.6% year-over-year)
  - **Spread-based**:
    - Total spread-based revenue of **$373 million** (up 1.6% year-over-year)
    - Average spread-based balance of $99.8 billion (up 7.4% year-over-year)
    - Thus, Net Interest Margin (NIM) =
      - $373 million / $99.8 billion = 0.374% (quarterly)
      - NIM (annualized) = 0.374% x 4 = 1.49% (vs. 1.53% last quarter vs. 1.58% a year ago)
  - **Fee-based**:
    - Fee-based revenue of $82 million (down 1.2% year-over-year)
    - Average fee-based balance of $157.1 billion (up 9.1% year-over-year)
    - Thus, Investment Product Fee Yield =
      - $82 million / $157.1 billion = 0.052% (quarterly)
      - Investment Product Fee Yield (annualized) = 0.052% x 4 = 0.209% (vs. 0.211% last quarter vs. 0.231% a year ago)
- Total client assets of $667 billion (up 2.2% year-over-year)
- Record interest rate sensitive assets of $108 billion (up 8% year-over-year)
- Net new client assets* of $16.2 billion (9.2% annualized growth rate, up 20.9% year-over-year)
- Diluted EPS of $0.40 per share (up 3.5% year-over-year)
- Trailing-12-month (TTM) average return on equity (ROE) of 16.9% (up from 16.7% a year ago)
- Capital management:
  - Paid $0.15 per share in cash dividends in the quarter (a 1.8% yield on the current share price)
  - Repurchased 7.1 million shares of its common stock at an average share price of $33.52 per share
  - Declared a $0.17-per-share quarterly cash dividend (an increase of 13% year-over-year), payable on Nov. 24 to all holders of record of common stock as of Nov. 10.

*excludes changes in client assets due to market fluctuations

Analysis

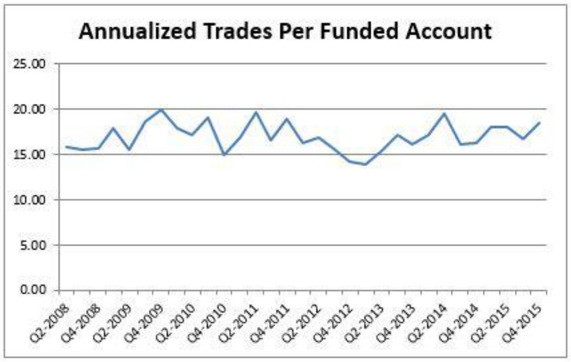
After a bit of a slowdown last quarter, the rate of growth in asset gathering picked back up in Q4, with net new assets up $16.2 billion, or 9.2% year-over-year. This was despite a decline of over 6% in the S&P 500 index during the quarter, showing how TD Ameritrade is able to grow its asset base even when equity prices are declining.

For the fiscal year ended this quarter, the company brought in a record $63 billion in net new assets, a 10% annualized growth rate. This was the 7th consecutive fiscal year of double-digit net new asset growth. The company's Fiscal 2016 and long-term goal is to grow net new assets at a rate between 7-11%, which based on current trends seems reasonable:



Source: TD Ameritrade September Quarter Earnings Presentation

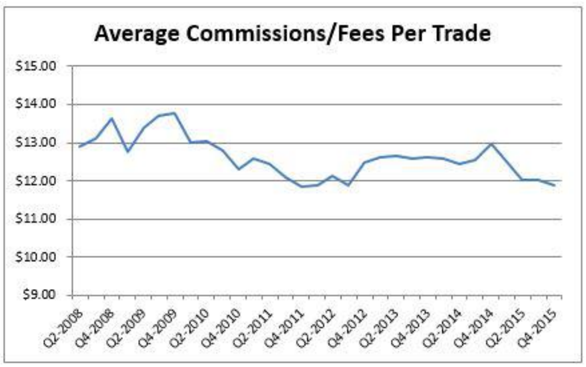
Trading activity ticked up in the quarter with particularly high trading metrics during the volatile month of August. In August, TD Ameritrade posted a record 537 thousand daily average revenue trades (DARTs), the highest figure I have on record.



Source: Company filings and analyst calculations.

The company continues to execute on penetrating derivatives (a record 43% of DARTs during Fiscal 2015, up from 41% in Fiscal 2014) and mobile trades (a record 16% of DARTs during Fiscal 2015, up from 13% in Fiscal 2014). Trading activity seems to be trending upwards as higher-activity derivatives traders are comprising more and more of the company's customer base. This bodes well for transaction-based revenue if the trends continue into the future.

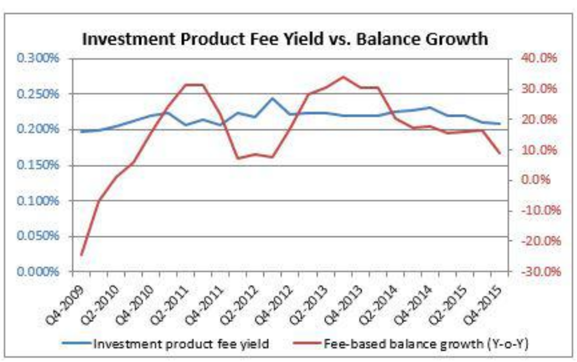
Despite the higher activity, average commissions and fees per trade declined quite significantly to $11.90 (down 8.3% year-over-year) to stay at the low end of the company's recent historical range. This is not too much of a concern in terms of our assessment of the business, as my valuation assumes a steady decline in commissions and fees per trade. Management focused on product mix to explain this pressure on commission rates, noting that a higher mix of futures (which is a lower revenue per trade product) is to blame:



Source: Company filings and analyst calculations.

However, TD Ameritrade generally has the highest commission rates among online discount brokers, and it's possible that promotional activity and price competition across the industry are affecting the company's pricing. I'll be watching this metric and the growth in funded accounts more closely over the coming quarters to make sure that TD Ameritrade is able to support its premium pricing while still bringing in a healthy amount of new accounts.

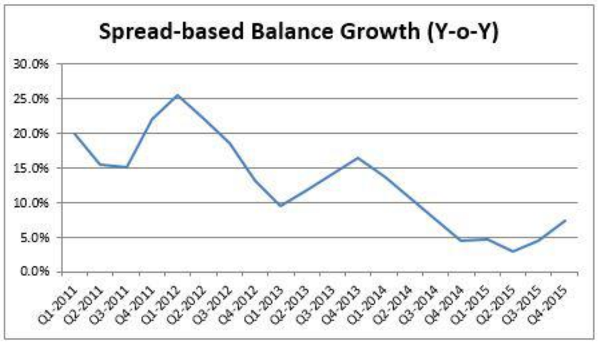
Speaking of competition, growth in the fee-based segment of the business has actually turned negative, down 1.2% year-over-year (compared to 7.6% growth last quarter and 23.9% growth a year ago). The decline in this segment was caused by several factors, including a lower fee-based balance due to asset price declines, lower net new asset growth, and lower fee yields (which is partially affected by the company's performance-based Amerivest fee rebate promotion).



Source: Company filings and analyst calculations.

As I suspected last quarter, increased competition in the investment guidance industry is certainly slowing the pace of growth in this segment of the business. This is more of a concern than the decline in commissions, as my valuation assumes continued healthy growth from this segment of the business (although it's still not a huge value driver at about 10% of companywide net revenues). Based on the last few quarters, I'm going to ratchet down my longer-term expectations for this portion of the business. Management expects to return the segment to growth in Fiscal 2016, guiding to 14% year-over-year growth in fee-based revenue for 2016 based on the midpoint of guidance. I'm curious to see how this segment fares over the next several quarters.

As for the spread-based portion of the business, the rate of growth in the spread-based balance accelerated again this quarter:



Source: Company filings and analyst calculations

This portion of the business is the one that's sensitive to interest rate changes, so it's great to see an acceleration of growth in one of the company's key value drivers. We'll continue to watch this metric over time to make sure it's staying on track, especially as we inch ever closer to the Federal Reserve's interest rate increase.

The company released full year 2016 guidance, implying (at the midpoint of guidance) no growth in transaction-based revenue, 11% growth in spread-based revenue, 14% growth in fee-based revenue, and 8% growth in earnings per share. Guidance seems reasonable if not somewhat conservative.

What We Think Now

TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and when interest rates increase, the company is positioned to grow earnings sharply.

If you have questions, post them on our TD Ameritrade discussion board.

Pro Quality Checklist: American Tower

Published Oct 26, 2015 at 3:58PM

Dear *Pro* Fools,

Last week, we introduced you to our newly updated checklist of the eight qualities we look for in an ideal *Pro* company. And as Jeff mentioned on the boards, we plan on publicly sharing our thoughts on each of our stocks in relation to the eight criteria. With this Memo, I'll kick it off by running one of the companies I cover, **American Tower** (NYSE: AMT), through the *Pro* quality gauntlet. Let's get started!

1. A Sustainable Competitive Advantage

Yes. American Tower leases space on more than 40,000 towers in the U.S. and almost 60,000 internationally, American Tower owns the largest portfolio of towers in the world. Especially in the U.S., where tower infrastructure is essentially saturated, American Tower has a geographic and regulatory advantage in terms of owning a large portfolio of well-placed assets. For wireless carriers looking to upgrade their networks, it often makes more financial sense to lease space on a well-located American Tower property than to obtain the necessary permits and spend the money to build towers from scratch.

Additionally, American Tower benefits from switching costs. The company has long-term, non-cancellable contracts with customers, meaning those customers can only switch providers at the end of a lease term. Furthermore, switching equipment from one tower to another introduces the risk of disruption of network quality, and it costs the carrier significantly in both time and money. As evidence, churn rates for leases are very low, typically in the 1%-2% range.

2. Pricing Power

Yes. This one is simple – American Tower has the pricing power to include annual escalators in its contracts. In the U.S., the escalators are approximately 3% annually (which is higher than the current U.S. inflation rate); internationally, the escalators are typically based on local inflation indices.

3. Dependent Customer Base

Yes. In the past, wireless carriers used to own and operate many of their own towers. However, thanks to the economics of co-location (the ability to support more than one carrier on each tower), companies like American Tower are able to own and operate towers more cheaply and efficiently than the carriers themselves.

This explains why, in the past several years, we've seen all of the major U.S. wireless carriers offload their tower assets to tower companies:

- 2008: Sprint sells about 3,000 towers to TowerCo (later acquired in 2012 by SBA Communications)
- 2012: T-Mobile USA sells about 7,200 towers to Crown Castle
- 2013: AT&T sells about 9,700 towers to Crown Castle
- 2015: Verizon sells about 11,300 towers to American Tower

The rationale behind the sales is easy to understand – it's simply more cost-effective for the wireless carriers to sell and lease the assets than it is to own, operate, and maintain them themselves. Now, since the tower companies own almost all of the prime tower infrastructure, the carriers need the tower companies in order to run their networks, and the tower companies need the carriers as tenants on their towers. It's a symbiotic relationship.

4. Predictable Revenue

Yes. This one is easy – American Tower has long-term, locked-in contracts. As of June 30, 2015, the company has approximately $32 billion of non-cancellable, contracted revenue in its backlog. Based on approximately $4 billion in revenue in fiscal 2014, that's about eight years of locked-in revenue. Additionally, thanks to the contracts, American Tower also knows the timing of the revenue. Not many companies have such strong revenue visibility in terms of both amount *and* timing.

5. Growing Free Cash Flow With Compounding Returns

Yes. American Tower has outstanding compounding dynamics. Not only does the company generate strong (and growing) free cash flow, but management is also continually reinvesting that cash flow into new projects (predominantly acquisitions – see a recent example here) with high returns on invested capital.

For example, since the fourth quarter of 2011, American Tower has increased its trailing-12-month adjusted funds from operations (REIT-speak for "free cash flow") from $1.06 billion to $1.95 billion as of the most recent quarter. That's a 19% compound annual growth rate in 3.5 years.

American Tower's strategy is to use its cash flow to acquire underutilized new assets, increase cash flow from those new assets, and then reinvest its now-higher cash flow into more new assets, which will then fuel further growth in cash flow. It's a virtuous cycle and a perfect example of how compounding works.

6. Financial Resilience

Sort of. I'm giving American Tower half credit on this one. The company has a significant debt load, with net debt of nearly $16 billion compared with an adjusted EBITDA (earnings before interest, taxes, depreciation, and amortization) run rate of about $3.05 billion, giving it a net leverage ratio (net debt/adjusted EBITDA) of 5.2.

Management has stated that it strives to run its business with a net leverage ratio between 3 and 5, so this figure is a bit higher than ideal. The ratio is a bit elevated because management has been flexible with leverage in order to make some significant acquisitions over the past few years, raising debt (and in some cases issuing equity) to do so. This has led to a slight deterioration in the company's credit rating, which makes borrowing a bit more expensive. All else equal, that's a bad thing.

Nonetheless, despite the debt load, the company generates heaps of operating cash flow (more than $2 billion per year and growing), which is more than enough to service the debt *and* keep growing. Additionally, the company has more than $2 billion in additional liquidity from cash on hand and unused drawings from its credit facilities.

It remains to be seen how the recent acquisition of Viom Networks will impact the company's financial position; we'll likely hear more when the company reports earnings this week. But if American Tower wants to improve its credit rating and get back into the target leverage range, it'll need a few quarters to increase cash flow and to pay down debt. At the current juncture, American Tower's financials are resilient, but not bulletproof.

7. Expanding Possibilities

Yes. American Tower is one of the prime beneficiaries of one of the largest secular trends on our planet today: the exponential growth of mobile data consumption. As per the most recent Cisco Visual Networking Index (VNI) forecast, global mobile data traffic will grow tenfold between 2014 and 2019, a compound annual growth rate of 57%. And as this traffic grows, wireless carriers will have to race to upgrade their networks with the capacity to meet this exploding demand. Additional and upgraded equipment will have to be placed on towers, and global tower operators will benefit.

This is where American Tower differentiates itself from its U.S.-based competitors – not only will our company benefit from the growth of mobile data traffic in the U.S., but with its significant and expanding international presence, it will also benefit from growth in other markets, some of which are growing even faster than the global average. Geographic diversification and experience give American Tower the benefit of being able to study its portfolio and optimize its incremental investments into the geographies that are growing the fastest and have the most potential.

8. The Three C's of Management

Clarity: Yes. Management does an excellent job outlining its investment process, goals, and priorities, on both a long-term and a short-term basis. Each earnings presentation contains a slide titled "Capital Allocation Priorities," generally in reference to the current year. Additionally, in the fourth quarter of 2012, CEO Jim Taiclet outlined an "aspirational goal" to double the company's tower count and generate "mid-teens" growth in adjusted funds from operations per share over the next five years.

Consistency: Yes. Management not only outlines its goals but refers to them often, and these priorities seem to be very important in driving business decisions. Management answers questions honestly and consistently, and often repeats its principles or strategies on conference calls to drive them home.

Capability: Yes. CEO Jim Taiclet has been in his role since 2003, and has shepherded the company through its current growth strategy. When he first took the job, American Tower operated 15,000 towers and had $715 million in annual revenue and $156 million in annual operating cash flow (a 21.8% margin). Today, the company operates nearly 100,000 towers, and in the most recent fiscal year, it generated $4.1 billion in annual revenue and more than $2.1 billion in operating cash flow (a 52% margin). In November 2014, the *Harvard Business Review* ranked Taiclet No. 18 on its list of the 100 best-performing CEOs in the world over the previous decade. I am consistently impressed with Taiclet's understanding of capital allocation priorities and his ability to communicate with the investment community.

The *Pro* Bottom Line

All in all, American Tower scores a 7.5/8 on our *Pro* quality checklist, with the only question mark being financial resilience, where I gave the company half credit. That's a strong showing, and it's evidence (along with the stock's discount to our fair-value estimate) as to why we rate this company a Buy First and why we own long-term calls in order to leverage upside. We think American Tower is a great example of a *Pro*-like business. And keep an eye out for further Memos like this one, in which we run more of our companies through our checklist to see how they score.

Fool on!

Gentex Mirror Sales Accelerate

Published Oct 26, 2015 at 2:23PM

***Pro*'s Take: GNTX Q3 2015 Earnings**

Quarter Quick Take

Gentex (NASDAQ: GNTX) turned in an excellent quarter in the Q3 2015, delivering 11.1% net revenue growth and 16.1% total mirror unit growth despite flat auto production in the company's primary markets over the same period. Unit growth continues to handily outpace global auto production, which suggests that the core element of our thesis (higher auto-dimming mirror penetration rates) is playing out.

The company sold 12.4% more interior mirrors (+9.2% in North America and +14.4% internationally) and 22.2% more exterior mirrors (+38.9% in North America and +14.4% internationally) than it did in Q3 2014. The company has announced and launched several new products that look to drive growth throughout 2015 and beyond, and there are more new product launches coming in Q4 2015 (namely the full display mirror on the 2016 Cadillac CT6). As cars become more technology-rich than ever before, Gentex is well positioned to meet that demand.

As evidence, consider that in 2013, the company had 37 new launches of its inside and outside electrochromic (EC) mirrors. In 2014, there were 43 new launches of inside and outside EC mirrors. And in 2015, through nine months, the company has had 54 new vehicle launches. This increased rate of adoption is why Gentex has been able to consistently grow sales often at a rate of 10% or more than global auto production.

Management continues to buy back stock at an increasing pace, repurchasing $34 million of stock during the quarter at an average price of $15.99 (below the current price). Management is historically stingy with repurchases, but as cash piles up on the balance sheet (cash + cash equivalents are up 22% year-over-year, representing 9% of the current share price once you net out debt), management appears to be more willing to pursue buybacks as a capital allocation strategy. I view these continued and increasing buybacks as a signal of confidence from management, and with Gentex shares trading below our estimate of fair value, I think the buybacks are a strong capital allocation decision.

Guidance Update

Despite slight declines in margins related to foreign currency fluctuations, Gentex is continuing to do what it does best -- sell its products at a pace well above the rate of auto production growth, and invest in manufacturing and product development initiatives in order to raise average selling prices and reduce manufacturing costs to offset annual price reductions expected by its powerful automaker customers. As global auto production picks up and as more and more automakers integrate technology into their models, Gentex should benefit over the long-term.

Our fair-value estimate remains unchanged at $18, and with the stock trading almost 10% below our FV estimate, **Gentex remains a Buy First** on our scorecard. At just over 16 times trailing-12-month earnings and at 8.6 times EV/EBITDA, the company is trading at valuation levels that are about as low as they've been throughout its history despite a robust balance sheet, steady operating performance, and continued success in market penetration and organic growth. If you've yet to start a position or fill out your allocation in Gentex, now is a great time.

We also have a 1.5% look-through allocation in December 2015 $15 written puts, which we wrote at attractive prices during the late August market volatility. Those puts are on track to expire fully as income, although we are still nearly 2 months away from expiration. If you haven't matched us you can still write the puts, although with a higher stock price and lower marketwide volatility, the yield is much lower than when we wrote them.

Updated Guidance: Buy First (no change)

Recommended Allocation: 2.8% with 1.5% in written puts

Fair-Value Estimate: $18 (unchanged)

Current Price: $16.37

Our Thesis

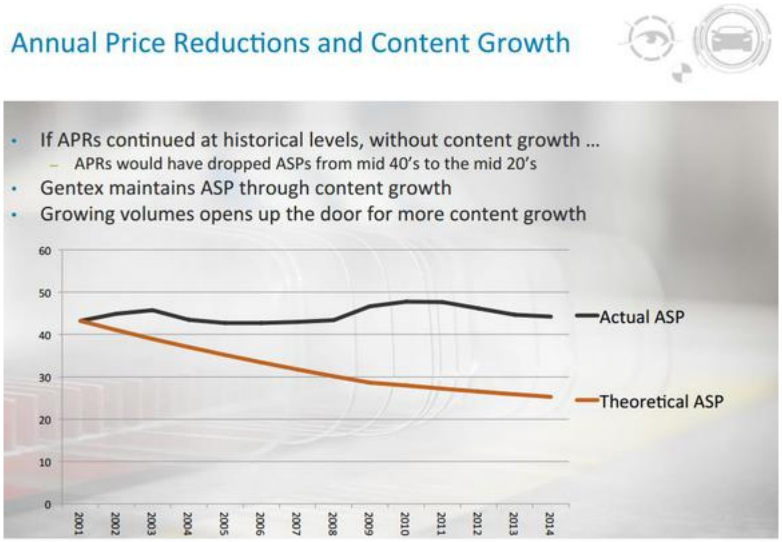
Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

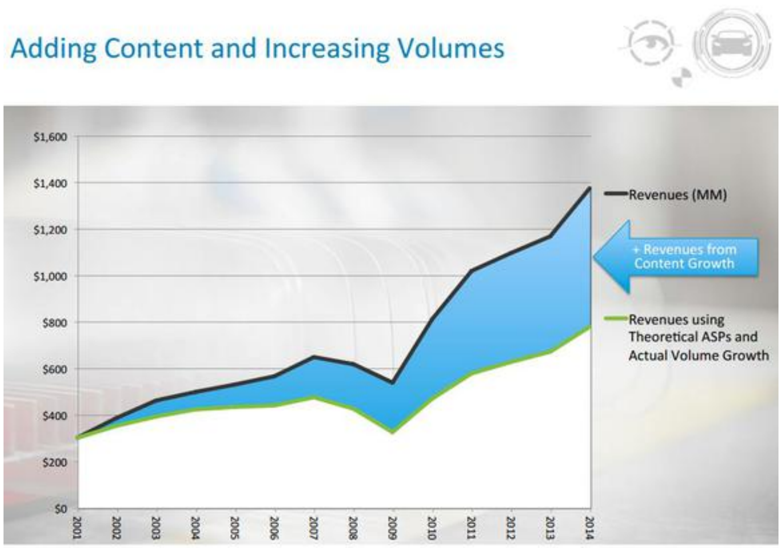
The Most Important Things

1) Penetration: Unit growth vs. auto production. Over time, we want to see Gentex's auto-dimming mirrors to continue to gain market share. If the company is increasing units sold faster than auto production, it is moving in the right direction. Global interior mirror unit volumes accelerated nicely to +12.4% year-over-year growth (up from +7.3% a quarter ago), despite flat auto production in the company's primary markets, showing that Gentex continues to significantly outpace vehicle production growth and capture market share. Interior units sold in North America accelerated to +9.2% (up from +3.1% a quarter ago) and international increased +14.4% (up from +10% a quarter ago), for +12.4% interior unit growth overall.

Exterior mirror unit volumes continue to grow even faster, up a blazing +38.9% in North America and +14.4% internationally. The exterior mirror attach rate was 40.8% (i.e. 40.8% of cars equipped with interior units also were equipped with exterior units), compared with 37.5% a year ago. The attach rate resumed its upward trend after a slight dip last quarter. Exterior mirrors currently only have about 7% to 8% market penetration relative to global auto production, but that penetration rate is clearly increasing, as evidenced by strong unit growth metrics.

2) Pricing and value: Unit growth vs. automotive segment sales. Powerful auto makers force annual price concessions on their suppliers, and Gentex isn't immune. Price reductions have recently been in the range of 2% to 3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices (ASPs) and gross margins. Here's are two slides from a recent management presentation that shows how Gentex has been able to execute on this strategy over the last 15 years:





During the quarter, total units (interior + exterior mirrors) increased +15.1% and automotive segment sales were up +11.2%. This dynamic suggests lower ARPU (average revenue per unit) and is consistent with the expectation of annual price concessions. However, some of the lower ARPU can be explained away by the continued success of exterior mirrors, which have lower ARPU but higher margins relative to interior mirrors. Despite the lower ARPU, the more exterior mirrors Gentex sells, the better it is for the business. They lift the overall margin profile of the business and since exterior mirrors are sold alongside interior mirrors, they are increasing the total dollar value of their products in cars. Here are some relevant comments from management:

> **Vice President and Chief Accounting Officer Kevin Nash:** "*...if you look at the orders, you'll see that outside mirrors outpace inside mirrors in terms of growth rate, almost double. And so when you look at the price points of those, outside mirrors are always going to be far less than inside mirrors. And so it's great business. It's a great margin profile product. However, it is well below the ASP of the company, currently. And so that is really what's creating the negative on the ASP side. It's not a negative for the business, in fact, quite the opposite and that's why we try to look at more of a content type equation than an ASP conversation, because it's not really indicative of the success or health of the business.*"

3) Margin performance. During the quarter, gross margin was 39%, down from 39.5% a year ago in Q3 2014, due largely to foreign currency fluctuations. I mentioned last quarter that as the company works through new product launch inefficiencies and as higher-margin new products make their way through the sales pipeline, gross margin should see a boost. That's what we saw this quarter with a sequential increase in gross margin from 38.4% to 39%, as launch inefficiencies were no longer a headwind and improved product mix and purchasing cost reductions gave margins a sequential boost. Management reiterated its 2015 full-year gross margin guidance range of 38.5%-39%. SG&A and R&D expenses are in line with historical norms, perhaps even slightly lower than normal due to the benefit of foreign currency fluctuations on R&D and SG&A expenses. Operating margins followed gross margins lower, coming in at 28.9% vs. 29.3% in Q3 2014. However, if we adjust for FX fluctuations, operating margins would have increased compared with the year-ago period, despite the decline in gross margins (due to fixed overhead cost leveraging related to production facilities running at high capacity levels).

What We Think Now

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

If you have questions, drive on over to the Gentex discussion board.

Close Half of Your Short Position on World Acceptance

Published Oct 23, 2015 at 1:19PM

How You Participate

- **Action:** Buy to close *one-half* of your short **World Acceptance Corp.** (NASDAQ: WRLD) shares.
- **Allocation:** We are currently short 0.90%, and we will reduce that to about 0.45%, closing approximately half of the 700 shares we're short.
- **Scorecard Status:** Sell Short (unchanged). (If someone new to the position wanted to match us at 0.45%, they could.)
- **Recent Price:** $33.75
- **Price Guidance:** ***Use a limit order*** **and today aim to pay less than $34**
- **Special note:** The company is scheduled to report earnings Oct. 29.

What We're Thinking

We're in a strange position with World Acceptance Corp.: Our thesis is playing out exactly as we hoped, but it's also the reason we need to close part of our position.

The stock is down more than 40% since we sold shares short in *Pro*, with many members having even larger gains than us thanks to a more advantageous start price. And things are playing out as we anticipated, though if we're being perfectly honest, we didn't expect it to happen this quickly!

The business continues to struggle here in the U.S., and we finally got confirmation that the Consumer Financial Protection Bureau will in all likelihood take legal action against the company. But shares have recently become harder to come by, and the cost to borrow shares to sell them short has spiked to more than 20% a year (with only 15,000 shares available today at Interactive Brokers). We still believe the odds are in our favor that the stock will ultimately head lower as the CFPB continues to clamp down on the business, but the longer it takes for this to play out, the more the fees to short World Acceptance will eat into our returns -- and the longer we sit on the risk of being called out of our short on any large spike in price.

What we are *not* doing is recommending that members close half their position in response to the stock gradually drifting higher over the past few weeks on below-average volume. We do not believe that this movement in the stock provides any insight into what is to befall the company at some point in the future. There have been days where the stock spiked dramatically based on rumors that the CFPB will go easy on World Acceptance on a specific date. But these dates have always come and gone without a peep from the CFPB, and at face value these rumors appear to be nothing more than attempts to manipulate the stock price. For example, look at the trading on Oct. 1: This was one of the days when the rumor mill was in full force, driving the stock up 15.7% at one point. It finished the day up only 0.7% once it became clear that the CFPB was not planning on releasing a statement. But we would hate for our entire short to be called out during such a move.

How This Decision Fits Into *Pro*

Similar to our move with **Caesars** (NASDAQ: CZR), by closing half of our position in World Acceptance of our own free will today, we are able to lock in an extremely attractive return. And because we recently closed our position in **The Buckle** (NYSE: BKE), we can do so without increasing our net long exposure compared with a week ago. This is in line with our desire to maintain steady market exposure overall right now.

Once again, **please use a limit order** to close half of your short! This stock is thinly traded, and our activity will move the stock up considerably if we do not *all* use limit orders.

Alternative Trades

- **If you set up a synthetic short, or simply bought puts:** You can close half of your contracts. If you only set up only one contract, you have a choice on your hands; keep it or close it based on what seems best for your portfolio.

Write Puts on Wells Fargo

Published Oct 23, 2015 at 11:46AM

Is this for you? Since we're looking to add 1.5% to our stake in this company, this alert should be applicable (now or perhaps later) to all *Pro* members, whether you already own shares of **Wells Fargo** (NYSE: WFC) or not.

How You Participate

- **Trade:** Sell to open January 2016 $52.50 puts.
- **Allocation:** 1.5% — write one put for every $350,000 you manage; *Pro* will write seven contracts. In addition to our current 3.6% stock holding, this would bring our total allocation to about 5.1%.
- **Price Guidance:**
  - **Now:** Based on the pricing in this alert, use a **limit order** to target $1.10 or greater to start (for a 2.1% effective yield in 85 days). **If we all use limit orders** and the stock price cooperates, we should be able to achieve at least $1.10 today. Be aware that as the stock price bounces around, the premiums will change, and the guidance in this alert may quickly become stale. If you can get a higher premium, go for it, using a limit order to split the bid/ask spread.
  - **Later:** As prices and time to expiration change, those approaching the position should aim to get paid a yield of at least 0.75% or so per month to expiration (Wells Fargo's volatility is below average, so we are willing to accept a slightly lower yield than what we typically target).
- **Prices (as of 10:20 a.m. Oct. 23):** Stock, $54.50; options, $1.08 bid / $1.13 ask. Guidance: $1.10. Current prices.
- **Scorecard Status:** Buy First, 3.6% allocation; now we're adding 1.5% in additional look-through exposure via these new puts.

What We're Thinking

After two successful rounds of covered strangle writing on Wells Fargo, the last of which expired fully as income back in April, we've been patiently monitoring the company's earnings reports (check out our coverage of Q3 2015 here) and the general macroeconomic environment, waiting for a good opportunity to revisit the position. A covered strangle has been a good strategy to pursue on Wells Fargo thanks to the company's low volatility (and thus low premiums) and the low-interest rate environment, which has meant a sluggish growth environment for lenders and a relatively low likelihood of runaway upside for the stock.

Recently, however, we've taken a more cautious stance on selling the upside of Wells Fargo (the short-call leg of a strangle) in light of the potential for an interest rate increase from the Federal Open Market Committee (FOMC). Speculation about an increase -- let alone the increase itself -- has the potential to cause a bounce in the stock prices of financial companies that rely on lending spreads for profits.

As such, given the potential for nearer-term upside, and given a somewhat higher-volatility environment that allows us to collect higher premiums, we no longer think it's the best course of action to cover the upside of Wells Fargo as part of our income strategy. Especially in light of our recent sales (AmTrust, Papa John's, and The Buckle), we've decided that we're happy to target a lower buy price on another slug of shares of one of our favorite companies, earning some decent income in the meantime.

More That Matters

- **Maximum loss:** For this iteration of the put strategy alone, our risk is the same as share ownership starting at about $51.40, or 5.7% less than the recent price.
- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At $1.10, that's a 2.1% effective yield in 85 days.
- **Follow-up:** On just this iteration of the put strategy, we'll buy shares at a net $51.40 (about 1.5 times current book value) if the stock is below our $52.50 strike price at January expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 3.6% allocation first — Wells Fargo's shares are a Buy First. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1.5% of your portfolio, then just buy 1.5% in stock directly *if and when Pro* does so through these puts (we'll alert you).
- **Write other puts?** Consider writing December 2015 $52.50 puts if the price on those options holds up better than the January puts after this alert is issued. You could also consider a shorter time period or an alternative strike price by using the weekly options. Be aware of how this would change your yield and effective buy price.

Pro Can Help

Another Steady Quarter From Wells Fargo

Published Oct 21, 2015 at 11:10AM

Wells Fargo (NYSE: WFC)

Updated Guidance: Buy First (no change)

Recommended Allocation: 3.6%

Fair-Value estimate: $58 (no change)

Current Price: $53.25

What Happened?

- Diluted EPS of $1.05 per share (up 3% from Q3 2014)
- Revenue of $21.9 billion (up 3.3% from Q3 2014)
- Efficiency ratio of 56.7% (vs. 58.5% in Q2 2015 vs. 57.7% in Q3 2014)
- ROA of 1.32% (vs. 1.33% in Q2 2015 vs. 1.40% in Q3 2014)
- ROE of 12.62% (vs. 12.71% Q2 2015 vs. 13.10% in Q3 2014)

Continued increases in loan/deposit growth and credit quality:

- Core* loans of $849.2 billion (up 9.5% from Q3 2014)
- Average core deposits of $1.09 trillion (up 8.1% from Q3 2014)
- Net charge-offs as a % of total loans of to 0.31% (vs. 0.32% in Q3 2014)
- No reserve release** (vs. $300 million Q3 2014)

Capital allocation:

- Share buyback activity continued (diluted share count declined 26.7 million, or 0.5% of total shares outstanding, from last quarter)
- Quarterly common stock dividend of $0.375 per share (2.8% yield on the current share price)

Operating segments:

- Community Banking: Net income of $3.69 billion (up 6.2% from Q3 2014)
- Wholesale Banking: Net income of $1.77 billion (down 7.7% from Q3 2014)
- Wealth, Brokerage, and Retirement: Net income of $606 million (up 10% from Q3 2014)

*"Core" loans excludes the impact of the non-strategic/liquidating loan portfolio

**Reserve release represents the amount by which net charge-offs exceed the provision for credit losses

Chairman and CEO John Stumpf:

> "Wells Fargo's strong third quarter results reflected the ability of our diversified business model to generate consistent financial performance in an uneven economic environment while continuing to meet our customers' financial needs. Compared with a year ago, we grew loans, deposits and capital, and returned more capital to shareholders through dividends and share buybacks. Our balance sheet and credit results remained strong and our 265,000 team members continue to focus on helping our customers succeed financially."

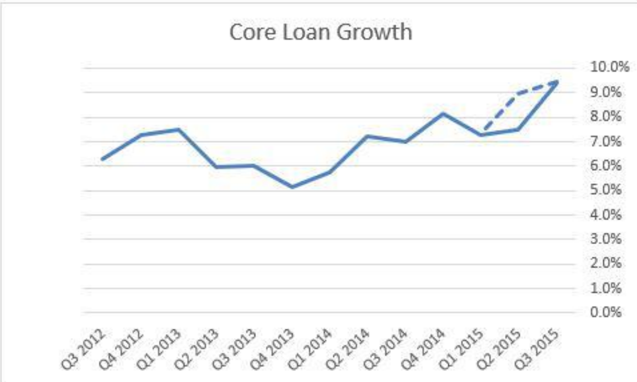
So What?

The 3 key items that I watch for Wells Fargo:

- Growth (or lack thereof) in core loans and deposits
- Trends in credit quality (as monitored via net charge-offs and reserving policy)
- Trends in the efficiency ratio and expense reduction

1) Growth in loans and deposits

Core loan growth for the quarter came in at a very healthy 9.5% year-over-year. This figure includes the impact of $354 million in loans acquired from GE Capital, but even *without* the GE loans, at 9.4%, loan growth was the highest it's been since I've been covering the company. Similar to last quarter, there was particular strength in commercial and industrial loans (which includes the GE Capital loans, up 15% year-over-year) and credit card balances (up 14% year-over-year).



Source: Company filings, analyst calculations. Dashed line shows growth including the loans acquired from GE Capital.

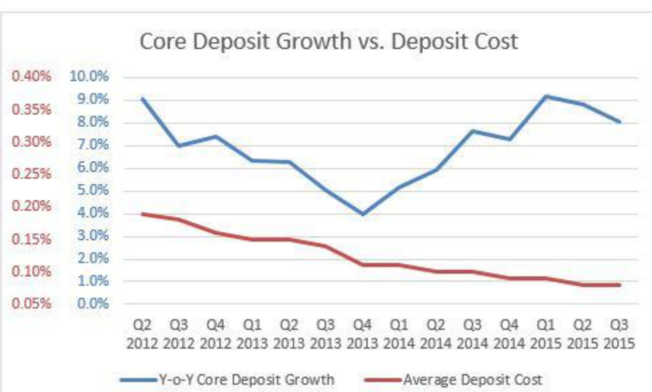
Since Wells Fargo is so large and so involved in many facets of the U.S. economy, the company's financial performance can provide some good information about general U.S. economic conditions. I've been mentioning that I hadn't expected loan growth to increase meaningfully (i.e. to 9-10% growth) unless U.S. economic growth starts to sustainably accelerate (say to the 3-3.5% growth level) and long-term interest rates rise. Despite that sentiment, both including and excluding the acquired loans from GE, loan growth came in above 9%, so this was an excellent result for the quarter.

Although the acceleration of loan growth may be partially explained by the decline in loan *yields* (down to 4.11% vs. 4.29% a year ago), it may also be indicative of a few other trends. For one, we can see that the real estate market continues to be an area of strength for the U.S. economy, with Wells' commercial real estate loan portfolio up 10% and 1-4 family first mortgages up 7%. Additionally, the American consumer seems to be doing well, which is not surprising given higher employment, higher wages, and lower gas prices. In addition to strength in Wells' consumer housing portfolio, credit card balances were up 14% and automobile loans were up 7%. Based on this data, I wouldn't be surprised if U.S. economic growth in the third quarter comes in perhaps slightly higher than expectations.

Finally, commercial and industrial loans have continued to increase at a very healthy rate, although this may be less indicative of strength in those markets and more a function of stress and need for short-term financing from companies in those industries. Industrial markets are struggling right now due to low energy prices and a slowing of demand from China for goods and many commodities. Strong increases in loans in these markets (+15%) may be reflective of an increase in risk taking from Wells, as loanees in those markets are experiencing tough times.

Not surprisingly, as growth in loans in the commercial and industrial segment have increased, improvements in credit quality have leveled off and reserve releases have gotten smaller. In fact, the reserve release for this quarter was zero, with net charge-offs equaling the provision for credit losses -- the first time since Q1 2013 that Wells did not report a reserve release. Nonetheless, I'm confident in Wells' risk management practices and I trust that management will continue to maintain a prudent balance between loan growth and credit quality. This is an area I'll continue to monitor over time.

As for deposits, Wells continues to shine. The company achieved 8.1% year-over-year growth in core deposits. Funding costs remained stable at an ultra-low rate of 0.08%. Deposit growth decelerated a bit from last quarter's 8.8% growth, but deposit growth remains very healthy and well above the U.S. banking industry average as per the latest FDIC summary of deposits survey:



Source: Company filings, analyst calculations

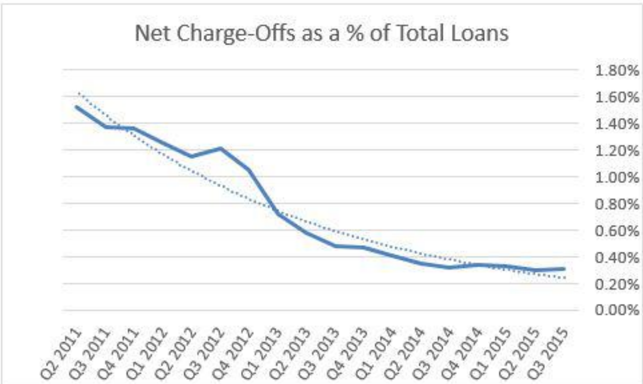
The company's ability to grow deposits meaningfully at a very low cost is perhaps the company's biggest structural competitive advantage. Wells is able to do this by having a nationwide presence with significant geographic density in most markets, optimizing distribution via newer channels (mobile/technology), and strong customer relationship management and product cross-sell achieved via a consistent culture that has been a hallmark of the company for decades.

Net interest margin declined slightly, coming in at 2.96% vs 2.97% last quarter. The net interest margin is unlikely to meaningfully increase until long-term interest rates rise (who knows when that will happen).

2) Trends in credit quality

Credit quality showed a slight sequential decline quarter, with net charge-offs as a percent of total average loans increasing to 0.31% (from 0.30% last quarter). Despite the increase, this charge-off rate is still very low, well below the industry average of 0.42% (which is quite low itself). Improvements in credit quality have been a consistent theme of the current credit cycle as banks have cut down on risk in response to the turmoil of the 2008-2009 financial crisis.

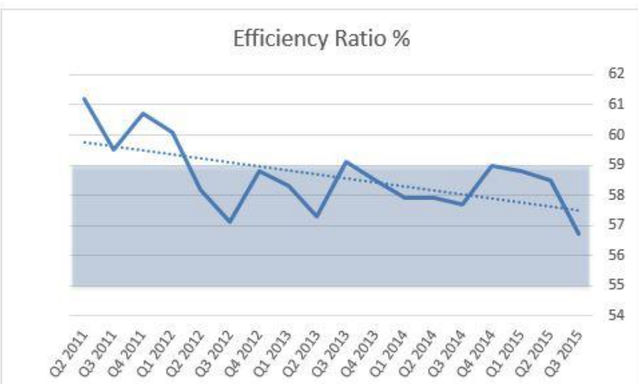
It will likely be difficult to keep improving credit quality from these very low levels. But since Wells Fargo is known for underwriting discipline, I anticipate continued strong performance from this metric. Slight deterioration in credit quality from these levels will not worry me (and may actually be beneficial in terms of generating higher loan growth), but we want to watch the trend to make sure that the company's discipline is staying on track.



Source: Company filings.

3) Trends in the efficiency ratio

The efficiency ratio (a measure of the bank's overhead costs as a % of its revenue -- lower is better) decreased meaningfully this quarter, coming in at 56.7% vs. 58.5% last quarter and 57.7% in the same quarter a year ago. The efficiency ratio is in the middle of management's target range of 55-59% (blue shaded area in graph).



Source: Company filings.

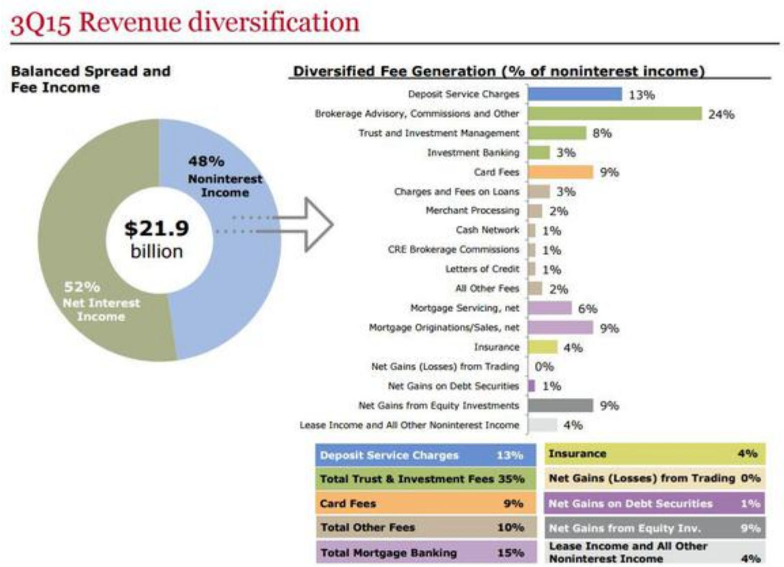
Wells' focus on expense control yielded positive results in the quarter, although management mentioned that in the absence of higher revenue growth, they expect to operate at the high end of their target range for the rest of the year as they invest their savings from expense control into other areas of improvement such as compliance, risk management, and technology. Interestingly, this commentary from management aligns well with our thesis for another Pro company, **Broadridge** (NYSE: BR), which benefits as financial institutions increasingly invest in and outsource those functions.

Now What?

Yet again, Wells Fargo is so consistent that I can simply quote prior write-ups for my conclusion:

> "Not much different from last quarter (or the quarters before for that matter). Wells Fargo continues to execute its strategy and boast admirable consistency despite a fluctuating and uncertain macroeconomic environment. The company's performance is a testament to its diverse operating model. The company has so many levers to pull that if one segment falls others pick up the slack."

For additional clarity, here's what I mean when I mention the company's diverse operating model:



The company's income is split about 50/50 between interest income (lending spreads) and noninterest income (fees and other services). And the noninterest income is very well diversified, with no category in the quarter accounting for more than 24% of the total. The company does a great job of managing these both of these profit streams better and more consistently than peers, and we expect that to continue.

From our long-term view, underlying business results remain strong, the core earnings power of the business remains intact and is poised for positive operating leverage when interest rates and lending spreads rise, and the company's capital return program continues to benefit shareholders.

Data and Guidance

- Current Price: $53.25
- Fair Value: $58 (no change)
- Market Cap: $272 B
- P/B 1.58

After incorporating this quarter's results into our model, our Fair Value estimate remains unchanged at $58 per share (representing a 1.72x P/B multiple). Wells Fargo remains a Buy First on our scorecard with a 3.6% allocation, and those who have yet to fill out their position in this long-term compounder can feel comfortable doing so at current price levels.

Fool on!

Billy

8 Qualities of an Ideal Pro Company

Published Oct 19, 2015 at 12:58PM

Pro Completed Trades

- **AmTrust Financial Services** (NASDAQ: AFSI): We sold about 20% of our shares via October $60 calls. Our allocation is now 6.9% and the stock remains a buy.
- **O' Reilly Automotive** (NASDAQ: ORLY): We bought to close our October $250 calls, keeping our shares and leaving them uncovered for now. The stock is a buy. We have a 5% allocation.
- **Papa John's International** (NASDAQ: PZZA): We sold one-third of our shares via October $65 calls. Our allocation is now 3.2% and the stock remains a buy.
- **SPDR S&P 500** (NYSEMKT: SPY): Our October put ratio spread expired unused. We're looking at new hedges to set up, including an update to our November SPY hedge for those not yet in it (including us!) because of price changes.

Pro Guidance Changes

- **Tupperware** (NYSE: TUP)**:** The stock moves to Hold as we review its attributes for up to 30 days.
- **Valmont Industries** (NYSE: VMI)**:** The stock moves to Hold for the same reason.

Dear *Pro* member:

At *Pro*'s inception in 2008, we shared with you seven qualities we believe make for a great company and ideally an excellent investment. Today, we've updated the list and added an additional quality. As we updated, it was was pleasing to see we didn't need to change much (what we're doing is working!) -- but we do believe we've made meaningful improvements, and the eighth quality we added is important. Let's walk through it all below. As we proceed, just note that these qualities aren't necessarily listed in order of importance; many of them feed into one another. And remember to invert: If we want these qualities in our investments, we also want to avoid or consider shorting companies that lack most of them.

8 Qualities We Want in Pro

1: A Sustainable Competitive Advantage

You'll often hear investors and analysts tout the importance of a "protective moat" around a business that protects its profits, but we want to pin that cliche down. What protects profits at **Procter & Gamble** (NYSE: PG), for a random example? In the case of any *Pro* stock, we want to know. How is **Gentex** (NASDAQ: GNTX) keeping competitors at bay? What assures us **Broadridge** (NYSE: BR) will continue to keep most public companies as customers of its proxy services? We study to make sure our companies have advantages that won't slip away.

2. Pricing Power

Along with a lasting competitive edge, Warren Buffett says pricing power is the biggest indicator of a company's long-term success. The ideal *Pro* company will be able to increase prices systematically or as necessary and not lose customers. **Verisk Analytics** (NASDAQ: VRSK) is an ideal example, as it increased prices throughout the financial crisis. **Starbucks** (NASDAQ: SBUX) has been able to charge more for coffee and keep growing. We want to avoid companies that can't increase prices without harming the business. They're just not as powerful.

3. Dependent Customer Base

This is the first quality we tweaked in our update. It used to read "Diverse Customer Base," but we think "dependent" more accurately sums up what we seek. Company X may have many customers, but if they're not dependent on Company X in particular, they can easily go elsewhere. A *dependent* customer base suggests a competitive moat and should afford the business pricing power. Think **Apple** (NASDAQ: AAPL): Many customers feel dependent on the Apple operating system and pay up for the company's products. Or consider **Skyworks Solutions** (NASDAQ: SWKS), which is providing modular solutions that customers can't easily get elsewhere, so its margins are going higher. **Visa** (NYSE: V) and **MasterCard** (NYSE: MA) serve millions of merchants that need to offer the convenience of credit cards to their customers.

4. Predictable Revenue

We used to call this one "Naturally Recurring Revenue." Better and more broadly said, we want highly *predictable* revenue. The previous phrase encompassed strong contract renewal rates at **Oracle** (NYSE: ORCL), **OpenText** (NASDAQ: OTEX), or **AmTrust** (NASDAQ: AFSI), for example, and the recurring transaction-based revenue at MasterCard. But we've broadened the wording such that we can now include something like **Amazon.com**'s (NASDAQ: AMZN) predictable revenue, which occurs thanks to the lack of an equally strong competitor. (What type of business lacks predictable levels of revenue, let alone pricing power? Most commodity-based businesses.)

5, Growing Free Cash Flow With Compounding Returns

It's a mouthful, but in our update, we added three words at the end here. We want our companies to steadily increase their free cash flow, yes -- but we also want them to then *reinvest that cash* in new opportunities for strong returns. This is how our businesses become compounding machines. We still favor long-term growth rates of at least 10%, in order to challenge our North Star.

6. Financial Resilience

This quality was formerly called "A Strong Balance Sheet." But on update, we think that's subjective and narrow in scope; plus, sometimes debt is smart. Overall, what's much more important is a company that runs its financials so it survives in all environments and thrives in most. Our businesses stayed profitable in the Great Recession and didn't have to worry about debt loads. We don't want to own companies that are just a few bad years away from financial trouble.

7. Expanding Possibilities

This used to be "Expanding Product Possibilities," but we realized it should include geographic expansion, acquisitive possibilities, new customer growth, and more. Basically any way a company could grow, we want to make sure our investments are situated to do so. This also relates to increasing free cash flow with compounding reinvestment possibilities.

8. The Three C's of Management

This is our new category. We wanted to add several important management qualities, and JP came up with these "three C's" to encompass them.

- **Clarity:** We need to keep our money with management teams that lay out a clear long-term strategy for success.
- **Consistency:** Members of management need to do what they say they will, and when they need to pivot, they should admit it rather than rewriting the past. We want a consistent narrative of events and consistent execution on a clearly outlined plan, even if that plan has to evolve.
- **Capability:** Is this management team the right one for the job? We need to believe they're highly capable and trustworthy.

An 8-Point Gauntlet

We encourage you to run all your companies through this checklist. It isn't easy to clear. Our recent sell, **The Buckle** (NYSE: BKE), lacked all but No. 6, and on No. 7, even as it adds stores, it's struggling to grow results. In fact, poor communication and planning from The Buckle management inspired us to add the eighth quality above. We're learning from our losers and, we hope, improving our future investments as a result.

Currently, we're running recent laggards **Tupperware** (NYSE: TUP) and **Valmont Industries** (NYSE: VMI) through the gauntlet to make sure they should remain in the portfolio. Both have been moved to Hold as we review them for up to 30 days. Overall, we want a portfolio of steady compounders, not companies that struggle to grow or depend on luck to soar. If each of our investments fits most or all of the eight *Pro* qualities, we should have strong long-term results.

Potential Trades on O'Reilly Automotive and SPDR

Published Oct 15, 2015 at 1:20PM

Is this for you? This is for all *Pro* members who wrote October $250 covered calls on **O'Reilly Automotive** (NASDAQ: ORLY) and/or those who set up the Oct. 16, 2015, put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY), which includes owning $200 puts.

How You Participate: O'Reilly Automotive

- **Condition:** If the stock is above $250 on Friday (or today if you prefer), buy to close your $250 calls.
  - **Trade:** Buy to close your October 2015 $250 covered calls.
- **Allocation:** Buy every call you previously sold.
  - **Price Guidance:** Use a **limit order** and aim to pay as little time value as possible, but realize you need to close these calls on Friday if the stock is above $250. As of today, the calls still have more than $1 in time value that you'll have to pay if you wish to close them.
  - **Prices** (11 a.m. ET):
    - Stock: $249.50
    - October 2015 $250 calls (bid/ask): $1.30/$1.55 (by Friday this value should be lower, unless of course the stock goes above $250 by more than this amount).
- **Follow-Up:** We're not issuing a rolling trade alert today because rolling may not be possible; instead, we're waiting until our existing calls are closed before we consider writing new calls on this stock. This will probably be after earnings, which are due Oct. 28.

How You Participate: SPDR S&P 500 ETF

- **Condition:** No matter what, by the end of Friday, sell to close your Oct. 16, 2016, $200 puts on SPY. You could close them today if you prefer, but if you do, close the other half of your put ratio spread (your short puts) as well. That way you won't be exposed to a potential crash in SPY's price.
  - **Trade:** Sell to close Oct. 16, 2015, $200 puts on SPY.
- **Allocation:** Sell to close each $200 put you currently own.
  - **Price Guidance:** Accept what the market will pay you.
  - **Prices** (11 a.m. ET):
    - ETF: $200.50
    - Oct. 16, 2015, $200 puts (bid/ask): $0.57/$0.58. On Friday, this will be higher or lower depending on where SPY trades.
- **Follow-Up:** We want to reinitiate hedges on the index and we aim to do so very soon, providing new guidance for those not yet in the November hedge (because of pricing changes, this includes us!). We may initiate a brand-new hedge, too, if we like the pricing.

What We're Thinking

As shared in yesterday's email update, we have some options expiring tomorrow that kindly request our attention. If luck were to shine on us, O'Reilly's stock would be below $250 at expiration and our covered calls on it would end fully as income, while the S&P 500 would somehow tank below $200 so we could sell our puts for a good profit (and then watch the S&P rebound next week). However, the market doesn't fulfill our short-term dreams very well at all. Thankfully, though, it's excellent at doing so over the long term, so we won't complain.

You can act on both of these options today or Friday. If O'Reilly's stock price is above $250, you can buy to close your $250 calls, ideally keeping some income (right now, that is the case). You can do that anytime -- now if you don't mind paying time value, or Friday late afternoon to pay less time value (while taking a chance the stock goes higher still). We plan to target new covered calls on the stock a bit later.

Meanwhile, with the SPDR S&P 500 ETF, we can sell our $200 puts expiring tomorrow for some cash -- a small gain on the hedge. Just be aware that if you sell before late Friday afternoon, you'll need to buy to close your short puts as well (assuming you wrote $187 to $191 puts with us as part of the overall hedge). If you don't, you'll be sitting on an unlikely but large potential loss. It'll cost you a penny to close out that risk and buy to close those short puts, if you sell your $200 puts much before Friday's close. Why play with fire for a penny or so? Or, you can wait until the end of Friday and then close your $200 puts and let your lower-strike puts simply expire. Just realize that of course the $200 puts may not have any value at all left (they're all time value right now) by Friday afternoon unless SPY is lower than $200. Right now, it's at $200.50.

How These Trades Fit in With *Pro*

We're likely to initiate another defensive income position on O'Reilly later this month, given the valuation on the shares, but only between earnings reports. We don't want to sell these shares yet (they're rated Buy on our scorecard), because we see more long-term potential in the business and we are doing some selling elsewhere in the portfolio to raise cash.

And SPY put ratio spreads continue to be a hedge of choice in the portfolio. We'd like our long puts to end in-the-money sometime! But when they don't, the hedge doesn't set us back. In this case, we may be able to make some dough with SPY right around $200 or lower, by closing those puts by Friday. And then we hope to have new hedges announced soon.

Pro Can Help

Sell The Buckle

Published Oct 14, 2015 at 7:47PM

Is this for you? This sell recommendation is for any *Pro* member who owns shares of **The Buckle** (NYSE: BKE) and won't mind selling. Read our reasons for selling below.

How You Follow Along

- **Trade:** Sell **The Buckle** (NYSE: BKE).

- **Allocation:** Sell all shares. *Pro* is selling its 1,100 shares, representing 1.6% of the portfolio.
- **Price Guidance:** Use a **limit order**, please, to sell at the going price, lately above $35.
- **Our Return:** From Day One, we've earned about 7% annualized holding this position, all thanks to dividends. Newer members have a loss.

Deciding when to sell a stock is never easy. In the case of The Buckle, we've decided to do so because of our North Star -- specifically, because we believe the only near-term catalyst that could enable the stock to deliver North-Star-like returns over the next three years would be a change in market sentiment about The Buckle. And we don't foresee any catalysts that would make that likely.

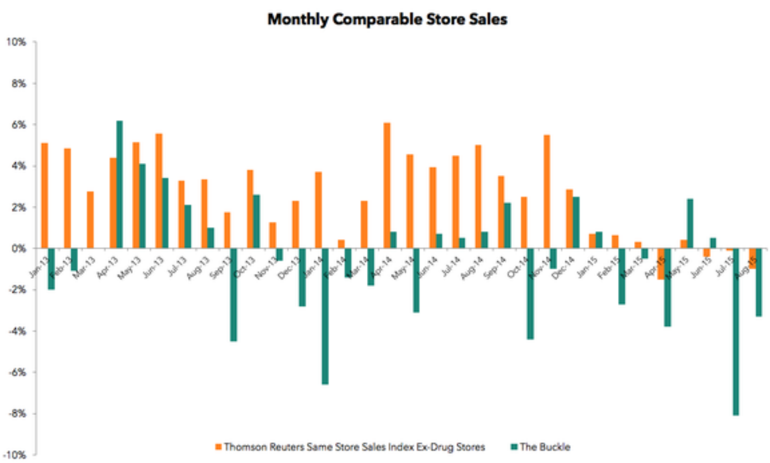
What's Changed?

When we first recommended buying The Buckle back in June 2012, we highlighted a few key metrics we like to keep an eye on when looking at retailers, and we noted how impressive the company's performance had been over the previous 10 years (2002 to 2012). Unfortunately, these trends didn't continue after we first purchased shares.

($ figures in thousands)	2002	2011	Annual Growth Rate	2014	2011 - 2014 change
Stores	304	431	4.0%	460	6.7%
Sales per store	$ 1,339	$ 2,498	7.2%	$ 2,321	-7.1%
FCF per store	$ 57	$ 406	24.3%	$ 330	-18.7%
Sales per square foot	$ 274	$ 462	6%	$ 459	-0.6%
Inventory turnover	4.7x	6.2x	3%	4.5x	-25%

Source: SEC Filings, S&P Capital IQ, and analyst estimates
Per store calculations are based on average stores open during the period

And if you take a look at comparable-store sales, you'll see that The Buckle's results over the past few years have disappointed on both an absolute and a relative (to the industry) basis.



Source: Thomson Reuters Corporation and company filings

So what's to blame? For starters, the company missed out on the activewear trend that has been such a huge tailwind for **Nike** (NYSE: NKE), **Lululemon** (NASDAQ: LULU), **Under Armour** (Nasdaq: UA), and others. (For some context, here is an article on how Levi's is trying to adapt to this new reality.)

Apparel and Activewear (Dollar % Change)

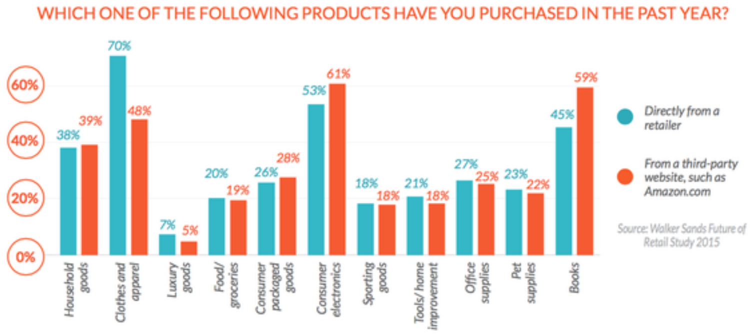
	Total Apparel (w/ Activewear)	Total Apparel (w/o Activewear)	Activewear
12 months Jul'11-Jun'12	+4 percent	+3 percent	+8 percent
12 months Jul'12-Jun'13	+4 percent	+3 percent	+10 percent
12 months Jul'13-Jun'14	+1 percent	-1 percent	+7 percent

Source: The NPD Group, Inc. / Consumer Tracking Service 2011-2014

This has been a huge headwind for The Buckle, but we don't believe it's the only issue. Management may be disciplined when it comes to capital allocation, but they were slow to react to the shifts in the industry brought about by the rise of online shopping and social media. For years, one of The Buckle's greatest strengths has been its in-store experience and great sales staff. This greatly reduced the need for the company to participate in the pricing warfare many competitors waged, and it also fostered customer loyalty. Unfortunately, this strength starts losing its relevance once a customer starts researching and purchasing clothes online.

Now, stories of online shopping killing brick-and-mortar shops are often exaggerated -- e-commerce sales accounted for only 7.2% of total U.S. retail sales in the second quarter of 2015, after adjusting for seasonal variation. But the threat is more serious in the apparel industry, where consumers are far more willing to purchase items online.

Most Common Types of Products Purchased Online in the Past Year



According to The NPD Group, online transactions *already* account for 17% of total apparel sales. And while in-store apparel sales were down 2 percent for the 12 months ending in February 2015, online purchases continue to strengthen, with many of the largest markets in the U.S. increasing by at least 10% over that time (total online purchases increased by 19 percent). And the online space is arguably even more cutthroat than the malls The Buckle operates in, with new competitors showing up overnight and most companies now regularly offering sales, free shipping and returns, and other incentives to win customers. These are practices that The Buckle has been slow to adopt (and which management still seems somewhat hesitant to use), and unfortunately, research has found that they are also some of the most important factors that influence whether someone purchases an item online.

Relatedly, we also believe that The Buckle is losing mindshare to its competitors as it struggles to play catch-up with its social-media presence.

Followers on various forms of social media

	Facebook	Twitter	Pinterest
The Buckle	387,626	21,400	29,100
American Eagle	10,622,904	705,000	80,700
Urban Outfitters	2,068,613	1,020,000	275,100
Gap	7,180,058	639,000	101,000
J. Crew	1,445,781	360,000	208,100
H&M	24,131,687	6,950,000	172,200
Topshop	4,052,563	1,190,000	118,100
Madewell	452,916	63,900	116,600

last updated October 12, 2015

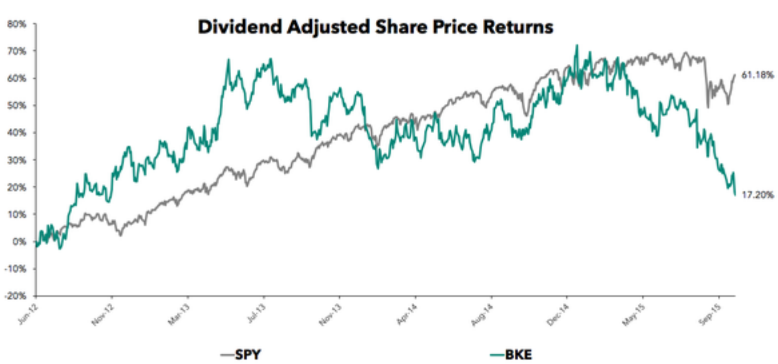
These admittedly aren't prefect comparisons for The Buckle; there are differences in store count, target audience range, and sales strategies, to name a few. But we believe it does give some insight into the type of competition The Buckle is facing. For example, Madewell -- a division of J. Crew tailored to "denim lovers" -- plans to finish this year with around 105 stores, less than a quarter of The Buckle's current store base, but it already has 17%, 199%, and 301% more followers on Facebook, Twitter, and Pinterest, respectively.

The company also doesn't fare very well when you look at it through the prism of our recently updated checklist (we'll detail this checklist in Monday's upcoming Memo):

Sustainable Competitive Advantage	✗	The company's ROE and margins over the past 10 years have been quite impressive, but given the changing landscape, we believe the likelihood of repeating these results over the next 10 is anything but a sure thing.
Pricing Power	✗	With troubling trends in mall traffic and pricing wars online, the company will likely need to compete more on price than it has in the past.
Dependent Customer Base	✗	Tastes change and customers are fickle.
Predictable Revenue	✗	It is a certainty that people will purchase clothes, but the styles they will gravitate toward are anything but certain.
Growing Free Cash Flow	✗	Free cash flow growth has stagnated over the past few years.
Financial Resilience	✓	The company is conservative and has a healthy balance sheet.
Expanding Possibilities	✓	The company should be able to open additional stores at a slow pace over the next few years.
The Three C's of Management	✗	Management is notoriously close-mouthed.

The Stock

Our position started off extremely strong, absolutely crushing the North Star by returning more than 60% through July of 2013. But it's been distressed denim since then as the S&P 500 continued to grind higher while The Buckle stalled out.



Source: S&P Capital IQ

Despite being a dividend all-star for *Pro* (we've collected more than $12,000 in dividends on our $42,000 initial investment!), the company's stock has been a disappointment from a capital-gains perspective after the one-two punch of troubling financial results and a high dividend payout ratio. Regarding the latter point, we actually applaud management's decision to return such a large amount of capital to shareholders, especially when you consider the alternatives (letting the cash sit on the company's books earning almost nothing, or aggressively redeploying it toward projects that ultimately destroy shareholder value). Nonetheless, a stock normally drops by about the amount of the dividend once it goes ex-dividend.

	P/E	Standard Deviation	EV/EBITDA	Standard Deviation
Since IPO average	15.24x	4.44x	6.96x	2.34x
10-year average	14.55x	2.55x	7.25x	1.22x
5-year average	13.91x	1.15x	7.22x	0.69x
3-year average	14.09x	1.06x	7.34x	0.63x
1-year average	13.96x	1.13x	7.28x	0.57x
Current	10.9x		5.6x	

Source: S&P Capital IQ, author's calculations.

As you can see, the sentiment surrounding The Buckle's stock is bearish, with the lowest multiples we've seen in recent memory. As an additional data point to support this notion, short interest now stands at 25% of the float, which is pushing near the upper bounds of the range it's held to since the start of 2015. The stock has always carried a high short interest, partly because of the belief that in the apparel industry, reversion to the mean is an unescapable gravitational force. And some are claiming that now is the time to short the company, since The Buckle's metrics have started to turn over.

It's true that this industry is littered with casualties. We've seen founder-led companies run into the ground (American Apparel, Abercrombie & Fitch); industry darlings turned into pariahs (Aeropostale); failed turnarounds (Wet Seal); dominant companies that fell from grace only to recover and then fall again (The Gap); companies that dominated a niche, but fell from grace and never stopped falling (dELiA*s) ... Even some luxury wares (Coach), thought to be more resilient thanks to brand and pricing power, have seen their stock, and products, thrown in the discount bin. Selling clothes is not for the faint of heart, and when things take a turn for the worse, it can be hard for a company to reverse course. Today's valuation may prove to be a value trap if fundamentals continue to weaken at The Buckle.

The *Pro* Bottom Line

We've stressed in the past that we would never short a stock based solely on valuation, and the inverse is just as true: We won't refrain from selling a stock on valuation alone. An expensive stock can become even more expensive, and a cheap stock can get even cheaper. We can't predict if or when the market will assign higher value to The Buckle. The hope of this happening is one of the few things the stock has going for it. But that alone is certainly not worth keeping it in our portfolio; we believe we can invest in a much more *Pro*-worthy company instead. Following slowly degrading results capped by the recently released dismal sales data for the month of September (a 5.6% decline in net sales and a 6.7% decline in comparable-store sales), we simply no longer believe The Buckle is likely to generate North Star-beating returns over the next three and five years. **We will use a limit order to sell our position sometime in the next 30 days.**

To discuss this, please visit [The Buckle board](#).

A Foolish Update: Pro's October Options Expirations

Published Oct 14, 2015 at 3:20PM

Dear *Pro* member,

Five options positions in *Pro* will expire on Friday, so today we want to give you the essential updates on our plans for each. And even if you don't use options, our plans this week may affect you on two positions: **AmTrust Financial** (NASDAQ: AFSI) and **Papa John's International** (NASDAQ: PZZA). We wrote covered calls on some of our shares of these companies, and as planned, we're ready to sell off those partial positions to raise some cash.

So, if you didn't write covered calls, you should consider your tax and portfolio situation and consider selling some of these shares directly to match us. Details follow, so let's do the rundown.

AmTrust Financial Services (NASDAQ: AFSI)

In short: Do nothing with our October 2015 $60 calls. Those calls are set to sell about 20% of our shares for us. Members who don't use options would trim the position to 6.8% to match us.

Our October $60 covered calls paid us about $2, and if the stock stays above $60 by Friday, the calls will sell 700 of our 3,267 shares at $62. That's about 20% of our AmTrust holding, so our allocation to the stock will decline from 8.7% of the portfolio to 6.8%, remaining our largest holding by 1.5%. If you own more than 6.8% and didn't write covered calls, consider trimming your stake down to that level, while keeping your taxes and portfolio situation in mind.

We sell a leader like this in order to raise cash for new positions while still keeping this position sizable. Because it's an insurer, we also view AmTrust as a higher-risk position, so we have limitations on how large a portion of the portfolio we'll let it become. But so far, we're grateful for its performance. In fact, we probably would not need to sell any if we were adding money to the portfolio regularly, since that would make this allocation smaller automatically. But given our mandate, we're ready to sell some shares via covered calls to trim it. If you own less than 6.8% already, you needn't sell any.

Live Nation (NYSE: LYV)

In short: Do nothing; our written $24 puts are on track to expire as income.

For the second time, our written puts on the live-music leader are set to expire as income as long as the stock remains above $24 on Friday. We're watching for new opportunities with Live Nation. We don't yet own shares.

O'Reilly Automotive (NASDAQ: ORLY)

In short: The stock is near the $250 strike price of our covered call; we'll roll or close by Friday if need be, so watch for a conditional trade alert on Thursday.

If O'Reilly stock remains near our $250 strike price, we'll issue an alert tomorrow, to be acted on by Friday if needed. If the shares remain below $250, our covered calls will expire as income and no action will be required. If shares tick above $250, on Friday we'll either close our calls for a partial profit, or roll them to a higher strike. Thursday's conditional trade alert will provide parameters. For now, we don't need to act quite yet.

Papa John's International (NASDAQ: PZZA)

In short: Do nothing with your October 2015 $65 calls. Our calls are set to automatically sell about one-third of our stock position. Members who don't use options would trim the stock to 3.3% to match us.

If the pizza purveyor's stock stays above $65 by Friday, we'll see 600 shares get sold, or about one-third of our position, for around a net $68. This will lower our allocation from 5% to about 3.3%. So if you own more than 3.3% in the stock and didn't write calls, consider your portfolio needs, cash, and taxes, and then consider trimming. To match us, you would reduce to 3.3%. We still like Papa John's – it remains a buy – but as one of our largest positions trading at assertive value multiples, we're content to trim from it again. It's been an outstanding performer and the long term is still promising.

SPDR S&P 500 (NYSEMKT: SPY) ETF

In short: We aim to sell to close our $200 puts by Friday for the value we can get. Our short puts at a much lower strike price can be left alone to expire.

Right now, we're rooting for SPY to go lower! We capture more value in our $200 puts, which expire Friday, the further below that price SPY falls. Assuming they hold any value, we'll "sell to close" the $200 puts by the end of Friday (following a Thursday trade alert). As a hedge, we'll keep these puts until right toward the end, and then close. Our short puts (at strikes of $187 to $191) are set to expire, but you might want to keep your long $200 puts open until you're certain the short puts will expire – in other words, until the end of Friday – so that you're not nakedly exposed to SPY's downside via all your short puts.

In Summary

That's it for our scary October options! Turns out that up close, there's nothing scary about them. We're ready to let some shares of AmTrust and Papa John's be sold via covered calls, raising 3.6% more in cash for the portfolio, bringing *Pro* to about 15.7% cash. Our Live Nation puts can be left alone to expire; our O'Reilly covered calls are set to expire as income, too, but we'll act by Friday if the stock rises above $250; and our SPY hedge may earn us a little return if we can close the $200 puts for any value Friday. Any questions, please visit the *Pro* options board!

Thank you for being a Fool with us. Fool on!

-- Jeff (TMFFischer)

Analyze Backward, but Invest Forward

Published Oct 12, 2015 at 9:49AM

Note: Jeff is traveling back from the Fool member event in Miami today; we'll address this week's options as soon as possible after he returns!

Fellow Fools,

I love the Internet, and not just because it allows my 4-year-old daughter to watch cake-decorating videos to her heart's content and my 6-year-old son to learn about the latest Minecraft "mod" (whatever that is) before his friends do. I'm constantly amazed at how the Internet allows for the proliferation of information and enables us to dig deeply into topics of interest. Thanks to the magic of the Web, I recently spent an hour listening to a lecture by John Burbank of Passport Capital in which he shared his investing process -- a privilege that, pre-Internet, would have only been enjoyed by the MBA students at UC Berkley's Haas School of Business.

Burbank is well known in the hedge-fund community for his prescient call about the housing market collapse in 2007, and he's one of the top-performing hedge-fund managers so far this year. He continues to manage $4.2 billion across three equity-focused funds that combine top-down macro thinking with bottom-up fundamental analysis. I found his talk particularly interesting because it focused almost exclusively on the "art" of investing: using incomplete information to make educated guesses about the future. Burbank distilled his investment process into these three points:

- Invest in things that never happened before.
- Hedge against reversion to the mean.
- Depend on the unimaginable.

A quick glance at that list should make it obvious that this isn't your normal paint-by-numbers recipe for investing success. Rather, it's a way to frame your thinking about the future. Looking out five years from now, it's nearly impossible to make those guesses with any amount of precision -- but in many cases, you only need to be vaguely right to find profitable investments. Many experts agreethat thanks to the demographic headwinds from an aging population across the world, we'll likely see slower global economic growth in the coming decades. Even so, it's important to realize that some companies will be able to capture a disproportionate share of that value creation, and it's our job as investors to try to imagine which ones they'll be.

Tuning Your Crystal Ball

At the end of his lecture, Burbank also provided a valuable framework for thinking about technological change . He spoke of how the Internet bubble was really an Internet *infrastructure* bubble, and though many of the companies that laid the fiber-optic cable no longer exist, the rest of the economy is only just beginning to reap the benefit from that massive investment in new technology.

This line of thinking reminds me of a book by Daniel Gross called *Pop!: Why Bubbles are Good for the Economy.* The book, which was published just after the housing bubble imploded, also examined booms and busts like the telegraph, the railroads, the Internet, and alternative energy. Gross concluded that the early investors who build the infrastructure to support a new technology often lose out when enthusiasm results in overcapacity, but the businesses that find novel ways to use that cheap capacity end up capturing the most value.

For example: Overbuilding of the railroads led to numerous bankruptcies, but it also made possible mail-order catalogues, like Sears Roebuck, and allowed for the creation of a modernized food distribution system and national consumer brands. Likewise, the Internet continues to lower costs and make it easier to share ideas. Media streaming companies including **Netflix** (NASDAQ: NFLX) and **Pandora** (NYSE: P) continue to benefit from the miles of "dark fiber" that were dormant for years before the desire for on-demand entertainment became a mass-market phenomenon.

Many of these benefits seem obvious in retrospect, but they're much more difficult to recognize in real time. Access to cheap capital in recent years has likely led to overinvestment in many industries and the creation of excess capacity, which will fuel future innovation. One area where I expect to see this is the energy industry. The improving efficiency of hydraulic fracking has led to a glut of fossil fuels, and alternative energy sources are becoming more competitive than ever, driving down energy costs for a wide range of industries.

The *Pro* Bottom Line

My wife and I recently spent two weeks in Europe celebrating our 10th wedding anniversary with two of our closest friends. For a few days, we stayed with our friends' family in Italy. They own part of a large paper manufacturing company, and for multiple generations, the business has provided the family with significant wealth and a comfortable lifestyle -- but it's obvious that the next generation won't be so lucky. In addition to being excellent hosts, the family was also gracious enough to entertain my questions about the state of the business. The one thing they said that struck a nerve (and partially inspired this Memo!) was, "We knew this was going to happen – it's not a surprise -- but we didn't think it would happen so fast."

It's easy to dismiss conversations about technology and innovation as the domain of speculative growth investors, but it's risky to ignore the ways your investments might be disrupted by the next new thing. Though at *Pro*, we search for businesses with strong competitive advantages, all companies fight the winds of change. As we enter another earnings season, it's just as important to try to imagine the trends that will drive a company's next three years as it is to focus on how it performed over the past three months. I'm looking forward to an update on how our collection of businesses is performing, but I'm just as excited to hear from the *Pro* community about where you see the groundwork being laid for the next boom -- and who you imagine those winners and losers could be.

Thoughts? Bring them to our Memo Musings board. Have a great week, Fools!

Best,

-- Jeremy (TMFTank)

Portfolio Positioning Event: Dec. 1, 2015

Published Oct 8, 2015 at 1:26PM

The *Pro* team held a Portfolio Positioning Event on this page at 1 p.m. Eastern on Tuesday, Dec. 1. The video and text chat are archived below!

Video Transcript

CHRIS HILL:

Hi, I'm Chris Hill joined by *Motley Fool PRO* and *Options* Lead Advisor Jeff Fischer. Thanks for being here.

JEFF FISCHER

Hey, Chris. Thank you.

CHRIS HILL:

Welcome to the *Motley Fool PRO* Positioning live event. Off camera we've got some of our fellow Fools in the text chat room (Ellen Bowman, Billy Kipersztok, Jeremy Myers, and the whole crew). We wanted to first talk through the new hedge trade that members have gotten.

JEFF FISCHER

Right, Chris.

CHRIS HILL:

A brave new world, I think, for new *PRO* members who have been with the service for three or four weeks or so.

JEFF FISCHER

That's right.

CHRIS HILL:

If you're an experienced investor, you're probably experienced in going long on stocks, but as we've talked about before, and as *PRO* members know, the *PRO* portfolio is a lot of going long on stocks, but it's also shorting and hedging.

JEFF FISCHER

So true, Chris. For the past few weeks new members have been getting up to speed. Buying *PRO* Buy stocks and Buy First stocks. Now these are our core positions — the great companies that we plan to own and hope to own for years to really compound our money.

If you only buy our stocks — our long portfolio — you should do well over the years. You should do really well, hopefully. But for those many *PRO* members who want to short and hedge, now is where we start to get into that.

Why do we do all the buys, first? Well, because you need something to hedge, so we assume now if you're going to hedge that you're at least 80% invested with us. That you're mostly invested long and that's why you may now want to learn how to hedge and short, so we issued a new hedge position just yesterday.

CHRIS HILL:

Let's talk about it. We'll get right to it. It's the "set up a put ratio spread on the SPDR S&P 500."

JEFF FISCHER

That's right. Now what we love about this, and what we try to do in *PRO* when we hedge, Chris, is have a low cost and a low drag position. We don't want to pay much to set it up and we don't want it to hit our returns when the market goes up, but when the market falls, we want it to help us. It sounds like we want the best of all worlds…

CHRIS HILL:

You want your cake and eat it, too. That's what it is.

JEFF FISCHER

We do and we always have, and that's largely what this does for us. This is no cost to set up. It actually can pay us a credit to set it up. And if the market goes up, this hedge doesn't hurt us. It just disappears. We get the credit. We can make some income, actually. If the market falls, this hedge comes into play and will buffer the market downturn.

Now how is this possible? It's because there is a small catch to it. We are agreeing to buy into the S&P 500 Index ETF if it falls, in this case, more than 15% or so. So that agreement — selling that insurance out into the market — is what's paying for our hedge at a higher price and that's how we get the best of both worlds. We profit if the market falls anywhere from about 5-15%, but we're agreeing to buy into the index if the market falls more than 15% and we're comfortable with that.

CHRIS HILL:

It seems like for some people there's a little bit of a mental barrier to get over with this type of hedge, because part of it is saying "I'm essentially betting on the U.S. stock market to drop, and just at a gut level I don't want to do that."

But in some ways this is really not all that different than just simply having some cash (which is something I think a lot of investors are used to). Just saying, "Well, I want a little cash on the sidelines." This is essentially the same thing, only putting it to work for you.

JEFF FISCHER

That's true, Chris, and this will result in returns if the market falls. Your cash will essentially grow. Then what we like to do is cash that in, take our gain, and put that money to work in stocks that are now cheaper.

That said, if members do not want to hedge, they don't need to. They can just carry cash. *PRO* right now has about 16% cash and that's a good cash cushion that we'll also look to put to work when prices fall on anything that we want to buy.

So you don't need to hedge, but if you want to, this is a great way to hedge without money out of pocket and without a position that works against you when the market rises. So many hedge funds short the market directly and sometimes we do that. The problem, then, is as the market rises, they're paying more and more for that short. It's a drag on their returns. And the other even trickier thing is when you close that short. When you know to take your hedge off.

This one expires in February and, like I said, it has set parameters where if the market falls 5-15% it pays us. If it falls more than that, we get to buy into the market…

CHRIS HILL:

At a discount.

JEFF FISCHER

At a good discount. And if the market goes up it doesn't matter. We make some income. This expires in February (we set up another one) so it's a great hedge. What you're doing is selling two puts at a lower price — in this case in the report we said $190 — and then you're buying one put at the $200 strike price. So as you see, the proceeds you get from selling the puts at $190 pay for the protective puts. You're short, in essence, so you buy at $200, and that's all spelled out in the report.

CHRIS HILL:

Where is the *PRO* portfolio right now in terms of percentage that is long and percentage that is hedges and shorts?

JEFF FISCHER

A great question. We're about 85% long and with this short we'll be about 15% short, so we'll be about 70% net long. And Chris, since 2012 (going on four years now) we've been about 72% net long on average, yet it's been our strongest four years compared to the market and on absolute terms. So you can be 72% net long and still do much better than the S&P 500. You're doing better with less risk and we love that combination.

CHRIS HILL:

We'll get to some of the questions from members in just a second, but back to the percentages. I'm curious. When you're looking at managing the *PRO* portfolio, do you have a basic number you're trying to hit or at least stay within range of? That 72% you talk of? I'm curious if in four years the portfolio is at a point where you think to yourself, "Uh, you know what? We're a little too long. I've got to focus my attention on finding some hedges and shorts."

JEFF FISCHER

Definitely, Chris, and that's a great question. There are times where we've been 90% net long for a period of months and during that time we really did look for shorts and hedges. But to your first question, I've found that over the last 15 years or so that 70-80% net long should, given the types of companies we're buying, still let you do better than the market. So you have less risk and less exposure, but you're keeping up with or doing better than the market. That's kind of our sweet spot — 70-80% net long.

Now when prices get really attractive, we may be 90-95% long, and when we want to be more defensive, we could be 50% long only. Or we could even be market neutral. With one quick trade we could short an 80% SPY, be market neutral, and just wait it out if we think things are really risky. But about 70% is our long-term average.

CHRIS HILL:

Let's get to some of the questions from members. From Bill who writes, "I'm only about 50% invested so far. Should I set up the hedge anyway?"

JEFF FISCHER

Great question, Bill. Do read the SPY report. That spells out our guidance there, as well. But our thought is if you're at least about 80% long, then set this up, because it will take you 10% lower long down to about 70% and that's where we want you to be if you're following *PRO*. But if you're already less than 70% long, you don't need to set up this hedge. You can wait until you buy more stocks and until you're more exposed to the market.

The hedge is really about your market exposure and managing it on a whole.

CHRIS HILL:

A question from Cheryl. Should I do the December and January options you have in the portfolio?

JEFF FISCHER

A great question. Today we issued the *PRO* Portfolio Positioning Report — just recently issued it — and there's a lot there. It spells out all of our current options, all of our current shorts, and our hedges, as well. We're saying to now hold off on the December and January options on Gentex and Wells Fargo, because here we are at December. December will expire very soon and January, as well. We've made most of the income on those puts. When they expire we'll have new ones. We expect to issue brand new ones for everybody, including new members, so that's when you can jump on board.

There are a few options that are currently recommended and that's in the Portfolio Positioning Report. You can buy calls on American Airlines and buy calls on American Tower to start.

CHRIS HILL:

You can also short Caesars Entertainment.

JEFF FISCHER

So the Portfolio Positioning Report also spells out three shorts that you can short to join with us. One is Caesars Entertainment, the country's largest casino operator. They are, unfortunately, basically insolvent. They tried to rejigger their whole business and put all the debt into a new subsidiary that they then put into bankruptcy hoping to keep the parent company safe from all that. Right now the courts are deciding whether all the maneuvers they did were legal. To us they don't appear to be legal. It appeared to be a calculated maneuver to shove all the debt off to somebody else and keep the owners safe in their parent company.

We don't know that it will work out. If it doesn't work out, the stock could basically go to zero. Caesar's parent could claim bankruptcy. If it does work out, then the stock will probably stick around to where it is or go up a little bit and we would close our short. So far we've made about 30% on the short. We still think it's a good short for about a 0.6% position.

CHRIS HILL:

Is that always the goal with a short? We're looking for this thing to go to zero? Or are there times in the *PRO* portfolio where you've shorted a company simply because you and your team have looked at it and said, "You know what? This is way too overvalued. This is going to come down. It might not go to zero, but this is absolutely going to come down from where it is."

JEFF FISCHER

We try to do a combination of both. That said, shorting on valuation is much more difficult. We could be missing something. We could be wrong. But sometimes we'll short something hoping to make 20-25% on a value and fundamental space argument. But frequently we're looking for really flawed or greatly under-fire companies like Caesars or World Acceptance (which is now on hold as a short). Or Five Below, which was more a valuation short. But generally we're looking for companies that have flawed businesses at prices that shouldn't be sustained.

CHRIS HILL:

A couple of questions from members about the portfolio itself. From Ed who asks, "How long should I take to buy all the *PRO* stocks?"

JEFF FISCHER

A good question, Ed. You can take your time. We always advise patience. Gradually move into them. Or some members have joined and bought them all at once — just buying all the Buys and Buy Firsts in our allocations to get up to speed and then get on with their lives. That's fine, as well. But if you want to take your time and space it out over several months, or a few earnings reports, you can do that, as well.

CHRIS HILL:

From Dennis, who writes, "I own stocks from *Stock Advisor* and with some *PRO* stocks I'm now 100% invested. How do I buy more *PRO* stocks?"

JEFF FISCHER

A good question. A lot of members have asked this on the discussion boards, too. Go to the Making Pro Fit You board and ask any question. But right now our answer to that is do as you've done. Sell your least favorite holdings from previous services. You don't need to sell things you love. Why would you want to? But sell things you really don't like and then move into the *PRO* stocks that you like better.

And again, you can take your time. If it takes a year to do this or longer, that's fine. If you end up with a hybrid *Stock Advisor*/*PRO* portfolio, that's also fine. The key is that you like everything that you own. And then with the strategies that you're learning in *PRO* (ways to hedge and short, and options) you can overlay that onto any long stock portfolio that you like. That's the great thing.

So you can be 100% long in *Stock Advisor*, *Million Dollar Portfolio*, and *PRO* combined stocks, and then use *PRO* strategies to put on a 20% hedge and get yourself to 80%, say. So you don't have to only own *PRO* stock investments for the long term. You can own some other stocks, as well.

CHRIS HILL:

And that's something that can be difficult to do initially looking at your portfolio, particularly if there are holdings that you've had in your portfolio for a while. But if you can get over that mental hurdle — just look at them and ask yourself from this point forward which ones you feel the best about over the next five years — if you can do that and push aside when you bought them, and how much money you might have made with them, and you just start from today looking out over the next five years, then it's a little bit easier to say to yourself that one in particular has had a good run but you don't feel as good about it for the next five years.

JEFF FISCHER

That's true, Chris. And also keep in mind your tax situation. Taxes are a real cost. If you're in a taxable account and you have some large gains in Disney or Netflix or something, be careful about selling those and incurring a large tax bill.

CHRIS HILL:

A question from Linda. "Can I set up the new SPY hedge in a few weeks?"

JEFF FISCHER

You can. The good thing about this hedge — there's guidance in the report that tells you how to adjust it. If the S&P goes up a few dollars per share or down a few dollars per share, when you go to set up the hedge, adjust your strike prices by a similar amount. By a dollar or two lower or higher. The key is to keep a spread of about $10 between your upper and lower strike price, and to try to get a credit when you set this up. So even if SPY is higher or lower, you can approach the trade later. Just adjust by the same amount up or down on your strike prices.

CHRIS HILL:

And you just mentioned a moment ago the discussion boards for *Motley Fool PRO* members and the idea of making *PRO* fit for you. This is so important because there are all of these recommendations from you and the team, but it is important for members to make it their own.

And particularly at the end of the year when I think about Linda's question. Every year like clockwork, once we get into December, then you have the mainstream business media talking about, "Wow. Historically this is what happens in December." Or, "This is what happens the week between Christmas and New Year's." And even more than usual as investors we're bombarded with the stats on what happens to the S&P 500…

JEFF FISCHER

That's so true.

CHRIS HILL:

…and that's where the discussion boards become this safe haven where you can go to shut out the noise from the mainstream financial media and just focus on what's going to work for you.

JEFF FISCHER

It's a great point, Chris, and you'll also hear a lot, at this time of year, about rebalancing. *Sell your winners and move into energy* or whatever was beaten down this year. We don't do that in *PRO*. We use December as an opportunity to make sure we love everything we own. To maybe take some losses on things we don't like anymore to offset the gains we've had this year (or partially offset them).

We've had a good year, but we don't rebalance just as a matter of course. We don't believe in that. We like to let our winners run. That's a Fool-wide belief. Let your winners run to the extent that you're comfortable doing so. Don't move into losing industries just because they're losing. They may lose for a long time.

I don't have great confidence in energy now, any more than I did before. We don't own it in *PRO* — energy as a whole. I don't know that we'll move into it. I think there are so many energy sources coming online that energy pricing may stay down for quite a long time, for one example, anyway.

So use the boards to make sure you're comfortable with your portfolio at the end of this year and going forward, but don't rush. You don't have to rush. You need to make *PRO* fit you exactly [00:16:25].

CHRIS HILL:

A question from John. "How do I use ideas from *Motley Fool Options* alongside *Motley Fool PRO*?"

JEFF FISCHER

A good question. *Motley Fool Options* is *PRO's* sister service and for the life of your *PRO* membership you get *Options* free. It's a great complement. A great community over there, as well. All *PRO* members have access to *Options* and then you have a large *Options* community, as well, that is only in *Options*.

So use that community, as well. Use the ideas as a complement to your *PRO* portfolio. The *Options* ideas are all vetted by the team, myself, and Jim Gillies. They're all from us. We like them just as I like *PRO*. That means those ideas make good sense next to *PRO*. If you're looking for extra income, extra leverage, or things like that you can add those options onto your *PRO* portfolio.

CHRIS HILL:

We've talked about this before and a couple of the members have indicated this with their questions about timing. With *Options*, as with *PRO*, you don't need to rush. That's another thing that we have to fight against — the popular concept that options is this frenetic trading vehicle when really, the way you and the team use options, it's much more, dare I say, boring.

JEFF FISCHER:

Yes, it's true. And especially new members, and people new to *Options* think they have to rush in and get a certain price. Get the price that's in our published report. But that's not true, and as you learn how options work over time, you'll see that you can just adjust the trade a few weeks or even a few months later. Use a different expiration or use a different strike. You can still express the same belief about a position and get equally good pricing, even down the road, so take your time.

CHRIS HILL:

Can we go through some of the positioning that's been communicated to me so far? I mean, we talked about Caesar's…

JEFF FISCHER

Yup…

CHRIS HILL:

…but I'm wondering if we can spend just a couple of minutes going through some of the other Positioning Report.

JEFF FISCHER

Yes, it's a large report, Chris, and it was just sent today so take your time. Read it and get to know it and let's talk through some of it today. We have three active shorts. Caesar's is something you can short now. The euro — the CurrencyShares Euro Trust. We've been short that since 2011.

CHRIS HILL:

I was just going to say. For a good few years.

JEFF FISCHER

A long time. We're up about 20%, but the euro could still fall further to the dollar as our interest rates go up and Europe keeps its stimulus on. That should lead to a stronger dollar and the euro could, dare I say, get down to $0.90 to a $1.00, from $1.04 right now. That should be a great time to go to Europe.

CHRIS HILL:

And we talk about ways to use hedging. This trade is essentially a hedge against all of the U.S. companies, and it appears to be a growing list. Over the last six to 12 months as they've done their quarterly earnings reports, one of the things we've heard over and over is "These results would have been better, but the dollar is so strong." It's like if you want a way to play against the strong U.S. dollar, here's one of them.

JEFF FISCHER

That's so true, Chris. That's a great point and this position has helped a bit in that regard. But you saying that makes me realize we probably could have made this position larger a year or two ago as more and more companies complained about the weak euro. But it's been a good short and it may still be a good short. We think it still is. Your rewards may not be as large as we've had so far, but they're still worthwhile potentially.

And the other good thing about this short is it's very unlikely the euro is going to soar against the dollar, so it's a relatively low-risk short.

CHRIS HILL:

In terms of the options — I think you mentioned this earlier — American Airlines and American Tower.

JEFF FISCHER:

Those are two simple call options you can buy — 2017 to target upside in these two positions. They're small — they're about half a percentage point each — and we believe in them. You're getting a good price on American Airlines. The stock is down since we started this position about a year ago, so you get a better price than us. And American Tower — you get about the same price we paid and you're then positioned for extra upside in those shares. We also own shares of American Tower and recommend, of course, that you buy shares, as well.

CHRIS HILL:

And then in terms of the rest, there's some pretty big names out there, and two of Warren Buffett's favorites in Coca-Cola and Wells Fargo.

JEFF FISCHER

That's right. Right now they're on hold. All the rest are just on hold. Coca-Cola — our options expire in January of 2016. We're not sure if we'll turn that to stock or not, yet, here in *PRO*, and so we're asking you to hold off on that for the moment. That said, if you set up the Coca-Cola position in *Motley Fool Options*, that's a fine complement to *PRO* and you can keep following that service.

Wells Fargo — we recommend the stock here in *PRO*. We hope you've bought shares. And we also, as we talked about at the outset briefly, wrote put options for income on Wells Fargo. Those expire very soon, so hold off on that. We've made most of that money already. We'll write new ones, soon, and invite you in with a brand new trade alert at that time.

CHRIS HILL:

Again, I love seeing the complex, in-the-weeds business right up against the everyday, everybody-knows-it business and in this case it's Tupperware.

JEFF FISCHER

Tupperware. A stock that's on hold right now. We first bought those shares in 2009 or 2010. Made good money on them. Sold them, because they looked inflated. Then the stock started to fall and we bought back in, but we bought back in too early, and now we're down about 20% on those shares.

But the more worrisome thing — the market does that sometimes — is the way management is spending money. They borrowed a lot of money to buy back shares, so we're making sure we want to stick with this management team. The stock is on hold. We'll have an update in December for all members, and if we believe we want to keep it then we'll tell you to buy shares. They do look cheap. But if not, then we'll use that as a tax loss and sell it this month. But we'll know very soon.

CHRIS HILL:

Management is something that I think members who have been with The Motley Fool for a long time have come to expect out of you and the other analysts and advisors. We do look at management. It does matter. At the end of the day, it is human beings that are running these businesses. I'm curious to what extent you and the *PRO* team look at management — if management becomes a bigger X factor when you're thinking about shorting a stock or if it's the same consideration whether it's *we're going long on this. We're shorting*. Whatever.

JEFF FISCHER

That's a great question. It does become a bigger factor. It can, naturally, when you're shorting something, because you're really looking for management that seems to be off balance or doesn't have a good strategy. May be outright failing at what they're doing. And that, when you spot it, is unfortunate to see, but also kind of fun to see as a short seller. *We have these guys by the tail. Let's short this company.*

But it's equally important with the companies we buy. We have "8 Qualities of a *PRO* Company." Chris, you know of that list. And one of the qualities is management. We want management that has a clear vision and consistently executes on that vision. So, yes, management is important whether we're going long or short.

CHRIS HILL:

Before we wrap up, I'm curious. What can members expect from *PRO* in 2016?

JEFF FISCHER

It's a great time of year because new options are coming out for 2018 and we're looking at those. We're looking at new shorts to replace some of these that we're closing just recently that members saw. And we have this new hedge that we're setting up now. We'll probably set up another one to complement this hedge that expires a different month. And we have 16% cash, so we're looking at new buys.

So we have a wide array — a wide docket — of things that we're really interested in and excited about that we'll roll out soon. It should be a good end of the year. It's one of my favorite times of year — the end of the year — to really reassess everything you have (which we've already done with all of our Buys and Buy Firsts) and then prepare yourself for the next year, and get yourself where you want to be. It's a good time to be building your portfolio with us, because that's what we're doing, and it's a fun time to look at new shorts and new longs.

CHRIS HILL:

In terms of the stocks that you're thinking about going long on, are there particular industries that you're looking at? It sounds like energy is not on the list. And if you think back that was one of the big narratives one year ago this week — looking at how the price of oil had fallen so much…

JEFF FISCHER

Yeah. It did collapse.

CHRIS HILL:

…and what we were going to see in 2015, et cetera.

JEFF FISCHER

A lot of people thought, "Here's a buying opportunity," and now those energy stocks are much, much lower than they were a year ago. We are, though, looking at energy. We won't write anything off and we may, very well, find something we like that makes money in a tangential way from energy. We bought energy after the BP oil spill and made a good return on that, so we'll see. Our sweet spot is financials, technology, and now healthcare, as well. Those are three areas we're really looking as well as consumer-oriented businesses.

The other thing we're always looking at, Chris, is monthly income. Our goal in *PRO* is also to generate income every month. So we'll be busy, as ever, and yet hopefully in our own calm, steady, no-rush, no-stress way.

CHRIS HILL:

Before we wrap up this event — and we will keep the text chat going, by all means — any concluding thoughts for the members who have been on board for about a month or so?

JEFF FISCHER

Yes. Welcome. We hope you're enjoying your time with us. Please read the Portfolio Positioning Report. Post any questions you have. If you're feeling like you're not yet on your feet, or you haven't yet started, go to your *PRO* home page and fill out the survey there. Use the tracker to help you get on track — on your own track.

Then ask any questions you have on the boards. We're there to help. Especially with this new hedge, I know it's an intimidating-looking trade, but once you get it, it's a really potent tool to have in your toolbox and it's pretty easy once you do it a few times.

So whether it's shorting, options, or hedging, we're here to help. Take your time. The key is that you'll be about 80% invested in stocks now or soon. That's where you'll really compound money over the long term and that gives you time to learn to hedge, to short, and to use options with us. So thank you for being here.

CHRIS HILL:

Thanks everyone for being here. As Jeff mentioned, check out the discussion boards. We'll keep the text chat going for a little while longer, but we're here 24/7, particularly on the discussion boards. On behalf of Jeff Fischer and the entire *PRO* team, I'm Chris Hill. Thanks for watching. Fool on!

[End]

Pro Catch-Up Trades: Oct. 5, 2015

Published Oct 5, 2015 at 3:13PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

Pro's Buy First stocks are worth adding to your long-term portfolio:

- **American Tower** (NYSE: AMT), 3.4% in stock and 0.5% in January 2017 $80 calls
- **Gentex** (NASDAQ: GNTX), 2.8% in stock and 1.5% by writing ("sell to open") December 2015 $15 puts
- **Gilead Sciences** (NASDAQ: GILD), 3.6% in stock
- **Oracle** (NYSE: ORCL), 3.7% in stock
- **Wells Fargo** (NYSE: WFC), 3.6% in stock

There's also:

- **Apple** (NASDAQ: AAPL), buy up to 4%
- **Skyworks Solutions** (NASDAQ: SWKS), buy up to 4%
- **Parexel International** (NASDAQ: PRXL), buy up to 3.2%
- **Medtronic** (NYSE: MDT), buy up to 2.9%
- **Tupperware** (NYSE: TUP), buy up to 2.1%

And then there's our airline investment, characteristically (of airlines in the past) deep in the red. But we're still believers in the value here. Members who lack a stake can take note of this recommendation:

- **American Airlines** (NASDAQ: AAL): Buy to open 0.5% to 1% in January 2017 $30 calls.

And our new hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): To adjust the put ratio spread for the jump in the index if you haven't made the trade yet, now sell to open two Nov. 20, 2015, $179 puts and buy to open one Nov. 20, 2015, $187 put. You can do so for a small credit, lately. This is only an $8 spread, and at higher strikes, but still complements our October hedge well. For more details on allocation, see our recent trade alert.

A Fireside Chat With Member fullofcarp

Published Oct 5, 2015 at 9:36AM

Dear *Pro* member:

When we asked you, our community, to name your favorite community member for *Pro*'s 2015 Polaris Award, you gave the victory to Bill (fullofcarp). Bill has been a *Pro* member since the beginning and is an institution on the *Pro* boards, helping others and sharing his investing thoughts. As when RockyTopBob won the inaugural Polaris Award and aleax won the second, we were delighted to see fullofcarp take the honor this year. Thank you, members! And congratulations, Bill!

Today, we have the pleasure of spending some time talking with Bill about his life, his investing, and his passions. We hope you enjoy the interview! -- Jeff

---

Q: Bill, please tell us about where you grew up. What about your younger years influences you most today?

I grew up in a redwood forest in California where my dad was the head ranger. When my humor falls flat, I blame it on the fact that I grew up mostly talking with raccoons and squirrels and deer (and occasionally with rattlesnakes and scorpions) and not with people!

I learned from very early on to take care of the forest. Because some percentage of visitors were either incapable of or unwilling to pick up after themselves, it was the responsibility of the rest of us to do more than our "fair share" (e.g., picking up trash) to ensure it didn't deteriorate over time. Today, I view my role in society/on the planet in the same way, especially as somebody blessed to have grown up and lived in such a wealthy, privileged country. I feel a deep sense of responsibility to pull more than just "my own" weight on a regular basis.

Q: Why did you start to invest in the stock market? What was your dream? And do you remember your first purchase?

During the dot-com bubble, I invested in some high-flying tech companies. I temporarily made some huge paper profits, then eventually lost it all (and then some, since I added during the descent) during the bursting of the bubble. Then eight years went by when I didn't think about investing very much. I think back on those years and wish that I'd done much, much more. Unfortunately, at that time I didn't have any money available for investing. Since then, I've tried to make up for lost time. I'm hoping to be able to retire "early" (within one to three years, having just turned 60), and what I've learned from *Pro* is a major reason that I believe I can do it.

As to the first purchase, I honestly don't remember which was the first one; all of those original ones were disasters. My memories of *Pro* purchases are much stronger.

Q: How has your investing approach changed over the years?

Before I started to follow TMF about eight years ago, I really had no plan. I understood that I should have one, but did not. Then I spent a few years following TMF recommendations, but relied solely on my first impressions with a particular recommendation without spending any serious time thinking about it. Finally, for the past five years or so, I've been giving enough thought to each recommendation so that I'm comfortable with it, including thinking about how a particular idea fits in with the rest of my existing portfolio.

Not including hedges and tactical trades (e.g., volatility trades), I've had between about 20 and 80 different positions open over the past five years. Currently, I have what I consider to be 28 core positions, plus three hedges and 12 speculative positions. For me, this is a manageable number, and the mix suits me very well. I have *Pro* to thank for my willingness to make those hedges and for the inspiration and confidence to take suitable risks using options with my speculative positions.

Bill with his girlfriend, Maria Susana, in [Tayrona National Park](), Colombia.

Q: Bill, what first drew you to the Fool, and what keeps you here?

After the dot-com bust, I joined TMF as part of a New Year's resolution on Jan. 1, 1999, but didn't really do anything with it. It wasn't until I had some investable money eight years later that I started to rethink the mistakes that I'd made during the dot-com era and started doing some reading. I realized that I needed some guidance, and the overall Fool philosophy made sense. Even so, until recently, I hadn't actually dug very deeply into comparisons of different approaches. Now, after trying out a few different Fool services and understanding the sometimes significant differences between them (part of the "Motley" part of TMF), I've now found a mix of things that work for me. My current mix of *Pro* as a solid foundation plus more risky positions that have been recommended by Tom and/or David Gardner is something that I can't imagine doing without.

Q: You've been a member of *Pro* since 2008. Why, Bill, why?!

I was one of the original members of *Pro* when it first started in the fall of 2008 — I confess that I fell victim to the Fool marketing menace. [Ed. note: We're glad it worked, as long as it rewards you!] Maybe I'm still the victim of mind control and that's why I'm still here.

I had been a member of another Fool service that had fared quite badly during the 2008 market collapse. *Pro*'s goals of steady returns with a balanced portfolio suited my perspective at that time, and the idea of using options in particular appealed to me. One of my Ph.D. minors is in finance (including option pricing theory), but I had never done anything with finance in the years since. However, the combination of those old memories and my math abilities (I am a self-described "recovering mathematician") has meant that the technical details of what *Pro* does with options and shorting come easy to me.

I don't, however, have any desire to do deep fundamental analysis, and so I rely on that work by *Pro*. I often apply my own different options strategies to the ideas of particular stocks and ETFs that *Pro* provides. I guess that to some degree it's simply the case that I have a deep sense of loyalty to Jeff and his teams of advisors over the years because they have truly changed my life for the better.

Q: The community voted you as the most valuable community member. What has the community given to you over the years?

The *Pro* discussion boards are a very enjoyable hobby for me, and the *Pro* community feels like a part of my family. Even though I've spent a meaningful amount of time in person with only a small number of Pro members, it feels like home.

As [fellow *Pro* Fool] phooLon has written, I think the boards provide an outlet for the itch that remains from my former days as a college professor. And as with the more traditional forms of teaching, I believe that this has greatly helped me, and that I've gained at least as much as I have helped others. Staying active on the boards is not only my hobby, but it keeps me engaged and educated with my investments. As is probably obvious to anybody who has read very many of my posts, I often stray from the formal *Pro* recommendations, adapting the basic idea but using different strategies (usually involving options) that fit my own situation. Since that includes frequent adjustments to the option positions (which is sort of equivalent to trading stock shares around a base position), staying emotionally active is important. *Pro*'s community energizes me on a regular basis.

But I'm also keenly aware that what I do is probably inappropriate for most members, and in keeping with "the Motley," I trust my handle and signature to remind readers to not take me — or any other poster for that matter — too seriously. We must all choose our own path and accept personal responsibility for our actions.

Q: If you could give one sentence of advice to your fellow investors (and you can right now!), what would it be?

Patience: This is a marathon, not a sprint.

The longer version: If there's anything that you don't understand, you should consider two options — take your time and learn the topic better before making any investment in anything related to it, or else skip it entirely if you don't have the time or inclination to learn more.

There is no one investment that is so magical that you absolutely MUST make it, certainly not immediately. If you aren't comfortable with an investment position and it (inevitably, eventually) turns against you for a while, you will have a very high risk of doing the wrong thing in reaction to it. Emotions often trump logic in times of stress. And even if you make the right decision, you'll likely be very emotionally stressed, and that's not a good thing. Only if you are comfortable with a position will you remain calm and take the time to do things right. This does *not* mean that you have to do deep fundamental analysis. Personally, I leave that to the *Pro* experts. But I always try to understand the fundamentals at least enough so that I'm comfortable with a particular recommendation before making a trade.

Very well said, Bill. Thank you so much for your time today, for your thoughtful responses, and for being a Fool with us! We'll see you on the boards!

Updated *Pro* Performance

Put Ratio Spread Trades on the SPDR S&P 500

Published Sep 29, 2015 at 3:32PM

Is this for you? At *Pro*, we use hedges to earn returns during a meaningful market decline. You don't need to hedge to succeed with *Pro*, but if you are at least 80% invested in stocks and want to hedge against a market decline, then consider following along. Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $200,000. **If, like us, you have the Sept. 30 put ratio spread, you could potentially "sell to close" your Sept. 30 $185 puts by expiration to capture some value. Leave your October put ratio spread alone.**

How You Participate

- **Action:** First, if you have our Sept. 30, 2015 put ratio spread in place, you can "sell to close" your Sept. 30 $185 puts by the close of business on Wednesday to capture any value. Wait until the last minute if you believe the index could keep falling. Then, set up this new put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF once you're certain the Sept. 30 one is expiring.
- **Allocation:** Nine percent of your total portfolio value, measured on the look-through value of the $181 puts you're buying (each put represents $18,100 in hedge value). Set up one 2:1 put ratio spread for every $200,000 or so you manage and want to hedge; hedging 9% of its entire portfolio, *Pro* will sell 24 puts and buy 12.
- **Trade:**
  - **Use a ratio spread order to simultaneously ...**
  - Write ("sell to open") **two** Nov. 20, 2015, $171 puts, and:
  - Buy ("buy to open") **one** Nov. 20, 2015, $181 put. Click "view all" at your broker to see all strikes.
- **Price Guidance (3:15pm ET):**
  - Sell to open **two** Nov. 20, 2015, $171 puts: Lately $2.32 x2 = $4.64 credit
  - Buy to open **one** Nov. 20, 2015, $181 put: Lately $4.45 debit
  - **Net credit:** Lately about **$0.21** credit per spread -- but this price will change; as prices change, just aim for a credit, or close to no cost, using a limit order.
  - SPY price: $187.50
  - **Potential Adjustment:** If SPY moves much in price before you set up your trade, you may want to move your strikes down or up accordingly, as much as SPY has moved, while still aiming for a credit. We will make just such an adjustment if need be, and tell you about it.

Note on our existing spreads: Our Sept. 30 spread is on track to expire, but lately you can sell to close the $185 puts by expiration to capture some value. Our October spread should be left alone for now. We'll address it near expiration.

What We're Thinking

At *Pro*, you know that we aim to have winners in down, flat, and positive markets -- and that means we need to address all three possibilities at once in the portfolio. A hedge on a market index is simply a hedge against a lower market. We generally don't care about declines of 5% or less, but when *Pro* is functioning as desired, declines of about 10% or more should result in some of our positions, like these spreads, becoming profitable. At the same time, the put ratio spreads we use are:

- Harmless to us if the market goes higher (they don't harm our return)
- Typically cash-free to set up (they can even pay us a small credit)
- Relatively low probability of loss

What's the trade-off? As with any written put, we need to be ready to buy the underlying investment; for today's trade, that means being prepared to buy shares of SPY via these hedges if the market falls too sharply, generally more than 15%. In this case, if the index falls more than 14.3%, this November hedge becomes a liability, with SPY falling below our breakeven point. If that happens, we would plan to buy long-term call options on SPY instead of shares, saving most of our cash in the process. See below for details on that.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2,394,000

- Nine percent of that value: $215,460
- Nov. 20, 2015, spread:
  - Buy to open $181 puts. Twelve contracts representing 100 shares each = $217,200 in look-through exposure, or a 9% hedge on our current portfolio value, cash included.
  - Sell to open $171 puts (24 contracts, half of which become a potential obligation, currently a 8.6% possible stake).
  - At home, you would buy one $181 put and sell two $171 puts for approximately every $200,000 in portfolio value you want to hedge ($18,100 look-through put value divided by $200,000 = 9%).

Return Details

SPY Price at Nov. 20 Expiration	Value of 1 Purchased Nov. 20, 2015, $181 Put	Value of 2 Written Nov. 20, 2015, $171 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Recent $189 (the SPY price has changed by 0.7% prior to publishing, to $187.50, but this table reflects $189)
$181 or higher	$0	$0	$0.21 gain per spread, or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 4.2%
$176	$5 x 100 = $500	$0	$500	(6.9%)
$171	**$10 x 100 = $1,000**	**$0**	**$1,000 (max profit per spread)**	**(9.5%)**
$168	$13 x 100 = $1,300	($3) x 200 = ($600)	$700	(11.1%)
$165	$16 x 100 = $1,600	($6) x 200 = ($1,200)	$400	(12.7%)
$161	**$20 x 100 = $2,000**	**($10) x 200 = ($2,000)**	**$0 (breakeven)**	**(14.8%)**
$155	$26 x 100 = $2,600	($16) x 200 = ($3,200)	($600)	(18%)
$150	$31 x 100 = $3,100	($21) x 200 = ($4,200)	($1,100)	(20.6%)

Our maximum profit is earned on this November spread if SPY declines 9.5% from its current level of $189. The spread will help us a little on a decline all the way to about 14.8%; beyond that, our short puts turn into an obligation that's in the red.

Follow-Up

Assuming we set this spread up for a credit, it will result in a small profit even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $171 put obligation if SPY is below that price by expiration.

However, if that does happen, our plan would be to close our puts and buy long-term SPY calls (or something we like even better, whether calls or stock) instead of buying the ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY itself. So, our potential 8% or so stake in SPY shares will only cost us about 2% of our cash if we buy calls instead. We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases.

How It Fits Into *Pro*

Pro consistently hedges to lower our market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market will make a difference. Even small gains add up over the years, especially if those gains are reinvested in depressed stocks. This hedge fits well with our goal of hedging in a cost-efficient way, one that doesn't work against us if the market rises. It does require regular upkeep, though, opening new positions as old ones expire, and staggering our months because these spreads really only help at or near expiration.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:**
  - For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, as we are, "buy to open" Nov. 20, 2015, $181 puts and "sell to open" *an equal number* of Nov. 20, 2015, $171 puts. Recently, this will cost you less than $2 ($200) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $10 ($1,000) per spread on a decline to $171 or any lower price, but you should be prepared to lose your $2 per spread if SPY doesn't decline below $181 by expiration.
- **To lower your market exposure while following our official trade (and make the position possible in some IRAs):**
  - Set up the original put ratio spreads as recommended, but also "buy to open" puts (with the same months of expiration as our two spreads) at strike prices *well below* $171. Buy *half as many* as the number of $171 puts you wrote. When you do so, all of your $171 puts will be "covered" (half by your $181 puts, and half by the other puts you choose to buy at a much lower strike; choose how much you want to pay to select your lower strike price). You will only need cash in your account to cover the difference between your two lowest strike prices, and your risk is capped, making this potentially IRA-friendly. Lately, you can buy the Nov. 20, 2015, $160 puts for about $1, meaning your only risk (and necessary cash reserve) is now $11 per share on half of your $171 puts. And this makes the total cost of your hedge about a $1 debit.

Pro Can Help

- **Need a refresher on ratio spreads?** Our guide can help.
- **Want to talk about SPY?** We have a discussion board for that.

Our Cautious 2015, and What's Ahead

Published Sep 28, 2015 at 3:05PM

Dear *Pro* member:

When it comes to new buy recommendations, 2015 has so far been the quietest year in the history of *Pro* (and *Motley Fool Options*, too!). Today, I'll explain why.

First, to review, we've only issued three brand-new buy recommendations in *Pro* this year:

- Buy calls on **American Airlines** (NASDAQ: AAL), January
- Buy **Visa** (NYSE: V), April
- Buy **Verisk Analytics** (NASDAQ: VRSK), July

Flying Low?

The first new position, buying calls on an airline stock, was an intentionally "contrary" investment; we took on higher risk hoping for higher returns. We invested 1% in call options on a stock trading at about 7 times expected earnings for the 18 months ahead. I argued that once investors begin to believe the airline's profits are sustainable, the stock should be awarded a much higher valuation.

Though oil prices have fallen since our January buy, the thesis hasn't played out yet. Shares are down around 31% since we started our position, and our call options are down twice that. However, I'm not discouraged on the longer-term prospects. Our 2017 calls on American Airlines provide plenty of time for a change in sentiment. And volatility in these shares is actually our friend -- it helps on the way up as much as it hurts on the way down. So, I hope shares remain volatile.

For those lacking a position, today you can invest up to 1% in the January 2017 $30 calls.

Charged Up and Skirting Risk

Issued in April and July, our next two new buys were much more risk-averse. Credit-card giant Visa has opportunities to grow in China and Europe (should it acquire its European namesake), while its core business is enjoying big tailwinds from new account wins with **Costco** (NASDAQ: COST) and **JP MorganChase** (NYSE: JPM). Our thesis also suggested that currency exchange rates would grow more volatile, helping the company's cross-border business. This currency volatility has started to play out. Underpinning all this is one of the most enviable businesses in the world, with a strong competitive moat, inflation-friendly dynamics, revenue growth as the world's wealth grows, and great room to expand as electronic payments replace cash. Visa fetches a premium valuation, but we believe it's merited, and so far the stock is up a bit since our buy despite a much lower S&P 500.

Our purchase of Verisk runs much in the same vein as Visa: We're buying the best business we could find at a price that seems merited. Providing deep data and analytical tools to insurance providers that have come to rely on the information, Verisk enjoys strong recurring revenue and a peerless competitive moat, and it has new growth markets on tap, including the health-care and energy sectors. Adding to our faith in the business, Verisk was able to increase prices and grow sales even during the Great Recession. We started with a 1.7% stake that we'll happily add to over time, believing that Verisk can ride through most any storm and keep growing.

As with Visa, Verisk's share price has held up despite a weak market. With both purchases, we were hoping to buy stability in a weak market and strength in a good market. Both stocks can be bought today at up to 2.3% and 1.8% stakes, respectively.

Why Not More New Buys?

You've probably already divined the reason we haven't been buying anything else this year: We've sought to avoid risk -- or, at least, to keep from increasing our portfolio's risk profile. Why? Because valuations on the stocks we've considered have suggested patience . We're content with our portfolio, and we only want to spend cash on new buys when we're strongly compelled. So far, the above is all that's compelled us! Valuations on most of the new stocks we've considered are at the higher end of an historical range, and today's growth rates are moderate or under pressure. Rather than force a new purchase, we're happy to wait. And we're not just waiting; we're also able to spend more of our time researching short sales and considering options trades.

Pro has issued 12 options trades this year, all of which mainly had a focus on income, including repeat strangles on **Expeditors International** (NASDAQ: EXPD) and written puts on **Live Nation** (NYSE: LYV) (another new name in the portfolio) and **Gentex** (NASDAQ: GNTX), among others. We've also issued shorts on **Boulder Brands** (NASDAQ: BDBD) and **World Acceptance** (NASDAQ: WRLD), as well as writing covered calls on **Coca-Cola** (NYSE: KO), **O'Reilly Automotive** (NASDAQ: ORLY) and others. Covered calls are a low-risk form of shorting, and while in a sense the rewards are also low, they do offer good yields.

We've considered many other new shorts, but our bar is high. We don't want open-ended business risk; the cost to short can't be too steep; shares need to be available in sufficient quantity; and so forth. Beginning a new short position takes us considerable time, though we continue to work on it. Meanwhile, as share prices go down,* the valuations on our list of favorite possible new *long* investments get more attractive, too, so we're watching for opportunities there that we like.

The Big Lesson: Always Be Patient

One of the most important investing lessons I've learned over many years is simply to be patient. Don't act until -- and unless -- you're truly compelled to act. If you don't have strong feelings regarding what to do at any given time, don't feel forced to do anything (assuming you like what you already own and how your portfolio is set up). Because we do like our portfolio, waiting for sweet pitches this year has been relatively easy, and this patience has saved us all money. Even though we're a "newsletter," we're not going to create activity for you unless we're genuinely excited about the positions we recommend for your money. We are willing to wait a long time for that. For another example, not buying into energy has been a good decision so far.

Meanwhile, I know newer *Pro* members are waiting for returns to begin with most of our long positions. Our specific losers aside (for which we take full responsibility!), negative market periods like this are an unavoidable part of investing. Sometimes, the market is stuck in neutral or reverse. As a *Pro* member in these circumstances, ideally you're saving more money and adding to our Buys over time. After all, most of our businesses keep increasing their profits, and eventually the stocks will follow suit.

Other Volatile Positions and What's Next

We're also seeing volatile moves from **Gilead Sciences** (NASDAQ: GILD), **Skyworks Solutions** (NASDAQ: SWKS), and our **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS) ETF. I'm not concerned about any of these. In fact, I'm glad the stocks remain volatile, because that cuts both ways. Biotech and chip stocks have swung wildly on headlines, but both of our businesses in those spaces are performing well. Meanwhile, emerging markets have been in a downtrend that requires patience. I'm glad we haven't bought more lately, although we might eventually.

Overall, this has been a year to move deliberately rather than quickly. The S&P 500 is currently (as of 1:30 p.m. Eastern) down more than 8% for the year. We would have liked to have had more shorts by now, but we're glad we've stayed modest with our new buys this year, and it's best that we remain careful in what we choose to short, too. As we enter the last three months of the year, we hope to add a few more shorts, we'll continue to write options whenever we see a good window, and if prices provide, we're ready to add more buys. We may also trim or cut some losers in a year-end cleanup, if the stocks aren't too cheap to do so.

Update: Our SPY Hedge

Our $170/$185 put ratio spread on **SPDR S&P 500** (NYSEMKT: SPY) is set to expire on Wednesday, Sept. 30. Lately, SPY is $188.60, so our $185 puts expiring in two days suddenly sport a little time value that we could capture (value that will balloon if SPY declines below our strike price). But this value won't last if SPY gains ground in the next 48 hours. We'll have a trade alert out soon to close the $185 puts and, ideally, set up a new put ratio spread in a similar vein expiring some months later.

Meanwhile, our October put ratio spread, which had us buy October $200 puts, is deep in-the-money on those puts, which is nice. Our October $187 short puts (later adjusted to $191 for those who missed the trade) are not yet an obligation (or are only a small obligation that we could just close) if this position were to end today. But we'll keep an eye on that.

Overall, realize that we welcome volatility. It should shake out some good opportunities. But we're not just waiting on that. We'll issue new shorts, options, or -- yes -- longs when we're strongly compelled to. We like how we're invested, and we like that we have optionality ahead of us.

Foolishly,

-- Jeff (TMFFischer)

**Editor's note: Jeff and I both ended up with [this earworm](), so we decided to share it with you, too. Happy Monday!*

Pro Catch-Up Trades: Sept. 28, 2015

Published Sep 28, 2015 at 3:02PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking.*

Pro's Buy First stocks are worth adding to your long-term portfolio:

- **American Tower** (NYSE: AMT), 3.3% in stock and 0.5% in January 2017 $80 calls
- **Gentex** (NASDAQ: GNTX), 2.7% in stock and 1.5% by writing ("sell to open") December 2015 $15 puts
- **Gilead Sciences** (NASDAQ: GILD), 3.6% in stock
- **Oracle** (NYSE: ORCL), 3.6% in stock
- **Wells Fargo** (NYSE: WFC), 3.6% in stock

There's also:

- **Skyworks Solutions** (NASDAQ: SWKS), buy up to 4.2%
- **Parexel International** (NASDAQ: PRXL), buy up to 3.4%
- **Medtronic** (NYSE: MDT), buy up to 2.7%

And then there's our airline investment, characteristically (of airlines in the past) deep in the red. But we're still believers in the value here. Members who lack a stake can take note of this recommendation:

- **American Airlines** (NASDAQ: AAL): Buy to open 0.5% to 1% in January 2017 $30 calls.

Charts of the Week

Published Sep 21, 2015 at 3:29PM

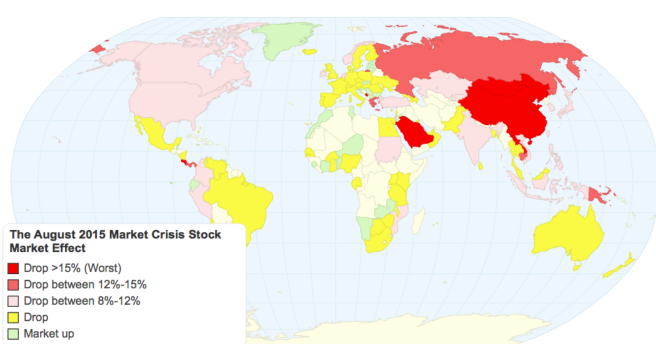
Dear *Pro* Fools,

If you haven't noticed yet, I'm a charts guy. And I don't mean stock charts -- the visual form of stock price and volume data that technical analysts use to try to forecast future price movements. I'm talking about charts in the most general sense: "information in the form of a table, diagram, etc.," as defined by Merriam-Webster.

In almost all of the content I contribute to the Fool, I try to include at least one chart. I love how charts can take large amounts of disparate data and distill it down into something that's visually appealing and easy to understand. In fact, I'm so into charts that on my resume, under Hobbies and Interests, you'll find a bullet point that mentions how I am "interested in [the] development of novel data visualization designs."

For this week's Memo, I thought I'd share my love of charts with you all by showcasing five of the most interesting and market-relevant charts I came across this week while perusing the financial blogs and websites I frequent. Without further ado:

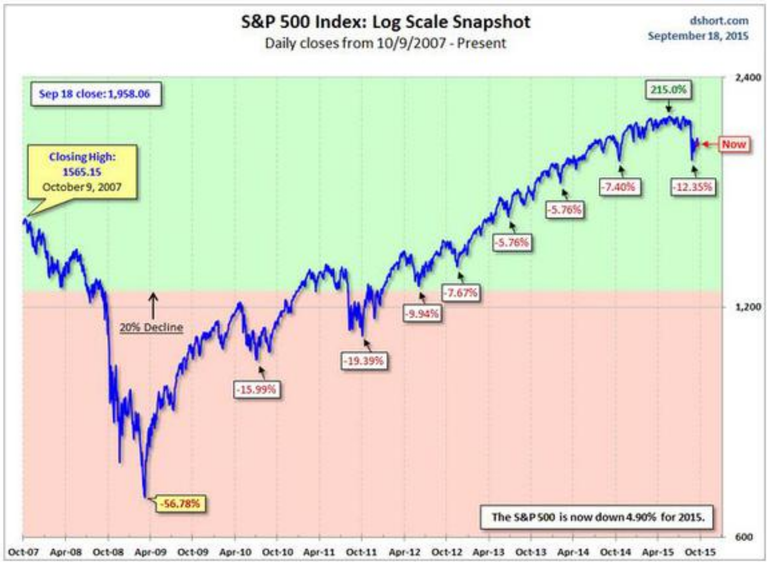
1. The August 2015 Market Crisis Stock Market Effect



via chartsbin.com

This chart shows the percentage change in market capitalizations between Aug. 14, 2015, and Aug. 24, 2015 for countries across the world, in U.S. dollars. The chart is interactive, so if you scroll over it with your mouse you can compare the P/E ratios from before the crisis to after the crisis for each country.

2. S&P 500 Index: Log Scale Snapshot



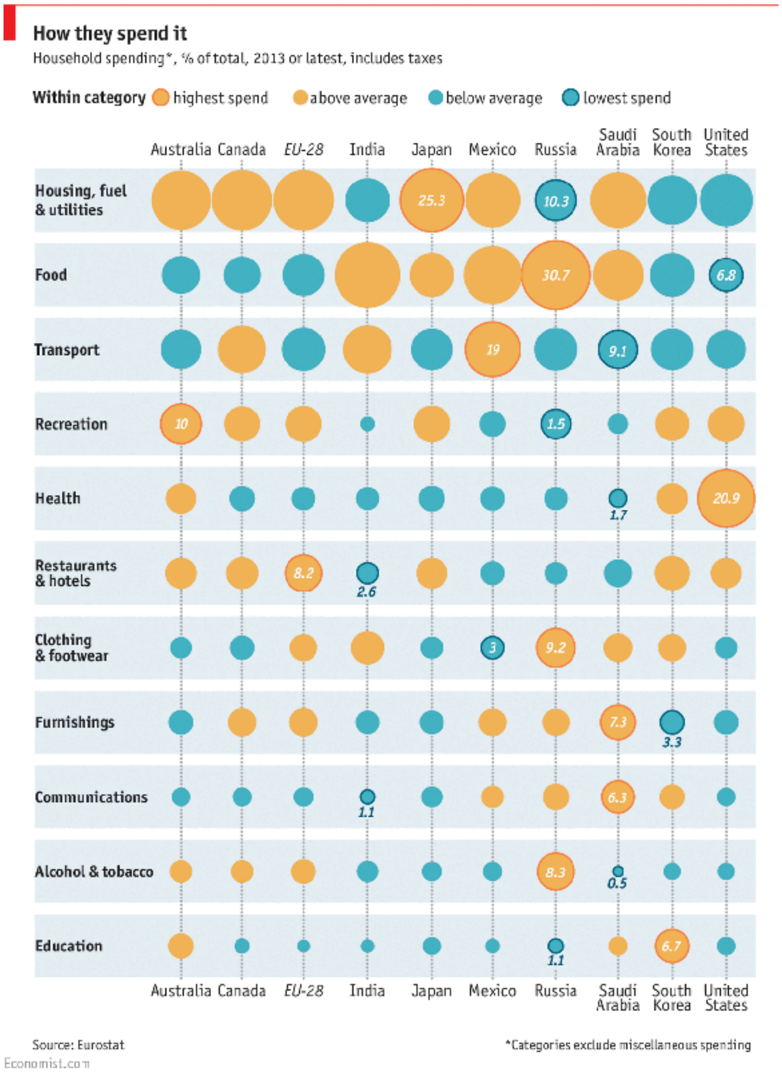
This chart, from Doug Short at Advisor Perspectives, shows the daily S&P 500 closing value, starting with the all-time high prior to the Great Recession. The chart shows major peak-to-trough declines since the lows of the financial crisis, including the most recent -12.35% movement detailed in the interactive chart above. This chart helps provide some longer-term perspective on the recent stock market "crisis."

3. New Home Sales and Recessions

Source: [Calculated Risk]

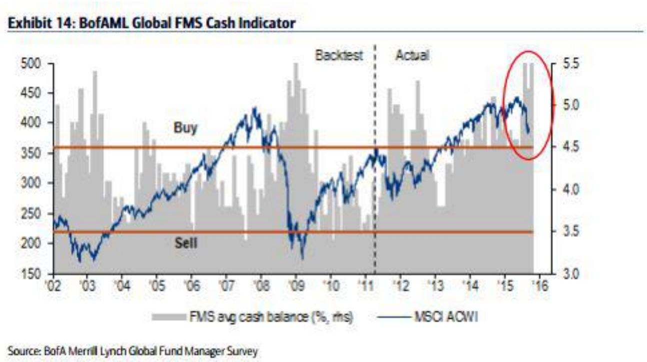
This chart from the blog Calculated Risk compares the Census Bureau's new residential sales data (since 1963) to U.S. economic recessions (shaded in blue). The dashed line represents the July 2015 sales rate. We can see from this graph that while the housing market has recovered from its post-recession lows and is in an uptrend, we are still very far from pre-recession highs. The Census Bureau is set to report August new-home sales data on Thursday, Sept. 24; when the data is released, you'll find it [here].

4. How Countries Spend Their Money



This chart from *The Economist* shows household spending by category for certain countries (or groups of countries, with respect to the 28 European Union nations). For each category, in terms of percent of total spending, you can see which country spent the most (denoted by a large orange circle) and which country spent the least (denoted by a small blue circle). For me, as a United States citizen, the most interesting takeaway from this chart is how much we spend on healthcare relative to the other countries in the chart.

5. Bank of America Merrill Lynch Global Fund Manager Survey Cash Indicator



This chart from the September 2015 Bank of America Merrill Lynch Global Fund Manager Survey (FMS) shows the average cash balance of the funds it contains as a percent of total assets (denoted by gray bars in the chart), compared with the MSCI All Country World Index (ACWI). The FMS contains information from 214 panelists with $593 billion in assets under management. In September 2015, the average cash balance for the managers in the survey increased to 5.5%, which is the highest since the 2008-2009 financial crisis. The chart notes (via the orange-brown lines) that when the balance rises above 4.5%, it's a contrarian buy indicator, and when it declines below 3.5%, it's a contrarian sell indicator.

The *Pro* Bottom Line

There you have it, Fools -- the top five charts of the week from your self-professed "charts guy." Even if you don't share my enthusiasm for the visualization of data, I hope you've at least learned something new from these charts. Have a wonderful week, and Fool on!

Best,

Oracle's Cloud Biz Is Gaining Momentum

Published Sep 18, 2015 at 11:03AM

For long-term **Oracle** (NYSE: ORCL) shareholders, the company's gradual transition to a cloud-based SaaS business has been painfully slow. We keep waiting for that big, breakout quarter to prove that the business has turned the corner-and it looks like we'll be waiting at least another three months. Oracle continues to grow cloud sales at a rapid pace, analysts continue to prod management for more details about the economics of the cloud business, and the stock continues to trickle down as investors gradually lose patience with their investment. Currency swings are once again a significant headwind for the business, resulting in a 9% drag on total sales and $0.06 knock on earnings for the quarter. Thankfully, at least in this instance, Oracle doesn't have a very big presence in China, so the recent turmoil there had a negligible effect on the company's performance. Though Oracle's stock sold off modestly following the earnings report, we still think there's a lot to like about this business.

The strong growth of the cloud-based SaaS and PaaS business continues to be the key to our long-term thesis, and that part of the story is very much intact. Though on-premises revenue was only up 4%, with most of the gain coming from software updates and product support, cloud revenue grew by 34% and cloud bookings increased by 165%. Management attributed the growing momentum in cloud sales to a number of factors, including the completion of a full product suite to offer customers, better trained sales staff, and most recently, the translation of the software into more languages allowing for sales across to more regions.

Based on contracts already in place, management expects revenue growth to accelerate in the second half of the year and for annual cloud sales to grow 50% year-over-year. A portion of this growth will come from existing customers that signed up a year or two ago with promotional pricing that is beginning roll off. By comparison, on-premises is expected to only grow modestly at 0% to 2%. Though we'd like to see this cash cow part of the business growing at a faster pace, the fact that the licensing business is holding steady means that Oracle isn't cannibalizing its installed base to drive growth, nor are cloud competitors making significant inroads with existing customers.

Also, capital expenditures are expected to decline significantly in the second half of the year following the massive spending needed to to launch the full suite of cloud products and fund the infrastructure build-out (a 90x increase in data capacity over the past three years) which needed to be in place before the company could grow it's cloud business. Also, for the first time management shared that the cloud gross margin is expected to hit 60% by end of the year and 80% within two years as the business rapidly scales.

As Competitive As Usual

As always, Ellison and Hurd made sure to draw comparisons between how the company is performing versus competitors **Salesforce.com** (NYSE: CRM) and **Workday** (NYSE: WDAY). In human capital management (HCM), Oracle doubled the new customer count at 166 and 200 new enterprise resource planning (ERP) customers added is more than Workday's lifetime sales. For the year, management expect to book between $1.5 billion and $2 billion of SaaS and PaaS business, between 50% higher and double what Salesforce.com expects to sell this year.

Oracle's key competitive advantage is its unique ability to allow customers to have both on-premises and cloud-based running at the same time and allow companies to move their data seamlessly between the platforms. According to co-CEO Mark Hurd,

"The major differentiation for Oracle that nobody else can do is we can actually do this on-premises for you and do it for you in the cloud. And we can do it at the exact same time. We can deliver to you a capability in the cloud and we can deliver the exact same capability to you on-premises and move those workloads back and forth, whether that's Database as a Service, some dev tests, dev testing our cloud into your data center to run your production applications. It's important to understand, this is a huge differentiator that only this company can deliver."

Oracle is also encouraging customers to run their development test in that cloud instead of on-premises because they believe it lowers the customer's costs while generating more total revenue for Oracle. Additionally, many of Oracle's competitors, including SAP, NetSuite, and Salesforce run Oracle's database software, and they've rapidly adopted the company's multi-tenancy and in-memory solutions which allows them to use less hardware and run their software more efficiently.

The Pro Bottom Line

The big idea driving the shift to the cloud is that it allows Oracle to capture more of the overall tech spends and allow clients save on their overall IT costs. Of course, this sounds too good to be true because someone has to be losing. In this case that "someone" is a combination of the IT employees that maintained on-premises databases and server stacks, the vendors that sold non-Oracle branded equipment, and the data centers that hosted corporate servers. Now Oracle employees cover those functions using Oracle servers,which are running Oracle software and are located in Oracle data centers, allowing Oracle to capture the majority of the profit in that value chain.

Even following the poor performance of the stock so far this year, Oracle still doesn't look especially cheap at a 9.4-times EV/EBITDA, which is just below the company's 3-year average. Looking forward, analysts on the conference call seemed skeptical about management's growth and margin guidance, which suggests The Street may be overly conservative in their future profit estimates-especially once the cloud business starts to scale. Not surprisingly, management is bullish on the cloud business and backed it up last quarter by increasing share buybacks during the quarter to $3 billion versus last year's quarterly run-rate of $2 billion. Further, they claim they will increase the buybacks even more if recent markets conditions persist.

We continue to think that Oracle has done a great job of defending its core installed base while its cloud business gets up to speed. Now that the company has completed its portfolio of cloud-based applications, we expect growth to accelerate in the coming year. Oracle continues to be a Buy First and we would consider adding to the position opportunistically if this pullback continues.

SVXY: Past, Present, and Future

Published Sep 14, 2015 at 3:28PM

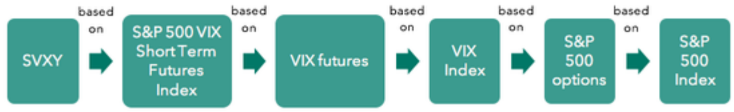
Fellow Fools,

As you know, *Pro* has had a small stake in the **ProShares Short VIX Short-Term Futures ETF** (NYSEMKT: SVXY) since November of last year. The SVXY has been a source of confusion lately, so today we're going to take a deeper dive into the instrument itself as well as our future plans for the position. This is going to be a lengthy memo, so let's get started!

What Is This Thing, Anyway?

Though the value of the SVXY is ultimately derived from movements in the stock market, purchasing shares doesn't make you a partial owner of a company like it would with, say, Apple. And the SVXY's relationship to the market is a lot more convoluted than those of the other ETFs in our portfolio (FAZ, for example). The goal of the

SVXY is to deliver daily returns that are the inverse of the S&P 500 VIX Short Term Futures Index. That index, in turn, attempts to replicate a position that rolls futures contracts on a daily basis to deliver a constant one-month rolling long position in VIX futures contracts. The relationship looks a little like this:

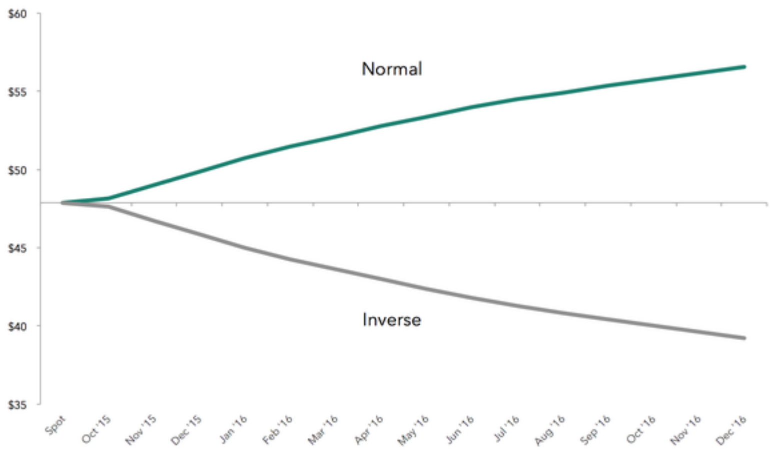


The CBOE created the VIX to provide a measure of the market's expectation for volatility over the next 30 days, using option prices for the S&P 500 Index. Because it is an estimate of an expectation, the VIX isn't always right. Even so, it has become widely known as the "fear index," and it's often used to gauge market sentiment. This name isn't 100% appropriate, though, as the VIX is measuring option premiums, not movements in the market. Most of the time the VIX works as expected (since downward moves have historically been more volatile and associated with higher premiums than upward moves), but Vance Harwood found that 20% of the time, the VIX actually moved in the same direction as the S&P 500.

For those who want to create securities to trade volatility, there's a complication: You cannot buy or sell the VIX. In order to get around this, market participants have instead created instruments that derive their value from VIX futures contracts. In order to better understand what is taking place with the SVXY, we actually need to devote some time to talking about the instrument from which it derives its value — futures.

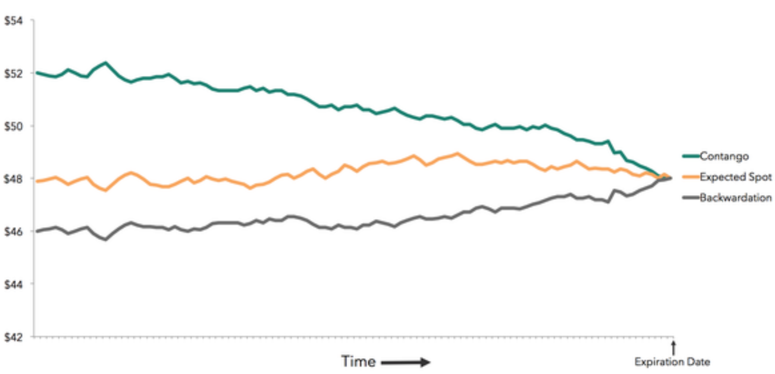
Under the Hood

Futures are standardized contracts that represent the obligation to buy or sell a specific asset at a future date for a predetermined price. They are similar to the options we're used to dealing with here in *Pro*, but there are some key differences (including the fact that they represent an obligation, not a right). There are multiple expiration dates for each asset, and you can plot the prices for each date on what is known as a futures curve. A normal futures curve is one where the prices tend to rise over time, while an inverse curve is where prices tend to fall as you move further along the curve.



Over time, the spot (current) price and the futures price must converge. The spot price can rise up to meet the futures price, the futures price can fall to meet the spot price, or they can meet somewhere in the middle. It doesn't really matter as long as they converge by expiration. (If they didn't, an arbitrage opportunity would be available.) This is where contango and backwardation come into play.

Contango, the buzzword we all like to use when talking about VIX futures, refers to a state in which the futures price is above the expected futures spot price (*not* simply when the curve is upward-sloping). This distinction is important because it is entirely possible for there to be no contango in a normal curve, and therefore no roll yield (see further explanation below). . Backwardation is simply the opposite of contango. When contango occurs, the futures price will roll down to converge with the spot price over time. When backwardation occurs, the futures price will roll up to converge with the spot price.



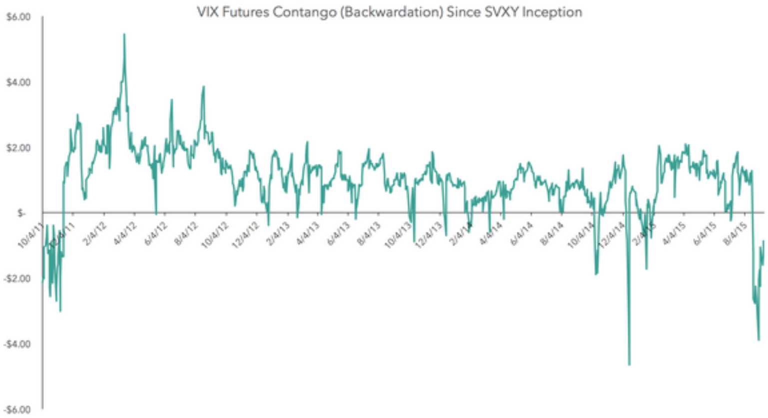
Roll yield refers to the return you can capture depending on the shape of the curve:

Type of Position	Contango	Backwardation
Long	negative	positive
Short	positive	negative

It is calculated as the change in the futures price minus the change in the spot price. As a simplified example, suppose you bought a futures contract at $10 with the underlying asset trading for $13. By expiration, the asset is trading for $15; to prevent an arbitrage situation, your futures contract must be worth $15 as well. The roll return you captured is ($15-$10)-($15-$13), or $2. You achieved this return because you were long a futures contract when the curve was in backwardation. If that remained the case, you could once again purchase a futures contract price at a discount to the spot price, so in this instance you would continue to maintain the same exposure while pocketing the extra $3.

Gazing Into the Future

So what determines the prices on a given futures curve? Well, it depends on the underlying commodity. In the case of the VIX futures, we're dealing with a non-storable commodity, and those tend to offer a better prediction of futures expectations. Going long the SVXY has been a pretty smart move over the years, because the the VIX futures curve is normally in a state of contango -- that is to say, the VIX consistently overestimates realized volatility.

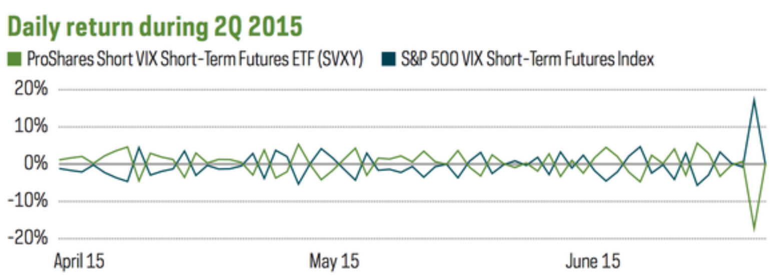


Data source: Bloomberg, calculated using constant one- and two-month VIX futures

And it is this factor that brings the SVXY its positive roll yield, not the act of actually rolling the contracts (so yes, the name "roll yield" can be a bit misleading). This is because a notional amount -- not a fixed number -- of first-month futures contracts (specifically: a contract multiplier, $1,000 in this case, multiplied by the spot price) are rolled into second-month VIX futures. This has to be the case; otherwise, the net asset value would actually increase every time contracts were rolled and they would not be able to achieve their target weight. The roll yield is actually achieved over the life of the contracts as they are held in the portfolio as the futures prices decline toward the spot price (since contango is far more prevalent than backwardation).

A Broken Mirror

Another common question: Why are the SVXY's results so different from what you'd expect after looking at the VXX, which attempts to achieve the opposite of the SVXY (it aims to *mirror*, not invert, the daily returns of the S&P 500 VIX Short Term Futures Index). The VXX is down 17% year to date, so shouldn't the SVXY be up 17% instead of down 20%? Unfortunately for us, the answer to this question is no. It's just the way the math works out (or if you want to use academic-speak, it's because of volatility drag). You see, the SVXY only attempts to deliver (before fees, of course) the inverse of the daily performance of the S&P 500 VIX Short Term Futures on a daily basis. And it does a pretty good job of doing just that:

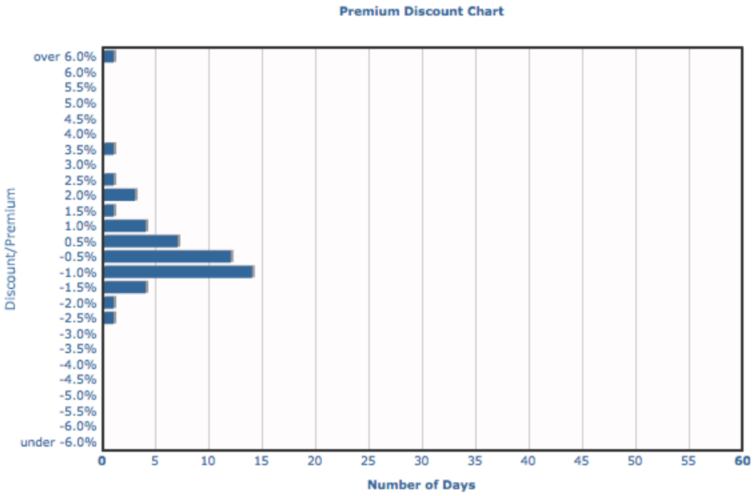


Source: ProShares Short VIX Short-Term Futures ETF fact sheet

But this does not mean that the compounded returns over time will result in a similar chart, as you can see from the hypothetical example below. Also, spikes in volatility can actually exacerbate the problem -- hence the term "volatility drag."

daily return	t0	t1	t2	t3	t4	t5	t6	t7	t8	t9	t10
Index X	--	5%	7%	3%	5%	-3%	10%	15%	2%	4%	4%
Index Y	--	-5%	-7%	-3%	-5%	3%	-10%	-15%	-2%	-4%	-4%
cumulative return											
Index X		5.00%	12.35%	15.72%	21.51%	17.86%	29.65%	49.09%	52.08%	58.16%	64.49%
Index Y		-5.00%	-11.65%	-14.30%	-18.59%	-16.14%	-24.53%	-35.85%	-37.13%	-39.65%	-42.06%

Also note that buying and selling pressure can force the SVXY stock price to deviate from what it should be based on its NAV.



Source: ProShares

That said, the SVXY's prospectus provides for what are referred to as "authorized participants." Whenever the stock price falls too much, they step in and buy blocks of shares, and whenever it rises too much, they can sell shares back into the market.

So Now What?

We've spent a good amount of time talking about contango, but with the recent spike in volatility, we currently find ourselves in a state of backwardation. Remembering our roll yield chart above, this is a tailwind for instruments that are currently long VIX futures, and a ball and chain for the SVXY. The sharper the decline, the more the SVXY suffers. Here's a look at how the SVXY and VXX have done since the SVXY started trading in late 2011:

30-day returns since SVXY inception

	VXX	SVXY
mean	-9.9%	7.8%
median	-11.2%	7.4%
std. deviation	14.6%	17.6%

When in backwardation

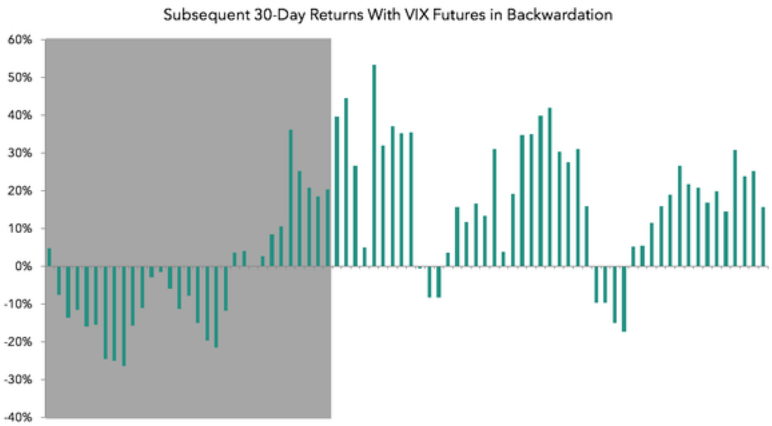
	VXX	SVXY
mean	-13.6%	9.9%
median	-16.1%	11.5%
std. deviation	13.4%	19.6%

When in contango

	VXX	SVXY
mean	-9.6%	7.6%
median	-10.9%	7.3%
std. deviation	14.7%	17.5%

Data source: Bloomberg, author's calculations

At first glance, buying the SVXY whenever the futures curve moves into backwardation looks like a pretty smart move. But VIX futures have spent less than 6% of total trading days in backwardation since the SVXY started trading, and if you take a look at the contango/backwardation chart above, you'll see that except for the first 31 days after the SVXY hit the market, there was never an extended period in which the VIX futures curve was in backwardation. So the backwardation data directly above is misleading, because it also includes periods during which the SVXY had the one-two punch of a falling VIX and a curve rapidly moving back into contango. But if you look at that 31-day period (the gray portion of the chart below), you'll see that an extended stay in backwardation is no fun for the SVXY.



Data source: Bloomberg, author's calculations

This is why we haven't rushed in to buy more of the SVXY during its recent decline. We don't know how long the futures curve will stay in backwardation, and because of that, we don't know how the SVXY will behave in the coming weeks. Despite all this talk about the future and futures, the behavior of the VIX futures going forward is unknown to us -- and until Nostradamus accepts our multiple generous offers to join the *Pro* team, that will remain the case. . But we'll likely look to add to our stake (through either buying additional shares or writing puts) as backwardation lessens, because one of the surest ways to make sure the position ultimately works out in our favor is to systematically add to it whenever it gets beaten down.

Foolishly yours,

-- JP (TMFYossarian)

Congratulations to all members who made it through today's lesson! Grab a glass of wine (or tea, or moonshine -- we won't judge) and come mingle with us on the Philosophy & Strategy discussion board.

Write Covered Calls on O'Reilly Automotive and Part of Your AmTrust Financial Services Position

Published Sep 4, 2015 at 12:45PM

Is this for you? This is for *Pro* members who own more than 6% in **AmTrust Financial Services** (NASDAQ: AFSI) in lots of 100+ shares, and who wouldn't mind selling some shares through covered calls. And for members who are comfortable targeting short-term income on **O'Reilly Automotive** (NASDAQ: ORLY), with the possible risk that we might lose our shares if a big enough resurgence in price makes rolling our covered calls impractical.

How You Participate: AmTrust Financial Services

- **Trade:** Sell to open October 2015 $60 calls on AFSI
- **Allocation:** To potentially decrease your allocation from 7.9% to around 6%, cover about 21% of your stake. But ultimately, only sell one call for every 100 shares you own and want to cover (**do not cover shares you wish to keep!**). *Pro* will cover 700 of its 3,267 shares, writing 7 calls.
  - **Price Guidance:** Use a limit order and ideally aim to be paid at least $1.50. As prices change over the coming days, aim to be paid at least 2% of the current share price (lately that's $1.16). After that, watch for our Catch-Up Trades on Mondays.
  - **Prices** (11 a.m. ET):
    - Stock: $57.80
    - October 2015 $60 calls (bid/ask): $1.25/$2 ($1.625 splitting the bid/ask, but we said $1.50 above to give better odds for success at today's price)

How You Participate: O'Reilly Automotive

- **Trade:** Sell to open October 2015 $250 calls on ORLY
- **Allocation:** Sell one call for every 100 shares you own and want to cover (**do not cover shares you wish to keep!**). We have a 4.9% stake in the stock, and will cover it all. So, *Pro* will cover all of its 500 shares, writing 5 calls.
  - **Price Guidance:** Use a limit order and ideally aim to be paid at least $3.20. As prices change over the coming days, aim to be paid at least 1% of the current share price (lately that's $2.35). After that, watch for our Catch-Up Trades on Mondays.
  - **Prices** (11 a.m. ET):
    - Stock: $235
    - October 2015 $250 calls (bid/ask): $2.85/$3.80 ($3.325 splitting the bid/ask)

What We're Thinking

You might have noticed that volatility has increased in the stock market, with the Chicago Board Options Exchange VIX index (or "fear index") jumping from 12 in mid-August to a recent 28, well above its long-term average of around 19. The VIX usually rises when the S&P 500 declines, and true to form, that's been the case. One advantage of a higher VIX is inflated options prices, amid expectations for increased volatility. We now get paid more for writing options, including short-term contracts that are decently out-of-the-money. We're going to start capitalizing on this opportunity with two new covered call positions for possible stock sales and income.

AmTrust

Shares of this plucky insurer are up 34% in the past 12 months, and our position has grown to our largest by a greater than 50% margin, at 7.9%. This is a good problem to have, but as more opportunities shake out in the marketplace, we will be content to sell this position down a bit, to around 6%, looking to invest the proceeds in other ideas. We like other financial stocks as much as we like AmTrust, and by moving some funds out of it, we lower our concentration risk. Although our *modus operandi* is to let our high-quality winners run as long as merited, as a small insurance company, AmTrust always harbors more potential risk. The company has a much greater chance of unpleasantly surprising us than does something like **Visa** (NYSE: V) or **Verisk Analytics** (NASDAQ: VRSK), both of which are contenders for a greater allocation in the portfolio.

Perhaps the only thing I don't like about potentially selling some AmTrust is the tax bill. It's a long-term capital gain for us, but it's still a tax bill. Consider your own situation. Also, some members may not have a gain in AmTrust if they recently bought above $60. Keeping your full stake is not out of the question — we're only potentially trimming 1.9% of our total portfolio exposure to it and around 21% of the position, after all, and we intend to remain long-term investors in the business. But for us, trimming down our holdings would be fine (AmTrust would remain our largest stake). If you own less than 6% already, you can sit tight. AmTrust is modestly above our $52 fair value estimate, and these calls will reach expiration before the next earnings report.

O'Reilly

O'Reilly's a stock that perpetually looks expensive. But these days, its price premium is more accentuated than usual, thanks to consistently strong business results. We've been wise not to write calls on O'Reilly yet, and we take some risk of losing our shares by covering for the next 40 days, but these income-targeted covered calls are more than 6% out-of-the money, and are set to expire before O'Reilly's next earnings report. The calls will pay us about 12% annualized, thanks to a higher VIX, and we'll take that given O'Reilly's current valuation.

The stock trades at 15 times trailing EBITDA (earnings before interest, taxes, depreciation, and amortization), although its 10-year average EBITDA multiple is closer to 11. Indeed, the stock is about 24% above our $190 fair value estimate. It trades at 29 times trailing earnings, and 25 times expected earnings for the next 12 months.

So why not sell outright? Because O'Reilly has been growing diluted earnings per share by 23.5% annualized the past three years. That type of consistent growth, coupled with growing margins and a long runway for future growth, deserves a premium. So we're not *eager* to sell — indeed, the stock is still rated a Buy. But we finally believe the stock may be at a point where we can carefully write covered calls for income and either not lose our shares, or actually not regret losing them if we do — and eventually get a better chance to buy back lower.

We'll cover our shares at $250 and either let the stock go if it rises more than 6% in about a month, or roll the calls higher if we decide that's our preferred course of action. Currently, I would lean toward rolling to keep our shares and avoid another tax bill. Given that stance, we *are* bending our covered call rules here (as we occasionally do), since we're not 100% ready to let the stock go. But the odds of just earning income in 40 days, in a choppy market, seem to outweigh the risk of the stock jumping too much. Time will reveal us to be fools or Fools on this thought.

How This Fits in With Pro

These two trades will bring a small amount of extra income to *Pro*, and potentially position us to trim our largest position and perhaps sell our 4.9% stake in our auto-parts retailer (if the stock rises and we don't roll the calls), raising cash for new positions. Both moves are in line with our mandate to manage the portfolio with reasonable risk in terms of allocations and valuations. To be clear, though, I don't believe that O'Reilly has more risk than the average stock, but its *future returns* rely on greater business outperformance than many of our stocks need to achieve.

So let's see whether we can use the higher VIX to help us earn some income in October.

Alternative Trades

If you don't own enough AmTrust or O'Reilly to write covered calls, do nothing, but be ready to sell your allocation in AmTrust down to 6% if we do so via covered calls (we'll alert you with a new email if that turns out the case). And, be ready to potentially sell your O'Reilly shares if we let ours get called away next month (again, we'll alert you).

Pro Can Help

- **Covered Calls.** Want to learn more about them? See our guide to the strategy, and to rolling covered calls.
- **Questions?** Rev on over to the *Pro* Philosophy board to ask general questions, and see the company-specific boards — AmTrust and O' Reilly — to pose questions on those.

Sell Your Protective Calls on Boulder Brands

Published Sep 2, 2015 at 12:19PM

Is this for you? This trade is only for members who are following along with our **Boulder Brands** (NASDAQ: BDBD) short position and bought protective calls alongside us. All others should ignore this recommendation. Bring your questions to the Boulder Brands board.

How You Participate

- **Trade:** Sell to close your September 2015 $7.50 calls.
- **Allocation:** Sell all of your protective calls; *Pro* will sell 62 calls.
- **Price Guidance:** Based on today's pricing, **it is critical that you use a limit order** to try to sell at $1 or higher (with the stock at about $8.25, this implies $0.25 of time value). With increased volume from this alert, this guidance may not hold. But with three weeks to September expiration, we should be able to sell some time value. For this week, as the stock price changes, try to sell your calls for at least $0.10 to $0.15 above intrinsic value. As we get closer to expiration, you may need to sell for closer to intrinsic value. Realize that if the stock declines from current prices, you'll ultimately need to accept less to sell your calls, but you should still use limit orders and still aim to get time value!
- **Recent Prices (as of 10:40 am Sept. 2):** Stock, $8.25; September $7.50 calls (bid/ask), $0.80/$1.20

What We're Thinking

Boulder Brands has been a great case study on why shorting is difficult. Since we established our initial position in March, our short thesis is tracking almost perfectly: Competitive pressure and poor earnings quality are taking a toll on revenue growth and margins, and the company's governance issues have led to the resignation of the co-founder and CEO.

Nonetheless, because of the timing of when we increased our short position, and because the stock has risen alongside rumors of a buyout (exactly the sort of news we were protecting against with our bought calls), we're currently sitting on a nearly 10% gain on our overall short position, which includes two tranches of short shares and our protective calls:

	# of Shares/Contracts	Start Price	Cost Basis	Current (Sold) Price	Market Value	Profit (Loss)
Original Short (3/23/15)	-3900	$9.60	($37,432)	$8.25	($32,175)	$5,257
Add More To Short (6/22/15)	-2300	$6.98	($16,050)	$8.25	($18,975)	($2,925)
Sept 2015 $7.50 Protective Calls (6/22/15)	62	$0.60	$3,726	$1.00	$6,200	$2,474
TOTAL			($49,757)		($44,950)	$4,807

After analyzing second-quarter earnings and evaluating the possibility of a buyout offer, we've decided to cash in the profit on our protective calls and reset our uncapped short position with this alert today.

While it's always possible that the company could be acquired at a premium, the acquiring company would be paying rich acquisition multiples, and it would have to be making some quite optimistic assumptions about synergy and the ability to reignite growth. We think it's unlikely that Boulder would be acquired for much more than $10 per share (which represents more than a 20% premium over the current price), and we also believe that Boulder is likely to report more poor results with third-quarter earnings (set to be released in early November).

Because we think upside above $10 per share is unlikely, and because we'd have to pay at least $0.50 per call to roll out to December, we think the proper decision from here is to sell our calls and leave our short position uncapped. Including the profit from our calls, our net short price (and thus our breakeven on the position) becomes $9.03 (9.5% above the current price). Once we sell our calls, we'll once again profit (or lose) one-to-one with Boulder's stock price.

Alternative Trades

- If you're more cautious, you can consider rolling your September $7.50 calls out to December, paying a net debit of about $0.50 (about 6% of the current share price) to do so. This caps your risk at $7.50 or higher, but reduces your profit if Boulder's stock declines from here.

A Perspective on Perspectives

Published Aug 31, 2015 at 3:27PM

Fellow Fools,

It seems that an essential part of being a kid is maintaining a list of favorites. In addition to a favorite color (blue), a favorite number (1,000), and a favorite food (cheeseburgers), my son also has a favorite animal. He's had a soft spot for lions ever since he was a toddler, and even though he's almost seven now, every time we go to the zoo we still make a beeline to the lion exhibit in hope of catching one of the beasts doing something other than napping. After spending years admiring these impressive creatures from a safe distance, I could see why so many Americans were outraged when they learned that a dentist from Minnesota had killed one of these majestic animals while hunting in Zimbabwe.

No Memo Next Week

Fools, next Monday is Labor Day, so we will not be publishing a Memo. Enjoy the day!

Shortly after the story trickled down to the local media outlets, *The New York Times* published an op-ed from a Zimbabwean-born doctoral student in molecular and cellular biosciences (say that three times fast): "In Zimbabwe, We Don't Cry for Lions." Though many Americans were quick to persecute the hunter for slaughtering a defenseless animal, it appears that you may interpret this news differently if you grew up in a place where lions roamed free and were known to occasionally enter your village and attack a relative or two. Go figure.

I've always found it interesting that two people can look at an event or a piece of information and come to vastly different conclusions, both convinced they are right beyond any doubt. This is true for investing, too: Individual perspectives aggregate to form a market, but each is framed by a unique life experience, and our biases are largely influenced by individual self-interest. That explains how every transaction involves a buyer and seller who are deriving a vastly different conclusion about the future prospects of a business from the same pool of information. These opposing forces are essential for price discovery, and a prerequisite for a properly functioning stock market.

The example of Cecil the lion may be a bit extreme, because it's so obviously influenced by geography and culture. But after the market turmoil we've experienced over the past few weeks, we're reminded that investors' behavior can be just as dramatically polarized. Here a few examples of hot topics -- including a few from our own *Pro* community -- where I've noticed varying perspectives determining how events are being interpreted.

On Oil Prices

When probed by analysts on where they think energy prices will be a year from now, **Core Laboratories** (NYSE: CLB) management likes to defer to "the law of physics and thermodynamics" when predicting a V-shaped recovery. To them, it's all about energy produced versus energy consumed when estimating future supply. But trying to determine how markets will interpret those variables to set prices is a bit more complicated.

Most people agree that an extended period of depressed oil prices is generally bad for highly leveraged oil exploration and production companies, deepwater drillers, and oil sands producers. In the longer term, this downturn will likely reward the conservative companies that didn't overextend during the boom and will thus be able to acquire distressed assets on the cheap. It will also force both the petroleum industry and the alternative energy providers to innovate and find novel ways to reduce production costs to remain economically viable.

The decline is also a drag on small towns in remote drilling areas, like North Dakota and West Texas, which benefited from the influx of petrodollars but have few economic alternatives to fall back on. By contrast, in Hawaii, electricity costs are normally more than three times the national average because about two-thirds of the state's energy comes from oil-fueled power plants. Thanks to the decline in oil, Hawaiians benefited from a 23% decrease in their electricity bills in June 2015 versus the previous year.

Cheaper gas prices result in more disposable income for consumers. They're also a boon for transportation companies and airlines including *Pro* holding **American Airlines** (NASDAQ: AAL), which count fuel among their highest costs. Though the U.S. is consuming less gasoline than in the past, a strengthening U.S. economy will likely take up more of the slack over time.

On Market Volatility

One of my favorite financial bloggers, Josh Brown, posted an insightful and timely missive on why the stock market has to go down the day before the market tanked last Monday.

> "The only reason stocks can go up is because they can also go down. It is this risk that keeps investors in check and that keeps people from paying an infinite amount of money for shares in a business. The reintroduction of risk, in the context of this summer's sell-off, is the best thing that could have possibly happened."

A steadily climbing market lulls investors into a false sense of security, convincing them to take more risk than they could otherwise stomach. Weeks like the one we just experienced are an important reminder of exactly how much risk you accepted when designing your portfolio. Volatility is scary. It's even scarier when you are in or near retirement, or you have under-saved, and you *need* the market to keep climbing to hit your number. On the other hand, investors who are still in the asset-accumulation phase are probably frustrated that the market bounced back before they could invest more capital.

On Managing Our Laggards

I've noticed a number of comments on the *Pro* discussion boards and during our live chats regarding what we should do to manage some of our underperforming positions. We spend a lot of time thinking about the construction of our portfolio and the correlation between individual assets. It would be difficult to say we had a diversified portfolio if everything were performing well at the same time. Back in May, Jeff turned a critical eye toward several of our "problem positions," but we're generally just as deliberate in making a decision to remove a position as we are when we decide to include it in the first place.

If I look at a portfolio and see no underperforming positions, I get worried. That usually means that either all of the holdings are benefiting from the same tailwind, or the portfolio isn't taking enough risk. Losing money on some positions is a necessary evil when trying to build a portfolio of uncorrelated assets.

The *Pro* Bottom Line

When I started penning this memo, I had hoped to simply point out some interesting contradictions without taking a side. But it was impossible not to allow my own biases to creep in – and I guess that's the point. The most difficult thing we can do as investors is to try to put our own biases aside and learn to appreciate the other side of the trade, whether we agree with it or not.

When discussing the challenges of successful investing, Charlie Munger once told Howard Marks, "It's not supposed to be easy. Anyone who finds it easy is stupid." The best we can do is to constantly test our assumptions, try to keep an open mind when new information presents itself, and do our best not to be "stupid."

Questions? Comments? Bring them to the Memo Musings board.

Yours in intelligence,

-- Jeremy (TMFTank)

Pro Catch-Up Trades: Aug. 31, 2015

Published Aug 31, 2015 at 3:18PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

Pro's Buy First stocks are worth adding to your long-term portfolio:

- **American Tower** (NYSE: AMT), 3.4% in stock and 0.5% in January 2017 $80 calls
- **Gentex** (NASDAQ: GNTX), 2.8% in stock and 1.5% by writing ("sell to open") December 2015 $15 puts
- **Gilead Sciences** (NASDAQ: GILD), 3.9% in stock
- **Oracle** (NYSE: ORCL), 3.7% in stock
- **Wells Fargo** (NYSE: WFC), 3.7% in stock

And then there's our airline investment, characteristically (of airlines in the past) deep in the red. But we're still believers in the value here. Members who lack a stake can take note of this recommendation:

- **American Airlines** (NASDAQ: AAL): Buy to open 0.5% in January 2017 $30, $32.50, or $35 calls, depending on how much you want to spend per call, and how much time value you want to pay.

China, Oil, Interest Rates -- and Calm

Published Aug 24, 2015 at 3:38PM

***Pro* Completed Trades**

- **Expeditors International** (NASDAQ: EXPD): We sold to open a November 2015 strangle, selling 10 November $46 puts and 10 November $50 calls for a $3 credit. Today you can get more! See our trade alert for details.

Dear *Pro* members:

It's days like this that show you what type of investor you are. Are you calm in the face of adversity? Do you remember why you invested in the first place, and does that help you stay the course? We certainly hope so. It does us. But let's survey the landscape.

What's Up?

Stocks were battered and fried last week, with the S&P 500 falling 5.8% and the Nasdaq sliding 6.8%. All major U.S. indexes are now down for the year, with the S&P down 4.3% year-to-date as of Friday. For several minutes this morning, panic selling ensued; the S&P 500 was down more than 5% at the market open, bringing it 12% below its recent peak. Soon, however, it began to claw back.

The prices we saw briefly after 9:30 a.m. point to the danger of using stop-loss orders or market orders (as many apparently did) to sell *any* of your stocks. Consider the horrible prices panic sellers obtained this morning compared with where these stocks are trading just hours later:

Company	**Low of the day**	**Recent Price (1:30pm)**
Apple (NASDAQ: AAPL)	$92	$107.35
Facebook (NASDAQ: FB)	$72	$85.35
Gilead (NASDAQ: GILD)	$86	$104.70
MasterCard (NYSE: MA)	$74.61	$90.47
Skyworks (NASDAQ: SWKS)	$70.87	$83.40
Visa (NYSE: V)	$60	$70.30

Note that four of these stocks had a low today that was an even number: $60, $72, $86, $92. Why? Very likely because people had stop-loss orders at those levels. In a panicked market, when buyers are few and far between, prices can slide so fast that your outrageously low stop-loss order can suddenly be hit -- and get filled. Ouch.

This morning's indiscriminate selling also suggests a lot of "hot money" and stocks bought on margin. Speculators wanted to get out, *or had to*, and prices reflect that. Now, don't lament that you didn't buy. Volatility may return, these prices lasted mere minutes, and some brokers weren't working anyway; many investors' hands were frozen by unresponsive websites.

But what does this volatility mean? What's happening?

First, some context to keep in mind: Stocks have gained so much ground over the past several years that some giveback is to be expected, just as we've been saying for years. That's no consolation to those starting to invest right now, though. The more important factor for them – and us – is the valuations we're paying today.

I don't know where the market will close today, but as of Friday, the S&P 500 traded at 16.7 times expected 2015 earnings; for the Dow Jones Industrial Average, that number was 14.9. Both valuations are in the middle of long-term historical averages. Further, as of Friday, the S&P 500 paid a 2.2% dividend -- more than the 10-year Treasury bond. Better, the earnings yield on stocks (which is the inverse of the P/E ratio) is a healthy 6%.

Looking across the investment landscape, stocks still appear to be the most attractive place for money you won't need in the coming three years or longer.

So why all the selling?

The truest answer is: Because it's natural. On average, the stock market falls at least 10% once every 11 months. Stocks may be the best-performing asset you can hold for the long term, but the price of that performance is volatility. If your head doesn't know that, or your stomach can't take it, then you'll likely miss the long-term benefits of ownership, because you'll sell at the worst time.

Recent selling may be random, but the media is offering us reasons if we want them, including the fall of stocks in China, lower oil prices, and the likelihood of an interest rate hike from the Fed. Let's talk about each.

China

The slide in China's Shanghai index has grabbed headlines, but its ascent from January to June went relatively unnoticed in the United States. Beginning the year around 3,200, the index hit 5,178 in June, and has since declined back to 3,200. Speculators have created this volatility. Now the concern is how the falling stock market will affect China's economy -- and we don't think it will do so with any real magnitude.

About 55% of U.S. households own stock, but only about 10% to 12% of households in China do. China is still a nation of savers with cash in the bank, so the decline in the stock market is not likely to affect consumer spending much. China's economy as a whole is a black box (how much is it really growing? Can we trust the government?), but it has enough tailwinds that odds favor continued GDP expansion, albeit at a slower pace.

A second point to keep in mind is that the Shanghai market is filled with speculators and new investors. Valuations on shares listed in Hong Kong, where institutional investors have long been ensconced, are much more reasonable than the prices seen on the Shanghai market. So, we shouldn't assume the volatile Shanghai market is an accurate reflection of the strength of China's economy. It isn't. Unfortunately, though, its volatility has spooked investors around the world.

Oil

Texas crude spilled below $40 per barrel last week, causing concern among investors who believe this suggests soft demand because of weakening economies. But it's unlikely that's the case. Demand for oil is still expected to grow to a record level in 2015 as economies expand. The imbalance is with supply. Thanks largely to U.S. innovation, the world is producing more oil than it needs, and the glut will likely persist well into next year. That reality – along with selling fueled by levered investment funds that *need* to unwind bullish oil positions – is likely to blame for driving oil prices lower, rather than much weaker economies. By the way, the market seems even more irrational when I see **American Airlines** (NASDAQ: AAL) stock getting clobbered even though oil, its chief cost, is tumbling.

Interest Rates

This is the bogeyman we imagine under the bed. Interest rates are currently so low that if the Fed increases them slowly by quarter-points, which seems likely, it could take *years* to get back to a historically healthy level of 3% to 4% (ideally a bit above inflation). A tiny increase in rates this year won't suddenly make stocks unattractive, and it won't derail the economy.

Once rates begin to increase and investors see that stocks are still the most attractive option out there, this bogeyman may start to fade. Higher rates are not likely to derail our slow-moving economy, either. Rates will go up so gradually that companies and consumers will have time to adjust and plan for them. If anything, the knowledge that rates are going up could drive more economic activity, driving people to buy homes or companies to finance investments before rates go higher still.

In Sum

This isn't to say all is rosy. Risk is ever-present in stocks if you view price volatility as risk (we typically don't). China could slow down enough to hit the whole world. Perhaps oil's fall *is* a precursor to much slower economic growth. And even a small rate hike might slow the U.S. economy. But I believe odds strongly favor the opposite in each case. China will grow over the next three years. Cheaper energy will help many other economies grow, too. And rate hikes will be slow and modest enough to keep the U.S. on a path of recovery. Against this backdrop, U.S. stocks are reasonably priced. They're not cheap, but they're not too dear, either, especially compared to alternatives. We expect price volatility. But we also expect to come out ahead on the other side of it.

We were preparing to buy some of the deals we saw this morning, but those prices disappeared in a flash. We're not concerned. Opportunities will reoccur. We're patient. We're also considering whether we want to short some indexes as additional hedges. But overall, we're happy with what we own. We don't use margin, and we always have a three-year outlook. Given those facts, today is like any other -- we're just more watchful for opportunities amid the volatility. To discuss, please visit the Memo Musings board.

Foolishly,

-- Jeff (TMFFischer)

Pro Catch-Up Trades: Aug. 24, 2015

Published Aug 24, 2015 at 3:30PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

- **American Tower** (NYSE: AMT)**:** If you've yet to match our allocation, invest up to 0.5% of your *Pro* funds in January 2017 $80 calls.
- **Medtronic** (NYSE: MDT): Buy up to 3% in stock if you lack exposure.
- **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY): Buy up to 1% in shares if you lack exposure.
- **TD Ameritrade** (NYSE: AMTD): Buy up to 2.7% in shares if you lack exposure.

What Happens Next?

Published Aug 24, 2015 at 11:00AM

Morgan Housel is Motley Fool One's expert on the intersection of investing, economics, and human nature. He studies the impact of big-picture issues on individual investors' lives — making us better Fools along the way.

There have been 4,559 weeks since 1928. Last week was the 434th worst for the stock market.

And there have been 22,793 trading days since 1928. Friday was the 249th worst.

As I write this Monday morning, stocks are about to open down big time.

It's not fun. I know so many investors who, during bull markets, say they can't wait for a pullback so they can buy cheaper shares. Then the pullback comes and they say, "You know what, this actually isn't fun. It hurts to see your net worth go down." In psychology, "prospect theory" is the idea that a loss hurts multiple times worse than a gain. It's real, and it's powerful. Investor Ben Carlson put it this way last night: "Stocks rose more than 400% in the 1980s, but all anyone remembers is the crash of 1987."

But if you look at those stats I provided above, you can only come to one conclusion: **This stuff happens.**

As bad as last week was, it didn't even crack the top 10% of weeks since 1928. And keep in mind, the market has risen 3,500-fold since 1928, or the equivalent of turning a $20 bill into a BMW.

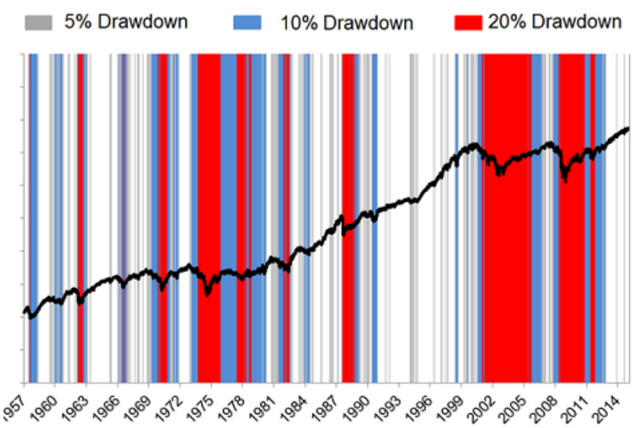
You've heard the standard advice: Don't panic. This is normal. Stick to your plan. Think long term. Maybe start looking for bargains, as a lot of us are.

But when this stuff happens I also wonder: What happens next?

Statistically, I mean. On average. Because no one knows exactly what happens next.

Here's What History Says

This chart, made by my friend Michael Batnick, shows when the S&P 500 has been down 5% from its all-time high (gray), down 10% from the high (blue) and down 20% from the high (red):



Crunch all the data in this chart, and you'll see that the market is at an all-time high just 7% of the time. And ...

- It's between **0% and 5%** below its all-time high **36%** of the time.
- **5% to 10%** below its all-time high **15%** of the time. This is where we are now
- **10% to 20%** below the all-time high **22%** of the time.
- **20%** or more below the high **21%** of the time.

In other words, the market is where we are today or lower from its previous all-time high about half the time. And again, that's during a period when the market made millionaires out of modest savers.

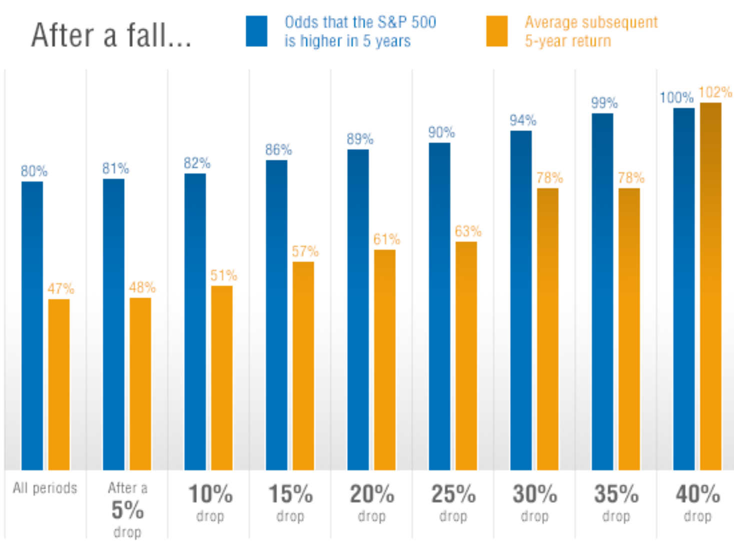
Some more numbers for you: Historically, about one-third of 5% declines go on to become 10% declines. And about half of 10% declines go on to become 20%+ declines.

So, think about that. **Stocks are down about 10% from their all-time high. Historically, half the time this happens they fall another 10% or more.**

Now for the Good News

Everything about successful investing comes back to one thing: The long run.

Earlier this year, I looked at the five years *after* the market drops by a lot. Here's what I found:



After a 10% drop, stocks are higher five years later 86% of the time. The average return during that period is 51%, which is great. If the market were to fall 20% from its all-time high, historically it's been higher five years later 89% of the time. There are no sure things in investing, but that is darn close.

I heard a smart person on TV last week say something along the lines of, "With markets falling, it's time to be careful."

Really? That kind of thinking is exactly why most people fail at investing. The time to be careful is when everything is going well. That's when you create a long-term plan that helps you endure through volatility.

The most important thing to remember right now is that today's pain plants the seeds for tomorrow's gains. That's always the case in investing. The reason the market has done so well over the last six years is specifically because we had a terrible bear market in 2008. The pain of last week sets us up for higher, and more probable, future returns. It could easily get worst from here. But the worse it gets, the higher the odds of future success. That's why I shake my head at comments like that on TV. The last thing you want to be is be ambitious last Monday and careful today.

The lines outside Chipotle are still long. The willingness to pay $5 for Starbucks coffee is still strong. The engineers at Tesla are still geniuses. When I think about "what next?" that's what I think about. It's what ultimately matters most, and what you'll remember most when looking back at your investments years from now.

Nick Murray, one of my favorite investment writers, once wrote:

> $6,200,000,000
>
> Yes, that's right, it's six billion two hundred million dollars. A very large sum of money, wouldn't you say? Now what, you ask, does it represent?
>
> It is roughly how much Warren Buffett's personal shareholdings in his Berkshire Hathaway, declined in value between July 17 and August 31, 1998. And now for the six billion dollar question. During those forty-five days, *how much money did Warren Buffett lose in the stock market?* The answer is, of course, that he didn't lose anything.
>
> Why? That's simple: he didn't sell.

Write Puts on Gentex

Published Aug 21, 2015 at 12:02PM

Is this for you? Since we're looking to add 1.5% to our stake in this company, this alert should be applicable (now or perhaps later) to all *Pro* members, whether you already own shares of **Gentex** (NASDAQ: GNTX) or not.

How You Participate

- **Trade:** Sell to open December 2015 $15 puts.
- **Allocation:** 1.5% — write one put for every $100,000 you manage; *Pro* will write 25 contracts. In addition to our current 2.7% stock holding, this would bring our total allocation to about 4.2%.
- **Price Guidance:**
  - **Now:** Use a **limit order** to target $0.85 or greater to start (for a 5.7% effective yield in 120 days). **If we all use limit orders** and the stock price cooperates, we should be able to achieve $0.85 today. Due to the wide bid/ask spread, if our volume starts to affect pricing, accept no less than $0.80 per put today, **but start with a limit order of $0.85 at first**.
  - **Later:** As prices and time to expiration change, those approaching the position should aim to get paid a yield on time value of at least 1% or so per month to expiration.
- **Prices (as of market open Aug. 21):** Stock, $15.14; options, $0.65 bid / $1.15 ask. Guidance: $0.85. Current prices.
- **Stock Rating:** Buy First, 2.7% allocation; now we're adding 1.5% in additional exposure through these new puts.

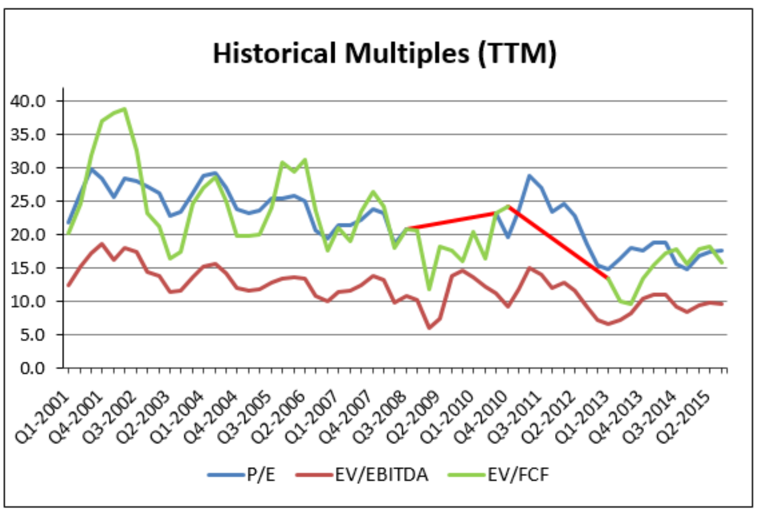
What We're Thinking

After our first round of put writing on Gentex expired fully as income in March, we've been patiently assessing the company's earnings reports and waiting for a good opportunity to revisit the strategy. Given the recent market volatility (which increases option premiums) and the fact that Gentex stock is down 19% from its year-to-date high of $18.80 on March 23, we think now is a favorable time to reestablish our written put position, targeting both income and the opportunity to buy shares at a lower price.

Since our first puts in January (just more than two quarters ago), Gentex's quarterly revenue has increased by 8.3%, its operating income has increased by 9.1%, and it has raised its dividend by 6.3%. And yet, because of valuation-multiple compression since then, we're now able to target an effective buy price on this particular iteration of written puts of $14.15, 15% below the effective buy price targeted in our first round of puts, and 21% below our recently updated fair-value estimate of $18 per share.

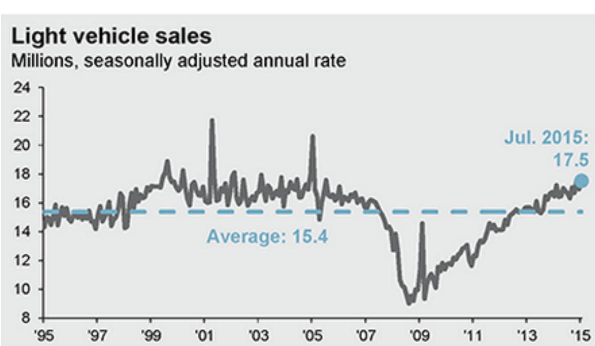
Although the company is historically cheap right now, and though we like its long-term prospects, as we mentioned in our **Live Nation** (NYSE: LYV) write-up, our current long exposure leaves us wanting to be a bit more defensive with our income-generating positions. With the income for this iteration of the strategy at $0.85, we'll have brought in a total of $1.49 per share with our two written puts on Gentex this year, giving us an effective start price of $13.51. (Your mileage may vary depending on how much you collected in the first go-round and your tax situation.) This is about 11% lower than the current level, and 25% lower than our fair-value estimate; we'd happily buy shares for this price.

With an effective buy price on the overall strategy of $13.51, we'd be buying shares at 13.6 times trailing-12-month (TTM) earnings, 7.3 times TTM EBITDA, and 13.1 times TTM FCF, at the low end of historical ranges in the company's past 15 years, including the 2008-2009 period when auto sales plunged and several automakers looked like they might go bankrupt:



Note: Red lines represent omitted outlier multiples that correspond to recession-depressed earnings and cash flow.

And when we compare today's auto market environment to the recessionary environment, it makes those multiples all the more attractive:



Source: JP Morgan Market Insights-3Q 2015 Guide to the Markets®

More That Matters

- **Maximum loss:** For this iteration of the put strategy alone, our risk is the same as share ownership starting at about $14.15, or 6.5% less than the recent price.

- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At a minimum of $0.80 (but again, use a limit of $0.85 to start!), that's a 5.3% effective yield in 120 days.
- **Follow-up:** Including the premiums from our previous put write, we'll buy shares at a net $13.51 if the stock is below our $15 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 2.7% allocation first — Gentex's shares are a Buy First. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1.5% of your portfolio, then just buy 1.5% in stock directly *if and when Pro* does so through these puts (we'll alert you if and when we do).
- **Write other puts?** Consider writing March 2016 $15 puts if the price on those options holds up better than the December puts after this alert is issued. Right now, the bid/ask on the March 2016 puts is $1.10/$1.60, good for a 8.7% effective yield in just more than seven months.

Pro Can Help

- See our Options U guide to writing puts if you want more on this strategy.
- Check your mirrors and switch lanes over to the Gentex discussion board.

Write a New Covered Strangle on Expeditors International

Published Aug 20, 2015 at 2:45PM

Is this for you? This is for *Pro* members who are following our option writing for income on **Expeditors International** (NASDAQ: EXPD), and, like us, have August options reaching expiration tomorrow (Friday). But please read the note below, as there are timely and, uh, "conditional" conditions.

How You Participate

Conditional Note: With the stock lately at $49.80, our August 2015 $46 puts and $50 calls are due to expire as full income after Friday. This is a good thing, and it means we don't need to touch these options *unless* the stock rises above $50 on Friday. You have two potential approaches, and we're sending this alert today so you're prepared no matter which you choose.

1. You can buy to close your August $50 calls today for a small sum (currently $0.15), and write the new strangle detailed below. You'd do this if you wanted to remove any chance that the stock could drift above $50 tomorrow and surprise you. Only write the new strangle after you're certain your August $50 calls are closed.
2. You can wait and see whether Expeditors stock stays below $50 tomorrow, letting your whole strangle expire for full income if it does. (You'll save some money by not buying back your calls!) Then, write the new strangle late tomorrow or Monday after expiration becomes certain. Alternately, if EXPD is above $50 tomorrow, you can close the August $50 calls and then write the new strangle (again, only after you're certain they've been closed).

Pro must wait 24 hours, so we'll be acting as necessary on Friday afternoon.

- **Action:** As the circumstances play out, use a strangle order to simultaneously sell to open November 2015 $46 puts, and sell to open November 2015 $50 calls.
- **Allocation:** Sell one strangle (one of each option) for every 100 shares of exposure you have to the company. We have 1,000-share exposure through 10 contracts of a synthetic long, so we're selling 10 puts and 10 calls, as we've done before -- this potentially doubles our exposure to a full 3.5% allocation.
- **Prices:**
  - **Stock:** $49.80
  - **Options:**
    - November 2015 $46 puts (bid/ask): $0.90/$1.00
    - November 2015 $50 calls (bid/ask): $2.15/$2.25
    - Combined bid/ask: $3.05/$3.25
- **Price Guidance:** Split the bid/ask, aiming for a **combined credit of $3.10** or higher to sell the strangle. If we all use **limit orders**, then $3.10 should hold for Day One. As prices change, aim to get paid at least 4.5% of the current share price to write the strangle, lately about $2.25, targeting at least 1.5% in yield on share price per month to expiration.

What We're Thinking

Our global logistics buddy Expeditors International reported healthy earnings last quarter, with ocean and air freight volume up 5% and 9% respectively, leading to a 6% increase in revenue. Further, the company was able to contain costs, so operating income rose 28%, its strongest year-over-year gain in years. Share repurchases helped earnings per share to rise 33%.

Fortunately, our August strangle provided enough headroom for upside in the stock following these results; shares hit a new high early today even as the market faces headwinds, necessitating this potential "roll trade" before our options expire. Whether or not we'll need to close our August $50 calls tomorrow, though, we're sitting pretty and about to earn most of our August income. And because this is an income position, we're ready to write new options again.

Why This Strategy?

Since since starting this position in August 2014 (assuming our options expire tomorrow), we will have earned about $5,000 in income so far, and we have unrealized gains of more than $8,600 on our synthetic long. That amounts to more than $13,600 in realized and unrealized gains on the less than $600 in capital we deployed to start this position last Aug. 15.

So, our "income with upside" objective that leverages our capital is playing out well. In fact, it's worth pointing out today that we would use a higher strike than $50 for our November covered calls if possible, *but* the next strike price available is $55 and pays little, so we're all but forced to write calls with a strike near the current share price to continue our income objective. (And that's the case even though Expeditors is doing well.) This is fine -- we're content to be more defensive with $50 covered calls.

More That Matters

- **Maximum loss:** The same as owning at least 200 shares of stock (100 now, and 100 at $46), minus the option premiums received.

- **Maximum gain:** This new strangle caps our upside at $50, plus the premium received, which means $53.10 per share. The most we can make on this strangle alone is the $3.10 in premium, which is earned if the stock stays anywhere between $46 and $50 by expiration.
- **Breakeven**: Our existing synthetic long mirrors stock ownership that started at about $40.60, while this new short strangle in isolation has breakeven points at $42.90 and $53.10, giving us a nice range.
- **Follow-up:** The current plan is to continue writing strangles to earn income, and roll our existing strangle up or down if need be. By January 2016, we'll decide whether to turn our synthetic long into stock or roll it forward, too.

Alternative Trades

- **IRA-friendly/covered calls:** If you simply bought shares of stock earlier and wrote August 2015 $50 calls, you can follow the same guidance in this alert, closing the calls if necessary tomorrow and writing the new November 2015 $50 calls (ideally for at least $2.15, although that price will change if the stock moves). Accept the going price in that case. Finally, if the stock rises above $50 by Friday, we believe you should roll your calls, rather than lose your shares -- hence today's report. Those wanting to avoid any excitement tomorrow can simply close the August $50 calls today, lately for about $0.15 -- or use a rolling order to close them and write the new November $50 calls, resulting in a net credit of about $2.

Pro Can Help

- **Want more on this strategy?** See our guides to covered strangles and synthetic longs. We're combining the two into a synthetic covered strangle.
- **Questions?** Please ask, Fools! Ship yourself on over to our Expeditors board.

Another Pleasant Quarter at AmTrust

Published Aug 20, 2015 at 1:32PM

Pro's favorite insurance provider, **AmTrust** (NASDAQ: AFSI), showed us yet another strong quarter earlier this month. AmTrust continues to acquire business lines that management believes are mispriced, and until the market starts to harden, we can continue to expect full steam ahead. As an added bonus, shareholders also learned that the company will be increasing its quarterly common stock dividend by 20%.

AmTrust Financial Services Q2 2015

Consolidated Results

		change
Gross written premium	$1.68 billion	16%
Percetnage retained	60.1%	-390 bps
Net earned premium	$969 million	11%
Operating diluted EPS	$0.84	-37%

Insurance ratios	
Loss ratio	65.9%
Expense ratio	24.6%
Combined ratio	90.5%

GAAP rolling returns	
ROE	21.6%
ROA	2.5%

Segment Results

- **Guidance**: Buy
- **Recommended allocation**: Veterans have 8%; for newcomers, start with 3.5%, then look to opportunistically increase your position size over time.
- **Fair-value estimate**: $52

Segment Results

Segment Insurance Ratios

		Second Quarter 2015	Second Quarter 2014
Small commercial	Loss ratio	65.1%	66.7%
	Expense ratio	25.8%	25.6%
	Combined ratio	90.9%	92.3%
Specialty risk and extended warranty	Loss ratio	65.3%	67.1%
	Expense ratio	20.2%	19.8%
	Combined ratio	85.5%	86.9%
Specialty program	Loss ratio	68.7%	68.1%
	Expense ratio	28.1%	27.2%
	Combined ratio	96.8%	95.3%

Small Commercial Business (SCB)

Gross written premium for AmTrust's biggest segment increased by 24.3%, or $171.2 million, to $875.8 million this quarter. Workers' compensation accounted for the majority of this growth as the company's policy count increased by 45.1%. And AmTrust continues to target the states where it has the largest presence -- workers' comp policies in California, Florida, New Jersey, and New York made up 63% of the growth in this division. Pricing still supports expansion given that it remains somewhat favorable (prices are up 7.4% in California and 3.7% in New York year-to-date), but competition is heating up in some spaces. This was the reason the company's average policy size decreased by 16.1% this quarter. Call us crazy, but we were actually happy to see this happen. One of the most important things we look for when analyzing an insurer is discipline, and it appears AmTrust is exhibiting exactly that with its refusal to engage in a pricing war for its larger accounts -- even if that means they go to a competitor.

Net written and earned premiums increased by 14.2% and 24.9%, respectively. Net written premiums were lower than gross primarily because the company passed on a greater percentage of the latter to reinsurers during the quarter. But because the premiums are earned (recognized on the income statement) over the life of the policy, net earned premium growth still hit the mid-20-percent range. Net earned premiums also got a bump thanks to the cut-through reinsurance agreement with Tower Group International, because it was not subject to the company's quota share agreement with **Maiden Holdings** (Nasdaq: MHLD). (In this agreement, AmTrust passes through a percentage of the the premium written by its U.S., Irish, and U.K. insurance companies, as well as the corresponding losses.)

Specialty Risk and Extended Warranty (SREW)

Gross written premium actually decreased 4.7% ($23.7 million) this quarter, to $479.9 million, as a strong dollar continues to hurt this segment -- 68.8% of gross written premium was generated outside the U.S. this quarter. Net written and net earned premiums decreased by 4.3% and 11.7%, respectively. Overall retention was essentially unchanged this quarter, but net earned premiums fell by a greater percentage because the company is now writing policies with longer tails.

Specialty Program (SP)

Gross written premium for this division was up 37.1% ($87.3 million) this quarter, to $322.7 million. Workers' comp tends to account for about 30% of the SP segment's business, so many of the catalysts behind the strong growth in the SCB division were in play here as well. Also similar to SCB: The premium retention ratio decreased by 650 basis points, as a greater percentage of SP's business is now covered by the quota share agreement with Maiden. So net written and net earned premium growth, both with growth of 23%, trailed gross written premium this quarter. The company is continuing to push for rate increases in this segment, and it's restricting its underwriting guidelines in an attempt to improve the quality of the business even more.

Services and Fees; Investments

Service and fee income growth continues to be steady. The segment was up by 8.2% ($8.2 million) this quarter, as recent acquisitions and increased fees from certain customers helped to offset a $2.7 million decline in fees from business associated with SREW. The company's investment portfolio has grown by more than 330% since 2010, as it's gone from a small insurer to a behemoth that has underwritten $6.4 billion over the past 12 months. Underwriting still accounts for the majority of AmTrust's profits, but as with most large insurers, the bigger the company gets, the more important the fees-and-investments side becomes. Investment income was up 11.3% ($3.7 million) this quarter to $36.3 million, primarily because of an increase in fixed-income investments; this came about in part because the company invested a portion of the proceeds from its recent stock offerings (both common and preferred), as well as from recent acquisitions.

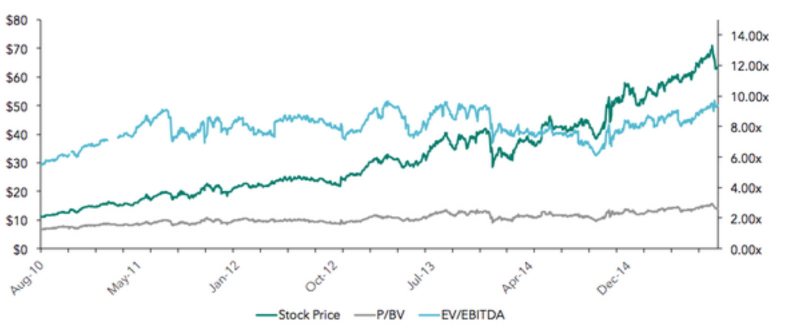
Pro's Take

AmTrust's low tax rate for the quarter (effectively 5.2%) ensured a strong beat on the bottom line, but there were plenty of other things to like. Currency exchange losses were the primary culprit behind the decline in net income (a $47.3 million loss this quarter versus a $1.1 million gain in Q2 of 2014), but loss trends continue to be encouraging while growth and profitability remain robust. But given the cyclicality of AmTrust's market, these results don't come as a complete surprise. This cyclicality is why we were pleased to hear that the company is willingly shedding some of its larger accounts rather than slash prices. Competition is clearly heating up, but who knows when the market will finally harden. So it's nice to see the company taking pre-emptive measures instead of trying to play the market-timing game. In particular, I liked this comment from CEO Barry Zyskind:

> And the other phenomenon is when the market is a rising market and there are not a lot of players in there, besides us writing our small workers' comp, we'll see bigger workers' comp. So let's say we have a real expertise in restaurants. We'll see big chains, restaurant chains, and so we'll have bigger premiums. When the market becomes more competitive ... we're seeing very good growth in policy counts, but actually those bigger accounts [are] what the market's chasing.
>
> So what we tend to do in this market is ... just hunker down and really focus on the small, low-hazard [policies] , and we don't worry about the big chains. We let everyone else ... fight it out on the bigger stuff. So, for example, two years ago there was an opportunity to do workers' comp, which we've done for many years, in auto dealerships, and we had a nice book of business. And came January 1, some markets came in and became very, very aggressive about pricing. We basically got rid of all that business -- not on purpose, we put our price out, but the market was way below [it]. And instead we're making it up with what we do very well, the smaller stuff.

But even though AmTrust is deliberately letting some business go, it has issued both equity (common and preferred stock) and debt in the past year. So we expect that the company will make multiple new acquisitions before the year is out, out even though it's already made nine year-to-date.

Over the past year, the S&P 500 is up about 4.5%. But AmTrust's stock has been on an absolute tear, having risen almost 50%. Though operational performance has been a big driver, the stock is not immune to the multiple expansion that has permeated the market.



Going forward, we'll continue to watch AmTrust's insurance ratios closely -- the loss ratio to see how underwriting is going, and the expense ratio to get insight into the integration of acquisitions as well as organic expansion efforts. But we continue to believe that the future is bright for this opportunistic niche investor, and that shareholders with an appropriate long-term mind-set will be rewarded with North Star-challenging returns, even at the current price.

Catching Up With 3 More Pro Companies

Published Aug 17, 2015 at 2:55PM

Dear *Pro* Fools,

After a deluge of company updates from Jeff last week, I've got another earnings recap Memo for you on three companies that reported within the last two weeks: **Broadridge** (NYSE: BR), **Parexel** (NASDAQ: PRXL), and **Papa John's** (NASDAQ: PZZA). If you're not in the mood to dive deep into the nitty-gritty details, check out the **bolded information** in each company's write-up — or skip to the end of the Memo!

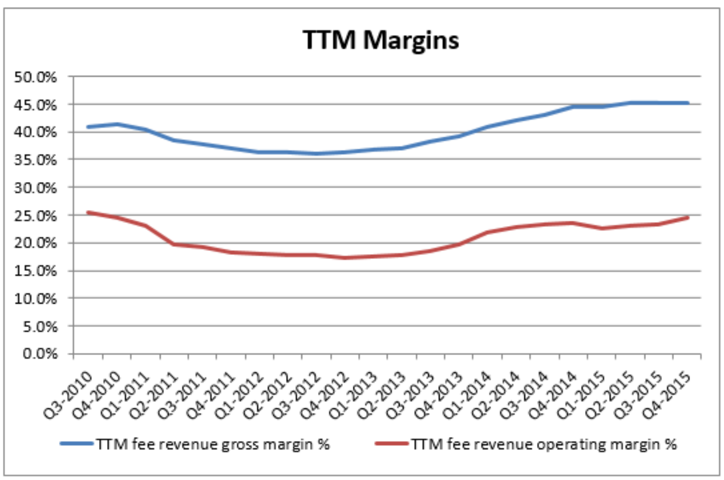
Broadridge®

Our leading provider of investor communications and financial industry technology solutions closed fiscal 2015 in its usual steady manner, posting record full-year recurring revenue closed sales (RRCS) of $146 million (up 15% year-over-year). RRCS represents anticipated annual revenue for new client contracts signed during the period, and that revenue must be recognized over time, rather than all at once right away. As such, Broadridge's reported revenue grew at a slower pace, up 5% year over year.

Once Broadridge's customers are on board, high switching costs discourage them from changing providers; revenue recurs at stratospheric rates of about 98%. Thus, RRCS is one of Broadridge's most important metrics, and tracking it gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

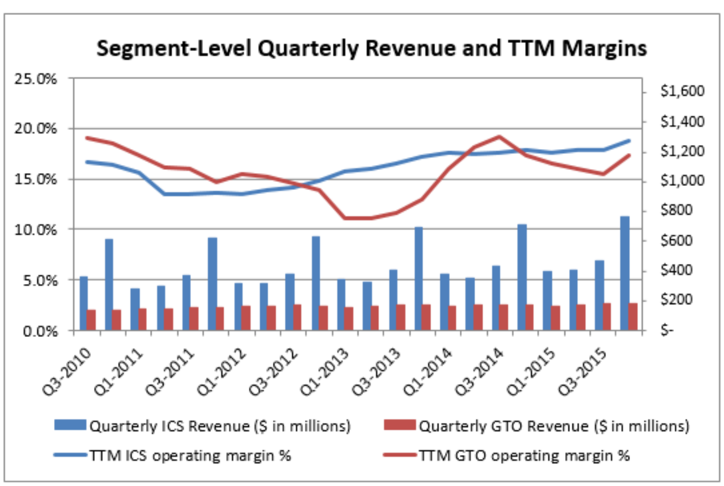
RRCS showed strong growth in fiscal 2015, demonstrating Broadridge's strong value proposition for its financial-industry clients, which include banks, broker-dealers, mutual funds, and corporate issuers. Additionally, RRCS was atypically stable this year, with no quarter accounting for more than 33% of the total for this year, and fiscal Q2 (calendar Q4) was the strongest sales quarter of the year. This is in contrast to the past three years, where fiscal Q4 (calendar Q2) accounted for an average of 46% of full-year RRCS. At the beginning of the year, management guided to $110 million-$150 million in RRCS, and the company was able to tip the scales at the very high end of that range.

Despite foreign currency headwinds, gross margin for trailing-12-month (TTM) fee revenue was up 70 basis points to 45.3%, and operating margin rose 89 basis points to 24.5% compared with the year-ago TTM period. Because Broadridge is a seasonal business — activity spikes in the company's fiscal fourth quarter as clients file proxy materials and annual reports — we prefer to look at TTM margins to smooth out quarterly fluctuations. These margins are the highest in the company's history, demonstrating the scalability of the company's capital-light business model:



Note: These figures exclude pass-through distribution revenue and costs, providing a clearer picture of the true profitability of the business. As such they are different than the margins reported in the press releases.

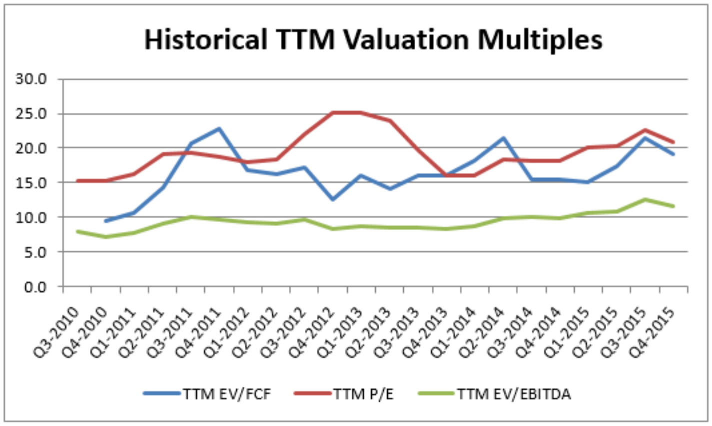
When looking at each individual segment — Investor Communications Solutions (ICS) and Global Technology Operations (GTO) — margins show a similar, albeit lumpier trend. This graph does a good job showing Broadridge's seasonality (note that it shows *quarterly* revenue compared to *TTM* margins):

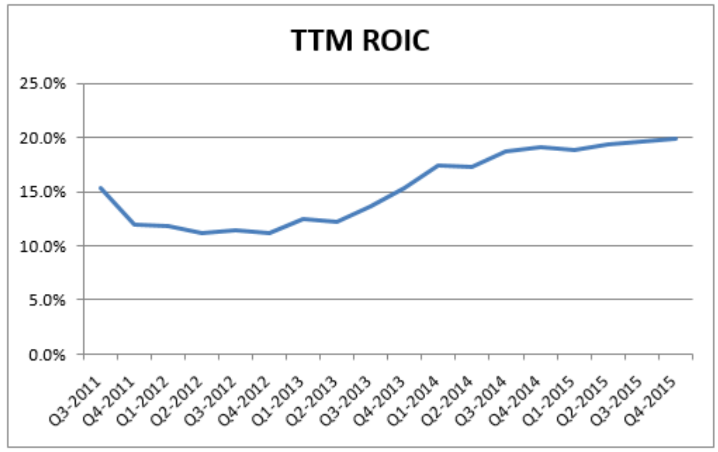


After incorporating fiscal 2015 results and the company's newly updated forward three-year objectives into my model, **we're increasing Broadridge's fair value estimate from $49 to $54**. Broadridge continues to benefit from a trend toward increased regulatory compliance and digital communication, and management's capital-allocation skills and investments in growth should lead to stronger sales performance and reinforced competitive advantages over time. The company has an excellent acquisition track record (a 20%-plus IRR) and in fiscal 2015 alone, the company spent over $200 million on four acquisitions (Direxxis, Wilmington Trust, Lipper's Fiduciary

Services and Competitive Intelligence Unit, and TwoFour Systems), which helps to augment the company's current product and service offerings. With more growth levers and cross-selling opportunities than ever before, Broadridge is very well positioned to meet the goals it outlined in its December 2014 Investor and Analyst Day presentation (see slide 87), which, if achieved, would lead to North Star-like stock price returns.

Although the company is trading at the mid-to-high end of historical valuation ranges at 24 times P/E, 12 times EV/EBITDA, and 20 times EV/FCF, the company boasts a historically high ROIC to show for it:



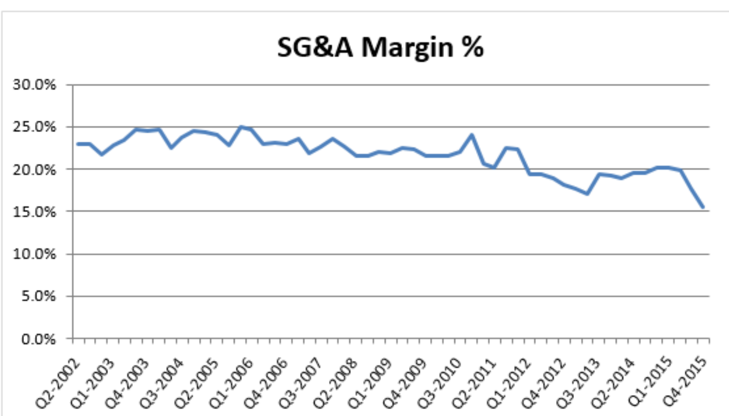


2016 guidance implies a forward multiple range in the vicinity of 20 times on a P/E basis and 17.6 times to 20 times on an EV/FCF basis. This high-quality business deserves to trade at premium multiples, and **Broadridge remains a high-conviction Buy on our scorecard. Now is as good a time as any to establish a position or fill out your allocation**.

PAREXEL

After pre-announcing a restructuring program and reduced guidance a little over a month ago, Parexel reported a typically lumpy quarter in fiscal Q4 2015. For the quarter, the company reported slowing growth in service revenue (2.4% vs. 10.2% in the same period a year ago), declining gross and operating margins (31.2% and 7.5%, respectively, vs. 35.7% and 11.5% a year ago), and a 12.8% decline in EPS.

But despite the ugly headline numbers, the underlying trends in the business are actually pretty healthy. The decline in operating margin has a lot to do with the $20 million of restructuring charges related to the company's "Margin Acceleration Program," and we got a sense of the type of cost savings we might expect once those charges (mostly employee separation benefits) are off the books. Thanks to a more streamlined organizational structure, SG&A expenses as a percent of service revenue (lower is better) declined sharply to 15.5%, the lowest it's been since as far back as I have data on the company. This ongoing expense reduction should ultimately result in higher margins over the long term:



As for gross margin, it's mostly mix- and timing-related, as the company continues to grow its headcount ahead of an expected ramp-up in revenue starting in fiscal 2016. Much like Broadridge, Parexel often books more revenue than it recognizes in a given quarter due to revenue recognition requirements. For example, in each quarter in fiscal 2015, Parexel reported higher growth in net new business wins (gross bookings minus cancellations) than growth in reported revenue:

	Q1-2015	Q2-2015	Q3-2015	Q4-2015
Reported service revenue growth (Y-o-Y)	9.4%	2.5%	2.0%	2.4%
Net new business growth (Y-o-Y)	9.7%	17.2%	13.9%	5.4%

As such, the company's net book-to-bill ratio remains at a healthy 1.19, suggesting that reported revenue should ultimately start to converge with new-business win growth as project revenue recognition milestones are met throughout fiscal 2016.

All indications suggest that we should see improved revenue growth and expanded margins in fiscal 2016 and beyond. But we may need to be patient; the company expects to pay further restructuring charges, and new employee productivity continues to ramp up. Still, underlying sales data and a biopharma industry tailwind toward increased clinical research and development outsourcing seem to point toward a brighter future for Parexel. We'll be watching to make sure that the company achieves its revenue ramp-up as expected in fiscal 2016.

We're increasing Parexel's fair value estimate from $61 to $63. Based on Friday's closing price around $68 per share, recent prices are a reasonable entry point for new investors or those who wish to fill out their allocation (or you could consider writing puts to buy shares a bit cheaper). The stock should continue to challenge the North Star, so long as Parexel can deliver on our expectations for 7% to 12% revenue growth and moderate margin expansion over the next three to five years.

PIZZA PAPA JOHN'S

Papa John's delivered yet another strong quarter in Q2 2015, with North American restaurants increasing comps by 5.5% and international restaurants increasing comps 6.8% (in constant currency). Global restaurant sales growth (which includes new restaurant units) came in at a solid 8.8%, although total revenue growth was a bit weaker (at 4.8%) in part because of a sharp drop in cheese block prices compared to a year ago (PJ's sells cheese to its franchisees — when cheese prices decline, the fixed-markup franchisee cheese sales decline in proportion). Due to strong international comps performance over the first six months of the year, management raised international comps guidance from a midpoint of 6% to 7% for full year 2015, on top of raising the midpoint of its domestic comps guidance from 3% to 4% last quarter.

Despite the strong comps and sales performance, earnings per share fell 33% year over year predominantly due to a $12.3 million legal settlement expense relating to the collective and class action lawsuit, *Perrin v. Papa John's International, and Papa John's USA*, which alleged delivery drivers were not reimbursed in accordance with the Fair Labor Standards Act. Adjusting for the non-recurring legal settlement expense, EPS grew 22.5% year over year.

Limited-time offers (including new menu additions Garlic Knots, Cinnamon Knots, and Papa's Lighter Choices), effective marketing, and continued migration to digital ordering (which garners higher average tickets and now makes up more than 50% of total sales) helped drive comps higher. These growth rates continue to suggest market-share gains at the expense of pizza industry rivals as Papa John's strong digital offerings and laser focus on quality continue to resonate with consumers.

The American Customer Satisfaction Index recently released its 2015 rankings for pizza chains, and for the 14th time in 16 years, Papa John's was awarded the top spot (tying with Pizza Hut):

ACSI Customer Satisfaction Scores

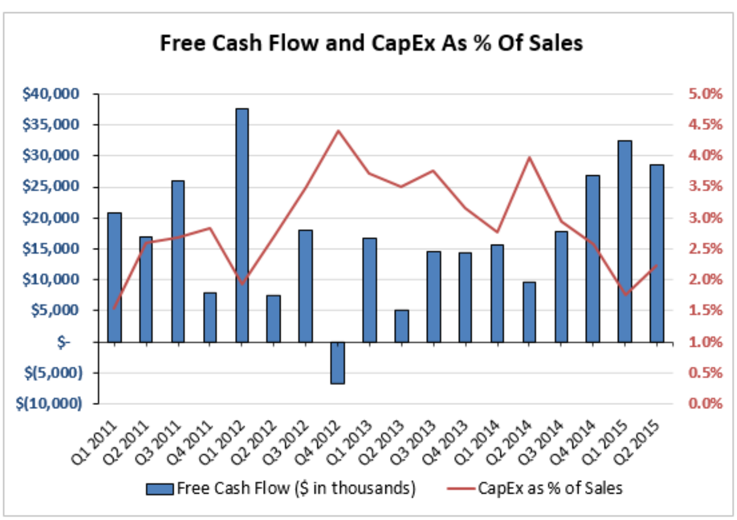
Gap	7.7	7.7	6.7	3.0	1.0	3.5	6.0	3.0	3.0	0.7	(0.3)	2.3	(0.3)	4.0	1.0	1.3	2.3

Note: 2004 wasn't reported due to a change in measurement, so for continuity, the years 2003 and 2005 are averaged to obtain a 2004 data point.

Additionally, now that the company's FOCUS point-of-sale system rollout is essentially complete and cheese and meat prices have moderated, the company's margins are starting to improve, as we anticipated. The company's operating margin came in at 7.8% (vs. 7.1% in the same period a year ago), and free cash flow margin came in at 7.2% (vs. 3.5% a year ago), even despite unusually high G&A expenses in the period. Margins are likely to continue to increase as we approach the back half of 2015.

Trailing-12-month (TTM) free cash flow came in at $105 million, the highest since I've been covering the company, although this figure is bound to decrease a bit over the next year due to the legal settlement payment (despite recording the hit to earnings, the company hasn't paid the settlement yet and expects to do so within the next 12 months). As we can see, elevated capital spending (visualized as "CapEx as % of Sales") has moderated and free cash flow is higher because of it (note: this graph shows *quarterly* free cash flow rather than *trailing 12 months*):



Due to the higher free cash flow, the company now trades at about 30 times EV/FCF, which is lower relative to 2013 and early 2014 when it was often trading in the 40 to 50 range amid its FOCUS rollout and elevated spending. On an EV/EBITDA basis, the company is trading around 18.6, at the high end of historical ranges (which, alongside increased profits, helps explain why PJ's stock has appreciated over 80% in the past year). Neither EV/FCF nor EV/EBITDA are affected by the legal settlement expense, and as such the P/E ratio jumped higher to 36, due to depressed earnings because of that settlement expense. For context, fellow international franchisors **Domino's** (NYSE: DPZ) and **Dunkin' Brands** (NASDAQ: DNKN) trade around 40 times EV/FCF and 19.4 times EV/EBITDA, and 38 times EV/FCF and 17.7 times EV/EBITDA, respectively.

As the company has continued to trade higher, expectations have remained high, and that alongside the substantial legal settlement expense probably contributed to the stock declining more 5% on the day of its earnings release. After incorporating this quarter's results into my model, **we're increasing Papa John's fair value estimate from $54 to $57.50**, but at over $72 per share as of this writing, the stock is more than 25% above our conservative point estimate. Papa John's continues to post comps performance well in excess of what I've modeled (my base case assumes 3.5% annually over the next 10 years), and even as I've accounted for a higher likelihood of the bull case, the stock price continues to race ahead of my valuation estimates.

Nonetheless, if PJ's can continue to consistently churn out mid-to-high single digit comps growth, paying up for (and holding) the stock may be justified. **Papa John's remains a Buy at current prices, with a partial allocation of October 2015 $65 covered calls** that would see us sell one-third of our stake at a net $68.40 if the share price is above $65 at expiration. As expiration approaches, depending on the share price at the time, we'll consider either rolling our calls or letting them be assigned. Members who have yet to sell calls can still match us with $65 calls if they desire (achieving a higher net sell price), or they can sell higher-strike calls if they want to give their position more breathing room for upside. Of course, don't sell calls if you're not comfortable selling the shares you cover.

The *Pro* Bottom Line

Each of these three companies remains a Buy on our scorecard, with fair value estimates and allocations as follows:

- **Broadridge:** FV estimate increases to $54 (from $49), 4.6% allocation
- **Parexel:** FV estimate increases to $63 (from $61), 3.4% allocation
- **Papa John's:** FV estimate increases to $57.50 (from $54), 5% allocation plus a one-third allocation of October 2015 $65 covered calls

Despite the currently volatile market environment, we maintain our long-term view and believe that each company will be able to deliver North Star-beating returns (lately around 8% to 9% annualized) over the next rolling three-year period.

Boulder Brands Stock Spikes on Buyout Hopes

Published Aug 14, 2015 at 10:28AM

What Happened?

After announcing the resignation of its CEO and preannouncing lowered guidance, **Boulder Brands** (NASDAQ: BDBD) reported an awful quarter that even underperformed its own recently lowered estimates. Despite guiding to net sales in the quarter of $122-$124 million and adjusted EBITDA of $12-$14 million less than two months ago, the company reported sales of $118 million (-10.4% year-over-year) and adjusted EBITDA of $11.7 million (-33.5% year-over-year). The company guided to a 0%-2% year-over-year increase in sales in the Natural segment and 16%-18% year-over-year decrease in sales in the Balance segment, but delivered a decline of -2% in the Natural segment and a decline of -24% in the Balance segment.

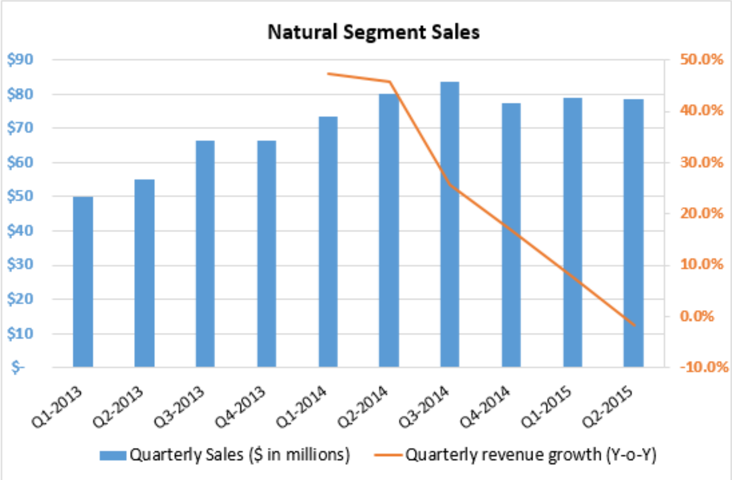
But yet, the stock rose over 17% on the day of the report, and it was up almost 5% the day after. Though it has given back some of those gains, given where the price is as I write this, the stock is up 40% from it's year-to-date low of $6.28 on July 8th, just over one month ago. The stock is trading close to where it was when we established our initial short position in March, despite the aforementioned resignation of CEO and co-founder Stephen Hughes and sharply deteriorating financials since then.

Why? Alongside earnings, the company announced that it is exploring "a range of strategic and financial alternatives to enhance shareholder value" -- corporate-speak for "we are looking to divest a portion of our business or be acquired". The company mentioned in the announcement that they have "recently received inquiries from a number of qualified parties that expressed interest in discussing a potential transaction with Boulder Brands."

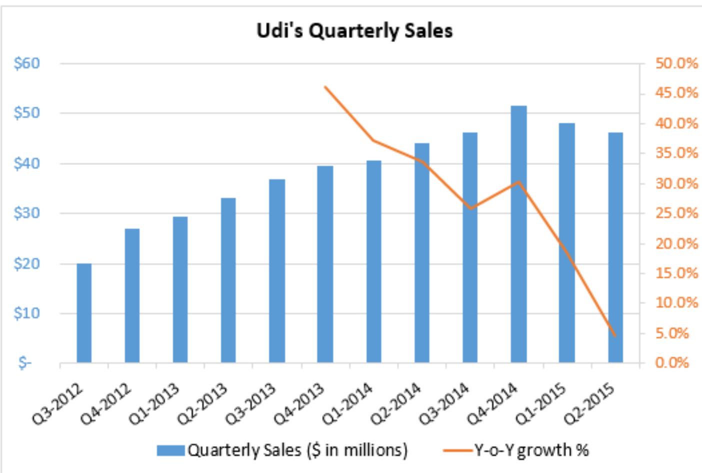
This announcement, alongside the disclosure of a 9.6% position by activist investing fund Engaged Capital, seems to have sparked renewed interest in Boulder Brands from special situations investors hoping to make a quick profit on a merger or acquisition candidate. It also doesn't help that Bill Ackman recently disclosed a multi-billion dollar stake in consumer packaged goods (CPG) giant Mondelez International (NASDAQ: MDLZ), drawing market attention to the possibility of further waves of food industry consolidation.

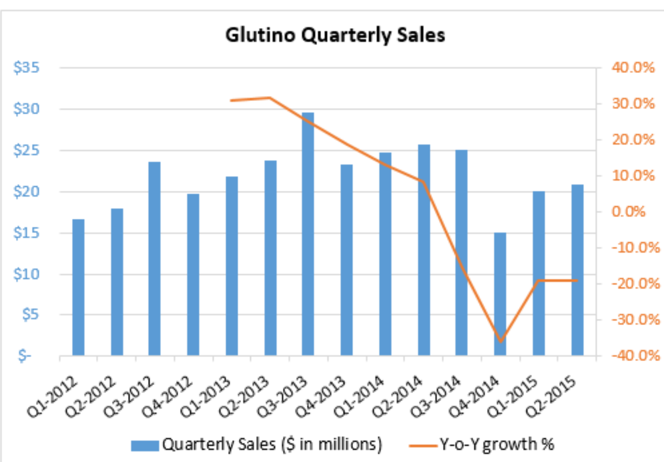
So What?

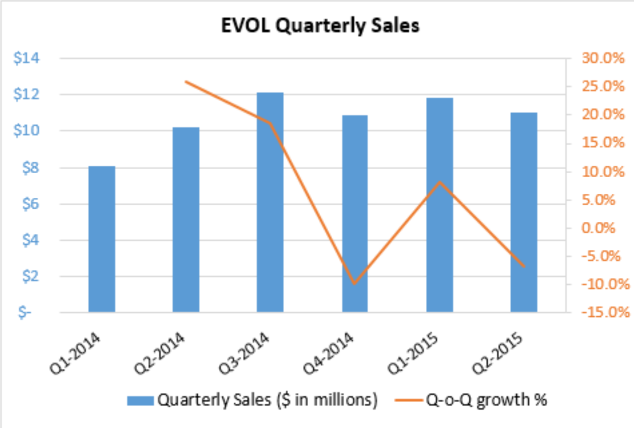
Based on the numbers from the Q2 report, our short thesis is tracking wonderfully -- perhaps even better than we expected. The key element to our short thesis was that the prior sales growth trajectory of the company's Natural segment (composed predominantly of the newly acquired Udi's, Glutino, and EVOL brands) was misleading and was likely to slow. That's exactly what happened. As of the most recent quarter, the Natural segment is now experiencing *declining* sales, down -1.9% vs. the same quarter a year ago:



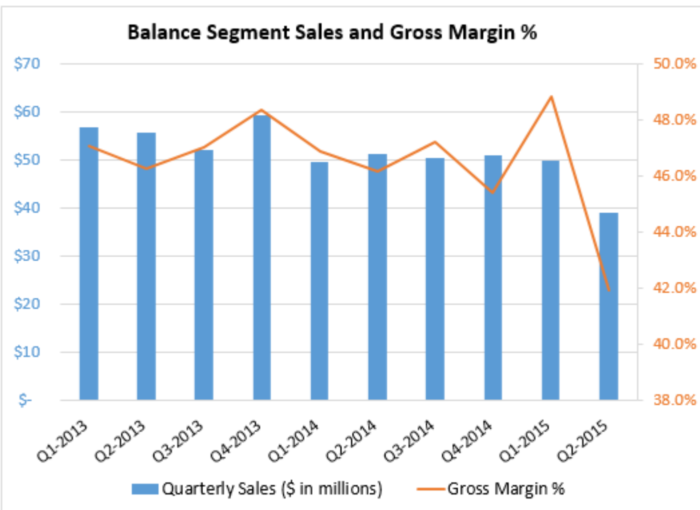
Breaking it down even further by looking at each individual brand, we can get an even more granular picture of how sales growth in the Natural segment has deteriorated now that initial distribution gains have been fully lapped. Given that the company continues to change its disclosures on brand-level sales (perhaps in order to obscure the data), note that these sales figures are educated guesses derived from piecing together disparate yet corroborating data points:





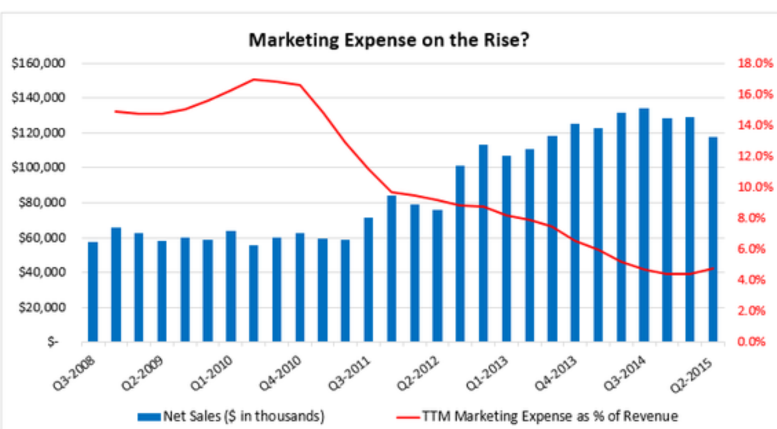


All three of the company's key brands in the Natural segment are experiencing declining growth trends, with some brands (notably Glutino) posting strongly negative growth. In addition to weakness in the company's previously high-growth Natural segment, the company's legacy Balance segment experienced severe weakness as well, posting the worst quarter for this segment in the company's history:

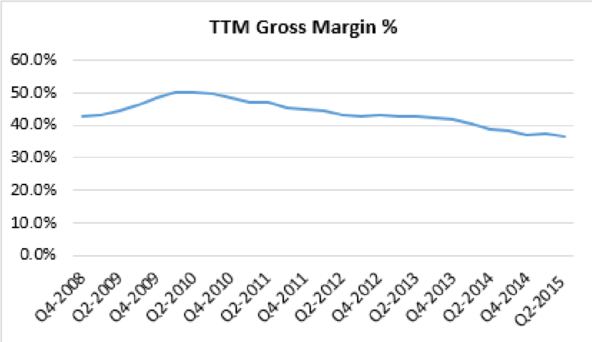


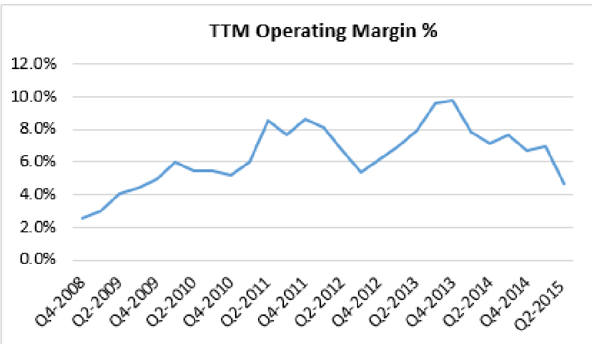
I wrote last quarter that I expected the Balance segment to post weak results due to an early Easter date in Q1, but I didn't expect the deterioration to be as severe as it was, especially in light of increased marketing spend from the company as the new management team shifted strategy following the resignation of the previous CEO. Nonetheless, this segment may bounce back a bit next quarter as the Easter-related seasonal factor rolls off.

Interim CEO Jim Leighton spent quite a bit of time on the call talking about the company's marketing strategy, mentioning that one of the company's critical issues is to become "more balanced and effective in marketing". In Q2, the increased marketing spend didn't seem to pay off, and due to increased competition, a weak financial position, and diminished brand positioning/awareness, the company may have a difficult time translating the increased spend into proportionally higher sales. The company may have entered a vicious cycle where higher marketing spend lowers margins, which diminishes the ability to reinvest in the brands, which reduces sales, and so on and so forth:

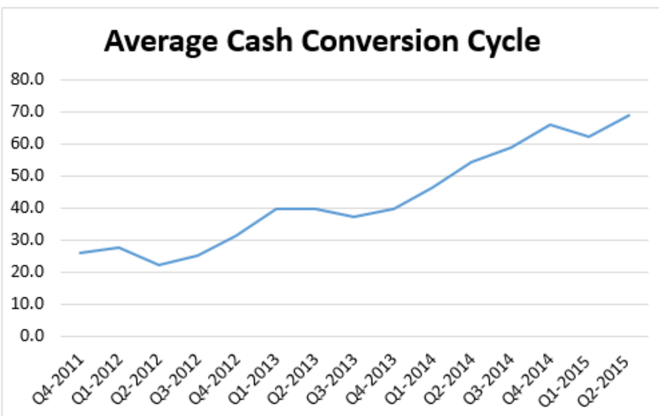


Due to increases in operating expenses across the board, margins really took a hit in Q2, with gross margin coming in at 32.4% (vs. 35.7% a year ago) and operating margin coming in at -3.6% (vs. 6.6% a year ago), and net margin coming in at -3.1% (vs. 2.1% a year ago). On a segment-level basis, the Natural segment posted a 27.6% gross profit margin (vs. 29.1% a year ago) and the Balance segment posted a 41.9% gross profit margin (vs. 46.2% a year ago).





Other financial metrics aren't faring well either, with the company's cash conversion cycle continuing to rise (lower is better) even as the company reported negative sales growth. The company continues to take longer to move its inventory and to collect on sales, suggesting that even these lower sales levels may have further to fall:



Now What?

Despite the rise in the stock price, because we capped our risk with protective calls in late June, here's how Pro's profit on the overall strategy looks so far:

	# of Shares/Contracts	Start Price	Cost Basis	Current Price	Market Value	Profit (Loss)
Original Short (3/23/15)	-3900	$9.60	($37,432)	$8.79	($34,281)	$3,151
Add More To Short (6/22/15)	-2300	$6.98	($16,050)	$8.79	($20,217)	($4,167)
Buy Protective Calls (6/22/15)	62	$0.60	$3,726	$1.40	$8,680	$4,954
TOTAL			($49,757)		($45,818)	$3,939

Based on our total cost basis of -$49,757 (our cost basis is negative since this is a short), our profit of $3,939 leaves us with nearly an 8% profit so far on the overall strategy. Capping our risk with protective calls just over a month ago turned out to be a prudent move -- without the calls, we'd be looking at about a 2% loss on our overall short.

Due to the profit/loss curve on our position, the profit on our position is essentially locked in -- we can't lose money on the strategy if the stock keeps going up (with the exception of a small amount of erosion from the time value still embedded in our calls), and we can still earn a higher profit if Boulder Brands' stock price ends up below $7.50 per share by September expiration.

Given the company's continued deterioration in financial metrics, negative business momentum, and still-high valuation (a negative GAAP P/E ratio, 125x trailing adjusted earnings, 17.2x adjusted EBITDA, and 547x trailing free cash flow), we think maintaining exposure to downside at these levels is still a prudent decision.

Although it's always possible that the company is acquired at a premium to the current share price, we're doubtful that an acquiring company would want to pay the current (let alone higher) multiples for a business that's struggling as mightily as Boulder Brands. We think that the announcement of "strategic and financial alternatives" was a strong public relations move that was able to draw attention away from the company's deteriorating financials without giving any real insight into the actual likelihood of a sale. And even if the company is acquired, our profit is locked in by our protective calls, which we can exercise at any time to close our short. **Boulder Brands remains an active 2.1% short on our scorecard, fully hedged by in-the-money September $7.50 owned calls.** If the company is yet to be acquired by September expiration, we'll consider rolling our calls out to December or March in order to maintain exposure to further downside.

For those who have yet to start a position or who have not yet bought protective calls, I'd suggest that they do one of three things:

- **For those who want to match *Pro*:** mirror *Pro's* position with a 2.1% short allocation and one bought (buy to open) September 2015 $7.50 call for each 100 shares shorted, or establish the functionally equivalent trade of buying (buy to open) September 2015 $7.50 puts, targeting a 2.1% allocation (with the latter you must may cash up front as opposed to receiving a cash inflow).
- **For those who wish to be more aggressive:** establish a 2.1% short allocation and buy (buy to open) one September 2015 $10 call for every 100 shares shorted, or establish the functionally equivalent trade of buying (buy to open) September 2015 $10 puts, targeting a 2.1% allocation. Note that this would be off-reservation from *Pro* and you will not receive official guidance on this position moving forward.
- **For those who wish to be even *more* aggressive:** establish a 2.1% short (or synthetic short) allocation, leaving it uncovered. You could establish this position if you are confident that the share price is likely to decline from here and are willing to accept the risk of the stock rising (for example if the company is bought out at a premium to the current price). Note that this would be off-reservation from *Pro* and you will not receive official guidance on this position moving forward.

Note that with the three strategies mentioned above, your profit/loss curve will be different than that of *Pro's* position which has been established over time. For those with $7.50 calls, if you establish the position today, because of the protective hedge, you won't begin to profit until the stock declines below about $7.50. For those who choose to buy $10 calls, you won't begin to profit until the stock declines below about $8.50, and you can lose money up until the stock rises just above $10 per share, at which point you would be hedged by your bought calls. For those who choose not to hedge their short, you will profit inversely at a 1:1 ratio as BDBD's stock price changes (for each share you short: for every one dollar the stock price goes down, you gain one dollar, and vice versa), and your maximum risk is uncapped.

7 Pro Company Updates; Plus, Medtronic Is a Buy

Published Aug 10, 2015 at 3:11PM

***Pro* Completed Trades**

- **Coca-Cola** (NYSE: KO): We set up synthetic covered calls per last week's trade alert, selling to open January 2016 $43 calls for $0.90 each. We wrote one call for every January 2016 $35 call we own.
- **Live Nation** (NYSE: LYV): We wrote puts per last week's trade alert, selling 21 contracts for $0.65, a 2.7% yield in 2.2 months.

***Pro* Guidance Changes (details in the Memo)**

- **Medtronic** (NYSE: MDT): The stock moves to **Buy**, with a new, higher fair-value estimate of $74, and a 3% allocation. Earnings are due around Aug. 17.
- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $85. Shares remain a Buy with a recent 4.1% allocation.
- **Tupperware** (NYSE: TUP): Fair-value estimate decreases to $72. Shares remain a buy with a 2.2% allocation.

We Welcome *Pro*'s New "Home Fool!" We're delighted to announce that Toby Bordelon (you may know him as TMFEpsilon) has joined *Pro* and *Options* as our "Home Fool." You'll find Toby answering questions and pointing members in the right direction on our discussion boards -- now in an official capacity for us, though he's been doing just that at TMF since 1998. At the same time, we want to thank Lon Levy (phooLon) for his work as our previous Home Fool. Lon did an outstanding job helping hundreds of members in *Pro* and *Options*. We're very grateful, and we're excited that Lon remains as active as ever in our community. Thank you to Toby and Lon! Be sure to check out Toby's great introductory post.

Dear Fools,

Earnings season has blown through like a summer storm, and *Pro* sailed through it. Our portfolio has appreciated, most positions are higher, and -- most importantly -- most of our companies are excelling, while none (except our shorts) are on shaky foundations. Let's review several... with guidance updates!

American Airlines (NASDAQ: AAL)

- Buy January 2017 $35 calls
- About a 0.5% allocation

Last quarter, our favorite airline (or our favorite airline *investment*, anyway) reported a record second-quarter net profit of $1.7 billion, or $2.41 per share. That was compared with $864 million in profits, or $1.17 per share, the year prior. The financials are flying high as fuel prices keep doing the limbo. More important, the consolidated U.S. airline industry is by most signs being managed for profits rather than market share. This is good. Reflecting confidence in its position, and dubbing its share price undervalued, management bought back $753 million in stock at $43.53 per share last quarter, and announced a new $2 billion buyback.

But Wall Street remains focused on passenger revenue per average seat mile, or PRASM, and this number fell 6.9% to $0.1357. PRASM was down 5% domestically; the rest of the decline was because of a strong dollar and and results from international markets, mainly Latin America. Given much lower operating costs, airlines are spending some money to grow capacity. More seats mean lower prices in some markets -- or more empty seats, decreasing PRASM. American Airlines management says this may be the new norm, and advises Wall Street to focus on total profitability instead. American has $4.2 billion in trailing net income, and management expects record profits to continue even though PRASM may decline another 6% to 8% in the third quarter. Because of the aforementioned capacity increases and the strong dollar, PRASM may not turn positive again until the second half of 2016 (which would be fine for our 2017 calls). Either Wall Street will learn to look beyond PRASM to operating results, or we'll be waiting a while before enthusiasm returns to the shares.

We're in no hurry to write diagonal calls on our beaten-down calls, though. The stock only fetches about 6.6 times expected 2016 earnings. Oil has recently slipped again, and American (which doesn't hedge fuel prices) should benefit further. The company is bullish on its future, and we know how quickly Wall Street's emotions can change toward a stock, especially an industry leader that looks cheap. If investors become comfortable with current PRASM dynamics and start to believe that profits overall are here to stay, American shares should benefit greatly. We're content to sit on our calls, which are a small position.

Gilead Sciences (NASDAQ: GILD)

- Buy First
- 4.1% allocation
- Fair-value estimate stays at $120 (but is due for an update, likely trending higher, next quarter)

Our biotech giant exceeded expectations and raised guidance for the year yet again. Revenue climbed 26% to $8.2 billion, nearly 10% higher than estimates, and earnings per share were up 33.5%. The company's new (as of last year) Hepatitis C drugs accounted for more than half of revenue, and the increase there was more than was expected. Once again, management said it's "still early days" for the drugs: Many patients haven't yet been given access to this potential cure, new patients are diagnosed every day, and international markets are still opening up. In the U.S. alone, Gilead has only treated about 300,000 patients out of 1.6 million diagnoses.

From the start of our position, we've argued that Gilead's Hepatitis C franchise would bring in strong revenue for a much longer period than Wall Street was estimating, and we continue to believe that's the case (though sales will eventually level out). Currently, Gilead is grabbing about 90% of the market share in treating the disease, showing that health-care providers recognize Gilead's superior cure and side-effect profile. As of last quarter, about 470,000 patients globally had started treatment with Gilead's hepatitis drugs, a tiny sliver of the potential audience.

At a recent $118, the stock trades at only 10.1 times expected earnings for this year, and it remains a Buy First. Looking out longer than a few years, we'll have to see how Gilead can fill in the eventual large sales gap that slowing Hepatitis C revenue will bring. I suspect a large acquisition may come into play.

Medtronic (NYSE: MDT)

- Returns to **Buy**
- 3% allocation
- Fair-value estimate increases to $74

A leading medical-device maker, massive Medtronic increased sales by 7% in its April quarter after adjusting for currency effects. After our early assessment of its merger with Covidien, we're returning the company to Buy status, and members without shares can purchase up to 3%. Keep in mind that an earnings report is due again mid-month. We view that as a non-event; it's just a chance to learn more, given that nobody knows how the stock will react in the short term.

Zeroing in on value creation, the company delivered $1.7 billion in free cash flow in its last quarter and should reach $6.5 billion free cash flow for the year. Management plans to continue to return about 50% of cash flow to shareholders through increased dividends and buybacks, and expects the Covidien merger to lead to at least $850 million in cost synergies by the end of fiscal 2018.

While Medtronic has long touted itself as a play on international markets, growth in the U.S. has regained traction, too. Last quarter (ended April 24), U.S. revenue was up 8% to represent 56% of sales. Emerging-market sales rose 11%, representing just 13% of sales. Management sees strong long-term potential in emerging markets, but our sense is that this nut is proving harder to crack than expected, and it's going to take longer than hoped to reach scale in places like China. But it's still possible over time.

Whether it's cardiac issues, spine injuries, knee problems or something else, Medtronic is a steady innovator and market leader in vital medical devices. The stock yields nearly 2%, and over the past 38 years the dividend has increased every year -- resulting in an 18% compounded annual growth rate (CAGR). Expect continued dividend increases, sales growth of about 4% to 6%, and earnings-per-share growth even higher than that, all of which should combine for North Star-challenging returns. The stock moves back to Buy as our confidence in the Covidien merger grows.

OpenText (NASDAQ: OTEX)

- Buy
- 2.5% allocation
- Fair-value estimate stays at $55

With about 65,000 cloud software customers and renewals in that space running at about 95%, OpenText is now a cloud software company -- the cloud accounts for fully 33% of sales. But as with **Oracle** (NYSE: ORCL), it's really a hybrid. OpenText also sells software on-premises on a license basis (the old-school way!), and renewal rates on those are in the low-90% range. To be clear, OpenText is not looking to replace license sales entirely with cloud sales. Instead, some customers have a preference for one over the other, and many customers order a combination of both. This is fine with OpenText; offering and supporting both is the long-term plan.

A leader in Enterprise Information Management (EIM), OpenText offers customers a full array of related software solutions. The three areas of focus are data and information management; information exchange platforms within and across organizations; and analytics, where "big data" is used to gain insights and run the business better. OpenText helps customers go digital with their data, a market that should grow smartly for a long time. Last year, OpenText increased adjusted operating cash flow by 25%, and margins are expected to trend higher going forward. The $46 stock trades at 13.2 times expected non-GAAP earnings for the year ending June 2016.

So where we do stand now? We're considering moving OpenText to Buy First status based on valuation, and if we do, we may add a tad more to our position as well. That would be an easier decision if we didn't already own a decent stake in Oracle, but since we do, we have to be certain we want more software exposure before acting. If not, we're content with our current stake. Either way, we're inclined to wait in part because the IRS is seeking $550 million in taxes and penalties relating to a 2010 restructuring. OpenText strongly disagrees with the request, and is fighting it. Resolution would be welcome. OpenText has the cash, but it would be a giant amount to pay out. Management is confident right now that they won't have to, but ... you never know.

O'Reilly Automotive (NASDAQ: ORLY)

- Buy
- 4.8% allocation
- Fair-value estimate stays at $190

Auto-parts retailer O'Reilly presented another outstanding quarter, with revenue up 10.2%, same-store sales up 7.2%, higher margins, and earnings per share up 20%. Growing complexity in car parts is helping the business, as are other tailwinds: People are driving more; cars are lasting longer and thus being repaired more often; fuel prices are lower; employment is going up. Plus, O'Reilly is excelling with both professional and retail customers, while steadily adding close to 50 stores per quarter (99 in the first half of the year).

Though the $240 shares trade a premium (26 times forward earnings estimates), we're happy to keep owning our stake in O'Reilly. We will likely see a flat few years, though, in a weaker stock market. That's something we're willing to wait through rather than selling, paying taxes, and hoping to get back in at a lower price. We will consider covered calls, meanwhile, but so far *not* writing any has been a very good choice. We have also considered moving the stock to Hold, but haven't yet; in the past, doing so proved to be a mistake.

Skyworks Solutions (NASDAQ: SWKS)

- Buy
- 4.1% allocation
- Fair-value estimate increases to $85

Increasing complexity in Internet-connected devices is driving higher profit margins at analog semiconductor leader Skyworks. From the horse's mouth, the company "sells the smallest, most efficient, and most integrated products in the market today, incorporating all amplification, switching, logic and filtering. And this is both in transmit and receive functions." Like music to our ears, Skyworks is winning customers across multiple industries, from home to auto to smartphones to appliances to routers, as competitors can't deliver these complex, integrated solutions. As complexity increases, the lead time on design cycles with customers is growing to as many as two to three years. This gives the company better visibility on revenue than it has ever had, and Wall Street loves that.

At the same time, gross margins are heading higher, and management says that should be the case for years ahead. By calendar 2016, the company is targeting $7 in earnings per share on a run-rate basis (most recent quarter times four). The $89 stock trades at only 12.9 times that projected result. Last quarter, sales grew 38% to $810 million, and earnings per share jumped more than 60%. The company expects its long-term total addressable market to grow around 15% annualized, and hopes for a rate even faster than that.

Tupperware (NYSE: TUP)

- Buy
- 2.2% allocation
- Fair value estimate decreases to $72

Although Tupperware's stock has had a rough ride in recent years, the business has been stable. Free cash flow is steady, sales were up 4% last quarter in local currencies, and the company expects $4.42 to $4.52 in earnings per share this year. That values the $59 stock at about 13 times earnings (at the midpoint of guidance), and the shares yield a generous 4.6%.

However, Tupperware hasn't increased its free cash flow (or revenue) for many years, and management decisions over the past few years have us starting to question how long the business belongs in the portfolio. Specifically, the company took on debt to buy back shares at much higher prices, and management hiked the dividend to a level that allows no room to reasonably increase it unless the business grows much more. To put it simply, they were too aggressive.

Meanwhile, Tupperware's 3-million-strong global sales force produces sporadic results by region. Sometimes European countries are hot, other quarters they're cold. Weakness has occurred lately in emerging markets, too, which was never the case in earlier years (to my memory). Emerging markets make up two-thirds of sales, and revenue there should increase by at least 10% annualized, but some markets hit air pockets, and the strong dollar dings every sale when it gets converted to U.S. currency.

This leaves us with less than a compounding machine. Right now, we're giving Tupperware the benefit of the doubt, hoping it can unlock the secret to securing steady growth for a number of years, driving shares much higher. But if growth doesn't start to materialize, our patience will wear thin, and we'll strongly consider ditching Tupperware at that point for something better. Let's hope it doesn't come to that, but if it does, we'll be ready.

Foolishly,

-- Jeff (TMFFischer)

MasterCard Rings Up Another Solid Quarter

Published Aug 6, 2015 at 5:16PM

Though MasterCard (NYSE: MA) posted disappointing sales growth for the quarter, shares have continued to perform well as investors remain optimistic about the business's long-term potential. A combination of currency headwinds, soft economic conditions in Asia and Latin America, and falling gas prices all weighed on results, but the company is still on track to hit management's long term goals of 11% to 14% net revenue CAGR, 20% earnings CAGR and 50% annual operating margin.

Globally, the number of cards grew 8% to 2.2 billion and processed transactions grew by 13% in the quarter to over 12 billion. An important indication that the business is strengthening is that processed volume has increased by two percentage points sequentially in both the U.S. and internationally, and every region grew at a double-digit rate except the U.S. which grew in the high single digits.

Adjusted for currency, net revenue increased 7% and earnings per share grew 15% despite higher expenses from integrating acquisitions. G&A increased 14% for the quarter, but that growth would have only been 3% excluding acquisitions. The company is also still digesting the loss of the Chase portfolio, which will result in tough comps through the end of the year.

What About China?

Management remains cautiously optimistic about their planned entry into China. The company confirmed that it will be technically ready to process payments in China by the end of 2016, but it expects there to be numerous restrictions and complicating factors as the market slow opens to foreign competition. As a result, management is being very deliberate with their near term investment plans for the country and have yet to include any China spending in the 2015 cost guidance.

What? Another Law Suit?

Regulatory issues will continue to be a problem as a new antitrust suit was filed in Europe, but these allegations also confirm the strength of the card company's competitive advantage. In July, the EU announced that it was filing an antitrust suit against MasterCard regarding the difference in interchange fees charged on cross-border transactions. For context, this suit covers less than 1% of the company's total volume and similar charges were levied against Visa over three years ago without a resolution. I expect a similar drawn-out process to take place with MasterCard and though the company may need to pay fines and reduce some fees, based on the outcome of similar suits over the past several years it shouldn't impair the long term prospects of the business.

How 'Bout Those Acquistions?

MasterCard's recent acquisitions also continue to show positive results. The company's SafetyNet technology that not only detects fraud events but also reacts in real-time is quickly growing in popularity. Only two years after its initial launch 80% of MasterCard's issuers are using the service. Cybersecurity is a critical differentiator for processors and it will continue to be an increasing cost of doing business for the entire payment industry.

Also, by combining the company's existing Asia-Pacific gateway with the recent DataCash and TNS acquisitions, MasterCard has created one of the few global e-commerce gateway solutions which allows for more cross-selling opportunities across the company's existing customer base. As a result, we're also seeing early success in expansion to adjacent offerings like loyal programs that will likely become even more important as we transition to mobile payments.

Where From Here?

Despite lukewarm economic conditions across most of the world, MasterCard continues to execute well and consistently grow its global market share. Shares are up about 12% year-to-date, easily besting the market and contributing positively to our North Star return goal. Thanks to a growing global presence and consumers' transition from cash to digital payments driving demand, we're looking forward to many years of value creation. MasterCard remains a Buy and we'll be reevaluating our fair value estimate in the coming weeks.

Write Puts on Live Nation

Published Aug 6, 2015 at 9:54AM

Is this for you? This is for *Pro* members who are looking to generate income and lack at least 2% exposure to this company.

How You Participate

- **Trade:** Sell to open Oct. 16, 2015, $24 puts on **Live Nation** (NYSE: LYV).
- **Allocation:** If we get shares, 2% in stock. Sell one put for every $120,000 in your portfolio. *Pro* will sell 21 contracts.
- **Price Guidance**
  - Now: Initially, aim to get paid at least $0.90 per put. This is a 3.8% yield in a little less than three months.
  - Future: As prices and time to expiration change, those approaching the position should aim to get paid a yield of around 1% or so per month to expiration. Also, make sure the strike price you choose is at least 2.5% below the current stock price.
- **Prices** (as of 1:56 p.m. ET):
  - **Stock price:** $25.12
  - **Option Price (bid/ask):** $0.85/$0.95 (splitting the bid/ask = $0.90)
- **Note**: The company reports earnings Aug. 10.

What We're Thinking

It's been business as usual with LiveNation since our initial trade alert on March 31; the only point of note came after first-quarter earnings July 30, when the stock briefly popped almost 7%. But that doesn't mean it's been a snoozefest – in the past few months, Live Nation has announced multiple new sponsorship partnerships, not to mention a few meaningful acquisitions.

- April 30: Bonnaroo, one of the largest music festivals in the United States
- June 9: Front Gate Tickets and Universe -- the former helps strengthen Ticketmaster's position in the festival space, and the latter does the same for DIY ticketing.
- August 3: Marek Lieberg, the fifth-largest concert promoter in the world

Since peaking at $29.21 on June 11, the stock has fallen around 14% for reasons unbeknownst to us. But we're not complaining -- we find writing puts to be a lot more attractive at this level. We estimate that the stock is worth somewhere between 12.5 and 13 times EV/EBTIDA (the level it reached after first-quarter earnings), compared with its current multiple of 11.7.

We're once again targeting a $24 strike price because, though we like the company's long-term prospects, our current long exposure leaves us wanting to be a bit more defensive with our income-generating positions. With the income for this position at $0.90, we'll have brought in a total of $1.60 per share with our two written puts on Live Nation, giving us an effective start price of $22.40. (Your mileage may vary depending on how much you collected in the first go-round and your tax situation.) This is almost 11% lower than the current level, and we'd happily buy shares for this price.

More That Matters

Maximum loss: Our risk is the same as share ownership starting at about $23.10, or 8% less than recent prices.

Maximum gain: On this put write alone, our maximum gain is the put premium. At $0.90, that's a 3.8% yield in 71 days.

Follow-up: We'll buy shares at a net $23.10 if the stock is below our $24 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **Not using options?** In that case, wait to see if the stock declines to about $23.50 or so and then start a 2% stake.
- **Want to be even more defensive?** The January $24 puts pay about $1.50, which is a 6.4% yield and reduces your net start price even further to $22.50.

Visa Charges Ahead

Published Aug 5, 2015 at 1:17PM

The world's largest payment processor, **Visa** (NYSE: V), rolled with the punches as usual this quarter, once again reporting solid results.

Visa Q3 2015

Consolidated Results

		change
Revenue	$3.5 Billion	12%
Free cash flow	$2 Billion	11%
EPS*	$0.74	29%

Total Cards
2.4 billion
7% increase

Segment Results

(USD Billions)

		change
Service revenues	$1,550	9%
Data processing revenues	1,400	6%
International transaction revenues	1,039	21%
Other revenues	199	2%
Client incentives	(670)	5%
Total operating revenues	$3,518	12%

Updated guidance: Buy (no change)

Recommended allocation: 2.3%

Fair-value estimate: $74 (up from $72)

Current Multiples

Multiple	Trailing	Forward
P/S	13.5	13.5
P/E	31	27
EV/EBITDA	19.7	17

Revenue growth came in above management's expectations for the quarter, despite sizable foreign-exchange headwinds and other challenges (including high currency volatility and lower client incentive levels, which came about because of lower payment volumes and performance adjustments). Moving down the income statement, the company also recognized a $280 million tax benefit this quarter that had the effect of pulling forward $0.12 of EPS from Q4 (when it was originally expected to occur).

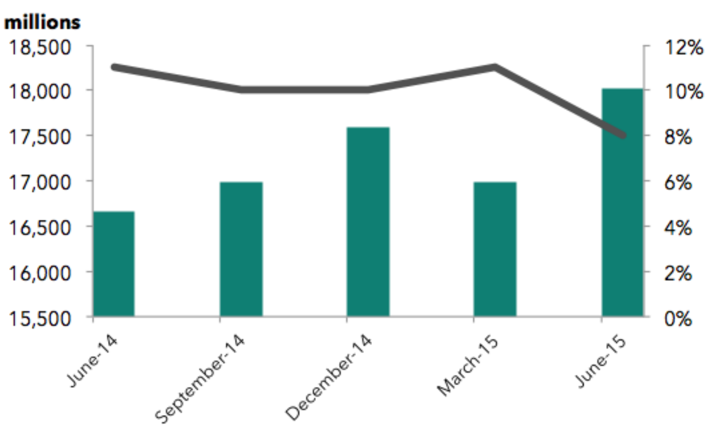
Global Payments Volume

(USD Billions)

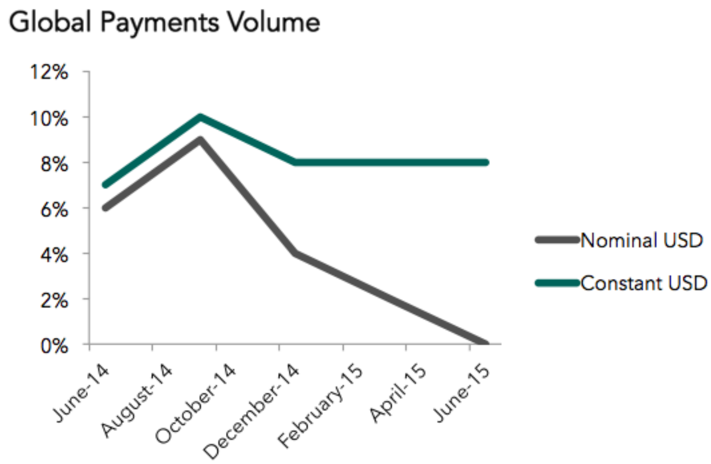
	Growth	
	Nominal	Constant USD
Asia Pacific	8%	15%
Canada	-6%	5%
CEMEA	-6%	15%
LAC	-13%	12%
US	9%	9%

Global payments volume, which is the primary driver of service revenue, increased by 5.1% this quarter, or 11% based on constant dollars. Cheap gas prices continue to have a sizable negative impact on Visa's results here in the U.S.; consumers are using most of the savings to pay down debts or improve their household balance sheets, rather than charging new purchases. Another contributor to the deceleration in growth was the continued moderation of the Chase conversion, though winning this account should ultimately prove to be a tailwind for the company for a long time.

Processes Transactions & Growth



Transactions processed over Visa's network, the primary driver of data-processing revenue, were up 8% year over year to a little more than 18 billion. Sequentially, however, this was a decline of 3% from the March quarter. This is primarily because the company transferred domestic processing in Russia to a national card payment system known as NSPK, which was created in response to the actions of Visa and MasterCard during U.S. sanctions against the Crimea last year. Given that this transition just finished up, we should expect this type of negative hit to the growth rate for the next three quarters as well.



Global cross-border volume was once again up 8% on a constant dollar basis, continuing the trend we've seen for the past few quarters. Cross-border transaction processing and currency conversion activities are the drivers of international transaction revenue, which was up 21% this quarter. That's thanks to pricing changes on certain U.S. acquirer fees that took hold in April, as well as higher currency volatility (which increases the fees Visa earns when it converts payments from one currency to another for customers).

Management was hush about the possibility of acquiring Visa Europe, but if you ask us, it seems like the odds of this deal increase with each passing day. Management noted that Visa is unlikely to repurchase any additional stock this quarter because of regulations regarding material non-public information (the SEC wouldn't look too kindly on the company repurchasing a ton of Visa stock and then announcing the terms of a Europe deal).

Speaking of Visa Europe, one of the biggest hits to the company this quarter was the $110 million increase in the Visa Europe put option. Currently, Visa Europe has a perpetual put option that will require Visa to purchase all outstanding shares of Visa Europe if exercised. The option must be valued periodically and is recorded as a liability on the company's balance sheet. But it is neither a cash expense nor an accurate representation of how much it will cost Visa to acquire Visa Europe – under the terms of the option, the purchase price will likely be in excess of $15 billion, even though the put option is currently valued at $255 million.

One of the more interesting comments from CEO Charles Scharf during the Q&A session came in response to a question about how Visa's strategy against PayPal will adapt now that the mobile payments leader has completed its separation from eBay. Visa's strategy won't change all that much in the immediate future, but Scharf did acknowledge that the current relationship is not sustainable for the long term. Right now, Visa cards are used in roughly 25% of transactions that go through eBay wallets, but PayPal uses the data from these transactions to try and disintermediate Visa from the transaction.

In our original write-up, we noted that we're more comfortable paying up for a high-quality business like this one than buying a lesser company simply because it looks cheap. Given the secular (the shift toward electronic payments) and company-specific (Chase, Costco, etc.) tailwinds behind Visa, I don't anticipate our stance to change anytime soon.

Write Synthetic Covered Calls on Coca-Cola

Published Aug 5, 2015 at 10:02AM

Is this for you? This is for *Pro* members who have a **Coca-Cola** (NYSE: KO) synthetic long (or just own calls or at least 100 shares of stock), and who want to write covered calls for income. We are doing so as our position approaches its natural expiration in January.

How You Participate

- **Trade:** Sell to open January 2016 $43 calls on Coca-Cola
- **Allocation:** Sell one call for every Coca-Cola call you own (or every 100 shares you own) and want to cover (**do not cover shares you wish to keep!**). *Pro* will cover all of its contracts, writing 17 calls.
  - **Price Guidance:** Ideally, aim to be paid at least $0.90 to $0.93. As prices change over the coming week, aim to be paid at least 2% of the current share price (lately, that's $0.84).
  - **Prices** (Aug. 5):
    - Stock: $42.05
    - January 2016 $43 calls (bid/ask): $0.90/$0.96 ($0.93 splitting the bid/ask)

What We're Thinking

In March 2014, we recommended setting up a synthetic long option position on Coca-Cola when its stock price was $38.33. The stock is 9.7% higher today, and owners (not us) have also been paid more than a 3% annual yield, resulting in a respectable 17-month return. But that's largely because we set the position up during a drop in price. The stock is actually down since its April 2013 high, so our March 2014 buy was a fortuitous price.. Our synthetic long has made money, turning unused equity in our portfolio into about $8,600 in unrealized profits so far.

As our position's January 2016 expiration nears, we're looking to squeeze a bit more income out of it by writing synthetic covered calls. This also turns our long 2016 calls into a bull call spread, as a way to end the position. Doing so caps our upside at $43, but in return we're guaranteed a bit more income.

Management performed admirably in the last year, taking market share yet again, increasing beverage sales and volume, and reducing costs -- but that doesn't change the fact that 46% of sales in 2014 were Coca-Cola soda products which are under fire, meaning there will be challenges to growth. I believe that in the long run Coca-Cola will create more value, and shareholders will continue to be rewarded, but it will likely be a slow rise.

We're still considering what (if anything) we will choose to do next with Coca-Cola in *Pro*. Buying shares, thereby committing some of *Pro's* capital to the company, seems an unlikely next choice from where we stand today (although if we did so, we could use the shares for covered calls). So does setting up another synthetic long. If we continue our involvement with Coca-Cola, we're likely to go on viewing it as a reasonably priced, but slow-growing, income-oriented position. For now, however, we just need to focus on bringing our synthetic long to a conclusion, and writing some calls on it makes sense to us.

More That Matters

- **Maximum gain:** Our net sell price is $43.93, or about 4.5% higher than the recent share price, in about five months.
- **Maximum risk:** The full value of our January 2016 $37 calls, minus premiums received from the new short calls, plus the stock exposure of our January 2016 $37 puts.
- **Follow-up:** We currently plan to bring the synthetic long to conclusion at expiration in January. Any new recommendation on Coca-Cola would be a new, fresh position.

Alternative Trades

Given the short-term nature of this trade, and our stated intention to move toward closing the position, we don't have alternative trades to offer today. However, you could follow the new trade in *Motley Fool Options* if you lack exposure to Coca-Cola and want to set up an income-oriented position.

American Tower Transmits a Strong Quarter

Published Aug 3, 2015 at 3:26PM

What Happened?

- Total rental and management (R&M) revenue of $1.17 billion (year-over-year core* growth of 23%)
- Domestic R&M segment revenue of $803 million (year-over-year core growth of 21%)
- International R&M segment revenue of $351 million (year-over-year core growth of 28%)
- Adjusted EBITDA of $762 million (year-over-year core growth of 21%)
- Adjusted funds from operations (AFFO) of $537 million (year-over-year core growth of 25%)

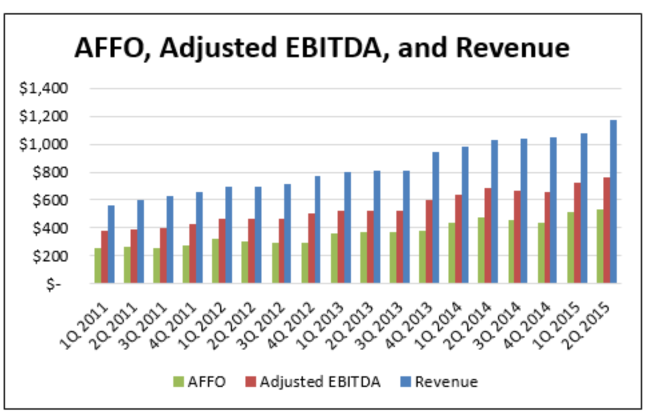
*Core growth reflects adjustments for foreign currency exchange rate fluctuations, pass-through revenue, straight-line revenue and expense recognition, and material one-time items

CEO Jim Taiclet:

> "Our second quarter 2015 results reflected yet another quarter of strong demand for our tower space both domestically and abroad. In the U.S., we are rapidly integrating our Verizon portfolio, which already has more than 900 lease applications in its pipeline. Internationally, leasing activity from our top customers, including Telefónica, América Móvil and Airtel, drove Organic Core Growth in revenue of nearly 12%.
>
> In addition, we are confident that the customer network investment trends developing in markets like Mexico, India and Brazil position us well to not only deliver 2015 Core Growth of over 20% in rental and management revenue, Adjusted EBITDA and AFFO, but also to drive compelling growth in all three of these metrics well into the future."

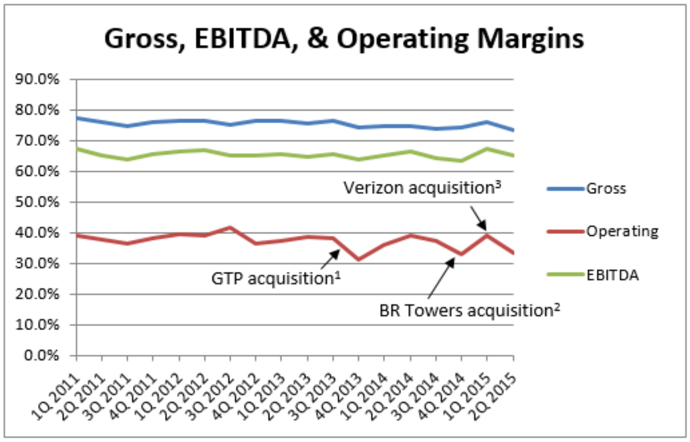
So What?

American Tower (NYSE: AMT) reported a typical quarter that provides further evidence that the company continues to build on its strong business performance and compounding dynamics. The company continues to steadily march ahead with its strategy of using cheap debt to consolidate a critical industry with growing end-markets and secure, recurring revenue characteristics. This has resulted in strong and consistent growth in revenue, EBITDA, and AFFO as growth in end-markets continues and new assets are integrated and leased up:



The company has closed on and is in the process of integrating several new acquisitions, including 11,500 towers from the Verizon acquisition, 4,200 sites in Brazil from Telecom Italia, and 4,700 towers in Nigeria from Bharti Airtel. The company also has ~2,300 sites in Brazil and up to 200 sites in Nigeria that have yet to close and are expected to do so over the next 12 months or so. The company is already getting strong initial trends on the Verizon portfolio, with 900 lease applications in pipeline, and the Airtel Nigeria sites are already expected to contribute ~$30 million in cash EBITDA in full year 2015. Given the performance of the business, management raised full year 2015 guidance to reflect international outperformance, cost controls, the impact of the Nigeria Airtel portfolio, and savings on cash interest from significant refinancing activity on the company's debt portfolio (see example here) during the quarter. Guidance does not include the 2,300 sites in Brazil or the 200 sites in Nigeria yet to be closed or demand catalysts in Mexico related to expected investments from AT&T and America Movil. As I noted last quarter, initial 2015 guidance was somewhat "sandbagged" and I've noticed that management has a tendency to provide low initial guidance and then raise it over the course of the year in order to influence and manage market expectations, which I appreciate.

I noted last quarter that "we may see slower revenue growth and stagnant or declining margins in the coming quarters as [timing-related] factors dissipate and new acquisition-related assets (and their lower margin profiles) make up a larger portion of the company's revenue. But over time, we should see margins tick up as scale and incremental leasing activity on new assets take hold." That's exactly what happened this quarter, with margins declining across the board. But as I wrote previously, the margin impact is very typical of American Tower's acquisition strategy, and we've seen it happen before:



1) GTP acquisition closed on 10/1/13, adding over 5,000 domestic sites (22% growth from the then-previous domestic base)

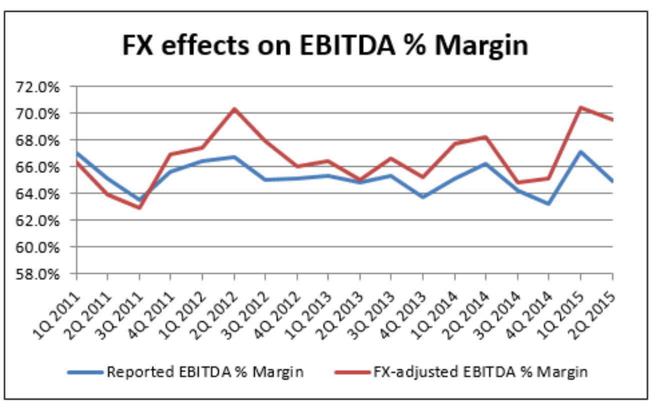
2) BR Towers acquisition closed on 11/19/14, adding over 4,600 international sites (11% growth from the then-previous international base)

3) Verizon acquisition closed on 3/30/15, adding over 11,000 domestic sites (40% growth from the then-previous domestic base)

In each case, a big acquisition resulted in a temporary hit to margins as the lower-tenancy, lower-margin assets were added to the existing asset base. And again in each case, margins consequently ticked up in the following quarters. American Tower has demonstrated that they are very efficient operators and they are able to quickly meet or exceed their integration targets with regular consistency. Management provided detail on the conference call about their ability to integrate assets, providing data showing that the longer American Tower has managed an asset, the higher the tenancy rate (and thus the higher the margin profile).

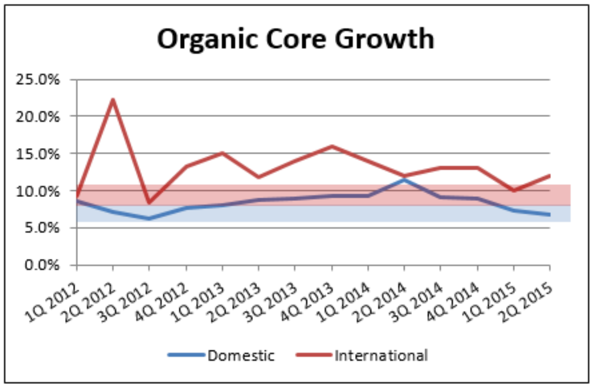
For example, on Brazilian sites that they've constructed or acquired between 2000 and 2005, the sites average nearly 3 tenants per tower and a local currency net operating income (NOI) yield of 50%. And for sites in Brazil constructed or acquired between 2005 and 2010, the sites average nearly 2 tenants per tower and an NOI yield of almost 30%. Management mentioned that this dynamic is repeatable in all of their markets. In Mexico (AMT's longest-tenured international market), 2000 to 2005 "vintage" towers generate NOI yields of more than 30% with average tenancy of over 2.0, and 2005 to 2010 "vintage" towers generate NOI yields of about 30% with average tenancy of over 2.0. The company also mentioned strong organic core growth trends in South Africa (almost 15% since 2011) and India (3-year average of about 9%).

Additionally, the company has been able to increase margins after acquisitions despite significant foreign currency effects. Take a look at how foreign currency fluctuations have affected American Tower's adjusted EBITDA margins:



American Tower's significant exposure to international markets and international currencies provide a potential future catalyst if foreign currencies eventually turn around and increase in value relative to the dollar. This will provide a boost to U.S. dollar-denominated revenue and cash flow if and when that occurs.

Finally, organic core growth (growth excluding revenue associated with new properties) continued to track well, with international organic core growth showing acceleration (coming in at 12% vs. 10% last quarter) and domestic core growth slowing a bit (coming in at 6.8% once adjusted for non-recurring timing effects vs. a comparably adjusted 7.4% last quarter) as AT&T and Sprint have reduced their U.S. network investment activity relative to the same periods in 2014. AT&T and Sprint are expected to pick up their investment activity into 2016 and beyond as they launch their next-generation network plans, which should support higher domestic organic core growth. Organic core growth continues to track within management's target ranges (the shaded area on the graph below) and ahead of my longer-term estimates:



As for debt, the company's net leverage ratio came in at 5.2x, and management expects to reach 5x leverage or below by the end of 2016. The company has plenty of liquidity (nearly $3 billion), no significant debt maturations until 2018, and a weighted average debt tenor of over 5 years.

Yearly distribution growth continues to track ahead of management's 20% long-term growth target, coming in at 29% growth ($0.44 per share, a 1.9% yield on the current share price). 20% annual distribution growth continues to look like a more than reasonable target for 2015 and beyond.

Now What?

This quarter's report yet again provides confirming evidence that our investment thesis (that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time) continues to play out. Despite short-term margin pressure related to acquisitions, the company's strong operating history, excellent management, and enviable competitive position in a growing industry give me confidence that American Tower will continue to grow revenue and cash flow at high rates for a long time, providing strong returns on capital.

Data and Guidance

- Current Price: $95.11
- Fair Value estimate (unchanged): $115
- Allocation: 3.3% plus 0.4% in bought calls
- Market Cap: $40.3 billion
- EV/EBITDA (TTM): 20.1
- EV/EBITDA (2015 projections): 18.6

AMT remains a Buy First, with no change to our recently updated fair value estimate of $115 per share and an allocation of 3.3% plus 0.4% in January 2017 $80 calls. If you've yet to start a position or haven't yet bought calls, now is as good a time as any to match us. The stock may continue to stagnate in the short-term due to its tendency to trade alongside the interest rate-sensitive REIT sector, but over the long-term the underlying strength in business fundamentals should shine through.

Fool on!

Analyzing Verisk Analytics

Published Aug 3, 2015 at 12:40PM

***Pro* Completed Trades**

- **SPDR S&P 500** (NYSEMKT: SPY): We set up our 11% look-through allocation in October put ratio spreads, buying 14 October 2015 $200 puts, and selling 28 October 2015 $191 puts (adjusted from $187 for those who had not made the original trade yet, including us). We paid a $0.03 debit to make the trade. (This was and is a catch-up trade for those lacking this hedge.)
- **Verisk Analytics** (Nasdaq: VRSK): We bought a 1.7% stake, or 600 shares, at $72.76.

***Pro* Guidance Changes**

- **Facebook** (Nasdaq: FB): Our fair-value estimate increases to $84. The stock remains a buy at a 5.1% allocation.
- **Starbucks** (Nasdaq: SBUX): Our fair-value estimate increases to $47, and we have a 3.6% allocation. As with many strong stocks lately, our guidance comes with a caveat that we could see a flat year or two if the market weakens, as our fair-value estimate suggests.

Fellow Fools,

When we recommended our latest position, **Verisk Analytics** (Nasdaq: VRSK), on July 23, second-quarter 2015 earnings were still pending. We were obviously optimistic enough about the long term to recommend buying before the numbers came in, but it's always nice to see the short term looking rosy as well. The quarter got us off to a great start, with revenue up 18% (including acquisitions), adjusted EBITDA (which excludes nonrecurring transaction costs associated with the recent acquisition of Wood Mackenzie, as well a sizable hedge gain) up 22%, and free cash flow jumping 40%.

VRSK Q2 2015

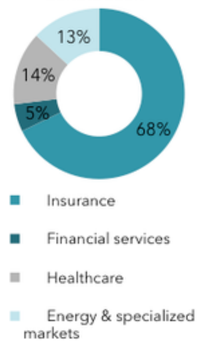
Contribution



In today's Memo, I'm going to analyze our analytics business to see how they like it when the tables are tur- I mean, to give some insight into why we are so excited to welcome this one to the *Pro* portfolio. For earnings details (guidance, valuation, multiples), scroll to the very bottom.

In our buy recommendation, we said Verisk is in the business of "finding truths buried in data and using them to help others make better decisions about risk and opportunities." Here's how that worked out for each division in the second quarter.

Insurance

The May acquisition of Wood Mackenzie, which provides data analytics to the global energy, chemicals, metals, and mining markets, will help accelerate management's plans to further diversify Verisk's business and become a global data powerhouse. For now, though, it's insurance that still brings in most of the business. And business is good.

- **Risk assessment:** Revenue growth here was 6% this quarter, right in line with what we were expecting, and we think Verisk's solutions will continue to dominate their respective markets. The outlook for the division is slow and steady: growth at the rate of the markets it serves, plus a little extra from annual price increases. This should result in 5% to 6% annual growth for this segment for the foreseeable future. That's far from a bad thing when you've got the best margins in the space, not to mention dependable cash flows that can be reinvested back into the business or returned to shareholders through buybacks. Management calls risk assessment its "heritage business," but we think of it as the company's personal cash cow.
- **Decision analytics:** No surprises here, either. Revenue was up a little more than 8% this quarter, below a few analyst estimates, but we're more than happy with this number considering that the segment grew 14% last year. Over the past three years or so, this division has consistently reported quarterly revenue growth in the range of 8% to 12% or so, and we expect similar results going forward. There are new markets to be found and existing markets to be further served, especially as the company increases its focus on international expansion in the aftermath of the WoodMac deal.

Financial Services

The company that accounts for almost all of this division's revenue is named Argus, and it provides competitive benchmarking, scoring solutions, analytics, and customized services to the financial industry. It's a subscription-oriented business, but it's still relatively young (and so are many of its markets), meaning it also brings in project-based revenue. Until the latter customers transition to the subscription model (which we think is highly likely), revenue here will likely be somewhat lumpy. That said, management predicts growth in the high teens going forward, with this quarter actually coming in at 21%.

Health Care

Revenue growth for this division was recorded as 6%, but that number is misleading. Long story short, Verisk changed the language in some of its contracts regarding Medicare Advantage to avoid having to become a "licensed medical provider"; this means the company records less revenue on the income statement, but that's all that it means. This move has no impact on the actual business, nor does it impact segment EBITDA or net income. On a comparable basis, then, revenue actually increased by 19.6%. That's a great sign considering that this division tends to ramp up in the third and fourth quarter each year. We have high hopes for Verisk's health-care business, and so far things are progressing nicely.

Energy and Specialized Markets

As mentioned above, Verisk recently acquired Wood Mackenzie, and thanks to that plus the acquisition of a company called Maplecroft, revenue growth in this division nearly tipped 200% for the quarter. About 62% ($40 million) of that came from WoodMac, though the deal didn't even close until halfway through the quarter.

Impressively, organic growth for WoodMac came in at 10% when measured in British pounds (WoodMac's headquarters are in Edinburgh), despite the turmoil in the commodity markets. That's because most -- 80%-plus! -- of WoodMac's revenue is subscription-based (Verisk knows great minds think alike), with long-term contracts and high renewal rates that hit 98% in 2014. It also doesn't hurt that WoodMac's services actually become more valuable to the customer when times are tough. Asked why WoodMac's growth was so strong given the current environment, Verisk CEO Scott Stephenson said:

> WoodMac content is must-have for their customers. It's absolutely indispensable. ... When an end market gets perturbed the way that it has, there are puts and takes. And everybody likes to talk about the takes ... which is capex temporarily moving down. But the put is that people need to understand this dynamic marketplace even more than before. And as a result ... some of the customer segments, some geographies in the world ... have actually grown quite strongly. ... When you have must-have information, it's going to find its market, and that's what WoodMac is doing right now.

Purchase accounting rules will artificially deflate margins this year, but WoodMac should return to its historical 45% to 47% EBITDA margin starting next year.

Pro's Take

Verisk broke with tradition earlier this year when it issued 10.6 million shares to help finance the WoodMac acquisition. And as we noted in the [trade alert](), while management's goal is a debt-to-EBITDA ratio of 2.5 by the end of next year, we believe that will leave plenty of cash to finance additional acquisitions and/or buy back even more shares. (Happily, Stephenson confirmed our expectations on the call by noting that buyback program should be resumed before the close of 2016.) In fact, the company has already offset some of this dilution -- outstanding share count only increased by 10 million this quarter thanks to the completion of an accelerated share repurchase program.

Verisk is a premium company trading for a premium valuation, but if you compare the stock's current forward multiple to what it's fetched in the past, you'll see why we believe we got a very fair price for our first (and likely not last) purchase. Since its 2009 IPO, Verisk's EV/EBITDA ratio has averaged 14.6. That's less than half of one standard deviation below the company's current forward multiple of 15.1. (Because of the recent acquisitions, trailing-12-month multiples are misleading right now.) In the chart that follows, you can see how the current forward multiple compares to the multiple the stock has fetched since its IPO (blue line).

If Verisk's stock is still trading for the same trailing-12-month multiple (19) next year, it will likely be one of the best, if not *the* best, performers in our portfolio. But we don't need all-time EV/EBITDA highs to ensure our success; in fact, we fully expect that multiple to fall, not because we think the stock price is going down, but because we think year-over-year EBITDA growth will be strong over the next few quarters and the company will be paying down some of its debt using its operating cash flows (which, *ceteris paribus*, reduces enterprise value).

Even if Verisk's multiple falls all the way back in line with its historical average -- which we think is highly unlikely with its prospects so bright -- we estimate we'll still be able to hit our North Star target over the next three years. That said, if it does go on sale, you won't hear us complain. We'd be more than happy to buy additional shares at that price.

Foolishly yours,

-- JP (TMFYossarian)

What's a Bubble?

Published Aug 3, 2015 at 11:00AM

Morgan Housel is Motley Fool One's expert on the intersection of investing, economics, and human nature. He studies the impact of big-picture issues on individual investors' lives — making us better Fools along the way.

The Shanghai Composite stock index doubled from last June to this April. As of a few weeks ago, it was up roughly 60% this year alone.

Then someone turned the lights off.

The index has lost a third of its value since mid-June. Chinese regulators set up a bailout fund to stem the bleeding, which has already erased $3.2 trillion of wealth.

So, let me ask you: Is this a bubble?

The obvious answer is "yes." But no other topic can be as misleading, controversial, or important as whether or not a market is in a bubble. Before we get too excited about this bubble, let's take a minute to appreciate how hard it is to spot one in real time.

On top of a China bubble, smart people say we now have a U.S. stock bubble, a bond bubble, a new housing bubble, a debt bubble, a profits bubble, a Fed bubble, a dividend bubble, a social media stock bubble, and a healthcare bubble.

The word "bubble" didn't exist in economic textbooks 20 years ago, according to Yale economist Robert Shiller. How can a concept that's not even old enough to drink suddenly be everywhere we look?

The fact that no one talked about bubbles two decades ago is why we seem to have so many bubbles today. Since there's no objective definition, anyone can anoint anything they want as a bubble and make a convincing argument that they're right.

Shiller, who won the Nobel Prize for his research on bubbles, took this problem into his own hands.

"It wasn't carefully defined, so I wrote my own definition," he once told NPR.

A bubble is "like a mental illness," he said. "The American Psychiatric Association's diagnostic and statistical manual, which defines mental illness, consists of a checklist of symptoms." For Shiller, the checklist symptoms of a financial bubble are:

- Rapid price increases.
- Investors tell stories to justify the reasons for the bubble.
- People share stories about how much money they're making.
- People feel envy and regret that they didn't participate.
- The media gets excited.

But just as mental illness can be overdiagnosed, a lot of investments could fit this checklist without being a bubble.

Take **Microsoft** (NASDAQ: MSFT) stock in the early 1990s.

A time of rapidly increasing prices? Check. The stock price increased eightfold from 1985 to 1990.

Stories to justify the reason for the bubble? Check. "Superchips Herald a Revolution," *The New York Times* wrote in 1984.

Stories about how much money insiders made? Check. "THE DEAL THAT MADE BILL GATES $350,000,000," *Fortune* wrote in 1990.

Envy for not participating? Check. About 1 in 5 Microsoft employees were millionaires in 1992, "many under the age of 30," one news article pointed out. You can imagine how that made new employees feel.

Buoyant media? Check. The personal computer was *Time* 's Person of the Year in 1982.

It fit Shiller's bubble criteria to a T.

But Microsoft stock in the early 1990s wasn't a bubble. It was an amazing bargain. Anyone who bought Microsoft stock in 1990 has since earned a 5,900% return, versus the S&P 500's 740% gain. What looked like a textbook bubble was *literally the opposite* of a bubble.

Think about **Amazon.com** (NASDAQ: AMZN) in 1998, **Google** (NASDAQ: GOOGL) in 2004, **Netflix** (NASDAQ: NFLX) in 2005, or **Apple** (NASDAQ: AAPL) in 2007. The list of things we erroneously thought were bubbles dwarfs the list of actual bubbles by tenfold, at least. Which is why looking at something like Chinese stocks today, or even U.S. stocks, is always more complicated than it seems.

Everyone knows bubbles exist. We know tech stocks in 2000 and housing in 2006 were swamps of irrationality.

But that's hindsight. And hindsight is a misleading jerk. I promise you, 9 out of 10 people who say the housing bubble was obvious would have given you a different answer in 2006.

Eugene Fama, an economist who shared the Nobel Prize with Shiller, says he knows why this is. He doesn't think bubbles can be predicted. And since they can't be predicted, he doesn't think we can say they even exist.

"The word 'bubble' drives me nuts, frankly," Fama told NPR. He thinks markets are efficient at pricing in all available information, even if in hindsight we know that information was wrong.

"If I can predict that housing prices will go down, if the market is working properly, then they should go down now," Fama said. "Because what you're saying is, 'I have information that prices will go down,' and that information is not in the prices. But if the market is working properly, the information should be in prices."

Sure. But do markets work properly?

On a chalkboard, yes. In reality, of course not. In textbooks, the average consumer spends her day calmly calculating ways to maximize her odds of success. In reality, we're tricked by marketing, terrible at math, fooled by randomness, plagued by bad policy, blind to history, and drunk on courage.

NPR asked Fama, in a sarcastic tone, if he really believed bubbles can't exist.

"I don't think there's any evidence that says anyone can reliably predict when prices go down," Fama said. "So if you interpret the world 'bubble' to mean, 'I can predict when prices are going to go down,' you can't do it."

Shiller rebuts that calling something a bubble doesn't mean you know when it's going to burst, just that it will eventually.

"You can have a fairly high degree of confidence," he said. "That's what I felt in the stock market in the late 1990s. And then again I felt that in the 2000s, with the housing bubble." Anyone familiar with Shiller's work knows he doesn't call timing. He'll be the first to admit predicting what markets will do next is impossible.

Fama is still skeptical. "What happens each time [a bubble bursts] is the media goes in and finds someone who predicted it, and that person gets anointed," he said. "You don't go back and look at past predictions and see if it's just luck."

But doesn't Shiller calling the last two bubbles prove they can be predicted? "Statistical reliability means more than two," Fama said. "Predicting the next 10 would be really convincing. Then I'd be convinced."

Shiller laughed. "Yeah, but I don't live that long."

That's the problem.

Economics isn't like chemistry, where we can conduct thousands of controlled experiments in a lab to prove something exists. So few bubbles have occurred that we don't have enough data to be 100% sure of much of anything. By the time we have enough data to prove a concept, the economist who came up with the original idea is often dead, misquoted, or forgotten. We're left dealing with theories, often shaped by political beliefs.

The biggest problem is that even if a bubble is spotted, it's hard to know what to do about it. It's like a dog chasing a deer who finally catches up to it and has no idea how to respond. Bite? Run? Bark? He didn't think he'd ever get this far. Most bubble spotters aren't content just avoiding them; they try to bet against them. But that can be more dangerous than falling for them. A lot of smart people lost fortunes shorting tech stocks in the 1990s. Even if someone is smart enough to spot an actual bubble, their advice on what to do about it can be disastrous .

If the history of bubbles teaches us anything, it's to be humble.

Many were shocked when Shiller and Fama shared the Nobel Prize, since the two hold what look like opposite beliefs. But they have a common denominator: They both advocate humility. Fama doesn't think we can predict bubbles. Shiller thinks we can, but doesn't think we can ever know when they'll collapse.

What we need, but I know we'll never get, is more of this type of thinking. I'm holding out for a humility bubble. And I have no idea what Chinese stocks will do next.

Facebook's Dominance Is Still Just Beginning

Published Jul 31, 2015 at 4:39PM

> *If you go back 10 years, most of how people communicated and shared was text. We are going through a period where now it's mostly visual and photos. We are entering into a period where that's going to increasingly be primarily video, and we're seeing huge growth there.*
>
> *But that's not the end of the line. There's always a richer way that people want to share and consume thoughts and ideas, and I think that immersive 3-D content is the obvious next thing.*
>
> *— Facebook CEO Mark Zuckerberg*

Social network king **Facebook** (NASDAQ: FB) reported second-quarter results on Wednesday that demonstrated its continued dominance in online advertising. The results were good, and we think the opportunity to expand its core business looks even better.

But the company is also investing heavily into richer forms of content and a few initiatives that could change the world of online advertising as we know it. This is the stuff to keep in mind as you look at Facebook's expenses for the quarter. In contrast to Wall Street's initial disappointment over short-term margin contraction, we're satisfied that Facebook is doing what it takes to beef up its hefty competitive advantage today and lay the groundwork for potentially revolutionary ways of reaching its users tomorrow.

We'll get back to those world-changing initiatives in a minute. Let's first take a look at this quarter's results, which you can also review in this company presentation.

The Numbers

Revenue increased 39% to $4 billion, with $3.8 billion of that still coming from the company's core advertising business. Mobile accounted for 76% of total ad revenue, yet another increase.

Facebook's pace of growth during the past decade has been incredible. But perhaps even more impressive is the growth potential for its core business. Nearly half of the company's ad revenue — some $1.8 billion — currently comes from the U.S. and Canada. There are 213 million active users in this region, and the average ad revenue per user is $8.63. Compare those numbers to Asia-Pacific, where there are more than twice as many users (496 million) but the total ad revenue is only $600 million and the average ARPU is only $1.25. There are still *plenty* of future profits to be had as Facebook optimizes its advertising platform internationally.

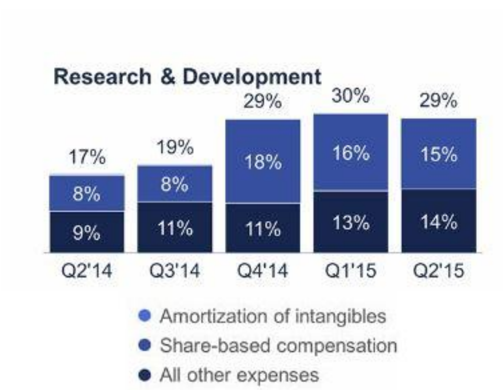
Monthly active users have reached 1.49 billion, and daily active users have reached 968 million. The percentage of users who sign on daily is increasing, indicating that engagement remains high and Facebook is still highly relevant.

DAUs / MAUs

Q2'13	Q3'13	Q4'13	Q1'14	Q2'14	Q3'14	Q4'14	Q1'15	Q2'15
61%	61%	62%	63%	63%	64%	64%	65%	65%

Rounding out revenue, the "Payments and Other" segment clocked in at about $215 million. Those who use the site regularly may have noticed that Facebook is now promoting its Payments feature, which allows users to send money directly to one another — while storing users' bank account information, which would make future purchases that much easier for them. The company is also beta-testing a Buy button on certain pages that would let users purchase directly from advertisers.

Expenses, meanwhile, *significantly* outpaced revenue this quarter. On a GAAP basis, total expenses increased 82%, causing operating margin to fall from 48% to 31%! A good chunk of those expenses come in the form of stock-based compensation ($763 million) and the amortization of intangibles ($180 million), largely related to Facebook's $22 billion acquisition of WhatsApp last fall.



Components of Facebook's R&D expense. Source: Facebook investor presentation.

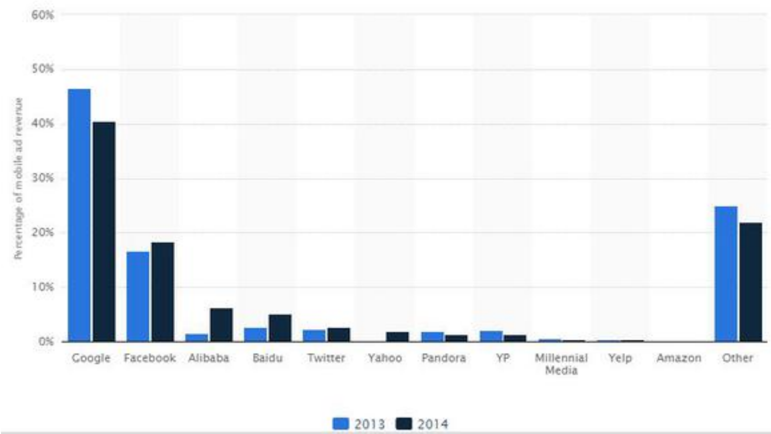
But even excluding those non-cash costs, expenses still rose 57% on a non-GAAP basis, which tightened the operating margin from 60% to 55%. In the grander scheme of things, having an operating margin of *only 55%* is hardly a problem. Facebook's core business is an absolute cash cow, churning out a steady stream of profits that the company can use to expand into other endeavors.

The Priorities

COO Sheryl Sandberg outlined the company's top three priorities for investing that profit stream: capitalizing on mobile, growing the number of advertisers, and making ads more relevant. Note that each of these programs would make Facebook's core platform even stronger.

1. Capitalizing on Mobile

In the conference call, Sandberg said Facebook now gets one out of every five smartphone minutes used in the U.S., as its video advertisements have been a huge hit with mobile. At last glance, Facebook has been aggressively winning share, pulling in 18.4% of the $40 billion total mobile Internet advertising market last year. Facebook's gains have come largely at the expense of **Google** (NASDAQ: GOOGL) and a fragmented collection of competitors.



Source: Statistica.

Not only is Facebook winning, but mobile is a lucrative market that is growing extremely quickly. The global mobile ad spend is already expected to nearly quadruple between 2014 and 2019, reaching almost $200 billion (if this statistic didn't blow your mind at first glance, read it again).

Mobile Internet Ad Spending Worldwide, 2013-2019

	2013	2014	2015	2016	2017	2018	2019
Mobile internet ad spending (billions)	$19.20	$42.63	$68.69	$101.37	$133.74	$166.63	$195.55
—% change	117.9%	122.1%	61.1%	47.6%	31.9%	24.6%	17.4%
—% of digital ad spending	16.0%	29.4%	40.2%	51.1%	59.4%	65.9%	70.1%
—% of total media ad spending	3.7%	7.8%	11.9%	16.5%	20.5%	24.1%	26.8%

Note: includes display (banners, video and rich media) and search; excludes SMS, MMS and P2P messaging-based advertising; ad spending on tablets is included
Source: eMarketer, March 2015

186887 www.eMarketer.com

Source: eMarketer.com

By the end of next year, mobile will account for the majority of all digital advertising. Facebook is rightly taking notice, continuing to invest in and improve its mobile user experience.

2. Increasing the Number of Advertisers

Not surprisingly, businesses have identified the power of Facebook's network effect. More than 40 million small and medium-sized businesses now have their own Facebook pages. Sandberg explained that setting up a page is now easier and cheaper than even launching a small-business website, while still capturing a wider audience and building brand recognition:

> *"If we look at even in the United States, which is a very advanced market, I think it's something like 35% of SMBs don't have a Web presence of any kind. But a great majority of those do have a Facebook page, and that's because setting up a Web presence for an SMB is complicated and expensive. You can't just start a Web page. But it is easier and free to start a Facebook page until you see broad adoption."*

Facebook today is focusing on getting businesses and advertisers to build a presence on their site. As I alluded to above, its next step will be building out the Buy button.

3. Making Advertisements More Relevant

Once again, we saw a sharp increase in the price Facebook charged per advertisement, complemented by a decrease in the total number of clicks. Cost per click (whose definition the company recently changed) increased 220% year over year, while the total number of clicks decreased 55%. The company is getting more targeted in its advertising, showing "the right ad to the right person at the right time."

	Q2 2015	Q1 2015	Q4 2014	Q3 2014	Q2 2014
Price Per Ad (Y/Y % Change)	220%	285%	335%	274%	123%
Total Ad Impressions (Y/Y % Change)	(55%)	(62%)	(65%)	(56%)	(25%)

New advertising products, such as carousel ads (multiple images in one ad unit), dynamic product ads (upload a full catalog, then match products with users), and lead ads (allow users to connect with companies) are unlocking additional value and boosting prices.

We'll expect to see Facebook continue to focus on targeting advertising in future quarters.

The Bigger Picture

Facebook's user base is not only growing, but it's also discovering the platform in different ways. About 300 million people use Instagram, 700 million use Messenger, and 800 million use WhatsApp on at least a monthly basis. The company recently celebrated the first anniversary of Internet.org, which has provided free basic Internet service to more than 1 billion people across 17 countries. Facebook's user base of 1.5 billion people will likely be going nowhere but up.

So we have a company that has established itself as a global phenomenon, with a dominant competitive advantage that is only getting stronger.

Where does Facebook go from here?

The first step appears to be making a fundamental change in the way potential customers communicate online with advertising businesses. Today's methods are fairly simple: We research products we're interested in and read reviews from others who have already purchased. But Zuckerberg sees Facebook strengthening the relationship between buyers and sellers — similar to what customers experience when walking into a bricks-and-mortar location today:

> "Right now, some people in WhatsApp use the service in order to message businesses, [where] Messenger is more people-to-people today. We're working on a lot of different things that make it so that people can get value from interacting with businesses. The long-term bet is that by enabling people to have good organic interactions with businesses, that will end up being a massive multiplier on the value of the monetization down the road when we work on that and really focus on that in a bigger way."

At first glance, this sounds like the live chat features already available on several e-commerce sites. But let's not forget that we're talking about Mark Zuckerberg here. This is the same visionary leader who spent $24 billion over the past two years acquiring Oculus and WhatsApp to bring richer content to a larger audience.

The Oculus Rift will begin shipping to consumers in the first quarter of 2016, which is only six months away. Zuckerberg is already promoting it as the world's best available virtual-reality experience. I expect the number of headsets sold will be in the millions, and they'll be incredibly well-received -- especially by gaming enthusiasts.

Since Facebook's primary business is still in advertising, I suspect that Oculus will complement Facebook's core competencies by allowing advertisers to interact directly with users over the site. This essentially breaks down the "window-shopping" that customers have done, to the chagrin of electronics retailers such as **Best Buy** (NYSE: BBY), for years. No more looking at and test-driving products in the store, then buying them online for a better price. With Facebook, retailers wouldn't need the physical locations at all — they could just demonstrate products directly to customers in virtual reality.

We're still very early in the transition. But Zuckerberg has dropped enough hints to suggest that Oculus and WhatsApp will have a much bigger impact than many who scoffed at their initial acquisition cost are currently giving them credit for.

The Foolish Bottom Line

Facebook remains a Buy in *Pro*, with a current 5.1% allocation. Our fair-value estimate increases to $84. To discuss this *Pro* recommendation, please visit our Facebook board. -- *Jeff Fischer*

Starbucks' Quarter Gives Investors a Jolt

Published Jul 30, 2015 at 1:48PM

Despite meaningful foreign currency headwinds and the challenges of taking full ownership of Starbucks Japan, the coffee giant has once again posted results that more than lived up to our expectations. Starbucks served an additional 23 million more customers at locations that have been open for at least 13 months, and its latest class of stores is shaping up to be one of its best in recent memory.

SBUX Q3 2015

Consolidated Results

		change

P/E	32x	31x

EV/EBITDA 19.6x 17.2x

Investment Thesis

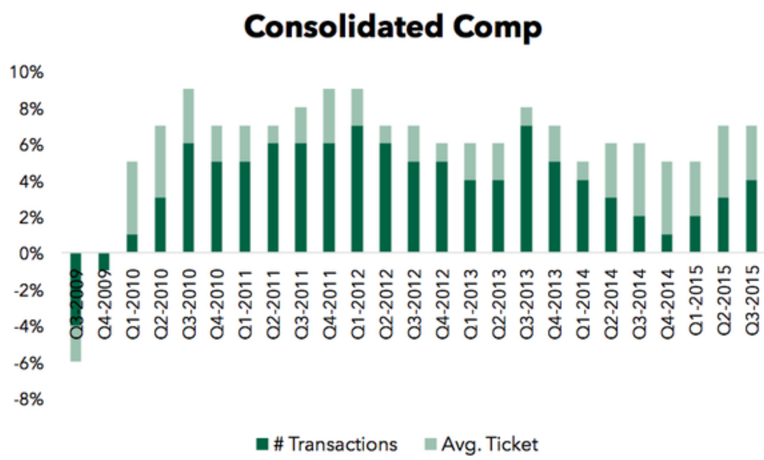
Starbucks (NASDAQ: SBUX) offers a unique blend of sales drivers (domestic and international growth, food and beverage innovation, and channel development, just to name a few) and cost-reduction opportunities (payment innovation, European restructuring, expansion of consumer product margins). We believe the coffee is just a gateway for the company to repeatedly sell customers an experience rooted in comfort, quality, health, community, and conscience. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand into new products, new platforms, new times of day, and new brands. We expect new store openings across the globe to strengthen the company's brand and cost-based competitive advantages and improve profitability over time.

With a company as large as Starbucks, you might think there isn't much more room for growth. But you'd be wrong. As laid out during the company's most recent Biennial Investor Day presentation, management believes that within five years, Starbucks will increase its store base to more than 30,000 global locations (up from 22,088 today), achieve $30 billion in annual revenue (up from $17.7 billion TTM), and double its annual operating income. Given the global strength of the Starbucks brand, we believe that this is definitely possible.

Results

Comparable-Store Sales

	Q3 2015			Q3 2014		
	Sales growth	Change in transactions	Change in ticket	Sales growth	Change in transactions	Change in ticket
Consolidated	7%	4%	3%	6%	2%	4%
Americas	8%	4%	4%	6%	2%	4%
China, Asia, Pacific	11%	10%	1%	7%	6%	1%
Europe, Middle East, Africa	3%	2%	1%	3%	2%	2%



Americas

This quarter proved once again that Starbucks still has legs here in the States. Transaction volume was up an impressive 4%, along with a 4% increase in average ticket size. Starbucks has demonstrated an ability to continually raise prices without seeing much in the way of customer attrition, but the largest contributor to the 4% increase in average ticket was not price hikes -- it was customers voluntarily trading up to more expensive items as well as adding additional items to their order. Growth in ticket size is extremely important because there are limits to the number of people a given store can serve, not to mention the number of people who are interested in going to Starbucks in the first place. So we shouldn't expect this type of transaction growth to continue indefinitely. In fact, management made a point of trying to temper expectations about the future somewhat and noted that analysts should be modeling for an overall comp number in the mid-single digits with a "modest" increase in traffic.

One of the key contributors to the growth in the average ticket size this quarter was the continued increase in the number of people purchasing food from Starbucks. Food contributed more than two points to the U.S. comp this quarter, with breakfast sandwiches doing particularly well. Management noted that only half of the 30% growth in breakfast sandwiches came from an increase in attach (customers adding food to their order), suggesting that we're actually seeing meaningful growth in the number of people who are only looking for something to eat swinging by their local Starbucks on their way to work in the morning.

Member growth in the My Starbucks Rewards program was an impressive 28% this quarter, and the increase in gold members was even better (32%). Management also gave more color on its latest MSR initiative -- partnering with other businesses to let them to purchase Stars from Starbucks and distribute how they see fit. It's a win for these businesses because they can use these Stars to acquire and retain customers, and it's a win for Starbucks because it provides a new source of revenue and because it helps further integrate Starbucks into its customers' daily lives, which we always love to see. So far, Starbucks has partnered with Spotify, The New York Times, and Lyft, and as usual, the company has ambitious plans for this latest initiative.

Starbucks hit another milestone this past quarter -- 20% of its in-store transactions took place using mobile payments. And the tests of Mobile Order & Pay came in above expectations, with the service helping to improve store performance even in the busiest of Starbucks locations (a great stress test). The company is accelerating the rollout, with the goal of offering it at every store in time for the holidays.

China, Asia, Pacific (CAP)

Excluding the $309 million of incremental revenue from the acquisition of Starbucks Japan, revenue growth for the CAP region was a robust 20%. The company has opened 615 stores so far this year in the region, and management noted on the call that the latest class of stores is tracking to be even more profitable than those that came before. Apple isn't the only company in our portfolio that can stir up excitement when it opens a new store overseas -- there was around 1,000 people (and 50-plus reporters) waiting in line when Starbucks opened up its first store in the Tottori Prefecture.

Since Starbucks didn't complete the acquisition of Starbucks Japan until late 2014, stores in this country won't be included in the CAP comp until the beginning of next year. COO Kevin Johnson mentioned that the Japanese quarterly comp numbers were among the strongest in the past few years, but I'll be interested to see how they look once the stores are included in the comp base. (And since we have a pretty good handle on what the rest of the region is doing, we'll be able to get a rough estimate of how the Japanese stores are doing even if management doesn't provide us with actual numbers.)

Europe, Middle East, Africa (EMEA)

Despite significant foreign-currency headwinds and other challenges, Starbucks was able to report a 3% comp in EMEA. This was the ninth consecutive quarter of positive growth, and while this pales in comparison to the 22 straight quarters of 5% or greater comp growth for the overall company, I do believe it's a sign that the shift in EMEA business strategy is paying off. Excluding the $44 million in currency headwinds, sales for the quarter actually increased 5%.

Channel Development

It was business as usual in channel development, with revenue for the division up 8% as the company continues to take market share in the K-Cup category. And this is in spite of the fact that competition continues to heat up in this space. Starbucks also announced that it will be partnering with PepsiCo to bring the Bucks' ready-to-drink coffee and energy-drink portfolio to Latin America, where the company estimates a market of about $4 billion. The plan, which is similar to the deal the company stuck with Tingyl to expand its ready-to-drink offerings in Asia, is to start distributing beverages next year.

Pro's Take

A lot of factors come into play when deciding where to buy your next cup of coffee, hamburger, milkshake, etc. One of those factors helps explain the immense popularity of restaurant chains: familiarity. When you go into an Applebee's, for example, you generally know what the food will taste like, how long it will take to arrive, and so forth. There's something to be said for that knowledge. And in some ways, this is how we felt after going over Starbucks' latest results. The results felt somewhat familiar because the company has been firing on all cylinders for awhile now.

We think the market agrees with us on that: Even after factoring in the acquisition of Starbucks Japan, the multiples at Starbucks stocks continue to inflate (some are a sip or two away from 10-year highs). In isolation, this data point doesn't scare us; we believe the outlook for the company is extremely bright. But because the market is far more mercurial, we could see a meaningful sell-off should Starbucks not live up to the market's lofty expectations at some point in the future. Something like this wouldn't decaffeinate our confidence in the business, but it doesn't hurt to be prepared for such a move ahead of time.

As far as the business is concerned, we continue to be impressed with the rate of MSR adoption, growth in food sales, and Starbucks' international expansion opportunities. We expect more great things on the horizon for the company, which is why it remains a Buy on our scorecard even though the current price is still meaningfully above our revised estimate of fair value.

No V-Shaped Recovery for Valmont Industries

Published Jul 30, 2015 at 10:43AM

What's a management team to do when everything that can go wrong, does go wrong? In **Valmont Industries'** (NYSE: VMI) case, they put their heads down and keep doing what's made the company successful for the past few decades.

Between currency headwinds, weak public spending on infrastructure, depressed crop prices hurting farm profits, falling commodity prices crushing miners, and a double dip in oil prices crimping productions, nearly all of Valmont's end markets are suffering – and if that's not enough, why don't we throw in currency headwinds for good measure. At this point it should be little surprise that Valmont reported its third earnings miss in a row as profitability continues to suffer from declining sales and increased restructuring costs.

It's amazing, though, that a high fixed-cost manufacturing business like Valmont has been able to remain profitable through this malaise. Though sales declined 19% over last year's quarter, the company still managed to deliver a 9% operating margin. I think that speaks to both the resiliency of the business and quality of the management team that is navigating this unusual confluence of cyclical soft spots across the business.

Turning to the business segment updates -

- **Engineered Infrastructure Products** (37% of sales) – Currency headwinds and order delays for both wind turbine structures and offshore drilling equipment hurt sales again this quarter. The highway bill remains stuck in Congress, which continues to restrict states' willingness to move forward on many transportation projects. As a result the company remains focused on growing its commercial customer base.

- **Utility Support Structures** (23% of sales) – Quoting activity for large projects has recently increased. Pricing on small projects remains competitive and management decided to raise prices on bids for these projects rather than writing unprofitable business. I respect management's decision even though it will hurt sales volume in the near term. It makes more sense to figure out how to cut costs and run a profitable business rather than accepting thin margins just to keep the plants running. It'll be interesting to see how competitors respond

- **Irrigation Systems** (22% of sales) – Management reported that even though sales volume has dropped significantly, the industry is maintaining a surprising amount of pricing discipline and market share is remaining fairly consistent. Valmont and Lindsay are so dominant in this industry that this statement feels a bit like management is signaling. Last year's second and third quarter were boosted $15 million both quarters by an unusually high amount of storm damage. Also, currency weakness in Brazil and changes to the government's subsidized loan program hurt demand.

- **Coatings** (11% of sales)– Weak demand for custom projects in the U.S. and fewer internal orders from the Irrigation and Utility segments. The company idled its Australian coatings plant and recorded an impairment charger

Restructuring Progress

In the quarterly conference call, management was clear that it doesn't expect any near term catalysts for the business, but they're focused on streamlining the business and managing those variables they can control. Management is focused on cutting costs and restructuring the business's global footprint, a move which will result in $30 million of cash and non-cash charges and is expected will deliver $20 million of incremental operating income by 2016. So far this year they have closed, consolidated, or repurposed several plants and they expect to have the majority of the restructuring completed by the end of the year.

Though management claims that despite the facility rationalization, they are maintaining excess capacity to be able to respond quickly to a rebound in demand, I'm a bit concerned about underinvestment. Management believes that maintenance capex is $40 million and they are planning to spend $55m over the next two years, but D&A is expected to be $95 million this year. When the cycle turns, the company should see significant operating leverage as it spreads growing revenue over a smaller fixed cost base, BUT (and that's intentionally a big "but") at some point they'll have to increase capex to meet demand which could be a disproportionate drag on future free cash flow. This is something we'll need to watch closely when the cycle eventually turns.

Where From Here?

Big picture, Valmont's balance sheet remains strong with $317 million and no debt and the company generated $61 million of cash flow from operations this quarter. That means management has the ability to make opportunistic investments if the downturn worsens, rather than only playing defense. Over the past year the company has reduced its diluted share count by 13% and is has $234 million remaining in its repurchase authorization which, at today's market prices, could knock out an additional 9% of the share count. When the cycle eventually turns, this reduction should provide additional leverage on per share metrics.

Based on today's tough operating environment it's difficult to imagine where Valmont's business is going to be a year from now, but looking out 3 to 5 years it's not a stretch to believe that this company will be substantially more valuable. Most investors maintain a watch list of high quality business that they'd love to buy on a pullback, but Valmont is a great case study to show why that strategy is always more difficult in practice. Though it's difficult to see a losing position on the scorecard, I think the potential upside from this point significantly outweighs our risk of a permanent capital impairment. This remains a high quality, well-managed business that still deserves a spot in the Pro portfolio.

Catch-Up Trade: Put Ratio Spread on the SPDR S&P 500

Published Jul 29, 2015 at 12:03PM

Is this for you? This is only for *Pro* members who (like *Pro*) have **not yet** set up the October 2015 put ratio spread recommended last month on the **SPDR S&P 500** (NYSEMKT: SPY) ETF. We're adjusting our lower strike price so we can make the trade at a credit, and this is a good catch-up point for anyone who's not yet in the trade. Members already in the trade should sit tight -- you're good!

How You Participate

- **Action:** Set up a put ratio spread on the SPDR S&P 500 ETF.
- **Allocation:** 11% of total portfolio value. Set up one 2:1 put ratio spread for every $200,000 you manage and want to hedge. *Pro* will sell 28 puts and buy 14, hedging 11% of our entire portfolio value (our cash included).
- **Trade:** Write ("sell to open") **two** October 2015 $191 puts. (Our price was $187 originally, and members who already sold those puts don't need to change.) Simultaneously, buy ("buy to open") **one** October 2015 $200 put for every $200,000 you're hedging. Click "view all" at your broker to see all strike prices.
- **Price Guidance:**
  - Sell to open *two* October 2015 $191 puts: Lately $1.35 x 2 = $2.70 credit
  - Buy to open *one* October 2015 $200 put: Lately $2.67 debit
  - **Net credit:** Lately about **$0.03** per spread (but this price will change; ideally just aim for a credit, or no cost, using a limit order)
  - SPY price (10 a.m. ET): $209.50

Our existing spreads: We continue to keep our Sept. 30 spread in place. No action is needed on that one. This October 2015 spread will complement that one.

What We're Thinking

Within hours, if not minutes, after we issued our new put ratio spread recommendation on SPY last month, it became impossible to achieve the trade for a net credit. This appears to be because too many members failed to use limit orders to set up the trade. Even on an ETF as gargantuan as SPY, groups such as ours can influence options prices if we don't use limit orders. Why? Because professional market makers (who provide liquidity and are usually the ones on the other side of your option trade) can see every order out there, and if they suddenly see hundreds of retail orders like ours coming into the marketplace, especially ones without limit orders, they'll take advantage. They make more money on sloppy investing. So: ***Please use limit orders on any order you place.***

Although this hedge should help us if the market falls by our expiration, I have not been eager to set it up for a debit, so I've waited. We'll now aim to set it up tomorrow (after our 24-hour wait period), ideally for a small net credit again (or, at least, no cost). That's only possible now if we change one of our strike prices. We're moving our lower strike price up $4 to $191, from $187. This lowers the potential profit on the trade, and exposes us to a possible SPY purchase at a higher price, but we're still comfortable with the trade. The break-even on this hedge is $182 -- is close to the maximum profit on our September hedge, which is at $185.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value (10 a.m.): $2,576,000
- 11% of that value: $283,360
- October 2015 spread:
  - Buy to open $200 puts. Fourteen contracts representing 100 shares each = $280,000 in look-through exposure, or an 11% hedge on our current portfolio value, cash included.
  - Sell to open $191 puts. That's 28 contracts, half of which become a potential $267,400 obligation, currently a 10.4% possible stake.
  - At home, you would buy one $200 put and sell two $191 puts for approximately every $200,000 in portfolio value you want to hedge.

Return Details

SPY Price at October Expiration	Value of 1 Purchased $200 Put	Value of 2 Written $191 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Current $209.50
$200 or higher	$0	$0	$0.03 gain per spread, or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 4.5%
$195	$5 x $100 = $500	$0	$500	(6.9%)
$191	**$9 x $100 = $900**	**$0**	**$900**	**(8.8%)**
$185	$15 x 100 = $1,500	($6) x 200 = ($1,200)	$300	(11.7%)
$182	$18 x 100 = $1,800	($9) x 200 = ($1,800)	$0 (breakeven)	(13.1%)
$180	$20 x 100 = $2,000	($11) x 200 = $2,200	($200)	(14.1%)
$175	$25 x 100 = $2,500	($16) x 200 = ($3,200)	($700)	(16.5%)
$170	$30 x 100 = $3,000	($21) x 200 = ($4,200)	($1,200)	(18.9%)

Our maximum profit is earned on this October spread if SPY declines 8.8% from its current perch above $209. The spread will help us a little on a decline all the way to about 13%; beyond that, our short puts turn into an obligation that's in the red.

Follow-Up

Assuming we set this spread up for a credit, it will result in a small profit even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $191 put obligation if SPY is below that price by expiration.

However, if that does happen, our plan would likely be to close our puts and buy long-term SPY calls (or perhaps something we like even better, whether calls or stock) instead of buying the ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY itself. We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases.

How It Fits Into *Pro*

Pro consistently hedges to lower our market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and our guide is inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market makes a difference. Even small gains add up over the years, especially if those gains are reinvested in depressed stocks. This hedge fits well with our goal of hedging in a cost-efficient way, one that doesn't work against us if the market rises.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:**
  For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, as we are, "buy to open" October 2015 $200 puts and "sell to open" *an equal number* of October 2015 $191 puts. Recently, this will cost you around $1.32 ($132) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $9 ($900) per spread on a decline to $191 or any lower price, but you should be prepared to lose your $1.32 per spread if SPY doesn't decline to at least $198.68 by expiration.
- **To lower your market exposure while following our official trade (and make the position possible in some IRAs):**
  Set up the original put ratio spreads as recommended, but also "buy to open" puts (with the same months of expiration as our two spreads) at strike prices *well below* $191. Buy *half as many* as the number of $191 puts you wrote. When you do so, all of your $191 puts will be "covered" (half by your $200 puts, and half by the other puts you choose to buy at a much lower strike; choose how much you want to pay to select your lower strike price). You will only need cash in your account to cover the difference between your two lowest strike prices, and your risk is capped, making this potentially IRA-friendly.

- **Want to talk about SPY?** We have a discussion board for that.

Product Over Profit

Published Jul 28, 2015 at 10:00AM

Morgan Housel is Motley Fool One's expert on the intersection of investing, economics, and human nature. He studies the impact of big-picture issues on individual investors' lives — making us better Fools along the way.

Which of these two (real) companies would you invest in?

The first boasts in its annual report that it has a single goal: "Maximizing shareholder value."

A few lines later, it promises: "We are deeply committed to building the value of the Firm ... in everything we do, we are constantly identifying and evaluating ways to add value."

After discussing ways to boost the company's share price in a conference call, the CEO emphasizes that "our goal is simple; that's to create value for our shareholders."

The other company takes a different approach.

Its annual report states that the business "was not originally created to be a company." Customers who are key to its future "believe in something beyond simply maximizing profits," it reads.

Its CEO once stated bluntly, "We're definitely not in it for the money," and admitted to a friend that "I don't know business stuff."

One analyst wrote that management simply "doesn't care that much about making money."

What are these companies?

The first is Lehman Brothers, just before it went bankrupt in 2008.

The second is **Facebook** (NASDAQ: FB), just before it went public in 2012 and started generating billions in profit.

I cherry-picked this example. But if you look closely you will find something similar across most businesses.

Companies that focus on profits often lose customers, while companies that focus on customers often find profits.

This is a key theory we think a lot about at The Motley Fool.

Many of us are, for the most part, more interested in companies that focus on customers, employees, and shareholders (usually in that order) rather than companies whose sole priority is maximizing shareholder value.

This isn't because we don't care about making money. It's just the opposite.

Amazon has consistently sacrificed short-term profit in the name of creating the best products in the industry. Far from hurting investors, shares surged 1,100% in the last decade.

Before **Google** (NASDAQ: GOOGL) (NASDAQ: GOOG) went public in 2004, it warned investors that it would do "good things for the world even if we forgo some short term gains." That ethos allowed it to build one of the most profitable businesses in the world, earning a cumulative $91 billion in profit since going public and sending shares up 895%.

Biographies of Steve Jobs portray a man largely indifferent to money, frustrated by corporate cultures that worshiped short-term profits. Instead, 100% of his focus went toward building phenomenal products. This has, of course, turned Apple into the most profitable company the world has ever known.

Start with a relentless drive toward serving customers, and profits will find their way.

Lehman Brothers, on the other hand, went bankrupt because a singular drive for profits led management to bury the company's balance sheet with $30 of debt for every $1 of net worth, which scared away enough customers in late 2008 to bankrupt the whole firm.

General Motors also lost its way when the "car guys" were overrun by the "bean counters" and profits took precedence over products, as former vice chairman Bob Lutz put it. He elaborated:

> Leaders who are predominately motivated by financial reward, who bake that reward into the business plan and then manipulate all other variables in order to "hit that number," will usually *not* hit the number, or, if they do, then only once. But the enterprise that is focused on excellence and on providing superior value will see revenue materialize and grow, and will be *rewarded* with good profit.

These are enormously complicated topics prone to generalization and confusing of correlation with causation. All businesses need a balance between customers and shareholders.

But the broader message, I think, is important. Lehman Brothers obsessed over profits and failed miserably. Facebook obsessed over products and flourished -- with incredible profits and shareholder wealth as a result. Neither is a coincidence, and the comparison says a lot about what it takes to become a profitable company.

Pro Catch-Up Trades: July 27, 2015

Published Jul 27, 2015 at 2:15PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

- **WisdomTree Emerging Markets Small-Cap Dividend Fund** (NYSEMKT: DGS): Feeling bold? Feeling Foolishly contrarian? As emerging markets fall, you can buy into our emerging markets ETF if you lack current exposure. We have a 1.8% stake in this top-rated international dividend ETF. We simply have to have a long-term perspective. We may add to our stake if prices get really juicy.
- **Oracle** (NYSE: ORCL): Software is in the doghouse, but Oracle is built to last. If you lack exposure, you can buy shares up to our 3.6% allocation.

Apple Beats Estimates but Investors Want More

Published Jul 27, 2015 at 2:02PM

Despite exceeding expectations, **Apple**'s (NASDAQ: AAPL) third-quarter results didn't seem to please investors. The iEverything giant crushed Wall Street estimates: Earnings per share increased 45% over the prior year; revenue, 33%. However, the report included a few items that left analysts wanting, which led to the stock's decline.

Let's take a look at the key takeaways from the conference call.

iPhone

The company's key product sold 47.5 million units during the quarter, which was up 35% year over year. iPhone revenue outpaced volume growth and was up 59% owing to a $99 increase in average selling price. Compared to the previous quarter, unit volumes were down 22%, which seemed to surprise some of the analysts on the call. This decrease is normal for a relatively new product, but the drop was slightly greater than what we've seen in the past, which added pressure to Apple's stock price.

The popularity of the phone and its importance to Apple is staggering. For the consolidated quarter, the iPhone accounted for 63% of total sales. An interesting statistic mentioned by CEO Tim Cook was that roughly "27% of the installed base of customers prior to the launch of the 6 and 6 Plus have now upgraded." He went on to say that the company views this "as a very bullish sign on the future that there's a lot of headroom left for upgraders. We also are incredibly happy to see the highest Android switch rate that we've observed."

iPad and Mac

The iPad continues to struggle as unit volumes declined 18% and revenue dropped 23%. Management boasted about very positive customer satisfaction metrics for the iPad, but we aren't seeing that reflected in the financials. The enterprise segment continues to be a focus, and **United Airlines** (NYSE: UAL) has renewed its contract to provide iPads for pilots. There's certainly some overlap now given the iPhone 6 Plus isn't much smaller than the iPad Mini, so consumers are opting to use their phones more, lessening the need for a tablet. That said, the positive customer satisfaction metrics provide evidence that iPad sales could tick up as replacement cycles — which are longer than the phone — come due.

Mac units sold increased 9% over last year as the company continues to grow its share of the PC market. Revenue growth matched volume growth for the product.

Services, Other Products, and Capital Return Program

Service revenue was up 12%, reaching a record $5 billion in sales. Management mentioned particular strength in China, where sales doubled over last year. As of the end of the quarter, the China App Store has 250,000 apps that customers can download.

Apple Music is less than a month old. The service has been launched in over 100 countries. Apple Pay was launched in the U.K., and **American Express** (NYSE: AXP) will now support the service for its corporate clients. Neither of these services will likely have a huge impact on cash flow; however, they both add to the premium ecosystem the company has developed, which keeps people coming back to its products.

It's pretty clear given the questions on the conference call that analysts were hoping to hear unit volumes for the Apple Watch. Management isn't disclosing those figures so as to not hand over valuable information to competitors. That said, they did shed some light on the popularity of the newest gadget. The overall category grew sales by

49%, and the Apple Watch accounted for more than 100% of this growth. That might sound odd to you — more than 100% of the growth — but that's because the Watch's growth more than offset the decline in iPod and sales of accessories.

Finally, Apple's sticking to its commitment to reward shareholders. The company paid out $3.1 billion in dividends and bought back $4 billion worth of stock in the open market. As of the quarter's close, the company has executed on $126 billion of its $200 billion capital return initiative.

The *Pro* Bottom Line

Apple remains a Buy in *Pro*, with a 4.3% allocation and a fair-value estimate of $126. We'll be updating our valuation this quarter, and it will likely move higher. We continue to believe the mobile computing industry is in relative infancy, and Apple is the most innovative company in the space — and is by far the most profitable. Our company also has more cash than most *countries*, and is able to acquire disruptive companies and technologies, as well as return funds to shareholders. Although its enormous size (relative to the size of companies historically, but not necessarily in the future) brings unique challenges, we continue to believe the investment can challenge, or top, the North Star on a rolling three-year basis. -- *Jeff Fischer*

A World of Hurt?

Published Jul 27, 2015 at 1:03PM

In our trade alert for **World Acceptance** (NASDAQ: WRLD), we focused largely on the ominous Consumer Financial Protection Board investigation and on the changing moods of World's creditors. But as we noted in our follow-up Monday Memo, World's core U.S. business isn't exactly firing on all cylinders. So we weren't surprised when we saw that the company's first-quarter fiscal 2016 results had very few bright spots. That said, we *were* surprised to see the stock finish 11% lower on the day (at one point it was down almost 19%!).

The Results

Net income rose 4.8% and EPS rose 16.7% because of cost-cutting (including provisions for loan losses, which fell 15.1%) and because the company has reduced the weighted average of its diluted shares outstanding by 10.2% since Q1 of fiscal 2015. One of the main reasons we decided to establish our position was that we believed World's creditors were unlikely to permit the company to repurchase any shares until the CFPB investigation was completed, and this hunch proved to be correct -- the company did not repurchase any shares this past quarter.

Net income also benefited from the sale of accounts that we previously charged off, to the tune of $1.1 million (the company recognized $1.8 million in revenue, and management has previously commented that the margin on these sales is around 63%). This move also helped the company's ratio of net charge-offs to average net loans improve to 11.9% from 12.7% last year. At first glance, this looks like a sizable jump in the right direction, but if you want to make an apples-to-apples comparison, you need to include those accounts that were sold. When you do this, you'll see the ratio was essentially unchanged at 12.8%. Interestingly, the buyer of these accounts has already contacted World because the accounts' early performance has been worse than expected. The sale was expected to generate about $1 million per month for World for a year and a half, but if performance doesn't improve, the timing and/or amount World ultimately receives will come into question.

Revenue fell 6% on a 5.5% decline in interest and fee income and a 9.5% decline in insurance and other income. Gross loans decreased 1.2% to $1.15 billion, a theme as of late, though a weak Mexican peso helped contribute to this decline. On a currency-neutral basis, management attributed the weakness to lower volumes and a higher number of accounts 60-plus days past due (the company stops accruing revenue on an account once this happens). Obviously, neither factor is desirable for the company. New customer volume continues to highlight the difficulty World is having in attracting new customers – it was down about 4.8% quarter-over-quarter.

Other Notes From the Call

- Management no longer believes the earnings-per-share target of $16 per share is achievable by March 31, 2017 and has stopped providing guidance.
- The company has finally started to embrace technology and is working on updating its website (which is sorely needed -- you couldn't access a branch locator online until last year!).
- Management doesn't plan on asking for approval to repurchase shares until they get more clarity surrounding the CPFB investigation. But they do believe they have more than enough capital to continue with their growth strategy.
- Based on World's counsel and CFPB guidelines, management expects they'll hear back from the CFPB in the next six months.

Pro's Take

It's true that we initiated this short position just before earnings, but that's not because we expected the stock to be hit so hard. We're not complaining; we're just not really sure what Mr. Market was reacting to. These results were very much in line with what we were expecting -- strong bottom-line results because of the (now suspended) buyback and cost-cutting, with most other metrics indicating that the company's core business is under pressure because of increased competition and scrutiny. Given that this is what has been playing out for the past few quarters, we don't think it should have come as a surprise. Maybe Mr. Market was holding out hope that World had already received approval from its creditors to continue repurchasing shares, or perhaps investors didn't like that the company withdrew its 2017 guidance without providing any update. Regardless, our short position is off to a good start, with the stock currently trading around 15% lower than our original limit guidance.

We're still waiting on the CFPB to reach a decision regarding World's business practices, but it's worth pointing out that the agency did fine Citibank and Discover last week. We think there is a lot of similarity between some of the justifications for those fines and World's current business practices. So while there is no way to know for certain what the CFPB will do to World (if anything), we do believe these are positive signs.

We can't tell what the future will hold; however, our plan is to hold our position until the CFPB investigation comes to a close. If the stock continues to fall in the interim, we may look to close part of our position or establish a hedge, as we recently did with fellow shorts **Caesars** (NASDAQ: CZR) and **Boulder Brands** (NASDAQ: BDBD). If you haven't established a short position in World yet and are considering it, please remember to size your position accordingly. This stock is likely to be volatile over the next six months, at least.

A Cloudy Future for Oracle and OpenText

Published Jul 27, 2015 at 12:08PM

Pro Guidance Changes

- **Gentex** (Nasdaq: GNTX): The company moves to Buy First from Buy. We have a 2.7% allocation, and our fair-value estimate has increased to $18 per share. See our latest earnings coverage.

Pro Completed Trades

- **Caesars Entertainment** (Nasdaq: CZR): In a move to help ensure profits on our short no matter what, we closed 48.5% of this position last week (1,700 of 3,500 shares) at a price of $7.75. We kept a 0.5% position active, which is now worth 0.3% of the portfolio after the stock fell sharply on a court ruling that Caesars' parent company can be sued while its subsidiary is in bankruptcy. This ruling increases the risk that the parent company may need to file for bankruptcy protection, too, eventually. We're happy to sit on the rest of our short, monitor news, and manage the position accordingly, either adding, subtracting, or doing nothing. See our trade alert.
- **World Acceptance** (Nasdaq: WRLD): We sold short 1.5% exposure, or 700 shares for *Pro*, last week at $58.14 per share. World Acceptance is still a short at today's 1.4% exposure. See our trade alert.

Fellow Fools,

"Thesis creep" can be a costly mistake for investors. It's easy to explain away a stock's short-term problems when its industry is experiencing rapid change, and it becomes even easier when the position in question is a profitable one and the company has a management team you've grown to respect. Since the *Pro* team is running our portfolio with the goal of generating North Star-beating returns, it's crucial that we constantly reexamine our assumptions when companies begin to struggle.

As you might remember, Billy's recent semi-annual review of the *Pro* portfolio called out **Oracle** (NYSE: ORCL) and **OpenText** (NASDAQ: OTEX) as two of our portfolio's biggest laggards year-to-date; I thought that warranted some special attention. Though both picks are still in the green overall, we need to stay focused on where these companies are going, not where they've been.

These businesses are both suffering from the same affliction: a shift in the software industry, which is moving away from a perpetual-license, on-premises pricing model and toward a cloud-based, monthly subscription model. This has resulted in near-term accounting messiness (for lack of a better word) that we think is obscuring a more profitable future. Though both Oracle and OpenText are competing with a wide range of scrappy start-ups along with established cloud players, it's encouraging that both companies have loyal customer bases and the resources necessary to make the required jump.

Over the past few quarters, it seems that both companies have finally committed to growing their cloud business. In May, OpenText management announced in a special meeting that it's restructuring its business and refocusing its sales force on cloud-based products. Oracle's latest quarterly conference call was practically a pep rally for the cloud, and rumors are that Oracle sales reps are being paid more to push cloud products. In the meantime, analysts and investors are worried that the companies will cannibalize their cash-cow legacy businesses in favor of an untested business model. Let me explain why I think these concerns are overblown.

So What's the Confusion?

To fully understand why this transition has been so disruptive, we need to start with a quick primer on how this shift in business models affects a company's short-term profitability. (If you would like a more detailed explanation of software as a service, or SaaS, economics, I highly recommend this post by venture capital firm Andreessen Horowitz.)

The biggest difference between the perpetual-license and SaaS models has to do with how revenue is recognized under GAAP accounting standards. When a perpetual-license sale is made, both the revenue from the sale and the costs of acquiring that customer are both recognized immediately on the income statement. This provides a fairly clear picture of the profitability of each transaction. By contrast, cloud-based subscription revenue can only be recognized as it's periodically billed, even if there's a multi-year contract. The remaining value of the commitment sits on the balance sheet as a liability called "unearned revenue," which is reduced over time as the service is delivered.

So with cloud subscriptions, while the customer-acquisition cost hits the balance sheet immediately, the revenue is spread out equally over the term of the contract. This mismatch is a huge drag on early profitability, especially when a company is growing quickly and incurring a lot of sales and marketing costs, and it doesn't account for the lifetime economic value of that revenue stream. As the client base matures and growth slows, the recurring subscription revenue begins to exceed the new-customer acquisition costs, and the business can become incredibly profitable.

The SaaS-ier, The Better

According to Oracle management, the typical SaaS customer is worth about three times as much as a perpetual-license client over a 10-year term , even when accounting for the time value of money. OpenText leadership has confirmed similar economics for its cloud offerings, noting that it takes about three years to break even, after which the cloud customer could be worth considerably more.

I'm always skeptical when management throws around numbers like these, but OpenText's assertion has been confirmed in a blog post from IT industry consulting company Gartner discussing the pros and cons of SaaS pricing. According to Gartner, "The rule of thumb for web analytics is that three or four years of annual SaaS payments matches the cost of buying a comparable software license." That's consistent with other industry blogs claiming the rule of thumb for SaaS is that a one year of a cloud subscription usually costs two-thirds of the value of a perpetual license, plus one year's maintenance cost. So, it looks like we're all on the same page.

That raises a question: If cloud products are significantly more expensive over time, why are customers so happy to sign up for them? For many businesses, the answer is in the flexibility they provide. There's no big cash outlay up front; the software can usually be deployed faster than a licensed version; it's upgraded automatically by the service provider; and the recurring costs of maintaining an in-house server stack can be eliminated. Instead, these costs are all wrapped neatly into a predictable recurring monthly subscription cost, which gives warm fuzzies to cash-flow-conscious CFOs.

The *Pro* Bottom Line

Though Oracle and OpenText built their business on the traditional software licensing model, there's a SaaS land grab under way. We're encouraged that both companies are taking the threat seriously. Investors who had become accustomed to consistent, predictable cash flow won't be happy while the transition takes place, but this seems like a necessary evil if both companies want to secure their market position going forward.

To complicate matters, analysts now have two vastly different business models to try to value -- and one is likely siphoning customers from the other. That doesn't exactly make for a nice, tidy DCF model and/or a high-conviction price estimate. What it does make for is uncertainty, and the Street *hates* uncertainty. It's no surprise that many investors have decided that it's better to sell now and reinvest later, once there are signs of improvement. The problem with waiting for the "all clear" signal is that, as Warren Buffett has noted, you pay a steep price in the stock market for a cheery consensus.

Though both companies came late to the fight, Oracle and OpenText have strong customer relationships and deep pockets, allowing them to close the gap quickly. These nascent cloud businesses haven't been around long enough to provide credible estimates of customer churn and acquisition cost, but over time we expect the relationships to be just as sticky as they were under the traditional model, and margins should steadily improve. More importantly, both companies' success in rapidly growing their cloud businesses suggests that their competitive advantages are in fact sustainable, so we're happy to sit on our hands for a few more quarters and (optimistically) wait out the transition.

Battle Your Brain to Become a Less-Biased Investor

Published Jul 27, 2015 at 11:00AM

Morgan Housel is Motley Fool One's expert on the intersection of investing, economics, and human nature. He studies the impact of big-picture issues on individual investors' lives — making us better Fools along the way.

You've probably never heard of Mohnish Pabrai. And there's a reason for that.

Pabrai is one of the most successful investors of the last 20 years. One dollar invested in his hedge fund in 2000 would be worth more than $7 today, versus $1.78 in the S&P 500. And that's "after my ridiculous fees," as Pabrai jokes.

Why have you never heard of him?

I first learned of Pabrai from a friend in 2007. There was almost nothing written about him at the time. He wrote a book in 2006, but no publisher was interested, so he self-published a handful of copies.

I discovered that Pabrai lived near me, gave him a call, and asked if I could interview him. He graciously agreed.

I came to his office expecting to see a normal hedge fund arrangement: dozens of well-dressed analysts, rows of Bloomberg terminals, TVs tuned to CNBC.

But I found something completely different.

Pabrai manages more than half a billion dollars entirely by himself. He became one of the world's best investors with a desk, a filing cabinet, and a nap room. "I have a hard time getting past the day without the nap, so the nap is a must," he says.

Pabrai was the antithesis of most hedge fund managers. This made me even more fascinated in his success. So I asked him what his secret was.

"Control over my emotions," he said.

"That's it?" I asked.

"It's huge," he said. "It's all you need. You'd be surprised."

Pabrai isn't a successful investor because he has more information than everyone else, or because he's better at math than everyone else, or because he knows more about business than everyone else. He's successful because he has won the battle with his brain.

The reason you probably haven't heard of Pabrai is because he has such control over his emotions that he has little desire for fame. I don't think he feels the need to be on CNBC or have his face on the pages of *The Wall Street Journal*. He's emotionally grounded enough to be perfectly content reading at his desk.

Successful investing has little to do with what you know and almost everything to do with how you act. This report will attempt to be instructive. How, exactly, do you overcome these flaws? How do you become more like Pabrai?

A year ago, I interviewed Daniel Kahneman, a Princeton psychology who won the Nobel Prize in economics. I asked him if humans can overcome biases or if they are deeply ingrained flaws that we're stuck with — whether Pabrai is a freak of nature, essentially.

"They can be partially overcome, yes," he said. "There are ways people can become better thinkers."

He elaborated on how this applies to investors:

> I think it is very important not to encourage people to do things that are likely to expose them to regret. The potential for regret is something that investors should know about themselves.
>
> "How much am I going to suffer if this decision of mine doesn't work out?" "How easily am I going to think, 'Oh, I made a mistake'? How prone am I to think that I made a mistake?" It's a big variable, and really worth discussing, I think, with clients because part of the inability to stay the course ... you have to inoculate yourself against regret.
>
> At its core, overcoming cognitive biases is about inoculating yourself against regretful decisions.

This is, of course, easier said than done. And tackling this subject for every personality would be impossible.

I see three areas that consistently cause investors huge amounts of regret:

1. **Where you get your information.**
2. **ho you talk to about your investments.**
3. **How you keep yourself accountable to your own goals.**

Let's go through each one.

1. Where You Get Your Information

Twenty years ago, only a few media outlets dominated the dissemination of financial information: *The Wall Street Journal*, *New York Times*, an early version of CNBC, and Louis Rukeyser.

Today, those outlets make up a minuscule fraction of what's published (and Rukeyser is no longer with us). Financial media has exploded, with hundreds of outlets providing thousands of opinions each day.

Though that's mostly a good development, it can also be dangerous if you don't know how to use it.

The truth is that, while news coverage has grown exponentially in the last two decades, the amount of news has not. Today's financial media offers copious amounts of drivel, gossip, rumor, innuendo, and nonsense. As author Nassim Taleb once wrote, "The calamity of the information age is that the toxicity of data increases much faster than its benefits."

To avoid bias, therefore, it is vital that you as an investor know how to navigate this world.

Finding reasonable information is about more than using reputable sources. Consider this quote from a December 2008 front-page *Wall Street Journal* article:

> Igor Panarin posits, in brief, that mass immigration, economic decline, and moral degradation will trigger a civil war next fall and the collapse of the dollar. Around the end of June 2010 or early July, he says, the U.S. will break into six pieces — with Alaska reverting to Russian control. California will form the nucleus of what he calls "The Californian Republic," and will be part of China or under Chinese influence. Texas will be the heart of "The Texas Republic," a cluster of states that will go to Mexico or fall under Mexican influence. Washington, D.C., and New York will be part of an "Atlantic America" that may join the European Union.

Keep in mind, the economy was falling apart in December 2008. And this was *The Wall Street Journal*, America's most prestigious financial news source, so people took this seriously. You may have yourself.

After years of trudging through the financial media, here's how I would dissect a story like this today to ensure it doesn't bias my behavior.

Who is Igor Panarin?

A quick search would have shown that Panarin, a Russian political scientist, has a history of making outlandish predictions. He first presaged the same six-part American disintegration in 1998. In previous years, he augured what he called the "New British Empire," the "New Eurasia," the "Eurasia Union," and a new global currency — none with any success.

This is vital to know, because you instantly realize that this prediction tells you more about Panarin's personality than his objective analysis of the economy. Predicting collapse is just what he does. It's who he is.

If you get to know enough financial pundits, you'll find this is a recurring theme. People who are currently bearish on stocks — Peter Schiff, Marc Faber, John Hussman — have by and large been bearish for *decades*. Bulls like Jeremey Siegel have been bullish for most of their careers as well. It's a reflection of their personalities.

After you learn the background of pundits and analysts, you are less likely to take them as seriously as you did before. You will learn that most analyst are athletes in a full-contact sport called punditry. Realizing this helps prevent you from being biased by their views.

If Panarin is right, what should I do about it?

Let's say America is about to break apart into six pieces. Or let's say the analyst predicting a market crash is right. Or the guy who says **Chipotle** (NYSE: CMG) is going to beat earnings is right.

What should you do about it?

For most long-term investors, the answer is almost always *nothing*.

If you need to sell stocks next week to cover your mortgage, knowing if the market is going to crash next week is vital. If you're investing for the next 15 years, what the market does next week is irrelevant. If you are a day trader or hold short-term options, Chipotle beating earnings is really important to you. If you're a long-term shareholder, it shouldn't be at all.

The worst trait of the financial media is its inability to recognize that investors have different time horizons, which makes it impossible to offer blanket advice. Yet it does all day long. Very few sources of information come with a warning that says "This advice is intended for a 62-year-old investor with at least 10 years to invest." Instead, it's given as "The market is going to crash and *you* should sell." The truth is that the person writing this information has no idea who you are, what your goals are, or how long you have to invest. Even if their prediction turns out to be accurate, you should not assume it is applicable to you and your goals. Because it rarely is.

To prevent media from biasing your financial decisions, my sincere advice is: Consume less of it. It does not have to be more difficult than this.

In his book *The Information Diet*, Clay Johnson writes:

> It's not information overload, it's information overconsumption that's the problem. Information overload means somehow managing the intake of vast quantities of information in new and more efficient ways. Information overconsumption means we need to find new ways to be selective about our intake. It is very difficult, for example, to overconsume vegetables.

We also have to distinguish between *information* and *analysis*. Company annual reports, economic data, and conference call transcripts have information. Pundits and analysts provide analysis. In my research, successful long-term investors favor information over analysis by at least a 10-to-1 margin. Most people are good thinkers, but are gullible to being persuaded by pundits who are trying to grab attention. If you go for the information and ignore the pundits, you will have a better time coming to smart, unbiased decisions.

Stock picks, board posts, and articles within the Motley Fool community are a great resource because they are the closest bet you have to reading material that aligns with your goals, strategy, and investment philosophies. They are as close as you will get to vegetables.

Outside of the Fool, I would advise favoring books over articles. There are lots of bad books and lots of great articles. But books are more likely to be thought out, thorough, fact-checked, and edited than most articles. They are also more likely to make you think, rather than act, which is exactly what you want information to make you do.

For those of you with a voracious appetite for more, you will find a list of my favorite authors, journalists and resources for solid, reliable investment information at the bottom of this report.

2. Who You Talk to About Your Investments

New York Times columnist Carl Richards has a great saying. A financial advisor, Richards says, is someone who puts a gap between you and stupid.

Even brilliant investors are tempted to fall for biases and do dumb things with their money. An advisor's job is to look you in the eye, shake his head, and walk you back from the ledge.

One of the leading causes of biased financial decisions is confirmation bias. It's the tendency for investors to seek out advice from people who already agree with their views.

I attend a lot of financial conferences, many of which are theme-based — macro conferences, gold conferences, dividend conferences, and so on.

What astounds me at these conferences is how closed off they are to differing opinions. If you attend a gold conference and say anything negative about gold, you will be treated as an ignorant outsider and avoided. People think they attend conferences to learn something new, but I've learned that's not really the case. They attend to have their views confirmed by other people. It is pure confirmation bias. And it's dangerous.

Kathryn Schulz, author of the book *Being Wrong: Adventures in the Margin of Error*, once explained:

> The first thing we usually do when someone disagrees with us is we just assume they're ignorant. They don't have access to the same information that we do, and when we generously share that information with them, they're going to see the light and come on over to our team. When that doesn't work, then we move on to a second assumption, which is that they're idiots. They have all the right pieces of the puzzle, and they are too moronic to put them together correctly. And when that doesn't work, we move on to a third assumption: they know the truth, and they are deliberately distorting it for their own malevolent purposes. So this is a catastrophe.

If you don't surround yourself with people who disagree with your views, you'll never realize that you can be just as biased — and wrong — as everyone else. And you'll keep making the same mistakes.

Part of The Motley Fool's investing ethos is a culture of encouraged debate. We not only accept dissent when making stock picks but encourage it. Junior analysts can — and do — tell their bosses why they're wrong. This is how we fight confirmation bias.

But there's something we can't do for you, our members: prevent you from buying more stocks when the market is bubbly and selling out when it crashes.

One of Kahneman's pieces of advice to avoid biases is to have an advisor who is in a different emotional state than you are. This is how individual investors can avoid confirmation bias.

You should have a trusted person in your life — a friend, a relative, a co-worker — who you run financial decisions by.

This person should know you well. They should know your goals and your flaws. But they can't be emotionally attached to your financial decisions. Their goal is to provide a trusted, yet unbiased, opinion of your decisions. They put a gap between you and stupid.

For the last seven years, I have shared my personal financial plan with fellow Fool Matt Koppenheffer. I trust Matt, but he thinks differently than I do. He's not nearly as emotional as I am in some areas, sees risks that I don't, and offers a point of view that I could never come up with on my own. It is a perfect arrangement for avoiding biases, because while I trust Matt, I don't agree with everything he says and he doesn't always agree with me. That is exactly what you want. Rather than confirm my views, Matt makes me think and puts a gap between me and stupid. Every investor should have someone like this.

3. How You Keep Yourself Accountable to Your Own Goals

One of the most important lessons I've learned about investment biases is that people are terrible at predicting their future emotions.

Every investor I know says they'll be greedy when others are fearful. They never assume that they themselves will be the fearful ones. But someone has to be, by definition.

No investor wants to think they'll panic and sell if stocks fall 20%. They're more likely to say that a 20% decline would be a buying opportunity. This is the right attitude, but the reason there will be a 20% crash is specifically because some investors choose panic selling over opportunistic buying.

My experience is that most investors who say they'll be greedy when others are fearful soon realize that they are the "others." It has to be this way: When everyone thinks they're a contrarian, at least half will be wrong.

When investors are bad at predicting their emotions, sticking to their financial goals becomes difficult. I can say I plan on investing $500 a month each month for the next 30 years. Or I can assume that I won't sell when the next market crash comes. But those goals rely on the assumption that I can behave the way I'd like to in the future. And that's a dicey assumption to make.

I have found that the best way to get a realistic picture of my future emotions is to document my past emotions. You can do this by keeping an investing journal.

Every investor, no matter how active or passive, should have an investing journal. It doesn't have to be elaborate. Just document how you're feeling when you make investment decisions.

If you keep a detailed journal of your feelings and emotions when making investment decisions and review it over time, I think you will notice that how you expected to feel when the market falls, or surges, is far different from how you actually feel.

This is easy for me, because I'm an investment writer. All of my thoughts and feelings are documented on Fool.com.

I'd like to think of myself as a contrarian investor. I'd like to think a market crash is a wonderful thing to take advantage of. I want to be Mohnish Pabrai.

But when I look back at articles I wrote in 2008 and 2009, as the market was crashing, I have to admit: I was more scared and pessimistic than I thought. If I'm honest, they show that I have a lower risk tolerance than I think I do.

And I never would have known this unless these past feelings were in writing.

Admitting this is part of the reason I choose to hold quite a bit of cash in my portfolio, as I wrote about in a previous report. I don't want to pretend that I have a high risk tolerance that, objectively, is probably a fantasy. Right now, with the market near an all-time high, that would be easy to do. To prevent bias, I want to look at my past behavior and realize that it's probably a good indication of what my future behavior will be.

I would recommend every investor write down their feelings. A few sentences a few times per year. Keep this journal active for years, throughout different market conditions, and be honest with yourself about what you find. It could be the best tool you have to avoid future regret.

Gentex Looks Forward as Mirror Sales Increase

Published Jul 24, 2015 at 4:33PM

***Pro*'s Take: GNTX Q2 2015 Earnings**

Quarter Quick Take

Gentex (Nasdaq: GNTX) turned in a stout quarter in the second quarter of 2015, delivering 12.4% net revenue growth and 10.7% total mirror unit growth despite a decline in auto production in the company's primary markets over the same period. Unit growth continues to handily outpace global auto production, which suggests that the core element of our thesis (higher auto-dimming mirror penetration rates) is playing out.

Gross margins took a bit of a hit this quarter (down to 38.4% vs 39.7% a year ago) as annual customer price reductions, manufacturing inefficiencies, unfavorable product mix, and currency rate fluctuations affected that figure. Operating margins were also down this quarter (28.5% vs 29.5% a year ago), but were affected by one-time severance charges and foreign currency fluctuations and should pick up a bit in the next few quarters. Margin performance and a narrowing of gross margin guidance is a potential culprit for why the stock sold off a bit after reporting, but the business is doing just fine.

The company sold 7.3% more interior mirrors (+3.1% in North America and +10% internationally) and 20.2% more exterior mirrors (+35.3% in North America and +13.1% internationally) than it did in Q2 2014. The company has announced and launched several new products that look to drive growth throughout 2015 and beyond. As cars become more technology-rich than ever before, Gentex is well positioned to meet that demand.

Management continues to buy back stock, repurchasing $25.1 million worth at an average price of about $17.93 (almost 11% above the current price). Management is historically stingy with stock repurchases, but as cash piles up on the balance sheet (cash + investments are up 37% year-over-year, representing 9% of the current share price once you net out debt), management appears to be more willing to pursue buybacks as a capital allocation strategy. The company has repurchased shares at an increasing pace the last four quarters, with $10 million in buybacks in Q3 2014, $20 million in Q4 2014, $25 million in Q1 2015, and now $25.1 million this past quarter. I view these continued and increasing buybacks as a signal of confidence from management. Management also made some comments on their acquisition strategy on the call, and their comments were intelligent and reasoned, reaffirming my favorable view of their merit:

> "We're constantly evaluating acquisition targets. One of the things we do talk openly about, however, is from a strategy perspective, Gentex is very careful about making sure we find acquisition targets or anything that we would buy. It has to keep with our current corporate profile in terms of the what that business looks like, how unique is it in the marketplace, does it fit well with our existing business from a technology and a roadmap standpoint, and then does it have the type of margin profile that we look for and have the longevity that we think we need in order to justify the investment. And so from a strategic perspective, those are all factors we take into consideration.
>
> On the finance side, things are going pretty high premiums right now, and so it's one of the other factors we look at. We're not too interested in overpaying for a technology, if it's something that we believe we could either development in house or if it doesn't meet that strategic objective. That -- all that being said is we're very interested in looking for opportunities like the HomeLink one, but it's got to be the right fit, and we're not going to over-pursue any opportunity or overpay. Our strike zone is probably a little smaller than a lot of suppliers as it relates to acquisition, but we are constantly evaluating opportunities there."

Guidance Update

Despite slight declines in margins related to price reductions from its powerful customers (the big automakers), Gentex is continuing to do what it does best -- sell its products at a pace above the rate of auto production growth, and invest in manufacturing and product development initiatives in order to raise average selling prices and reduce manufacturing costs. As global auto production picks up and as more and more automakers integrate technology into their models, Gentex should benefit. After incorporating this quarter's results into our model and updating our forward projections, **we've increased our fair-value estimate from $17.50 to $18**, and with the stock trading more than 10% below our updated FV estimate, **we're moving Gentex from Buy to Buy First** on our scorecard. At just over 16 times trailing-12-month earnings, the company is trading at valuation levels that are about as low as they've been throughout its history despite a robust balance sheet, steady operating performance, and strong industry tailwinds. If you've yet to start a position or fill out your allocation in Gentex, now is a great time.

Updated Guidance: Buy First (changed from Buy)

Recommended Allocation: 2.8%

Fair-Value Estimate: $18 (up from $17.50)

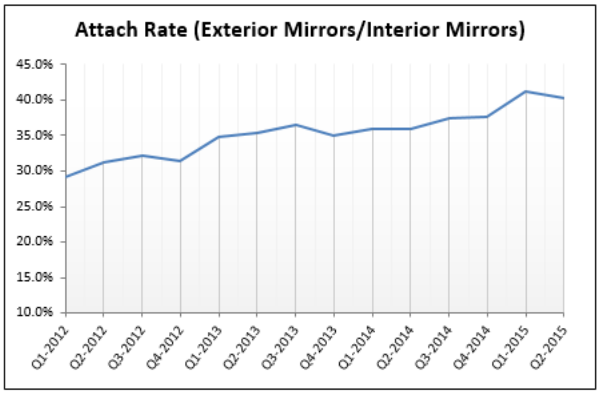
Current Price: $16.13

Our Thesis

Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1) Penetration: Unit growth vs. auto production. Over time, we want to see Gentex's auto-dimming mirrors to continue to gain market share. If the company is increasing units sold faster than auto production, it is moving in the right direction. Global interior mirror unit volumes were up +7.3% and auto production in the company's primary markets was actually down about 1%, showing that Gentex continues to significantly outpace vehicle production growth. Interior units sold in North America increased +3.1% and international increased +10%, for +7.3% interior unit growth overall. Exterior mirror unit volumes grew even faster, up a blazing +35.3% in North America and +13.1% internationally. The exterior mirror attach rate was 40.3% (i.e. 40.3% of cars equipped with interior units also were equipped with exterior units), compared with 36% a year ago. The attach rate dipped a bit compared to last quarter's record 41.2%, but this quarter's attach rate is the second highest in the company's history. Exterior mirrors currently only have about 7% to 8% market penetration relative to global auto production, but that penetration rate is certainly increasing.



2) Pricing and value: Unit growth vs. automotive segment sales. Powerful auto makers force annual price concessions on their suppliers, and Gentex isn't immune. Price reductions have been in the range of 2% to 3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices and gross margins. The company has been experiencing inefficiencies around new product launches recently, which affected gross margins by about 30 basis points this quarter (down from about 50 to 75 basis points last quarter). As the company works through these inefficiencies and as the higher-margin new products (such as the full display mirror scheduled to be launched in Q4 2015 on the Cadillac CT6) make their way through the sales pipeline, gross margin should see a boost. During the quarter, total units (interior + exterior mirrors) increased +10.7% and automotive segment sales were up +12.4%. This dynamic suggests lower ARPU (average revenue per unit) and is consistent with the expectation of annual price concessions.

3) Margin performance. During the quarter, gross margin was 38.4%, down from 39.7% a year ago in Q2 2014. For the trailing 12 months, gross margin was flat at 38.8% compared with 38.8% in the year-ago TTM period. Management narrowed its 2015 full-year gross margin guidance range by 0.5% at the top end (to 38.5%-39%) because of the aforementioned manufacturing issues. If the company can generate strong unit growth (especially in higher-margin products), it may be able to beat guidance, but that will likely be a difficult achievement. SG&A and R&D expenses are in line with historical norms, and operating margins followed gross margins lower, coming in at 28.5% vs. 29.5% in Q2 2014. However, if we adjust for FX fluctuations and one-time severance-related charges, operating margins would have been flat compared with the year-ago period, despite the decline in gross margins (due to SG&A leverage related to production facilities running at high capacity levels).

What We Think Now

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

If you have questions, drive on over to the Gentex discussion board.

Buy Verisk Analytics

Published Jul 23, 2015 at 3:31PM

How You Participate

- **Action:** Buy **Verisk Analytics** (NASDAQ: VRSK).
- **Allocation:** 1.7% (*Pro* will buy about 600 shares).
- **Scorecard Status:** Buy
- **Fair-Value Estimate:** $80
- **Recent Price:** $74.25
- **Dividend Yield:** 0%
- **Price Guidance:** Use a limit order and initially aim to pay less than $74.75. As prices change over time, this starting guidance will quickly lose relevance; as that happens, **our guidance will remain "Buy"** until we officially notify you otherwise.
- **Next Earnings Date:** July 28

What's in a name? In the case of Verisk Analytics, more than you might think. Verisk's name is a combination of the Latin word for truth, "veritas," with the English word "risk." And that's exactly what the company is all about – finding truths buried in data and using them to help others make better decisions about risk and opportunities.

The Business

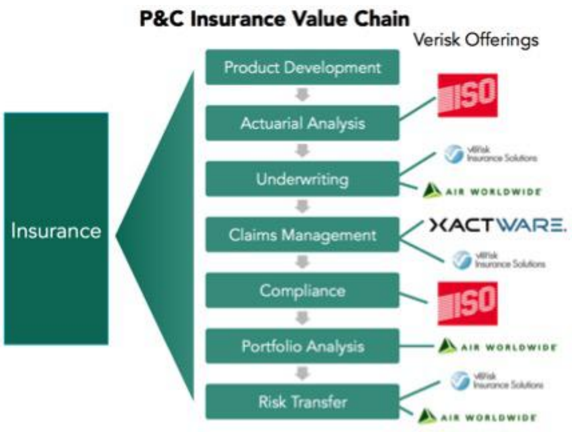
Similar to current *Pro* holdings **Visa** (NYSE: V) and **MasterCard** (NYSE: MA), as well as prior holding **CME Group** (NASDAQ: CME), Verisk was actually created by its customers. Major players in the insurance industry set up an "information utility" called ISO (now a Verisk subsidiary) in 1971 to help make the industry more efficient.

Nowadays, Verisk is a vertically focused data and analytics powerhouse that provides customers with solutions in all sorts of arenas: raw data, tailored analytics, enterprise reporting systems, policy fraud detection solutions, competitive benchmarking, and legally tested policy language, just to name a few. Verisk leverages its mass of proprietary data, industry expertise, and predictive analytics to serve hundreds of customers in all sorts of industries: financial services, including the top 100 U.S. property and casualty (P&C) insurers and 29 of the top 30 credit card issuers in North America, the U.K., and Australia; health care, including nine out of the top 10 health-plan providers; government entities; and professionals in the supply-chain management and risk management businesses. And as of May 19, Verisk's clientele now includes entities in the energy, chemicals, and metals and mining industries as well -- we'll talk more about that below.

What We're Thinking

A strong competitive advantage, high customer retention, robust and contract-based cash flows, a scalable business model, large (and growing) markets -- all these traits make Verisk a prototypical *Pro* holding. In fact, the company actually scores 7 of 7 when using our quality checklist.

As mentioned, Verisk is "vertically focused." This means the company is primarily concerned with creating solutions that help customers with a variety of tasks throughout the value chain of a particular industry (see image below), as opposed to creating one product that it tries to sell to customers across different industries ("horizontally focused"). This means that Verisk's solutions are more likely to be tailored to the needs of its customers and highly integrated into those customers' workflow, which results in high customer retention and pricing power for Verisk.



Source: Company filings

Verisk's solutions become even stickier when you realize the company is more than just a one-trick pony -- its offerings help customers boost their top line as well as control costs. And in the industries Verisk serves, there is a *lot* of demand to control costs.

In 2014, around 68% ($380 billion) of the earned premiums in the U.S. P&C insurance market had to be used for claims and claims settlement expenses. And in 2011, *The Journal of the American Medical Association* estimated wasteful spending in the U.S. health-care system of at least $558 billion (the midpoint of the estimate was actually $910 billion). Because Verisk's solutions help control costs, customers actually end up valuing them even more when times get tough. For example, not only did the company's insurance segment expand between 2007 and 2010 -- during what management referred to as one of the worst P&C insurance markets since the Great Depression -- but Verisk was actually able to push through price increases without a negative effect on customer retention.

The insurance industry makes up the bulk of Verisk's clientele (72% of 2014 revenue), and as you can probably imagine, being a company created by its customers comes with certain advantages. Verisk has been able to leverage its long-standing relationships with insurers to create multiple products that occupy the top spot in their respective categories; in fact, some have a market share higher than than 90%.

Sizable opportunities also exist in both health care (18% of 2014 revenue) and financial services (5.5%). Verisk recently entered the health-care space with the goal of removing inefficiencies from the market while helping drive the shift from volume-based to value-based health care. Management is only targeting a $4.8 billion market at the moment, but they've already captured 6.6% of that, and they expect that market to almost double by 2019.

Management estimates the current addressable market for its financial-services division at $500 million. That means Verisk has captured slightly less than 20% of this market since it entered the space with its 2012 acquisition of Argus. Five hundred million may sound small (in this context, anyway), but this market is a part of a much larger whole that's riding secular, not cyclical, trends. For example, Verisk's market share of global business analytics spending, reporting, and modeling for the financial services industry (a $15 billion market) is around 25 basis points (bps), and its market share of the $9 billion that financial services companies spend annually on media targeting and optimization is around 33 bps.

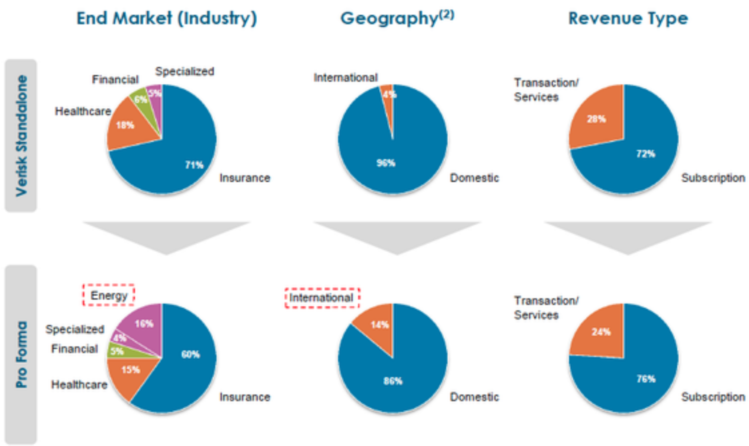
Organic growth in these two newer divisions has been impressive so far, but we believe we're still in the early innings. As management has been known to mention, this business doesn't have many iPod or iPhone-like opportunities. Also, new customers don't immediately sign up for everything Verisk has to offer; Verisk will frequently work with them to create a customized solution, which the customer will then put through proof-of-concept and an isolated trial phase before deciding to scale up. That said, that first solution often acts like a gateway drug –- Verisk's health-care division signed on 35 new clients in 2014, but it was able to make 115 upsells. And the company is constantly developing new solutions to make its customers' lives simpler and more profitable.

The Financials

As you might imagine, this type of business can be very attractive from a cash-flow perspective. After the necessary investments to get everything set up, the incremental costs of selling additional solutions to a customer are very low, as are maintenance capital-expenditure requirements. This results in strong margins (2014 EBITDA and net income margins were 45% and 23%, respectively) and returns (ROC and ROE were 24% and 98%, respectively), as well as plenty of cash for Verisk management to do with as they please.

Too much cash can actually destroy shareholder value if it entices a company to make ill-fated acquisitions. But Verisk's capital-allocation track record is extremely impressive. Using a conservative EBITDA multiple of 10, management estimates an annualized return on its acquisitions of around 20%. Additionally, between its 2009 IPO and May of this year, Verisk had already shrunk its share count by almost 12%.

Now back to that May 19 expansion of its client base I mentioned. On that date, Verisk acquired Wood Mackenzie, a leading provider of data analytics to the global energy, chemicals, metals and mining markets. The cost was sizable -- $2.8 billion, with $722 million coming from a secondary share offering. The market wasn't sure how to react to the deal given the high price, but we think it makes a lot of sense: Verisk has bought a company that's essentially a copy of itself, but in different end markets (WoodMac actually has higher margins and a greater percentage of subscription-based revenue). This means Verisk gets access to additional data it can use to develop new products and further diversify its revenue sources. Management has also hinted in the past that they see sizable opportunities for the company outside of the U.S., and this deal is a big step in that direction.



Source: Verisk's WoodMac acquisition presentation

We like the current mix of organic and acquisition-based growth, but as long as Verisk management continues to look for businesses to bring into the fold (which they've said is their plan), the risk remains that the company could ultimately end up overpaying, or that a venture into a new line of business could destroy shareholder value. As a counterpoint, though, management has previously demonstrated a willingness to cut ties with a business if it isn't performing or is no longer "Verisk-like." In February of 2014, the company sold its mortgage analytics business, Interthinx; though the mortgage industry has come under pressure since originations peaked years ago, the company was still able to generate an internal rate of return (IRR) on Interthinx of around 20%.

How It Fits Into *Pro*

By adding Verisk to our portfolio next to **Visa** (NYSE: V), we're returning our exposure to the financial services industry to a level close to what we had before we sold **American International Group** (NYSE: AIG). But with Verisk, we also get exposure to powerful tailwinds within the energy and health-care industries, among others.

Verisk has something in common with Visa when it comes to valuation, too; both are above-average companies trading at above-average multiples. Verisk currently trades at 32 times earnings and 16.5 times EV/EBITDA. But it's important to note that only the numerator in those equations factors in the acquisition of WoodMac, since the company has already issued the additional 10.6 million shares. Pro forma, Verisk is currently trading for around 15.3 times our estimate of fiscal 2015 EBTIDA, a price we're willing to pay for such a high-quality company that we expect to hold for many years. We're taking a measured approach, starting our position at 1.7%, and we'll be prepared to add to it (either by writing puts or buying shares) if the stock experiences a rough patch at some point.

The company borrowed $1.9 billion to acquire WoodMac, and the plan is to use free cash flow to rapidly reduce debt to 2.5 times EBITDA by the end of 2016. By our estimates, Verisk should be able to do this easily, with around $500 million in free cash flow to spare. That's cash that could be used to opportunistically acquire another business or start repurchasing shares once again. Either way, we believe the company is poised to deliver North-Star like returns over the years, with the potential for considerably stronger performance thanks to its business model and broad market opportunities.

Questions? Bring them to our brand-new, veritably veracious Verisk board!

Pro's Take: AMTD Q3-2015 Earnings

TD Ameritrade (NYSE: AMTD)

Quarter Quick Take

In Q3 2015, TD Ameritrade yet again demonstrated its ability to deliver consistent results even though the company's value drivers (trading activity and interest rates) are mostly unpredictable. This consistency is a testament to the company's competitive advantages and strong management. Despite a difficult operating environment (low volatility and trading, low interest rates, and increased competition), net revenue was up 4.1% year-over-year and EPS grew 5.2% year-over-year. This well-managed company is able to pay a well-funded dividend and steadily increase its core earnings power, and the company's interest-sensitive earnings are set to grow sharply during periods of rising interest rates (who knows when that will happen).

President and CEO Fred Tomczyk:

> "As we complete our third quarter and look back on the last nine months, we remain upbeat about our growth and prospects for another strong year"..."We continue to execute well against our growth strategy, with $47 billion in net new client assets gathered year-to-date, an organic growth rate of 10 percent and up 17 percent over last year. Likewise, average client trades per day, year-to-date, are 456,000, up 5 percent over last year. This leaves us with good momentum, and we will continue to invest in organic growth initiatives."

Guidance Update

After incorporating this quarter's results into our model, our fair-value estimate remains unchanged at $35 per share. At just more than $37 per share, the company is trading nearly 6% above that estimate, so members without a (full) position may want to consider spacing out new purchases or selling puts to buy shares at a lower price. After a rough start to 2015, the stock has experienced strong appreciation (up 15.7% from its year-to-date low of $32.07 per share on Feb. 2) as investors have bid up shares in anticipation of the Federal Reserve's upcoming interest rate decision.

Updated guidance: Buy (no change)

Recommended Allocation: 2.9%

Fair-value estimate: $35 (no change)

Current price: $37.12

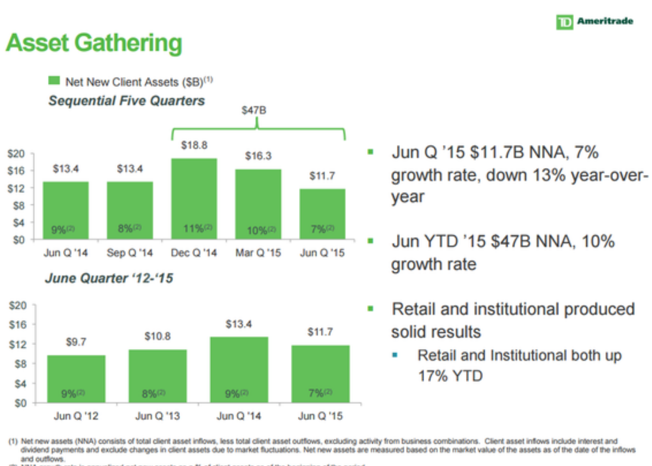
The Numbers

- Net revenue of $794 million (up 4% year-over-year)
  - **Transaction-based**:
    - Funded accounts grew to 6.55 million (up 5% year-over-year)
    - Trades per funded account of 4.17 (vs. 4.50 last quarter vs. 4.05 a year ago)
    - Average commissions and fees per trade of $12.01 (vs. $12.03 last quarter vs. $12.55 a year ago)
    - Totals up to:
      - 6,551,000 x 4.17 x $12.01 = **$328 million** in transaction-based revenue (up 3.5% year-over-year)
  - **Spread-based**:
    - Total spread-based revenue of **$365 million** (up 4% year-over-year)
    - Average spread-based balance of $95.3 billion (up 4.5% year-over-year)
    - Thus, Net Interest Margin (NIM) =
      - $365 million / $95.3 billion = 0.383% (quarterly)
      - NIM (annualized) = 0.383% x 4 = 1.53% (vs. 1.50% last quarter vs. 1.54% a year ago)
  - **Fee-based**:
    - Fee-based revenue of $85 million (up 7.6% year-over-year)
    - Record average fee-based balance of $161 billion (up 16.5% year-over-year)
    - Thus, Investment Product Fee Yield =
      - $85 million / $161 billion = 0.053% (quarterly)
      - Investment Product Fee Yield (annualized) = 0.053% x 4 = 0.211% (vs. 0.219% last quarter vs. 0.228% a year ago)
- Record total client assets of $702 billion (up 8% year-over-year)
- Record interest rate sensitive assets of $102 billion (up 6% year-over-year)
- Net new client assets* of $11.7 billion (6.7% annualized growth rate, down 13% year-over-year)
- Diluted EPS of $0.36 per share (up 5.2% year-over-year)
- Trailing-12-month (TTM) average return on equity (ROE) of 16.4% (down from 16.6% a year ago)
- Capital management:
  - Paid $0.15 per share in cash dividends in the quarter (a 1.6% yield on the current share price)
  - Repurchased 125,000 shares of its common stock at an average share price of $36.75 per share
  - Declared a $0.15-per-share quarterly cash dividend payable on Aug. 18 to all holders of record of common stock as of Aug. 4.

*excludes changes in client assets due to market fluctuations

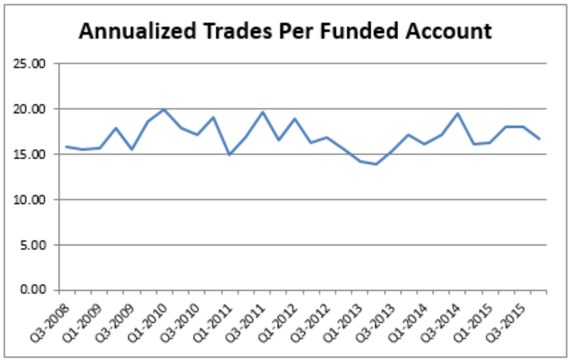
Analysis

In this quarter, the rate of growth in asset gathering slowed a bit, with net new assets down 13% year-over-year (the first time in five quarters that the company gathered fewer net new assets than the same period a year ago):



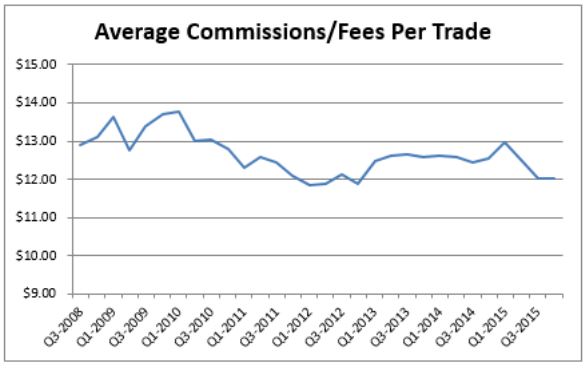
Source: TD Ameritrade June Quarter Earnings Presentation

Trading activity was a bit muted relative to the previous two quarters, but the company continues to execute on penetrating derivatives (comprising a record 44% of trades per day in the quarter) and mobile trades (comprising a record 17% of trades per day, up from 13% a year ago). Management called out low intra-day volatility in the quarter (it had the fewest days in a quarter with intra-day volatility higher than 1% since the December quarter of 2006) as a reason for muted trading activity:



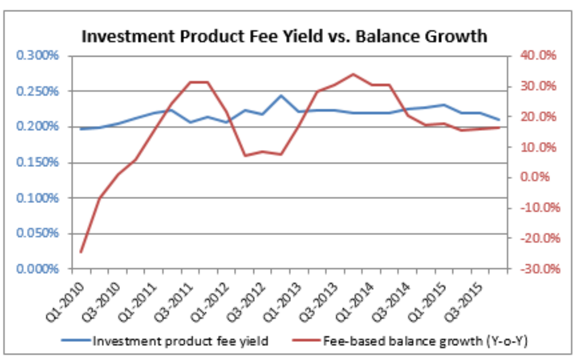
Source: Company filings and analyst calculations.

Average commissions and fees continued to stay at the low end of the company's recent historical range. The commission rate was essentially flat sequentially as low retail investor trading and a historically high mix of futures as a percentage of derivatives trading (about 10%) continue to negatively impact commissions per trade:



Source: Company filings and analyst calculations.

Growth in the fee-based segment of the business is slowing down, with revenue growth decelerating to 7.6% year-over-year (from 13.3% last quarter and 21.5% a year ago). The revenue growth in this segment was most strongly affected by a decline in the average investment product fee yield because of the [Amerivest performance-based rebate offer] that is currently on the market.

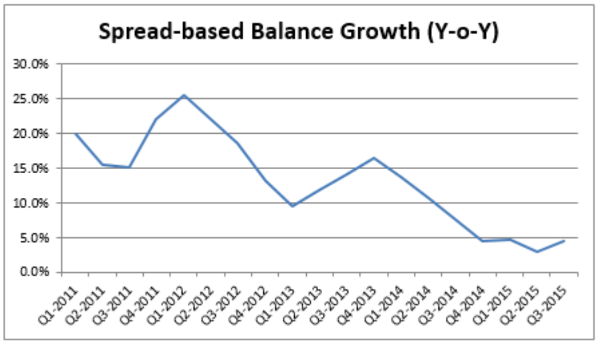


Source: Company filings and analyst calculations.

After capitalizing on rapid growth in this segment during the nascent stage of the robo-advisor industry, TD Ameritrade is seeing increased competition from the likes of companies such as Betterment, Acorns, and Wealthfront affecting its growth in this arena, as the company's growth in fee-based investment balances is not accelerating despite lower yields. Although fee-based revenue represents only 11% of the company's revenue, it's also been the company's fastest-growing segment. I'm interested to see how this part of the business performs over the next several quarters.

As for the spread-based portion of the business, it is very sensitive to changes in interest rates, and it will provide a big boost to profitability if and when interest rates rise. The company has guided that a 100-basis-point increase in the Fed Funds Rate will increase annual earnings by $0.38 per share in year 1, $0.44 in year 2, and $0.51 in year 3. Given that trailing-12-month EPS was $1.47 per share, that's some pretty healthy upside (26%, 30%, and 35%, respectively).

Given that information, we want to see that spread-based balance continue to grow at a healthy clip. When interest rates eventually do rise, we want TD Ameritrade to have as many interest rate-sensitive assets as possible. The rate of growth in the spread-based balance accelerated a bit this quarter:



Source: Company filings and analyst calculations

Our valuation assumes slowing growth in the spread-based balance, so an acceleration of growth in one of the company's key value drivers is a welcome sign. We'll continue to watch this metric over time to make sure it's staying on track, especially as we inch ever closer to the Federal Reserve's interest rate increase.

What We Think Now

TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and when interest rates increase, the company is positioned to grow earnings sharply.

If you have questions, post them on our TD Ameritrade discussion board.

Where's the Inflation?

Published Jul 20, 2015 at 12:29PM

Morgan Housel is Motley Fool One's expert on the intersection of investing, economics, and human nature. He studies the impact of big-picture issues on individual investors' lives — making us better Fools along the way.

A *Motley Fool One* member emailed me recently asking: "The Federal Reserve has printed trillions of dollars of money since 2008. How is it possible that this hasn't brought hyperinflation?"

It's a good question. With the disclaimer that economists have written entire books on this subject, here's a 500-word answer.

Inflation goes up when there's too much money chasing too few goods. Simple supply and demand.

Virtually every historical bout of hyperinflation has been caused by the *latter half* of that equation.

History will show that it's hard to get hyperinflation just by increasing the money supply — you also need to decrease the amount of goods in the economy. This can happen after wars, when factories have been bombed out (Japan, 1940s); when neighbor countries take your assets to pay reparations (Germany, 1920s); or when governments confiscate productive assets like farms (Zimbabwe, 2007).

One reason America hasn't experienced high inflation since 2008 is because our biggest problem after the crisis was *too many* goods. Too many vacant homes. Too many office buildings. Too many cars. This wasn't true just in America, but most of the developed world.

Contrary to popular belief, the Federal Reserve doesn't actually control the money supply. All money creation in our economy occurs when private banks make loans. When **Citigroup** (NYSE: C) lends you $1,000, it essentially creates about $900 out of thin air (they keep the rest on reserve). That's how money is made. The Fed lends money to banks and tweaks the amount of reserves they hold. But without banks making new loans, the amount of money sloshing around the economy won't rise, no matter how much is printed.

That's important, because since 2008 our glut of too much stuff — too many homes, too many toys, too much oil, etc. — has caused banks to be reluctant to ramp up lending.

Mortgage issuance plunged after 2008. Lines of credit were cut. The federal government ran massive budget deficits after the financial crisis, but even that wasn't enough to offset the decline in private-sector lending. Total debt — government and private — as a share of GDP declined from 2009 to 2013.

So what happened to the trillions of dollars the Fed printed, a practice known as quantitative easing?

QE doesn't necessarily increase the amount of money floating around the economy. The Fed buys Treasury bonds from a group of private banks called primary dealers. After they agree on a price, banks give the Fed Treasury bonds, the Fed gives banks newly printed cash.

As far as the economy is concerned, no new assets are really created. The Fed printed $3 trillion of new cash, but it also removed $3 trillion of Treasuries from the private banking system. (This is different from other economies which have, for example, printed money and injected it directly into the economy, often to pay soldiers during wars.) The new cash in the banking system provides liquidity and can help banks make new loans. But if those banks aren't willing to make new loans because the economy already has too much stuff, the Fed can print a tremendous amount of money without doing much to inflation.

Which is exactly what's happened since 2008.

None of this is a forecast of what might happen next. I have no idea what the future rate of inflation will be, nor does anyone else. Things could change quickly — lending could ramp up, the Fed could hike interest rates, there could be an oil shock based on political disputes.

But the headlines of how much money the Fed printed over the past seven years made it way too easy to conclude hyperinflation was right around the corner. In reality, these kinds of events are always more complicated than they seem on the surface.

Investing great Peter Lynch was once asked about how to invest given high inflation in the 1980s.

"I don't worry about any of that stuff," he said. "I've always said if you spend 13 minutes a year on economics, you've wasted 10 minutes."

The lesson: Buy good businesses. Hold them for a long time. The rest is commentary.

What's the Word on World?

Published Jul 20, 2015 at 10:39AM

Fellow Fools,

We always try our best to give you the full scoop in each of our trade alerts, but it's unavoidable that some of our work gets left on the cutting-room floor. Our recent short of **World Acceptance Corp.** (NASDAQ: WRLD) was no different. So for today's Memo, we thought you might enjoy a Q&A session with some more detail about what we found while looking into World. Let's do this!

Q: Aside from the Consumer Financial Protection Bureau's civil investigative demand (referenced in the alert), how's the business doing?

A: Return metrics are still impressive, but it looks as though World's business is slowing down. Interest and fee income (which accounts for 86% of overall revenue) and total revenue increased by only 0.1% and 1.8%, respectively, in fiscal 2015, even though the company opened 69 new branches. (That said, that number is somewhat misleading -- the net increase in branches was only 3.9%, because World actually merged 22 unprofitable branches with others.) World's loan portfolio remained relatively unchanged in size on a constant currency basis, while loan origination volume has actually fallen for two straight years. And by the company's own admission, it's getting increasingly difficult to attract new customers to its stores. Ironically, we suspect this is because competition in the installment-loan industry is heating up, with payday lenders and their ilk moving to installment loans in hopes of staying one step ahead of regulators.

Q: Management turnover appears to be a theme with many of your shorts (whether before or after the position is initiated). Does this continue with World?

A: Yes. Current CEO and Director Sandy McLean III will be leaving in two months. Preceding him out the door were the prior CFO and senior vice president at the end of 2013, the COO and president in late 2013, and the former senior vice president of the company's southern division in June of this year. It's also worth noting that World's former auditor, KPMG, resigned in August of last year as well. It's hard to know ahead of time whether these moves are a sign of worse things to come, but the amount of turnover we've seen as things have started to get tougher for the company is noteworthy.

Q: Do you think the company's creditors will prevent World from repurchasing any of its stock, and if so, how long will the moratorium last?

A: For context, and as noted in the trade alert, the most recent amendment to World's credit agreement states that World can't buy back its own shares unless lenders who hold at least 66 2/3% of the company's aggregate commitments approve of the buyback.) We're not mind-readers, but we believe it's unlikely that World's creditors will let it continue to repurchase stock at the pace it has in the past. There are a couple of related reasons for this. First: For years, amendments to World's credit agreements have proven ever more favorable for the company -- but in the past four amendments, creditors have become increasingly stringent. And the pace is increasing, too; the prior four years averaged around one to two amendments per year, but we've already seen three in calendar 2015. It looks like the balance of power has shifted in favor of the creditors.

The second reason is that World has traditionally preferred to leave some headroom between the maximum amount it can withdraw under its revolving credit agreement and the amount it actually borrows. It's currently on the hook for about $500 million, so seeing the limit reduced to $600 million isn't that troublesome -- yet. But the most recent amendment also states that World's borrowing limit will be reduced again, to $500 million, by March of next year. The chart below illustrates World's historical headroom, and if management wants to maintain these levels, World will likely want to reduce the amount it's borrowing (unless it expects its creditors to reverse course).

Source: Company filings

The third reason is the seasonality of World's business. The company's fiscal year ends in March, which as we've noted is when its revolving credit limit is expected to drop again. The fourth quarter also accounts for the highest percentage of World's free cash flow, and we expect that the company will have a hard time reducing its debt in earnest (as we assume will be necessary) while simultaneously repurchasing stock. One possible lever would be to pull back on its lending practices, but this would have a negative impact on future growth. World has a bit more than $38 million in cash on its books, which it could conceivably use to buy back shares -- but we have a hard time seeing the creditors let World use that cash to buy back stock instead of paying down its debt.

Q: What is it about the latest amendment to World's credit agreement that spooked the market so much?

A: In addition to the new stipulation about buybacks, the new provision included a clause that said if a governing body hands down any type of ruling (other than the imposition of a monetary fine) that is likely to have a material impact on World's business, and it's not bonded or otherwise stayed within 60 days, the company will be considered as having defaulted on its loan. Shortly after the amendment was filed, financial services firm Sterne Agee suspended its price target, saying that this will "essentially eliminate" any buyback World had planned and prevent the company from expanding its loan portfolio. Meanwhile, investment bank FBR downgraded the stock based on similar concerns.

Q: How risky is this position?

A: We view this position as similar to our **Caesars Entertainment** (NASDAQ: CZR) short. Specifically, we think it will likely be somewhat binary in nature – if the CFPB ultimately decides to come down against World, the shorts (like us) will make out handsomely, but if the punishment isn't as harsh as many are expecting, the market will need to establish a new equilibrium for how much it's willing to pay for a business like World. That's hard to estimate with certainty, but it's safe to say it would be meaningfully higher than today's price. If things don't play out like we anticipate, we're unlikely to wait around for that new equilibrium, since we'll have a clear indicator that our thesis isn't working out.

Finally, World is a great example of why we pay such close attention to position size. With an initial allocation of 1.5%, we believe this position can meaningfully help our portfolio if our thesis does work out, but if it doesn't, the position is still small enough that our portfolio will be able to overcome it.

If you've got a different question you'd like us to answer, make sure you head on over to the discussion boards.

Foolishly yours,

-- JP (TMFYossarian)

Close Half of Your Short Position on Caesars Entertainment

Published Jul 17, 2015 at 10:39AM

How You Participate

- **Action:** Buy to close *one-half* of your short **Caesars Entertainment** (NASDAQ: CZR) shares.
- **Allocation:** We are currently short 0.90%, and we will reduce that to about 0.45%, closing approximately half of the 3,500 shares we're short. (We'll round to 100-share lots, though, in case we ever want to use options.)
- **Scorecard Status:** Sell Short (unchanged). (If someone new to the position wanted to match us at 0.45%, they could.)
- **Recent Price:** $6.81
- **Price Guidance:** ***Use a limit order* and today aim to pay less than $6.90.**
- **Special note:** A July 22 court ruling may have significant influence on the stock, up or down.

What We're Thinking

On Oct. 1, 2014, *Pro* issued a recommendation to open a 2% short position in Caesars Entertainment. Ten months later -- and happily for us -- the shares are down 42%. Why? The company sought voluntary bankruptcy protection for one of its new subsidiaries in January, and the parent company is now bogged down by lawsuits from debt holders who claim that management illegally sheltered billions of dollars in assets during its restructuring. We side with the bondholders; although we're not lawyers, our belief is that Caesars did illegally move assets to keep them from creditors. Should the court agree, it's likely the stock price will fall to zero, because not just the subsidiary but Caesars itself would likely be forced to file for bankruptcy in that case.

Based on my read of the law and history, I believe the odds of this happening are better than 60%.

However, I know I could be wrong. Courts are anything but predictable, and the law is much more complex and nuanced than any of us would care to admit. Laws and how they're interpreted evolve over time, so you never know how a judge is going to rule in a particular case until the gavel comes down. The next gavel to fall is on Wednesday, July 22, when a Chicago judge will rule whether lawsuits against the parent company (Caesars itself) can go forward while one of its subsidiaries is in bankruptcy. There is no clear precedent; in some historical cases, lawsuits against the parent were allowed to continue, while in others, they've been "stayed" to give the parent stability while getting its subsidiary through bankruptcy. The latter ruling seems especially possible when the new lawsuits could bring the parent to its knees, derailing all chances of organized resolution, as could be the case here.

So what's the upshot? If the ruling on Wednesday allows lawsuits against the parent company to proceed, Caesars itself may soon need to file for bankruptcy, and the stock will crater again. But if the ruling gives Caesars a reprieve from lawsuits, the stock will likely enjoy a relief rally, regaining some lost ground. If the ruling coincides with a new debt settlement among creditors, there could be an even bigger rebound; rumor is that hedge fund giants John Paulson and George Soros are close to reaching such an agreement with Caesars, although we can't confirm this.

With this short, we have bet against some of the biggest giants in the private equity world -- including Apollo Global Management and TPG -- and we have won. We've made money while they're losing, and we've made money while countless giant hedge funds (including Paulson's and Soros's) invested in Caesars have lost so far. We should be happy. But we should not underestimate our competition. They will fight until Caesars' last breath. To greatly increase the odds that we make money on this short whatever comes next, we're closing half of our position and taking a partial victory lap with our 42% gain.

How This Decision Fits Into *Pro*

We don't know how the court will rule on Wednesday, let alone what might happen in bigger, future rulings, and we've already earned a very attractive return as of today. Locking in a large gain on half of our position means that even if the stock returns to $11, we'll still have a nice overall gain of about 20% net. Meanwhile, we're adding a new 1.5% short to the portfolio -- **World Acceptance** (NASDAQ: WRLD) -- and we recently increased the allocation to our existing short of **Boulder Brands** (NASDAQ: BDBD). So, even as we cut our Caesars short in half, our overall short exposure in the portfolio is increasing. This is in line with our desire to decrease our direct market-exposure risk.

We considered buying protective call options instead, but they're expensive on Caesars, and the cost would have hit our returns meaningfully while only protecting us at a considerably higher net price. Today's decision isn't easy -- we do believe the stock could go much lower, and we believe the only way the parent company can treat creditors fairly is to file bankruptcy and give up its assets. But closing some of our short is the "reasoned" approach, nearly guaranteeing that we can end this entire short position with a healthy profit later -- even if the stock rises again. And if the stock keeps falling, possibly to $0, our portfolio still benefits from our remaining 0.45% position.

We will use a **limit order** and carefully close half our position. Please be smart and use limit orders with us. Paying any price just to get your trade done will only make this less profitable for everyone.

Alternative Trades

- **If you set up a January 2016 synthetic short, or simply bought puts:** You can close half your contracts. If you only set up only one contract, you have a choice on your hands; keep it or close it based on what seems best for your portfolio.
- **If you set up a bear put spread:** Your decision on whether to close should depend on your strike prices and how much profit you've earned. If you've earned most of the profit you can possibly make on the spread (say 75%, 80%, or more), it may be logical to close it, but that again depends on your strike prices. Ask us

questions on the board below.

Wells Fargo Reports Consistent Results as Usual

Published Jul 16, 2015 at 3:17PM

Wells Fargo (NYSE: WFC)

Updated Guidance: Buy First (no change)

Recommended Allocation: 3.8%

Fair-Value estimate: $58 (no change)

Current Price: $58.15

What Happened?

- Diluted EPS of $1.03 per share (up 2% from Q2 2014)
- Revenue of $21.3 billion (up 1.1% from Q2 2014)
- Efficiency ratio of 58.5% (vs. 58.8% in Q1 2015 vs. 57.9% in Q3 2014)
- ROA of 1.33% (vs. 1.38% in Q1 2015 vs. 1.47% in Q2 2014)
- ROE of 12.71% (vs. 13.17% Q1 2015 vs. 13.40% in Q2 2014)

Continued increases in loan/deposit growth and credit quality:

- Core* loans of $832.1 billion (up 9% from Q2 2014)
- Average core deposits of $1.08 trillion (up 8.8% from Q2 2014)
- Net charge-offs as a % of total loans down to 0.30% (vs. 0.35% in Q2 2014)
- $350 million reserve release** (vs. $510 million Q2 2014)

Capital allocation:

- Share buyback activity continued (diluted share count declined 23.1 million, or 0.4% of total shares outstanding, from last quarter)
- Increased quarterly common stock dividend to $0.375 per share from $0.35

Operating segments:

- Community Banking: Net income of $3.36 billion (down 2.1% from Q2 2014)
- Wholesale Banking: Net income of $2.01 billion (up 3% from Q2 2014)
- Wealth, Brokerage, and Retirement: Net income of $600 million (up 11% from Q2 2014)

*"Core" loans excludes the impact of the non-strategic/liquidating loan portfolio

**Reserve release represents the amount by which net charge-offs exceed the provision for credit losses

CFO John Shrewsberry:

> "Wells Fargo's second quarter results once again reflected the benefit of our balanced business model. Compared with the first quarter, revenue increased on net interest income growth and expenses declined. Our balance sheet remained strong, as evidenced by solid asset quality, liquidity and capital, and we were within our targeted ranges for ROA, ROE and efficiency."

So What?

The 3 key items that I watch for Wells Fargo:

- Growth (or lack thereof) in core loans and deposits
- Trends in credit quality (as monitored via net charge-offs and reserving policy)
- Trends in the efficiency ratio and expense reduction

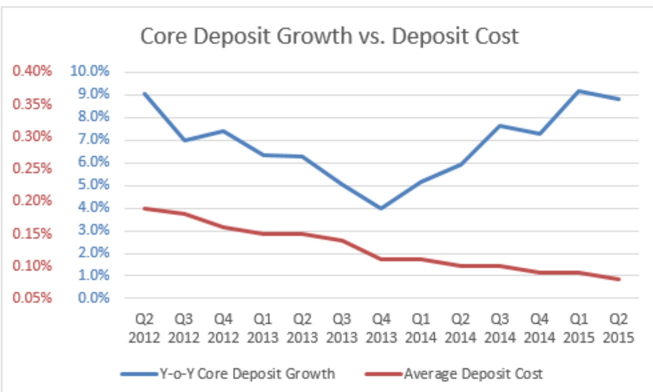
1) Growth in loans and deposits

Core loan growth for the quarter came in at 9% year-over-year. This figure includes the impact of $11.5 billion in loans acquired from GE Capital. *Excluding* the GE capital acquisition, core growth came in at 7.5%, accelerating a bit from last quarter's 7.3% growth.There was particular strength in commercial and industrial loans (which includes the GE capital loans, up 15% year-over-year) and credit card balances (up 14% year-over-year).

Source: Company filings, analyst calculations. Dashed line shows growth including the $11.5 billion in loans acquired from GE Capital.

I wrote last quarter: "I don't expect loan growth to increase meaningfully (i.e. to 9-10% growth) unless U.S. economic growth starts to sustainably accelerate (say to the 3-3.5% growth level) and long-term interest rates rise. In the meantime, if the company can keep its loan growth in the same general range as it's been recently, I'll be happy." Both including and excluding the acquired loans from GE, loan growth accelerated from last quarter, so no qualms here.

As for deposits, Wells continues to shine. The company achieved 1.5% quarter-over-quarter growth and 8.8% year-over-year growth in core deposits. Funding costs dropped one basis point from last quarter to an ultra-low rate of 0.08%. If they're only paying 0.08% on deposits, they should be gathering as many deposits as they can, and that's what they're doing. Deposit growth decelerated a bit from last quarter's outstanding 9.2% growth, but deposit growth remains very healthy:



Source: Company filings, analyst calculations

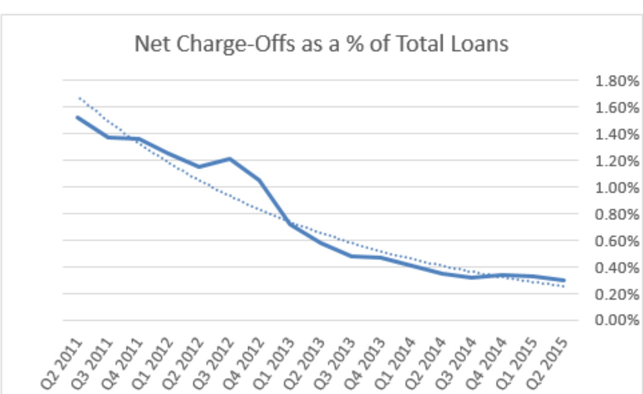
The company's ability to grow deposits meaningfully at a very low cost is perhaps the company's biggest structural competitive advantage. Wells is able to do this by having a nationwide presence with significant geographic density in most markets, optimizing distribution via newer channels (mobile/technology), and strong customer relationship management and successful product cross-sell achieved via a consistent culture that has been a hallmark of the company for decades.

For the first quarter since 2012, the net interest margin increased, coming in at 2.97% vs 2.95% last quarter. The net interest margin is unlikely to meaningfully increase until long-term interest rates rise (who knows when that will happen).

2) Trends in credit quality

Credit quality improved this quarter, with net charge-offs as a percent of total average loans declining to 0.30% (from 0.32% last quarter). This is the lowest charge-off rate I've seen from Wells Fargo since I've covered the company, and management continues to impress me with their ability to maintain healthy loan growth while still managing to wring out improvements in credit quality.

It will likely be difficult to keep improving credit quality from these very low levels. But since Wells Fargo is known for underwriting discipline, I anticipate continued strong performance from this metric. Slight deterioration in credit quality from these levels will not worry me (and may actually be beneficial in terms of generating higher loan growth), but we want to watch the trend to make sure that the company's discipline is staying on track.

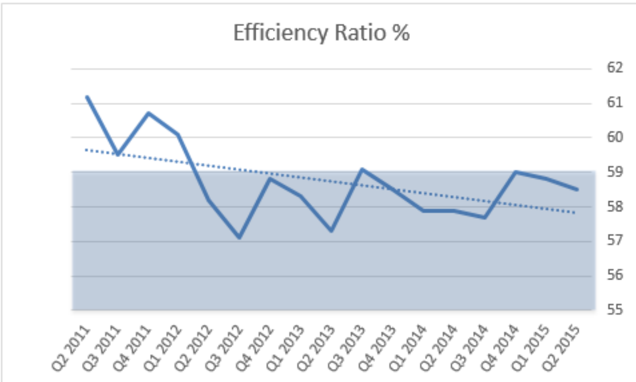


Source: Company filings.

The reserve release this quarter was $350 million (vs. $100 million a quarter ago and $510 million in the same period a year ago).

3) Trends in the efficiency ratio

The efficiency ratio (a measure of the bank's overhead costs as a % of its revenue -- lower is better) ticked down a bit this quarter, coming in at 58.5% vs. 58.8% last quarter. The efficiency ratio remains at the high end of management's target range of 55-59% (blue shaded area in graph). Management has stated that their goal is to ultimately get the efficiency ratio down to 55%, but in the absence of higher economic growth or higher long-term interest rates, the efficiency ratio is likely to stay near the high end of management's range.



Source: Company filings.

Now What?

Wells Fargo is so consistent that I can simply quote prior write-ups for my conclusion:

> "Not much different from last quarter (or the quarters before for that matter). Wells Fargo continues to execute its strategy and boast admirable consistency despite a fluctuating and uncertain macroeconomic environment. The company's performance is a testament to its diverse operating model. The company has so many levers to pull that if one segment falls others pick up the slack."
>
> "From our long-term view, underlying business results remain strong, the core earnings power of the business remains intact and is poised for positive operating leverage when interest rates and lending spreads rise, and the company's capital return program continues to benefit shareholders."

Data and Guidance

- Current Price: $58.15
- Fair Value: $58 (no change)
- Market Cap: $299.4 B
- P/B 1.76

After incorporating this quarter's results into our model, our Fair Value estimate remains unchanged at $58 per share (representing a 1.76x P/B multiple). Wells Fargo remains a Buy First on our scorecard with a 3.8% allocation, and those who have yet to fill out their position in this long-term compounder can feel comfortable doing so at current price levels.

Fool on!

Short World Acceptance

Published Jul 16, 2015 at 3:11PM

Is this for you? This is for Fools with a margin account who can locate shares to short with their broker. Before our release of this alert, Interactive Brokers had shares available to short. Check with your broker to locate shares and inquire about fees involved. Additionally, this trade is only for Fools who don't mind volatility and the special stresses of shorting — this could be a bumpy ride. Remember, shorting isn't necessary to succeed as an investor.

How You Participate

- **Trade:** Sell short **World Acceptance Corporation** (NASDAQ: WRLD)
- **Allocation:** 1.5%
- **Price guidance:** Use a limit order and initially aim to short above $59.25. As time goes on and prices change, newcomers may need to short below that.
- **Recent price:** $60.25
- **Availability at Interactive Brokers (July 16):** 350,000 shares
- **Current annualized shorting fee (July 16):** 2.75%
- **Short interest (percentage of shares outstanding as of July 16)**: 44.37% (per S&P Capital IQ)
- **Next earnings date**: July 23

Short sellers have been circling World Acceptance Corporation (henceforth known as World), one of the nation's largest installment lenders, for a few years now. To date, things have not played out like those observers have hoped, but we believe the tide is finally starting to turn against the lender.

The Business

World positions itself as a lender for those who have limited access to capital and have been spurned by banks and other lenders. Technically this is true, but the business is a lot less altruistic than this description might lead you to believe.

Fifty percent of the company's loans come with an interest rate (as defined by the Truth in Lending Act) that exceeds 50%.

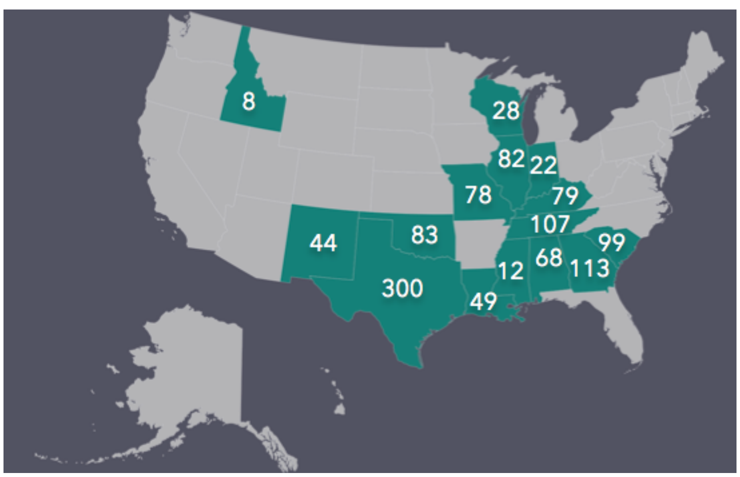
APR Low	APR High	Percentage of Gross Loans Receivable
25%	36%	23.4%
37%	50%	23.5%
51%	60%	10.9%
61%	70%	8.6%
71%	80%	3.7%
81%	90%	14.1%
91%	100%	6.2%
101%	150%	8.8%
151%	199%	0.7%

U.S. Portfolio Loan Size	Percentage of Total Portfolio
$0 - $250	1.3%
$251 - $500	14.9%
$501 - $750	10.0%
$751 - $1,00	11.9%
$1,001 - $1,500	18.9%
$1,501 - $2,00	12.9%
$2,001 - $5,000	26.5%

Source: Company filings and investor presentation

And this rate actually understates the true cost of the loan, thanks to other fees and insurance products the company actively markets to borrowers. (This was detailed in Pulitzer Prize-winning organization ProPublica's piece on World, called "The 182 Percent Loan.") In fiscal 2015, the average length of a smaller loan from World was 10 months; for a larger loan, it was 23 months. But these numbers understate how long the average borrower remains with World. The high interest rates often leave borrowers unable to repay their loans, after which they're essentially forced to accept World's offer to refinance. In fact, refinancing activity accounted for a shocking 71.5% of the loans World originated over the past fiscal year. Unfortunately, refinancing often leaves a borrower in an even worse position. It requires even more fees, and early payments consist primarily of interest (similar to a home mortgage), so it can be hard to make progress on principal. Also, World's predetermined lending amounts can mean that customers who were already struggling to repay a loan are refinanced into an even bigger one.

As of March 31, World operates in 1,172 U.S. locations plus 148 in Mexico. Branch location is important to every business, given considerations like brand awareness, specialized product offerings, knowledge of the customer, etc. But it's especially important to World because there are states where World's practices have essentially been banned. A 2012 study by the Corporation for Enterprise Development found that 22 states capped the APR for installment loans of $500 or less at 36%. (Both the cap rate and the size of the loan covered vary by state.) That particular number is important because the company admits in its 10-K filing that a nationwide 36% cap rate would "certainly eliminate our ability to continue our current operations" should it ever be implemented.



Branch location source: Company presentation

Why Short Now?

This is without question an unsavory (and un-Foolish) business; if we were ever going to root for a company to go under, this would be the one. But we won't short (or buy!) any company based on emotion. We need supporting facts. Short sellers and other organizations have been calling for World's downfall for years, and we've been watching it for some time as well; we even considered shorting it last fall, though we ultimately decided against it. However, a few recent developments have left us believing that now is the right time to act.

The first piece of the puzzle has to do with the Consumer Financial Protection Bureau (CFPB), which has released a proposal for additional regulations for certain payday, vehicle-title, and similar predatory loans. To be clear, World is not a payday lender. Only the 20% of its gross loan volume that's secured by borrowers' vehicles would be regulated under the new rules. But it's very much like one. And the CFPB doesn't look kindly on lenders whose loans end up being refinanced repeatedly, so it should come as no surprise that the agency issued a Civil Investigative Demand to World in 2014 and has asked for additional information since then.

We believe that the CFPB has World in its crosshairs, and we think its recent proposal indicates what it will likely try to accomplish with World and other installment lenders in the future. If that's the case, the outlook isn't bright. The CFPB proposal is not without flaws and is likely to undergo revisions, but many have noted that the requirements would come close to eliminating the loans it targets. And the CFPB isn't hiding what it's trying to accomplish — the following table shows the results of agency simulations under different versions of the proposals, with different assumptions about the behavior of the borrowers:

	Assuming Consumers Do Not Return After Cooling-Off Period		Assuming Consumers Return After Cooling-Off Period	
	Amortization	Off-Ramp	Amortization	Off-Ramp
Number of Loans	-62.2%	-62.2%	-54.8%	-56.5%
Loan Principal	-76.2%	-67.1%	-71.2%	-61.7%
Loan Fees	-74.5%	-65.4%	-69.5%	-60.3%

Source: CFPB (2015): *Small Business Advisory Review Panel for Potential Rulemakings for Payday, Vehicle Title, and Similar Loans*

It's not unheard of for a government agency to move on to installment lenders after initially pursuing other types of predatory lenders. The Department of Defense did exactly that when it amended the Military Lending Act to cap interest rates for covered borrowers at 36%. (Management says those borrowers only account for a fraction of World's business.) At a minimum, the CFPB expects to issue an additional ruling to identify and supervise major participants in the installment lending market, but we believe a harsher punishment is more likely.

Also, after multiple amendments to the company's revolving credit line that were increasingly favorable to World (and left us scratching our heads), the lenders are finally starting to reverse course. The most recent amendment had it all: a decrease in the company's credit line, an increased interest rate, a reduced allowable-debt ratio, and a provision saying the company can't repurchase stock without the approval lenders holding at least 66 2/3% of the aggregate commitments. There are other provisions that could threaten World's business in there too, and it's perhaps not surprising that this harsh amendment was followed by a downgrade from one analyst and a price-target suspension from another; all that was itself followed by a 20%-plus decline in World's stock price.

Take note of the news about buybacks above. Short sellers have had to endure a massive buyback over the past few years – the share count has nearly been halved since the start of 2010, helping prop up the price. One of the reasons we didn't act when we considered shorting World previously was that we didn't want to short a company that was in the midst of a massive buyback binge, so this new amendment made a real difference for us. Plus, if World's creditors are starting to get spooked, one can't help but wonder what's on the horizon for the company.

In terms of its earnings multiple, World actually looks like a bargain. The company has always traded at a discount to the market (and deservedly so, if you ask us), but it's currently trading near the low end of its historical range at 5.03 times TTM earnings. However, this is a case where we need to look to where the business is headed, not where it's been.

Depending on the severity of the CFPB's ruling, we believe there are multiple ways this position can work out in our favor. For example, it might go after World's aggressive selling of credit insurance (Discover Bank and Capital One Bank have been fined for similar deceptive practices). Insurance commissions account for around 14% of World's revenue — but as other short sellers have pointed out, if you examine customer receipts, you'll see that World often lends borrowers money to purchase the insurance. Since this amount gets bundled into the loan, World is actually able to collect interest on the insurance cost as well. So a nontrivial amount of the company's interest and fee income is also tied to credit insurance. And margins are likely to be extremely high for this division since World just sells the insurance. This means the percentage of net income attributable to the company's questionable insurance operations is likely shockingly high.

As with other financial companies, we also think it's important to look at World in terms of its price-to-book-value ratio. The stock currently trades for 1.7 times book value, which is rather generous in our opinion given the quality of the loans on its book. With such a large percentage of loan volume coming from refinancing, it's hard to accurately estimate what the ultimate recovery rate would be if the CFPB did limit World's ability to continually refinance its loans. Charge-offs as a percentage of average loans receivable are an already lofty 13% to 17% ; we believe that number would shoot higher with CFPB limitations. And given World's poor recovery rate, we might see a double whammy — a decline in book value per share, and a decline in the amount the market is willing to pay for shares.

How It Fits Into *Pro*

As the latest addition to our growing basket of short positions, this short of World Acceptance will lower both our overall net long exposure and our exposure to the financial sector (the largest sector in our portfolio). Given the potential moratorium on buybacks that could last for the foreseeable future, we believe the stock is likely to serve as a good market hedge over the near term while we wait for more details on the CFPB's plans. Once this happens, we expect the position to generate alpha regardless of what the market is doing. And make sure you stay tuned -- we'll have even more to say about World in next week's Monday Memo.

Alternative Trades

- **January 2016 synthetic short:** Experienced investors who cannot locate shares to short can consider setting up a January 2016 $60 synthetic short. Please note that while we expect an update from the CFPB before then, there is no definitive timetable for that investigation. So you may have to roll your position (for either a loss or gain). Keep your look-through allocation to 1.5%.
- **IRA Friendly:** There are no IRA-friendly trades to be had here. Apologies!

My Cash Strategy for Beating the Market

Published Jul 15, 2015 at 2:00PM

Morgan Housel is Motley Fool One's expert on the intersection of investing, economics, and human nature. He studies the impact of big-picture issues on individual investors' lives — making us better Fools along the way.

You may have never heard of Arnold Van Den Berg, but he's among the greatest investors of our time.

Van Den Berg was born in Holland in 1939 and survived Nazi occupation when he and his brother were smuggled into an orphanage. He moved to America after the war, finding a job as a mutual fund salesman after high school. In 1974, he set out on his own, opening an investment management company called Century Management, aiming to invest based on the value principles of Benjamin Graham.

The rest is history. Since 1974, Van Den Berg's fund has returned 14.5% a year, versus 11.9% a year for the S&P 500. That 40-year track record puts him in the upper echelon of investors. $1,000 invested in his fund in 1974 would be worth $196,000 today, versus $80,000 for the S&P.

But what's fascinating about Van Den Berg isn't his returns. It's how he achieved them.

During the 40 years he's been managing money, cash has made up more than 20% of his assets, on average. The typical mutual fund holds closer to 5% cash over time.

To me, that is remarkable. As investors, we constantly hear about how much a drag cash can be. That's been especially true over the past five years, as interest rates have hovered close to zero percent, or negative after inflation.

"Cash is trash," one recent headline read.

"Money market funds are the stupid investment of the week," another warns.

It's enough to make you mad. How do we reconcile the idea that "cash is trash" when one of the world's most successful investors held more than one-fifth of his assets in cash for four decades?

The answer is more complicated than it seems.

The 3 Main Strategies for Your Cash

Most investors, especially the young and working, are constantly saving, with new cash ready to invest each month or year.

But that poses a dilemma. Maybe it's a dilemma you face, too: How, and when, should investors invest their extra cash back into the market?

Index giant Vanguard did a study last year asking a simple question: If you inherit some money today, should you invest it all at once, or spread it out in even amounts over time, known as dollar-cost averaging?

Most financial advisors I know would recommend dollar-cost averaging, investing evenly over, say, a one-year period.

But Vanguard's data doesn't support that idea. The firm looked at market data going back to 1926, and what it found was clear as day: The majority of the time, you are better off investing all of your cash at once, in a lump sum.

The reason is simple. Stocks tend to go up over time. Holding cash means you'll possibly — even probably — miss out on the market's returns. And since no one can know when stocks might slip into another bear market, it makes sense for long-term investors to remain fully invested rather than tip-toeing in over time. Over 10-year periods, the investor who invested her cash in a lump sum outperformed the investor who practiced dollar-cost averaging by an average of 2.3% per year. The results were pretty much the same when Vanguard looked at U.K. and Australian markets. "It's logical," Vanguard wrote, "to implement a strategic asset allocation as soon as possible because it should offer a higher long-run expected return than cash."

But there's another side to this story. And it's where Van Den Berg comes back in.

Vanguard's report assumes there are only two ways to deploy cash: in a lump sum, or an even dollar-cost average.

But there's obviously a third way: investing strategically, deploying cash only when you think the market offers the best opportunities.

Know Your Optionality

When most investors think about the return they're getting on cash, they take the yield in their savings account, maybe strip out inflation, and come to some abysmally low number.

But if you're a strategic investor, cash earns another type of return that often goes overlooked. It's called optionality.

I've been thinking a lot about optionality since having breakfast with a seasoned financial advisor earlier this year. I asked him, what the biggest mistake investors make is. "Not having enough cash, ever," was his answer.

"What do you mean?" I asked.

"Interest rates have been low for 10 years. So no one wanted to hold cash," he said. "But think about 2008. There were two types of people: those with secure jobs and those without. Then the economy crashed. Those with secure jobs didn't have enough cash to take advantage of once-in-a-lifetime investing opportunities. Those without secure jobs didn't have enough cash to keep their heads above water."

This reminded me of something Nassim Taleb, author of the popular book The Black Swan, once wrote: "Optionality is the property of asymmetric upside (preferably unlimited) with correspondingly limited downside (preferably tiny)."

That's what cash is.

Cash gives you options other assets don't. It lets you take advantage of some situations and protects you from others. For investors, the optionality value of cash comes from the fact that it possibly lets you buy stocks at cheaper prices in the future.

And here's what's important: The value of that optionality can more than offset the abysmal interest rate you're earning on your cash.

Van Den Berg was once asked why his fund holds so much cash. "Think of it this way," he said. "If we sit in cash and wait for a $15 stock to get down to our $10 buy point, then when it eventually goes back up to $15, we get a 50% return on our investment. We think this more than makes up for the few months or quarters we might have to wait in cash, even if cash paid no yield at all."

When you think of it this way, cash in the bank yields a lot more than the advertised fraction of 1% most people earn these days. The "real" yield is the pitifully low interest rate plus the value of the optionality.

Take two hypothetical investors. Each has saved $100 per month, every month, since 1929 (bless them).

The first practices dollar-cost averaging. He invests his $100 every month into the S&P 500 come rain or shine.

The second puts her $100-a-month savings in cash when stocks are rising and deploys the entire amount only after stocks have declined 20%.

How have these two investors fared since 1929?

The investor who's hoarded her monthly savings, and only deployed it when the market crashed, has nearly 14% more money today than her friend who practiced dollar-cost averaging.

That extra return, which can add up to a lot of money over a lifetime of savings, is the optionality value of the cash she held in the bank all those years, waiting for the market to fall. It's a very real return she earned on top of her savings account's interest rate. For years, her friends chided her for earning a puny 1% or 2% yield on her savings account, when in reality she was earning substantially more once the value of the cash's optionality is factored in. Now she's richer than her snickering friends.

This kind of thinking is why smart investors like Van Den Berg outperform the market over time despite holding a lot of cash. Their cash hoards aren't anchors earning low returns; they are opportunities awaiting a large return. "Cash combined with courage in a crisis is priceless," Warren Buffet once said.

All this is fine, you're probably saying, but everything I've discussed is backward-looking theory. How can you implement an actual cash strategy in your portfolio today?

My "Crazy" Cash Strategy

I can't provide individual advice — investors of different ages, incomes, and risk tolerances have different priorities. But I can tell you how I think about cash with my personal money.

Bill Gates was once asked why Microsoft kept so much cash on its balance sheet. "I wanted to have enough money in the bank to pay a year's worth of payroll even if we didn't get any payments coming in," he said.

That may seem extreme, but Gates understood something most Americans overlook: Things change fast. You can go from on top of the world one day to fighting for scraps the next. The best way to protect yourself from life's vicissitudes is to ensure you aren't forced to sacrifice long-term gains to deal with short-term pain. If Gates hadn't kept so much cash in the bank, he might have had to sell strategic assets, or even the entire company, if Microsoft had a bad quarter. I will even suggest that a main reason Microsoft has been so successful for 30 years is because it's kept enough cash in the bank to remain flexible and focused on the long run while its competitors have had to sell out to remain solvent in the short run.

I take a similar approach with my own money. I keep as much as 40% of my assets in cash, which is inordinately high for my age.

Most financial advisors will tell me this is crazy. But I disagree. I want to make sure I never have to sell my holdings to generate cash to cover a short-term problem, such as illness or unemployment. It's being forced to sell stocks before you're ready that will clobber your long-term wealth — not earning a low interest rate on your cash. That's especially true when you think about the fact that you're more likely to need emergency cash when the economy is in poor shape, triggering layoffs and friends and family in need. And that's exactly when stocks are likely to be cheap.

For most of you, how long you stay invested is the single biggest determinate for how well you'll do at investing. And the best way to remain invested for the long run is to keep enough cash around to ensure you're never forced to sell out.

I want to stress that everyone's finances are different, and this is not personal advice. But some people think they are maximizing long-run potential by remaining fully invested in the market, when in reality they are putting themselves at the mercy of short-term wobbles. As Buffett put it, "When forced to choose, I will not trade even a night's sleep for the chance of extra profits."

A Simple Plan for Taking Advantage

The other reason I keep a large chunk of cash around is the same reason Van Den Berg does: I want to be ready and able to invest when the market presents opportunities to buy cheap stocks.

But that's easier said than done. How do you know when to deploy your cash? And how much of it should you invest when the market tanks?

I have a simple method that provides what I think is a good framework for cash management.

Throughout history, the harder the market drops, the more opportunity there's been for bold investors to make their moves. The problem, of course, is that the deepest market drops — where stocks fall 30% or more — occur less often than shallower drops of, say, 10%. I needed to figure out how to deploy enough cash to take advantage of decent opportunities while still keeping enough cash on hand for big opportunities.

So I looked back at 140 years of market data and came up with a plan.

Say I have $1,000 cash set aside to invest (in addition to emergency funds so I sleep well at night). It's opportunistic investment money. Here's my roadmap for deploying it:

Market falls by	I invest	Historical frequency
10%	$100	Every 11 months
15%	$220	Every 24 months
20%	$300	Every 4 years
30%	$130	Every decade
40%	$125	Every few decades
50%	$125	2-3 times a century

I deploy the most cash when the market falls by 20% because that's both a big decline and one that, historically, occurs pretty frequently. A 50% or greater crash represents the biggest opportunity, but it occurs rarely enough that I don't want to set aside too much cash waiting for it to happen.

As for which companies I'll invest in when the market crashes ... I'm comfortable not knowing that beforehand. Every crash affects different industries in different ways, creating opportunities that simply can't be predicted in advance. How much I'm comfortable investing can also fluctuate alongside valuations. I might not buy stocks after a 10% drop if we're coming off a bubble, such as tech stocks in 2000.

What my roadmap does help with is thinking about how much value my cash has when the market drops. Investors have a natural tendency to freeze and panic when stocks fall. Being armed with a plan to deploy my cash based on historical evidence is the best way I know of to combat the emotions that prevent most investors from taking advantage of market opportunities. It's how I prepare to actually realize the optionality value of my cash.

As Van Den Berg once put it, "That cash you're holding today is the raw material of tomorrow's superior returns." Wise words to consider as investors fret over minuscule returns earned in their savings accounts.

Quick Take: Morgan Housel on the Inevitable Crash

Published Jul 13, 2015 at 12:00PM

At the recent *Motley Fool One* member event in Seattle, Motley Fool One senior analyst Morgan Housel spoke about the eventual end of this bull market — and how Fools can tune out predictions and thrive over the long run. Watch these clips for some of Morgan's top advice on how to think about investing in stocks:

- Assume the market may crash at any moment
- The cost of admission for long-term success

Assume the Market May Crash at Any Moment

Even if we know the history of market crashes — how frequent they are, how inevitable they are, and even how good they can be for future returns — one of the worst things you can do is think that you know when it's going to come. ...

So we know that market crashes occur pretty regularly, but we have no idea when the next crash will occur, and this cognitive dissonance between these two I think really trips up a lot of investors. ...

So I think the most important thing you can do right now is prepare for a market crash without trying to predict it. And I think that's not only true right now — it's true for your entire life as an investor. No matter what the market's doing, I think a good default position is to assume that the market is going to crash pretty much at any moment. You just have to be prepared for it in your investing without trying to predict it. ...

Whether that means you need to keep a certain percentage of your assets in cash or bonds — or even if you have a tremendous amount of money and you can afford a 50% decline in your assets — do you have the mental fortitude to be able to handle that, too? Or when 2009 rolls around, will you go out and sell your assets, even if you have plenty of money?

So it's really important to know yourself and know your own behavior..

The Cost of Admission for Long-Term Success

What's so true for all investors is that how you're going to perform over the long run is not necessarily how you did when the market was surging. It's how you react when the market is falling. If you can keep your head on straight during those brief periods the market is falling and just not screw up during those periods, it's hard not to do well in stocks over the long run. That's the good news. ...

The reason you can make a lot of money in stocks over time is specifically because they go down a lot in the short run. You have to be willing to accept that cost of admission and if you're not, there are other assets that are stable that will give you no returns.

Pro's Second Annual Mid-Year Review

Published Jul 13, 2015 at 10:41AM

Dear *Pro* members,

Last week, while rereading *Pro*'s historical archive (as I sometimes do for fun and to check in on our past thinking), I came across a Memo I wrote almost exactly a year ago discussing *Pro*'s performance halfway through 2014. I had been planning to make today's Memo an earnings preview for the companies I cover (Wells Fargo reports Q2 earnings tomorrow),* but after rereading that past column, I decided that reviewing *Pro's* performance on a semi-annual basis is actually a pretty good idea. Doing so provides us with information on how our results or approach have changed (if at all), and we can potentially use this new information to our benefit.

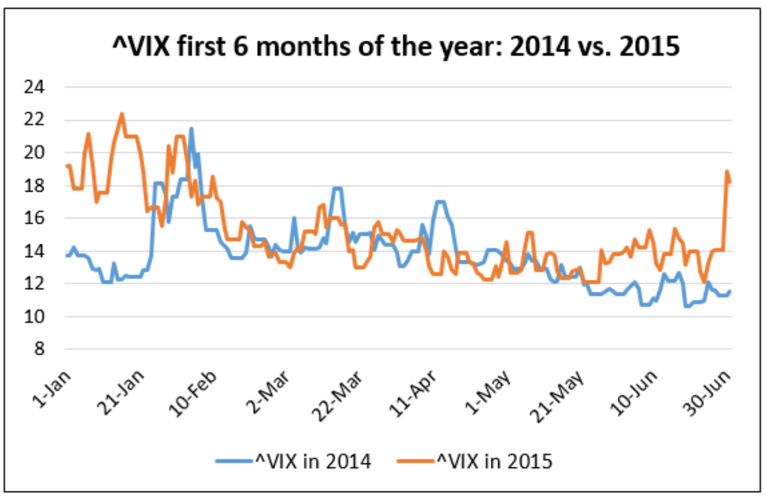
The Review

The *Pro* portfolio has performed well over the first six months of 2015. Our year-to-date performance as of June 25, 2015, is about 9.4%, outpacing both the S&P 500 (which whipsawed to a volatile 1.2% gain through June 25 after roaming between -3.2% and 3.5%) and our North Star (up about 4.7% in the same time frame). Our gross long exposure is about 88%, almost exactly in line with our historical averages. Here's a comparison of the performances of *Pro*, the S&P 500, and our North Star over the first halves of 2013, 2014, and 2015:

Year	***Pro***	**S&P 500**	**North Star***
2013	22.4%	12.6%	4.1%
2014	7.4%	7%	4.4%
2015	9.4%	1.2%	4.4%

**Source: US Bureau of Labor Statistics seasonally adjusted, indexed, monthly CPI-U data series. 2015 figure is as of June 1, 2015 (the most recent data point as of this report).*

Volatility (as measured by the ^VIX index) started the year at an elevated level amid falling oil prices and developments in foreign exchange markets. It steadily declined from there before spiking again at the end of June during renewed concerns over the Greek debt crisis:



Source: S&P Capital IQ.

As far as our activity, the pace of our trades is similar to the first halves of 2013, 2014, and 2015:

Metric	**2013**	**2014**	**2015**
New Purchases	2	2	1
Allocation Increases	3	1	0
Options for Income	8	8	8
Options for Leverage	1	1	1
Shorting	1	0	2
Hedging	4	4	4
Sales (or short covering)	3	3	1

Pro has been a bit less active in buying in 2015 compared with 2014 and 2013; we've established one new stock position (**Visa** (NYSE: V)) so far this year, and we haven't increased our allocation to any of our core stocks. Part of the reason is that we haven't outright sold much of anything, either; *Pro* is a fixed-money portfolio, meaning that if we want to keep our exposure the same while adding new stocks, we must first sell something we already own. In addition to adding a new stock in Visa, we've introduced two other new companies to the portfolio via options -- a bought call on **American Airlines** (NASDAQ: AAL) and written puts on **Live Nation** (NYSE: LYV).

When it comes to generating income, we've been just as active as in the past, with eight income trades so far this year. Those include written puts on **Gentex** (NASDAQ: GNTX)), a covered strangle on **Wells Fargo** (NYSE: WFC), and two covered strangles overlaid atop our **Expeditors International** (NASDAQ: EXPD) synthetic long.

Some of our income trades didn't work out exactly as we expected, including an ill-timed diagonal call on our American Airlines position. We ended up committing additional capital to that position to roll up to a higher strike about a week after we initiated it, only to see that additional capital incinerated when American's stock price retreated back below our *original* call strike price before expiration. From that experience, we learned to be more careful with income strategies on positions that aren't explicitly intended for income from the outset.

Our partial covered calls on **Papa John's** (NASDAQ: PZZA) are now well in-the-money, and unless the stock price retreats measurably before October expiration or an attractive rolling opportunity is available, we'll let them be exercised to sell one-third of our position. If that comes to pass, it's an outcome we anticipated and are prepared for; we'll be divesting a portion of our shares at a price well above our estimate of fair value while still benefiting from share-price appreciation on two-thirds of our position.

We also introduced a new short this year, this one on **Boulder Brands** (NASDAQ: BDBD). Later, we increased our allocation and bought protective calls after the stock fell more than 20% following the resignation of co-founder and former CEO Stephen Hughes.

Our strongest-performing stocks so far this year have been Papa John's (40% return YTD), **Skyworks Solutions** (NASDAQ: SWKS) (38%), and **Starbucks** (33%). Our worst (again, so far) have been **OpenText** (NASDAQ: OTEX), down 33%; **Oracle** (NYSE: ORCL), down 10%; and Gentex, down 9.5%.

All in all, while the first six months of 2015 have been choppy -- the S&P 500 is just barely into positive territory -- the *Pro* portfolio is performing well. We've used options for income to take advantage of a more volatile market, we've seen strong appreciation from a number of our core stocks, and we've added shorts and slowed down our purchase activity to take a slightly more defensive stance in this uneasy market environment.

The *Pro* Bottom Line

Pro's low-turnover approach is patient, flexible, and focused on an absolute-return strategy. We try to keep our underlying philosophy in mind with every portfolio decision we make. So fittingly, the conclusion from last year's mid-year review column is still completely applicable today. Here it is, with edits in brackets only to change the reference to the year:

> "While we aren't market prognosticators and we can't tell you what to expect from the market over the second half of [2015], we can tell you what our approach to portfolio management will be. We will continue to invest in core stock positions (i.e., compounding machines) when the balance of risk and reward looks favorable. We will continue to use options strategies either for income, to add to our positions at lower prices, or for leverage, depending on what opportunities present themselves. We will seek to short weak, disadvantaged companies that appear poised for a stock price decline, and we will manage our net long exposure via index hedges as market conditions dictate. Here's to a successful first half of [2015], and hopefully to a successful second half as well."

Fool on!

*Bonus Content: Earnings Preview!

Three of the companies I cover are set to report earnings within the next two weeks. Here are a few things I'll be looking for when each company reports:

Wells Fargo (reports July 14)

1. Growth in loans and deposits
2. Trends in credit quality
3. Trends in the efficiency ratio
4. Management commentary on the overall economy and interest rates

TD Ameritrade (NYSE: AMTD) (reports July 21)

1. Trading activity, mobile and derivatives penetration, and pricing
2. Net new asset growth (and specifically fee-based balance growth)
3. Net interest margin and management commentary on a changing rate environment

Gentex (reports July 23)

1. Gross and operating margin performance
2. Mirror unit growth (both exterior and interior) relative to auto production growth
3. Share buyback activity and management commentary on capital allocation priorities

---

The Hierarchy of Investor Needs

Published Jul 6, 2015 at 1:41PM

Morgan Housel is Motley Fool One's expert on the intersection of investing, economics, and human nature. He studies the impact of big-picture issues on individual investors' lives — making us better Fools along the way.

One summer in college, I interned at an investment bank. It was the worst job I ever had – more on that another time.

A co-worker and I survived our days by bonding over a mutual interest in the stock market.

My co-worker was brilliant. S*cary* brilliant. The kind of guy you felt bad hanging out with because he made you realize how dumb you are. He could dissect a company's balance sheet and analyze business strategies like no one else I knew or have met since. He was the smartest investor I ever met.

He went to an Ivy League school, breezed through an advanced financial course load, and after college landed a high-paying gig at an investment firm. He went on to produce some of the worst investment results you can imagine. Not just bad, but shockingly, disastrously bad.

Didn't see that coming, did you?

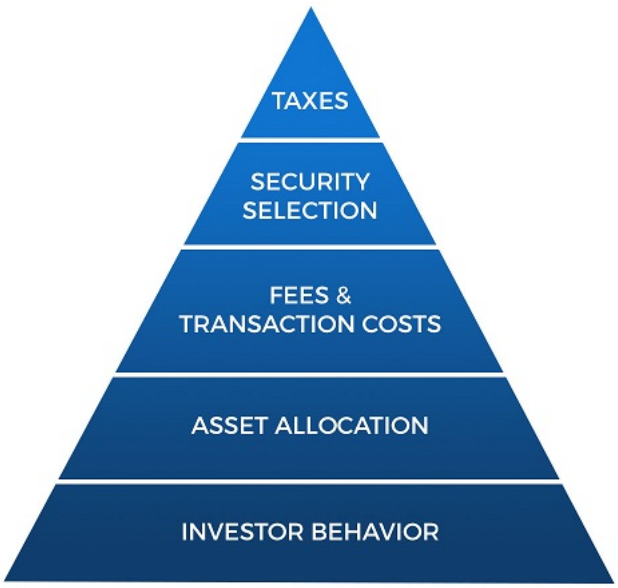
My co-worker is a genius on paper, but he didn't have the mental disposition to be a successful investor. He was too emotional, had too much of a gambling mentality, and never grasped that his book intelligence didn't necessarily translate into investing intelligence, which made him massively overconfident in his ideas. His textbook investing brilliance didn't matter. His emotional faults led him to be a terrible investor.

He's a great example of a powerful investing truth: You can be a brilliant investor on one hand, but fail miserably because of what you lack on the other.

There is, in other words, a hierarchy of investor needs. There are skills that matter more than others and, until they're mastered, render all other skills useless.

Here's what I came up with.

The most important investing topic is at the bottom. Each topic has to be mastered before the one above it can matter:



Every one of these topics is incredibly important. None should be belittled.

But you can be the best stock-picker in the world, yet if you buy high and sell low – the epitome of bad investing behavior – none of it will matter. You will fail as an investor.

You can be a great stock-picker, but if you only have 10% of your assets invested in stocks – a poor asset allocation for most investors – you're not going to move the needle.

You can be a super-tax-efficient investor. But if your stock selection is poor, you're not going to have many capital gains to pay taxes on in the first place. And if you're paying too much for advice, your tax savings can be irrelevant.

This graphic will mean different things to different people. Some investors have already mastered most of these topics. Others will find a few of them meaningful.

But no matter what level we've reached, a common problem any investor can encounter is the temptation to try to solve one problem without first mastering a more fundamental one. It can cause severe frustration, because if you've gotten the hang of a more advanced topic, you might think you should be on the road to riches -- but a more basic issue, like investor behavior or asset allocation, could still put you on a road to ruin. Just like my old co-worker.

The GDP and the Stock Market

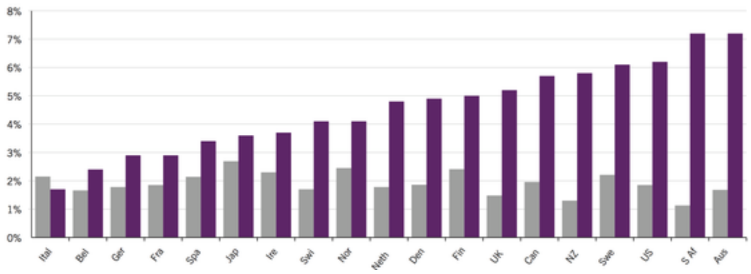
Published Jul 6, 2015 at 11:24AM

Fellow Fools,

Ignoring for a second the effects of buybacks, stock splits, and multiple expansion, why is it that the price of a successful company's stock increases over time? Generally, it's because the company gets bigger. Consider the fictional but excellent company Foolish Diamonds Inc., which sells diamond rings. As those rings grow more popular, the company's revenue increases each year, which results in the earnings per share of its common stock doing the same. If the stock price doesn't also increase, the P/E ratio will fall over time, indicating that the company is actually getting cheaper. It'd be akin to buying a diamond ring, then returning to the store at a later date to pay the same amount for another ring that's identical except for a bigger diamond. Opportunities like this are rare, but the market does occasionally offer them up.

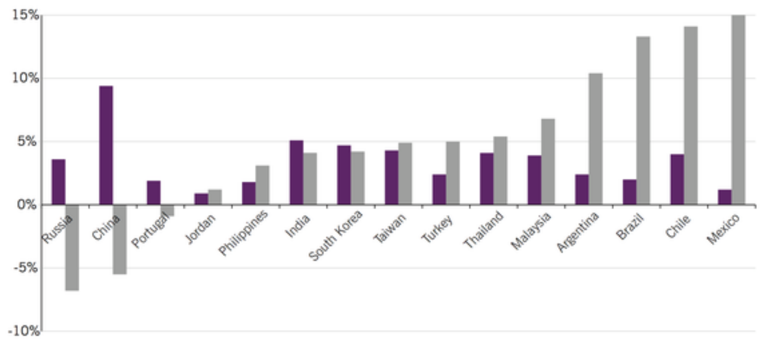
So it would stand to reason that robust growth in gross domestic product should result in impressive equity returns, right? This statement is often used as a selling point for investing in emerging markets, and it sounds logical: Strong real GDP growth should drive strong growth in corporate profits, which in turn should help deliver impressive equity returns. Reality, though, is not quite as simple (shocking, I know). In fact, evidence suggests the opposite is actually true.

Jay Ritter from the University of Florida found that from 1900 to 2011, the correlation between per-capita income growth and real equity returns was actually negative.



Source: Ritter, J.R. (2012). Is economic growth good for investors? *Journal of Applied Corporate Finance, 24(3)*, 8-17. Real per capita GDP growth rate per annum (on left in gray) and real equity return per annum (on right, in purple), 1900-2011. The real return data (dividends plus capital gains, adjusted for inflation, in local currency units) are from Dimson, Marsh and Staunton (2012). Real per capita GDP growth rates are from the World Bank, Dimson, Marsh and Stanton (2012), and Maddison (2010).

The countries included in this original analysis were selected because they have stock markets that have been in continuous operation since 1900. But what about emerging-market countries? In this case, the analysis was run from 1988 (1993 or 1995 for the BRIC countries) through 2011, but the results were the same – the correlation was negative.

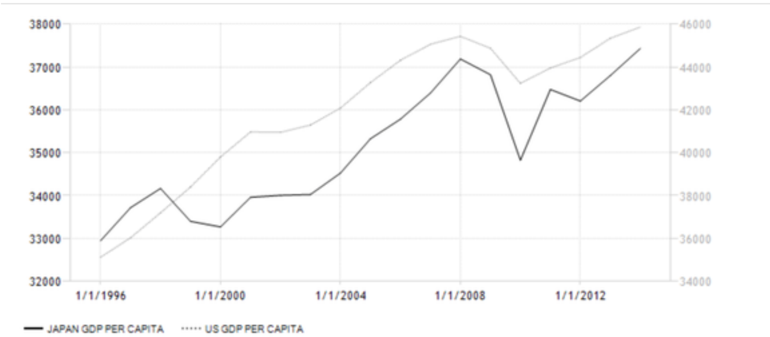


Source: Ritter, J.R. (2012). Is economic growth good for investors? *Journal of Applied Corporate Finance, 24(3)*, 8-17.

So what's going on here? Is this just data mining, or have we found a spurious relationship? To start, it's important to note that the above is an attempt to simplify an incredibly complex relationship. A long sample period was chosen in an attempt to avoid the effects of monetary policy, business cycles, international revenues, expectations for future GDP growth, and a myriad of other variables that can and do impact market returns over the shorter term. These factors might very well come into play for you as an individual investor, depending on the length of your investing horizon.

But on the other hand (and as Ritter notes), these findings are actually consistent with what Warren Buffett and University of Pennsylvania professor Jeremy Siegel have said: In a competitive economy, consumers -- not the owners of capital -- are often the primary beneficiary of technological advancement, because it leads to a higher standard of living. And if an economy grows because of investments in new or existing companies through equity or debt offerings, returns do not accrue to existing shareholders unless they're greater than what was already being achieved – and unfortunately, the opposite is true more often than not.

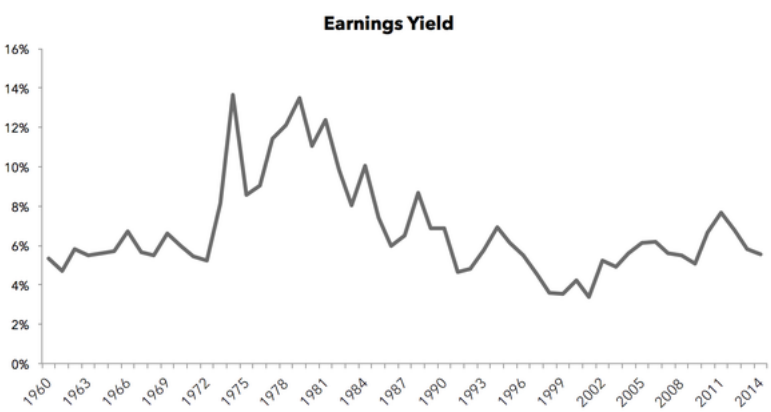
If you wanted to see this play out in real time over the past 20 years, all you needed to do was keep an eye on Japan. The country has done its best to keep up with the U.S. when it comes to growth in per-capita GDP, but the discrepancy between stock market returns is vast. (They may end up in a relatively similar position, but note the discrepancy in starting points.)



Source: tradingeconomics.com

And consider China, where the equity market has grown from "almost nothing" in 1993 to $3 trillion in 2011 (the end date of Ritter's analysis). You'd expect annual returns to be impressive over that time horizon, but as the emerging-markets chart above illustrates, they've been anything but. That's because much of this growth in the aggregate market cap has come from the increase in the number of listed companies, including China's four largest state-owned banks.

Of course, here at *Pro*, we evaluate our performance over rolling three-year periods, not multiple decades, so it's necessary for us to take a different stance than Ritter in that respect. These results don't give us a free pass to ignore what our economy is doing right now. But they do give us insight into future market returns over time, or at least Ritter's beliefs about them. He posits that the most important factor is the market's earnings yield, which is simply the inverse of the P/E ratio (so high = cheap). For reference, here's where the S&P 500 earnings yield finished at the end of 2014:



Data source: Aswath Damodaran

We do pay attention to the price of the overall market, but we're really sticklers when it comes to the price we're paying for individual companies. That's because Ritter is right: A great company can be a bad investment if you pay too much. This doesn't mean we're dyed-in-the-wool value investors, however. Our focus is the price we're paying relative to the value we're receiving, not the price we're paying compared with historical prices or the current price of competitors' stocks.

Our latest recommendation, **Visa** (NYSE: V), is a perfect example of this. Visa was trading for 22 times projected 2016 earnings and 23.8 times trailing free cash flow when we sent out our trade alert. This certainly doesn't sound like a bargain, but we're more than happy to pay up for such a strong company with a huge runway. We want companies with competitive advantages we believe will last for the foreseeable future, because they are the ones best positioned to deliver excess returns to shareholders – regardless of the macroeconomic picture.

Foolishly yours,

-- JP (TMFYossarian)

Despite Trimming Guidance, Parexel Remains on Track

Published Jul 2, 2015 at 10:34AM

Dear *Pro* Fools,

Last week, **Parexel** (NASDAQ: PRXL) held its annual Investor Day presentation, providing updated 2015 guidance and outlining a "Margin Acceleration Program" designed to improve the efficiency of the organization. The market reaction to the announcements was negative, and the stock declined almost 8% on the day of the presentation.

We don't always feel the need to comment on a large price swing (especially on a volatile stock like Parexel), but since the stock has traded consistently above our fair-value estimate so far in 2015, we decided to take a closer look at the presentation and management commentary to ensure that the recent price decline represents a more attractive entry point for members who have a partial position or no position.

After reading through the press release, the presentation slides, management comments, and reviewing industry resources, we have **increased our fair-value estimate to $61 (from $59).** So long as our thesis continues to track, we believe Parexel should continue to challenge the North Star over at least the next three years.

What Happened?

In the press release accompanying the Investor Day presentation, Parexel trimmed fourth-quarter revenue and earnings guidance because of currency headwinds and restructuring expenses associated with the margin acceleration program. The company plans to record $35 million to $45 million in pre-tax charges, primarily separation benefits related to the elimination of up to 850 positions. As a result of the restructuring, the company expects to achieve $20 million to $30 million in pre-tax savings in FY 2016, and annual pre-tax savings of $50 million to $60 million once the restructuring is fully completed.

In addition to the restructuring program, the company offered full-year 2016 revenue guidance slightly below consensus expectations, implying 7% to 9.5% revenue growth from the midpoint of 2015 guidance. These implied growth rates are slightly less than our longer-term expectations of low-double-digit growth in revenue over the next five years.

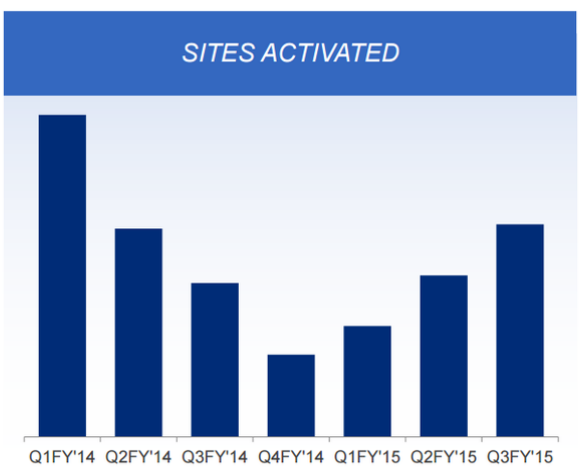
What Does It Mean?

When I read that Parexel was planning on eliminating up to 850 positions in a restructuring, my first reaction was concern. Was this an abrupt change from the company's recent strategy? Over the past several quarters, the company had been aggressively hiring employees in anticipation of a ramp-up in projects and revenue, with accelerating growth in headcount since Q4 2014. As I wrote last quarter:

> "The company continues to hire employees in anticipation of a ramp-up in revenue as multiple projects mature through the next quarter and beyond. Headcount increased 14% year over year, and those new hires mean the company's revenue per employee is historically low; it's likely to bounce back over time as projects progress, new-employee productivity improves, and revenue growth resumes at a higher pace."

But after reading through management commentary on the restructuring, I believe the eliminated positions are unrelated to the ramp-up in hiring in the clinical research and partnership functions of the business. The positions targeted for elimination are in support functions, and the company is seeking to more efficiently integrate its service offerings and eliminate overlap and unnecessary layers in the organizational structure.

Management is still confident in their active projects and partnerships over the next several quarters, and they've been hiring ahead of the demand curve, meaning they expect revenue growth will occur without the need for incremental labor -- that means cost leverage and higher margins. The company's healthy 1.30 book-to-bill ratio, 12% TTM growth in net new business, and recent increases in sites activated all support management's view of accelerating revenue growth:



Guidance Update

All in all, the business continues to track well against our thesis despite a competitive operating environment and currency headwinds. I also appreciate a management team that's willing to take a short-term hit on profits in order to optimize the longer-term efficiency of the organization. With that said, we'll want to make sure that the restructuring plan leads to the cost savings as anticipated. Additionally, we want to keep a close eye on quarterly results to make sure the company continues to win new business as the partnership model continues to gain traction, the backlog conversion rate stays healthy (management expects it to range between 10% and 11%, most recently it was 9.8% last quarter), and cancellation rates stay reasonable (the historical range is between 2.5% and 7%; it was 5.7% in the most recent quarter).

The 7%-plus stock-price decline on the day of the company's Investor Day presentation is ultimately not too worrisome. In the two weeks prior, the stock had risen almost 10%, so the market knocked it back down to a level similar to that seen after the company reported lukewarm Q3 earnings in late April. Parexel is a volatile stock, prone to sudden lurches in the share price based on lumpy results, but despite the volatility, we believe the company should continue to reward us with solid returns over the long run. Since its addition to the *Pro* portfolio in late 2013 (and including one set of written puts), the stock has provided about a 26% annualized return.

The increase to our fair-value estimate is due to an increase in longer-term expectations for clinical development outsourcing penetration. The most recent industry data continues to support the notion that contract research organizations (CROs) like Parexel will continue to win an increasing share of the increasing global clinical development market.

Updated guidance: Buy (no change)

Recommended Allocation: 3.3%

Fair Value estimate: $61 (up from $59)

Current price: $64.50

At current prices, members who have yet to match our allocation can feel comfortable either buying shares outright or writing puts to target a buy price closer to our fair-value estimate.

Set Up a Put Ratio Spread on the SPDR S&P 500

Published Jun 30, 2015 at 2:22PM

Is this for you? At *Pro*, we use hedges to earn returns during a meaningful market decline. You don't need to hedge to succeed with *Pro*, but if you are at least 80% invested in stocks and want to hedge against a market decline, then consider following along. Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $200,000 or so.

How You Participate

- **Action:** Set up a put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
- **Allocation:** 11% of total portfolio value. Set up one 2:1 put ratio spread for every $200,000 you manage and want to hedge, *Pro* will sell 28 puts and buy 14, hedging 11% of our entire portfolio value (our cash included).
- **Trade:** Write ("sell to open") **two** October 2015 $187 puts, and buy ("buy to open") **one** October 2015 $200 put for every $200,000 you're hedging. Click "view all" at your broker to see all strikes.
- **Price Guidance:**
  - Sell to open *two* October 2015 $187 puts: Lately $2.68 x2 = $5.36 credit
  - Buy to open *one* October 2015 $200 put: Lately $5.32 debit
  - **Net credit:** Lately about **$0.04** per spread (but this price will change; ideally just aim for a credit or close to no cost using a limit order)
  - SPY price: $206

Our existing spreads: We are letting our existing June 30 spread expire today, and we'll continue to keep our Sept. 30 spread in place. No action is needed on either one. If you lack the September spread, see Alternative Trade guidance at the end of this report.

What We're Thinking

At *Pro*, we aim to have winners in down, flat, and positive markets -- and that means we need to address all three possibilities at once in our portfolio. A hedge on a market index is simply a hedge against a lower market. We don't know if or when a meaningful decline will occur, of course, but if it does, a hedge can help us get through it more easily. We generally don't care about declines of 5% or less (those are just part of the market), but when *Pro* is functioning as desired, declines of about 10% or more should result in some of our positions, like these spreads, becoming profitable. At the same time, the put ratio spreads we use are:

- Harmless to us if the market goes higher (they don't harm our return)
- Typically cash-free to set up (they can even pay us a small credit)

What's the trade-off? We've had to be ready to buy shares of SPY via these hedges if the market falls too sharply. So with today's trade (as with any written put), we need to be ready to buy the underlying investment -- in this case, the SPY ETF -- if it falls below our lower strike price. If the index falls more than 15.5%, our new October hedge becomes a liability. However, if that happened, we would plan to buy long-term call options on SPY instead of shares, saving most of our cash in the process. See below for details on that.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2,535,000
- 11% of that value: $278,850
- October 2015 spread:
  - Buy to open $200 puts. Fourteen contracts representing 100 shares each = $280,000 in look-through exposure, or an 11% hedge on our current portfolio value, cash included.
  - Sell to open $187 puts (28 contracts, half of which become a potential obligation, currently a 10.3% possible stake).
  - At home, you would buy one $200 put and sell two $187 puts for approximately every $200,000 in portfolio value you want to hedge.

Return Details

SPY Price at Oct. Expiration	Value of 1 Purchased $200 Put	Value of 2 Written $187 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Current $206
$200 or higher	$0	$0	$0.04 gain per spread, or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 2.9%
$195	$5 x $100 = $500	$0	$500	(5.3%)
$190	$10 x 100 = $1,000	$0	$1,000	(7.8%)
$187	**$13 x 100 = $1,300**	**$0**	**$1,300 (max profit per spread)**	**(9.2%)**
$185	$15 x 100 = $1,500	($2) x 200 = ($400)	$1,100	(10.2%)
$180	$20 x 100 = $2,000	($7) x 200 = ($1,400)	$600	(12.6%)
$175	$25 x 100 = $2,500	($12) x 200 = ($2,400)	$100	(15%)
$174	**$26 x 100 = $2,600**	**($13) x 200 = ($2,600)**	**$0 (breakeven)**	**(15.5%)**
$170	$30 x 100 = $3,000	($17) x 200 = ($3,400)	($400)	(17.5%)

SPY Price at Oct. Expiration	Value of 1 Purchased $200 Put	Value of 2 Written $187 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Current $206
$165	$35 x 100 = $3,500	($22) x 200 = ($4,400)	($900)	(19.9%)
$160	$40 x 100 = $4,000	($27) x 200 = ($5,400)	($1,400)	(22.3%)

Our maximum profit is earned on this October spread if SPY declines 9.3% from its current perch at $206. The spread will help us a little on a decline all the way to about 15%; beyond that, our short puts turn into an obligation that's in the red.

Follow-Up

Assuming we set this spread up for a credit, it will result in a small profit even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $187 put obligation if SPY is below that price by expiration.

However, if that does happen, our plan would be to close our puts and buy long-term SPY calls (or perhaps something we like even better, whether calls or stock) instead of buying the ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY itself. So, our potential 20% or so stake in SPY shares will only cost us about 5% of our cash if we buy calls instead. We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases.

How It Fits Into *Pro*

Pro consistently hedges to lower our market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market will make a difference. Even small gains add up over the years, especially if those gains are reinvested in depressed stocks. This hedge fits well with our goal of hedging in a cost-efficient way, one that doesn't work against us if the market rises.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:**
  - For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, as we are, "buy to open" October 2015 $200 puts and "sell to open" *an equal number* of October 2015 $187 puts. Recently, this will cost you around $2.64 ($264) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $13 ($1,300) per spread on a decline to $187 or any lower price, but you should be prepared to lose your $2.64 per spread if SPY doesn't decline to at least $197.36 by expiration.
  - **To lower your market exposure while following our official trade (and make the position possible in some IRAs):**
    - Set up the original put ratio spreads as recommended, but also "buy to open" puts (with the same months of expiration as our two spreads) at strike prices *well below* $187. Buy *half as many* as the number of $187 puts you wrote. When you do so, all of your $187 puts will be "covered" (half by your $200 puts, and half by the other puts you choose to buy at a much lower strike; choose how much you want to pay to select your lower strike price). You will only need cash in your account to cover the difference between your two lowest strike prices, and your risk is capped, making this potentially IRA-friendly.
  - **Haven't yet gotten into our September 2015 $185/$170 put ratio spread?** The *Pro* portfolio also has a put ratio spread on the above options, in a 9% allocation (set up in March). If you lack this complementary hedge and want to add it, you can set the same one up today for a net debit of about $0.25 per spread. So, you do need to pay a bit to set this up today. If you prefer, you could sell to open two $175 puts (instead of $170) and buy one $185 put, and do so for a credit of about $0.25 per spread. Just realize you'll have a higher breakeven price.

Pro Can Help

- **Need a refresher on ratio spreads?** Our guide can help.
- **Want to talk about SPY?** We have a discussion board for that.

Of Gyro Sandwiches and Feta Cheese

Published Jun 29, 2015 at 12:15PM

Dear *Pro* members:

As the price to buy into American companies declined this morning, a headline in my inbox said, "Greek Drama Makes New Investments Risky."

The media tells it like this: As prices fall, stocks get more risky (rather than less); on the other hand, as prices *rise*, the coast is clear to pay more for your shares than you would have the day before, because there's less risk. We've heard this counterintuitive sentiment before, and I don't doubt we will again.

It's completely illogical, but that's how many on Wall Street still think. Thankfully, this gives us an opportunity to benefit from thinking differently. Lower prices, not higher, are better for buyers. Higher prices simply steal from future returns. We'd rather have slow and steady returns than an overexcited market, and given my druthers, I'd much rather have cheap stocks than expensive ones, because the odds would favor above-average long-term returns. So bring on the cheap.

Further, as Morgan Housel has pointed out, every market crash was an opportunity in hindsight. So why do we view future market declines as a risk?

Sure, we dislike downturns partly because we're already largely invested, and nobody likes to see the value of their holdings dwindle. But at *Pro*, we know prices don't always go up, so we keep some cash on the sidelines (we have 13.7% right now), and we maintain shorts and hedges. That way, a portion of our portfolio benefits from lower prices. If some of our short stocks were to fall sharply, we might close them and put at least some of that cash to work in cheaper stocks.

When it comes to Greece, the country has lived beyond its means and doesn't have the resources to sustainably support its debt. This has seemed obvious for five years (see Morgan Housel's explainer for more). Had we avoided stocks because of it, we would have missed years of gains. And why? Greece's economy is small, and most of its debt is carried by other European countries (rather than public companies), so any default should do relatively little to no harm to the companies we own. Meanwhile, we've been short the **CurrencyShares Euro Trust** (NYSEMKT: FXE) ETF since 2011. We'll close that short if we believe the euro has suffered enough.

Sadly, though, our bullish long-term investments can't avoid the way investor emotion affects the stock market, leading to price volatility like today's. We also can't avoid the unknown -- there may be risks in Greece that nobody has realized yet, and that's why some are selling stocks indiscriminately. But emotions and as-yet-unknown risks are both temporary factors. Emotions calm eventually, and emergent risks are attacked. The long-term earnings power of our companies is still what matters most, even if emotions rule the day for a short time.

And right now, they do. That's obvious when even a company like **O'Reilly Automotive** (NASDAQ: ORLY), which only operates in North America, is down ostensibly because of "Greece." Maybe someone thought the issue was "grease."

A Snapshot of Select *Pro* Holdings

American Airlines (NASDAQ: AAL): It seems that airlines remain a tough investment, and this one hasn't helped our portfolio yet. But the stock is inexpensive, and risk-tolerant newcomers to the position can "buy to open" January 2017 $35 calls for about $10.50 each, investing up to 0.5% of their funds to match our current portfolio.

Boulder Brands (NASDAQ: BDBD): We increased our short last week to 1.7%, and bought September 2015 $7.50 calls to cap the risk on our entire short position. Now we can comfortably cheer for much lower prices.

Five Below (NASDAQ: FIVE): The teen retailer has run up on us, becoming the only short position that's currently losing us money. We're sticking with it for now, keeping it partly as a hedge against a weak market. Should stocks remain weak, Five Below may break down again. The business still looks expensive, even though its prospects are looking a bit better than one quarter ago. Those who want to mirror our 1.4% short can do so.

Oracle (NYSE: ORCL) and **OpenText** (NASDAQ: OTEX): Large, legacy software companies are facing headwinds right now, including a strong dollar hurting results overseas (a dilemma many U.S. companies face) and a steady move to cloud software subscriptions rather than software license sales. The latter is leading to lower revenue bookings initially, but should bring much higher total revenue over many years. So, we believe it's worth waiting through this business transition. Both stocks have suffered, though. Newcomers can buy up to 3.8% in Oracle and 2.2% in OpenText to match us today.

SPDR S&P 500 (NYSEMKT: SPY): Our June put ratio spread, which we used to hedge against downside in the general market, expires at market close tomorrow, June 30. We expect to issue a new alert as that happens, replacing the first of our two current index hedges with a position with a later expiration date. (Our second existing SPY hedge expires Sept. 30, but kicks in at much lower index prices.) So, watch for that new alert. It's important that we let the June hedge die before setting up a replacement, because put ratio spreads carry an obligation if the market falls very sharply, and we don't want to double up on that obligation. We haven't needed the hedge so far (the market is about flat this year), but we didn't pay to set it up. Our last two put ratio spreads paid us a small credit in total.

In closing for today, I hope you're enjoying summer! It's a great time of year for tomatoes, olives, olive oil ... and you know, hummus sounds good right about now, and pita bread, and feta cheese, and ...

Foolishly,

-- Jeff (TMFFischer)

Greece vs. the Euro

Published Jun 29, 2015 at 10:51AM

For a broader perspective on the news from Greece, we bring you this update from Motley Fool One *senior analyst Morgan Housel, explaining how we got here — and what's next.*

Greece's economy may have peaked in 450 B.C., but it's the most influential economy in the world this morning, wreaking havoc on global markets as the country inches toward defaulting on its national debt.

What's going on? To explain, we have to go back to the 1990s ...

- **Doing business in Europe was a pain in the neck** when all countries had their own currency. An Italian buying a French bicycle had to convert lire to francs, and the French bicycle company had to convert francs to Deutsche Marks when importing parts from Germany. Everyone involved took a risk that someone else's currency would fluctuate during the process, leaving them with a loss.
- **To make things easier for everyone,** a group of European countries adopted the euro as currency on Jan. 1, 1999. This made it simpler to do business with neighbor countries, increasing trade and making everyone better off (in theory).
- **The setup is similar to that of the United States:** We have 50 individual states that share a single currency (the dollar).
- **But there's a key difference:** Our 50 states have a central government that collects taxes, pays social insurance, runs the military, and so forth. It's important that all 50 states share a central government budget because some states are richer and more productive than others. Connecticut residents paid an average of $13,163 in federal taxes in 2012; Mississippi residents paid an average of $3,503. But no matter what state you live in, the same federal government has your back. Residents in states that don't pull their weight in federal tax revenue still get Social Security, Medicare, protection from a national army, and so on. Rich states subsidize poor states, creating cohesion and semblance of order under a single currency.
- **But Europe doesn't have a central government.** Each country collects its own taxes, creates its own social insurance program, pays for its own roads, and funds its own national healthcare, all with varying degrees of largesse.
- **This is a problem with a single currency,** because low-debt countries prosper with a strong currency that encourages investment, while unproductive high-debt countries actually need a currency that loses value to help boost inflation (inflation makes it easier to repay debt) and make exports cheaper for other countries to buy.
- **Knowing this could be a problem,** the original euro pact set guidelines banning big budget deficits among member countries. It was an attempt to keep every country on the same fiscal page.
- **Alas, these rules were not enforced.** Greece spent the 2000s running up huge deficits, fueled by large pension benefits and a cultural indifference to tax cheats.
- **In 2010, the world wised up** to the extent of Greece's debts and stopped lending it money. Normally in a situation like this, Greece's currency would plunge in value, and surging inflation would devalue its old debts. This would cause a deep recession, but ultimately put its economy back on track.
- **But Greece doesn't have its own currency. It has the euro.** Which meant it couldn't inflate its debt away with a cheap currency, and more importantly, other countries with the euro didn't want to let one of their brethren fail, because the whole idea of the euro is that everyone is in this together.
- **So other countries and the International Monetary Fund** have been bailing Greece out for the last five years. Debt terms were renegotiated and aid was provided. In return, Greece was ordered to slash government spending, raise taxes, and get its national finances under control.
- **Those budget cuts sent Greece's economy into utter agony.** Unemployment hit 28% in 2013, worse than the U.S. ever experienced during the Great Depression. In 2012, 77-year-old Dimitris Christoulas shot himself after his government pension was cut. His suicide note summed up the situation: "The government has annihilated all traces for my survival, which was based on a very dignified pension. And since my advanced age does not allow me a way of dynamically reacting. I see no other solution than this dignified end to my life, so I don't find myself fishing through garbage cans for my sustenance."
- **People don't put up with that kind of misery for long,** so a new government was elected in January. The new government – the Syriza party – promised to stand up to foreign creditors and end economy-crippling budget cuts. "The verdict is clear: We will bring an end to the vicious circle of austerity," newly elected prime

minster Alexis Tsipras said on election night.

- **This began six months of Greece and its lenders** calling each other's bluff. Greece said there would be no more budget cuts. Lenders said there would be no more bailouts.
- **Greece lost this showdown last week** when finance ministers from 18 countries rejected pleas for a bailout extension.
- **This sets Greece up to default on its debt,** which will likely occur on Tuesday when it's due to pay the International Monetary Fund 1.55 billion euros that it doesn't have.

Greece is holding a national referendum next Sunday, asking its people whether it wants to keep negotiating with creditors or go its own way.

The latter would mean Greece will leave the euro and return to its old currency, the drachma. A new drachma would be worth a lot less than the euro, meaning all savings held in Greek banks would instantly be worth much less than before.

In response, Greeks spent the last week draining their bank accounts as fast as they could, attempting to hoard paper euros before they might be converted into new drachma.

This is a classic run on the banks – as of Saturday, one-third of Greek ATMs were out of cash, and on Sunday the Greek government shut down the banking system altogether. Banks across the country will not reopen until July 7. The Greek stock market will be closed for at least as long.

What a mess. I'll have more later this week.

Oracle Earnings: It’s All About That Cloud

Published Jun 22, 2015 at 9:35PM

One thing has become obvious from **Oracle**'s (NYSE: ORCL) fiscal fourth quarter report; it's becoming increasingly difficult for Wall Street analysts to predict the company's quarterly results. It may seem that Oracle has become a chronic underperformer after missing earnings expectation in four of the past six quarters, but the reality this quarter is that the company is a victim of its own success. Oracle's focus on selling its cloud-based Software-as-a-Service (SaaS) and Platform-as-a-Service (PaaS) applications resulted in the company blowing away its own internal estimates, posting $428 million in sales versus management's $300 million expectation. This was a 34% increase (on a constant currency basis) over last year and management expects growth to be as high as 60% next year.

Though this seems like this would be great news, the market reacted negatively over worries that the cloud success may have come at the expense of the company's cash cow licensing business, which declined by 10% (also in constant currency) during the quarter. This is a cause for concern because software licenses, along with the accompanying updates and support, still represent over 70% of the company's revenue. The change in GAAP revenue recognition rules caused by the transition from the pay-upfront licensing model to the ratable revenue of cloud services is going to wreak havoc on the financial statements, making it nearly impossible for investors to build a high-conviction valuation model.

Short-term Pain, Long-term Gain

Companies generally avoid sharing the specifics of their contract terms for competitive reasons, but to assuage investors' concerns, management spent a large portion of the conference call explaining the economics of the two contract types. According to management, when comparing the cash flow from a software license versus a cloud contract over a 10-year term, management expect the cloud deal to generate about 3-times more revenue. For this reason management is adamant that they prefer to sell cloud services even if it will be a short-term drag on sales and profitability. According to co-CEO Safra Catz,

"While we believe our overachievement in cloud bookings will be much more valuable in both revenue and earnings over time, cloud revenue is recognized ratably unlike new license, which is recognized upfront. This shift has the effect of lowering near-term earnings per share but, over time, will increase it significantly

So for example, a $1 million license deal, which would be recognized upfront drop right to the bottom line, would ultimately result in about $3 million in revenue over 10 years. A $1 million SaaS, PaaS booking -of SaaS booking results in $10 million over that same time period. I would not trade the cloud revenue for the license revenue, as cloud revenues and cloud bookings mean significantly more in revenues and earnings over time"

Now that Oracle has filled out its portfolio of cloud applications, management is ready to hit the accelerator. Of the $858 million of new SaaS and PaaS sales during the year, about half occurred in the fourth quarter. It should be noted that the fourth quarter is seasonally strong because sales reps try to close deals to hit year-end quotas, but even so, Oracle is demonstrating that it has an extremely competitive cloud product offering. During the quarter cloud billings-defined as total cloud revenue plus the sequential change in gross deferred revenue-increased by 78% compared to 21% at **Salesforce.com** (NYSE: CRM) and 31% at **Workday** (NYSE: WDAY). In FY 2016, management expects to sell between $1.5 billion and $2 billion of new cloud business. That's 50% more than Salesforce.com expects to sell this year.

One of the biggest concerns that many investors have is that the rapid increase in cloud sales is cannibalizing the core license business. Management was sure to point out that the majority of the SaaS deals are not existing Oracle customers. According to co-CEO Mark Hurd,

"Last quarter, I think I said that 82% of our cloud SaaS deals were actually not Oracle customers of an application when they acquired or contracted for a SaaS application. This quarter, it was over 60%. So these are -- this is not just a conversion of Oracle customers -- Oracle application customers to SaaS. This is a lot of greenfield new market share for Oracle as well"

This means that the SaaS model is more desirable for global midsized companies that can't afford the added expense of a large on-premises deployment, which should significantly expand Oracle's market opportunity.

Looking Forward

For the past few years, Oracle's management has remained focused on becoming the market leader in SaaS and PaaS and they will likely achieve that goal in the coming year. Though the license business slowed during the quarter, management insists that the on-premise installed base still has room to grow. Following the recent sell off, Oracle's stock is trading for about 10-times EV-to-EBIDTA and 14-times trailing free cash flow, which seems reasonable for an industry leader that is executing well and doing all of the right things to maintain its competitive position. Though this transition to the cloud is likely to result in volatility over the next few quarters, Pro members should be pleased that the company is well ahead of plan in establishing a fast growing stream of recurring revenue.

Of Unicorns and Bubbles

Published Jun 22, 2015 at 4:43PM

Guidance Changes

- **The Buckle** (NYSE: BKE): Our fair-value estimate decreases to $48 from $51. Shares remain a buy at a 2% allocation.

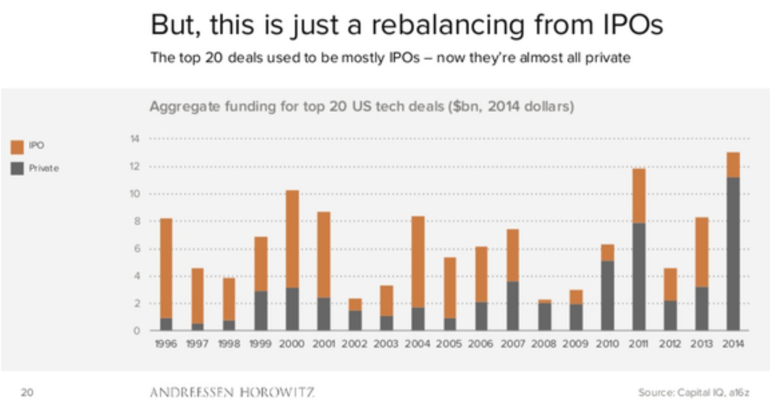
Fellow Fools,

In a recent coverage update for our sleepy clothing retailer The Buckle, I mentioned my belief that there are three truths in life: death, taxes, and changes in what's fashionable. But because I prefer even numbers, I'd like to add one more to that list today: talks of bubbles whenever our market starts hitting new "all-time highs."

In a discussion about bubbles, the tech sector is almost always mentioned, of course. And one of the biggest reasons for the chatter this time around is the number of unicorns currently inhabiting Silicon Valley. Private-company unicorns, a term that was coined by Cowboy Ventures founder Aileen Lee, were once the stuff of legend, but in recent years it's become far less rare for a company to achieve a $1 billion valuation based on fund-raising. When Lee published the initial "unicorn club" article in 2013, there were 39 unicorns here in the United States. Morgan Bender, Benedict Evans, and Scott Kupor of Andressen Horowitz noted in a recent presentation that there are now 61 of these mythical beasts stateside -- and that 75% of the largest venture-capital investments ever have been raised in the last five years. Meanwhile, Fortune's list of unicorns now pegs the global count in excess of 100.

I've read some pretty convincing articles on both sides of the bubble talk. And I've got to admit that some of the more recent valuations have left me scratching my head. It's certainly possible that the proliferation of unicorns could create a bubble that spills over into the public markets, and there are other ways you and I could be affected as investors, too.

Ever heard someone say something like "I'm investing in Company XYZ because it's going to be the next [Microsoft, Apple, Oracle, Amazon ...]"? Often, the implication is that the speaker expects the returns on XYZ's stock to mirror those of [Microsoft, Apple ...] to a certain degree. Spotting a company that is destined to join that select group is hard enough, but even if you're able to achieve such an impressive feat, you might not end up with similar returns in your portfolio going forward. You see, one of the main reasons there are so many unicorns around all of a sudden is simply that tech companies are now staying private for longer. Bender, Evans, and Kupor referred to the late-stage financing rounds that result in these generous valuations as "quasi-IPOs" and noted how the median time to IPO has expanded from four years in 1999 to 11 years in 2014.

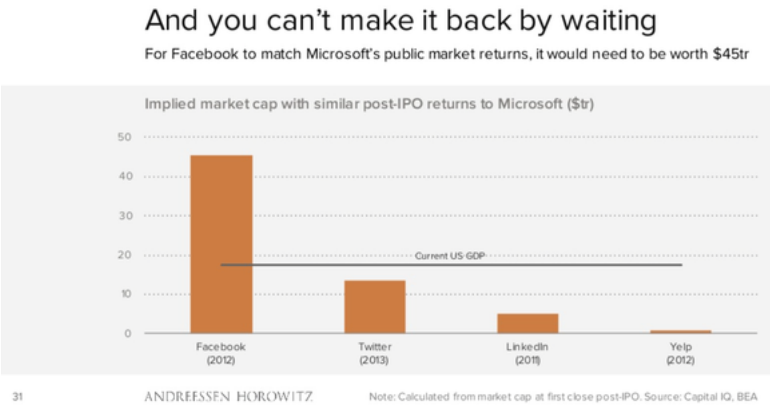


Source: Andressen Horowitz

IPOs that take place later in a company's life should be a net positive for our public markets, since we won't have as many companies like pets.com and flooz.com going public and then failing spectacularly. (Come to think of it, perhaps this is a negative for us at *Pro*, since we won't be able to short them.) But this is a drawback for the best public-market tech investors, since it also means there's increasingly less meat on the bones when a company does go public. Private investors are capturing more of the value that these companies are creating than ever before:

Source: Andressen Horowitz

Your *Pro* team can't boast that we were early adopters of Facebook (we weren't cool enough), but the *Pro* service was an early adopter of the stock, having purchased call options on the company around six months after it went public. We believe that the future is very bright for Facebook, but even so, we're not expecting Microsoft-like returns, and it took a significant decline in the stock for us to become interested. Why? Simply put, because Facebook's valuation doesn't allow it:



Source: Andressen Horowitz

I'll leave it to someone far smarter than me to figure out if and when the next tech bubble will burst, but I do think it's clear that what's taking place out in Silicon Valley is affecting us regardless. You already know that in *Pro*, we're here for the long haul. We know bubbles (and unicorns!) will come and go. Keeping an eye on this activity is just one way we can position ourselves nimbly and opportunistically, without trying to time the market.

Foolishly Yours,

-- JP (TMFYossarian)

Short More Boulder Brands and Buy Protective Calls

Published Jun 22, 2015 at 3:13PM

Is this for you? This trade is for members who have an active direct short position on shares of **Boulder Brands** (NASDAQ: BDBD). All others should read the "Alternative Trades" section of this recommendation, or bring your questions to the Boulder Brands discussion board.

How You Participate

- **Trade:** This recommendation has two components:

1. Sell short more Boulder Brands
2. Buy September 2015 $7.50 calls on Boulder Brands

- **Allocation:** Bring your short allocation on Boulder Brands up to 1.7%. *Pro* is currently short 3,900 shares for a 1.1% allocation -- we will be adding 0.6% more to our short, or shorting 2,300 additional shares. Then, purchase (buy to open) one September 2015 $7.50 call for every 100 shares of BDBD that you're short. *Pro* will be buying 62 calls. Depending on your broker, you may be able to save on commission costs by completing this trade in one transaction.
- **Price Guidance:**
  - For adding to the short: Initially, **use a limit order** to short at current prices when you make your trade, lately around $7.18; as time goes by, ideally add to your short at no less than $7 per share.
  - For the September 2015 $7.50 calls: **It is critical that you use a limit order**, initially aiming to split the current bid/ask spread. At current prices, **pay no more than $0.55 per call.** As the stock price changes, the cost of the call will change.
- **Recent Prices:** Stock: $7.18; September 2015 $7.50 calls (bid/ask): $0.45/$0.60

What We're Thinking

Last week, Boulder Brands partially vindicated our short thesis by announcing the resignation of co-founder and CEO Stephen Hughes alongside a slumping sales outlook that suggests a slowing growth trajectory. The stock price declined by more than 20% on the day of the announcement, and as I type this, our short is up about 26% since we established our position in late March.

However, unlike our long positions, which we try to ensure are great businesses that compound slowly over time, short positions require much more incremental thought and activity. The success of our initial position precipitates a new question – what do we do next? In our write-up of the resignation announcement, we noted that there was an argument to be made for "all three choices: 1) add to our short, 2) hold, or 3) cover." In fact, with this alert, we've decided to take a *fourth* choice – adding to our short while buying protective calls to buffer our downside. Here's why.

As outlined in the aforementioned write-up, we think there's a strong argument to be made for continued downside from current stock-price levels. We believe our short case is now stronger than ever for several reasons:

- The declining sales outlook lends credence to our thesis of unsustainable inventory-management and cash-conversion trends, weakening interest in the company's newly acquired brands, and increased competition.
- Boulder's debt picture is troubling, with $291 million outstanding under its term loan versus just $9 million of trailing-12-month (TTM) free cash flow. Declining sales will make it very difficult for the company to increase the latter number. Additionally, the company's debt bears interest at a variable rate, meaning Boulder will owe more in interest when short-term rates rise.
- Recent board reshuffling and management turnover suggest discontinuity and negative business momentum. Management can't fully focus on fixing the current troubles until there's a new CEO and a new business strategy in place. Boulder will have to spend resources that could be used elsewhere to find and compensate a new CEO, and employee morale may be affected.
- At about $7 per share, the company's valuation is still quite high. Boulder trades at about 40 times TTM impairment-adjusted earnings and 26 times original 2015 non-GAAP earnings guidance (which will clearly end up being too generous -- and non-GAAP excludes "one-time" costs that have been ongoing since 2011). If the company can't reignite growth, the stock price may experience further multiple compression.

For all the above reasons, we think maintaining exposure to Boulder's downside (or upside for our short) remains an attractive proposition. As for the upside for Boulder (the *downside* to our short), the success of our initial short position has afforded us a compelling risk/reward opportunity. By buying protective calls, we ensure a worst-case scenario of a small profit on our overall position if the stock price rises above $7.50 between now and September expiration.

The math works as follows. With 3,900 shares shorted at $9.60 and 2,300 shares shorted at $7.10, our net start price on our 1.7% short allocation is $8.67 per share. Assuming we pay $0.55 per September 2015 $7.50 call, the cost to buy calls to protect our entire short position would be $3,410 (6,200 shares times $0.55 per contract). The table below details the profit potential on our overall strategy:

BDBD ends at:	Net Profit on BDBD short:	Net Profit % w/o Protective Calls:	$7.50 Call Value at Sept. Expiration	$7.50 Call Net Profit at Sept Expiration	Total Strategy Net Profit at Sept. Expiration	Total Strategy Net Profit % at Sept. Expiration
$ -	$53,770	100%	$0	-$3,410	$50,360	94%
$ 3.50	$32,070	60%	$0	-$3,410	$28,660	53%
$ 4.00	$28,970	54%	$0	-$3,410	$25,560	48%
$ 4.50	$25,870	48%	$0	-$3,410	$22,460	42%
$ 5.00	$22,770	42%	$0	-$3,410	$19,360	36%
$ 5.50	$19,670	37%	$0	-$3,410	$16,260	30%
$ 6.00	$16,570	31%	$0	-$3,410	$13,160	24%
$ 6.50	$13,470	25%	$0	-$3,410	$10,060	19%
$ 7.00	$10,370	19%	$0	-$3,410	$6,960	13%
$ 7.50	$7,270	14%	$0	-$3,410	$3,860	7%
$ 8.00	$4,170	8%	$0.50	-$310	$3,860	7%
$ 8.50	$1,070	2%	$1.00	$2,790	$3,860	7%
$ 9.00	-$2,030	-4%	$1.50	$5,890	$3,860	7%
$ 9.50	-$5,130	-10%	$2.00	$8,990	$3,860	7%
$ 10.00	-$8,230	-15%	$2.50	$12,090	$3,860	7%

The highlighted columns show why we believe this strategy to be compelling. By buying protective calls, we eliminate all downside on our overall Boulder Brands short and lock in a minimum 7% gain on our effective start price of $8.67 per share. At the same time, we maintain most of the upside should the stock continue to fall. Buying calls protects us from several otherwise adverse potential outcomes, such as a takeout offer or merger, a surprisingly strong quarterly report in August, or the hiring of a star manager that lifts the spirits of the investor base.

The *Pro* Bottom Line

While we are happy to see evidence in favor of our short thesis so soon after establishing our position, we believe more trouble may be on the horizon for this struggling business, so we think adding to our short is prudent. The downside to buying protective calls is that we spend 0.1% of the portfolio's value to cap our risk, but there are multiple benefits. With this strategy, we lock in a profit no matter what happens with the stock, and we maintain plenty of upside should the stock continue to fall. And in addition to its merits as a stand-alone position, this risk-capped short presents a compelling hedge to our longs. If the market experiences weakness, Boulder Brands will likely be susceptible because of its economic sensitivity and high multiples. We'll continue to monitor the business to make sure the thesis stays on track, starting with Q2 2015 earnings, set to be reported in early August. And if we haven't taken action by the time September expiration comes around, we'll look to make our next incremental decision – either closing the position, leaving it as is, or buying December or further-dated calls to continue to cap our risk.

More That Matters

- **Maximum Loss:** On our overall short strategy, we risk what we pay to buy the protective calls, which will end without value if Boulder remains below $7.50 per share by September expiration. We also risk further losses in our Boulder short, up to $7.50. Maximum loss from here forward would result in about a 7% profit on our overall short strategy (including the shares we originally shorted in March).

- **Maximum Gain:** On our overall short strategy, our maximum gain is 94% should Boulder's stock end up worth $0 (note: we believe a $0 outcome to be unlikely).

- **Follow-Up:** After second-quarter earnings in early August, we'll decide whether to use our calls to cover our short if Boulder is above $7.50, or if we want to keep our short (and perhaps hedge it again) if shares remain below $7.50.

Alternative Trades

- **Haven't yet established a short position on BDBD?** While the risk/reward is less compelling than it was in March, you can still follow the spirit of this recommendation by establishing a 1.7% short position and buying one September 2015 $7.50 call for every 100 shares of BDBD you're short. Note that your profit/loss potential will be different than what is outlined in the table in this alert, and your breakeven on the short will be $6.63 per share, or 8% less than the current price. That 8% is the cost of buying calls as insurance against upside. While the profit potential on this more recently established trade is lower, it still serves as an attractive hedge to our longs.
- **Cant or don't want to short?** You can establish a functionally equivalent trade and match our profit/loss curve by simply buying September 2015 $7.50 puts, targeting a 1.7% allocation on a look-through basis. This trade provides identical exposure to our trade with one fewer trade command, although you must pay cash up front as opposed to receiving a cash inflow.
- **Working with a synthetic short based on our previous recommendation?** You can match our strategy by setting up additional synthetic short contracts to align with our 1.7% allocation, and buy one September 2015 $7.50 call per set of synthetic short contracts to cap your risk.

Nothing New at Five Below

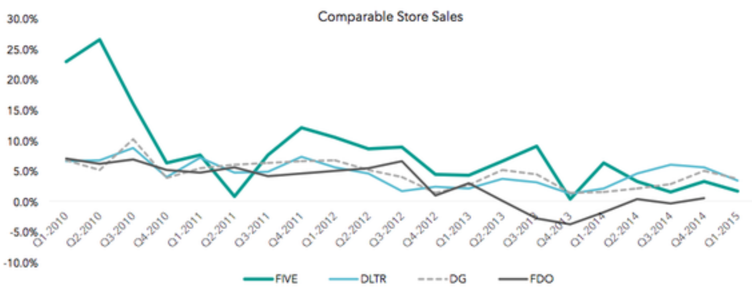
Published Jun 17, 2015 at 9:46AM

The first quarter of fiscal 2016 marked the first full quarter with new CEO Joel Anderson at the helm, but the results were very much in line with what we've come to expect at **Five Below** (NASDAQ: FIVE).

The Results

Headline numbers continue to impress, thanks to strong store unit growth (up 19% year over year). Revenue, EBITDA, and net income increased by 22%, 28.8%, and 38.9%, respectively, as the company opened up 19 stores this quarter. New-store performance was the reason the results exceeded management's previous guidance;

comparable-store sales, for those that have been open for at least 15 months, came in at 1.7% because of a 2.6% increase in average dollar value and a 0.9% decline in transaction volume.



Comparable-store sales have been weak for the past few quarters, I'm but I'm actually OK with giving the company a pass this quarter, since it was up against a 6.2% comp from Q1 of last year. And as for what the rest of the year may hold, management expects comps to be 4% to 5% next quarter and around 3% for the crucial holiday quarter.

The Valuation

Five Below continues to trade at a premium valuation, one that suggests the market does believe the company will ultimately end up hitting its 2,000-store target while holding comps somewhat steady. Valuation isn't a cornerstone of our thesis, which is a good thing given that Five Below's multiples have actually contracted over the past year -- the company continues to open up stores at a blistering pace, while the stock is up less than 10% over the same time. Even so, the stock still currently trades for around 2.5 times forward sales and 37 times forward earnings.

Pro's Take

Results for the quarter came in above management's expectations, but we think this has more to do with management under-promising and over-delivering than anything else. While there are some companies out there who shoot straight from the hip, this is more the exception than the rule and investors should always be wary about blindly following management's words.

The company also raised its full-year guidance with just one quarter in the books. Sales are now expected to end within the range of $820 million to $828 million this year, up from $816 million to $824 million. This really isn't all that surprising, though; as I said last quarter, using management's own store-opening and comparable-store sales guidance gets you closer to $830 million in sales.

At the end of the day, this quarter was more of the same – both bears and bulls were able to look at the results and believe the numbers supported their thesis. The continued slowdown in traffic leaves us wondering if customers are losing interest in Five Below, but the company continues to push forward with its rapid expansion plan. The key to shorting is doing so right before the catalyst that drives the stock lower materializes. Unfortunately, this is also the hardest thing about shorting, because it does involve a bit of market timing. We're a little bit more than a month away from the one-year anniversary of this short, and currently we're about 12% in the red. So our timing wasn't the best. But the impact on the overall portfolio has been minimal, and we still believe this position deserves a spot in our long/short portfolio as a bear-market hedge as well as an individual position. We also have plans to visit a few more stores in the near future and will report back with our findings, so stay tuned.

The Buckle Gets Thrown Into the Clearance Bin

Published Jun 15, 2015 at 3:31PM

The Buckle's (NYSE: BKE) first-quarter results for 2015 continued to follow its usual pattern for this year. Unfortunately for shareholders, that pattern means somewhat uninspiring results and uncertainty about when things will change for the better.

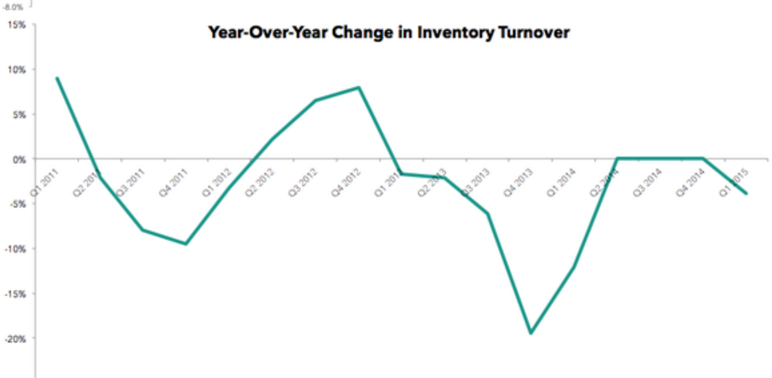
	Q1 2015	Q1 2014
Net Sales	$271.3 million	$271.7 million
Operating Margin	19.5%	21.8%
Net Income	$33.6 million	$37.3 million
EPS	$0.70	$0.78
Comparable Store Sales	-2.2%	-0.9%
Retail Stores	463	450
Sales per Square Foot	$105.82	$110.41
Change	-4.2%	-1.4%
Inventory Turnover	4.9x	5.1x
Ending Inventory per Store	$280 thousand	$265 thousand
Change	5.7%	10.8%

Note: Comparable-store sales for Q1 2014 do not include online sales, while Q1 2015 comps do.

Updated Guidance: Buy (no change)

Recommended Allocation: 1.9%

Fair-Value Estimate: $48 (down from $51)



The Buckle has increased its store count by 13 stores since this point last year, but stores open at least a year continue to struggle. Comparable-store sales (comps) fell 2.2% for the quarter thanks to a 6% decline in the number of transactions and a 0.4% decline in the number of items sold per transaction. These declines were partially offset by a 4.5% increase in prices. Online sales continue to be a bright spot (with 12.9% growth this quarter), but because those still only account for around 9% of net sales, their ability to offset the weak in-store performance continues to be minimal. We did see a nice boost in comps for May that helped the stock rise by about 5% the day the numbers were released, but we need to remember that this 2.4% growth came on the back of a -3.1% comp for May '14.

The growth in men's merchandise sales continues to outpace women's merchandise (6% versus -4%), but women's merchandise sales still account for the majority of sales (46.5% versus 43.5% for men's merchandise). Accessory and footwear sales were up 2% and 1.5%, respectively, and continue to grow in importance as they now account for 8% and 6.5% of all sales.

Weak comparable-store sales also hurt the company's margins this quarter. As management has said in the past, The Buckle needs an annualized comp number somewhere in the mid-single digits to provide operating leverage at the gross margin level. In the first half of the year, the necessary comp number is a little bit higher, since the company's sales tend to be greater in the back half. But either way, we will likely see deleveraging for the first half of the year, as The Buckle actually reported a negative comp for the first quarter.

Pro's Take

Online sales continue to be a bright spot for The Buckle; however, the competition in this space is fierce and getting more intense by the day. As I noted in last quarter's earnings coverage, even though online sales still account for less than 7% of total retail sales, the apparel industry is converting at a much faster clip. And The Buckle now finds itself going up against both its brick-and-mortar competitors and a new army of flash-sale sites, both of which are happy to offer free shipping as well as frequent sales to win your business. The Buckle is doing its best to try and carve out its own niche in the cutthroat world that is fashion retail, but I believe its approach is better suited to the brick-and-mortar world, because one of the cornerstones of that approach (having a great in-store experience) matters very little when your customers are shopping online.

After selling off mildly after releasing results, the company now finds its stock priced more like something you'd find at The Gap than the latest collection from Comme des Garçons. The Buckle might be against discounting its merchandise, but historically the market has not shared the same sentiment when it comes to The Buckle's stock:

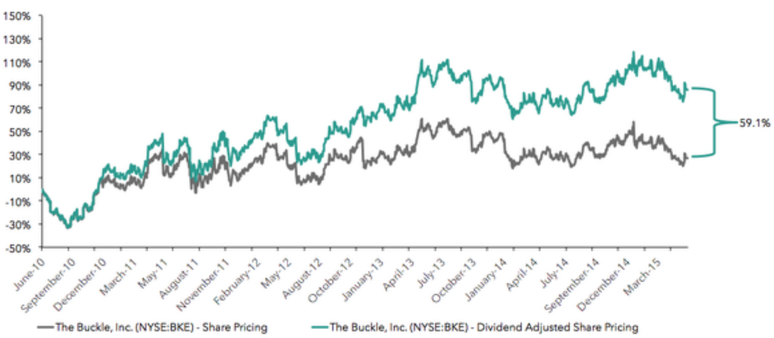
Average mulitple	10 year	5 year	3 year	1 year
EV/EBITDA	7.21x	6.96x	7.29x	7.37x
P/E	14.78x	13.72x	10.67x	14.20x

Current multiple	
EV/EBITDA	7.18x
P/E	13.64x

Standard deviation above (below)	10 year	5 year	3 year	1 year
EV/EBITDA	(0.02)	0.16	(0.16)	(0.44)
P/E	(0.43)	(0.02)	2.65	(0.68)

Given the company's recent performance, it's hard to argue that trading at a discount to the retail apparel industry average (EV/EITDA: 12.4, P/E: 24.8) is unwarranted. We're lowering our fair-value estimate to $48 today, or 14.5 times trailing earnings, to account for this continued weakness in the brick-and-mortar stores. We still expect the company to continue to methodically expand its presence across the lower 48, but the profitability of those stores has become increasingly uncertain over the past year.

The Buckle continues to be *Pro*'s dividend all-star. So far in 2015, we've collected $3.23 in dividends, a 6.2% yield on the stock's closing price for 2014. And if we assume that management will keep with tradition and wait until the start of 2016 before increasing the quarterly dividend again, we'll finish the year with a 7.03% yield. Our focus is on total returns for each of our positions, but the discrepancy between capital gains and total returns for The Buckle is perhaps the biggest of any in our portfolio.



Data source for dividend adjusted returns: S&P Capital IQ

This is why our position in The Buckle has been able to produce North Star-beating numbers even though the stock has remained somewhat range-bound since we first bought it in 2012. If the stock recovers, we may consider writing calls against our position to extract even more income, but for the time being, we're content to just sit back and collect our dividends.

Capitalize on the Whims of the Crowd

Published Jun 15, 2015 at 10:37AM

Dear *Pro* members: Today, we're delighted to welcome Jeremy Myers (TMFTank) as the newest analyst on the *Pro* team! Joining Billy, JP, Ellen (our editor extraordinaire), and me, Jeremy brings to *Pro* an acute knowledge of investing in small to medium-sized companies. Many of you already know Jeremy from his role as senior analyst on *Motley Fool Hidden Gems* over the past six years. He still holds that position, and as part of *Pro*, he'll be working to add more smaller companies to our portfolio. He'll also help us find shorting opportunities and exceptional large companies that fit into the portfolio. Jeremy jumps right in today with a great column on investing diversity. Enjoy! And then please welcome Jeremy on the Meet & Greet board. -- Jeff Fischer

Dear fellow Fools,

As we all know, diversity is a good thing. Genetic diversity is essential to the survival of life on our planet. Cognitive diversity is critical to building and maintaining a successful business. Relationships tend to be more rewarding when the parties have complementary rather than competing traits. Even portfolio diversification is referred to as "the only free lunch" – and what Fool doesn't like free food?

But although it's a blessing in many areas of life, variance is actually the enemy of an enterprising investor who's searching for mispriced assets. Research shows that when it comes to making estimates of an unknown value, the collective is almost always a more accurate guesser than even the most skilled member of the group. That's a humbling prospect for professional investors who dedicate their lives to trying to outwit the competition, but the good news is that this research also points to where some of the best investment opportunities hide.

That Crowd Is Smarter Than You – Until It's Not

One of the best descriptions I've read of what drives the machinations of the stock market is Michael Mauboussin's article, *The Wisdom and Whims of the Collective*. In this essay, Mauboussin proposes the "diversity prediction theorem" -- first described by Scott Page in *The Difference* -- as a key driver to maintaining market efficiency.

The basic tenets of the diversity prediction theorem are:

1. The collective is smarter than the average person in that collective. Not sometimes, but always.
2. Collective error is determined in part by ability and in part by diversity.
3. The collective is usually better at predicting results than the best of the individuals.

And in order for these tenets to hold true, certain conditions must also be met:

1. There must be diversity within the underlying agents.
2. There must be an aggregation mechanism that brings the information together.
3. There must be rewards for being right and penalties for being wrong.

Of that list of prerequisites, the condition most likely to be missing in financial markets is cognitive and/or emotional diversity. At one extreme, Mauboussin believes these breakdowns lead to asset bubbles; at the other end of the spectrum, you find a more subtle condition called "time arbitrage," which is when the short-term prices reflect more noise than signal. This second type of diversity breakdown is much more common, and it can be prime hunting ground for new investment opportunities if you can recognize it as it happens.

The Theory in Practice

As humans, our fundamental biases make it difficult to recognize when our sentiments have diverged from reality. For that reason alone, it's worth stepping back occasionally and reflecting on whether there are any investing narratives you see repeated a bit too often? For example, here are three areas I've been watching:

- **FOMO stocks:** The astronomical valuations being assigned to both biotech stocks and a host of privately held tech start-ups is likely being driven by both greed and FOMO (fear of missing out). Last week, **Axovant Sciences** (NYSE: AXON), a recently founded biotechnology company, raised $315 million in an IPO that valued the company at nearly $3 billion. Axovant is run by a 29-year-old former hedge fund manager. It generates no revenue, and its only asset is a developmental drug for Alzheimer's disease that it bought from **GlaxoSmithKline** (NYSE: GSK) for $5 million. Is it a coincidence that this is happening only a month after specialty ETF shop Direxion launched the first triple-levered biotech ETF? I doubt it.

  The climate is just as euphoric over in Venture Capital Land, where Uber raised financing at a $50 billion valuation, placing its worth at nearly equal to that of **FedEx** (NYSE: FDX). Even **Men's Wearhouse** (NYSE: MW) founder and former executive chairman George Zimmer recently announced the launch of zTailors, an "Uber for the tailoring world." Since we don't have ability to invest in (or short) these names, I'll leave that discussion for later, but paint me skeptical.

- **The oil patch:** The carnage we've witnessed across a wide range of energy-sector stocks suggests that investors are taking a "sell now and ask questions later" mentality -- even toward companies only tangentially related to oil production. I won't pretend to have any insight into where oil and prices will be a year from now (or five), but we can be certain that fossil fuels will continue to power a large portion of the global economic engine. There are a number of high-quality businesses with strong balance sheets that should be able to ride out the current storm and end up in a stronger position if and when oil prices recover.

- **Dividend stocks:** The recent sell-off of many dividend-paying stocks looks like a great example of indiscriminate selling. Many investors are using basic decision rules and selling entire industries without considering how their individual constituents may perform. For example, this *Wall Street Journal* article quotes two unrelated financial planners who have both nearly eliminated REITs and utilities from their clients' portfolios.

  Though interest rates could cause short-term volatility in these stocks, if rates are rising in response to an improving economy, that should be a net positive for most of these businesses. I expect that the volatility in many of these dividend payers will only increase as we get closer to a Federal Reserve rate hike and speculation intensifies.

The Foolish Bottom Line

Over my six-year career at The Motley Fool, I've been focused exclusively on finding situations in which overly negative sentiment has caused a breakdown in cognitive diversity. In *Pro*, I'm excited to use a wider range of tools to capitalize on the other end of the sentiment spectrum as well. As the new, old kid on the *Pro* block, I'd like to say how thrilled I am to be working with the *Pro* team and the community of like-minded Fools who've gravitated toward Jeff's investment philosophy. I've loved searching for small, undiscovered investment opportunities at *Hidden Gems* (and I'll continue to do just that), but I'm looking forward to developing a more holistic view of portfolio construction and risk management here at *Pro*. I've already seen a lot of familiar names from the *Hidden Gems* community, and I look forward to meeting the rest of the *Pro* family on the boards.

Foolish best,

-- Jeremy (TMFTank)

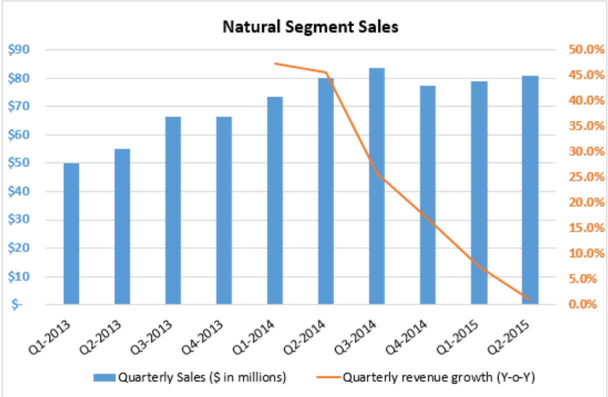
Boulder Brands Co-Founder and CEO Resigns

Published Jun 10, 2015 at 2:28PM

In a surprise move, **Boulder Brands** (NASDAQ: BDBD) today announced that co-founder and CEO Stephen Hughes has resigned, effective immediately. The company also provided an outlook for Q2 2015 that was less than inspiring, expecting sales between $122 million and $124 million during the period, a year-over-year decline of 5% to 7% compared with the second quarter of 2014. The market was not pleased with the announcement (rightfully so), and as I type this, the stock is down more than 20% as all the major U.S. market indices are up almost 1.5% ... a nice result for short sellers like us!

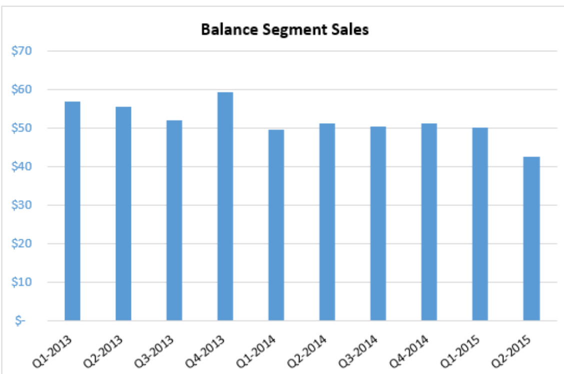
For now, **there's no change to our guidance**, and we will continue to hold our short position (currently an active 1.1% allocation) until we come to a decision on how best to proceed from here. For some more color, here are some excerpts (slightly edited for clarity) from an email I sent to the team earlier today:

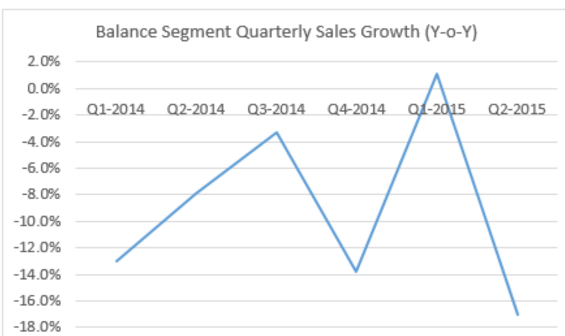
> "Just fully read through the press release. I'm very happy with the way the thesis is playing out and I'm glad we were in when the wheels started to fall off. This quarter looks to be the one where [the numbers start to really deteriorate] after the company has worked for so long to delay the inevitable.
>
> "I'm most pleased with the updated sales growth estimates that the company gave. I've long stated that the key element to this short would be the sales growth trajectory (or lack thereof) of the company's Natural segment (its newly acquired brands). Well... check out what the updated estimates imply:



"The under-investment in marketing, the roll-off of acquisition-fueled growth, the ramp-up of well-funded competitors, channel stuffing, and ultimately the lack of value proposition for its grocery store customers is finally leading the stagnating growth that we hypothesized.

FWIW, the legacy Balance segment is getting crushed, too:





"After an early Easter date made the Balance segment's last quarter look good (1.1% growth), I expected poor performance this quarter as that seasonal factor rolled off, and that's what we got. But I think this segment will revert a bit next quarter, since if you adjust for the timing effects, the true trajectory of the business is likely the average [of] what we got for last quarter and this quarter (somewhere in the negative 8% to negative 12% range... still pretty awful). So we will likely see relative 'improvement' from the Balance segment in Q3.

"The question now becomes -- what do we do next? I think there's an argument to be made for all three choices: 1) add to our short, 2) hold, or 3) cover. [I don't want to make a hasty decision, but initially I'm leaning toward perhaps adding more to our short, for a few reasons:]

" • I now have more confidence in the viability of the short thesis than ever before, since we finally have numerical evidence that the sales-growth trajectory of the newly acquired brands (and thus the shiny growth prospects for the business) have fallen off the table.

" • I think the company is in a dire situation, with a lot of debt and not a lot of growth with which to earn a satisfactory return on that debt. If current trajectories hold, the company will struggle to simply earn enough cash flow for working capital needs, maintenance capital expenditures, and interest payments. And since the company's debt is variable-rate, rising rates will hurt them even more. More goodwill impairments may be likely.

" • The management change will likely hurt the business. The board and the executives will spend valuable time looking for a replacement, and will likely have to spend heavily to attract a decent manager (what manager would want to jump into this mess unless there's a financially compelling compensation package?). There will be likely be more "one-time" earnings charges related to the management change, and there might be more organizational restructuring that adds even more "one-time" costs. Employee morale will be affected (especially for the employees that were "acquired" from Glutino or Udi's, etc.), and the negative momentum of the business may fuel a negative feedback loop, especially in the sales/marketing teams.

" • The valuation is still quite high. At $7 per share, the company still trades at 40 times TTM impairment-adjusted earnings, and at 26 times original 2015 non-GAAP earnings guidance (which clearly will end up being too generous, not to mention that non-GAAP excludes "one-time" costs which really aren't one-time at all). The company trades at about 1.9 times book value, and for a company that is now struggling to earn a positive rate of return on investment, let alone its cost of capital or excess returns, I argue it should probably trade closer to book value. Maybe 1.5 times book value is an optimistic estimate of fair value. That would place FV in the $5.50 range, with downside (upside for our short) to 1 times book value, or about $3.50 per share (another 50% gain from here)."

The *Pro* Bottom Line

All in all, we're happy with the way this position has worked out so far, but we want to work to make the proper decision from here forward. I in fact do not see this 20%+ decline as a knee-jerk reaction -- rather, I see the CEO's resignation as a catalytic event that helped the market come to a more realistic assessment of the true intrinsic value of the business. And the stock may have further to fall, or it may not. The team and I will discuss the position, and any action to be taken will be communicated to you all with a trade alert. For now, we'll hold on to our active short position at about a 1.1% allocation.

Fool on!

--Billy

Have We Reached the Top?

Published Jun 8, 2015 at 3:02PM

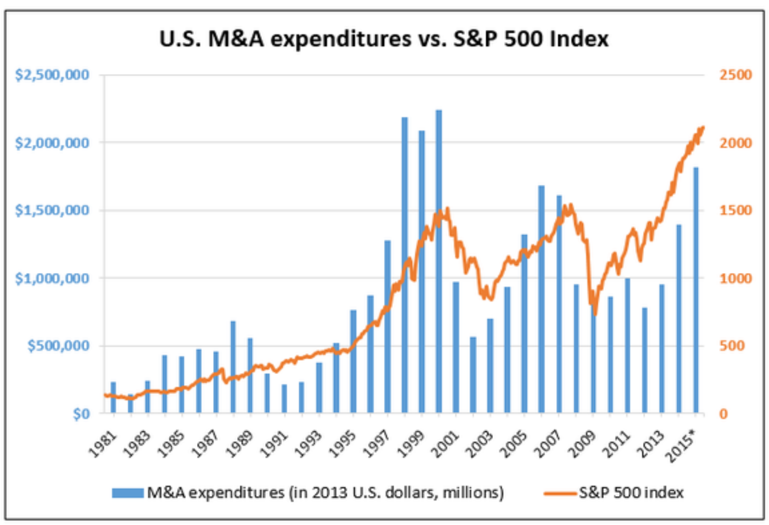
Dear *Pro* Fools,

If you've been paying attention to U.S. financial news, you've probably noticed a lot of mergers and acquisitions (M&A) from American companies lately. Some notable M&A activity this year has been:

- **Charter Communications**' (NASDAQ: CHTR) complex three-way megamerger/acquisition with **Time Warner Cable** (NYSE: TWC) and Bright House Networks
- **Avago Technologies**' (NASDAQ: AVGO) cash-and-stock deal for fellow chipmaker **Broadcom** (NASDAQ: BRCM)
- **Intel**'s (NASDAQ: INTC) all-cash acquisition of **Altera** (NASDAQ: ALTR)
- **AbbVie**'s (NYSE: ABBV) acquisition of **Pharmacyclics** (NASDAQ: PCYC)

In fact, U.S. M&A activity hit an all-time monthly record in May 2015, totaling $243 billion. Before that, the previous two monthly peaks were $226 billion in May 2007 and $213 billion in January 2000.

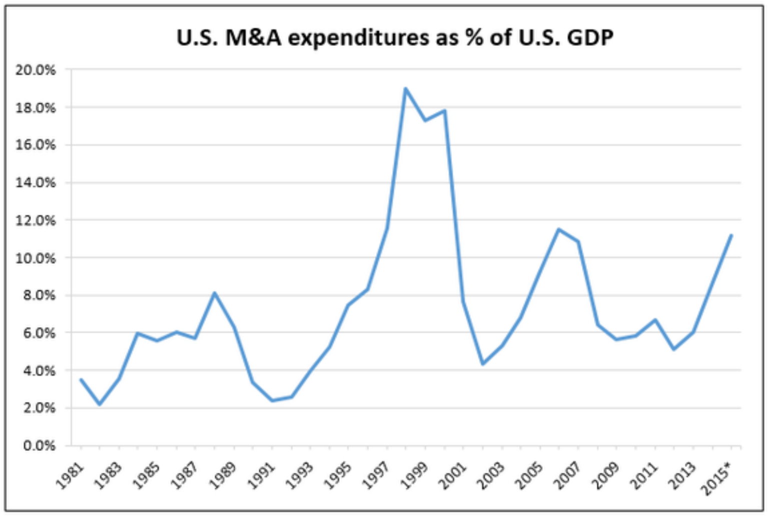
If that timing jumps out at you, no, it's not a coincidence: M&A activity tends to peak near market tops. Check out this graph of U.S. M&A expenditures compared with the S&P 500 index:



Sources: Capital Allocation: Evidence, Analytical Methods, and Assessment Guidance, Michael J. Mauboussin and Dan Callahan, CFA (2014), S&P Capital IQ, FactSet. 2015 figure for M&A expenditures is an annualized run rate based on data as of May 2015.

As I noted in a previous Memo ("On Capital Allocation"), M&A expenditures tend to reach their apex when stock market values are high (i.e. managers can use inflated equity as currency) and capital is cheap and easily accessible. If that sounds similar to the financial environment we're in right now, that's because it is (see: near-zero interest rates and record year-to-date U.S. corporate bond sales).

So should we be concerned? Does record M&A activity mean that we've finally reached the top of this six-year-plus bull market? Well, when we take a closer look at the data, there's reason to believe that this *isn't* the peak. For example, if we compare total M&A expenditures to GDP to normalize for the growth of the economy, the graph looks like this:



Sources: Capital Allocation: Evidence, Analytical Methods, and Assessment Guidance, Michael J. Mauboussin and Dan Callahan, CFA (2014), Federal Reserve FRED economic database. 2015 figure is Q1 2015 seasonally adjusted annual rate. GDP data in chained 2009 dollars.

After adjusting for the growth of the economy, we haven't yet reached the height of the tech-bubble M&A peak. Additionally, during previous peaks, interest rates were much higher. In January 2000, the 10-year Treasury rate was 6.66%, and in May 2007 it was 4.75%. Capital is much cheaper today, with the 10-year Treasury rate hovering around 2.4%, meaning that companies can justify even higher purchase prices relative to 2000 and 2007. Given those extra data points, there may be room for even higher levels of M&A expenditures.

Despite the data above, the truth is, there's only one way to know whether this is a market peak: *hindsight*. We could be sitting right at the top of a market cycle, or this monthly M&A activity record could just be the middle innings of an even bigger game. The only way to know is to let the future unfold.

At *Pro*, we don't try to divine short-term market movements. While it's interesting to observe the data, whether M&A activity portends a market peak is ultimately of no matter to us. We are focused squarely on our underlying philosophy and goal, which is to maintain a diverse, flexible portfolio that aims to generate North-Star beating returns over every rolling three-year period. And we work every day to position our portfolio to achieve that goal.

Fool on!

Valmont Is Still in a Valley

Published Jun 1, 2015 at 2:05PM

Guidance Updates

- **Valmont Industries** (NYSE: VMI): Shares remain a Buy at a 1.9% allocation, but our fair-value estimate decreases to $140. For our current take, read on!

Returns to Date

- We're having a good year so far. The returns table on our Recommendations page was just updated through the end of May -- click here to see how we're doing.

Dear Fools,

In November 2013, *Pro* suggested investing in shares of diversified manufacturer Valmont Industries. Shares are down 12% from the recommendation price; include dividends, and as of last week we've lost around 10.5% in 18 months. Why? All four of Valmont's business lines entered a weak cycle. This isn't a complete surprise. Following a record 2013, nearly everyone expected the company's irrigation sales to soften. In fact, we were buying the stock *after* it had declined some on that very premise. But we didn't expect the other business lines to follow suit. The red dot shows when our our trade alert was issued, at about $142.

For six months or so, the business did well enough to reward us; then, one year ago, the company's utility division began to disappoint as competitors drove prices lower. Next, commodity prices declined, affecting Valmont's mining-related sales in Australia, and irrigation sales weakened as expected. With all business lines soft, Valmont is now initiating a restructuring plan to lower costs, effectively going on the defensive. We want the typical *Pro* business to smartly be on the *offensive*, so let's break down what's behind this current disappointment.

The Lowdown

Valmont reports results in four operating divisions.

Engineered Infrastructure Products (34% of Q1 sales)

In this division, Valmont uses its steel expertise to build traffic and light poles, communications towers, grates, offshore structures and more. Sales ticked up 4% this quarter, to $238 million, thanks to an acquisition and better results in Europe and Asia. However, mining-dependent Australia remains weak, and governments are not readily funding infrastructure projects in North America and Europe. Operating income declined 13% to $11.9 million -- representing 5% margins, compared with 6% a year ago -- because of lower profitability in Australia and currency translations. We know much of the infrastructure in the U.S. is in need of repair; when will the government green-light it?

Utility Support Structures (25% of Q1 sales)

Sales dropped 18% last quarter, to $176 million, in the division that provides steel poles and support towers for utilities. This was partly because of competitors driving prices lower (leading Valmont to bid on fewer projects), and partly because those projects tended to be on the smaller side. The larger the project, the fewer the number of companies that can potentially fulfill it; Valmont is hoping for large projects to resume, because competitive pricing on those should be more rational. Operating income dropped 53% to just $15 million, showing how modest profits are on small projects that suffer pricing wars. Another challenge here: Revenue is tied to steel costs, and steel has declined 35% in the last six months.

Irrigation (22% of Q1 sales)

Farm irrigation equipment revenue declined 27% to $154 million as volume dried up around the world, compared with a healthy 2014. In the United States, farm income is declining with crop prices, and around the world, lower commodity prices dampen demand -- as could changes to a government financing program for farmers in Brazil this year (that's a large Valmont market). Operating income declined 44% to $24 million because of lower volume on fixed costs. Pricing in the industry stayed "somewhat stable," as the CEO put it, and historically that has been the case. Were that to change, our thesis would come into question.

Coatings (11% of Q1 sales)

Revenue in the coatings division -- which includes galvanizing to prevent corrosion or rust, painting, and anodizing -- fell 10%, mostly due to a weak Australian market. Operating income declined 21% to $11 million. Valmont is a world leader in galvanizing, and it's a strong-cash-flow business when demand is high.

The Restructuring

In response to these challenges, which management does not expect to dissipate soon, Valmont just initiated a $30 million (cash and non-cash) restructuring plan. Targeting aspects of the business they *can* control, they're making sure they're operating as efficiently as possible by cutting unnecessary spending and closing some redundant facilities. The cash expenses of $19 million should be recovered through lower operating costs in 12 to 18 months.

The Big Picture

Should we continue to own shares? I believe the answer lies in another question: Does Valmont still have competitive advantages? If so, we should be rewarded, as planned, by owning shares over the long haul. The stock has returned 15.4% annualized since 1993, more than doubling the S&P 500's 7.3% (measured by Valmont to Jan. 7 of this year). But double-digit annualized returns will only resume if Valmont still has competitive advantages, *and* governments increase spending on infrastructure, *and* irrigation demand keeps growing. Those are some "ifs" and "ands" to overcome. Plus, if steel prices and the competitive landscape in the utility sector do not improve, those will be headwinds.

It's encouraging that during past downturns, Valmont has remained profitable and generated healthy free cash flow (we wouldn't have invested in it otherwise!). And it has steadily grown in the process. Here's a history of the key numbers:

Valmont	2005	2006	2007	2008	2009	2010	2011	2012	November 2013 Buy Report
Sales ($B)	1.11	1.28	1.50	1.91	1.79	1.98	2.66	3.03	3.29
Oper. ($M)	83	111	156	229	238	192	266	381	485
EV/EBITDA	8.6	11.3	13.9	7.3	7.4	11.2	8.0	8.6	**6.8**
P/E	21.5	25.1	26.5	12.7	13.8	26.2	16.2	12.8	13.3
P/FCF	13.9	23.9	91.6	41.1	10.9	44.2	32.7	29.5	17.6
ROE (%)	12.5	16.9	20.8	23.3	21.4	11.1	22.1	18.7	20.2

And here's where we stand since our buy report:

Valmont	2013	2014	Now
Sales ($B)	3.3	3.1	3.0
Oper. ($M)	485	358	317
EV/EBITDA	7.1	7.1	8.3
P/E	13.8	16.9	19.7
P/FCF	18.2	16.2	13.2
ROE (%)	19.0	13.5	11.9

Numbers source: S&P Capital IQ.

Sales are down about 10% since we bought, and operating income is down nearly 35% because of fixed costs in this industrial business. The company's EV/EBITDA value multiple was only 6.8 when we bought it, well below the 13-year average of 8.7. I believed that would limit our downside risk even at a peak cycle. It certainly hasn't hurt. Today, on lower results, the business is at 8.3 times EBITDA, still below its average. We can't forget the leverage in this business: On an upturn in revenue, profits are traditionally magnified as sales are spread over the steady, fixed costs of doing business, so the valuation (and thus the stock) should respond nicely.

The Conclusion

Valmont's revenue, income, free cash flow, and dividend have been steadily increasing for years, and if the business maintains competitive advantages, we believe management will continue to deliver, meaning we should be hitched to a North Star-challenging stock here, eventually. However, if at any point we want to be more defensive and raise cash, want capital for a stock we like better, or feel Valmont's edge is blunted, we will at that time sell shares to likely offset gains elsewhere.

Right now, though, we still believe in this long-term thesis: All these business lines should see growing demand in the long term, and reasonably-priced Valmont is positioned to profit. In the near term, we have hopes that within months we'll see some light on the other side of this valley. Will we buy more stock or at least write puts if we see a recovery coming? We're not ready to commit yet, but that's certainly on the table. On the flip side, if new competitive pressures make a recovery seem unlikely, we'll be ready to sell and move on. Like most investments in any business, the long-term attraction of this one comes down to its competitive advantages. We will keep assessing those.

For more on Valmont, check out its recent investor presentation. See *Pro*'s latest Valmont numbers, and post any questions on the Memo Musings board or the Valmont board. Fool on!

— Jeff (TMFFischer)

Pro Catch-Up Trades

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking.*

- **American Airlines** (NASDAQ: AAL): If you don't own calls yet, you can buy January 2017 $30 calls for about $15.50 each. Invest up to 0.5% of your funds in the calls.
- Obviously, most of our other stocks remain Buys.

Pro Catch-Up Trades: May 26, 2015

Published May 26, 2015 at 3:05PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking.*

- **American Airlines** (NASDAQ: AAL): The stock was battered last week. If you don't own calls yet, you can buy January 2017 $30 calls for about $15 each. Invest up to 0.5% of your funds in the calls.
- **AmTrust Financial Services** (NASDAQ: AFSI): As we return this stock to a Buy, purchase up to 3.5% in shares if you lack a position. We'll watch for opportunities to tell you to add more to get closer to our allocation over time.
- **OpenText** (NASDAQ: OTEX): This company also got battered last week. You can buy up to 2.4% in the stock if you don't own shares yet.
- Obviously, most of our other stocks remain Buys.

Our 'Problem' Positions

Published May 26, 2015 at 2:04PM

Guidance Updates

- **AmTrust Financial Services** (NASDAQ: AFSI): Shares return to a Buy, with a suggested 3.5% allocation to start (and gradually grow to match us over time). Fair value estimate increases to $50.
- **Apple** (NASDAQ: AAPL): Fair value estimate increases to $126 from $118. Shares remain a Buy at a 4.6% allocation.

Dear fellow Fools,

Here at *Pro*, we don't invest much money in the retail or energy sectors, and volatility in recent months may remind you why. Consumer retail is a tough nut to crack if your goal, like ours, is steady growth for decades: Consumer tastes change, competition is omnipresent, and even how and where we shop is changing. Energy, meanwhile, is a sprawling, largely commoditized industry that's spawning more competitors as solar and alternative sources expand.

There are, of course, countless interesting investments in both sectors, but in our quest for compounding machines, we usually prefer to buy subscription- or transaction-based businesses with recurring fee revenue, such as you find in software or financials. Where we *have* ventured into retail or energy, volatility has resulted, but we've kept the positions small so the portfolio as a whole is mostly insulated.

For today's column, I'll call the following volatile positions our "problem positions," and by that I only mean they're in the red lately. Not all are energy- or retail- related, but not surprisingly, four of the six are.

Problems ... With Solutions

"*You fix what you can fix and you let the rest go. If there ain't nothin to be done about it it ain't even a problem.*" -Cormac McCarthy

American Airlines (NASDAQ: AAL), **0.5% exposure.** Our recent foray into an airline investment is (perhaps not surprisingly?) our worst performer this year. We invested a small amount in call options, and as calls will do, they've been cut in half while the stock is down about 16%. Wall Street is spooked that airline capacity is growing and revenue per average seat mile is lately declining across the industry, but these and pricing concerns appear overblown. I believe once management teams reiterate a commitment to maintaining strong profits, the stocks in this volatile sector should start to recover -- and American Airlines is among the cheapest of the bunch.

That said, I actually consider the airline a leveraged investment in energy. If oil prices languish, American continues to benefit. If oil rebounds too much, American's profits will decrease. So we've kept the position small, even though I believe airline profits will persist and this company is cheap. If it gets much cheaper, we just may be compelled to add a tad more.

The Buckle (NYSE: BKE), **1.9% exposure:** *Pro* is in the green on the clothing retailer -- and don't forget the large, special dividends -- but I know many newer members are not. The Buckle has declined lately on lower same-store sales. JP is waiting for an SEC filing to finish his review of the recent quarter, but we're in agreement that the stock looks inexpensive. We believe jeans will stay in fashion (we make bold bets here!), so as long as this well-managed jeans purveyor can continue to increase store count and find ways to increase foot traffic, it's positioned to create long-term value. But as with much of retail, the stock has been down this year on lighter spending from customers. Gas is cheaper than before, but it turns out folks aren't spending the difference -- they're saving the money instead. Eventually, though, they'll have enough saved to do some spending. Plus, jeans wear out. We would like to see The Buckle make its brand more resonant and relevant with more people, though.

OpenText (NASDAQ: OTEX), **2.4% exposure:** New members have a loss on this enterprise information management (EIM) software leader. The stock is down smartly following third-quarter results and last week's news that the fourth quarter is tracking much lower than Wall Street estimated. Most of the difference, though, is attributed to the strong dollar. When the currency situation eventually changes, OpenText's results should be amplified to the positive. OpenText is also transitioning more customers to cloud contracts, which lowers up-front revenue, but adds long-term subscriptions. About 86% of the company's revenue is recurring. I'm willing to wait for better results, as OpenText continues to generate strong free cash flow in a growing industry, and looks inexpensive.

Tupperware (NYSE: TUP), **2.6% exposure:** I'm working to maintain patience with this direct retailer. About 67% of sales are overseas, and the strong dollar is hitting results here, too, but Tupperware has also bungled past share buybacks using debt. We're down 19% on Tupperware excluding dividends we receive (which pay more than 4% annually now), making it our largest stock loser. Our total loss is relatively modest, but it's still not helping our portfolio climb toward its North Star. Free cash flow growth has been lacking for several years at Tupperware, and we'll only hold the stock as long as we believe it will resume. For now, that remains the premise.

WisdomTree Emerging Markets Small-Cap Dividend Fund (NYSEMKT: DGS), **2.1% exposure:** Emerging-market stocks haven't done well for several years, period. The U.S. stock market has handily outperformed them. But we know eventually they will have their day in the sun; in the meantime, they're inexpensive, and this fund is well run. It's sensible diversification to keep some emerging markets in our portfolio. This keeps us in tune with these markets and may see us better prepared to add to the position when we finally feel the time is right. Including dividends, we've made some money on this ETF, but it has lagged developed markets. Eventually it should do very well comparatively.

Valmont Industries (NYSE: VMI), **2% exposure:** Another energy-related business, Valmont suffers as commodity prices decline, governments spend little on infrastructure projects, and the utility sector becomes extremely competitive. This has historically been an outstanding long-term investment, so we're assessing to make sure that Valmont maintains enough of its competitive advantages to merit continued strong performance. I should have my next earnings review this week. For now, we certainly still believe in management and in the potential of this long-term investment.

These six investments add up to 11.5% of the portfolio. Exclude OpenText, which is still a winner for us since inception, and these losers are just 8.9% of the portfolio. Of course, we frown on any movement into the red, but knowing that some losses are inevitable with stocks, your measure of success is how small you keep them. Meanwhile, we continue to believe in the merits of these investments over the longer haul. Remember, studies show that losers eventually become winners, and vice versa. It stands to reason then that having some losers helps diversify your portfolio; they could become winners when other positions start to struggle.

Elsewhere, we've seen weakness lately in **American Tower** (NYSE: AMT); the stock trades with REITS, which are sensitive to any hints about future interest rates. But we can celebrate strength in most of our large positions, including AmTrust Financial, **Apple** (NASDAQ: AAPL), **Skyworks Solutions** (NASDAQ: SWKS), **Gilead Sciences** (NASDAQ: GILD) and others, while all of our shorts are making money since we started the positions. Portfolios will always have gainers and laggards. We seek to minimize our losers, of course, and have winners that do well enough to make the losers less and less significant.

Finally, let's all keep this in mind: This market has been nothing if not friendly (unless you're selling short), and still lingers near all-time highs. It will get much, much more volatile at times. We'll do our best to add shorts, hedges, and options to navigate it, while knowing time is on the side of great businesses -- those we own, and those we will be looking to add.

Questions on our current losers? Post on the Memo Musings board. Thanks, and Fool on!

— Jeff (TMFFischer)

OpenText Reads the Coming Cloud

Published May 22, 2015 at 10:37AM

Guidance: Shares remain a Buy at today's 2.3% allocation.

OpenText (NASDAQ: OTEX) CEO Mark Barrenechea regained the helm of the company this week, having returned from treatment for leukemia. His illness apparently gave him pause to reflect, because his first move is bold: He's restructuring the company to prepare for a larger cloud-based future. Restructuring in this case means losing about 5% of the workforce, and shedding some facilities, in order to save about $50 million per year in operating costs. The one-time charge to get there will be $25 million.

The plan takes shape as more and more customers are signing cloud subscription agreements for their software needs, rather than paying the up-front cost of a license and putting the software on their own servers. That means OpenText is hosting more software on its servers for customers, and charging each a monthly fee. Revenue and margins are initially lower with cloud software (and that's why many cloud competitors are not yet profitable), but over the long haul, total revenue received should be higher. Also, as more customers are added to the cloud, margins should improve as the cost of hardware is spread over more customers. This is why, as with **Oracle** (NYSE: ORCL), OpenText is happy to embrace the cloud.

Currently, about 30% of OpenText's revenue is already cloud-based, and that number is increasing rapidly. In fact, the company's transition to the cloud is already half finished. Management suspects that in a year -- two years, tops -- a majority of revenue will come from the cloud. ("Majority" here means perhaps as much as 60%.) The company continues to support license sales, too (in which the customer buys a license and takes the software to their premises), and many customers in highly regulated industries, such as financials, will continue to buy a license.

Overall, OpenText's business has not changed. The company is selling the same products. But as more customers request cloud contracts, it realized the need to streamline costs a bit more to maintain its margins. It wants to optimize its sales and customer support structure for more cloud sales. OpenText is also seeking more cloud acquisitions, looking for attractively priced, complementary software businesses with strong recurring revenue. Currently, 86% of its own business is recurring revenue, and its maintenance contract renewals top 90%.

Lower Guidance

Though it adds uncertainty, the company's restructuring seems logical for the changing times. So it was probably management's fourth-quarter 2015 guidance that sent shares 13% lower Thursday. Usually, OpenText does not provide sales or earnings guidance, but it used this opportunity to say that Wall Street's expectations for the coming quarter were too high. Its internal expectations are on track, but Wall Street was expecting too much. Management says most all of the reason for the shortfall is currency-related, with the weak euro knocking about $44 million off quarterly revenue. Currency-neutral revenue could reach nearly $500 million in the quarter (higher than Wall Street's model, and on par with last year), but after adjustments, revenue will likely land around $440 million to $455 million. This means earnings per share next quarter of between $0.64 and $0.72, lower than Wall Street expected.

Also dinging quarterly results by a small amount (no more than $10 million) is the customer shift to the cloud from license contracts. Again, these cloud contracts cost much less up front, but result in a long-term (three-year minimum) monthly fee that adds up to compete with license revenue. Finally, a tough selling environment is dampening results, which we've seen across many software companies. OpenText is holding its own (it increased revenue 8%, excluding currencies, in the quarter that just ended), so we don't believe it's losing market share. Assuming the bulk of today's issues are currency- and macro-related, both pain points should eventually ease. In the long term, cloud sales represent exactly the type of stable, recurring revenue and sticky business model we want to see. It just takes time to get there.

Valuation

Lately $42.50, the stock trades at about 11.5 times free cash flow. Our fair-value estimate remains at $55, although given the restructuring and more cloud revenue around the corner, we may need to be patient to see that price again; ideally it'll be followed by long-term appreciation as long as OpenText keeps executing. As our world continues to go digital, the Enterprise Information Management software industry OpenText leads should keep growing at North Star-challenging rates over the long haul.

Apple Still Has No Equal

Published May 20, 2015 at 3:33PM

Apple (NASDAQ: AAPL) had its biggest second quarter ever, with $58 billion in sales, $19 billion in cash from operations, and $13.6 billion in net profit. A giant 69% of revenue came from overseas, where growth is strongest. iPhone revenue was up 55% year-over-year, and Apple estimated that only about 20% of active iPhone owners have upgraded to a model 6. Margins improved again, and the company expanded its capital return program to $200 billion (on a $750 billion market cap) through March 2017. Apple Watch is off to a great start. The stock remains a Buy and our conservative fair value estimate increases to $126 -- that's 14 times EPS estimates for the year ending September 2015.

Looking Ahead: Apple predicts a healthy Q3, with sales up about 27% YOY to $46 to $48 billion on continued strong iPhone demand. Currency headwinds are decreasing sales growth considerably, but it's still strong. Gross margins should be stable YOY around 38.5% to 39.5%.

============

What We Think Now: Apple is the leader in mobile computing products, and the number of people buying into its ecosystem continues to grow. Apple capitalizes on this by making its operating system work seamlessly across devices, increasing stickiness. The mobile computing revolution is still in early stages, and Apple still has no equal.

The Prognosis Is Good for Gilead Sciences

Published May 20, 2015 at 2:02PM

Gilead Sciences (NASDAQ: GILD) reported a strong first quarter in all product categories, including continued momentum for its Hepatitis C franchise. The company increased revenue guidance for the year, to $28-$29 billion (up from earlier guidance of $26-$27B). That's growth of 14% to 18% over last year. The stock remains a Buy First in *Pro*, with a 3.9% allocation. Our fair value estimate remains conservative as long as strong Hep C sales are sustainable a number of years.

```
=========================
    Pro Guidance
=========================
Status:     Buy First
Fair Value Est:   $120
Current Allocation:  3.9%
=========================

    Q1 Key Stats

Revenue:      +52% to $7.6 billion
Net Income:     +85% to $4.6 billion
Earnings Per Share: +99% to $2.94

Hep C Sales:    +19% sequentially to $4.6 billion
HIV product sales: +15% YOY to $1.4 billion
```

Key Thoughts

- Gilead is maintaining dominant market share in Hep C treatment, with an estimated 90% share of genotype 1 patients beginning treatment in Q1 using Gilead.
- Harvoni use is growing faster than Sovaldi did, as more markets open.
- From a competitor's conference call that I went though (to be clear, GILD won't say these things), competitor **AbbVie** (NYSE: ABBV) projects $750 million of its own quarterly Hep C sales by the fourth quarter 2015 -- that's 16% of the size of GILD's Hep C sales this quarter, or still modest. It had $231 million in Hep C sales this quarter.
- GILD shares look reasonably to cheaply priced given that Gilead and AbbVie project the Hep C market to remain large for years to come, as patients are gradually treated around the world. These two are likely to remain #1 and #2 in the market. The largest risk to year-over-year results may be lower drug prices as contracts come to renewal in years ahead and more competitors reach the market.

Looking Ahead

As we said from the start, what matters most the coming handful of years is Hep C sales -- how strong will they be? Since the drugs cure patients, revenue will not be linear. Sales will subside, leaving a sizable headwind for year-over-year growth in years to come. But for now, we expect sales will be healthy at least through 2018, as patients are slowly reached. In recent calls, management shared the same long-term view, with long-term marketing plans -- though none of us can predict what competitive pricing pressures may eventually challenge this assertion.

Conference Call Notes

Sovaldi & Harvoni (HEP C):

- $4.6 billion in revenue (60% of total) in Q1, with $3.4 billion in the U.S, the rest in Europe. It's up 19% over Q4 and doubling year-over-year. Approximately 90,000 patients started in the quarter.
- In the U.S., Hep C revenue grew 8% sequentially to $3.4 billion, with approximately 70,000 patients starting, up more than 50% since the last quarter.
- About 21,000 Hep C patients started in Europe, with $1 billion in revenue, and more markets coming online.
- About 90% of people with health insurance in the U.S. are now under insurance plans that have contracts with GILD on Hep C, and 83% of those have direct access to Harvoni. (Of course, not all of these contracts are exclusive. Many plans may also offer competing drugs.)
- Remember COO Milligan said last quarter, Harvoni has "proven to be useful in a far greater range of patients than we thought. I look at our next generation opportunities, and I think we have by far the most competitive portfolio out there. And that gives me great confidence that we will be able to continue to have good product pricing throughout our segments. So I'm not at all concerned about future competition that people seem to be concerned about."
- But that said, this quarter for competitive reasons GILD said it will no longer share its gross to net adjustments. It in fact didn't mean to last quarter, but remember how we zeroed on it? It helped. We wrote here: "Gilead expects its 2015 gross to net adjustment for HCV products in the U.S. to be about 46%, compared to 22% at the end of 2014. In other words, they're more than doubling the discount on the drug, but this is done with the requirement that it is offered to many more patients (rather than just the primarily severe patients that have been treated so far). (So, simple math suggests about a $51K price tag for Harvoni, compared to the $95K list price, and compared to a $74K price at last month's 22% discount. This suggests that growth in patients will keep revenue growing this year even as the price is much lower.)" So far this is proving out, especially as GILD just increased revenue guidance.
- GILD estimates capacity to treat at least 250,000 Hep C patients in the U.S. this year, or about 78% more than started last year. Though prescriptions are currently flattening off in the U.S., it does not expect that to remain the case. The company still expects 250,000 patients or more being treated in the U.S. this year, and around 100,000 patients likely in Europe this year.
- Sovaldi's list price in Europe is $41-$45K, and Harvoni will be about 15% higher.
- Japan is a giant market where Sovaldi was approved March 25, and Harvoni should see approval by mid-year.
- GILD has drugs in phase II studies to help patients wipe out chronic Hepatitis B, which is a lifelong infection for most patients.

HIV

- Sales up 15% to $1.4 billion.
- Three new HIV regimens could be approved between Nov. 2015 and mid-2016.

- Eight out of 10 new HIV patients started on a GILD drug this quarter, as competition from **GlaxoSmithKline** (NYSE: GSK) takes some market share (it used to be that 9 of 10 started with GILD). But GILD remains in a "very, very strong position" as its single-tablet regimens grow sharply, with Stribild up 75% YOY, Complera 33% YOY, and still new treatments in late-stage trial.

OTHER

- The oncology pipeline is now 30 clinical studies strong, with 10 being Phase III studies.
- The company has the widest, deepest number of candidates in its pipeline than it ever has (how much revenue it amounts to is too early to say).
- The company bought back $3 billion in stock, or 29.6 million shares at an average $101.38, and in April it started buying shares as part of its new $15 billion buyback (9.3% of the current market cap).
- The company is always considering acquisitions, staying in therapeutic areas. It likes acquisitions of phase III products where it can speed up the process and expand the product use.

==============

What We Think Now: Gilead Sciences offers a great investing trifecta: size, growth and value, all in one. Its blockbuster Hep C treatment has the early lead around the world; its HIV franchise is stronger than ever; and its balance sheet has never been stronger. Its strong pipeline targets deadly diseases with novel treatments as Gilead works to improve lives.

Small Commercial Business

Gross written premiums (GWP) decreased 4% for the quarter because of $174 million in non-recurring premiums AmTrust assumed as a part of the Tower Group deal last year. Excluding the $174 million in premiums, GWP actually grew by 21.9%. California, Florida, New York, and New Jersey continue to be areas of strength for the company, as these states accounted for approximately 55% of the GWP growth. Workers' compensation GWP increased by 30.3% for the company as a whole this quarter, and even though AmTrust has big plans for other lines of business, workers' comp continues to be the primary driver for this segment -- it accounted for $140 million of the increase in GWP, which accounts for more than 100% of the segment growth after removing the non-recurring premiums. This means that the other lines in this segment must have seen a net decrease in GWP.

One of the lines in which GWP declined year over year was the commercial line, which AmTrust acquired in the Tower Group deal. At first glance, this might sound alarming -- management has been vocal about believing this could be AmTrust's next billion-dollar line -- but this decline wasn't entirely unexpected; it had always seemed unlikely that all of the business AmTrust received through the agreement would renew. Losing $20 million out of the $90 million that was included in the original cut-through agreement isn't great, but it gives us a firmer baseline against which to measure performance going forward. Management still believes that they are on a pace to write between $400 million and $500 million in premiums this year, and I expect that this amount will quickly grow as the company continues to acquire related businesses such as ARI Mutual.

Net written premium (NWP) -- the gross written premiums that the company does not cede to a reinsurer -- also declined for the quarter, again because of the Tower Group premiums (which were not subject to AmTrust's quota share where it cedes around 40% of written premiums and corresponding losses to Maiden Holdings (NASDAQ: MHLD)).

Net earned premiums (NEP) -- the premiums that are actually earned by the company in a given quarter -- increased by 11.5% for the segment this quarter. Because premiums are recognized on a pro-rata basis over the life of a policy, and the average policy for this segment tends to have a term of one year, the large increase in NWP over the past year (23%) was able to largely offset the loss in NEP from the non-recurring Tower Group premiums.

Specialty Risk and Extended Warranty

Over the past year or so, around 60% of this business has been generated internationally. We knew that, so we knew this segment was going to have a significant headwind this quarter – the strength of the U.S. dollar. Good results stateside were the sole reason for the 5.3% growth in GWP in this segment, as the adverse currency movements completely offset international premium growth in local currencies. Using the exchange rates that prevailed during the first quarter of 2014, gross written premium growth would have been closer to 14%.

NWP for the quarter increased by an even smaller 2.3% because the company ceded a larger percentage of segment GWP this quarter, but NEP actually jumped 21.2%. This discrepancy can be attributed to segment growth, as well as the assumption of $33 million of unearned premiums during the quarter. It's worth noting that CEO Barry Zyskind specifically called out how they are preparing to devote even more time to building out this segment as the small commercial segment becomes more competitive.

Specialty Program

Strong expansion of existing programs (commercial automotive and general liability) resulted in an increase in GWP of 28.2%. But similar to the specialty risk and extended warranty segments, NEP increased by a smaller percentage this quarter (14.9%) as AmTrust ceded a higher percentage of GWP (35.3% versus 29.1% in Q1 2014).

Services and Fees; Investments

Results for both segments were strong. Income from the service and fee business increased 24.1% to $112.9 million, while investment income and realized gains tallied $50.3 million this quarter. Dividends and interest on fixed-income securities accounted for $34.6 of the $50.3 million, while $15.7 million came from gains on investments. AmTrust's investment portfolio is now worth more than $5.8 billion, and -- similar to most insurers -- is primarily composed of cash equivalents and fixed income.

Pro's Take

Pricing wasn't as favorable in AmTrust's largest markets this quarter, but the company is still positioned to remain competitive going forward thanks to its strategy of opportunistically entering into markets. California is a perfect example of this -- AmTrust has benefited from pricing increases to the tune of 55% since its first foray in the state in 2011, even though the company was not around to take part in the losses that resulted in such aggressive pricing increases. Going forward, AmTrust has one of two options in its larger markets as competition ramps up – it can continue to compete on price and gain market share, or it can position itself to be more defensive by being less competitive on pricing and relying primarily on renewals until pricing becomes more favorable.

Over the past 12 months, the company has written $2.5 billion of workers' compensation premiums, making it likely that AmTrust will count itself as one of the top five underwriters in the U.S. by the end of the year. As we've mentioned in the past, the company will soon have to make a more deliberate choice between strong growth and high profitability in its workers' compensation business. When you're small, it's easy to grow at a fast clip while remaining highly profitable by cherry-picking your customers. But this is not a luxury afforded to the big dogs of the industry. Given that we would strongly prefer management choose the latter (profitability), it has been reassuring to hear the team repeatedly talk about how they aren't afraid to pull in the reins if need be. Wells Fargo is expecting the competition to continue heating up this year since three plus years of above average rate increases have resulted in premium growth that is now outpacing incurred losses and a recent decline in the frequency of losses. AmTrust's largest markets will likely be some of the last states to see all out pricing wars, but this is something we'll definitely be keeping an eye on.

But -- and this is a big "but" -- this doesn't mean that AmTrust will soon be relegated to "GDP plus a few hundred basis points"-type growth. With the Tower acquisition, the company has just started moving into the commercial package business in a meaningful way. In 2013, SNL Financial estimated that the size of the commercial insurance market (which includes workers' comp) was $233.6 billion in net written premiums, and AmTrust believes that its commercial package business can become its next billion-dollar platform.

So far in 2015, the company has made four acquisitions that were large enough to require disclosure, and based on recent comments by the management team -- as well as the fact that the company recently raised capital through a secondary equity offering -- I suspect that management will continue to grow through acquisitions throughout the rest of the year.

Just like we did with **O'Reilly Automotive** (NASDAQ: ORLY) yesterday, we're moving AmTrust back to a Buy. Actually, the situations are quite similar in that we're making this move even though shares of both companies are trading noticeably higher than our newest fair-value estimates. What gives? At the risk of sounding like a broken record, I'll paraphrase what I talked about during the most recent FoolFest. Fair-value estimates are exactly that: estimates. It is more accurate to think of a fair-value estimate as a range. And given the quality of the business and size of the opportunities that we believe AmTrust has (even as it becomes one of the big dogs in the workers' comp market), the range for AmTrust is wider than it is for some of *Pro*'s other holdings -- for example, **The Buckle** (NYSE: BKE) or **Valmont Industries** (NYSE: VMI). Even at this price, we still think AmTrust can underwrite North Star-beating returns over the next three years.

But that doesn't mean that you need to immediately increase your allocation to match our 7.7%, especially if you currently do not own any AmTrust shares. Pick an allocation that you feel comfortable starting out with (perhaps around 4% or so) and then look to opportunistically buy shares when the opportunity presents itself. Though put options don't pay as well as they once did, writing puts is another viable alternative if you prefer to get paid while you wait. As I currently type up this report the September $57.50 puts pay around a 4.7% yield in 122 days and give you a net start price that is around 9.5% below the stock's current price.

Pro Catch-Up Trades: May 18, 2015

Published May 18, 2015 at 2:18PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

- **American Tower** (NYSE: AMT): Down lately, shares remain a Buy First at a 3.4% position, and we own about 0.5% in January 2017 $80 calls.
- **Boulder Brands** (NASDAQ: BDBD) and **Five Below** (NASDAQ: FIVE): These shorts are priced around where we originally sold short. We have 1.5% and 1.2% short allocations, respectively. If you have yet to join us, now might be a good time.
- **O'Reilly Automotive** (NASDAQ: ORLY): Buy up to 2.5% in stock if you don't have a position.

O'Reilly Automotive Revs to a Buy

Published May 18, 2015 at 1:37PM

Guidance Updates

- **O'Reilly Automotive** (NASDAQ: ORLY) moves to Buy, with a 2.5% starting allocation recommended. Its fair-value estimate increases to $190.
- **Skyworks Solutions**' (NASDAQ: SWKS) fair-value estimate increases to $80. The stock remains a Buy with a 4.7% allocation.
- **Tupperware**'s (NYSE: TUP) fair-value estimate ticks down to $74. The stock remains a Buy at a 2.7% allocation.

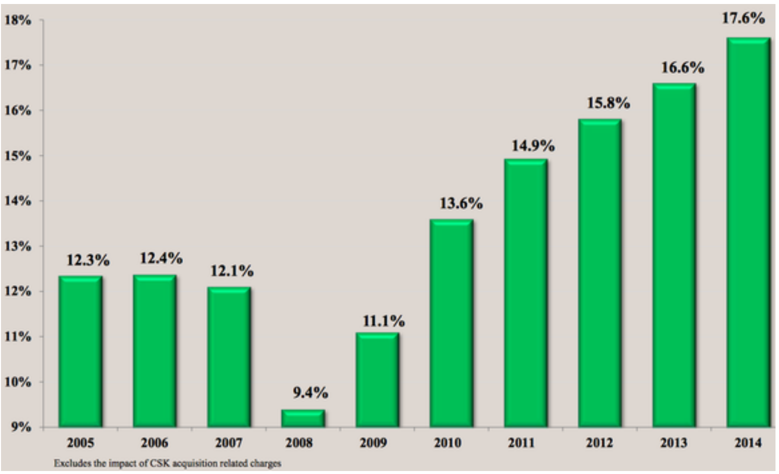
Dear *Pro* members,

The United States grew up on the automobile, leading to a motor-centric life that today supports more than 250 million registered cars in a population of 320 million people. But when we recommended buying shares of a leading auto-parts retailer, **O'Reilly Automotive** (NASDAQ: ORLY), in April 2013, the trade alert was largely met with a yawn. And why not? It's an auto-parts company. I was honestly a little bored myself while writing the report, but I had no hesitation in buying the stock for *Pro*. Behind the dull facade, this is an incredible business and long-term performer, with shares up 23% annualized since the 1993 IPO. For us, the stock is up 124% in just more than two years, with plenty more road ahead.

I placed the stock on hold last November as new members joined *Pro*. I was being cautious on the valuation, and it seemed prudent not to ask new members to buy *all* of our stocks at once -- averaging in over time usually leads to some opportunities. O'Reilly has continued to gain ground since then with exceptional growth in its business. In the first quarter of 2014 (so, last year), the company achieved same-store sales growth of 6.3%. That was a challenging result to lap this year, so I thought we might see some selling on first-quarter results. Instead, the company blew past the prior year. Same-store sales were up 7.2% last quarter *on top of* last year's 6.3%. And this was the sixth quarter in a row of same-store sales growth higher than 5%. What's the secret here? Let's look under the hood.

The Luck of the Irish

With more than 4,400 locations, O'Reilly is the third-largest auto-parts retailer in the country, behind only **AutoZone** (NYSE: AZO) and **Advance Auto Parts** (NYSE: AAP). However, it has considerably higher profit margins than Advance, and it's neck and neck with AutoZone. O'Reilly boasts an impressive 11% net profit margin, and profitability is still rising. Here are operating margins:

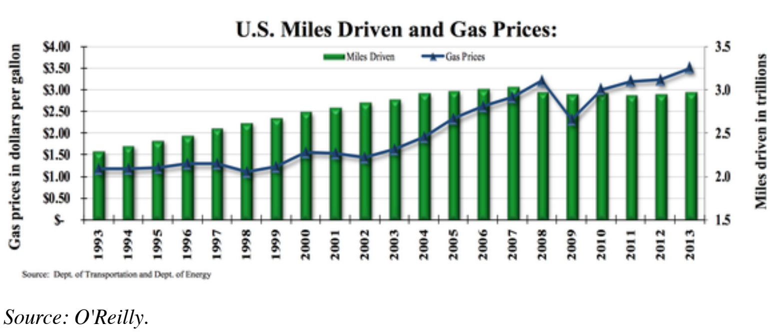


Source: O' Reilly investor relations.

How is this happening? Pricing on auto parts is rational rather than cutthroat, because pricing isn't what drives a sale. Availability of parts and helpful service drives a sale. O'Reilly caters equally to do-it-yourselfers and the professional market, but whoever the customer is, the key is that O'Reilly has knowledge to share about the customer's problem and has the parts available to solve it. The average O'Reilly store manager has been with the company from 12 to 18 years, and the clear message to new employees is that this is a service business. Since pricing remains stable, the company can drive higher margins as it builds out its distribution network, bringing greater efficiencies.

In O'Reilly's April conference call, management talked about taking market share as it becomes the *first* place more customers go for parts, rather than a second or third choice. Why? Because when someone goes to O'Reilly, even if it wasn't their first choice, they take note of the employees' helpful answers and the wide selection of parts available quickly. O'Reilly opens giant distribution centers in key markets, surrounded by larger hub stores, both serving hundreds of surrounding smaller stores with more than 146,000 parts -- fast. Most customers have questions they need answered, and they want the parts immediately, so online orders are less of a threat to this industry than to many others. Many people making repairs also need follow-up help, so a local store with technicians they trust is key.

Even so, management says the No. 1 driver of O'Reilly's business is miles driven. The more miles America drives, the better for O'Reilly. Yet much like **MasterCard** (NYSE: MA) and **Visa** (NYSE: V), which are doing well despite a tepid economy, O'Reilly has shone through the lower-mileage years from 2008 to 2013.

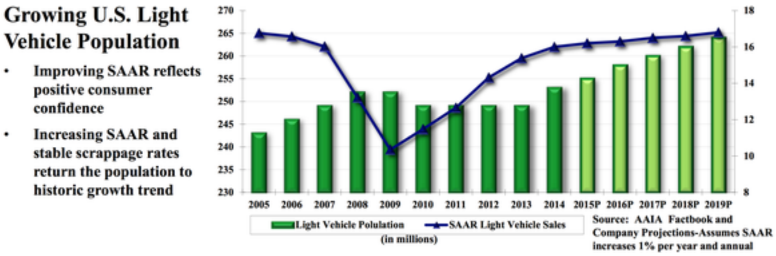


Source: O'Reilly.

With gas prices down sharply over the past six months and U.S. unemployment continuing to improve, O'Reilly should enjoy tailwinds. More people working means more people driving, and lower fuel prices make everyone more willing to drive further.

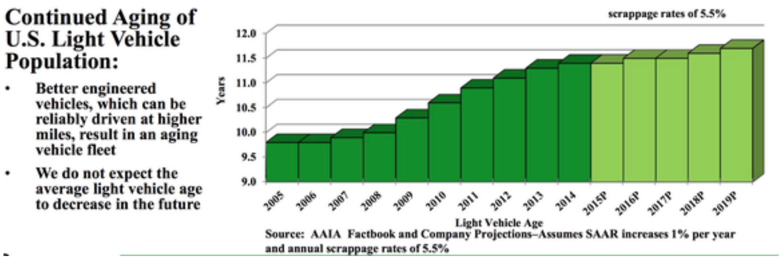
Also propelling O'Reilly is a growing *and* aging vehicle population. Cars are more reliable than ever, so they're staying on the road longer. But older cars need more maintenance, and older parts often cost more. Plus, the repairs on older cars are usually larger jobs (for example, brakes or suspensions). Meanwhile, parts on *newer* cars are getting more complex, so they're also getting more expensive to replace and repair. Both facts help the business.

Finally, after weak performance during the recession, light vehicle sales are expected to increase annually at least through 2019 ("SAAR" stands for Seasonally Adjusted Annual Rate).



Source: O'Reilly.

At the same time (like all of us!), the average car on the road is getting older (and wiser and better-looking, right?).



Source: O'Reilly.

These tailwinds coincide with O'Reilly adding 200 new stores a year (or about 4.5%) to its base, which is larger unit growth than it has ever seen. Management maps out plenty of opportunity ahead, too, including untapped markets. Of the more than 36,000 auto-parts stores in the U.S., fewer than half are owned by large chains.So acquiring of small players and grabbing market share by adding new locations are two additional growth avenues. As it did last year, O'Reilly expects to add 200 stores again in 2015 (this chart is from a year ago).

Source: O'Reilly.

Large, lucrative markets in Florida and the Northeast remain largely untouched by O'Reilly as yet. Meanwhile, the company boasts more than 600 stores in Texas and more than 400 in California, demonstrating how many stores some states can hold.

Now we come to price. The stock has looked expensive ever since I started following it in 2006, when it traded at around 25 times earnings. It's up more than 700% over the past 10 years, so its pricey appearance has led to dramatic results. Today at around $223, shares trade at 28.6 times earnings and 22.6 times consensus forward EPS estimates, while earnings per share were up 28% in the quarter just ended. We should expect this growth rate to slow soon (barring acquisitions), but a long-term earnings growth rate in the upper teens is possible, and since margins are expected to tick higher, a premium price is likely to remain. Equally important, O'Reilly has a history of generating more free cash flow than expected -- more than $800 million over the past 12 months, feeding its $23 billion market value -- even as it opens a new store on average every 1.8 days.

Our fair-value estimate of $190 prices shares at 21.8 times our estimated earnings for the year ending in December. The stock is about 17% above our fair-value estimate (about a year ahead of itself, you could say), but we know there's plenty of room for error with estimates. Shares are a Buy with our standard three-year rolling outlook. We recommend newcomers buy around 2.5% (up to 3%), and build up to 4.5% or so on meaningful price declines. You could also sell to open puts -- such as August or November $200 puts, for example -- to potentially buy 100 or more shares at lower prices.

For more on the business, steer to the company's annual presentation from May 5, or last year's Analyst Day presentation. And cruise on over to our O'Reilly discussion board if you have any questions!

Fool on!

— Jeff (TMFFischer)

The Sky's the Limit for Skyworks

Published May 15, 2015 at 11:58AM

As the demand for and the complexity of wireless connectivity both continued to incease, **Skyworks Solutions** (NASDAQ: SWKS) again topped expectations, reporting a record second quarter that nearly doubled profits. The stock remains a Buy, and our estimated fair value increases to $80. That's 15.5 times our non-GAAP EPS estimate for the year ending this September (four months away). I view this fair-value estimate as being fairly conservative; I harbor a belief that growth is likely to outstrip current expectations in 2016, too.

```
    Overview
========================
   Pro Guidance
========================
Status:       Buy (no change)
Fair Value Est.:   $80 (up from $75)
Current Allocation: 4.7%(up from 4% last Q, due to appreciation)
========================

   Q2 2015 Key Stats

Revenue:      +58% to $762 million
Oper. Income:    +99% to $259 m
Net Income:    +114% to $220 m
Earnings Per Share: +85% to $1.15 (non-GAAP)

   Q3 2015 Outlook

Revenue:      +36% to $800 million
Gross Margin:    48% (up 130bps)
EPS:        +54% to $1.28

   Longer-Term Outlook

Gross Margin:    50%+
Earnings:      $7 annualized EPS, for a start
```

Key Thoughts (Mostly the Same!)

- Skyworks is growing more rapidly than expected; last year, $5 in annualized EPS was an intermediate-term objective; now they're already targeting $7 per share in annualized earnings.
- Multiple factors are converging to drive strong growth. An overlying theme is growing demand for wireless connectivity, and not just in phones, but multiple devices outside mobile (cars, homes, medical, etc). Along with this, wireless needs are becoming more complex, narrowing the number of competitors who can deliver as solutions become modular, meaning you need wide expertise in various components. This increases the value-add of a company like Skyworks, as it leads to more content sold into each unit at higher margins. This also leads to longer-term roadmaps with customers, even 2-3 years out.
- Expect volatility from a semiconductor stock, especially one that has gained 91% since we bought in August. But also recognize Skyworks' unique position in the industry (including healthy margins that appear protected by a moat), and surging demand for its products across vertical markets and in the China mobile market. Apple represents concentrated risk as a very large customer, but hints of roadmap discussions suggest they will remain a customer for at least a few more years, and then ideally of course longer (while the rest of Skyworks' business grows, too).

Conference-Call Key Quotes and Points

- Some of the company's out-performance has come from gaining more content in each device it's selling into -- so, a higher dollar share of each product. This deepens the customer relationship. But SWKS is also expanding rapidly in vertical markets, with 27% growth YTD in Internet Of Things markets like automobiles (with multiple design wins with GM's OnStar telematics), connected homes, machine-to-machine modules for industrial applications, and others such as Google's video monitoring solutions (whatever those are! sounds evil).
- Sales are denominated in dollars, so SWKS is the first company I've covered this quarter that hasn't had to complain about currency exchange rates.
- CEO David Aldrich: "...We are reaping the benefits of our dual H strategy of providing leadership and custom integrated solutions, while continuing to diversify into high-margin verticals. And as a measure of our progress, in 2011, around 60% of our revenue came from single-function devices for mobile applications. Today, more than 2/3 of our revenue is comprised of integrated mobile systems and broad markets, which are our fastest growth areas, driving improved financial returns, and putting us on a clear path toward 50% gross margins and above. And as the leader in complex RF and analog integration, we're the primary beneficiary of the ongoing industry shift toward systems solutions. And as the communications architectures continue to advance in complexity, we're becoming an integral part of our customers' development roadmaps, providing more value in the overall supply chain. This is creating a fundamental shift in our business model; simply put, more complex systems drive increased profitability."
- Power amplifiers were 31% of revenue; integrated mobile systems 47%; broad markets 22%. Integrated mobile systems grew 139%, but the broad market portfolio (mentioned above as IOT) grew 27%.
- SWKS sells to every smartphone manufacturer, and almost every smartphone platform (some manufacturers have multiple platforms).
- SWKS continues to grow its production capacity substantially, but customers are lined up to consume that capacity. It maintains a flexible base of in-house and outsourced manufacturing.
- "By all measures, wireless connectivity is exploding as an enabling technology... Much of the excitement [is] around innovations in the connected car, the automated home, wearable technologies and previously unimagined new categories like drones, all utilizing enabling technologies like 4G, like GPS, local area networking, and near field protocols like ZigBee and Bluetooth. Our overarching mission is to make it effortless for customers to embrace these forms of connectivity, leveraging our decades of experience in mobile to enable more and more devices in adjacent markets to become seamlessly connected. Powering these will be a combination of sensors, microcontrollers and most importantly for Skyworks, connectivity and power management solutions. With a high proportion of analog content and comparatively low digital processing needs. These products require a high level of integration and will need customized solutions produced in massive scale at attractive cost points. All of these attributes play directly into Skyworks' core strengths. In this way, Skyworks is a conduit into the Internet of things. This is an exciting opportunity, but just one of many tailwinds we're capitalizing on today."
- Four major trends are driving growth: 1) A surging need for high-performance integrated systems for connectivity. 2) Bringing connectivity to emerging markets. 3) Internet of Things. Machine-to-Machine connections are estimated to grow fourfold through 2020. Connected Homes and Wearables could drive tens of millions of new units. 4) New vertical markets, ones with longer product life cycles, fewer competitors, and higher margins, including automotive, medical and industrial.
- CEO Aldrich:

> "I would like to provide some added perspective on the underlying trends that we see fueling our growth in the coming years. At the highest level, the world is rapidly becoming more interconnected, fueling an explosion of network devices along with massive growth in wireless data traffic. According to recent report, mobile data usage grew by 69% last year, driven by proliferation of smartphones and other interconnected devices within the Internet of Things, along with the adoption of high data rate services like 4G, LTE and 802.11ac. Now for service providers, this growing ecosystem of connected devices provides a vital gateway for new revenue streams, linking millions of subscribers with lucrative services like on-demand music and video content, over-the-top programming, security and cloud-based enterprise services.
> "At the same time, consumers are recognizing that the quality of the connectivity pipe is a key factor in their overall user experience and are upgrading to more powerful devices, bigger data plans and faster connections. The end result is a raise by OEMs across our served markets to provide leading-edge performance, creating a market opportunity that is growing at a mid-teens pace for the foreseeable future. And an addressable market for Skyworks, it's growing even faster. I'd like to highlight 3 key trends that fuel this: First, there's an explosion in RF and analog complexity, and it's driving robust growth in our served markets and a consolidation of market share. Skyworks' mission is to simplify this increasingly more challenging technical environment for our customers. Across the board, we see more content opportunities in each successive generation of device and integrated solutions displacing conventional discrete components. As this happens, a host of component providers, who lack our technology brand, our integration capabilities and system expertise, are simply unable to keep pace."Second, we are rapidly expanding our footprint within existing customers and existing markets, increasing our serviceable opportunity. Our systems solutions enable us to sweep in an unprecedented amount of new Skyworks content, like filtering, like tuning and power management. And a prime example is our high-performance filter portfolio, where our unique technology edge is enabling higher levels of system performance through tighter band spacing, less interference and a more efficient signal path.
>
> "On top of this, we're launching entirely new product categories like we serve -- like we see diversity modules, which support enhance download speeds

and represent a substantial expansion of our addressable opportunities."Third and finally, we're leveraging our decades of experience in mobile. We are enabling a growing array of devices in adjacent markets to become seamlessly interconnected, like wearable technologies, home automation and the connected car, utilizing enabling technologies like 4G, like GPS, local area networking standards and low-energy near-field protocols like ZigBee and Bluetooth."So in closing, we remain quite optimistic about our prospects for the remainder of 2015 and beyond. And we created a unique business model, tether to the global wave of connectivity and combining consistent above-market top line growth, with the financial returns of a best-in-class, diversified analog company."

- SWKS is well positioned in China where 3G is a 2x multiplier (if not more) on its profits per phone, and now 4G LTE is rolling out and moves profits up even further.
- China is a both volume opportunity *and* content gains (selling more into each device) that "will be around for many, many years."
- The company's recent SkyOne module is becoming a core product.
- Relationships with **Qualcomm** (NASDAQ: QCOM) and MediaTek remain strong.
- A question came in regarding SWKS' largest customer. The answer: "Obviously, we can't comment on that specific customer. But in general, the architectures are getting much more complex. And we're very fortunate to have visibility out, 2, in some cases 3 years in terms of the overall architectures that are being deployed to deal with all this complexity. We see nothing slowing that down, so it's obviously a tailwind for us. We're seeing more addressable content in those kinds of functions you typically think about for us, power amplifiers, duplexers, Wi-Fi, switching and control. But we're seeing awful lot now in what we're able to produce in terms of complex, antenna tuning, devices on the receive path, lighting, power management. And I will say that, as an incumbent, we've been very successful and quite proud of it in maintaining and growing our footprint with each successive design with all our major customers."
- CEO David Aldrich: "I don't see anything turning the tables on this natural tendency toward complexity for the next five years."
- Filters and modules are two rapidly growing areas for SWKS.
- The second half of the year is usually the strongest, financially, but seasonality is waning as they sell into more markets, so I'm guessing the second half may be a bit less pronounced.
- Pricing remains stable (strong, in other words) and they don't see anything changing that dynamic soon given the modules they're selling. Again, margins should head higher over time.
- Autos are slowly becoming a meaningful part of revenue (no longer trivial) as "smart auto" designs proliferate (a connected hub environment in the car). It's obviously the future (who in the U.S. to start will want a dumb car in a few years, five years, time?). Connected homes and energy management systems may follow.

Pro Summary

All of the attractive reasons that led to recommending SWKS for the Pro Portfolio remain in place, and are stronger than before. In the original buy report, I suggested a conservative 25% growth rate early on, and SWKS has more than doubled that. As a "chip" industry company, expect volatility in the shares. We're hoping to be invested for several years, and hope to see its markets grow much larger over that time. The company will need to maintain its technology edge and combat lower pricing that always plagues tech, but today Skyworks is excelling, and the outlook looks promising. The stock isn't inexpensive as it was before, but longer term it still holds ample promise. We may need to wait through some periods where it looks pricey, as we'll likely only sell if it becomes much more expensive-looking.

Papa John's Delivers An Excellent Quarter

Published May 14, 2015 at 12:48PM

Pro's Take: PZZA Q1-2015 Earnings

Papa John's International (NASDAQ: PZZA)

....

Q1-2015

Total revenue growth: +7.7% (vs. +12.9% in Q1-2014)

Operating profit margin: 8.7% (vs. 8% in Q1-2014)

EPS growth: +22.1% (vs. +6.1% in Q1-2014)

....

Quarter Quick Take

Papa John's delivered an excellent start to 2015 in Q1, with North American restaurants increasing comps by 6.5% and international restaurants increasing comps 7.7% (in constant currency). Earnings per share grew 22% year-over-year, increasing due to higher operating margins and ongoing debt-fueled buybacks, even despite a $(0.03) per-share impact from POS system roll-out costs. Limited-time offers, effective marketing, and continued migration to digital ordering (which garners higher average tickets and now makes up more than 50% of total sales) helped drive comps higher. These growth rates suggest continued market-share gains at the expense of pizza industry rivals. Free cash flow generation is starting to turn the corner after several quarters of elevated spending and high commodity costs, which began to moderate in the last quarter of 2014. Papa John's continues to focus on quality, consistency, and measured international expansion, and the company looks set for a strong 2015 despite conservative full-year guidance that has already been increased and may have more room for increases.

Guidance: Buy (no change)

Recommended Allocation: 4.7% plus partial covered calls.

Fair Value estimate: $54 (no change)

Papa John's trailing twelve month (TTM) valuation multiples remain near their historical highs at 36x P/E (32x expected 2015 earnings), 17x EV/EBITDA, and 33x EV/FCF, but we think recent operational performance, improving margins, and a long growth runway support those high multiples. For context, **Domino's** (NYSE: DPZ) trades at 19x EBITDA and **Dunkin' Brands** (NASDAQ: DNKN) at 18x. Papa John's is finally beginning to benefit from its recent investments in technology, and as those costs roll off throughout the rest of the year, financial performance should improve and trailing multiples should contract.

Our partial covered call position expires in October and will see us sell one third of our stake at a net $68.40 if the share price is above $65 at expiration. If the company continues to perform as well as it did in this quarter, our calls are likely to be in the money at expiration and we will either have to roll our calls or let them be assigned. As we get closer to October expiration, depending on how the business performs and how the stock price moves, we'll decide which course of action to take (if any is needed). Members who have yet to sell calls can now sell them at a higher price than *Pro* achieved, or they can sell October $67.50s or $70s if they want to give their position more breathing room. Of course, don't sell calls if you're not comfortable selling the shares you cover.

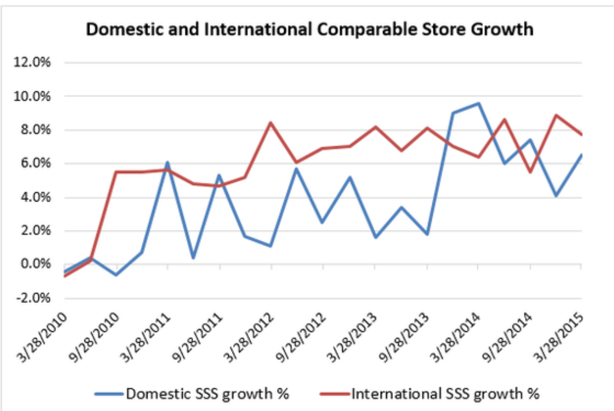
Our Thesis

Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main quick service restaurant (QSR) pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only about 1,350 international restaurants the company has a long runway for growth (compare to Domino's which has over 6,600 international stores). Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

1) Store *Performance:* During Q1-2015, systemwide restaurant sales increased +7.4% (9.6% when excluding the impact of foreign currency). Domestic comps increased +6.5% while international comps increased +7.7%. As I noted last quarter, management's initial full year 2015 domestic comps guidance (2%-4%) seemed quite conservative given the recent momentum in the pizza market, and accordingly this quarter management raised 2015 domestic comps guidance to 3%-5% (which is still below the current trend). Management kept international comps guidance at 5%-7% despite exceeding the high end of that range in Q1.

The company just continues to churn out amazing comparable store sales performance-this quarter marked the 18th straight quarter of positive domestic comps and the 20th straight quarter of positive international comps:

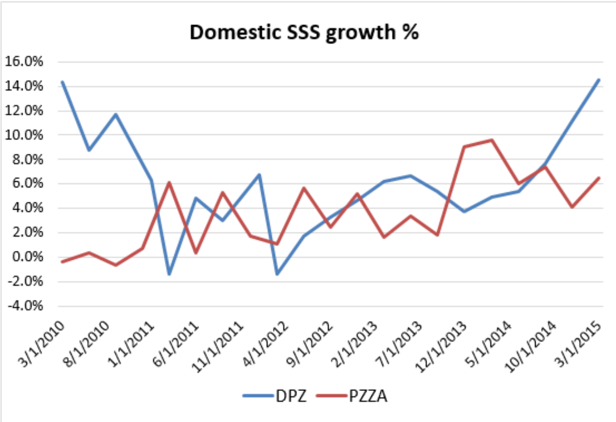


The company's measured expansion continued, adding 36 new restaurants (net) in the quarter, almost all of which were international. The company expects to open 220-250 net new restaurants in 2015 (representing 5% unit growth year-over-year), with most of the unit growth weighted toward the end of the year. The company's pipeline remains healthy, with 200 domestic restaurants and 1,000 international restaurants scheduled to be opened over the next six years.

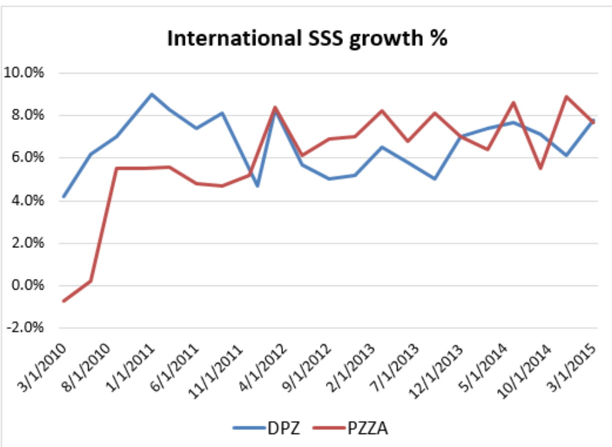
2) Brand: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantages and higher price per pie. Based on recent data, which includes store growth, the domestic pizza market is growing at about 2%-3% and the international market at about 5%-6%. So Papa John's comps (which *exclude* store growth) suggest continued market share gains at the expense of competitors. This is likely due to the company's competitive advantages related to scale (efficient advertising/distribution) and an early lead in technology (digital ordering).

As for PJ's strongest peer, Domino's domestic comps came in at an outstanding 14.5% in the quarter, outperforming Papa John's meaningfully. Domino's menu has a much wider assortment of items outside of pizza (pasta, sandwiches, chicken, and breads), and new menu initiatives at Domino's helps to explain some of the difference in comps. Papa John's is committed to a much more pizza-focused menu, and although it may lead to lower comps in some periods where competitors' new menu item launches are successful, it reduces complexity and prevents missteps, and it allows the company to continue to focus on what it does best: Better Ingredients, Better Pizza. Papa John's mentioned on the call that they don't expect to generate meaningful comps growth from menu expansion:

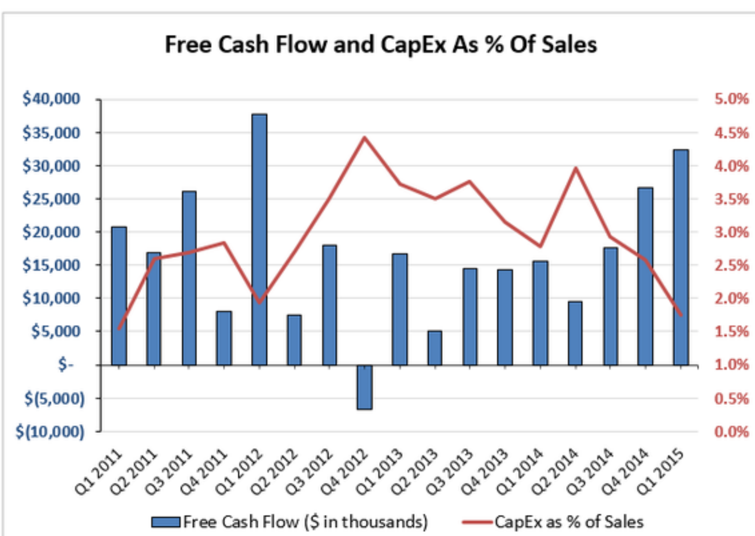
> "*...we've said this before, our brand and our model is one of quality, consistency and simplicity. We'll continue to play that play. Pizza will be our focus*."..."*I would not expect ever to see at Papa John's an extensive development of sandwiches and an array of side items that would create any kind of complexity within our operations model*." **-COO Steve Ritchie**



Papa John's and Domino's are neck and neck internationally, where most of future growth will occur. The strong international comps performance continues to suggest that the company's brand and expansion strategy are translating overseas:



3) Margins: Ultimately, we expect the capital light business model to result in higher operating margins that propel free cash flow generation. Since the beginning of 2014, the company has dealt with depressed margins and free cash flow due to the roll-out of the company's new new proprietary POS system (FOCUS), which as of this quarter is now substantially complete. The company has been financially affected by franchise royalty incentives, higher levels of working capital investment (equipment inventory), and higher depreciation and capital expenditures. Now that the investment in FOCUS is complete, capital expenditures have moderated, and margins and free cash flow should see a nice boost throughout the rest of the year, especially as cheese prices (which historically represent 35%-40% of food cost) have moderated from a peak of nearly $2.30 per 40-pound block last year to the low $1.50s this year. In this graph, note the inverse relationship between capital expenditures and free cash flow- when capital expenditures are elevated, free cash flow is depressed, and vice versa:



What We Think Now

Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. Near term headwinds (commodity prices and technology investments) should prove temporary and Papa John's should deliver improved financial performance.

Write a New Covered Strangle on Expeditors International

Published May 14, 2015 at 12:37PM

Is this for you? This is for *Pro* members who are following our option writing for income on **Expeditors International** (NASDAQ: EXPD), but please read the note below, as there are timely conditions. If you are new to the trade, you can buy shares in 100-round lots, or set up a January 2017 "at-the-money" synthetic long, and write the strangle. The minimum commitment is about $9,300, or 200 potential shares. *Pro* has a 3.8% allocation, half through a synthetic long and half through short puts.

How You Participate

Conditional Note: With the stock lately at $47.20, our May 2015 $43 puts and $48 calls are due to expire as full income after Friday. This is a good thing. We don't need to touch these two options *unless* the stock rises above $48 on Friday, in which case you'll need to buy to close the $48 calls as you write today's new strangle. Speaking of today's strangle, you will be best off writing it Friday at the *end of the day* (once you're certain the old strangle is expiring), or closing your May options first for $0.05 each, or just waiting until Monday to write the new strangle. We're sending the alert today so you're prepared, mainly in case the stock rises above $48 Friday.

- **Action:** After the circumstances above have played out, use a strangle order to simultaneously sell to open August 2015 $46 puts, and sell to open August 2015 $50 calls.
- **Allocation:** Sell one strangle (one of each option) for every 100 shares of exposure you have to the company. We have 1,000-share exposure through 10 contracts of a synthetic long, so we're selling 10 puts and 10 calls, as we've done before -- this potentially doubles our exposure.
- **Prices:**
  - **Stock:** $47.20
  - **Options:**
    - August 2015 $46 puts (bid/ask): $1.35/$1.45
    - August 2015 $50 calls (bid/ask): $0.75/$0.85
    - Combined bid/ask: $2.10/$2.30
- **Price Guidance:** Split the bid/ask, aiming for a **combined credit of $2.20** to sell the strangle. If we all use **limit orders**, then $2.20 should hold for Day One. As prices change, initially aim to get paid at least 4.5% of the current share price, lately about $2.10 combined; longer-term, target at least 1.2% per month to expiration.

What We're Thinking

Expeditors International reported healthy earnings last week, with ocean and air freight volume up 12% and 13% respectively, boosting revenue by 14%. Further, the company was able to contain costs, so its operating income grew 25%, its strongest year-over-year gain since 2011. Share repurchases helped earnings per share to rise 31%. Fortunately, our strangle has provided enough headroom for upside, with the stock up a market-beating 5.5% year-to-date. Our synthetic long is benefiting, and we're booking income, too. As an income position, we're ready to write options again, and we're again moving our strangle to higher strike prices to account for the 15%-or-so earnings growth Expeditors expects this year.

Why This Strategy?

So far since last August, assuming our May options expire tomorrow, we will have earned $3,206 in total income, and we have unrealized gains of $7,428 on our synthetic long. That's more than $10,600 in realized and unrealized gains on the less than $600 in capital we deployed to start the position last August 15. So far, our "income with upside" objective is playing out well.

More That Matters

- **Maximum loss:** The same as owning at least 200 shares of stock (100 now, and 100 at $46), minus the option premiums received.
- **Maximum gain:** This new strangle caps our upside at $50, plus the premium received, which means about $52.20 per share. The most we can make on this strangle alone is about $2.20 in premium, which is earned if the stock stays anywhere between $46 and $50 by expiration.
- **Breakeven**: Our existing synthetic long mirrors stock ownership that started at about $40.60, while this new short strangle in isolation has breakeven points at $43.80 and $52.20, giving us a nice range.
- **Follow-up:** The current plan is to continue writing strangles to earn income, and roll our existing strangle up or down if need be.

Alternative Trades

- **IRA-friendly/covered calls:** If you simply bought shares earlier and wrote May 2015 $48 covered calls, you're on track to let them expire tomorrow, and then you can sell to open August 2015 $50 calls just as we are, ideally for at least $0.80. If you want a higher credit, consider writing August 2015 $49 calls instead, lately $1.10; just realize that you have a lower ceiling for upside if you do. Finally, if the stock rises above $48 by Friday, you'll want to roll your calls tomorrow, rather than lose your shares -- hence, this report today.

Pro Can Help

- **Want more on this strategy?** See our guides to covered strangles and synthetic longs. We're combining the two into a synthetic covered strangle.
- **Questions?** Ship yourself on over to our Expeditors board.

Tupperware Is Still Good

Published May 13, 2015 at 2:27PM

We're keeping **Tupperware** (NYSE: TUP) as a Buy, but we're content with our 2.7% allocation, rather than compelled to add to it for now.

```
==============================
    Pro Guidance:
```

```
• Buy (no change) at a 2.7% allocation
• Fair Value Est.: $74 (down from $76)
• Members lacking a 2.7% allocation can buy, or write June-Sept $65 puts to target a still lower price

===============================
```

Tupperware is seeing a large relative decrease in reported sales and earnings due to the strong dollar, with revenue down 12% in dollars but up 3% in local currency. The company's leverage remains a bit high, but management believes revenue, cash flow, and earnings will increase over the coming 12 months, putting them in a position to buy back shares again. Currently, about $130 million of the company's $180M-$190M in FCF is going to the dividend -- which is getting a bit close for comfort. They do not plan to change the dividend, though, and should be able to steer through this with room to spare.

History

Our relationship with Tupperware dates back nearly six years, to June 2009, when the stock was $26. After writing a series of puts, we ended up owning shares at about $40, and enjoyed something around 100% appreciation to about $80 (plus dividends). After we sold via calls due to valuation, we saw a strong quarter or two and started writing puts again, getting new shares in the $80s, and adding more in the low $70s. More patience would have paid off instead (I had some concerns on the company's capital allocation as they kept buying shares in the $90s). But in the next three years, the stock still has good potential to challenge our North Star. Tupperware is far from our strongest business, though, so our small allocation today seems merited.

```
=========================
  Q1 2015 Results
=========================
• Revenue:    +3 local currency, down 12% in dollars
• Diluted EPS:  +4% local currency
• Emerging mkts: +8% local currency (66% of sales)
• Estab. markets: -6% (mainly Europe)
• Sales force:  -1% active sales force, up 2% total sales force
========================
```

Projections

Q2

• Q2 2015 sales growth of 5% to 7% constant currency
• Q2 2015 EPS of $1.14 to $1.19, up 11% in local currency, down 19% in dollars after $0.40 negative foreign exchange

2015

• 2015 FCF of $180 million to $190 million (down from earlier $200M guidance due to the dollar)
• 2015 sales in local currency up 4% to 6%
• 2015 EPS of $4.50 to $4.70, down from up to $5 est. due to currency, and down from $5.38 last year; shares have a 14.4x P/E at the mid-point of guidance

```

• TUP has increased its operating margin from single digits in 2005 to the low teens lately, and believes it can improve further. Keep this in mind when considering historical valuation multiples above -- they should trend upward from 2005.

• TUP has addressed 25% to 30% of emerging market possibilities at the most, so there's much more room for growth. They should keep growing in China around 20% a year even if GPD there slips.

• Brazil, U.S. and Canada were strong, with U.S. and Canada sales up 7%. This was the third quarter in a row of sales growth there after refocusing efforts.

• Asia-Pacific was surprisingly weak, down 6%, but believed to be an anomaly.

• China was up 19%.

• Europe was overall weak, led by France, which suffered mightily under terrorist attacks. Parties were cancelled and mistrust remains in society. Germany, meanwhile, was strong, and Russia was also up.

• More scale will improve operating margins more than anything else; they're already very cost-aware; they need to efficiently drive growth (and productivity from the 2.9M sales staff) to get more scale.

• TUP expects better cash flow in 2016, leading to a stronger balance sheet and more possible share buybacks; they won't take on debt now to buy stock "cheap," since that additional debt is too risky. (I agree with them. Unfortunately, they took on debt earlier to buy stock when it was higher, which we didn't love at the time, and which ties their hands now. Lesson learned on their new share buyback strategy? Let's hope so. For all of us.)

How It Fits Into Pro

We appreciate that TUP provides non-tech exposure and profitable, growing consumer exposure in emerging markets. It trades at a reasonable price with a strong yield. We want to see management improve how it uses capital, though, and how it motivates and retains the sales force. The stock still merits a spot in Pro today, but even as we give the business leeway for a few soft years, we need to see signs that FCF will grow nicely over rolling-three-year periods. At this point, our stake in TUP doesn't need to be any larger than it is. We would rather add to it upon seeing signs of lasting structural and financial improvement than add now and risk not seeing improvement.

==============

For more details, please see the press release, presentation, and 10-Q. Post on our Tupperware discussion board with any questions!

American Airlines Sees Clear Skies Ahead

Published May 13, 2015 at 1:26PM

American Airlines (NASDAQ: AAL) CEO William Parker said during the recent first-quarter conference call, "... Anybody that really takes the time to study the industry and where it is now versus where it's been in the past knows it's different. I certainly know it's different, therefore I'm confident doing what I've done."

What has he done?

He decided to take all of his compensation in equity instead of cash. He believes, "My compensation should be paid in the same currency as we ask our shareholders to accept, because we should have interests that are highly aligned."

He's also willing to do this because he strongly believes it "really is different this time... I wouldn't be doing this if I thought it was still the same old airline business, because it's not. We're not suggesting there's not still risk in airline stocks, but we're really bullish on what the outlook is for years to come. So I'm more than happy to be compensated the same way you are."

He went on to clarify that it's still a cyclical business, but "the peaks are much, much higher than they were before, and the troughs are going to be much, much higher. And I think the swings are going to be much less." He believes this will prove out in the next downturn.

His view supports our investment thesis, wherein we argue that airline consolidation has led to more rational pricing and fuller planes. After decades where losses in the name of competition were accepted, the consolidated industry appears much smarter about money, and wants to fly profitably. Maybe the players are finally learning the lessons that Southwest Airlines (LUV) has been teaching for decades?

However, it's still not easy. The key themes in AAL's Q1 were:

- The company is tamping down its own capacity in many international markets, partly by delaying new planes. Demand is still growing, but capacity is growing more in some markets.
- Passenger Revenue per Available Seat Mile (PRASM) at AAL dipped again, partly due to the dollar, and due to competition.
- Lower fuel costs drove record profits, and lower-than-usual fuel costs are expected to last this year at least.
- With nearly $10 billion in cash, the company will continue to invest in its gates, planes, employees and share buybacks, and pay down debt.

```
=========================
   Pro Guidance
=========================
Status:         Buy LEAPS (Jan. 17 $35 calls)
Stock price:      $49
Stock Fair Value Est: $70-78
Current Allocation:  0.9% in the calls
=========================
```

Q1 2015 Numbers:

- Pretax margin of 12.4%, with net profit of $932 million, or $1.30 per share (up from $480 million last year Q1).
- Operating revenues of $9.8 billion, down 1.7%, as mainline capacity at AAL declined 1.7%.
- PRASM down 1.7% with 1 percentage point being the stronger dollar; normalized, it was down 0.7% to $0.1565. (Rev per seat mile is priced like an option!) :)
- Avg. mainline fuel cost of $1.83 per gallon, down 41%
- Mainline CASM (cost per avg. seat mile) was $0.0949, up 5.8% primarily due to higher salaries
- $2.5 billion in cash from operations and $1.1 billion in Free Cash Flow this quarter

See the full press release

Notable Changes

This is a new position, so changes are few. However, the dip in PRASM and delaying of capacity is worth noting. It's not enough to change the thesis today, though.

Overriding Thoughts After My Review

- AAL continues to look like a deep value trading at 6 times 2016's post-tax estimated earnings, when it should merit about 10x assuming profits are here to stay.
- But it's not a slam dunk investment by any means. Risks are above average, because costs are steep, passenger demand could dip, and oil prices could surge.
- We are also dependent on competitors acting rationally. If they keep adding more capacity than is needed, that could lead to some trouble. This appears to be more of a problem internationally.

Outlook

- Strong results in Q2 last year, lower capacity today, and a 2-point currency headwind will lead to a 4% to 6% drop in PRASM in Q2.
- Beyond Q2, the outlook should improve.
- In 2016, the benefits of a single reservation system (after merging with US Airways) will start to show.
- AAL domestic capacity should still grow 2% to 3% this year, and international about 1%.

```

Owning calls on AAL is a way to own upside should the business continue to operate well enough to draw in more investors, and should oil remain lower than it has in recent years. If oil rises, or AAL mis-steps, our risk is reasonable and we're ready (worst case) to lose what we invested in the calls.

Whether or not we want to write diagonal calls on our LEAPS is currently a tough choice, but if we're going to, we may want to between earnings announcements. It's tough because the stock is viewed as a value play, and could run up on us, and if we're covered we ruin the reason we bought the calls. But, the calls pay well, and AAL shares could continue to languish for months since many believe oil prices will go up, and Q2 will likely be soft either way.

We are content to own the calls with 2017 in mind, but will continue to watch diagonal calls for possible income. If we move to write diagonal calls, that has to become part of the strategy of this position, rather than a conflicted "one-off" trade. So, if we start writing diagonal calls, it may be as a formal income strategy on this position between earnings reports.

Best,

Jeff

Opportunity Still Beckons for MasterCard

Published May 12, 2015 at 1:15PM

MasterCard (NYSE: MA) continued decent year-over-year growth in a difficult environment, and shares ascended to a new high. Our fair-value estimate increases a bit after two quarters, but the stock's valuation still does appear to be about 18 months ahead of its financial results (I attribute a small part of this to lost business, such as Chase, that is moving over to Visa). I imagine the market is giving MasterCard the benefit of the doubt and believes struggling economies will improve eventually, driving higher growth. Unrelated, the strong dollar is a large headwind that will someday reverse to become a tailwind, and China is a new, large long-term opportunity.

```

U.S. GDV:       +7%
Volume Growth X-US: +14% (local currency)
Cross-border Volume: +19% (")
Processed Trnsactns: +12% to 11 billion
```

Notable Changes: The company still sees a struggling worldwide economy, and the strong dollar further weakens its results. But great cost management, continued transaction growth, share buybacks, and a lower tax rate all drove strong earnings-per-share growth. Is it sustainable? Perhaps for a few quarters, but we need to see economic improvements for MasterCard to maintain growth near today's levels for the long term. The opening of China's market starting in June is a giant potential opportunity, but it will take years to develop. Meanwhile, lower gas prices decreased U.S. gross dollar volume by 2 percentage points -- it's meaningful. Finally, MasterCard acquired Applied Predictive Technologies, a cloud-based analytics company. This will allow its customers to use their own data to measure the profit impact of marketing, merchandising, operations and spending. MasterCard wants to offer differentiating services to customers.

Overriding Thoughts After My Review

- Most of the world remains a large, long-term opportunity
- Cost management (and leverage) in the business remains impressive
- The Chase credit card roll-off (to Visa) remains a headwind to 2015 results
- The dollar is a large headwind that will one day change
- Much of the world is limping (Russia, Asia-Pacific, Latin America); how long will that last?
- Will Europe continue to slowly recover thanks to stimulus? It holds some logic
- Lower gas prices are a drag on U.S. results so far; consumers are saving rather than spending that money
- If this is MasterCard during weak times, we can look forward to strong times

2015 Outlook

- Currency-adjusted high-single-digit revenue growth, after a few slower quarters as Chase rolls off to Visa; low-single-digit revenue growth before currencies.
- Operating expenses should grow by mid-single digits on a currency-adjusted basis, but primarily due to a 7-point hit from acquisitions. Leverage remains in the business.
- MasterCard will provide a new long-term objective in September at Investor Day. The overall growth prospects in the industry have not changed. For now, it expects to meet its old long-term objectives on the low end (11% to 14% CAGR revenue growth and at least 20% CAGR EPS growth from 2012-2015, with at least 50% operating margins). But that's mostly history now.

Remaining Conference-Call Notes

- U.S. retail sales (ex-automobiles and gas) grew 5.1% in Q1, up from 4.1% last Q. (Side-note: Will this help FIVE?)
- Some improvements seen in U.S. and European economies, but much of Latin America and Asia-Pacific remain slow.
- China will require an initial capital commitment of about $160 million, but the long-term opportunity is large. MasterCard estimates that it'll be ready for business there before the end of 2016. China and India (the world's two most populous countries) are still 95% to 99% cash transactions, but already China is an enormous credit market (remember the stats in our Visa report? China rivals the rest of the world already; the question is, how much will the government let MA and V profit on it?).
- Reminder: Europe remains "an enormous opportunity" given that, outside of the Nordic countries, a vast majority of transactions are done in cash. Europe grew strongly last quarter with transaction growth in the low-20% range.
- MasterPass is live in 16 countries, and MasterCard is working with Samsung Pay, which will soon launch in the United States. (Of course, it's also on Apple Pay.) The company is technology-agnostic; it just wants to work with any secure payment system around the world.
- The company bought back 11 million shares at an average cost of about $86, for a generous $947 million. Clearly they believe the stock is worth more than we do, which is a good thing. We choose to be more conservative.
- We should think of rebate incentives as a good thing; they're front-end-loaded costs that lead to larger revenue growth later.
- Reiterated this point: MasterCard is growing rapidly in emerging markets, but there are different yield structures in many of them. You have to align your pricing structure with the local scenario. First, newcomers to cards use ATMs (withdrawing cash to go make purchases); those are much lower-yield transactions for MA. These users migrate later toward debit card and then credit card use, with higher yields for MA. Right now, MA is still in the lower-yield phase of many emerging markets. It's a long-term growth story.

==============

What We Think Now (unchanged): MasterCard's global network is a financial toll road that takes a small slice of each transaction. Though there are many established and upstart competitors, the world leader is cash with 85% market share, representing plenty of room for MasterCard to grow by offering a more convenient alternative.

Steady Growth From Broadridge

Published May 11, 2015 at 3:00PM

Pro's Take: BR Q3-2015 Earnings

Broadridge Financial Solutions (NYSE: BR)

Q3-2015

Quarterly recurring fee revenue growth: +4.7%

TTM Operating profit margin*: -84 bps to 22.5%

Quarterly EPS growth (Y-o-Y): +5.1%

*Operating profit / Fee revenue

This removes the impact of distribution revenue, which is a pass-through, and distorts the true economics of the business

---

Quarter Quick Take

Broadridge's recent investments in its sales force are paying off-the company continues to generate excellent sales momentum, with a record $108 million in recurring revenue closed sales (RRCS) for the year-to-date period, up 74% compared to the same period a year ago. Although margins are facing near-term pressure due to those investments, the company has begun to lap the periods of elevated spending, and margin pressure should alleviate over the next several quarters. The company continues to pursue its tuck-in acquisition strategy, acquiring Direxxis LLC for $33 million in March, and acquisitions contributed 2% to growth in recurring fee revenue in the quarter. The company has now entered the strongest seasonal sales quarter of the year, and the business is well on track to meet or exceed management's guidance for FY-2015: recurring fee revenue growth of 5%-7% (YTD +5.2%), RRCS of $110-$150 million (YTD $108 million), and free cash flows of $320 million-$370 million (YTD $126 million).

Updated guidance: Buy (no change)

Recommended Allocation: 4.3%

Fair Value estimate: $49 (no change)

Based on management's guidance, at $51.50 per share, the stock is priced at about 20x projected 2015 cash flow and 22x projected 2015 GAAP EPS. Both of those metrics are near Broadridge's historical highs, but relative to its history, the company now has more stable cash flows, a steadier growth profile, strengthened competitive positioning, and higher margins to show for it. **There's no change to our recently updated fair-value estimate, and Broadridge remains a Buy.**

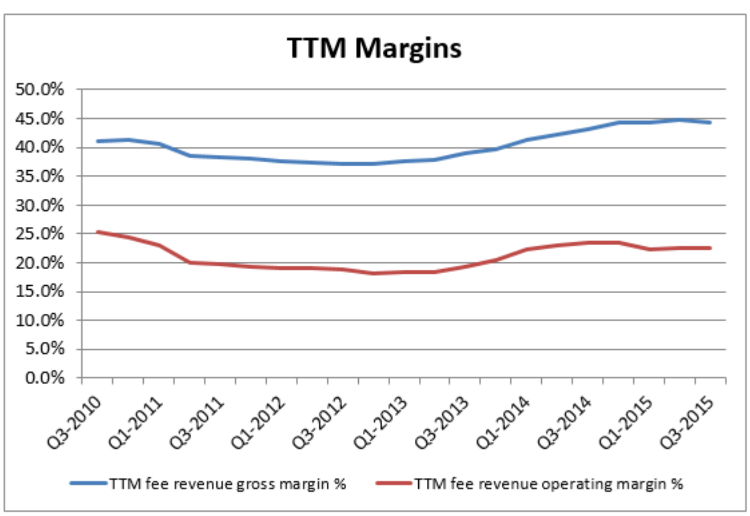
Our Thesis

Broadridge has a near monopoly in proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record and sound capital allocation policies make Broadridge a sturdy rock to build the Pro portfolio upon. We expect modest growth in fee revenue, slight operating leverage, plenty of free cash flow and a growing stream of dividends to help achieve North Star-like returns.

The Most Important Things

1) ***Recurring Revenue Closed Sales:*** This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (97%+). Tracking RRCS gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings. The company has been on fire with respect to RRCS, reporting record quarterly sales in Q1 and Q2. The strong performance continued into this quarter, with the company reporting $27 million in RRCS in Q3, up 13% from $24 million in the same period a year ago. Year-to-date RRCS are at a record $108 million, up 75% compared to $62 million over the same period a year ago. As such, the company has already essentially met the low end of its full year RRCS guidance ($110-$150 million). Seeing as Broadridge's fiscal fourth quarter is historically the strongest sales quarter of the year (over the least three fiscal years, Q4 has represented an average of 46% of full year RRCS), I'd be pretty surprised if the company doesn't meet or even exceed the high end of guidance for the year. Management mentioned that the sales pipeline remains strong, so I'm interested to see if the strong sales momentum continues into next quarter.

2) ***Fee Revenue Margin Performance:*** In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers) we prefer to look at trailing twelve months (TTM) margins to smooth out quarterly fluctuations. TTM fee revenue gross margins came in at 44.3% (up from 43.1% a year ago), and TTM fee revenue operating margins came in at 22.5% (down from 23.4% a year ago):



TTM operating margins are slightly depressed as the company has been investing in additional SG&A spend (i.e. commissions) to boost sales performance over the last four quarters. Given the company's outstanding performance in RRCS, I think this additional spending is justified. In part due to these investments, I expected margins to hold steady or decline slightly, and that's what we continue to see. However, as the year progresses, the elevated spending should roll off (for example, quarterly SG&A spend was down 4% y-o-y, while TTM SG&A spend was up 16%), and we should see some margin expansion if the company can continue its healthy sales growth.

3) ***Capital Allocation:*** Although Broadridge is a slow grower, it generates a lot of cash and has low reinvestment needs. Management recently updated its capital stewardship priorities for the next three years (through FY 2017), and management has a very clear plan to put that cash to work: it targets a 45% payout ratio, and it plans on using incremental debt capacity to pick up the pace of acquisitions (targeting $400-$600 million through FY2017) and share repurchases. On the dividend front, the company has paid out $1.02 per share on a TTM basis, good for a 49% payout ratio and about a 2% yield on the current price. On the acquisition front, the company is making good progress-they've closed three acquisitions this fiscal year (TwoFour, Direxxis, and Wilmington) for an aggregate amount of about $125 million. The company expects acquisitions to account for about 2% of growth in recurring fee revenue over the next three years, and the company is on track with that goal-they achieved 2% growth in recurring fee revenue in Q3 2015 due to acquisitions. As for share repurchases, the company bought back a net $109 million in shares at an average price of $52.90 per share in the quarter. As for debt, the company added $105 million in debt via their revolving credit facility, which has a variable interest rate between 1% and 2% (and may be refinanced into a longer-term instrument at some point in the future). This is consistent with the company's longer-term strategy to run the business at a debt-EBITDA ratio of 2:1 (based on my calculations the company is currently at about 1.2:1).

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Discipline or Dropping Anchors?

Published May 11, 2015 at 2:41PM

Fellow Fools,

Imagine it. You spend countless hours researching company XYZ, trying to figure out what its stock is worth. After many late nights, you finally come up with your estimate of fair value, but unfortunately, the current price doesn't afford you a large enough margin of safety. So, being the disciplined investor that you are, you decide to simply add it to your watch list.

A few months go by, and you decide to check back in on XYZ. Much to your surprise, the stock is now 25% higher! You spend the afternoon getting up to speed with what has taken place since you did your valuation work, but you don't find anything worthy of such a large move. Stumped, you decide to seek out two fellow investors you respect (I'm feeling imaginative today, so let's call them investors A and B).

After hearing you describe the situation, investor A replies that "investing is about waiting for fat pitches. It sounds like you're doing the right thing and remaining disciplined." But before investor A has finished, investor B interjects: "Wait a second, investor A. Can't you see that our friend here is engaging in anchoring? He's helplessly basing his belief about what the stock is worth on his original estimate, which might actually have been wrong! The market is subject to the occasional bout of irrationality, but it is also frequently right."

Compounding Biases

In the scenario above and its real-life counterparts, a fascinating question arises: Is the investor who passes on the stock remaining disciplined, or is she engaging in the cognitive error of anchoring and adjustment? On the one hand, we know that discipline is a must if we want to be successful investors. But on the other hand, our estimates of a stock's fair value are just that: estimates. And we know that anchoring around these estimates is a very real phenomenon, one that often causes investors to sell too soon or miss out entirely.

One of the biggest problems with behavioral biases is that they often end up combining with one another. This can make it rather difficult to peel away the layers and figure out what is really going on inside your mind. For example, whether you end up anchoring on a specific price can depend on another information-processing bias — the availability bias.

That is to say, whether you ultimately decide to stay on the sidelines or buy in after a large move can be heavily influenced by your most salient memories. Did you decide to pass on multiple stocks right before the financial crisis hit? Do you remember passing on stocks that ultimately went on to become multi-baggers? If you have memories of the former, you'll be more inclined to conclude you're being justifiably disciplined, while if you have strong memories of the latter, you'll likely start to question your original decision and whether you're now engaging in anchoring.

Not only that, but regret aversion, loss aversion, conservatism bias, and overconfidence bias also play a role (just to name a few). This really shouldn't come as a surprise, since as Roger Penrose once quipped, "compared to the complexity of a brain, a galaxy is just an inert lump."

My Investing Sextant

Whenever I find myself questioning whether I'm unjustifiably anchoring to a certain price, I like to look at three things to try and clear things up:

- **Measuring stick:** What am I using to determine whether I made the right decision? Ultimately, an investor's measuring stick needs to be the price of a stock, but prices can be an unreliable indicator over short time periods. So, instead of measuring my success based on the stock's behavior over weeks or months, I revisit my original thesis and expectations for the company. If I realize that the company in question actually has a far bigger end market than I originally estimated and I refuse to change my original estimate of the stock's fair value then I'm not just anchoring, I'm being stupid.
- **Time period:** The investment management industry was in large part built around a fundamental mismatch between performance and compensation. Ultimately, we should be graded based on how we were able to do over long stretches of time, but compensation is paid out on performance over much shorter periods. A 10% move in the wrong direction in the aftermath of one earnings release doesn't automatically mean that I made the wrong call. If the stock price is the only thing signaling a potential error, then I'm usually content to wait and see how things progress over the coming quarters.
- **Sample size:** Batting 1.000 is pretty much impossible when it comes to investing in stocks, so rather than spend all my time focusing on one decision, I prefer to look at multiple situations in which the key variables were somewhat similar. If the overall results suggest that my process works for me in a given situation, I don't spend time thinking about the one stock that got away.

Though our **Live Nation** (NYSE: LYV) position was not the inspiration for today's Memo, it does provide a great example of why it's so important to have a system for evaluating your investing process. Since we recommended writing puts at the end of March, the stock is up more than 7% thanks to an almost 11% jump after earnings earlier this month. Does that mean we made the wrong decision to write puts instead of simply buying shares? I'll have no problems issuing a mea culpa if our decision ultimately ends up being a subpar one, but at this point I believe it's too soon to tell. Using the actual numbers the company reported as our measuring stick (as opposed to the stock's reaction), the quarter was decent and the summer concert season appears to be shaping up in line with our expectations. And looking at the other two factors, our time period is still far too short and our sample size too small if we just consider the one put-writing position in isolation.

Skepticism, in Moderation

I originally chose my TMF name because I believe it's healthy for investors to have a little bit of skepticism and paranoia in them. The rationale behind our decisions might not always be obvious to us, so I always like to pause before acting to think about (a) what I want to buy/sell, (b) how I came to this conclusion, and (c) why I decided to act. But as with most things in life, there are diminishing marginal returns to this activity. Spending too much time thinking about your biases can lead to paralysis by analysis if you're not careful. We all have our own reasons for investing, but I don't think anyone does it because they like spending their days second-guessing themselves. Make what you believe is the best decision at the time and then learn from your mistakes and successes. That's what Foolish investing is all about.

Enjoy your week, Fools.

-- JP (TMFYossarian)

Pro Catch-Up Trades

- **Gentex** (NASDAQ: GNTX): If you lack a 3.1% position, shares have dipped lately, and remain a buy, as reported last week. Or, you can consider writing $17.50 puts.
- **OpenText** (NASDAQ: OTEX): If you lack a 2.7% position, the stock is down after earnings, and remains a buy.

Pro Catch-Up Trades: May 11, 2015

Published May 11, 2015 at 2:15PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking.*

- **Gentex** (NASDAQ: GNTX): If you lack a 3.1% position, shares have dipped lately, and remain a buy. Or, you could consider writing $17.50 puts.
- **OpenText** (NASDAQ: OTEX): If you lack a 2.7% position, the stock is down after earnings, and remains a buy.

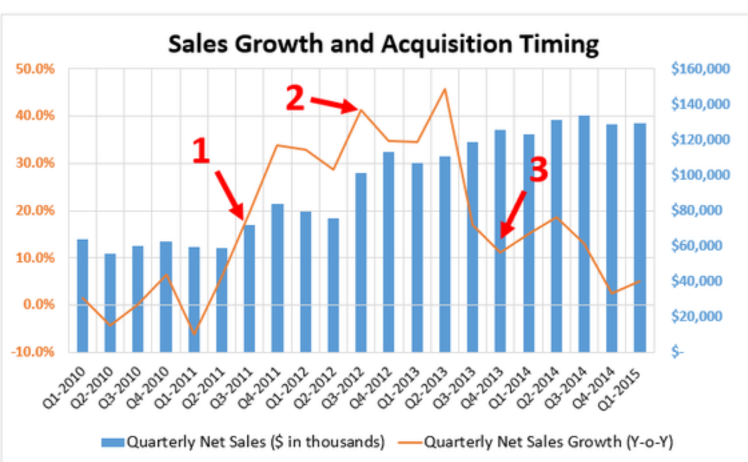
Boulder Brands: Discount Quality at a Premium Price

Published May 11, 2015 at 10:18AM

In its first quarter since *Pro* opened our short position in late March, **Boulder Brands** (NASDAQ: BDBD) reported modest results that met Wall Street's consensus expectations on revenue and adjusted EPS. The market reacted favorably to the report on the day of the release, bidding shares up almost 10% by the end of the day on strong volume. But the next day, on a day when all three major market indices were up over 1%, the stock traded down nearly 5% on lighter-than-average volume. It seems the market doesn't really know how it wants to interpret this earnings report. In any event, we're not too concerned with market movements or consensus Wall Street expectations, and after digging into the results we're content with how the business is progressing against our short thesis.

What Happened?

The company reported quarterly net sales of $129 million, up just 5% year-over-year. After fully lapping its most recent acquisition (EVOL) last quarter, the company's revenue growth now is fully comparable on a year-over-year basis and it's clear that growth is slowing now that acquisition-fueled gains have rolled off the books:

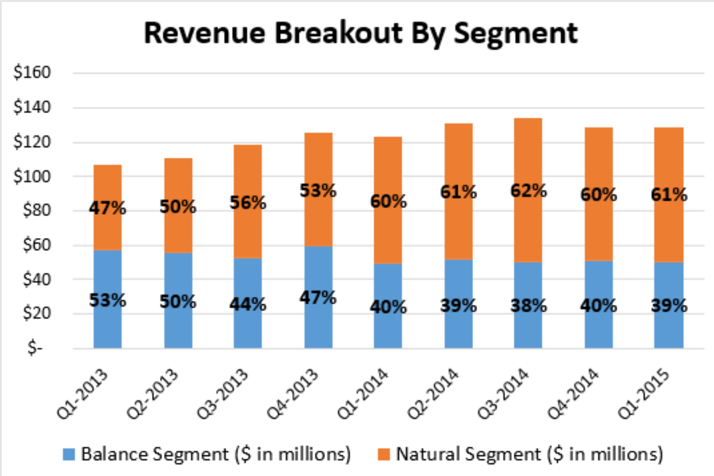


1) Glutino acquired on 8/3/11 for $66.3 million.

2) Udi's acquired on 7/2/12 for $126.9 million.

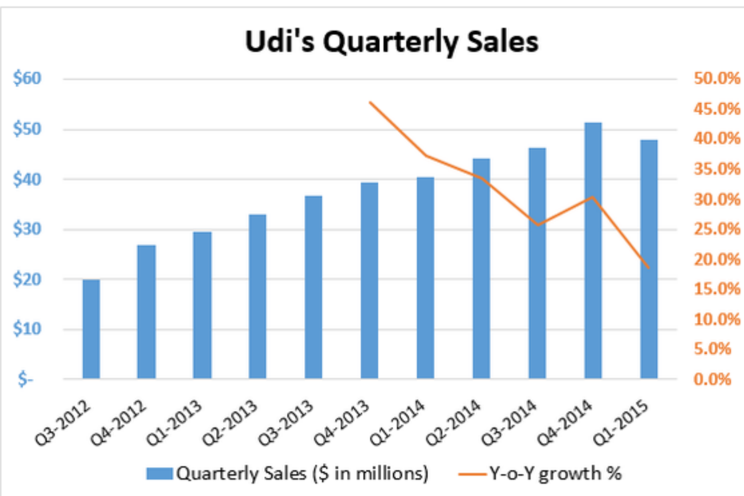
3) EVOL acquired on 12/23/13 for $48.9 million.

We can look at the company's two main reporting segments - "Natural" (i.e. the company's newly acquired brands: predominantly Udi's, Glutino, and EVOL) and "Balance" (i.e. the legacy Smart Balance brand and the newer Earth Balance brand) - to get a more granular sense of the trends in revenue. For context, here's how revenue between the two segments has broken out since Q1 2013 (the earliest date since the company reshuffled its reporting segments):

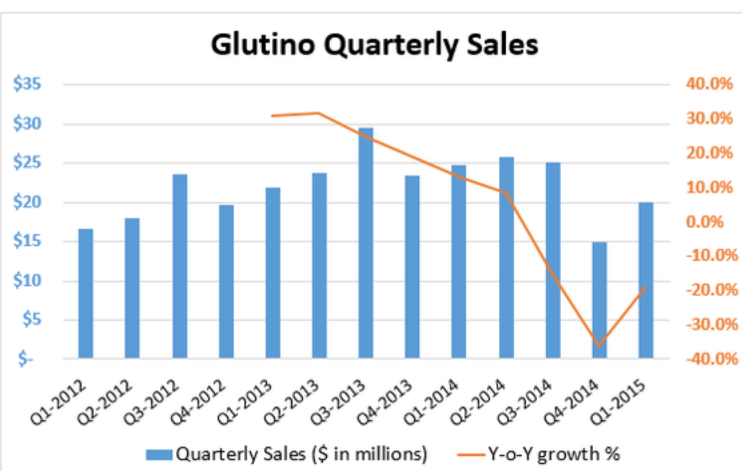


The Natural Segment:

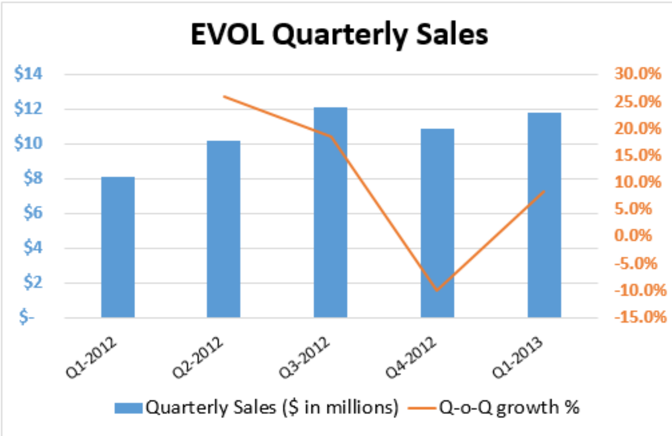
Despite guiding to 13% year-over-year revenue growth for the Natural segment for full year 2015, the company reported growth of just 7.6% in the first quarter. One of the most important facets to our short thesis is that growth from acquired brands is already slowing and may not be sustainable, so based on this quarter's data, that element of our thesis is tracking nicely. Because the company doesn't break out sales by brand in its reports (which obscures the ability to track growth), I have to back into the figures by using the limited data provided in the company's filings and information from company presentations. But based on my best estimates for quarterly sales, growth in the acquired brands continues to be less than inspiring:



It's encouraging to see growth slowing at Udi's as it has been the brand with the most momentum and I believe it has the highest potential to disrupt our short thesis. CEO Stephen Hughes mentioned on the call that they are "in the heart of the selling season", and the company's sales and marketing strategy is centered around Udi's, so we'll want to keep an eye on sales trends as the year progresses.



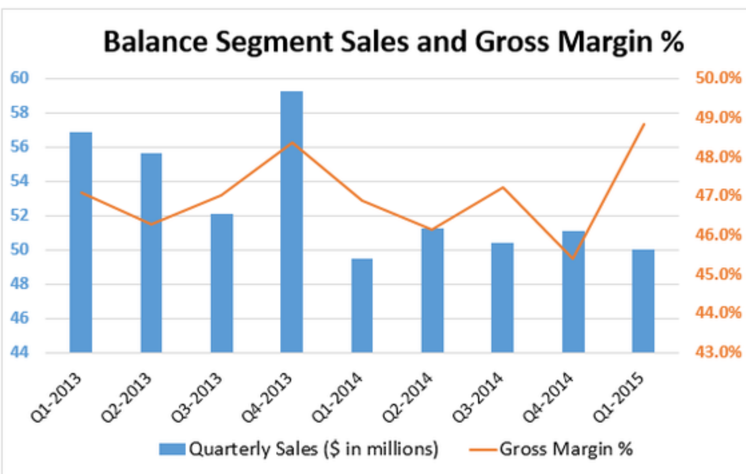
As for Glutino, despite a sequential uptick, year-over-year sales growth is still sharply negative. This brand is really struggling, and the company is working on revitalizing the brand by improving taste and quality. Part of the sales decline (about 4%) was due to discontinued items, which should continue until Q3 when the company will no longer be comparing to periods when discontinued items were still in distribution.



For EVOL, the acquisition is still pretty new and it's difficult to make conclusions about future growth. Year-over-year growth rates are strong (45%) as the company continues to build out distribution of the brand, and sequential (quarter-over-quarter) growth ticked up a bit after three straight quarters of deceleration. Along with Udi's, EVOL is an important part of the company's "Frozen Forward" sales and marketing strategy, so we'll continue to monitor sales trends as the year progresses.

The Balance Segment:

The Balance segment performed surprisingly well this quarter, achieving year-over-year growth in sales (of 1.1%) for the first time in four quarters. Gross margins increased substantially, up nearly 200 basis points:



However, the performance was affected by a few important items of note. For one, the segment benefited from an early Easter date (April 5th this year compared to April 20th last year), and sales in baking spreads tends to peak during that seasonal time period. This had the effect of pulling forward some sales, and will make year-over-year comparisons look good in this quarter and look bad next quarter. The Easter pull-forward had a $1.5 million positive impact on sales in the quarter, indicating that absent the timing factors, sales growth would be down about 2% year-over-year.

As for gross margin, it was likely somewhat affected by the Easter sales gains, but the company mentioned that the gross margin increase was "primarily driven by our strategic decision to reduce trade and couponing for Smart Balance". As mentioned in our original write-up, reduced spend in marketing may boost margins in the short term, but it impacts long-term brand positioning and sales growth and sustainability. I'm expecting pretty poor performance from this segment throughout the rest of the year as reduced trade spend should negatively impact future sales and the difficult Easter comparison period lies ahead next quarter.

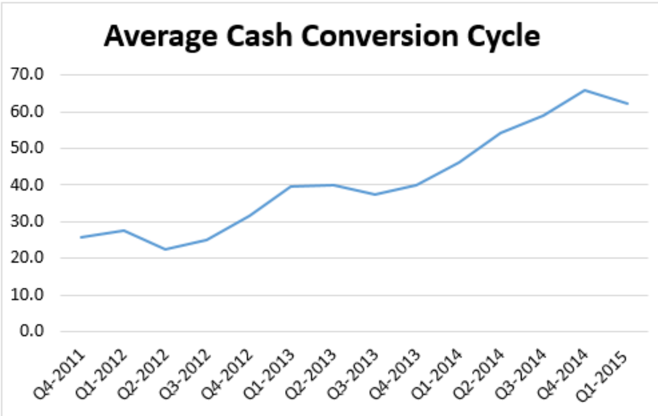
So What?

Overall, I don't really understand why the market viewed this earnings report so favorably. The trading patterns of this stock are a bit confusing. I think the 10% gain on the day of the release was in part due to heavy selling ahead of the earnings report - the stock declined 12% between April 27th and May 6th (the day before earnings). So the stock is more or less trading around the same price as it was before the sharp decline leading up to the report.

Perhaps the market was impressed with the strong uptick in gross margins, but if that's the case then I think the market is misguided, since it was mostly due to the seasonal factors and reduced trade spend which should negatively impact future sales and margins in the company's stagnating Balance segment. Additionally, sales growth trajectories are pacing below guidance (on pace for $516 million in sales vs. guidance midpoint of $555 million), although the company may be able to achieve guidance if sales and marketing efforts pay off in the upcoming quarters.

However, the company is limited in its ability to spend on marketing due to strained financial flexibility. The company produces enough operating earnings to cover its debt maturities, capital expenditures, working capital needs, and interest expense, but there's not very much left over to reinvest back into the business to reinvigorate growth. If sales slow further due to limited investment in marketing, the company's financial picture might get even worse. They really need sales growth to pick up in order to give themselves some breathing room, and so far it's not happening.

Finally, the company's earnings quality did not meaningfully improve in the quarter. Accounts receivable (up 17.4% y-o-y) and inventory (up 14.9% y-o-y) yet again grew faster than sales (up 5% y-o-y). And although the company's cash conversion cycle improved a bit (i.e. decreased) this quarter, it's still quite elevated compared to recent history, indicating relative difficulty in converting inputs to cash:



Note: Figures in this graph differ from the graph in the original report due to a change in the calculation of days payable outstanding-I'm now excluding "other accrued expenses" from the days payable calculation.

Now What?

After reviewing the quarter, I don't feel much different about the company or our investment thesis. As I've mentioned before (bottom paragraph in that link), the primary driver of whether this short will be successful or not will be the growth trajectory of the company's recently acquired brands and the stagnation (or turnaround) of the company's spread business. In this quarter, we saw what looked like the start of a turnaround from the spread business, but in fact the numbers were inflated by a timing-related benefit and reduced trade spend, which will likely hurt results throughout the rest of the year. The growth trajectories of Udi's, Glutino, and EVOL continue to show signs of weakness as earnings quality did not meaningfully improve and future growth will be dependent upon the company's effectiveness with its sales and marketing campaigns. Due to limited ability to invest in sales and marketing, I think the company will face meaningful hurdles in generating healthy, accelerating growth, especially as bigger competitors with stronger financial positions continue to angle for their share of the natural and specialty foods market.

After adding back the $150 million goodwill impairment incurred in Q3 2014 and using a normalized tax rate of 40% (management's guidance for full year 2015), at $9.50 per share the stock trades at 54x trailing adjusted earnings. Even using management's non-GAAP earnings (which exclude a variety of "non-recurring" costs despite these costs having been ongoing since Q3 2011), the company trades at 42x trailing non-GAAP earnings. On a forward basis, the company trades at 35x management's 2015 guidance for non-GAAP earnings. And based on my optimistic estimates (the company meets sales guidance, improves operating margins to 7.5% for the year from 6.8% this quarter, and does not incur any "one-time" costs) the company is trading at 41x expected 2015 earnings.

Based on a simple discounted cash flow model, the current market price implies strong, sustained revenue growth and margin expansion over at least a decade. Given the company's meaningful issues related to operational momentum, earnings quality, financial flexibility, and governance, we frankly don't think that's likely to occur, and we think the intrinsic value of the stock is much lower than the current market price. **Boulder Brands remains an active, though volatile, short on the *Pro* scorecard with a 1.5% allocation, and members who have yet to initiate their short can feel comfortable shorting at or near current prices.**

Earnings News From 4 Pro Companies

Published May 4, 2015 at 11:48AM

Dear *Pro* Fools,

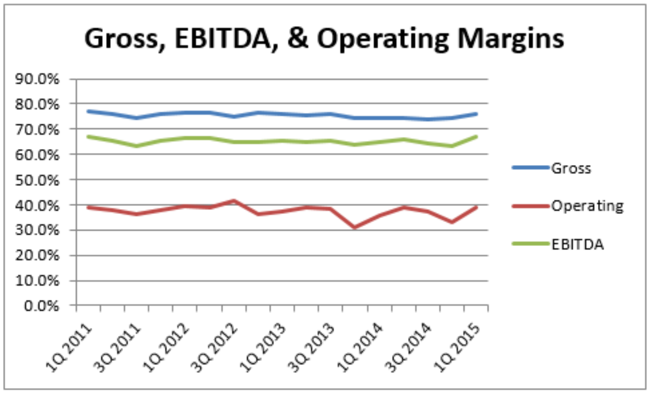
It's that time again -- earnings season! Your *Pro* team has been working hard to analyze our companies' recent earnings reports, and in this Memo I'll take the opportunity to update you on four of the companies I cover for the portfolio: **American Tower** (NYSE: AMT), **Gentex** (NASDAQ: GNTX), **Parexel** (NASDAQ: PRXL), and **TD Ameritrade** (NYSE: AMTD). I'll give a quick overview of each company, summarizing results and recapping our investment theses now that I've had a chance to dig into the numbers and monitor business progress. **All four positions remain active holdings on our scorecard for new and veteran members alike.**

The Results

American Tower

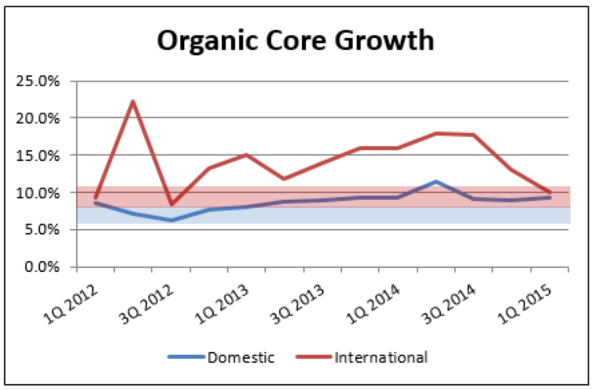
AMERICAN TOWER®

American Tower had a very solid first-quarter 2015, reporting healthy core growth in revenue (16%), adjusted EBITDA (18%), and adjusted funds from operations, or AFFO (22%), the three headline metrics I watch closely. This strong growth was in spite of continued foreign-exchange headwinds that knocked about 4% off reported revenue. Adjusted EBITDA and AFFO growth outpaced revenue growth, indicating rising margins.



Part of the margin performance is because AMT is better able to leverage operating expenses as the business grows, but timing factors also played a role. Expenses related to maintenance and preferred stock distributions were lower than expected, and revenue -- thanks to a $17 million decommissioning agreement with one of AMT's major tenants -- was higher than expected. So we may see slower revenue growth and stagnant or declining margins in the coming quarters as these factors dissipate and new acquisition-related assets (and their lower margin profiles) make up a larger portion of the company's revenue. But over time, we should see margins tick up as scale and incremental leasing activity on new assets take hold.

Organic core growth slowed a bit this quarter, coming in at 9.3% domestically (7.4% excluding the decommissioning agreement) and 10% internationally, reflecting the slowdown in carrier spending and lease activity seen in late 2014. But management stated on the call that their application pipeline showed a significant increase in the quarter from three of their four top customers, supporting the expectation that new leasing activity (and thus organic core growth) should pick up in the second half of the year. Organic growth in the quarter was still on target with management's expectations (shaded areas reflect management's guided ranges):



Source: Company filings and conference calls.

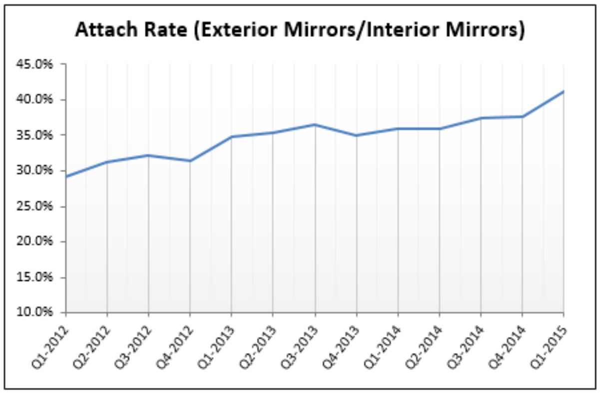
Overall, the company's business performance and compounding dynamics continue to impress me. American Tower steadily reports strong revenue and profit growth despite a difficult currency environment, and it's able to reinvest its copious cash flow at high rates of return. We continue to believe this company is extremely well-positioned to benefit from the continued growth of technological innovation in the global telecom industry. After incorporating the company's recent performance and increased guidance (which now includes the impact of the Verizon transaction), **we've increased our fair-value estimate to $115 per share**. This includes a dilutive impact of about 8% from the stock offering that was used to help fund the Verizon transaction.

Though it's more of a tech/telecom company than a real estate company, American Tower tends to trade alongside the REIT sector, so its stock price has stagnated as market speculation around interest rates has whipsawed REITs. The stock's near-term weakness makes our call purchase in December look a bit poorly timed, but the short-term volatility is exactly what we were looking to capitalize on with that purchase. In fact, if the share-price weakness continues, we may even consider increasing our allocation to the calls (as we hinted in the original report). The business is as strong as ever, but shares are trading at the lower end of recent historical ranges. At current prices, based on sandbagged 2015 EBITDA guidance (which hasn't yet incorporated the acquisitions yet to close), the company trades at about 18.6 times EV/EBITDA. The last two times the company traded at such a low multiple were in the third quarter of 2013, when it was the subject of a short attack by Muddy Waters, and in the third quarter of 2011, in the midst of a market correction attributable to the European sovereign debt crisis. **We think shares are significantly undervalued, and the stock is a Buy First, with a 3.4% stock position and 0.4% in January 2017 $80 calls. With shares currently about 18% below our fair-value estimate, members who have yet to fill out their allocation should consider doing so.**

Gentex

GENTEX CORPORATION

After missing guidance on sales and profits last quarter, our mirror maker rebounded with an excellent first-quarter 2015. The company posted 10% year-over-year net revenue growth, 11% EPS growth, and total mirror unit growth (interior and exterior) of 11%. The strong unit growth was achieved despite a 2% decline in worldwide light vehicle production, so we know Gentex continues to gain market share. Results were especially strong for exterior mirrors, with 23% year-over-year unit growth and a record exterior attach rate of 41.2%.



The exterior attach rate shows how many of Gentex's interior mirror systems come with exterior mirrors "attached" as well, and because exterior mirrors are both more complex and more profitable, higher is better. The success in exterior mirrors played a part in increasing margins, with gross profit margin coming in at 38.8% vs. 38.4% a quarter ago:

Gross profit margins are an important metric for Gentex, as powerful automakers force annual price concessions on their suppliers and the company must reduce production costs and add new features to hold the line on average selling prices and gross margins. The company performed well on that front during the quarter -- total units sold (interior and exterior mirrors) increased by 11.4% and automotive segment sales were up by 10.5%. These figures suggest slightly lower ARPU (average revenue per unit), with price per unit declining less than the typically cited range of 2.5% to 3%.

Because of operating-expense leverage and currency fluctuations reducing staffing costs in overseas markets, operating margins increased as well, up to 29.2% from 28.1% a quarter ago. Additionally, margins are slightly depressed in the short term because of increased costs associated with new product launches. As those costs roll off by the end of the fiscal year, management hopes to see continued improvement in gross and operating margins. Accordingly, and in part because of current foreign exchange rates, management lowered its operating expense guidance for fiscal 2015 (implying higher profits).

Gentex's strong profitability and cash generation has led to a rising cash balance. The company now has $1.37 per share in net cash and investments on the balance sheet (about 8% of the current share price). In addition to the $0.08 regular dividend in the quarter (a 1.8% forward yield on the current share price), management continued the recent string of share repurchases, buying back $25 million worth of shares in the quarter at an average price of $17.86. This marks three straight quarters of share buybacks for the company, each bigger than the quarter before (they spent $10 million two quarters ago, and $20 million last quarter). Management is typically very selective with buybacks, so I view this as a signal that they foresee continued strong performance in the quarters and years ahead.

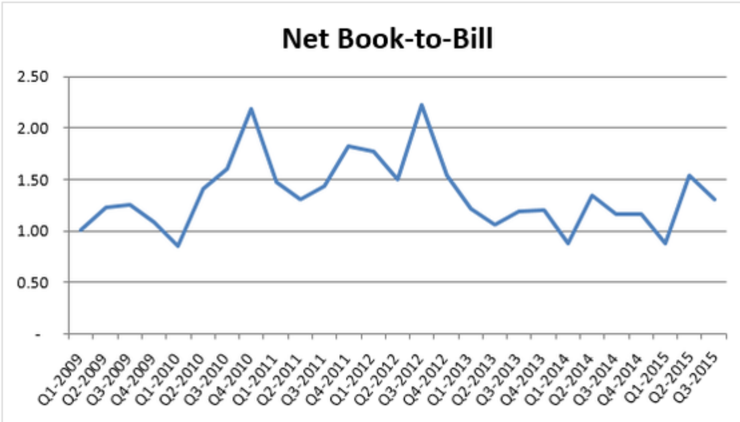
As for *Pro's* position, we own a 3.1% allocation and wrote $17.50 puts that expired as income in March. Since then, we've been waiting to see a quarter of results before deciding whether to write new puts. Once we update our valuation (likely after Gentex files its 10-Q), we'll decide whether to continue our written put strategy. **Gentex remains a Buy, and members who have yet to fill out their allocation should feel comfortable purchasing shares at current prices.**

Parexel

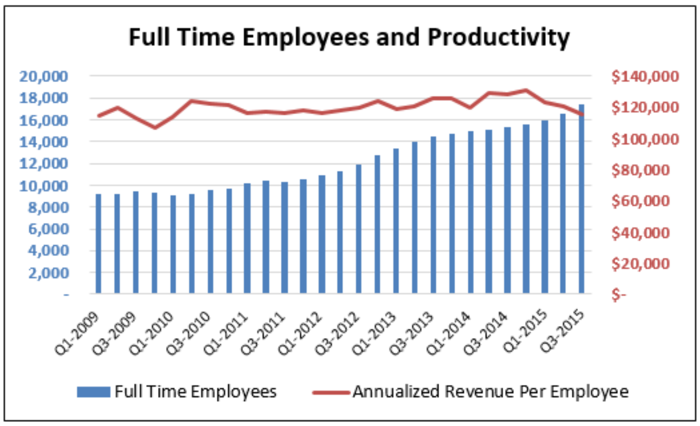
PAREXEL®

As is typical for our biopharma contract research organization (CRO), Parexel reported a lumpy fiscal third quarter, which ended March 31, 2015. The company missed its own guidance on revenue because of foreign exchange effects and client delays on projects in the consulting division. Consolidated service revenue came in at $502 million, up just 2% year over year (5.1% when excluding the $15.4 million negative impact of foreign exchanges). Gross margins in the company's largest division (clinical research services, or CRS, which accounts for almost 80% of consolidated revenue) declined 126 basis points sequentially and 283 basis points year-over-year, landing at 28.8% and contributing to a year-over-year decline in companywide gross profit for the first time since the first quarter of 2012. Accordingly, the stock sold off almost 7% on the day of the earnings release as the market digested the company's results.

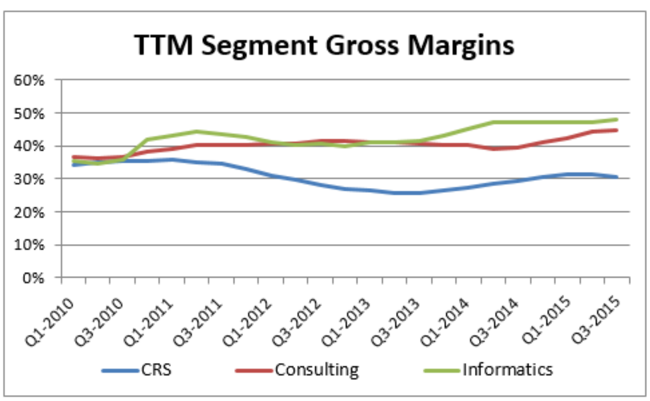
But if we dig deeper than the seemingly negative headline numbers, Parexel is progressing just as we expect. We wrote last quarter that currency headwinds and a sales mix weighted toward younger projects in the start-up phase "should continue to pressure reported revenue in the near term (and backlog growth should outpace reported revenue growth)." And that's exactly what we saw this quarter, with backlog growth of 5.3% year over year and net new business wins up 14% year over year. The net book-to-bill ratio came in at 1.3 this quarter, suggesting healthy demand:



The decline in gross profit was expected and is also not worrisome -- I wrote last quarter that "we should expect to see project mix continue to pressure gross margins in the CRS division into the rest of 2015." The company continues to hire employees in anticipation of a ramp-up in revenue as multiple projects mature through the next quarter and beyond. Headcount increased 14% year over year, and those new hires mean the company's revenue per employee is historically low; it's likely to bounce back over time as projects progress, new-employee productivity improves, and revenue growth resumes at a higher pace.



The margin expansion story for the rest of the business is intact. Gross margins in the company's other two divisions (consulting and informatics) continue to tick up on a year-over-year basis, driven by cost controls and a favorable business mix, and we expect this trend to continue.



Despite a volatile share price, the company continues to track well against our investment thesis (that Parexel should benefit as the CRO industry picks up a higher percentage of biopharma R&D spending). Management comments suggest that revenue growth should begin to pick up on a sequential basis as the company's project pipeline begins to mature, and we'll be watching to make sure revenue growth and margin expansion stay on track as the year progresses. **After incorporating recent results into our model, we're increasing our fair-value estimate from $57 to $59. Shares remain a Buy with a 3.4% allocation.**

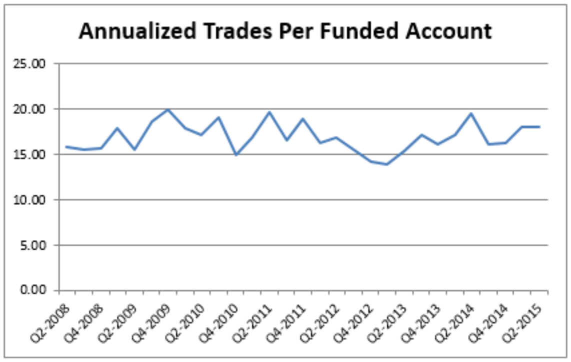
TD Ameritrade

TD Ameritrade

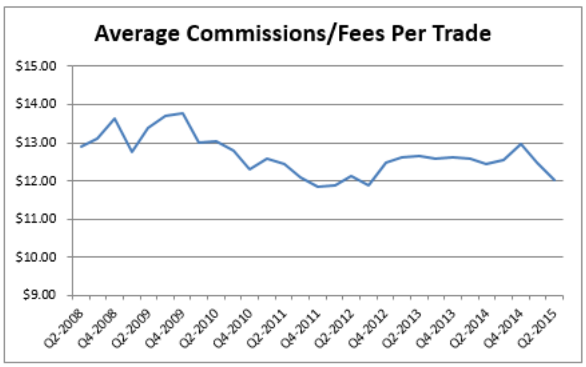
TD Ameritrade delivered a solid second quarter (its fiscal year begins in September of the previous year), boasting record client assets of $695 billion and record fee-based investment balances of $155 billion. But the market wasn't particularly pleased with the results, with shares trading down nearly 3% on the day of the release despite a flat day for the S&P 500. TD Ameritrade met earnings expectations with $0.35 per share (flat year over year) but missed consensus revenue expectations, posting quarterly net revenue of $803 million vs. an expected $820 million, a 1.1% year-over-year decline. Additionally, higher operating expenses pushed operating margins down to 36.9% from 42% a quarter ago.

Despite the lackluster headline results, the underlying business trends remain strong. TD Ameritrade is still doing what it's done for a long time – gathering assets at a healthy pace, stimulating higher trading activity through its award-winning platforms, and generating impressive results from its fast-growing fee-based business.

The main culprit for the revenue miss was lower average commissions per trade. Despite healthy trading activity, with annualized trades per account at the higher end of the company's historical range ...



... average commissions and fees per trade saw a significant sequential decline, coming in at $12.03, at the lower end of the recent historical range:



Management explained this on the conference call by noting that volatility in the energy sector increased investors' appetite for commodity futures, which rose to a record 10% of trades, up from 7% last year. Futures have lower commissions per trade than almost anything else TD Ameritrade offers, and increased volume was the primary contributor to the drop. We're not concerned about the drop in transaction-based revenue, as trading activity will vary from quarter to quarter based on market developments, and the company continues to increase its derivatives activity (now a record 42% of trades per day) and mobile activity (now a record 15% of trades) at a consistent clip.

TD Ameritrade continues to excel at adding net new assets, adding $16.3 billion in the quarter (excluding changes due to market fluctuations), a 10% annualized growth rate. Specifically, the fee-based portion of the business continues to grow rapidly and gain market share. Fee-based balances were up 16.1% year over year (accelerating from 15.5% growth a quarter ago), and investment-product fee revenue was up 13% from a year ago. Fee-based revenue now accounts for an 11% (and growing) share of net revenue, and we expect continued strong performance from this part of the business.

Overall, despite lumpy quarter-to-quarter results, TD Ameritrade continues to steadily increase its earnings power while maintaining strong upside to rising interest rates. Meanwhile, we benefit from a stable (and growing) regular dividend, occasional special dividends, and share buybacks. There's no change to our recently updated $35 fair-value estimate, but after reviewing earnings, **we're moving shares to Buy from Buy First on valuation**. The stock is trading above our fair-value estimate, and results are volatile enough to make its downside profile more in line with our Buys than with our Buy Firsts. **Despite the guidance change, members who have yet to match our allocation can feel comfortable doing so at current prices.**

The *Pro* Bottom Line

In summary, after going through results and updating our valuations, we've made the following changes:

- **American Tower:** Fair-value estimate increases from $110 to $115; shares remain a Buy First, with a 3.4% stake in stock and about 0.4% in calls.
- **Gentex:** No change to fair-value estimate; shares remain a Buy, with a 3.1% allocation.
- **Parexel:** Fair-value estimate increases from $57 to $59; shares remain a Buy, with a 3.4% allocation.
- **TD Ameritrade:** No change to fair-value estimate; shares move from Buy First to Buy on valuation, with a 2.9% allocation.

Each of these four companies continues to progress well against our investment theses, and we continue to believe that each will deliver North Star-beating returns (lately around 8% to 9% annualized) over the next rolling three-year period.

If you have any questions about this Memo, feel free to stop by the appropriate company's discussion board:

P/S	4.3x	3.7x
P/E	30x	29x
EV/EBITDA	18.5x	16x
P/FCF	29x	

Investment Thesis

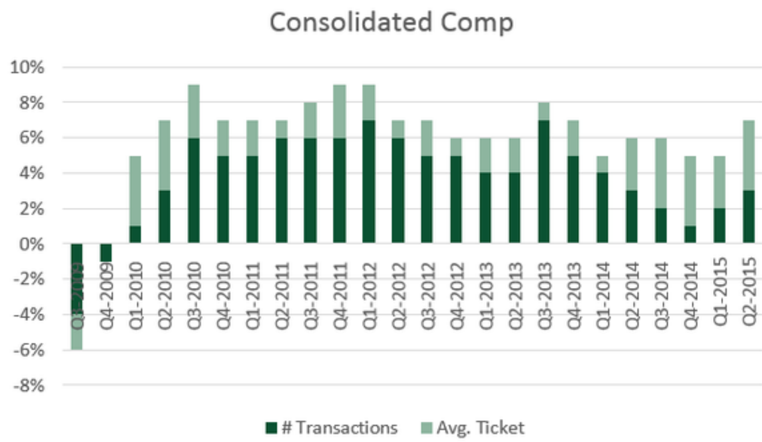
Starbucks offers a unique blend of sales drivers (domestic and international growth, food and beverage innovation, and channel development, just to name a few) and cost-reduction opportunities (payment innovation, European restructuring, expansion of consumer product margins). We believe the coffee is just a gateway for the company to repeatedly sell customers an experience rooted in comfort, quality, health, community, and conscience. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand into new products, new platforms, new times of day, and new brands. We expect new store openings across the globe to strengthen the company's brand and cost-based competitive advantages and improve profitability over time.

With a company as large as Starbucks, you might think there isn't much more room for growth. But you'd be wrong. As laid out during the company's most recent Biennial Investor Day presentation, management believes that within five years, Starbucks will increase its store base to more than 30,000 global locations (up from 22,088 today), achieve $30 billion in annual revenue (up from $17.7 billion TTM), and double its annual operating income. Given the global strength of the Starbucks brand, we believe that this is definitely possible.

Results

Comparable-Store Sales

	Q2 2015			Q2 2014		
	Sales growth	Change in transactions	Change in ticket	Sales growth	Change in transactions	Change in ticket
Consolidated	7%	3%	4%	6%	3%	3%
Americas	7%	2%	5%	6%	2%	3%
China, Asia, Pacific	12%	10%	2%	7%	7%	0%
Europe, Middle East, Africa	2%	2%	1%	6%	5%	1%



Americas

The closure of 132 licensed locations at Target stores in Canada (sorry, Jim!) meant a year-over-year decline of 130 net stores in Starbucks' largest segment, the Americas, but revenue was still up 11% YOY while 110 basis points (bps) of operating margin expansion resulted in even better operating income growth (17%). A 7% Americas comp was particularly impressive on the back of a strong 6% comp in 2014. Results for both food and tea offerings were robust (sales up 16% and 15%, respectively) and we continue to see food sales meaningfully contribute to the Americas comp. Food attach rates were higher in every region and time of day, and contributed 2 percentage points to the Americas comp.

China, Asia, Pacific (CAP)

CAP had an equally impressive quarter, with revenue and operating income up 124% and 29% respectively. At first glance, the divergence of these two growth rates might sound alarming, but it's important to remember that the change in accounting treatment for the remaining Starbucks Japan stores is the primary culprit. Starbucks' acquisition of those stores had a negative impact of 1,470 bps on CAP operating margin, even though they're actually some of Starbucks' most profitable locations. I believe investors should pay close attention to the fact that the net decline was actually only 1,390 bps because the company achieved a positive 80 bps of sales leverage. As of the end of fiscal 2014, Starbucks' EMEA segment (see below) was still its second-largest geographically, but I wouldn't expect that to last for too much longer. The company opened 176 stores this past quarter in CAP and has opened 769 net new stores in the region in the last 12 months. With 5,034 stores in this region, Starbucks is now more than halfway toward its goal of 10,000 CAP stores within five years.

Europe, Middle East, Africa (EMEA)

The turnaround story for this region continues. The 2% comp isn't the best in an absolute sense (especially when compared to the results in CAP and the Americas), but I believe that the move to shift this segment more toward licensed stores in order to help improve profitability is the right one. The opening of 35 net new stores helped the company report record results in this region even though foreign-currency headwinds reduced overall company revenue by two percentage points.

Channel Development

Net revenue for this division increased by 16% for the quarter, while operating leverage helped drive margins higher and increase operating income by 23%. As we've mentioned in the past, there is a tremendous opportunity here for Starbucks as it continues to reach consumers in more than 1 million places that *aren't* retail stores. This is important because when Americans drink coffee, they do so in a coffee shop only 20% of the time.

***Pro*'s Take**

During the company's most recent investor day, the management team laid out their seven strategies for growth:

Source: 2015 Annual Meeting of Shareholders

And while it will take multiple quarters, if not years, before the final verdict is in on whether the company is hitting its goals, I believe the early signs suggest it's headed in the right direction.

In particular, I was very impressed with the continued strength in gift card amounts, mobile adoption, and My Starbucks Rewards (MSR) membership growth. Historically, the company hasn't broken out the dollar amount loaded on to gift cards each quarter, but management did mention that number was $1.6 billion last quarter. This quarter's $1.1 billion was pretty impressive, too. Deferred revenue has grown at a compound annual growth rate of almost 20% since 2010, and while this isn't a completely clean look at gift card use (only the remaining unused balance is captured on the balance sheet at the end of each quarter, and deferred revenue also includes other items including the value of unredeemed items MSR members have earned), I do think it gives a strong directional indication.

MSR members growth also continues to be robust. The company added around 1.3 million members this quarter and now has more than 10.3 million in total, which is 14% higher than at the end of last quarter (and 27% higher than at this point last year). We know that MSR members are more valuable to the company (they tend to spend up to four times as much) and that growth in gift-card usage begets MSR membership growth, so these metrics are great signs.

App usage was also up 23% quarter over quarter and now accounts for 19% of transactions. And while we're still in the early innings of the Mobile Order & Pay rollout, management noted that it's driving an increase in the daily transactions attach rates in the 600 stores where the service is currently offered.

Even though we're increasing our fair-value estimate by almost 5% to $43, the stock remains higher than that as the market has recently increased the multiple it's willing to pay for Starbucks shares. But we're keeping our Buy rating because I believe that, as it stands right now, Starbucks is currently in a position where its operational execution can still leave members with North Star-like returns even if multiples contract somewhat. History doesn't always repeat itself, but for some context, consider that back in October of 2013 the EV/EBITDA multiple for the stock was the highest it's been in the past five years (more than 20). The stock was trading for around $40.45 then, so even though the multiple has contracted somewhat over the subsequent months, the CAGR for the stock over this time frame was more than 14% excluding dividends.

Questions? Comments? We snagged you a table on the Starbucks board.

OpenText's Long-Term Story Looks Unchanged

Published Apr 30, 2015 at 1:22PM

Greetings, Fools!

```
==================================================
Guidance Unchanged

• Fair Value Estimate remains $55 (No Change)
• Remains a Buy at our 2.8% allocation (or write puts)

==================================================
```

OpenText (NASDAQ: OTEX) CEO Mark Barrenechea was on the conference call, spoke a lot, and said he's on track with his 100-day treatment for Leukemia. So, that's great news. The company is going full steam ahead, as it's of course bigger than any one person, as he put it. He's still working, too, just traveling less.

To the third quarter: A confluence of factors sent earnings much lower. The culprits: Foreign currency exchange rates hitting sales, more customer transitions from pricier upfront license deals to subscription cloud deals, weakness in Europe, Middle East, Africa -- basically everywhere but the U.S. -- a higher tax rate for OTEX, higher interest expense following acquisitions with debt, and bad debt write-offs at GXS, which OpenText acquired more than a year ago (GXS had debts on the books that passed one-year-old, so OTEX took the full charge, even though it plans to recover as much of the funds as possible). Macro-economic issues aside, many of these financial factors are one-time.

Now OpenText is in its fourth quarter, traditionally a stronger quarter. Nearing the end of its 2015, year-to-date on a constant currency basis the company has grown revenue 30% and adjusted EPS 15%, and even its license software growth rate is 6%, while cloud is growing much more. OpenText is agnostic about what customers sign on for -- cloud, license, or otherwise. They just want to form the relationship and earn the revenue over the years. Just as **Oracle** (NYSE: ORCL) says, cloud revenue becomes beneficial compared to license revenue after 3 years. It just takes time for the cloud subscription revenue to add up to the upfront license cost.

It was definitely a surprisingly weak quarter when it came to income, with a lot of factors I'm still going through in detail, but the long-term story looks unchanged and remains promising. We will consider writing puts to potentially add to the position over time, or buying shares directly, especially if the price goes lower. Time will tell. We have to be cautious and patient because the expected growth rate for OTEX (and many companies) is coming down quickly to account for currency rates and a slower-than-expected world economy. It seems we're currently on shakier ground, when it comes to near-term growth potential, than we've been in a long time. And that seems largely universal, at least for international companies. Of course, that could change as soon as a quarter from now, too. Nobody knows. That's why we invest for the longer haul.

```
=========================
  Q3 2015 Results
=========================
• Revenue:    +1% to $447 million (+8.1% constant currency)
• Adj. Net Inc: -20% to $81 million (-13% constant currency)
• Diluted EPS:  -21% to $0.66 (-13% constant currency)
• Oper cash flow: Up slightly, new record at $144M
• Recurring rev: +3.8% to $384M, 86% of revenue (+10% constant currency)
• License Rev:  -12% to $64M (down 4% constant currency)
• Cloud Rev:   +12% to $144M (+17% constant currency)
• Dividend:   +16% to $0.80 per share/year
=========================
=========================
```

Background

OpenText sells enterprise information management (EIM) software via cloud, license, or managed services contracts to help customers organize and run electronic content, business processes, regulatory and other data.It also conducts, invoices, and manages business transactions through GXS. Through a recent acquisition (Actuate), it's now offering data analytics, too, which can fold into its software over time. The company's sales are spread across industries, governments, and geographies, but the Americas were 58% of sales, EMEA 33% and Asia only 9% last quarter.

Pro's thesis: The enterprise information management (EIM) software industry will grow by about 10% annualized over the long haul, and OpenText will grow stronger than the industry every rolling three years. In addition, OpenText will be a leader in business exchange transactions, and recurring, fee-based revenue will grow. As long as shares are reasonably valued and OTEX continues to serve its markets well, we should enjoy healthy long-term returns.

========================
```

Key Conference Call Notes

• Operating margins should remain at 28% to 32% this year

• Cloud services revenue should continue to grow most rapidly; the industry continues to move toward cloud, as more customers what more flexibility; OTEX has been selling cloud for going on three years now, and it's becoming a substantial part of the business

• OTEX remains focused on recurring revenue (now 86% of sales), adjusted net income, and cash flow.

• Along with currency rates, revenue was affected by customers taking longer to ponder license vs. cloud deals. And macro weakness especially in EMEA (Europe, Middle East, Africa).

• The Blue Carbon software release is on track for the end of this calendar year.

• The company continues to seek more acquisitions; prices are up a bit.

• Renewal rates on maintenance revenue are very strong, in the low-90% range.

• Cloud revenue was up 17% constant currency.

• The headlines for Q3, the CEO said, were foreign exchange hits, cloud transitions (which slow revenue recognition), EMEA macro weakness, "some unique expense items, strong cash flows, and a strong product lineup."

Review Material

• OTEX's large cloud operation: 25 core data centers around the world; 1,500 production racks; 150,000 square feet of raised floor space, 900 managed customers, 60,000 cloud customers, 600,000 trading grid partners, nearly 2,000 staff (of 8,000 total at OTEX)

• The Actuate acquisition allows OTEX to bring analytics everywhere within the OTEX ecosystem -- on-premise, in cloud, and to the development community. Actuate has been providing analytics for 20 years. OTEX closed on Acuate on January 16. The enterprise value was $272 million, or 2.5x revenue. They have 500 employees in San Mateo, with 72% of revenue in N. Amer and 28% the rest of the world. There's an opportunity to grow it around the world. Some customers include The Royal Air Force, Shell, Johnson Controls. Partners include Cisco and Dell, NetApp and NCR. They'll stay in San Mateo. Initially, Actuate is hitting OTEX's margins.

• I like this quote from CEO Mark Barrenechea last quarter: "Fifteen years ago you could be Amazon-ed. Today, you could be Uber-ed, which is a reflection of digitalization. OpenText is well-positioned, as our vision is a digital-first world, and our key platforms allow customers to begin digitalization of their enterprise processes today, such as the customer journey, supply chains, risk and governance, innovation and employee functions."

• SAP relationship remains strong.

Bottom Line

In summary, it was not an attractive quarter on the bottom line! We dislike seeing any of our investments earn less income. But cash flow remains strong, and revenue is growing in constant currency. Currency is a big headwind with the euro down 18% against the dollar since last fall, but eventually currency will be neutral, and then it will be a tailwind. Eventually. We have to get through that (with all of our international companies) and make sure OTEX stays focused on growing the underlying business with strong profits. Today, the overall business remains on track and the shares, reasonably valued, remain a buy. When currency is a tailwind and the business is still growing (against lower comparisons a year ago, too), it should result in very attractive looking growth rates down the road, for OTEX and others.

This was a quick review of yesterday's results and conference call; when and if I have more, I'll share it.

Best,

Jeff

Impressive iPhone Sales Give Apple Another Stellar Quarter

Published Apr 28, 2015 at 4:12PM

See for Yourself

- Check out Apple's earnings release.

Apple's (NASDAQ: AAPL) second-quarter earnings are out, and it should come as no surprise that the numbers are impressive. Sales grew 27%, to $58 billion, and earnings per share rose 40%, to $2.66, for the quarter. Below are a few points to note from the earnings release and conference call:

- Gross margin ticked up 150 basis points for the quarter to 40.8%.
- International sales made up 69% of overall revenue for the quarter.
- China sales were up 71% for the quarter to a record $16.8 billion.
- Revenue for the third quarter is projected to be $46 billion to $48 billion.
- Third-quarter gross margin is projected to be 38.5% to 39.5%.

iPhone

iPhone sales were solid again in the second quarter, with 61.2 million units sold and very strong performance in emerging markets. The average selling price for iPhones jumped $62 compared with the same quarter last year, to $659, thanks to a strong mix of 6 and 6 Plus units. Management noted that it continues to see a stronger rate of consumers switching to iPhones from rival devices compared with previous cycles. Executives also said that they estimate that about only 20% of users have upgraded to iPhone 6 or 6 Plus, indicating robust demand to come.

iPad

Tablet sales continue to decline; Apple sold sold 12.6 million iPads compared with 16.4 million a year ago. This isn't really news — the replacement cycle for iPad simply isn't like that of the iPhone. However, strong performance in Japan and China, as well as ongoing opportunities in enterprise, demonstrate that there are still plenty of opportunities to enlarge the iPad consumer base.

Macs and Services

Apple sold 4.6 million Macs in the quarter for 10% year-over-year growth. Management was particularly encouraged that this happened while the global PC market contracted 7%. The company's services revenue grew 9%, to $5 billion, thanks to strong performance in the App Store. According to market data firm App Annie, the App Store generated 70% more global revenue in the March quarter than did Google Play, up from a 60% lead in the September quarter.

Apple Pay, the Watch, and a Dividend Raise

Not long ago, management referred to 2015 as the year of Apple Pay, and executives continue to be encouraged at the progress they're making. **Discover** (NYSE: DFS) has signed on as a partner, **Best Buy** (NYSE: BBY) offers Apple Pay in-app and will roll out in stores later this year, and a leading health-care payment network will bring

Apple Pay to more than 50 major hospitals around the country.

The reception of Apple Watch has been positive. Those sales don't affect the second quarter, but we will start to see those sales in the third-quarter. Although Apple didn't provide any information about how many watches have been sold, CEO Tim Cook noted that Apple Watch margins will be lower than the company average for the foreseeable future.

Management increased the size of Apple's capital return program from $130 billion to a whopping $200 billion. (I guess when you have $193.5 billion in cash and equivalents on the balance sheet you can do things like this.) But it's worth noting that more than $171 billion of this is held offshore. For the quarter, Apple spent $7 billion to repurchase 56.4 million shares and paid out $2.7 billion in dividends. The company also announced an 11% bump in the dividend, from $0.47 to $0.52 per quarter.

The *Pro* Bottom Line

At a 4.6% position that has been rated "Buy" for a long time (and "Buy First" before that), Apple remains one of the largest holdings in *Pro*. Pro needs to run a valuation update following these strong results, but the expectation today is the stock will remain in the portfolio. Although this is a bit of a different story today than it was a few years ago, the business is still innovating and growing — it's just growing a little more slowly than before. And that's OK by us ... Fools are patient.

Buy Visa

Published Apr 28, 2015 at 3:09PM

How You Participate

- **Action:** Buy **Visa** (NYSE: V).
- **Allocation:** 2% (*Pro* will buy about 760 shares).
- **Scorecard Status:** Buy
- **Fair-Value Estimate:** $72
- **Recent Price:** $66.70
- **Dividend Yield:** 0.7%
- **Price Guidance:** Use a limit order and initially aim to pay less than $67. As prices change over time, this starting guidance will quickly lose relevance; as that happens, **our guidance will remain "Buy"** until we officially notify you otherwise.
- **Special note:** Visa announces earnings the evening of Thursday, April 30. We have no idea how the stock will react, but it shouldn't affect our rolling three-year outlook as we start to buy shares. That said, if you don't like buying into volatility, you can wait a day.

What We're Thinking

The ubiquitous nature of credit and debit cards in America means that many of us can go through life rarely touching cash. Yet in the U.S., cash still accounts for approximately 40% of transactions, followed by debit cards at 25% and credit cards at 17%. And globally, cash is truly still king: **MasterCard** (NYSE: MA) estimates that 85% of consumer transactions take place with old-school paper and coins. But all of that is slowly changing as economies modernize and middle-income families proliferate, bringing more converts to the benefits of electronic payment. With its mission to "accelerate the electrification of commerce," industry leader **Visa** (NYSE: V) has most of the world left to conquer.

The Business

Created by a group of banks when Gerald Ford was in the White House, Visa has been building its competitive moat and powerful brand for 40 years,but it only went public in 2008, in the fog of the financial industry meltdown. After that came a downpour of new regulations, and though the dust is still settling, we can see Visa for what it is: an extremely profitable, well-run organization with plenty of long-term potential. Even during the world's economic malaise, Visa has been able to increase revenue by 10.8% annualized the last three years, and cash from operations 21.4% annually. As economies expand and *more* money changes hands, Visa will benefit further. Inflation helps, too, because much of Visa's revenue is based on transaction value.

As with *Pro* holding MasterCard, Visa doesn't issue credit cards or carry consumer loans. Instead, it licenses its brand to issuing banks and operates the largest electronic payments network in the world, VisaNet. Set up in 200 countries and territories, VisaNet handled $4.5 trillion in payment volume in the year ended March 2014. That's greater than the nominal GDP level of every country or region except the E.U, U.S., China, and Japan (according to IMF estimates), but it still represents less than 6% of the world's estimated $77 trillion in 2014 GDP ... and GDP keeps growing.

Keeping it simple, Visa's business has one reportable operating segment, "Payment Services." Encompassing Visa-branded debit, prepaid and credit cards, its business makes money from:

- **Service Revenue** (38% of $15.3 billion in gross 2014 sales): Primarily a toll collected on the *dollar volume* transacted on Visa cards.
- **Data Processing Revenue** (34%): Fees for network access, including authorization, clearing, and settlement. These fees are based on the *number* of transactions.
- **International Transaction Revenue** (23%): Transactions conducted across country borders, resulting in international transaction fees and currency fees. Volatile currency exchange rates help Visa make more money.

Other client services account for the rest of revenue (5%). Overall, all revenue is offset by a cost called "client incentives," which are long-term payment contracts with banks and partners to promote the use of Visa. Client incentives were about 17% of revenue in 2014, and are expected to remain in the high teens for now. These incentives may in part have helped Visa recently wrestle the giant **JP Morgan Chase** (NYSE: JPM) portfolio of business away from MasterCard and win the **Costco Wholesale** (NASDAQ: COST) account from **American Express** (NYSE: AXP). (Costco represented nearly 8% of Amex's annual dollar volume.)

These new clients will add significantly to Visa's business (in relation to Costco, starting in 2016). And Visa already dwarfs its competitors on the electronic commerce stage, likely lending it more negotiating power with customers, whether they're banks, merchants, or partners. Here's how 2013's $8.6 trillion in payment volume was dispersed.

Company	Payment Volume ($billions)	Transactions (billions)	Cards (millions)
Visa	$4,383	89.7	2,219
MasterCard	$2,991	52.7	1,281
American Express	$940	6.4	107
Discover (NYSE: DFS)	$127	2.2	64
JCB	$176	1.9	83

Diners Club	$26	0.2	6

Source: Visa 10-K filing, 2014.

As large as Visa appears, these numbers exclude Visa Europe, which is a separate business that Visa may purchase someday. They also exclude China, where foreign companies have not been allowed to compete. Estimated at another $6.8 trillion in size and growing 33% last year, the Chinese debit and credit card market is slated to open to Visa, MasterCard, and other competitors starting in June. Until now, the market has been run by Chinese monopoly UnionPay. Visa is already on the ground in China with limited operations and long-term partnerships. Details of the new Chinese laws are pending, and growing a business there will be a long process, but it brings access to another 20% of the world's population in a country with ever-increasing affluence. Fun factoid: China now accounts for more iPhone sales than North America.

With the world's income growing, electronic commerce spreading, and new markets opening across the globe, if we had to choose one word to describe Visa's business, it would be "tailwinds." But we could just as easily choose "leadership," "moat," "growth," or "leverage."

Financials

Measured by the profitability and scalability of the business, Visa has one of the strongest business models of any in the *Pro* portfolio. Costs to run its payment network are largely fixed, so increases in revenue – through any combination of new card users, more transactions, or greater dollar volume – largely fall to the bottom line, bringing larger percentage gains in income. With a net income margin of 43% (up from 34% in 2009) and return on equity above 20%, Visa is turning more than 50 cents of every sales dollar into free cash flow. That cash can be reinvested to drive more card usage at higher returns, turning the business into a compounding machine.

You don't often get to buy this type of company on the cheap, especially in a bull market. We're paying a premium price of 23.8 times trailing free cash flow and 22 times expected earnings per share for the year ending September 2016. Annual revenue growth is expected to be about 10% over the next two years, but annualized earnings-per-share growth over the next five years is estimated at more than 18%. Given leverage in the business, today's slothful economy, and Visa's abundant free cash flow, odds favor additional positive catalysts that we're not counting on today.

Whether we're correct about that or not, we're still comfortable starting a position in Visa today. As the common axiom has it, history shows it's better to pay up for an outstanding business than to buy a mediocre one at a discount. It would likely take incredible technological evolution or devastating regulation to derail Visa's trajectory. So far, Visa has its finger on the pulse of new ways to pay, including **Apple** (NASDAQ: AAPL) Pay, and although regulatory battles in the U.S and Europe are far from over, the worst of the storm may have subsided along with the financial crisis.

How It Fits Into *Pro*

For too long, we've allowed our 4.3% stake in MasterCard to be the sole representative of our belief in the long-term promise of electronic payments. Visa deserves a spot alongside it. We're starting Visa at only a 2% allocation, so our combined direct exposure to the industry will be 6.3%. Obviously, we still like MasterCard as well -- and notably, that stock has always looked expensive, too, but it has been one of our best performers. With that combined exposure, we still have room to add a bit more to either position, or to another company in the financial industry, partly because we're removing more than 4% exposure to financials by selling **American International Group** (NYSE: AIG).

Adding Visa to our portfolio now may remind some members of when we added **Apple** (NASDAQ: AAPL) in 2012. Some believed it was too late to buy such a giant company at a nearly $500 billion market value. Our return on Apple is 88% (excluding dividends) in less than three years, and now its market value is $773 billion even following giant share buybacks. Visa is valued at $165 billion, and given its tiny market share, its ceiling should be much higher than that. It fits into *Pro* as a recurring-revenue business that invests its free cash flow in more growth at still higher rates of return, making it a compounding vehicle.

Visa is everywhere you want to be -- except in our portfolio. It's high time we change that.

Alternative Trades

- **Only want to target lower buy prices?** You can sell to open puts, one for every 100 shares you would buy at lower prices. Take your pick of options, but realize this is a Buy stock and we're starting with a direct 2% stake.

Sell AIG Stock and Warrants

Published Apr 27, 2015 at 1:21PM

Is this for you? This trade is for Fools who own shares, warrants, or calls of **AIG** (NYSE: AIG).

How You Participate

- **Trade:** Sell AIG stock and warrants.
- **Allocation:** We recommend selling the entire position -- both shares and warrants (or calls if you have them in lieu of warrants, as we do). For *Pro*, that is 1,500 shares (3.4% of our portfolio) and six calls (0.6% of our portfolio).
- **Price Guidance:** For the stock, **use a limit order** to aim to sell as close to the going market prices as possible. For the warrants (or calls), **it is imperative that you use a limit order to aim to sell as close to the midpoint of the bid-ask spread as possible**. These are thinly traded and **will** be affected by a spike in volume.
- **Recent Prices:** Stock, $56.90; warrants (bid/ask), $23.79 / $24.00
- **Scorecard Status:** Sell
- **Note:** AIG reports 2015 first-quarter earnings on Thursday, April 30, so if you want to avoid price volatility associated with earnings, aim to close your position before then. This is especially important for members with calls (rather than warrants) that expire soon, as leveraged option gains can be ephemeral. Those with longer-dated positions can likely afford to be more patient if increased volume results in lower pricing. As always, consider your own portfolio, your cash, and your tax situation before undertaking any stock sale. Finally: As we've said in the past, most of the stocks we sell will probably continue to do well once we're out of them. But when our thesis has been met for a non-core holding, we are apt to sell and move the funds into a position that promises greater long-term compounding.

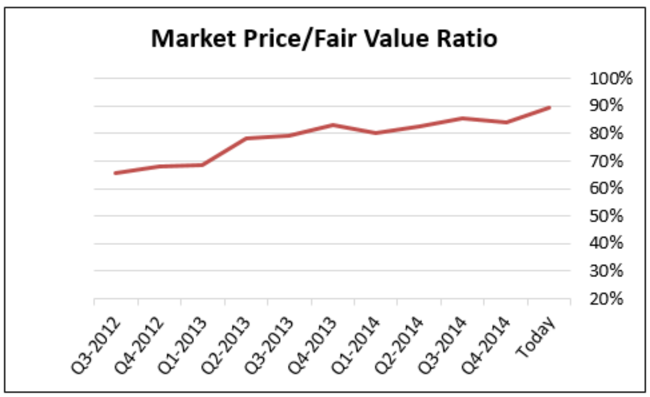
What We're Thinking

Today, we're recommending that you sell your entire stake in AIG – both stock (*Pro* holds a 3.4% allocation) and warrants (because we can't track warrants on our scorecard, *Pro* owns a 0.6% allocation in January 2016 calls). Here's why:

- **The market has rewarded AIG with a higher price-to-book ratio as the company's operations have improved.** When we first recommended buying AIG stock and warrants in [August 2012](), the company was still disentangling itself from a near-collapse that had almost brought down the world's financial system. The Federal Reserve and the U.S. Treasury had provided billions of dollars in bailout funds to AIG, and the company was a black sheep among investors and to the public – hardly anyone wanted to touch it (except us!). The valuation at the time reflected that sentiment, with the stock trading at 0.56 times book value.

  Since then, the company has done an admirable job cleaning up its operations – paying back the government in full, divesting non-core assets, and improving its core insurance operations to the point where it is now solidly profitable and able to pay out a regular dividend. As the market has recognized this improvement, it

  has rewarded the company with a higher valuation:
- **It's neither dirt cheap nor a core *Pro* holding.** For our core long holdings, *Pro* aims to buy outstanding businesses that will ideally compound our capital for many years to come. These outstanding businesses tend to share certain characteristics (for example, sustainable competitive advantages, pricing power, and expanding product possibilities). We've long stated our belief that AIG is just a so-so business, deficient in many of those characteristics, and that we own it because it is cheap. AIG's discount to our fair-value estimate is currently at its narrowest since we initiated the position, so we believe now is as good a time as any to say farewell to a so-so business that has turned out to be an excellent investment.



The *Pro* Bottom Line

Any asset can be a good investment at the right price, and AIG is a great example. We bought undervalued shares when market sentiment was almost universally negative. Since then, we've achieved a 62% cumulative return (23% annualized), earned via modest dividends and strong stock and option price appreciation. We've long stated that we'd be happy to part with our position if the stock nears our fair-value estimate, and we think now is an opportune time to cash in our chips.

Again, bear in mind that AIG is set to report earnings after market close on Thursday, April 30. No matter whether the stock goes up or down after the report, we'll be happy with our decision, and we look forward to putting our capital to work elsewhere.

Deep Cuts From the Pro Vault

Published Apr 27, 2015 at 11:51AM

Pro Guidance Changes

- **American International Group** (NYSE: AIG): Shares move to Sell as we exit this non-core position as it nears our fair-value estimate. Please read the sell report and consider your own situation before selling.
- **Facebook** (NASDAQ: FB): Fair value moves up to $80 (from $72). The stock remains a Buy with a 4.5% allocation. See our earnings review.
- **Earnings Reviews:** Just a friendly note that we're going through earnings on many of our companies right now, and updates will be issued as ready. So far, none of our Buy guidance has changed; our many Buys remains Buys, and our few positions on hold are being evaluated for new buyers. And of course, we work for you, so you'll be the first to know when this guidance changes!

Dear *Pro* members:

George Santayana once famously said that "progress, far from consisting in change, depends on retentiveness. When change is absolute there remains no being to improve and no direction is set for possible improvement: and when experience is not retained, as among savages, infancy is perpetual. Those who cannot remember the past are condemned to repeat it." So in the ongoing quest to avoid perpetual infancy, I've recently taken up the task of learning more about *Pro*'s history -- much to the chagrin of Jeff and Ellen, as this has resulted in me asking them even *more* questions. [Editor's note: We actually don't mind this, but we do act annoyed to keep him on his toes. You have to *earn* your way onto this team.]

Polaris Award 2015

Now in its third year, our Polaris Award honors the *Pro* members who contribute so much to our thriving community -- and we need your help to choose the nominees. Tell us who you love >>

Given this new hobby of mine, it was only natural that I decided to comb through the archive of *Pro* Monday Memos. It was, perhaps, even more natural that I should choose to do so in search of inspiration when I found myself with a severe case of writer's block and the deadline for *this* Memo fast approaching. I came away with a much better understanding of how the portfolio evolved over time, what Jeff & Co. were thinking about in years past, and how our style has evolved -- so much so that I decided to create a time capsule, if you will, of some of *Pro*'s earliest memos.

Do be aware that this isn't a collection of the best of the best per se; rather, it's simply a collection of Memos I enjoyed reading. For those of you who, like me, are relatively new to the service and are interested in learning more about *Pro*'s history, I'd encourage you not to stop with just the few below -- take it from me that combing through the Memo archives in their entirety is a great way to spend a lazy afternoon or Sunday morning. And for those of you who have been here since the beginning, get ready to take a trip down memory lane!

- It only seems right to start with Jeff's first Monday Memo.
- And here's the first Memo that talks about shorting. Out of curiosity, I decided to check how many of the stocks mentioned in this Memo have underperformed the S&P 500 since it was published on Nov. 10, 2008. (Disclaimer: I know it's unlikely that someone would keep a short position on a particular stock on for this long in the real world.) As it turns out, Jeff and former *Pro* analyst Todd Wenning got three out of five correct: **Citigroup** (NYSE: C), **Weyerhaeuser** (NYSE: WY), and **Zions Bancorp** (NASDAQ: ZION) have all underperformed on a capital-gains basis, while **Brinker International** (NYSE: EAT) and **Trina Solar** (NYSE: TSL) have beaten the S&P 500 over the subsequent years.
- *Pros* vs. Joes: In this December 2008 Memo, Todd and Jeff noted that TMF's CAPS All-Stars were displaying more bearish behavior while the rest of the CAPS community was getting more bullish. It's interesting to note that the market hit a bottom only a few short months after this Memo was published.
- What did the *Pro* portfolio look like in early 2009? Take a peek.
- Three days after the aforementioned market bottom, what was *Pro* talking about? South Park, tractors, and Europe, naturally.
- *Pro*'s Buy Firsts, the July 2009 edition.
- And here's an interesting 2009 Q&A session with Jeff and Todd.
- Thinking long and hard about short positions: Jeff chimes in with another great memo on shorting.
- Here's what *Pro* was up to in early 2010 with what Jeff dubbed "*Pro*'s biggest update ever."
- How do you get started analyzing a company? Todd gives his take in this memo.
- What would Ben Graham think of *Pro*? Former *Pro* analyst Bryan Hinmon offers his thoughts.
- I have a dog named Hobbes. The title of this Memo is a reference to the *Calvin and Hobbes* comic strip. Of course I'm going to include Nick's memo discussing the three investing lessons of Calvinball.
- Jeff chimes in on four traits he believes every great investor should have.
- It may seem like a distant memory, but it wasn't all that long ago when volatility was par for the course.

Do you have any favorite Memos from previous days? Share them with us on the Memo Musings board!

Foolishly yours,

-- JP (TMFYossarian)

Celebrate Our Community: Polaris Award 2015

Published Apr 23, 2015 at 10:58AM

Pro Polaris Award 2015

And the winner is ...

fullofcarp!

Want to offer your congratulations and adulation? Do so on this discussion-board thread -- but note that fullofcarp let us know he's traveling through tomorrow, May 19, so he may not respond immediately.

As proposed by ADrumlinDaisy in 2013, the Polaris Award is "a *Pro* community analogue of the Feste Award, an annual award given to the member who provides the most value to his or her fellow members." Criteria include a regular, frequent, Foolish presence on the *Pro* discussion boards; helpful, expert-level advice; creativity; and efforts to foster a sense of community.

As you can see above, our winner this year is the esteemed and deserving **fullofcarp**! He will receive a shiny new discussion-board charm and $250 to use at Apple or Starbucks — winner's choice. See the full rules here.

Best,

The *Motley Fool Pro* Team

Polaris Award 2015 Contest Rules

Published Apr 23, 2015 at 10:42AM

OFFICIAL CONTEST RULES

1. ENTRY: No purchase necessary to enter or win. The contest will begin on 4/23/2015 and end on 5/15/2015. The entry deadline for the contest is 5/15/2015.

2. ELIGIBILITY: This contest is open only to legal U.S. residents, over the age of 18.

Employees and contractors (and their families) of The Motley Fool or any of its affiliates are not eligible. Void where prohibited by law. Contestants residing in those areas where the contest is void may participate in the contest but may not win any prizes.

3. WINNER SELECTION: The member who has the most votes from other members of the Pro community will be declared the winner. Votes will be collected in a manner as stated by TMF with these rules, and each individual in the Pro community can only vote once. Motley Fool employees and contractors may vote, but are not eligible to win.

4. PRIZES: The winner will receive a $250 gift card from their choice of either Apple or Starbucks. [Value: $250]

5. WINNER NOTIFICATION: The winner will be notified within 5 days after the determination date. Inability to contact a winner may result in disqualification and selection of an alternate winner.

6. GENERAL CONDITIONS: The winner will be required to execute and return a Certificate of Eligibility, Consent and General Release form within 14 days of notification. The winner may also be required to complete and return a W-9 for tax purposes. Non-compliance within this time period may result in disqualification and selection of an alternate winner. Any income tax liability is the sole responsibility of the winner. By acceptance of the prize, the winner consent to the use of his or her name and/or likeness for purposes of advertising or trade without further compensation, unless prohibited by law.

7. USE OF CONTEST INFORMATION: All entries become the property of The Motley Fool. The Motley Fool reserves the right to use any and all information related to the contest, including submissions provided by the contestants, for editorial, marketing and any other purpose, unless prohibited by law.

8. CONDUCT: All contest participants agree to be bound by these Official Rules. The Motley Fool in its sole discretion, reserves the right to disqualify any person it finds to be tampering with the entry process, the operation of this website or is otherwise in violation of these rules.

9. LIMITATIONS OF LIABILITY: The Motley Fool is not responsible for late, lost or misdirected email or for any computer, online, telephone or technical malfunctions that may occur. If for any reason, the contest is not capable of running as planned, including infection by computer virus, bugs, tampering, unauthorized intervention or technical failures of any sort, The Motley Fool may cancel, terminate, modify or suspend the contest. Entrants further agree to release The Motley Fool from any liability resulting from, or related to participation in the contest.

10. WINNERS LIST: The names of the winner may be obtained by sending a self-addressed stamped envelope to Pro Member Contest 2014, The Motley Fool, LLC, 2000 Duke Street, Alexandria, Virginia 22314.

The Shortfalls of Shorting

Published Apr 20, 2015 at 3:19PM

Greetings, *Pro* members,

All of us invest (at least in part) to reach or maintain financial freedom. And part of that freedom means not being tied down by our portfolios every day. As much as we enjoy investing, we all have days when we say to ourselves, "OK, I got it. Own great companies for the long haul. It doesn't matter what prices do today" -- and we unplug and go about our lives. When you sell a stock short, though, you have less leeway to go sail around the world and leave your investments alone. Shorts require more attention, even if they're small positions.

Why is that?

For one, a short is a margin investment -- in reverse. You're paid the proceeds from the sale on the day you sell something short, and the stock you sold could theoretically double or rise tenfold (or even a hundredfold); if it did, you would be on the hook to buy it back at that devastating price. It's no surprise that short selling has destroyed countless hedge funds, let alone small investors.

And for what? The risk-and-reward trade-off of shorting is unfavorable. The most you can earn on a short sale is 100%, and that's if the stock delists. And 100% of *what*? Of the amount you're willing to risk on day one, which is usually a modest sum (because as a savvy investor, you want to contain your risk). So, even if you reach a perfect 100% gain on a short, it's usually not going to benefit your portfolio by more than a few percentage points -- the allocation of your initial short.

Sure, every percentage point matters, but 100% gains on a short are rare enough that in practice they're almost nonexistent. A successful short is much more likely to net you 20%, or perhaps 40% (a very good short), or sometimes even 60%, before you close. On a 1% or 2% allocation, that won't move the needle on your portfolio much, especially if you have other shorts that are working against you because of shorting fees, dividends you have to pay, appreciation, or all three. You're fortunate if your short positions are a wash at best in a half-decent stock market, even though shorting consumes a lot of time and subjects you to oversized risks.

All told, it's difficult to make meaningful money selling short unless you happen to have many good shorts open when the market falls sharply, taking those positions with it. Consistently making money by shorting is close to impossible, given the market's preference for rising over the years and the fact that the system is stacked against short sellers. Business owners, employees, investment banks, inflation, and capitalism are all aligned to generate growing value for even half-successful companies.

Plus, barring bad news, it's easier to steadily attract new buyers to a stock, lifting shares higher, than it is to make existing owners sell, pushing the stock down. Shares of even a mediocre company may rise for years until a bear market finally pushes more people to sell than buy.

Given all these negatives, why short at all? How do we justify it in *Pro*?

I'm glad you asked.

Of Shorts and Hedges

As much as we would like our short stocks (as opposed to our index hedges) to earn value for us *no matter what* the stock market does, we know that isn't always a realistic assumption. It's a bold assumption. Market correlation means that, historically, a majority of stocks will move up when the market goes up. That also means a majority of stocks *fall* in a market downturn, so shorts are likely to reward us when the market declines.

We like having shorts in place for market declines, but ultimately this only adds value if we're shorting stocks that *don't go up much* while we wait, even if we wait years for a 20% market fall. That's a difficult goal to obtain, and it's why we spend so much time considering any short before recommending it.

Not much time has passed, but so far our "direct" shorts have fared well for us despite the positive market. Here are the returns of *Pro*'s past and present shorts as of 11 a.m. this morning, compared with the performance of a short of market indexes. (Note that our shorts of inverse and volatility ETFs are not included, since those behave as longs.)

Short	Rec Date	Rec Day Closing Price	Price Today (11:20 a.m.)	Our Short Return	Short S&P 500 Return	Short Nasdaq Composite Return
Boulder Brands (NASDAQ: BDBD)	3/23/15	$9.42	$10.29	(9.2%)	0.1%	0.3%
CurrencyShares Euro Trust (NYSEMKT: FXE)	12/12/11	$131.39	$105.79	19.5%	(70.1%)	(91%)
Caesars Entertainment (NASDAQ: CZR)	10/1/14	$12.32	$10.44	15.3%	(8.1%)	(12.8%)
Five Below (NASDAQ: FIVE)	7/16/14	$35.27	$35.64	(1%)	(6.2%)	(12.8%)
Sony (NYSE: SNE)	4/18/12	$16.89	$13.32*	21.1%	(7.8%)**	(3.7%)**

*All returns exclude dividends and fees. Returns are from recommendation date shown to today (or to closing day in the case of Sony). *We recommended closing our Sony short on Jan. 22, 2014, and the price shown is our higher closing price the next day. **From April 18, 2012, to Jan. 22, 2014.*

You can see that three of our shorts enjoy (in Sony's case, enjoyed) double-digit returns despite market indexes that went up over the same period; shorting the market indexes would have resulted in the losses shown above. Our shorting returns against a positive market suggest we're doing some things right. Hedge funds would tout these results. Elsewhere, our Five Below short is nearly a wash, despite the market being substantially higher -- the Nasdaq is up about 13%. Our Boulder Brands short is new, but this volatile stock has a losing start for us on absolute and relative terms. The market is down a tick since the short started, but small-cap Boulder (should we call it Pebble?) is up 9%.

Overall, our modest "short book" has added some value to the *Pro* portfolio despite the bull market. Shorting requires a lot of time and attention and increases our risks, so if it can add value even when going against the market trend, that's one way to justify it. Also, our shorts help us to comfortably be more invested than we otherwise would (including owning **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY), which is a counterbalance to our shorts). And our shorts have not cost us big the way some of our market hedges have, such as shorting the **SPDR S&P 500** (NYSEMKT: SPY) ETF over the past years.

Finally, providing a lesson about taking gains when you have them, we closed Sony at a 21% gain when shares were about $13. Today, the stock is above $30. Even a struggling company can generate confidence with turnaround plans that begin to show up in the financials. Shorting requires more of some skills we're not trying to master: market timing and short-term thinking.

Shorts in the Short Term

Shorts are usually short-term in nature, requiring all of us to flip our thinking, which is not easy. As Foolish investors, we've internalized the need to hold good companies for years to see compounding, but often a short should be closed within mere months if it's earned a good return. Why? Because it's rare that a company will continually get weaker over the years, unless it's truly dying. Companies will do anything to improve and survive. Plus, you pay to short -- so in other words, the clock is ticking.

The Short Take on Shorts

So, what is our takeaway on all this?

- Shorting is difficult. Even full-time short experts fight an uphill battle to make money. *Pro* is doing admirably with its direct shorts so far, and to us, that means that -- unless we want a quick market hedge -- we should *not* return to shorting market indexes directly as long as we can build a short book that does better than that. (That said, using options to hedge indexes still makes sense.)

- Shorting is expensive and has unusual risks, including being called out of the position, new company initiatives that change your thesis (reorg plans, being acquired, share buybacks), and losses that *compound* against you. A falling stock you own becomes less and less meaningful to your portfolio, but a short becomes more and more costly and risky as it works against you.

- Short selling cannot compound your money. You need to short again and again, typically making small gains each time, and be correct to a magnitude that exceeds your losses. This means that shorting requires a lot of your time and attention. (Plus, it results in short-term taxes no matter what.)

So Why Short at All?

1. We believe we can identify weak companies with stocks that should not do well, and ideally fall. If there's a bull market, we can usually wait it out as long as that particular company's business doesn't improve.
2. Our company shorts also serve as market hedges, since a majority of stocks move together. In a down market, our basket of shorts should benefit the portfolio in most cases. While we wait, ideally our short basket is less costly than shorting the market index would have been. And if we're really good, our shorts in aggregate will fall even in a rising market.
3. Having a basket of carefully chosen shorts increases our short exposure, which allows us to increase our long exposure. This way we can own more great companies for the long haul while staying true to our absolute-returns goal.

In summary, building a short book here in *Pro* is worth it as long as we continue to do it in a way that adds value in various ways. But you don't need to short to succeed. Many investors never become comfortable with shorting, and thus they (wisely) choose not to do it. If you are happy to short, though, then you can sleep easier knowing you have some positions that should help in a bear market -- and perhaps even in a good market, too.

Keeping an Eye on Five Below

Published Apr 17, 2015 at 7:30PM

The holiday quarter is ultra-important for discount teen retailer **Five Below** (NASDAQ: FIVE), and our intention has always been to use 2014's holiday quarter as a guidepost as to whether our short thesis for the company remained valid. That quarter is in the books, so let's take a look at what Five Below reported as well as what the future might hold. **I want to note right up front first that we're continuing to stay the course.**

The Past

Fourth-quarter and fiscal-2014 results for Five Below came in at the high end of management's guidance, but only after the company lowered the top end of its guidance range nine weeks into the fourth quarter. Sales and adjusted net income increased by 27% and 31% for the year respectively on the back of 62 new stores. For the quarter, sales and adjusted net income were up by 24% and 29% respectively.

A 20% increase in the overall store count helped to drive the impressive top- and bottom-line growth metrics, but the performance of seasoned stores wasn't nearly as strong. The company had a very favorable setup going into the 2014 holiday quarter, given that 2013's Q4 comparable-store sales (comp) number was a lackluster 0.3% (management blamed the weather). But Five Below could only muster a 3.2% comp for the quarter and 3.4% for the year. Interestingly, Five Below's comps have basically fallen in line with general deep-discounters, even though the company markets itself (and we tend to see it) as more of a preteen/teen retailer.

Note: X-axis refers to calendar quarters

The comp number gets even more interesting when you divide it into its two components: sales growth that's driven by an increase in the number of transactions, and sales growth that's driven by an increase in the average dollar value of each transaction.

	2011	2012	2013	2014
Transaction volume	6.1%	6.9%	4.8%	1.4%
Average dollar value	1.8%	0.2%	-0.8%	2.0%
Comp	7.9%	7.1%	4.0%	3.4%

You'll see that average dollar value (i.e. ticket size) rebounded in 2014, and if you're a parent you'll know why: Remember those rubber band looms every kid was playing with for awhile? Those were great for Five Below's traffic, but they had a downward pressure on transaction size in 2013. Now that purchases have shifted away from rubber bands, ticket size has returned to a more normalized level. Such are the vagaries of preteen retail.

As we've noted before, the company has admitted in the past that the primary long-term driver of its comp growth will have to be volume, and given Five Below's young target demographic (as well as the self-imposed ceiling on prices), we agree. So we need to be cautious about extrapolating the 2014 results for this metric into the future. However, the 240-basis-point decline in transaction volume is certainly worth our attention, and as you can see, this is the second straight year in which that metric declined significantly. This is a cornerstone of most short theses for Five Below, including our own.

First-Year Metrics

Historically, the company has been able to post impressive first-year metrics for its new stores. Let's dig a little deeper: In the most recent 10-K, management notes that its new-store model assumes "approximately $1.6 million in the first full year of operation and an average new store cash investment of approximately $0.3 million." That's actually a slight increase from prior filings, which referenced "$1.5 million to $1.6 million."

Subtle changes in regulatory filings can provide big clues into how the business is actually doing, but in this case I believe what CEO Joel Anderson said was actually even more important. In the past, management had always pointed out that Five Below's newest stores were performing "above expectations," but I believe this was the first earnings call during which someone actually provided us with figures to help put those words into context. Anderson noted that 2014 marked the fourth year that first-year sales came in at approximately $1.9 million per store. I had always assumed that figure was higher than the $1.5 million or so the company reported -- the latter would put the average yearly sales for mature stores at perhaps 25% higher than at the new ones, and that seemed unlikely. This means that new stores are performing similar to their seasoned brethren right out of the gate.

So why the disconnect between new and seasoned stores? In *Pro*'s original write-up, current Fool and former *Pro* analyst Bryan Hinmon noted competitive pressures nipping at Five Below's heels; nothing the company does is proprietary. But I actually don't think this is what we're seeing here. At least not yet. I suspect that this may just be customer fatigue. In a way, Five Below is a cooler version of the dollar store, one that's initially able to attract customers from all walks of life. But I can't help but wonder if over time, the novelty of Five Below's store experience and product offerings starts to wear thin. Because the company doesn't sell consumer staples (unless you count candy), there's no reason for customers to visit unless the company gets them excited to.

The Stuff They Sell

Inventory continued to rise on a per-store basis, up 7.5% year over year as the company tried to mitigate the impact of port labor conflicts on the West Coast. Congestion is still an issue as the ports try to work through the backlog, according to Bloomberg, and data from Datamyne suggests that container inflows are still down 12% compared to last year.

According to CEO Levi Strauss & Co. Chip Bergh, the situation has gone from "manageable to bad." A recent article in *The Wall Street Journal* noted that some companies are beginning to worry about receiving some of their spring products in time as four-day delays stretch into two weeks. Some companies have attempted to combat this issue by rerouting their shipments to the East Coast, where February port inflows were 14.7% higher than last year.

The Future

In our original short thesis for Five Below, some of the most compelling arguments had to do with red flags around management. The co-founders' prior public company had gone bankrupt, turnover in the executive suite was picking up, and insiders were selling large blocks of shares. Since then, the co-founders have continued to sell shares and the company has taken on a new CEO, a new EVP of Merchandising, and two new board members.

So what should we make of this? Taken in isolation, it's hard to view all this as anything other than a sign that the short case for Five Below is still valid. But the turnover in management could end up being a positive thing. Previously, Five Below's business model exhibited extremely impressive store-unit economics but was managed by people whose ability to steer the ship was more than questionable. Neither the new CEO nor the EVP of Merchandising have track records to suggest they'll shoot the lights out during their time at Five Below, but maybe they don't need to. Maybe all they need is to be slightly better than the people they've replaced.

It's still far to early to tell whether we'll actually see any changes and whether they're be a net positive or negative, but I found two comments from the new CEO to be interesting on this front:

> And lastly, but perhaps most importantly, is priority No. 5, marketing. Although our stores generate strong sales, recent market surveys we have conducted indicate that we have an exciting opportunity to expand our brand awareness and attract more customers to the Five Below experience in both new as well as existing markets. We simply need to do more to make people aware of this great concept. Our marketing strategy has been predominantly circular-driven, but in 2015, we will begin to optimize our media mix as we aim to be more effective with our marketing message by speaking to our core customers in the channels that are most relevant to them. What this means is a steady transition away from heavy circular dependence and a move to more digital and social media messaging.

Five Below's advertising budget had been primarily focused on print -- and remember, this is a retailer with a teen and pre-teen focus. Intuition tells me that audience is heavily skewed toward electronic entertainment as opposed to the Sunday circulars. This is low-hanging fruit, if you ask me, and it's something the co-founders should have done years ago.

Moving on:

> Our revenue forecast for 2015 assumes another strong class of new stores coupled with a same-store sales increase of approximately 3%. This reflects a slow start to Q1, given unfavorable weather in late February and early March. It also reflects the conservative approach to Q4, particularly in early December. While we have marketing and merchandising plans that we are excited about, we would rather see them drive results than assume associated upside in our outlook at this juncture.

The last sentence piqued my interest. Does this new team plan to under-promise and over-deliver instead of the other way around? That would be dangerous for those who are short the stock, because it would demonstrate that the company has become aware of two major cognitive errors, anchoring and adjustment and framing. A management team that is aware of these errors and trying to use them to its benefit (as most companies do nowadays) could make for a difficult short in the near to intermediate term.

Valuation

Five Below expects fiscal 2015 sales to be in the range of $816 million to $824 million, which would be top-line growth of 20 percent or so, and net income between $55.9 million and $57.7 million, growth of maybe 17 or 18 percent. (Management says the reason for the divergence is that this will be an "investment year.") For 2015, management expects diluted EPS of $1.02 to $1.05, which places the current price at around 35 to 36 times forward earnings.

Management expects to open 70 new stores this year -- 60% of those in the first half, with 18 coming in the first quarter. If we assume that these stores will ultimately end up generating around $1.9 million in sales during their first full year of operation, we could end up seeing the 2015 vintage contribute between $80 and $90 million to the bottom line this year (adjusting for the amount of time these stores will be open in fiscal 2015 and the seasonality of Five Below's sales). If we assume that the rest of Five Below's stores will achieve an annualized sales growth rate of around 3%, then the company could end up reporting closer to $830 million in sales.

You'll notice that this is above the top end of the guidance management provided to investors -- again, I wonder if management is planning to under-promise and over-deliver. If they can report revenue "above expectations," they'll gain flexibility in reporting bottom-line results that are at least in line with expectations. So I wouldn't be surprised if the company does end up reporting 2015 net income within guidance. But by my calculations, the current stock price implies that Five Below will be able to increase its free cash flow by 20%-plus for at least the next ten years, which seems doubtful unless management can keep up rolling out new stores fast -- and profitably.

What now?

In our opinion, 41 times 2014 earnings and 35 times forward earnings is rather generous for Five Below, but shorting a stock based solely on valuation frequently ends badly. So it's good to see that some parts of our thesis are playing out just like we had hoped. But we've also been thrown some curveballs, and I think that warrants shortening our leash at least a little.

The issue is not whether the thesis will ultimately play out; we still have a hard time envisioning this company profitably scaling to more than 2,000 stores. The issue is how quickly it will play out. We've seen enough to suggest that it could play out sooner rather than later, and we want to keep our short position open if it does. But we will be sensitive to any improvements we see in the business. Meanwhile, as we wait, we need to view this position as not only a short of Five Below specifically, but as a hedge against a bear market. A weak market would likely benefit most shorts, including this one. Along with our business thesis, then, this short continues to make sense in our long/short portfolio as a bear-market hedge as well as an individual position.

Want to talk about Five Below? C'mon over to our rad discussion board.
(That's something preteens say, right?)

Wells Fargo's Admirable Consistency

Published Apr 16, 2015 at 2:18PM

Wells Fargo (NYSE: WFC)

Updated Guidance: Buy First (no change)

Recommended Allocation: 3.7%

Fair Value estimate: $58 (up from $56)

What Happened?

- Diluted EPS of $1.04 per share (down 1% from Q1 2014)
- Revenue of $21.3 billion (up 3.3% from Q1 2014)
- Efficiency ratio of 58.8% (vs. 59% in Q4 2014 vs. 57.9% in Q1 2014)
- ROA of 1.38% (vs. 1.36% in Q4 2014 vs. 1.57% in Q1 2014)
- ROE of 13.17% (vs. 12.84% Q4 2014 vs. 14.35% in Q1 2014)

Continued increases in loan/deposit growth and credit quality:

- Core* loans of $802.7 billion (up 7.3% from Q1 2014)
- Total average deposits of $1.2 trillion (up 9% from Q1 2014)
- Net charge-offs as a % of total loans down to 0.33% (vs. 0.41% in Q1 2014)
- $100 million reserve release** (vs. $500 million Q1 2014)

Capital allocation:

- Share buyback activity continued (diluted share count declined 35.6 million, or 0.7% of total shares outstanding, from last quarter)
- No objection from the Federal Reserve to the 2015 Capital Plan, which included a proposed dividend rate of $0.375 per share for Q2 2015, up from $0.35 per share in Q1 2015

Operating segments:

- Community Banking: Net income of $3.67 billion (down 4.7% from Q1 2014)
- Wholesale Banking: Net income of $1.8 billion (up 3.2% from Q1 2014)
- Wealth, Brokerage, and Retirement: Net income of $560 million (up 18.1% from Q1 2014)

*"Core" loans excludes the impact of the non-strategic/liquidating loan portfolio

**Reserve release represents the amount by which net charge-offs exceed the provision for credit losses

CFO John Shrewsberry:

> "Wells Fargo earned $5.8 billion in first quarter 2015, an increase of $95 million from the prior quarter, including the benefit from lower income tax expense in the first quarter. Credit quality remained strong, as net charge-offs continued to decline. Expenses also decreased from the prior quarter and our efficiency ratio improved. We remained within our targeted ranges for ROA, ROE, efficiency ratio and net payout ratio, while maintaining record liquidity and capital levels."

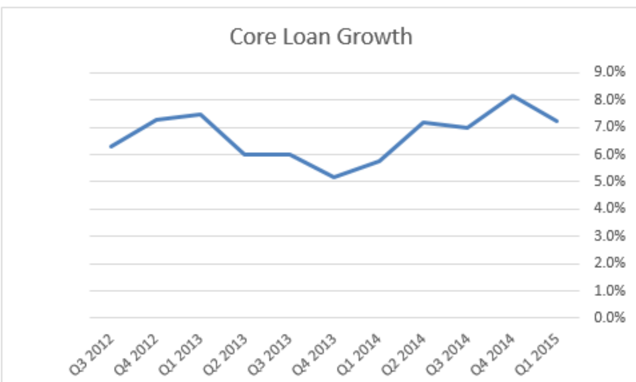
So What?

The 3 key items that I watch for Wells Fargo:

- Growth (or lack thereof) in core loans and deposits
- Trends in credit quality (as monitored via net charge-offs and reserving policy)
- Trends in the efficiency ratio and expense reduction

1) Growth in loans and deposits

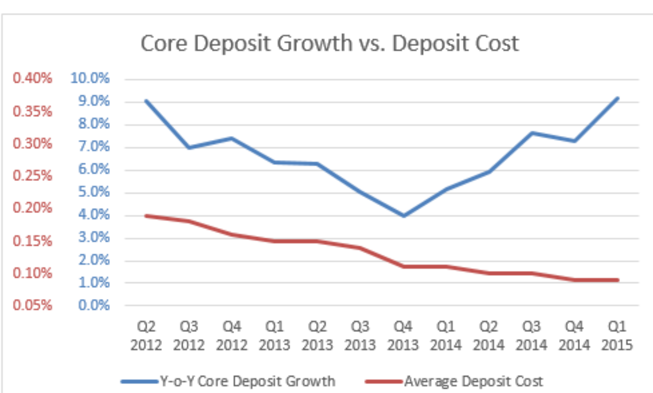
Core loan growth for the quarter came in at 7.3% year-over-year. The growth rate decelerated a bit from last quarter's excellent 8.1% growth level, but remains at a strong level. There was particular strength in commercial and industrial loans (up 13% year-over-year) and credit card balances (up 15% year-over-year). In the current U.S. economic environment of 2-2.5% GDP growth, I am very happy with loan growth in the range of 6-8%.



Source: Company filings, analyst calculations

Given the fluctuating economic environment (for example, declining oil prices and the concurrent effect on the energy and manufacturing industries), continued low interest rates, and Wells' laser focus on risk management and credit quality, recent loan growth trends have been excellent. I don't expect loan growth to increase meaningfully (i.e. to 9-10% growth) unless U.S. economic growth starts to sustainably accelerate (say to the 3-3.5% growth level) and long-term interest rates rise. In the meantime, if the company can keep its loan growth in the same general range as it's been recently, I'll be happy.

As for deposits, Wells continues to shine. The company achieved 2.6% quarter-over-quarter growth and 9.2% year-over-year growth in core deposits. Funding costs were stable at a rock-bottom rate of 0.09%. If they're only paying 0.09% on deposits, they should be gathering as many deposits as they can, and that's what they're doing. Deposit growth continues to accelerate in recent quarters:



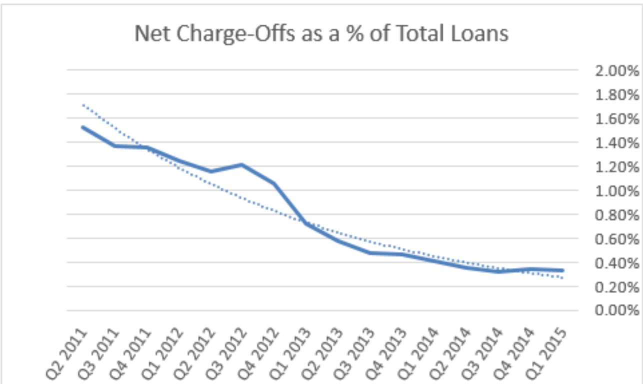
Source: Company filings, analyst calculations

The company's ability to grow deposits meaningfully at a very low cost is perhaps the company's biggest structural competitive advantage. Wells is able to do this by having a nationwide presence with significant geographic density in most markets, optimizing distribution via newer channels (mobile/technology), and strong customer relationship management and successful product cross-sell achieved via a consistent culture that has been a hallmark of the company for decades. CEO John Stumpf stated on the earnings call that "this is some of the strongest deposit growth years I've seen in my 30-some years with the company", and given the company's industry-low cost of deposits, deposit growth trends suggest that the company's competitive advantages may be strengthening.

Since deposit growth again exceeded loan growth, compression of the net interest margin (NIM) continued, coming in at 2.95% (down from 3.04% last quarter and 3.2% a year ago). I've written about net interest margin compression here. Quick summary is, it's not a big deal and so long as Wells continues to proficiently collect deposits, we will likely see NIM compress until rates rise and loan growth picks up.

2) Trends in credit quality

After a slight uptick in net charge-offs last quarter (a reversal from the unbroken trend of improvement that began in Q3 2012), credit quality improved slightly, with net charge-offs as a percent of total average loans declining to 0.33% (from 0.34% last quarter). Improvements in credit quality have leveled off, as we've long expected they would, and it will be difficult to wring out future improvements from these very low levels. But since Wells Fargo is known for underwriting discipline, I anticipate continued strong performance from this metric. Slight deterioration in credit quality from these levels will not worry me (and may actually be beneficial in terms of generating higher loan growth), but we want to watch the trend to make sure that the company's discipline is staying on track.

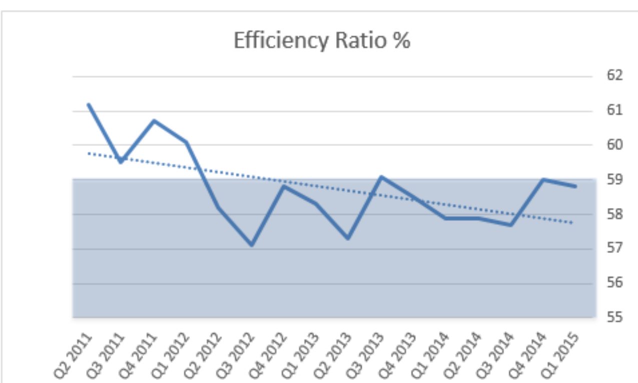


Source: Company filings.

The company is relying less and less on improved credit quality to generate earnings growth, which is good to see, although it creates some challenging comparisons to year-ago periods. For example, the reserve release in the year-ago period was $500 million compared to $100 million in this quarter. All else equal, if the reserve release in this quarter was the same as it was a year ago, the company would have reported 6.7% growth in earnings per share rather than a 1% decline.

3) Trends in the efficiency ratio

After a poor showing last quarter, this quarter showed sequential improvement in efficiency, with the efficiency ratio (a measure of the bank's overhead costs as a % of its revenue) declining to 58.8% from 59% last quarter, and within management's target range of 55-59% (blue shaded area in graph). Management has stated that their goal is to ultimately get the efficiency ratio down to 55%. For now, the company is investing in demands related to information security, compliance, and risk management (areas where another of our *Pro* holdings, **Broadridge** (NYSE: BR) stands to benefit), and that is likely to keep Wells at the higher end of their target range in the current economic and interest rate environment. But management is laser-focused on expense control, and I'm confident in their ability to steadily drive this figure lower, although the improvement won't be linear and will take time:



Source: Company filings.

Now What?

Quoting prior write-ups:

> "Not much different from last quarter (or the quarters before for that matter). Wells Fargo continues to execute its strategy and boast admirable consistency despite a fluctuating and uncertain macroeconomic environment. The company's performance is a testament to its diverse operating model. The company has so many levers to pull that if one segment falls others pick up the slack."

The market wasn't particularly pleased with this quarter's results, with shares at one point trading down nearly 2% during intra-day trading on the day of the earnings release (4/14). A rare year-over-year earnings decline, a sub-3% net interest margin, and a year-over-year decline in profit in the company's Community Banking segment (the largest segment) are likely contributors to the lukewarm investor reception to the report. But from our long-term view, underlying business results remain strong, the core earnings power of the business remains intact and is poised for positive operating leverage when interest rates and lending spreads rise, and the company's capital return program continues to benefit shareholders.

Data and Guidance

- Current Price: $54.65
- Fair Value **(updated)**: $58
- Market Cap: $281.6 B
- P/B 1.54

After incorporating this quarter's results into our model, we've increased our Fair Value estimate from $56 to $58 (representing a 1.77x P/B multiple). Wells Fargo remains a Buy First on our scorecard with a 3.7% allocation, and those who have yet to fill out their position should feel comfortable doing so at current price levels. We've been running a covered strangle strategy on Wells Fargo off and on over the past year, with our most recent iteration of the strategy ending with a fully profitable expiration on April 2nd. In light of the Fair Value update and the most recent quarter's results, the team may consider reinitiating the strangle strategy on Wells Fargo, and if we do, you'll receive an alert.

Fool on!

Pro Catch-Up Trades: April 13, 2015

Published Apr 15, 2015 at 9:28AM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

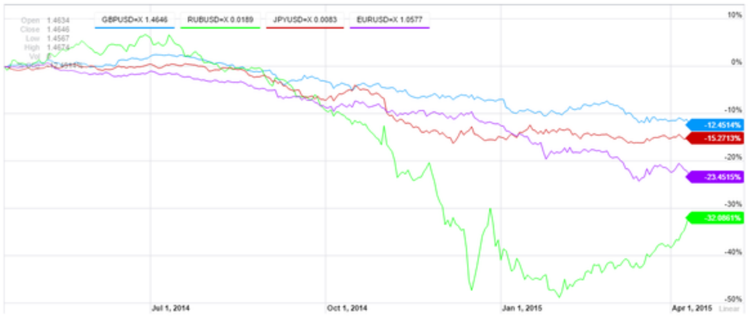
- **Expeditors International** (NASDAQ: EXPD): If you lack a position, target 3.5% total long exposure. Either buy about 1.8% in stock, or set up a January 2017 $45 synthetic long for the same allocation. Sell to open January 2017 $45 puts, and buy to open the same number of January 2017 $45 calls, lately for about a $2 debit with the stock at $47. Each synthetic long represents $4,500 in stock exposure. To then target another 1.7% in potential stock exposure, write a covered strangle. Sell to open May 2015 $46 puts and May 2015 $49 calls, one each for every 100 shares of Expeditors you have current exposure to, and every 100 more you could buy. Lately, you can get a credit on the covered strangle of about $1.50. (Keep in mind, *Pro* may convert to shares as our 2016 synthetic long comes to completion.)
- **SPDR S&P 500** (NYSEMKT: SPY) June hedge: If you haven't yet set up a put ratio spread to hedge, today you may using the same June 30, 2015, puts we used but adjusting the lower strike. Sell to open two June 30, 2015, $190 puts for every one June 30, 2015, $200 put you're buying. Lately, you'll pay about a $0.10 debit per spread. Each put you buy represents $20,000 in look-through short value, and each uncovered put you write represents $19,000 in a potential SPY purchase obligation. Set up one put ratio spread for every $200,000 you want to hedge. With SPY lately at $210, this put ratio spread has a maximum profit when the market falls 9.5% and a break-even price on a potential SPY purchase at 14.2% lower. See our past trade alert for more on the mechanics of this trade.
- **SPDR S&P 500** (NYSEMKT: SPY) September hedge: If you haven't yet set up our *second*put ratio spread to hedge, today you can using the same September 30, 2015, puts we used. Sell to open two September 30, 2015, $170 puts for every one September 30, 2015, $185 put you're buying. Each put you buy represents $18,500 in look-through short value, and each uncovered put you write represents $17,000 in a potential SPY purchase obligation. Lately, you can set this up for about zero cost (zero debit or credit). Set up one put ratio spread for every $185,000 you want to hedge. With SPY lately at $210, this put ratio spread has a maximum profit when the market falls 19% and a break-even price on a potential SPY purchase at 26% lower. See our past trade alert for more on the mechanics of this trade.

Pro's International Exposure

Published Apr 13, 2015 at 4:22PM

Dear *Pro* Fools,

Over the past year, investors have had money on the brain — more so than usual, as international currencies seem to have earned a greater portion of mindshare. As the United States continues its slow economic recovery and other major world economies have experienced relative weakness, the U.S dollar has become a safe haven for global investors, driving up its value relative to the other major world currencies. Here's the one-year performance of the pound sterling/dollar (blue), ruble/dollar (green), yen/dollar (red), euro/dollar (purple):



Source: Yahoo Finance

Multiple events over the past year have affected global financial markets and foreign currency exchange rates, for example:

- Japan's surprise expansion of its fiscal stimulus policy
- Russia's interest rate hike from 10.5% to 17%
- The Swiss central bank's decision to abandon its ceiling vs. the euro
- The European Central Bank's announcement of a 60 billion-euro-per-month stimulus program

International Exposure and *Pro*

Although international exposure is not a primary consideration for us here at *Pro*, it certainly affects the finances of our companies. Because our companies report their financials in dollars, weakening foreign currencies can have a significant impact on reported revenue. **American Tower** (NYSE: AMT), for example, reported a -4% effect on reported revenue core growth because of currency fluctuations in the most recent quarter.

I've also noticed more questions and board posts from *Pro* Fools related to currencies, international exposure, and investment opportunities outside the United States. For example, during our most recent live chat, I received a great question from VelobiciOptions:

> "*Was wondering about Pro's (our) exposure to US vs International economy. Many Pro companies obtain revenues in a variety of regions. Was wondering if the holding size weighted per region revenues or profits are tracked so that we can assess our International exposure...*"

To answer VelobiciOptions's question, I decided to look at our long positions. I pulled the most recent annual filing from each one and scoured the footnotes for a breakout of domestic (U.S.-based) vs. international (any other country) revenue for each company. I then used each position's allocation (total position value as a percentage of our long exposure, excluding long options) to calculate the total weighted average international revenue exposure.

Here are the results:

FY 2014 Revenue	Domestic Revenue %	International Revenue %
Pro's Total Weighted Average	60%	40%

Source: Company annual filings, analyst calculations.

Adjusting for position size, 40% of *Pro's* companies' revenue in their respective fiscal 2014s came from customers outside the United States. The degree to which our companies are exposed to international revenue varied widely. The three positions with the highest percentage of international revenue are, in order, **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) (100% international), **Skyworks Solutions** (NASDAQ: SWKS) (97.9% international), and **Tupperware Brands** (NYSE: TUP) (92% international). The three companies with the least are **O'Reilly Automotive** (NASDAQ: ORLY), **TD Ameritrade** (NYSE: AMTD), and **The Buckle** (NYSE: BKE) — all of which actually get 100% of their revenue from customers in the United States.

The companies with a relatively higher percentage of exposure to Europe include **Parexel International** (NASDAQ: PRXL), **Oracle** (NYSE: ORCL), **Gilead Sciences** (NASDAQ: GILD), **Open Text** (NASDAQ: OTEX), and **Gentex** (NASDAQ: GNTX). And companies with a relatively higher percentage of exposure to the Asia-Pacific region include Skyworks, Tupperware, and **Apple** (NASDAQ: AAPL).

The *Pro* Bottom Line

A few caveats: Because there's no standard format for reporting international revenue, the data aren't perfect. Each company has slightly different categorizations for various regions, which made it difficult to obtain anything more granular than a simple U.S. vs. international breakdown. Additionally, not all revenue reported as international is denominated in foreign currency; companies can still bill foreign customers in U.S. dollars. Despite these caveats, I hope the information gives you a better, though rough, understanding of how much exposure *Pro* has to international economic and currency developments.

Fool on!
Billy (TMFTailwind)

Pro Completed Trades

- **American Airlines** (NASDAQ: AAL): The April 10, 2015, $57 calls expired, as did our earlier $52 calls. We only own our original January 2017 $35 calls, uncovered for now.
- **Boulder Brands** (NASDAQ: BDBD): *Pro* sold short 3,900 shares at a net price of $9.60 per share, establishing 1.5% exposure.
- **Live Nation** (NYSE: LYV): *Pro* sold to open 21 July 2015 $24 puts at a net price of $0.71 per contract, establishing 2% exposure.

Pro Catch-Up Trades

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

- **Expeditors International** (NASDAQ: EXPD): If you lack a position, target 3.5% total long exposure. Either buy about 1.8% in stock, or set up a January 2017 $45 synthetic long for the same allocation. Sell to open January 2017 $45 puts, and buy to open the same number of January 2017 $45 calls, lately for about a $2 debit with the stock at $47. Each synthetic long represents $4,500 in stock exposure. To then target another 1.7% in potential stock exposure, write a covered strangle. Sell to open May 2015 $46 puts and May 2015 $49 calls, one each for every 100 shares of Expeditors you have current exposure to, and every 100 more you could buy. Lately, you can get a credit on the covered strangle of about $1.50. (Keep in mind, *Pro* may convert to shares as our 2016 synthetic long comes to completion.)
- **SPDR S&P 500** (NYSEMKT: SPY) June hedge: If you haven't yet set up a put ratio spread to hedge, today you may using the same June 30, 2015, puts we used but adjusting the lower strike. Sell to open two June 30, 2015, $190 puts for every one June 30, 2015, $200 put you're buying. Lately, you'll pay about a $0.10 debit per spread. Each put you buy represents $20,000 in look-through short value, and each uncovered put you write represents $19,000 in a potential SPY purchase obligation. Set up one put ratio spread for every $200,000 you want to hedge. With SPY lately at $210, this put ratio spread has a maximum profit when the market falls 9.5% and a break-even price on a potential SPY purchase at 14.2% lower. See our past trade alert for more on the mechanics of this trade.
- **SPDR S&P 500** (NYSEMKT: SPY) September hedge: If you haven't yet set up our *second* put ratio spread to hedge, today you can using the same September 30, 2015, puts we used. Sell to open two September 30, 2015, $170 puts for every one September 30, 2015, $185 put you're buying. Each put you buy represents $18,500 in look-through short value, and each uncovered put you write represents $17,000 in a potential SPY purchase obligation. Lately, you can set this up for about zero cost (zero debit or credit). Set up one put ratio spread for every $185,000 you want to hedge. With SPY lately at $210, this put ratio spread has a maximum profit when the market falls 19% and a break-even price on a potential SPY purchase at 26% lower. See our past trade alert for more on the mechanics of this trade.

The Buckle Doesn't Change the World

Published Apr 8, 2015 at 4:16PM

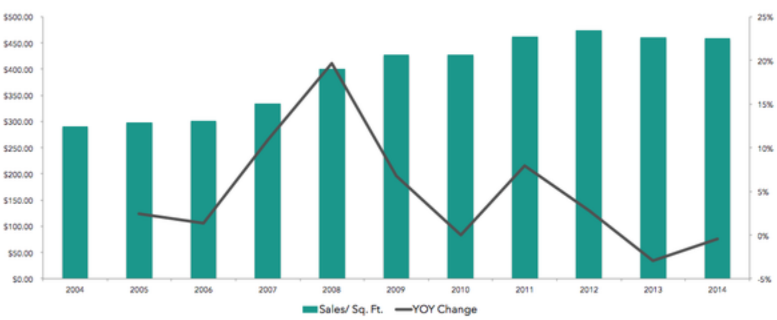
As has been the case since I took over covering the company, **The Buckle**'s (NYSE: BKE) fourth-quarter and fiscal 2014 results were muted. Top-line growth for the quarter came in at 4.3%, while net income remained essentially stagnant ($60.1 million vs. $59.3 million). The bright spot for the company continues to be online sales, which were up 12.6% for the quarter (6% for the year) and accounted for around 8% of sales for the year.

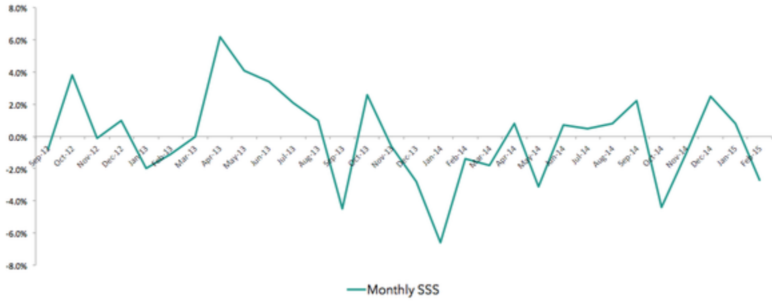
Updated Guidance: Buy (no change)

Recommended Allocation: 2.2%

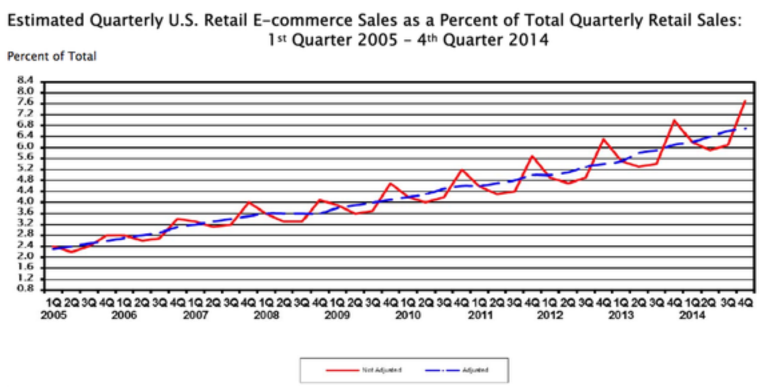
Fair-Value Estimate: $51 (no change)

The company increased its store count by 10 net new stores in 2014 to end the year with 460. Average sales per store were essentially flat (0.13%), as were comparable-store sales (comps), while sales per square foot fell slightly (down 0.4%). Forty basis points of decline isn't the end of the world, but it's worth noting that this metric was down last year, too -- and that prior to 2013, you'd have to go all the way back to 2003 to find the last time it declined.





The combination of muted in-store metrics and strong online growth suggests that some of The Buckle's customers are shifting their purchases online. That said, the impending demise of brick-and-mortar stores has been greatly exaggerated in the past. Even though e-commerce sales were up by more than 15% in 2014, they still only accounted for about 6.5% of the total.



Source: U.S. Department of Commerce

But it's important to note that the transition to online is further along in some industries. NPD Group estimated that online sales accounted for 14% and 15% of men's and women's apparel sales in 2013 (2014 numbers should be out sometime this month), with growth in online apparel sales far outpacing growth in store. This speaks to the importance of The Buckle getting its online experience right, and we'll be watching this closely going forward.

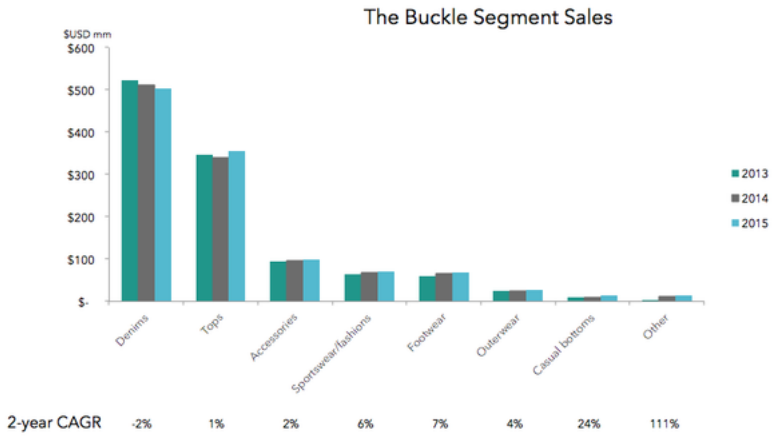
Store traffic also continues to be a struggle for The Buckle. We saw a 3.5% increase in units sold per transaction and a 1.3% increase in the average retail price of merchandise sold in 2014, but comps were flat, meaning in-store traffic must have fallen by 4.8%. Signs point to some of this volume shifting online, which is probably why the company will start incorporating online sales into its comparable store-sales results. The Buckle was essentially able to push through price increases across the board.

Even though The Buckle does offer activewear, the current trend away from more traditional attire has likely been a net negative for the company. Activewear is booming -- sales accounted for around $33.7 billion, or 16% of total U.S. apparel sales, for the 12 months ending in June 2014, and The NPD Group reports that the segment has been one of the primary drivers behind overall market growth. We believe that this trend has played a large role in the recent weakness in The Buckle's largest offering -- denim. Sales are down more than 3% in the past two years in this segment.

Apparel and Activewear (Dollar % Change)

	Total Apparel (w/ Activewear)	Total Apparel (w/o Activewear)	Activewear
12 months Jul'11-Jun'12	+4 percent	+3 percent	+8 percent
12 months Jul'12-Jun'13	+4 percent	+3 percent	+10 percent
12 months Jul'13-Jun'14	+1 percent	-1 percent	+7 percent

Source: The NPD Group, Inc. / Consumer Tracking Service 2011-2014



Source: Company filings

So given all this lukewarm news, why are we still holding The Buckle? In short, because we think our original thesis continues to have merit. When we recommended the company, we noted that it offers retail exposure with low fashion risk (jeans and tops); that its management team is properly incentivized, has meaningful ownership, and runs the business well; and that measured growth from store openings, online expansion, and a wider assortment of merchandise (footwear and children's clothes) would drive consistent earnings growth and dividends both regular and special. The thesis has been right on the money so far (our annualized total return including dividends is 17.6%), but of course, if we're going to keep this company in the *Pro* port, we need to believe that can continue.

The Buckle currently trades for around 7.9 times EV/EBITDA and 15.1 times earnings, which doesn't sound unreasonable on an absolute level. From a historical perspective, both multiples are above their 5-, 10-, and 15-year averages, but not outrageously so.

	EV/EBITDA		P/E	
	multiple	% of time above current	multiple	% of time above current
15-year average	6.59x	20%	14.32x	37%
10-year average	7.20x	29%	14.83x	40%
5-year average	6.96x	17%	13.72x	18%
current	7.93x		15.08x	

Source: S&P Capital IQ, analyst calculations

This was very much a ho-hum quarter for The Buckle, but such are the vagaries of fashion. Recent fashion trends haven't been helpful for the company, but as far as I'm concerned, there are three truths in life: death, taxes, and changes in what's fashionable. For now, we're content to watch and wait.

The Devil's in the Details

Published Apr 6, 2015 at 4:25PM

Fellow Fools,

Time for a quick pop quiz: In aggregate, which basket of stocks tends to outperform over time: large caps or small caps?

Most of us are taught early on in our investing careers that for time periods measured in years (which is what Foolish investors care about), the answer is small caps. And those who initially reject this conclusion usually convert after being presented with mounds of academic research from the '80s and '90s to reinforce it. In fact, there's an extension for the ubiquitous (for better or worse) capital asset pricing model (CAPM), the Fama-French three-factor asset pricing model, that includes a size beta because “small caps are riskier than large caps, therefore small-cap investors should be rewarded with a higher expected return.” So imagine my surprise this weekend when I came across a brief passage buried within the 2,200 or so pages of the CFA level III curriculum that questioned the validity of the size premium.

The authors seemed perfectly willing to quickly move on to another topic after making a statement that some might consider heresy, but I was not (especially because the Fama-French model was part of the curriculum for levels I and II). I immediately stopped studying and took to the Internet, ready to devote the rest of the day to discovering the truth about something I had previously accepted as gospel. I ended up needing less than an hour. As with so many things in life, it turns out that the devil is indeed in the details.

This table from an article by Vitali Kalesnik and Noah Beck over at Research Affiliates essentially sums up the debate in eight bullet points:

Summary of Findings on the Size Premium

Arguments in Favor:

1. Over the period July 1926 to July 2014, there was a size premium of 3.4% per annum in the United States.
2. The U.S. size premium is statistically significant (with a p-value of 1.7%), *assuming the returns are normally distributed.*
3. In the 30+ years since the publication of Banz's (1981) article , there has been an average size premium of 1.0% per annum across 18 developed markets including the United States.

Arguments Against:

1. There is an upward bias in size premium estimates due to inaccurate returns on delisted stocks in major databases.
2. Indices and hypothetical portfolios ignore trading costs.
3. The statistical significance of the size premium estimates is likely overstated due to data-mining and reporting bias.
4. Even with the biases that favor small stocks, there is no unquestionably significant evidence in support of the size factor.
   - The estimate of the U.S. size premium is dominated by extreme outliers from the 1930s.
   - The assumption of normality used to obtain statistical significance in the U.S. sample is extremely dubious.
   - There is no statistical significance outside the United States.
5. Even with the biases that favor small stocks, there is no risk-adjusted performance advantage attributable to the size factor.

Source: Research Affiliates (2014)

Ken Fisher noted in a *Financial Times* piece that small-cap stocks are a leveraged play off the bottom of a bear market. Exclude the first two years of the bull markets that began in 1932, 1942, 1974, and 2002 from the 1926 data and large caps actually outperform small caps on an annualized basis – 7.9% to 7.6%. Kalesnik and Beck also noted how a few data points can skew the overall results for monthly data when discussing the plausibility of returns being normally distributed. Here, "premium" refers to the difference between small- and large-cap stocks:

> The 23.6% premium registered in January 1934 is a 6-sigma event. If it were drawn from normal distribution, this would be a one-in-67-million-year event, like the one that wiped out the dinosaurs. The 27.2% difference in returns in September 1939 is a 6.9-sigma event; in a normal distribution, it would have about a one-in-five chance of occurring in the 4.5 billion years since the planet earth came into existence. The 33.8% premium in August 1932 is an 8.6-sigma event, and the 51.6% premium in May 1933 is a 13.1-sigma event. If these last two outliers were drawn from a normal distribution, each would have much less than a one-in-a-hundred chance of occurring in the entire 13.8 billion years the universe has existed.
>
> To add to the problem, all four outliers occurred in the 1930s. If they were removed, the estimated size premium in Table 1 would drop from 3.4% to 1.9% and lose statistical significance.

You frequently hear financial pundits question what's wrong with the market when small caps stocks start lagging large caps for any meaningful period of time. Perhaps the answer to that question is "nothing." The empirical evidence to support the notion that small caps stocks are rewarded with a size premium is nowhere near as bulletproof as many were taught to believe and, as Mr. Fisher noted, a few phenomenal years doesn't automatically equate to permanent brilliance.

Now before the Fools over at *Hidden Gems* get here with their pitchforks and torches, let me just say that I didn't bring this up to take a shot at those who prefer to invest in small caps. There are definitely opportunities to be had among smaller stocks; the results of the *HG* team are a testament to this. Rather, I'm writing about this topic because I think this is yet another great reminder that we could all probably stand to hold our beliefs a little less firmly, myself included. Most of the knowledge we accumulate is circumstantial in nature, yet our minds are quick to categorize it as absolute and unworthy of further scrutiny. I've lost track of how many "scientifically proven" diets we've seen over the past 15 years, how many things I've learned in school that turn out to be wrong. Morgan Housel recently wrote about how important it is for investors to be willing to change over time, because the market is constantly evolving and what worked in the past isn't always guaranteed to work going forward. But sometimes we need to update our approach and beliefs because we were wrong to begin with. It's happened to me before, and it'll happen to me again. That is one thing I do believe to be absolute.

Foolishly yours,

– JP (TMFYossarian)

Returns

Pro Completed Trades

- **Boulder Brands** (NASDAQ: BDBD): We sold short 3,900 shares at $9.60, initiating our 1.5% short position. See our recent trade alert for why!
- **Live Nation** (NYSE: LYV): We sold to open one July 2015 $24 put, getting paid $0.85 ($0.84 after commissions). The rest of our order didn't fill, so we still have 20 more puts to write, per our recent trade alert.

Write Puts on Live Nation

Published Mar 31, 2015 at 1:30PM

Is this for you? This is for *Pro* members who are looking to generate income and lack at least 2% exposure to this company.

How You Participate

- **Trade:** Sell to open July 17, 2015, $24 puts on **Live Nation** (NYSE: LYV).
- **Allocation:** 2% in stock if we get shares. Sell one put for every $120,000 in your portfolio. *Pro* will sell 21 contracts.

- **Price Guidance:** Initially, aim to get paid at least $1.00 per put. This is a 4.2% yield in about 3.5 months.
- **Future Guidance:** As prices and time to expiration change, those approaching the position later should aim to get paid at least a 1% yield per month to expiration. That's $0.24 per put, per month, remaining to expiration in mid-July. So, today that means get paid a minimum of $0.84 or so per put.
- **Prices** (as of 12:15 p.m. ET):
  - **Stock price:** $25.25
  - **Option Price (bid/ask):** $0.90/$1.15 (splitting the bid/ask = $1.03)

What We're Thinking

It may be cliché of us to say this, but there really is something magical about live music. Yes, 99.5% of the time the audio fidelity doesn't come anywhere close to what we have on our smartphones, but attending a live show is about much more than just sound quality. These events are about the people you go with, the electricity in the air, the memories you create. This is why the global concert market has proven to be so resilient over the years — the annual growth rate for the past 15 years is around 10% — even as other parts of the music industry seem to get disrupted on a monthly basis.

But what makes this industry even more attractive is the fact that a fundamental shift that has taken place within the music industry. You see, artists used to go on tour to promote their albums. Now they release albums to create buzz for their tours. Major acts generate upwards of 95% of their revenue from live events. At the center of this shift stands Live Nation, the world's largest concert promoter and our latest put-writing target.

The Business

Scale: It Matters

The best way to think about Live Nation's business is a flywheel, an analogy even the company has adopted. At the core is the absolutely massive concert promotion and live music event business, which accounts for close to 68% of revenue. Surrounding the core are ticketing (22% of revenue, primarily from Ticketmaster), its artist management business (6%), and sponsorship and advertising (4%).

The analogy works because management's focus on scaling the core business on a global level has, in many ways, become self-reinforcing. The larger the company gets, the more fans attend its events. More fans equals more money for artists, venues, and sponsors, which means more artists, venues, and sponsors want to work with Live Nation. And while concert promotion is a very low-margin business, the size and reach of Live Nation make it possible for the company to create additional business units with great margin profiles. For example, its on-site ancillary business has 50% adjusted operating margins while the sponsorship and advertising business' margins are north of 70%. This size also means that small investments can pay big dividends. Each time Live Nation figures out how to sell an additional 10 tickets to *all* of their shows, millions of dollars flow straight to the bottom line.

So how big is Live Nation? Well, the company estimates that it controls around 35% and 20% of the North American and global concert markets, respectively. Some estimate that its share of the concert promotion industry exceeds 60%; every 20 minutes a Live Nation event starts somewhere around the world. Last year it was responsible for almost 23,000 shows that were attended by 519 million fans in 33 countries, all while selling 154 million primary tickets. The company operates 158 venues (like The House of Blues), has sponsorships with 750-plus brands, and manages more than 280 artists (U2, Madonna, Maroon 5, and Pharrell, just to name a few). In terms of annual attendance, Live Nation is bigger than the NFL, NBA, and NHL *combined*.

GAAP, Schmaap!

On the surface, Live Nation's financial statements are anything but impressive. Since being spun out of Clear Channel Communications in late 2005, Live Nation has been unprofitable each year according to its generally accepted accounting principles (GAAP) financial statements. But if you dig a little deeper, you'll see that management's current focus is on continually reinvesting its capital into the business in order to gain market share and increase free cash flow. This is why so many doubted CEO Michael Rapino when he said in 2012 that the company would grow free cash flow by 40% to 45% over the next three years. Right now, the odds seem quite good that the company will hit the high end of its target range by the end of this year.

Creating shareholder value while at the same time reporting GAAP net income losses is not unheard of. **Liberty Media** (NASDAQ: LMCA), whose largest shareholder is John Malone, increased its stake in Live Nation by $38.5 million dollars last year and now owns 27% of the company. This is the same John Malone who was able to build a cable empire by focusing on minimizing reported profits in order to minimize taxes and increase free cash flow. His original masterpiece, Tele-Communications, outperformed the S&P by over 40-fold while he was at the helm even though the company never paid significant taxes. While comparing the two isn't apples to apples, it should provide some reassurance to investors that Live Nation has the people in place to skillfully allocate capital and create shareholder value.

Why This Strategy?

If we're bullish on the long-term prospects of the company, why write puts? While we believe the stock is currently slightly undervalued (current EV/EBITDA multiple is 11.8 times; our estimate of fair value pegs it closer to 13 times), we believe a patient approach is justified in today's choppy market, and we don't expect shares to soar away on us (although it's a risk we accept). We've been watching Live Nation all year and an effective entry price of $23.00 gets us to our most recently updated entry price target. As it happens, $23.00 is $0.25 more than the average price Liberty Media paid to increase its stake last March. So we'd be in good company should we end up buying shares. Selling puts also helps us with our goal of trying to generate more income this year.

More That Matters

- **Maximum loss:** Our risk is the same as share ownership starting around $23.00, or 9% less than recent prices.
- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At $1.00, that's a 4.2% yield in 108 days, or about 15% annualized.
- **Follow-up:** We'll buy shares at a net $23.00 if the stock is below our $24.00 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **Not using options?** In that case, wait to see if the stock declines to around $23.00 and then start a 2% stake.

Pro Catch-Up Trades: March 30, 2015

Published Mar 30, 2015 at 3:17PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

- **American Airlines** (NASDAQ: AAL): If you haven't invested 1% in calls yet, you can buy to open January 2017 $30 calls now (rather than $35, to keep time value lower), lately at around $26 each. That price will change as the stock moves. Click "see all" to see all strike prices with your broker.
- **OpenText** (NASDAQ: OTEX): If you don't own 3% in this stock yet, it's down lately on unfortunate news that CEO Mark Barrenechea is being treated for leukemia. We wish him a full recovery! The business should remain stable, and the stock can be bought up to 3%, or you can write $50 put options expiring in May or August to target a still-lower buy price.

Options, Earnings, and ... Europe?

Published Mar 30, 2015 at 2:21PM

Greetings, *Pro* members!

Today we have a "housekeeping" Memo, putting things in order and updating you on what's going on around *Pro*. So roll up your sleeves and put your kerchief on (or something like that!). We'll start with our upcoming options expirations, in chronological order.

Upcoming Options Expirations

- **SPDR S&P 500** (NYSEMKT: SPY) put ratio spread: Our March 31 put ratio spread is set to expire at the end of the day tomorrow. With SPY recently at $207 and our strike prices at $195 and $182, we don't need to take any action. The options will disappear after the 31st, leaving us with nearly $500 income even though the hedge didn't come into play. And just how did we earn this? In essence, we were paid for our agreement to buy SPY if it declined below $182. We already set up two new put ratio spreads, expiring June 30 and September 30. If you haven't initiated those yet, visit the trade report and ask questions on the SPY board. Positions very similar to ours can be set up for a credit with some minor strike-price tweaks.

- **Wells Fargo** (NYSE: WFC) **covered strangle:** Our April 2 covered strangle has strikes at $52.50 and $57.50, and the stock is lately $55. We're on track to earn about $1,200 on this short-term income position. Assuming no major price move on the stock, we can do nothing and let both options expire. We'll look to write a new strangle after Wells Fargo's earnings, which are due April 14.

- **American Airlines** (NASDAQ: AAL) **diagonal calls**: Our short $57 calls expire on April 10, and lately the shares are about $53. Members who already rolled from $52 to $57 are currently in the clear (though we have a debit to earn back later!). Those who haven't rolled yet (including us, because of price changes) are waiting for time value in our short $52 calls to dissipate or for the stock to rise again, at which point we would roll to avoid an onerous cost. We recommended rolling from $52 to $57 because we knew that if the stock rose much more at that point, rolling would be especially costly. But shares are volatile, and a price decline soon after made the roll less pressing — for now. Still, as long as shares are above $52, those who haven't rolled yet will need to take action before April 10.

  We bought our 2017 AAL calls for long-term upside, and we knew that writing short-term calls for income was a risk. Still, some setbacks like this included, we expect to make good returns on AAL overall. And it's true that new positions sometimes have a "breaking-in" period, during which you're more likely to make mistakes (or less than optimal decisions) until you find your groove. Those who only own the long 2017 calls can sit tight for now. We ourselves may keep those calls alone after our diagonal calls expire, and we may consider setting up a *separate* income position on AAL if we want — staying true to our own advice for options writers!

- **Expeditors International** (NASDAQ: EXPD) **synthetic covered strangle:** Our synthetic covered strangle on the shipping logistics provider is set to expire in more than a month, on May 15. The $48 calls in our short strangle are in-the-money, and I check daily to see if there's a roll we should make. So far, no need; right now, we can wait to see the time value in the $48 calls dissipate. Since we set it up last August, when the stock was out of favor, this "income with upside" position has been playing out well.

Earnings on Tap; Europe Up to Bat

We look forward to a new round of earnings reports starting in April. I posted last week that many stocks look generously valued; we have some on hold here in *Pro* in cases where the valuation is about 20% or more above the stock's long-term average. We want to ascertain if that premium is merited before telling newer members to buy, even if we're content to hold. (Keep in mind, the cost of selling is 20% or more in taxes in a regular account.) We like what we own, of course, and we only keep stocks that we believe will challenge our North Star over the coming three years; but we're also content to put some positions on hold and wait a quarter or two to better determine whether their valuations are merited.

Some stocks (not necessarily ours) are reaching prices where selling becomes an easier choice. Successful investing is largely about buying good companies and sitting on your hands for years, and we've done that, watching valuation multiples expand year by year. But we'll take action — sell, protect, or cover — if any stocks don't look priced to reward us over the next rolling three years. To that end, we're looking forward to earnings next month. In related news, we just saw results from short **Five Below** (NASDAQ: FIVE), and JP is taking a close look to see if we want to stay short or not.

Out in the world, I find Europe's depressed economy (and markets) and new 60-billion-euro-a-month stimulus program (up to 1 trillion euro by September 2016) an interesting combination. We've seen something like this in the U.S. before; is this an investment opportunity with a tailwind? Meanwhile, additional stimulus in Europe has aided our euro short, as has the U.S. preparing to raise interest rates — which was one key catalyst we expected.

Now it's back to the quiet realm of reading, thinking, and planning investments (which we know many of you enjoy doing as much as we do!). Until we talk again, thank you for being a *Pro* Fool with us. Fool on!

— Jeff (TMFFischer)

In Investing, Nothing Is Always True

Published Mar 23, 2015 at 2:48PM

Fellow Fools,

Your brain is truly amazing. Just let it think about itself for a second: Eighty-six billion neurons, 100,000 miles of axons, neural impulses traveling at speeds upwards of 250 miles per hour — what's going on behind your eyes is mind-boggling. Given that level of activity, perhaps it should come as no surprise that our brains are constantly on the lookout to find shortcuts or create mental cheat sheets whenever possible.

Generally speaking, I'd say automation like that is a net positive; after all, as Jeff mentioned in a recent *Options* Weekly, we don't have an unlimited store of cognitive energy. Think about the number of tasks you complete within the first hour of waking up: getting out of bed, exercising, taking a shower, walking down the stairs, making your breakfast, reading the paper (or the screen), brushing your teeth ... When you first learned to do all of these things, they took a ton of energy and concentration, but as an adult you can do them almost without thinking. Now imagine what it'd be like each morning if you had to relearn each skill all over again! You'd be mentally spent before you even walked out your front door to go to work.

So mental automation can make many things easier. But there's a flip side: Your brain is also on the lookout for new shortcuts during activities were you actually *don't* want to cut corners, like when making financial decisions. The majority of cognitive errors and emotional biases associated with investing are connected by one common thread — they're in some way less mentally taxing than their alternatives. They're simply easier. This also has something to do with the proliferation of investing maxims ("Bulls and bears can make money, but pigs get slaughtered!") that traders and investors alike use to justify their actions.

The reason many of these maxims initially gain traction is that someone, somewhere, at some point in time, was able to achieve desirable results by following the action(s) the maxim prescribes. That means you can't dismiss it entirely as being factually incorrect. When you combine this with the fact that most of these maxims sound logical at first, it's easy to see why they gain so many adherents. And of course, there's an investing maxim for almost every situation and possible action, so that many contradict one another — and give investors a way to justify almost any suboptimal decision.

But unfortunately, whenever you base a decision solely on an investing maxim, you're making a fatal mistake: attempting to grossly oversimplify a complex system, like how some investors try to use stock charts to predict the future. Sure, a stock may have fallen 35%, but what is the underlying reason behind it? A technical analyst who sees a "death cross" (where a short-term moving average, say the 50-day SMA, crosses over a long-term, say the 200-day SMA) might respond that it doesn't matter, the chart tells you all you need to know. I beg to differ. A death cross that forms because Wall Street didn't like **Whole Foods**' (NASDAQ: WFM) quarterly results is very, very different from a death cross that shows up because a company's product is quickly being displaced by its competitors, à la **BlackBerry** (NASDAQ: BBRY) a few years back. The former could be a great buying opportunity; the latter not so much.

"Buy best-of-breed companies, regardless of price." "Buy the rumor and sell the news." "Invest in what you know." "Always let your winners run." "Always use stop-loss orders." "Never catch a falling knife." "The trend is your friend." There are countless maxims I could talk about. Some of them I disagree with entirely; with others, I agree with the premise but take issue with those who decide to use the maxim as a brush with which to paint every situation. One of the most popular investing maxims — "Be greedy when others are fearful" — is a great example of the latter.

As many of you already know, that quote comes from Warren Buffett's 2008 *New York Times* op-ed. It's hard to fault Buffett's logic that the best time to buy is when Mr. Market is acting highly irrational. Time has proven that this is a strategy for long-term investors. The issue I have in this situation is not in the maxim itself; it's that some investors misinterpret Buffett's comments to mean that any stock that falls off a cliff is a great buy. But take a look at the quote in context:

> A simple rule dictates my buying: Be fearful when others are greedy, and be greedy when others are fearful. And most certainly, fear is now widespread, gripping even seasoned investors. **To be sure, investors are right to be wary of highly leveraged entities or businesses in weak competitive positions.** But fears regarding the long-term prosperity of the nation's many sound companies make no sense. These businesses will indeed suffer earnings hiccups, as they always have. But most major companies will be setting new profit records 5, 10 and 20 years from now. (emphasis added)

Options' Jim Gillies was channeling his inner Buffett (or was Warren channeling his inner Jim?) when he noted during his excellent FoolFest presentation that a large decline after an earnings miss is not always a signal to start buying. Sometimes the decline is simply a precursor of what's to come; in those cases, the market actually needs to fall more before the deterioration of a company's fundamentals has been appropriately incorporated into the stock price. Understand the business, the industry it operates in, its competitive advantage. There is no easy alternative. Or to invoke another investing maxim, don't fall prey to the "dead-cat bounce."

One of my favorite tools for combating the urge to rely on maxims is to simply talk to someone else about a stock I'm interested in. Articulating your thesis to someone else is a great way to catch yourself in the act, as I often do. But even if I don't, the person I'm talking to usually only needs about five minutes to find the error in my ways. It's humbling for sure, but I'd rather make a good decision after eating a slice of humble pie than make a bad decision while living with my head in the clouds.

Have a great week, Fools.

— JP (TMFYossarian)

Short Boulder Brands

Published Mar 23, 2015 at 12:03PM

Is this for you? This trade is for Fools with a margin account who can locate shares with their broker. Before this alert was sent, TD Ameritrade, Interactive Brokers, Fidelity, and OptionsHouse had shares available to short. Check with your broker to locate shares and inquire about any fees involved. Also, this trade is only for Fools who don't mind volatility — the stock will likely bounce around depending on quarterly results, so be prepared for a potentially bumpy ride.

How You Participate

- **Trade:** Sell Short **Boulder Brands** (NASDAQ: BDBD)
- **Allocation:** 1.5% (sell short $1,500 worth of shares for every $100,000 you manage)

- **Price Guidance:** Initially, aim to short around current prices, around $9.60 or higher.
- **Recent Price:** $9.70

What We're Thinking

Boulder Brands (formerly Smart Balance) is a young consumer-packaged-goods (CPG) company that provides food solutions to people with unique nutritional needs. It owns brands that play in several health-focused niche categories, including heart-healthy spreads (Smart Balance); vegan grocery items (Earth Balance); gluten-free grocery, frozen foods, and bakery items (Glutino and Udi's); frozen foods with a focus on simple ingredients (EVOL); and diabetic nutrition (Level Life).

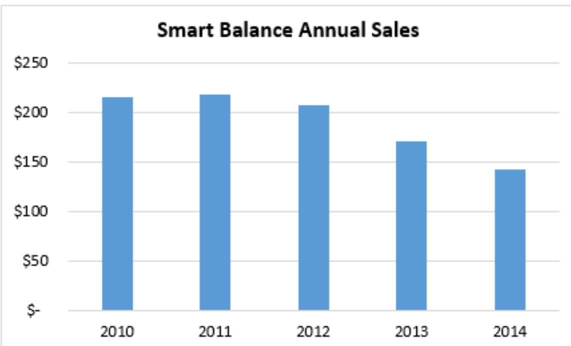
The bull case for Boulder Brands goes like this: The company owns established brands in nutritional niches that are gaining mainstream momentum and growing quickly. Boulder will increase distribution, increase items per store, innovate with new products within its brands, and make smart acquisitions to add brands that cater to other needs. Its small size, fast growth, and "healthful" food association also make it an attractive acquisition candidate for a larger, lumbering CPG food company.

The bear case for Boulder Brands goes like this: The company has troubling management and governance issues; an intensely competitive industry environment and limited financial flexibility may keep profits low; earnings are of questionable quality; and its business strategy is unlikely to succeed in commanding a premium valuation.

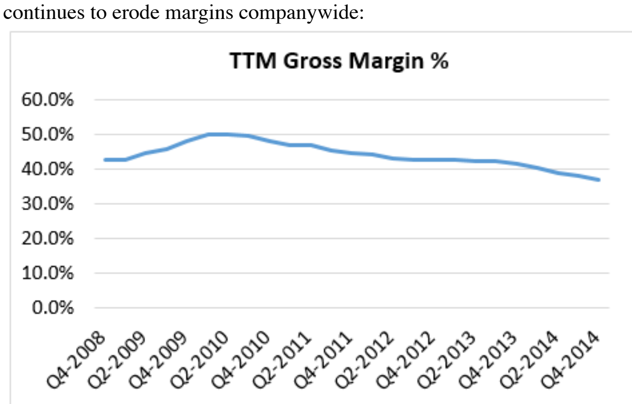
Given the company's slowing growth, financial strain, and management issues, we think the current price of $9.70 per share is well above the true intrinsic value of the business. We think there is potential for outright downside from these price levels as competition and limited market acceptance may lead to continued deterioration in business fundamentals. The stock is priced at 44 times trailing adjusted earnings, 36 times forward earnings, 16 times trailing operating income, and 16 times trailing adjusted EBITDA. In our opinion, these metrics are too high for a company that shows signs of trouble in each of the three key areas we focus on for short candidates: competition, people, and finances.

Competitive Flags

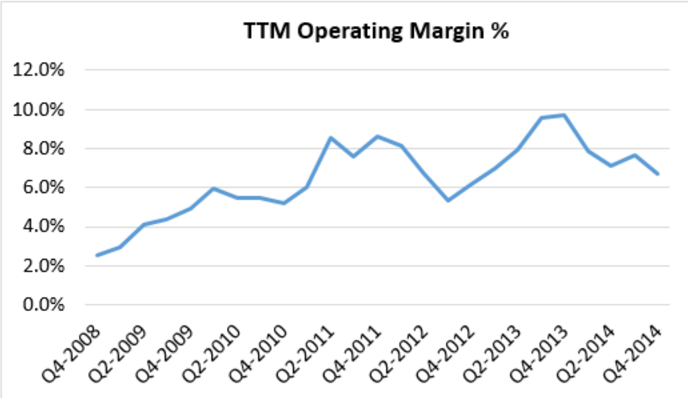
- We don't believe the company has a sustainable competitive advantage. Smart Balance has historically been the company's cash cow, as it's protected by patents allowing the company to make heart-friendly health claims on the package (no other spread can do so). This patent protection has led to high gross margins (40% to 50%) and strong cash flow. However, the patents that protect Smart Balance will expire in April, and once it comes off-patent, company gross margins — which are already weakening — will likely be under even more pressure.
- In addition to the loss of patent protection, competitors have been finding ways to compete more effectively with the health claims made by Smart Balance, hindering its sales growth. When it comes to spreads, the company competes with big companies with far greater operational resources (**Unilever** (NYSE: UL) and **ConAgra** (NYSE: CAG)), and their scale offers them advantages over Boulder Brands in marketing and distribution.

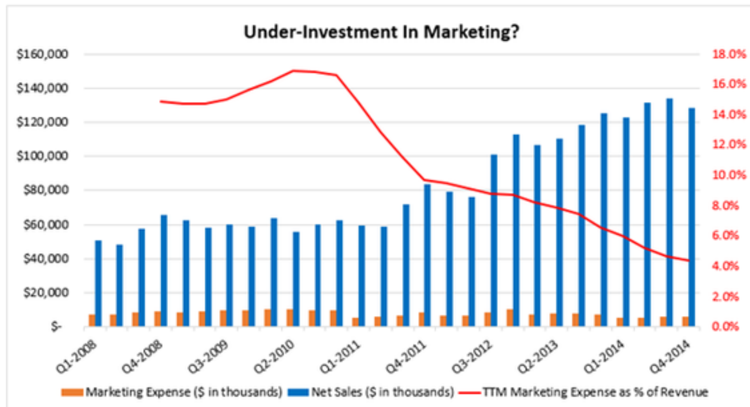


- The company foresaw this threat to sales and profits and began making acquisitions (Glutino in 2011, Udi's in 2012, and EVOL in 2013) to boost sales growth, enter shiny new markets, and attempt to mute the impact. But Boulder Brands doesn't benefit from patent protection in these new categories, which also bring it into competition with even more CPG heavyweights including **General Mills** (NYSE: GIS) (which owns Annie's) and **Hain Celestial** (NASDAQ: HAIN). Competition continues to erode margins companywide:



- Despite these declining gross margins, operating margins have been on the rise. What's going on? The answer is that the company has consistently under-spent on marketing to give the illusion of improving operating profitability. While operating margins have gone up (until recent quarters) ...





... the percent of revenue dedicated to marketing has dropped off sharply:

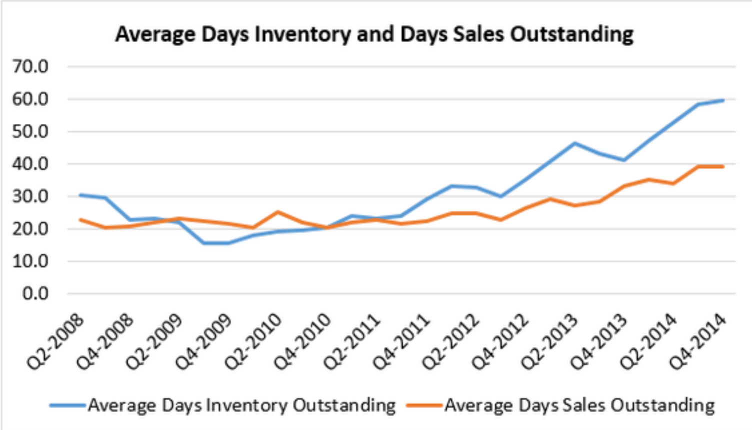
- We believe this is an example of brand mismanagement. This is a brand-driven company with incredible competition — if Boulder doesn't build its brand loyalty, it will not be able to charge premium prices. While under-investing in marketing helps short-term profits, it sacrifices long-term brand positioning and sales sustainability. Ultimately, under-investment in the brands through marketing will hurt profitability, and once sales slow a bit, the lack of profitability will return to the forefront.

People Flags

- In our opinion, CEO Steve Hughes has a history of chasing trends under the guise of being a "health food guy," not building enduring companies. The time he spent at ConAgra (Healthy Choice), Tropicana, Celestial Seasonings, and Dean Foods (White Wave/Silk) all reveal similar stories: Find a trend, rapidly expand product lines, and focus on building sales while neglecting profitability and the logistical problems related to rapid product-line extensions.
- In September 2011, three board members (Robert Gillespie, Michael O'Brien, and lead director Robert McCarthy) abruptly resigned. The resignation letters were short but damning. Reading between the lines, these three independent directors clearly didn't like the direction of the company (Glutino was acquired in August 2011) or the July 2011 expansion of the board to make room for two more directors, both of whom had historical ties to CEO Steve Hughes.
- We believe the board is compromised and governance issues will persist. As alluded to above, CEO Steve Hughes has built a board of close friends or colleagues. Some digging uncovers that much of the board has historical ties to Hughes.
- In December 2011 ,the company's CFO, Alan Gever, stepped down. This move was also abrupt, and is notable coming on the tail of the director departures three months previous and the decent-sized acquisition of Glutino just before that. Gever received a $752k payout over 22 months and the immediate vesting of his otherwise at-risk bonus for his final year. The severance agreement notably included a non-disparagement clause where Gever was restricted from issuing any communication that "reflects adversely on" the company. Evidence suggests that Gever's resignation was not amicable.
- Hughes and management have a history of aggressive forecasting and missing guidance. In 2009, Hughes suggested that the Smart Balance brand could reach $1 billion in sales by 2014. As we can see from the graph above, 2014 Smart Balance sales were less than $150 million. And in 2014, the company missed guidance on revenue, earnings, and gross profit margin.
- We think the company's acquisition strategy is poorly chosen. Boulder's aim was to acquire new products in a healthy niche, but we think the gluten-free specialty food market is small and not likely to attract a large proportion of the population. Less than 1% of Americans have celiac disease — they *must* eat gluten-free or they suffer health consequences. Demand for gluten-free products from the rest of the market is reliant upon the perception that they're healthier and more desirable than traditional products. We're not sure that perception is likely to persist.

Financial Flags

- An analysis of earnings quality reveals some troubling red flags. Inventory growth has exceeded sales growth in 18 straight quarters, and as the company has striven to show short-term sales growth from its acquisitions, it has sacrificed cash collection for reported sales. Boulder's average days sales outstanding (how long a company takes to collect revenue after a sale has been made) has risen from the low 20s to nearly 40 days over the last few years, and days inventory outstanding (how long the company takes to turn its inventory into sales) has also increased at a similar pace:



- Taken together, this has not boded well for the company's cash conversion cycle, which is the length of time it takes for a company to convert inputs into cash flows. Boulder has quickly pivoted from a negative cash conversion cycle (it received payments from customers before it paid its suppliers) to a quickly rising positive cash conversion cycle: 
  These figures are indicative of potential channel-stuffing, where a company inflates sales figures by pushing more products through a distribution channel than the channel is capable of selling. In the most recent quarterly earnings release, the company experienced an "inventory rebalancing with [its] largest distributor", further supporting this possibility. While the initial buildout of shelf space can explain some of this behavior, it's also very likely that sales growth could experience even more pressure down the road as "fill"-related growth transitions to pure consumption growth, which is likely to be much slower.

- The company's recent acquisitions and the reshuffling of its reporting segments have two effects: masking the slowing sales growth in the company's Smart Balance cash cow, and making future growth look more promising than it actually is. The initial distribution of these new brands made it look like sales were growing quickly and sustainably, but in reality, Boulder is more than likely benefiting from the initial stocking of new shelf space. Boulder doesn't break out its sales by brand in its quarterly reports and has adjusted reporting segments several times over the last few years (another red flag), but my best estimates for quarterly sales for Glutino, Udi's, and EVOL suggest that growth from the acquired brands is already slowing and may not be sustainable.

- Boulder has limited financial flexibility because of its heavy debt load. It has $301 million of long-term debt outstanding, a debt-to-equity ratio of 126%. In 2014, the company had to increase its maximum debt/EBITDA ceilings from 4.75 to 6.5 (and 6 for quarters ending Dec. 31, 2015, and beyond) as declining margins and slowing sales have hampered EBITDA growth. I estimate that debt/EBITDA for 2014 was about 5.3. If EBITDA doesn't increase meaningfully, financial flexibility will be even more limited.

- The asset side of Boulder's balance sheet doesn't look strong enough to support more debt, either. Goodwill and other intangibles make up 66% of total assets — primarily consisting of brand value and trademarks/tradenames. For those asset values to be relied upon, we have to believe Hughes was a good acquirer — it's worth noting he paid $491 million to acquire the rights to Smart Balance in 2007, then took a $130 million goodwill impairment on that asset in 2010 and another $151 million impairment in the third quarter of 2014.

How It Fits Into *Pro*

Given Boulder's questionable earnings quality, management and governance issues, and limited financial flexibility, we feel comfortable with a 1.5% short position to start. If financials exhibit further deterioration, we may look to increase our allocation to the short. On the other hand, if the company manages to reignite growth and the stock price rises, we'll reexamine our thesis.

This small position is an addition to our direct short basket, and it modestly lowers *Pro*'s net long exposure to the market. This short should fare well for us in a falling market as the company's debt load, limited financial flexibility, and premium pricing and brands expose it to outsized risk if the overall economy takes a turn for the worse.

Roll Your Diagonal Calls on American Airlines

Published Mar 19, 2015 at 1:50PM

Is this for you? This recommendation is for all *Motley Fool Pro* members who own calls on **American Airlines** (NASDAQ: AAL) and who wrote April 10 calls with us last week.

How You Participate

- **Trade:** Use a rolling order to buy to close your April 10, 2015, $52 calls on American Airlines, and sell to open an equal number of April 10, 2015 $57 calls. *Please note that these are **weekly** options*. And please read the full alert first.
- **Allocation:** Roll all of your short calls. *Pro* will roll its 10 calls.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a limit order and initially aim to roll for a net debit of $2.70 or less. If AAL is lower than the quoted price below, then the roll should cost less. If it's higher, the roll will cost more.
- **Prices** (11:30 a.m.):
  - **Stock price:** $54.75
  - **Buy to close April 10, 2015 $52 calls (bid/ask split):** $3.65
  - **Sell to open April 10, 2015 $57 calls (bid/ask split):** $0.95
  - **Rolling cost:** $2.70 net debit

What We're Thinking

There's an old joke among options geeks like us: If you want to make sure a stock's price will jump on you, just write calls on it. That's exactly what American Airlines stock has done since we wrote diagonal calls last week. Most of the recent surge was driven by the March 17 news of its inclusion in the S&P 500 index. The country's largest airline is surprisingly being added back to the venerable index not long after its bankruptcy -- most expected this could occur in 2016 or so, but it's happening on Friday. Ahead of that day, funds that mirror the index are buying shares, leading to heavy trading volume and price gains.

Same as ever, we can't know what the stock will do in the days and weeks following Friday, but we still believe the shares represent value, and we want to own our 2017 calls as long as that remains the case. Our attempt to earn short-term income prior to earnings (due around April 22) is costing us today, but we can't begrudge that outcome. We talked about this risk just last week in the trade alert. We knew the chance we were taking.

Given the looming expiration and the strike price on our short calls, we simply need to react to recent events. The situation has changed in the near term, so we want to adjust, too.

Source: Fool.com.

Why This Strategy?

We're rolling our calls to a higher strike price to avoid being short shares. We're willing to pay a debit to roll today, knowing that we have nearly two years to write more calls and likely earn back this debit and more. For now, we're keeping our April 10 expiration because we want these calls to expire before earnings. Plus, if the stock continues to rise after this roll, we can try rolling to April 17 if need be, which should also expire before earnings.

However, we should all realize that if the stock continues to gain altitude, we may need to pay another debit to close these new short calls before earnings. We don't want to miss the forest for the trees: We believe our 2017 calls could be worth much more over the next few years, and we don't want to miss that opportunity. But since we risked writing short-term calls for income, we need to manage that position as seems best until it plays out. We're not ready to simply close our calls today given that the extra buying from the S&P 500 news should slacken and subside in coming days. But we also want to roll higher to avoid getting "pinned" to our strike price and losing more and more upside in the process should shares keep rising. So, we take the middle road today, paying to roll and seeing what happens next.

If we roll our $52 calls to $57 at a $2.70 net debit, given that our first calls paid us $0.81 originally, we're $1.90 in the hole on our income strategy. We have a long time to work to make that back, assuming we see good ways to do so. But also note that we're gaining $5 in upside ($57 vs. $52) for a $2.70 cost, so the roll makes sense from that perspective, as long as we believe shares will hold up.

That said, if you wish to wait and hope for a few down days before rolling, you could. The $52 calls have about $0.90 in time value remaining, which should slowly dissipate, lowering your cost to close (at least in terms of time value). And rolling to $57 isn't exactly urgent. Given the recent Deltas on each, the $57 calls will move by about $0.33 for every dollar move in the stock right now, while the $52 calls will move by about $0.73 for every dollar change in the stock. So, if the stock keeps going up, this roll gets more costly. But if the stock goes down, the roll becomes cheaper. Either way, we want to get this trade alert out to share the intention, and then act on it soon.

More That Matters

- **Maximum gain:** After the roll, the credit on our new $57 calls is the most we can earn on the diagonal calls, and that strike price caps our long $35 call potential, too.
- **Maximum risk:** The full value of our long $35 calls, minus any net premiums received from short calls. So far, we'll have added to our cost basis with short calls -- not the desired outcome.
- **Follow-up**: We hope to see these short calls expire next month, then wait to see earnings results around April 22 before potentially writing new calls. If we need to roll or close, we will, paying to do so if need be, because we believe the long-term value of the stock is higher.

Alternative Trades

- **Own stock?** If you wrote April 10 $52 covered calls on shares of stock, roll those the same as we are, to April 10 $57.

Options Can Help

- **Want to know more about this strategy?** Our Options U guide to [writing diagonal calls] is available -- and unlike luggage, there's no additional charge.
- **Questions about this trade?** Fly on over to our [American Airlines board], where the soda and snacks are on us. Well, actually they're not. Sorry!

On Capital Allocation

Published Mar 16, 2015 at 3:31PM

Dear *Pro* members,

Investors talk about capital allocation a lot. When I was first learning about investing, capital allocation was something I was taught to focus on. I heard phrases like "make sure management is good at capital allocation" and "successful capital allocation is the key to long-term wealth creation." You may have heard of the book *The Outsiders*, which — in the words of Warren Buffett (a pretty good capital allocator himself) — is "an outstanding book about CEOs who excelled at capital allocation."

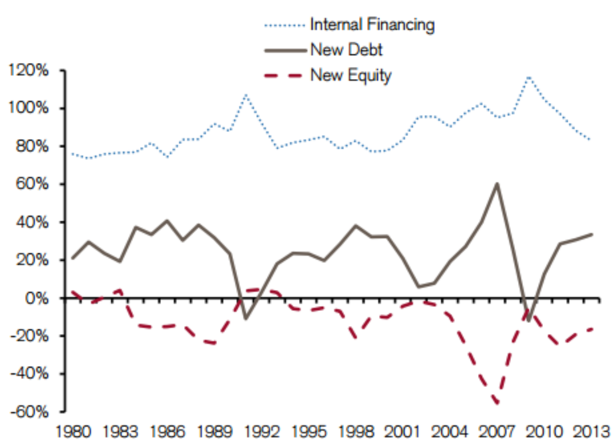
So it's clear that capital allocation is important, but it's all too easy to throw around the phrase without knowing what it really means. Here, we'll take a deeper look at capital allocation and give you a few examples of how to know whether management is doing its job right.

What Is Capital Allocation?

In its most simple form, capital allocation is the process of converting financial and other operational resources into something more valuable than they would be otherwise. If a manager invests $1 into a project that ultimately generates $2, then he or she has done a masterful job of capital allocation.

Sources of Capital

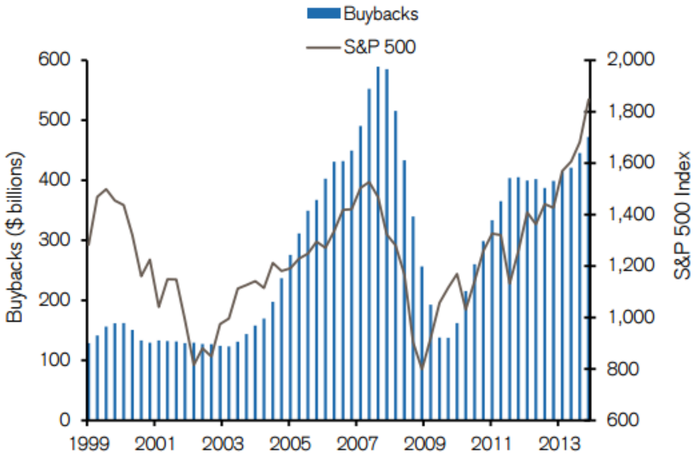
Capital comes from three main sources: internal financing (cash generated by the business from operational cash flow or asset sales), new debt issuances, and new equity issuances. Here's a chart that shows the breakdown of sources of capital for U.S. companies from 1980 to 2013:



Source: Capital Allocation: Evidence, Analytical Methods, and Assessment Guidance, Michael J. Mauboussin and Dan Callahan, CFA (2014)

You can see that internal financing is by far the predominant source of capital for U.S. companies, representing about 80% to 100% of total capital during this period. It's interesting that equity has predominantly been a negative source of capital, meaning that companies have spent more on buybacks than they received by issuing new equity.

Also interestingly, a closer look at share buybacks reveals that managers have generally not optimized their buyback timing with respect to capital allocation. Buybacks can add significant long-term value if they're done when shares are undervalued: If a stock worth $1 is selling on the market for $0.50, that's a no-brainer capital-allocation decision. On the flip side, buybacks can detract significantly from long-term value if they're done when shares are overvalued: If a manager spends $1.50 for a share that's worth $1, he is incinerating capital. Buybacks of shares at fair value add no incremental long-term value and in fact may detract from value when considering opportunity costs. Here's a chart of companies in the S&P 500 index that compares their total buyback volume to the level of the S&P 500 index from 1999 to 2013:

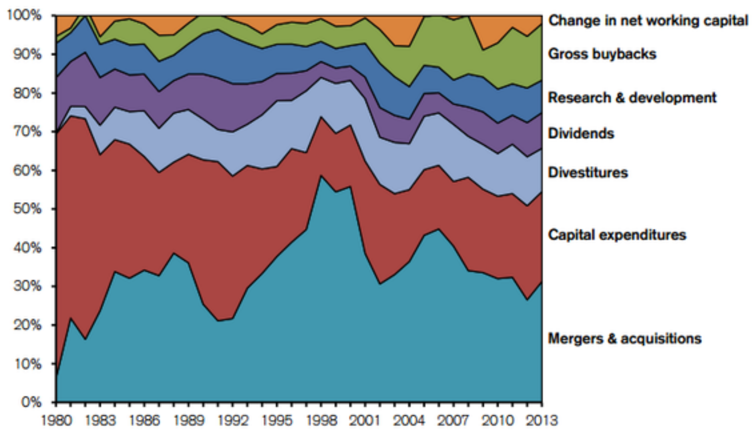


Source: Capital Allocation: Evidence, Analytical Methods, and Assessment Guidance, Michael J. Mauboussin and Dan Callahan, CFA (2014)

If companies were maximizing their use of buybacks, we'd see the highest volume of buybacks during market troughs and correspondingly less volume at market peaks. But in fact, we see the opposite — that management teams have a tendency to buy high and sell low. Bad!

Uses of Capital

Share buybacks are just one way management can spend capital. The chart below shows a breakdown of spending by source for the top 1,500 U.S. companies from 1980 to 2013:



Source: Capital Allocation: Evidence, Analytical Methods, and Assessment Guidance, Michael J. Mauboussin and Dan Callahan, CFA (2014). *Note: Data for R&D, capital expenditures, buybacks, and dividends exclude financial companies and regulated utilities; data for mergers & acquisitions and divestitures include all industries*.

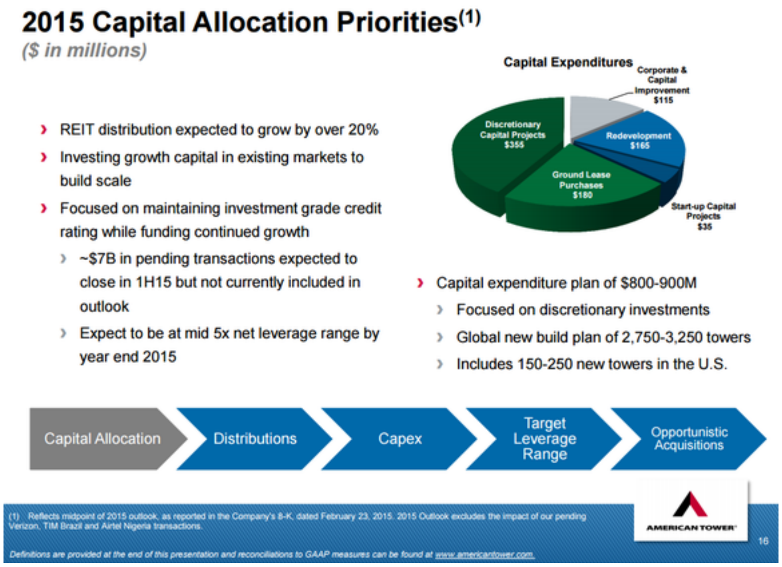
We can see that buybacks represent only about 1% to 15% of total capital spending. The largest source of capital spending is mergers and acquisitions. This chart again provides evidence that managers have a tendency to buy high — M&A expenditures are cyclical, tending to peak when the stock market is high and access to capital is easy (see: late 1990s and 2005 to 2006). If managers were focused on growth in long-term value, peak M&A activity would take place when stock market values (and thus whole-company values) are low.

Evaluating Capital Allocation

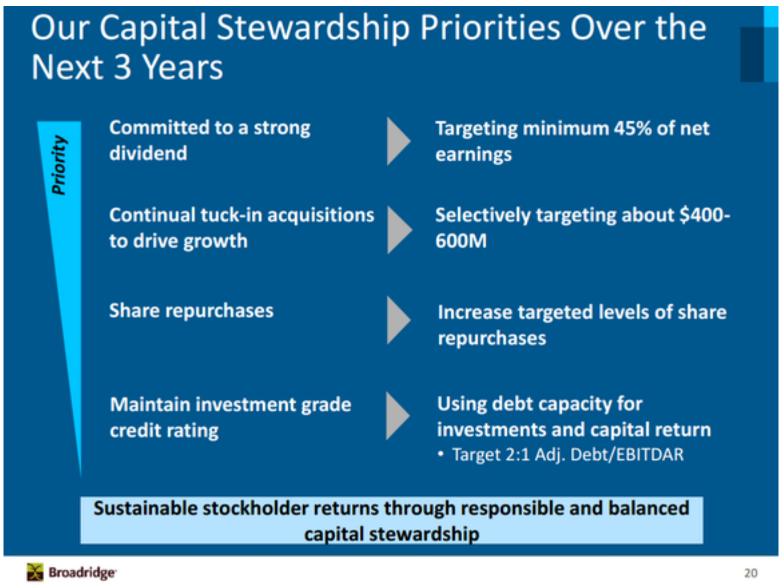
So, how do we know if management is good at allocating capital? Here are three ways to know whether your management team prioritizes effective capital allocation, with some examples from the *Pro* portfolio:

1) They talk about capital allocation.

It's surprising how many companies fail to appropriately communicate their capital-spending priorities. Managers should have a clearly articulated strategy for capital allocation. For example, **American Tower** (NYSE: AMT) and **Broadridge** (NYSE: BR) are very clear about their priorities, often including slides like these in their investor presentations:



Source: American Tower Q4 2014 earnings presentation



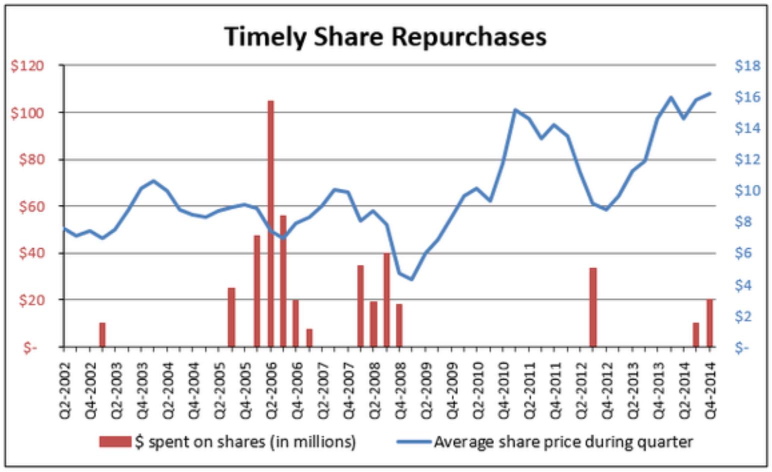
Source: Broadridge Investor Presentation at Credit Suisse Annual Global Services Conference (3/10/15)

2) They are appropriately incentivized.

If managers are incentivized to prioritize the short term over the long term, they may sacrifice proper capital allocation to try to juice short-term profits to hit their bonuses. We want to see incentive structures that clearly affect growth in long-term value per share. This may take a variety of forms (short-term vs. long-term goals, equity-based vs. cash-based, etc.), but the metrics used should focus on value (that is, metrics focused on capital efficiency such as ROE, ROIC, or EVA) rather than volume (growth in sales). For example, **Wells Fargo** (NYSE: WFC) executives receive a small, fixed base salary (14% to 20% of compensation), a small annual incentive award based on EPS and ROE (18% to 21%), and the rest in long-term equity-based incentives based on average three-year absolute and relative performance in ROE (62% to 65%). These types of incentive structures align management with growth in long-term value per share.

3) They display good timing with buybacks or acquisitions.

As I mentioned, managers have a tendency to spend more money on buybacks and acquisitions when stock market values are high. Optimal capital allocation principles suggest that managers should do the opposite — buy back shares and make acquisitions when stock market values are low. **Gentex** (NASDAQ: GNTX) is historically very good at this; it has a history of selectively buying back shares at or near local lows in the stock price, suggesting that it uses buybacks as a capital-allocation tool rather than as a use for residual cash:



Source: Company filings

Another good example is **TD Ameritrade**'s (NYSE: AMTD) $600 million acquisition of Thinkorswim Group during the depths of the credit crisis in January 2009, when the stock was trading at its lowest price in three years:

Source: S&P Capital IQ historical price chart of Thinkorswim Group (red arrow indicates timing of acquisition)

The Foolish Bottom Line

To summarize, capital allocation is perhaps a management team's most important function, and proper capital allocation is the key to maximizing long-term growth in value per share. Capital comes from three main sources — internal financing, debt, and equity — and can be spent on a variety of sources, including working capital, buybacks, dividends, divestitures, research and development, and mergers/acquisitions. We want to see management teams that clearly articulate their capital-allocation priorities, are properly incentivized, and are prudent in the timing of their capital spending.

Fool on!
Billy (TMFTailwind)

Pro Completed Trades

- **American Airlines** (NASDAQ: AAL): We sold to open 10 April 10, 2015, $52 calls at $0.81 per contract. The stock has risen since the alert, so if you've yet to complete this trade, it may make sense to increase the strike price on the sold calls to give yourself more room for upside. Make sure to target at least a 3.5% yield on your long January 2017 call value. See the alert for more details on yield math.
- **Papa John's** (NASDAQ: PZZA): We established a partial covered call position on Papa John's, selling 6 October 2015 $65 calls at $3.40 per contract to cover one-third of our 1,800 shares. That price will change as the stock moves.

FoolFest 2015: Pro Welcome Q&A

Published Mar 13, 2015 at 8:46PM

Jeff Fischer and the *Pro* team, with special guest Jim Gillies, welcome members and take a few questions at the kickoff of FoolFest. Recorded at FoolFest 2015 in Alexandria, Va.

{% video %}

Jeff Fischer: Good morning, everybody.

Audience members: Good morning, Jeff.

Fischer: It's great to see you all here. Thank you for being here. We know that you could be anywhere in the world right now, and you chose to be here with us, and we greatly, we appreciate that.

Audience member: We love you, Jeff.

(laughter)

Fischer: We love you, as well. It's really great to see so many Fools here again or for the first time. We have Fools from Mexico, from Alaska again, Kendall. From Spain, Pablo is here again. Mitchell came from Mexico, Fools from the West Coast, of course, California. Canada.

Audience member: Canada.

Fischer: Canada.

(laughter)

Audience member: Who's this guy?

Fischer: All over, so we're really honored that you're here. Now that said, we are not naïve. We know Alexandria and Washington, DC, are a winter haven that people are flocking to. And in fact, the balmy Potomac, if you have seen it, it's teeming with red snapper and goliath grouper and other tropical fish, so if you're looking to charter a boat tonight and go fishing, I recommend the night time, that's when the temperature cools down a little bit out on that water or ice, it's great fishing.

So thank you for being here. Let me introduce Jim Gillies' Motley Fool Options.

(applause)

And Special Ops. Billy Kipersztok. Fool Pro and Options. J.P. Bennett. Motley Fool Pro and Options. And the star behind the scenes, Ellen Bowman. Motley Fool Pro and Options. She makes everything work, and when we arrive at nine in the morning and say, Ellen, we have a trade that we need to get out by 10, 10:30, she's all smiles, like, no problem. I can edit in five minutes. She does great work.

So we're going to start because we only have 30 minutes before lunch break, so we thought we'd start, just hit the ground running with questions that you all have about Pro, about Options, about investing in general, about Jim's fashion choices and where he shops in Canada. Anything you want to ask, that's how we're going to start this first half hour, and then after lunch, when you're all sleepy, we will lift you up with our presentations. So there's a microphone right there, and you can also yell out any question and I will repeat it for everybody because this is being recorded. But don't let that intimidate you, so. Who wants to ask the first question?

Audience member: Hi, I'm Susan. I'm from Denver.

Fischer: Hey, Susan.

Audience member: Last night, Jeff, I asked you where you're going to be moving the portfolio and you had mentioned more shorts. Do you think in the next couple of years, you'll be moving the portfolio at all into any international companies?

Fischer: It's a great question, Susan. And thank you. Susan did ask that last night and my, my intuition, my feeling, and it's the feeling of the team, as well, is that we want to add more shorts to the portfolio. We're actively looking at all times. We want to increase our short, what you can fancifully call a short book or just our short, our direct shorts of companies. Weak companies, we hope, struggling companies, kind of the opposite of what we try to buy. Now the reason we want to do that is valuations on a lot of companies do look generous, especially some companies that don't have a track record or recent IPOs, and it's slightly, I wouldn't call it an irrationally exuberant market, but it's a slightly happy market.

(laughter)

And but either way, we believe we can find weak companies that we want to be short, whether the market goes up or down. Hopefully, those shorts will perform whatever the market does. And if a short does west, less well than a strong market, even that is a win, but really, for us, the ideal of course is a short like **Five Below** or **Caesars** or **Sony** in the past, that goes down even when the market's going up. That's a really nice result to have.

Audience member: RadioShack!

Fischer: RadioShack. It was--

Audience member: That was done.

Fischer: We looked at that and it's, it's pretty hard to short most of the time, but we probably missed a window there. So I think we want to keep the companies that we really believe in even if they look slightly overvalued or modestly overvalued. We want to keep them to compound over time and one way to do that is to add more shorts and more hedges and I think that's the direction we will be moving in the coming months and year or two.

Billy Kipersztok: And you asked specially about international stocks, as well? Right? Do you have any thoughts on that?

Fischer: I thought you were going to answer, Billy.

Kipersztok: I'd be happy to.

Fischer: So international stocks, we, we own some shares. It's only a 2% position in the Wisdom Tree small and emerging markets small cap dividend fund. DGS is the ticker, and we are thinking about all the time adding to that a bit, and we've also looked at European companies to possibly add. So far, we haven't, but I would be surprised if we don't add some more international exposure because those stocks, especially emerging markets right now look historically inexpensive and they're much less expensive than U.S. stocks.

Kipersztok: But we are limited to those that trade on U.S. exchanges. Right, so you know, the foreign company ADRs or their ETFs.

Audience member: Would there be any overlap between some of the companies that you looked at and some of the stuff that (unclear 05:53) is doing? Like the international fund I heard about last night. Would that what you would be drawing from or would you be going out on your own (unclear 06:02)

Fischer: That's a good question. We would go out on our own, but there's nothing that stops us from looking at the filings of Tim's fund, and what would be a good starting point. Each quarter, when they file their holdings, we can look at those if we wish, and we know that's been vetted by at least one team already, so.

Audience member: (unclear 06:21) within the universe.

Fischer: As long as it's in, as long as it's in this solar system, we can do it.

(laughter)

Yeah, I do. Pro's universe is anywhere. We can go anywhere. Options is, are the full newsletters, the five newsletters and special reports. But so Pro can wander.

(laughter)

Ellen Bowman: Hey, so this is being recorded for later viewing, so anybody who doesn't want to ask a question in the microphone we're just going to need to repeat it up here so that it is audible later.

Fischer: Great. See, Ellen keeps us organized and tells us what's important.

Audience member: Are you ready for another question?

Fischer: Mm-hmm.

Kipersztok: Sure.

Audience member: My name's Ellen and I'm from Crozet, Virginia, outside of Charlottesville. I'd love to hear about your team's internal process for asset allocation. Not just kind of from a quantitative point of view, but from a deliberative, people, kind of discussion point of view.

Fischer: So how we talk about asset allocation?

Audience member: Mm-hmm.

Fischer: It's an evolving process. The portfolio's nearly seven years old. And good question, by the way. Thank you. And over that time, of course, you have some positions grow and become more of the portfolio and others shrink. And our, our overriding philosophy is we want to let our winners go on winning as long as merited. As long as we believe in them. We're not, at this stage, and maybe we will be later. We're not, we don't really favor the idea of rebalancing excessively. We've sold little parts of large winners in the past to put them into ideas that we like better and we'll keep doing that. But we're not going to chop something off just because it's grown to a larger part of the portfolio than other positions.

So it is an evolving thing, though, and right now, we're 80-ish% long, speaking of broad asset allocation, and I could see us being 60% or 50% net long in the coming year or two if that's what we believe is best. So allocation can change in that way, as well, by adding shorts and hedges. But on a position by position basis, we look at each one individually, and we should be comfortable with everything we own that if it grows and grows, we're okay with that. There may reach a point where we want to sell some because we are a fixed funds portfolio. We don't have new money coming in, and when we see something we like better, we'll need to trim from somewhere. But overall, we like to let our winners go as long as we believe in them.

And as far as how we talk about it as a team, basically, twice a month we talk about our positions overall, in any, and at any moment we'll talk about any that are concerning us that's, there's always an open conversation. If anything's concerning us, we start talking about it.

Audience member: Hi, I'm Morris. I'm a member from New York. I've seen the, I've been a member for about a year or so, and I've seen the portfolio do very well over that time, but it seems to be tracking the broad market indexes much more than it tracks he North Star, and I'm wondering why or how you're planning to make it track the North Star more than the market indexes during the inevitable downturn.

Fischer: Great question. The North Star, over the long term, and if you guys want to--Billy, you want to start?

Kipersztok: Sure, why not?

Fischer: Otherwise, I'd keep going, but…

Kipersztok: Yeah, I think you know, our portfolio falling the broader market indexes recently I think is just a function of our allocation. You know, we're predominantly in equities, obviously, so with the equity indexes as they go, we will go. But the decision to be allocated in a specific manner is something that we talk about and we discuss as a team all the time. And so you know, our thought process is, you know, as market conditions change, we expect to continually have our conversations and then hope to position ourselves in such a way that we can react to market conditions quickly. So if that might take the form of putting on a direct short where we can reduce our exposure by x %, you know, shorting a specific index or something like that.

So I think we try to take kind of a reactive approach to managing our portfolio and you know, and also we want to recognize that the North Star isn't necessarily something that we try to achieve over a short term period. It's something that we're looking to achieve over a long-term period. So with that said, it's not going to be a steady 8% return every single year. To achieve the North Star, we might have some periods where we have, you know, very strong returns and then some periods where we have less strong returns but over the average, it comes out to something closer to the North Star. So I think it's a combination of various things.

Audience member: (unclear 11:37) successful?

Fischer: No, I think Billy has a great answer, I think. A reactive, we'll be reactive to the market conditions. And the thing to keep in mind in a downturn of, we don't real, we don't, were not so concerned about downturns of 5 to 7 or 8%, those happen, they come and go very quickly. But the downturn of 10%, 20%, that's something we hope to be positioned for, whether we get positioned after a 7 or 8% decline or we happen to be positioned ahead of time. A lasting downturn can last up to a year, 18 months. And we'll have time during then to short things on the way down, to use some options, ideally. Things like that.

So it's, it's a reactive rather than predictive approach to a large degree. That said, when we look at valuations right now, we're looking for more shorts, and we'll put those on any time. We're continually hedging and I think we're going to hedge more in the near future as, not as a reactive function just because we want to, and we want to do it while things are rising. So it's, just as we've slowly increased our long exposure over time as we grew more confident in the recovery, in a downturn, we'll have less time to react but still time to react and try to capture returns during a slide, as well, as it occurs.

The other--one more thought is the North Star over time does better than the S&P 500, so when the S&P 500 is rising, we really want to be rising with it and hopefully making up some ground on North Star because when the S&P is falling, and the North Star is still going up 10% a year, it's going to be a beast to try to--we just want to keep close to it in that case.

Bowman: And the follow-up question was about whether this is market timing and how it might differ.

Fischer: Thank you Ellen. I'll answer it again now for the recording.

Bowman: I think you should, yeah. Backwards this time.

Audience member: Gene from Virginia, semi-local Fool. Hi.

Fischer: Hey, Gene. Good to see you.

Audience member: Thank you, thank you. My question, three years ago, four years ago, maybe as recent as two, my memory's a little hazy, a Pro sort of aspirational goal was to reduce if not the number of positions, at least the number of underlying instruments. To around 20, the reasoning back then being less things for you all to study and make sure that each sort of meaningfully contributed. I haven't heard that in the last year or 18 months. Why has your thinking on that changed or has your thinking on that changed?

Fischer: It has changed a little bit, Gene. We have 24 core positions now. We were at one point, we were up to 28 or 29 and we slowly whittled it down, and we feel comfortable with two dozen at this point. And we like having some smaller positions that are lagging, frankly, and I'll talk about that a bit later why we like that. And so we haven't felt compelled to whittle things down further. I guess the answer is, we're at 28, 29. We thought 20 may be better and we slowly decreased, but once we got to around two dozen, we were happy with that.

The other reality of what we do is we're trying to serve all of you with a portfolio that does really well over every rolling three years. But at the same time, we're trying to scratch that itch for new ideas when we see them and like them. If we're doing our job, we should always be finding, I don't care what he market is. We should always be finding at least a handful of really compelling ideas every year, whether that's three or four or whatever. And so then we need to add them into the portfolio and that's, we may not have as many positions that we're selling at the same time.

So we do realize, we're probably going to bounce around in the mid-20, low to high 20s as far as main positions go. And as we add more shorts, right now, we only have two direct company shorts. Three if you count the Euro, which you can't count. But Caesars and the Five Below, if we had say, our ideal is to add six, seven, eight more and have 10 shorts that are each 1-2% apiece. And then we'll have many more companies to follow, but I think too, when we were saying we're going to get down to 20 companies, we're trying to get rid of some work. Shed some work, but we decided, we were told we can't do that.

(laughter)

I kid on that one.

Kipersztok: Just to add a little bit of color to that, as well, so maybe it's not something that we have kind of publicized or talked about in our communications, but it's definitely something that we talk about as a team. Making sure that, you know, if we're going to be adding a new position to the portfolio, we want to make sure we start at a specific allocation. We want it to be meaningful to our returns, so we're trying not to introduce a bunch of small positions. We want to have relatively fewer, more meaningful positions. And that's something that we definitely try to emphasize.

Fischer: These are great questions. You guys are coming out swinging. Hello.

Audience member: Hi. I'm John from Arlington.

Fischer: John.

Audience member: I just joined the Motley Fool One in October, and so this is my first real involvement with the Pro service. I was just wondering is there any way to use the two, Everlasting portfolio and the Pro approach. Is there any sort of integration that's possible or if there is, what would be your suggestions to start doing that.

Fischer: That's a great question. J.P., do you have thoughts on that? And then I would also ask any member who is doing that to maybe share their thoughts.

J.P. Bennett: Yeah, I think there can definitely be some integration. I know a lot of members have talked about in the past so they may not dedicate their entire portfolio to Pro so it's really kind of looking at your personal portfolio and really what you want to try to achieve. If you're more concerned with achieving a return similar to like what we're trying to do as far as tracking the North Star, maybe dedicate a little bit more towards Pro. And on the other hand, maybe if you like Tom's idea of building an Everlasting portfolio of really buying stocks and holding them for the long term, maybe you can allocate a little bit more towards that.

So in many ways, we're looking for very similar type companies. We want high-quality companies that we can hopefully own for an extended period of time but our approaches are definitely different in what we're trying to achieve and of course, we take shorts into consideration and looking at actively hedging if we think there is a chance that the market might experience a correction and we would be put in a place where it would be harder for us to achieve North Star like returns unless we hedge out.

Fischer: Yeah, and I'll add that there is some overlap. Naturally, they both the portfolios have off the top of my head, **Starbucks** and **Facebook** and **MasterCard**. Tom took that one. And …

(laughs)

And so there is some overlap and what I do in watching Tom's Everlasting portfolio, he invests quarterly. When he buys something two times, three times, four times, that should get your attention. It means he really likes it and consider adding that to your portfolio as a complement to whatever Pro holdings you do have.

Kipersztok: And then also, as a Pro member, well, as a One member, you have access to all of the services, right? So you have access to Pro and to Options, which we're a little bit different in that we utilize some different strategies than some of the rest of the newsletters. So what a lot of Fool One members have done and have been successful doing in integrating the services is to use some of those tools that they've learned from Pro and Options, um, you know, things like Option strategies, various strategies, and applying it to the recommendations from other services. So that's one way that a lot of people have been able to integrate them.

Fischer: Are there any members who would like to share how they use Everlasting and Pro together, Pablo? Thank you, Pablo. Pablo from Spain.

(applause)

Audience member: Yeah, what, what I can share with you isn't exactly what he was saying now about using options. I'm starting to jump into the Everlasting portfolio. I joined first Pro, which is my favorite service still. And then I jumped into a bunch of others (unclear 20:22) portfolio and finally, I'm a One member now. I follow today four different services and I keep four different portfolios in the world. I buy every month Stock Advisor Tom recommendations. I buy every quarter the five recommendations by Tim in Everlasting. And I keep a mirror portfolio of Pro and a medium, a mirror portfolio of Million Dollar Portfolio.

And the way I use now Everlasting portfolio, but also Stock Advisor. Thanks to Jeff and Jim teaching on options is that they both portfolios at Stock Advisor and Everlasting are long-term ones. Stock Advisor is not really determined to be a long-term thing, but it is. If you look at the track history of Stock Advisor, they rarely sell anything. They mostly buy and then buy again and then buy the same company two years later, and then rarely, they put something on hold or even sell. And Everlasting portfolio is the same, for five years, they don't sell.

So what I do is when there's a new recommendation on either Stock Advisor or Everlasting portfolio, I first check if the company is giving dividends. If the company is not giving dividends, then I consider buying LEAPS. (unclear 21:46) if they are available. If they are not, which sometimes they are not, and you can only by calls like for three months period, then I just buy the stock, but if you can buy LEAPS which are deep in the money, let's say that the company's price at 100, I will buy with a strike of 70. Or around. Then I will buy LEAPS for one or two years long and then I will pay a really small premium. I will be low rate and then I will be using the cash that I'm not deploying on that in something different. So that's a way of combining both.

Fischer: That's great, Pablo.

Audience member: And sorry, on the other hand, if you join One as I did and some positions were already there and they look like really overpriced now, let's say **Zillow**, okay? When I joined One, they already had Zillow in the portfolio and I didn't buy Zillow. What I have been doing with some success is to write puts. To sell, make puts on that. Because if Tom thinks that this position will grow over time, and my interest is to buy it at a lower price than it is today. Then if I make it great, then it will match that position with Everlasting, if I cannot make it, great, as well. Because I will be compounding around 1% per month which is about 13% per year on that position.

Fischer: That sounds great, and I'm going to guess that it took you several months or even a few years to figure out how you're making all of these things work together, so that's I think a reality here, as almost everybody has found a way that's almost unique to themselves and what they are seeking to accomplish to make things work together., whether they end up using just one service or four or however many. That was great. Thank you, Pablo.

We have about--so at 11:45, we're breaking for lunch. But we're going to break at 11:43 so you guys can get to lunch before the others. No, I'm not, but I know the crowd out there.

Audience member: Hi guys, it's Mark. De Moines, Iowa.

Fischer: Hi, Mark.

Audience member: Second time. Love it.

Fischer: Great to see you.

Audience member: Hey, I wondered if you could speak a little bit to, you seem like you're taking a little bit more a deep dive approach on holds. **Papa John's**, **Medtronic**, and I know some of your recent comments, talking about you know, we're willing to take three, four months sometimes now to take a harder look at where we're at and make a more permanent decision. I've struggled with Papa John's personally. I just--I don't get pizza for some reason. That's my problem. I like to eat it, but I don't invest in it. I'm wondering if you could speak a little bit to the--what's going on in a team and what you're looking at as you take that deeper dive into holds and how you ultimately make your decision.

Fischer: Great. Great question, mark. So Papa John's did go on hold recently, and before that, **O'Reilly Automotive** in November, December. And right now **AmTrust** and Medtronic are both on hold as we go through earnings there. One thing that is in our mind is we're six, seven years old, and we only open a couple times a year, typically. And we had everything on buy up until last November. So we believe or we assume that everyone who wants to has bought these stocks and owns them already, and that gives us some leeway to then put them on hold for a quarter, even, or longer, to make sure that we want to keep recommending it, let alone keep owning it.

And why some things have gone on hold lately is we're looking at their valuation compared to past valuation, typically. And if it looks stretched by a significant measure, then we want to try to determine why, what has changed. Is this new price merited? Should we then continue to hold it or should we indeed get rid of it or at least write calls on it if we're comfortable that it's not going to fall much at all. So yeah, as the market has changed so much, pricing has changed so much, we're finding that we want more time, and some cases, to see a whole quarter and see how things are going before we move something back to buy.

That's been the case with O'Reilly, which was put on hold in late November to go through earnings as the valuation has, it's more than doubled for us, I think, less than two years. And it's a great business, but every business has its price where you may not want to own it. So it was put on hold in November and then oil prices, of course, cratered in December and it helped the stock even further. And what we're trying to determine is how much this lower fuel price is going to help O'Reilly. Management has said it will help. It will make a notable difference, but we want to know how much before we make a decision on whether to move it back to buy or not. So yeah, it's taking a little bit longer, but we only have four companies out of 24 on hold and our goal is to get that either to, back to buy or to a sell, whatever we decide looks best for everyone here and then for anyone who's new to the service, too.

Kipersztok: Yeah, and I think in the past, we kind of had an informal process where if we put a stock on hold, we would kind of do a 30-day review, and I think like what Jeff was mentioning, in some cases, it makes more sense to wait for a quarter or results, as opposed to an arbitrary 30-day window, so the whole process, just to give maybe a little bit of insight into it, because Papa John's is a company that I cover, so I'm responsible for conducting the review.

The team has a lot of conversations about it. On a given day, we might see something and just fire an email or the rest of the team, start a chain of discussion. So the process is kind of dynamic in some cases, you know, we're kind of monitoring day to day, seeing what the prices are and trying to look at valuation multiples; and then in other cases, we're waiting for earnings results and trying to incorporate those results into our model and seeing like Jeff said, if this new price is warranted. So yeah.

Fischer: Yeah, Billy has done a lot of research on Papa John's as we look it over again. He's sending us cheese industry facts and cheese pricing history and dairy pricing. It's very interesting. Because cheese prices stay low for a long time, that'll help Papa John's a lot; cheese prices, as you may or may not know, have fallen a lot lately.

(laughter)

Nice thing. So yeah.

Audience member: So based on this morning's talk, that doesn't portend bad things for the market.

Fischer: It may help pizza purveyors. So a lot of that research will go out when Billy issues an update. You'll get to see how we came to that conclusion. So.

Bowman: I think this will have to be our last question if we really want to break at 11:43.

Fischer: It's 11:40.

Audience member: Bill, I'm a local from Herndon just about a 45-mintue drive away. Speaking of valuation, do you do a relative valuation in the Tom Engle sense where you track the history of at various points in time along the way and make your decisions based on that sort of thing as opposed to any point in time in isolation. So for example, the share price may have gone up, but the earnings went up even higher or other fundamentals, so that relatively you could argue that it's an even better deal now than it was when the price was 20% less.

Kipersztok: Absolutely. The …

(laughter)

You may have seen or may not have seen, this is supposed to be more of a Pro panel but I'll co-opt for a second on Options. There was a, there was a position in **Costco** recently that I thought we were going to run for years, to be honest with you. And based solely on exactly what you were talking about. Costco, they announced a $5 special dividend and the efficient market promptly bid it up $12. To a literally, to an all-time high on any relative valuation basis you wanted, and so we killed the position.

And I know I personally do for anything, anything that's going out, we're always looking at what is the relative point. And also you want to start to take into account, you know, what is the, you know, can you come up with a justified, certainly more of like a price to book multiple. Sometimes you can come up with the so-called justified multiple. What's good for a company like **AIG**, for example, which I know is a Pro holding. But yeah, I mean, I think that has to be part of your valuation work. So, my two cents.

Fischer: Five dollars. Canadian. And I do love when that happens, when a company's earnings have grown so much that a stock at 100 has a lower valuation multiple than it did at 50, and that's what makes investing work. That's how compounding works. Any other? It is 11:42. If there are no more, we'll break for lunch, and we'll be back here at what time?

Audience members: 12:30.

Fischer: 12:30. We have a great afternoon planned. We look forward to seeing you. Thank you.

FoolFest 2015: Pro Stock Talk With Billy Kipersztok

Published Mar 13, 2015 at 8:33PM

Pro analyst Billy Kipersztok explains why the service has such an affinity for **TD Ameritrade** (NYSE: AMTD). Recorded at FoolFest 2015 in Alexandria, Va.

[Billy's PowerPoint slides in PDF format]

{% video %}

Billy Kipersztok: All right, well, I'm going to go ahead and get started here, guys. I just want to start again by thanking you all for joining us again. I'm Billy Kipersztok, as I was mentioned before. I'm going to be doing a little session with you guys called Pro Stock Talk. I'm going to go in-depth and talk a little bit more about why we like a specific company that we invest in for Pro, and that company is **TD Ameritrade**, which is a holding in our portfolio. I did a similar session last year on **American Tower**, and if you guys are interested, if you weren't here last year, you can go back into our extras section on the website, and you can see all the presentations from last year. Just go to February or March 2014. You can see those presentations, but yeah, so I'm just going to go into a little bit more detail about this specific company and why we like it as an investment for Pro.

So let me start off by asking you guys a question. So how many of you guys use TD Ameritrade as your broker? Show your hands. Okay. Pretty good. And of those people, how many of you guys use **Think or Swim**, which is their kind of more advanced platform? So fewer. Okay. Interesting. So yeah, a lot of you guys are probably familiar with them as a consumer. And I think it would be interesting to kind of drill down into the business. And I've talked a lot about this company in the service, so if you've read that and you're familiar with the business, hopefully this is a good refresher. And then also I've included some new information data in there, so even if you are familiar, hopefully, there's something new in here for everybody.

So why Pro likes TD Ameritrade as a Pro investment. I structured this presentation as with four main categories here, why we like the company. I'm going to go into detail of each one. The four categories are: competitive advantages, low financial risk, positive exposure to rising interest rates, and strong management and capital allocation. So let's get started.

So competitive advantages, brand and switching cost. So TD Ameritrade, one of their advantages, one of their competitive advantages that we believe that they hold, is that they have a strong brand. They have a good reputation in the industry, and they're known for their service quality, as well. So with that comes awards, so they have been recognized by various websites and other things for the excellence of their products. So they were the number one overall broker in 2015 by Stockbrokers.com, fourth straight year. Number one tablet app in the trader community. How many of you guys have used their tablet app for TD Ameritrade? A few? It's pretty good yeah. And then number one ranking best in class recognition in nine other categories, all of these things for multiple years in a row. So they're very well recognized, very well-awarded in the industry.

And then of course, this is true across the entire industry, is that all brokers have and benefit from switching cost. So anybody who's tried to switch brokers, I was just talking to Keith about it myself, thinking about switching brokers, but it's such a hassle because you have to fill out all the paperwork, worry about tracking your cost basis information, all of these other logistical issues that go into switching brokers. So what happens when you have a strong brand and switching costs, competitive advantages, it leads to pricing power.

So here this graph shows the average commissions and fees per trade for these four brokers. The green line is TD Ameritrade, the blue line is **Charles Schwab**, the purple is **E*TRADE** and then the orange-ish kind of brownish is **Interactive Brokers**. So you can see that TD Ameritrade has the highest average commissions and fees per trade, which is great if you're an investor in the company, not so great if you are a consumer of the company, obviously. And it's also interesting to note, you can see interactive broker is way below all of these other brokers. They kind of compete on a different strategy, so this is what's interesting about looking at various metrics across competitors, you can get a sense of where they're trying to position themselves strategically relative to the rest of the industry, so TD Ameritrade, Schwab, and E*TRADE tend to focus more on the retail investor, a little bit less trading and higher commissions, whereas Interactive Brokers tends to focus more on the much more active institutional client. So they get much more active traders trading for a lower cost per trade.

And those competitive advantages, so getting to quantifying competitive advantages, lead to stronger financial returns. So TD Ameritrade's average return on equity since 2009 is 16.3% compared to all these other brokers, which is better than them. And any time you see a return on equity in the mid-teens, that's a very strong performance. E*TRADE, I just want you guys to note so that you can see they have had negative return on equity since 2009. That is predominantly due to very big writedowns that they took on their loan book in 2009 when the financial crisis occurred. So that kind of goes hand in hand with my next point, which is why we like TD Ameritrade, is low financial risk, clarity and simplicity of financials.

So TD Ameritrade, unlike Schwab or E*TRADE, doesn't take on you know, undue risk with the assets that they earn interest on. So TD Ameritrade didn't experience any of those big writedowns on loans that E*TRADE or Schwab experienced in 2008, 2009. So TD Ameritrade has three main revenue drivers. The first is transaction-based revenue, which is revenue that they generate on commissions on trade execution. The second is spread-based revenue, which is revenue generated from interest earning assets, which are predominantly client-margin balances, which are margin loans, interests that they earn on loans, margin loans to clients. And securities lending.

So if you do shorting and you incur fees on any of the shorts that you have, that is included in spread base revenue. This portion of revenue is what we refer to when we are talking about TD Ameritrade has exposure to rising interest rates. So we'll talk about that a little bit more later. But TD Ameritrade does not engage in risky practices with its spread-based revenue, like say an E*TRADE or a Schwab, which exposes them to less financial risk.

And then the third revenue driver is fee-based revenue, which is revenue generated on company programs such as Amerivest or Advisor Direct, which is registered investment advisor referrals. So those are the three main revenue drivers for TD Ameritrade. Here's what it looks like versus the rest of the competition, so for TD Ameritrade, transaction-based is 44% of revenue, spread-based is 44% of revenue, and fee-based is 10% of revenue. You can see how it works out for the industry, you can see E*TRADE has a much larger portion in the spread-based revenue, which is why they were hurt much more disproportionately when the spread based assets faced a decline in value. I also want to point your attention to Interactive Brokers. You can see they have that purple segment that none of the other brokers have, and that's trading gains and currency exposure. So Interactive Brokers is more of a global operator; TD Ameritrade is only based in the United States. So that was fiscal year 2013, which contributed about 25% of revenue.

In 2014, which was actually a pretty bad year for currency, some of you may be familiar with that. This portion of revenue actually detracted about 12% from revenue. So we like that TD Ameritrade is not exposed to some of these more volatile sources of revenue. And then capital structure versus competition; TD Ameritrade has a very simple 80% equity, 20% debt structure. Less debt than some of their competitors such as E*TRADE with 60% debt to equity, and then Interactive Brokers is actually pretty interesting, they have a unique capital structure, where the public equity is actually only a very small portion of the overall equity in the firm. The rest is owned by a minority interest owned by the founder of the business. So low financial risk, clarity and simplicity of financials gets a check mark.

So the third reason why we like TD Ameritrade is positive exposure to rising interest rates, and this is probably the most important reason why we like them. Provide some optionality, in the case of interest rates rising from their current lows. So talking about how TD Ameritrade earns spread-based revenue, mention it's the yield on interest-earning assets plus the yield on insured deposit accounts. Now insured deposit accounts, this is a relationship that TD Ameritrade has with **TD Bank**. TD Bank owns 41% of the company, and client cash from TD Ameritrade, so cash that's held in brokerage accounts, is funneled to TD Bank and then TD Bank earns a spread on that client cash, and then TD Ameritrade receives that spread minus a servicing fee in various, the FDIC insurance premiums.

So anyway, in 2014, they earned $1.4 billion in spread-based revenue. Okay, interest-earning assets, like I said, client-margin balances, generate about 65 to 75% of interest-earning asset revenue and then securities lending balances, which is again fees on shorting, generates 20 to 35%. Recent yields on these assets of 2.8 to 3.3% and that's going to fluctuate with interest rates. So if interest rates are rising, we would expect the yield on these assets to rise, as well.

One interesting thing that I track from TD Ameritrade, this is kind of a footnote to the presentation, but I think it's pretty interesting, is client-margin balances as a percent of total client assets. And I think this is interesting to track, because it gives you a sense of kind of the friskiness of retail investors. So if investors are feeling very strong about markets, they might take on a higher percentage of their assets in margin loans. So you can see in 2006, 2007, client margin as a percent of total client assets was up near 3%. Took a sharp decline when the financial crisis hit, and then it rose up a little bit and then it came back down. So it's just interesting to note that even despite the stock market reaching, you know, new highs and having a very strong past five years, client-margin balances as a percent of total client assets is actually not that high, so that's just an interesting data point that I track with TD Ameritrade.

IDAs, again, yield on insured deposit accounts, it's an agreement to sweep client cash to FDI insured money market funds held at TD Bank. Again, this is how they are able to not have exposure to those riskier assets that could cause big writedowns on their books, and then instead of achieving a spread on the interest rate, they collect a marketing fee from what TD Bank is able to achieve.

This is a slide from TD Ameritrade's most recent presentation. It explains the impact to earnings per share, I'll point your attention to the bottom right hand side, of a 100 basis point increase in the federal funds rate, or 1% increase. A 1% increase in the federal funds rate, we would expect to increase earnings in year 1 by 38 cents, which based on last year's earnings, is about 27%. And what is great about this exposure to rising rates you can see it has a big impact on earnings. Not just on revenue, because the revenue, the extra revenue generated from higher interest rates comes with virtually no incremental cost. So it drops basically all down to the bottom line. So we're not saying that interest rates will rise, but if and when they do, TD Ameritrade stands to benefit.

All right, and then the final reason why we like TD Ameritrade is strong management and capital allocation. This is something that we kind of seek for across all of our investments at Pro. We want to have strong managers and people that know what they're doing with allocating their capital.

So this is the CEO, his name is Fred Tomczyk, he's been CEO since 2008. COO from 2007-2008 and before that, he was working with TD Bank, which obviously has a relationship with the company and now owns 41% of the company. Tomczyk owns $78 million in stock. So he's definitely financially incentivized to increase the value of this company, which is great. 86% of his pay is performance-based, which is good to see as well, and his incentives are earnings per share, net new client assets, and market share of trades. That's also something that we really try to focus on is how is management incentivized, and are the incentives something that will drive value to the investment? And in this case, I think they definitely are and TD Ameritrade has excelled in all three of these areas where the CEO's incentivized.

As far as capital allocation, the company has a history of rational acquisitions and expansion. In the early 2000s, they were involved in consolidating the overall online brokerage industry. And then in 2009, pretty much near stock market lows, they acquired Think or Swim, which has turned out to be a really great acquisition for them, so that was very well-timed. Smart acquisition by management. And then also they returned cash to shareholders, they initiated a regular dividend in quarter 1 2011.

And then another hallmark, I think, of a strong management team is the ability to issue special dividends. So when you have cash on your balance sheet and you have nowhere to invest it, why not return it to your shareholders instead of just letting it sit there on the balance sheet, so that's something that they've done in the past and may continue to do in the future. So overall smart, strategic decisions and operational priorities, strong management, capital allocation gets check mark.

So those are the four reasons why we like TD Ameritrade. And that's our investment there, and oh, one more thing. So yeah, TD Ameritrade has been very successful for us since we brought it into the portfolio July of 2013. Since then, it has returned over 50%, including dividends, which includes also the special dividends, versus the

North Star, which has returned about 14%. So hopefully, we expect this performance to continue and that's that. Any questions?

(laughter)

And use the microphone, as well, to ask your questions, if you have them.

Audience member: Just could you give us some insight into how you estimate the, that it will meet the required rate of return for the North Star, whatever, sort of with your valuation metrics? How that fits in?

Kipersztok: Yeah. So our evaluation process, at least personally, for me, I mean, all of our analysts use, you know, their own ways to do it. But for me, you know, I'll go out and I'll do a discounted cash flow valuation, projecting revenue out for a various amount of years, projecting expenses and then projecting cash flow, discounting it back at a given rate of return. For us, I typically discount equity at our North Star rate of return or maybe a little bit higher, and that's basically the answer to your question.

Audience member: So I have a question. I own both Interactive Brokers and TD Ameritrade.

Kipersztok: Sure.

Audience member: I understand that they probably target different segments. Is that changing, is Interactive Brokers, is it going after more retail investors like myself, and I guess the other question I have is they have a more bigger global operation?

Kipersztok: Yes.

Audience member: And is that a plus or a minus in your perspective?

Kipersztok: Yeah. Good questions.

Audience member: I think also, one of the other metrics, I don't know if you guys consider this, is the net revenue per employee.

Kipersztok: Revenue per employee?

Audience member: Yeah.

Kipersztok: Yeah.

Audience member: I think it's higher margin, good extent for Interactive Brokers compared to Ameritrade.

Kipersztok: Yeah, so, okay, three part question there, so yeah. First was are they targeting retail clients. Right, more. I think so, I mean, it seems to be that way anecdotally. I haven't specifically looked at the numbers, breaking it out institutional versus retail, but just from having conversations from people around Fooldom, it seems like Interactive Brokers is a pretty popular broker. I'm considering switching some of my assets over to Interactive Brokers as well. And I think the low commissions are just a compelling draw to people who are sensitive to price. So yeah, I mean, I think that they're targeting retail investors, but not necessarily on purpose; it just seems to be that they're drawn to their low commissions and their good trade execution.

The next part of the question, they have more global operations. Yes, so is that a good thing or is that a bad thing? So you can see, so in some cases it's a bad thing. So they had more currency exposure in 2014, which actually detracted from their revenue. So in that case, it's a bad thing, but in some ways, it's a good thing, as well, because it provides them with some more diversity in terms of growth rates and markets. And whatnot. So I think it's a mix of both good and bad.

And what was the third question again? Ah, revenue per employee. Yeah, so Interactive Brokers is kind of known for being very technologically focused and automating things very well. I would expect their revenue per employee to be very high. I don't know the numbers off the top of my head versus the competition, but I think, I mean TD Ameritrade is, any online broker really will be very efficient in terms of revenue per employee, because a lot of trade execution and revenue generation is automated. So that's an interesting point to look at and I'll research that. Thank you.

Any other questions? All right, well, thank you very much.

(Applause)

Jeff Fischer: Thank you, Billy, that was excellent overview and it shows clearly how we are working hard to know our companies really well so you don't have to. But if you want to, we are ready to convey that information on discussion boards through the updates that we do provide every quarter, and occasionally, we talk about them in the Monday memos, as well. And also at these events through Q&A. We spend the bulk of our time knowing our companies and learning more about them, and I'm going to talk about some of the resources we use to do that, as I start here.

Okay. It's already here, great. I can kind of read that. I hope you all had a good lunch. This is going to be fun; this is like, every year we do brand new presentations, because we're fortunate to have many members return repeatedly.

(laughter)

So I get to work on, we get to work on these and do them once and then off they go. This year, I want to talk about portfolio pitfalls for the first time. And I'll start by saying that we are all on a lifelong pursuit together and individually, and that pursuit is really about financial security and freedom for ourselves and our families. And how, in my opinion, how do you achieve that along the way and also have it when you are hitting your milestones, your goal points, your, your ultimate end of retirement. And I think the way, one great way to do that, the way I view it, is to have a great portfolio, a portfolio that has certain attributes that help you succeed from the beginning all the way to your goals.

And let's just talk about what a great portfolio is in the mind of Motley Fool Pro. It's a living, breathing, and flexible thing. It's not static. It will change to the environment that changes around it. It will adapt without you having to do anything. We'll talk about how that occurs. It allows for easy adjustments though, so if you do want to tweak it along the way, there are ways that you know of and ways that you can just tweak your portfolio to adjust it. And as we've talked about and Tom mentioned this morning, and I've expanded it a little bit, you have positive outcomes and you can have positive actions whether the market is down, flat, or up. So even if the market is going nowhere, you're having positive outcomes in your portfolio at that time. When the market's going down, your portfolio has positive results occurring within it. You may be not going up in value overall, but you have at least some positions that are making money for you as the market falls, and then it helps a lot with your approach to the market and what you choose to do next.

So in Pro, how do we achieve this, just in a nutshell? We have stocks for the long, term, long-term compounding in a strong market. We have options for income, let's call that a neutral market. Market's going nowhere, we're still making money with options. Ideally, month after month, and you've seen this year, we're really trying to have options expire every month. So far, so good two months in. It's just two months.

(laughter)

Then you have shorts for bear markets, and that's something we haven't had much of since we started in 2008 and that's a good thing in hindsight, but we do want to add more shorts as we talked about this morning to the portfolio and build out the short positions that we have. And that requires a bit more activity because shorts are usually a shorter-term holding, maybe six months, maybe a couple of years; whereas the longs, of course, we hope to own for many, many years. So we cover there with stocks: bull market, options, neutral, shorts, bear market, and then we add hedges for the unknown.

You want all four of these working together at once. And of course, you can always alter your allocations as you go. Right now, were 75%, 80% long. Next week, we could be 50% net long. We could put on a hedge that really lowers our exposure like that, and we can rest easy, if that's what we need. So this does look easy enough, and I think once you've been with Pro a while or even in your own experience, you see how this can work. So what gets in the way? How come so many of us don't have portfolios that fit in to all these attributes and succeed in good and bad markets to at least some degree? What derails our plan? What are the pitfalls, in other words, to portfolio greatness? And I open the floor up to throw a few examples out there, who would like to name one pitfall to having a great portfolio?

Audience member: Emotion.

Fischer: Emotion. That's a great one. Inertia. I like that one, especially.

(laughter)

Overconfidence. Fear. Lack of cash. Lack of cash.

Audience member: Not listening to you.

(laughter)

Fischer: Take your picture. Those are all great. Those are all great. We have fear, emotion, lack of cash, not listening to somebody. And a few other, those are all accurate. I'm happy to say I tried to find ones that may not, that we may not think about but that are always there. So pitfall number one: I have four pitfalls that we're going to talk about today. Pitfall number one is forecasting, or believing that you know the future, and that's in any way. So let's just, let's get this out early now. You don't know the future.

(laughter)

None of us know the future. We don't know what's going to happen in 20 minutes. I really don't know. So I want you to leave this event when you do in a couple days, or whenever you have to leave, liberated from the idea that you know the future or anything about it. Just take that weight off your shoulder because we don't know. Nobody knows what the future will hold.

When was the last time you saw a really outstanding investors, Warren Buffett being one of them, talk about a forecast for the economy or the market? He speaks in very general terms that he wouldn't bet against America in the long-run, that he would only want to be in stocks for ten years or longer. That's the kind of forecast that has some history behind it. But anything nearer-term, one or two years, nobody has any idea what will happen. So none of us should think that we can predict what's going to happen, and we have no reason to believe that we can. So why do we always look to forecasts? Why are we so dependent on forecasts? We'll have an answer for that.

But first, let's look at the pros. And this is from Davis Funds*, these are Wall Street's top strategists and it's their average prediction for the S&P. And what actually happened? And you can see, they completely missed, and most people did, 2008, 2009. Just it wasn't even on their radar that stocks may go down a little bit, they're predicting the market to continue to go up in 2008. I will say the one good thing I can say about this is they're hovering around a 10% annualized prediction and that's pretty smart, because that's about what the market does over the long term.

(laughter)

But let's take a different look and go back a bit further. So this is back to 1991. And it looks pretty darn good, doesn't it? The experts, their forecast is tracking the market extremely well. There's the actual S&P and there's the, well, the forecast. The only problem is this is about a year or two years behind what actually happened. So what they're actually doing is just retelling what has just occurred.

Their forecast is always lagging and the chart kind of shows it, but as the market finally did go up in mid '93, they started to predict that in mid '94. And then as the market started to fall in 2000, which, come on, 2000? You knew it was going to fall a little bit. That was craziness. They didn't start to predict a decline until almost into 2001, after the market had already fallen quite a bit. In fact, they were almost two years behind there.

Let's go back even further. Well, first let's look at operating earnings. Now, it stands to reason they're not any better at predicting operating earnings, Wall Street analysts. And they're not, their forecasts lag in much the same way the S&P index itself. They're always about a year behind. And these are the S&P 500 companies, large companies that can be fairly predictable in their operations, especially given the way management works to manage earnings, and yet the experts are still far off the mark and well behind the times. And this is going back to 1986.

Let's go back even further. And this is from the Wall Street Journal recently. Since 1929, the average market forecast by the experts on Wall Street has missed the mark more frequently and by a greater degree than darts just thrown at a range of random numbers. So 80, 90 years now, we've seen nobody can predict the market where it's going to go next. And yet over that time, if you had just said, ah, about 10% annually, you were right. But nobody does that, nobody wants to know that you can double your money every 7.2 years on average in the market if you just buy and wait with the index, with the index or let alone with good companies. People want to know the next couple of years. Why is that? Why do we forecast at all when we obviously cannot do it? And the answer might surprise you.

It's because forecasting is anchoring. We, and it's a survival instinct, too, we want to think that we know the future or know what's going to happen. And so we grasp at anything when we don't know the future. We make plans, obviously. We hope for the best, but when it comes with investing, when it comes to investing, we grasp at anything and what Wall Street learned everyone can grab on to, and so it has become ingrained on Wall Street, our forecasts. But a forecast is a form of anchoring. You're putting numbers and dates and price targets and earnings targets out there that we then take as not a forecast, our mind kind of turns it into knowledge and we anchor on that and believe that's what's going to happen. And when it doesn't, we're badly surprised.

So we forecast because we want to feel a sense of control. We forecast and then we anchor on what that forecast is, whether it's GDP growth, unemployment, and the funny thing is, so many of those numbers are then adjusted a month or two later, they're adjusted greatly, unemployment or GDP. And no one pays any attention. It really didn't matter, it turns out.

But why is forecasting a pitfall to having a great portfolio? One reason is we investors act on forecasts, either published or of our own making. One obvious example is to sell to avoid a predicted market decline. If the forecasts are saying, oh, this market's overheated, it's going to fall. And people have been saying that really, since 2011, 2012, easily. You may sell to avoid that. But that takes you off-track. You've been derailed from your portfolio plans.

We all know families, unfortunately, who sold in 2009. I know a few families who sold in March 2009. Really successful families doing very well. Their portfolios had been cut in half. They believed what they heard and what they read, what the market would keep falling, and so they sold, they sold on a forecast. And it was very hard to get back in years later. So a forecast can decimate your returns. If you're acting on what you believe is going to happen to the market, it can really destroy your results.

Forecasting is a pitfall in the other direction, too, though. You can take on too much risk if you are forecasting, you have a feeling things are going to be great. And that's whether it's the market as a whole and so as Billy talked about, you may margin up because you think the market's going to do really well; 2007, what a horrible time to ad margin, and yet people were. They were forecasting better returns ahead. That derailed them, without question.

You can also do it with stocks. We know Fools, unfortunately, and all of us have done it at some point possibly, who bet too much on a stock. Some Fools have lost a lot of money on **Apple** because they put too much into that single company at the wrong time and couldn't keep the position when it had that decline a couple of years ago. 35% decline. So a bullish forecast can lead you astray and destroy value as much as forecast of a falling market. Whether you act on fear or greed, you are forecasting an outcome that you do not actually know.

Another pitfall is investors trade more frequently due to forecasts of all kinds, whether they change from commodities to different sectors or company to company. They're again, just acting on a forecast. And that has disastrous results. As we heard this morning, here's another look at that, what was it called, it was a behavior gap. 8.7% the average stock mutual fund is returned from 94 to 2013, 5% is the return of the average fund investor. And that's not even counting the fees and the churn and taxes. That's just because people are selling and buying based on forecasts. They get in their own way.

So a forecast becomes an anchor that distracts you from the things that actually matter. It throws a balanced portfolio out the window because you've put your portfolio out of balance because you're believing something's going to happen based not on reality, but on a feeling or someone's prediction. And once you derail your portfolio, it may take a long time to get back on track. Once you sell out, it's very hard to get back in the market, because you want to prove yourself right. You want to wait and see prices actually fall.

But we do, okay, so forecasting. We don't want to rely on forecasting. It's a pitfall. But we want something. We want something to gauge the market, and what is the solution? The one I'll offer today is to use history, actual real history, versus now, which is an actual reality. And take forecasting out of the picture. So let's look at our reality right now compared to history. We have an S&P 500 on a trailing basis at about 17 times trailing earnings. So it's about 13% above its long-term average, which if you can see the red bar, is 15.3, and that's the red bar all the way across and this goes back to 1929, conveniently. And then we have a 25-year average, the green bar, of 18.9, and the little blue bar past ten year average of 16.9. So we have a market, on this measure, anyway, that is right in its average valuation range. It's 13% above the long-term average and I wouldn't argue with that. We could easily see stocks flat for a year or two. I wouldn't complain about that. We would do what we could to make money in that situation.

But let's use this; instead of a forecast, let's use reality. Let's look at where we're at right now, and this is whether it's an individual company or the market as a whole or to the extent that you can and want to, the economy as a whole. Look at it right now and look at history. Let's not try to guess what's going to happen next. We do this for all of our Pro stocks. We look at their current situation, their current valuation, and compare it to their historical valuation. Then we look at what's changed in the business to merit any change in the valuation, and if there's a great discrepancy, we need to ask why. Is it lower interest rates, that could be a reason why. That's a factor that plays a lot into stock valuation. Is it growth rates? Is it alternative investments? That's certainly a case now. Bonds are not attractive, emerging markets are weak. All these things play into the current valuation and yet, we're still within a historic range. And that's where we stand right now. We're not going to guess what's happening next.

But let's look at this. S&P 500 forward P/E. So based on this year's estimates and 2016 estimates, 16.4, 15.5, it's right in that average range and goes back down to the average range. And for a minute, you probably thought that was great. I know we all looked at those numbers and I know we had some comfort from that. Like, oh, that's good. The market's earnings are still predicted to go up, the market will be priced really reasonably. But no, this doesn't matter at all. Doesn't matter at all, what those numbers, the forward P doesn't matter at all, but I know we all looked at them, I did, and thought, all right, that's good, I can live with that. Doesn't matter, that could be a complete fiction and so now, the hard part for you is going to not, is going to be to not anchor on these. Don't leave here thinking 16 times, 15 times. Doesn't matter, we're at 17. 17.7 as of now, 17.3 as of last week.

But look how quickly, if you're anything like me, that you grasped on to those numbers. They become an instant anchor. Even though we can't bank on them. Proof of that is, here are the S&P 500's earnings per share going back to the 1870s. Look how choppy they are. They're anything but smooth, they're all over the place, so nobody predicted this; nobody could have. But again, if you took the super long term, and I'm sure somebody did 100 years ago, and they just don't get any credit for it, you could just draw a diagonal line upward, and that's how earnings have gone over the long term. That's the irony, it's much easier to forecast 10 or 20 years but you cannot forecast six months, and by forecast, we're not really forecasting, we're just looking at history and believing it will continue.

So if pitfall number one is forecasting and relying on forecasts to make your decisions, and we're going to avoid that by looking at the current situation, the reality compared to history. Pitfall number two … is the illusion of knowledge. And with this, I'm really trying to make your life easier, because now, you're leaving here saying I don't know the future, I'm not going to try. I'll look at the current present. I'll look at the past. That's the best I can do. So don't worry about the future anymore. Make plans, but don't plan on it.

And now, I want you to rely less on knowledge. You don't need excessive knowledge. Beyond some key factors, additional information is not only irrelevant, but it's even detrimental to your decision making. And here are some of the reasons why: more knowledge leads to overconfidence, which then, predictably, I imagine, leads to poorer results. You're taking oversize bets, you have too much belief in what you think is going to happen because you've done all this research, and so you bet too much on it. I'm betting we've probably all done that at some point.

Having more information makes you less efficient at processing. And so I've put very little on these slides in particular. Studies also show that we make better decisions with fewer data points. We'll show that in a moment. Because after all, all information that you gather is not good. And then I had to throw this in there, that forecasts are frequently mistaken for knowledge. So not only is there an illusion of knowledge that more knowledge is better, but things that you read are predicting things, you will assimilate and believe that it's become knowledge in your mind, even though it was a forecast, it was a prediction. There's no, it's not based on a fact whatsoever. Look how we all did that, I believe, with the forward S&P numbers I just put up there. We anchored on them and believed in them for whatever brief moment.

Back to having too much knowledge, period, overall, though. Keep in mind also that not all information is good. There's a lot of noise out there that clutters and just clouds your mind and makes it harder to make decisions. There is a lot, we're awash in bad information right now, inaccurate information or misleading information. Everyone has an agenda. And then there's what I call dramatic data. It's the 24-hour news cycle, which is now more than ever, a part of our lives if we don't unplug from it. And that, the news is driven to connect with you in some way to get an emotional response from you. That's the whole purpose and hope is that you'll stay glued to the TV. That's a disaster, of course, when you tie news with your investing decisions. It leads to emotional results.

So let's get some stats behind this. This is fun because it's looking at bookies, book makers, and it goes back to '73. And the more data that you gave a bookie for horse races, the more confident he became. His confidence, his or her confidence grew. And yet their accuracy actually went down. So with five data points, they had an accuracy level that was as good as or better than what they had with 40 data points. They didn't improve at all with more data and yet their confidence grew, so they were more likely to make bigger bets, make bad decisions. And take on too much risk.

Here's another example, which is a little troubling because these are, this is a study of judges. And stage one, two, three, four, at each stage, they were given more information about a certain subject or case. And the more information they had, you can see the dark line is their confidence level. The more information they had, the greater their confidence and yet the gray line, their accuracy did not go up. It stayed pretty flat. It went up a little bit, at stage two for reason, it went way down, so be careful of stopping at stage two. Stage three and four, really no market benefit compared to stage one information. So they spent a lot more time learning, they have a lot greater confidence, and yet the results don't show for it.

This is true in investing, as well. These are, again, Wall Street pros are the dotted line at the bottom. And this is measuring their confidence on a stock selection, and this is pretty striking. The more confident a pro, a Wall Street pro, anyway, is in a stock selection, the less accurate they're going to be. When they have 100% confidence, they have 15% accuracy. So when they're on TV, pounding the table, saying this is what you've got to buy right now, this is what I believe in most, it's gold, whatever it is.

That desperation, which is also a form of overconfidence, in these studies, anyway, results in very low, very low accuracy results. They're usually wrong. The top line shows how perfect calibration would look if as your confidence grew, your accuracy grew in line, that's how it should look. The typical Fool, you and me, does better than a pro. At least we kind of hold our own on our accuracy.

So one more look. And with more information, you get worse earnings forecasts from Wall Street. With a baseline amount of information only, which is on the far left, the margin for error on the forecast is smallest. When you add more information, add redundant information, the margin for error goes up tremendously. And that's true even when you add the baseline plus non-redundant, so plus extra information. You haven't gotten any benefit. It's the baseline that has, that is the most accurate and that matters most.

And yet at the same time, again, to tie back to our other two examples, as they had more information, their confidence went up each time. Yet we know their accuracy actually went down. So they were more confident and they were making more mistakes.

So what is suspect knowledge? There's too much information. And what else is suspect information or suspect knowledge? I would offer these as some examples. Brokerage houses, still, even though it was hoped to take away some conflict of interest after '99, 2000, it really hasn't happened. To this day, is **Merrill Lynch** wants to get **Twitter**'s secondary business, they need to write positively about Twitter. So broker reports still have a conflict of interest and are overwhelmingly positive because that's how they get business. If you write negatively about a business as a broker, you typically are not working with them again.

I'll throw in there all secondary sources for the sole reason, I mean, there are plenty of great secondary sources, but for the sole reason that you have to then double-check it. If you're going to a secondary source, you can't take it at face value. You need to make certain that what they're telling you and sharing with you is accurate and true, and then also dig in to see what conflicts of interest they may have. You'll spend a lot of time on that.

Smaller news websites, I've noticed this in the last couple of years, especially, should be avoided because they're desperate to get eyeballs. It's become much harder to generate traffic through various means at Yahoo Finance, other sites. And so you're mainly paying for traffic and you want to make your advertisement or however you're doing it pay off, so you're desperate. You're writing dramatic headlines, you're writing dramatic pieces, either about companies you're being extremely bullish on companies or extremely bearish, anything to get attention.

Blogs, of course, goes without saying. Get to know the person. Know their history, conflicts of interest, avoid anonymous blogs. That said, when our companies get attacked anonymously, we do, as you've seen from Bryan Hinmon last year and J.P. in December of last year, as well, we dig into it and we try to debunk in everything that they're saying because we want to believe in what we own. But as a whole, it's suspect knowledge. It's probably not worth your time. Talking heads, as well.

But you need a solution. There's so much noise out there and so many things that you want to avoid that will just clutter your mind and lead to bad decisions. This is what we rely on, and this by far, the majority of it. I'd say 90% of what we rely on is right here. It's the company SEC filings, which are quarterly and then the annual is outstanding for the amount of information you get from there. The company conference calls that we go over every quarter, and summarize for you, as well. You can learn a lot about management over the years by following these calls and seeing how consistent they are, how they react in adverse situations, how they approach opportunities and risk. And the conference calls are live and the questions range from bad to good, but you still get a rounded view of the management team.

Some long-term analysts that you trust, if you can find them. I find so many analysts move around from job to job, house to house. It's hard to find ones that are in one place for a long time, covering just a certain thing. But then independent industry reports, as well, are well-worth considering. And of course, yourself. So this is 90% or more of what I used to make decisions is right here. And that's true with the team, as well. But what do you focus on? You still need a focus as you go through this. And as you could predict, we focus on the business. There's a lot on this slide, so take a second.

Billy went over many of these points in his talk about TD Ameritrade, which I did want to say before I started is still rated a buy. It's about a 3.4% allocation. It's around our fair value, which means we expect to earn North Star better over time. So yeah, we still like that company clearly. So this is what we look for. Using those sources on the previous page, the key things we've always focused on in Pro are among these five to six and couple others, but these are the key ones.

Competitive advantage, only if a company has a competitive advantage can it have pricing power, which Warren Buffett has called the most important thing to investment success. If a company has pricing power, that tells you a lot of what you need to know about their competitive advantage, about how sustainable that might be, about where their margins might go, and about their growth opportunities. If you can raise your price and keep your customers or grow your customer base, you're really serving a need out there that is being unmet.

Of course we want a growing market. **Skyworks** is one of our most recent examples with the internet of things is just taking off. And Skyworks is really well-positioned and it's not a Johnny-come-lately, they've been planning for this since about 2002. So they're in a great position for what's probably going to go on for much longer than anyone believes, which are connected devices I think, just like the smartphone revolution. We're still in the very early innings worldwide of connectivity, mobile connectivity.

Of course we want a strong capital structure with healthy free cash flow. Goes without saying. And we prefer recurring revenue. 80% of revenue at **Open Text** recurs naturally through contracts or transactions. It's largely true of **MasterCard**, too. **Oracle**, as well. A lot of contract revenue, 45%. Why? Why do we love it? It's stability, clearly, it's recurring stability, so even in financial downturn and the crisis, companies like that we follow and own have a stable base of revenue. **AmTrust** is another one where renewal rates are very strong.

Of course, the fluffiest one, the hardest one to really know is the honest, competent management. We want companies that as the saying goes, that a monkey could run, because we want them to be that strong. But bottom line is, you need competent management and you need honest management. And it's hard to judge, but by knowing a company a long time, and the average Pro company we've known about seven to eight years now, some we've known twice that long, knowing the company a long time, following the conference calls, and just how they convey themselves, that's how we get a sense of that. Also when we're researching new companies, we look at the executives and their history, of course. Again, looking at history, not trying to forecast what's going to happen.

So pitfall number two was the illusion of information. So I like to review, because that's the only way I remember everything, or anything. So now we're not going to make decisions based on forecasting, but on reality versus history. And we know we don't need mountains of information. We just need good information about a business from a few sources that we trust. The rest you can do if you enjoy, but you're probably wasting your time.

Pitfall number three … is false diversification. I have tried to simplify this by saying, you're not really diversified if all of your positions are moving together. It doesn't matter how many you have. If they're all moving the same way, it's almost moving like one position. You're also not diversified if you only keep positions that are currently winning. If you're selling something that's lagging, because you don't have patience for it, and you only want green in your portfolio, you're decreasing your diversification, and increasing your forward risk as a result.

You're also arguably not diversified if you own all high or all low P/E stocks. So in other words, if you call yourself a growth investor, period, and so you just go after growth companies all the time, or you're a value guy and you only want to own value stocks, we'll talk about all these. Finally, if you mistake many holdings for diverse holdings, truly again, it's not if they're all moving together. Let's review the great Pro portfolio goal, we want positive outcomes and we want to be able to take positive actions, whatever the market is doing. If everything's moving together, we certainly can't do that.

Last year, I talked about one of the largest risks to a portfolio manager, in my view, is being hamstrung at the worst time. So in a moment of crisis, everything conspires to tie your hands, you can't do a thing. A lot of people were in that situation in 2008, 2009, of course, and it's a horrible feeling. And so your instinctual reaction is going to be to try to run away from it. To sell at the worst time. So if we can keep ourselves from having our hands tied, we're in much better shape. And the only way we can do that that I know of is to have a portfolio that reacts, that has sections of it that react differently to different markets. How are we doing so far on that?

My favorite. The colors kind of come through. Last month, Billy put this in a Monday memo. It's a correlation of all the Pro core holdings. And you can kind of see, I think, the green shades are our shorts, the **Caesars** and **Five Below**, and the Euro. And then we have a little bit of green also with a **Facebook**, Open Text, **PAREXEL, Papa John's**, those are all shades of green. This is a month ago because they were doing well in when the market was kind of down in January. But the only point I wanted to make here is we still, we don't have that much green on the portfolio. We don't have, and the green shows things that move inversely to everything else. And we want more green, as we talked about earlier today, so we're looking to add more shorts. Definitely.

But we also want some laggards in the portfolio, and thankfully, we have some. Why do we want that? Okay, the problem. The problem again, all positions moving together? Well, stocks that did well the past three years tend to reverse and then lag the other market, the other stocks the next three years, and the opposite of that. In other words, it's a see-saw. And other studies show that positive or negative moves for a stock on average last about 18 months. A stock will go down for about 18 months and slowly reverse or it'll go up for 18 months.

Now that's spread out over a very long time, but the point is just that stocks cycle, different stocks cycle. The baton is passed from one type, whether it's growth, to value and back and forth, and you want smoother returns in your portfolio, this is why you want some losers in your portfolio. Because eventually, they will take the lead while your winners take a rest. And this shows how that happens. Year one, you have the winners beating the losers. Year two, and this was a study, a 25-year study, the losers, on average, gained 8% on last year's winners in the second year. And by year three, they made up all the difference. Now they could both be winning overall if it's a good market. But the point is, if you sold your losers, you sold what were going to become your better investments in the next couple of years. You didn't have patience.

As we heard earlier this morning, the average mutual fund is held for around three years now. The average stock in this country is held for around 11 months. So people have no patience. If something moves on average 18 months before it turns around and you're selling around 11 months because you lost patience, you have missed out when it recovers.

So this tells you two simple things: don't just chase current market winners as tempting, as that is, and then don't give up on the laggards in your portfolio that you still believe in. This is a key point. If something's busted and your thesis is gone, of course, move on. Get away from it. But if you still believe in it, keep it because that laggard is likely to become a winner down the road. We have some in Pro, of course. We have **Valmont** and **Tupperware**, lately, and the **WisdomTree**, emerging markets ETF. Those are all in the red for us.

And in the case of emerging markets, that thing has been lagging for going on three years now. So its comparative return has been horrible compared to U.S. stocks. But we're happy to go on owning it because we believe in the ETF. We believe n the broad thesis that emerging markets will do well, will create value over time, and the cherry on top, I strongly believe emerging markets will have a long period again of outperformance and we'll be very glad when we still own emerging markets and maybe we own more by that point. We'll be very glad we held on to it when it's going up year after year and U.S. stocks are flat. So let's keep those losers in there, as long as we believe in them.

The other thing to keep in mind is top investors frequently lose. This is again a study from Davis Funds that you all may know of. We wrote about it in the memo a few times. What this is showing, the top quartile of large cap investors, fund managers over a ten-year period of study, so they were top quartile over a ten-year period prior, so over 20 years altogether, 95% of them fall into the bottom half of all investors for a period of time. And 73% of these investors fall into the bottom quarter, so they become among the 25% of the worst fund managers of all over at least one three-year period over this period of time. So just as stocks trade the baton back and forth between winners and losers, top investors do, too, which stands to reason they invest in a certain way that works sometimes and doesn't work other times.

But you know very well, if someone's lagging for three years, most people would sell that mutual fund and that's why I think we have a three-year average holding period on a fund. People lose patience. Studies show that you can hold it out for a year and a half, two years, but at some point, the average person hits a breaking point and they get out. It just happens to be the time when things will start to turn around. And there's some kismet to that.

So bottom line, though, not all of your positions should be winning all the time, and keep in mind, not all investors will be, either. Whether it's Billy, J.P., myself, anyone at the Fool, we'll have bad years. So let's look now at P/E stocks. What if you only owned growth stocks? Kind of an amazing study that I found and I need to dig into it further because I want to find more information on it, is that low-growth companies over the long haul rival high-growth companies when it comes to long-term EPS. Earnings per share growth. There's actually very little difference. They're nearly the same.

Now, partly that's because large low-growth companies are typically consistently profitable, and small companies are not. But, sorry about that. Small. Okay. The small stocks, as you know, over time, outperform large companies. And the reason is they're given a higher multiple to earnings because they're growing more quickly in the short-term. But if you take away, if you risk-adjust the returns, they're pretty much identical. You lose the advantage that small caps historically give you because they're generating the same amount of earnings as a large cap. They're just given a higher price. So risk adjusted, there's not much advantage. But still, you want to own, you want to own both.

Here's a study that goes back so far, it predates the digital age. This was made, I don't know, by a pencil and this is from 1933 to 1980. And it shows how low P/E stocks, which were the previous losers, then went on to become the winners compared to the high P/E stocks, the growth stocks that were winning beforehand.

So it just reinforces the idea that losers become winners again, as well. And here, I don't know if you can see this, but jumping into the modern age, this is a Morningstar chart that shows **Coca-Cola** returns. I thought we would all be surprised to see that the past 10 years, which is on the far right side, Coca-Cola has outperformed the Russell 2000. The Russell 2000 is up 8% annualized, Coca-Cola is up 9% annualized. And that's with soda sales falling every year.

So large companies have advantages. They buy back shares, they pay dividends, and dividends are factored in to this total return. So if you're only looking at growth, you should diversify and have value, as well. For both reasons, that the growth companies pay a higher price, but the earnings growth will actually about mirror that of value companies in the long run. And at some points, value will do well. Some points, growth.

So you want to diversify, in other words, by the price to earnings ratios. And we've done that in Pro. We have everything from the emerging markets, which right now is 11 times earnings. To, you can read right down the list, stocks trading everywhere from 11 times to 70 time earnings. It's P/E diversification. It should, over the long run, smooth out your returns. It should help. And it again argues why you want to be a value and growth investor, and that's what Pro has done and does do. We have everything from relatively slower growth, **Broadridge** or Gentex, to Facebook. Very fast growing.

So let's move to the next point in this pitfall number three, which was your number of holdings. Mistaking many for diversification. Now we could get into a great fun debate about how many stocks you should own. But I don't think it's a worthwhile debate and I don't think that anyone has the answer. I did a lot of research and found convincing evidence that seven stocks is enough, but other evidence that says today you really need 12 or 24 or 30 and new stats are saying you need 60 to 100 if you really want to diversify around the world and across different sectors and commodities and whatnot if you want to.

So I simplified this down to, you should own the number of stocks that you are comfortable owning and that works for you. It's different for all of us. Pro has about 24 core holdings but about 30, 33 altogether with shorts and options. But just realize that if everything that you own is moving together, you are not really diversified, so that's what you want to look at, rather than number of stocks that you own, how are they moving?

So these are the solutions that we have and that we aim to offer in Pro to false diversification. Keep in mind always that all positions should not be moving together. If they are, think about how you want to change that, and that's something we're actively thinking about in Pro right now, because most of our positions are moving together, and we want to, we've enjoyed a great market. We still believe that most companies are within reasonable valuations. But we want to decrease our diversification risk a bit. We want to put in more shorts.

At the same time, a solution is to own value and growth stocks. And keep winners and losers. As long as you believe in a loser, keep it.

All right. So on to pitfall number four. Let's review. We're no longer going to act on forecasts or let them sway our opinion. We're going to look at reality versus history. We don't need mountains of information, we don't want excessive information. It clouds our minds. It makes us make worse decisions. We lose our focus. And you're not diversified if everything is moving together or nearly everything is moving together. Now if you don't mind riding out a market downturn, that's okay, but if you want to do better in a market downturn, all of your portfolio should not be winning right now. You should have some losers. You should have some red in there, and things that will do well in a market downturn.

Pitfall number four, though, might be the most important. It may have the largest impact on your portfolio, even larger than the first three. It's mismanaging your winners. Losers take care of themselves, ultimately. They become ever smaller. If you're like many Fools who don't care to sell and do not sell or like Stock Advisor, you just not quick to sell, that loser becomes a smaller and smaller, it becomes insignificant. But winners have a potential to change your whole financial future. Winners, a winner or two alone can make a world of difference, as many of you know. But what do many of us do with our winners, even today? Many of the people I meet and talk with do this, if you can read that.

These are a couple of examples of something that I'm sure almost all of us have done at some point. The stock doubles, and they sell. They sell half to get their money back, or in the case below, which is, this is 2009, **Netflix** hitting 50 and so a Fool had made, they had doubled their money, and so they sold. And said, well, if it gets to 40, I'll maybe start another position. And we've all done this, I'm not calling it out to be cruel. I don't own Netflix, so I can't say I did better. But instead of owning a number, owning something that's doubled, oh, it's doubled, I'm taking my gain and going, we have to think that we're owning a business. We own part of a business. Don't even look at the number.

But here's what happened with Netflix. It doubled, so they sold, and they sold around that red dot. It never really went down again, and it's up 10x from that cell. So they had a double, which was well-earned. It looks like they could've waited a few years to get that double and when you get a double on a stock, it does feel pretty monumental. For some reason, we anchor on that number, and it feels like a milestone, even though it's completely random to everyone and anyone except us. And we take action, which is, I guarantee you, nine times out of ten, among Fool stocks, a giant mistake to sell because we doubled. It's up 10x since then.

So now imagine, instead of selling it, instead of selling your winners, imagine when a stock doubles, I want your first thought to be, maybe I should add to it. Maybe this is one, I really believe in the company, the thesis is going right, its' working out. Maybe I should add to it. Through sheer luck and stupidity, that's what I did in the '90s with **AOL** and **Amazon** and **Iomega**, I added to them as they went on because I was just starting out and I had savings from work and I put it into the stocks I knew already and owned even though they were up a lot. And that makes a world of difference. If you're adding to **Starbucks** as it goes up in the '90s instead of selling it because you doubled.

It's kind of funny, too, when you think about it, that we make stock decisions differently than we do life decisions. My wife and I went to a mediocre restaurant a couple of months ago and we have no desire to go back. But if you, I know more people, and I've done it, too, who add to their losing stocks instead of to their winning stocks. It's like finding a really great restaurant and then never going back again. So consider adding to your winners.

That's something David has done in Stock Advisor to great effect. He's added to Netflix six times. Recommended it six times, and he still beats himself up for having sold it once.

(laughter)

He also did the same with **Disney**, added six times through **Marvel** and through other things that Disney acquired, but it's mainly Disney. And David is very keen on adding again and again to his winners. And he does it sometimes where it doesn't work out. **Electronic Arts** and Schwab, he added three times, or added two times, bought them two times. Didn't work out and he ended up selling. But the point is though, even when you add to something repeatedly and it doesn't work out, the times where you do when it does work out with your winners makes a very large difference. And I think that's largely to thank in these results. I mean, Tom and David are both equally smart guys.

(laughter)

But the one thing that I see that David does differently, one of the main things, is that he buys his winners again and again. And Tom in Stock Advisor has, it seems, preferred to add new ideas to deliver the novel idea more frequently than not. So Tom has more diversity among his company names, but David, who has more concentration, has these great returns partly because he's added several times to his favorites, to his best winners. And as we know, both of them have let their losers largely be and fade into obscurity.

So as we think about building a portfolio, let's also think about building winners the way David does and the way very visibly Warren Buffett has. It's extremely rare that Buffett has ever bought something just once. Even when he was a much smaller fund, he would build up a stake over many, many years. Coca-Cola as you can see, he was buying it for seven years. **Geico**, he bought for about a decade, and then he finally decided, what the heck, I'll buy the whole thing. **Procter & Gamble**, he bought, started buying in 1989, he bought a bit more afterwards, and then he bought a lot more, it's interesting to note, in 2005, when the **Gillette** deal came through. He liked that deal, even though it was pricey and he even said so. It was an expensive deal, but he bought a lot more in 2005 on that news. I think part of the reason why is he had confidence because he had known P&G for six years. And then **Wells Fargo**, his largest holding, he's been buying it ever since he started in 1989. He almost every year, he buys more. So he is building winners. He's adding to them. And even now, his equity portfolio is very concentrated. Most of his holdings are in about eight positions.

This I don't know if you can see it, but just want to throw out there how consistent Buffett is in buying Wells Fargo every year and even in 2008, 2009, he might have been a little miffed. His percentage of company ownership went down due to dilution. But he kept putting in more money and grew his stake in Wells Fargo.

So pitfall number four, the solution to mismanaging winners, is to flip your thinking and at least consider, when you have a double or a triple or any magnitude of size winner, consider adding to it, consider building much further rather than selling it. This is something I have not done enough of myself in life. Or in Pro. We've pretty rarely added to winners and had we have, so far, we would have better results. Now we have a challenge that many of us have, which is we have limited funds, so if we're adding to a winner, we need to take that money from somewhere else so that's part of the reason we don't add that much so far.

But there are no promises that we won't add to winners in the future much more than we have in the past. We have bought more **AIG** and more AMT, one way we like to do it and you can consider too is to buy calls. So you can add to your winner, but invest much less in doing so by the long-term call, and every two and a half years, you just roll it and so you've added to your winner effectively but not had to put in a lot of capital to do it.

So I do need to thank James Montier, who's a primary source for the first two pitfalls on forecasting. And the illusion of knowledge. Some of those charts came from him and the data. All of the solutions come from us, so I hope they work. And now to wrap up, we're going to have a little pitfall avoidance session.

So I hope you're all ready, because we're going to do this together. So pitfall number one avoidance session. We're going to say together, I can't predict the future. That was good. It's fun, let's do it again, on three. One, two, three.

Audience: I can't predict the future.

Fischer: Excellent. Instead, we'll look at today's reality, and we'll compare to history. And … instead of forecasting. At the same time, though, we're going to update our look at the reality today for the things that are a little different. Interest rates, growth rates, things like that. Things we do for you. So you don't have to unless you want to.

Pitfall avoidance session number two: I don't heed analysts …

Audience: … analyst information.

Fischer: Nice job. Instead, we'll focus on a few good sources, and we'll use those sources to know the business, to focus on the business. Turn off the TV and get to know the business, and we'll do our best to help you along the way. Our quarterly reports, we want to make them better all the time and more of an ongoing research report that you can have at your fingertips, so that's a goal that we have this year.

Pitfall avoidance session number three. All right, we'll do this on three. One, two, three.

Audience: Not all my positions should be wining at the same time.

Fischer: Nice, and we almost said that at the same time, so that was good. This is true, not if you want true price diversity. Instead, own stocks that are running a different strides, hedge and short with Pro strategies or following Pro, right options. In other words, just address the bull, bear, and flat market all at once with your portfolio today.

And finally, session number four. Pitfall avoidance. One, two, three.

Audience: I can invest more in my winners.

Fischer: Nicely said, you guys are good. So in this case, whether that means more money or more time, let your winners go for more time as long as you believe in them if you can and you're confident to put more money into them. Think of them as building the long-term position, building your stake in that company. And with that, our four portfolio pitfalls to avoid. Thank you.

(applause)

Thank you all, we all have six minutes until our break, so we can take a few questions. Yeah.

Audience member: Hi, my name is Bob.

Fischer: Hi, Bob.

Audience member: From the great state of Virginia. Or Commonwealth. One of the things that I was wondering is, when you were talking about things, research that you trust, and SEC filings, I find them rather voluminous.

Fischer: Mm-hmm.

(laughter)

Audience member: And I was wondering if there was something like an outline or a read this and skip a lot of the other stuff that you all might have or could put out that would allow the novice in us to access that information without being overwhelmed.

Fischer: That's a great idea. This whole presentation will be on the Pro site, and we'll use it as a framework to provide the solutions that are in here, and that's a great idea and not just say here are our SEC filings for our companies, but here's what you should look at.

Off the cuff, I could say, of course, we look at the business overview, how they view their business, their industry, their competitors, and then a lot of times, especially if you've done it before, you can just zip through the risk factors, 'cause they're the legal boilerplate type of things. It's good to read them, the headlines and try to pick up any risk that you wouldn't know already or intuitively, but a lot of them you can skim right through and then get to the financials. So looking at a company, looking at its business, it's market, its competitors, and then its financials, those four things can usually tell us in a couple of hours whether we want to pursue it or in some cases, if it doesn't pass the test. Like a company, for instance, that relies on one or two customers, we'll usually move on. It's too risky.

Audience member: The letter to shareholders, as well.

Fischer: Yeah. The letter to shareholders every year summarizes the year well, too. So the 10K for those core business factors is great and then the quarterly's for the financials. Yeah. Yeah.

Audience member: And I'm Gerald* from, member from New York. Thank you very much for your session on diversification and these. My question is if you did on your last of the four pitfalls, if you did say have the good fortune to buy Netflix at 25, and it's a 20-bagger, and it's now 50% of your portfolio, given that you start with like a 3 or 4% position, at some point do you decide, I just am not going to own something bigger than a certain amount or that in itself is too much risk? I'm not sure what, I'm not sure what the answer is, but I don't know.

Fischer: It's such a great question. I don't want to give a cop-out answer. I do think it's personal risk tolerance, to a large degree. But you do reach a point where for anybody, if something is half of your net worth, you have to seriously consider decreasing that. I am comfortable personally with 10% even 15% in one position that I know really well. If it grows beyond that, I have to really consider whether I want to keep it that size, and depending on where you are in your life, you're either possibly adding more funds and that'll shrink its size a little bit, but in the case of a Netflix multi-bagger like that, that won't be the case. You may have to trim some. You could use options to protect it, but that'll be expensive to some degree.

But yeah, I think everyone has their own point where the risk is too high and that's largely up to your situation, I think. But 10%, 15% is a good baseline for me to start to really think about what to do.

Audience member: This is a great presentation. One question I have about predicting and forecasting. Is when you're doing, say, cash flow analysis and valuation, and you're predicting revenues and trying to discount that back. How do you balance that?

Fischer: It's a great question. How do you avoid forecasting, which is what we want to avoid? There, too, we are looking at history, and we're looking at how the business, it's not a static history, the business has typically grown over time, and so you have the history of as it grows at this rate, how do things change? How do margins change, how do expenses change? And you can factor that into you look at the reality right now where it is and it's almost as easy as extrapolating. Assuming certain key factors are the same, that their cash flow will remain a certain margin or trend higher. Your discount rate is what it is and whatnot, but it's, there's obviously some forecasting involved, but we're doing it as much as we can on the current reality versus history, interpreting history and projecting that forward, just as we would do with the S&P's earnings overall, as well.

But it's much more nuanced with a company, of course, especially when the company is changing, like Papa John's is a good example. They're just recently growing in international markets and they're one of the few chains that have, that is making it work really well. So Billy's had to work really hard to try to estimate how large that market could be, what the margins will be compared to the U.S. market, and growth rates and all those factors and it goes into a range, J.P.'s going to talk about valuation. Goes into a range of possible valuation scenarios that again, kind of look at the past and broaden it to look at the possible futures. But yeah, we try to avoid making predictions. We instead try to kind of extrapolate what we know, if that makes sense. Good question.

Audience member: Larry Quinn from Maryland. Probably a dumb question, but I've had shorts with you for several years, and they've always grown. But now--

Fischer: In a bad way?

Audience member: No, in a good way. I mean, it gets smaller and smaller, but they're a greater percentage. Now, in a down market, I would assume they would go the other way.

Fischer: So with shorts, are they index shorts or?

Audience member: No, I'm thinking, you know, like Caesars.

Fischer: Ah. Five Below.

Audience member: Fin Bear Real Estate.

Fischer: Oh, yup, yup. Yup.

Audience member: And (unclear 1:28:12) and real estate. I mean, they've always been going good, but now in a down market, I thought I'd have to get rid of them.

Fischer: So there's a two-part answer to your question. Two of our shorts, the FAZ and the SRS are inverse ETFs so they're bearish ETFs that were short and so that's a bullish position.

(laughter)

And so in the bull market or a rising market, it's done well. But you're right, in a falling market, those two ETFs will work against us. But we still believe that financial stocks are a reasonably priced and that real estate is reasonably priced, so we plan to keep those shorts. They've become very small now, which is a nice thing when a short works out, even if it runs up a bit against us it won't affect the portfolio much, and there are so many things working against those ETFs, including their leverage, over the long-term that we think the good shorts should just keep riding toward nothing as long as we can. So those two shorts, we'll probably keep 'cause they're so small. As long as we believe the valuation are reasonable on banks and real estate. 'Cause again, in essence, these are bullish bets on those two sectors.

And then our other shorts, Caesars and Five Below, have gone down despite a healthy market. Will they revert back in a bear market? We hope not. We don't believe so at the moment because Caesars, anyway, is a very weak and crippled business. We'll see how the lawsuit bankruptcy comes through. And Five Below we just think is overpriced and in a bear market, people will, we hope, believe that with us even to a greater degree. So our ideal is to find shorts, company shorts that do well whatever the market does, like those two have so far. But if we believe they have lived up to their potential and we should get out because some shorts, some bad companies will do well in a bear market. The money will go to what's already beaten down. Then we'll get out if we feel we should. It's a good question.

Audience member: In the handling of the 10-Qs 10Ks, gap versus non-gap is what kind of like to hear addressed.

Fischer: It's a real problem, a real issue. And I struggle with it, I think we all do. Because gap results, a handful of our companies, especially Facebook stands out, are very different compared to non-gap. So if you value Facebook just on gap, it looks a lot more expensive than it does on non-gap. The struggle that we have is the market tends to, now more than ever, value things on non-gap. That's what's cited, that what leads in press releases and research from analysts. And it seems to be what's driving stocks. All these so-called one-time charges whether they're currency related or stock grants, there's this delusion or this suspended belief that that's a one-time charge, even though they keep recurring. But people are forgiving of these charges. So we kind of take the middle ground and hope that on both the gap and non-gap basis that the companies look reasonable for the cash flow they're creating and what we, you know, model for them. How we model for them to grow over time.

Audience member: Going through your discussions, do you represent both the gap and non-gap and publish it to us?

Fischer: You know, we should more than we do. I don't think we have that much. Because most of our companies, thankfully, are very close. Oracle, for example, its gap results are better than its non-gap results. The only one that really stands out that I can think of is Facebook because it pays so much money in stock compensation. Its non-gap results are much stronger than its gap results. And right now we're seeing on a lot of our companies, Coca-Cola included, the currency exchange gap versus non-gap. Or even Tupperware, that grew sales 7% excluding currency last quarter. But negative growth, including currency. With currency, though, we cut a break because we know currencies will fluctuate typically within a couple years, and eventually it'll be a tailwind. But on other charges that are recurring, Facebook included, we can call that out more frequently. But we try to see that it's reasonably priced on gap and non-gap. Good question.

Audience member: Hi, Brent from Kentucky and I want to thank you for a wonderful presentation. And you were talking about anchoring on data and that there's some useful data and a lot of irrelevant data. And also, talking about maybe buying more winners and selling losers. And I just wanted to focus for a second on the purchase price, and what you purchase at really only has one consequence, which is in a taxable account, whether you pay capital gains or capital loss. But other than that, it has no effect on what a stock will do in the future.

And so I know in my own stock research, I like to periodically review the stocks. But I never look at what they've done, if they've gone up, if they've gone down, 'cause it has really no effect on what the company will do in the future. So I'll look at it for a capital gains or capital loss maybe, but as far as evaluating what I think the stock will do from here, whether I've gotten a double or a quadruple, or my position's been cut in half, the stock doesn't know that and it does care, so that sort of goes in my book into that irrelevant data.

Fischer: That's a great way to look at it and a really healthy way to look at it. I think you're in very rare company.

(laughter)

I think most of us have a really hard time not anchoring. Do we have a win or a loss here? Do we, how much have we gained or lost? But it's interesting. On TD Ameritrade, you can remove your prices if you want. You can show prices or not, turn them on or off. If you turn them off, try turning them off for a week or two, and your perspective is very different. You're not as, as, you know, what's the word? You're not as thrown or you don't lose your calm when prices are changing as much as you might otherwise if you're watching, and you're right, you don't look and see, here are my big winners. You just see all the companies you own with no numbers next to them. And it is a different feeling and approach; so that you can do that automatically is great. I know many of us struggle with anchoring on the price we paid. But you're right, it's not relevant, aside from taxes.

Great point. And we have to cut for a break, so thank you all again very much.

Papa John's Moves Back to Buy

Published Mar 10, 2015 at 2:33PM

Pro's Take: PZZA Q4-2014 Earnings and FY-2014

Papa John's International (NASDAQ: PZZA)

Quarter Quick Take

Papa John's delivered strong results for full-year 2014, as North American restaurants increased comps by 6.7% and international restaurants increased comps 7.4%. EPS grew 13.4% for the year, juiced by ongoing debt-fueled buybacks. Limited-time offers, effective marketing, and continued migration to digital ordering (which garners higher average tickets and now makes up more than 50% of total sales) helped drive comps higher. These growth rates suggest continued market-share gains at the expense of smaller rivals and other large pizza chains. Financial results are finally starting to turn the corner after several quarters of elevated spending and high commodity costs, which began to moderate in the last quarter of 2014. Papa John's continues to focus on quality and measured international expansion, and the company looks set for a solid 2015 despite conservative full-year guidance from management that may have room to increase as the year progresses.

....

Q4-2014 | FY-2014

Total revenue growth: +9.7% (vs. +5.6% in Q4-2013) | +11.1% (vs. +7.2% in FY-2013)

Operating profit margin: 7.9% (vs. 7.3% in Q4-2013) | 7.4% (vs. 7.4% in FY-2013)

EPS growth: +26.1% (vs. +10.1% in Q4-2013) | +13.4% (vs. +18.8% in FY-2013)

....

Guidance Update

After reviewing Q4 and full year 2014 results, **we are moving Papa John's back to Buy**. Accelerating comparable-store sales, continued success overseas, moderating commodity costs, and the roll-off of recent business investments have led to strong performance for 2014, and the outlook remains promising for 2015 and beyond. Papa John's is doing what it's done for a long time: supporting franchisees during times of rising commodity costs, expanding overseas at a measured pace, and maintaining its focus on quality. The future is far from certain and results may be lumpy, but the long-term economics of the business remain very sound.

Updated Guidance: Buy (from Hold)

Recommended Allocation: 4.5% plus partial covered calls. See concurrent trade alert here for more details.

Fair Value estimate: $54 (up from $46)

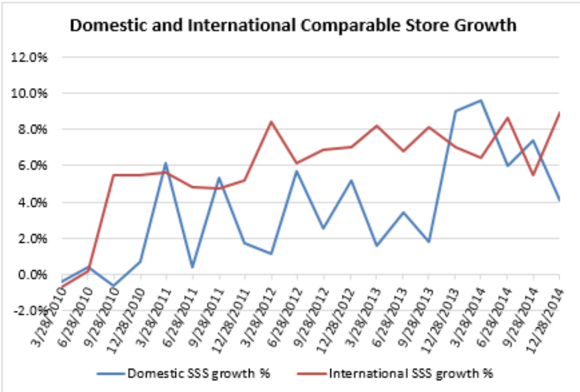
PZZA's valuation multiples are near their historical highs at 35x TTM P/E (32x 2015 earnings), 17x EV/EBITDA, and 39X EV/FCF, but recent performance and operating trends support those expanded multiples. For context, **Domino's** (NYSE: DPZ) trades at 19x EBITDA and **Dunkin' Brands** (NASDAQ: DNKN) at 16x. Papa John's is finally beginning to benefit from its recent investments, and 2015 looks to be a year of continued financial success.

Our Thesis

Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main QSR-pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only about 1,300 international restaurants the company has a long runway for growth (compare to Domino's which has over 6,000 international stores). Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

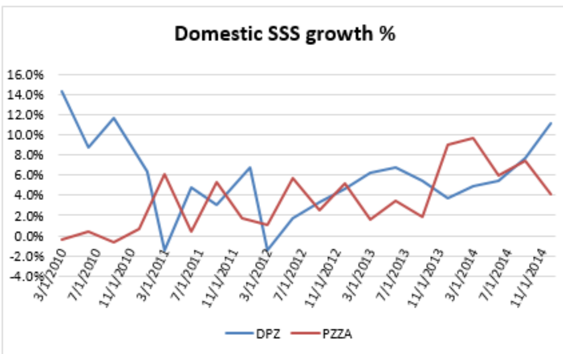
The Most Important Things

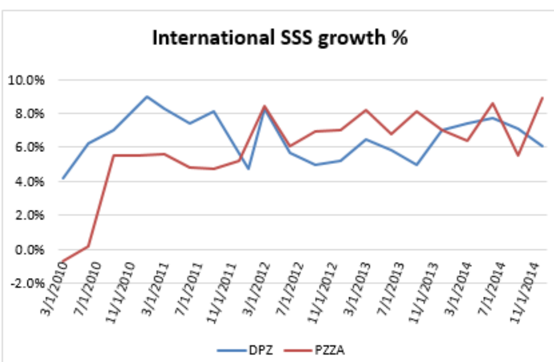
1) Store *Performance:* During Q4-2014, systemwide restaurant sales increased +6.6%. Domestic comps increased +4.1% while international comps increased +8.9%. Management offered full year 2015 guidance of +3% domestically and +6% internationally. This was a bit of a disappointment given that 2014 domestic and international comps were +6.7% and +7.4% respectively in full year 2014. Analysts probed into the comps guidance, and management signaled that perhaps they're sandbagging a bit. PJ does have a history of setting relatively conservative guidance and then raising it later in the year as they did in 2014, and CEO John Schnatter stated on the call that "I'd rather underpromise then overdeliver". Hopefully performance in 2015 will prove to be better than guidance, but our valuation doesn't count on it (our base case assumes low-to-mid 4% comp growth systemwide). But overall, performance in 2014 was very good as comps (particularly internationally) accelerated, and the solid restaurant performance keeps franchisees signing up: PJ opened 235 restaurants (net) in 2014 and expects to open 220-250 (net) in 2015. Its pipeline consists of 200 domestic commitments and 1,000 international commitments (the majority of which are scheduled to be opened over the next six years).



Source: Company filings.

2) Brand: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantages and higher price per pie. As the U.S. pizza market grew at about 3% in 2014, Papa John's domestic full year comps of 6.7% show that the company continues to gain share versus the industry and its brand positioning remains strong. Relative to its strongest peer, Domino's modestly outperformed Papa John's domestically, but Papa John's has a slight lead over Domino's internationally, which is where most of future growth will occur:

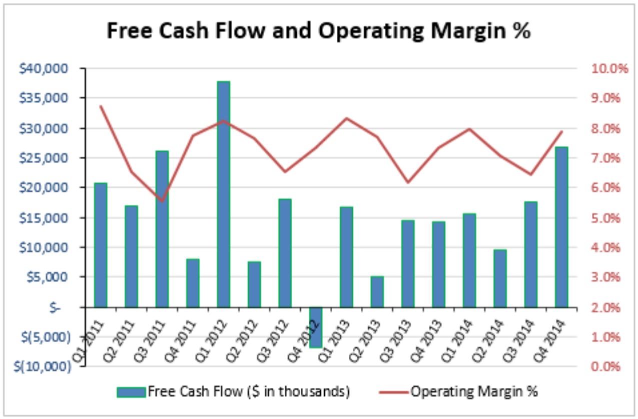




Source: Company filings.

It's interesting to track the international comps performance of Domino's vs. Papa John's since they take different strategies on international expansion-Domino's has focused on expanding quickly in its top 10 markets, while Papa John's expands more slowly across a variety of markets. Papa John's recent success in generating strong international sales growth provides evidence that its brand and expansion strategy are translating overseas.

3) Margins: Ultimately, we expect the capital light business model to result in higher operating margins that propel free cash flow generation. In the near term, we expect Papa John's to continue to spend heavily to support the build-out of its new POS system (FOCUS), and international infrastructure and development. This trend continued in Q4-2014 and full year 2014, with the FOCUS rollout alone impacting EPS by $0.02 and $0.06, respectively. But cheese prices have finally moderated (currently hovering around $1.50 per pound vs. a high of $2.50 per pound in mid-2014), and that along with lower gas prices provided a boost to free cash flow and margins (as we expected):



Source: Company filings and analyst calculations.

Comments from management suggest that margin performance should continue to strengthen (Schnatter about Q1-2015: "margins are just good as they ever have been") and as FOCUS costs should mitigate after the first half of 2015, I'd expect to see free cash flow continue to rise from 2014 levels.

WWTN

Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. Near term headwinds (commodity prices and technology investments) should prove temporary and Papa John's should deliver improved financial performance.

Establish a Partial Allocation of Covered Calls on Papa John's

Published Mar 10, 2015 at 2:19PM

Is this for you? This is only for *Pro* members who own a full allocation (currently 4.5%) in **Papa John**'s (NASDAQ: PZZA), for the equivalent of at least 300 shares of stock. For those with smaller portfolios, or for those who have yet to establish a position or who own a partial allocation, see the Alternative Trades section below.

How You Participate

- **Trade:** Sell to open October 2015 $65 calls.

- **Allocation:** Cover one-third of your shares. Pro owns 1,800 shares, so we will be selling six calls to cover 600 shares.

- **Price Guidance:** Papa John's options are thinly traded, so **it is critical that you use a limit order.** For now, aim for a credit of at least $3.25, but realize that the value of the calls will fluctuate with the stock. These calls expire in seven months, so there is no rush to set them up. Those who are patient may be rewarded with a higher premium if volatility leads to a higher stock price between now and October expiration.
- **Recent Prices:**
  - Papa John's: $60.90
  - October 2015 $65 calls (bid/ask): $3.10/$3.50

What We're Thinking

Shares of pizza purveyor Papa John's have been volatile over the past year, reaching a high of $55 in March 2014 and dropping more than 30% to a low of $38 in September, then soaring again by 70%-plus to a recent high of $66 per share just a few weeks ago. That has led *Pro* to a cycle of guidance updates, with the stock moving from Hold to Buy and back.

Now, after analyzing the most recent quarter and reviewing our longer-term expectations, we have decided to move Papa John's back to Buy. We believe in the long-term upside of the stock, but we also recognize that the current price reflects rosy (but we think achievable) expectations and that there may be short-term volatility if the company's recent momentum slows.

With this trade, we aim to take advantage of that volatility by selling a partial position of covered calls. This trade will help us manage our Papa John's position as we move forward by giving us a predetermined sell price on a portion of our shares, reducing our allocation (and thus our position-level risk) when the share price reaches a level where we are happy to sell. In the meanwhile, we also benefit by earning some income and by buffering a portion of the potential downside of the stock.

With a net sell price of about $68.25 per share (26% higher than our fair-value estimate) for these covered calls, we maintain 12% upside from the current price on one-third of our Papa John's position, and we maintain full upside for the remaining two-thirds. If the stock price stays below $65 per share by October expiration, we'll have earned a small premium that in effect reduces our cost basis in the stock and eases a portion of its downside volatility.

In other words, this partial allocation of covered calls serves as a position management tool. Because we believe in the company's long-term upside but recognize the potential for downside volatility, we are aiming to achieve a positive outcome in either scenario. If the stock continues to rise, we still own most of the upside and we stand to benefit. And if the stock price falls, we earn some income and mitigate a small portion of the downside. These partial covered calls are in line with our belief in holding excellent businesses even if they seem slightly overpriced.

More That Matters

- **Maximum Loss:** The same as stock ownership, minus the credits we received for selling the calls.
- **Maximum Gain:** Our upside is capped at $68.25 for the shares we cover with calls, or about 12% higher than today's price.
- **Breakeven:** The breakeven point on the covered shares is $57.65.
- **Follow-Up:** If shares are above $65 at expiration, we'll likely sell the shares that are covered, leaving us with about a 3% allocation.

Alternative Trades

- **Working with a smaller portfolio and own a full 4.5% allocation?** If you can't easily cover one-third of your position, leave your shares alone — we believe in the long-term upside of this stock. If you are more cautious, you can sell enough to achieve a 3% allocation and then look to reestablish a full allocation if the stock price retreats closer to our fair-value estimate.
- **Own a partial position or don't yet own shares?** If you don't yet own a full allocation in Papa John's stock, then aim to match our partial covered call position with a buy/write covered call on the first 1.5% of your allocation, then buy 3% more in unencumbered stock. If you are more cautious, you can build up the remaining 3% of your allocation gradually.
    - **Working with a smaller portfolio?** If you own a partial position or don't yet own shares and can't easily match our one-third covered-call position, then aim to patiently match our *stock* allocation of 4.5%. Shares are volatile, so it may make sense to build a full allocation over time. If you want to use written puts to help you build a position, the July $55 or $57.50 puts currently offer an effective buy price (if exercised) near our fair-value estimate. Be aware that with written puts, you forgo the upside of the stock.
- **Prefer a shorter time to expiration?** You can look at the July $65 calls instead of the October $65 calls. The absolute dollar value of the July calls is lower than the October calls, but the yield per day is higher.

Write Diagonal Calls on American Airlines

Published Mar 10, 2015 at 1:58PM

Is this for you? This recommendation is for all *Motley Fool Pro* members who own calls on **American Airlines** (NASDAQ: AAL), or are ready to buy them now, and who don't mind the potential hassle of managing diagonal calls with us to target periodic income.

How You Participate

- **Trade:** Sell to open April 10, 2015, $52 calls on American Airlines. *Please note that these are **weekly** options*.
- **Allocation:** Sell one call for every January 2017 $35 call you already own (or are buying now). *Pro* will cover its 10 long calls.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a limit order at going prices as long as you get at least a 3.5% yield on your long January 2017 call value (see the math below).
- **Prices** (March 9):
    - **Stock price:** $46.78 (as of 1:40 p.m. 3/10/15)
    - **Sell to open April 10, 2015, $52 calls (bid/ask split):** $0.68
    - **January 2017 $35 calls we own (bid/ask split):** $17.50
    - **Diagonal call yield:** $0.68/$17.50 = 3.9% in 31 days.
- **Catch-Up Trade:** If you're setting up the whole trade today, use a diagonal call order to aim for a net debit of $16.85 or so. Invest about 1% of your funds in the long calls if you're matching our allocation.

What We're Thinking

What *are* we thinking? We only bought our long calls on this resurgent airline about six weeks ago, but even in our original report we said we might follow up by writing diagonal calls. Frankly, we're doing so because these calls pay so well -- but of course, that very fact could be a warning sign to call writers like us. High premiums suggest the market expects volatility, and it's true that shares could rebound and fly high, leaving us unpleasantly required to roll these short calls to catch up. That said, the country's largest airline looks undervalued, and we think the stock could indeed soar much higher by 2017 — but 2017 won't be here in 31 days, when today's calls are set to expire. We see this as a chance to earn some income before the company reports earnings in late April.

These written calls could pay us as much as 3.9% on our current long call value in just one month, and they'll expire before earnings on or around April 22. Plus, our $52 strike price is 11% above the recent share price, and our net "sell" price of $52.68 is 12.6% higher. Of course, we don't plan to close or sell, so we'd have to roll and potentially pay a credit if the stock increases that much in a month.

Why This Strategy?

American Airlines stock is down since its January earnings for several reasons. Management is intent on spending its copious cash flow on employee raises, airplane seats, check-in counters, and airport lounge improvements. They're also seeing more competition in some markets, and they expect lower revenue per seat mile in the current quarter than Wall Street hoped. None of that deters us on our longer-term thesis, but it's all put a damper on the stock lately, and it's hard to imagine the fog will lift completely in a month.

Wall Street will probably need to see earnings in late April before seriously reassessing the stock, likely giving us a chance to earn some income now that we've waited several weeks after January earnings for a price recovery that hasn't come. We seek to make one cup of lemonade out of this current lemon, and then leave it uncovered for upside again (we hope) with April's earnings. That's the plan. It's possible some folly will result. But sometimes we're OK with accepting a low risk of missed upside in the name of current income.

More That Matters

- **Maximum gain:** The 3.9% premium earned from writing the calls, plus upside in our owned calls to our short call strike price at $52, which is lately 11% higher.
- **Maximum risk:** The full value of our long $35 calls, minus premiums received from short calls.
- **Follow-up**: We hope to see these short calls expire for income next month, and then wait to see earnings results. If we need to roll or close, we will.

Alternative Trades

- **Own stock?** If you bought 0.5% to 1% in stock instead, and that equates to 100 shares or more, you can write covered calls if you wish -- sell to open the same April 10, 2015, $52 calls we're writing.

Options Can Help

FoolFest Folly: Four Portfolio Pitfalls

Published Mar 9, 2015 at 4:13PM

Dear *Pro* members,

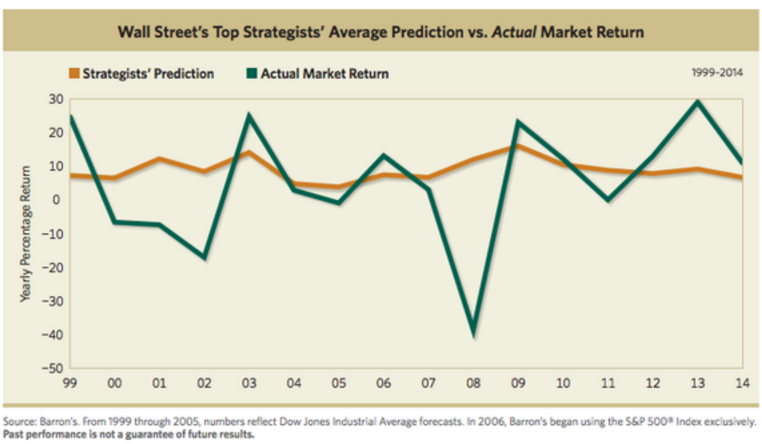
We greatly enjoyed hosting nearly 200 *Pro* members last week in Alexandria, Va., for TMF's annual FoolFest event. We hope to see even more of you next year! The Westin conference room was packed with about 700 Fool members in total. Many of them were *Motley Fool One* members, and many of those started with *Pro* and *Options*. It's always a pleasure to put a face and a life story to a name. At Fool events, there's also a third dimension: The mention of a screen name can make you realize you've known the person online for years. It's exciting to finally meet them in "real life"! Fools flew in from all around the world: Spain, Mexico, Venezuela, Alaska (yes, I know it's part of the United States ... sort of), you name it.

In the four-hour *Pro* breakout group, we enjoyed long Q&A sessions with members alongside four presentations (all of which will be available on the site shortly). Billy offered an educational deep dive on **TD Ameritrade** (NYSE: AMTD), explaining the drivers of the business and why we rate it a Buy First, as well as predicting new highs for the stock by last Friday — which it did achieve (or maybe he didn't bother to predict it; he just knew it). JP spoke about how we value companies, using **AmTrust Financial** (NASDAQ: AFSI) as an excellent example. Jim Gillies represented *Options* with a chat on how he buys LEAPS on beaten-down blue chips. I had to be the downer in the group and talk about portfolio pitfalls, though at least I was able to offer some solutions.

Let's run through those four pitfalls and solutions today, as reinforcement for those who attended and to share them with those who did not.

Portfolio Pitfall No. 1: Forecasting

Forecasting is a pitfall for your portfolio for a few reasons. For one, nobody can consistently forecast earnings, GDP growth, the S&P 500, or anything else for that matter. Yet we're too often prone to changing our portfolios because of forecasts — loading up on certain stocks, selling others, or even getting out entirely. Those are certain ways to derail your goal of a balanced portfolio. From Davis Advisors, look at how well experts were able to forecast the largest S&P 500 decline in decades:



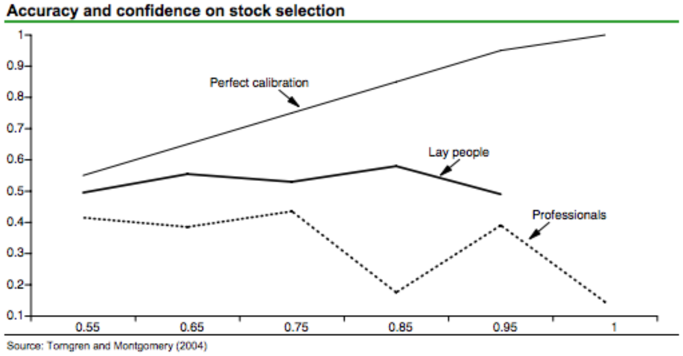
They completely whiffed. So why listen to them for anything else? Indeed, *The Wall Street Journal* has reported that throwing darts would have resulted in more accurate market predictions than the professionals gave, all the way back to 1929.

Solution: Instead of using forecasting to make decisions, we look at the current reality and compare it to history. Lately, the S&P 500 trades at around 17.7 times earnings — within its historical average, albeit at the higher end. We then take into account record-low interest rates, high margins, and so on to reach a take on the market. We do the same for our individual companies, looking at the current reality, comparing it to history, and adjusting our thesis for where the business stands today. That's right: We have theses, rather than forecasts. A thesis has vulnerabilities by definition, while a forecast welcomes overconfidence, leading to poor choices.

Portfolio Pitfall No. 2: The Illusion of Knowledge

Studies show that beyond a certain point, more information *does not* lead to better decisions — in fact, it makes for worse outcomes. Having mountains of data sloshing around in your head can lead to overconfidence, clouded judgment, and suboptimal results. What you need instead is the appropriate *core* information needed to make a decision. Much of the rest is noise.

This is important to us, because at *Pro* we seek high accuracy. We want as many of our positions to make money as possible. Studies show that the more data you gather, the higher your confidence but the lower your accuracy. Take a look at the below, from James Montier's paper, "Seven Sins of Fund Management." Accuracy percentile is shown on the left (Y) axis, and confidence percentile on the bottom (X) axis:



The more confident a professional investor becomes, in most cases, the more their accuracy declines. In fact, accuracy plummets down to just 15% at the 100% confidence level (the bottom-right of the chart). That table-pounding analyst is dead wrong. On the left side, when the pro investor is only 55% confident, accuracy is around 40%. Which begs the question: Who are these pros? They're not strong in either case. The lay person does much better — that's you, Fools.

Solution: We discount or ignore secondary sources (the constant news cycle, talking heads, conflicted brokers, opinionated bloggers) and focus on primary sources instead: SEC filings, company conference calls, and audited financials; our own heads to synthesize it all; and independent research to show us the big picture. When it comes to our companies, we use this information to affirm competitive advantages, pricing power, growing margins, strong financials, and proven management. We want enough information to have a strong thesis, but not so much that we're overconfident or clouded.

Portfolio Pitfall No. 3: False Diversification

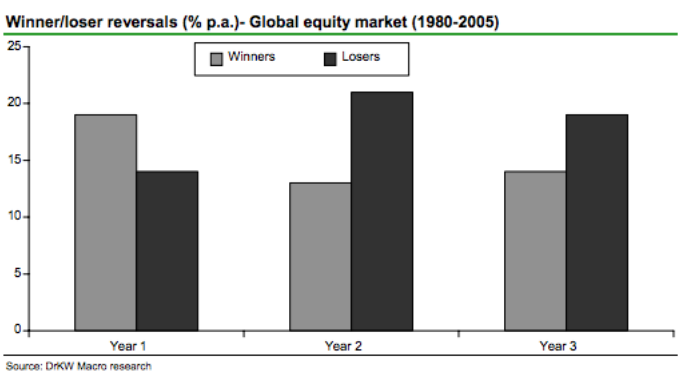
The number of positions you need to be diversified is debatable, with some research claiming seven companies is enough, and other data suggesting you need 12, 30, or even 100 stocks from around the world. Given *Pro*'s goal of having winners in up, down *and* flat markets, we can simplify the idea of diversification to this: *If all of our positions are moving together, we are not diversified*.

We want some positions winning when nothing else is, we want some laggards when everything else is winning, and we want some gains when the market is not going anywhere. We want to address all types of markets at the same time in our portfolio. So we have, all at once:

- Stocks for long-term compounding in bull markets
- Shorts for bear markets
- Options for flat markets (among other uses)
- Hedges for the unknown

We want our portfolio to have some positive outcomes whatever the market is doing, and we want to be able to take positive actions in all markets, too. If every position is moving together all the time, the portfolio is too binary for our goals. In addition to multiple strategies, we want some losers like our **WisdomTree Emerging Markets SmallCap Dividend Fund ETF** (NYSEMKT: DGS). Why?

Because losers eventually take the lead from winners. Many investors make the mistake of chasing winners (and selling their losers), ignoring studies that show that within three years, losers often catch up to — or even surpass — past winners. With the average stock held only 11 months, most investors don't have enough patience to see their losers turn green. If you still believe in your losers, keep them. From Montier again, here's how previous losers (presumably with good fundamentals) catch up:



Interestingly, studies also show that value stocks rival growth stocks for total long-term EPS growth. But growth is granted a higher multiple to earnings (meaning higher risk). So you want to own both, especially since sometimes growth is in favor, and sometimes value.

Solution: All of our positions should *not* be moving together. We use diverse strategies with inverse correlation. We also want to continue to own high-P/E stocks (growth) and low P/E stocks (value) — as well as winners *and* losers we still believe in.

Portfolio Pitfall No. 4: Mismanaging Winners

Too many investors sell winners when they have a double (or some other arbitrary number) or to "lock in gains." Instead, you should consider *adding* to your proven winners. Imagine if we had added a bit more to some of our stocks on their first double — **Papa John's** (NASDAQ: PZZA) or AmTrust, for example — rather than trimming.

We all need to be mindful of our total risk in any position, of course, but selling winners has almost surely left more wealth on the table for investors in aggregate — hundreds of billions of dollars, if not trillions — than any other mistake. Warren Buffett has it right: He *builds* on winners, adding for years on end. He bought shares of Geico through the 1970s and into the 1980s, before buying the whole company in 1996. He bought **Coca-Cola** (NYSE: KO) shares for years. He has been buying more **Wells Fargo** (NYSE: WFC) stock almost yearly since 1989. He is "building mountains" with his favorite companies.

Solution: Flip the notion of how you manage winners on its head. Rather than selling winners, consider adding a bit more to them. Consider building up your winners over many years.

Say it with us: You can't predict the future. You don't need endless amounts of information. Not all of your positions should be moving together. And you can give more — more time and/or more money — to your winners.

FoolFest 2015 in the History Books

Thank you to everyone who make the trek to D.C. for a wintry get-together! We enjoyed seeing many of you again and meeting others for the first time. By the way, for next year's FoolFest, we're hoping to have at least one *Pro* company executive visit to give a speech. This year, the CEO of **Skyworks Solutions** (NASDAQ: SWKS) was interested, as were AmTrust officials, but the dates didn't line up. Next year? We hope to see you there, too.

— Jeff (TMFFischer)

Pro Performance

Performance as of 2/28/2015

	Annualized		
	Since Inception	Rolling 3-Year	YTD

Pro Completed Trades

- **SPDR S&P 500 ETF** (NYSEMKT: SPY): Per Friday's trade alert, we set up two put ratio spreads, setting up the June 30 spread for a cost of $0, and the September 30 spread for a $0.40 net credit.

Pro Catch-Up Trades

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

- Please see our Portfolio Positioning Report, which was issued today. It has five trades (shorts and options) for those not yet partaking in those positions, and a brief update on all of our positions on Hold or that are not currently timely for newcomers.

Portfolio Positioning Report: March 9, 2015

Published Mar 8, 2015 at 1:29PM

Welcome | Shorting in Short | Hedging ... in Short | Your Exposure | This Stuff Is Optional
Options Are Optional, Too — but Advised! | About This Report | The Positions Themselves (Shorts, Hedges, Options, All the Rest)

See the replay of our March 9 live event

Dear *Pro* member,

Our first two Portfolio Building Reports gave you guidance on all of *Pro*'s Buy First and Buy stocks. This final report will do the same for our shorts and options positions, many of which we use as hedges. For reasons I explain below, we don't expect that many of you will initiate all of the positions in this report right away, or perhaps at all. And that's perfectly fine!

Hedging is about lowering portfolio exposure, and to a lesser extent, shorting is as well. They're tools to tweak and adjust your *existing* portfolio, so if you're still building your collection of long stocks, concentrate on that for now. Stock investments are the core of the *Pro* portfolio, and by owning *Pro* stocks, you are positioned to compound your value over time. We know there's a learning curve for some of these strategies, as well, so it's important you know there's no rush; you can incorporate the positions in this report when you're ready. We're here for you in the meantime.

Before explaining the positions themselves, I'll discuss how each strategy works. Let's start with shorts — a sort of "anti-investment" that we believe will decline in value, adding profits to our portfolio in the process.

Shorting in Short

When you sell something short, you borrow shares from your broker and immediately sell them, collecting the proceeds. At various brokers, this trade action is called "sell short," "sell to open," or just "sell." In the future, you'll need to buy shares back to replace the ones you borrowed and sold. This second step is called "cover," "buy to cover," or "buy to close." You hope to buy the shares back at a lower price than when you opened the position.

The difference between your original sell — or short — price and the price you pay to buy back (and return) the borrowed shares is your profit. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock soars to $30, you've lost $10 per share when you buy it back. We use shorts in *Pro* because they're one good way to profit when the market or a weak company falls, but they do come with their own risks — shares can be hard to borrow, fees are often involved, and a short can get closed on you (you're forced to buy it back) if the broker wants the shares back early. So, we need to size our short positions appropriately small.

Finally, a special note related to *Pro*: We do short individual companies, but we really like to short flawed investment vehicles, typically ETFs that use leverage. Because of the way they're constructed, these ETFs are all but destined to lose value over the long haul. This makes them expensive to short, but as we've shown, it can be worth it.

Hedging ... in Short

Similar to a short but different in intent, a hedge is a position taken to *offset* the risk we have in another position or in our market exposure as a whole. So, when we sell short a market-index proxy like the **SPDR S&P 500** (NYSEMKT: SPY) ETF, we are hedging our exposure to the stock market as a whole. A hedge is a form of insurance — it only pays out when you need it. We know a market-index hedge will go up in value whenever the market goes down, because like insurance, it's there to protect us in that very situation. But most times, the market won't fall, and our hedge will go unused.

For this reason, we try to spend relatively little to hedge, but the costs can still add up. We have to reconcile this with the fact that hedging lets us stay *more* invested than we otherwise would, given our absolute-return goals. In other words, one key way we profit from our hedges is by using them to help us keep our long stock exposure higher. As with shorting, you should only hedge if you have specific stock or stock market exposure you want to "hedge out." Recently, *Pro* issued two hedges — put ratio spreads — using the SPDR S&P 500. Those are our current market-hedge recommendations for anyone who wants to hedge up to 20% of their long exposure.

Your Exposure

Let's talk about your market exposure. This is simply how much of your total portfolio is invested in long stocks. Excluding options and shorts, Pro is 86.4% invested in long stocks as of March 6. That's high for an absolute-return portfolio (which is part of why we want to short and hedge!). But for new *Pro* members, four stocks — accounting for 18.8% of our exposure — are on Hold. So if you bought all of our current buys, you are only 67.6% invested in stocks. You have less reason to hedge and short right now (unless, like many members, you own other stocks beyond *Pro*'s). The bottom line is: As you consider adding hedges and shorts to your portfolio, first know how much of your portfolio assets are invested in stocks. That helps dictate how much shorting or hedging exposure you want to initiate to reach the *net* market exposure you desire. Pro has averaged around 70% net long exposure over its lifetime, but that number will move up and down as our opportunities do. Our exposure is shown at the bottom right of the Recommendations page.

This Stuff Is Optional

Not every *Pro* member is comfortable with shorting or hedging, and there are practical considerations to take into account as well. First, you need a margin account to sell short, so you can't do it in an IRA. Second, you have to accept that shorts can run strongly against you, so you need cash to cover that risk. Third, you'll usually pay an annual fee of anywhere from 1% to 5% of the daily short value to short something. Fourth, in many cases it's hard to borrow shares to short, period. That is the situation with some of our current shorts today. Finally, short shares can bought away from you at the worst time, when they're up in price (a "forced buy-in"). If brokers can no longer find shares to borrow, you're forced to "buy in" at market prices to return your borrowed shares.

So what to do? You can use options to short in some cases; we do, and we explain how to do so wherever appropriate. You can also consider opening a brokerage account that is particularly friendly to shorting. Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does, and does not charge a fee for shorting. Or, you can wait and see whether shares become available in your existing, traditional brokerage account (be aware that at many brokers, certain shares are basically never available for shorting). Or, if you're not drawn to it, you don't need to short at all.

Options Are Optional, Too — but Advised!

Our options positions are also ... optional, but we strongly advocate learning to use options and following along with ours over time. Options are powerful tools for income, hedging, upside, and more. We know from experience that they're worth the time it takes to learn them, and we're here to help you do that. Options can make you a much more confident and versatile investor, and they can free up whole new streams of income for you and your family. So, if you're new to options, you're in a great place! Use *Motley Fool Pro* and our sister service, *Motley Fool Options* (free for the life of your *Pro* membership!), to learn how to use these great tools. On a personal note, if you're going to learn just one simple strategy, I suggest learning how to write puts (link goes to *Motley Fool Options*) for income or to buy a stock lower.

About This Report

Let's return to the main show. This Portfolio Positioning Report and the special live chat accompanying it today, March 9, at 3 p.m. ET, will (when you're ready!) help you short vehicles we believe will decline, hedge your portfolio, and generate returns from options. Do keep in mind that this is just a start; we'll have many brand-new investment recommendations arriving to your inbox as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way!

On the other hand, if this looks overwhelming right now — or if you're still catching up with our core stock positions — that's perfectly fine, too. You don't need to start these positions now. As mentioned, long positions are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and often rewarding — aren't necessary to succeed with *Pro* in the long term, let alone immediately. As you learn these strategies and progress with us, just keep your exposure to the stock market in mind.

In closing, I'll stress again that you shouldn't feel pressured to act immediately. We will continue to make recommendations on an ongoing basis, including in our Monday Catch-Up Trades — and brand-new opportunities emerge regularly. That's part of the fun! So, take your time, and make an investment only when you're ready. Finally, please bring any questions to our Making *Pro* Fit You discussion board.

Foolishly,

— Jeff Fischer, *Pro* advisor

CurrencyShares Euro Trust (NYSEMKT: FXE): Sell Short

Shorting the euro against the dollar is relatively low-risk disaster insurance.

Suggested Short Allocation: 1.9% to match us

How It Fits Into *Pro*

We've been short the euro against the dollar since late 2011. We view this position as a quiet anti-investment in which the risk to us is relatively known (and reasonable) and the profit potential, while less clear, is worth pursuing. Although we are up 18% on the position as the euro has declined to a recent $1.07 to the dollar from about $1.30, parity to the dollar is still a possibility, and it needn't stop there. With interest rates ready to increase in the U.S., and with Europe starting a massive bond buying program, the dollar may be preferred to the euro for at least a few more years. And if Greece or other euro members default, the euro could be badly punished. The vehicle we're shorting (it's called a trust, but trades like a stock) only holds physical euros, so it's a pure way to short the euro against the dollar in our U.S.-based brokerage account.

For More

- *Pro*'s recommendation history
- Talk about FXE on our discussion board

Availability

Shares of FXE are often available for shorting at various brokers; the annual fee is lately 1.8% at Interactive Brokers, and there is no fee at TD Ameritrade.

Alternative Trade

If your broker does not have shares available for shorting, and you're trading in a margin account, you can instead set up a synthetic short. "Sell to open" January 2017 $107 call options on FXE, and to buy to open an equal number of January 2017 $107 put options (lately for about a $1 credit, but that price will change). Just realize that you, just like us, are short the vehicle at today's price, and you will see losses if FXE's price goes up. Also, only sell to open one call option for every $10,700 in FXE you can afford to be short, remembering that each option represents 100 shares. We have about a 2% allocation, so to set up one synthetic short and keep it at just 2%, you would need an account value of about $500,000. If 100 shares via options is too large an allocation for you and you can't short fewer shares directly, then just sit this one out! There are no IRA alternatives at this time that are attractive enough to merit your IRA dollars.

Direxion Daily Financial Bear 3X (NYSEMKT: FAZ): Sell Short

Daily leverage keeps steady downward pressure on this bearish ETF.

Suggested Short Allocation: 0.4% to 1% (we are currently short only 0.4%,
as the position has shrunk nicely, but we may add to it opportunistically)

How It Fits Into *Pro*

This bearish ETF is meant to provide 3 times (300%) the daily inverse results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. By shorting this ETF, we're effectively 3 times long, on a daily basis, the U.S. large-cap financial sector.

As we touched on in the introduction, leveraged ETFs like this one are flawed because they rebalance their derivative positions daily in order to maintain a constant leverage. Over longer holding periods, the costs involved with rebalancing eat away at returns, keeping downward pressure on the vehicle as a whole. Also, returns are compounded daily, which adds to tracking errors. As our original buy report details, we continue to believe that large-cap U.S. financials are cheaply priced — and we own several of them as a result. That belief makes shorting this flawed bearish financial ETF all the more attractive.

That said, shorting it has become difficult over the years, and our position size has dwindled severely. New members can skip this position if shorting it proves difficult (or use options if you have a six-figure account). We own plenty of strong financial companies instead.

For More

- *Pro*'s recommendation history
- Talk about FAZ on our discussion board

Availability

This is hard to borrow! Lately, only 85,000 shares of FAZ were available for shorting at Interactive Brokers at a 6.3% annual fee. Periodically, TD Ameritrade has shares available with no fee.

Alternative Trade

If you can't short shares directly, then you can set up a synthetic short in a margin account. "Sell to open" January 2017 $12 calls on FAZ, and "buy to open" an equal number of January 2017 $12 puts. Lately you will pay about $0.50 per contract, net. This makes you short FAZ with a start price of $12.50, and sets you up to profit if FAZ declines in price. Only sell one call for every $1,200 in FAZ you are able to comfortably short. On a $120,000 account, one contract would be a 1% allocation. That's as much as we recommend. (Eagle-eyed members will notice that *Pro*'s short position on FAZ is 0.4% of your portfolio. We're recommending 1% to newcomers because we know you'll be unable to short another position we have in our portfolio, SRS (more on that later). There are no IRA-friendly alternatives for this short. If you can't short it at all, you could add 0.5% to one of our financial companies — **Wells Fargo** (NYSE: WFC) or **MasterCard** (NYSE: MA) — instead.

Five Below (NASDAQ: FIVE): Sell Short

This young retail chain targets pre-teens and teens with $5-and-under items, but its stock has been caught up in IPO hype and still looks expensive.

Suggested Short Allocation: 1.1% to match us

How It Fits Into *Pro*

Five Below management would like investors to believe that the company can increase its current store count of around 350 stores to 2,000-plus in the coming years. But a ruthless competitive landscape and notoriously fickle target audience (pre-teens and teens) for this price-capped ($5 max) retailer make us skeptical of notion that the company will continue to achieve above-average growth and profitability. Management turnover and disappointing same-store sales growth for Five Below's all-important holiday quarter suggest that chinks in its armor may already be forming.

The stock is down 17.6% since we first recommended selling it short, but we believe more downside is possible given that it still trades for more than 31 times forward earnings. We'll see a new earnings report at the end of this month.

For More

- *Pro*'s original recommendation
- Talk about FIVE on our discussion board

Availability

Shares are readily available for shorting. Interactive Brokers charges a 0.75% annual fee.

Alternative Trades

The options on Five Below aren't long-term or attractive enough to consider.

Hedges

SPDR S&P 500 (NYSEMKT: SPY): Set Up Put Ratio Spreads

Pro currently has two actively recommended hedges on our portfolio, detailed in our March 6 trade alert on the SPDR S&P 500. Please see that report to see how to set up a 20% portfolio hedge if your market exposure is high (80% or above), as *Pro* has done. (We want net exposure of around 70% or lower.) The trade alert has IRA-friendly alternatives, as well as low-cost spreads for those lacking the cash required to hold open the official trades.

Options

American Airlines (NASDAQ: AAL): Buy Calls

Allocation: 1%

These calls target long-term upside on what we believe is a resurgent, disciplined airline that will enjoy profitable operations.

This trade alert, to buy January 2017 $35 calls on American Airlines was issued Jan. 23 to all members, so you may already own this position. But if you don't, now is a good time to join in. Call prices are lower, and we still believe in the long-term valuation upside on offer. Realize that we may write diagonal calls against these calls for income while we wait. Get started with our original report. Note, again, that prices are lower now.

American Tower (NYSE: AMT): Buy Calls

Allocation: 0.5%

These calls target long-term upside on American Tower, adding to our existing stock holding.

For More

- *Pro*'s original recommendation
- Talk about American Tower on our discussion board

We're seeking leveraged returns if American Tower stock appreciates by 2017. To follow along, **use a limit order** to buy to open January 2017 $80 calls. Aim for a price near the midpoint of the current bid/ask spread. A 0.5% allocation at current prices most closely equates to buying one call for every $450,000 you manage. This is a small position by design, so be careful not to over-allocate to the calls; we may seek to add more to our position later if volatility provides us with lower prices. Members for whom one contract would over-allocate their portfolios can consider these choices:

- Buy 0.5% more in stock, bringing your stake to 4.1%. Realize you won't benefit from the leverage the calls will provide, although you will have a better breakeven price and no expiration.
- Consider allocating 0.5% to a bull call spread at small strike increments. The in-the-money $90/$92.50, $92.50/$95, and $95/$97.50 spreads all offer attractive annualized returns if the stock price is above the higher strike price at expiration. Out-of-the-money spreads offer higher returns but an increased chance of total capital loss. (Our sister service, *Motley Fool Options*, offers what we think is an excellent overview of bull call spreads here. Please post subsequent questions on Pro's AMT board.) — Billy Kipersztok

---

All the Rest of *Pro*'s Positions!

As a *Pro* member with an especially keen eye (and great memory!), you will note that we haven't updated you on every position in the portfolio yet. Pricing opportunities being what they are, not all of our positions are primed for new action right now, and not all options positions are timely. Worry not. We will publish Catch-Up Trades when we see new *Pro* opportunities on existing positions. One by one, it won't take us long to get there. Here's the status on our remaining positions that are currently "on pause for newcomers" — either on hold or not timely.

AmTrust Financial Services: Hold

Shares are simply on hold as we review recent earnings at **AmTrust** (NYSE: AMT). We expect them to return to Buy status soon. But as this is our largest position at 7.1%, we may advise newcomers to buy less than that. We'll alert you when we're ready with a decision. Please watch for Catch-Up Trades on Mondays.

Caesars Entertainment: Short

Pro is currently short shares of casino operator **Caesars Entertaiment** (NASDAQ: CZR), which has put one of its units into bankruptcy proceedings. The stock is volatile and has fallen nearly 20% since we shorted it. We would rather new members short during one of its fairly frequent surges, so we suggest waiting for now. If we see shares jump from a current $9.63 back to around $12, we may recommend newcomers short the stock then. That said, we are also debating closing our short and taking our 20% profit. The outcome on this short is partly dependent on the courts now, and we don't have an edge in analyzing that. However, the business continues to suffer.

Coca-Cola: Synthetic Long

Pro holds a 2016 synthetic long option position on **Coca-Cola** (NYSE: KO), but 2016 is not that far away, and a synthetic long may not be what we choose to do next. Within a few months, we'll have an updated strategy decision. We advise new members to wait. (Some of you started an option position on Coca-Cola with *Motley Fool Options* — that's a fine substitute for now and perhaps indefinitely, unless we get a great new opportunity.)

Expeditors International: Synthetic Covered Strangle

Shares of shipper **Expeditors International** (NASDAQ: EXPD) have run up sharply since last August, making us hesitant to suggest newcomers set up this predominately income-oriented position now. If and when it dips into the mid-$40s, we can get you started with it. Watch Monday's Catch-Up Trades, especially after any good market declines!

Gentex: Written Puts

Pro has written March 2015 $17.50 puts that, if exercised, would have us add about 1% in stock to our **Gentex** (NASDAQ: GNTX) position. The goal with these puts is to earn income and potentially add to our existing stock position at lower prices. Since this position is just two weeks from expiration, we don't recommend that new members join us now. The stock is hovering near the strike price, so as we approach expiration, we will decide whether we want to accept shares, roll the puts out to a later month to target more income, or (if the stock price ends above the strike price) write new puts. We advise that you wait a few weeks for us to send a new alert on Gentex before you act on this position. Meanwhile, as noted in Portfolio Report No. 2, we recommend you own 3.2% in this buy-rated stock. — Billy Kipersztok

Medtronic: Hold

We have a 3.1% position in medical devices giant **Medtronic** (NYSE: MDT). The position is on hold as we analyze the company's latest earnings in light of a much higher share price over the last year. We may write covered calls on the position, and could get newcomers into it then. Stay tuned.

O'Reilly Automotive: Hold

We have a 4.2% stock position in **O'Reilly Automotive** (NASDAQ: ORLY), but it's on hold for new members. Given that this auto parts retailer trades at record valuation multiples (partly justified by record results), we're considering our next move. We'll let everyone know.

Papa John's International: Hold

As we wrap up our earnings analysis, expect an update soon on the currently on-hold **Papa John's** (NASDAQ: PZZA).

ProShares UltraShort Real Estate: Short

We have a small (0.3%) short remaining in the **ProShares UltraShort Real Estate ETF** (NYSEMKT: SRS). We enjoy watching its slow descent in price, but the ETF only has $33 million in assets now, making it too small to recommend to new members. Plus, outside of our broker (Interactive Brokers), it appears impossible to borrow shares to sell short now — and if you do find them, the annual percentage fee to short is high (recently 6.7% at IB). Instead, as shared above, we recommend that you sell short up to 1% in FAZ as a long-term alternate, or buy up to 1% in shares of the **iShares Dow Jones US Real Estate** (NYSEMKT: IYR) as a long-term hold instead. Or just sit this small position out.

Wells Fargo: Short Strangle

Pro has written an April 2, 2015, $52.50/$57.50 covered strangle on Wells Fargo (note that these are *weekly* options). A strangle consists of two legs — a written put and a covered call — with different strike prices but the same expiration date. The goal of this strangle is to opportunistically target income on a stable stock. This strangle is playing out well so far, but a lot of time value has already dissipated since the alert, so we don't recommend new members join us just yet. Wells Fargo is set to report earnings in mid-April, and after our review of the quarter, we'll decide whether we want to pursue another income-generating strangle. If we do, you can join in with us then. — Billy Kipersztok

In Conclusion

We'll likely recommend many of these positions (except the SRS short) to new members once we reaffirm that there's sufficient opportunity to make up for the current risk, and/or when pricing improves. Just watch for *Pro* Catch-Up Trades, issued Monday or whenever an especially timely opportunity crops up.

At the same time, we're not standing still. In this and our two previous Portfolio Building Reports, you have many great *Pro* investments to move into gradually. And of course, we'll continue to send brand-new investment recommendations to all members. It's not vital that your portfolio be 100% identical to ours, but being closely attuned to it, especially with our core stocks, should position you to succeed well with *Pro* over the time frame that matters. Meanwhile, if you're new to shorts, hedges, and options, start to dip your toes in as your comfort allows. We're here to help, and we believe you'll see the many great benefits as the years unfold.

Fool on!

— Jeff (TMFFischer) and the *Pro* team (Billy, JP, and Ellen)

Set Up Put Ratio Spreads on the SPDR S&P 500

Published Mar 6, 2015 at 11:38AM

- **Is this for you?** Greetings, Fools! Go slow and read this full report carefully. **There is no need to rush.** If there's anything you don't quite understand, you can wait for our Monday [Portfolio Positioning Event] for more details and to ask questions.

  At *Pro*, we use hedges to protect against the unknown and to earn returns during a meaningful market decline. This report recommends two hedges. It's important to realize that you don't need to hedge to succeed with *Pro*, but if you are at least 80% invested in stocks and want to hedge against a market decline, then consider following along. Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $200,000 or so.

How You Participate

- **Action:** Set up two put ratio spreads on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.

First Spread: June 30, 2015, $187/$200

- **Allocation:** 11% of total portfolio value. Set up one 2:1 put ratio spread for every $200,000 you manage and want to hedge; hedging 11% of its entire portfolio value, *Pro* will sell 28 puts and buy 14.
- **Price Guidance (March 6):** Lately, you can set up this trade for around no cost or a small credit.
  - Write ("sell to open") **two** June 30, 2015, $187 puts, and buy ("buy to open") **one** June 30, 2015, $200 put for every $200,000 you're hedging. Note that these are quarterly options that expire the end of June. Click "view all" to see all strikes.
    - Sell to open two June 30, 2015, $187 puts: $2.15 x2 = $4.30 credit
    - Buy to open one June 30, 2015, $200 put: $4.25 debit
    - Net credit: About $0.05 per spread (these prices will change, but ideally aim for a credit or close to no cost using a limit order)
    - SPY price: $210

Second Spread: Sept. 30, 2015, $170/$185

- **Allocation:** Another 9% of total portfolio value. Set up one 2:1 put ratio spread for every $185,000 you manage and want to hedge; hedging 9% of its entire portfolio, *Pro* will sell another 24 puts and buy 12.
- **Price Guidance (March 6):** Today, you can receive a healthy credit to set up the trade.
  - Write ("sell to open") **two** Sept. 30, 2015, $170 puts, and simultaneously buy ("buy to open") **one** Sept. 30, 2015, $185 put for every $185,000 you're hedging. Note that these are quarterly options that expire the end of September. Click "view all" to see all strikes.
    - Sell to open two Sept. 30, 2015, $170 puts: $2.20 x2 = $4.40 credit
    - Buy to open one Sept. 30, 2015, $185 put: $3.90 debit
    - Net credit: About $0.50 per spread (these prices will change, but aim for a credit using a limit order)
    - SPY price: $210

Our existing March 31 spread: We are currently letting our existing position run to expiration. It continues to be a hedge between now and then should SPY fall below $200. If we decide to close it, we'll send a trade alert. Newcomers don't need to worry about this one.

What We're Thinking

At *Pro*, we aim to have winners in down, flat, and positive markets -- and that means we need to address all three possibilities at once in our portfolio. A hedge on a market index is simply a hedge against a shock. We don't know if or when one is coming, of course, but if it does, a hedge can help us get through it more easily. We generally don't care about declines of 5% or less (that just comes with the market), but when *Pro* is functioning as desired, declines of around 10% or more should result in some of our positions, like these spreads, becoming profitable. At the same time, these put ratio spreads are:

- Free to us if the market keeps going higher (they don't harm our return)
- Cash-free to set up (they even pay us a small credit)

As our March 31 put ratio spread nears expiration, we're due to earn a small credit -- $488 -- for a hedge that never came into play. We'll take that. What's the trade-off? We have been ready to buy shares of SPY via that hedge if the market fell too sharply. So with these spreads, as with any put-writing trade, we need to be ready to buy the underlying investment (in this case, the SPY ETF) if it falls severely. If the index falls more than 17.1%, our new June hedge becomes a liability; if it falls 26%, the September hedge does, too.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro's* allocation and our collective possible returns.

- *Pro* portfolio value: $2,470,000
- 11% of that value: $271,700
- 9% of that value: $222,300
- **June 30, 2015 spread:**
  - Buy to open $200 puts (14 contracts representing 100 shares each) = $280,000 in look-through exposure, or an 11.3% hedge on our current portfolio value
  - Sell to open $187 puts (28 contracts, half of which become a potential obligation, currently a 10.6% possible stake)
  - At home, you would buy one $200 put and sell two $187 puts for every $200,000 in portfolio value you want to hedge.
- **Sept. 30, 2015 spread:**
  - Buy to open $185 puts (12 contracts representing 100 shares each) = $222,000 in look-through exposure, or nearly a 9% hedge on our current portfolio value
  - Sell to open $170 puts (24 contracts, half of which become a potential obligation, currently a 8.2% possible stake)
  - At home, you would buy one $185 put and sell two $170 puts for every $185,000 in portfolio exposure you want to hedge.

Return Details: June 30, 2015 Spread

SPY Price at June 30 Expiration	Value of 1 Purchased $200 Put	Value of 2 Written $187 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Current $210
$200 or higher	$0	$0	$0.05 gain per spread, or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 4.7%
$195	$5 x $100 = $500	$0	$500	(7.1%)

SPY Price at June 30 Expiration	Value of 1 Purchased $200 Put	Value of 2 Written $187 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Current $210
$190	$10 x $100 = $1000	$0	$1000	(9.5%)
$187	**$13 x $100 = $1300**	**$0**	**$1300 (max profit per spread)**	**(11%)**
$185	$15 x $100 = $1500	($2) x 200 = ($400)	$1100	(11.9%)
$180	$20 x $100 = $2000	($7) x 200 = ($1400)	$600	(14.3%)
$175	$25 x $100 = $2500	($12) x 200 = ($2400)	$100	(16.7%)
$174	**$26 x $100 = $2600**	**($13) x 200 = ($2600)**	**$0 (break-even)**	**(17.1%)**
$170	$30 x $100 = $3000	($17) x 200 = ($3400)	($400)	(19%)
$165	$35 x $100 = $3500	($22) x 200 = ($4400)	($900)	(21.4%)
$160	$40 x $100 = $40000	($27) x 200 = ($5400)	($1400)	(23.8%)

Our maximum profit is earned on the June spread if SPY declines 11% from its current perch. The spread helps us a little on a decline all the way to about a 17% drop. Beyond that, our short puts turn into an obligation that's in the red. We'll talk about our plan in that case in a moment.

Return Details: Sept. 30, 2015 Spread

SPY Price at Sept. 30 Expiration	Value of 1 Purchased $185 Put	Value of 2 Written $170 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Current $210
$185 or higher	$0	$0	$0.50 gain per spread or any credit or for setting up the trade	Any increase in price, or any decline of less than 11.9%
$180	$5 x $100 = $500	$0	$500	(14.3%)
$175	$10 x $100 = $1000	$0	$1000	(16.7%)
$170	**$15 x $100 = $1500**	**$0**	**$1500 (max profit per spread)**	**(19%)**
$165	$20 x $100 = $2000	($5) x 200 = ($1000)	$1000	(21.4%)
$160	$25 x $100 = $2500	($10) x 200 = ($2000)	$500	(23.8%)
$155	**$30 x $100 = $3000**	**($15) x 200 = ($3000)**	**$0 (break-even)**	**(26.2%)**
$150	$35 x $100 = $3500	($20) x 200 = ($4000)	($500)	(28.6%)
$145	$40 x $100 = $4000	($25) x 200 = ($5000)	($1000)	(31%)
$140	$45 x $100 = $4500	($30) x 200 = ($6000)	($1500)	(33.3%)
$135	$50 x $100 = $5000	($35) x 200 = ($7000)	($2000)	(35.7%)

The September spread comes into play if SPY declines more than 11.9%, with our maximum profit earned on a 19% decline. On a drop larger than that, our put obligation starts to eat into our profits until hitting our breakeven at expiration if SPY is 26.2% lower than today. A larger decline than that starts to turn this hedge into a loss. Market declines larger than 30% are rare, occurring about once a decade.

Follow-Up

Assuming we set these two spreads up for credits overall, they will result in small profits even if the market rises or treads water, let alone falls. But we need to be ready to fulfill the $187 and $170 put obligations if SPY is below those prices by our respective expirations.

However, our presumed plan in that case is to close our puts and buy long-term SPY calls instead of buying the ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY itself. So, our potential 20% or so stake in SPY shares will only cost us about 5% of our cash if we buy calls on SPY instead. We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases. In fact, we like the potential obligation of purchasing the index (in one form or another) at much lower prices. Though that's not the initial purpose of our hedge, history says it's a good move.

How It Fits Into *Pro*

Pro consistently hedges to lower its market exposure, or risk, in part because we have a goal of achieving positive returns every rolling three years and inflation plus 7% annualized (our North Star) over 10 years. With these challenging goals, any small advantage we gain in a falling market will make a difference. Even small gains add up over the years, but especially if the gains are reinvested in depressed stocks. This hedge fits well with our goal of hedging in a cost-efficient way, and in a way that doesn't work against us if the market keeps rising.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts:**
    - For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, like us, "buy to open" June 30, 2015, $200 puts, and "sell to open" *an equal number* of June 30, 2015 $187 puts. Recently, this will cost you around $2 ($200) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $13 ($1300) per spread on a decline to $187 or any lower price, but you should be prepared to lose your $2 per spread if the market doesn't decline enough.

      Next, if you want to set up the September hedge, too, use a spread order again to "buy to open" Sept. 30, 2015 $185 puts and "sell to open" *an equal number of* Sept. 30, 2015 $170 puts. Recently, this spread will cost you around $1.60 each ($160), and that is your maximum risk. This spread would be worth up to $15 ($1500) per spread on a decline to $170 or lower, but you should be *very prepared* to lose your $160 per spread if the market doesn't decline enough. Odds are it won't! As with any market hedge that you pay to set up, you have to *expect to lose* your investment most of the time, especially on a hedge that only kicks in during a large, lasting market decline. So only spend what you're ready to lose. (On your option chain, click "See All" to see these strikes. If prices change modestly, that's fine.)
    - **To lower your market exposure while following our official trade (and make the position possible in some IRAs):**
        - Set up the original put ratio spreads as recommended, but also "buy to open" puts (same months of expiration as our two spreads) at strike prices *well below* $187 and $170, respectively. Buy *half as many* as the number of $187 and $170 puts you wrote. When you do so, all of your $187 and $170 puts will be "covered" (half by your $200 and $185 puts, and half by the other puts you choose to buy at a much lower strike; choose how much you want to pay to select your lower strikes). You will only need cash in your account to cover the difference between your two lowest strike prices, and your risk is capped, making this potentially IRA friendly.

- **Managing less than $200,000?**
  - Use mini-options. If you want to use the non-standard (NS) mini-options, which represent just 10 shares of SPY instead of 100, then use the **June 19, 2015, mini-options (there are no June 30 minis)** to set up one 2:1 put ratio spread for every $20,000 you want to hedge. Use the same strike prices as our official recommendation, and use a limit order on the options, ideally for no cost or a small credit. There are no viable minis right now for the September hedge. We can wait to see if some list. They may.

Pro Can Help

- **Need a refresher on ratio spreads?** Our guide can help.
- **Want to talk about SPY?** We have a discussion board for that.

Pro on the Go With AmTrust

Published Mar 2, 2015 at 1:23PM

Dear fellow Fools,

Two Fridays ago, Jeff and I braved acrtic temperatures and the occasional woolly mammoth to venture up to New York City to meet with Barry Zyskind and Beth Malone, **AmTrust Financial Services**' (NASDAQ: AFSI) CEO and head of investor relations. Train delays and the aforementioned mammoths may have cut into our time at the headquarters of *Pro*'s largest holding, but the experience was still very insightful.

During earnings-call Q&As for most companies, Wall Street analysts usually hone in on short-term guidance and specific details. While these things are undoubtedly important, here at *Pro* we also like to take a step back and look at the bigger picture, and to focus on some of the more qualitative aspects of a company. And visits with management teams are a great chance to do just that. Without further ado, here is a collection of Zyskind and Malone's responses to our questions.

Q: What impact have the short attacks had on your business? How did they affect your time?

A: Prior to the December onslaught, we didn't spend much time on it. We just defended ourselves whenever something trickled to the surface because we never wanted this to become our focus. We didn't want to go down to their level and thought that the best way to deal with everything was to continue to execute. But from December until February earnings, we did spend a lot of time on it.

It never materially affected the business. This gave some an easy out if they wanted to use it as an excuse to do business with someone else, but ultimately very few did. I never once lost sleep about what they were saying; we beat it because the truth was on our side.

Q: Did it have an impact on morale?

A: It actually boosted morale. Sometimes you need something like that to bring everyone together; something everyone can rally behind.

Q: How about your relationship with regulators?

A: Tower Group was a huge win. [For JP's explanation of the Tower Group acquisition, see this post.] We had multiple regulators go over every part of our business with a fine-toothed comb — the short-seller even made a presentation to regulators outlining why the deal shouldn't go through — but they still approved the deal.

Q: Can you kind of walk us through your process for doing deals using Tower as an example? How long did it take for you to get comfortable with the deal? What were the sticking points?

A: When looking at a business, we ask, "Is there a piece of the business here that is profitable? Can we get just to the good part?" With Tower, after doing our due diligence, we realized that the problem wasn't that it was a bad book of business. The loss ratio was in the 60s — so, not a bad book of business. The issue was that Tower was booking a 50% loss ratio when it was really in the 60s. So adverse developments turned it into an 80% loss business and nobody wanted to touch it. But we saw that it wasn't a bad business. We didn't want to take the bad stuff, so we started looking into how we could isolate the part of the business we wanted. Since we don't want to bet the balance sheet, we often have to offload parts of a business to other entities. That's what we did here with ACP Re. We should easily be able to get the book to a 90% combined ratio, and this will end up being one of our most creative deals ever.

Q: On your last conference call, you mentioned how you've done over 30 deals. It's probably safe to say that not every deal has worked out like you had hoped. What have you learned from failed deals?

A: We protect against making big mistakes by refusing to bet the balance sheet and paying a price where we can still do well even if [things don't turn out like we had hoped and we end up paying a higher multiple]. Most of our acquisition mistakes in the past have had to do with joint ventures. Often, we find that we ultimately have different goals — they're focused on the short term while we focus on the long term — and this can create problems and we ultimately have to buy out our partner. We tend to do better when we can control the entire thing. So for example, if we like a particular fee business, it might make sense to take both sides (underwriting and fee) of the business so we don't have to worry about someone coming in and using the underwriting side to take the fee business out from underneath us.

Q: Currently you have a huge advantage as far as technology is concerned. Are others catching on?

A: You'd think so, but the industry still isn't waking up to technology. It's just really hard to change the wheel of a bus while it's moving. As we get bigger, we have to do bigger deals to move the needle, but sometimes the bigger companies are even more inefficient. We're still finding good deals where it's just the expense ratio that is the major problem.

Q: How has your management style changed as you've grown? What type of culture do you want to build?

A: The same core group has been together for 13 years. Our focus remains on hiring good people and letting them take control of their own destiny. We want to build an entrepreneurial culture. One where people do the right thing, but aren't afraid to take risks to try and get ahead. We want to find people who realize there is more than one way to do things.

The *Pro* Bottom Line

I had long suspected that Barry Zyskind and the other members of AmTrust's management team were "in it to win it" type of individuals, and our meeting only reinforced this notion. Whether it's going after a niche segment of the insurance industry or dealing with a short seller, I have a hard time believing this team does anything halfheartedly. The company's results over the past few years, and its reviews at Glassdoor, suggest that this mind-set permeates the culture at AmTrust.

Given Barry's comments on recent earnings calls with what we were able to learn during our meeting, I think it's reasonable to conclude that regulators left no stone unturned before approving the Tower Group deal. I also suspect that we will hear very little in the future from the vocal short-seller who made the end of last year so interesting.

Foolishly yours,

— JP Bennett (TMFYossarian)

Pro Portfolio Building Report No. 2: Feb. 25, 2015

Published Feb 24, 2015 at 4:11PM

Welcome, Fool! This report details our current thinking on all of the Buy stocks in our portfolio. Once you've read this and the previous report detailing our Buy First positions, you're ready to start building your *Pro* portfolio as swiftly or as slowly as you like. We want our advice to be uncomplicated: Buy our Buy Firsts first (again, taking your time according to your situation -- there's no rush); buy our Buys after that; match our allocations as closely as you can; and stay tuned for our Portfolio Positioning Event on March 9, which will address our shorts, hedges, and options.

We're glad you're here. Bring any questions to the Getting Started & Help discussion board, and Fool on!

Best,

The *Motley Fool Pro* team

Table of Contents

Buy: American International Group (NYSE: AIG)

Time and even average performance should lead to solid returns from this undervalued insurer.

Suggested Allocation: 3.3% stock, 0.6% warrants

What It Does / How It's Doing

Today's **American International Group** (NYSE: AIG) is not the same company that disgraced itself so profoundly in 2008. AIG has divested itself of whole business units since the financial crisis, managing to eliminate almost all of its previous exposure to the nasty derivatives that nearly brought down the economy. Left behind is a streamlined, disciplined company selling for cheap.

The company's insurance operations are better than they've been in years and are poised for continued, albeit lumpy, improvement. Structurally, those operations now consist of two main divisions, commercial and consumer; across both, AIG is writing fewer premiums at better prices than in past years, a great indication of improved underwriting discipline.

We recommend buying 3.3% of AIG stock and 0.6% of AIG warrants (see below for more on those). AIG has cleaned up its business, and it's currently cheap at about 0.7 times book value. Investors who buy AIG now are positioning themselves for outsized future returns with less risk -- contrarian investing at its best.

A Note on Warrants

Warrants are similar to call options, except that they are issued by the underlying company. They offer the purchaser the right (but not the obligation) to buy the stock in question at the specified price. The warrants we're recommending on AIG are valid for 10 years from the date of issue (Jan. 19, 2011), and they can be exercised at any point before they expire on Jan. 19, 2021. When exercised, they allow the holder of the warrant to buy shares of AIG at $45 per share, regardless of the market price. That

$45 strike price adjusts favorably in the event of dilution or annual cash dividends greater than $0.675 per share (which would also lower the share price). Warrants are illiquid, and Goldman Sachs is the designated market maker for them; when you buy them, be sure to use a limit order so Goldman doesn't get more than a fair price.

Be aware that if our investment in AIG works out, those who own warrants will earn leveraged returns on them. But it's possible that the warrants could end up as a total loss if AIG's stock price is below the $45 strike price at expiration (even though they're currently in-the-money by a few bucks).

Buy: Apple (NASDAQ: AAPL)

The leader in mobile computing products should see more long-term growth than anyone expects.

Suggested Allocation: 4.8%

What It Does / How It's Doing

For More

- Pro's original recommendation (2/14/12)
- Most recent earnings update (2/4/15)
- Talk about Apple

Led by its iPhone, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the smooth Apple operating system, iOS, which centers on the iTunes and App Store marketplaces, as well as the new Apple Pay. iTunes alone earns more revenue each year than two-thirds of the companies in the Fortune 500, while Apple itself is the most valuable company in the world, with $200 billion in annual sales. Yet it's still growing strongly, with 38% earnings-per-share growth last quarter. The company's integrated hardware and software make for a sticky consumer experience that provides disincentives to switch to a competitor, and as more people use multiple computing devices, Apple makes it easy to transition seamlessly from one of its products to another.

Apple Watch will launch this spring, while rumors still swirl about an Apple TV and even the possibility for an Apple Car. We're not counting on that last one! But we are counting on record numbers of phones being sold to both existing customers and new ones over the coming years, and we want to be along for the ride.

Buy: Broadridge Financial Solutions (NYSE: BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 4.5%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation (4/27/10)
- Talk about Broadridge on our discussion board

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in its fiscal 2014 (ended June 30, 2014), its platforms processed more than 80% of all shares in the U.S. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider to manage investor communications.

The company's smaller segment, Global Technology and Operations (GTO), accounts for 26% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy: The Buckle (NYSE: BKE)

We don't know fashion, but we can read financial statements — and this retailer has some style.

Suggested Allocation: 2.2%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation (6/20/12)
- Most recent earnings coverage (11/25/14)
- Talk about The Buckle

Your *Pro* team doesn't know much about fashion, but we can read financial statements. And if the next decade of business performance by **The Buckle** (NYSE: BKE) looks anything like the last one, we'd be willing to wear whatever getup the company suggests. The Buckle sells jeans, other apparel, and accessories at 463 retail locations across the United States, and we think the fantastic management team has figured out a formula that works: measured growth, middle-of-the-road merchandising, and great service. The store concept is in the middle of its life cycle, and the company's financial prudence and operational acumen should lead to a growing stream of free cash flow, dividends, and extra payouts — all of which can help the *Pro* portfolio in our pursuit of our North Star.

Buy: Facebook (NASDAQ: FB)

The world's leading social network — and most-trafficked website — is managed for long-term growth.

Suggested Allocation: 4.5%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation (9/18/12)
- Most recent earnings coverage (2/4/15)
- Talk about Facebook

More than 1.3 billion people use **Facebook** (NASDAQ: FB) to connect with friends, families, companies, marketers, and celebrities each month. Incredibly, more than 850 million people visit daily. Most traffic arrives through mobile devices, and the company has shown early success monetizing that traffic. Over the long term, management seeks to make the ads on the site as targeted and relevant to users as are the updates from their friends and family.

Meanwhile, Facebook keeps working to stay on the edge of social technology. The company has the equity to acquire competing platforms and to build traffic before monetizing the sites once they hit critical mass — which in Facebook's opinion is 1 billion users. Even now, CEO Zuckerberg is waiting to monetize Facebook's massive WhatsApp, Messenger, and Instagram audiences. Facebook is spending aggressively to grow its technology and platforms, but that spending should be rewarded down the road. The potential remains very large, as social sites currently draw just a tiny slice of the world's advertising pie.

Buy: Gentex (NASDAQ: GNTX)

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 3.2% stock; 1% in written puts (March 20, 2015 $17.50 puts)*
**If you're not ready to use options, you can simply buy stock and omit the written puts.*

What It Does / How It's Doing

For More

- Pro's most recent update (1/30/15)
- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex on our discussion board

In 1982, a small company in Zeeland, Mich., called **Gentex** (NASDAQ: GNTX) made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands almost 90% of that market, and it sells eight times more units than its closest competitor. We think there's a bright future here.

Buy: MasterCard (NYSE: MA)

Plastic — and digital — is pushing paper out as the world's way to pay, and MasterCard leads the charge.

Suggested Allocation: 4.4%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation (9/8/11)
- Most recent earnings update (11/22/14 — this quarter's update is on the way)
- Talk about MasterCard

MasterCard (NYSE: MA) is among the most attractive businesses in the world. Here's why: The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders, who are actually exposed to the card users' finances; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

Though MasterCard competes with a large number of well-heeled and (in some cases) innovative businesses, the company's profitability is growing nicely even though the global economy isn't. And that makes perfect sense, because when it comes to paying for stuff, the global market leader isn't **Visa** (NYSE: V), or PayPal, or banks ... it's cash. Cash is used for a still-astounding 85% market share of transactions, but it's slow and inefficient, and with no one managing its brand, it's quickly losing out to better alternatives -- like MasterCard. We continue to believe in the stock for the long haul (*especially* for the long-term potential!). With earnings out recently, expect a valuation and earnings update soon.

Buy: OpenText (NASDAQ: OTEX)

This company's information management software keeps the digital lives of businesses in order, and its exchange platform drives business transactions.

Suggested Allocation: 3.3%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation (8/31/11)
- Most recent earnings coverage(1/29/15)
- Talk about OpenText

OpenText (NASDAQ: OTEX) is a leading provider of enterprise information management (EIM). It sells software that lets companies organize their electronic content, and it offers a leading business exchange platform for enterprise commerce. A majority of its revenue recurs "naturally" each year as OpenText's products help companies, governments, and universities operate more efficiently and effectively, meet compliance requirements, communicate with colleagues, customers, and partners, and make transactions. OpenText has increased sales and cash from operations by more than 14% annualized over the past three years, and the goal is to continue to grow by at least 10% annualized as its various industries expand. Margins have grown with sales, and its cloud software revenue is increasing rapidly.

On Feb. 23, we heard that CEO Mark Barrenechea is being treated for leukemia. He's been a great CEO, and we wish him the best. He plans to return to OpenText after treatment.

Buy: Parexel International (NASDAQ: PRXL)

Parexel is poised to benefit as pharmaceutical companies gradually outsource more drug development work to select CRO partners who can perform the work better, faster, and cheaper.

Suggested Allocation: 3.4%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation (12/23/13)
- Most recent earnings update (2/3/14)
- Talk about Parexel on our discussion board

Parexel (NASDAQ: PRXL) is one of the world's largest and most respected contract research organizations (CROs). Over more than 30 years, it has built a stellar reputation on helping drug makers navigate complex clinical trial processes quickly, which has enabled it to cement important relationships and have a role in developing more than 90% of the 200 top-selling drugs.

From 2004 to 2013, the number of development dollars outsourced to CROs (outsourcing penetration) has increased by almost 50%. Outsourcing is a cheaper alternative to the traditional high-fixed-cost model of staffing lots of white coats across various therapeutic specialties all around the globe. For large drug developers, letting CROs handle the development work -- and those massive staffing needs -- can boost profits and time to market, and for smaller drug developers who can't afford a huge staff, there is no other choice. As regulators require more efficacy data, larger patient participation, and increasingly global results, navigating the challenges of the 110,000-plus trials being conducted globally has become frustratingly complex, turning large, proven CROs with expertise and global capabilities into value-adding partners rather than transactional customers. We think Parexel is poised to benefit.

Buy: ProShares Short VIX Short-Term Futures ETF (NYSEMKT: SVXY)

Profit from the long-term nature of stock market volatility to revert to an average level after each spike.

Suggested Allocation: 1%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation(11/25/14)
- Talk about SVXY

Buying shares in — let's make it easy and use the ticker, shall we? — SVXY is a recommendation for *Pro* members who are comfortable owning a small stake in a volatile position that we plan to add to during market downturns. *Pro* is a portfolio service, so all positions are meant for everyone, to the extent you can do them and wish to. But this position will be especially volatile, so only follow it if you're comfortable with high volatility in a holding.

This vehicle increases in value when stock market volatility, as measured by the CBOE Volatility Index (or VIX), goes down or is range-bound. How so? This ETF *sells short* futures contracts on the VIX that have one month and two months to expiration. Unless volatility in the S&P 500, as measured by the VIX, increases above and beyond the premium already baked into the futures contracts being shorted, the positions turn a profit and the ETF goes up in value. Helping further, VIX futures contracts are historically in a state of "contango" up to 90% of the time. Contango means future-month contracts are increasingly more expensive than earlier months and than the current VIX level itself (much like a call option has a premium above the current stock price). This is a tailwind for SVXY, and it exists most of the time. As long as volatility stays near its average overall, then just holding this small stake over the years should reward us very well. We recommend starting at 1%, and we may add to it when the VIX soars — meaning when volatility in the market is high. We're ready for it!

Buy: Skyworks Solutions (NASDAQ: SWKS)

This leading designer of semiconductors, antennae, and more for smartphones and connected devices is growing sharply.

Suggested Allocation: 4.2%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation (8/5/14)
- Latest earnings coverage (2/14/15)

Skyworks Solutions (NASDAQ: SWKS) makes technology that powers wireless connectivity in a wide variety of products: Apple and Samsung smartphones and tablets, **Medtronic** (NYSE: MDT) medical devices, **Google** (NASDAQ: GOOG) and **General Electric** (NYSE: GE) products, and the list goes on. In the "Internet of Things," billions of physical objects are being connected to the Internet, and Skyworks is uniquely positioned to benefit. Not only does it serve *all* of the top-tier mobile device makers, but the company is diversified across industries to serve more than 2,000 customers.

Skyworks sells more than 2,500 high-performance analog semiconductors and related products, supported by nearly 1,000 patents. The product list includes amplifiers, attenuators, receivers, switches, diodes, modulators, GPS power and voltage regulators, and more, often sold together as components of a phone or connected device. Skyworks earns industry-beating operating margins of more than 30% by selling specialized solutions to giant customers with growing connectivity needs. Plus, as wireless complexity increases, fewer companies can deliver the integrated modules customers need, putting Skyworks in an even stronger position. The China opportunity is large as well. This can be a volatile stock, but its long-term outlook (which is the time frame we care about!) remains very compelling.

Buy: Starbucks (NASDAQ: SBUX)

You only think you're there for the coffee — the ubiquitous java purveyor has big plans.

Suggested Allocation: 3%

What It Does / How It's Doing

For More

- Most recent earnings update (2/2/2015)
- *Pro*'s original recommendation (8/22/2012)
- Talk about Starbucks

You may not realize it, but "**Starbucks**" (NASDAQ: SBUX) is no longer a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense it's just a front. We *think* we go to Starbucks for the coffee, but those little white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

Starbucks began opening America's eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 21,800 stores in 65-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences to fill more than 70 million mouths and hearts each week. This company is continually finding new ways to reach customers; we're grabbing a latte and a cake pop and coming along for the ride.

Buy: Tupperware (NYSE: TUP)

This is not your mother's Tupperware.

Suggested Allocation: 2.9% (round to 3% if you wish)

What It Does / How It's Doing

For More

- *Pro*'s latest buy recommendation(7/30/14)
- Latest earnings coverage (2/3/15)
- Talk about Tupperware

Tupperware Brands (NYSE: TUP) earns nearly 70% of its revenue from immense emerging markets, including China and India, where it's been increasing sales by more than 10% annually. But the company is still only scratching the surface in the world's most dense, emerging urban population centers. As these countries, Brazil, Malaysia, and others begin to enjoy disposable income, citizens are able to store food for the first time, and many more can afford inexpensive kitchen products offered by Tupperware. In addition, Tupperware offers women in these regions a way to earn reliable income, something that's still tragically hard for women to find in many emerging markets.

Elsewhere in the developed world, "Tupperware parties" thrive in places as erudite as France and as prosperous as Germany, as well as in the good ole U.S.A. Cutting out retailers to focus on direct sales sets Tupperware apart, and with a sales force of 3 million and new products every year, the company has plenty of potential ahead. Meanwhile, we enjoy its 3.8% dividend and a reasonable valuation.

Buy: Valmont Industries (NYSE: VMI)

Providing irrigation systems and support structures, this industrial company benefits as agriculture needs increase and countries build infrastructure.

Suggested Allocation: 2%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation(11/5/13)
- Most recent earnings coverage (11/2/2014 — this quarter's update is on the way)
- Talk about Valmont

Valmont Industries (NYSE: VMI) offers four business divisions, each serving a growing need around the world. Founded in 1946, Valmont's engineered products division supplies steel and aluminum poles to infrastructure projects worldwide, including road and traffic lights, stadium and parking lights, and wireless communications poles and support towers. This division also sells highway safety products including barriers and road grating. In addition, because it sells steel and concrete support structures, Valmont profits as electrical grids are renovated or built out.

Then there's water, essential to the world's farmers. Under the name "Valley," Valmont's center-pivot irrigation systems are the world's leading brand. More than 80% of the planet's irrigated acres still use inefficient "flood" watering methods, rather than efficient mechanized irrigation, so there's lots of room to run.

To top it all off, the company provides hot-dip galvanizing (just like Mom used to make), anodizing, and other coatings to protect aluminum and steel from corrosion. One of the largest custom galvanizers in the world, Valmont expects continued growth because it still captures a small percentage of the total market. Overall, Valmont operates in more than 80 countries. This is a long-term investment in an exceptionally run business, even though the business is cyclical and is currently in a downturn (which is when you want to start to buy). We've started with a small position.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund (NYSEMKT: DGS)

Diversification in emerging markets with some of the best small, high-yield companies you've never heard of.

Suggested Allocation: 2.1%

What It Does / How It's Doing

For More

- *Pro*'s original recommendation (11/22/10)
- Talk about DGS

At *Pro*, we like the idea of investing in emerging-market small caps to diversify and target higher growth. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) (the longest ETF name in the world!*). This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields around 3%).

For *Pro*, owning shares of this well-managed ETF offers exposure to up to 600 of the most promising international business that we couldn't easily buy in any other way! Serving as direct exposure to emerging markets, this is an excellent way to invest in small companies in locations where we don't have a discernible edge but where growth exists — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The benefits of diversifying outside our home market are equally important over long periods. Emerging markets have badly lagged developed markets for the last several years, but eventually emerging markets will take the performance baton for a number of years again, and we'll be in good stead with this position. In the meantime, we just wait for emerging markets to return to favor.

*Statement may not be true

Think Big!

Published Feb 23, 2015 at 2:21PM

Dear *Pro* members,

As of this morning, the *Pro* portfolio is up 6.2% this year. We're off to a strong start; meanwhile, our North Star is gaining less than 1% a month (although that adds up fast!), and the S&P 500 is up 2.2% year-to-date. All of our shorts are making money. Most of our long investments are, too. And we're making some income already this year.

But aside from short-term satisfaction and a continued belief in the companies we own (most of which we've known and owned for years), the first seven weeks of the year mean very little.

We need to think bigger than that — much bigger.

Think Big!

Many of us go into each January wondering what we can accomplish that year, and in a way that's good, but in another way it keeps us on a fast treadmill and shortens our outlook a bit too much. Just as *Pro* is always thinking in terms of three years — how can we generate positive returns every rolling three years? — there's great value in having intermediate-term goals in life, too, and focusing on those.

What do you hope to accomplish in three years?

In terms of investing, you know that *Pro* is aiming for positive returns every rolling three years, and we seek to earn at least 7% plus inflation (our North Star) annualized over longer periods. That would double our real purchasing power every 10 years. Those results would obviously clobber inflation, and would historically clobber the S&P 500 index, too — though the latter is not our goal.

Bigger!

It's always fun to hear stories from people about the stock they owned that made 300%, or how they made 75% in a few months on a call option they bought. But truly, that's just small talk. One-off victories don't add up to much unless you have a *long-term system* that produces victories *consistently over time*.

In *Pro*, we invest most of our money in compounding machines: businesses that are increasing free cash flow and reinvesting it for *more* growth at attractive returns. These companies enjoy competitive advantages and, often, pricing power. Owning a business with great attributes at a reasonable price should compound your dollars over the years, if you only let it.

Biggest!

What do we hope to accomplish in 10 years? Nothing short of extremely strong returns by most any measure, while taking less risk than many others because we use hedges and options and keep cash for opportunities.

Any results along the way are incidental. We need to think big, and then bigger, keeping our eyes on the horizon. It's not that far off anyway.

Three years is only 1,095 days, or 26,280 hours.

Ten years is fewer than 88,000 hours, not even 3,700 days. That people choose to think in terms much shorter than that, in mere weeks, or even a few days or hours, is a giant obstacle to their returns, and it's downright surprising given how quickly time goes by if you just let it.

Only in quiet waters things mirror themselves undistorted.
Only in a quiet mind is adequate perception of the world. — Margolius

Your Chance to Think Big

The world's opportunities are large for investors. The media likes to portray stocks as risky (ignoring market history), but putting your money with a business that has thousands of employees, mounds of cash, and great opportunities puts a lot of positives on your side. Where better could you put it? But time is the essential ingredient to success.

You would think after coming through 2009, and seeing markets recover, investors would internalize the fact that sharp declines are passing opportunities and no longer obsess about when the next decline will occur. If you made it through the last one, there shouldn't be much left that will faze you. Yet, the fear of waves in our calm investing waters continues to distract many investors. Why? The waves are opportunities that pass. We hope to capitalize on them even as we keep looking to the horizon.

In *Pro*, we work to dampen volatility, manage risk, and generate short-term income, but we also keep thinking big. Not of what's around the next corner, or even what this year can do for us — but what the next three years, and then five years, and then 10 years can do for us. That's where there's true victory to be had.

We're seven years into our first 10, but we look forward to the next decade even more. In that spirit, welcome to new *Pro* members! We look forward to helping you get started!

— Jeff (TMFFischer)

Pro Completed Trades

- **Expeditors International** (NASDAQ: EXPD): We bought to close our February 2015 $45 calls for a small gain, while our February $43 puts expired as full income. We sold to open a new May 2015 $43 put, $48 call strangle for a new $1.85 credit -- continuing to generate income on this income position with upside.
- **Wells Fargo** (NYSE: WFC): We sold to open an April 2, 2015 covered strangle, selling the April 2 $52.50 puts and $57.50 calls for a credit of $0.72 -- targeting income if the stock stays in this price range.

Pro Catch-Up Trades

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

- **American Airlines** (NASDAQ: AAL): If you haven't invested 1% in calls yet, you can buy to open January 2017 $30 calls now (rather than $35, to keep time value lower), lately at around $24 each. That price will change as the stock moves. Click "see all" to see all strike prices with your broker.
- **American Tower** (NYSE: AMT): If you haven't invested 0.5% in calls yet, you can buy to open January 2017 $80 calls, lately for around $22. That price will change as the stock moves. We also own 3.6% in the stock, which is rated Buy First.

Pro Catch-Up Trades: Feb. 23, 2015

Write a Covered Strangle on Expeditors International

Published Feb 20, 2015 at 11:51AM

Is this for you? This is for *Pro* members who are **already following along** with our option writing on **Expeditors International** (NASDAQ: EXPD) for income. Those brand-new to *Pro*, or brand-new to using options, can safely sit this one out. Instead, we recommend that you wait for our Portfolio Positioning event on March 6, when we'll advise on options positions for new members -- and, of course, please do read and ask questions in the meantime!

How You Participate

- **Action:** Use a strangle order to simultaneously "sell to open" May 2015 $43 puts, and "sell to open" May 2015 $48 calls, to create a covered strangle on **Expeditors International** (NASDAQ: EXPD).
- **Allocation:** Sell one strangle (one of each option) for every 100 shares of exposure you already have to the company. We have 1,000-share exposure through a synthetic long, so we're selling 10 puts and 10 calls, as we've done before.
- **Prices:**
  - **Stock:** $45.60.
  - **Options:** Sell to open May 2015 $43 puts (bid/ask): $0.95/$1.05. Sell to open May 2015 $48 calls (bid/ask): $1/$1.10. Combined bid/ask: $1.95/$2.15 credit.
- **Price Guidance:** Split the bid/ask and aim for a combined credit of $2.05 to sell the strangle. If we all use **limit orders**, then $2.05, or at least $2, should hold for Day One. We want to get the trade completed before Feb. 24.
- **Previous Position:** We closed our February $45 calls this week, and our February $43 puts are expiring as income today -- just make sure that remains the case in the final hours today if you go to write these new puts. *Pro* will transact next week.

What We're Thinking

Shipping logistics and freight consolidator Expeditors is estimated to be reporting earnings on Feb. 24. Our latest strangle written on the stock is ending today, so we had a choice: Wait and write the next strangle *after* earnings; or sneak it in right before earnings.

We chose the latter because this position was set up for income, and option premiums are currently inflated in anticipation of earnings. We have no reason to believe the stock price will irrecoverably fall, and we don't mind if it rises, because that will add a price gain to our income. So we're taking advantage of today's higher premiums. Writing options soon before earnings makes sense given that this is an income position we've known and followed since 2009. So, let's maximize our income.

If we waited until after earnings to write our next strangle, it's true that we would have another quarter's worth of knowledge under our belts; and we might have adjusted our strike prices by a few pegs depending on where the stock is after earnings. But we would very likely be paid considerably less than we can get today, and income is the main objective with this position.

Why This Strategy?

Expeditors is expected to report a year-over-year earnings-per-share gain of nearly 20% early next week. Its freight business likely remains healthy as trade between China and the U.S. slowly grows in both directions, whatever you hear about China's economy. A stable, profitable, well-run business trading at a reasonable valuation, Expeditors is a company we're comfortable using for income. Even during 2008-2009, when revenue dropped sharply, the company remained nicely profitable. We made money on it from 2009 to 2012, and rejoined it last August on a dip in price.

So far since last August, including today's expiration, we will have earned about $1,400 in new income and unrealized gains of about $4,600 on our synthetic long. That's approximately $6,000 in total on the less than $600 in capital we had to deploy to start the position (instead of cash, our equity makes holding the position possible). Expeditors is a strong company, but worldwide trade is not growing rapidly, so it has offered a good range-bound stock on which to earn income. We'll continue to write options on it (and roll to higher strike prices for upside if merited) as long as this remains the case.

More That Matters

- **Maximum loss:** The same as owning at least 200 shares of stock (100 now, and 100 at $43), minus the option premiums received.
- **Maximum gain:** This new strangle caps our upside at $48, plus the premium received, which means about $50 per share. The most we can make on this strangle alone is about $2.05 in premium, which is earned if the stock stays anywhere between $43 and $48 by expiration.
- **Breakeven**: Our existing synthetic long mirrors stock ownership that started around $40.60, while this new short strangle has breakeven points at $41 and $50 -- a nice wide range. Above $50, our gains are just capped. Below $41, we start to lose on 200 shares of stock.
- **Follow-up:** The current plan is to keep writing strangles to earn income.

Alternative Trades

- **IRA-friendly/covered calls:** If you simply bought shares earlier and wrote February 2015 $45 covered calls, you'll need to roll those calls if you haven't closed them already. You can sell to open May 2015 $48 calls as we are.

Pro Can Help

- **Want more on this strategy?** See our guides to covered strangles and synthetic longs. We're combining the two into a synthetic covered strangle.
- **Questions?** Ship yourself on over to our Expeditors board.

Pro Portfolio Building Report No. 1: Feb. 18, 2015

Published Feb 18, 2015 at 1:07PM

Welcome, Fool! We're glad you're here. This report is meant to get you up to speed on our Buy First stocks — the companies on our scorecard that we think are the best bets for new money now. But first, a few words about *Pro*:

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that aims to generate winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* fit you.** We know not all investors are in the same situation! We can help you figure out how to buy the *Pro* investments given your personal situation, including investing in an IRA or coming to *Pro* already fully invested. Check out our advice for every approach to *Pro*: Invested Elsewhere | "Free-Range" | Whoever You Are
3. **Catch up with our portfolio at your own pace.** Start with the stocks in this report, and wait for our next two reports to come. You can always see our latest take on all of our positions on our What We Think Now page. As you explore our recommendations, it's important to remember that a stock's "scorecard status" (Buy First, Buy, or Hold) is the best indicator of how we feel about it. If a stock is listed as a Buy or Buy First on the What We Think Now page, that means we think you can buy it today.

Bring any questions to the Getting Started & Help discussion board, and Fool on!

Best,

The *Motley Fool Pro* team

Table of Contents

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 3.6%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Total U.S. mobile data traffic is expected to increase by more than 2,000% between 2012 and 2018, and U.S. mobile lines in service (including smartphones, computing devices, and machine-to-machine applications) are expected to increase from 360 million in 2012 to 648 million in 2018. Communications site operator **American Tower** (NYSE: AMT) is well-positioned to benefit from this trend.

What It Does

AMT leases antenna space on more than 69,000 cell sites (towers, rooftops, and more) to wireless service providers across the globe. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, non-cancellable, and feature contractual annual price escalations. About 60% of AMT's properties are located in 11 different countries outside the U.S., including India, Brazil, Germany, and South Africa, and AMT is intent on growing its international portfolio as it continues to build and acquire more towers.

How It's Working

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE (or, in Africa, from voice to data), or to increase coverage density. When they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; 98% to 99% of AMT's customers up for renewal each year do so, and more than 85% of its current leases don't renew until 2019 or later.

What We Expect

Revenue is up 25.3% year-over-year in the most recent trailing-12-month (TTM) period, with the international division up 27.2%, outpacing the domestic side. We expect revenue to roughly double over the next five years through a combination of price escalations, new towers, and upgrades, and year-to-date 2014 results suggest that the company is well on its way.

After its 2011 conversion into a real estate investment trust (REIT), AMT is required to pay out 90% of taxable income to shareholders. It currently distributes $1.52 annually, a 1.6% yield, and management expects to increase the dividend by 20% annually over the next five years. (Importantly, only the U.S. business and a small portion of the international business is organized as an REIT. For more, see our original write-up, linked in the sidebar.)

For More

- *Pro*'s original recommendation (5/6/13)
- *Pro*'s "Buy More" recommendation (3/17/14)
- Talk about AMT

Management reduces taxable income though the use of net operating losses. And because the useful life of its tower properties exceeds the depreciation schedule, AMT also uses a depreciation shield, which reduces taxable income and understates the value of some assets on the balance sheet. Thus, typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

The *Pro* Bottom Line

We value AMT at about $110 a share. Today's price provides an acceptable margin of safety for a business of this caliber. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network.

Buy First: Gilead Sciences (NASDAQ: GILD)

One of the strongest biotech companies on earth, Gilead is positioned to keep rewarding owners.

Suggested Allocation: 3.8%

What It Does

For More

- *Pro*'s original recommendation (4/30/14)
- Most recent earnings update (2/6/15)
- Talk about Gilead

Gilead Sciences (NASDAQ: GILD) helps millions of people fight life-threatening diseases. Its HIV drugs are prescribed to 8 out of 10 new HIV patients, and are already helping millions enjoy much better lives. The company's HIV products represented the majority of Gilead's revenue until its Hepatitis C cures, Sovaldi and Harvoni, were approved last year. The most successful drug launch in history, Sovaldi topped $10 billion in first-year revenue, and Harvoni is headed to megablockbuster status as well.

An estimated 2.7 million to 3.2 million hepatitis C patients reside in the United States, and a whole 2.8% of the world (almost 200 million people) is thought to have this common blood-borne infection. That means tens of millions could conceivably benefit from Sovaldi or the newer single-pill version, Harvoni, and this would still leave plenty of room for competing drugs to do well, too.

How It's Working

Gilead's revenue rose 137% in the quarter just reported, sending earnings per share up more than 340%, yet the $103 stock trades at less than 11 times expected 2015 earnings. The company's products have a healthy lead over competitors' hepatitis C drugs both in the U.S. and in other countries. The new Harvoni drug, approved in October, is the first single-pill regimen for curing Hepatitis C, and competitors aren't likely to match it anytime soon. Meanwhile, the company's HIV franchise remains unparalleled, and Gilead has more than 200 compounds in clinical trials.

What We Expect

In 2015, we expect healthy sales growth as Harvoni is prescribed to tens of thousands of new patients around the world. Beyond this year, countries will slowly approve the drug and its reimbursement over many years; Gilead expects the European market, for example, to grow for many, many years. Even as drug prices come down as more competitors arrive, profits will remain substantial. Meanwhile, we expect Gilead's refreshed HIV franchise and growing oncology franchise to help increase shareholder value in the coming years. It's important to realize that the stock can be volatile at times; nonetheless, Gilead is one of the best biotechnology companies in the world.

Buy First: Oracle (NYSE: ORCL)

This old-guard tech giant at a low price has more room to grow.

Suggested Allocation: 4.3%

What It Does

Oracle (NYSE: ORCL) is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems** (NASDAQ: CSCO), **Dell**, and **Microsoft** (NASDAQ: MSFT) — Oracle's value has steadily risen as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe. And when it comes to hardware, Oracle's own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

Combining hardware with boxed software and cloud services, Oracle is a full-service solution, one that's poised to enjoy long-term growth in free cash flow. The business is incredibly sticky — companies don't trust their data to just anyone, and it's tricky and even risky to make a switch. To add to its massive recurring revenue base, Oracle cross-sells new products to existing clients and continues to rope in new customers with its comprehensive software and hardware solutions, whether on site or in the cloud. The company has also been known to make some (read: *many*) acquisitions to propel growth.

For More

- *Pro*'s original recommendation (9/17/09)
- Latest earnings coverage (12/29/14)
- Talk about Oracle

How It's Working

Leading software sellers can write a program once and sell millions of copies, then provide small but critical updates on a regular basis. These updates drive a subscription business model, which leads to recurring revenue. Most of Oracle's customers renew annual software contracts that represent more than 40% of its revenue. This is stability upon which Oracle grows. Even better, as more customers move to a cloud-based relationship (rather than licensing on-premise software), Oracle enjoys increasing, monthly, recurring cloud revenue, even as customers save money because they no longer need to host their own software. For Oracle, economies of scale make hosting inexpensive.

What We Expect

At about $43, Oracle trades at about 14 times free cash flow, below the S&P 500's average, and management expects more operating leverage ahead and greater overall profits as cloud revenue steadily increases. We model about an 11% annualized return, topping our North Star with relatively low risk. This is a good buying opportunity for a proven business that still has plenty of room to grow.

Buy First: TD Ameritrade (NYSE: AMTD)

Assets and investment fees are rising; earnings should surge when interest rates head higher.

Suggested Allocation: 2.9%

Entrusted with about $670 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NYSE: AMTD) hosts around 440,000 stock, options, and futures trades on an average day, collects investment fees, and earns interest on billions in cash.

What It Does

Aside from being a leading discount broker, TD Ameritrade has a partnership with **TD Bank** (NYSE: TD) (which owns 41% of the company), giving it a unique position in its industry. The partnership allows TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank, and with cross-selling opportunities and below-average risk to boot. So, when the current record-low Federal Funds interest rate increases, TD Ameritrade will earn much higher interest income, all of it pure profit. Meanwhile, it continues to focus on job No. 1: increasing client assets and launching more investment products.

But about that Fed Funds rate: In 2007, it was 4.75%, up from 1% in 2003 during the last recession. Today, it's hovering between zero and 0.25%. The first year that it increases by 100 basis points (to 1.1% from today's 0.1%), management estimates TD Ameritrade's earnings per share will rise by an extra 26% compared with the prior year, on top of any other growth. And as history shows, interest rates could rise by much more than 100 basis points over the next three, five, and seven years.

How It's Working

TD Ameritrade has increased new client assets by at least 10% annualized for the last six years and counting. Management says this rate of growth has been about double that of its nearest competitor. For context, the S&P 500 (including dividends) has delivered about a 48% total return since 2007; client assets held at TD Ameritrade are up by 240% over the same period. Operating margins are strong, too, lately in the low-40% range.

For More

- *Pro*'s original recommendation (7/11/13)
- Monday Memo on TD Ameritrade's business model (9/15/14)
- Talk about TD Ameritrade

Diligent capital management led Standard & Poor's to upgrade the business to an "A" credit rating in 2012 (and reaffirm that rating in July 2014), which has helped fuel recent dividend increases; the quarterly dividend has grown 44% annualized since Q1 2011. With steady gains in customer accounts, decreasing shares outstanding, and a commitment to paying out roughly two-thirds of earnings to shareholders, the business should continue to reward owners — with the added benefit of much higher profits when interest rates increase. Meanwhile, the stock is trading right around its 10-year average price-to-book value of 4, although the company is more diverse and stronger now than over the past decade.

What We Expect

Management will continue to be excellent stewards of capital, returning profits to shareholders and increasing additional investor value. All the while, we know higher interest rates will someday lead to much higher net income. But even as we look forward to that, we can admire the company's current results and should enjoy healthy returns.

The *Pro* Bottom Line

Our current fair-value estimate on TD Ameritrade is $35. The company's earnings are likely at a cyclical low. Believing as we do that TD Ameritrade's profit potential is much greater than recent results suggest, we think the stock is a compelling buy in anticipation of higher interest rates. TD Ameritrade's business model is powerful when rates are headed upward. Most investors have probably forgotten that power since 2007, but will remember it when earnings start to jump.

Buy First: Wells Fargo (NYSE: WFC)

At heart, banks are simple businesses, and Wells Fargo is one of the best of the breed.

Suggested Allocation: 3.8%

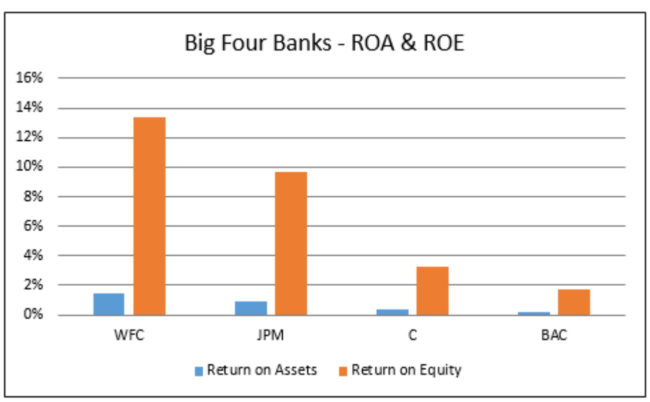
What It Does

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** (NYSE: WFC) is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 8,700 branches and 12,800 ATMs. It's the fourth-largest bank in America, it has a reputation for high customer loyalty and satisfaction, and it's the leader in mortgage and small-business lending.

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During tough lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

How It's Doing

CEO John Stumpf and team are truly the best of the breed. Return on assets and equity for fiscal year 2014 were rock-solid, at 1.45% and 13.4% respectively — great results given the low-interest rate environment and new regulations that require higher liquidity levels (i.e., less leverage) than before the financial crisis. A look at ROE figures for the other three big banks shows Wells Fargo's excellence:



Source: Wells Fargo February 2015 Credit Suisse Financial Services Forum Presentation

Total revenue growth has been elusive, but expense reductions and improvements in credit quality have driven quarter after quarter of earnings growth, leading to higher earnings than before the financial crisis. Deposit growth has been tremendous (coming in at 8.4% in the fourth quarter of 2014), and as Wells Fargo grabs additional "wallet share," fee income increases as well. The credit quality of the loan portfolio is very strong, with net charge-offs at just 0.34% of total loans as of fourth-quarter 2014. All of this has contributed to a very well-capitalized balance sheet, allowing Wells Fargo to comply with the aforementioned capital regulation requirements well ahead of schedule.

More Resources

- *Pro*'s original recommendation (12/10/10)

- *Pro*'s recent "Buy More" recommendation (7/29/14)
- Talk about Wells Fargo on our discussion board

What We Expect

Wells Fargo's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. In the current low-interest rate environment, we should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But when the U.S. economy picks up, interest rates rise, and loan demand resumes, Wells Fargo's real earnings power — bolstered by growth in fee-based revenue — will hit its full stride. And many customers who start a deposit account or mortgage with Wells Fargo will explore the company's offerings in other areas, too.

Shares are trading at less than fair value, and they yield a growing 2.5% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. *Pro* has also used options in the past to generate even more income from this position, so try to invest using round, 100-share lots if it keeps you within half a percent (plus or minus) of our 3.8% allocation. If that's not feasible for you, share ownership alone is fine, too; with its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

Close Your Short Calls on Expeditors International

Published Feb 18, 2015 at 12:00PM

Is this for you? This is for all members who wrote February $45 calls on **Expeditors International** (NASDAQ: EXPD). As long as the stock remains above $45 by Friday, we need to buy to close our calls — **members can do so now or wait and see if the stock is still above $45 by Friday**. By closing these calls, we're capturing extra income from our strangle; we plan to take a new position soon, which will be detailed in a separate trade alert.

How You Participate

- **Trade:** Assuming shares remain above $45, buy to close all of your February 2015 $45 calls on Expeditors International between now and Friday. (Leave your February 2015 $43 puts alone to expire as income.)
- **Price guidance:** You must **use a limit order** to pay as little time value as possible. Lately, with shares $0.35 above the strike price, you would realistically hope to pay no more than $0.50 to close. That will change as prices change, but the time value you pay should continue to be $0.15 or less.
  - **Recent prices (10:30 a.m. ET):**
    - Stock: $45.35
    - February 2015 $45 calls (bid/ask): $0.45/$0.70

What We're Thinking

Since last August, we've set up two covered strangles on freight consolidator Expeditors International, making income on both. But we had to close our short calls in the first trade to avoid exercise, and as it stands today, it looks like the same is true for our current short calls as well. We also have a synthetic long on the company, which is in the green. The second strangle we're ending today will result in income, too, and we plan to set up a new covered strangle soon.

Expeditors is due to announce earnings on Feb. 24, with 20% year-over-year EPS growth expected. The company's focus on U.S. and China trade drives growth as commerce increases between the two countries, while margins have benefited from cost controls.

If the premiums are inflated enough, we will recommend writing a new strangle right before earnings; otherwise, we'll wait and see how the stock responds to earnings before acting again. Either way, this remains primarily an income position (unless something in the results tells us it should be otherwise!), so we're going to keep targeting more income. Watch your inbox for the future trade alert.

More That Matters

- **Maximum gain:** These particular calls paid us $0.99 per share to start; that's the most we can earn on them if the stock ends Friday below $45. We plan to "buy to close" early if need be, though, and our maximum gain will be $0.99 minus what we pay to buy to close. On our whole strangle, the $43 puts paid us $1.04 per share and they're set to expire as income.
- **Follow-up:** The plan is to keep writing strangles at various strikes to earn income. Ideally, we would also like our synthetic long to continue to tick up in value as well, though that's of secondary importance.

Alternative Trades

- **Only wrote covered calls?** You can "buy to close" those just as described here.
- **Only wrote puts?** Those are set to expire as income. You won't need to do anything if the stock stays above your strike price.

Pro Can Help

- **Want more on this strategy?** Dust off our guide to covered strangles, and synthetic longs while you're at it. We're just combining the two into a synthetic covered strangle.
- **Questions?** Visit our revitalized Expeditors board.

Write a Covered Strangle on Wells Fargo

Published Feb 17, 2015 at 2:52PM

Is this for you? This is for *Pro* members who own shares of **Wells Fargo** (NYSE: WFC) and can write options for income.

How You Participate

- **Trade:** Use a combo order to write a covered strangle on your owned Wells Fargo stock. A strangle consists of two legs — a written put and a covered call — with different strike prices but the same expiration date:

- Write ("sell to open") April 2, 2015, $52.50 puts
    - Write ("sell to open") April 2, 2015, $57.50 covered calls
    - **Note** that these are **weekly** options (click "view all strikes" if you don't see these dates or strike prices)
- **Allocation:** Write one strangle (one written put *and* one covered call) per 100 shares of Wells Fargo you own. For *Pro*, that's 17 puts and 17 calls.
- **Price Guidance Now:** Because these are thinly traded weekly options, **it is critical that you use a limit order**. Aim for a credit near the midpoint of the combined bid/ask spreads of the put and call options (around $0.78 as of the day we issue this trade; realize that it will change).
    - **Later:** As the bid/ask spread compresses, aim for a credit slightly higher than the combined bids of the put and call options.
- **Recent Prices:**
    - Wells Fargo: $55.30
    - April 2, 2015, $52.50 puts (bid/ask): $0.40/$0.45
    - April 2, 2015, $57.50 calls (bid/ask): $0.33/$0.39

Why a Covered Strangle?

Today, *Pro* is going back to the well (pun intended) with a covered strangle on Wells Fargo. We've used this income-generating strategy on the company before, and we are again targeting income and potential profit within a certain range of stock prices. The thought process and execution behind this strategy are almost identical to those behind our previous strangle, but the strike prices and return math are slightly different. Specifically, at expiration (using the combined bid prices as the reference point), if the stock price is ...

- Less than $52.50: We'll be assigned to buy new shares at a net price of $51.77 (7.6% less than our fair-value estimate)
- Between $52.50 and $57.50: Our covered strangle will earn us the equivalent of a 1.3% yield on the current share price in 45 days.
- Higher than $57.50: Our covered calls could be exercised, forcing us to sell our shares at a net $58.23 if we don't take action.

Note that the third bullet point above violates Rule No. 1 of writing covered calls: Don't write calls on shares you don't intend to sell. We want to continue to hold Wells Fargo, and we intend to roll this strangle as needed, but if we are forced to sell our shares, we'll do so at 104% of our $56 fair-value estimate — not a terrible outcome.

We should also consider that Wells is already at a 3.9% allocation in *Pro*, and the written-put legs of this strangle could potentially increase that to about 7.5% if all of them are exercised. We wouldn't be comfortable with such a heavy allocation to most stocks, but Wells Fargo is an exception thanks to its operational excellence, consistency, and stability. Although we don't anticipate accepting more shares, it's comforting to know that we can if we need to. If we do increase our position by that much, we might write covered calls on some shares to ultimately trim it again.

Choosing an expiration in the first few days of April means we will sidestep any potential earnings surprises (and associated stock-price volatility) coincident with first-quarter 2015 earnings, to be announced April 14. Our $52.50 and $57.50 strike-price choices provide us with acceptable outcomes on either end of the strangle, as well as flexibility to roll up or down if necessary.

More That Matters

- **Maximum loss:** The same as stock ownership, minus the credits we received for setting up the strangle.
- **Maximum gain:** Our upside is capped at $58.23, or 5.3% higher than today's price.
- **Breakeven:** There are two breakeven points for strangles -- in this case, $51.77 at the low end and $58.23 at the high end.
- **Follow-up:** We'll consider writing a new strangle if this position expires fully as income. If it doesn't, we plan to roll the strangle to avoid accepting new shares (for the written-put leg) or selling our owned shares (for the covered-call leg).

Alternative Trades

- None. Neither individual leg (the written put or the covered call) pays well enough on its own, so we only suggest pursuing a strangle.

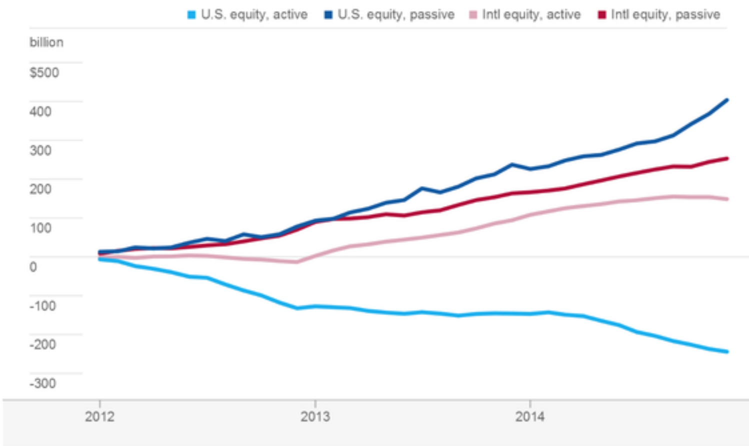
Passive vs. Active: The Final Reckoning

Published Feb 17, 2015 at 1:21PM

Fellow Fools,

The title of this Memo may be a bit melodramatic, I admit. That's especially true given the current battle between active and passive funds for U.S. investor dollars, where the results are a bit one-sided, to say the least. According to Morningstar, active U.S. equity funds lost $98.4 billion in 2014 versus $166.6 billion in inflows for passive funds, continuing the trend of the past few years.

Cumulative Flows for U.S. and International Equity Funds Since 2012, Active Vs. Passive



Source: Morningstar Direct Asset Flows, 2015

Clearly, Jeff, Billy, Ellen, and I work on a service that's swimming against the current. But does this mean it's time to start dusting off our resumes and finally embrace the cult of indexing? Au contraire, *mes amis*. And this isn't because I'm simply being stubborn.

An Active Investor, a Passive Investor, and Two Economists Walk Into a Bar ...

In their subtly titled paper *On the Impossibility of Informationally Efficient Markets*, Sanford Grossman and Joseph Stiglitz argue that, while an equilibrium degree of disequilibrium is possible, markets simply cannot remain in constant equilibrium. Their body of work eventually led to what has become known as the Grossman-Stiglitz paradox, which can be summed up like this:

- If markets are in constant equilibrium and asset prices reflect all information, then there is no reason for anyone to collect information and trade assets. Active investing will get you nowhere.
- But if everyone passively invests, then nobody will be watching to ensure that asset prices actually reflect all available information. Over time, the number of mispriced assets and the size of the deviations will both increase.

Imagine that everyone wakes up tomorrow and concedes that markets are 100% efficient. Even Bill Ackman and Carl Icahn decide to simply invest in an index fund and get on with their lives. In this new world, stock-price movements no longer reflect changes in the fundamentals of the underlying businesses. Instead, they're determined by fund flows and index compositions. For example, each time the Fool deposits some of my paycheck into my 401(k), the constituents of the index funds I invest in all get a little (and I mean a very, very, very, very little) bump as the inflow of capital forces them to buy more shares. And each time you liquidate some of your portfolio because it's time for your biannual six-week vacation, that decision will lead the funds you hold to sell shares, putting a downward pressure on prices.

In this brave new world of ours, nobody is monitoring prices. Companies who knock the ball out of the park, operationally speaking, are not rewarded with a higher stock price, while those who stink up the joint continually get a free pass. Given enough time, almost every asset will become mispriced.

So what does the endgame look like for this hypothetical market? Most of the outcomes I can envision are less than ideal; manipulation seems highly likely. Regardless of the outcome you predict, it should be clear by now why passive investors need the likes of you and me. In order for indexing to be successful, there must be price watchmen and watchwomen to exploit mispricing and keep everything in line. Without us, passive investing wouldn't work nearly as well as it does.

Passive Investing, *Pro*, and You

By now I'm sure many of you have realized that Grossman-Stiglitz cuts both ways: Active investors also benefit from passive investors. In fact, the more individuals who decide to simply mirror an index and call it a day, the better off *Pro* is. That's because the greater the percentage of investor funds dedicated to active approaches, the fiercer the competition to find mispriced assets. I might not go so far as to say finding mispriced assets would be impossible if 100% of investor funds were dedicated to the active approach, but it sure would be awfully hard.

Just Call Me Nostradamus

So what does the future hold for the active-passive battle over investor funds? My divination skills aren't the best, and markets are notoriously good at making soothsayers look like small-f fools, but I wouldn't be shocked if we see a reversing of investor preferences somewhere down the line.

Darwinism isn't restricted to just biology, and I think the pace of natural selection in the active-investing arena has begun to accelerate. 2014 was the worst year for hedge-fund closures since the financial crisis, and many are speculating that 2015 will be even worse. The active managers left standing will likely be some of the best at generating alpha, and if the growth in passive investing does lead to more opportunities for active investors, they may well end up with consistently enviable returns. And as subpar managers fall by the wayside, the best will take up a larger percentage of the active industry, resulting in higher average returns for the industry. This will make active investing look more enticing, because if there is one thing retail investors are good at, it's chasing performance.

The *Pro* Bottom Line

When you hear pundits talk about data similar to what I referenced at the beginning of this Memo, it can be tempting to start questioning whether you're making the right decision. Going against the grain can be hard. But I hope you decide to stay with us -- because our odds for success actually increase as more individuals throw in the active towel. And if you want to make our odds of success even better, make sure you tell everyone you know that indexing is the best way to invest. Just kidding ... but seriously, if you can't get them on board with *Pro*, that might not be bad advice.

Foolishly yours,

– JP (TMFYossarian)

Pro Guidance Changes

- **Skyworks Solutions** (NASDAQ: SWKS): The company's fair-value estimate increases to $75 on stronger growth. Shares remain a buy at a 4% allocation.
- **AmTrust Financial Services** (NASDAQ: AFSI) and **Medtronic** (NYSE: MDT) move to Hold as we review recent earnings results. With new members joining *Pro* this week, we want to be through earnings before recommending buys here at specific allocations.

Pro Catch-Up Trades

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking*.

- **American Airlines** (NASDAQ: AAL): If you haven't invested 1% in calls yet, you can buy to open January 2017 $30 calls now (rather than $35, to keep time value lower), lately at around $22 each. That price will change as the stock moves.
- **American Tower** (NYSE: AMT): If you haven't invested 0.5% in calls yet, you can buy to open January 2017 $80 calls, lately for around $22. That price will change as the stock moves. We also own 3.6% in the stock, which is rated Buy First.

Pro Guidance Changes: Feb. 17, 2015

Coca-Cola Shows Some Fizz

Published Feb 17, 2015 at 11:36AM

Coca-Cola (NYSE: KO) is in a transitional period, reorganizing how it addresses its myriad markets, changing bottling relationships, investing in brands, and cutting costs. During all this, revenue will likely be flat this year, while earnings should grow around 5%, same as last year. In *Pro* we have a profitable 2016 synthetic long option position that we *may* start to write synthetic covered calls on for income. It appears logical during this transitional year, assuming they pay well enough. Our estimated fair value remains $44, though this is a little challenged by lower growth than hoped for so far.

```
  Overview
========================
   Pro Guidance
========================
Status: Jan. 16 $35 syn long (newcomers would set up 2017)
Fair Value Est.:  $44  (no change)
Current Allocation: 3%  (look-through)
========================

  Q4 2014 Key Stats

Unit case volume: +1%
Revenue:    +4% currency neutral
Oper. Income:  +7% currency neutral
Cash from Ops:  +1% to $10.6 billion
EPS:      +5% currency neutral

   2015 Outlook

Revenue:   Slight growth
EPS:     +mid single-digits (5%-ish)
```

Key Thoughts

o The story is little changed from the past several quarters, as 2014, 2015 and perhaps even 2016 remain transitional years for Coca-Cola. The company is working to overcome a long-term decline in America's soda sales, filling the gap with new (and often non-sparkling) beverages. It is doing a commendable job, and now houses twenty billion-dollar+ brands, fourteen of which are not sparkling.

o There is probably much more value in Coca-Cola than the current business throws off -- which is why rumors persist that it would be an excellent (though giant) business to acquire and "rationalize." We don't bank on that, but I believe that management is trying to take action to realize long-term value in much the same way a buyer would.

o The macro-environment remains challenging, especially in Europe, and Coca-Cola is a giant freighter on the world's ocean. It can't change direction quickly. We should expect only slow improvements. However, expectations are modest, so even small positives quarter-by-quarter could grow the profit in our synthetic long. Meanwhile, downside should be limited to around $40 or the high-$30s in a poor market.

For now, we stay the course. For more on the quarter, please see our thoughts on the Coca-Cola board.

Skyworks Solutions Soars Higher

Published Feb 17, 2015 at 11:28AM

As demand for wireless connectivity grows, **Skyworks Solutions**(NASDAQ: SWKS) stormed past expectations, reporting a record first-quarter 2015 that nearly doubled profits. The company also provided strong guidance for the second quarter, side-stepping much of the seasonality it once faced. Margins are also growing. The stock remains a Buy in *Pro* and our estimated fair value increases to $75 -- that's 15x our EPS estimate for the year ending this September.

```
    Overview
========================
   Pro Guidance
========================
Status:         Buy (no change)
Fair Value Est.:   $75 (up 13% as growth greatly exceeds estimates)
Current Allocation:  4%
========================

   Q1 2015 Key Stats

Revenue:        +59% to $806 million
Oper. Income:    +114% to $282 m
Net Income:      +106% to $245 m
Earnings Per Share: +88% to $1.26 (non-GAAP)

   Q2 2015 Outlook

Revenue:      +56% to around $750 million
Gross Margin:    46% to 46.5% (up)
EPS:          +80% to $1.12

   Longer-Term Outlook

Gross Margin:    50% goal
Earnings:       $7 annualized EPS
```

Key Thoughts

o Skyworks is growing more rapidly than expected; last year, $5 in annualized EPS was an intermediate-term objective; now $7 per share in annualized earnings is already the target.

o An overlying theme is growing demand for wireless connectivity across broad product categories (phones, tablets, cars, medical, home, etc). Along with this, wireless needs are becoming more complex, narrowing the number of competitors who can deliver as solutions become modular. This increases the value-add of a company like Skyworks, and leads to more content sold into each unit at higher margins.

o Expect volatility from any semiconductor stock, especially one that has gained 50% since we bought in August. But given Skyworks' high-margin, industry-topping growth, the company is well-positioned to create additional value over our rolling 3-year time-frame.

For more, please see our coverage on its discussion board.

Pro Portfolio Analytics

Published Feb 9, 2015 at 3:21PM

Dear *Pro* Fools,

In my Memo from a month ago titled "Correlations Redux," I hinted at "a future Memo with more risk measures such as beta, Sharpe ratio, and style categorizations." What was once the future is now the present (wait, that's confusing ... does time really exist?): In today's Memo, I'll take a closer look at the *Pro* portfolio and analyze its historical performance.

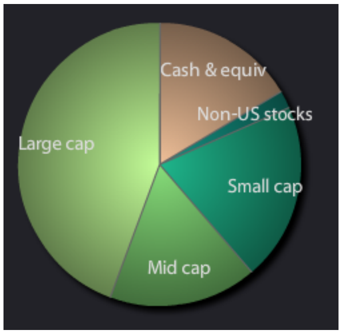
I will begin with a few disclaimers:

1. This analysis only considers *Pro*'s core long stock positions and our cash balance, excluding from consideration all shorts, ETFs, and options. If our shorts, ETFs, and options were included in the analysis, the metrics would of course be different; that said, this approach gives us a much cleaner look at the results of our long-term holdings, which are the main driver of our results.
2. Because of the methods and software used to perform the analysis, the metrics in the analysis represent only the historical performance of the **current *Pro* portfolio as it stands today, extrapolated backward.** Positions that we have owned and subsequently sold and any historical portfolio adjustments (allocation increases) are NOT factored into this analysis. What that means is that the analysis does not accurately represent the true history/performance of the real *Pro* portfolio.

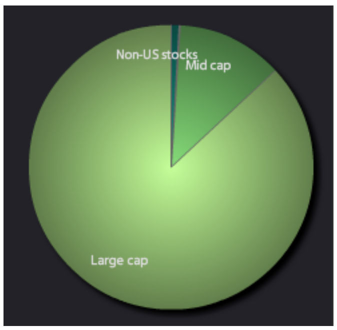
But we've had remarkably low turnover (our core positions have a weighted average holding period of 2.8 years), and our core longs plus our cash balance together historically represent about 85% to 105% of our total portfolio value (this number can be higher than 100% thanks to shorts!). Given those facts, the metrics below should be a decent proxy for the true performance of the *Pro* portfolio.

Finally, you'll notice that I chose both the S&P 500 Index and the Russell 1000 Growth Index (rather than our North Star) as the benchmarks for comparison. While the North Star is our guidepost for long-term (rolling-three-year) returns, it doesn't make much sense to compare the short-term risk and volatility measures of an equity portfolio to a metric that is not investable and doesn't trade on an open market. The S&P 500 is the most widely used benchmark, and the Russell 1000 Growth Index is a more comparable index to *Pro*'s portfolio in terms of mid-cap exposure and a bias toward growth stocks. I chose to include performance data only up to three years, as it corresponds with our average holding period.

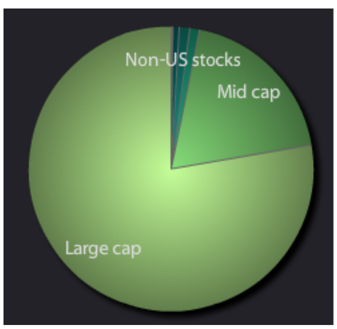
***Pro* Portfolio:**



S&P 500:



Russell 1000 Growth Index:



Source: Portfolio Lab Pro

Defining the Metrics

The metrics used in this analysis are often used in measuring the performance of hedge funds, and they are listed and defined as follows:

- **Annualized Total Return:** the total return of the portfolio over the period (including dividends).
- **Volatility (Standard Deviation):** the annualized standard deviations of the monthly returns (for a period of one year or more) or weekly returns (for a period of less than one year)
- **Alpha:** the excess return of the portfolio over a benchmark (in this case the S&P 500), after adjusting for risk (beta). A positive value of alpha implies that the portfolio has performed better than expected, relative to its risk. The higher the alpha, the better. This measure is annualized if the backtest period is more than one year.
- **Beta:** the volatility of the portfolio with respect to the benchmark. A value lower than 1 indicates that the portfolio is less volatile than the market. A value greater than 1 indicates that the portfolio is more volatile than the market.
- **Sharpe ratio:** compares the portfolio return against a risk-free return (i.e., a U.S. treasury bill), adjusted for risk. The greater the Sharpe ratio, the better the portfolio's risk-adjusted performance. For example, if two portfolios have achieved the same returns but with different levels of volatility, the portfolio with less volatility will have a better (higher) Sharpe ratio.
- **Sortino ratio:** a modification of the Sharpe ratio, using downside deviation for the risk adjustment instead of standard deviation. The downside deviation only considers the periods of negative returns. The greater the Sortino ratio, the better a portfolio's risk-adjusted performance.
- **Up/down capture ratio:** represents how much the portfolio participated in the moves, up or down, of the benchmark. An up capture ratio greater than 1 is desirable; it means that on average, the portfolio manager had higher returns than the benchmark in months when the benchmark had positive returns. Conversely, a down capture ratio lower than 1 is desirable, because it means the manager captured less of the market downside. To calculate the up capture ratio, you first identify the months in which the benchmark had a positive return, then divide the average monthly return for the portfolio during those months by the average monthly return of the *benchmark* during those months. Similarly, the down capture ratio is calculated using the months in which the benchmark had negative returns.
- **Maximum drawdown:** the largest peak-to-trough decline observed during the period.

Source: Portfolio Lab Pro

In looking at the results, the backtest of the *Pro* portfolio is pretty amazing. For each data point, the bolded green font represents the best performance between the *Pro* portfolio, the S&P 500 Index, and the Russell 1000 Growth Index. *Pro* sweeps every category except the up capture ratio, which is to be expected for a portfolio that's 16%-plus in cash.

Pro's annualized returns are higher in every period, our volatility is lower in every period, our portfolio was a risk-adjusted outperformer in every period, and we captured 88% of the upside and just 43% of the downside of the S&P 500 over the past three years.

That downside capture ratio is something we strive for at *Pro*: We want to lose less than the market when the market goes down. We aim to achieve that goal by picking high-quality businesses with stable, recurring cash flows and strong balance sheets, and these numbers help to show that our approach is working, at least over the past three years. And mathematically, the downside capture ratio is a main contributor to the outperformance of the *Pro* portfolio. Even though we don't capture all of the upside of the market, by losing less when the market goes down, we have a larger base of capital from which to appreciate when the market starts to go up again.

Astoundingly, in searching Morningstar's database of almost 30,000 funds, I didn't find a single mutual fund that came close to achieving the trailing three-year absolute (let-alone risk-adjusted) returns of the *Pro* portfolio backtest. The only one in the ballpark was the Biotechnology UltraSector ProFund (ticker: BIPIX). And as of Barron's May 2014 hedge fund review (which analyzed performance through year-end 2013), only 25 hedge funds that qualified for the list had achieved a three-year annualized return greater than that of the *Pro* portfolio backtest.

The *Pro* Bottom Line

I'll again emphasize the limitations of this analysis: It excludes options, ETFs, and shorts; the impact of relatively new positions (like **Skyworks** (NASDAQ: SWKS) and **Gilead Sciences** (NASDAQ: GILD)) is overstated; and sold positions (such as **Intel** (NASDAQ: INTC) and **GrafTech** (NYSE: GTI)) are not considered. But this analysis of *Pro*'s historical performance gives us numerical evidence that our core approach works.

Because we focus on companies with high-quality franchises, strong balance sheets, and sustainable competitive advantages, *Pro* stocks tend to gain as much or more than the market when it rises, and lose less value than the market when it declines. This has led to some pretty heady results over the last three years.

Bringing us back to reality, the market doesn't typically return 17%-plus annualized over a three-year period ... and we know these results won't continue forever. The market of the last three years has been one of spectacular stock returns, and that played a significant part in explaining our own excellent returns. Nonetheless, the core *Pro* portfolio has been a risk-adjusted outperformer, and we hope to continue that performance into the future.

Fool on!

-- Billy (TMFTailwind)

Pro Guidance Changes

- **Apple** (NASDAQ: AAPL) Our fair-value estimate increases to $118. Shares remain a Buy with a 4.5% allocation.
- **Broadridge Financial Services** (NYSE: BR): Our fair-value estimate grows to $49. Shares remain a Buy with a 4.5% allocation.

- **Facebook** (NASDAQ: FB): Our fair-value estimate gets a "Like," increasing to $72. Shares are still a Buy with a 4.4% allocation.
- **Tupperware** (NYSE: TUP): Our fair-value estimate drops to $75. Shares remain a Buy with a 3% allocation.

Broadridge Shows Strong Sales Momentum

Published Feb 9, 2015 at 12:48PM

Pro's Take: BR Q2-2015 Earnings

Broadridge Financial Solutions (NYSE: BR)

Quarter Quick Take

Broadridge continues to execute its business strategy, booking record recurring revenue sales in Q1 and Q2, setting the company up for a strong end to Fiscal 2015. Broadridge registered 7% growth in recurring fee revenue, 25.4% year-over-year growth in EPS, and announced two small, complementary acquisitions over the quarter. The company outlined its three-year plan at its investor day in December, and Broadridge should continue to challenge the North Star through 2017 with 7-10% recurring fee revenue growth, margin expansion due to increased scale, dividends/share buybacks, and tuck-in acquisitions to complement its existing product portfolio. Broadridge is a well-managed business with steady upside, low downside risk, and shareholder-friendly management.

....

Q2-2015

Total recurring fee revenue growth: +7%

TTM Operating profit margin*: +26 bps to 23%

EPS growth (Y-o-Y): +25.4

*Operating profit / Fee revenue

This removes the impact of distribution revenue, which is a pass-through, and distorts the true economics of the business

....

Guidance Update

After two record quarters of sales in what are historically seasonally weak quarters, management's reaffirmed FY-2015 guidance looks pretty conservative: recurring revenue growth of +5% to +7%, EPS growth of +8% to +13%, recurring revenue closed sales of $110-$150 million, and FCF of $320-$370 million. I'd be surprised if Broadridge doesn't manage to outperform its guidance once results from the historically strong back half of the year are tallied.

Updated guidance: Buy (no change)

Recommended Allocation: 4.5%

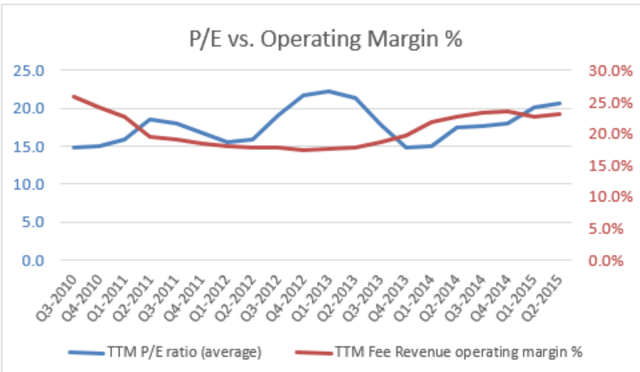
Fair Value estimate: $49 (up from $43)

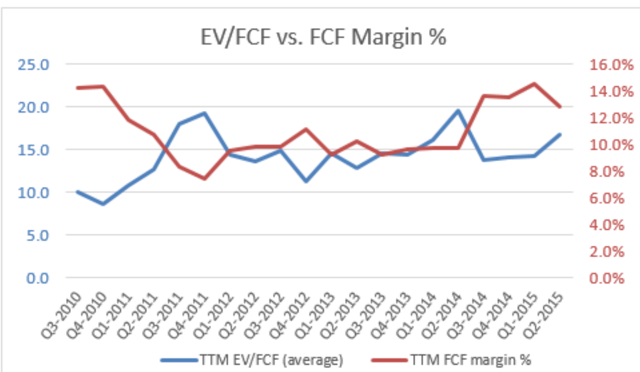
After adjusting my model and accounting for recent business performance, I've updated our Fair Value estimate to $49 per share (from $43). You'll notice that's a 14% increase since the last update-a pretty large increase for a steady business like Broadridge. The reason for the large increase this quarter is because after reviewing my valuation model, I determined that the discount rate I was using was too high (I was assuming a 5.5% cost of debt rather than the more accurate 4.5%):

	Outstanding Borrowings	Fixed Interest Rate
Senior notes due June 2017	$124.6	6.125%
Senior notes due September 2020	$399.5	3.95%
Total	$524.1	
Weighted average cost of debt		4.47%

Source: Broadridge Q2 2015 10-Q, Notes to Condensed Consolidated Financial Statements, Note 9

Since debt makes up 35% of the company's capital structure, that had a significant effect on the overall discount rate (i.e weighted average cost of capital, or WACC) I was using to discount projected cash flows.This change in discount rate contributed about $4 of the FV increase, and the balance of the increase was made up with cash generated since the last FV update and stronger near-term growth expectations due to the excellent start to Fiscal 2015. The stock's not a screaming bargain, especially after gaining over 3% on the day of earnings; the business is priced at 19x projected 2015 cash flow and 21-22x projected 2015 EPS. Both of those metrics are near Broadridge's historical highs, but relative to its history, the company now has more stable cash flows, a steadier growth profile, strengthened competitive positioning, and higher margins to show for it:





Sources: Company filings and analyst calculations.

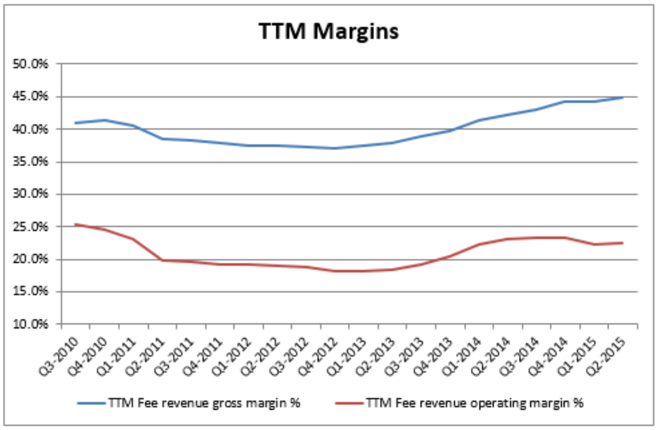
Our Thesis

Broadridge has a near monopoly in proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record and sound capital allocation policies make Broadridge a sturdy rock to build the Pro portfolio upon. We expect modest growth in fee revenue, slight operating leverage, plenty of free cash flow and a growing stream of dividends to help achieve North Star-like returns.

The Most Important Things

1) ***Recurring Revenue Closed Sales:*** This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%+). Tracking RRCS gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings. After posting a Q1-record RRCS of $32 milllion last quarter, Broadridge yet again delivered stellar results with a Q2-record $49 million in RRCS. Although RRCS are lumpy, Broadridge's business is historically seasonally stronger in the second half of the fiscal year (due to regulatory filing deadlines imposed on its public reporting company and mutual fund clients). Due to the record RRCS performances in Q1 and Q2, the company should be able to easily meet its full year 2015 guidance of $110-$150 million in RRCS. Comments from a "very enthusiastic" management suggest the sales pipeline continues to be "robust with very good momentum". I'd be pretty surprised if the company doesn't challenge the upper end of guidance by the end of Fiscal 2015.

2) ***Fee Revenue Margin Performance:*** Broadridge maintains a technology platform upon which its business operates. As it brings more business (volumes) on board, it should benefit from low variable costs and increasing margins. We track gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue, and because of Broadridge's seasonality we prefer to look at TTM margins to smooth out quarterly fluctuations. TTM fee revenue gross margins came in at 45.3% (up from 41.9% a year ago), and TTM fee revenue operating margins came in at 23% (up from 22.8% a year ago). I wrote last quarter that I expected margins to hold steady or decline slightly in coming quarters as the company plans strategic growth investments to be executed in the second half of the fiscal year, and that's what we got. We should see these investments fully bear fruit in FY 2016 as the elevated spending rolls off, but if sales growth continues its strength we could see further margin expansion this year.



3) ***Capital Allocation:*** Although BR is a slow grower, it generates a lot of cash and has low reinvestment needs. Management has a very clear plan to put that cash to work: it targets a 45% payout ratio, then looks for bolt-on acquisitions that can achieve a 20% IRR, or it looks to repurchase shares. The company announced two acquisitions this quarter-a) acquiring the trade processing business of M&T Bank Corporation's (NYSE: MTB) Wilmington Trust Retirement and Institutional Services unit for an undisclosed amount and b) closing the acquisition of TwoFour Systems for about $32 million. The company plans to step up the pace of its acquisition spending over the next three years, targeting about $400-$600 million of tuck-in acquisitions to drive faster growth. Both of these new acquisitions tie in nicely with Broadridge's existing product lines, and management has historically been a good acquirer, so I view these transactions favorably. Broadridge also paid $32 million in dividends and bought back about $10 million in shares at an average price of $45.40 in the quarter. Broadridge gets a solid check mark for capital allocation in Q2 2015.

WWTN

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Gilead Sciences Has a Record 2014

Published Feb 9, 2015 at 10:12AM

Gilead Sciences (NASDAQ: GILD) reported record results and suggested that the market for Hepatitis C will remain large for many years to come. Wall Street is focused on price cuts, but those only come with increased patient access, so volume should benefit. The pricing concessions are larger than we hoped, though; even so, our fair value estimate is able to stay at $120, or 12.5x 2015 EPS estimates, and the stock remains a Buy First. Starting its first dividend, the stock will yield about 1.6%.

=========================
Pro Guidance
=========================

Status: Buy First
Fair Value Est: $120
Current Allocation: 3.7%

=========================

Q4 Key Stats

Revenue: +137% to $7.2 billion
Net Income: +340% to $3.4 billion
Earnings Per Share: +341% to $2.43

Key Thoughts

o Concerns about Hepatitis C pricing have proven more legitimate than we assumed they would this early on, but this does not change the positive trajectory of the valuation, even if the magnitude is dampened a bit in the near term.

o Discounts in pricing on Harvoni and Sovaldi are given on the condition that access to patients is increased, meaning many more patients should qualify for treatment than have been so far.

o Gilead's Hepatitis drugs have the best outcome profile, and that is likely to remain the case, meaning Gilead should keep a healthy majority of market share. Gilead is not much concerned about future market entrants.

o Gilead's HIV franchise remains a growing powerhouse, and its pipeline is strong.

Looking Ahead

As we said before, what matters most the coming few years are Hep C sales -- how strong will they be? Since the drugs cure patients, revenue will not be linear. Sales will subside, leaving a sizable headwind for year-over-year growth in years to come. But for now it's a giant cash generator, adding value, and we expect sales will be healthy well past 2018. In this conference call, management voiced the same thought (and it's interesting it isn't being reported anywhere I read):

COO, John Milligan: "*...the number that's pretty strong is the 1.6 million people who are currently diagnosed and have been under care at least at some point in the past, and we see there's great opportunity for Gilead in future years to drive those patients into care. And so there are a number of programs that we'll be embarking upon this year, educational campaigns with things like primary care, not with the intent of them treating [right now], but with referring and identifying the disease, all the way through advertising campaigns that in 2016, 2017 and 2018 and beyond -- can go to the number of years beyond that -- will continue to drive those patients into care. I* *think additionally, as these therapies have gotten both more affordable for the system and better because of the simplicity of use, we will see those other patients, that roughly 3 million to 4 million people who are out there, the additional 2-plus million who are out there above the 1.6 million, will also have an opportunity to seek care. And we do see a great opportunity to drive those patients. So we do see this as a long-term sustainable business based on what we've seen today despite the rapid influx that we saw in 2014 and the continued influx that we anticipate in 2015."*

And in Europe:

"In Europe, the situation is actually quite sustainable, I think, for a number of years here. What we're seeing are commitments from the public sectors to treat a certain number of patients. And in most of those cases, it's a considerably higher number of patients than have historically been treated. But when we look at the denominator, the total number of patients who could be treated, this is something that plays out roughly 10 to 15 years or, in the case of some of the high prevalence countries like Italy, even beyond that. So we do think it is quite a sustainable market through Europe."

Should the market size remain robust (similar to 2015) for years, and pricing not decline meaningfully year-to-year as contracts roll over, then the value creation at Gilead the next 5-10 years is being sold very cheaply at today's stock price. Those are a few big "ifs," though, so some discount to the potential cash flow is merited. The discount looks a bit large right now, though. Shares remain a Buy First.

For all the numbers, outlook, and conference call notes, please visit our Gilead board.

Facebook's Value Increases Even as Spending Jumps

Published Feb 9, 2015 at 9:18AM

Greetings, Fools,

Facebook (NASDAQ: FB) had a "big" year, growing headcount 45% to 9,200, and investing in its future, yet achieving $3.6 billion in free cash flow on $12.4 billion in revenue. The stock remains a Buy and our estimated fair value increases to $72 -- that's about 36.5x EPS estimates (non-GAAP) for this year.

***Pro* Guidance**

- **Status:** Buy (no change)
- **Fair-Value Estimate:** $72 (up from $67)
- **Current Allocation:** 4.5%

Q4 Key Stats

- **Revenue:** +49% to $3.9 billion
- **Non-GAAP Operating Income:** +48% to $2.2 billion
- **Non-GAAP Net Income:** +86% to $1.5 billion
- **Non-GAAP EPS:** +69% to $0.54
- **FCF:** $1.07 billion

Key Thoughts

- Facebook is a fast-growing company that doesn't necessarily care if it grows quickly. The company is focused on the very long term, and has a primary goal of "connecting everyone." If it comes close to its goal, it will also "figure out" ways to keep earning growing revenue on its engaged audience.
- Wall Street is focused on Facebook's growing expenses, but I believe similar to Google last decade, higher expenses will eventually look reasonable in relation to how large revenue grows.
- The stock appears reasonably valued as long as site engagement remains as strong as it is now, and continues to grow (even slowly), while Facebook takes more advertising spend year by year. Social advertising is still a tiny slice of the total ad pie, and Facebook is intent on showing how well it works, and has early success.

Overview

- **Recent Price:** $75.40
- **Yield:** 0%

Valuation

- **Market Cap:** $211 billion
- **Cash & Equiv.:** $11.1 b
- **LT Debt:** $0 b
- **Enterprise Value:** $199.9 b

Metric	Multiple
EV/EBITDA	32.9
EV/EBITDA NTM est.	19.2
P/E	67.8
P/E NTM est.	38.2
P/FCF	55.2

TTM Cash Flow

- **CFO:** $5.45 billion
- **Cap EX:** $1.83 billion
- **FCF:** $3.62 billion

TTM Margins

- **Gross Margin:** 83.5% (all up lately)
- **EBITDA Margin:** 49.6%
- **Operating Margin:** 23.6%

- **FCF Margin:** 31.4%
- **ROE:** 11.3%

Historical EV/EBITDA

Year	Dec. 31	Annual Average
2012	44.1	33.8
2013	39.8	41.2
2014	33.6	35.1
Now	32.2	32.9

(Next-Twelve-Month estimate 19.2)

Note the historical value multiples. As you would expect, the EBITDA multiple is slowly declining as the business grows, even as the stock appreciates. It again reminds one of Google's early years. For the "Next Twelve Month estimate," the multiple would contract mightily unless the stock appreciates. This has been the case each year, though.

Looking Ahead

Facebook doesn't provide guidance, but expects currency exchange rates to decrease total revenue (from what it would otherwise be) by about 5%-point in 2015. Non-GAAP expenses should increase 50% to 65%, and GAAP expenses will grow a robust 55% to 70%. They're investing in people, product, and infrastructure (servers, Internet.org, etc). 2015 capital expenditures will be $2.7 to $3.2 billion, up from $1.8 billion last year. A year of investment, we don't expect fireworks on the bottom line or in free cash flow this year, but expect better growth later to make up for it.

Conference Call Notes

The Focus

- **3 years:** The main focus is to continue to serve and grow the community by providing better services for people and businesses worldwide.
- **5 years:** Build the next generation of Facebook services. Messenger is at 500 million monthly actives, WhatsApp at 700 million. Instagram has more than 300 million actives, more than 70% outside the U.S. Facebook Search is a work in progress with early promise. Facebook's Audience Network allows it to work with developers, forming an App model similar to Apple.
- **10 years:** Connect everyone to the Internet through Internet.org and develop the next generation of computing platforms, including Oculus.

The Audience

- The number of people using FB on an average day increased 18% in December, year-over-year.
- 1.39 billion people now use Facebook each month; 890 million visit daily, an increase of 165 million monthly actives and 133 million daily actives in 2014.
- Time spent per person per day across FB continued to rise, growing in Q4 by more than 10% compared to last year (and that excludes WhatsApp).
- WhatsApp, Messenger, Instagram still far from being monetized

2014 and More Q4 Numbers

- 2014 revenue +58% to $12.5 billion; $3.6 billion in FCF
- Q4 ad revenue +53% to $3.6 billion; mobile was 69% of total ad revenue, doubling to $2.5 billion.
- Q4 GAAP expenses up 87% to $2.7 billion; Non-GAAP expenses up 50% to $1.6 billion; Non-GAAP is not out-of-line with growth. Stock-based compensation and amortization were key drivers of the non-GAAP jump; headcount was key in the GAAP increase.
- Full-year, GAAP costs up 47%, non-GAAP up 34%. Again, reasonable for the growth. But there's bigger spending ahead (so large there's a chance FB won't be able to spend as quickly as it projects).

Ads

- The average price per ad increased 335%; total ad impressions declined 65% (due to a redesign of the right-hand column).
- The company's strategy is not to serve more and more ads the more content a user consumes, but simply to serve better ads to everyone.
- Instagram ads started to roll out (in a small way) in Q4 in Australia and Canada.
- Video views are soaring, to more than 3 billion views per day hosted by FB.
- Custom Audiences — FB's proprietary targeting products — are doing well for clients. (Example: Thomas Cook reached 30% of the Belgian population in one day and achieved a 3.85x return on investment.)
- Audience Network (ads off of Facebook) still new, but promising.
- Overall, clients are excited by the ability to be creative and tell stories with their ads on FB — and measure results quickly. Now the challenge is to scale. "Even for our largest clients globally, we still represent a really small part of what they do."
- The ultimate goal in the ad division is to be "a critical business partner to clients, providing people-based marketing at scale" to build brands and earn clients a good return.
- In the U.S., "mobile gets 25% of consumer media time, but only 10% of the ad budgets. ... that means that for every consumer hour spent on print, marketers spend $1, and they spend $0.07 per hour on mobile."

What We Think Now: The social-networking leader is building and always improving its services, aiming to be integral to life, with a goal of retaining and growing its audience. That will provide a lucrative platform to host relevant ads at greater profits for shareholders. By three years from 2014, Facebook's revenue could potentially double.

Why Kickstarter Is Off to a Great Start

Published Feb 6, 2015 at 10:14AM

JP recently contributed to a series in Motley Fool Rule Breakers *profiling private companies with disruptive potential. We thought you'd like to see his entry here! Read on to learn more about a disruptive company whose mission is helping out other potential disruptors.*

If you have a hankering to make some potato salad, but find yourself low on funds, there's a place on the Internet where strangers might contribute $55,000 toward your carb-loaded concoction. Sound like a joke? The same site can help your game-changing business idea or research project get financial support when you need it most — and it's disrupting the financial industry.

Kickstarter, a private crowdfunding company, is helping redefine how creators raise funds for business ventures, films, video games, music, art, technology, you name it. It's an extension of a model that once was the primary method for funding art — soliciting money from patrons in exchange for something like an early copy of a novel — only, as the company puts it, "turbocharged by the Web." In a world where traditional gatekeepers like banks, venture capitalists, or entertainment companies have the final say on what ideas see the light of day, Kickstarter places that power in the hands of you and me. See something you like? Support the project by pledging a donation. If the project meets its funding goal before the deadline, backers receive various perks, and the creator receives the total amount pledged — minus Kickstarter's cut.

Last year, 22,252 projects were successfully funded on Kickstarter, and 7.7 million people have pledged more than $1 billion for projects in the past six years. Oculus VR, which was later acquired by **Facebook** (NASDAQ: FB), raised almost 10 times its original goal back in 2012. A campaign to bring back the educational TV show *Reading Rainbow* raised $5.4 million, and an idea for a portable cooler was able to raise over $13 million!

Even though Kickstarter still has a start-up-type mentality and is heavily investing in its business (Kickstart Norway just launched this past September), the company has been profitable since mid-2010. Just as **eBay** (NASDAQ: EBAY) makes money by collecting a fee for sales that occur in its marketplace, Kickstarter collects a 5% fee from each project that is successfully funded.

Chairman Perry Chen came up with the idea for Kickstarter in 2002 when he tried unsuccessfully to raise funds to throw a concert. Not your typical tech company founder, Chen held a variety of jobs prior to starting Kickstarter, including artist, day trader, recording engineer, gallerist, waiter, and preschool teacher. A writer and rock critic (current CEO Yancey Strickler) and a designer (Charles Adler) later joined Chen to help found the company. Along the way, Kickstarter has received funding from prominent investors like **Twitter** (NYSE: TWTR) co-founder Jack Dorsey, but management has always insisted on doing things its own way.

Chen and company believe that creative projects make for a better world — and that their company is a tool to bring creative projects to life. Kickstarter is doing more than just changing the way people go about raising funds: It's helping fund disruptors all over the world.

Tupperware Pops

Parexel's Backlog Is Back on Track

Published Feb 3, 2015 at 12:36PM

Pro's Take: PRXL Q2-2015 Earnings

Parexel International (NASDAQ: PRXL)

Quarter Quick Take

After last quarter's poor sales performance, new business wins picked up in Q2 2015. The net book-to-bill ratio, an indicator of future business, jumped to 1.54 from 0.88 last quarter as strategic partnership sales (a key element of our thesis) came back strongly. Revenue growth slowed a bit (2.5% year-over-year) due to currency headwinds and a sales mix that was weighted toward younger projects in the start-up phase. Both of these factors should continue to pressure reported revenue in the near-term (and backlog growth should outpace reported revenue growth), but as the projects mature and milestone are met, we expect revenue growth to return to our 8-12% expectations. Margin expansion and non-operating items led to 41% growth in EPS.

....

Q2-2015

Sales growth: +2.5%

Operating profit margin: +99 bps to 10.6%

EPS growth: +41%

....

Guidance Update

The business continues to track well against our thesis despite a competitive operating environment and currency headwinds. Parexel's largest business segment, Clinical Research Services (CRS), bounced back after a weak Q1, and it continues to win new business and earn strategic partnerships. The company's Consulting and Informatics segments are growing more modestly, but margin expansion in these smaller segments is helping companywide results. Longer term, these businesses should be meaningful contributors to economic value. There's no change to our $57 Fair Value estimate, as near-term revenue headwinds offset recent cash generation in our valuation model.

Updated guidance: Buy (no change)

Recommended Allocation: 3.4%

Fair Value estimate: $57 (no change)

Members lacking a (full) position should be patient in initiating or adding to their position with the stock about 7% ahead of our Fair Value estimate. Parexel shares have been volatile - customer concentration, lumpy quarterly results, and a high multiple make this likely to continue - so we may look to be opportunistic with options to generate current income.

Our Thesis

Because of its reputation, global reach, and technology prowess, Parexel International will win its fair share of the growing pharmaceutical development market. In addition, we expect the proportion of R&D dollars outsourced to contract research organizations to grow as large biopharma companies adopt the strategic partnership model and smaller biotechs become responsible for more drug discovery. Finally, as new business wins mature, the true earnings power and margin potential of the company's business will shine through.

The Most Important Things

1) ***Penetration and Backlog*****:** Penetration refers to the proportion of biopharma R&D dollars that go to CROs versus being used in-house for development and provides evidence that the biopharma/CRO partnership model is winning. As we wait for industrywide 2014 data to be tabulated, we can monitor backlog trends to ensure Parexel is sufficiently adding future business – backlog that converts to sales usually represents ~80% of the sales in any given quarter, so strong backlog growth suggests strong future sales growth.

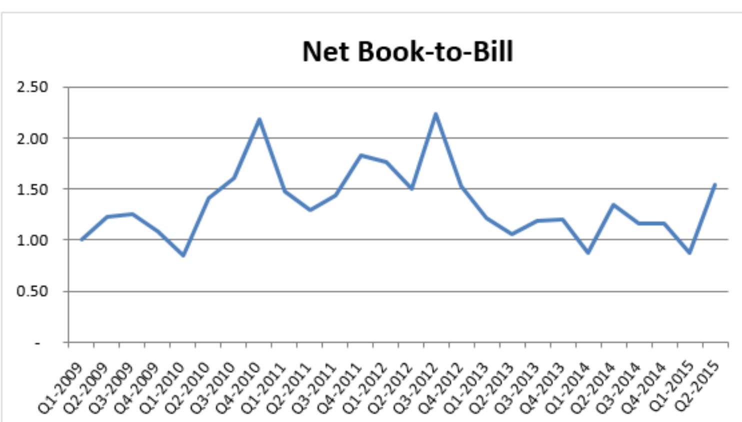
Backlog grew 4.5% sequentially and 6% year over year (5.5% and 6.9% if adjusted for unfavorable currency fluctuations). Because of Parexel's global presence, currency fluctuations (specifically the weak euro) should continue to have an effect, so that may dampen reported revenue growth figures as we approach the back half of the fiscal year. Additionally, management comments on the conference call suggest that revenue growth may lag backlog growth in the coming quarters due to project mix:

> "We still have a large number of projects that are in the start-up stages that typically generate lower revenue for labor effort expended. In addition, we have other studies that are winding down and, therefore, there is not as much backlog in the higher revenue generating enrollment stages at this point in time. As a result, we anticipate that revenue growth will lag new business success somewhat in the short term." -Josef von Rickenbach, Chairman / CEO

Part of that increase in backlog was due to a renewed and expanded partnership with GlaxoSmithKline (NYSE: GSK) which was referenced in the Q4 2014 call but not disclosed. Here are some comments from von Rickenbach regarding the GSK partnership:

> "...it is a multiyear agreement and it involves certain future new business commitments. In accordance with our policy, we have included in backlog only the elements that we expect will start to convert into revenue within the next 6 months.
>
> Part of the agreement includes the transfer of approximately 450 GSK employees to Parexel. These employees will transfer with work, including ongoing clinical trials. We look forward to welcoming these employees and to bringing them onboard. Our agreement with GSK is a prime example of how our partnerships with big pharma are deepening, it highlights our innovative thinking and demonstrates how we work strategically with clients to jointly evolve the business model. We have a close relationship with GSK and are very happy that they have trusted us in this new and expanded manner."

After last quarter's poor showing, the book-to-bill ratio bounced back to a healthy 1.54 due to the GSK partnership and solid increases in net new business. As we suspected, the poor book-to-bill last quarter seemed to be related to non-recurring timing issues, and those lost sales partially found their way into this quarter's results:



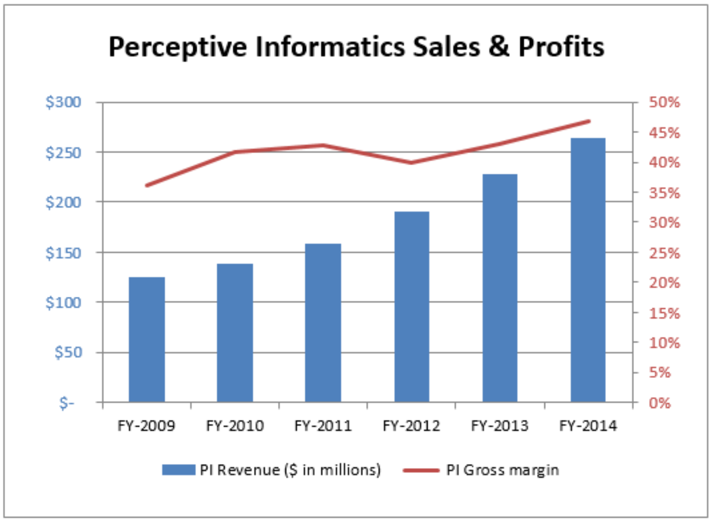
Source: Company filings and analyst calculations.

As the CRO industry picks up a higher percentage of biopharma R&D spending, we should see revenue and backlog growth outpace the expected 2-3% growth in R&D spending. With 8% growth in TTM service revenue and 6% growth in backlog, that's what we're seeing, which-along with new partnership announcements-provides evidence that our thesis continues to progress.

2) ***Margin Performance***: Company gross margin declined 72 bps sequentially and increased 105 bps year-over-year. Gross margin improvements have slowed a bit mostly due to the project mix and new hiring in the company's largest segment-Clinical Research Services (CRS)-as mentioned in the above section. We should expect to see project mix continue to pressure gross margins in the CRS segment into the rest of 2015. But as start-up projects mature and newly hired staff becomes more productive, over time we should see gross margins continue to tick up.

As for the other two business segments, Parexel Consulting and Medical Communications (PCMS) gross margins increased to 45.2% (up from 40.2% a year ago) and Parexel Informatics (PI) gross margins increased to a record 50.5% (up from 46.8% a year ago). The main contributors to the gross margin expansion in the two smaller segments (PCMS and PI are 11% and 13% of revenue, respectively) were favorable product mix and productivity improvements. Our model assumed more modest margin improvements, but we aren't complaining. If the company can keep up its margin performance in these segments, we may need to revise our long-run estimates upward.

3) ***PI Business Trends:*** Technology is a core competence for Parexel. The company's PI segment is the lifeblood of innovation for transforming the traditional clinical trials process into a more efficient, more effective, technology-driven one. We want to see this business perform well to ensure it remains a competitive differentiator for Parexel and helps it win business in its CRS and PC segments. Now reaching scale, we also expect PI to exhibit operating leverage and become a more meaningful portion of profits. Revenue stagnated a bit (down about 3% year-over-year) but as mentioned above the gross margin hit a record quarterly high of 50.5% (sooner than we expected). We expect PI to achieve 55% gross margins by 2020 – and performance is tracking nicely. Of note, PI's Randomization and Trial Supply Management system, ClinPhone RTSM, was recently ranked as the industry leader of interactive response technology, as reported in a new global survey of pharmaceutical and biotechnology companies conducted by Industry Standard Research. PI's success has synergistic benefits with its other segments-Parexel can integrate PI's technology into Research Services' projects and partnerships.



Source: Company filings and analyst calculations.

What We Think Now

Helping pharmaceutical companies get drug candidates to market, Parexel is poised to benefit as those companies gradually outsource more of this process to select CRO partners who can perform the work better, faster, and cheaper. We also expect margin expansion as recent investments pay off and continued growth of the Parexel Informatics technology segment.

What's Up With What's Down?

Published Feb 2, 2015 at 1:37PM

Pro Guidance Updates

- **Starbucks** (NASDAQ: SBUX): Our fair-value estimate increases to $82. The stock remains a Buy at a 3% allocation. Read JP's full report on earnings.
- **TD Ameritrade** (NYSE: AMTD): Our fair-value estimate increases to $35. Shares remain a Buy First with a 2.8% allocation. Get Billy's take on earnings.
- Many of our companies will receive a valuation update -- typically higher -- as we review January earnings. Stay tuned!

Dear *Pro* Fools,

Like many of us, the S&P 500 is apparently not a fan of winter -- the total returns index was down 3% in January. Over the same period, the *Pro* portfolio gained 0.0008%, leaving us basically flat, while our North Star gained 0.6%. Though we held our ground overall, some positions did slip-slide downhill. Today, I want to touch on our thinking on those.

For context, the stock market has declined over the past two months on world events that are more *Jaws* than Mickey Mouse. Oil is down 40% in two months, and although that should be a net positive for Western economies, it initially brings sharply lower prices for energy stocks and thus the market in general. Russia, the Ukraine, Syria all remain in conflict; China's growth is slowing; Europe and Japan flirt coyly with recession; the strong dollar is dinging earnings at home; and today it was reported that U.S. consumer spending was negative in December. To many, the glass is starting to look half-empty.

Against this backdrop, S&P Capital IQ prices the S&P 500 (at 1,995 on Friday) at 16.8 times expected normalized earnings for 2014. With an aggressive 8.5% in earnings growth estimated for 2015, the index fetches 15.4 times normalized 2015 estimates. That would price the index right at its historical norm. On a GAAP basis, the index is more expensive, and either way any threats to earnings could cause the market to have a subpar year. On the flip side, positive events could justify a move higher.

This either-or environment is rewarding companies that continue to thrive -- **Apple** (NASDAQ: AAPL) comes to mind -- and making it an "investors' market," if you will. We like that. But some of our positions have declined lately, too.

The A's Don't Have It

In case you haven't noticed, we've been showing our patriotic stripes: We've bought calls on **American Airlines** (NASDAQ: AAL), **American International Group** (NYSE: AIG), and **American Tower** (NYSE: AMT). (What's next? **American Express** (NYSE: AXP)? Maybe!) But right now, all of our American-named call options are in the red a tad.

AIG stock has been weak for reasons that remain unspecified to us; earnings on Feb. 12 will hopefully start to alleviate the situation. American Tower's stock has dipped a few dollars as well, and call options like ours can easily move 10% or more on a small move like that. Leverage works both ways. When it works against you on something you believe in, you wait it out with long-term calls, which is what we're doing with both positions.

Third up (or down) is American Airlines. The position has descended since earnings last week, even though results were fine. Management's focus on spending -- for better customer service and more growth, to increase pay for all employees, and because of more competition in some markets -- is weighing on the stock afresh at the moment. But the business is priced at around 5 times expected earnings for 2016, well below industry averages -- so if management delivers, investors could be well rewarded by our 2017 expiration.

The stock is volatile (as are all airline stocks), so our calls will be even *more* volatile. Don't let that spook you. We have a small 1% position. If we get an additional price opportunity we can't pass up, we may add a bit more. Other than that, we know our risk is small and limited, and we'll consider writing diagonal calls on our position, too, if that makes sense while we wait for appreciation. So, we have options with our options. And we're content to wait.

Volatility Returns

Historically, volatility is tame between Thanksgiving and February, but this year choppiness returned to the market even over the holidays. If it's getting to you, turn down your sensitivity to it. Be sensitive to others, and to good food, fresh flowers, and the like -- but don't be sensitive to market moves that are less than a few percentage points a day.

Volatility has sunk our small stake in the **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY) ETF. It stands at 0.9% of the portfolio, down from 1.3%. We will almost certainly add to this position when we see an especially attractive opportunity. I would like to see the CBOE VIX two-month futures at a minimum 25 -- and ideally 30 or higher -- before investing a bit more into this ETF for the long haul. Lately, the futures are just above 20.

We need to move *slow* and think *small* with this position, because even if the market's volatility stays the same (just grinding back and forth), SVXY's value could continue to decline if volatility remains choppy. We will only invest a small stake overall in this ETF, adding very small amounts judiciously. Over the long haul, the pricing structure of volatility futures should lead to slow but sure appreciation here, as it has for years, perhaps even making this a sizable position through appreciation someday. We just happen to be experiencing increasing volatility right now.

The Big Picture

Overall, we can't repeat it enough. We need to:

- Manage the portfolio as a whole, aiming for healthy rolling three-year annualized returns while taking reasonable risks.
- At the same time, we aim to manage each position in a way that seems best for it, including position sizing and strategy.
- We need to change positions thoughtfully and deliberately -- *if* and as the situation changes.
- We need to keep small positions and modest market volatility in context. The S&P 500 is 5.1% below its all-time high as of this morning.

It's also always worth repeating that we're seeking new shorts, considering additional hedges, income positions, and learning more about new possible investments every week. We always know we could do better, and we know we can't take our eyes off the ball. Right now, in addition to the above, we're going through earnings analysis.

Questions or comments? As always, please visit the Memo Musings board.

Have a great afternoon, and Fool on!

— Jeff (TMFFischer)

Pro Completed Trades

- **Gentex** (NASDAQ: GNTX): We sold to open fourteen March 2015 $17.50 puts for $0.65 each. The puts are in-the-money now, and we'll either happily accept more shares by expiration, or roll the puts before then if we want to target more credit. If your puts are exercised, keep your shares. See our earnings analysis.

Pro Catch-Up Trades

- **American Airlines** (NASDAQ: AAL): If you haven't invested 1% in January 2017 $35 calls, you can do so today at a lower price, lately around $18.50 each.
- **American Tower** (NYSE: AMT): If you haven't invested in these calls yet, you can buy 0.5% in January 2017 $80 calls, lately for around $22. That price will change as the stock moves. We also own 3.7% in this Buy First stock.
- **Gentex** (NASDAQ: GNTX): We have a 4.1% allocation total, with 3.1% in this Buy stock and 1% in extra stock exposure through short puts. If you haven't matched this allocation yet, you can do so by buying 3.1% in shares to start. Writing $17.50 puts makes less sense at the moment because you're mostly writing intrinsic value.

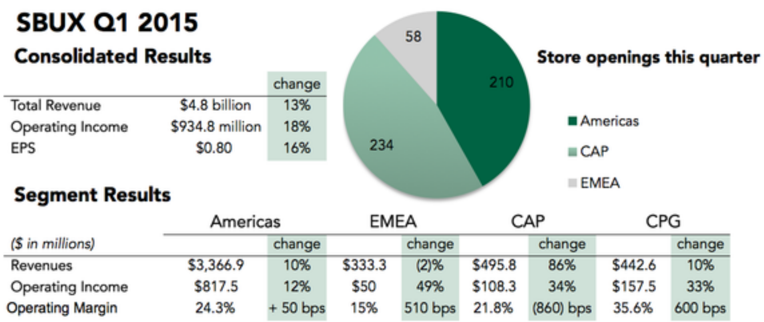
Starbucks Serves Up Another Winner

Published Feb 2, 2015 at 12:28PM

The strength of **Starbucks**' (NASDAQ: SBUX) results last quarter may have been open to interpretation (for the record, I thought they were quite strong), but the first-quarter results for fiscal 2015 left no doubt. Q1 2015 was the most successful holiday quarter in the company's history, highlighting the coffee chain's ability to thrive in a world where consumers increasingly favor shopping online over brick-and-mortar locations.



Consolidated Results

		change
Total Revenue	$4.8 billion	13%
Operating Income	$934.8 million	18%
EPS	$0.80	16%

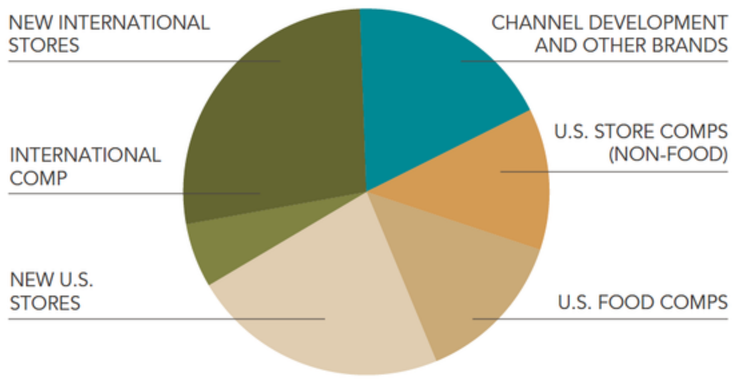
Investment Thesis

Starbucks offers a unique blend of sales drivers (domestic and international growth, food and beverage innovation, and channel development, just to name a few) and cost-reduction opportunities (payment innovation, European restructuring, expansion of consumer product margins). We believe the coffee is just a gateway for the company to repeatedly sell customers an experience rooted in comfort, quality, health, community, and conscience. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand into new products, new platforms, new times of day, and new brands. We expect new store openings across the globe to strengthen the company's brand and cost-based competitive advantages and improve profitability over time.

With a company as large as Starbucks, you might think there isn't much more room for growth. But you'd be wrong. As laid out during the company's most recent Biennial Investor Day presentation, management believes that within five years, Starbucks will increase its store base to more than 30,000 global locations (up from 14,401 today), achieve $30 billion in annual revenue (up from $17 billion TTM), and double its annual operating income. The largest driver of growth will be new store openings, both domestic and international, but a slide from Chief Strategy Officer Matt Ryan's presentation highlighted how the company is planning on achieving strong growth in all facets of its business:

Diversified revenue growth



Source: Starbucks 2014 Biennial Investor Day presentation

Segment Results

Comparable-Store Sales

	Q1 2015			Q1 2014		
	Sales growth	Change in transactions	Change in ticket	Sales growth	Change in transactions	Change in ticket
Consolidated	5%	2%	3%	5%	4%	1%
Americas	5%	2%	3%	5%	4%	1%
China, Asia, Pacific	8%	8%	0%	8%	7%	1%
Europe, Middle East, Africa	4%	3%	1%	5%	3%	1%

Americas

Nearly 9 million more customers made their way through U.S. Starbucks stores in Q1, reversing a six-quarter trend of declining transaction volume. Food sales were up 29% and contributed 2% to the overall comp growth of 5%. Teavana results were essentially flat for the quarter, but total tea sales were up 17% as the company leveraged its other methods of distribution, like selling shaken iced tea and Teavana tea lattes in Starbucks retail stores. The company's goal is to double both its food and tea businesses over the next five years, and given the size of these two markets and Starbucks's current market share, we believe this is definitely achievable as long as the company continues to execute.

Europe, Middle East, Africa (EMEA)

The smallest geographic segment for the company (6.9% of sales), EMEA continues to be a turnaround story. Segment revenue would have been 3% higher if not for unfavorable changes in currency exchange rates; instead, it fell by 2%. Even so, this was the most profitable quarter for EMEA in the company's history as sales leverage, cost management, and a continued shift toward higher-margin licensed stores combined to expand operating margins by an impressive 520 basis points (bps). Comps for licensed stores continue to come in higher than the segment totals, suggesting the move toward licensed stores is paying off. For the quarter, EMEA licensed-store comps were in the high single digits, with Middle East stores serving up even higher growth in the mid-teens.

China, Asia, Pacific (CAP)

Excluding the impact of the Starbucks Japan acquisition, revenue was up 28% for this segment on the back of strong comps and 767 net new store openings in the past 12 months. This marks the 18th straight quarter in which revenue growth has met or exceeded 28%. As expected, the acquisition had a sizable, negative impact on CAP operating margins (a whopping (1,050) bps impact, to be specific), but this is simply a reflection of the change in accounting treatment for the division, not operational performance. Excluding the impact of the change in ownership structure, operating margins for Starbucks Japan actually increased by 200 bps and continue to be some of the highest in the company's portfolio. China continues to be one of the main drivers of Starbucks's growth; the company opened its 1,500th store in China last month and is targeting 3,400 by fiscal 2019.

Consumer Product Goods (CPG)

Overall revenue growth for the CPG division came in at 10 percent. Starbucks is now No. 1 in the business for coffee K-Cups; close to 100 million of them were shipped this past December, a 20% year-over-year increase. CPG currently accounts for 9.2% of sales, and management believes it can increase segment sales by 60% over the next five years. Currently, this division enables Starbucks to reach consumers in more than 1 million places that *aren't* retail stores. This is important because when Americans drink coffee, they do so in a coffee shop only 20% of the time.

Holiday 2014

If you received a Starbucks gift card from someone this past holiday season, you're not alone — in fact, one out of every seven American adults did. The company sold 2.6 million Starbucks cards on Dec. 23 alone! For the quarter, $1.6 billion was loaded on cards in just the U.S. and Canada, a 17%-plus increase over last year. That sure is a lot of lattes.

This will obviously be a boon for the company in the coming quarters as customers begin spending all that money, but the total benefit to Starbucks is far greater than the $1.6 billion already loaded on the cards. Gift cards help drive My Starbucks Rewards membership, and MSR members are far more valuable to the company than their non-member counterparts — in an average year, they visit three times more often and spend three times as much per visit. This past quarter, total MSR membership eclipsed 9 million (a 23% increase) as the company added 900,000 new members. And more than 60% of those 9 million MSR members are gold members, who spend four times as much as non-members!

The eagerly anticipated test results for the company's Mobile Order & Pay service also exceeded management's expectations. The company is now in the process of launching it in more than 600 stores in the Pacific Northwest over the next couple of months and plans a national launch by the end of 2015.

Investing in Employees

Management also announced that Starbucks will be making "the single-largest new investment we have ever made in our partners." The company will be increasing barista and shift supervisor pay rates, creating enhanced recognition programs, offering new food benefits, and investing in technologies to make their employees' lives easier and more productive. This investment will affect more than 135,000 employees here in the U.S., and we believe it's a great move — the customer-employee relationship as a key ingredient in Starbucks' success. True, there are up-front costs, but we're willing to bet that in the long run, happier employees = happier customers = happier shareholders.

Foolish Bottom Line

Starbucks serves up good coffee, great experiences, and ever-increasing variety for passersby and brand loyalists alike. Given its strong competitive position, excellent growth prospects, and a top-notch management team in place, we believe the company is poised to continue brewing returns that make Foolish shareholders very happy.

Pro Catch-Up Trades: Feb. 2, 2015

Published Feb 2, 2015 at 11:00AM

Catch-Up Trades are timely ideas to help you catch up with a Pro *portfolio position you may be lacking, or with trades where price guidance was due for an update.*

- **American Airlines** (NASDAQ: AAL): If you haven't invested 1% in January 2017 $35 calls yet, you can do so today at a lower price, lately around $18.50 each. That price will change as the stock moves.
- **American Tower** (NYSE: AMT): If you haven't invested in these calls yet, you can buy 0.5% in January 2017 $80 calls, lately for around $22. That price will change as the stock moves. We also own 3.7% in the stock, which is rated Buy First.
- **Gentex** (NASDAQ: GNTX): We have a 4.1% allocation total, with 3.1% in stock and 1% in extra stock exposure through short puts. If you haven't matched this allocation yet, you can do so by buying 3.1% in shares to start. (Writing $17.50 puts makes less sense at the moment because you're mostly writing intrinsic value.)

TD Ameritrade Stays the Course

Published Jan 30, 2015 at 1:19PM

Pro's Take: AMTD Q1-2015 Earnings

TD Ameritrade (NYSE: AMTD)

Quarter Quick Take

Overall, TD Ameritrade delivered a strong start to Fiscal 2015-net revenue grew 9% year-over-year and EPS grew 11% year-over-year. This well-managed company benefited from higher trading activity, continued to excel at gathering client assets, and continues to gain market share in its fee-based portion of the business. TD Ameritrade is still very well-positioned for rising interest rates (who knows when that will happen), and they are doing well at managing the parts of the business that are under their control.

President and CEO Fred Tomczyk:

> "We're off to a great start for 2015 as we delivered our best asset-gathering quarter in company history adding $18.8 billion in net new assets, up 30 percent year-over-year. We continue to see strong asset gathering in both the retail and institutional channels. Trading was at strong levels due to market volatility and investors continue to increase their usage of options, futures and mobile technology."

Guidance Update

After incorporating this quarter's results into our model, we've upped our Fair Value estimate to $35 (from $34). This business is poised to earn North Star-like returns from this price, and members lacking a full allocation can feel comfortable initiating or filling out their stake at today's prices.

Updated guidance: Buy First (no change)

Recommended Allocation: 2.8%

Fair Value estimate: $35.00 (up from $34)

The Numbers

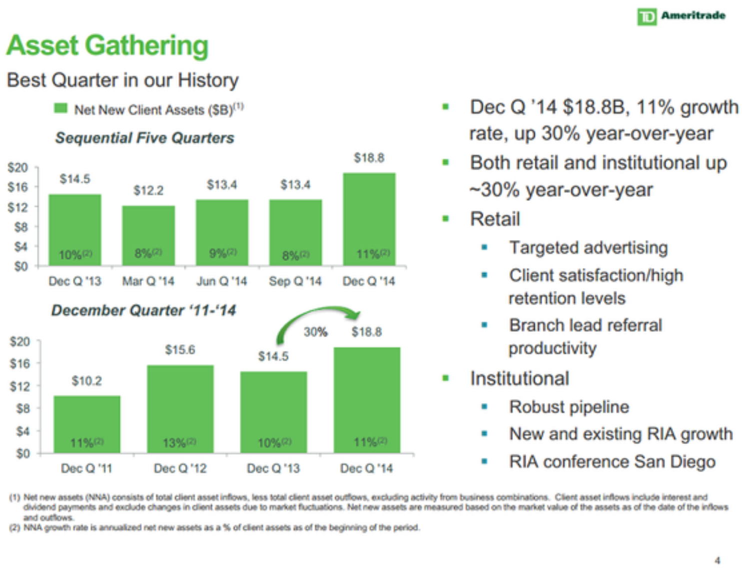
- Record Net Revenues of $819 million (up 9% year-over-year)
  - **Transaction-based**:
    - Funded accounts grew to 6.37 million (up 5.3% Y-o-Y)
    - Trades per funded account of 4.52 (vs. 4.06 last quarter vs. 4.31 a year ago)
    - Average commissions and fees per trade of $12.47 (vs. $12.97 last quarter vs. $12.58 a year ago)
    - Totals up to:
      - 6,370,000 x 4.52 x $12.47 = **$359 million** in transaction-based revenue (up 9.5% Y-o-Y)
  - **Spread-based**:
    - Total spread-based revenue of **$368 million** (up 10% Y-o-Y)
    - Average spread-based balance of $94.5 billion (up 4.7% Y-o-Y)
    - Thus, Net Interest Margin (NIM) =
      - $368 million / $94.5 billion = 0.389% (quarterly)
      - NIM (annualized) = 0.389% x 4 = 1.56% (vs. 1.58% last quarter vs. 1.48% a year ago)
  - **Fee-based**:
    - Fee-based revenue of $83 million (up 15% Y-o-Y)
    - Record average fee-based balance of $151 billion (up 16% Y-o-Y)
    - Thus, Investment Product Fee Yield =

- $83 million / $151 billion = 0.055% (quarterly)
- Investment Product Fee Yield (annualized) = 0.055% x 4 = 0.220% (vs. 0.231% last quarter vs. 0.221% a year ago)
- Record total client assets of $672 billion (up 13% Y-o-Y)
- Record net new assets* of $18.8 billion (11.5% annualized growth rate, up 30% Y-o-Y)
- EPS of $0.39 per share (up 3.2% Y-o-Y)
- Trailing twelve months (TTM) average return on equity (ROE) of 17% (up from 16% a year ago)
- Capital management:
  - Paid $0.15 per share in cash dividends in the quarter (a 1.9% yield on the current share price)
  - Repurchased 3.7 million shares of its common stock at a weighted average share price of $32.39 per share
  - Declared a $0.15 per share quarterly cash dividend (up 25% Y-o-Y), payable on Feb. 18, 2015 to all holders of record of common stock as of Feb. 4, 2015.

*excludes changes in client assets due to market fluctuations

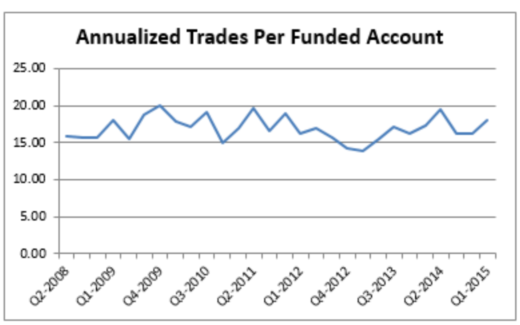
Analysis

The company continues to excel at gathering client assets. The more assets it gathers, the more it stands to benefit when the positive exposure to rising interest rates kicks in:



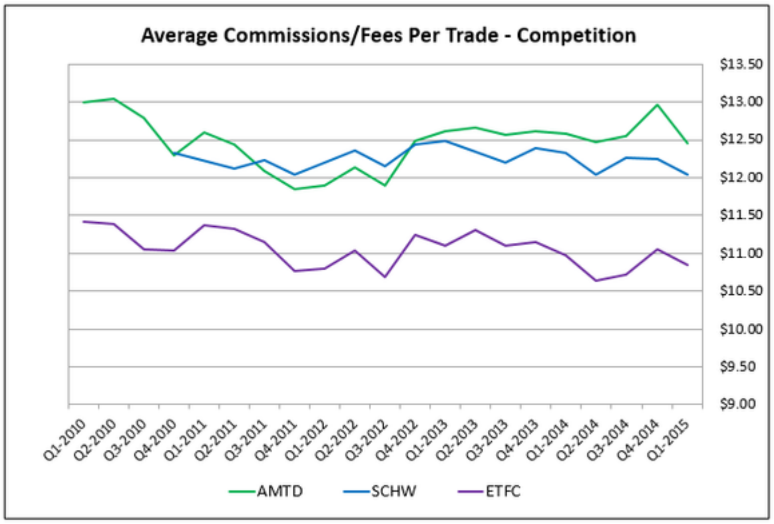
Source: TD Ameritrade December Quarter Earnings Presentation

The company continues to benefit from higher trading activity (posting the second best quarter for trading in company history), with higher-margin derivatives comprising 41% of trades per day, and mobile trades (mobile users are typically higher-activity traders) comprising a record 14% of trades per day (up from 12% a year ago, with daily mobile logins up 32% from last year). Management called out high intra-day volatility in the quarter (29 days where the S&P 500 moved greater than 1%!) as a reason for higher trading activity:



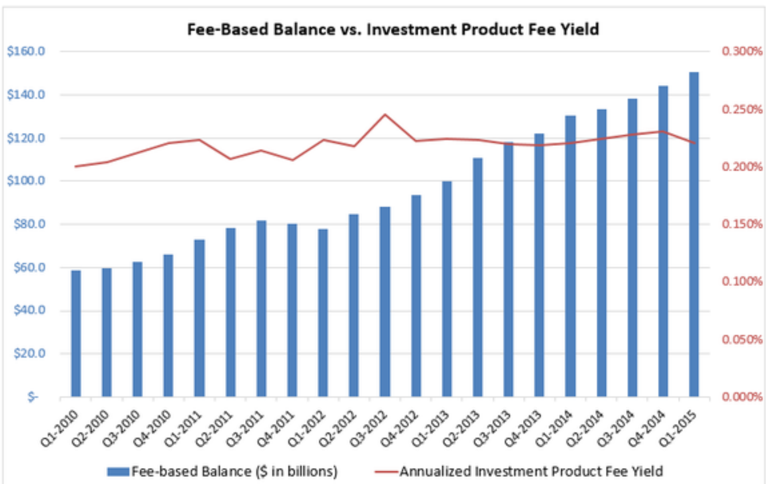
Source: Company filings and analyst calculations.

Average commissions and fees per trade normalized a bit after a strong increase last quarter (to $12.45 per trade from $12.97). Management mentioned that the commission rate was down primarily due to "the mix of derivatives trading as futures, which is a lower revenue per trade product, was a record 9%" (typically 6-7%) of average daily trades (driven by crude oil and the E-mini S&P 500 index). But TD Ameritrade continues to outperform its major discount-broker peers when it comes to pricing, as they've done a good job producing the technology and platforms needed to attract and retain higher-revenue derivatives traders:



Source: Company filings and analyst calculations.

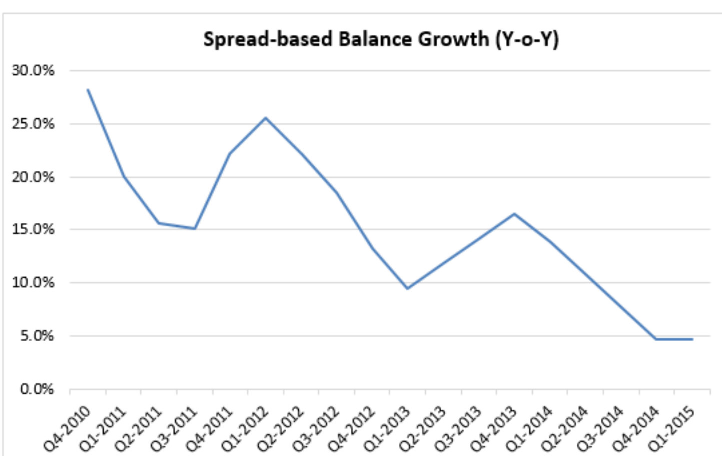
The fee-based segment of the business continues to impress, although revenue growth slowed a bit down to 15% Y-o-Y after 20%+ growth every quarter for the previous 10 quarters. The fee yield also declined a bit, affected likely by incentives and product mix. But management is "very bullish" on this particular part of the business, and it continues to grow rapidly and gain market share. We'll watch to make sure growth trends here stay on track.



Source: Company filings and analyst calculations

As for the spread-based portion of the business, it is very sensitive to changes in interest rates, and it will provide a big boost to profitability if and when interest rates rise. The company has guided that a 100 basis point increase in the Fed Funds Rate will increase annual earnings by $0.38 per share in year 1, $0.44 in year 2, and $0.51 in year 3. Given that trailing-twelve-months EPS was $1.46 per share, that's some pretty healthy upside (26%, 30%, and 35%, respectively).

Given that information, we want to see that spread-based balance continue to grow at a healthy clip. When interest rates eventually do rise, we want TD Ameritrade to have as many interest rate-sensitive assets as possible. After four straight quarters of decelerating growth, the rate of growth stabilized this quarter.



Source: Company filings and analyst calculations

Our valuation assumes slowing growth, so it's not super concerning, but we want to watch this metric over time to make sure it's staying on track.

What We Think Now

TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and when interest rates increase, the company is positioned to grow earnings sharply.

Gentex Misses Guidance but Still Posts a Decent Quarter

Published Jan 30, 2015 at 9:50AM

Pro's Take: GNTX Q4-2014 Earnings

Gentex (NASDAQ: GNTX)

Quarter Quick Take

Despite guiding to 10-15% revenue growth and a 39.5-40% gross profit margin after Q3 results, Gentex disappointed Wall Street with 7% revenue growth and a 38.4% gross profit margin in the fourth quarter. Accordingly, the stock sold off almost 6% the day of the earnings release. Management cited customer end of year inventory adjustments as a notable reason for the sales miss, and higher than expected manufacturing costs contributed 50-100 basis points to the gross profit margin miss.

While missing guidance is never good, when we drill down into results, operations are sound and poised for future growth. Gentex sold 9.4% more interior and exterior mirrors than it did in Q4-2013 (+7.9% in North America and +10.3% internationally). Certain product lines (HomeLink and SmartBeam) are growing faster than the overall corporate growth rate of 7-12%, and show promise for continued strong growth throughout 2015 and beyond. The company has also announced and launched several new products that look to drive growth throughout 2015. Unit growth continues to handily outpace global auto production, which suggests that the core element of our thesis (higher auto-dimming mirror penetration rates) is playing out.

....

Q4-2014

Sales growth: +7.2%

Operating profit margin: -112 bps to 28.1%

EPS growth: -1%

....

Guidance Update

The sales and gross profit miss this quarter seem to be due to temporary issues relating to timing and new product launches. Gentex is historically good at improving manufacturing efficiency, so I'm expecting the cost headwind to mitigate as we move toward the back half of the year. Management guidance for full year 2015 implies 9-10% revenue growth, about in line with our expectations. If the sales and manufacturing issues are indeed temporary, our recently updated $17.50 Fair Value estimate looks reasonable.

Updated guidance: Buy (no change)

Recommended Allocation: 3.1%, with 1% in written puts.

Fair Value estimate: $17.50 (no change)

Pro has a 3.1% allocation to Gentex, with March $17.50 written puts that if exercised will bring us to a 4.1% allocation. If current prices hold, as of today we are leaning toward adding more shares via our puts (in other words, simply letting our puts get exercised), but depending on market conditions, we may decide to roll our puts to a later month and target another credit. If your puts are exercised early (members report some have already been exercised), then we recommend you keep the new shares. That was our original intent and still is. Members lacking a (full) position should feel comfortable purchasing shares today – they're priced to achieve North Star-like returns over the long-run.

Our Thesis

Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1. ***Penetration: Unit growth vs. auto production.*** Over time, we want to see Gentex's auto-dimming mirrors to continue to gain market share. If the company is growing units sold faster than auto production, it is moving in the right direction. Interior mirror unit volumes were up +7.2% and global auto production was actually down about 2% (suggesting continued market penetration). Interior units sold in North America increased +4.7% and international increased +8.8%, for 7.2% interior unit growth overall. Exterior mirror unit volumes grew even faster, up +19% in North America and +14.2% internationally. The exterior mirror attach rate was 38% (i.e. 38% of cars equipped with interior units also were equipped with exterior units), compared to 35% a year ago.
2. ***Pricing and value: Unit growth vs. automotive segment sales.*** Auto makers force annual price concessions on their suppliers and Gentex isn't immune. Price reductions recently are expected to be in the range of 2.5%-3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices and gross margins. When manufacturing costs rise unexpectedly, we can see pressure on gross margins, which is what

happened this quarter. During the quarter, total units (interior + exterior mirrors) increased +9.4% and automotive segment sales were up +6.9%. This dynamic suggests lower ARPU (average revenue per unit) and is consistent with the expectation of annual price concessions.

3. ***Margin performance.*** During the quarter gross margin was 38.4%, down from 39.4% in Q4-2013. For the trailing twelve months, gross margin was 39.2% compared to 36.8% in the year-ago TTM. Management guided to gross margins of about 39% for fiscal year 2015, so as manufacturing efficiency improves, we should see this figure rise a bit. If the company can generate strong unit growth, it may be able to eke out further improvements, but they will be hard to come by. SG&A and R&D expenses are in-line with historical norms, and operating margins followed gross margins lower, coming in at 28.1% vs. 29.3% in Q4-2013.

What We Think Now

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

OpenText Stays on Course

Published Jan 29, 2015 at 2:53PM

OpenText (NASDAQ: OTEX) reported second-quarter 2015 results, and we have the scoop on the *Pro* community boards. The stock remains a "Buy" in *Pro* with a 3.3% allocation.

Pro's 2014 Results in Foolish Detail

Published Jan 26, 2015 at 3:48PM

Dear *Pro* Fools,

Reviewing the details of your investments each year shows where you can improve. You might be surprised to find that you traded more often than you planned, for example, or didn't receive as much dividend income as you thought. Armed with information, you can adjust for the future.

As we wrote recently, *Pro* had a good 2014, with relatively few stock sales. Let's dig into the details.

2014 Redux: $345,000 Appreciation

The *Pro* portfolio started 2014 worth $1,975,000, and was up 17.5% by year's end to $2,320,000. On average, we were 71% net invested over the year, using shorts on market indexes to lower our exposure. Yet our returns were pleasing by most any measure:

Investment	2014	3-Year Annualized Return
Pro	17.5%	22%
North Star	8.5%	8.7%
S&P 500	13.7%	20.4%
MSCI World	2.9%	13.1%

A tailwind for stocks has helped us generate a strong lead over our North Star, but years when stocks are negative will likely lessen this gap. The S&P 500 Total Returns index above assume all dividends reinvested and no fees. Our dividends are added to cash, and our commissions are deducted from results. Of note is how poorly the MSCI World index has performed comparatively; U.S. stocks crushed the world index in 2014, and continue to draw worldwide interest from investors.

Our gains were propelled by the likes of **AmTrust Financial** (NASDAQ: AFSI), up 73%; **Apple** (NASDAQ: AAPL), up 38%; **Facebook** (NASDAQ: FB), 41%; **Medtronic** (NYSE: MDT), 26%; **OpenText** (NASDAQ: OTEX), 28%; **Oracle** (NYSE: ORCL), 18%; **O'Reilly Automotive** (NASDAQ: ORLY), revving 49% higher; **Papa John's** (NASDAQ: PZZA), baking up 24%; and **Skyworks Solutions** (NASDAQ: SWKS), which shot up 41% from our August purchase. Several other gainers and a lack of big losers — **Tupperware** (NYSE: TUP), down 25% on us, was the largest — helped us earn strong results despite maintaining cash, hedges, and shorts. (Please note that these stock returns *exclude* dividends.)

Looking ahead, we continue to think in terms of rolling three-year annualized returns as we assess the potential of our holdings.

Hedges: ($34,673)

Last year, we used direct shorts and options on the **iShares Russell 2000 ETF** (NYSEMKT: IWM) and **SPDR S&P 500 ETF** (NYSEMKT: SPY) to hedge. Keep in mind that hedging allowed us to comfortably stay *more* invested in longs than we otherwise might have — in other words, hedging did help us achieve our returns, while lowering our risk and staying true to our mission.

That said, hedging has a real dollar cost. We booked $34,673 in losses on hedges last year, or about 1.8% of the portfolio's 2014 starting value. That's more of the portfolio than we would like to spend for positions that were typically hedging only 10% to 15% of our exposure. More than half of this loss ($18,985) came in November on $200 puts on SPY that we bought when the index was around $189. The mighty S&P 500 soared above $200 in a few weeks, erasing the entire value of that hedge. That was a case where spending much less to buy $190 or $185 puts would have been a welcome choice. That's hindsight, but I'll think three times before buying deep in-the-money puts to hedge again.

The $34,673 in losses on hedges still helped the portfolio to grow by $345,000 last year, though mostly in unbooked gains. Still, if we hadn't hedged, we might have sold more winners instead, cutting off long-term compounding.

Rolling Calls: ($10,037)

We spent $10,037 last year to roll calls higher, namely on **Intel** (NASDAQ: INTC). It was money well spent, because the stock kept climbing, and we sold at a higher price as a result of rolling. But it's still a notable sum, and a reminder to cover stocks carefully if you're going to. We would have been better off letting Intel be, although its sale resulted in buying Skyworks, which so far has been a great silver lining.

Realized Long-Term Gains and Losses: $96,343 and ($4,369)

We booked $96,343 in realized gains last year, all of it long-term, from four profitable sales. Much of it came from selling half of our Facebook calls (letting the rest turn into the stock position we hold today). We also booked a profit through our covered-call-induced sale of Intel. Pacer was nicely acquired away from us, and we sold our shares of the struggling **Graftech International** (NYSE: GTI). Finally, we sold **StoneMor Partners** (NYSE: STON) for a $4,369 long-term capital loss, *excluding* distributions it paid us. Including the company's 9% annual distribution, we earned a North Star-challenging return.

Dividends: $25,387

We received $25,387 in dividends last year, adding to our cash. That added 1.3% to our 2014 return, or just 7.4% of the year's total gain. Our largest absolute payers included **The Buckle** (NYSE: BKE), AmTrust, Tupperware, **Broadridge Financial** (NYSE: BR), and **Wells Fargo** (NYSE: WFC). Offsetting this income a bit, we *paid* a $513 dividend for being short shares of the iShares Russell 2000 ETF.

Option Income: $7,581

Implied volatility was low during most of 2014, resulting in modest option premiums. We saw few worth writing, so we mainly focused on new stock recommendations and making sure we wanted to keep our other holdings. We earned just $7,581 in option-writing income last year, adding 0.4% to the portfolio. Still, that effectively brought our "income yield" (including dividends) to nearly 1.7% on the whole portfolio value last year, while we were only about 71% net long. We are hoping to target considerably more option income this year.

Sitting Still: Priceless

We issued 34 trade alerts in *Pro* last year, or nearly three per month (that would explain a lot to my wife!). Still, it was one of our quietest years — we issued 42 trade alerts in 2013, and 55 in 2012. But 34 is still plenty of activity. The key is that we don't sacrifice returns for activity.

We want to keep stock turnover low, and we did a better job last year than in some earlier years, when team turnover helped drive more stock turnover. Much of last year's activity was related to options and hedges. So what we did that created the most value last year (other than some new buys) was decide to leave most of our stocks alone, whatever storms appeared to brew around some of them. Having a three-year minimum outlook helps. Sitting still will look very expensive some years, but over our time frame, it's necessary for compounding.

Building Further: Also Valuable

With 2015 under way, we're focused on more of the same (if something works for decades, keep doing it!). We're seeking more shorts, we want to maintain steady hedges (but at lower costs than last year), we always make sure we like our current positions and allocations, and we're looking at new buys and options for income and more. If you have questions about our returns or anything else, please visit the Memo Musings board.

I know many of you customize your Foolish portfolio. Look over your results last year to see what you did well and what can be improved. Thank you for being a *Pro* Fool with us! Fool on!

— Jeff (TMFFischer)

Pro Completed Trades

- **American Airlines** (NYSE: AAL): We bought ("buy to open") 10 January 2017 $35 call options, setting up a 1% allocation in absolute terms. See our transaction list (it may take 24 hours to appear there). Our order filled at $24.55.

Pro Catch-Up Trades

- **Gentex** (Nasdaq: GNTX): We're ready to accept a lower price to sell to open March 2015 $17.50 puts, if need be. As posted, we'll accept as low as $0.65-$0.60 now to get the trade done, and advise the same to members.

Buy Calls on American Airlines Group

Published Jan 23, 2015 at 1:52PM

Is this for you? *Pro* is targeting long-term upside by buying LEAPS, seeking leveraged returns if the stock appreciates by 2017. All members lacking any exposure to this industry or company could do the same.

How You Participate

- **Action:** Buy ("buy to open") January 2017 $35 calls on **American Airlines Group** (NASDAQ: AAL). (As a reminder, these calls will move up or down with the stock, and they give you the right to buy the shares for $35 any time before expiration if you so choose. We don't plan to. Need a refresher on when and why we buy calls? Click here.)
- **Allocation:** Invest approximately 1% of your *Pro* funds in the call premium. At recent prices, this most closely equates to buying one call for about every $237,500 you manage; for *Pro*, that's about 10 contracts. This is a small position by design, so be careful not to over-allocate. *Pro* members with smaller portfolios should see the Alternative Trades section below.
- **Price Guidance:** To split the wide bid/ask, **use a limit order**. At current prices, ideally you would pay $23.75 or less per contract — but if the stock price rises, you'll need to pay more.
- **Recent Option Price (bid/ask):** $23/$24.50 (split: $23.75)
- **Recent Share Price:** $55
- **Timing Note:** American Airlines reports earnings the morning of Tuesday, Jan. 27. We will likely buy our calls before then simply because our decision has been made. We expect upbeat guidance for 2015, but we know a stock can do anything immediately after earnings. If you prefer to wait until after Tuesday, please do. We're eyeing 2017 with this anyway.

What We're Thinking

It's still a tough business, but the airline industry has changed considerably in recent years. Steady consolidation means the four largest U.S. airlines now control roughly 90% of the nation's flights, down from a dozen airlines in that position last decade. This concentrated power supports rational ticket prices, because multiple competitors aren't swooping in with empty seats and dreams of market share. Indeed, as the industry benefits from much lower fuel costs, there has been no indication that leading airlines intend to lower fares in response. Demand should drive fare prices, and demand is healthy. At the same time, airlines today are better at limiting supply than in years past. Finally, most major airlines hedged some of their 2015 fuel costs, so they won't fully benefit from cheaper fuel.

The company we're buying calls on — American Airlines Group — is the only major airline that has *not* hedged its 2015 fuel costs, so it's positioned to enjoy the full benefit of lower prices. Fuel and related taxes are American Airline's largest operating cost, at 25% of recent revenue. With the price of jet fuel cut in half since last summer, savings in the industry — and for American alone — should amount to several billion dollars this year. In American's case, if fuel prices remain near current levels, 2015 fuel savings could exceed $5 billion. That's greater than the company's $4.3 billion in operating income the past 12 months.

Although investors dread the potential for fare wars, it appears that airlines are planning to use increased cash flow to pay down debt and reward shareholders, rather than pass savings onto customers. After all, fares are already low in historical terms. Yesterday, the leading discounter and one of the nation's four largest carriers, **Southwest Airlines** (NYSE: LUV), suggested in its guidance that it will hold fares steady, and **Alaska Airlines** (NYSE: ALK) flatly said "no," it won't lower prices in response to lower fuel costs.

The world's largest carrier, American Airlines entered bankruptcy in 2011, and merged with U.S. Airlines in 2013 after emerging from Chapter 11. Being leery of airline stocks is sensible. I am. (I never believed I would invest in an airline — ever.) But having flexible thoughts has merit. The recently consolidated industry knows it needs to run profitably, and the airlines have become smarter operators. They're filling seats at sensible revenue per mile, keeping capacity in line, charging for everything from baggage to food, and keeping costs in control. Plus, Southwest Airlines has shown steady profits are possible, with a 41-year profit streak.

American Airlines expects to have the industry's leading profit margins as it completes its consolidation with US Airways. The business could earn around $10 per share this year, and close to that again in 2016 (it should start to pay around a 25% tax rate that year, having burned off its past losses). Those results would put the stock at around 6 times 2016 earnings. If Wall Street's skepticism relaxes, shares could enjoy an earnings multiple closer to 10, giving flight to healthy appreciation.

How It Fits Into *Pro*

Many things need to go right for us to enjoy a higher altitude, so we're keeping our risk fairly modest at 1% of our capital. Perhaps foremost, if oil prices rebound too much, enthusiasm will likely wane for airline stocks, and earnings may disappoint. Second, American still needs to finish integrating US Airways and serve its sprawling customer base profitably. Airlines are incredibly expensive to run. Southwest aside, history shows how difficult it is to maintain profits. Finally, airlines are sensitive to the economy. Greater job creation helps sell more tickets, but another economic slowdown would likely hit hard.

The *Pro* portfolio has benefited handsomely from a lack of energy investments. We've sailed through a time when most energy stocks fell. Today, we can afford to add a small stake in a riskier (though cheap-looking) business that may benefit from the new energy landscape. At the worst, we'll lose 1% if American Airlines declines below $35 by expiration. Our stake in call options, as opposed to buying stock, lets us control 100 shares for about $2,375 rather than $5,500. Here's how returns at expiration could stack up from a starting price of $23.75 for the calls versus $55 for the stock:

American Airlines Share Price	Call Gain (Loss) on $2,375 Invested	Call % Return	Stock Gain (Loss) on $5,500 Invested	Stock % Return
$30	($2375)	(100%)	($2500)	(45%)
$35	($2375)(max loss)	(100%)	($2000)	(36%)
$40	($1875)	(79%)	($1500)	(27%)
$45	($1375)	(58%	($1000)	(18%)
$50	($875)	(37%)	($500)	(9%)
$55	($375)	(16%)	$0	0%
$60	$125	5%	$500	9%
$65	$625	26%	$1000	18%
$70	$1125	47%	$1500	27%
$75	$1625	68%	$2000	36%
$80	$2125	89%	$2500	45%
$85	$2625	111%	$3000	55%
$90	$3125	132%	$3500	64%

More That Matters

- **Maximum loss:** Our entire 1% investment if the stock is less than $35 at expiration.
- **Maximum gain:** Unlimited as the shares ascend.
- **Breakeven:** Around $58.75 on the stock at expiration.
- **Follow-up:** We may write calls on our long calls, turning it into a diagonal call income position, or a bull call spread, but we hope to see appreciation first. If our thesis plays out early or is failing, we may simply sell to close our calls. We don't foresee taking shares or having a long-term relationship beyond a few years, but that could change.

Buying calls, we don't view American Airlines as a core, long-term holding. We may write diagonal calls on our calls for income, or sell outright if our thesis plays out or falls into danger. Bottom line: We aren't ready to call an airline business a compounding machine that we want to own for years on end. That still seems far-fetched. But as the industry looks to stay rational on pricing and restrain seat supply, profits the next few years should draw the attention of more investors, lifting valuations on leading airline stocks. At the same time, persistently low fuel costs represent a giant potential tailwind. Wheels up!

Alternative Trades

Members for whom one contract would over-allocate their portfolios can consider the following:

- Buy 0.5% to 1% in stock if you'd rather not buy 1% in calls. You won't get the benefit of leverage, but you get the dividend, voting rights, and can go on owning shares as long as you like.

Pro Can Help

- Tell us we're crazy — er, we mean, ask us questions — on the American Airlines Group board. Seat belts on? We're ready for departure (in more ways than one).

Write Puts on Gentex

Published Jan 21, 2015 at 1:51PM

Is this for you? Since we're looking to add 1% to our stake in this company, this alert should be applicable (now or perhaps later) to all *Pro* members, whether you already own shares of **Gentex** (NASDAQ: GNTX) or not.

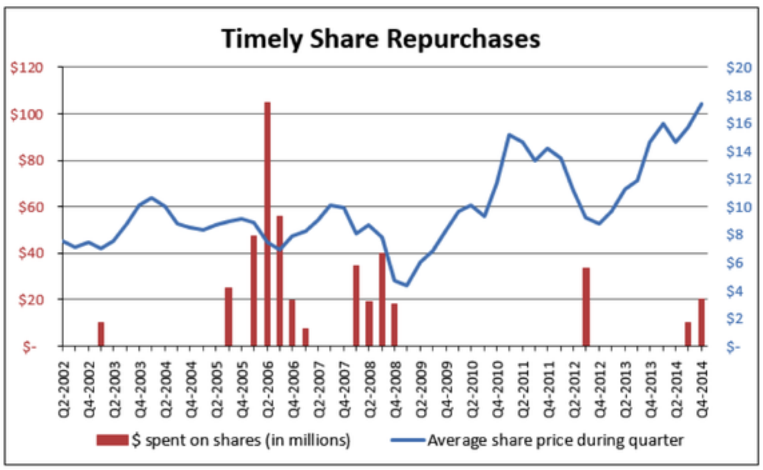
How You Participate

- **Trade:** Sell to open March 2015 $17.50 puts.
- **Allocation:** 1% — write one put for every $166,000 you manage; *Pro* will write 14 contracts. In addition to our current 3.3% stock holding, this would bring our total allocation to 4.3%. If you're devoting less than $166,000 to *Pro*, see our Alternative Trades at the end.
- **Price Guidance Now:** Use a limit order of $0.85 or higher to start (for a 4.8% yield in 58 days.)
  - **Later:** Gentex reports Q4 2014 earnings on the morning of Jan. 28. After investors' uncertainty about the earnings report has passed, we expect the yield on these puts (at least measured by time value) to decline significantly . So we suggest you write this put before Jan. 28 and target $0.70 (at the very least) for each put, a 4% yield. You will not likely be able to achieve this price after the earnings report (unless the stock falls).
- **Prices (1/21/15):** Stock, $17.50; options, $0.75 bid / $0.95 ask. Guidance: $0.85. Current prices.

What We're Thinking

Back in October, Gentex reported an excellent third quarter (scroll down to see the Gentex section). The company, which primarily sells advanced automotive mirror systems, turned 22% net revenue growth into 29% earnings-per-share growth, and management expects another strong report in the fourth quarter. Despite a forecast of declining auto production, management expects organic sales growth of 10% to 15%, suggesting strong market-share gains.

Additionally, over the past several months, management has sent us a strong signal that they believe shares are undervalued by buying them back: $10 million worth at an average split-adjusted price of $14.22 in the quarter ended Sept. 30, and $20 million worth at an average split-adjusted price of $18.28 in the current quarter. In the past, Gentex has displayed excellent capital allocation skills with its share buybacks, buying at prices corresponding to local lows in the stock price ...



... so when management buys back stock, we pay attention.

Additionally, after spending time analyzing last quarter's results, researching updated auto production forecasts, and incorporating management's forward guidance into our valuation model, we've **upped our fair-value estimate** from $16.50 to $17.50 per share. All of these factors played into our decision to recommend this written put, as we will be happy with either potential outcome: earning at least a 4%-4.8% yield on capital at risk in just less than two months, or accepting shares at March expiration at an effective buy price of (ideally) $16.65 per share or lower.

How It Fits Into *Pro*

Pro's exposure to the automotive industry is about 7.3% of our overall portfolio, via Gentex and **O'Reilly Automotive** (NASDAQ: ORLY). We're comfortable with the possibility of more exposure to this industry, but are mindful of our current positions. We are opting to generate income with written puts rather than purchasing more shares directly because we'd like to achieve a lower net purchase price (and thus a higher margin of safety) should we end up taking more shares.

Should these puts remain at-the-money (as they currently are) at March expiration, meaning the stock price remains at or less than our $17.50 strike price, we would get shares at about 4.8% less than our estimate of their worth and 8% less than what the notoriously stringent Gentex paid in its most recent round of buybacks. If we are assigned at expiration, we'll end up increasing our allocation in this well-managed compounder from a relatively small 3.3% to a more meaningful 4.3%, although we may roll our puts to avoid taking shares if we decide that is the proper course of action. We believe in management's acumen and capital allocation skills, the company's dominant competitive niche and strong financial position, and recent positive trends in the cyclical auto industry. So we are ready to own more Gentex close to today's prices.

More That Matters

- **Maximum loss:** Our risk is the same as share ownership starting around $16.65, or 4.8% less than the recent price and 15.7 times this year's earnings estimate.
- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At a minimum of $0.70 (but again, use a limit of $0.85 to start!), that's a 4% yield in 58 days, or about 25% annualized.
- **Follow-up:** We'll buy shares at a net $16.65 if the stock is below our $17.50 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 3.3% allocation first — Gentex's shares are a Buy. Then you can consider writing these puts for income or to add more shares. If one put exceeds 1% of your portfolio, then just buy 1% in stock directly *if and when Pro* does so through these puts.
- **Write other puts?** Consider writing February 2015 $17.50 puts if the price on those options holds up better than March after this alert is issued. You could also consider writing June 2015 $17.50 instead, for at least $1.25, or a 7.1% yield in less than five months.

Pro Can Help

- See our Options U guide to writing puts if you want more on this strategy.
- Check your mirrors and switch lanes over to the Gentex discussion board.

Can You Really Have Too Much Cash?

Published Jan 20, 2015 at 1:55PM

Fellow Fools,

Investors frequently underestimate the effectiveness of cash as a hedge. The more cash you have, the less a market decline will affect your portfolio, and when fear (or outright panic) dislodges prices from reality, you're that much more equipped to take advantage. Cash is also easy to use and very cost-effective. In fact, James Montier, a member of GMO's asset allocation team and a prior co-head of global strategy at Société Générale, found that using cash as a hedge was preferable to tail-risk hedging (hedging for extreme market movements like we saw during 2008) from 2005 through 2011. A 75% equity, 25% cash portfolio soundly outperformed tail-risk hedging over this time period, and it also reduced the maximum drawdown (the difference between peak and trough portfolio values) compared with a portfolio that was 100% in equities.

What a Drag

So more cash = better, right? Not necessarily; believe it or not, holding too much cash can be a bad thing. As you know, equities have historically outperformed cash. This means that if your portfolio is too heavily weighted in cash, that weight will drag down your overall returns. This is what professionals have so intuitively decided to call "cash drag."

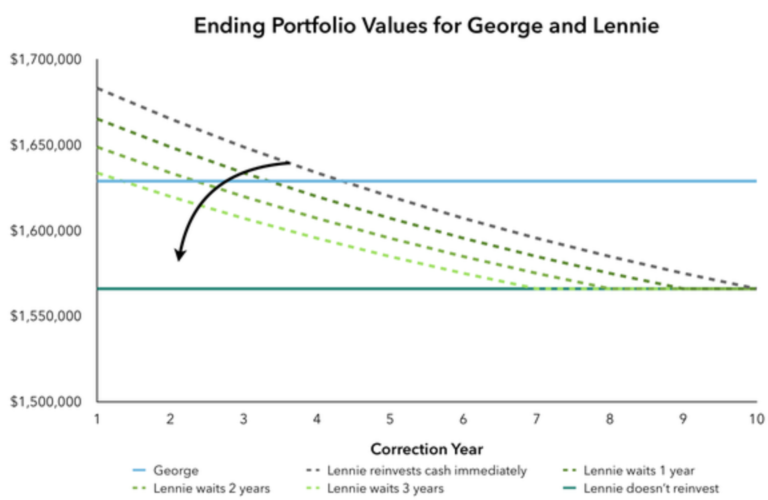
To better illustrate, let's work through an example. Imagine we have two investors, George and Lennie. In this hypothetical scenario, both investors have:

- Equity portfolios worth $1 million
- No plans to contribute additional funds
- Ten-year investment horizons
- The same equity returns each year

The big difference between the two is that at the beginning of our example, Lennie decides to sell some of his stocks to raise cash, fearing that a correction is right around the corner. He sells 10% of his equity portfolio, or $100,000. For the sake of this discussion, we'll define a correction as an annual return of -25%. In any year that *doesn't* feature a correction, we'll assume both investors achieve 9% returns on their equity investments. It's also important to realize that we're dealing with just their equity portfolios, so Lennie's additional $100,000 can be seen as a tactical investment decision — it's above and beyond the cash he already has, and it's independent of his liquidity requirements.

Now let's assume Lennie nails his prediction. By the end of the first year, George's portfolio is worth $750,000 while Lennie's is worth $775,000 ($675,000 ending equity value + $100,000 in cash). So Lennie is better off in year one. But remember, we're dealing with a 10-year investment horizon, so there's still nine more years to go.

If Lennie's ability to call the bottom is just as good as his ability to call the top, it won't be a fair fight. Lennie will easily outperform George. But who will come out ahead after 10 years is not set in stone. The following chart illustrates the range of potential outcomes for George and Lennie depending on when the correction comes (X-axis) and when Lennie decides to reinvest his spare cash (various green lines).



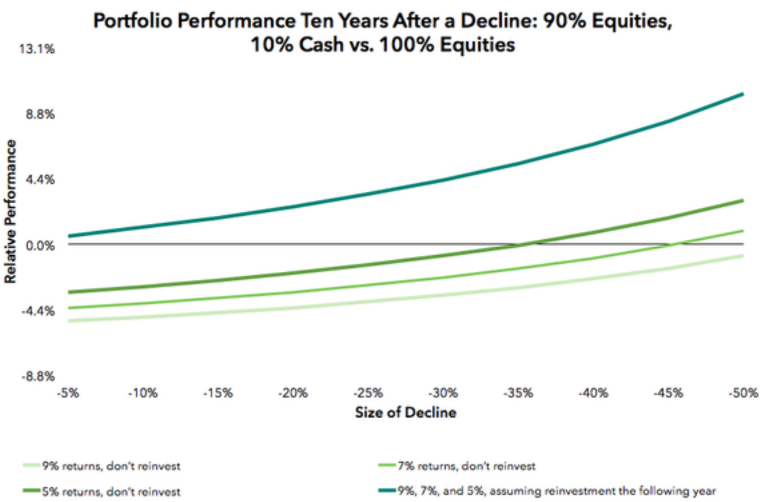
A couple of takeaways from this chart:

- The length of time it takes for the correction to come and Lennie's ability to take advantage of the decline are negatively related. This can be seen as you work from left to right on the chart. By year five, George's static portfolio is destined to outperform Lennie's, regardless of how quickly Lennie reinvests his cash.
- The longer Lennie waits to reinvest the $100,000, the more his returns will start to mimic the performance of a portfolio that doesn't reinvest the cash. This is indicated by the dashed lines' shift toward the solid "*Pro* green" line. Unfortunately, a large percentage of individual investors did something similar after the finical crisis, waiting to reinvest until they were sure it was "safe" to start investing in equities again. In real life, though, the outcome is often worse because markets tend to rebound sharply after a big drawdown (e.g., the S&P rebounded by more than 65% in 2009 after bottoming out in March) and most investors sell closer to the bottom than the top.

- If Lennie decides after the correction to just keep the $100,000 in cash because he likes how it reduces the volatility of his portfolio, then he must also accept that it will act as a drag on his returns over time (the difference between the two solid lines).

But Wait, There's More

The following chart may look complicated at first glance, but it's not so bad. It simply shows the ending value of a portfolio that started out 90% in equities and 10% in cash, divided by the ending value of a portfolio that started out 100% in equities, 10 years after a market decline. The x-axis shows the relative performance for declines of various size, and the y-axis indicates which portfolio outperformed – a positive value indicates that the 10% cash portfolio outperformed; a negative value indicates the opposite, meaning an investor would have been better off 10 years later if they just remained 100% in equities.



Some takeaways from this chart:

- The lower the equity returns, the greater the benefit of holding cash (e.g., it's harder for subsequent returns to overcome what was lost during the market decline).
- The larger the correction, the greater the benefits of holding cash.
- After a decline, the optimal decision is to put the cash to work, regardless of the size of the market drawdown and future equity returns.

Remember Why That Cash Is There

If you read all the way to the end of this Memo in hopes that I'd tell you exactly how much you need to keep in cash, I'm afraid you're going to be disappointed. Mimicking *Pro* is a great place to start (12.6% in cash ex-shorts), but your optimal allocation will likely differ based on your individual preferences and constraints. What I *do* hope you take away from this memo is this: The benefit you can derive from tactically increasing your cash position depends on a variety of factors. Perhaps the most important determinant is what you do with your cash when the opportunity arises. If you want to get the most out of your dollars, you need to put them to work at some point.

Foolishly yours,

– JP (TMFYossarian)

Pro Guidance Changes

- **Papa John's International** (NASDAQ: PZZA): We're moving the pizza purveyor to Hold (down from Buy) pending our review of its new valuation. Shares are up nearly 50% since we last moved them to Buy several months ago. (Incidentally, the company is expected to report earnings around Feb. 24.)
- **Skyworks Solutions** (NASDAQ: SWKS): The stock is up 45% since we recommended it last summer. Today, it's moving to Buy from Buy First on price.
- **Tupperware** (NYSE: TUP): Although shares still appear inexpensive, the stock is moving down to Buy from Buy First because of increasing uncertainty in many of its international markets, including Russia, China and South America.
- With these changes, see all *Pro*'s current Buy Firsts and ratings on the Recommendations page.

Correlations Redux

Published Jan 12, 2015 at 1:16PM

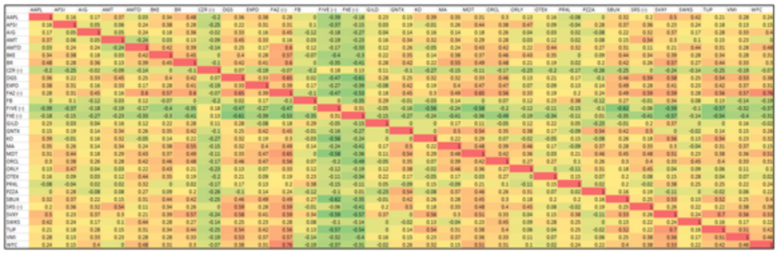
Dear *Pro* Fools,

A few weeks ago, Jeff started a discussion on the boards about removing the "Consider Adding More" (CAM) price from our Recommendations page and ceasing its use within *Pro*. As a team, and with the help of member input, we have in fact decided to get rid of CAM, and you can expect to see us phase it out in the coming days. In that same thread, Jeff also asked members what they'd like to see as a replacement for CAM on the recs page. We received several great ideas that we're still actively discussing, and when we've decided on a functional, useful alternate data point, we'll update the recs page to reflect that.

Some member suggestions we received centered around the correlations between stocks in our portfolio (and, more broadly, around risk measures in general). This reminded me of the Memo written by former *Pro* analyst Nick Crow back in 2012 in which he discussed the *Pro* portfolio's correlations for every position we held then. In that spirit, I decided to rerun the analysis and recreate the correlation matrix for *Pro*'s current holdings. It's my hope that this Memo will be useful not only to those members who were already interested, but to those who've never considered our correlation before. Do be sure to reread Nick's Memo for background information on how to interpret the correlation matrix.

Pro's Correlation Matrix

The graphic below shows all the possible correlations between each pair of stocks (pairwise correlations) for our portfolio. Note that — unlike in Nick's original matrix — I decided to include our shorts and companies on which we only hold options positions. A (-) in the header indicates that we are short that security. I did exclude our SPY hedge; since it's a derivative position, price correlations are meaningless because the profit/loss curve is not linear (i.e., correlations change depending on what price we're talking about). (Click to make the table larger.)



Source: Portfolio Lab Pro and analyst calculations. Correlations are based on monthly price movements.

As we can see from their green shading, our direct shorts (**Caesars Entertainment** (NASDAQ: CZR) and **Five Below** (NASDAQ: FIVE)) are negatively correlated with most of the rest of the portfolio, offering us diversification benefits. Our shorts zig when the rest of our portfolio zags, and it is partially for this reason that we are intent on continuing to build out a direct short "sleeve."

There are other interesting insights to be found here, too. As the lead analyst on both of these positions, I wasn't surprised to note that **American Tower** (NYSE: AMT) and **TD Ameritrade** (NYSE: AMTD) are negatively correlated. A savvy investor might expect this to be the case — American Tower is a REIT, and the REIT sector generally declines when interest rates are expected to go up (because REITs' debt therefore costs more). Conversely, TD Ameritrade would be expected to increase in value when interest rates rise, thanks to the interest rate sensitivity of its spread-based revenue.

Another intriguing insight is that among our core long positions, the three with the lowest correlations to the rest of the portfolio are Facebook, Gilead, and Parexel (in that order). And the three positions with the highest correlations are Medtronic, Broadridge, and Oracle (also in that order).

Index Correlations

Along with determining the correlations of our positions to each other, we can also calculate the correlation of our overall portfolio to various indexes. This analysis includes only our long positions, and excludes shorts and options.

Index	Correlation to Portfolio
Dow Jones U.S. Consumer Services Index	0.91
Russell 1000 Growth Index TR	0.89
Russell 3000 Index TR	0.87
S&P 500 Index TR	0.86
Dow Jones U.S. Industrials Index	0.83
S&P 400 MidCap Index	0.82
MSCI All Country World Index TR	0.8
Dow Jones U.S. Technology Index	0.79
Russell 1000 Value Index TR	0.78
Dow Jones U.S. Consumer Goods Index	0.78
Dow Jones U.S. Health Care Index	0.77
Dow Jones U.S. Financials Index	0.77
Russell 2000 Growth Index TR	0.71
Russell 2000 Index TR	0.71
S&P 600 SmallCap Index	0.69
MSCI EAFE Index TR	0.68
Russell 2000 Value Index TR	0.68
MSCI Eurozone Index TR	0.67
Dow Jones U.S. Basic Materials Index	0.66
MSCI Emerging markets Index TR	0.56
Euro currency	0.52
Dow Jones Composite REIT Index TR	0.46
Barclays US 1-3 Year Treasury Bond Index	0.43
MSCI Japan Index TR	0.33
Dow Jones-UBS Commodity Index	0.27
Dow Jones U.S. Oil & Gas Index	0.26
Gold spot	0.24
Dow Jones U.S. Utilities Index	0.24
Barclays US Aggregate Bond Index	0.22
Barclays US 7-10 Year Treasury Bond Index	0.16
Dow Jones U.S. Telecommunications Index	0.11
MSCI China A Index TR	0
Barclays US 20+ Year Treasury Bond Index	-0.08
Japanese Yen	-0.22
Dollar Index	-0.46

Source: Portfolio Lab Pro. Correlations are based on monthly price movements.

Perhaps unsurprisingly thanks to our heavy exposure to tech and financials, we are most highly correlated to the Dow Jones U.S. Consumer Services Index. We are also more highly correlated to the Russell 1000 Growth Index than we are to the S&P 500 index (but only slightly so), primarily because of our focus on growth companies and the fact that we own a higher proportion of mid- and small-caps than the S&P 500 index. This index correlation table may be useful to us (or to enterprising *Pro* members!) as we contemplate future hedges.

The *Pro* Bottom Line

The conclusion from Nick's 2012 Memo is still completely applicable today. So rather than restate it, I'll reproduce it here in full (with a slight edit in brackets to account for our SPY hedge):

> "Fortunately, we follow a flexible, absolute-return investing strategy that allows shorts and options. Our portfolio is well diversified, and our current S&P 500 [put ratio hedge] offers significant negative correlation to our holdings [once the index falls below a certain level], further reducing overall riskiness. Moreover, as options investors, we build strategies with non-normal return profiles — in plain English, we hedge and collect premiums in exchange for the obligation to sell shares higher or buy shares cheaper. That means we can manage our risk *and* profit through a wide range of outcomes."

While some of the names of the companies have changed, and the correlation table looks a bit different than it did in 2012, our underlying philosophy and our goals are the same. We continue to aim for North-Star beating returns over every rolling three-year period, and correlation and diversification are important parts of achieving that goal.

To discuss this Memo or ask questions, please post on the Memo Musings board. And keep an eye out for a future Memo with more risk measures such as beta, Sharpe ratio, and style categorizations.

Fool on!

— Billy (TMFTailwind)

Pro Live Chat, January 2015

Published Jan 12, 2015 at 10:02AM

Members joined the *Pro* team at 2 p.m. Wednesday, Jan. 28, for our first live chat of 2015. If you missed the chat or just want to read it again, the transcript is below!

A plain-text version of the transcript appears below in reverse chronological order.

Jeff (TMFFischer)

Indeed, Billy. Fool on!

JP Bennett

thanks for spending the afternoon with us, everyone! Hope to see most of you in person at FoolFest and during next month's chat!

Jeff (TMFFischer)

(Big movers first, usually.)

Billy Kipersztok

Thanks for joining us - Fool on! Now back to earnings :)

Jeff (TMFFischer)

We'll see you on the boards. I'm going through earnings with an initial focus on OTEX, TUP, SWKS...

TMFKabellen

Thank you so much for joining us! Jeff is right, it always goes by so fast. If you've got questions before our next monthly chat, of course, please bring them to the boards! Pleasure spending time with you all today. :) -Ellen

Jeff (TMFFischer)

Thank you all for being here today! This is always the quickest hour of the week/month. It flies by! We look forward to seeing you next month in both the Options and Pro live chats. Hope you enjoy the time before then...

Comment From Ray

How are your insights on BBT , mid regional banks?

Billy Kipersztok:

I've looked at a few regional banks (for example M&T). But I haven't looked at BB&T. For regional banks, I want to see a strong underwriting culture and excellent credit performance, disciplined management / capital allocation, and I'd also want to get a sense what types of loans are on their books to see whether there is undue risk (concentration in a specific industry, for example).

Banks that fit those criteria, have 10 % ROE's and trade at a low P/B multiple might interest me.

-Billy

Comment From Karen (KBecks)

Here's to a wonderful 2015, Pro members and team! Great chat today. Thank you for this forum!

Comment From IDavid

I'll be at Foolfest.

TMFKabellen:

Yay! Don't be a stranger. I know Lon will be there and some of our other superFools ...

Comment From jagilford

Hi all, I'm new to pro and have a question about taxes when selling old stocks to free up cash. Should that be a consideration when deciding to sell a stock that has done extremely well? I'm nervous to sell it as I've had it many years and it has gone way up.

Jeff (TMFFischer):

@jasilford, I'd say definitely. I dislike selling and paying taxes, of course, if you can avoid it. You need to like the new places for your money more than enough to compensate for the tax bill. With Pro, we try to walk a balance between caring and not, because about 40% of members invest via an IRA. But at any rate, do take taxes into mind -- they're a real part of managing your taxable account. But don't sit in poor stocks just to avoid a tax bill. Love what you own (in an objective way). :)

Comment From Scott

last post

TMFKabellen:

Nice try

Comment From bru5ce

An hour has gone by already? Wow! Thanks, folks, for everything you do!

TMFKabellen

OK, gents, answer the questions you're working on now and then I'm afraid we'll have to shut this down.

(Anyone here coming to FoolFest, by the way?)

Comment From Scott

Much thanks to Jeff, Billy, JP, and Ellen....I'm glad to have made the decision to Join PRO late in 2013 and to gain from your experience throughout 2014. I'm already recommending to my other MBA buddies your approach and perhaps I can persuade some to join

TMFKabellen:

That's so great to hear! Thank you :)

Comment From terrapin

Jeff, if yu get an idea from Jim for MSFT, do I just have to wait to see if a recommendation comes out? I'm against MSFT, but I like their Surface laptop surprisingly well.

Jeff (TMFFischer):

@terrapin: I'd probably say to Jim, "You run with that one," because he knows MSFT better than I do. If he wanted to do something with it, yup, it would come out as a MF Options trade alert.

Comment From RTichy

What else would be considered a "core" position for people just starting?

Billy Kipersztok:

Hi RTichy -

Of course any of our Buy Firsts, and virtually all of our Buys (with the exception of DGS and SVXY, and perhaps AIG) can be considered "core" holdings.

-Billy

TMFKabellen

Twoooooooooooo miiiiiiiiiiiiiiiiiiiiiiiiiiiinutes!

Comment From Ray

Are you still long on wear able tech stocks?

Jeff (TMFFischer):

@Ray: In that we own Apple and Skyworks, yes. But we're really just long on personal computing. Who knows if wearable will REALLY take off. That remains to be seen, even if it seems logical and likely. With these companies, we should earn returns either way.

Comment From silverFox

I'm new to Pro, but I thought I saw SWKS as Buy First and now is is Buy. Was it "downgraded"? If so when and why?

TMFKabellen:

silverFox, yes, it was -- see "Pro Guidance Changes" at the bottom of this Memo for details. We always report guidance changes in the next Memo after they happen. http://newsletters.fool.com...-E

Comment From phox

Dear Pros, I'm fully allocated in MA but don't have any shares in my IRA partition. I like American Express better from a consumer stand point and I like to own companies that I like. Would AXP, at its current price, be a reasonable proxy?

Jeff (TMFFischer):

@phox: Greetings! They're very different businesses (AXP takes on consumer debt), but I own both, so that makes it easier to say, yes, you could IMO spread your dollars into both. I respect AXP a lot, too. They are facing more competition from high-end Visa and MasterCard cards, and digital money requires investment to stay at the forefront, but I think they'll continue to do well over the long haul right now. And the valuation is lower.

Comment From VelobiciOptions

Good to you and the whole team. Congratulations on a wonderful year as shown in the 2014 report. Pro is doing very well indeed. Among the best in returns AND doing it year over year, which is very rare!

JP Bennett:

Thanks, Velobici! And thank you for your contributions to our boards!

Comment From BandCJ55

The pause by scrolling up slightly works on Chrome as well. It moves rapidly when you start moving down.

TMFKabellen:

Verified here, too (in Chrome) -- thank you!

Comment From Scott

How does the PRO team feel about the upcoming GILD earnings? Any concerns for a stock correction in the near term?

Jeff (TMFFischer):

@Scott: Another fun one! I think results should be decent given Harvoni's strength out of the gate. But guidance will tell the tale, and until we see how the new PBM relationships are shaping up, no point trying to guess. But I like the valuation of the business vs. reasonable expectations, so I'm glad to own it going forward.

TMFKabellen

Five-minute warning, Fools! Get your questions in now ...

Comment From devinder

are Skywork solution and Invensense similar businesses

Jeff (TMFFischer):

@devinder: Not really. Only in that they make small components for computing devices. But SWKS is much more diversified and has strong margins and cash flow.

Comment From terrapin

With a fairly vlatile stock, i.e., GoPro, but even Google as well, does it make sense to assume you can go in an out of Options as it varies?

JP Bennett:

We're not traders, so we don't recommend trying to jump in and out of stocks just to make a quick buck or two.

Comment From JSPColorado

You can effectively "pause" just by scrolling slightly up from the most recent message. Then scroll down slowly. On Safari, at least, that works to pause the feed.

Comment From Old Hippie Nerd

Any thoughts on the Chicago selection for the CZR circus as it relates to our position?

Jeff (TMFFischer):

@Old Hippie Nerd: It seems unfortunate! Yet, you never know. If we keep the short long enough to see, Chicago may rule against CZR where Delaware wouldn't have. Meaning: You just never know. I don't love that about this short -- that much of it comes down to a legal battle. So, we'll see if we want to keep it through the duration. Meanwhile, the weak business should help us. But on the surface, Delaware would appear to be the better court for us. In reality, only fate will show what Chicago does.

Comment From Karen (KBecks)

Did you plan this month's chat specially for Apple earnings day? :)

TMFKabellen:

Karen -- happy coincidence! :)

Comment From BandCJ55

Thanks. Very helpful comments on DGS.

Comment From Hemanth

Is there a way to track the options in the Pro Scorecard?

TMFKabellen:

Sorry, Hemanth, this is one of the most requested features we're not likely to provide anytime soon. :(I wish I had a better answer! -E

TMFKabellen

@terrapin: I also promote them on the homepage starting a week or two before the event itself, and there'll be a link in at least one Monday Memo email before the chat. I should add them to our coverage calendars, too -- note to self.

Comment From BandCJ55

Still feeling strong about Wisdom Tree (DGS) and if so why?

Jeff (TMFFischer):

@BandC: Haven't felt strong about DGS in a long time! But do believe emerging markets will have there day, and this is a very good ETF for that. Keep in mind, we're not well diversified if everything moves together at once. DGS has diverged greatly from our U.S. stocks. Eventually it should do well and U.S. stocks may not. And that's fine with us -- and makes it worth keeping because we do believe in the fund. But I think waiting for results in DGS could require still more patience. When it does finally have a good several years, that'll be nice. These things to cycle, and emerging markets have been weak a long time.

Comment From terrapin

Do you have these chats on a redoctable interlude, e g, every two weeks? How do we know when you'll do it again? Often on Wed.s?

JP Bennett:

They're monthly and we send out an email reminder, terrapin :)

TMFKabellen

^ Thank you!

Comment From I certainly second...

Something for we slow readers: in Safari there's an menu option under the debug menu (activate in prefs) to *pause web process.* Also in all the browsers at the bottom right of the chat window there is a well icon for settings. There you can click on the sound icon and mute or unmet the sound.

Comment From Jim

I noticed Jeff updated recommendations on the AAL calls and GNTX puts recently on the boards. I just happened to run across the comments, but am not on the boards routinely. I would have expected an email when a pricing recommendation is changed. Did I miss one? Other than looking frequently, will we be notified if you make comments on the boards regarding active trade recommendations (not follow-up comments)? Thx

Jeff (TMFFischer):

@Jim: We didn't update pricing guidance on AAL in any way -- that recommendation stands as is. We happened to buy our calls higher than they traded on day one, but there was no guidance to stick to the price on day one. On GNTX, the guidance was updated to everyone first in the Monday Memo. It wasn't a new trade alert, just a Pro Catch-Up Trade -- catch-up, in this case, to the latest pricing. Those are in any Monday Memo. Does this answer your question?

Comment From devinder

where is jim gilles TMF kanuck

JP Bennett:

Jim is not a part of Pro. He's on Options and Special Ops, devinder.

Comment From Susan

Scott, Consider the tax implications on syn longs. The short puts are taxed at ordinary income rates in taxable accounts. The long calls are at long term capital gain/loss rates.

Billy Kipersztok:

Thanks Susan! Yes, an important consideration.

Comment From foolinsd

FYI for those that don't like the alert sound, click on the gear icon on the bottom of this live chat to turn it off. You do have a choice :)

Comment From terrapin

Where are you with fallen hero INVN now--about my biggest loss that I clung to stubbornly.

Jeff (TMFFischer):

@terrapin: We sold more than a year ago, because, like DDD, the financials weren't shaping up as hoped. We wrote calls when the CEO was booted, and sold around $11. So, we've been out for a long time, and the stock is higher since. Right now, I look at the financials and still don't like them. But I know many at the Fool believe strongly in the CEO and the business. I like SWKS much better -- when I view it as a financial analyst and business analyst.

Comment From Scott

Is there some general rubric Pro uses to determine whether an investment thesis should be a syn long, Buy a LEAPS call, or go long the stock? Now that I'm fill out my portfolio, I would like to know how one generally starts in execution options (pun intended :)

JP Bennett:

I believe Billy answered a similar question somewhere up above, Scott.

Comment From Susan

Thanks Jeff. Not rambling at all. It helps to read/reread your thinking even though I have been with PRO for a while.

Comment From smides

For me, I was able to re-enable the typewriter sound by clicking the gear icon at the bottom of the chat window and clicking the speaker icon with the red slash through it. When the red slash is gone, you'll hear the dulcet clickity-clack once again.

Billy Kipersztok:

Thanks for sharing smides!

Comment From VelobiciOptions

Looks like a good day to sell puts on OTEX

Jeff (TMFFischer):

Hey VO! We shall see! Maybe a strangle again? I have to go through results. Since we're about 3.1% in OTEX, we have flexibility. Good to see you!

Comment From Scott

Hello Pro Team, I'm curious about syn longs. If one were to find a stock with Jan 17 LEAPS, and the investment thesis is for appreciation over the next 3 years, how would this make less sense than going long on the stock or simply buying a LEAPS call? From a novice standpoint, I see the syn long as a way to use margin in my margin account to keep a cash balance as a hedge. Moreover, why is KO a syn long and not other core PRO holdings?

Billy Kipersztok:

Hi Scott -

Deciding between a syn long vs. bought stock vs. a bought LEAP should take quite a few variables into consideration.

For one, the type of account matters. In IRA accounts, margin is not allowed, so the leverage benefit of a syn long is wiped out. It's better off in that case either buying stock or buying a call.

Secondly, for the Pro portfolio, we take into consideration our current allocations. A bought call only risks the capital we invested, whereas a syn-long commits us to buying more stock if the price ends up below the written put leg strike at expiration. For positions where we already have an allocation, we may not want to increase our allocation by that much.

In KO's case, we had no position in the stock, and we could benefit from the leverage of the syn-long since Pro is in a margin account.

There are other considerations as well (upside potential vs. downside risk, etc.) but that's a start.

-Billy

Comment From Dave

Any thoughts or suggestions on Facebook for today?

Jeff (TMFFischer):

@Dave: It remains one of my favorite "growth" businesses right now. I think FB is still reasonably priced. I compare it to Google early on, all the time, and it looks good. That said, this year they expect to spend a lot to grow. That's fine. But we'll see how Wall Street takes it. Of course, they share results in a few hours. So, we'll get a new look at the business soon. I like the idea of owning it for years as long as they continue to be THE place for social activity online. And they do, with their various properties. In a mammoth way. And the audience is remaining very engaged. Will that change? I don't know if that follows logic. People are very social creatures. FB just needs to remain the social hub of choice. And buy any threats. :)

Comment From Parshooter

Did not get in on the CZR trade originally, does the team feel that there is still time? Thank You!

JP Bennett:

This one will definitely take some time to play out, so I'd suggest checking the boards and reading the original rec. No need to rush :)

Comment From bru5ce

Maybe the people who don't like the click could mute their speakers?

Comment From RTichy

So tell me about Amtrust (AFSI). I haven't started a position at all, yet. It's way past the Fair Value and it's the largest holding. The portfolio recommendations screen has very mixed signals about whether or not one should immediately jump into 7.1-7.3% of one's money. If I read the WWTN page, I'd say it seems like a "core" position for Pro. Any disagreement with that?

Jeff (TMFFischer):

@RTichy: It is a core holding, I'd agree with that. But it is a large position lately (a good problem to have) at 7.1%. We suggested new members last fall average in over time, and perhaps only allocate up to 5% for now. Because we do consider trimming it from time to time. But at the same time, I lean to letting winners be. Letting them continue on. At any rate, if I were starting now, I'd start with a more modest position and plan to add later. Just to be a little more careful. That said, many people average into every position over time, not just AFSI. We'll have a value update before long, as we see results in February. We're also slated to visit the CEO and CFO in NYC on Feb. 20th.

Comment From Karen (KBecks)

Hey should we talk about Five Below (FIVE) during this chat??? :) I closed a little bit of my short position and I'm much less nervous now. Anything interesting with this one or has it become a little sleepy?

JP Bennett:

My opinion on the company has not change one bit. It's likely to remain sleepy until they report in March. I was not impressed with their holiday numbers at all. - JP

Comment From terrapin

Alright, Ellen, how can Old Hippy hear your clicking, and I can avoid it? No setting on our own computers?

TMFKabellen:

Nope. That would be too easy.

Comment From RTichy

How come the icon for "catch up trades" on the WWTN page links to a memo from April 21st, 2014?!

TMFKabellen:

Goodness! It shouldn't do that. I'll go examine/fix in 17 minutes. Thanks for the heads-up! -E

Comment From DL

I liked it too, for the same reason

TMFKabellen:

Duly noted! It's our usual practice to turn it off, but today the setting didn't "stick" -- maybe it's more popular than we ever realized! -E

Comment From DUWANGO

Any chance of investing in a snow shovel manufacturing company? Hope you are all warm and dry. Love this service. Extra congrats to PhooLon

TMFKabellen:

Leslie! I hope you're warm and dry out West as well. We dodged most of the blizzard, but it's times like this I miss living in Houston. Good to see you here! -E

Comment From AMG

I have a position in UBNT with a basis in the 40s... Hit prettty hard in 4th quarter and continues to decline... Do you have a recommendation on this stock?

Billy Kipersztok:

Hi AMG -

I personally haven't looked at UBNT. It's not a Pro recommendation, but I think it is for Rule Breakers?

In any event, I don't have much to say about it since I don't follow it. Your best bet is to ask on the company boards for the service in which it is an active rec.

-Billy

Comment From Karen (KBecks)

Good question about call buying, Susan! Good stuff.

Comment From terrapin

Think Microsoft is as bad as it appers? Candidate for a LEAP or a long put?

Jeff (TMFFischer):

@terrapin: I'm going to talk to Jim G about it for a start. He has followed MSFT in the past. Perhaps there's an opportunity there, was my thought, mainly for MF Options.

Comment From bru5ce

LOL, I kind of like the typing sound, because I can hide the window and then go back to it when there's something new! Ya can't please everyone... :-)

TMFKabellen:

Great minds! See above :)

Comment From Old Hippie Nerd

Hey... I liked the new clickety clacking.... :-))

TMFKabellen:

Goes to show, you can't please everyone. :) -E (who is now singing John Fogerty to herself)

Jeff (TMFFischer)

@devinder, On CZR, as of right now the position is about flat for us, while the market is up over the same period, so as a short, it hasn't scored us a win, but has done okay... so far. But it's an unusual short at this case. We have to make sure we remain comfortable shorting through a lawsuit. Luckily, the business is weak -- or has been -- while we wait.

Comment From mainmike

Any thoughts about offering alternate strike prices on recommendations to reduce the pile on effect that prevents many of us from executing the trade?

Billy Kipersztok:

Hi mainmike -

Sometimes we do that, as with the GNTX put write (at the bottom under "Alternative Trades"):

http://newsletters.fool.com...

Other times, we specifically mention that we don't recommend alternatives, and other times you can use your knowledge and comfort with options to make an educated "off-reservation" decision on your own.

-Billy

Comment From Tracy

That's it! Exactly! Thank you.

Comment From Susan

Jeff, When you buy LEAP calls, how do you decide on the strike and amount of TV you are willing to pay (other than as little as possible). Are you using back-of the envelope calculations on how much the leveraged position is likely to gain and then decide on the strike price?

Jeff (TMFFischer):

@Susan: One of the key levers is I want the potential to earn 100% on the calls I buy, since I am risking the whole capital amount (a 100% loss). So, that was true with the FB call purchase, with DIS, with the original KO purchase, and AAL -- you need to be able to make the case that your particular calls could reasonably double in value if your thesis plays out. Otherwise, I don't want to risk it. I don't want to risk a 100% loss for, say, a 50% gain... Second, the call is usually 20% or more in the money, because we're not trying to speculate. We're just trying to capitalize on a higher stock price over time. Buying in the money lowers time value and increases the odds we end with some value, of course. I dislike paying more than 10% time value over two years (5% a year), as an arbitrary round number, but on something as volatile as AAL, it was okay. So, the time value you'll pay really depends on the volatility of the stock. Hope the helps a bit. Long winded and rambling. Our guides to Buying Calls help, too.

Comment From terrapin

When you have long puts going further against yu than yu expect, what can you do to reduce losses?

JP Bennett:

If you bought puts you can just look to sell them to close your position. You could also consider rolling them to another date and possibly another strike, but you'll probably have to invest even more capital to do so. - JP

Comment From Tracy

I now this sounds lame...! It often seems like I have to stumble about on the website to find the list of positions and allocations for Pro. Most of the time - I go to nevercontent's weekly posting on the philosophy board to find what I need. What's the easiest way to access this information?

Billy Kipersztok:

Tracy -

Is this what you're looking for?

http://newsletters.fool.com...

To access that page, you just have to click on the "Recommendations" tab at the top of the site.

-Billy

Comment From devinder

CZR short should have shot up with bankruptcy filing but seems like PRO is still losing money on it. Any thoughts

JP Bennett:

This is going to take some time to play out. There are some folks on the long side who are going to do everything they can to try and isolate the damage and unlock value for the equity holders (i.e. themselves). We don't think they'll be successful, but it isn't going to play out over night, nor is it an open and shut case.

Comment From terrapin

How can I get rid of the typing sound on the message board just now?

TMFKabellen:

terrapin, I turned that setting off. Apologies for the clackity-clack! -E

Comment From Pixal

I also have had great difficulty matching the alerts with my trades. How many PRO members are there? I don't want to blindly trade, so it takes a little time to analyze the trades I want to match.

TMFKabellen:

Pixal, we can't tell you how many members there are, but it's good that you're not trading blindly, of course. As members have noted, by 4 or 5 days after the trade alert, pricing has usually settled down. -Ellen

Comment From No rate hike near ...

Oil crashing!

Jeff (TMFFischer):

Is it again today? That should of course ultimately be good for AAL.

Comment From RTichy

@JP to follow up on my short positions question: Are the short positions designed to relate to a particular long position, though? Yes I want to follow Pro very closely, but I am not sure on how to allocate my money into the portfolio effectively. Some of the longs are already well past Fair Value, and so I am holding off on those because I don't want to put money into a position Jeff is just waiting to drop, and if a short position is part of a tandem trade position, I don't see that on the portfolio screen, either...

JP Bennett:

I see, RTichy. You should look at our shorts in the context of our entire portfolio. They're not an attempt to hedge a specific stock/sector exposure on the long side of our holdings, but rather to help hedge the entire portfolio (though ideally we will make money on our shorts regardless of where the market goes).

Comment From Snapback

What are thoughts on buying BHI as way to play oil going back up at some point and also to profit from merger with HAL?

Comment From Snapback

any thoughts on buying BHI as way to play oil going up some day. hopefully benefiting from merger with HAL along the way.

Jeff (TMFFischer):

@Snapback: Oil isn't my forte. Energy in general I believe is a tricky industry because more and more energy keeps coming online. Many people allocate to energy as a rule because it's so integral to life. But I think you can do fine without energy investments, too. But really it's just not my area... That said, we are batting around possible ideas between us on the team, and reading suggestions from members. If something really looks good, like BRS did before, and VDE when oil was down -- like it is now -- then maybe. But what has changed since the last time we bought VDE is US oil production has soared, of course.

Comment From Kevin H

As a follow-up to Tracy's comment above concerning option trades -- it takes patience as preached by Jeff & Jim in MF Options. I also have found it can take 4-5 days before the recommended trade executes. (And always use limit orders.)

TMFKabellen:

Wise words.

Comment From M

Are you considering directly shorting any companies? like the sony short from couple of years ago.

Billy Kipersztok:

Hi M -

Yes, all the time :)

That's definitely a focus for Jeff, JP, and I. But good, high-conviction shorts are few and far between.

-Billy

Jeff (TMFFischer)

Hi All: We're still answering questions from 10-15 minutes ago. We'll get there!

Comment From SteveH

Hi, thanks for the chat. I have moved assets from a financial adviser into my MF sphere. Any suggestion on the best way to evaluate the mutual funds they had selected in order to sell intelligently in order to invest in MF recommendations. Is Morningstar a good option?

Billy Kipersztok:

I have used Morningstar personally in the past to evaluate mutual funds. They are generally well-regarded in the industry for their evaluation criteria. If you are a premium M* member and can read the analyst commentary, that's even better.

Additionally, you can check the funds' websites to see what their holdings are. That can also help in making determinations.

-Billy

Comment From M

I had synthetic short on FAZ that I allowed to exercise couple of weeks ago. My broker TDA forced me to cover the short saying that the stock is hard to borrow. Therefore I don't have any position in FAZ now. Any suggestions on how I can re-enter the short position?

Jeff (TMFFischer):

@M: A 2017 syn short should do the trick...

Comment From mfdravid

Any thoughts on the FXE short> Is it still a valid rec?

Jeff (TMFFischer):

@mfdravid: It still is an active recommendation. That said, of course the risk/reward is less attractive now, and it's much harder to short now than it was a few years ago. But it's active as a rec. We have no "hold" rec for Shorts because that's a risky way to view a short, IMO. We either say Short or Close it. We are still short.

Comment From phox

Hi Pro Team ... sitting here munching on a bowl of OTEX ... bought back a few more shares today. I love you guys!

TMFKabellen:

The feeling is mutual! Enjoy :)

Comment From Norman

I started Pro a yr ago. I'm ready to double up but things look a bit extended. Any suggestions

JP Bennett:

I'm not going to sit here and say I know for certain where the market is going to finish this year, but I do know a healthy amount of skepticism never hurt anyone. Just move at a pace you're comfortable with. I know we are with our new recommendations. - JP

Comment From Guest

any comments on svxy, it dropped a lot since recommended

Billy Kipersztok:

Hi Guest -

See this thread:

http://boards.fool.com/1228...

-Billy

Comment From Tracy

Thanks for feedback on O'Reilly and Papa Johns!

Comment From Tracy

American Airlines alert was surprising...in a good way! What triggered the possibility?

Jeff (TMFFischer):

@Tracy, As you know, it's not easy to find "value" (or deep value) type stocks right now that also have strong growth on tap. AAL showed up. Add that with a changed industry (or so we hope it'll stay changed, with fewer players) and strong consumer demand, alongside a very skeptical Wall Street, and it's an interesting situation. Now, it's still an airline investment, so we kept it small. :)

Comment From Tracy

@uwman - I find that it takes 4-5 days before the MFPro Options trade happen. I try every day until it finally happens.

Comment From Wisemann

I must admit that mat portfolio is a mix of PRO and other FOOLS recommendation, but PRO of late preformed much better than mine. PRO loses less on down days/weeks and rise more no good ones.

Billy Kipersztok:

One of Pro's primary goals is to lose less than the market when it falls. So that's good to see. And that we have been rising more than the market on good days is not a specific goal, but it sure is great when it happens. Here's to working towards and hoping that it continues :)

Comment From tbkurz

Any comments about considering doing short term options, ie weeklies?

JP Bennett:

They can definitely be lucrative, but they are also very dangerous. Make sure you're constantly aware of (and ok with) the risk you're taking on when using them - JP

Comment From JSPColorado

TMFKabellen:

Right? Like it's even a contest. -Ellen

Comment From DL

who did MDT merge with?

Jeff (TMFFischer):

@DL: Did they merge? No, no, I kid. I fool. I Fool. They merged with Covidien. Here's a good overview: http://www.bizjournals.com/...

Comment From Tracy

I'm slowly building my Pro Portfolio, and I'm skipping Papa John and O'Reilly Automotive for now. Should they be the last ones to add? Not add for now? Thoughts?

JP Bennett:

Hi Tracy, I'd wait until they are no long on "hold." They may go back to being a buy, but we could also decide to sell them. It'd be a bummer if you made a move only to see us put out a trade alert recommending you do the opposite shortly after. No harm in waiting. - JP

Comment From Karen (KBecks)

2014 Pro CEO of the Year…. who would you pick and why?

Billy Kipersztok:

Hi Karen -

Being as Morningstar singled out O'Reilly and Gilead's CEOs as finalist for their CEO of the year (I believe GILD's CEO ended up winning), those are the easy choices :)

Both companies had outstanding 2014s.

Other candidates might be AMT's James Taiclet, due to strong execution and deal-making in 2014, setting the company with an excellent competitive position both in the US and internationally over the next several years.

Papa John's and Starbucks also continue to perform well, with remarkably strong and consistent comparable store sales.

-Billy

Comment From BandCJ55

Any thoughts on a position in TSLA?

Comment From BandCJ55

Thanks. I belong to both Pro and Options. Thanks for the comment on WFM. What is your take on DDD and or TSLA?

Jeff (TMFFischer):

@BandC: We sold DDD because the financials weren't shaping up as hoped. TSLA is a one-of-a-kind business with a valuation that may price in a lot of the upside at this point for quite a while. They don't expect profits until 2020 I believe now...

TMFKabellen

@uwman: For Pro, Jeff means Catch-Up Trades -- TYCM are in Options. Pretty much the same thing though :) -Ellen

Comment From uwman

I have a lot of trouble getting options at your recommended pricing. Is my problem Vanguard, which seems to actively discourage options trading?

Jeff (TMFFischer):

@uwman: It depends on the position and the direction of the market. We're making our guidance flexible, though, and we provide follow-up guidance in Trades You Can Make -- we'll get better at this, I'm confident. And the market will cooperate much more when it's not so strong.

Comment From Old Hippie Nerd

A bigger window would be nice so that long comments and answers don't require scrolling back and then forward to see all of it.

TMFKabellen:

That I might be able to help with, though not in this session. Duly noted! -Ellen

Comment From erkaye

TUP is a very slow grower that shot up over night. Any options plays come to mind?

Jeff (TMFFischer):

@erkaye, It has actually been a fast-grower over our history (we started with it around $27, with various positions, and sold around $80, then got back in and it has declined since)... But right now, yes, sales are growing slowly and we will consider writing strangles on it again as we have in the past. For income. I was looking at the premiums this morning. :) But I need to go through earnings first. And then we'll decide.

Comment From RTichy

If one is just starting to develop a Pro portfolio, when should we start initiating the short positions? Relative to investing in the long positions, I mean.

JP Bennett:

I think it depends on what you want to get out of Pro. If you want to mirror us 1 for 1, then it would make sense to consider following on the short side of our book as well. But you don't have to if it isn't something you're comfortable with. Shorting can be volatile and isn't for everyone :) Personally, if I were in your shoes I'd probably wait until I was comfortable with the long side of my "Pro portfolio" - JP

Comment From No rate hike near ...

Where can I see the 2014 portfolio review memo?

TMFKabellen:

It was sent out this Monday and is still linked on the homepage -- URL is here:http://newsletters.fool.com... -Ellen

Comment From mrrobertinBangkok

i may have missed this, i just joined the chat. But any thoughts on Gentex earnings today? other than you are glad you didn't get in?

Billy Kipersztok:

Hi Mr. Robert -

Here's what I posted in response to a similar question earlier:

"We recommended GNTX for a combination of reasons. After reviewing Q3 (last quarter's) results, we updated our valuation to $17.50 per share. We saw management buying back stock, which historically was a strong indicator of improved performance. Management's forward guidance for Q4 implied strong performance. And we were ready to own more shares, if it came to that.

In light of management's guidance of 10-15% growth in net sales, yes, we expected a stronger quarter than 7% growth. But yet, it wasn't a *bad* quarter, just not up to par with expectations.

In my opinion, GNTX is still relatively cheap, and the effective buy price from the put write is an attractive entry point for a new slug of shares. In that sense, our opinion is unchanged.

I expect better performance next quarter, given management's comments on the call and their forward guidance. But results and time will tell. As we can see from this quarter, sometimes guidance is wrong :)

But there is enough margin of safety with this stock (for example, >12% of the share price is cash) to feel comfortable moving forward."

I also posted my preliminary thoughts on the results on the Gentex board.

-Billy

It would. Right now I'd settle for a pause button! -E

Comment From bbdoc1

you talked about writing Tesla puts on Motley fool 1 what dates were you thinking of and the price you would consider

Jeff (TMFFischer):

@bbdoc1: That was a question just put to me on the spot, so I don't have dates or even any thoughts in mind about telling someone what to do. But if someone wanted to buy TSLA lower, potentially, they could sell to open puts at various strikes and expirations -- choose your desired buy price....

Comment From terrapin

What are some simple ways utilize options for an earnings report that you think isiikely to be a win?

Billy Kipersztok:

The simplest way might be to buy a near-the-money call expiring soon after earnings. If you're right, you could see big gains. But if you're wrong, you can incinerate your capital.

Comment From Ralph

Interested in your thoughts on selling calls (diagonalizing) on our AAL LEAPS. Too volatile?

Jeff (TMFFischer):

@Ralph: That's certainly on the table. It's being considered and will be considered. We'll want to be careful to not miss the bulk of our thesis though, which is that the stock could rise strongly over time...

Comment From mfdravid

Hi Pro Team

TMFKabellen:

Hallo!

Comment From Karen (KBecks)

Just wanted to offer a big thumbs up for the 2014 portfolio review memo. It was a good read! Thanks for summarizing the history and for sharing your thoughts on what was learned in the past year. (Maybe I'll get to work on the math calculating my own 2014 portfolio performance too.)

TMFKabellen:

Jeff deserves the congrats, but I'll be the messenger: thanks, Karen! :) -E

Comment From No rate hike near ...

TUP?

Jeff (TMFFischer):

Question? I can't see it in this format. TUP had better results last quarter but sees a so-so 2015 shaping up. $5 in EPS puts it at 13x, though, along with a strong yield. So... still looks like a fine long-term holding for us. But I have to go through results.

Comment From RTichy

Why is the "recommended Allocation" in the portfolio based on the moment instead of an actual fixed point, and then report the amount the portfolio is above/below the allocation? Then you'd have to reset the allocation guidance say quarterly, but the way it is now, I fell like allocation is dependent solely upon performance since the position began...

JP Bennett:

Hi RTichy, You are correct that the way it is reported right now is dependent upon performance of our holdings, but I don't see this as an issue. These are our target allocations for members because these are the allocations that we are happy with -- if they weren't we would adjust the positions.

Comment From terrapin

I can't see that "rolling a call" is any dofferent than buying a new one--what's the dofference?

Billy Kipersztok:

Rolling a call means selling a previously bought call while simultaneously buying a new call.

Buying a new call is just that - establishing a brand new position with a bought call.

Comment From David

How close to expiration might you plan to cash in on your KO position?

Jeff (TMFFischer):

@David: We'll cross that bridge later this year, starting to seriously consider it this summer (unless earnings suggest doing so earlier). The bigger question may be to simply continue it -- roll it forward two years. And to possibly diagonalize it (which could happen anytime, IMO, but now we may as well wait for earnings).

TMFKabellen

Bob! Hey, Bob! :)

Comment From Wisemann

AIG is near its one year low. Any comment why the stock is not performing in the last few months? interest rates, new CEO, financial sector...

Billy Kipersztok:

Hi Wisemann -

I'm not sure :)

Perhaps interest rates - which have generally brought down the financial sector as expectations for rising rates have seemingly been pushed back.

See this comparison of AIG with the Financial Sector index:

http://finance.yahoo.com/ec...

Comment From Bob

RTB: Just hello to all and congratulations to Jeff and the team for a great performance in 2014 (and since inception. Did I hear we were going to beat the S&P by 20% this year? Extra hello to Mad Dog (Billy), see the boards ;-) Bob

Jeff (TMFFischer):

Great to see you, Bob! Thank you for stopping by. Yes, perhaps you heard that right, but it was someone else saying it, not us. :) I guess last year was 29%. I'll take any positive return at all, though. :)

Comment From bru5ce

Is this where LON jumps in and says it's LEAPS calls, not "leap calls"? :-)

Comment From terrapin

Best option setups fpr F, TWTR, BABA????

Jeff (TMFFischer):

@Terrain: In MF Options we have a syn lon on F. We may write calls on it, too, but the calls pay so little. It's a boring long-term holding. Boring but inexpensive. No thoughts on TWTR or BABA currently. Not enough to give advice. :)

Comment From Scott

Is buying $35 calls on AAL still recommended?

Jeff (TMFFischer):

@Scott: No change. The business looks inexpensive enough that even some less than stellar comments yesterday (about more competition in some markets) don't dampen the two-year outlook. The position is still recommended in our small allocation.

Comment From tbkurz

Curious as to whether you would advise buying more leap calls on American Airlines given that the price has softened a bit if we hadn't met our suggested fractional investment in it.

JP Bennett:

If you're still below a 1% allocation I don't see why not :)

Comment From foolinsd

TMFKabellen:

Party hats! Noisemakers! Streamers! :)

Comment From jojorunner

Billy Kipersztok:

Pro is short the Euro via FXE at a 2.1% allocation. That is perhaps a good place to start :)

Comment From Geoff Nordloh

Hope you don't mind a joint Pro/Options query: Often options recs seem to move out of recommended price range -- even within minutes of a rec -- and many of these seem never to look back. Difficult question to answer in general, but are you able to provide some guidance on how far to chase these? I feel I miss out on a lot of the good options trades as a result.

Jeff (TMFFischer):

@Geoff: Good question! Though this has been a long struggle, we do aim to make the guidance flexible in the original alert, and then provide updates in Trades You Can Make (or Catch-Up Trades in Pro). So, these positions do remain actively possible more often than not, for a long time, off and on...Some never come again, but I'd say a majority do. But we keep working on making the alert guidance as helpful as possible and flexible. Maybe this year we'll crack that nut for good!? Advice welcome, of course....

Comment From DL

DDD was a buy on the Stock Advisor report I first received from MF about 2 months ago

TMFKabellen:

Hey DL, are you an SA member? They cover that stock like it's on fire over there ... -Ellen (who also owns it)

Comment From Jim A

American Airlines is down since we bought calls. I'm thinking about selling the matching puts to create a synthetic long. Is this logical?

JP Bennett:

I wouldn't worry about a small loss this early in the lifespan of our position. There is still a long way to go here. We like calls because of our ability to risk only a small percentage of our total capital. Personally I wouldn't be looking to create a synth long just yet.

- JP

Comment From Daya

Jeff, any thoughts on covered calls on our AAPL holdings..?

Jeff (TMFFischer):

@Daya: Not at the moment. We have an aversion to writing calls on "core" (apple core -- ha -- sorry) holdings. In many cases, we'd eventually regret it. But I do have to go through the latest valuation and see where we stand on AAPL. If the possibilities are still looking attractive, we probably won't cover it. If we have questions about it, we may take various action. Good question!

Comment From Old Hippie Nerd

Are there any plans to use the results for the correlation in diversifying the Pro port?

Billy Kipersztok:

Hey there Michael -

I don't think we'll use the results in and of themselves to diversify just for the sake of diversification. But for any portfolio adjustments, we can consider the output from the correlation table in terms of making the best marginal decision. For example, if we have two stocks we want to sell, all else equal, we'd sell the one with the highest correlation to the rest of the portfolio.

In addition, as mentioned in the Memo, the index correlation table may be useful in contemplating future hedges.

-Billy

Jeff (TMFFischer)

You can get advice on DDD in Rule Breakers... And we still have a "sold DDD" board here in Pro where some members post.

Comment From John S

I was hoping to have MF Pro/ MF Options as part of a SMA account under MF One, but it requires a 300K initial investment to include MP Pro. Which is the initial outlay so high?

I'm sorry, John, we can't answer questions about the SMAs -- legally, not because we don't want to. I'd recommend calling Member Services and asking for someone who is legally allowed. Apologies! -Ellen

Comment From sockpirate

very concerned about DDD

Jeff (TMFFischer):

@sockpirate: Which services are you in? Pro sold DDD more than a year ago. We don't have it any longer. I think Pro was first to buy it and first to sell it. :)

Comment From Any Info whyGNTX i...

Any Info why GNTX is down today?

Billy Kipersztok:

They reported earnings and missed guidance. Check out my preliminary comments on the Gentex board.

Comment From is tis suppose to ...

Is this suppose to be a video chat?

TMFKabellen:

No, it's text-only. Our regular monthly chats are almost always text-only because the guys can answer a lot more questions when they aren't also appearing on camera! -Ellen

Comment From Jane

I have a question about Ocwen Financial. I bought it right after it was recommended and it is down 2/3 to 3/4. I know there is the problem in CA. Should I sell at this low point or hold it with the expectation that it will increase. This is the third stock recommendation that has done this in the last few months. I just sold LeapFrog at a huge loss also. Please advise re Ocwen. Thanks!

Jeff (TMFFischer):

@Jane: Hi, Jane. I don't know Ocwen at all. I'm told that was a recent recommendation in Inside Value, so please visit that service, and post on the Ocwen board there. I know they will help you! LeapFrog is also not in this service -- that was in Million Dollar Portfolio and maybe Hidden Gems? This chat -- and the analysts here -- only work on Pro and Options. Apologies!

Comment From Karen (KBecks)

I will admit to only skimming Billy's awesome article about correlation. So let me ask while I have got you here… Are AAPL and SWKS very intertwined? I'm off allocation with Pro's recommendations and they are currently #1 (AAPL) and thanks to growth #2 (SWKS) in my port at present.

Billy Kipersztok:

Hi Karen!

AAPL and SWKS are intertwined, perhaps enough so to describe it as "very". Jeff might be able to provide more info as far as how much of Skywork's revenue is related to Apple products. When Apple products sell well, that means more demand for Skyworks' chips.

From the correlation table, only TD Ameridtrade (interestingly) is more highly correlated to SWKS (at 0.44) in terms of price movements than Apple (0.42).

But generally, yes, we should expect to see Skyworks' fortunes move alongside Apple's. While there are a lot of new applications for SKWS's technology outside of Apple products, and over time we'd hope to see the reliance on Apple decrease - for now Apple product sales are one of the biggest contributors to SWKS's results.

-Billy

Comment From Tony

Yeah AAPL

JP Bennett:

Yep, that was a doozie :)

Comment From M

Considering how low the oil prices are I suspect some time in future they are going to go back up. It might take several months or year or two. But the oil prices are going up some day. Any thoughts on how we can benefit from that? Is pro considering any stock or ETF for that?

JP Bennett:

We're always looking for opportunities, regardless of the sector. My advice would be to look for companies that can create value even at these levels. NOV, SLB, and HAL are possibilities as long as you're willing to be patient.

Comment From No rate hike near ...

Anyone else underwater on TUP?

Comment From When will we roll ...

did you get my question on KO?

TMFKabellen:

Yes! You should see Jeff's answer above :) -Ellen

Comment From bru5ce

Okay, it's an iPad thing. Firefox on Linux works great.

Comment From When will we roll ...

When will we roll the Feb diagonal over?

Jeff (TMFFischer):

I bet you're talking about the KO diagonal? That's a MF Options position, rather than Pro. We'll address it as expiration approaches next month. It may not need to be rolled at all. The $44 calls may just expire (the desired outcome) and we'll write a new call.

Comment From BandCJ55

Sending in comments, but I do not see any responses to questions.

TMFKabellen:

Hey BandCJ55, we publish them as we answer them, so that doesn't necessarily mean they haven't come through -- more likely someone is working on a response! That said, I don't see any Qs in the queue with BandCJ55 as the author, so maybe try to submit once more and I'll keep an eye out? -Ellen

Comment From BandCJ55

Any comments on WFM and a covered call option price to go with today?

Jeff (TMFFischer):

@BandC: WFM is an income position in MF Options, rather than Pro. We haven't recommended a brand new position there for a while, though, just rolling calls. You would only cover a position you were okay selling and had bought for income.. If that's the case, you can write near-the-money calls -- typically a few strikes higher than the price.

Comment From Bluerose113

okay, thanks.

TMFKabellen:

Sorry I couldn't be more helpful. -Ellen

Comment From Tony

I see the names

Jeff (TMFFischer)

@Dwight: I'll add that One provides access to all Fool services -- including Pro and Options. As well as Tom G's Everlasting Portfolio which is only in One. One also has access to financial advisors and wealth management tools including funds. So, it has other services, too. I say this because I know One opens this week for a short while, so for members who want those services, now is a possibility.

Comment From Bluerose113

i am curious in how big a portfolio makes it worthwhile to look into the new SMA service?

TMFKabellen:

Hey Bluerose, I'm pretty sure that legally we're not allowed to answer that, innocuous though it seems. I'd call Member Services and demand to speak to someone who is allowed. :)

Comment From mark

why did you recommend gntx and what went wrong with earnings- did you expect better earnings and are you still optimistic moving forward

Billy Kipersztok:

Hi Mark -

We recommended GNTX for a combination of reasons. After reviewing Q3 (last quarter's) results, we updated our valuation to $17.50 per share. We saw management buying back stock, which historically was a strong indicator of improved performance. Management's forward guidance for Q4 implied strong performance. And we were ready to own more shares, if it came to that.

In light of management's guidance of 10-15% growth in net sales, yes, we expected a stronger quarter than 7% growth. But yet, it wasn't a *bad* quarter, just not up to par with expectations.

In my opinion, GNTX is still relatively cheap, and the effective buy price from the put write is an attractive entry point for a new slug of shares. In that sense, our opinion is unchanged.

I expect better performance next quarter, given management's comments on the call and their forward guidance. But results and time will tell. As we can see from this quarter, sometimes guidance is wrong :)

But there is enough margin of safety with this stock (for example, >12% of the share price is cash) to feel comfortable moving forward.

-Billy

Comment From Jim

FYI using safari and can readily see comments.

JP Bennett:

Yep! I'm using safari and it looks good to me :)

- JP

Comment From bru5ce

Reno, and it's 46. We'll take all your snow - we're entering our fourth year of drought.

TMFKabellen:

I've never been to Reno, but my husband's grandmother got divorced there one day and married the next. So it sounds like a fun town to me! Anyway, welcome. :) -Ellen

Jeff (TMFFischer)

Maybe it's Explorer?

Comment From Dwight

Hi Guys. I am a recent Pro member and have invested in most all of the securities you have recommended, excluding options to this point. Can you tell me the difference between Pro and One?

JP Bennett:

Pro is a complete portfolio management service. Like One we're looking for great stocks to hold for the long run, but our approach to portfolio construction is different. Check this out for more info on how we operate here in Pro: http://newsletters.fool.com...

- JP

Comment From Old Hippie Nerd

The names are coming through fine on my Chrome browser.

TMFKabellen:

Excellent.

Jeff (TMFFischer)

I'm using Safari and it's working fine. Others using Chrome are fine...

Comment From Lon

Thanks to everyone who is congratulating me. As I have been writing on the boards, this is a fantastic community and I am honored to be a part of it. Delighted to be your Home Fool. phooL on! Lon.

Comment From Jazzmaven

Hello Pro Fools! Hope everybody's having a good day.

TMFKabellen:

Hey jazzmaven! Jeff got some bad news about his windshield today (he needs a whole new one), but other than that I think we're muddling along :)

Comment From Bluerose113

i'm using Firefox and it is working fine.

TMFKabellen:

Good to know. -Ellen

Comment From Chris

Working fine Chrome here and all names displaying -- on a Mac.

TMFKabellen:

Well no wonder they can't replicate it! :) It looks good in Chrome on my end, too. -Ellen

Comment From Daya

Three cheers to Lon!

Comment From Wisemann

I am under allocated in OTEX should buy more today? Do you think you would move TUP to buy first after the current earning?

Jeff (TMFFischer):

@Wisemann, You probably know I need more time to go through both results. From what I've seen so far this today, as I posted, I'm not concerned about OTEX, and matching our allocation is a good first step. We may look to add more. We'll see. On TUP, I don't think it's likely to move to Buy First, but that'll depend on a valuation update. They still see a tough 2015. But Buy First and Buy for us isn't a critical distinction. It's a whole portfolio , of course, and all stocks rated buy are rated buy. :)

Comment From kathy

When will sound click in?

TMFKabellen:

Hey kathy, there's no video or audio component on today's chat, just text.

Comment From marksrjm (Bob)

I see names on the responses

TMFKabellen:

Bob, I think it differs by browser, which is one reason the provider can't replicate it. IE seems to work, Chrome less so. -Ellen

TMFKabellen

Also, Fools, I asked after our last chat, and our provider doesn't have a way to pause comments while the chat is live. I know people were hoping for a different answer, and I'm sorry.

Comment From Gary

Refresh didn't help me. I'll try IE rather than Google Chrome

TMFKabellen:

Gary, I'm sorry. That will almost certainly help. -Ellen

Comment From Lon

Hi Ellen or whomever should know, names are not appearing on responses ... just on the initial comment which is being responded to. Thanks. phooL on! Lon.

TMFKabellen:

Thanks, Lon. That's frustrating because our provider hasn't been able to replicate the problem, so obviously they can't fix it. We'll sign our names. -Ellen

Comment From No rate hike near ...

No rate hike near term

Jeff (TMFFischer)

-Jeff

Comment From bru5ce

Responses aren't signed, again....

Jeff (TMFFischer):

We'll be sure to put our names down, then...

Comment From John B

Happy to be here for one! Thanks for the opportunity!

TMFKabellen:

Woo hoo! -Ellen

Jeff (TMFFischer)

Big welcome and round of applause for Lon! He's incredible in the Foolish community, especially in Pro and Options, and we're all very fortunate to have him here! Thank you, Lon!

Comment From Tracy

Yay, Lon! I also call him - Zen Master

Comment From Karen (KBecks)

Congrats Lon -- Woo Woo!

Comment From erkaye

Want to say anything about AAPL and TUP. Yikes, nice moves. Does TUP seem over extended. The numbers I saw didn't seem to be that good.

JP Bennett:

I'll leave TUP for Jeff, but Apple... that was... a very, very good quarter :)

Comment From bru5ce

Good morning (here, anyway) Fools!

TMFKabellen:

Greetings, bru5ce! Where are you? Is it warmer than 25 degrees there? :)

Comment From kevio

HI Everyone

TMFKabellen:

Hey kevio!

Jeff (TMFFischer)

I hope you were able to see our 2014 review in Monday's Memo... That sums up last year pretty well, for a start anyway. So far this year, the market has been choppy (some options opportunities may be forthcoming, among others). The portfolio has overall gone up a bit. So far, it's not eventful to total returns, even though many positions have moved meaningfully in either direction. That's nice. It could bring opportunities in positions.

Comment From Old Hippie Nerd

Huge round of applause for Lon!

Comment From Karen (KBecks)

I refreshed and now I can see… huzzah!

TMFKabellen:

Oh thank goodness :)

Comment From Gary

Still can't see the screen.

TMFKabellen:

Hey Gary, Karen said she refreshed and that fixed it -- can you try that?

Comment From Bluerose113

hi

TMFKabellen:

Hey!

Comment From JSPColorado

I have a comment, not a question. Three cheers for phooLon!

TMFKabellen:

Agreed! I don't throw the word "invaluable" around lightly, but Lon is one I'll use it for. :)

Comment From Chris

As long as Jeff and Billy go south and our stocks do not...

TMFKabellen

LON! Everyone give Lon a round of applause on his recent transition to Pro Home Fool :)

Comment From Karen (KBecks)

You are invisible on my screen! No color in the type.

TMFKabellen:

Oh for heaven's sake I am getting a little exasperated with this service provider. (This is an understatement.) Can you see this?

Also, hey, Karen :)

Comment From Lon

Hi Pro Fools, extra delighted to be here and looking forward to learning from you. phooL on! Lon.

Billy Kipersztok:

Great to see you on the chat, TMFPhooLon ;)

JP Bennett

Hi everyone! Glad you could join us once again!

Jeff (TMFFischer)

Greetings, Pro members! We're glad you're here and look forward to this chat with you... Of course, the chat will be recorded and Ellen will lovingly put it on the site when it's ready. :)

Billy Kipersztok

Hello Pro Fools! Billy Kipersztok (TMFTailwind) here, looking forward to this next hour with you all.

TMFKabellen

We're happy to have you here today. Jeff and Billy are both back from their tropical vacations and ready to answer your questions!

TMFKabellen

Welcome, Fools!

Learning From 2014 — the Good, the Bad, and the Glad

Published Jan 5, 2015 at 2:28PM

Dear *Pro* members,

Welcome to 2015! *Pro* enjoyed a strong 2014, and more importantly for our service goals, we also capped off a good three-year stretch. Now we look forward to the next rolling three years. We'll review our 2014 returns later this month (once we have final numbers from our broker and the Fool), but we're starting today with a look back on what we did well last year, and areas we need to improve.

To the Positive!

We had low turnover.

Countless studies show that investors who trade less end up with more wealth. As Charlie Munger more colorfully says, the best thing he and Warren Buffett ever did was sit on their hands. Contrast that with the dismal performance of hedge funds since 2009, and you see how less "flash" can add more value. In 2014, *Pro* sold just three full positions — **GrafTech International** (NYSE: GTI), **StoneMor Partners** (NYSE: STON), and **Intel** (NASDAQ: INTC) — and one partial position, closing half of our **Facebook** (NASDAQ: FB) calls (the rest turned to stock, becoming one of our largest positions).

Clearing out just three positions from an average of 30, including shorts and core options, gave us low turnover of 10% last year (and notably, we didn't initially intend to sell Intel). Some years our turnover will be higher, but last year was indicative of how much we want to sit on our hands. It's commonly cited that the average mutual fund has a turnover ratio of 100% or more, meaning it holds its average stock less than one year. At *Pro*'s recent turnover rate, we would hold our average stock 10 years.

Two of our sells in 2014 were reasonable for *Pro* (we'll get to the third later). GrafTech is a struggling commodity business that lacks pricing power (the stock is down more than 50% since we sold), and StoneMor, although it yields about 10% a year, has been diluting owners' holdings about that much by issuing new units (or shares). We owned GrafTech longer than we should have, believing in a rebound in steel and needle coke pricing as the world economy grew stronger. That didn't happen, and while *Pro* members who bought at the outset still earned a decent return, many others unfortunately did not.

We let our winners be.

This dovetails with low turnover, but there's nuance. It's tempting to sell, reduce, or at least write covered calls on your best-performing stocks. To calm this temptation, we remind ourselves we're invested for at least the next three years, so as long as a valuation offers strong upside over that time period and our allocation is still reasonable, we want to sit tight. Not writing covered calls on, or selling the likes of, **O'Reilly Automotive** (NASDAQ: ORLY), **Medtronic** (NYSE: MDT), **Papa John's International** (NASDAQ: PZZA), **AmTrust Financial** (NASDAQ: AFSI), and many others rewarded us greatly this year. Of course, we'll keep watching valuations, and we will lower our exposure if that seems best.

We added quality businesses.

Last year, we started some investments in strong companies that typically have pricing power, and those positions have already added to our returns. Specifically, we began stakes in **Coca-Cola** (NYSE: KO), **Gilead Sciences** (NASDAQ: GILD), **Skyworks Solutions** (NASDAQ: SWKS), and **Expeditors International** (NASDAQ: EXPD). We also added more shares of **Wells Fargo** (NYSE: WFC), **American Tower** (NYSE: AMT) and **Tupperware** (NYSE: TUP). So far, all but Tupperware have added to our returns. In 2015, we will start new investment relationships with more outstanding businesses.

To the Negative (Boo!)

Our hedges were inconsistent.

We use hedges to lower our market exposure and let us stay more invested in the process; in that way, hedges help us earn our total return. But last year, the timing of our hedges was (inadvertently!) borderline awful. Part of it was bad luck, but we need to improve our process this year.

As some hedges expired last year, we took too much time to set up new ones; by the time we did, the pricing had changed considerably. Then, late in the year, we set up a very responsive hedge, buying in-the-money puts at $200 when the underlying index was $189. The hedge did respond. Sharply. And when the underlying index made one of its fastest ascents ever, to more than $200 in a few weeks, our puts expired worthless. We spent more on that hedge than we would have liked. The egg is on my face for too casually believing the **SPDR S&P 500** (NYSEMKT: SPY) would not soar over those few weeks, and being absolutely wrong. We need to keep hedging in ways that limit our expense.

Though they let us keep more funds invested, our hedges were (as is typical) a drag on our returns last year, and that's expected. I'll have the math on how much of a drag when we look at our returns later this month; it's likely larger than we model (or would like) just because of the in-the-money puts we bought. We seek to lower this expense in 2015.

We covered Intel.

After waiting years for the PC market to rebound, we wrote covered calls on our Intel shares last February after management said it expected another flat year. We basically lost patience with the stock. A few months later, Intel raised guidance, and the stock price began to rise strongly as PCs rebounded after all. Because of our covered calls, we missed much of that upside. This shows some of the folly that's possible with covered calls: We were content to sell our shares at $26 when we wrote the calls — *assuming the status quo*. But as Intel's business suddenly spiked, our sell price looked bad, and we were stuck. So, even when you're ready to sell a stock, covered calls may come back to haunt you. There's a silver lining, though: We invested in Skyworks Solutions as a replacement, and we're considering other investments in the industry, too.

We didn't always short/invest incrementally.

We started our short in **Caesars Entertainment** (NASDAQ: CZR) at a fairly full 2% allocation. Had we started at 1%, we could have shorted more when the stock price shot higher. Likewise, we could have started **Five Below** (NASDAQ: FIVE) with a smaller position than the 1.5% we began with, and shorted more when it spiked, too. The take-away: When starting shorts in volatile stocks, we may make our initial positions smaller (about 1%) so we can easily add more. We did start smaller in our purchase of **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY), and we'll almost certainly get good chances to add to that position this year when volatility spikes.

Execution.

This one falls squarely on me (and a bit on the team). We saw opportunities that we didn't act on in time: great shorts, some longs, and even hedges. This is about process and execution: We can't possibly take every opportunity we see — we need to assess and choose our favorites — but we shouldn't miss moves we want to make. We missed a few this past year due to distraction or delay. We're content to miss ideas if we have lingering concerns, but once we've decided on a recommendation, we need to bring it home — get it out the door — whatever obstacles are thrown in our path.

Income?

Finally, we didn't target much option income in 2014, but that was mainly because we saw stock upside instead. This isn't so much a mistake (stocks did rise nicely) as an admission. In future years, we'll target more option income. Perhaps this year.

To Be Glad Is Foolish

In closing, 2014 was *Pro*'s sixth full year in operation (and my 20th year publicly managing money). Despite our mistakes and shortcomings, we're pleased with our results. You could say we did more right than wrong; I also think we did well largely thanks to the decisions made in years prior that we didn't undo last year. We hope to continue to improve in many ways in each coming year and beyond. And with our ongoing desire to learn from the past, we'll continue our review of 2014 as we roll into 2015.

Comments? Questions? Visit the Memo Musings board. Thank you for being a Fool with us, and happy 2015!

Gentex's Stock Splits 2 for 1

Published Jan 2, 2015 at 12:39PM

Gentex (NASDAQ: GNTX) split its stock 2 for 1 on Dec. 31, 2014. If you own shares, the split doesn't affect your proportional ownership in the business — it simply means you now own twice the number of shares of the auto-parts supplier at half the price.

If you own Gentex and have entered it in your Fool scorecard, keep in mind that it will take up to 24 hours for the change to go into effect. If you track Gentex in your own system, make sure to double the number of shares you own and halve the price of each share in your records to keep your accounts accurate.

As usual with stock splits, remember that this move doesn't change the value of the company or your investment — it's all about the bookkeeping.

Bring any questions to our discussion boards, and Fool on!

Oil Prices and the Risk of Financial Contagion

Published Dec 29, 2014 at 12:56PM

Dear *Pro* Fools,

As 2014 comes to a close, we can look back on what will be the sixth straight year of positive returns from U.S. equities:

2009	26%
2010	15%
2011	2%
2012	16%
2013	32%
2014	13%

Almost six years after the current bull market began on March 9, 2009, we're still enjoying its presence. But it hasn't been completely smooth sailing — short-term fears have caused several market sell-offs along the way. Some examples include the Greek debt crisis in 2010, the U.S. credit-rating downgrade in 2011, continued Eurozone fears in 2012, and the Ebola- and geopolitical risk-fueled sell-off in October of this year.

With the 2008-2009 global financial crisis fresh in investors' minds, each of these sell-offs was accompanied by temporary panic and media rhetoric that the markets might be in for a major crash, but in each case, the market quickly bounced back and resumed its persistent upward trajectory.

As I read through financial news and headlines, the most recent short-term fear seems to be related to the sharp decline in the price of oil. After trading between $85 and $110 per barrel between 2012 and July of this year, oil prices have taken a rapid nosedive toward $50 per barrel over the past six months.

In parallel with the other market sell-offs of the past few years, the decline in oil prices has led to more media rhetoric and headlines speculating that the oil-price collapse may be the shock that leads to another global financial crisis. (Want examples? See here, here, and here.)

While I won't go so far as to say that the oil-price decline poses no threat to the global economy, I do believe that the linked articles and others like them might be overstating the potential risks, particularly in relation to the U.S. economy. Here are two key arguments behind "oil-price shock" claims, and why I think they are overstated:

1. Oil and gas junk bond defaults might cause a contagion effect.

The argument here is that highly leveraged oil and gas producers will be unable to service or roll over their debt, leading to defaults, asset sales, and a ripple effect throughout the oil and gas industry and the banks that underwrote the loans. Here's an example referring to the impact of oil loan exposure on **Wells Fargo** (NYSE: WFC).

After examining the data, I believe this fear is overstated. For example, referring to the Wells Fargo article above, the author neglects to compare Wells Fargo's oil and gas loan exposure to the size of its total loan portfolio. The author states that "Wells Fargo currently has very large exposure to the O&G industry relative to its peers." But as of the most recent 10-Q, Wells Fargo carried a total average loan balance of $833 billion, of which only 1.9%, or $15.4 billion, is related to the oil and gas industry. Even if default rates on oil and gas loans quintuple, there will be minimal impact on Wells Fargo's overall loan portfolio and credit quality.

On a more macro basis, I recently read a blog post comparing the size of the high-yield energy debt market to the total value of the U.S. bond and equities market, using data from the Bank of America Merrill Lynch bond database. The data show that even if the entire high-yield energy debt market defaults (an outlandishly unlikely scenario), it would only wipe out 0.6% of the value of the total U.S. bond market. Although this analysis is simple and neglects the impact on related equities and non-U.S. debt, it illustrates the fact that high-yield energy debt is a very small part of the total financial market, meaning that a contagion effect isn't highly likely.

2. Lower oil prices will hamper U.S. job growth.

After peaking at 10% in October 2009, the U.S. unemployment rate has been on a steady decline, and it now sits at a multi-year low of 5.8%. Low unemployment is good for an economy because it leads to higher production capacity, which in turn leads (along with increased labor productivity) to higher growth and economic development.

The fear here is that layoffs in the oil and gas industry might increase the unemployment rate and reverse favorable economic trends. While there will undoubtedly be layoffs in the energy sector, the effects are not likely to be severe.

According to the most recent data from the Bureau of Labor Statistics, all jobs directly related to the oil and gas industry represent just 0.7% of total U.S. non-farm employees. Even if job growth decelerates because of a retrenchment of investment in oil and gas exploration, the effect on the overall U.S. labor market will likely be small.

The *Pro* Bottom Line

As humans, our fear of loss often trumps the desire for gain. So it's only natural for us to jump to fearful conclusions when a new risk comes to light, such as the risk that the collapse in oil prices will lead to a financial crisis. But after examining the data, it appears that the fear of "oil-price shock" is less substantiated than the headlines suggest.

In addition to the two counterpoints I noted above, another intriguing aspect to the decline in oil prices is its potential to boost consumer spending — less money spent on gas means more disposable income for other things. And because personal consumer expenditures account for about 70% of U.S. GDP, if oil prices stay low, we may see newfound strength in consumer spending, stimulating higher GDP growth.

Fool on!

— Billy (TMFTailwind)

Pro Guidance Update

- **Oracle** (NYSE: ORCL): Our fair value estimate increases to $46 from $42. Shares remain a Buy First, with a recent 4.7% allocation. You can read our new update on recent earnings here.

Oracle Shines Again

Published Dec 29, 2014 at 11:28AM

Oracle (NYSE: ORCL) reported stronger-than-expected results on December 17 as its cloud software pipeline continues to turn into revenue. The company now has a $2-billion annual run-rate on cloud software, and that's "annually recurring revenue." It will continue to build on that. On-premise software and hardware also sold well.

Overall, Oracle is benefiting from its comprehensive software and platform suites, and from its highly focused, larger sales staff. Our fair value estimate increases to $46, targeting 10% annualized returns from there, and the stock remains a Buy First, at a current 4.7% allocation. See our full review on *Pro's* Oracle discussion board.

Stocks to Watch in 2015

Published Dec 29, 2014 at 9:00AM

Discover the three stocks Fools are watching in the new year.

{%video%}

Matt Argersinger: My stock to watch in 2015, it's got to be **SolarCity** (NASDAQ: SCTY), a company we've bought a couple times for our Odyssey 1 mission in *Supernova*. I just think they're at a point where they're seeing massive growth, but they're going to hit a million customers in a few years. With solar power now competitive, in most places, with traditional forms of electricity, it's going to be a huge ramp up for them.

Buck Hartzell: Stock to watch 2015 is **BofI** (NASDAQ: BOFI), Bank of the Internet. It's taking share from all of the big traditional bricks and mortar banks with retail branches, doing it online. They've had a phenomenal year, and the stock hasn't moved that much so I think it's going to have a good year next year.

Rana Pritanjali: I'll be watching energy sector, and the stock in particular would be **Seadrill** (NYSE: SDRL). Last year, because of the falling oil prices, energy sector has been just hammered. I think it has underperformed S&P 500 by 15%, and Seadrill is down more than 50% this year.

There's a lot of speculation going on whether they'll continue their current dividend payment. Right now, as you see, at the current price the yield is very high, so that's a stock I'm going to watch. *(Editor's note: Seadrill canceled its dividend after this video was filmed.)*

The company keeps on buying new rigs, and they are taking debt, and the CEO is pretty bullish on how the oil is going to go from here on out. I think the price of oil, the current price is not sustainable, so it's going to change. That's a company I'm going to watch for.

Outrageous Predictions for 2015

Published Dec 29, 2014 at 9:00AM

Four Foolish analysts take a stab at anticipating the investing stories that would surprise us in 2015.

{%video%}

Transcript

David Kretzmann: I'm going to say that **Apple** (NASDAQ: AAPL) is going to acquire **GoPro** (NASDAQ: GPRO) for $20 billion or more in 2015.

Buck Hartzell: My outrageous prediction for next year, 2015, is that **Berkshire Hathaway** (NYSE: BRK-B) and Warren Buffett will reload his elephant gun and actually acquire **Coca-Cola** (NYSE: KO). It would be about a $200 billion purchase, largest ever — probably in history — and he's got the cash and the capability and the borrowing power to do it, and I don't think he likes incumbent management. Untapped brand, and that will be his coup de grâce in his whole career, if he can acquire that venerable brand.

Brendan Matthews: This is a completely outrageous prediction. We've seen a big bubble in marijuana penny stocks, fraudulent companies that are capitalizing on the hype. I think that's actually going to continue, because I think President Obama is going to be the most prominent politician that's ever spoken out in favor of legalized marijuana. He is in his lame-duck years. He just lost the Senate. I think he's thinking about his legacy, and he wants to be on the right side of this issue.

Jason Moser: I think that this is the year that Warren Buffett will actually give us full clarity into his succession plans for Berkshire Hathaway, when he decides to step down. We have a lot of clarity thus far on the investing side, with Ted Weschler and Todd Combs, but we don't know as much about the executive positions and who's going to be the CEO of the company. He keeps that under wraps for now. I think that 2015 is the year where we get total clarity, and I don't think the market will freak out about it.

Gilead and Caesars Shake It Up

Published Dec 22, 2014 at 3:44PM

Dear *Pro* member:

The stock market rarely takes a holiday. I was going to use today's Memo to remind everyone that we should expect more volatility in coming years than we've seen the past few years — and that's not a bad thing. You just need to remain calm through it, and view sudden shifts as moments of opportunity. We didn't need to wait long, though, as today presented large moves in two of our positions.

For those rushing to wrap gifts and get to family gatherings, my takeaway is that our reasonable allocations helped the portfolio glide through today, and we need to keep managing our position sizing in 2015, too. That's half the battle. Meanwhile, our guidance on the two companies in the spotlight today remains unchanged. Now, let's discuss the stock-specific news.

Gilead Gets the Cold Shoulder

The landscape for pharmaceutical sellers may have begun to change today — and that includes Buy First stock **Gilead Sciences** (NASDAQ: GILD). **Express Scripts** (NASDAQ: ESRX), the country's largest pharmacy-benefits manager, will offer **AbbVie**'s (NYSE: ABBV) new hepatitis C drug for patients with the most common form of the illness — but not Gilead's drug nor other competing drugs. Why? Express Scripts signed an exclusive deal because AbbVie gave it pricing concessions.

This controversial move by Express Scripts blocks customers from accessing Gilead's arguably better treatment (it has fewer side effects, and requires only one pill a day instead of four to five). Express Scripts handled approximately 30% of all drug prescriptions across the U.S. last year, and now in a bid to lower costs, its CEO is promising to push drugmakers into pricing concessions — or be locked out. Even AbbVie fell on today's news, because it suggests that drugmakers are losing some of their power.

The takeaway for Gilead: There's no doubt that being largely shut out of the largest pharmacy-benefits manager in the country will affect Gilead's hepatitis C earnings. The question is to what magnitude. The AbbVie deal pertains only to the type 1 genotype of hepatitis C, which accounts for about two-thirds of cases. Express Scripts will still offer Gilead's drugs to cover other genotypes. So, that's two-thirds of Express Script's hepatitis C cases not being offered to Gilead, on approximately one-third of the U.S. population that's under Express Scripts.

That's obviously large, but more concerning is whether other benefits managers will try to go the same route as Express Scripts, forcing Gilead to lower prices in the process, or lose market share. Our valuation on Gilead is conservative enough that we believe it will fulfill our return objective over the coming years even now. But the odds of the stock nicely *exceeding* our goals are lower now, and risks are higher than before. If Gilead loses favor with other major pharmacy-benefit managers, our thesis will be challenged. For now, though, we believe it can weather this setback and still offer us handsome returns.

But it's not the last word: Controversy may also cause Express Scripts to backtrack eventually. Not allowing patients a better drug just due to (perhaps small) cost differences may not be good business. AbbVie's hepatitis C treatment costs $83,300 for 12 weeks, before the undisclosed concession that it granted Express Scripts (which we estimate could be as low as $60,000). But let's remember what Gilead said last quarter:

> We [Gilead] received FDA approval for Harvoni, a simple, safe and highly effective oral single-tablet regimen for hepatitis C. The 12-week regimen price for Harvoni is $94,500, which is in line with the regimen cost of the previous standard of care... We expect over time that up to half of genotype 1 patients may benefit from just eight weeks of therapy, meaning that the cost will be reduced by one-third for many patients.

That would bring Gilead's Harvoni treatment down to $62,370 for many patients, or perhaps about the same as AbbVie's, but with a better, easier treatment.

Express Scripts' CEO has long stated his anger about drug costs, and vows to take his fight to other major drug categories, too. But is he losing sight of patients and the big picture?

Still, in the immediate future, the U.S. is Gilead's most important market, and today's news could reduce by nearly a third its new hepatitis C sales in this country. The stock's reasonable valuation should limit our downside risk and still leave us with good profits over the coming years, but shares will face headwinds until there's more clarity regarding how much sales are affected by today's deal, and the possibility that other battles ensue.

Gilead lately trades at 9.2 times expected earnings in 2015, and consensus earnings growth was estimated at a relatively modest (for Gilead right now) 27%. We ourselves were modeling much closer to 20%. The company's growth could still be in that ballpark as its hepatitis C sales expand in Europe, Japan, and of course keep taking root in America. It remains a Buy First, although it's suffering a setback today, and has more uncertainty now in 2015.

Caesars Keeps Shuffling

Making today doubly interesting, **Caesars Entertainment** (NASDAQ: CZR) announced it would merge with **Caesars Acquisition Company** (NASDAQ: CACQ) in an all-stock deal. Caesars Acquisition was created in 2013, but already it's being acquired by its original parent company, which apparently has more arms than an octopus. CACQ has equity and debt investments in the gaming industry, including four casino properties that used to be held by the parent company, as well as online gaming ventures. It's those final two parts that interest Wall Street, who cheered the acquisition because it brings online gaming back to the fold at the parent company, along with four stronger casinos.

The excitement seems overstated, though, given the lack of financial strength at CACQ. At the same time, Caesars itself is technically in default, and has reportedly only reached a voluntary restructuring agreement with a few of its many debt holders. As long as the others stand firm and continue to sue, the company may face an involuntary bankruptcy in 2015 — depending on how courts rule.

One media source describes today's news as the company continuing to shuffle chairs on the deck of the *Titanic*. We won't be so bold as to say that. We know Caesars could still avoid the iceberg and roll over our short position instead. But our position is small enough that we'll be able to ride through that outcome, should it occur. We'll close the position if Caesars can pull off a restructuring that greatly lowers it debt, but we believe the odds still favor an outcome that gives control to those who actually deserve it: The first-lien bond holders (not the equity owners). An outcome should arrive in 2015. The stock remains a Sell Short right now for brave investors who keep the position small.

In Other News ...

Elsewhere in the portfolio, our largest position, **AmTrust Financial Services** (NASDAQ: AFSI), remains under fire from a small hedge fund that has a giant bearish spread on the stock. Alistar Capital needs the stock to fall very sharply to avoid a 100% loss on its massive option position. As you've seen, we take Alistar's attacks seriously, address them as they appear, and hope to meet with AmTrust early in the New Year. AmTrust is suing Alistar for defamation, among other things.

Our Portfolio Should Thrive Over the Years

Overall, today was an inauspicious day in *Pro*. One of our core investments was among the biggest losers on Wall Street, and one of our shorts was among the biggest winners. But we've had a good year, and over the past six years, *Pro*'s portfolio has outperformed the vast majority of all hedge funds and mutual funds. Days like this just happen. They're a reminder that nobody is infallible, and that we have to always work to keep our portfolio in the shape we want it. Only a sensible portfolio allows us to take days like this in relative stride.

Enjoy the holidays! We look forward to a Foolish 2015 investing with you!

— Jeff (TMFFischer)

Pro Catch-Up Trades

- **American Tower** (NYSE: AMT): Buy to open January 2017 $80 calls, in a 0.5% cash allocation, per last week's recommendation. Lately, you would use a limit order at $24.85 to split the bid/ask spread. Our total stock and option position in this business is now 4.3%.
- **Gilead Sciences** (NASDAQ: GILD): Shares remain a Buy First at a 3.7% allocation, even as competitive news rocks the price today. Through risks are higher now, we believe that over our time frame (a rolling three years) owners will still be rewarded.
- **SPDR S&P 500 ETF** (NYSEMKT: SPY): As a hedge, set up a put ratio spread as recommended. With SPY higher today, now the original spread can be set up for about a $0.05 or so debit (rather than a small credit), but it is still a menial cost. Please see the trade alert for allocation and other details, and for a link to the board for questions.

Pro Completed Trades

- **American Tower** (NYSE: AMT): We bought six January 2017 $80 calls at $23.35 each, for a 0.5% (cash basis) allocation, bringing our total exposure to this company (on a cash basis) up to 4.3%, per our recommendation.
- **SPDR S&P 500** (NYSEMKT: SPY) **ETF:** We sold to open twenty-four March 31, 2015 $182 puts, and bought to open twelve March 31, 2015 $195 puts, setting up a put ratio spread as a 10% look-through allocation hedge, per our recommendation. We received a $0.43 net credit to set this up.

Pro Catch-Up Trades: Dec. 22, 2014

Published Dec 22, 2014 at 2:12PM

Catch-Up Trades are timely ideas to catch up on a Pro *portfolio position you may be lacking, or on trades where price guidance was due for an update.*

- **American Tower** (NYSE: AMT): Buy to open January 2017 $80 calls, in a 0.5% cash allocation, per last week's recommendation. Lately, you would use a limit order at $24.85 to split the bid/ask spread. Our total stock and option position in this business is now 4.3%.
- **Gilead Sciences** (NASDAQ: GILD): Shares remain a Buy First at a 3.7% allocation, even as competitive news rocks the price today. Through risks are higher now, we believe that over our time frame (a rolling three years) owners will still be rewarded.
- **SPDR S&P 500 ETF** (NYSEMKT: SPY): As a hedge, set up a put ratio spread as recommended. With SPY higher today, now the original spread can be set up for about a $0.05 or so debit (rather than a small credit), but it is still a menial cost. Please see the trade alert for allocation and other details, and for a link to the board for questions.

Pro Completed Trades: Dec. 22, 2014

Published Dec 22, 2014 at 1:36PM

Pro's recent completed trades:

- **American Tower** (NYSE: AMT): We bought six January 2017 $80 calls at $23.35 each, for a 0.5% (cash basis) allocation, bringing our total exposure to this company (on a cash basis) up to 4.3%, per our recommendation.
- **SPDR S&P 500** (NYSEMKT: SPY) **ETF:** We sold to open twenty-four March 31, 2015 $182 puts, and bought to open twelve March 31, 2015 $195 puts, setting up a put ratio spread as a 10% look-through allocation hedge, per our recommendation. We received a $0.43 net credit to set this up.

The Best CEOs of 2014

Published Dec 22, 2014 at 9:00AM

Watch this video and discover which CEOs rank among the best for 2014.

{%video%}

Jason Moser: We go back to February, with the Olympics and Sochi speed skate suitgate. You remember that, the big issue with the U.S. speed skate team? There were some problems, I guess, with the way the suits ... there was a perception there that the suits were not working very well. It turned out really it wasn't the suits, it was their training regimen. Kevin Plank is getting my call for CEO of the year, the way he handled that with total equanimity. He was not pointing fingers or making accusations, but being very proactive to the solution. It all ended up with the U.S. speed skate team renewing their deal with **Under Armour** (NYSE: UA) to supply uniforms for future events.

John Rotonti: The best CEO of 2014 was Warren Buffett. I think three different times in 2014 he acquired businesses by swapping stock from **Berkshire**'s (NYSE: BRK-A) (NYSE: BRK-B) portfolio that had huge unrealized gains, which saved Berkshire shareholders billions of dollars in taxes, and he's giving more and more responsibilities to Todd and Ted, to help plan for his eventual retirement.

Sara Hov: In 2014, **Williams-Sonoma** (NYSE: WSM) has just had really great success, even though the overall retail landscape has been extremely hard. I think CEO Laura Albert is a big part of that. She's kept the company focused on doing the right things to not only increase overall sales, but also just really kill it in the direct-to-consumer sales, which are now 51% of total revenue.

The Biggest Winners of 2014

Published Dec 22, 2014 at 9:00AM

Watch the video and discover which companies had an excellent year.

{%video%}

Brendan Matthews: The company I think had the best year in 2014 was **GoPro** (NASDAQ: GPRO). The stock is up 129%, successful IPO, $9 billion valuation — but really, the product is amazing. I've owned 20 cameras in my life, and this is the best one I've ever had. It's not even the camera, it's the stuff that people have done with it. You can go on YouTube and watch a fireman saving a kitten. It's amazing, and it's a company that's sold over a million units in the last quarter alone. I'm very impressed by GoPro.

Matt Argersinger: I'm going to go with **Keurig Green Mountain** (NASDAQ: GMCR). I think it's still, at this point, the No. 1 performer in the S&P 500 this year, totally surprised everyone. Everyone left the whole Keurig single-serve coffee machine for dead a few years ago, but it's actually become now, I think, the huge platform for single-serve coffee and potentially other drinks, so Keurig Green Mountain — awesome 2014.

John Rotonti: I think the company that had the best year in 2014 was **Apple** (NASDAQ: AAPL). I think the stock was up 48% for the year, and I think the market is giving the company credit for being more than just a hardware company now, but also an aspirational brand, which gives them pricing power, and a great software company as well. Then Apple also has a ton of optionality because of the $150 billion of cash on the balance sheet.

Sophia Lee: I think the company that had a great year in 2014 was **Ambarella**, AMBA (NASDAQ: AMBA). They supply camera chips for tech products like GoPro, security cameras, and wearable technologies. I think going forward they are riding this enormous trend in robotics and wearable technologies. Their competitive positioning is also helping their 120% growth this past year.

Sara Hov: Activision Blizzard (NASDAQ: ATVI) killed it this year. Their traditional games that they're known for are continuing to gain members, like *World of Warcraft*, and their new releases have just blown expectations out of the water. It's been a great year for them.

The Best Way to Invest in America's Future

Published Dec 17, 2014 at 3:55PM

Baby Aiden

Andrea was just 22, and had only been dating Eric for a few months when she learned she was pregnant. Andrea and Eric felt overwhelmed by the news. They desperately needed help.

Fortunately, Andrea enrolled in the national Nurse-Family Partnership® program, which provides nurse home-visits to low-income, first-time mothers. Andrea's nurse was able to answer questions about her pregnancy, and later, after her son Aiden was born, offered guidance on the baby's health and development.

Despite being young and woefully unprepared, Andrea and Eric eventually became successful parents. Andrea notes that "there isn't a class in school that tells you how to raise a kid" and believes that Nurse-Family Partnership is "like an instruction book that gives you the knowledge and positive encouragement to raise a baby." Aiden is now a thriving 11-year-old, and a big brother to his baby sister Briella, sister Autumn, and brother Cody.

By working with young, first-time moms, Nurse-Family Partnership is able to truly change lives – for generations to come. That's why The Motley Fool is proud to announce its collaboration with Nurse-Family Partnership for our 2014 Foolanthropy campaign. Click here to invest your tax-deductible contribution before 2014 ends, or keep reading to learn more about this outstanding evidence-based community health program.

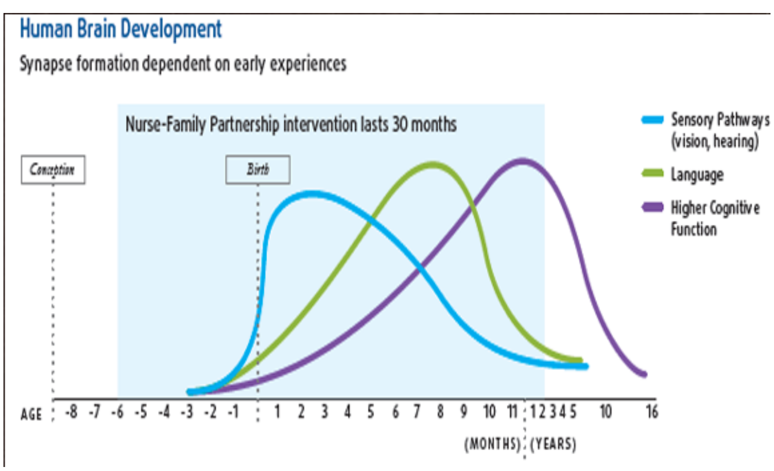
How Nurse-Family Partnership Changes Lives

The Nurse-Family Partnership program provides nurse home visits to first-time, low-income expecting mothers, most of whom are teenagers and unmarried. Beginning in pregnancy, the young woman is supported by a registered nurse who provides her with home visits to help her have a healthy pregnancy. After birth, the home visits continue until her child's second birthday. The organization focuses on new moms because a first pregnancy provides the best opportunity to promote and teach positive health and development behaviors between a mother and her baby.

Since the program began in 1996, 206,412 families have been served. Currently, 30,309 families are enrolled in the Nurse-Family Partnership in 43 states, the U.S. Virgin Islands, and six Tribal communities.

The program is based on the innovative work of David Olds, Ph.D., professor of pediatrics, psychiatry, and preventive medicine at the University of Colorado Denver. Olds passionately believes that early childhood development is crucial to success later in life. This belief led him to create a nurse home visitation program for vulnerable moms and their children.

Infancy is a critical time for child development. The level of support an infant receives early on has a major lasting impact on the child's emotional, educational, and social progress throughout life. According to Olds, "Terrible things can be prevented and good things can be made to happen with the involvement of nurses with these families early in their lives."



Source: Nelson, C.A., In Neurons to Neighborhoods (2000). Shankoff, J. & Phillips, D. (Eds.)

Nurse-Family Partnership helps poor first-time mothers during that critical first two-year window of opportunity for babies by sending nurses to teach mothers good health practices, and how to provide responsible child care, plan their economic future, and find work.

The evidence is clear that providing mothers with high-quality medical and emotional support from experienced nurses is an effective way to promote positive results during a critical phase in children's lives.

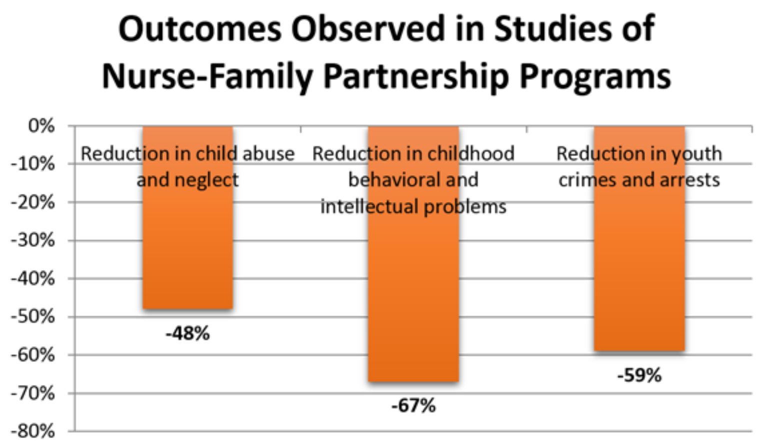
Investing in early childhood development could be the best investment we can make in America's future, and Nurse-Family Partnership is one of the best programs out there.

The remarkable story of Dr. Olds and his innovative idea is featured in the best-seller *A Path Appears: Transforming Lives, Creating Opportunities*, written by Pulitzer Prize winners Nicholas Kristof and Sheryl WuDunn. The authors write that Nurse-Family Partnership is "one of the most vigorously backed antipoverty programs in America, one that pays for itself several times over in reduced costs later on." Indeed, the RAND Corporation found that local communities can see up to a $5.70 return for every dollar they invest in the program.

One of the Best Antipoverty Programs in America

Here are just a few of the impressive benefits that have been observed in randomized, controlled trials among families participating in Nurse-Family Partnership:

- **48% reduction in child abuse and neglect:** The support and knowledge of nurses help mothers and children avoid the worst outcomes.
- **67% reduction in childhood behavioral and intellectual problems at age 6:** Better parenting leads to improved behavioral, emotional, and educational development for children.
- **59% reduction in youth crimes and arrests at age 15:** A healthy foundation in childhood helps to set children on the right path for later in life.



In addition, a study by Ted Miller, Ph.D., with the Pacific Institute for Research and Evaluation predicts that when Nurse-Family Partnership is brought to scale, it can achieve a 60% reduction in infant mortality and a 53% reduction in alcohol, tobacco and marijuana use for children ages 12 through 15.

Studies also indicate the program has other positive benefits for families and even saves more money than it costs by reducing the government's welfare, juvenile crime, and other expenses.

- **82% increase in months employed for mothers:** In addition to teaching parenting skills, nurses help poor mothers plan their economic future and find work so they can get on their own feet.
- **20% reduction in months on welfare**
- **68% increase in father's presence in household:** Families that have access to Nurse-Family Partnership show greater stability in other areas, as well.

It's Up to Us, Fools

We couldn't be more impressed with the program's effectiveness at helping mothers who want to raise their babies well and just need knowledge and support.

Right now, there's a huge opportunity to help Nurse-Family Partnership expand. Currently, Nurse-Family Partnership only reaches 2%-3% of eligible families.

During last year's Foolanthropy drive, our members raised $113,000 to build schools in Guatemala, absolutely shattering our $50,000 goal.

This year, we're aiming to raise $75,000 for the 2014 Nurse-Family Partnership Foolanthropy campaign with the help of the Fool community. This investment will help expand nurse visits to even more communities around America.

The Fool has made a $5,000 initial contribution, will match up to $5,000 in employee contributions, and will donate an additional $2,500 if we as a Foolish community reach our stretch goal of $100,000.

So now's your chance to chip in with us alongside the many Fools who are helping to make sure that every child gets the very best possible start in life. (Remember to claim your 2014 tax deduction if you contribute before the year-end deadline.)

Buy Calls on American Tower

Published Dec 17, 2014 at 1:26PM

Is this for you? *Pro* is targeting long-term upside by buying LEAPS on **American Tower** (NYSE: AMT), seeking leveraged returns if the stock appreciates by 2017. If you're following our portfolio closely, you should do the same.

How You Participate

- **Action:** Buy ("buy to open") January 2017 $80 calls on American Tower. (As a reminder, these calls will appreciate with the stock; they give you the right to buy the shares for $80 any time before expiration if you so choose. Need a refresher on when and why we buy calls? Click here.)
- **Allocation:** Invest approximately 0.5% of your *Pro* funds. At recent prices, this most closely equates to buying one call for about every $400,000 you manage; for *Pro*, that's about 6 contracts. This is a small position by design, so be careful not to over-allocate. We already own 3.8% in the stock. *Pro* members with smaller portfolios should see the Alternative Trades section below.
- **Price Guidance:** This option is not very liquid, so **it is critical that you use a limit order**, aiming to split the bid/ask spread. At current prices, ideally you'd pay about $20.50 or less per contract, but if the stock price rises, you'll need to pay more.
- **Recent Option Price (bid/ask):** $19.40/$21.10
- **Recent Share Price:** $96

What We're Thinking

Stock Info

- **Fair-Value Estimate:** $110
- **Scorecard Status:** Buy First

Pro members who have been following our American Tower position since the original buy report know that we view the stock — and the investment — favorably. Since our purchase at about $84 per share in May 2013, we've written and rolled a series of puts to try to add to our position, earning income along the way. Earlier this year, we added to our position outright, raising its allocation and making the company a more meaningful contributor to our results. Now, with the stock hovering near $96 per share at a 3.8% allocation, we've earned a North Star-beating annualized return of more than 13% when including all dividends and put proceeds. With today's call purchase, we're hoping to capitalize on additional upside.

The company has progressed against our investment thesis wonderfully since we first recommended purchasing the stock. In our original recommendation, we expected exponential growth in worldwide mobile data consumption to lead to strong revenue growth over the subsequent five years through a combination of price escalations, acquisitions, upgrades, and international investment. The company is ahead of pace to achieve our expectations; here's how some of American Tower's key metrics have changed since May 2013:

	May 2013	Now	% change
# of Towers	55,966	69,912	25%
TTM Rental Revenue	$2.9 billion	$3.9 billion	35%
Revenue Per Tower	$51,781	$55,813	8%

What's impressive about American Tower's growth is that newly acquired assets typically have a lower tenancy ratio (and thus lower revenue and margins) than assets that have been in the portfolio for several years. Yet even as the company has expanded its tower portfolio by 25%, revenue per tower has still gone up by 8%, demonstrating strong organic growth from increasing mobile data consumption and significant network investments from wireless carriers.

And the company is certainly not done growing – American Tower has made three large-scale acquisitions since June of this year, all international, and one of them in a brand-new country (Nigeria). These acquisitions will add about 16,000 towers to American Tower's portfolio, none of which are accounted for in the above table.

Because these acquisitions will likely stretch American Tower beyond its target leverage range of 3 to 5 times net debt/EBITDA, I suspect management will dial back on big acquisition spending over the next few quarters and will focus mostly on integrating the new assets and using cash flow from the business to pay down debt.
