At *Pro*, we would love to invest in emerging-market small caps if it were easily accomplished and we could diversify. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS).

This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields about 3.5%). For *Pro*, it offers exposure to 521 of the most promising business we've never heard of.

This ETF gives us an excellent way to invest in unfamiliar companies in locations where we don't have a discernible edge — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The risk-reducing benefits of investing outside our home market are equally important.

How It's Doing

It’s no surprise that small-cap companies (even dividend-paying ones) in emerging markets can be volatile. We expect DGS itself to continue to experience higher-than-average volatility, even though the diversification it brings to our holdings will likely lower the portfolio’s volatility overall.

More Resources

- *Pro*’s original recommendation (11/22/10)
- Talk about DGS on our discussion board

We’d always prefer to own great businesses over great ETFs, so this holding has a permanent spot on our short list of positions we’d sell if we needed cash or found a higher-conviction alternative. In the meantime, for a reasonable 0.64% expense ratio, we get a basket of businesses with a history of exceptional performance, weighted by the size of their annual cash dividend. The fund’s heavy weighting toward financials (23%), industrials (16%), and the consumer discretionary sector (14%) leaves it well positioned to benefit from an economic recovery if and when one comes along.

What We Expect

This is a top-notch fund, and you don’t have to take our word for it; Morningstar has bestowed its coveted five-star rating on DGS. It’s also made Morningstar’s list of the top eight funds in its category in each of the past three years, and it’s ranked No. 2 when considering five-year performance. We expect these impressive long-term results to continue. In the meantime, the watchword with small-caps, emerging markets, and this ETF is: patience.

The *Pro* Bottom Line

Once you’ve purchased our most recent buys, and the Buy First and Buy stocks in this report, you will be on your way to building your *Pro* portfolio with us! If you want to start slowly and average in, that is a Foolish approach, too. Some members buy positions in halves, or thirds, over several months. Just be sure, over time, to at least approximate our allocation guidance, since that’s key to our portfolio approach. In the coming weeks and months, we will also lead you into *Pro* shorts and options (for members using those strategies with us) with real-time opportunities. Just watch your inbox for trade guidance.

Welcome again to *Pro*! We’ll enjoy investing with you. Fool on!

— Jeff Fischer, advisor

RockyTopBob's Guide to Pro

Published Nov 18, 2013 at 4:00PM

For just the second time this year, we're welcoming new members to Pro *— and we're very pleased to be able to do so by sharing the perspective of a seasoned* Pro *member, RockyTopBob. Bob starred in a column over the summer that we thought was so good, it's worth passing along a second time. Today, we — and Bob — happily welcome all of our new* Pro *Fools! Enjoy ... — Jeff Fischer*

Fellow Fools,

At certain Metro stations in downtown Washington, D.C., just over the river from Fool HQ, there are "ambassadors" who hand maps to tourists as they step off the escalators. Those maps will help you find the Smithsonian museums, the local brewpubs, and Ripley's Believe It or Not — all of which are absolutely worth seeing. But if you want to know where to find a great cheap burger, small music venue, or low-key karaoke joint, your best bet is to ask a local. (For the record, our nominations for all three in D.C. are at the end of this Memo.)

Pro isn't exactly like D.C.; we weren't designed by Pierre L'Enfant, and we proudly answer to exactly zero lobbyists. But we opened our doors to new members for two days last week, and we think that — like the nation's capital — we're best explained to first-time visitors by a longtime resident. Nobody fits that bill better than RockyTopBob, the community-chosen winner of our inaugural *Pro* Polaris Award. A Fool since 2005, Bob joined *Pro* in January 2011, and he's distinguished himself time and again with his honest, thoughtful, endlessly helpful answers to other members' questions on our discussion boards.

We thought his insights deserved a broader platform, so in today's Memo, we've asked Bob to share his tips for putting your *Pro* membership to best use. We hope they'll serve as an insider's guide for new members and veterans alike.

Without further ado, a Q-and-A with RockyTopBob:

***Pro*: What are the first three places on the *Pro* website to which you would point a newcomer?**

RockyTopBob: No. 1, obviously, is the wonderful Guidebook tab, and I would recommend reading every link under the "Site Directory" tab (starting with "Meet the Team"). No. 2 is the Community tab, with a quick run-though of the available boards, followed by a post to the Meet & Greet board to introduce yourself. No. 3 would be the Recommendations tab, to review the *Pro* positions, namely Buy Firsts and Buys, and What We Think Now.

***Pro*: What are the first few pieces of advice you'd give to someone upon joining *Pro*?**

RockyTopBob:

1. Don't be in a hurry to trade anything.
2. Learn the ropes first by getting acquainted with the site's contents and *Pro*'s philosophy.
3. Read the Broker Data link in the Guidebook to determine if you are with the best one for you, and then set up your options missions.
4. Participate on the discussion boards to learn about the team and members and take advantage of all the information available there.
5. Pay attention to the Portfolio Building Reports and ask questions on the discussion boards if you don't understand the trades or the reason behind the position [click the "heart" above any board to make it a favorite, making it easy to return to].

***Pro*: What's the best advice you'd give to someone unsure if *Pro* is a fit for them?**

RockyTopBob: Post your concerns to the boards and ask other members what makes *Pro* a fit for them.

***Pro*: You are a past and present member of several TMF services — what do you think distinguishes *Pro* from other Fool offerings?**

RockyTopBob: The investment options, which go above and beyond long stocks, and the quality of the *Pro* team, especially their communication with members and willingness to answer all questions. A managed portfolio is a great advantage over a suggestions service.

RTB: The FAQ

Tennessee resident **RockyTopBob** spent his career in the space program, retiring early at 61 "because of some very good investment results." He's been investing for more than 40 years and loves everything about stocks, owning more than 200. He was born and raised in Chicago and still likes the Cubs! He and his wife and have two rescued golden retrievers and three ex-show Maine Coon cats.

To read more about the Polaris Award and Bob's formidable competition, click here. And finally, our favorite things in D.C.:

- Burger: BGR the Burger Joint / Elevation Burger (tie)
- Small music venue: Rock & Roll Hotel
- Hole-in-the-wall karaoke joint: Rock It Grill, Alexandria, Va. (reports of Fools being sighted there regularly are neither confirmed nor denied)

Whether you've just signed up or you've been with us since the beginning, thanks for being part of *Motley Fool Pro*. And thank you to RockyTopBob!

Best,

Ellen (TMFKabellen), *Pro* editor, and Jeff (TMFFischer), advisor

Pro Guidance Changes

- **American Tower** (NYSE: AMT) and **O'Reilly Automotive** (NASDAQ: ORLY): Both move to Buy First.
- **MasterCard** (NYSE: MA): Fair value and consider adding more both increased. MasterCard remains a Buy.
- **Medtronic** (NYSE: MDT): Shares move to Hold while we assess the stock (and other opportunities) after a strong advance. Get the full scoop.

Completed *Pro* Trades

- **SPDR S&P 500** (NYSEMKT: SPY) ETF: We bought to close all 11 of our November 2013 $170 calls, ending the short.

Pro November Expirations

- **American Tower** (NYSE: AMT): Our $72.50 puts expired as full income. We're eyeing new trades.
- **Tupperware** (NYSE: TUP): Our $85 puts expired as full income; we're eyeing new trades.
- **OpenText** (NASDAQ: OTEX): Our $65 puts expired as full income. We're... you know. Watch your inbox!
- **SPDR S&P 500** (NYSEMKT: SPY) ETF: Our long $164 puts expired without value.
- **iShares Russell 2000** (NYSEMKT: IWM) ETF: Our put ratio spread expired unneeded. We're considering new market hedges.

Buy to Close Your Written Calls on SPY

Published Nov 13, 2013 at 3:30PM

Guidance Essentials

- **Action:** Prior to the closing bell on Friday, buy ("buy to close") all previously written November 2013 $170 calls on the **SPDR S&P 500** (NYSE: SPY) ETF. *Pro* is closing all 11 contracts. (If you have SPY puts, you can just let them expire. They have no value.)
- **Price Guidance:** You may close these liquid call options at the going price when you place your order.
- **Recent Share Price:** $177.60
- **Call Price (bid/ask):** $7.60/$7.70 (this isn't price guidance — it's just a quote; close at the going price to end your position)
- **Alternative Trades:**
  - **Did you just buy puts or set up a bear spread?**They're expiring without value.
  - **Are you short SPY directly?** To follow *Pro*, you would close your short now. If you'd rather remain hedged, SPY remains a good direct market hedge.

What's New?

The government shutdown has not seemed to dent most corporate earnings or fourth quarter guidance, and although the government may shut down again in early 2014, the near-term catalyst for our hedge no longer exists. We purposely set up this position to expire in just over one month, giving us the opportunity to reassess and then "start over" as we deem appropriate. As the environment keeps changing, that's exactly what we'll do.

Rather than roll our short call options to a later date (which wouldn't give us much of a hedge unless we also bought new puts), or let these written calls turn into a direct short of the ETF, we're going to close them and reassess with a clear slate. We're already considering other hedges, on SPY again or on other vehicles, and we will issue a trade alert once a decision is made. This hedge – as with so many hedges – proved unnecessary, but our portfolio is up considerably since we set it up.

Next Step

- If you have questions about buying to close your November 2013 $170 calls, or anything related to this position, please visit the SPDR S&P 500 board.

Portfolio Building Reports for New Members

Published Nov 13, 2013 at 11:18AM

Building Your *Pro* Portfolio

To help you get started with a few positions at a time as you build up funds, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new *Pro* portfolio.

If you want to dive into our full set of holdings, you can see all our active positions, with Buy First, Buy, and Hold ratings, along with our latest opinions, in What We Think Now. Use this alongside our portfolio page's Recommended Allocation to help build your portfolio.

We recommend that you invest along with the reports in the order in which they are released, as they will contain our latest guidance and thinking on every stock in the *Pro* portfolio, and will make it a snap to match your portfolio to *Pro*'s.

Pro's Most Recent Buys: November 2013

Published Nov 12, 2013 at 6:01PM

Dear *Pro* Member,

Pro is a premier service at The Motley Fool not only because it's a portfolio service that incorporates options, shorts, and hedges alongside core stock investments — but because it is a full portfolio solution, period.

Thought goes into each part of the portfolio, the allocation we give to every position, and how the positions all work together. This means that every addition to the portfolio, including our most recent, serves a specific purpose. The following report outlines *Pro*'s five most recent stock purchases. These investments are our newest "core holdings" that we believe every *Pro* member should own; we believe they'll bring very healthy returns over the coming years.

Welcome to *Pro*!
— Jeff Fischer, Advisor

Getting Started With *Motley Fool Pro* | **American International Group** (NYSE: AIG) | **American Tower** (NYSE: AMT)
O'Reilly Automotive (NASDAQ: ORLY) | **TD Ameritrade** (NYSE: AMTD) | **Valmont Industries** (NYSE: VMI)

Download this report as a PDF

Getting Started With *Motley Fool Pro*

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that generates winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* Fit You.** We know not all investors are in the same situation! Our "Make *Pro* Fit You" PDF will help you figure out how to buy the Pro investments given your personal situation, including investing in an IRA or coming to Pro already fully invested.
3. **Catch up with our portfolio at your own pace.** Start with our most recent buys, delineated in this report. Then move on to the rest of our Buy and Buy First stocks in our Portfolio Building Report (hitting your inbox Nov. 20). You can always see our latest take on all of our positions on our What We Think Now page. As you explore our recommendations, it's important to remember that a stock's "scorecard status" (Buy First, Buy, or Hold) is the best indicator of how we feel about it. If a stock is listed as a Buy or Buy First on the What We Think Now page, that means we think you can buy it today.

Buy First: American Int'l Group (NYSE: AIG)

Time and even average performance should heal the company's wounds.

Suggested Allocation: 3.8% stock, 0.6% warrants

Today's **American International Group** (NYSE: AIG) is not the same company that disgraced itself so profoundly in 2008. AIG has divested itself of whole business units since the financial crisis, managing to eliminate almost all of its previous exposure to the nasty derivatives that nearly brought down the economy. Left behind are two steadfast and improving insurance businesses and an aircraft leasing company, and AIG plans to rid itself of the leasing business, too.

What It Does

Insurance is a business of collecting premiums, investing the float, and paying out claims — and AIG is getting ever better at it. Improved underwriting is showing up in a lower loss ratio, which in turn is driving a lower adjusted accident-year combined ratio. All that is a fancy way of saying that we're seeing underwriting profits for the first time since Q3 2010.

AIG's insurance offerings consist of two divisions: property and casualty, and life and retirement. The former provides casualty, property, financial, and specialty insurance (think aerospace) to commercial clients and consumers, typically through brokers. The life and retirement division offers domestic life insurance and retirement products (annuities, mutual funds, financial planning) through a diverse network of financial-services companies, brokers, agents, and advisors. Overall, AIG is writing fewer premiums at better prices than it was in past years, which is a great indication of underwriting discipline and a hardening market.

How It's Working

When we recommended buying AIG stock and warrants in August 2012, we were confident in the momentum of the company's turnaround, but we underestimated the rapid rate at which our thesis would unfold. In late 2012 (after our recommendation), the U.S. Treasury sold another $26.5 billion worth of its AIG shares. Management wisely used the opportunity to purchase billions of dollars' worth of stock at about half book value; that, of course, further increased book value in a virtuous cycle. Management continues to repurchase shares and has even instituted a dividend for the past two quarters.

- Schwab: AIG/WS
- TD Ameritrade: AIG+
- Vanguard: AIG_t

Helpful Links

- AIG's explanation of the warrants
- AIG's warrant registration statement filed with the SEC

What We Expect

Underwriting discipline will continue to drive increased earnings and a higher valuation. That plus a renewed focus on capital management will improve AIG's credit rating, reducing its cost of debt and providing another lever for higher profitability. Management is still ridding the company of non-core assets, including the aircraft leasing business mentioned above. We expect CEO Bob Benmosche to stay laser-focused on capital allocation, repurchasing shares so long as AIG continues to trade meaningfully below book value and maintaining or increasing the quarterly dividend if business performance supports it.

The *Pro* Bottom Line

We recommend buying 3.8% of AIG stock and 0.6% of AIG warrants (see below for more on those). Benmosche has cleaned out the business, so by purchasing now, you get in after all the hard work has been done. Book value — the best measure of an insurance company's worth — is steadily growing. And AIG's current share price is just over 0.7 times book value. That's cheap, especially given the company's momentum. Investors who buy AIG now are positioning themselves for outsized future returns with less risk: contrarian investing at its best.

A Note on Warrants

Warrants are similar to call options, except that they are issued by the underlying company. They offer the purchaser the right (but not the obligation) to buy the stock in question at the specified price. The warrants we're recommending on AIG are valid for 10 years from the date of issue (Jan. 19, 2011), and they can be exercised at any point before they expire on Jan. 19, 2021. When exercised, they allow the holder of the warrant to buy shares of AIG at $45 per share, regardless of the market price.

That $45 strike price adjusts favorably in the event of dilution or annual cash dividends greater than $0.675 per share (which would also lower the share price). Warrants are illiquid, and Goldman Sachs is the designated market maker for them; when you buy them, be sure to use a limit order so Goldman doesn't get more than a fair price.

Be aware that if our investment in AIG works out, those who own warrants will earn leveraged returns on them. But it's possible that the warrants could end up as a total loss if AIG's stock price is below the $45 strike price at expiration (even though they're currently in-the-money by a few bucks).

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 2.5%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Internet traffic from mobile devices in 2012 was nearly 12 times total Internet traffic in 2000, and the average connection speed of a mobile device doubled from 2011 to 2012. Communications site operator **American Tower** (NYSE: AMT) is well positioned to benefit from both trends.

What It Does

AMT leases antenna space on more than 57,000 cell sites (towers, rooftops, and more) to wireless service providers. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, non- cancellable, and feature contractual annual price escalations. About 60% of AMT's properties are located in 10 different countries outside the U.S., including India, Brazil, Germany, and Uganda, and AMT is intent on growing its international portfolio as it continues to build and acquire more towers.

How It's Working

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE (or, in Africa, from voice to data), or to increase coverage density. Every time they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; 98% to 99% of AMT's customers up for renewal each year do so, and more than 80% of its current leases don't renew until 2018 or later.

What We Expect

Revenue was up 17.7% year over year in 2012, with the international division up 34%, well outpacing the domestic side. We expect revenue to double from 2012 levels in the next five years through a combination of price escalations, new towers, and upgrades; year-to-date 2013 results suggest that the company is well on its way.

After its recent conversion into a real estate investment trust, AMT is required to pay out 90% of taxable income to shareholders. It currently distributes $1.12 annually, a 1.4% yield, and management expects to increase the dividend 20% annually for the next five years. (Importantly, only the U.S. side of this business is organized as an REIT. For more, see our original write-up, linked in the sidebar.)

For More

- *Pro*'s original recommendation (5/6/13)
- Talk about AMT

Management reduces taxable income though the use of net operating losses. And because the useful life of its tower properties exceeds the depreciation schedule, AMT also uses a depreciation shield, which reduces taxable income and understates the values of some assets on the balance sheet. Thus, typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

The *Pro* Bottom Line

We value AMT at about $100 a share. Today's price provides an acceptable margin of safety for a business of this caliber. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network.

Buy First: O'Reilly Automotive (NASDAQ: ORLY)

One of the best-managed companies in a growing space — with a great stock to match

Suggested Allocation: 3.3%

O'Reilly Automotive (NASDAQ: ORLY) is America's second-largest auto parts retailer, with more than 4,000 stores. Auto parts are a big business, estimated at $231 billion, and O'Reilly is an exceptional competitor, with an addressable market size of about $131 billion.

What It Does

Running 24 regional distribution centers and 240 hub stores as part of a two-tiered distribution strategy, O'Reilly provides same-day or overnight availability on more than 142,000 items, including many its competitors don't usually stock. Basic auto parts, tools, and services complement those hard-to-find treasures. As a result, O'Reilly's sales are historically split between "do-it-yourself " retail customers and more lucrative professional-services customers (such as auto repair shops), a luxury many competitors don't enjoy.

How It's Working

Since going public in 1993, O'Reilly has achieved 20 consecutive years of record revenue and operating earnings and has increased same-store sales every single year. Diluted net earnings per share have jumped more than 20% annually over the past decade, with 25% growth in 2012. All signs point to more growth ahead.

O'Reilly will open about 200 net new stores in 2013, increasing its 2012 year-end store count by 4.8%, and same- store sales are expected to rise by 3% to 5%. By clustering stores together, O'Reilly is able to rapidly achieve economies of scale, and by serving professionals and retail customers, it's able to enter smaller markets where competitors don't often tread. There's also no shortage of independent stores or chains to acquire in this highly fragmented industry. In 2012, O'Reilly acquired 56 locations on top of opening 180 net new stores. O'Reilly has steadily improved profitability, generated strong free cash flow, and maintained a healthy balance sheet while growing. As a result, shareholders have been greatly rewarded. But it's still young.

What We Expect

More Online

- *Pro*'s original recommendation (4/15/13)
- Talk about O'Reilly

By opening new distribution centers in key locations, and surrounding them with "spoke" stores, management sees more growth and operating leverage in its business model. Plus, cars last longer these days — meaning used cars are on the road longer, needing more costly repairs when something goes wrong.

The *Pro* Bottom Line

O'Reilly trades near our fair-value estimate today, but remember: Fair value is the price from which we can expect our desired rate of return, which is around 11% annualized on this stock. Plus, we think there's upside to that estimate as past success points to more to come. Last quarter, O'Reilly increased its earnings per share by a strong 28% year-over-year. This is a business we want to own for the long haul.

Buy First: TD Ameritrade (NYSE: AMTD)

Assets and investment fees are rising; earnings should surge when interest rates head higher.

Suggested Allocation: 3.1%

Entrusted with more than $500 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NYSE: AMTD) hosts about 378,000 stock, options, and futures trades on an average day, collects investment fees, and earns interest on billions in cash.

What It Does

Aside from being a leading discount broker, TD Ameritrade has a partnership with **TD Bank** (NYSE: TD) (which owns 45% of the company), giving it a unique position in its industry. The partnership allows TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank, and with cross-selling opportunities and below- average risk to boot. So, when the current record-low Federal Funds interest rate (targeted at 0%) increases, TD Ameritrade will earn much higher interest income, all of it pure profit. Meanwhile, it continues to focus on job No. 1: Increase client assets and launch more investment products.

But about that Fed Funds rate: In 2007, it was 4.75%, up from 1% in 2003 during the last recession. Today, it's hovering between zero and 0.25%. The first year that it increases by 100 basis points (to 1.1% from today's 0.1%), management estimates TD Ameritrade's earnings per share will rise by an extra 27% to 32% compared with the prior year, on top of any other growth. And as history shows, interest rates could rise by much more than 100 basis points over the next three, five, and seven years.

How It's Working

TD Ameritrade has increased client assets by at least 10% annualized for the last four years and counting. Management says this rate of growth has been about double that of its nearest competitor. For context, the S&P 500 is nearly flat since 2007, but client assets held at TD Ameritrade have more than doubled over the same period. Operating margins are strong, too, lately in the mid-30% range.

Diligent capital management led Standard & Poor's to upgrade the business to an "A" credit rating in 2012, which helped fuel a recent 50% increase in the dividend (likely the first of many). With steady gains in customer accounts, decreasing shares outstanding, and a commitment to paying out roughly two-thirds of earnings to shareholders, the business should continue to reward owners — with the added benefit of much higher profits when interest rates increase. Meanwhile, the stock trades about 20% below its 10-year average price-to-book value of 4, although the company is more diverse and stronger now than over the past decade.

What We Expect

For More

- *Pro*'s original recommendation (7/11/13)
- Talk about TD Ameritrade

Management will continue to be excellent stewards of capital, returning profits to shareholders and increasing additional investor value. All the while, we know higher interest rates will someday lead to much higher net income. But even as we look forward to that, we can admire the company's current results and should enjoy healthy returns.

The *Pro* Bottom Line

Our current fair-value estimate on TD Ameritrade is $34. The company's earnings are likely at a cyclical low. Believing as we do that TD Ameritrade's profit potential is much greater than recent results suggest, we think the stock is a compelling buy in anticipation of higher interest rates. TD Ameritrade's business model is powerful when rates are headed upward. Most investors have probably forgotten that power since 2007, but will remember it when earnings start to jump.

Buy First: Valmont Industries (NYSE: VMI)

The company's income is increasing as infrastructure expands around the world.

Suggested Allocation: 3%

Valmont Industries (NYSE: VMI) offers investors a proven, consistent suite of four business divisions, each serving a growing need around the world.

What It Does

Founded in 1946, Valmont's engineered infrastructure products division supplies steel and aluminum poles to infrastructure projects across the globe, including road and traffic lights; stadium and parking lights; and wireless communications poles and towers. This division also sells highway safety products such as barriers and road grating. In addition, by selling steel and concrete support structures for the global utilities industry, Valmont profits as electrical grids are renovated or built out.

Then there's water, essential to the world's farmers. Under the name "Valley," Valmont's center-pivot and mechanized irrigation systems are the world's leading brand. More than 80% of the planet's irrigated acres still use inefficient "flood" watering methods, rather than efficient mechanized irrigation, so there's lots of room to run.

To top it all off, the company provides hot-dip galvanizing (just like Mom used to make), anodizing, and other coatings to protect aluminum and steel from corrosion. One of the largest custom galvanizers in the world, Valmont expects continued growth because it still captures only a small percentage of the total market.Overall, the company operates in more than 80 countries and has more than 10,000 employees.

How It's Working

Valmont's stock has returned 17% annualized since 1993, outperforming the vast majority of stocks on the market, and the likes of **Starbucks** (NASDAQ: SBUX) and **Whole Foods** (NYSE: WFM) over the past 10 years. By focusing on strong returns on invested capital, smart acquisitions, new markets, and product-line expansion, Valmont has been able to steadily increase profits as the world economy expands. Yet it's still a relatively small company with plenty of potential in all business lines, and it currently trades at valuation multiples well below market averages.

What We Expect

For More

- *Pro*'s original recommendation (11/5/13)
- Talk about Valmont

With outstanding management and four business divisions that continue to expand around the world, we expect Valmont to continue to grow at a healthy rate (any cyclical bumps aside), and the stock to perform admirably in our pursuit of our North Star.

The *Pro* Bottom Line

Our fair-value estimate on Valmont is $170, providing plenty of upside. And remember, fair value is the price from which to expect your desired rate of return. A growing company's fair value will go higher annually. We hope to have a long, rewarding relationship with this new *Pro* stock.

Stacking the Deck

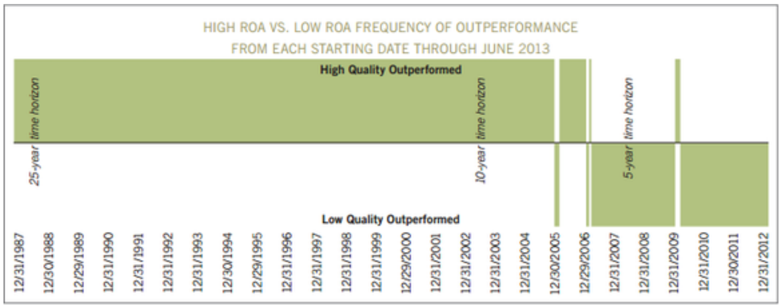
Published Nov 11, 2013 at 4:00PM

Dear Fool,

I don't like to lose money, so I'm not a big poker player. But I'd probably gamble more if I got to start each hand with a pair of aces. Anyone care to sit at my table under those rules? In cards, such a setup may look like cheating — but in investing, it's exactly the type of rigged scenario we hunt for in our core positions. A company's success depends in part upon the structure of the industry in which it operates, and an advantage in industry structure can work like a pair of pocket aces: It doesn't guarantee a win, but it sure shifts the odds in your favor. We probably don't talk enough about industry structure here at *Pro*, so let me deal you a hand ...

Pocket Aces Mean Dollar Bills

A simpler way to talk about industry structure is ask whether a company and its competitors operate "good businesses." Before we dive into the details of how to make that determination, here is why it matters:



Source: [The Intersection of High Quality and Cheap Valuation](), Fidelity Investments, 2013.

The chart above splits the investment world into two portfolios: good businesses (companies with a higher-than-average return on assets) and bad businesses (companies with a lower-than-average return on assets). The green shading then fills in based on the prospective returns from holding either portfolio from the date listed through June 2013. Two things jump out:

- The longer your holding period, the more quality matters to outperformance.
- In three-quarters of all investment periods in the study, higher quality beats lower quality.

Although this study focuses on the frequency of outperformance and not the magnitude, it's compelling evidence for investing in good businesses (those with advantaged industry structure, among other things) over bad.

Assessing Aces in Business

Investors love checking out a company's return on assets, because it's a great quick-and-dirty method of distinguishing between good and bad businesses. But stopping there is like only looking at two of your five cards in poker — you miss a lot of information. That's where competitive strategy — a company's plan to compete in its market — comes in. An effective strategy comes from a company's unique competitive advantages, but also from the structure of its industry. Harvard professor Michael Porter, who's sort of the Godfather of competitive strategy, constructed the Five Forces framework of assessing industry structure and the landscape our businesses operate in. Porter contends that the relative strength of, and interaction between, the five factors in the image below determines an industry's ultimate profitability.

Source: Harvard Business Review, Michael Porter, 2008.

All of the actors in this scenario (competitors, suppliers of inputs, buyers, makers of substitutes, and potential industry entrants) pursue the same profit pie, but the playing field is rarely even. The Five Forces framework is a great tool to help assess industry structure and parse advantaged situations from disadvantaged (for more detail, you can check out an updated reprint of Porter's original 1985 work [here]()). But some find it unnecessarily complicated.

Columbia professor Bruce Greenwald takes a simpler approach, suggesting in his book *Competition Demystified* that we should focus intently on "barriers to entry," or factors that deter competitors from encroaching on a company's business. Barriers to entry are equivalent to Porter's "Threat of New Entrants," and the thinking here is simple: Smart people and organizations are always on the prowl for profits, so unless there's some structural deterrent protecting a business' profit stream, someone (or someones) will be along to take a cut of the action.

Presto Change-O! Aces Aren't Forever

It's that assertion that should be our primary concern. Identifying these barriers, and their strength, is part of our research process for new investments, while the potential for disruptions and changes greatly informs our assessment of risk with our current holdings. The *Pro* team often says it's the quality of the business that helps determine whether we sell a stock, and a primary determinant of the quality of the business is the stability of its industry structure.

For example, former *Pro* holding **Rockwood** (NYSE: ROC) operates in several business lines; a few of them do offer advantages, but the company spent a good deal of its time and energy on the less appealing commodity titanium dioxide business. That business showed flashes of being OK, but we determined that its industry structure was worsening. Rockwood was already challenged by competitors willing to add unnecessary capacity, and as other competitors sponsored by Asian governments came on the scene, it became clear that barriers to entry were low. In addition, Rockwood's competitive response concerned us; in an effort to better control industry supply, it acquired competitors and took capacity offline. We viewed this strategy as unlikely to improve the industry structure over the long term, while at the same time diluting our ownership of Rockwood's other, better businesses. The adverse industry developments had increased our risk, so we sold.

The Foolish Bottom Line

When the dynamics of an industry undergo structural change, years of altered performance tend to follow. Take a gander at railroad company stocks over the past decade — industry consolidation, increased fuel efficiency, and rational pricing behavior have all led to huge profits for railroads and railroad investors. Some investors, like renowned Legg Mason fund manager Bill Miller, think the airline industry is still in the early stages of a similar change. I'm not yet convinced on that front, but we are examining a few industries applying the railroad recipe in search of potential long investments. Rest assured that *Pro* will keep searching for investments poised to benefit from structurally advantaged industries. And we'll keep using Porter's framework to assess risk so we know better when to hold 'em, when to fold 'em, and when to go all in.

Onward,

Bryan (TMF42)

Completed *Pro* Trades

- **AIG** (NYSE: AIG): We rolled our seven January 2014 calls to January 2016 calls for a net credit of $4.10 per contract. (This should have gone in last week's Memo, but we missed it. We blame Billy ... not because it's his fault, but because we can.)
- **Tupperware Brands** (NYSE: TUP): We wrote seven November $85 puts for $0.90 per share.
- **Valmont Industries** (NYSE: VMI): We purchased 400 shares at an average price of $143.69.

Pro Guidance Updates

- **GrafTech International** (NYSE: GTI): We moved shares to Hold and raised our estimate of fair value and our Consider Adding More price to $11.20 and $6.70, respectively.
- **Starbucks** (NASDAQ: SBUX): We raised our fair-value estimate and CAM price to $71 and $57, respectively; shares remain a Buy.

Coverage & Community

- Fools have a great conversation about Fair Value and CAM with respect to **Starbucks**.
- *Pro* Fools are digging in and getting more comfortable with our latest rec, **Valmont**.
- A little firsthand research goes a long way — we love to hear our members' experiences.

Buy Valmont Industries

Published Nov 5, 2013 at 3:30PM

Guidance Essentials

- **Action:** Buy **Valmont Industries** (NYSE: VMI)
- **Allocation:** 3%
- **Scorecard Status:** Buy First
- **Recent Price:** $142.60
- **Fair-Value Estimate:** $170
- **Consider Adding More:** $115
- **Dividend:** 0.7%
- **Options:** We may use them later, but they aren't necessary
- **Price Guidance:** This is **a thinly traded stock, so please use patience and a limit order**. When you make your investment, do not enter an order above the going ask price, lately $142.60.

The Business

Valmont offers investors a proven, consistent suite of four business divisions, each serving a growing need around the world, including in North and South America, China, India, and Africa.

> **Engineered Infrastructure Products** (33% of sales). Have you ever wondered how many light poles line the highways of the world? Or how many traffic lights stand at intersections? The scientific answer is "a lot," and more go up every year – many of which are sold by Valmont. The company's engineered infrastructure products division supplies steel and aluminum poles to infrastructure projects around the world, including road and traffic lights; stadium and parking lights; and wireless communications poles and towers. This division also sells highway safety products such as barriers, road grating, and more. Last quarter, sales in this division were up 6% to $260 million, with nearly 10% operating margins. Strong long-term potential exists around the world.
>
> **Utility Support Structures** (30% of sales). Selling steel and concrete support structures for the global utilities industry, Valmont profits as electrical grids are renovated or built out. Developed nations are upgrading transmission grids, developing nations are building them, and increased use of renewable energy drives additional demand. This division achieved 18% operating profits last quarter on $229 million in sales.
>
> **Irrigation Systems** (23% of sales). Then there's water, essential to the world's farmers. Under the name "Valley," Valmont's center-pivot and mechanized irrigation systems are the leading brand. More than 80% of the planet's irrigated acres still use inefficient "flood" watering methods, rather than efficient mechanized irrigation. With an 18% operating margin, this division enjoyed a record $175 million in third-quarter revenue. Valmont sees continuing growth opportunities in irrigation used for water, fertilizer, and pesticide application.
>
> **Coatings** (11% of sales). To top it all off, the company provides hot-dip galvanizing (just like Mom used to make), anodizing, and other coatings to protect aluminum and steel from corrosion. One of the largest custom galvanizers in the world, Valmont expects continued growth because it still captures only a small percentage of the total market. Operating margins in this segment topped 22% on last quarter's $89 million in revenue.

Does all that sound boring? Absolutely. We *love* boring businesses that are likely to achieve profitable, long-term growth. The stock is up 584% over the past 10 years, and 24,510% since the late 1970s (while paying dividends since 1990). Yet Valmont still sports a modest $3.8 billion market value, and it has lifelong revenue opportunities in the tens of billions.

The Financials

New contracts, opportunities to reinvest in the business, acquisitions, and strong return on equity have combined to make Valmont a compounding machine.

The company operates in traditionally cyclical industries, and it's dependent on three things: infrastructure spending (on private and government projects alike); utility spending; and farmer spending. While each segment does go thorugh hot and cold periods, the company as a whole has not shown great cyclical swings in revenue and profits over the past 10 years and beyond. Valmont's four business lines sell in more than 100 countries, and no single customer accounts for a substantial portion of sales, so Valmont's risks are diversified. To be safe, we certainly *expect* peaks and troughs in its industries, but over time we expect continued growth.

In the table below, you'll see how revenue and operating income have grown fairly consistently, and how the stock's value multiples have fared over the past decade as the share price climbed. Recently around $142, the stock is trading at the low end of its 10-year value range, at only 6.8 times EV/EBITDA and a P/E of 13. Meanwhile, return on equity has far surpassed our 11% North Star hurdle almost every year.

Valmont	2005	2006	2007	2008	2009	2010	2011	2012	Now
Sales ($billions)	1.11	1.28	1.50	1.91	1.79	1.98	2.66	3.03	3.29
Operating Income ($millions)	83	111	156	229	238	192	266	381	485
EV/ EBITDA	8.6	11.3	13.9	7.3	7.4	11.2	8	8.6	6.8
P/E	21.5	25.1	26.5	12.7	13.8	26.2	16.2	12.8	13.3
P/FCF	13.9	23.9	91.6	41.1	10.9	44.2	32.7	29.5	17.6
ROE (%)	12.5	16.9	20.8	23.3	21.4	11.1	22.1	18.7	20.2

Source: S&P Capital IQ.

Risks

Valmont's irrigation systems provide farmers a healthy return on investment, but most farmers only buy when they're feeling flush and crop prices are high. This year, North America enjoyed a record harvest, so 2014 farming income may suffer by comparison. This has already spooked investors into selling Valmont and competitors including **Lindsay** (NYSE: LNN), in part leading to today's low valuation multiple. However, Valmont CEO Mogens Bay said in the October conference call that he expects just a "small softening" in irrigation next year, and not a sharp decline. Still, it's a risk -- as is the pace of infrastructure spending around the world. If governments don't spend on roads, and utilities don't spend to upgrade, Valmont will suffer.

Additionally, if there's a steep, sudden price increase in any of Valmont's key raw materials (rolled steel coil, zinc, aluminum, etc.), the company can't pass the extra cost on to customers that are already under contract, so profit margins could temporarily be hurt. It's worth repeating that Valmont is dependent on large, time-intensive projects from government and private corporations, utilities, and farms – and all such spending will be cyclical, perhaps separately, perhaps simultaneously. There is a chance we're starting to invest at a near-term peak in at least one of Valmont's divisions. Plus, Valmont's customers typically need financing to fund their large projects, adding another layer of dependency. Finally, the company competes on customer service, product quality, and price. Seven decades of experience helps, but Valmont doesn't operate in a vacuum.

The Foolish Bottom Line

Roads need traffic poles, safety barriers, and lighting, as do parking lots and stadiums. Farmland needs irrigation and fertilizer systems. Utilities need support poles and towers. Steel and aluminum must be protected from costly corrosion. And demand for all these items rises as economies expand. In business since 1946, Valmont is not likely to be left behind by fast changes in technology or the competitive landscape, and is positioned to grow as economies do. Our thesis is Valmont will continue to serve growing markets and increase its profits. Prudent management should be able to reinvest for more growth, make smart acquisitions for even *more* growth, and expand into new areas of the world. Valmont could be a business we'll happily own for years -- even if we don't necessarily want to see the world covered in light poles.

9 Pro Companies Reviewed!

Published Nov 4, 2013 at 4:00PM

Dear Fool,

Quarterly earnings have been announced at most of *Pro*'s companies, and I'm ready to review key points from nine of them today. Besides refreshed financials, what I seek most from each quarter's reports are the key metrics, trends, and initiatives at our companies — as well as any warning signs. The *Pro* portfolio has been enjoying an exceptional year (up 28% as of Oct. 31), but it's more important to look forward than back. Let's dive in.

3D Systems

(NYSE: DDD)

The additive manufacturing company continues to pursue the consumer and professional markets with several new models of printers launched each year. Our shares were called away by covered calls, but we still have puts open (which keeps the stock a Buy at considerably lower prices).

- For the second quarter in a row, 3D is increasing its R&D and marketing spending to address growing opportunities, something we've long wanted.
- The competitive landscape is shifting, with giants like **Hewlett-Packard** (NYSE: HPQ) expected to enter the 3-D printing market next year, so the time is ripe to lock in new customers.
- Since December 2011, 3D's diluted shares outstanding are up 23.7%, and diluted earnings per share are down $0.01. Free cash flow is up only modestly since 2011, and 3D has yet to prove that its many dilutive acquisitions will result in strong returns on investment.
- High-margin materials sales continue to lag company projections; it's possible that average owners won't use as much material as hoped.

Despite these critiques, 3D Systems remains a pioneer in a promising space. Shares of most 3-D printing companies are flying high, reminding me of many similarly soaring dot-com stocks in the late 1990s. Not all will come out winners, but 3D Systems has a lead in the industry. For better or worse, we just want it at a lower price.

Apple

(NASDAQ: AAPL)

Speaking of pioneers, inexpensively priced Apple may enter a new product category as soon as 2014. Will its latest innovation be a watch? A TV? Or something else? Apple remains a Buy First on our scorecard.

- Apple's mighty free cash flow continues to be powered by the iPhone and iPad, while Mac computers are taking PC market share even as Apple Mac sales dip.
- Thankfully, Apple's margins appear stable for now; management has not lowered the price of the iPhone, and we like that choice.
- CEO Tim Cook tells us that by 2017, the global smartphone market will have expanded by about 70%, and the tablet market by 78%. New buyers of Apple products will likely account for much of that growth, and customer satisfaction surveys show that existing buyers have extreme loyalty to Apple products. Those loyal customers are likely to refresh their products every few years.

Facebook

(NASDAQ: FB)

At 42 times trailing free cash flow and 48 times expected earnings for the next 12 months, Facebook actually looks reasonably — even attractively — priced. It's less expensive than Google was one year into its life as a public company, and it's much cheaper than most of its social-networking peers (which does *not* mean Facebook deserves to trade much higher).

- In the third quarter, 725 million people visited Facebook daily, up 25% over last year.
- Revenue was up 60% to $2 billion, and the average price of an ad increased 42% over last year.
- Ads are starting to run on Instagram.
- Of some 20 million small businesses with pages on Facebook, only about 1 million are advertising so far.
- Only about a third of the world is online, and Facebook is intent on getting more people connected; to that end, it recently helped launch the Internet.org initiative for affordable Internet access.

We'll take action on our January 2014 Facebook calls before they reach expiration; I expect we'll continue our exposure to Facebook for the longer term. We just need to be as sure as possible that the Facebook we marvel at today has yet to hit the peak of its traffic; we need its amazing traffic to continue to rise.

Intel

(NASDAQ: INTC)

Rated a Buy, Intel remains inexpensive as Wall Street waits to see how its fate unfolds in mobile computing. The company is making gains with chips in new tablets and smartphones, but its mobile revenue is still dwarfed by its chip sales to the slowing PC market and the healthy server market.

- Management said the enterprise (or corporate) market is improving, both in PC sales and servers, although the consumer PC market remains hobbled, with many consumer dollars going to tablets and smartphones.
- "Two-in-one" computing devices (tablets and PCs combined) powered by Intel are starting to take market share in the traditional PC market.
- Intel's server and data businesses continue to expand robustly as companies store more terabytes on off-site servers (the cloud).
- The stock yields 3.7% and trades at a discount to the broader market.

MasterCard

(NYSE: MA)

The world's second-largest payments processor increased third-quarter revenue 16% and earnings per share 18%. Despite tepid economies, MasterCard enjoyed strong volume and transaction growth in every region of the world.

- MasterCard projects a compounded annual revenue growth rate of 11% to 14% from 2013 to 2015, and at least 20% annualized growth in earnings per share.
- Rebates are key to getting banks to issue your cards, and MasterCard does not foresee any significant change in its rebates or incentives compared to the last three years. This is excellent news given how strongly the business has been growing.
- Commercial credit spending remains weak; when businesses begin to loosen the purse strings, it should be another positive catalyst for MasterCard.

The company likes its positioning around the world, including in China, and should continue to benefit as cards replace cash and checks. I'm going through the financials now and will update our valuation guidance shortly, but I'm comfortable saying MasterCard is a long-term core holding.

OpenText

(NASDAQ: OTEX)

The enterprise information management provider continues to demonstrate its mastery of digital data.

- OpenText's operating cash flow was up a strong 29% last quarter even as revenue flattened because of the government shutdown and a general lull in the software industry. Margins improved in all business lines.

- In 2014, OpenText will launch Red Oxygen, a seven-package software suite to replace its current model (selling hundreds of modules). The company is moving aggressively to expand sales by at least 10% a year as customers invest in information management systems.
- Business is returning to normal now that the government (a significant customer) is back in operation.

Inexpensive OpenText is a Buy, and we're looking at writing new puts as our November $65 puts prepare to expire as income.

O'Reilly Automotive

(NASDAQ: ORLY)

Among the many stocks I cover, auto-parts retailer O'Reilly hosted the strongest conference call of the quarter. The company continues to execute and remains right on message.

- O'Reilly has opened 48 net new stores so far this year, and will open about 109 by year-end.
- Margins are up and 2013 earnings-per-share guidance ticked higher. EPS increased 28% year-over-year in the quarter just ended.
- The company is investing in new distribution centers and improved product acquisition costs, and sees plenty of acquisition targets and new market possibilities. Accounting changes and some investments will bring short-term headwinds in early 2014, but should lead to long-term rewards.

Today's well-made cars are a boon to O'Reilly — they last longer. And repairs to a car made in the last decade are typically costlier, because they're more complex. O'Reilly will continue to add more stores around the country, and will continue its discipline to increase same-store sales, too. The stock remains a Buy.

TD Ameritrade

(NYSE: AMTD)

This little compounding machine is strongly positioned for any increase in interest rates, and it's excelling even without that. In the year just ended, client assets were up 18% to $556 billion, and $96 billion of those assets are interest-sensitive. Importantly, *new* client assets gathered hit $50 billion in the year, up 10% annualized.

- Annual net revenue hit a record $2.8 billion, and investment product fee revenue was up 28% to $250 million.
- Yearly diluted earnings per share were up 15% to $1.22.
- The company just increased its dividend 33% to $0.48 per share annually and announced an extra $0.50-per-share special dividend payable in December.
- Operating expenses were flat — and have remained at the same level over the past three years even as TDA invests in and expands its business organically. Outstanding!

Shares trade at 3.2 times book value, offering plenty of upside potential when interest income increases. As a newer position in *Pro*, the stock is still rated Buy First.

Tupperware

(NYSE: TUP)

Our favorite maker of food-storage solutions continues to shine in emerging markets, but ...

- Tupperware continues to show tepid sales growth (just 1% last quarter, or 6% excluding currencies) and rapid earnings-per-share growth (16% when adjusted for currencies). A good part of EPS growth is thanks to share buybacks as the company levers up with debt.
- Free cash flow has not increased meaningfully since 2010. We believe FCF will rise as capital investments slow and emerging-markets sales continue to expand.
- Weakness in age-old Germany and France last quarter is hoped to be short-lived, while emerging markets (now nearing 70% of revenue) fared well.

With a share price that looks fully valued at the moment (meaning things need to go right to unlock more value), the stock remains a Buy when you remember our three-year outlook and acknowledge that the shorter term could be bumpy. We're watching to see how Tupperware manages a transition as its share buybacks likely slow over the next few years, but in the meantime, it's full steam ahead for a declining share count that drives EPS growth. After losing our shares to covered calls, we suggested puts in October to potentially buy back a partial (3%) position below today's price. We'll actively manage that recommendation.

Valuations

Here's a look at current valuations.

Company	Approx. Price	EV/EBITDA	P/FCF	P/E	P/E NTM Est.
3D Systems	$63	55	250	136	53
Apple	$520	8	14	13	12
Facebook	$50	41	42	225	48
Intel	$24	5.7	14.2	13	12.8
OpenText	$73	10.7	12.4	29	12.5
MasterCard	$737	17.5	31	29	25
Oracle	$33	8.5	10.9	14.4	11.3
O'Reilly	$124	11.5	24.8	21.5	19.1
TD Ameritrade	$28	N/A	N/A	22.7	20.8
Tupperware	$91	11.9	20.6	19	15.2

Source: S&P Capital IQ.
EV/EBITDA = Enterprise Value/Earnings before interest, taxes, depreciation and amortization.
P/FCF = Market Cap/Free Cash Flow
P/E= Share Price/Earnings
P/E NTM Est = P/E on next-12-month estimated earnings.

For comparison, I included Buy First stock **Oracle** (NYSE: ORCL), which reports earnings on its own schedule (thank you, Oracle!). Keep in mind, growth rates matter. MasterCard is expected to increase its earnings by 20% annualized, so this high-moat, high-margin business — while not cheap — can reasonably fetch 25 times forward earnings in a bull market. But we are not pretending that *isn't* a premium price. It is. It just still offers long-term potential. O'Reilly increased its earnings 28% last quarter, and has long achieved more than 20% annualized growth, so its forward P/E of 19 is justifiable, too. We just need to make sure management is on track to continue its success.

Apple, Intel, OpenText, and Oracle all look inexpensive on absolute terms, while Facebook and O'Reilly look attractive given their growth rates. TD Ameritrade is a good business at a fair price as well as a special situation (a play on any rise in interest rates). The rest of the companies above are either in the middle of the road on valuation (MasterCard, Tupperware), or they look expensive (3D Systems on free cash flow and EBITDA). Finally, trailing earnings here are on GAAP measures. You'll see lower P/E multiples listed for Facebook, OpenText, and some others on popular finance websites, because they exclude so-called "special" charges like stock option grants.

Celebrating a 100-Bagger — and Looking for the Next One

Published Oct 31, 2013 at 1:43PM

Amazon.com (NASDAQ: AMZN) is a special stock for The Motley Fool, and it recently hit a special — even mind-boggling — milestone. David's initial recommendation of Amazon for the Fool's Rule Breaker Portfolio back in September 1997 has become a *100-bagger*.

Today, we know Amazon as the A-to-Z king of e-commerce, but how did it look in 1997? And perhaps more important, how can we find the next 100-bagger opportunity?

In this special video, David and Tom talk all things Amazon and Foolishness:

- What inspired David to invest in Amazon before it conquered the online world
- What it took to ride out Amazon's lows so we could hit the unimaginable heights
- What to watch for so you can spot the next great growth stock

Transcript

Tom Gardner: Hi, Tom Gardner and David Gardner here, co-founders of The Motley Fool and we're here to talk about the incredible investment that has been Amazon.com.

So, since buying Amazon.com in 1997, the stock is now up 100x in value for you, so part of this is a celebration of long-term investing, of finding great businesses and of getting incredible results. But the first part of our conversation today, Dave ... I just want to hear a little bit about how you found Amazon, what you were looking for, a little bit about the *Rule Breakers* methodology ... but particularly as it applied to Amazon.

It's a $165 billion company today, but if you rewind and take it back a hundred-bagger, it's a small cap, at that point, or a relatively small company. And what were you looking for and why did you make your first investment in Amazon?

David Gardner: I think there are three things I'll just point out right out of the gate, Tom. Number one, it was a company that had a visionary leader and it was a leader at the time. It was perceived to be that. It's was Earth's biggest bookstore — I still have the mousepad, by the way — when I first recommended it, but it was very clear they'd named it "Amazon." It wasn't "OnlineBooks.com." So, you saw a visionary leader in play.

Second thing — the stock had already doubled from its IPO before we bought it on September 9th of 1997...

Tom: Now, that would be a reason that a lot of people would stay away from it...

David: Absolutely. Like I asked myself, "Did I miss this? Oh, darn." So, obviously we'd be talking about a 200-bagger today had we bought three months earlier, but absolutely no regrets. In fact, so often in my style of investing, we're buying the company after it's already doubled. That's happened any number of times in *Rule Breakers* and *Stock Advisor* among our best picks.

Third, I was in touch with it as a consumer. I was using Amazon. I'm pretty sure you were, too. You couldn't really miss it. It was for people who loved e-commerce — and there were big doubts at the time, maybe we'll talk about that later — big doubts that e-commerce would even work or could work as expansively as it turns out it has. And I'm by no means the visionary who was saying, "Look at what e-commerce would become." We were kind of thinking through it — looking for it a little bit ourselves. But to be a consumer, to be using it, to be in touch with that — helpful.

Tom: I just want to put those three factors in the context of finding the next 100-bagger. Maybe just give an example — you don't have to give a specific company — but what sorts of trends and themes are out there today that are bringing together the visionary leader with the broad approach — the Amazon-like name rather than in the narrow niche and the consumer experience that you're having.

David: So, of those three factors we talked about — if you're looking for the next 100-bagger — I think the primary factor of those three would be the second, which would be the business itself and the momentum and the technology and the disruption. Amazon, in a sense, is just a poster child for e-commerce. E-commerce was the real story in 1997 and has been for the 16 years since. E-commerce has been unbelievable. Amazon is the greatest brand and greatest example of that, but e-commerce benefited many companies. EBay was an early pick of ours that we still have maintained. It's done very well.

And so, Tom, I think looking and thinking ahead of trends and asking yourself what's going to be really big ... it would be the best way to locate the next 100-bagger.

Tom: And how about sales growth? We were talking off-camera beforehand that if you go back to — I could only date back in the SEC filings online to 1999. It was two years after you bought...

David: For Amazon? Okay...

Tom: For Amazon. And Amazon in that single quarter did about $350 million in sales and in the same quarter the previous year was $150 million in sales. So, they had at least a run rate of more than a billion in sales, but their growth rate was north of 100% in revenue. So, is that a factor that is an indicator for you of whether there's a huge market opportunity and a big theme ... is the top-line growth rate?

David: Yeah, I think it is. As a Rule Breaker, obviously, I'm never going to say that's it and that's always it — because there's all kinds of exceptions. It's always about context. But I think that's a pretty good indicator.

When we talk about big things like e-commerce or two recent trends that we've been early on and it's been to our benefit — 3-D printing and cloud computing, both of those in the *Rule Breakers* and *Stock Advisor* services — we had early picks in those. Those are really big stories and they had big sales growth. It wasn't just a hope and a dream. And there are many examples of it.

It doesn't always have to be the biggest thing of all. I mean biotech, in a big way — but also small ways, like just genomics or just a given cure — exhibits these characteristics on a more microcosmic level. Anyway, it's not always about the next big trend, but Tom, sales growth is definitely a factor.

Tom: Okay, so I just want to put these factors together. I'm really restating what you've said. So, if you're looking for the next 100-bagger today, you would be looking in a big trend that has a visionary leader, high sales growth rate and you have connection to it as a consumer ... that they're useful. Not the only place to find the next 100-bagger — but those four factors would be a useful way. And maybe the fifth is that it's a relatively small company. You have visionary leaders at Google, but it's not going to be a 100-bagger over the next 10 years.

So, it's a smaller company. Let's say market cap sub-$2 billion. Visionary leader. Big trend. High sales growth rate with consumer connection to you. And that would be a good way for somebody to look...

David: That's not a bad template. One thing I want to point out is you've described, in many cases, just what cool businesses are. Like, they have those things. A 100-bagger takes it from the realm of business into investing and how you, as an investor, achieve a 100-bagger, which is what we've done in Amazon.

And that's a little bit of a separate story, right? Because to get a 100-bagger — I mean, Amazon is one of the few stocks that's actually done that — that you could have done in the last 20 years and it took 16 years and it took watching that stock go from $3 (our cost) to $95 and then back to $7, and we held all the way through back to $95 and then $100, $200, $300. So, it took 16 years of patience in a world that is very myopic...

Tom: Six months is the average holding period...

David: ...and a lot of people sell off in advance of bad... Like worried about the next earnings. So, there's a whole separate story. We don't have to talk about it too much in this conversation...

Tom: No, I like it actually. Were you worried? When it went from $95 to $7, did you second-guess yourself at any point? You had a 30-bagger as an investment and you watched it fall...

David: To a 2-bagger...

Tom: To a 2-bagger. So, you still had the joy of saying, "I've doubled my money," but you watched a 90% decline and obviously in order for a stock to decline that much, most people have sold. So, what is it that allowed you to hold that? What are some factors in your approach to portfolio management or individual company investment?

David: Sure, and I'm going to be quick, because we're going to run out of time, but I'll just say for now, it's mostly looking at the business, not the stock. And you know that. I know I'm preaching to the choir — although while Tom and I have kind of got it for about 20 years, I think a lot of the world doesn't think about things that way.

Every time I watch financial television — which, by the way, I don't, really — I'm reminded again of how people are thinking too much about stocks, wigs, wags and short-term moves, and they're not really looking at the business. While Amazon's stock dramatically declined over that, the business did not nearly.

And it's not just Amazon, obviously. I'll just throw in another example near and dear to our hearts — **Netflix** (NASDAQ: NFLX). Netflix stock had dropped from a high in 2011ish over $300 down to $55 within about 18 months. We held all the way down and we've held all the way back — but did the business crumble? Even at its worst Qwikster moment, I think they lost about 500,000 subscribers from maybe 24 million to 23.5 million.

So, if you're looking at the business and you're not seeing any kind of drama there, I think it makes it a lot easier to continue to hold 30-baggers down to 2-baggers back to 100-plus-baggers.

Tom: Now, there are some of these huge multibaggers we've had that have not come back.

David: Sure.

Tom: And how does that fit into your approach as an investor?

David: Well, I can think about Iomega, which back in the day at The Motley Fool — as you remember, we were on the cover of *Fortune* magazine and it was partly a story about Iomega, but Celera Genomics was a 9-bagger in six months and we ended up selling not far above cost. So, obviously I can always think back on times that I wish I'd sold something that I held...

Tom: But the holds end up mathematically massively outweighing...

David: Yeah, when you take it all and all. Absolutely. In fact, I gave this talk internally — you heard this two months ago at our monthly huddle at The Motley Fool. I said, "*Rule Breakers* has had 32 stocks that have lost 50% or more." That's the *Rule Breakers* service. I know I'm speaking to some members today. Thirty-two stocks have lost 50% or more. That sounds horrible and it's not easy. In fact, it's painful, and every one of those I'm accountable for.

The good news, though, is that the 32nd-best pick in *Rule Breakers* is up 160%, so you've got to do the math. You've got to be mathematical here. It's not advanced math, but play that forward and you see the incredible benefits of being happy to occasionally give away a 10-bagger and end up at cost or suffer a 50% loss because you're holding all these other great things as the world is reshaped by these companies and you're a part owner of them measured in decades.

Tom: So, you're the best investor at our company. What does it feel like, to you, to have a 100-bagger investment in the portfolio that you know members are buying and talking about? Like what is motivating you as an investor when you're looking for the companies that you're finding?

David: Well, this is the last thing I'll say for now. Basically, Tom, for me, the purpose of our company is to help the world invest better and what I think about all the time is the people who are buying with us. And you're taking a risk when you buy companies with very high price-earnings ratios or Amazon.com — all of a sudden *Barron's* comes out with Amazon.bomb on the cover in the year 2000 or so.

But if you stay focused on the businesses — us, as investors — Tom your service's incredibly accomplished work in great numbers and across The Motley Fool. Heck, *Inside Value* was recognized by Hulbert Financial Digest as one of the top three performers in the last five years.

So, The Motley Fool has an incredible efflorescence of market-beating services and advice and I think what unites us all, more than anything, is that we're business-focused. That's the number one thing that I see running right through The Motley Fool. We are essentially MBAs without MBAs. We love business and we're doing that — we're just becoming part-owners of businesses. We're not playing with stocks.

Tom: A 100-bagger. Amazon.com. What an incredible achievement by you and the team in *Rule Breakers*, *Stock Advisor*, *Supernova* and all the services you're running. I will just close with this point of emphasis (although there are five or six or seven different great points here in this conversation).

Amazon, a 100-bagger, it took 16 years. And that's just a reminder that that's how you get these multibagger, awesome returns. They happen over 5 or 10 or 15 or 16 years, and it can transform your portfolio. So, Dave, thanks for sitting down and talking a little Amazon. And best of luck finding the next 100-bagger. I can't wait to buy right along with you.

David: Thanks a lot, Tom. That was fun.

Part 2, Step 1: Get Ready ...

Published Oct 30, 2013 at 12:00AM

Choose a Broker

You'll need a place for your money to reside and a platform to buy and sell. Any broker will do, but we prefer ones with low costs, transparent fee structures, a good options platform, and robust features. We don't endorse any broker in particular, but *Pro*'s account is housed at Interactive Brokers. You may find these resources helpful when deciding where to set up your account:

- ***Options* Brokerage Board:** Over at *Motley Fool Options*, which you receive free as part of your *Pro* membership, we've got a whole discussion board about brokerages. Visit the board »
- ***Options* Weekly:** If you think you're going to branch out into advanced options investing, be sure to read this can't-miss analysis from our sister service every Friday. See the *Options* Weekly archive »
- **TMF Broker Center:** This table compares features of six popular online brokerages. Visit TMF's Broker Center »

Request Options Permissions

Ask your broker (via the Options Permissions section in the account application, or just call them to request a form) for full options approval. Typically, this means level 2 or level 3 approval (it can vary by broker). The "levels" refer to what type of options strategies are allowable, so the higher your approval level, the more strategies you'll be able to participate in. Fill out, sign, and mail in the simple document, and after a few days you'll be approved. If you aren't granted a high level, be sure to submit another request after a few weeks with an account. You should be able to get promoted to higher levels over time and as your account size and experience grow.

Update Your Beneficiaries

Chances are, your account has a beneficiary designation. That is, when you set the account up, you answered the question: "Who should get my dough if space matter falls from the sky and makes me one with a crater?" That person, or entity, is your beneficiary, and now is a great time to make sure it is accurate. Life changes quickly and these things can be outdated. Your broker will have a beneficiary designation form that should be simple to fill out and submit.

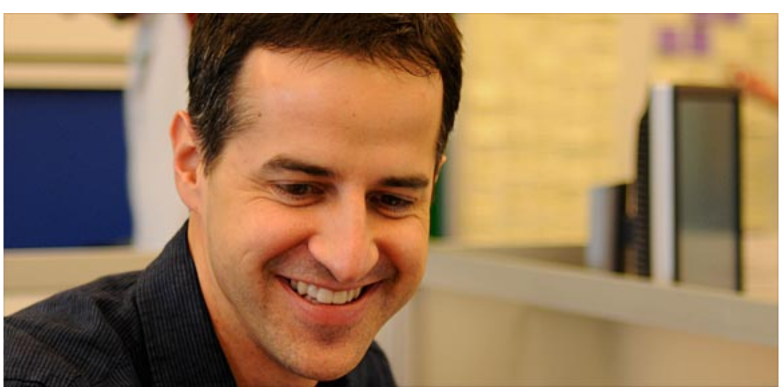
Jeff Fischer

Advisor



Jeff Fischer (TMFFischer), advisor of *Motley Fool Pro* and *Motley Fool Options*, started working at the Fool in 1996, soon after he won the Fool's first year-long online portfolio contest. Jeff co-managed the original Fool Portfolio with co-founders David and Tom Gardner, and co-founded and managed the Fool's Drip Portfolio. Jeff also wrote *Investing Without a Silver Spoon* and served as editor on several other Motley Fool best-sellers. All four of the real-money portfolios Jeff has managed or co-managed publicly since 1996 have beaten the S&P 500, although that isn't his first objective, which is steady returns with reasonable risk. Jeff is married to an actress/professor and has a young son.

Billy Kipersztok

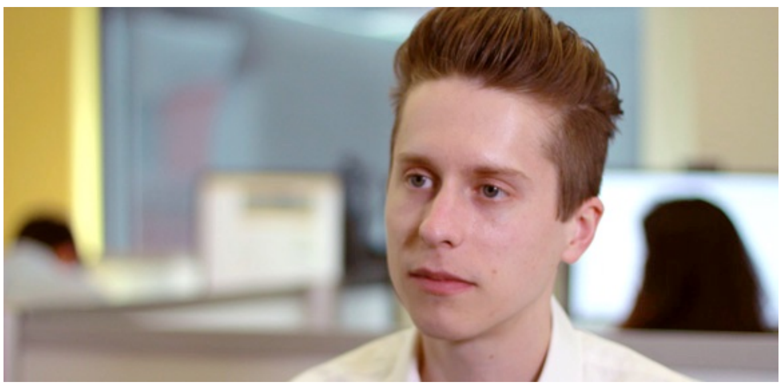
Research Analyst

Billy Kipersztok (TMFTailwind) was introduced to investing by his father, and began reading The Motley Fool as a teenager. He is a voracious reader of investment literature, and he enjoys scouring the market for investments with two characteristics: (1) favorable economics and (2) a fair price.

Prior to joining the Fool, he interned in the analytics department of the NBA's Atlanta Hawks, picked up an MBA and a master's degree in sport business management at the University of Central Florida, and earned a bachelor's degree in chemistry from the University of Florida. He enjoys learning, playing/watching sports, and cheering on his alma mater. (Go Gators!)

JP Bennett

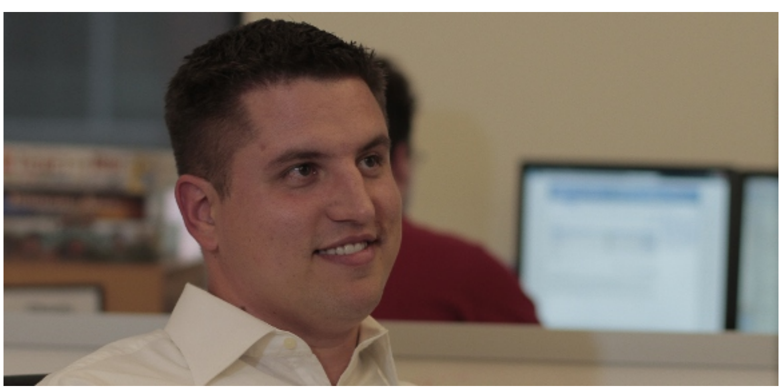
Research Analyst



JP Bennett (TMFYossarian) was once a doctoral student in psychology who thought that investing was destined to remain merely his favorite hobby. But following a career-changing epiphany, a very Foolish internship, and an MBA degree, he has returned to The Motley Fool to become a member of the *Pro* and *Options* teams. JP spends most of time researching companies and reading anything that might make him a better investor. He is also an avid runner and road cyclist, since these activities serve to counteract most of the negative consequences of his sedentary job and primary hobby (and also the fact that his favorite course of every meal is dessert). He is also a 2015 Level III CFA candidate.

Jeremy Myers

Analyst



Jeremy Myers, CFA (TMFTank) is a senior analyst for *Hidden Gems* and *Motley Fool Pro*. Jeremy joined The Motley Fool in 2009 after spending five years teaching ninth-grade biology and coaching football at a nearby public high school -- and, in his spare time, reading every investment book he could get his hands on. Jeremy attended the University of Virginia, where he majored in economics and spent two years as a member of the football team. After graduating, he started his career as an investment advisor for a large insurance company before returning to school to pursue a graduate degree in education.

As a devoted Fool since college, Jeremy developed a healthy skepticism for the financial establishment, which complements his deeply ingrained tendency to buy quality on the cheap. He also believes that the biggest advantage we have as individual investors is our ability to control our time frame and temperament. When he's not searching for the next 10-bagger, Jeremy can be found spending time with his young family, taking on home renovation projects that are over his head, or pursuing the elusive single-digit handicap on the golf course.

Ellen Bowman

Editor/publisher

Ellen Bowman (TMFKabellen) has been with The Motley Fool since 2006, first as a copy editor for Fool.com and then as an editor (and publisher, and chief bottle-washer) of various subscription services. She has worked on services from *Stock Advisor* to *One* and beyond, but considers *Pro* and *Options* "home." Ellen has a degree in creative writing from the University of Houston, and is amazed every day at how much a liberal-arts major can learn about investing when she has teachers like these!

Invest With Us

Part 2, Step 3: Go!

Published Oct 30, 2013 at 12:00AM

Ratings/Guidance Overview

For each of the holdings in the *Motley Fool Pro* portfolio, we will keep you updated on what to do — check out the "What to Do" column on our Recommendations page to see the Buy First, Buy, Hold, and Sell categories for all of our stocks and exchange-traded funds.

- **Recommended Allocation %**: If we were building a portfolio today, we'd invest this much (match us!).
- **Fair Value**: The price around which we think investors will earn a fair return for the risk taken.
- **Buy First**: Start here when building or adding to your portfolio. This is the best place for limited capital.
- **Buy**: After matching the Recommended Allocation % of the Buy Firsts, turn here next. We expect North Star-like returns or better over the next three years.
- **Hold**: This position is under review.

Make *Pro* Fit You

Check out the links on the Guidebook page to figure out how to buy the *Pro* investments given your personal situation. Consider it a choose-your-own-adventure: Figure out which category best applies to you, then follow along.

- **Free-Range**: You're new to *Pro* and able to follow every *Pro* portfolio move to a T.
- **IRA**: You invest predominantly through a tax-advantaged account that prohibits shorting and all but the simplest of options strategies.
- **No Complex Options**: You like to "Keep It Simple Stupid" and either aren't down with complex options strategies or don't have the requisite permissions.
- **Old Fool, New to *Pro* / Fully Invested**: You came from another Fool service or already have a fully invested portfolio of stocks.

Portfolio Building Reports

Our Portfolio Building Reports will get you invested in all the *Pro* stocks that are currently recommended as Buys or Buy Firsts. The first highlights our Buy First positions, the second addresses our Buys, and the Portfolio Positioning Report will help you align with our options and short positions. These updates will serve as your buy recommendations (we'll also link to our original buy reports, of course), so purchase these stocks to get started with *Pro*. You'll be getting some very good prices! They're available on the Guidebook page.

Catch-Up Trades

In most of our Monday Memos, we'll highlight a few trades that represent ways to get on board with *Pro* positions you're lacking. Typically, these will be ways to build positions in stocks we have on Hold. If you've got your own ideas, bring them to our Catch-Up Trades discussion board.

Our Most Current Thinking

The "What We Think Now" page holds our current thinking in brief on every position in the *Pro* portfolio, showing you where we stand on each of our investments right now, all on one page. Click here to see what we think now.

Part 2, Step 4: Keep Track

Published Oct 30, 2013 at 12:00AM

Measure Us

We all have different investing goals, but the bond that holds together all *Motley Fool Pro* investors is the desire to better control our financial lives (present and future) so that we can fully embrace life outside of our brokerage accounts. When you're trying to assess *Pro*'s performance, your goals are the best place to start: Is *Pro* helping you progress toward your financial goals? Are you learning and having fun? Are you sleeping well at night and able to enjoy your life outside of investing?

You can always find our results at the bottom of our Recommendations page. For something a little more detailed, try this on for size:

- **The Truest Way**: We'd like to help you double your money, taking inflation into account, every 10 years. In a nutshell, that is our North Star, an omnipresent fixture that offers us direction and reminds us what we're striving toward. If we are able to meet or approach this goal, it will mean that many Fools are achieving financial success.
- **The Simplest Way**: While you're likely most focused on whether your investment portfolio is achieving your goals, the investing community demands relative return comparison to a stock index. The most common stock indexes don't have much in common with our strategy, and we don't care much how any given stock index performs — but we realize many investors appreciate the reference point, and we cite the performance of the S&P 500 Total Return Index and the MSCI World Index on our Recommendations page.
- **The Risk-Adjusted Way**: Looking at returns in isolation is a dangerous game. For instance, it could be silly to compare two investments with completely different risk profiles, or two investments with completely different goals. We realize that the absolute level of returns is only one component in assessing the returns we achieve. A few of our favorite performance measurements, popular with academics, institutional investors (like pension plans), and hedge funds, attempt to adjust returns for the level of risk taken. Even though these measures are far from perfect (some assume returns conform to a normal distribution and/or that price variability is a good measure of risk, among other deficiencies), they shed some light on the outcomes of our investing process. We'll do the math for you from time to time and show you our score.

Measure You

Track your stocks using My Scorecard. My Scorecard is your personalized, one-stop shop for information about the stocks that matter most to you. It's part scorekeeper and part coverage collector. Enter your holdings, and it'll keep track of your performance and whether you're beating the market; enter more stocks you're interested in, and it'll help you follow your watch list.

Plus, My Scorecard brings together all of the premium Foolish coverage for your companies — updates, articles, discussion board posts, and more. You can filter this feed, below your list of stocks, to zero in on just the type of content you're looking for.

Unfortunately, My Scorecard doesn't yet handle options, but it's a great tool to help follow the stocks that you are long and short. Check out My Scorecard here »

The Furor, the Frenzy, the Earnings

Published Oct 28, 2013 at 4:00PM

Dear Fool,

As you may have noticed, we're once more in the thick of earnings season. Several of our *Pro* companies have already reported earnings, and 11 more (yes – 11!) of the names on our scorecard are set to report this week, beginning with **Apple** (NASDAQ: AAPL) today after market close. Some earnings reports have been surprisingly strong (see **Gentex** (NASDAQ: GNTX)), some have been boring and steady (see **Wells Fargo** (NYSE: WFC)), and some have been poorly received by the market (see **O'Reilly Automotive** (NASDAQ: ORLY)).

With such busy days ahead, I thought I'd take this opportunity to highlight a few things I'll be watching from the two companies I cover that are set to report this week:

American Tower (reports Wednesday)

1. The effect of recent acquisitions on the company's financials and leverage ratio.

There's been a lot of news from the tower industry this past quarter, with **American Tower** (NYSE: AMT) making two sizable acquisitions since the last earnings report in early August, and competitor **Crown Castle** (NYSE: CCI) recently resolving a big deal with **AT&T** (NYSE: T).

One of the key ratios for American Tower is its leverage ratio (calculated as net debt/EBITDA). American Tower has assumed a significant amount of additional debt in order to make its recent acquisitions, and I'm interested to see what the effect of the acquisitions will be on both components of the leverage-ratio equation. The earnings report and management commentary should sate my curiosity.

2. Rates of growth in international and U.S. markets.

The tower industry is currently in a growth phase, as wireless carriers race to improve their networks to keep up with fast-paced growth in end-user data consumption. Last quarter's growth rates were strong, with 12% and 32% year-over-year growth in U.S. and international revenue, respectively. Based on recent industry activity and carrier investment, I expect continued strong growth, and I also expect international growth to continue to outpace domestic growth.

AIG (reports Thursday)

1. Results from insurance operations.

Our investment thesis for **AIG** (NYSE: AIG) depends on continued improvement in performance from the company's insurance operations. The last two quarters have shown that AIG is executing as we expect; rates and pricing are on the rise, and the combined ratio (expenses as a percentage of premiums – ideally this is lower than 100%) is moving in the right direction. We'll see if AIG has been able to keep its insurance operations on track this quarter.

2. What's up with ILFC?

AIG has been looking to divest itself of its non-core aircraft leasing segment, ILFC, for some time. As detailed in last quarter's report, AIG has been trying to sell ILFC to a group of Chinese buyers, but it appears that may have fallen through. We'll likely hear news this quarter on what AIG plans to do with ILFC.

3. CEO Bob Benmosche's commentary.

Bob Benmosche has proven to be a shrewd operator in his time at AIG, completely transforming AIG's business and turning around its operations in admirable fashion. He also provides some honest and insightful commentary during the quarterly calls and investor presentations. Last quarter, I was encouraged by his comments on capital allocation, and it's likely he'll have some interesting things to say this quarter as well.

The *Pro* Bottom Line

So there you have it, Fools – two to three things I'll be watching from both of my companies reporting earnings this week. The boards should be plenty active in coming days with updates, insight, and commentary from the *Pro* team and the rest of the community – so get out there and join in the discussion!

Happy earnings season!

– Billy (TMFTailwind)

Pro Trade Roundup

- **Open Text** (NASDAQ: OTEX): We closed our November 2013 $70 calls for $8.10 per contract. We are still short November $65 puts.
- **The Buckle** (NYSE: BKE): We wrote eight December $45 puts for $1.30 per contract.

Coverage & Community

- Mistakes + *The Princess Bride* = winning discussion.
- Jeff reiterates that *Pro* will be *Pro* and may mention a stock he'd own for the next 30 years.

Buy to Close Your Written Calls on OpenText

Published Oct 22, 2013 at 11:45AM

Guidance Essentials

- **Action:** Prior to Oct. 30 earnings, buy ("buy to close") all previously written November 2013 $70 calls on **OpenText** (NASDAQ: OTEX). In doing this, we're uncovering our shares. We're leaving our written $65 puts alone.
- **Price Guidance:** Use a limit order, aiming to pay $1 or less in time value.
- **Share Price (Oct. 21 close):** $76.88
- **Call Price (bid/ask):** $7.50/$7.90 ($1.02 in time value at the ask)
- **Scorecard Status:** Buy
- **Fair-Value Estimate:** $81
- **Consider Adding More:** $65
- **Allocation:** We own 2.9%, plus we've written November 2013 $65 puts for another 2.4%
- **Alternative Trades:**
- **Have you written different calls?** If you've written $75 calls or calls that expire later than November, they will still have considerable time value, so you *may* be better off waiting to close those nearer expiration.
- **Not using options?** Continue to own 2.9% to 5.1% in OpenText stock without using options on it.

What's New?

Software provider OpenText will announce first-quarter 2014 earnings the evening of Oct. 30. Prior to that, we will be uncovering our shares – simply buying to close our existing covered calls. As the company's new fiscal year begins, our fair-value estimate has increased again -- this time to $81, or 14 times our estimated earnings for the year ending June 2014. This valuation is still conservatively lower than market multiples, so we don't want to cap our upside at today's price any longer.

Additionally, the *Pro* portfolio is changing, and we need to adjust for that. We're very likely to let our **3D Systems** (NYSE: DDD) shares get called away, and we're still angling to sell **StoneMor** (NYSE: STON) at a reasonable price before January. We've also set up a synthetic short on the **SPDR S&P 500** (NYSE: SPY). These defensive moves lead to a desire to remove some other hedges. As a small software provider that grew adjusted operating cash flow 31% in fiscal 2013, OpenText has the potential to significantly increase shareholder value over the coming few years and beyond.

For those keeping score (and we certainly are!), before today's action, we'd earned just more than $6 in option credits on OpenText. We'll give a few of our own dollars back in closing these calls (don't forget what they paid us originally), but we're also on track to earn more than a few dollars from the expiration of our November 2013 $65 puts (if we don't roll them for new income). Overall, our options are still on track to add roughly $6 to our OpenText profit so far, in addition to stock gains. And we're likely to write options on the company again -- most likely puts rather than calls.

Finally, closing our written calls prior to earnings isn't meant to suggest an opinion on the strength of quarterly results. We don't know what those will be; in fact, given that the government is a substantial OpenText customer, management will likely say the federal shutdown eliminated its ability to close some deals. But it's management's tone regarding the coming quarter and year that will guide the stock most. I do believe the company could perform better in 2014 than widely expected, given how the sales staff has recently been retrained, the young CEO is driven to succeed, and industrywide software sales have been weak for several quarters but will eventually pick up.

Next Step

- If you have questions about buying to close your November 2013 $70 calls, or anything related to this position, please visit the OpenText board.

See Pro's *holdings here. See the team's and David and Tom Gardner's holdings here.*

Are You Optimizing Your Life?

Published Oct 21, 2013 at 4:00PM

Dear Fool,

The Motley Fool's mission is "To Help the World Invest — Better." With around 300 full-time employees, the Fool's companywide values are:

- Collaborative
- Innovative
- Fun
- Honest
- Competitive
- Motley

For "motley," each employee chooses his or her own value, which is printed on a nameplate by his or her desk. Senior analyst Bryan Hinmon's motley value is "Better every day." Research analyst Billy Kipersztok's value is "Curiosity. Why?" My value is "Simplify ... to Amplify!" Our editor and content director Ellen Bowman's value is "Enthusiastic."

Combine these four motley values and the *Pro* team's bases are well covered. We're curious, and we like to ask why; we're enthusiastic about what we do, and we try to get better at it every day; and we seek to simplify (and focus on what counts) in order to amplify our results.

Coincidentally, all of our values are rooted in behaviors. Behavior, it turns out, is core to successful investing. Your temperament, your approach (are you deliberate or impulsive?), your outlook (optimistic or dour?), and your ability to stay the course all affect your investment returns.

We write about investing behavior often here in *Pro*, but we might as well be writing about life behavior, because the two go hand in hand. As we ponder our investing successes and failures, we should simultaneously ask ourselves, "Are we getting the most out of *life* that we can?"

In life and in investing, we want to maximize our current well-being and enjoyment, of course. But we also want (nay, need!) a *sustainable* approach that uses our time and energy efficiently — one that endures and improves over the long haul.

One of Bryan's favorite blogs is Farnam Street. It's new to me, but already this week I've found value in it. Among other posts, one titled "What can we learn from the science of high performance?" offered valuable reminders of some important guidance. To excel sustainably at anything, you need to:

1. **Develop healthy routines — in part to eliminate non-core decisions.** Good routines (including successful investing frameworks) compound into an enriched life,and allow you to make *fewer* trivial decisions. It's proven that every decision consumes energy, leaving you less able to make the next one. Like me, you likely feel this acutely during active times. So, in life, *cut all trivial decisions to a minimum*. I'm trying an experiment where I'm relinquishing non-pivotal decisions to others. If my wife and I go out to eat, what do I order? Nothing! I'll ask the restaurant to bring a dish they suggest. In business, **Google** (NASDAQ: GOOG) helps employees eliminate trivial decisions every day (including where to get lunch, and how or when to do laundry). President Obama only wears two shades of suits because he doesn't want to spend energy choosing what to wear. Did Steve Jobs have the same idea with his black mock turtlenecks and jeans?
2. **Focus; your daily routine should help you master your objectives.** Focus is instrumental to success. The blog offers these tips to help adhere to your healthy routines: Turn off all communication devices when you're doing work that requires thought. Remove any distraction. Do your creative work *first* in the day, and your reactive work second; your most important work should get your best energy. And finally, tackle your email in batches, during a set block of time, rather than leaving your email open all day.
3. **Practice.** Though experience helps a great deal in investing and elsewhere, deliberate practice is even more necessary to achieve mastery in most areas. There's a lot on this topic, so visit Farnam Street (the Oct. 15 entry) for details.
4. **Exercise.** Regular exercise leads to better cognitive performance in the realms of memory, reasoning, attention, problem-solving, and decision-making — not to mention more energy and better health.
5. **Rest.** Enough sleep is instrumental to long-term health and success.The amount may differ for everyone, but most studies suggest we need seven to eight hours minimum to maintain healthy cognitive function. Further, a new study suggests that our brains repair themselves greatly *only* during sleep.

To this list I would add a host of other ideas, including:

- You have less time than you think each day, so be ruthless in determining what's most important to achieve.
- Document your short- and long-term goals, and review them regularly.
- Aim for fulfillment in all areas of life (work, family, friends, etc.); otherwise you'll fail in more areas than you succeed.
- Foster productive routines, but break dull ones.

And a reminder: Don't cry for the moon. We can't have everything, and we'll never be perfect. We're aiming to do the best that's sustainably possible in every area of life.

And that returns us to values. What is David Gardner's motley value? Appropriately, it's "Excelsior. Ever higher." And Fool CEO Tom Gardner? His value is "Act like a monkey." That's another way of saying Tom's favorite motley value is *Billy's*: Stay curious; keep moving. When I spoke with renowned fund manager Chuck Akre, his biggest advice to me was: Stay curious; keep learning. It seems that all these Fools are on to something.

Have a curious week!

— Jeff (TMFFischer)

Pro Trade Roundup (from last week)

- **Write Puts on Tupperware Brands** (NYSE: TUP): Still pending for us (we may wait until after Oct. 23 earnings now that the puts pay so little)
- **Roll Your 2014 Calls on AIG** (NYSE: AIG): Still pending for us

- **Write Puts on The Buckle** (NYSE: BKE): Still pending for us
- **Papa John's Moves Back to Buy** (NASDAQ: PZZA): Buy 3.5% if you don't own it already

Pro Guidance Changes

- **Papa John's International** (NASDAQ: PZZA): Shares move to Buy from Hold. We have a 3.5% stake.
- **The Buckle** (NYSE: BKE): Shares move to Buy First from Buy on valuation. We own 2.8%.

Coverage & Community

- Following Bryan's Memo last week, members talk about risk management.
- We look at the early valuation of **Facebook** (NASDAQ: FB) compared to the early valuation of **Google** (NASDAQ: GOOG).
- Member nevercontent shares the results of his put-writing screen.

The Motley Fool owns shares of Google. See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Pro Position Update: Papa John's International

Published Oct 18, 2013 at 1:15PM

Papa John's International (NASDAQ: PZZA) has been on hold on the *Pro* scorecard for a long time now. Recently, analyst Bryan Hinmon (TMF42) reviewed everything about Papa John's as though it were a new position: Would we spend our hard-earned cash to add this stock to the *Pro* portfolio right now? His exhaustive research has led to a status change for Papa John's on our scorecard (it's now a Buy) and an uptick in both our fair-value estimate (to $73 from $60) and our Consider Adding More price (to $55 from $48).

We wanted to give you a look at Bryan's proposal to the team. You can download it by clicking here or on the green button below. Read it to see how he convinced advisor Jeff Fischer and research analyst Billy Kipersztok to go back out for PZZA. Or, if you just want the highlights: *Pro*'s current allocation to Papa John's is 3.5%, and we recommend that members match that allocation. We think the stock is a Buy at its current price, so if you have yet to add PZZA to your portfolio, consider doing so now.

Questions? Thoughts? Comments? Feedback? We're here for you on the delicious, savory Papa John's discussion board.

Click here to download Bryan's PZZA proposal!

The Motley Fool owns shares of Papa John's International. See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Write Puts on The Buckle

Published Oct 17, 2013 at 2:15PM

- **What We're Doing**: Writing puts for income, or to potentially add to our stake. (That said, we may roll our puts, if necessary, to target a net new buy price closer to our $41 "Consider Adding More" level. This trade is the first step, a stake in the ground that will pay us if shares hold up.)
- **What We're Thinking**: Poor single-month same-store sales in September will have little impact on the company's bright long-term future.
- **What We're Expecting**: Monthly results will be bumpy, but The Buckle will continue to open new stores; design, display, and manage its merchandise well; and operate wonderfully.

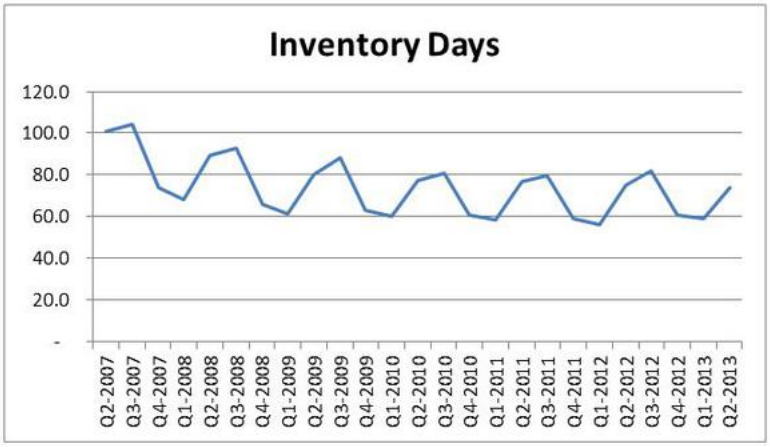
Trade Essentials

- **Action**: Sell to open December 2013 $45 puts on **The Buckle** (NYSE: BKE)
- **Allocation**: About 2%; we already own and recommend buying 2.9% in the stock, and today's put-writing recommendation gives us the potential for a total stake of about 5%. *Pro* will write eight contracts.
- **Share Price (Oct. 16)**: $47.79
- **Option Prices, bid/ask (Oct. 16):** $1.45/$1.50
- **Price Guidance**: Split the bid and ask, aiming for $1.45 or better. Over time, ideally accept no less than $1.20.
- **Alternative Trades**: If you don't yet have an allocation to The Buckle, we suggest you buy a 2.9% stake and write puts for another potential 2%. If your portfolio is less than $100,000, it might not make sense to write these puts. If that is the case, hang tight and see if we end up taking new shares by expiration (at which time you can buy shares directly). For a more conservative put write, you can choose the December $42.50 strike.
- **Be Aware of Special Dividends**: Historically, The Buckle has announced a special dividend between September and November; last year, it was $4.50 per share. There's no guarantee this will happen again, but if it does, the strike price of these put options will be reduced in accordance with the dividend. Here is the Options Clearing Corporation's Infomemo (PDF file) explaining how options were handled last year. If a dividend does come our way, we'll be sure to make sense of its impact (or non-impact, really) by spelling it out on the boards.

What's New?

Monthly same-store sales for The Buckle have historically been spotty, but over longer periods, the company demonstrates it can sling denim as well as Peyton Manning slings touchdowns. Over the last 10 years, The Buckle has scored flat or positive yearly same-store sales 10 times — that 100% completion percentage is enough to make Peyton jealous. The last decade doesn't promise us anything about the next one, of course, but it does suggest that management knows a thing or two about merchandising and creating a store experience that denim-loving debutantes (guys too) return to again and again.

September's sales performance was crummy, and growth has been decelerating since April — but we see no reason to believe those things are any indication that The Buckle has lost relevance with its customers or is losing its place among the operational kings of retail. The company's stores are still wonderfully profitable, and inventory levels (Inventory Days in the chart below) remain in check.



Source: Company filings and analyst calculations.

In short, consumer demand (in all its finicky glory) will ebb and flow, but we believe The Buckle will manage its business steadily. We're writing these puts to generate income; we would be comfortable taking shares, but at this point we assume our follow-up action on this trade will be to roll it if necessary. The Buckle remains a Buy First on our scorecard, and we think shares are worth $56.

How to Follow Along

Write ("sell to open") one December $45 put for every $4,500 in stock you'd be willing and able to purchase if the share price falls below $45 at expiration (and we choose not to roll). Use a limit order, splitting the current bid/ask. *Pro* will write eight contracts to potentially grow our 2.9% stake to around 5%.

- **Maximum return**: We make 3.2% in 64 days (18.4% annualized) if shares of The Buckle stay higher than $45 by expiration.
- **Breakeven**: We lose money by expiration if shares fall below $43.55, or 8.9% lower than where they are today.
- **Maximum risk**: If shares fall $4.24 to $43.55, our loss matches that of owning shares outright.

Next Step: Please post any questions on our The Buckle discussion board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Write Puts on The Buckle

Published Oct 17, 2013 at 12:00AM

- **What We're Doing**: Writing puts for income, or to potentially add to our stake. (That said, we may roll our puts, if necessary, to target a net new buy price closer to our $41 "Consider Adding More" level. This trade is the first step, a stake in the ground that will pay us if shares hold up.)
- **What We're Thinking**: Poor single-month same-store sales in September will have little impact on the company's bright long-term future.
- **What We're Expecting**: Monthly results will be bumpy, but The Buckle will continue to open new stores; design, display, and manage its merchandise well; and operate wonderfully.

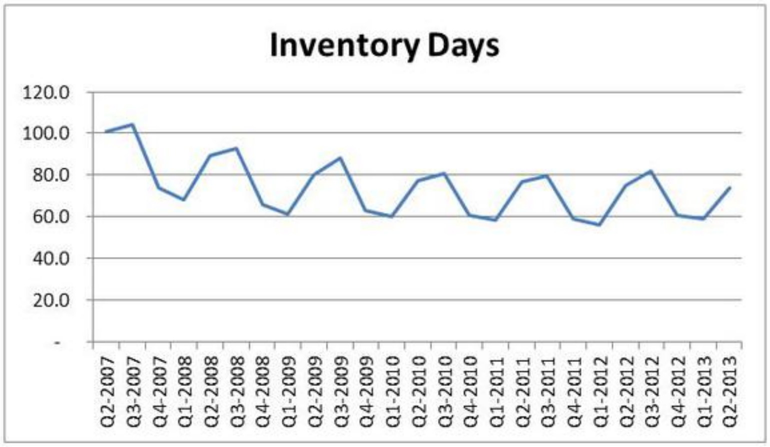
Trade Essentials

- **Action**: Sell to open December 2013 $45 puts on **The Buckle** (NYSE: BKE)
- **Allocation**: About 2%; we already own and recommend buying 2.9% in the stock, and today's put-writing recommendation gives us the potential for a total stake of about 5%. *Pro* will write eight contracts.
- **Share Price (Oct. 16)**: $47.79
- **Option Prices, bid/ask (Oct. 16):** $1.45/$1.50
- **Price Guidance**: Split the bid and ask, aiming for $1.45 or better. Over time, ideally accept no less than $1.20.
- **Alternative Trades**: If you don't yet have an allocation to The Buckle, we suggest you buy a 2.9% stake and write puts for another potential 2%. If your portfolio is less than $100,000, it might not make sense to write these puts. If that is the case, hang tight and see if we end up taking new shares by expiration (at which time you can buy shares directly). For a more conservative put write, you can choose the December $42.50 strike.
- **Be Aware of Special Dividends**: Historically, The Buckle has announced a special dividend between September and November; last year, it was $4.50 per share. There's no guarantee this will happen again, but if it does, the strike price of these put options will be reduced in accordance with the dividend. Here is the Options Clearing Corporation's Infomemo (PDF file) explaining how options were handled last year. If a dividend does come our way, we'll be sure to make sense of its impact (or non-impact, really) by spelling it out on the boards.

What's New?

Monthly same-store sales for The Buckle have historically been spotty, but over longer periods, the company demonstrates it can sling denim as well as Peyton Manning slings touchdowns. Over the last 10 years, The Buckle has scored flat or positive yearly same-store sales 10 times — that 100% completion percentage is enough to make Peyton jealous. The last decade doesn't promise us anything about the next one, of course, but it does suggest that management knows a thing or two about merchandising and creating a store experience that denim-loving debutantes (guys too) return to again and again.

September's sales performance was crummy, and growth has been decelerating since April — but we see no reason to believe those things are any indication that The Buckle has lost relevance with its customers or is losing its place among the operational kings of retail. The company's stores are still wonderfully profitable, and inventory levels (Inventory Days in the chart below) remain in check.



Source: Company filings and analyst calculations.

In short, consumer demand (in all its finicky glory) will ebb and flow, but we believe The Buckle will manage its business steadily. We're writing these puts to generate income; we would be comfortable taking shares, but at this point we assume our follow-up action on this trade will be to roll it if necessary. The Buckle remains a Buy First on our scorecard, and we think shares are worth $56.

How to Follow Along

Write ("sell to open") one December $45 put for every $4,500 in stock you'd be willing and able to purchase if the share price falls below $45 at expiration (and we choose not to roll). Use a limit order, splitting the current bid/ask. *Pro* will write eight contracts to potentially grow our 2.9% stake to around 5%.

- **Maximum return**: We make 3.2% in 64 days (18.4% annualized) if shares of The Buckle stay higher than $45 by expiration.
- **Breakeven**: We lose money by expiration if shares fall below $43.55, or 8.9% lower than where they are today.
- **Maximum risk**: If shares fall $4.24 to $43.55, our loss matches that of owning shares outright.

Next Step: Please post any questions on our The Buckle discussion board.

Roll Your 2014 Calls on AIG

Published Oct 16, 2013 at 3:30PM

Is This Trade for You? This trade should **not** apply to most members. As per our original trade alert, the official recommendation on this position is to own year 2021 warrants alongside your stock. That recommendation still holds, so if you own the warrants, **do nothing**. *Pro* was not able to buy the warrants ourselves, so we bought calls as an alternative. **We still recommend the warrants over the calls**. But if you can't buy warrants (say, they're not listed with your broker), you own calls instead, or you want to buy calls now, then read on.

Guidance Essentials

- **Company: AIG** (NYSE: AIG)
- **Scorecard Status:** Buy First. *Pro*'s official recommendation is a 4% equity stake and about a 1% stake in warrants.
- **Action:** Using a rolling order, sell ("sell to close") all previously owned January 2014 $25 calls, and simultaneously buy ("buy to open") the same number of January 2016 $30 calls (*Pro* is rolling all six of the calls it owns).
- **Share Price (Oct. 16):** $51.15
- **Option Prices (Oct. 16):**
  - **Sell to close Jan. 2014 $25 calls (bid/ask):** $26.05/$26.25
  - **Buy to open Jan. 2016 $30 calls (bid/ask):** $22.15/$22.50
- **Price Guidance:** You should be able to roll for a **net credit** of approximately $3.60 per call (our best guess), but because bid/ask spreads on the 2016 calls can get wide, you may want to try various (higher) credits and gradually move your limit lower until the trade fills. You have plenty of time over the coming weeks and months, so be patient.
- **Account Considerations:**
  - If you own the 2014 calls and execute this rolling trade, your 2014 calls will count as a realized gain in 2013 for tax purposes. If realizing the tax gain this year is undesirable, then simply wait until after Jan. 1, 2014, to execute this trade. (*Pro* has owned the calls for more than a year, so they count as long-term for us; check your start date.)
- **Alternative Trade**: If you don't invest in warrants or calls, simply buy up to 5% in AIG stock to match our total allocation.

What's New?

Nothing! Our stance on AIG has not changed. *Pro* owns calls rather than warrants because of tracking issues with our scorecard, but we still recommend owning AIG stock and AIG warrants (again: if you own the warrants, **do nothing!**). Since *Pro* can't own the warrants, we bought calls instead, and now we are rolling our calls because:

1. We want to continue our leveraged strategy as a proxy to owning the warrants.
2. Our owned calls are approaching their January 2014 expiration.
3. The 2016 LEAPS were listed on Monday.

This is simply a maintenance trade and does not reflect any change in thinking with respect to our position. Our 2014 calls have made us about 109% in just more than one year, while AIG stock is up about 48%. AIG continues to trade for less than book value, so we're happy to own shares and earn leveraged returns with calls, too (one more time, though: *warrants are preferred over calls* if you're able). AIG's next earnings release is set for the end of October, and we'll be watching to make sure our thesis is still on track.

Next Steps

- If you have questions about this trade, file your claim on the AIG board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Write Puts on Tupperware

Published Oct 15, 2013 at 3:30PM

What We're Doing: With this position, we're reestablishing our exposure to **Tupperware** (NYSE: TUP) with short puts that may let us buy shares lower.

Guidance Essentials

- **Action:** Sell to open November 2013 $85 puts on **Tupperware** (NYSE: TUP)
- **Allocation:** 3.2%. (If you already own 3% or more in the stock, you don't need to write these puts.) *Pro* is writing seven puts.
- **Prices (as of Oct. 15 12:30 p.m.)**
  - **TUP:** $87.20
  - **November 2013 $85 puts (bid/ask):** $1.80/$1.90
- **Guidance:** Sell to open for $1.80 initially. As prices change, ideally accept no less than $1.60, for a 1.9% yield in 32 days.
- **Considerations:** With the government still trying to battle out a budget deal, the next few days could make for volatile stock prices. Write puts before Thursday's potential showdown only if you're comfortable doing so. Or, hope for downward volatility and then write puts at better premiums. *Pro* can make its trade starting at 24 hours from issuance — so, late Wednesday at the earliest.
- **Alternative Trades:**
  - If you can't write puts, simply buy up to 3.2% in stock. Shares remain a Buy.

- If you'd like to be more defensive, sell to open January 2014 $80 puts, lately paying you around $1.70, or a 2.1% yield, or January 2014 $85 puts, lately $3.20.

What's New?

Our favorite direct seller of storage, preparation, and serving products for the kitchen and home is finding its offerings stacked in more and more cabinets around the world. In emerging markets, Tupperware is a growing premium brand. Emerging markets now account for 65% of Tupperware's annual revenue, and yet the company is only beginning to crack the lid on this long-term potential.

Optimism about the future has propelled management to buy back large amounts of stock this year, with more buybacks planned, on top of a dividend that grows with earnings. Revenue should grow 6% to 7% this year, while diluted earnings per share should climb around 11% (or 14% in local currency), to approximately $5.50 per share. Shares trade for around 15.9 times this year's expected earnings, and the $4.5 billion company is valued at approximately 18 times expected 2013 free cash flow of $250 million. The stock yields 2.8%.

Shares are no longer inexpensive, but they're still priced reasonably enough to merit a Buy rating from *Pro*. Our previously held shares were sold away by covered calls, so we're reinitiating our exposure to this unique, moderate-risk business — and we're hoping to regain shares a bit cheaper by writing puts.

How to Follow Along

Sell to open one put for every $8,500 in stock you would be happy to buy (about $8,320 net). Come the November expiration, if the stock trades below $85, we'll either accept ownership of shares or roll our puts to a later month to gather additional credits and target a still lower start price. Here are more trade stats:

Sell to Open:	November 2013 $85 puts
Bid/Ask:	$1.80/$1.90
Yield (at $1.80):	$1.80/$85 = 2.1%
Days to expiration:	32
Break-even (or potential buy price):	$85-$1.80 = $83.20
Recent share price:	$87.20
Difference to buy price:	4.5%

Next Step: Please visit our Tupperware board if you have any questions!

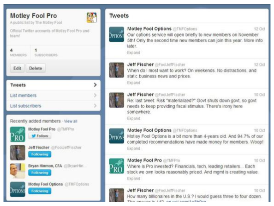
Risk Management for All Seasons

Published Oct 14, 2013 at 4:00PM

Dear Fool,

With so much great seasonal stuff to talk about (October baseball! Apple- and pumpkin-flavored desserts! Leaves on the hiking path!), I was shocked this weekend when a friend I was catching up with wanted to discuss the government shutdown. As usual, he wanted to pick my brain about investing, but this time his focus was on risk, and the shutdown had him spooked. Maybe you're in his shoes, or maybe you're just as excited about this topic as I was (read: not very). Either way, I'll tell you much of what I told him; I hope to ease your mind if you need it and reassure you if you don't, so we can get back to analyzing Big Papi's grand slam with no hard feelings.

We're Pros on Twitter



Follow the official accounts for *Motley Fool Pro* and *Motley Fool Options* — plus Jeff, Bryan, and Billy — all in one place on Twitter! Click here or on the above image for our *Motley Fool Pro* list.

What Is Risk?

Author and financial advisor Carl Richards (who stopped by Fool HQ last week) has a knack for simplifying complex concepts, usually by turning them into simple drawings. His definition of risk is "what's left when you think you've thought of everything." That isn't very comforting — but it is a pretty good definition. The sooner we accept risk as an unavoidable part of investing, the better we'll be able to behave when it presents itself. Where I think Richards' definition falls short, though, is that it presupposes that investors have taken basic measures to combat risk — that the "unknown unknowns" are all that remain. Personally, my definition of risk is "the permanent loss of capital that keeps us from achieving our financial goals." It's not nearly as pithy, and it's unlikely to get me a book deal — but I hope it's helpful.

Living to Play Another Round

The surest way to lose the financial game is not to play it. I once knew a boy named Bryan who got so upset about losing that, if it appeared his recess game of kickball would end in defeat, he was known to kick the game ball into the woods. He was too immature to realize that by doing so, he was throwing away any chance at a comeback and ensuring a much greater loss than just that afternoon game. I hope that poor lad turned out OK ... Anyway, the (stretched) investing parallel here: To continue to play the game (invest), you need a ball (an adequate rainy-day fund). Having some cash stashed safely ensures that even if your portfolio gets kicked into the woods from time to time, you still live to play another round.

Pro's Approach to Risk Management

Our approach to managing risk in the *Pro* portfolio is always evolving, but we generally assess it within the following buckets:

- **Company.** We're picky about the stocks we choose. We believe the business characteristics we seek out (strong competitive positions, compounding dynamics, and caring management) leave us with durable businesses unlikely to destroy value permanently. We also take care not to pay too much, and we monitor business developments to ensure our companies aren't engaging in value-destroying activities.
- **Portfolio.** *Pro* is a portfolio, so we think about how our individual holdings complement one another. We consider risk in terms of customer segments, key economic and business drivers, and obsolescence, and we try to diversify across those categories. We also manage risk by using tools (options and shorting) to change the risk-and-return profile of our portfolio, and by having a wide set of opportunities from which to choose complementary investments.
- **Behavioral.** Perhaps the most powerful risk-management tools we have are those designed to manage our behavior. We have a well-defined strategy, and our North Star provides a constant focus on combating loss of purchasing power. This framework provides a clear guide for our investing decisions. Finally, we have a commitment to communicate with you, the *Pro* community. While I like to think we're good at remaining dispassionate under fire, it helps to have to communicate our portfolio decisions publicly and address your discerning questions. Not only is it more difficult to misbehave with all of you watching, but tapping your collective knowledge helps us make better decisions.

The Foolish Bottom Line

Note that in this discussion of risk, we haven't cited volatility or cycles. Carl Richards would point out that investors can and do think about these things, so by his definition, they aren't risk. Stocks wiggle: that's a given. The economy wiggles: that's a given. Our government's refusal to compromise leads to a shutdown: recently, that's a given, too. Reframing the shutdown according to my definition of risk, the question becomes: Will it permanently impair the cash flows of the businesses we own? *Permanently* is the key word here. Even a temporary default or recession is unlikely to show lasting effects 10 years from now. In the end, I offered this bit of advice to my friend concerned with the shutdown: Instead of focusing on the supposed risk *du jour*, remain vigilant on sensible risk management (company, portfolio, and behavioral) — and go enjoy the delights of fall.

Onward,

Bryan (TMF42)

Pro Guidance Changes

- **The Buckle** (NYSE: BKE): We're moving The Buckle to Buy First. Short-term fashion and mall traffic fears are normal in this business — the company's business advantages haven't changed. (See more.)

Twitter Tweets With #LongTermPotential

Published Oct 7, 2013 at 4:00PM

Dear Fools,

By the time you gather with family and friends for a festive Thanksgiving, Twitter will likely be a public company. Anticipation is flying high, as it did for **Facebook**'s (NASDAQ: FB) IPO, but Twitter is a sparrow compared to Facebook's eagle, destined to debut at a much smaller valuation. And that's good! Both companies are in pursuit of the same thing: the advertising dollars that are starting to migrate to social media, where marketers can target audiences in unprecedented ways.

Each company has strong long-term potential, along with substantial risk. Both need to keep and grow traffic; both need tireless passion from employees; both need to show how social media is worthy of more and more ad dollars; and both need to stay sharp as the Internet evolves. Disruption of business models is a constant risk, and site visitors can drain away fast.

Twitter, What Are You?

Twitter seems to serve a niche between Facebook and **LinkedIn** (NYSE: LNKD). If Facebook is your portal for keeping up with friends and family, and LinkedIn is central to your professional life, then Twitter is where you refine your public persona and share with the world what matters to you. Twitter is a media and personality portal, where everyone is a personality with a voice. What makes the service so compelling is that you can follow anyone you wish, and anyone may follow you.

As a micro-blogging site, Twitter has inadvertently cultivated a news-breaking, real-time immediacy. Everyone from country presidents (including @BarackObama – 37.8 million followers) to Warren Buffett (@WarrenBuffett -- 656,000 followers) to the Dalai Lama (@DalaiLama – 7.8 million followers) uses the service to make announcements. (Then there's Justin Bieber, the biggest Twitterati at 45.5 million followers.)

Media outlets and publishers, sport franchises, charities, movie stars, and corporations have set up camp on Twitter, sharing news and events with followers in 140 characters or less. With a hashtag (for example, #greatstocks or #MotleyFoolPro), you can try to make a topic go viral on Twitter. And for a fee, you can run a sponsored "tweet" (Twitter's word for a post) to a mass audience. This is how Twitter makes most of its money. It also sells information about site usage.

Some question how Twitter can become a marketing force when advertisers need to make their pitch in 140 characters, but it's worth pointing out that ad banners and paid links on **Google** (NASDAQ: GOOG) often use less.

For comparison, here's how Twitter stacks up against Facebook and LinkedIn over the most recent reported trailing 12 months (TTM).

Metric	Twitter	LinkedIn	Facebook
Active Monthly Users	215 million	143 million (238 million users total)	1.15 billion
TTM Revenue	$448 million	$1.24 billion	$6.1 billion
TTM Operating Income	($98) million	$64.5 million	$1.9 billion
TTM Free Cash Flow	($46) million	$182 million	$2 billion
Market Cap	$9 billion to $12 billion est. at IPO	$26.8 billion	$123 billion
Price-to-Sales	20x-26x	22x	20.2x

Sources: Twitter S-1, S&P Capital IQ, Facebook and LinkedIn press releases.

And at What Price?

None of these companies is inexpensive; that goes without saying. But of the three, Twitter may have the most potential to compound (from a projected $9 billion to $12 billion IPO) over the coming 10 years. It has plenty of room to add users; it offers a universally applicable interface that's easy to join; it's an efficient way to follow your interests whether they're people or organizations (although that's the case on Facebook, too); and it's a compelling platform for those looking to build an audience.

As a result, the world is taking to Twitter with a vengeance. For example, countless websites link everything they produce to Twitter, and television shows and sporting events are enhancing programs with Twitter feeds. This viral phenomenon is building a powerful network effect around the business.

Lead the Way, Facebook

Adding to Twitter's momentum, Facebook is starting to forge a wide path for social advertising. Twitter may benefit from Facebook's efforts, and it could piggyback on those successes with its own twists on social marketing. Social advertising is in its infancy, and Facebook and Twitter stand to benefit most.

How High Is Too High?

It's unfortunate for all of us that leading companies like these no longer come public at $2 billion or less, as they did in the '90s: **Amazon.com** (NASDAQ: AMZN) was worth $438 million at its IPO and is up to $143 billion today, and **eBay** (NASDAQ: EBAY) ended Day One at $1.9 billion and is up to $71 billion today. The valuations given to leading IPOs these days tells us investors have gotten smart to the long-term potential. But Wall Street still gets it wrong much of the time, as **Groupon** (NASDAQ: GRPN), **Zynga** (NASDAQ: ZNGA), and so many other fallen IPOs attest.

Wall Street's excitement over any given IPO is proven justified only if there's still plenty of profit to enjoy later. Despite substantial share dilution, Google is up 700% since its 2004 IPO, to $290 billion in market value. Its IPO priced at $23 billion, and Google was widely considered overvalued then at about 10 times sales. Today's

Internet darlings tend to fetch a heady 20 times sales, but if Google had priced similarly, it still would have doubled a few times over the next decade (and maybe more, since it would have had more money at its disposal from its IPO).

If Twitter debuts at around $10 billion, there's no reason to think it will be the next Google. In fact, it almost certainly won't. But if it succeeds at what it does, it could compound investor value in similar fashion over the next 10 years. It will be a risky investment when it first takes flight, but we'll be watching the IPO and weighing our options.

Completed Trades

(See all past alerts.)

- **American Tower** (NYSE: AMT): We sold to open six Nov. 16, 2013, $72.50 puts for $1.50 each. This may increase our stake by about 2.5% to 5% total. The stock remains a Buy.
- **SPDR S&P 500** (NYSE: SPY): We set up a synthetic short, selling to open eleven Nov. 16, 2013, $170 calls, and buying to open eleven Nov. 16, 2013 $165 puts. We received a small net credit (averaging $0.04 each) to set up the trade.

Catch-Up Trades

- **American Tower** (NYSE: AMT): You can still write ("sell to open") Nov. 16, 2013 $72.50 puts for more than $1.50 lately. Follow our original recommendation.
- **SPDR S&P 500** (NYSE: SPY): You can still set up the synthetic short as recommended, per our Friday alert.

Set Up a Synthetic Short on the SPDR S&P 500

Published Oct 4, 2013 at 12:30PM

What We're Thinking: If the U.S. government is shut down for several weeks, then fourth-quarter earnings may be dampened by a lack of federal spending, lower consumer confidence, and less corporate activity (including delayed mergers, hiring, and spending). Although we remain calm and optimistic, we're initiating a new market hedge to account for the economic risks that grow a bit each day the government is bickering behind closed doors.

Guidance Essentials

- **Action:** Use a spread order (or custom order, or other order depending on your broker) to set up a Nov. 16, 2013 synthetic short on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
- **Allocation:** 10%. Initiate one synthetic short for approximately every $170,000 you manage. Or, using the non-standard mini-options that represent 10 shares rather than 100, set up one synthetic short for every $17,000 you manage. *Pro* will set up 10 or 11 contracts of the standard options (not minis).
- **Trade Details:**
  - **Sell to open:** Nov. 16, 2013 $170 **calls**
  - **Buy to open:** An equal number of Nov. 16, 2013 $165 **puts**
  - **Possible adjustments:** If SPY moves up or down before you trade, adjust your strike prices up or down to keep your cost neutral and your short call strike a few dollars above SPY's price. *Pro* will do this, too, when we're able to make our trade.
  - **Trade cost:** Near zero or a small credit. The cost will fluctuate with that of SPY (which is recently near $168), but adjusting your strikes if need be can lead to a near-zero cost.
  - **Exposure:** You're either agreeing to potentially short 100 shares ($17,000 worth) of SPY at $170 for every standard $170 call you write, or you're agreeing to potentially short 10 shares ($1,700 worth) of SPY for every $170 mini-call option you write.

The Big Picture

Nobody knows how long the first U.S. federal government shutdown in nearly two decades will last (the last closing, in 1996, lasted three weeks) — or how the market will react. Historically, one month after a shutdown ends, the S&P 500 is up 65% of the time, although the median gain is only 0.7%. The worst decline was 6.7% in 1978, one month after a 17-day shutdown. Our concern this time around: If the shutdown lasts more than a week or two, it could start to dent earnings at many companies in the now-under way fourth quarter.

How so? Well, foremost, the government is a big spender on technology, transportation, services and other industries, but it's not spending much money during the shutdown. Further, nearly one million government employees are not being paid, so they'll spend less the longer the impasse lasts. Additionally, lingering uncertainty from Washington may lower confidence at public companies and among consumers at large, slowing spending in the near term.

The shutdown began Oct. 1, the first day of the fourth quarter. The possibility of earnings being compromised grows with each passing day that Capitol Hill sits on its hands. So, rather than sit on *our* hands, we want to hedge the growing risk. Even if the government gets rolling again by the end of next week, it will likely take another week or longer for spending to get back on track. In other words, nearly a month of full federal spending could be lost from the quarter. If so, we're likely to begin hearing about this in mid-October as companies report third-quarter results and provide fourth-quarter guidance.

This November hedge (one of perhaps others to come) will take us through that time period and about a month beyond. *Pro*'s mission includes having gains in up and down markets, so rather than stare at this emerging uncertainty, we'll set up a hedge against it.

The Strategy

With the *Pro* portfolio about 75% long, this 10% synthetic short will bring us to about 65% net long. Make sure a hedge makes sense in your portfolio before following along. If you're already 35% cash, for instance, you probably don't need to hedge. (For more on hedging the *Pro* way, see this 2011 Memo.)

We've written about synthetic shorts since 2009, but we have not used them during a strong market. The strategy involves selling naked calls and using the proceeds to buy protective (or bearish) puts. With this trade, we're setting up a "split-strike" synthetic short — that means our call strike is higher than our put strike. This gives us a bit more breathing room on our naked calls, with a strike about $2 higher than the current ETF price. If the government makes nice soon, earnings will probably not be in danger, and we may be able to close our options without much cost (depending on how far the market jumps). If the shutdown drags out and the market keeps falling, our puts will be in-the-money soon. With SPY lately at $168, our $165 puts will be in-the-money on a 1.7% market decline. Our naked calls, meanwhile, will be in-the-money on a 1.1% market increase. If the ETF is between $165 and $170 at expiration, our synthetic short expires unused.

So, the possible outcomes:

- SPY is at less than $165 at expiration: Our puts have value; our calls expire, having financed our puts.
- SPY is between $165 and $170 at expiration: Our synthetic short expires unused; it hasn't cost us anything material (you may have even received a small credit setting it up).
- SPY is higher than $170 at expiration: We can roll or close our calls at a loss, or let them get exercised into a short of SPY. We'll cross that bridge.

You need a margin account to sell naked calls. Again, you can use the standard SPY options to represent a $17,000 short for each written call, or the non-standard mini-options that represent $1,700 each. Make sure you know which ones you're using! Minis are denoted by a "NS" at most brokers. And if you'd rather not write calls at all, please see the alternatives below.

Alternative Trades

- **IRA-friendly option: Just buy puts.** Although it would lately cost you about $230 per put, you could just "buy to open" the Nov. 16, 2013 $165 puts on SPY. You'll have a hedge with no further obligation and no extra risk if the market rises — other than what you invest in the puts. Only invest what you can afford to see go "poof" if SPY remains above $165 by expiration.
- **Short SPY directly.** We've been here before. If you want to short SPY directly, you can. It's a quick, liquid hedge. We're not shorting it this time because we like the modest-but-appealing 1.1% price cushion the synthetic-short strategy gives us, and we appreciate the automatic Nov. 16 deadline for our next decision.
- **IRA-friendly option: Set up a bear put spread.** Using a spread order, you can "buy to open" Nov. 16, 2013, puts and "sell to open" an equal number of puts at a lower strike. Your risk is capped to the net debit of your trade. For instance: Buy to open Nov. 16, 2013, $167 puts, lately around $2.88, and sell to open an equal number of $157 puts for about $0.90. On this net debit of about $2, you stand to make $8 if SPY declines to $157 or lower. If SPY remains above $167, your spread expires worthless. The most you risk is the $2 cost per spread. Feel free to use different strikes than provided here if you see ones you like better!

Next Step: To discuss or ask questions about this hedge, visit our SPDR S&P 500 board.

Pro One-Pager: Stocks We Like

Published Sep 30, 2013 at 4:00PM

Dear fellow Fool,

Happy Monday! In particular, happy Monday Memo!

As mentioned in a previous Memo, we at *Pro* are working on one-page strategy guides to efficiently summarize our approach to shorting, hedging, portfolio management, and other topics you're asking for. Today's Memo features the first of these guides (which I hope to improve with your input – more on that below). Its goal is to outline the core, long-term companies we like to own *most* in the *Pro* portfolio.

But before we jump into that, let's touch on the potential U.S. government shutdown. This morning, my colleague Ron Gross (the manager of the Fool's *Million Dollar Portfolio* service) shared some data from SentimenTrader that goes back to the 1970s. The takeaway: In 65% of cases, the stock market is *higher* one month after a government shutdown. In other words, the odds are better than a coin toss that stocks will soon shrug off this shutdown if it happens. We focus on earnings power at our companies, and only a long shutdown might start to crimp that for some businesses.

This said, given our mission (reiterated below), we don't take risk lightly. We're always considering our market exposure, and right now we're content with the 24% cash we're holding and the flexibility it gives us -- flexibility to, for example, buy more high-quality stocks that fit the criteria below if the market declines.

So without further ado, here's our first *Pro* One-Pager!

Pro One-Pager: Our Core Stocks

Motley Fool Pro's mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns that aspire to our North Star over every rolling three-year period, and double our real purchasing power every 10 years.

***Pro*'s North Star: Inflation (CPI-U) + 7% annually**

For core stock positions, where we seek to invest at least 3% to 5% of our capital, we prefer to see as many of the following strengths as possible.

1. We seek companies that consistently grow revenue and free cash flow with a sustainable competitive moat, represented by:

- Pricing power
- Stable or growing margins
- Switching costs for customers
- Barriers to entry for competitors
- Operating leverage inherent in the business (in other words, the company becomes more profitable as it grows)

2. Simultaneously, we seek companies that offer strong compounding dynamics, suggested by:

- A high degree of "naturally recurring revenue" that largely holds steady over economic cycles, in the process fueling long-term growth. "Naturally recurring revenue" can come in several forms:
  - Subscription-based revenue, as with software (**Oracle** (NYSE: ORCL)) or insurance (**AmTrust** (Nasdaq: AFSI)).
  - Transaction-based revenue driven by network effects, as with **MasterCard** (NYSE: MA) or **eBay** (Nasdaq: EBAY).
  - "Platform access" that is heavily relied upon and not easy to replicate (**American Tower** (NYSE: AMT), but also **Amazon** (Nasdaq: AMZN)).
  - Existing customer relationships with some shared dependency, as **Gentex** (Nasdaq: GNTX) has with many car makers. This is a lesser form of recurring revenue, but still meaningful.
  - Finally, repeating materials sales can qualify as "naturally" recurring revenue; **3D Systems** (NYSE: DDD) needs to sell as much printing material as it projects, while **Green Mountain Coffee** (Nasdaq: GMCR) counts on K-Cup sales.
- We also want to see free cash flow that grows more than revenue and supports multiple possible uses; in order of preference, those include reinvestment for organic growth, accretive acquisitions, dividends, and stock buybacks.
- Return on equity (ROE) of at least 14%, with ample opportunity to reinvest back into the business for more growth.
- A diverse and growing customer base.
- A product line or set of services that has lasting relevance and expansive possibilities.

3. We care about whether management cares.

- We prefer tenured, invested management (especially proven company founders), with incentive packages that drive long-term shareholder results.
- A company with below-average employee turnover suggests happy, productive employees.
- We like to see effective use of cash and debt over long periods.
- We seek a corporate culture that's open to shareholder scrutiny, with transparent disclosure policies.
- We admire a demonstrable ability to develop new leaders in-house.

4. We don't neglect the details.

- *Pro* prefers companies with a market cap of at least $500 million. We also demand a valuation (on business-appropriate measures) that provides a strong risk-to-reward ratio, with long-term compounding being the ultimate wish (although some stocks are shorter-term opportunities).
- Mid-caps ($1 billion to $20 billion) are a *Pro* sweet spot, and can be strong growers. But strong large-caps can compound value, too.
- We prefer U.S. companies with international opportunities.
- We prefer stocks that have options listed on them, but that's not required.
- We are currently seeking companies that could compound total returns at least 10% annualized, and grow with inflation, like our North Star.

Please let us know on the *Pro* Member Suggestions board what else you may like to see on this one-pager. We'll consider every idea, and respond. Remember, our topic for this one is not valuation; this is a guide to the qualities we like to see in a core *Pro* stock. We will offer a one-pager on the core valuation aspects we consider a bit later. Also, remember that not every stock we buy will have the qualities listed here; some stocks are special situations. For instance, we own some cyclical businesses, including **GrafTech International** (NYSE: GTI), in anticipation of an upswing.

In the end, we hope each one-pager will be a handy companion in your long-term journey to becoming a Foolish investing pro. To that end, once finalized, they'll also be available to print in a visually stunning PDF format (OK, "stunning" may be overselling it – but maybe not!).

Fool on,

Jeff (TMFFischer)

Completed Trades

- **WisdomTree Emerging Markets Small-Cap Dividend Fund** (NYSE: DGS): We sold to open four December 2013 $46 puts for $1.25 each, accepting today's price before our 30-day trade window starts to close. This nets us a 2.7% yield in 82 days. This position may increase our stake by 1% to 2.9% total, at a net $44.75 for these new shares. The stock remains a Buy.

Guidance Changes

- **Oracle** (NYSE: ORCL): Our fair-value estimate increases to $37.50 from $35.50. Our "consider adding more" level holds steady for now, at $30. We have a 4.4% position in this Buy First stock.

Coverage & Community

- Get our take on earnings from Oracle (or as we should say, America's Cup-winning Oracle!).
- Following last week's Memo, thinkingbig starts a good discussion on covered calls.
- Jeff visits an **Apple** (Nasdaq: AAPL) store in Maryland and finds phones all alone.
- ADrumlinDaisy's new chief investment officer, Sammie, makes her*Pro* board debut!
- Earnings are coming! TMFMoosie shares a calendar.

- Longing for still more put-writing ideas? Member nevercontent offers some independent possibilities.

Write Puts on American Tower

Published Sep 30, 2013 at 1:15PM

- **What We're Doing**: Writing new puts for income or to potentially add about 2.5% to our stock position (which would bring our total allocation to 5%).
- **What We're Thinking**: Our September written puts expired as income, and we want to keep the strategy going – writing puts to lower the effective buy price on a second helping of shares.
- **What We're Expecting**: Company fundamentals remain strong and will drive long-term performance, but other factors are clouding the near-term outlook.

Guidance Essentials

- **Action**: Sell to open Nov. 16, 2013, $72.50 puts on **American Tower** (NYSE: AMT).
- **Allocation**: About 2.5% more, enough to potentially bring our stake to 5%. For *Pro*, that means writing six contracts. Each new contract represents a $7,250 potential obligation.
  - **Recent Price**: $74.20
- **Option Price (bid/ask)**:
  - November 16, 2013 $72.50 puts: $1.60/$1.75
- **Price Guidance**: Use a limit order, aiming for $1.65 to start. As prices change, ideally accept no less than $1.50, for a 2% yield in one-and-a-half months.
- **Alternative Trades**:
  - If you don't yet have an allocation to American Tower, we recommend you buy a 2.5% allocation to match *Pro* (in round lots, if you can) and then write the November 2013 $72.50 puts for about $1.50 or better, representing about another 2.5% worth of shares. The stock remains a Buy.
  - If you're transacting in just one or two contracts and commissions are eating up your income, consider writing the January 2014 $72.50 puts. They currently pay around $2.90. If you'd like to be more conservative than *Pro*, consider the November $70 puts, which yield less but give you more breathing room if the stock price declines.

What's New?

In mid-August, American Tower's stock was being sold off along with the rest of the REIT sector, and we rolled our August written puts into September to continue our strategy (income and/or a lowered effective buy price). Since then, the REIT sector has remained in the doldrums, while American Tower has experienced a positive catalyst – a multi-billion-dollar acquisition of Global Tower Partners that confirms our investment thesis is on track. The acquisition also appears to be providing some positive momentum to the stock; since our last put roll in August, American Tower's stock is up 7.3%, while the S&P is up only 1.4%.

Although it appears that the market is finally beginning to de-couple American Tower from the rest of the REIT sector (and rightfully so, in our opinion), the pending "taper decision" from the Fed still looms on the horizon. Resulting pressure on REITs and other payout-focused assets remains a distinct possibility, and we still believe we'll be able to increase our allocation to American Tower at a great price at some point in the future. So far, writing puts has netted us about $4 in premium income; adding another $1.50 or better from today's put write, our effective buy price on our new shares would be around $67. In the meantime, we'll monitor American Tower's earnings (set to be reported Oct. 28) and keep an eye on what happens with **AT&T** (NYSE: T) as it looks to sell its tower portfolio.

Return Math:

- **Maximum return**: We make 2.1% in 46 days (about 16% annualized) on this put write if shares of AMT remain above $72.50. If that's the case at expiration on Nov. 16, we will have earned put premiums of $5.51, or nearly 8% of the capital we've risked since writing our initial August puts.
- **Breakeven**: We begin to lose money on this ongoing put strategy when shares fall below $67, or about 10% lower than where they are today. Considering just this iteration of the strategy, we'd begin to lose money if AMT fell below $71. Meanwhile, we own shares of stock already, too.
- **Maximum risk**: We're on the hook to buy shares if the stock price falls below $72.50 by expiration. If that's the case, we'll consider accepting shares or rolling to keep the strategy going.

Next Step: Please post any questions on the American Tower discussion board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Write Puts on American Tower

Published Sep 30, 2013 at 12:00AM

The acquisition also appears to be providing some positive momentum to the stock; since our last put roll in August, American Tower's stock is up 7.3%, while the S&P is up only 1.4%.

Although it appears that the market is finally beginning to de-couple American Tower from the rest of the REIT sector (and rightfully so, in our opinion), the pending "taper decision" from the Fed still looms on the horizon. Resulting pressure on REITs and other payout-focused assets remains a distinct possibility, and we still believe we'll be able to increase our allocation to American Tower at a great price at some point in the future. So far, writing puts has netted us about $4 in premium income; adding another $1.50 or better from today's put write, our effective buy price on our new shares would be around $67. In the meantime, we'll monitor American Tower's earnings (set to be reported Oct. 28) and keep an eye on what happens with **AT&T** (NYSE: T) as it looks to sell its tower portfolio.

Return Math:

- **Maximum return**: We make 2.1% in 46 days (about 16% annualized) on this put write if shares of AMT remain above $72.50. If that's the case at expiration on Nov. 16, we will have earned put premiums of $5.51, or nearly 8% of the capital we've risked since writing our initial August puts.
- **Breakeven**: We begin to lose money on this ongoing put strategy when shares fall below $67, or about 10% lower than where they are today. Considering just this iteration of the strategy, we'd begin to lose money if AMT fell below $71. Meanwhile, we own shares of stock already, too.
- **Maximum risk**: We're on the hook to buy shares if the stock price falls below $72.50 by expiration. If that's the case, we'll consider accepting shares or rolling to keep the strategy going.

Next Step: Please post any questions on the American Tower discussion board.

Building on Strength: Pro's Future

Published Sep 23, 2013 at 4:00PM

Dear Fools,

With the five-year anniversary of the *Pro* service approaching in early October, our portfolio is in a strong position – one we want to sustain, and grow from, over the *next* five years. As of Friday, the *Pro* portfolio had gained 23.7% this year; that's ahead of both our North Star (running around 11% annually) and (for context) the S&P 500, which was up 21.8% as of Friday.

Our results are especially pleasing given that we've carried hedges, shorts, and cash all year; in fact, we're currently about 24% cash. That means we've earned strong returns with lower-than-average risk and market exposure. We're about 70% net long at the moment, and that has been our rough average over the past five years, as well.

Since inception in October 2008, the *Pro* portfolio is up more than 80%, or around 12% annualized – again, a bit ahead of both our North Star and a strong S&P 500, even after accounting for our more defensive approach to investing. Let's not forget how much uncertainty existed over those years, and still does today!

We're happy with *Pro*'s progress over the past five years – but it's just the beginning. We're basically still on day one with the *Pro* portfolio and the service we dream of creating (and continually improving) for you. And The Motley Fool itself is anything but placid; at 20 years old this year, with a track record that's starting to demonstrate just how well the buy-to-hold philosophy truly works, the Fool, too, is just getting started.

On Deck

So what's next for *Pro*? First, we have a near-term agenda for our investments. Specifically, as we approach the final quarter of the year, we are seeking to:

- Hedge ourselves adequately for any market decline of more than 7%.
- Directly short companies that are losing their battles for success.
- Increase our **American Tower** (NYSE: AMT) position by writing new puts or buying shares (our $70 puts expired Friday as income).
- Likely roll our covered strangle on **OpenText** (NASDAQ: OTEX) to higher strike prices.
- Decide on our next move with our **3D Systems** (NYSE: DDD) covered strangle.
- Write puts on **Tupperware** (NYSE: TUP) or buy back our stock, which was called away early. Our fair value remains around $80, and the stock remains a Buy; members who own shares should sit tight.
- Reach new decisions on **Facebook** (NASDAQ: FB) and **American International** (NYSE: AIG) as our January 2014 calls on both companies reach their end.
- Invest more of our cash in strong companies with great competitive moats trading at reasonable prices. This is always on our agenda.
- Have a portfolio that is positioned for – and stands to benefit from – the likelihood of higher interest rates (and/or higher inflation).
- Short more **Direxion Daily Financial Bear 3x** (NYSEMKT: FAZ) and **ProShares UltraShort Real Estate** (NYSEMKT: SRS) to maintain our short exposure in these ETFs as they depreciate – or, write naked calls on FAZ to potentially short at higher prices.
- Short the **iPath S&P 500 Short Term VIX Futures** (NYSEMKT: VXX) ETN on a spike in volatility; or, when contango is steep, start a very small short position and add to it on volatility.
- We have not yet written our puts on **WisdomTree Emerging Markets Small-Cap Dividend Fund** (NYSEMKT: DGS), but we will do so within our 30-day window following the Sept. 11 trade alert, taking what we can get.

As you can see, we have a lot of activity ahead. This list (which is not exhaustive!) suggests at least 12 potential trades over the next three months, so watch your inbox. Additionally, earnings in October may shake out more opportunities.

Mid vs. Large?

Looking further ahead, I see the *Pro* port buying stock in more mid-sized companies. Giant companies have served the market well the past five years, and many of them will continue to provide healthy returns, but we often see greater long-term compounding opportunities with faster-growing, medium-sized leaders on Wall Street. We want to own more companies around the size of **Gentex** (NASDAQ: GNTX) ($3.7 billion), OpenText ($4.3 billion), and 3D Systems ($5.4 billion) – in some cases, even smaller. While behemoths such as **Oracle** (NYSE: ORCL) ($155 billion) will continue to serve as bedrocks of the portfolio, it's the mid-caps that will likely lead much of our charge higher in coming years.

Covering Upside?

This is partly the bull market talking, but I expect *Pro* to use even fewer covered calls over the next five years than we have in the past. Unless they pay very well, and unless they're used as an ongoing, dedicated strategy on specific positions, covered calls provide relatively small rewards for a portfolio our size, and they can cap our upside on substantial amounts of capital. Fortunately, we can use positions like bear call spreads to earn returns that emulate those of covered calls, but leave us free to sell our stock at will, without limiting upside.

Bottom Line: It's All Good!

Pro is in a strong position after our first five years. This gives us a great foundation to build on as we work to continually improve and make still better choices over the next five years. Thank you for being a *Pro* member! And thank you for your suggestions for our forthcoming *Pro* guides, too – please keep your ideas coming. Finally, if you have any comments about this Memo, please visit the Memo Musings board.

Fool on!

– Jeff (TMFFischer)

Catch-Up Trades

- **iShares Russell 2000 Index** (NYSEMKT: IWM): If you never set up our put ratio spread and want one, follow our past trade alert's general guidance, but use different strike prices. Sell to open Nov. 16, 2013, $95 puts, and buy to open Nov. 16, 2013, $100 puts (in a 2:1 ratio). Lately, you need to pay a net debit of about $0.11 per spread to set this up. Your protection starts at $100 on IWM, and you're also on the hook to potentially buy shares of IWM at a net $90. IWM is lately around $107.

Coverage & Community

- *Pro* is nearly five years old! And thanks to Morgan Housel, today you can relive many key headlines from the past five historic years.
- As **Apple** (NASDAQ: AAPL) sold a record 9 million-plus iPhones over the weekend, *Pro* members were discussing the new operating system (and loving it, for the most part).
- Member nevercontent shares his list of potential put-writing trades (cool dragon included!).
- TMFMoosie's calendar gives us a peek ahead at our earnings deluge on the way.

See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

722 Mastications and Buying in Thirds

Published Sep 16, 2013 at 4:00PM

Dear Fools,

Insanity, I tell you! At some point when you were a kid, a well-meaning person probably advised you to chew each bite of food 32 times for better health. Plenty of us still live by that advice — even if we aren't quite sure why. Turns out the idea originated in the late 1800s with British Prime Minister William Gladstone, who was a fine statesman ... but not a doctor. I was reminded of this "rule of 32" by a recent conversation on our *Pro* discussion boards about a certain investing rule of thumb, one that plenty of investors may also adhere to without fully knowing why: buying in thirds. Let's chew on this topic for a few hundred words.

The Real Magic of Buying In Thirds

Buying in thirds just means dividing each stock buy into three transactions. There is nothing inherently magical about that; the real power comes from the action, which reinforces some very simple, and very critical, Foolish investing beliefs. Specifically:

- **You can't time the market.** Neither can I. Unfortunately, academic research and a lot of red ink on brokerage statements support this assertion. Because of this, whenever we choose to buy a stock, only luck will allow us to nail the precise bottom. And while the stock might trade higher in the subsequent days and weeks, it might also trade lower; our very-short-term predictions are about as accurate as a coin toss. Committing to buy in thirds makes the timing of any single purchase less important, so we waste less time and energy fretting about each penny or nickel and keep our focus on the time frame that really matters — the long term. Win.
- **Own the stocks of great businesses.** Have you ever bought a crummy business because you thought it was cheap, watched its price get halved (making it even cheaper!), then found yourself too scared to buy more? Now imagine buying a *great* business you think is cheap, then watching *its* price fall by half. In that situation, is it easier to pull the trigger and buy more? Absolutely. When you commit to buying in thirds, you're likely to choose higher-quality businesses, whether you realize it or not. That's because if the price of a great business falls, it's much easier emotionally to go through with additional purchases. This also makes it easier to add to winners whose prices have started to rise. Another win.
- **The math doesn't lie.**Mathematically, stock returns are determined by three factors: the purchase price, which we control; any intermittent cash flows, which are uncertain; and the selling price, which is uncertain too. Mathematically, that looks like this:
  - [Return = (Sell price – Buy Price + Cash Flows) / Buy Price]
  - We control only one element in this formula: the buy price. The surest path to a high return is to buy as low as possible; buying in thirds encourages the practice of adding to our initial position, even when it has fallen, which can lower our cost basis. Yet another win.

So Why Doesn't *Pro* Buy in Thirds?

With all these wins stacking up, why doesn't *Pro* buy in thirds? First, there's a very practical consideration: Doing so would triple the time we spend writing up, editing, assembling, and distributing recommendations, which seems like a suboptimal use of our time. Because we value that time, we'd prefer to get paid for committing to another purchase instead, which is one reason we're so fond of writing put options to add to our positions. Also, we have a different tool to reinforce our Foolish investing beliefs: our community. Being active and involved on the discussion boards ensures that we're constantly clarifying the *Pro* way of investing. Conversing with members keeps our philosophy front and center for us at all times — and that means other rules of thumb (like buying in thirds) can recede a bit for us, because we're actively reinforcing our beliefs every day, on the boards, with our members.

The Foolish Bottom Line

It's natural to think that if splitting your buys into thirds is good, splitting your buys into fifths — or tenths! — must be even better, right? Well, let's go back to chewing. The economic nutritionist Horace Fletcher believed chewing should continue until each bite liquefies. He wrote: "One-fifth of an ounce of the midway section of the young garden onion, sometimes called 'challot' [sic], has required 722 mastications before disappearing through involuntary swallowing." Fletcher believed that chewing to liquification optimized nutrient absorption and aided digestion, at the small cost of just 10 minutes per shallot. Every choice we make has trade-offs, and considering the time, money, or jaw soreness on the other side of each choice should keep us from going to extremes.

How you choose to reinforce your investing beliefs and carry out your strategy is up to you. But I can promise that *Pro* will never recommend chewing any meal, *or* any investment, 722 times.

Onward,

Bryan (TMF42)

Care to discuss your chewing habits or buying in thirds? Bring your comments to the Memo Musings board.

Completed *Pro* Trades

- **Tupperware Brands** (NYSE: TUP): This weekend, *Pro's* short October $75 call options were exercised early, resulting in the sale of all 700 Tupperware shares. Despite this, the stock remains a Buy on our scorecard, and we're assessing our options to consider a new position.

Pro Catch-Up Trades

- **Wisdom Tree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS): We recently recommended writing puts for another 1% of DGS, ideally aiming to get paid at least $1.50. Right now, we would need a good dip to get that price, but we're waiting for it a bit longer ourselves. If you don't write puts, match our allocation by boosting your stake to 3%.

Write Puts on DGS

Published Sep 11, 2013 at 3:30PM

Guidance Essentials

- **Action:** Sell to open December 2013 $46 puts on **WisdomTree Emerging Markets Small-Cap Dividend Fund** (NYSEMKT: DGS)
- **Allocation:** We own 2% in stock already (match us if you haven't yet done so). We will write puts to add 1% more in the stock, for 3% total. *Pro* will sell four puts to potentially buy 400 more shares.
- **Prices (as of noon, Sept. 11):**
  - **DGS**: $46.78
  - **December 2013 $46 puts (bid/ask):** $1.55/$1.85
  - **Guidance:** Aim to sell to open for $1.70 initially. As prices change, ideally accept no less than $1.50, for a 3.2% yield in about 100 days.
- **Alternative Trades:**
  - If you can't write puts, simply buy 1% more in stock, ideally at less than $47, bringing your total allocation to 3%.
  - If you'd like to potentially get shares sooner, sell to open October 2013 $46 puts instead, lately paying around $0.90, or 2% in just over a month.

What's New?

The U.S. stock market has outperformed most others around the world over the past one, three, and five years, clobbering World Market indices — including emerging markets. Rather than lament this state of affairs, the *Pro* team responded by reassessing our allocation to emerging markets, which currently stands at just 2%. The result? We see an opportunity to increase that allocation, initially by writing puts on **WisdomTree Emerging Markets Small-Cap Dividend Fund** (NYSEMKT: DGS). We *want* to invest in promising areas when others are selling, and billions of dollars have fled emerging-market stocks this summer.

When the U.S. Federal Reserve suggested it would begin tapering down its stimulus programs later this year, rapid devaluation of many foreign currencies followed, making those countries' dollar-denominated debts more expensive. Emerging-market pundits are screaming "fire," but we believe that — as is usually the case — the emotional reaction is wrong. Overall, GDP and income per capita continue to rise in our ETF's targeted countries (see below for a list), and we expect leading small businesses to grow, too. That should eventually lead to share price appreciation, a reversal of fortunes over the last three years:

ETF Returns (to Sept. 11, 2013)	5-Year	3-Year	1-Year
WisdomTree Emrg Mkt SmallCap Div (DGS)	29%	(1%)	2%
Vanguard Emerging Markets (VWO)	8%	(4%)	(1%)
S&P 500 (SPY)	36%	52%	17%

Source: Google Finance

Over the past five years, DGS performed very well compared to other emerging-market funds, and nearly kept pace with a torrid S&P 500. But in the past three years, or roughly the time we've owned it, emerging markets have fallen as the S&P 500 gained 52%. Such a vast divergence should not last if the fundamentals of the "losing" investment remain intact, as we believe is the case with DGS. After all, emerging markets now account for more than half the world's GDP, and growing.

The latest data available (from June 30, 2013) evaluated our ETF at $46 (nearly the same as today's price). It trades at only 12 times trailing earnings, 1.5 times book value, and 0.9 times sales. And the ETF's dividend yield is well above average, and likely to continue to hug 3% to 4%. For a valuation comparison, the small-cap index in the U.S. — the **iShares Russell 2000** (NYSEMKT: IWM) ETF — trades at 28 times earnings and nearly 4 times book value as of Aug. 30. And that valuation caps book value multiples at 25 and excludes companies with negative earnings. Emerging markets should receive a discount to their less risky U.S. counterparts, sure — but *this* discount is pronounced. More importantly, the small-cap stocks in our ETF are inexpensive enough on their own that we're happy to increase our exposure either through put writing or (an alternative trade) a direct purchase.

As of Sept. 10, here's where DGS is concentrated. The list has not changed drastically since 2010, although Taiwan exposure is up from 20% when we first bought (we keep an eye on Taiwan):

Country	ETF Weight
Taiwan	26.7%
South Korea	9.7%
Malaysia	9.6%
South Africa	9.3%
Brazil	8.4%
Thailand	8%
China	6%
Chile	4.9%
Turkey	4.7%
Poland	3.6%

Source: WisdomTree

How to Follow Along

Sell to open one put option for every 100 shares of DGS you want to buy at a net purchase price of around $44.20 to $44.50 ($4,420 to $4,500), up to 1% in new shares, or 3% total if you lack DGS exposure today. (Or, buy 2% and write puts for the last 1%.) If you're not using options, simply buy shares up to 3%, ideally below $47.

Why are we writing puts rather than buying outright? For a basic reason: The Fed's tapering action is set to begin within weeks, and emerging markets are likely to remain volatile. Thus, we believe we can eventually nab a lower price by writing near-the-money puts until we get shares. Today's puts could result in a 5.3% lower buy price. But we also believe those buying shares today will be rewarded in the long run.

For the record, we're willing to eventually invest 4% to 5% in this ETF if it continues to be managed well and pricing remains favorable. So today's step up to 3% may not be our last.

Next Step: Please visit our DGS discussion board if you have questions!

A Pro Guide Gala

Published Sep 9, 2013 at 4:00PM

Dear Fools,

Over at our sister service, *Motley Fool Options*, I recently started a new initiative: writing a single-page reference guide for each strategy the service employs. To get the ball rolling, I asked members (that means you! As you may know, *Pro* members get free access to *Options*) for suggestions on what these guides should include. The first draft of our first guide, on writing puts, is now being edited to include those ideas. Single-page guides to our other option strategies will follow, each one intended to serve as a concise complement to our longer guides in Options U. We hope members will find these one-pagers to be tactical, handy companions on their investing journey.

What does that have to do with *Pro*? Well, on ourPhilosophy & Strategy discussion board, member connie137 recently asked for more guidance on how *Pro* invests. The in-depth *Pro* Guidebook on our site includes a good look at our investing strategy — including our North Star and seven qualities we seek in strong companies. But I think it's time to concisely outline how we approach investing across the board, with succinct guidance on shorting, hedging, and the use of options in a stock portfolio.

To address this, I'm planning to write several single-page guides outlining *Pro's* multi-pronged approach — and as with *Options*, I'm seeking your input. Which topics do you feel need to be addressed with short, informative *Pro* guides?

To get us started, here's my initial list of single-page *Pro* guides to write:

- *Pro*'s Investment Objective
- Winning Core Investments
- Cost-Efficient Hedging
- Successful Shorting
- Options as Tools
- Allocation & Exposure

The first topic, "*Pro*'s Investment Objective," is self-explanatory: What is our investment goal? How are we different? "Winning Core Investments" would outline the qualities we seek in companies we buy for the long haul. Next up, the ways we like to hedge, followed by shorting, options, and finally a guide to allocation and exposure.

One challenge will be to keep these short, but I know it can be done. We'll channel Steve Jobs and Google and keep to the point. Chuck Akre's investment site is also an excellent example: In just three short pages (actually three *half*-pages!), Akre Funds outlines its philosophy, stock selection, and portfolio construction process. (If you follow the link, you can see them on the left sidebar there.)

We'll want our *Pro* one-pager guides to be just like that: concise but very helpful. But first, let's make sure we're writing about the right topics! If you can take some time this week to think about it and share your thoughts — tell us what you want covered by brief guides — on the *Pro* member suggestion board, the team would greatly appreciate it.

Thank you! I'll start working on the list above soon, once it has been edited and updated with your thoughts and desires.

Also This Week

Among other possibilities, this week we'll share a decision on whether to add more **WisdomTree Emerging Markets Small-Cap Dividend Fund** (NYSEMKT: DGS) to the portfolio. The ETF has declined below our "consider adding more" price as investors fret about emerging markets. With our longer-term outlook on this investment, we aren't feeling their angst.

Fool on!

— Jeff (TMFFischer)

Completed *Pro* Trades

- **iShares Russell 2000** (NYSEMKT: IWM): We set up a 5% put ratio spread by selling to open 20 November 2013 $91 puts and buying to open 10 November 2013 $96 puts. We set it up for a net credit of $0.02 each.

Pro Catch-Up Trades

- **iShares Russell 2000** (NYSEMKT: IWM): You can still set up last week's recommendation — this morning for a credit of $0.03 per spread.

Coverage & Community

- **American Tower** (NYSE: AMT) gets all "spendy" and buys another tower company for billions. We'll assess the purchase, and we may write new puts if our Sept. $70 puts expire as income.
- Members ask for details on our IWM hedge and its timing — so Jeff answers.
- TMFVenus announces the first *Pro* Foolerang contest winners!
- Just as compounding sneaks up on you, numbers aren't always what they appear to be. See how much we've made on IWM hedges so far, and how DGS has really done for us.
- Member nevercontent posted a new list of option ideas from his experimental screen.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Set Up a Put Ratio Spread on IWM

Published Sep 5, 2013 at 11:15AM

- **What We're Doing:** We're creating a market hedge that will reward us if this small-cap index declines more than 5.7%, but won't cost us anything if the market keeps rising.
- **Who Should Follow Along:** We hedge to smooth returns during market declines. You don't need to hedge to succeed with *Pro*, but if you want to -- and can write naked put options -- then you should follow along. Those who can't write naked puts should consider Alternative Trades at the end of this report.

Trade Essentials

- **Action:** Use a spread order to set up a put ratio spread on the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF.
- **Allocation:** 5%. Set up one 2:1 put ratio spread for every $180,000 you manage; *Pro* will sell 20 puts and buy 10.
- **Price Guidance (all prices as of Sept. 4):** Seek a small net credit.
    - Write ("sell to open") two Nov. 2013 $91 puts, and simultaneously buy ("buy to open") one Nov. 2013 $96 put for every $180,000 you're hedging.
        - Sell to open two Nov. 2013 $91 puts: $2.02
        - Buy to open one Nov. 2013 $96 put: $1.93 (prices will change, but just aim for a small credit)
        - Net credit: $0.09 per spread
        - IWM price: $101.80

The Big Picture

Longtime *Pro* members (hello out there!) know that since 2011, we've set up several put ratio spreads on the **iShares Russell 2000 Index** (NYSEMKT: IWM), an ETF that tracks the 2,000 smallest companies in Russell's universe. It's liquid and more volatile than the S&P 500, making for an effective hedge. This trade has handed us profits a few times during market declines, and hasn't hurt us when prices climbed -- a key advantage of a put ratio spread.

The only catch is that -- as with any put-writing trade -- you need to be ready to buy the underlying investment (IWM, in this case) if its price falls enough. In this case, our break-even is about 16% lower than the current price – a healthy cushion on a large index. But it's also worth noting that this hedge doesn't benefit us at expiration unless IWM is at least 5.7% lower. That's by design; as we often say, there's little to be done about small market declines (say, 5% or less), but we want to consistently hedge against larger ones. This hedge will reach its maximum profit if the index declines 10.6%.

Finally, this is the first hedge we're setting up for autumn. It's a small first step. Another may soon follow. Here's how this one would play out at various index prices.

Return Details

iShares Russell 2000 Index ETF Price at Expiration	Value of 1 Purchased $96 Put	Value of 2 Written $91 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%) From $101.80

iShares Russell 2000 Index ETF Price at Expiration	Value of 1 Purchased $96 Put	Value of 2 Written $91 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%) From $101.80
$96 or higher	$0	$0	$0.09 per spread (or the credit received initiating the trade)	Any increase in price, or any decline of less than 5.7%
$95	$1 x $100 = $100	$0	$100	6.7%
$94	$2 x $100 = $200	$0	$200	7.7%
$93	$3 x $100 = $300	$0	$300	8.6%
$92	$4 x $100 = $400	$0	$400	9.6%
$91	**$5 x $100 = $500**	**$0**	**$500** (max profit)	**10.6%**
$90	$6 x $100 = $600	($1) x 200 = ($200)	$400	11.6%
$89	$7 x $100 = $700	($2) x 200 = ($400)	$300	12.6%
$88	$8 x $100 = $800	($3) x 200 = ($600)	$200	13.6%
$87	$9 x $100 = $900	($4) x 200 = ($800)	$100	14.5%
$86	**$10 x $100 = $1000**	**($5) x 200 = ($1000)**	**$0** (break-even)	**15.5%**
$85	$11 x $100 = $1100	($6) x 200 = ($1200)	($100)	16.5%

The bolded lines above show that our maximum profit will be earned if IWM declines 10.6% from its recent price, to $91, by our November option expiration. Our break-even on the strategy is $86 per share.

Assuming we set this up for a credit, the trade will result in a small profit even if the market rises or treads water. But you must be ready to fulfill the $91 put obligation if the market falls more than 10%. Depending on the situation, we'll either happily start a 5% allocation in the small-cap index then, or look at rolling our strategy to future months if we wish to avoid buying shares.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts:**
  - For a cost, you can set up a **bear put spread**, a strategy with capped risk that most IRAs allow. Using a spread order, "buy to open" November 2013 $96 puts, and "sell to open" *an equal number* of November 2013 $91 puts. Recently, this will cost you around $0.93 ($93) per spread, and that is your maximum risk. This strategy could pay you up to $4.07 ($407) per spread on a market decline to $91 or lower, but you should be prepared to lose your $0.93 if the market doesn't decline enough. As with any market hedge that you pay to set up, you have to *expect* to lose your investment most of the time, especially on a hedge that only kicks in after a nearly 6% decline.

- **To lower your market exposure while following our official trade (and make it possible in some IRAs):**
  - Set up the original put ratio spread as recommended, but also "buy to open" half as many November 2013 $86 puts as the $91 puts that you write. So, if you write 20 puts at $91 and buy 10 puts at $96, then also buy 10 puts at $86. This caps the downside in your previously uncovered $91 puts, and limits the capital required to hold the trade. The $86 puts cost about $0.50 lately, making the cost for the entire position (the put ratio spread plus these protective puts) about $0.41 per contract – that is also the most you can lose.

Football Fanatics and Passionate Communities

Published Sep 3, 2013 at 4:00PM

Dear Fools,

This past weekend marked the opening salvo for college football teams across the country, soon to be followed by the NFL this coming Sunday. To honor the occasion (and because I'm both a Florida alum and a huge sports nut), I ventured out to the local "Gator bar" here in D.C. — a cramped, three-story dive in the heart of Capitol Hill. On Saturday afternoon, the typical dingy atmosphere was replaced by legions of orange-and-blue-clad fanatics, all joyfully watching our team beat up on Toledo (sorry to any Rockets among our membership ...).

A day earlier, in different clothing, this group of people might never have interacted. But on this Saturday, we were gleefully high-fiving, sharing buckets of wings, and joining arms and swaying in unison at the end of the third quarter.

The Value of Community

The pageantry and the camaraderie of that experience reminded me strongly of the community we're lucky enough to be a part of here at *Motley Fool Pro*. True, we may not be as nonsensical, rambunctious, or ridiculous as a group of Gator fans who have been drinking beer since 10 a.m. But some other characteristics are more similar: a sense of loyalty, support for one another, and a connection to a community that is bigger than ourselves.

I've written more than once on our discussion boards about how impressed I am with the community atmosphere that's so apparent at *Pro*. I strongly believe that the process of investing is greatly enhanced by a knowledgeable, grounded, and diverse community. Each individual brings a unique perspective, knowledge, and set of experiences to the table. And while all that input comprises but a drop in the bucket of valuable investing information, as the size of the community grows — and more people provide their "drops" — the bucket inevitably begins to fill.

The Foolish Bottom Line

The beginning of the college football season gave me an opportunity to reflect on the concept of passionate and engaged communities (and also gave me a reason to throw in a plug for my Gators!). Real football fans don't care whether their team is a perennial championship contender or a perpetual basement-dweller; they stay loyal to the team and to the community. And while *Pro* members may not don lucky Jeff Fischer jerseys or bellow stadium-filling "Go *Pro*!" chants (or do they?), this community sticks together, too — working in mutual pursuit of our goals whether our investments and/or the market are up, down, or flat.

If you've yet to participate on our discussion boards, I feel like you're missing out on what may be the most valuable part of the *Pro* experience. Come comment on the Memo Musings board, do some exploring, and see for yourself what I'm talking about — then tell me why the Gators are bound for glory.

Fool on!

— Billy (TMFTailwind)

Smiling Under the Redwoods

Published Aug 26, 2013 at 4:00PM

Dear Fools,

Labor Day Scheduling Notice: The market, and TMF, will be closed Monday, Sept. 2. Your next Memo will hit your inbox at 4 p.m. Tuesday, Sept. 3!

Will You Be the One? On Sept. 19, Motley Fool co-founder and CEO Tom Gardner will invite a few of our most ambitious Fools to **give up their *Pro* memberships** and join him in a premier "club" that gives them access to every wealth-building tool, product, and service we've developed over the past two decades — including *Pro*. **Only about one out of every 100 Fools will be able to join.** To see if you qualify and to learn more about this one-of-a-kind endeavor, simply click here.

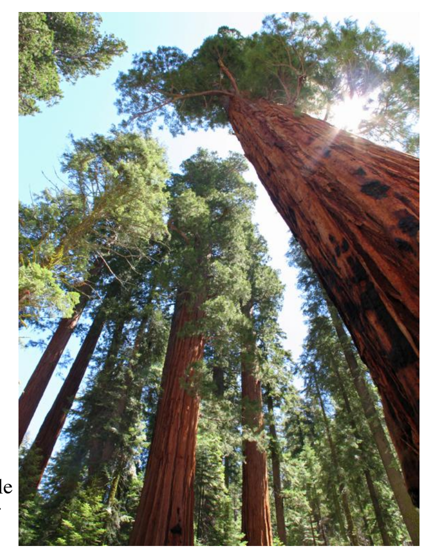
Halfway across the Golden Gate Bridge, the gnarly, toothed fog finally released its grasp on the hybrid my wife and I had rented (we're in San Francisco, after all), and our subsequent descent into Marin County was nothing but sunshine and ocean air. The sight of the Pacific Ocean — and the houses perilously perched on the hills above it — grabbed us immediately, but was challenged in short order by the wondrous draws tugging playfully at our other senses. After a few more switchbacks and a short hike, we were standing at the base of some incredible coastal redwoods.

No Left Turn

At this point in the Memo, I'd normally take a left turn onto Investing Boulevard and begin relating the magnificence of the trees to *anything* financial. Some ideas:

- The coastal redwood's bark is 12 inches thick. That resilience is a defense against predators and the elements — just like a meaningful, competitive barrier to entry that deters newcomers to an industry and protects a company's excess profit.
- The trees' 100-footwide root system ensures health and nutrients are always flowing from one direction, even if others may be barren — just like portfolio diversification ensures strong returns from one asset class even though others may suffer.
- The size and vitality of the great trees themselves fosters an entire ecosystem hundreds of feet below their canopies, just as a portfolio that grows tall and strong can fund years of life — and fun — for our families.

But I'm not going to turn left in this Memo. Instead, I'm going to glorify the moment exactly as it was. I love investing, but this was one of those experiences I invest *for* — a reward for all of the hard work, stress, and deliberate practice. In one sense, it's too bad such moments don't happen often, but the rarity is precisely what made it so special. We were able to fly across the country to take this vacation because of the saving and investing we undertake every day.



Holding my wife's hand, I allowed the clean air to dance under my nose, as bright and invigorating as the aroma of fresh-ground coffee beans first thing in the morning. As my nose followed the air upward, my eyes slowly closed, and I felt myself break into a great big grin. That smile was entirely organic, a gesture of pure appreciation. *That* is why I invest.

The Foolish Bottom Line

Many of those redwoods are more than 600 years old. I can only hope their beauty and magnificence have brought similar joyful revelations to millions of other visitors. And more specifically, I hope *you* have had a "redwood moment" or two in your investing career — an incident that reminded you of the adventures and memories your investments make possible, and of the people and experiences that make the process so worthwhile.

Thoughts? Comments? "Redwood moments" of your own? Share them on the Memo Musings discussion board.

Onward,

Bryan (TMF42)

Pro Catch-Up Trades

- **American Tower** (NYSE: AMT): Shares remain a "buy" for those lacking our 2.4% allocation. To potentially double your position to nearly 5%, write September 2013 \$70 puts if you haven't already. These puts recently bid \$1.50, for a 2.1% yield in 26 days. Or, write October 2013 \$70 puts for \$2.50 — that's a 3.6% yield in 54 days.

Pro Community & Coverage

- We'll miss Tom, but we welcome Daisy with open arms.

- What's a Foolerang? It's a contest that could win you a *Pro* hat, that's what!
- Unlike age-old redwoods, technology is always evolving. Will the competitive moat around **Intel** (NASDAQ: INTC) keep out foes? We have our eyes on it.
- Member nevercontent posts put-writing ideas.
- Why buy **AmTrust** (NASDAQ: AFSI)? Members discuss.

Rockwood Moves to Sell

Published Aug 19, 2013 at 4:00PM

Dear Fools,

Remember those agonizing dating decisions you had to make in high school? Today, the mere mention of a particular ex may still put your nerves on edge.

Breaking up with a stock can be just as difficult, especially because a stock won't tell you it's getting bored or wants to see other people — cutting the cord is solely on you. At *Pro*, we consider selling a position under the following circumstances, among others (and we don't care if prom is right around the corner):

- Any hint of management dishonesty
- A sudden, unexpected change in top leadership
- An ongoing failure to execute on goals or fulfill our thesis
- A share price that increases much more than the fundamentals support
- A large restructuring of the company that will change the business and financials

That last bullet point speaks directly to **Rockwood Holdings** (NYSE: ROC). The specialty chemicals company is on track to divest itself of three of its five divisions, leaving just lithium and surface treatments. Although this may be a smart long-term move, it creates a large degree of uncertainty.

The new, much smaller Rockwood will generate approximately just one-third of the revenue and 52% of the EBITDA it currently enjoys. Based on trailing 12-month results for its two remaining divisions, Rockwood will soon trade at approximately 14.2 times EV/EBITDA (enterprise value to earnings before interest, taxes, depreciation and amortization). That compares to just 6 times EV/EBITDA in 2011, when we were buying, and 11 times EV/EBITDA today. Plus, my estimate assumes management will use proceeds from the spin-off to pay off a generous $2 billion in long-term debt. It may pay down less.

Not only is Rockwood's stock getting more expensive, but its business is becoming more dependent on lithium prices — and there's no guarantee those will rise as industry leaders (including Rockwood) plan for more production. Rockwood will also need to increase its surface treatment revenue, which has stagnated this year. At the same time, freeing itself of three business divisions may not lower expenses as much as hoped; "right-sizing" the company may require more cuts and more time.

When we started buying Rockwood in early 2011, we (and management) believed the business was worth about 9 times EBITDA. To repeat, today it trades at 11 times EBITDA, and soon that figure will be an estimated 14.2. Granted, the new company will have higher margins, and management projects a long-term 20% revenue growth rate — but today that growth is elusive, and either way the valuation looks generous. Wall Street is excited about the company's plans, and seems to be paying up as a result. This happened when **GrafTech International** (NYSE: GTI) bought Seadrift, too, but that large change has not created value years later, and the stock has surrendered all of its gains.

At any rate, valuation estimates and uncertainty with the new business meant that we allowed our shares to be sold over the weekend through the $60 covered calls we wrote in April. Our whole 5.3% stake was sold at a net $64.59 (almost exactly where the stock traded Friday, incidentally). With this sell, the stock moves from Hold to Sell for those who still have a position.

A Recharged Future?

In the 30 months we've been involved with Rockwood, our position (bought in two increments) returned 42% on average (excluding dividends and option income), making it a strong performer. There is a lot to like about this company, including its transparent management, and we will closely watch it for future investment. Lithium demand should grow sharply this decade as its use in electric cars expands, and Rockwood is likely to be a high-margin business with potentially strong growth.

But we want to own the "new" Rockwood at a reasonable price, so we're targeting a lower valuation multiple, and we look forward to any market decline that may help us find it. We want to see how costs shake out in the new business, too, and how much debt management pays off. This will take time. But at the right price, we could write puts or buy Rockwood anew.

In closing, consider this an indefinite break from Rockwood. We can date other companies now, but like old high school sweethearts, we may yet have a future together. For now, the stock is a Sell.

To discuss the Memo, please visit the Memo Musings discussion board. Thank you for being a *Pro* member!

Best,

Jeff (TMFFischer)

Pro Guidance Changes

- **Amtrust Financial Services** (NASDAQ: AFSI): Our fair value and "consider adding more" prices were both adjusted lower to account for the company's 11-for-10 (10%) stock dividend, which went into effect Friday. We should get our new shares soon (one new share for every 10 we already own). Shares remain a Buy.
- **Rockwood Holdings** (NYSE: ROC): For those still in it, the stock moves to Sell from Hold.

Pro Trade Roundup

- **American Tower** (NYSE: AMT): We rolled all six of our August 2013 $70 puts to September 2013 $70 puts for a net credit of about $1.52 each. If exercised next month, this would double our stake to about 5%.
- **Rockwood Holdings** (NYSE: ROC): All 1,400 of our shares were sold via August $60 calls, for a net sell price of $64.59.

Pro Coverage & Community

- New member "turningitblue" has us Foolishly discussing position sizes in the portfolio. Is 5% large?

- RichardinReno launches a long discussion on how to integrate *Pro* with other Fool services. Great thoughts from members!

Roll Your Puts on American Tower

Published Aug 15, 2013 at 11:30AM

Hey, *Pro* Fool! This Alert is time-sensitive because these options expire on Friday, Aug. 16. If you're following along, make sure you take action by market close on Friday.

- **What We're Doing**: Rolling out our written puts, which will either bring us additional income with reduced capital at risk or will allow us to potentially add 2.5% to our stock position, bringing it to around 5%.
- **What We're Thinking**: With our current puts near-the-money and the stock trending lower, rolling choices are very attractive.
- **What We're Expecting**: Company fundamentals remain strong and will drive long-term performance, but other factors are ruling the near term.

Trade Essentials

- **Action**: Roll your August 2013 $70 written puts on **American Tower** (NYSE: AMT) to September 2013 $70 written puts. Your broker should allow this in one trade ticket, for a net credit.
- Buy to close your August 2013 $70 puts
- Sell to open new September 2013 $70 puts
- **Allocation**: Close all of your short August puts and write an equal number of September puts. If these new puts are exercised in September, our stake in AMT will increase by about 2.5%, bringing your total to a 5% position. *Pro* will roll all six of its contracts. Each new contract represents a $7,000 potential obligation.
- **Recent Price**: $69.18
- **Option Price (bid/ask)**:
- August 2013 $70 puts: $1/$1.15
- September 2013 $70 puts: $2.65/$2.80
- **Price Guidance**: What matters is the net credit to roll, not either individual leg. Split the bid and ask, aiming for a net credit of $1.50 or better. **You must complete this roll by market close on Friday afternoon if AMT stock remains at less than $70, so as that time approaches, you may need to accept a smaller credit.**
- **Alternative Trades**:
- If you don't yet have an allocation to American Tower, we recommend you buy a 2.4% allocation to match *Pro* (in round lots, if you can) and then write the September 2013 $70 puts for about $2.65 or better, representing another 2.5% worth of shares.
- If you didn't write August puts but have an allocation to American Tower, we suggest you write the September 2013 $70 puts for another potential 2.5%.
- If you're transacting in just one or two contracts and commissions are eating up your income, consider rolling to the October 2013 $70 puts (or writing them to begin an income position). They currently pay around $3.30 – a $2.15 net credit from rolling. If you'd like to be more conservative than *Pro*, consider the October $67.50 puts, which also pay well.

What's New?

One month ago, we speculated that American Tower's structure as a real estate investment trust (REIT) was prompting market participants spooked by REITs to sell the stock. Since then, the REIT sell-off has continued, with REITs underperforming a mostly flat stock market by more than six percentage points. And once again, American Tower is along for the ride. Although we think this broad-brush approach to buying and selling is silly, we don't think American Tower is immune – at least in the near term. Over a longer time frame, business fundamentals will drive stock performance, and we're quite comfortable with how American Tower's business is going:

- Recent results were A-OK, and management raised guidance for the year.
- The company announced a significant purchase of towers in Brazil and Mexico, which we believe provides a platform for increased cash flow per tower as those countries expand their mobile data usage and telecom companies look to support that growth in an economical way.

How to Follow Along

We believe our thesis is intact and we're happy to own more shares, so this roll is very much a numbers game. The market is presenting us with an attractive reward (3.8% in 36 days) for lowering our capital at risk (to $66). Shares could run away from us, but we believe continued pressure on REITs will allow us to increase our allocation at great prices at some point. So we're obliging Mr. Market and going back for another helping of income.

ROLL OUT YOUR WRITTEN PUTS		
Cost to close August $70 Put	($1.15)	
Income from writing September $70 Put	$2.65	
Gross Yield on strike price		*3.8%*
Annualized (36 days)		*38.4%*
Net credit from rolling out	**$1.50**	
Net Yield on strike price		*2.1%*
Annualized (36 days)		*21.7%*
Strategy breakeven and net buy price	**$66.00**	
Downside protection		*-4.6%*
Previous breakeven and net buy price	$67.50	

- **Maximum return**: We make 3.8% in 36 days (38% annualized) on this iteration if shares of AMT rise above $70. If that's the case at September expiration, we will have earned put premiums of $4, or nearly 6% of the capital we've risked for just two months.
- **Breakeven**: We begin to lose money on this strategy when shares fall below $66, or 4.6% lower than where they are today.
- **Maximum risk**: We're on the hook to buy shares if the stock price remains less than $70 – a fate we're perfectly happy with at this point. If shares fall $3.18, to $66, our loss matches that of owning shares outright.

Next Step: Please post any questions on the American Tower discussion board.

A Soul That Tastes Like Pizza

Published Aug 12, 2013 at 4:00PM

Dear Fools,

I love it when the opportunity to talk stocks pops up in unexpected places. As the frequent victim of this phenomenon, however, my wife loves it decidedly less -- but she promised "in sickness and in health," and she is fully aware of my investing sickness. (The stack of **Papa John's International** (NASDAQ: PZZA) annual reports piled on our kitchen table is a clue; she knows I'm taking over coverage with Nick's departure.) Plus, we were mid-row watching baseball at Nationals Park, so she was captive. With two oversized slices of fresh Papa's pizza in our laps and a prominently displayed Papa's logo plastered on the left-field wall, she asked: "So how's the Papa John's research going?" While my position review isn't yet complete, I'll tell you what I told her (well, maybe with a few more details) about what has impressed me so far.

Impressed by Management

Papa John'sis still run by its committed founder, John Schnatter (yep, the guy from the commercials). Schnatter owns 26% of the company, but more impressive to me is that, almost 30 years into making pizza, his passion remains infectious. It apparently even infected his wife, who owns a franchise! Here is what I've found notable:

- Schnatter keeps his entire management team laser-focused on quality. "The Papa John's Way" is the company's philosophy of ensuring quality in every facet of the business. It means avoiding shortcuts and winning over every customer one pie at a time. In fact, it seems management can't finish a sentence without adding the word "quality" -- on average, the Q-word is spoken an absurd 12 times per quarterly conference call. (Since 2010, the word has been spoken 164 times ... yes, I counted.) Management is on message all the time, not because they're robots, but because they truly believe quality will win.
- The company is incredibly disciplined. Not a quarter goes by without analysts getting into a tizzy about competitors' pricing strategies, but Papa John's steadfastly refuses to compete on price. Instead, the company has remained stoutly committed to its premium pricing (its brand, as you can guess, is centered on quality vis-à-vis its chain competitors). This strategy means more profit per pie, and it allows the company to leverage its advertising by keeping to a consistent message: "Better ingredients, better pizza." Papa John's is simply playing a different game than its price-focused competitors, and it can do so because of a nearly 30-year investment in consistent branding and execution.
- A long-term mind-set influences decision-making. The point about price ties in here: Matching competitors' prices would undermine the brand Papa has spent three decades building. However, *not* doing so might drive the most price-sensitive pizza buyers elsewhere, meaning Papa loses market share. This may seem like a tough decision for the company, but it isn't – time and time again, Papa John's has displayed its willingness to trade short-term pain for long-term gain. The company has also taken the hit on rising commodity costs when it believed franchisees needed the financial break, and it often waives the initial franchise fee to encourage its best franchisees to open more restaurants. These actions hurt financial performance today, but ensure the health of the company for the long term.
- I admire how Schnatter chooses to spend his time. He is very often traveling to visit, check in on, and reinforce the Papa John's Way with his franchise owners and employees. Culture and message don't often permeate if they're just handed down from on high, but a genuine, hands-on manner works wonders. Schnatter also spends time on developing leaders. He has stepped away from the CEO role twice in 30 years, and both times, the company lost its way. To keep this from happening again, Schnatter has been developing more and more leaders, promoting from within like crazy, and building bench depth.

The *Pro* Bottom Line

Papa John's is up nearly 200% for *Pro*, yet it seems like few members actually own shares. The PZZA discussion board is sleepy, and it's easy to write off this business as just a crummy pizza chain. But the results don't lie: There's something else going on here that has allowed this company to thrive in a cutthroat industry. It's something softer and more nuanced. I believe the difference is that Papa John's has a soul its competitors simply lack. It's hard to quantify and hard to model, but it has sustained this successful company for nearly three decades. It's the foundation upon which my emerging thesis for Papa John's will rest, and it will be a key area of focus as I begin to follow the business for *Pro*.

As it happens, my wife didn't buy the soul argument. But as Stephen Strasburg took the mound for the Nats with "Seven Nation Army" blasting over the ballpark speakers, she did manage to say (with a full mouth) that "at least their soul tastes pretty good." And that, I suppose, might be an even better thesis.

Onward,

Bryan (TMF42)

Pro Trade Roundup

- **AIG** (NYSE: AIG): We purchased 500 more shares of AIG for $48.09 per share, bringing our total allocation (stock plus options) to just shy of 5%.
- **BMC Software** (NASDAQ: BMC): We sold 1,600 shares for $46.01, exiting our position entirely.
- **iShares Russell 2000 ETF** (NYSE: IWM): We closed our August 2013 $91 short put options for $0.01 per contract. We did nothing with our August 2013 $96 long puts.

Pro Expiration Notices

- **American Tower** (NYSE: AMT): Our August 2013 $70 short puts are at the money. We're happy to take shares if the stock falls a bit this week, bringing our position closer to 5%. If shares are flat or rise a bit, we may look to write another round of puts to increase our position.
- **iShares Russell 2000 ETF**: Our August 2013 $96 long puts will likely expire worthless on Friday, but require no action.
- **Rockwood Holdings** (NYSE: ROC): Our August 2013 $60 short calls are in the money, and with no action, our entire position will be called away. Right now, we're likely to let this happen, although a final decision will be made by midweek.

Pro Coverage & Community

- Here is a classic *Pro* discussion about the market and so much more.
- Keeping tabs on insider selling is important, but not always damning.
- Did your favorite pizza make the list of the 33 best?

Buy More AIG

Published Aug 7, 2013 at 12:30PM

- **What We're Doing**: We're raising our equity stake to 4%.
- **What We're Thinking**: We want more capital behind our highest-conviction ideas.
- **What We're Expecting**: Improving insurance markets will continue to boost underwriting results, bringing the share price closer to book value.

Trade Essentials

- **Action**: Buy shares to bring your equity stake up to 4%, or your total allocation (stock plus calls or warrants) to around 5%. *Pro* will be buying another 500 shares.
- **Buy Around**: $48
- **Fair Value**: $60 (raised from $55)
- **Status**: Buy First

What's New?

Pro's one-year anniversary with embattled insurer **AIG** (NYSE: AIG) is fast approaching, and the stock remains a Buy First on our scorecard. Now seems like a great time to check in on how our thesis is playing out.

- **We expected AIG to slowly improve its underwriting.** Check. The company's second-quarter results show that, while results will be bumpy, things are modestly improving. Thanks to a solidifying pricing environment and AIG's continued discipline in managing underwriting and controlling expenses, we're optimistic this progress will continue.
- **We expected AIG to buy back shares from the U.S. Treasury at a discount to book value.** Check. The Treasury no longer owns shares of AIG, and although oversight will continue to be significant, the company's freshly announced dividend provides evidence that AIG has more control over its capital structure and decision-making than at any time since the financial crisis.
- **We expected AIG to earn improving returns on equity.** Check, mostly. AIG's messy past does make for a complicated present, but we believe core returns on equity are improving. As we sift through the moving pieces, we're confident that the drivers of ROE (insurance profitability, controlled asset growth, and intelligent use of leverage) are all moving in the right direction.

In fact, AIG has improved its business at a slightly higher rate than we expected, prompting us to raise our fair-value estimate and Consider Adding More price to $60 and $44, respectively. The compounding factor that bolsters our confidence is company management; CEO Robert Benmosche has consistently talked the talk *and* walked the walk with regard to vision, execution, and capital allocation. We understand he won't be around forever, but we believe he has assembled a deep bench of employees who are passionate about AIG's turnaround, are motivated by the proper incentives, and have our common interests in mind.

Rock ’Em Sock ’Em Earnings Review

Published Aug 5, 2013 at 4:00PM

Dear *Pro* Member,

We reviewed more than half a dozen earnings reports last week. But instead of squeezing our findings into a list of links at the very bottom of this Memo — and running the risk that you might miss something — we're making them thebulkof today's content. After all, while we know you hired the *Pro* team to monitor your *Pro* investments closely, we also know *you* want to hear about what's going on in your companies. So our reviews listed below are shared in that spirit.

Before we get started, though, let's touch on the big elephant in the room: the still-rising stock market, which is currently printing money even faster than the Federal Reserve. As of today, according to S&P Capital IQ, the S&P 500 trades at 16.4 times trailing normalized earnings and 15.6 times expected profits for 2013. That's still well within the bounds of the historical average, although the latter multiple is counting on a strong end to the year.

Even so, our ears are perked up and our eyes are peeled for new hedges and shorts (andlongs!) as we seek steady rolling three-year results with less risk. In the meantime, once we complete our recently recommended sale of **BMC Software** (NASDAQ: BMC), the *Pro* portfolio will be holding about 18% cash — a reasonable sum that leaves us open to opportunities. Now about those earnings ...

Terms to Know

Before we jump in, let's review some important ground. The bulk of the *Pro* portfolio is invested in strong businesses we believe will grow and compound value over time. We review results every quarter not so we can overreact to some arbitrary earnings "miss" or "beat," but to see whether the business in question still appears likely to compound our money over the coming years, or whether something is starting to threaten our thesis. These terms are important in that determination:

- **Fair Value (FV):** Our fair-value estimate seeks to name afair price for a stocktoday – and that's fair for a seller *or* a buyer. From its fair value, we expect a stock to deliver our desired long-term rate of return (generally 10% annualized or better today, in line with our North Star). When a business grows in any given year, its fair value should go up, too, as long as we see continued growth ahead. So, we will typically increase our fair-value estimate for every growing business we own during every successful year.
- **Consider Adding More (CAM):** We recommend that *Pro* members own our current allocation in any stock that's rated Buy First or Buy on the Recommendations tab. From there, we'll consider adding *more* to a position – increasing our allocation – if the stock falls to or below our "consider adding more" price.Of course, we may add to (or cut) any stock anytime if we believe it's the right choice, but the CAM price is a formal way to make us reassess.

Now, finally, in summary form ...

Guidance and Earnings Updates

3D Systems (NYSE: DDD): This printer's fair value increases to $30 and its CAM price rises to $26, but shares remain on hold for newcomers. The stock looks expensive given the company's lackluster net income and free cash flow growth. Management (and the business) remains long on promise, though. See our full review.

American Tower (NYSE: AMT): The company has made fewer tower acquisitions of late, but the business remains strong and revenue is of course contracted for years to come. This great business remains a Buy with no guidance changes. We've also written $70 puts.

Facebook (NASDAQ: FB): Our thesis that the world's stickiest website would generate strong advertising revenue appears to be taking shape. Newcomers can consider starting a small position in call options. See our full review first, then consider our Catch-Up Trades below.

GrafTech International (NYSE: GTI): Will steel see a bottom soon? Maybe. But right now, it remains ugly. No guidance changes on this Buy-rated stock, though.

OpenText (NASDAQ: OTEX): Fair value increases to $74 and CAM to $60. New license revenue was weak this quarter, but it jumped the quarter before that; this metric will be choppy but should grow overall. See our full review.

O'Reilly Automotive (NASDAQ: ORLY): The company revved up a very strong quarter. Fair value increases just a bit on this new holding, to $118, and CAM inches forward to $94. See the good news.

Starbucks (NASDAQ: SBUX): The company is more caffeinated than it has been in years, with earnings per share up 28% last quarter. FV jumps to $67 and CAM perks up to $53.50. See what's brewing at Starbucks.

Tupperware (NYSE: TUP): We announced this in last week's Monday's Memo, but it's worth repeating today: We've moved the container king to Buy and popped its FV to $80 and its CAM to $72. Read the update on this emerging-markets story.

- **Can't get enough reviews?** You can see more, and follow along as they're posted, on the central column of the *Pro* homepage.
- **See FV, CAM, and allocations for everything** on the Recommendations tab.
- **Want to discuss this column?** Hit up the Memo Musings board.

Fool on!

— Jeff (TMFFischer)

Pro Guidance Changes

- Please see above!

Pro Catch-Up Trades

- **Facebook** (NASDAQ: FB): Newcomers can invest about 1% by buying ("buy to open") January 2015 $20 to $25 calls. Start small. You could add more on dips to build closer to our 2.9% stake.

Pro Coverage & Community

- Long-time member aleax shares his view from the road (and from Motel 8) after discovering (again) how truly bad trading is for your returns.
- RockyTopBob's wife is on television! Wait, it gets better — it's for rescuing golden retrievers!!

Buy to Close Your Short Puts on IWM

Published Aug 5, 2013 at 12:30PM

Trade Essentials

- **Action:** Buy to close all of your August 2013 **$91** puts on the **iShares Russell 2000 Index** (NYSE: IWM). (Keep holding your long August 2013 $96 puts!)
- **Price Guidance:** Use a limit order to attempt buying to close at **$0.01**. That should work eventually.
- **Recent Price** (bid/ask): $0/$0.01
- **Recent IWM Price:** $105.50

What's New?

The iShares Russell 2000 Index, which tracks the 2,000 smallest companies in Russell's universe, has continued to ascend to new 52-week highs this summer, making our August put ratio spread "hedge" on it unnecessary. Fortunately, this strategy doesn't cost us when the market goes up. Today, the index is 16% higher than our $91 put strike price with less than two weeks until expiration.

You can argue that we could just let these puts expire a week from Friday — and we almost surely could. But we've made 99% of what the puts have paid us, and we can close them for just $18 (perhaps even without a commission, which many brokers don't charge when closing an option with less than $0.05 of time value left). Closing the written puts removes our potential obligation to buy a 5% stake in IWM should it decline 15% or more before Aug. 17 expiration, which is unlikely, but not impossible.

To be clear, we *will* keep our August $96 long (or owned) IWM puts in the portfolio. At this point, those long $96 puts are cheap insurance that will pay us if the market falls about 9% in the next week or so. We're also looking at new put ratio spreads (and other strategies) to hedge the market going into autumn. So, stay tuned.

Next Step: To discuss closing your $91 puts, visit our IWM board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Buy to Close Your Short Puts on IWM

Published Aug 5, 2013 at 12:00AM

Trade Essentials

- **Action:** Buy to close all of your August 2013 **$91** puts on the **iShares Russell 2000 Index** (NYSEMKT: IWM). (Keep holding your long August 2013 $96 puts!)
- **Price Guidance:** Use a limit order to attempt buying to close at **$0.01**. That should work eventually.
- **Recent Price** (bid/ask): $0/$0.01
- **Recent IWM Price:** $105.50

Sell BMC Software

Published Aug 2, 2013 at 12:30PM

Trade Essentials

- **Action:** Sell all shares of **BMC Software** (NASDAQ: BMC)
- **Price Guidance:** Use a limit order to sell above $46
- **Recent Price:** $46.02

What's New?

BMC Software agreed to be taken private at $46.25 per share this spring, but the stock had remained at least 1% below that price until recently — and I'm stubborn enough to want most of that 1%! Today, shares are only 0.5% below the buyout price, and with the prospect of a higher offer now all but gone, there's not much more to gain by keeping our 4.2% position.

Also, while we don't expect it, there's always a risk that the deal will fall through. We predict that the consortium of private equity buyers will complete the deal as planned ... but we're not behind the closed doors, sitting at long tables, to see the contracts getting signed and the billions of dollars preparing to change hands. We wouldn't know until afterward if there was a snag, or if the deal came apart at the last minute. BMC did announce on July 31 that it's looking to raise $1.38 billion to help fund the deal — and credit market problems could always rear up in a sudden economic crisis.

Given that we don't think such complications are likely, we could wait until sometime in September (perhaps later) to get another $0.23 per share — but that's not worth the risk of the stock price falling by several dollars, which could happen if problems do arise. BMC isn't holding quarterly conference calls any longer, so if management makes changes to the business, we won't know about them. We're choosing to give up about 0.5% in additional upside over the coming few months, but in exchange, we'll take our profit and remove any risk.

Overall, BMC returned 16.3% for us in about 22 months — somewhat shy of our North Star. We bought this struggling business after its problems arose, and it never found a way to grow consistently. However, our double-digit return supports the argument that if you buy a good business with stable free cash flow at a very good valuation, you can still make money even if the business doesn't improve. Thank you, BMC, for the memories — and the return.

A Bit of Sentiment ...

BMC first entered my universe in about 2005; its new business direction was featured in an airplane magazine, of all things, that I happened to read while on a flight to Costa Rica. (So stay curious as you go about your day! Ideas come from everywhere.) I bought shares and ended up doing well with them. This week, I returned to Costa Rica for another visit ... and we at *Pro* decided it was time to sell BMC. It feels like we've come full circle, which is rare in investing. People tend to like the neatness of "finality" — that's probably why many are too eager to sell their winning stocks. In most cases, we'll want to hang on to our winners. But in this case, finality was given to us. I'll raise a pineapple to that.

What's Next: To discuss our sell recommendation, visit the BMC board.

Shorting: The Good, the Bad, and the Alternatives

Published Jul 29, 2013 at 4:00PM

Dear *Pro* Members:

Like bungee-jumping and bodysurfing, short selling isn't for everyone. Many investors lack the will, interest, patience, and/or broker to sell a stock or ETF short. For starters, you need to understand that shorting means you're borrowing shares to sell, and you'll usually pay your broker an annualized fee to do so. You're also responsible for paying any dividends distributed by the underlying investment. There's always a risk the shares will be "called away" from you on a spike in price. You can't short in an

IRA. And finally, you need to be ready to stomach a jump in the price of the security (i.e., a decline in the value of your short), while accepting that the most you can earn on a short position is 100%.

The Good

All that said, short-selling can be lucrative and enjoyable. Being short an imploding stock is nearly as rewarding as watching a stock you own climb. Even better in our eyes, shorting a flawed ETF or ETN -- one that uses futures contracts or leverage, causing its value to erode -- can be like finding the Golden Ticket in a Willy Wonka bar. As the flawed vehicle erodes in price, you gradually short more of it ... and grow your profits along the way. That's our plan with our short of **Direxion Daily Financial Bear 3X** (NYSE: FAZ), among others (many of which have yet to debut in *Pro*).

The Dilemma

You'll doubtless have noticed that the first two paragraphs above pit perfectly against one another. Many people aren't open to shorting, but shorting can have significant benefits – so what's the right choice for you? We believe only *experience* will tell you. As with snowboarding, you won't know if you like it until you try. So try! Today's market gives us more reasons to be *ready* to short than we've seen in years, offering up not just a panoply of struggling companies but dozens of flawed ETFs, many of which will find their way into *Pro*. If you think you might be interested in shorting as part of your long-term investing strategy (which is, of course, how we use these positions in *Pro*), then certainly make sure your broker is friendly to shorting. Here's how.

Not All Brokers Are the Same

When it comes to companies (or flawed ETFs) with high short interest, most brokers lack any shares to lend. In our experience, Interactive Brokers (*Pro*'s broker) and TD Ameritrade (I use them personally, along with Interactive Brokers) have the most shares available for selling short. Interactive Brokers has the largest inventory, but charges an annual fee (ranging from about 1% to 6%); TD Ameritrade doesn't charge anything extra to short. Check with your broker to determine its fees and charges for short positions. And ask about availability: Do they have shares of FAZ to short? What about FXE? What about SRS? If the answer is no, consider opening a second account elsewhere to handle your short sales. (*Pro* members' take on several brokers can be found here.) And if in the end you don't want to short, *Pro* will usually offer you alternatives to any short position we recommend.

There Are Alternatives to Shorting

Currently, the *Pro* portfolio is only directly short three vehicles, as shown on the Recommendations page (and sent in past trade alerts, and highlighted in a recent Positioning Report for new members). It is not easy to borrow shares of any of these ETFs unless you use Interactive Brokers or (sometimes) TD Ameritrade. Fortunately, there are alternatives to shorting for two of them.

- **Direxion Daily Financial Bear 3X Fund** (NYSE: FAZ): If you can't match our current 1.3% short position with a short of your own (again, shares are scarce anywhere but Interactive Brokers), then we suggest you *add* 1.3% to your holdings in your *Pro* financial stocks. After all, shorting this bearish financial ETF is a vote of confidence in (read: equates to owning) industry giants like **Wells Fargo** (NYSE: WFC) and **MasterCard** (NYSE: MA). So you could add 1.3% *more*, total, to your allocations among our financial stocks. I would lean toward adding to **AIG** (NYSE: AIG) and Wells Fargo right now.
- **ProShares Ultrashort Real Estate** (NYSE: SRS): This flawed ETF uses leverage to short U.S. real estate and is even more difficult to borrow for shorting than is FAZ. Again, only Interactive Brokers seems to have shares, and it charges about 5% a year to short them. Your alternative is to *invest* about 1% (to start) in the **iShares Dow Jones US Real Estate** (NYSE: IYR) ETF. Owning this basket of REITs is essentially the same as being short SRS, but without the leverage. You own U.S. commercial and residential real estate and enjoy a 3.8% dividend yield. Just realize the ETF has been volatile since the phrase "Fed tapering" entered the national lexicon, but I believe interest rates will remain historically low and the market will calm down.
- **CurrencyShares Euro Trust** (NYSE: FXE):This fund is easier to borrow for shorting, and when you do, you'll profit if the dollar gains value against the euro. If you can't short this trust, though, we don't have an alternative today – except just holding onto U.S. dollars so you can potentially buy more euros someday if the euro goes down. An inverse euro trust does exist, but we do *not* recommend that you buy it, just as we don't recommend buying leveraged *long* ETFs. The flaws inherent in leveraged compounding are why we *short* leveraged ETFs.

In Sum: What Do You Do Next?

If you believe you want to short with *Pro* (and we will recommend many more shorts!), then make sure you have a broker friendly to shorting. If you don't believe shorting is for you, or you're investing in an IRA, then just watch for the alternative trades we'll offer whenever possible with each short we recommend. Of course, some shorts won't have alternatives. Finally, remember that the surest, steadiest way to build wealth is by owning strong companies for long time periods; in other words, shorting isn't essential. But for those who like the black-diamond runs at the mountain ski resort, shorting can add to your enjoyment and returns – and if you're still on the bunny slopes, your *Pro* instructors can help you increase your skills at your own pace.

-- Jeff (TMFFischer)

Pro Trade Roundup

- None last week.

Pro Guidance Changes

- **Tupperware** (NYSE: TUP): Shares move to Buy (from Hold), and our estimated fair value increases to $80 (shares are only about 3% higher than that). Our Consider Adding More price increases to $72. (We'll address our October $75 covered calls before expiration as time value dissipates, and look to write new puts.)

Pro Catch-Up Trades

- **OpenText** (Nasdaq: OTEX): As shared last week, members who hold an August 2013 covered strangle ($55 puts, $60 calls) can begin to roll that position to match our newer November 2013 strangle ($65 puts, $70 calls). Although your August $60 calls still carry about $0.40 in time value, you can "buy to close" those calls (and your $55 puts, to be safe) between now and expiration, and "sell to open" the November 2013 $65 puts and $70 calls to set up the strangle, selling one of each option for every 100 shares you own. Newcomers to the position should write the November strangle – again, $65 puts, $75 calls.
- **Tupperware** (NYSE: TUP): Those lacking a 3.4% position can buy shares now. Or, "sell to open" October 2013 $80 puts, lately for around $2.40 each. That's a 3% yield in less than three months, with a $77.60 potential start price. Sell one put for every 100 shares (at a net cost of $7,760) you could buy. Those who wrote the October $70 puts for an initial allocation to the stock can profitably roll up to October $80 puts (buy to close the $70s, and sell to open $80s). Those who wrote $70 puts to target a second purchase ("adding more") can let those be, or roll up to $75 puts.
- **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSE: DGS) remains a buy at a 2% allocation, if you lack shares.

Coverage & Community

- ***Pro* Earnings Coverage:**
    - **Apple** (NASDAQ: AAPL) reassured investors with its earnings, and our guidance remains steady.
    - **Facebook** (NASDAQ: FB) made a lot of new friends on Wall Street last week. Jeff posted quick thoughts, and will have an update for everyone ASAP.
    - **Gentex** (NASDAQ: GNTX) remains a steady buy.
    - **Intel** (NASDAQ: INTC) remains reasonably valued as we await mobile chip growth.
    - **Pacer International** (NASDAQ: PACR) continues to work on a turnaround, but is too illiquid to recommend to newcomers.
    - **Tupperware** (NYSE: TUP) is buying back stock like crazy, and our fair value increases.
- There's much more news on the way! Don't miss TMFMoosie's *Pro* calendar of earnings, dividends, and events.
- Invest $100,000 in 1993 ... in Beanie Babies? One family's costly mistake, with a lesson on the *demand* side of the investing equation.

The Motley Fool owns shares of American International Group, MasterCard, TD Ameritrade, and Wells Fargo. The Motley Fool is short CurrencyShares Euro Trust, FINANCIAL BEAR 3X, and UltraShort Real Estate ProShares and has the following options: long January 2014 $25 calls on American International Group, short January 2014 $25 calls on UltraShort Real Estate ProShares, and long January 2014 $25 puts on UltraShort Real Estate ProShares. See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Bull-Market Problems, and a Departure

Published Jul 22, 2013 at 4:00PM

Dear *Pro* Family,

In the spirit of ripping the Band-Aid off quickly, it's my sad duty to report that this is my final Memo: I will soon be leaving the *Pro* team. I'm not going far — I'm transitioning to a new role at the Fool — and I know I'm leaving you in excellent hands. Jeff remains captain of the *Pro* ship, and he has a world class crew. If you want to know more, you can jump ahead to the "Awkward Goodbyes" section at the end of this Memo. First, though, I want to take one last chance to talk about one of the most powerful and underappreciated aspects of *Pro* investing: knowing when not to sell.

On (Not) Selling

Deciding when to sell is perhaps the most difficult dilemma an investor will face. The disposition effect suggests that our natural inclination is to sell winners too soon, because we want to lock in gains, and hold on to losers too long, because we want to get back to even. Clearly, you need a better framework than that for making sell decisions (or potential sales through covered calls). Here are my top five reasons to sell an investment, in ranked order. (These are for full sales, not adjustments for portfolio allocation purposes.)

1. **Error.** As investors, we will make errors. As soon as we discover an error in our analysis that impairs the value of our thesis, we should sell.
2. **Fundamentals.** If the fundamentals of the business decline or fail to support our thesis, we should sell.
3. **Opportunity cost.** We should sell when we find a better risk-adjusted opportunity in another investment. (Cash is sometimes better; consider taxes as well.)
4. **Valuation.** If we buy a crummy business when it's mispriced, making it an attractive investment, we should sell that below-average business around fair value. (But we won't necessarily sell great businesses at fair value.)
5. **Life.** We might need the money to fund education or retirement, for example.

I try very hard not to sell great businesses at fair value (remember, it's ever-increasing) or because I have large gains. Instead, I remind myself that when you find great compounding machines, you should let them run. Add more capital to them when you can, and only sell when you can demonstrate that the company is no longer a great compounding machine. In doing this, look at the business, not the price.

Bull-Market Problems

This could be characterized a bull-market problem, but I can't remember a time where someone wasn't telling me we're at a market top, then either asking for my advice or offering me theirs. When I joined *Pro*, our portfolio balance was not quite $1.2 million, compared with almost $1.7 million as I write this. We have earned good returns and built a robust portfolio during a time of great uncertainty. Throughout *Pro*'s short history, we've been inundated with chatter about price manipulation, market tops, when to sell "the bounce," the when/why/how of short positions (with many saying we should short much more), and whether we should write more calls against our great businesses. Often, we talked ourselves out of those perspectives; at other times, we helped to talk members off the ledge. (Temperament is a team effort!) The wrong position at the wrong time can limit returns, preventing our compounding machine from doing its job.

We've certainly made errors during this period of growth, too. One of our biggest errors — and one we're likely to repeat — has been selling too soon (or writing calls) as a stock is moving upward on stronger business results. But — and this is a *huge* "but" — over that time, we have remained invested in great businesses; we've bought much more than we sold; and we've stayed more long than short. Perhaps most important, we've always taken the long-term view. It's the *Pro* way.

Awkward Goodbyes

You skipped all that text just to see why I'm leaving, huh?

OK, but first some backstory: I fell in love with *Pro* in October 2008, just after its launch. I was invited on board in September 2009, soon after founding *Motley Fool Options* with Jeff Fischer and Jim Gillies. Jeff, Bryan, and Ellen are some of my very closest friends, and I genuinely consider the *Pro* community to be my extended family. So you can imagine how tough a decision it was for me to leave *Pro* and *Options*. At the end of this month, I'll be stepping into a new role in product development at The Motley Fool, and while I believe this role will allow me to create additional value and ultimately help more Fools invest successfully with the company ... it's still bittersweet.

I find goodbyes awkward, and I'm terrible at them. And while I won't be interacting with members with the same frequency, I will be thinking about you and would welcome hearing from you. So instead of a goodbye, I offer my heartfelt thanks. Thank you for your trust and friendship, and know that all *Pro* Fools are in good hands. I've provided Jeff, Bryan, and Billy with my updated thoughts on every company I cover and my perspective on where to go from here, and I expect you'll benefit from their fresh perspective and from *Pro*'s continued great performance.

Thoughts? Comments? Awkward goodbyes? Bring them to the Memo Musings board.

Fool on,
Nick (TMFCrow)

Pro Trade Roundup

- **American Tower** (NYSE: AMT): We sold to open six August 2013 $70 puts for $2.50 each before commissions, looking to potentially increase our allocation to around 5%.
- **TD Ameritrade** (NYSE: AMTD): We purchased 2,000 shares at $25.70 before commissions, initiating a 3% position.

Pro Guidance Changes

- None this week.

Pro Catch-Up Trades

- **Tupperware** (NYSE: TUP): For those lacking at least a 3.2% position, "sell to open" October 2013 $70 puts, lately for around $1.50 each, or a 2.1% yield in three months. Sell one put for every 100 shares (at a cost of $7,000) you could buy. These puts set you up to potentially start a stock position below our fair value estimate. The stock remains on Hold at its recent $78 per share.
- **OpenText** (NASDAQ: OTEX): Members who hold an August 2013 $55 put, $60 call covered strangle on OpenText can begin to roll that position to match our newer November 2013 $65 put, $70 call strangle. Although your August $60 calls still carry about $0.50 in time value, you can "buy to close" those calls (and your $55 puts to be safe) between now and expiration, and "sell to open" the new November 2013 $65 put, $70 call strangle. Sell one of each option in the November strangle for every 100 shares you own.

Portfolio Positioning Report

Published Jul 18, 2013 at 12:00AM

These Catch-Up reports provide in-depth guidance on our active recommendations — a plan for starting to build your *Pro* portfolio:

Part 1 • Part 2 • Part 3 • Part 4 • Shorts & Options

You can also see all our active positions, with Buy First, Buy, and Hold ratings, along with our latest opinions, in What We Think Now. Use this alongside our portfolio page's Recommended Allocation to help build your portfolio.

Remember, there's no need to rush into any trades, so take your time. We're here to help — if you have any questions, the *Pro* team and fellow members have the answers in our *Pro* Community.

In This Report

PDFDownload this report as a PDF file

Introduction

Dear Pro Fools,

The majority of the recommendations in this report are "shorts" of vehicles we consider to be flawed — they're investments that should slowly decline in value, adding profits to the short part of our portfolio. But let's take the pressure off right away: For reasons I explain below, we don't expect that many of you will initiate most of the positions in this report right away, or perhaps at all.

Shorting in Short

For those new to shorting, let's step back for a quick overview. When you sell something short, you borrow shares from a broker and immediately sell them, collecting the proceeds. In the future, you'll need to buy shares back (called "cover" or "buy to cover") to replace the shares you borrowed. You hope to buy those shares back at a lower price. The difference between your original sell — or short — price and the price you pay to buy back (and return) the borrowed shares is your profit. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock soars to $30, you've lost $10 per share when you buy it back.

Why do we short in *Pro*? It's one way we're able to profit when the market (or a weak company) falls. We also like to short flawed investments that, because of the way they're constructed, are destined to lose value in most environments. Most of these instruments use leverage and/or hold futures contracts that eat away at their daily value; when we sell short a vehicle like this (two of which are outlined below), we anticipate this steady decline in price.

Shorting Is Optional

As interesting as it is, not every *Pro* member is comfortable with shorting. Practical considerations can have an impact as well. First, you cannot sell short in an IRA — you need a margin account. Second, you have to accept that shorts can run strongly against you. Third, you'll usually pay an annual fee of anywhere from 1% to 5% (of the short value) to short something. Finally, in many cases it's hard to borrow shares to short, period. That is the unfortunate situation with our suggested shorts today. When we initiated the short positions in this report, they were a bit easier to borrow, but today, most brokers don't have shares of these vehicles available for shorting.

So, what do you do? You can use options to short in some cases; we explain how to do so below. You can also consider opening a new brokerage account (Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does); or you can wait and see if shares become available in your existing, traditional brokerage account. Or, not short at all, if you're not drawn to it.

This Positioning Report

Returning to the main show, this Portfolio Positioning Report (and the special live chat accompanying it at 1 p.m. July 18) will — when you're ready! — help you short vehicles we believe will decline, and generate options income. Keep in mind that this is just a start — we'll have many brand-new trade recommendations as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way! On the other hand, if all this looks overwhelming at first — or if you're still catching up with our long positions — that's OK, too. You don't need to make all of these trades now. Stock investments are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and rewarding — aren't necessary to succeed with *Pro* in the long term.

As you progress with us, just keep your exposure to the stock market in mind; hedging is about portfolio exposure. If you've bought all of our stock recommendations to date, your *Pro* portfolio is only about 63% invested, meaning you have enough cash that you don't need to hedge yet! We've kept that in mind in putting together this report (which does not carry any market hedges), and we'll do so with our future recommendations to you, too. That said, we do plan new market hedges for all members who are interested soon.

In closing, I'll stress again that you don't need to feel pressured to act. We will continue to make recommendations on an ongoing basis — there are always new opportunities. So, as always, take your time, and make an investment only when you're ready. Finally, please bring any questions to our Making*Pro*Fit You discussion board.

Foolishly,
Jeff Fischer, *Pro* advisor

Short: CurrencyShares Euro Trust (FXE)

Shorting the euro against the dollar is relatively low-risk disaster insurance

Suggested Short Allocation: 3.4%

We're shorting the euro against the dollar. We view this position as an asymmetrical investment where the downside is relatively known (and reasonable) and the upside, while less known, is much larger. For this position to work against us, the euro would strengthen against the dollar, but likely only by so much (assuming the U.S. doesn't go belly-up).

Even if the euro returns to its all-time high against the dollar ($1.60 — currently one euro is worth $1.31) our losses will be tolerable. Meanwhile, our possible upside — hard as it is to believe — may be as much as 100%. If the worst happens, the euro could fall apart completely. The trust we're shorting only holds physical euros, so it could end with negligible value. We don't hope for that calamity, but we can accordingly view this position as disaster insurance with relatively low downside risk.

More Resources

- *Pro*'s recommendation history
- Talk about FXE on our discussion board

Alternative Trade: Shares of FXE are available for shorting at various brokers, but if your broker does not have shares available, and you're trading in a margin account, you can instead "sell to open" January 2015 $100 call options on FXE. These calls currently pay you about $30 each (that price will fluctuate). This naked shorting of calls will provide you profits on any decline in FXE down to $100. Just realize that you are, just like us, short the vehicle at today's price, and you will have paper losses if FXE's price goes up. Only sell to open one call option for every $13,000 in FXE you can afford to be short, at a reasonable total allocation of around 3.4%, remembering that each option represents 100 shares. There are no IRA alternatives at this time that are attractive enough to merit your IRA dollars.

Short: Direxion Daily Financial Bear 3x (FAZ)

Rebalancing costs keep constant downward pressure on this bearish ETF

Suggested Short Allocation: 1.3%

This bearish ETF is meant to provide 3 times (300%) the daily inverse results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. By shorting this ETF, we'll effectively be 3 times long, on a daily basis, the U.S. large-cap financial sector. Leveraged ETFs like this one are flawed vehicles because they rebalance their derivative positions daily in order to maintain a constant leverage. Over longer holding periods, the costs involved with rebalancing eat away at returns, keeping constant downward pressure on the vehicle as a whole. As our full report linked below details, we continue to believe that large-cap U.S. financials are cheaply priced — and we own several of them as a result. That belief makes shorting this flawed bearish financial ETF all the more attractive.

More Resources

- *Pro*'s recommendation history
- Talk about FAZ on our discussion board

Alternative Trade: Shares of FAZ are available for shorting at only one broker we know of right now — Interactive Brokers — and sometimes at TD Ameritrade. If you can't short shares directly, then in a margin account you can "sell to open" January 2015 $20 naked calls on FAZ, lately paying you about $10 per contract. This effectively makes you short FAZ at $30 (just as we recently did, adding to our position), and sets you up to earn as much as $10 if FAZ falls to $20 or lower by expiration. Be sure to use the "standard" FAZ $20 call option, not the "NS" option. Again, it will pay you around $10 (or $1,000) for every call you write. Only sell one call for every

$3,000 in FAZ you are able to comfortably short, up to a 1.4% allocation. Never over-allocate to a short, whether you're shorting with naked calls or shorting directly. Given the expense of FAZ put options, there are no IRA-friendly alternatives for this short.

Option Trade: Write a Covered Strangle on OpenText (OTEX)

Earn income while you wait to potentially buy more shares of this *Pro* holding on a decline

Suggested Allocation: Write one put option and one call option for every 100 shares you own

In our Catch-Up Report No. 2, we recommended that you invest about 3% of your funds in software leader OpenText. Now, to catch you up to our option position on this stock, we recommend you write a covered strangle on your shares. This means you'll write (or "sell to open") one put option and one call option for every 100 shares of the stock you already own. (If you don't own 100 or more shares, but already own 3% in the stock, simply keep holding the stock.)

A covered strangle pays you significant option income. It also sets you up to buy more shares (in this case, doubling your share count) if the stock falls enough, or sell your existing stock if it rises enough. Most likely, though, is we'll continue to manage our covered strangle together for income, rolling it to later months when expiration nears. So, to get started, you should:

- Use a strangle order if you can, and "sell to open" November 2013 $65 puts and November 2013 $70 calls on OTEX. Sell one of each option for every 100 shares of OTEX you already own (and we're assuming you only own a 3% allocation in the stock). Do not buy these options — sell them.
- Lately, look to get paid about $7.60 to $7.80 combined to sell this strangle. So, you'll collect about $760 to $780 per strangle that you write, or sell.

More Resources

- *Pro*'s recommendation history
- Talk about OpenText on our discussion board

This sets you up to potentially buy more shares around a net $57.40 (using the low end of recent prices), or sell your existing shares around a net $77.60. That's a nice wide range. If the stock stays between our $65 and $70 strike prices at expiration, we simply earn all $7.60 as income. We'll manage the position together with a real-time trade alert, if necessary, as expiration gets closer in November. But mostly, we'll just wait for these options to slowly lose value, paying us in the process.

If you have questions about this trade, please visit our OpenText board. And remember, you don't need to use options if you don't want to. We enjoy just owning the stock, too, and see good long-term things ahead for it.

Short: UltraShort Real Estate ProShares (SRS)

Another leveraged ETF with rebalancing flaws from which we benefit

Suggested Short Allocation: 1%

This ETF is meant to provide twice (200%) the daily inverse results of the Dow Jones U.S. Real Estate Index (from here out, "the index"). In other words, if the index goes up 1% in a day, the ETF will decline 2%, and vice versa. By setting up a short position on this inverse ETF, we are setting up a bullish position on the underlying index, and thus on U.S. commercial real estate. This is another leveraged ETF where we benefit from compound flaws as the ETF is rebalanced to maintain its 2:1 leverage.

More Resources

- *Pro*'s recommendation history
- Talk about SRS on our discussion board

Availability and Alternative Trades: Lately, shares of SRS are only available for shorting at Interactive Brokers and perhaps a few other brokers. This ETF does not have long-term options on it, so there are no alternative shorting trades available for anyone. However, if you want to follow the spirit of this trade, you can instead buy about 1% in shares of the bullish **iShares U.S. Real Estate ETF**, with its current 3.8% dividend yield. Our real estate investment thesis, and this alternative purchase, is outlined further in the full report link at right.

The Motley Fool owns shares of OpenText. The Motley Fool is short CurrencyShares Euro Trust, FINANCIAL BEAR 3X, and UltraShort Real Estate ProShares and has the following options: short January 2014 $25 calls on UltraShort Real Estate ProShares and long January 2014 $25 puts on UltraShort Real Estate ProShares.See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Portfolio Positioning Report: Live Chat

Published Jul 18, 2013 at 12:00AM

Welcome to our Portfolio Positioning Live Chat! In today's event, we'll discuss the three short positions and one new options income trade we've recommended for you in today's positioning report — including alternative trades. We'll also discuss our plans for hedging the portfolio against market declines, generating more income, and profiting when price volatility finally returns. Jeff and Bryan will be on screen for the first half hour or so in the video portion of the chat; then they'll join Nick, Billy, and Ellen in answering questions via text. Archives of both portions will be available on this page after the event ends. Fool on!

You need to have the Adobe Flash Player to view this content.
Please click here to continue.

Transcript

Jeff Fischer: Good day, Motley Fool PRO members. We are glad you are here with us today for our PRO positioning report that you've received in email and now live event. For the next hour, the whole PRO team is here to discuss the positioning report and the portfolio with you.

Resources

- [The Portfolio Positioning Report]
- [Our Getting Started & Help discussion board]
- [The *Pro* Strategy Guide]

I'm joined by Senior Analyst, Bryan Hinmon right here.

AccessDeniedAccess Denied08BB8CDC1ABACBCAXF5mBr1DOncZg0+iL7ntmp

Bryan Hinmon: Jeff, it's good to be here, thanks. PRO members, happy you're here too.

Jeff Fischer: Thank you, Bryan. You're both here on video and I see you posting in the live event at the same time as you speak. That's a great talent.

Bryan Hinmon: Jeff, we're really hoping to keep the video portion of this on the shorter side, just so we can cover as many questions as possible on the tech side, so we're going to talk I guess for as long as we feel it fit. As long as we're going through the positioning report and we feel like it's making sense, so we can hop on the text portion and really pound out those questions.

Jeff Fischer: That's exactly right, Bryan, so thank you for joining us for this brief video with Bryan and me.

On the text chat right now is Ellen, our editor, Ellen Bowman. Nick Crow, senior analyst and Analyst, Billy, Billy K.

Bryan Hinmon: Kiperzstock; we don't know how to spell it, so we're just going to call him Billy K.

Jeff Fischer: "Kiperzstock", perfect name for a stock analyst. And so let's get into today's report. First, members realize we're in earnings season. Earnings season is starting right now. We'll be covering earnings from every PRO company for you, but the main thing to remember is to stay calm. It's just another quarter in the course of many. We're investing to make real money over the coming years. We're not worried about what happens in one quarter.

Portfolio building, the last month or so you've been building your portfolio or starting to with us using our catch-up reports. If you have bought everything we've recommended to date, you're still only about 60% invested long. That's great. That's plenty of money put to work, but there's plenty more to go and we're excited to bring you there the coming weeks and months and to get you into position to have a fully rounded PRO portfolio that's built for both good markets like the one we have right now and that's hedged for when the market does inevitably turn south for a while or become more volatile. So we're getting there and the key is to go gradually and take your time. Make sure you're comfortable. It's never a race, as I just said; we're here to make money, real money, over the next couple of years and much longer. We're not concerned about the next couple of weeks, per se.

So let's get Bryan into our positioning report and talk about the shorts, three shorts that were recommend today and one options trade, options income trade that we recommend today in today's report. I'll start again by saying if you don't make these trades right away, don't worry; it's not a race. Some of you may never make them. Many PRO members only buy our stocks and look to own them for years and compound their wealth that way, but if you are interested in shorting and using options, you're in the right place.

One thing you may learn is that you may want to use a broker that is very friendly to shorting and we talk about that in the positioning report that you can read today. Because many brokers are not as friendly to shorting as others, and with the things that we short, we go out of our way to find unique short situations that we have high conviction in, but that are not always easy to short with a typical broker because there are not always shares available.

Now let's get into those.

Bryan Hinmon: But Jeff, you mentioned sort of two distinct types of PRO members. The first type of PRO member is the type of member who does everything, follows the PRO portfolio to a T. They obviously are going to be very interested in finding a friendly broker so that they're able to short when we recommend shorting and they're able to use whatever options strategy we throw at them.

Jeff Fischer: That's right.

Bryan Hinmon: The second type of PRO member is the one who might not be comfortable with shorting, and you speak about this in the intro to this PRO positioning report. That type of PRO member, what it's important to realize is you can still follow the spirit of the PRO portfolio spot on. Instead of shorting, all you need to do is focus on the net exposure that we highlight in our Net Exposure Table on the Recommendations tab right below our scorecard. So you see there essentially how much you should have invested and how much you should have sort of cash sitting on the sidelines.

Jeff Fischer: That's exactly right and right now you would be about 60, 63% invested long if you followed all of our catch-up trades to date, so you're still invested but conservatively so, and that's why we will now gradually get you into shorts and hedges, as we also recommend new long positions. So our typical balance or aim is about 70-80% long with some cash on the sidelines for opportunities and for income-generating opportunities as well.

But as Bryan was just speaking to, you can, if you only want to be a stock-long investor, you can do that with PRO and just up your allocation to get as exposed, as allocated as you want to be. And those who are using shorts and options will follow the exposure table and our exposure allocation guidelines.

Bryan Hinmon: Yeah, I'm really not sure what the expression means. There are many ways to skin a cat, but the two ways that we manage our net exposure is either by raising our cash balance or by staying invested at the same level of long investing and then adding on shorts and hedges, so if you want to be PRO investor type one who follows us to a T, that's one way to achieve this. And if you want to be the type that manages their cash balance a little more closely, that's another way, so they're perfectly acceptable.

Jeff, before we get started on the positioning report, let's just walk through really quickly the mechanics of shorting and make sure that the PRO members who are following are fully comfortable with what shorting really is.

Jeff Fischer: Great idea, Bryan. In the report today in the text, you can read a bit more about this. Shorting is where you borrow shares from a broker and then sell them immediately and you collect the proceeds, and your hope is in the future to buy the shares back at a lower price and your profit is the difference between what you sold at and what you buy back at later.

So it's very different from buying a stock to own because you're not owning the asset; you're selling it to begin with and hoping you're gong to replace it later, ideally at a lower price and you keep the difference.

Bryan Hinmon: Yeah, investors are very familiar with the adage, "Buy low, sell high," and that is how we make money on the long side of the equation, but on the short side it's the opposite. You want to sell high and buy low. Sometimes it helps me to think in terms of cash in, cash out, because it can get confusing with the buying and selling.

So when you buy a stock, you're putting your cash out initially, and so when you take your cash back in, you hope to have a lot more of it. And when you're shorting a stock, you're getting your cash in upfront and you're putting your cash out, the invested portion, later on down the line, so you hope the price to be lower.

Jeff Fischer: Exactly, Bryan. There is a difference between shorting and hedging. When you are shorting, you are just taking a high-conviction position, as with the three that we recommend today, in something that you believe will fall, no matter what the market does. When you're hedging, you are shorting some large part of the market typically, as a way to make money or decrease your volatility when the market as a whole falls. But with a hedge, you may not expect your hedge to make money; you actually expect the rest of your portfolio to make money and the hedge is there as insurance, so that's an important distinction.

Bryan Hinmon: We joke about this on the team in that we actually root for our hedges to lose money because if our hedges are losing money, that means the rest of our portfolio, or the bulk of the rest of our portfolio, is probably doing well enough to offset the loss on the hedges, plus a lot more.

Jeff Fischer: That's right.

Bryan Hinmon: So we actually root against our hedges.

Jeff Fischer: And so right now in the portfolio, we thankfully have very few hedges because it's been a very strong market all year. And for new members who are only about 60% invested, there is not a strong reason to hedge yet, but as we said, we'll get there in the near future too.

One way we're looking to profit on increased volatility is we're looking at the volatility index, which is low right now, and we're looking at ways to go long or invest in that index for the end of summer and into the fall when volatility typically goes up, and it may really go up this year if the Fed indeed begins to taper. So although everything is kind of smooth sailing right now, we're thinking ahead and we're looking to put positions in place soon that will capitalize on more market volatility whenever it occurs, and that could be sooner than we think.

Bryan Hinmon: And Jeff, I want to touch really quickly before we get into the actual positions here. You highlighted that a hedge is really a broader bet, a protection method, and a short is a more direct, high-conviction idea. I want to drill down on that just a little bit and tell members why it has to be such a high-conviction idea, and it has to do with sort of the mechanics of shorting.

First of all, we have to ask the question, can you short, period? And so you wrote nicely in the intro that check with your broker. You have to check with your broker to see if shares are available for shorting. The best way to do this is probably to call them, but some online brokerages also have shares available to short list that you can find somewhere on their website.

But the mechanics of why it has to be high conviction; well, if you're borrowing shares, what it means is you're borrowing them from someone else who actually owns them. And so to do this, you have to pay the dividend out. You also typically have to pay a fee to borrow it. Ultimately you can get untimely closes. If your broker determines that hey, we really don't have enough shares to be lending out, they can close your position automatically. And so you can think you have a short on and are taking advantage of your thesis when in reality they realize that they goofed or all of a sudden someone sold the shares and they no longer have them available for you to borrow.

Those are sort of frictional costs to shorting that make us say for us to put on a short; we really have to have a high conviction. We have to believe that our return is going to be great enough to achieve North Star-like returns, plus overcome these frictional costs.

Jeff Fischer: Exactly, Bryan, and that's another reason why shorting is not for everyone and you need to have a certain tolerance or a risk tolerance for it. At the same time, it's a great tool, especially with a broker that makes you comfortable. You're wondering which ones. Personally, I've used TDAmeritrade for years and I've had shorts in that account for years that just go on and on. And TDAmeritrade very nicely does not charge for shorting, whereas most brokers do charge a small annual fee for shorting, for the privilege of borrowing shares. So TDAmeritrade is one to look at.

PRO's broker is Interactive Brokers, which has the most availability of anything you'd want to short. They do charge for shorting, and it's, as we write in today's report, anywhere from 1% to 5% a year on average of the asset value of the short. Obviously we're only putting shorts on that we think could fall much more than that over time. So those are two brokers to consider, because if you are adding shorting to your toolbox for the long haul, then you need to be in a broker that makes you comfortable. Bryan, can you see what Steve is saying out there behind the…?

Bryan Hinmon: I can't see. (Unclear).

Steve Broido: Actually I'll just jump in the audience.

Jeff Fischer: All right. So the report today, positioning report, we summarize shorting for you. We remind you that it's optional; you don't need to get started right away and then we get into three issues that you could short right now, if the shares are available at your broker and you're ready to short them.

Let's go into the first one, and that is CurrencyShares Euro Trust. The ticker is FXE. All right, so we were just told by the producer, be sure to refresh your video player by hitting F5 on your keyboard. Hit F5 on your keyboard to refresh your player to correct any video that has been cropped or shortened or…?

Bryan Hinmon: We were just playing an incredible video of charades. Now I do not feel bad about not being able to guess what the clue was the entire time.

Jeff Fischer: So Fools, hit F5 to refresh your video player and now let's go into CurrencyShares Euro Trust, ticker is FXE. This is a short against the Euro. It's the Dollar versus the Euro, and by putting on this short, we are saying that we believe the Dollar should be worth more per Euro than it is right now. And/.or, in the worst case, the Euro could really plummet in value. If Europe cannot get its act together or its problems proliferate further, the Euro, which is around $1.30 per Euro right now, up from its low of about 80 cents, could really fall sharply.

So this short we view as kind of a low risk, high potential return short. But in most cases, it's likely to not go much of anywhere, but it's disaster insurance against if something really bad does happen in Europe.

Bryan Hinmon: Yeah, and one of the reasons that we feel it's low risk is because we feel like we've studied the history of how these two currencies trade versus one another, and we feel like we have a really good basis off of sort of how out of whack the ratio can go. Of course if the world changes dramatically, we won't be able to rely on that history. But until that happens, we feel like really the downside is truly pretty limited here. It's why we like this short so much.

Jeff Fischer: That's right, Bryan. Over its history, the Euro has traded from about 80 cents to a Dollar to $1.60 to a Dollar since the late nineties. It's around $1.30 now, so it's been very resilient, and we shorted it around this price about a year ago, maybe a bit more. So yeah, we don't think it has much chance of running up against us, but it could really fall if Europe weakens. And it could also fall when the Fed starts tapering because interest rates will go up on the Dollar, of course, and that makes the dollar a stronger currency against other currencies around the world.

I do think the U.S. is much closer to higher interest rates than Europe is right now. Europe is a couple years behind us on the whole easing and easy money program, so the U.S. will probably come out of that sooner and the Dollar should get stronger as a result. So we like shorting FXE right now. Shares are available at many brokers for low cost, for no cost at TDAmeritrade and it is a 3.4, 3.5% short position for us right now, so you would short about $3,400 worth for every $100,000 in your portfolio.

Bryan Hinmon: Right, so I'll talk about the next one really quickly.

Jeff Fischer: Great.

Bryan Hinmon: This is a short, about 1.3% allocation for PRO right now of the Direxion Daily Financial Bear, 3X levered ETF. This ETF is designed to match the opposite levered three times up movement on a daily basis of the largest, most steady, most stable, best financial institutions that we have across the globe.

Jeff Fischer: Yeah, the top ten holdings include things like MasterCard, Berkshire Hathaway, AIG I believe is up in there.

Bryan Hinmon: Absolutely.

Jeff Fischer: Wells Fargo.

Bryan Hinmon: American Express in there as well, so the preeminent financial service companies in the world that have been through; essentially been to hell and back and are now on sort of the strongest financial footing they've been almost in their entire lifetimes. Well this fund is designed to bet against them and achieve as a group whatever their price performance is each day, three times negative to that.

So first of all, the base of our thesis is do we agree with that? Do we agree that we would want to, if we bought this, bet against these big financial services companies?

Jeff Fischer: Many of which we own.

Bryan Hinmon: Many of which we own. So obviously the answer to that is no, so we're taking a contrary bet to what this fund is set up to do.

Jeff Fischer: Exactly, Bryan.

Bryan Hinmon: But the real kicker here is the structure of the fund. In order to achieve that three times returns, the fund invests using derivatives, and because it wants to match the daily movements, it has to rebalance is derivative portfolio every day. And quite simply, that isn't free; that's not a costless transaction. They can't just do that without paying anything. So every day when they rebalance, they end up having to pay a little bit, take money out of the value of the fund so that they can minimize their tracking error and keep close to what they're trying to do, is match that daily performance.

Jeff Fischer: Exactly, so it's what we would call a flawed fund, a flawed ETF or ETN, and there are many of them out there. Many are very difficult to short or are on their way to just disappearing, which would be ideal for a short.

We plan to have many more of them in PRO in the future, there are many that we have our eyes on for shorting, but FAZ is one of them and if you're interested in something like this, you will need to go to a broker that has availability .TDAmeritrade sometimes does; Schwab almost never does unless you're shorting $50,000 or more worth. Interactive brokers always have shares available.

So again, just to reiterate, if you want to short with us long term, and we definitely think there's a lot of profit to be made doing it over the long term, consider opening a different account to short positions like this, like this flawed ETF, FAZ. To summarize a little more, on average, the average company in this fund trades at 1.2 times book value. We think it's undervalued. This fund, as Bryan said, is shorting these great financial stocks. By shorting the short ETF, we are going long these companies. So whenever MasterCard, Berkshire Hathaway go up in price, we make money on this short ETF.

Now if you're not shorting with us or not shorting the ETF, an alternative trade is just to add a bit more to your AIG, your MasterCard or Wells Fargo position; that's the same thesis.

Bryan Hinmon: It accomplishes the same thing. So essentially what we're saying is we think it's silly to short the greatest financial institutions in the world right now because they're cheap, and we're saying that it's also silly to want to own a flawed vehicle like this.

Jeff Fischer: Yeah, that's the cherry on top is that these vehicles are flawed and they're made practically to slowly lose value because of the derivatives that they use and roll every day, like Bryan said. So we're shorting things like that and we'll continue to do so on PRO and add more to our roster too in the future.

Let's skip OpenText for now and stay with the shorting. We'll talk about the next short, UltraShort Real Estate ProShares, ticker is SRS. It's another leveraged ETF that has flaws, and it is shorting another sector or industry that we believe in greatly in the U.S. right now, which is real estate, which much like financials, the two do go hand in hand, is on a foundation now of slow, but steady recovery and the shares are still cheap, so why you would want to short right now if you have a couple year outlook is questionable. We, instead, want to be long real estate in the U.S, so one way we're accomplishing that, aside from owning Wells Fargo and things like that, is shorting this real estate ETF.

Bryan Hinmon: Some members might ask why the allocation to FAZ and SRS are pretty small, about 1%. Some of that has to do with the fact that we sort of view these together because as those financial services, the industry is going to go, so too largely is the commercial real estate industry, so you can sort of lump these two together and it makes the allocation seem a much higher conviction.

Jeff Fischer: I'm glad you brought that up, Bryan. Another great point is they've all started around 1 to 1.5% allocations. As they work for you, they shrink in size. You make money as they get smaller, so recently our allocation to FAZ went all the way from 1.5% to about 7.8%, and so we shorted more to bring it back to 1.5%, and that's our long-term plan too. Anytime it becomes much smaller, we'll short more, bring it back up to where we want it and we'll keep making money that way.

The great thing is, these things are so flawed that over many years, if you look at their long-term history, they've lost 896, 97% of their value, but they can keep doing that. From today's price, they can lose 96, 97%, they can lose 100%. They can keep losing that amount of money, so we can keep adding to them and growing our proceeds that way as they slowly go down in value.

Bryan Hinmon: So the theses here are similar, right? With FAZ we say it's silly to short financial services companies and it's silly to be invested in, to not bet against a flawed vehicle. With SRS we're saying it's silly to short U.S. commercial real estate and again, we have another flawed vehicle, so we want to bet against it.

Jeff Fischer: That's right, and SRS is much smaller than FAZ, so it's harder to borrow shares. You'll need a broker that has them available. There are no alternative trades. There are alternative trades on the Euro and FAZ, as you'll see on the report. There are not any on SRS because its options are not liquid or long term. So SRS you'll need a broker to short it directly, and interactive brokers we know have shares available. TDAmeritrade sometimes does, but not right now.

So again, if you can't make that trade or don't want to short, there is an alternative in the report today which is to buy the bullish ETF on real estate. Just buy shares of that instead, 1.5% in IYR, but just look it up in the report; it's right there as a very viable alternative trade for anybody.

Bryan Hinmon: All right, Jeff, let's chat OpenText.

Jeff Fischer: Yes. So this is an option income trade that we're recommending. It pays right now more than 10% in about five months, by a November expiration. Shares on OpenText are around $69 per share. This option strangle trade, when you sell a put and sell a call, will pay you more than $7 per share combined, so more than 10%, and expires in November. Bryan, do you want to talk about the mechanics of it?

Bryan Hinmon: Sure. So first off, I'll just say that OpenText is a company that you have followed for what?

Jeff Fischer: Since 2005 or so.

Bryan Hinmon: Two thousand five or so, so really what drives this strategy is your underlying comfort with the business of Open Text because when we set up a covered strangle, we have to be saying we know a price that we're willing to buy more into this business. And we also have to know a price where we're saying, you know what? I'm okay with selling my existing shares at this certain price. If you're not able to set those two prices, well then you're not going to be able to choose the strike prices wisely for setting up the strangle.

So a covered strangle involves three pieces here. First and foremost, own a hundred shares of the stock. Once you own a hundred shares of the stock is when those other two questions, what price would I buy more and what price would I be willing to sell come in. And essentially what we have done is we have said here's OpenText's price. We're willing to buy more shares here, so we write some puts and are paid income for that, the promise to buy at that strike price. And we write calls above the current strike price saying if OpenText shares rise beyond the call strike price at expiration, we're perfectly okay with letting the shares that we own go.

We're paid on both of those options, so essentially doubling our income for making those two promises. We're willing to buy at some price below the stock price and we're willing to sell at some price above it.

Jeff Fischer: Exactly, Bryan. So we recommended in Catch-Up Report Number Two that you buy about 3%, allocate about 3% of your funds into OpenText shares and by now selling to open this covered strangle on the stock, which is optional. You can just keep your shares and not use options on it, but by using these options on it, we are agreeing to either buy more shares at a lower price or sell at a higher price, and we get this $7-8 in option income, so that gives us a very wide price range, $57 to about $77, 78, to make income on the stock. If it stays in that wide range, we can close the strangle by expiration, maybe write another one, make some income, keep the stock, write another strangle. So it gives us a lot of optionality, a lot of flexibility.

Covered strangles are a great income strategy. One thing to remember is just combining writing puts and writing covered calls, so it's two simple strategies combined on one stock. You can make this trade today, as long as you own at least 100 shares of OpenText. Sell to open one, strangle. That's one of each, one put, one call, for every 100 shares you own, and we're assuming you have about a 3% allocation and can double that allocation if it comes to that. That's exactly the position we have in the portfolio right now.

Bryan Hinmon: And PRO members who don't choose to take part in the covered strangle here, don't fret at all. The reason that we threw out, that we recommended that you buy 3% allocation in OpenText is because we believe in the company. We believe that the value is there and that the downside risk that we take in owning the shares is perfectly acceptable.

All that we're doing with this covered strangle; it's important to realize that what we're doing with this covered strangle is we are saying we are so comfortable with the downside that we'd be okay with owning twice as much stock if it were a little cheaper. So a little reassurance there to the PRO members who just own shares of OpenText.

Jeff Fischer: Perfect, Bryan. I think we can wrap up the video portion and jump on to the live text chat and answer your questions. I see there are many questions coming in and Billy and Nick and Ellen are working to answer them, and now Bryan and I will jump on there as well to answer them.

Before we leave the video, we'll just say again, take your time, do as you're doing, ask questions. Never be anxious to invest; investing is a long-term endeavor. We're looking to make very real returns, very real money and that happens over a year, two years, three years, five years or longer really, and then beyond that. We're not worried about what happens today or tomorrow, so just keep your perspective, stay calm. You're in a great place.

We believe in PRO. You're in the right place to make real returns, North Star-like returns, annualized as we look forward, and all it takes is buying the stocks that we recommend, and now as you want to, start to learn the hedging, shorting and options strategies. We're here to help you each step of the way to that end. Let's get into the chat. Bryan, any closing words?

Bryan Hinmon: Yeah, I'd just like to say that I'm really excited about the crop of new members that we have here in PRO. The discussion boards have been fantastic. I feel like there have been a lot of business-oriented questions, at least on the companies where I'm the primary analyst. I've been answering a lot of business-specific questions, and it's always wonderful when new members come in and they don't just blindly jump in, but they look at the analysis we've done, they assess our thesis, they ask questions about it, they question us and it just shows that they're truly trying to get comfortable with what they're doing. As you noted, if you're going to be a successful investor, you need conviction because you need conviction to make it through the inevitable ups and downs of the market.

Now we've structured PRO to hopefully help even more deal with the ups and downs of the market and we truly believe that our strategy is built to do that, but you need the conviction too, and so I'm really happy that the PRO members that we have are here and I look forward to serving you for a long time and in a few minutes on the text portion.

Jeff Fischer: Here, here, well said, Bryan. It is a great group of new members that we have and existing members have done such a great job welcoming them and helping them get started. It's been a great couple of weeks and we look forward to the rest of the summer and the rest of the year, and really making sure that all members have portfolios that make them very comfortable in up and down markets and bring in steady income if you want. In short, invest the PRO way and do so very successfully.

So thank you for being here. Let's join you on the text chat right now. We hope you enjoyed the video chat and we'll see you on the boards as well after this chat. Fool On! Thank you members, Fool On!

Catch-Up Report: Part 4

Published Jul 16, 2013 at 12:00AM

These Catch-Up reports provide in-depth guidance on our active recommendations — a plan for starting to build your *Pro* portfolio:

Part 1 • Part 2 • Part 3 • Part 4 • Shorts & Options

You can also see all our active positions, with Buy First, Buy, and Hold ratings, along with our latest opinions, in [What We Think Now](). Use this alongside our portfolio page's [Recommended Allocation]() to help build your portfolio.

Remember, there's no need to rush into any trades, so take your time. We're here to help — if you have any questions, the *Pro* team and fellow members have the answers in our [*Pro* Community]().

In This Report

[Buy: AmTrust Financial Services]() | Its talent at capitalizing on human laziness is just part of what we love

[Buy: The Buckle]() | This well-managed retailer fits into its jeans admirably

[Buy: Starbucks]() | You only *think* you go for the coffee

[Buy: Wells Fargo]() | Banks are simple businesses, and Wells Fargo is the best of the breed

PDF[Download this report as a PDF file]()

Buy: AmTrust Financial Services (AFSI)

Its talent at capitalizing on human laziness is just part of what we love about this insurer.

Suggested Allocation: 6.9%

At *Pro*, we speak a lot about the importance and power of recurring revenue — mostly because we know that humans are inherently lazy. Insurance purveyor **AmTrust Financial Services** handily proves this point for us; many of the policies it writes (more than 80% in most lines!) renew at the end of their term without their owners even shopping for a better rate. Most of us, it seems, are guilty of preferring inertia to bargain-hunting, and AmTrust and its fellow insurers are the beneficiaries. Even better, companies with such high renewal rates can actually grow their recurring revenue stream by raising prices a teensy bit at renewal time. This is just one of the characteristics of AmTrust's business we love, and it contributes to our confidence in making it *Pro*'s largest holding.

What It Does

AmTrust is an insurance underwriter. In general, insurance companies make money in two ways. First, they get paid to take on risks other people don't want (like the cost of repairing your car if you get in an accident); if a company takes in more in these policy premiums than it pays out in policy claims and handling, it makes an underwriting profit. Second, because policyholders pay for their coverage up front, insurance companies can invest that money — the industry calls it "float" — until they need it to pay claims.

AmTrust focuses on insurance niches (primarily workers' compensation and product warranties) that are low-hazard and generally too small for large insurance companies to care about. But though AmTrust writes small policies, it's no small fry. Its high renewal rates allow it to focus on writing new policies and looking for struggling insurers to acquire — and AmTrust has proven to be a very opportunistic acquirer.

How It's Working

AmTrust's strategy — being a disciplined underwriter of low-hazard, small policies in well-defined niches; using technology to keep its expenses low; and opportunistically acquiring policies other insurers struggle to find profitable — has resulted in impressive growth. Gross written premiums have risen from about $1.1 billion to $2.7 billion over the past five years, and this increase, combined with a laserlike focus on low expenses, has resulted in consistent growth in earnings, dividends, and book value.

What We Expect

The insurance market works in cycles, and recent signs indicate an upswing on the horizon, which means pricing and profits should improve across the board. AmTrust should thrive in a strengthening market: It can charge as much as its competitors and make more in profits thanks to its lower expense structure, or it can undercut the competition on price in a bid to take market share. If the economy improves at all, the small businesses AmTrust insures should hire more workers and consumers should purchase more insurable goods, so there seems to be plenty of growth ahead.

More Resources

- [*Pro*'s recommendation history]()
- [Talk about AmTrust on our discussion board]()

The *Pro* Bottom Line

Although AmTrust currently trades for more than our $33.50 estimate of fair value, we believe the company's premium valuation is warranted given the consistency of its growth, quality, and profitability. AmTrust is *Pro*'s largest holding and we're happy to let this winner run, expecting to increase our fair-value estimate over time. We have high confidence that owning a piece of this business will help *Pro* Fools achieve satisfactory returns.

Buy: The Buckle (BKE)

This well-managed retailer has fit into its jeans admirably over the past decade.

Suggested Allocation: 3.6%

Your *Pro* team doesn't know much about fashion, but we can read financial statements. And if the next decade of business performance by specialty retailer **The Buckle** looks anything like the last one, we'd be willing to wear whatever getup the company suggests.

What It Does

The Buckle sells jeans, other apparel, and accessories at 443 retail locations across the United States, and we think the fantastic management team has figured out a formula that works: measured growth, middle-of-the-road merchandising, and great service. We're typically leery of the risks of investing in retail, especially fashion, but the proof is in the numbers for The Buckle. Shares are modestly undervalued, the store concept is in the middle of its life cycle, and the company's financial prudence and operational acumen should lead to a growing stream of free cash flow, dividends, and extra payouts — all of which can help the *Pro* portfolio in our pursuit of our North Star.

How It's Working

The Buckle is a surprisingly steady operator in the notoriously fickle specialty retail space. The company reported a modest same-store sales increase of 2.2% so far this year, but that's an improvement from the 1.2% increase through April. We accept a degree of lumpiness here and don't get too bent out of shape when these numbers bop around — The Buckle's target demographic is fickle teens and twentysomethings, after all. We simply monitor these figures for clues about the overall shopping experience and brand relevance. With this performance, we feel confident that the 13 stores management expects to open this year should be solid contributors. As the company expands cautiously, we marvel at its ability to boost margins, improve inventory management, and boost profitability per store.

What We Expect

With 443 stores at the end of fiscal third-quarter 2012, we believe The Buckle has plenty of room to grow as it expands from the middle of the country to both coasts; it should be able to achieve wonderful store economics with the 650 to 850 locations we ultimately expect. The table below outlines the key metrics we monitor for a retailer, and as you can see, The Buckle has fit into its jeans pretty well over the past decade.

Metric	2002	2012	TTM Q1 2013	Annual Growth
Stores	304	436	441	3.7%
Sales per Store	$1,339	$2,387	$2,398	6.0%
FCF per Store	$57	$406	$484	21.6%
Sales per Square Foot	$274	$475	n/a	6.0%
Inventory Turnover	4.7x	6.0x	n/a	3.0%

Dollars in thousands. Per-store calculations based on average stores open during the period. Sources: SEC filings, S&P Capital IQ, analyst estimates.

Not only has the company's footprint grown wider than a pair of bell-bottoms, it has sold more — and earned more — at each location thanks to its tight control over operations. The Buckle also has a history of paying special dividends with its excess cash; it's done so for six of the past seven years. Just last December, *Pro* members holding the stock received a $4.50-per-share payout from the company in addition to the regular $0.20 dividend. Naturally, we encouraged all members to celebrate by buying themselves and their loved ones a few new pairs of jeans.

- *Pro*'s original recommendation (6/20/12)
- Talk about The Buckle on our discussion board

The *Pro* Bottom Line

To us, The Buckle has two sides: a very healthy operating business and a not unimpressive bank account. We trust management to allocate the cash in that bank account appropriately, and we appreciate their propensity to return any extra to shareholders. While we can't count on special dividends, the average yield over the past six years, including special dividend payouts, has been approaching North Star-level returns. Meanwhile, the company's operating business has grown bigger, more profitable, and more valuable. An investment in The Buckle suits *Pro*'s penchant for superior businesses, steady income, and a favorable risk/reward profile.

Buy: Starbucks (SBUX)

You only think you go for the coffee — Howard Schultz & Co. are serving up an experience.

Suggested Allocation: 3.3%

You may not realize it, but "**Starbucks**" is no longer a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense it's just a front. We think we go to Starbucks for the coffee, but those little white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

What It Does

Starbucks began opening America's eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 18,000 stores in 60-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences to fill more than 70 million mouths and hearts each week.

By placing the customer experience first, Starbucks has cemented its role in the daily lives of consumers worldwide. People demand their Starbucks products at home, too, which has allowed the company to build out a consumer packaged-goods division that sells more than $1.2 billion worth of products in more than 100,000 locations worldwide. And the company is cultivating a portfolio of other brands (Evolution Fresh juices, La Boulange bakeries) whose products can be sold in Starbucks stores and grocery stores alike. Between coffee, health foods, and tea, Starbucks believes its end markets are a massive $140 billion and growing.

How It's Working

Recent results have been robust. Over the past three years, Starbucks has added almost 1,500 stores, its same-store sales have grown by more than 7% per year, and it has more than doubled earnings. All of this growth has been achieved by doubling down on the in-store experience and refocusing on quality. Starbucks constantly seems to be setting new records for sales, operating profits, and earnings. And if the lines at the two locations nearest to Fool HQ (where we perform our daily channel checks, purely for science) are at all indicative of larger business trends, Starbucks' mojo remains strong.

What We Expect

Given its very recognizable brand, artfully crafted business and fanatically loyal customers, we expect Starbucks' diversified growth to continue. We believe the world's coffee and tea drinkers will happily support 30,000 or so stores across the company's various brands, and that products bearing the aspirational Starbucks brand will expand the company's real estate on grocery-store shelves.

The company's scale and its ability to raise prices should help profits, as will its unique advantages in low-cost marketing. Starbucks is a pioneer in social marketing, and is perhaps better positioned than any other brand to reach out to its customers, nurture their relationship with the company, offer deals, and customize experiences.

More Resources

- *Pro*'s original recommendation (8/22/12)
- Talk about Starbucks on our discussion board

The *Pro* Bottom Line

Starbucks is riding high since CEO Howard Schultz's return to power in 2008, and it now has so many levers to pull that capturing its potential value in a spreadsheet is very difficult. We're not worried that shares trade higher than our fair-value estimate; we think Schultz & Co. have many tricks up their sleeves that will allow Starbucks to grow into and beyond its current valuation, and we want to be along for the caffeinated ride.

Buy: Wells Fargo (WFC)

At heart, banks are simple businesses, and Wells Fargo is the best of the breed.

Suggested Allocation: 3%

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 9,000 branches and 12,000 ATMs. It's the fourth-largest bank in America, it's consistently No. 1 in customer satisfaction for American large banks, and it's the leader in mortgage and small-business lending.

What It Does

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During tough lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

How It's Working

CEO John Stumpf and team are truly the best of the breed. Return on assets and equity for 2012 were very attractive, at 1.4% and 13% respectively — great results given that the bank was using less leverage than before the financial crisis. Total revenue growth, while modest, has combined with expense reductions to drive quarter after quarter of earnings growth, leading to record earnings. Deposit growth has been tremendous, and as Wells Fargo grabs additional "wallet share," fee income grows as well. The credit quality of the loan portfolio is impressive and is still improving. All of this has contributed to a very well-capitalized balance sheet, allowing Wells Fargo to comply with upcoming capital regulation requirements well ahead of schedule.

What We Expect

Revenue growth will be slow until U.S. loan demand resumes, but management's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. We should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But when the U.S. housing market emerges from its general malaise, Wells Fargo's real earnings power — bolstered by growth in fee-based revenue — will hit its full stride. And many customers who start a deposit account or mortgage with Wells Fargo will explore the company's offerings in other areas, too.

More Resources

- *Pro*'s original recommendation (12/10/10)
- Talk about Wells Fargo on our discussion board

The *Pro* Bottom Line

Shares are trading at less than fair value, and they yield a growing 2.8% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. Pro has also used options in the past to generate even more income from this position, so try to invest using round, 100-share lots if it keeps you within half a percent (plus or minus) of our 3% allocation. If that's not feasible for you, share ownership alone is fine, too; with its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

Buckle's Fair Value Bucks Higher

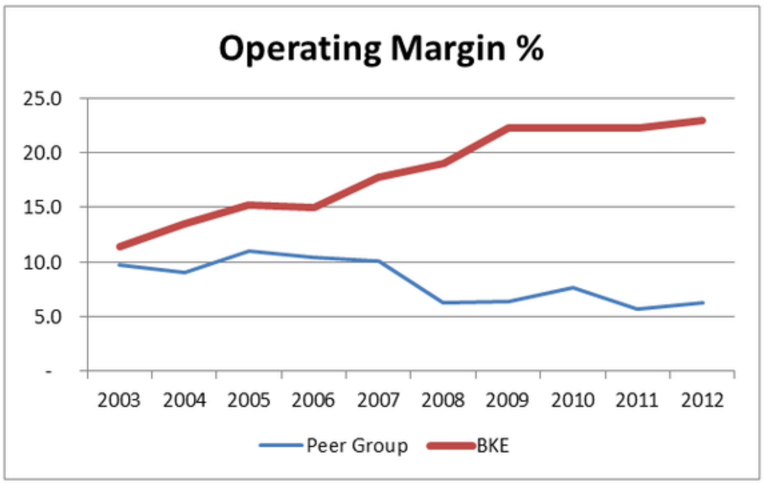
Published Jul 15, 2013 at 4:00PM

Fellow Fools,

Just a few days ago, as Jeff and I were walking to our local Starbucks (for a channel check, of course), I mentioned that I've worn one of my favorite T-shirts so many times I fear it may entirely disintegrate during its next wash. In response, Jeff lamented that his favorite T-shirts tend to disappear – his wife finds them quite comfortable. It's fair to say that when it comes to fashion, your *Pro* team is a Hold at best; we may even be due for a fair-value reduction. But *Pro's* only fashion-focused holding, **The Buckle** (NYSE: BKE), remains a Buy – and today, we're **boosting its fair value up to $56** and its Consider Adding More price to $41.

Why BKE is Better

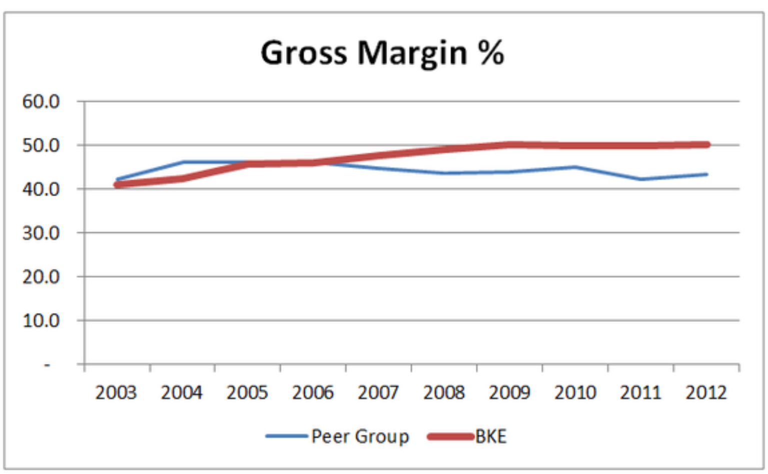
The Buckle has performed exactly as we expected since we purchased it just over a year ago: It has opened new locations, maintained a great in-store experience, and kept costs under control. In fact, the primary driver of the bump in fair value comes from my increased confidence in the company's ability to maintain its already impressive operating margins.



Fiscal years. Sources: Standard & Poor's Capital IQ and analyst estimates.

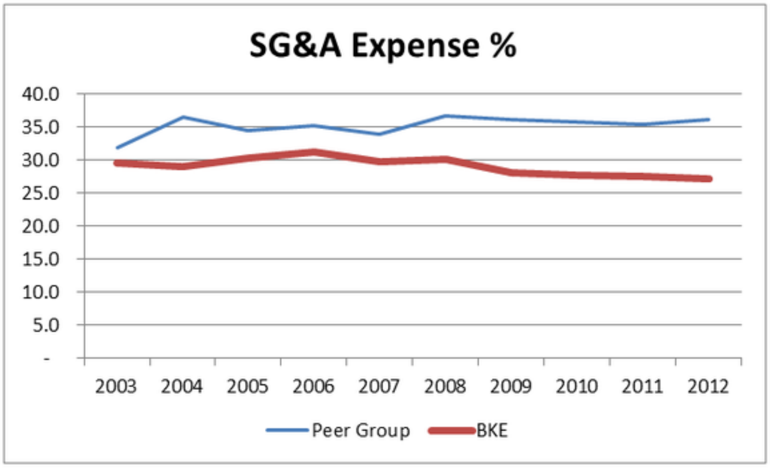
The chart above nicely demonstrates that The Buckle's business has performed admirably vis-à-vis its competitors over the last decade ... but we should care more about *how* it has been able to do this, and what we should expect over the next 10 years.

Regarding the how: The Buckle has improved its gross margins by selling more of its house-brand clothes and using its size to get better purchasing arrangements. Last year, 34% of sales came from Buckle brands, up from 20% 10 years ago. This shift has helped The Buckle expand gross margins by about 25%, while its peer group has basically held the line.



Fiscal years. Source: Standard & Poor's Capital IQ and analyst estimates.

The Buckle's investment in training sales associates, and its desire to promote from within, have led to lower employee turnover (compared with competitors) at and above the store-manager rank and reduced costs associated with rehiring. I don't have any hard data to prove this, but employee reviews and common sense suggest it to be true. We *can* be sure the company has done a great job holding down other overhead costs, which is captured in the proportion of each sales dollar that goes to sales, general, and administrative costs (SG&A expenses).



Fiscal years. Source: Standard & Poor's Capital IQ and analyst estimates.

What Does the Future Hold?

With the pretty pictures above, we dug into a few of the sources of The Buckle's great financial performance. But as we noted, the company's intrinsic value hinges on how it will perform in the future. To that end:

- Although private-brand sales are up 75% over the past decade, their expansion has stalled a bit, only expanding from 33% in 2010 to 34% in 2012. Still, the company is adding house brands across products, with plenty of room to go in kids' clothes, accessories, and tops.
- As The Buckle opens new stores closer to the coasts, rent will likely be higher than in the heartland, which would pressure gross margins. But increased sales via the company's website should help offset that trend (go get yourself one of the 5.5 million pairs of jeans the company sells each year!). I expect online sales growth to outpace in-store sales growth, which should benefit margins.
- There are also incremental benefits to be found in The Buckle's expansion plans. As it opens new stores contiguously and to fill in geographic gaps, shipments from its still-new distribution facility will achieve further efficiencies. In a similar vein, the growing store base shouldn't require much expansion at headquarters, so there will be slight benefit from overhead costs growing more slowly than sales.

Overall, I think The Buckle's margins are unlikely to change much over the next few years -- but I underestimated the sustainability of those impressive margins in my prior model, which caused me to underestimate the company's performance. I now expect management to hold the line over the next five years, at which point operating margins should begin to decline to more a sustainable level for a mature specialty retailer (about 17%).

The other main drivers of value are store openings, same-store sales growth, and the company's reinvestment profile (store remodel expenses and inventory requirements). All of these metrics look about the same as in the past, accounting for rising costs; I expect 4% growth in store openings and 2.5% same-store sales growth, on average, over the next decade.

The *Pro* Bottom Line

Will The Buckle have 639 stores, $2.1 billion in sales, and $244 million in free cash flow in 2023, as my model predicts? No. Of course it won't. But the modeling and valuation exercise is instructive because it shows us that, to justify today's price and earn us North Star-like returns, the company only has to expand modestly, and its financial performance (growth and margins) could actually deteriorate. To the extent the long-tenured, stellar management team is able to delay this deterioration, our returns should be even higher. As we await the company's second-quarter earnings next month, we should all keep an eye out for clues about what The Buckle may look like in 2023. The only thing I know for sure is that my favorite T-shirt will be long gone by then -- but I hope to be consoled by still owning shares of The Buckle.

Onward,

Bryan (TMF42)

Pro Catch-Up Trades

- None this week.

Pro Guidance Changes

- In case you didn't read the artfully crafted 900 words above, we're raising The Buckle's fair value to $56 and its Consider Adding More price to $41. Shares remain a Buy.
- We moved **BMC Software** (NASDAQ: BMC) to Hold as we wait for the company to be taken private.
- We increased our estimate of fair value for **Papa John's Pizza** (NASDAQ: PZZA) to $60. Shares remain on hold.
- We increased our estimate of fair value for **Wells Fargo** (NYSE: WFC) to $46. Shares are a buy.

Coverage & Community

- A note of reassurance from *Pro* member DWSCHULZ.
- Don't miss out on all the action happening in response to our newest recommendation.
- Our new guy writes his first Memo and only Carp can muster the courage to give him a hard time? C'mon, *Pro* community, let him have it.

The Motley Fool owns shares of BMC Software, Papa John's International, The Buckle, and Wells Fargo. See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Write Puts on American Tower

Published Jul 15, 2013 at 3:35PM

- **What We're Doing**: Writing puts for income and to potentially add 2.5% to our stock position, bringing it to around 5%.
- **What We're Thinking**: The slide in the stock price is unwarranted, and we're happy to take advantage of the volatility.
- **What We're Expecting**: This company's towers will enable the world's Internet junkies to use their mobile phones more and more.

Trade Essentials

- **Action**: Sell to open August $70 puts on **American Tower** (NYSE: AMT)
- **Allocation**: About 2.5%; with the 2.8% already in our portfolio, today's recommendation gives us the potential for a total stake of about 5%. *Pro* will write six contracts. Each contract represents a $7,000 potential obligation.
- **Recent Price**: $75.96
- **Option Price (bid/ask)**: $2.35/$2.45
- **Price Guidance**: Split the bid and ask, aiming for $2.40 or better. Over time, accept no less than $2.
- **Alternative Trades**: If you don't yet have an allocation to American Tower, we suggest you buy a 2.8% stake and write puts for another potential 2.5%. If your portfolio is less than $300,000, it may not make sense for you to write these puts. If that is the case, hang tight -- we might raise our stake if shares approach our Consider Adding More price. For a more aggressive put write, you can choose the $72.50 strike; for a more conservative put write, you can choose $67.50.

What's New?

American Tower is down 10% in the two months *Pro* has owned it. We don't even have a new quarterly release to update us on how business is progressing, so what's up? We see two possibilities.

1. The Fed. Chairman Ben Bernanke occasionally hints at rising interest rates (or at least that's how the pundits interpret his words), and each time, high-dividend stocks and real estate investment trusts get whacked as marginal investors rotate out of these assets and into now higher-yielding bonds. We think American Tower's inclusion in this dynamic is silly – while the company is structured as a REIT, the underlying dynamics of Internet usage on mobile phones make it a growth stock in a real-estate wrapper. If the company performs as we expect it to over time, investors will begin to see it for what it really is.
2. Debt. American Tower is one of the most indebted companies in the *Pro* portfolio; more than 70% of the company's capital is funded by debt. Higher interest rates make debt more expensive, so some investors may be scared by this large debt load. There are a few reasons we're not. First, the company's contract revenue is very consistent. Second, while debt coverage has been rising for past few quarters, interest coverage has fallen; this suggests the company is simply taking advantage of attractive borrowing opportunities. Third, management has indicated that the company's financial condition is strong enough to buy back shares in the face of all that debt. And finally, most of the company's debt is fixed-rate (so it won't adjust upward automatically when rates do rise), and very little of it will come due until 2015.

American Tower announces earnings at the end of the month, and while we have no idea what it will report, we're confident that the results will reflect the advantages we see in its business: a unique asset portfolio, a growing underlying market, and a financial position that will allow it to persist.

How to Follow Along

Write ("sell to open") one August $70 put for every $7,000 in stock you'd be willing and able to purchase if the share price falls below $70 by expiration. Use a limit order, splitting the current bid/ask. *Pro* will write six contracts to potentially grow our 2.8% stake to around 5% if we get shares.

- **Maximum return**: We make 3.4% in 33 days (45% annualized) if shares of AMT stay above $70.
- **Breakeven**: We begin to lose money when shares fall below $67.60, or 10.8% lower than where they are today.
- **Maximum risk**: If shares fall $8.36 to $67.60, our loss matches that of owning shares outright.

Next Step: Please post any questions on the American Tower discussion board.

See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Write Puts on American Tower

Buy TD Ameritrade

Published Jul 11, 2013 at 1:30PM

Trade Essentials

- **Action:** Buy **TD Ameritrade** (NYSE: AMTD)
- **Allocation:** 3%
- **Scorecard Status:** Buy First
- **Recent Price:** $25.60
- **Fair-Value Estimate:** $34
- **Consider Adding More:** $20
- **Dividend:** 1.4%
- **Options:** We may use them later, but they aren't necessary
- **Price Guidance:** When you're ready to buy, use a limit order to avoid pushing the stock higher

What It Does

Entrusted with $517 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NYSE: AMTD) hosts 378,000 stock, options, and futures trades on an average day. Since 2008, against a "perfect storm" of weak trading volume, near-zero interest rates, and a flattened yield curve (where short and long-term interest rates don't differ by much), this $14 billion company has managed to double client assets, contain operating costs, and return ever-more cash to shareholders.

At the same time, TD Ameritrade's partnership with **TD Bank** (NYSE: TD) (which owns 45% of the company) gives it a unique position in its industry. The partnership allows TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank, and with cross-selling opportunities and below-average risk to boot. So, when the current record-low Federal Funds interest rate increases, TD Ameritrade will earn much higher interest income, all of it pure profit. Meanwhile, it continues to focus on job No. 1: Grow client assets, and launch more investment products.

But about that Fed Funds rate: In 2007, it was 4.75%, up from 1% in 2003 during the last recession. Today, it's hovering between zero and 0.25%. The first year that it increases by 100 basis points (to 1.1% from today's 0.1%), management estimates TD Ameritrade's earnings per share will rise by an *extra* 27% to 32% compared with the prior year, on top of any other growth. And as history shows, interest rates could rise by much more than 100 basis points over the next three, five, and seven years.

The table below shows where TD Ameritrade has earned its revenue over the past six years.

% of TD Ameritrade's Revenue	2007	2008	2009	2010	2011	2012
Commissions and Transaction Fees	37.4%	40.1%	52%	46.6%	44.5%	41.2%
Net Interest Revenue	25.6%	21.7%	14.4%	16.5%	17.8%	17%
Insured Deposit Account Fees	24.6%	24.8%	23.6%	26.6%	27.6%	31.4%
Investment Product Fees	10.7%	12.2%	7.7%	5.1%	6%	7.4%
Other Revenue	1.7%	1.2%	2.3%	5.2%	4.1%	3%

Total revenue is up since 2007 despite a decline of about one-third in net interest revenue, as you can see above. But by growing client accounts, TD Ameritrade now has a much larger asset base on which to earn income when interest rates rebound (not to mention other benefits when trading volume grows). As of May, the company oversaw $88 billion in interest rate-sensitive assets. It also enjoys recurring fees from an expanding line of investment products: retirement accounts, advisor and institutional services (including AdvisorDirect), and exchange-traded and mutual-fund offerings.

How It's Doing

TD Ameritrade has increased client assets by at least 10% annualized for the last four years and counting. Management says this rate of growth has been about double that of its nearest competitor. For context, the S&P 500 is nearly flat since 2007, but client assets held at TD Ameritrade have more than doubled over the same period. The company's lucrative, quickly growing registered investment advisor business has contributed to this success, as have its new investment services. As evidence, two quarters into the current fiscal year, revenue from investment product fees is up 32% to $106 million.

Operating margins are strong, too, lately in the mid-30% range. Diligent capital management led Standard & Poor's to upgrade the business to an "A" credit rating in 2012, which helped fuel a recent 50% increase in the dividend (likely the first of many). With steady gains in customer accounts, decreasing shares outstanding (from 595 million in 2007 to 550 million last quarter), and a commitment to paying out roughly two-thirds of earnings to shareholders, the business should continue to reward owners – with the added benefit of much higher profits when interest rates increase. Meanwhile, the stock trades about 20% below its 10-year average price-to-book value of 4, although the company is more diverse and stronger now than over the past decade.

Following is TD Ameritrade's year-end book value multiple, along with the last Fed Funds rate for the given year:

Year	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
TDA P/BV	4.9	4.8	6.4	5.7	5.5	2.9	3.2	2.9	2.1	2.1
Fed Rate	1.0	2.25	4.25	5.25	4.25	0 – 0.25	0 – 0.25	0 – 0.25	0 – 0.25	0 – 0.25

Today the stock trades at 3.3 times book value. The table tells the story well: When interest rates head higher, investors anticipate higher earnings and higher return on equity, so they pay a higher value multiple for TD Ameritrade. And with rates currently at a generational low, we could see a steady climb upward for many years. At the same time, as noted above, TD Ameritrade continues to be a well-run business with a long runway. This isn't *just* an investment in higher interest rates -- but higher rates will be an impressive booster rocket for earnings.

What Could Make Us Sell

TD Ameritrade needs to continue to increase customer accounts and client assets against tough competition (lately, it is drawing assets away from old-school, full-service brokers). Beyond that, it's a waiting game for more trading volume, more investment fees, and higher interest rates. Although we don't believe it likely, the United States could maintain very low interest rates for years, as Japan has; if that happens, our patience will be tried. If rates do increase, higher interest income may drive new commission wars as brokers fight to gather assets. We believe this less likely in today's mature, consolidated industry, but if we see such issues developing, we'll temper our expectations and consider selling. Finally, as with any financial stock, if we have any reason to lose trust in management, we'll enter a sell order.

Alternative Trades

- Although we recommend buying shares today, if you want to potentially buy the stock lower, consider "selling to open" one November 2013 $25 put for every 100 shares you could buy. Lately, these pay about $1.30, or a 5.2% yield in just more than four months. You can also consider other strikes and months.
- If you want to invest less capital, consider "buying to open" January 2015 $20 call options for upside exposure until that date.

The Foolish Bottom Line

TD Ameritrade's earnings are very likely at a cyclical low. Believing as we do that the company's profit potential is much greater than recent results suggest, the stock is a compelling buy in anticipation of higher interest rates. TD Ameritrade's business model is powerful when rates are headed upward. Most investors have probably forgotten that power since 2007, but will remember it when earnings start to jump. We'll begin with a 3% stake within the next 30 days and will consider increasing it over time.

Next Step: Head over to *Pro's* new TD Ameritrade board to discuss this investment.

Buy TD Ameritrade

Published Jul 11, 2013 at 12:00AM

Trade Essentials

- **Action:** Buy **TD Ameritrade** (NYSE: AMTD)
- **Allocation:** 3%
- **Scorecard Status:** Buy First
- **Recent Price:** $25.60
- **Fair-Value Estimate:** $34
- **Consider Adding More:** $20
- **Dividend:** 1.4%
- **Options:** We may use them later, but they aren't necessary
- **Price Guidance:** When you're ready to buy, use a limit order to avoid pushing the stock higher

What It Does

Entrusted with $517 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NYSE: AMTD) hosts 378,000 stock, options, and futures trades on an average day. Since 2008, against a "perfect storm" of weak trading volume, near-zero interest rates, and a flattened yield curve (where short and long-term interest rates don't differ by much), this $14 billion company has managed to double client assets, contain operating costs, and return ever-more cash to shareholders.

At the same time, TD Ameritrade's partnership with **TD Bank** (NYSE: TD) (which owns 45% of the company) gives it a unique position in its industry. The partnership allows TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank, and with cross-selling opportunities and below-average risk to boot. So, when the current record-low Federal Funds interest rate increases, TD Ameritrade will earn much higher interest income, all of it pure profit. Meanwhile, it continues to focus on job No. 1: Grow client assets, and launch more investment products.

But about that Fed Funds rate: In 2007, it was 4.75%, up from 1% in 2003 during the last recession. Today, it's hovering between zero and 0.25%. The first year that it increases by 100 basis points (to 1.1% from today's 0.1%), management estimates TD Ameritrade's earnings per share will rise by an *extra* 27% to 32% compared with the prior year, on top of any other growth. And as history shows, interest rates could rise by much more than 100 basis points over the next three, five, and seven years.

The table below shows where TD Ameritrade has earned its revenue over the past six years.

% of TD Ameritrade's Revenue	2007	2008	2009	2010	2011	2012
Commissions and Transaction Fees	37.4%	40.1%	52%	46.6%	44.5%	41.2%
Net Interest Revenue	25.6%	21.7%	14.4%	16.5%	17.8%	17%
Insured Deposit Account Fees	24.6%	24.8%	23.6%	26.6%	27.6%	31.4%
Investment Product Fees	10.7%	12.2%	7.7%	5.1%	6%	7.4%
Other Revenue	1.7%	1.2%	2.3%	5.2%	4.1%	3%

Total revenue is up since 2007 despite a decline of about one-third in net interest revenue, as you can see above. But by growing client accounts, TD Ameritrade now has a much larger asset base on which to earn income when interest rates rebound (not to mention other benefits when trading volume grows). As of May, the company oversaw $88 billion in interest rate-sensitive assets. It also enjoys recurring fees from an expanding line of investment products: retirement accounts, advisor and institutional services (including AdvisorDirect), and exchange-traded and mutual-fund offerings.

How It's Doing

TD Ameritrade has increased client assets by at least 10% annualized for the last four years and counting. Management says this rate of growth has been about double that of its nearest competitor. For context, the S&P 500 is nearly flat since 2007, but client assets held at TD Ameritrade have more than doubled over the same period. The company's lucrative, quickly growing registered investment advisor business has contributed to this success, as have its new investment services. As evidence, two quarters into the current fiscal year, revenue from investment product fees is up 32% to $106 million.

Operating margins are strong, too, lately in the mid-30% range. Diligent capital management led Standard & Poor's to upgrade the business to an "A" credit rating in 2012, which helped fuel a recent 50% increase in the dividend (likely the first of many). With steady gains in customer accounts, decreasing shares outstanding (from 595 million in 2007 to 550 million last quarter), and a commitment to paying out roughly two-thirds of earnings to shareholders, the business should continue to reward owners – with the added benefit of much higher profits when interest rates increase. Meanwhile, the stock trades about 20% below its 10-year average price-to-book value of 4, although the company is more diverse and stronger now than over the past decade.

Following is TD Ameritrade's year-end book value multiple, along with the last Fed Funds rate for the given year:

Year	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
TDA P/BV	4.9	4.8	6.4	5.7	5.5	2.9	3.2	2.9	2.1	2.1
Fed Rate	1.0	2.25	4.25	5.25	4.25	0 – 0.25	0 – 0.25	0 – 0.25	0 – 0.25	0 – 0.25

Today the stock trades at 3.3 times book value. The table tells the story well: When interest rates head higher, investors anticipate higher earnings and higher return on equity, so they pay a higher value multiple for TD Ameritrade. And with rates currently at a generational low, we could see a steady climb upward for many years. At the same time, as noted above, TD Ameritrade continues to be a well-run business with a long runway. This isn't *just* an investment in higher interest rates -- but higher rates will be an impressive booster rocket for earnings.

What Could Make Us Sell

TD Ameritrade needs to continue to increase customer accounts and client assets against tough competition (lately, it is drawing assets away from old-school, full-service brokers). Beyond that, it's a waiting game for more trading volume, more investment fees, and higher interest rates. Although we don't believe it likely, the United States could maintain very low interest rates for years, as Japan has; if that happens, our patience will be tried. If rates do increase, higher interest income may drive new commission wars as brokers fight to gather assets. We believe this less likely in today's mature, consolidated industry, but if we see such issues developing, we'll temper our expectations and consider selling. Finally, as with any financial stock, if we have any reason to lose trust in management, we'll enter a sell order.

Alternative Trades

- Although we recommend buying shares today, if you want to potentially buy the stock lower, consider "selling to open" one November 2013 $25 put for every 100 shares you could buy. Lately, these pay about $1.30, or a 5.2% yield in just more than four months. You can also consider other strikes and months.
- If you want to invest less capital, consider "buying to open" January 2015 $20 call options for upside exposure until that date.

The Foolish Bottom Line

TD Ameritrade's earnings are very likely at a cyclical low. Believing as we do that the company's profit potential is much greater than recent results suggest, the stock is a compelling buy in anticipation of higher interest rates. TD Ameritrade's business model is powerful when rates are headed upward. Most investors have probably forgotten that power since 2007, but will remember it when earnings start to jump. We'll begin with a 3% stake within the next 30 days and will consider increasing it over time.

Next Step: Head over to *Pro's* new TD Ameritrade board to discuss this investment.

Catch-Up Report: Part 3

Published Jul 9, 2013 at 12:00AM

These Catch-Up reports provide in-depth guidance on our active recommendations — a plan for starting to build your *Pro* portfolio:

Part 1 • Part 2 • Part 3 • Part 4 • Shorts & Options

You can also see all our active positions, with Buy First, Buy, and Hold ratings, along with our latest opinions, in What We Think Now. Use this alongside our porfolio page's Recommended Allocation to help build your portfolio.

Remember, there's no need to rush into any trades, so take your time. We're here to help — if you have any questions, the *Pro* team and fellow members have the answers in our *Pro* Community.

In This Report

Buy: Broadridge Financial Solutions | This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Buy: Gentex | The maker of auto-dimming car mirrors has a bright future.

Buy: Intel | Rumors of the PC's death have been greatly exaggerated.

Buy: Medtronic | For once, maybe we can all profit from growing older.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund | Diversification with some of the best small companies you've never heard of.

PDF Download this report as a PDF file

Buy: Broadridge Financial Solutions (BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 3.5%

Broadridge Financial Solutions helps the global financial system work. It operates the technology and logistical plumbing behind the scenes of global securities trading and the communication between banks, brokers, funds, and shareholders, and it made about $2.3 billion last year doing so. It's not sexy, but Broadridge dominates its niches, has remarkably steady recurring revenue and cash flow, and has recently broadened its suite of products and services with some small acquisitions. We expect the company to be a slow grower, but its consistent earnings growth and a healthy 2.7% dividend should help achieve North Star-like returns over time.

What It Does

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. Broadridge's investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in 2012, more than 85% of shares voted electronically used the company's platform. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider to manage investor communications.

The company's smaller segment, securities processing solutions, accounts for 28% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance Broadridge technology kicks into action — the company processes more than $4.5 trillion worth of global stock and bond trades each day.

How It's Working

Mutual funds have been scrimping on investor communications recently, and low trading volume has dinged sales and profit growth. Still, it's a testament to the company's resilient business model that sales growth, profit margins, and free cash flow remain attractive — revenue grew 6% last year and earnings advanced 13%. And Broadridge continues to serve its customers masterfully; its 99% retention rate sets the stage for recurring revenue (and deepening relationships) in future years.

What We Expect

We think Broadridge will continue to write the e-book on electronic investor communications. Its dominance of this market should strengthen its competitive advantages, making it indispensable as transparency in the financial system increases. We also expect banks and brokerages to continue outsourcing their non-core operations to save money and increase flexibility; this should bring increased business and greater efficiency to Broadridge. Management expects 3% to 4% revenue growth this year, which should translate to more than 9% earnings growth. Much of Broadridge's revenue is recurring, making its sales and earnings growth highly reliable, and its impressive free cash flow will likely bring an ever-higher dividend and increased share buybacks.

More Resources

- *Pro* 's original recommendation (4/27/10)
- Talk about Broadridge on our discussion board

The *Pro* Bottom Line

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns. While we wait for the market to come around to the Broadridge story, we believe management is buying back shares at an attractive price. We think shares are worth $27.50 today.

Buy: Gentex

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 3.1%

In 1982, a small company in Zeeland, Mich., called **Gentex** made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors. Today, the company commands almost 90% of that market, and it sells eight times more units than its closest competitor.

What It Does

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. In 2000, the company sold 6.8 million units; in 2012, it sold 23.8 million. That growth has been driven by an increased focus on safety, higher car sales, and greater market penetration (more car makers offering Gentex mirrors as a trim option).

How It's Working

Gentex has turned these market dynamics into wonderful financial performance. Revenue is up by nearly 20% per year since 1987, and over the past decade, the company's net margins have bounced around the mid-teens. Those numbers are shockingly good for an auto parts supplier, showing that its fancy mirrors are showing up in more and more new cars. Gentex has reinvested in its business to sustain its advantages; it pioneers its own manufacturing technologies; it owns all of the manufacturing plants it builds (the land, too); and it sets aside 7% of sales for research and development. It's also got almost $5 per share in cash and investments, sending a strong signal to automakers that Gentex should easily avoid any potholes in auto demand.

What We Expect

Currently, less than one in every four cars made worldwide has an auto-dimming rearview mirror, and only 6% have auto-dimming exterior mirrors. For context, prior to 1987 those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher penetration; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More Resources

- *Pro* 's original recommendation (5/29/12)
- Talk about Gentex on our discussion board

The *Pro* Bottom Line

More and more technology is finding its way to the auto mirror, both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. With shares trading around our estimate of fair value, we think Gentex reflects a great opportunity.

Buy: Intel

Rumors of the PC's death have been greatly exaggerated.

Suggested Allocation: 5.2%

The world's leading producer of microprocessors and chipsets for computing devices, **Intel** trades at less than 12 times earnings, or more than a 35% discount to the average S&P 500 stock. It also pays nearly twice the average dividend yield, at 3.8%. That's cheap enough to indicate that all is clearly not right in Intel's corner of Silicon Valley.

While the media loves to talk about the demise of the personal computer, it's our job at *Pro* to sift through that constant chatter to see the truth and invest accordingly. And to our minds, the death of the PC has been erroneously predicted. Mobile computing is indeed changing our online behavior, and PCs are evolving as a result. But the outcome is more computing devices, not fewer, and Intel is positioning itself to be the brains behind ever more of them.

What It Does

Intel's goal is to be "the preeminent computing solutions company that powers the worldwide digital economy." Whether it's a high-speed server for a data center, a new Ultrabook with a touchscreen and detachable tablet, a smartphone, a tablet, a car, or just about anything else, Intel has the computing technology to drive it.

Admittedly, the company was late to the smartphone and tablet markets, but there's a silver lining: As these devices eat into PC sales, investors' fear about Intel's tardiness brings us the value opportunity we see in the stock. And because smartphones and tablets have very short life cycles, Intel can catch up quickly by steadily inserting its technology into new product designs.

How It's Working

Intel asserts that the tablet is broadening the PC market, not shrinking it, and we agree. Tablets are wonderful for what they are, and the hype surrounding them is admittedly intense. But it seems likely that the PCs of tomorrow will have the best qualities of both a tablet and a PC.

In emerging economies, PC unit volume has steadily risen for years; in North America, it slipped in 2012 for the first time in 11 years, but we believe that was because consumers are excited about the novelty of tablets, not done with PCs forever. Even as the market is expected to shrink, data company IDC expects 2017 shipments to be less than 5% lower than in 2012. We view this as a mature market where Intel will continue to dominate — and generate cash for reinvestment elsewhere.

What We Expect

More Resources

- *Pro* 's recommendation history
- Talk about Intel on our discussion board

Intel is investing for greater growth ahead. Wall Street is leery of the company's expensive capital investment plans, designed to maintain its leading-edge manufacturing abilities, but we view this spending as a strong indicator for the company's future. Intel's confidence in the future of microprocessors seems well-placed in our increasingly digital age; as the number of devices connecting to the Web grows exponentially, so does the need for more computing power.

The *Pro* Bottom Line

Historically, buying true blue chips (Coca-Cola, Johnson & Johnson, IBM …) when they're down has been an excellent investment strategy. We believe Intel will fit that bill, too. Our fair value on the stock is about $27; on a price-to-earnings basis, that would still leave the stock trading at a healthy discount to the S&P 500. We don't expect this value gap to be bridged immediately — first, Wall Street needs to believe in the company's future again. But this year or next, we expect Intel to show skeptics that it's here to stay.

Buy: Medtronic

For once, maybe we can all profit from growing older.

Suggested Allocation: 3.2%

Bryan likes to tell people that the mounting gray strands in his hair represent rapidly increasing wisdom. Nick claims his sore back is the result of lifting cars over his head. Jeff … well, Jeff just thinks cruising around on a Hoveround makes him look hip (it doesn't). The honest truth is that your *Pro* team is aging, and global demographics are shifting in that direction, too. Cost issues aside, global health care is a growth market we'd be silly to miss. Since 2009, *Pro* has stood by **Medtronic** because of its global reach, unrivaled commitment to research and development, and attractive financial profile.

What It Does

Medtronic is in business to "alleviate pain, restore health, and extend life" for the chronically ill. Sure, it also makes money for its shareholders and provides a good life for its employees, but the company has grown from a garage operation into the world's largest medical technology company by keeping its patient-centric mission front and center.

Today, Medtronic has a vast suite of high-tech products; it boasts market-leading share in key technologies; and it has successfully defended that position over time by keeping the pedal to the metal regarding research and development. And with more than 9% of sales directed back into R&D, there are research dollars left over to keep the company's new product pipeline humming. Finally, Medtronic has made selective acquisitions to target higher-growth areas and fill product holes, and it now racks up $7.5 billion a year in international sales (45% of the company's $16.6 billion total).

How It's Working

Over the past few years, some of Medtronic's core markets have come under duress; in some cases, competition has picked up, while in others, product efficacy and sales practices have been questioned. As of late, though, all that has been stabilizing — and the company's other businesses, and its 20% annual growth in emerging markets, were busy picking up the slack. Product diversification has been a big help in maintaining sales levels, and management's deft execution of its goals and impressive expense management have turned modest sales performance into admirable bottom-line results and cash generation.

Although sales have only advanced 4% annually over the past five years, earnings, dividends, and free cash flow have grown faster as management has cut costs, consistently rewarded shareholders, and maintained discipline with its reinvestments.

What We Expect

Under new CEO Omar Ishrak (who came aboard in 2011), we expect Medtronic to continue its clinical excellence and focus on chronic diseases. However, we expect more disciplined execution, a stronger focus on building the infrastructure for ongoing emerging-market growth, and an evolving balance between the clinical benefits of the company's products and their economic value. Management expects the company to generate $25 billion worth of free cash flow over the next five years, and half of that is likely to be returned to shareholders in the form of dividends and share buybacks.

More Resources

- *Pro* 's original recommendation (7/1/09)
- Talk about Medtronic on our discussion board

The *Pro* Bottom Line

We recommend you match our 3% allocation in this leading medical technology company. If it's as good an investment as we believe, we can all buy Hoverounds to chase Jeff — and truly profit from getting older.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund

Diversification with some of the best small companies you've never heard of.

Suggested Allocation: 2.1%

At *Pro*, we think we could develop an edge when it comes to investing in emerging-market small caps — but the investment in time and energy would be tremendous. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund**.

What It Does

This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields about 3.5%). For *Pro*, it offers exposure to 521 of the most promising business we've never heard of.

This ETF gives us an excellent way to invest in unfamiliar companies in locations where we don't have a discernible edge — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The risk-reducing benefits of investing outside our home market are equally important.

How It's Working

It's no surprise that small-cap companies (even dividend-paying ones) in emerging markets can be volatile. We expect DGS itself to continue to experience higher-than-average volatility, even though the diversification it brings to our holdings will likely lower the portfolio's volatility overall.

We'd always prefer to own great businesses over great ETFs, so this holding has a permanent spot on our short list of positions we'd sell if we needed cash or found a higher-conviction alternative. In the meantime, for a reasonable 0.64% expense ratio, we get a basket of businesses with a history of exceptional performance, weighted by the size of their annual cash dividend. The fund's heavy weighting toward financials (23%), industrials (16%), and the consumer discretionary sector (14%) leaves it well positioned to benefit from an economic recovery if and when one comes along.

What We Expect

Let’s be frank: We’ve lost a bit of money on DGS since recommending it in November 2010. But you shouldn’t fault DGS for our timing — it had great returns in 2010, before we bought it, and great returns in 2012, too. It’s the middling 2011 results that have us just now breaking even.

This is a top-notch fund, and you don’t have to take our word for it; Morningstar has bestowed its coveted five-star rating on DGS. It’s also made Morningstar’s list of the top eight funds in its category in each of the past three years, and it’s ranked No. 2 when considering five-year performance. We expect these impressive long-term results to continue.

More Resources

- *Pro* ’s original recommendation (11/22/10)
- Talk about DGS on our discussion board

The *Pro* Bottom Line

Overall, DGS provides cheap diversification and income for us, and it remains a well-run fund that has earned its place in the *Pro* portfolio. All that said, it needs to do its part in helping us achieve North Star-like returns over the coming years if it wants to stick around. We still believe that income and value within growing economies are worth investing in, and we suggest you match our 2.1% allocation now.

The Motley Fool owns shares of Broadridge Financial Solutions, Gentex, Intel, Medtronic, and WisdomTree Emerging Mkts Small Cap Div. See Pro*’s holdings here. See the team’s and David and Tom Gardner’s holdings here.*

3 Things I’ve Learned From Motley Fool Pro

Published Jul 8, 2013 at 4:00PM

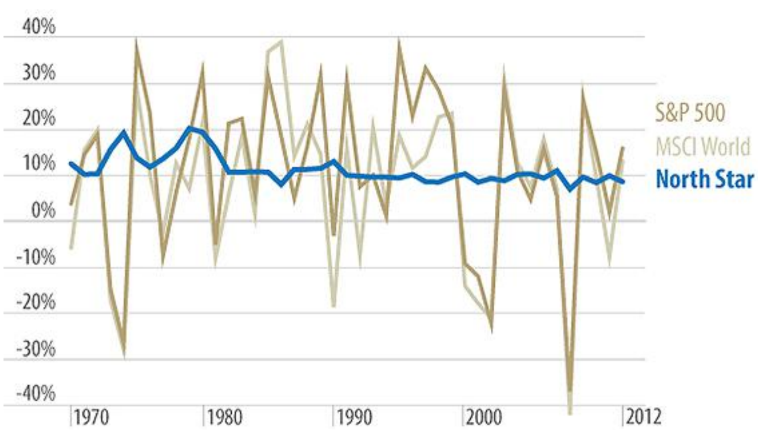
Dear *Pro* members,

Billy Kipersztok here (TMFTailwind), *Pro*'s resident analyst in development. Having joined the team in mid-April, I've only been with *Pro* a bit longer than our newest cohort of members. For the benefit of those Fools and our veteran members alike, the team thought it might be useful for me to share three of the most important takeaways I've learned in my time so far on the (awesome!) *Pro* team.

1. The *Pro* Philosophy and Our North Star

Pro's philosophy is unique among Motley Fool services in that we are a real-money portfolio service that aims to generate *positive real returns*in any market. Instead of comparing our performance to a market benchmark, we instead set our sights on our North Star: inflation + 7% annually.

Unlike a market index, which regularly produces negative returns over a given period, the North Star has virtually always been positive over the last 80 years. Using this graph from our Guidebook, you can see that over the past 43 years, U.S. and world markets (the S&P 500 and MSCI World, respectively) have dipped into negative territory with regularity, while our North Star has been positive in *every single year.*



2. Volatility and the Magnitude of Changes

That graph leads me to my next important takeaway: *Pro*'s thoughtful approach to volatility. Volatility is defined as "a statistical measure of the dispersion of returns for a given security or market index," which is just a fancy way of saying "uncertainty about the size of changes in a security's (or portfolio's) value." The price of a stock with high volatility can change dramatically over a short time period, while a low-volatility stock's price will remain much steadier.

As you can see in the first chart above, our North Star has exhibited much lower volatility than the U.S. and world market indices, which have swung wildly from one extreme (-40% in the mid-2000s) to the other (+40% in the mid-1990s). This means that as we aim for our North Star, over time, we should see smooth, steady returns over *any* market cycle.

Remember, though, that volatility isn't constant. As it changes, it can be measured indirectly with options prices. There's an index that tracks overall market volatility via options prices on the S&P 500: the Chicago Board Options Exchange Market Volatility Index (^VIX). Paradoxically enough, volatility itself is actually very volatile. Here is a graph of the ^VIX index over the last 10 years.

Spikes in volatility usually coincide with market corrections (most notably the late 2008-early 2009 spike), and for this reason, VIX is often referred to as the "investor fear gauge." As investors concerned about smooth, steady real returns, the *Pro* team keeps an eye on the VIX index to aid in our investment decision-making.

3. Tools in the Toolbox

So we've talked about our goals — whatwe aim for in *Motley Fool Pro*. My final takeaway is about *how* we invest in order to keep on track with our performance goals, as guided byour North Star.

As we learned from our first graph, stock market indices frequently dip into negative territory. Thus, if our goals are to minimize volatility and consistently achieve positive real returns, we obviously need to use strategies that differ from those indices. To that end, we generally aim to keep our invested capital allocated as follows: 70% stocks (long/short), 15% ETFs, and 15% options. Stepping outside the world of long-only stocks helps us to de-couple our portfolio's performance from that of any stock index and achieve our performance goals.

That said, while we do establish short positions, make sector-based bets with ETFs, and employ options, *Pro* is primarily focused on the long term. Often, our short positions are used to hedge downside risk (and thus decrease the portfolio's volatility). At other times, we may use such positions to leverage profit opportunities, but when we do, it is always with a very careful eye.

The *Pro* Bottom Line

In the past few weeks, we've welcomed in a new class of *Pro* members and celebrated our longer-tenured members. In sharing my three biggest takeaways from *Pro* so far, my hope is that *Pro* community members both old and new can benefit from what I've learned.

At *Motley Fool Pro*, we aim to generate positive real returns, minimize volatility, and skillfully employ a variety of investment tools to achieve our goal. Jeff, Nick, Bryan, and the rest of the *Pro* team are all here to help you profit with us as we continue on the ongoing journey toward our North Star. And let me know what you thought of my first Memo on the Memo Musings board!

Fool on,

Billy Kipersztok (TMFTailwind)

Pro Catch-Up Trades

- For new members and for those catching up, we issued Catch-Up Report No. 2 last week. No. 3 will be issued tomorrow (July 9), and No. 4 will be issued next Tuesday (July 16). If you're eager to jump ahead, all Buy First and Buy stocks on our Recommendations page are, of course, recommended to buy anytime.
- Our *Pro* Positioning report and live event takes place next Thursday, July 18. We'll recommend timely options and any hedges or shorts for those using these strategies with us.

Pro Guidance Changes

- **O'Reilly Automotive** (NASDAQ: ORLY):The shares move from Buy First to Buy after healthy appreciation.

Coverage & Community

- New members are introducing themselves on the Meet & Greet board!
- FoolishRob shares how he's a put-writing pro.
- Bryan Hinmon (TMF42) shares his take on prospects at **GrafTech** (NYSE: GTI).
- Earnings are around the corner! TMFMoosie shares a *Pro Calendar*. You can also see important dates in our calendar on the Alerts tab at the top right here.

Catch-Up Report: Part 2

Published Jul 2, 2013 at 12:00AM

These Catch-Up reports provide in-depth guidance on our active recommendations — a plan for starting to build your *Pro* portfolio:

Part 1 • Part 2 • Part 3 • Part 4 • Shorts & Options

You can also see all our active positions, with Buy First, Buy, and Hold ratings, along with our latest opinions, in What We Think Now. Use this alongside our porfolio page's Recommended Allocation to help build your portfolio.

Remember, there's no need to rush into any trades, so take your time. We're here to help — if you have any questions, the *Pro* team and fellow members have the answers in our *Pro* Community.

Buy: American Tower (AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 2.7%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Internet traffic from mobile devices in 2012 was nearly 12 times *total* Internet traffic in 2000, and the average connection speed of a mobile device doubled from 2011 to 2012. Communications site operator **American Tower** is well positioned to benefit from both trends.

What It Does

AMT leases antenna space on nearly 55,000 cell sites (towers, rooftops, and more) to wireless service providers. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, noncancellable, and feature contractual annual price escalations.

About 60% of AMT's properties are located in 10 different countries outside the U.S., including India, Brazil, Germany, and Uganda, and that percentage is growing quickly as AMT erects more towers.

How It's Working

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE (or, in Africa, from voice to data), or to increase coverage density. Every time they do, AMT increases the lease rate — on top of the scheduled price escalations.

Switching costs in this space are high; 98% to 99% of AMT's customers up for renewal each year do so, and nearly 80% of its current leases don't renew until 2022 or later.

What We Expect

Revenue was up 17.7% year over year in 2012, with the international division up 34%, well outpacing the domestic side. We expect revenue to double in the next five years through a combination of price escalations, new towers, and upgrades. After its recent conversion into a real estate investment trust, AMT is required to pay out 90% of taxable income to shareholders. It currently distributes $1.04 annually, a 1.3% yield, and management expects to grow the dividend 20% annually for the next five years. (Importantly, only the U.S. side of this business is organized as an REIT. For more, see our original writeup.)

Management reduces taxable income though the use of net operating losses. And because the useful life of its tower properties exceeds the depreciation schedule, AMT also uses a depreciation shield, which reduces taxable income and understates the values of some assets on the balance sheet. Thus, typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

More Resources

- *Pro* 's original recommendation (5/6/13)
- Talk about American Tower on our discussion board

The *Pro* Bottom Line

We value AMT at about $100 a share. Today's price provides an acceptable margin of safety for a business of this caliber. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network.

Buy: GrafTech International

Steelmaking is evolving, and graphite electrodes will help build the emerging world.

Suggested Allocation: 2%

The International Monetary Fund reduced global GDP estimates three times during 2012, an admission that its rosy outlook for the world economy had been too sanguine. Currently, it expects global growth of 3.25% this year and 4% next year. The share price of **GrafTech International**, a leading supplier of graphite electrodes that are used in the production of steel, dances pretty closely with GDP, so 2012 was an electric slide downward for this economically sensitive *Pro* holding. The first quarter of 2013 wasn't much better, but there are plenty of reasons we think this bumpy ride in the short term will pay off for *Pro* investors in years to come.

What It Does

With a diverse customer base and six facilities on four continents, GrafTech creates products used in the electronics, defense, oil and gas exploration, and aerospace industries. Its customers span 70 countries, and it's well positioned to grow as governments increase their spending on infrastructure, technology, and energy. Its worldwide factory network puts the company near its customers and renders more than 70% of GrafTech's annual sales outside the United States.

How It's Working

Unfortunately, demand for graphite electrodes is driven by economic activity, and prices are set (for the most part) by that demand relative to the industry's supply. This suggests that GrafTech is largely a price-taker, and it leads to lumpy results that can look ugly for long periods. Accordingly, when we analyze GrafTech, we pay particular attention to the long-term trends for steel demand (and our outlook on same), GrafTech's strategic positioning, and how the company manages the costs it can control.

On each of these points, things look bright. Steel use should grow modestly as the emerging world builds out infrastructure, and environmentally friendlier electric arc furnaces should take share from dirty, costly blast furnaces in the production of steel. Strategically, GrafTech recently took control of its primary input (needle coke) so it could better control costs and quality. It also retains a reputation for being the highest-quality producer of electrodes. Finally, the company continues to wring costs out of its structure under the guidance of experienced management.

What We Expect

While supply expansion from other industry players will keep downward pressure on electrode prices, this sort of behavior is not uncommon in the steel supply chain that GrafTech inhabits, and the company has successfully navigated such turbulence in the past. If Chinese suppliers persist in exporting their product at a loss, we think the most likely outcome is that GrafTech's low-quality, high-cost competitors will suffer the most — maybe even go belly-up. Meanwhile, as a large, high-quality, low-cost producer, GrafTech is the best positioned in the industry to weather this storm. The company has the financial wherewithal to withstand a downturn; all we have to do is wait.

More Resources

- *Pro* 's original recommendation (12/16/08)
- Talk about GrafTech International on our discussion board

The *Pro* Bottom Line

At about $7 per share, GrafTech is selling for just about the book value of its assets, but it's the electrode kingpin with a history of strong profitability and a portfolio of graphite science patents. In any given period, we're along for the economic ride — but over entire cycles, GrafTech is proving it is a business worth owning.

Buy: MasterCard

Plastic is overtaking paper as the world's way to pay, and MasterCard leads the charge.

Suggested Allocation: 4.2%

Simply put, **MasterCard** is among the most attractive businesses in the world. Here's why.

What It Does

The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders, who are actually exposed to the card users' finances; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

Though MasterCard competes with a very large number of well-heeled and (in some cases) innovative businesses, the company's profitability is growing quickly even though the global economy isn't. And that makes perfect sense, because when it comes to paying for stuff, the global market leader isn't **Visa**, or PayPal, or banks ... it's cash. While MasterCard's stock price has risen since we recommended buying in September 2011, our thesis remains intact: Cash has a still-astounding 85% market share of transactions, but it's slow and inefficient, and with no one managing its brand, it's quickly losing out to better alternatives.

How It's Working

This trend has already taken hold in the U.S., where we use cards for a third of our personal expenditures, so Americans often underestimate the opportunities — domestically and especially in developing nations. Last quarter, MasterCard processed $947 billion in gross dollar volume, $653 billion (69%) of which came from outside the United States. Growth in its U.S. business was 4%, outpacing our economy (as measured by GDP) like America was standing still. And worldwide growth, excluding the U.S., clocked in at a tremendous 16% in local currencies (15% in USD). Cash is losing, and fast, but there's a long way to go — and a lot of opportunity for MasterCard.

What We Expect

More Resources

- *Pro* 's original recommendation (9/8/11)
- Talk about MasterCard on our discussion board

Management recently confirmed guidance for continued 11% to 14% compounded annual revenue growth and 20% earnings-per-share growth through 2015. We think this is possible under current (difficult) conditions, and we expect even better if economies around the world can turn the corner. CEO Ajay Banga and team are doing a tremendous job moving the company forward, so much so that results have outpaced our expectations not once but twice in the short time we've owned shares. We wouldn't bet against a three-peat.

The *Pro* Bottom Line

MasterCard's current share price is near our $550 estimate of fair value, a fair price for a great business that's strengthening every year. Buy now, then sit back and enjoy your take every time millions of people around the world present their MasterCards.

Buy: OpenText

This company's information management software keeps our digital lives in order.

Suggested Allocation: 3%

As you may have noticed, the world is going paperless. Most of us have fewer files and binders lying around our homes and offices these days. But there's a flip side: Right now, your computer is storing ever-growing piles of email, not to mention digital documents so numerous that, if you're like me, you're getting ready to unfurl the white flag of surrender. This is where **OpenText** comes in.

What It Does

Put very simply, OpenText provides information management software. Specifically, it sells software that lets companies organize and manage their growing reams of electronic content. Its products help companies, governments, universities, and others operate more efficiently and effectively, meet compliance requirements, and communicate with colleagues, customers, and partners. OpenText is the leading independent provider of solutions in the enterprise content management market and a leader in the broader enterprise information management industry. Its top competitor, **IBM**, may be larger, but OpenText enjoys longstanding sales relationships with **Microsoft**, **Oracle**, and **SAP**.

How It's Working

In quarterly results announced in May, OpenText's revenue rose 15.5% year-over-year, and adjusted earnings per share were up 25%, reaching record levels. New license revenue jumped a strong 13.3% last quarter. The company's profit margins grew substantially over the past year, as did cash flow.

The stock trades at around 13 times free cash flow (below the market average by a significant degree). Most customers only have one to three of the company's software product modules, leaving OpenText strong opportunities to sell many more product suites to existing customers, not to mention new ones, as its sales force expands (see below).

What We Expect

We estimate that the electronic content management industries OpenText serves will grow top-line demand by at least 10% annualized over the next several years, and OpenText will continue to take market share — perhaps even surpassing IBM in its niches. OpenText has a long history of steady growth through acquisition, and its young CEO (who's only been at the helm for about a year) is also intent on growing the sales team, both to reach out to new markets and to upsell more products to current clients. OpenText already enjoys diversified software sales to numerous industries, most notably financial services, general services, technology, basic materials industries, consumer goods, and the public sector.

More Resources

- *Pro* 's original recommendation (8/31/11)
- Talk about OpenText on our discussion board

The *Pro* Bottom Line

No one-trick pony, OpenText has multiple growth avenues ahead across all industries as the world's piles of electronic data grow ever larger and in need of management. With new products rolling out in cloud services (off-site servers), renewed sales execution through more distribution channels, and an intense focus on its financial performance, this medium-sized company looks to have a big future.

Note: Although you don't need to use them, we also recommend options alongside owning OpenText stock. For those who want them, we'll recommend a complementary OpenText options strategy on July 18 in our *Pro* Positioning Report.

The Motley Fool owns shares of American Tower, GrafTech International Ltd., International Business Machines, MasterCard, Microsoft, OpenText, and Oracle. See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

The Time of Your Investing Life

Published Jul 1, 2013 at 12:00AM

Dear *Pro* members:

As we welcome our newest fellow Fools, let's take a moment to remember that we live during an amazing time. Our lives are surrounded by "luxuries" we take for granted, even though 100 years ago they were practically unimaginable:

- Cars that propel us when we push a pedal, and roads waiting to carry us from Alaska to Patagonia
- Affordable plane tickets that can place us anywhere in the world in 24 hours
- The near-eradication of many of history's deadly diseases
- Tiny rectangles that have GPS, music, videos, the Internet — and that we sometimes use to call anyone on the planet, too
- In major cities, we can enjoy any type of cuisine imaginable (powerful kings of the past couldn't accomplish this, even with a kitchen staff in the hundreds)
- Online investment services let you communicate with thousands of investors, working together to succeed

- And we have more peace, trade, and prosperity than the world has ever seen

And yet, so many sharing our planet obsess on the negatives. The world isn't perfect; it will always have problems (for those who are truly optimistic, "solutions in hiding"). But how many millions of individuals compromise their financial standing because they, too, fall prey to the negatives? Too many people can't shake a short-term view, so they sell when stocks are down — even though equities are arguably the best, most accessible long-term path to wealth on the planet.

In a world of so much abundance, many of us fail to reach our financial goals because of our own emotions. We instinctively harbor a fear that "it will all fall apart," even though over the course of history humans have steadily made progress, and rarely regressed. Now is your time to capitalize on the best companies in the world, owning a part of them; now is the time to recommit to protecting and growing your financial freedom the coming years. We invest to be free.

In *Motley Fool Pro,* we have more ways to grow our wealth than any other investing service I know of. We naturally own stocks — the biggest engine in our portfolio. We also use options for income — and we will use them much more when we see stocks taking a long-term breather. We hedge to smooth out market downturns, have money to invest when stocks are cheaper, and eliminate a desire to sell core holdings during declines. We short to profit on falling prices. And we use ETFs that can invest anywhere and in anything. Yet, overall, our approach is simple and powerful — our strategies will work together for a lifetime, and work well.

Pan back, and you'll see that the stock market has historically headed higher over time. That makes perfect sense as the population grows, companies expand and become more efficient, new products are created, and prosperity increases. But at *Pro*, we don't rely on a rising market. With our long/short and income strategies, our first goal is to make money every rolling three years, no matter how stock indexes perform. Over the long haul, we will compound our wealth by owning exceptional companies. In the shorter term, we'll greatly pad our gains with steady income, add further to our profits with successful shorts, and see our hedges turn green when they come into play.

Our North Star guides us. We define this *Pro*-only feature as inflation plus 7% each year. Lately, the North Star is running around 10% annually. We aspire to this type of steady return. Historically, the North Star has never had a negative year, and as inflation rises, our guiding light will see higher returns, too. The North Star reminds us we're not here to compete with a stock index that goes up and down. We're here to earn steady, positive returns, because inflation rarely rests. In fact, inflation is part of prosperity. As wealth spreads, demand grows, and prices go up. We want our investments to go up much more, and we want our *real* purchasing power to at least double every 10 years (that's our second ambitious goal).

Sharing our strong and clear objectives, we welcome new *Pro* members to the fold — and we thank veteran members for being so helpful on the discussion boards! New members: Please say hello on the Meet & Greet board (and tell us your goals), and enjoy your *Pro* welcome experience, including the *Pro* Guidebook and Catch-Up Reports. We look forward to growing your investments for years to come — and teaching you all you need to know for steady investing prosperity.

Thank you to everyone here for being a *Pro* member! We're in great company with fellow investors, and I look forward to recommending more new investments this summer and the rest of the year.

Foolishly,

Jeff (TMFFischer)

RockyTopBob's Guide to Pro

Published Jun 24, 2013 at 12:00AM

Fellow Fools,

At certain Metro stations in downtown Washington, D.C., just over the river from Fool HQ, there are "ambassadors" who hand maps to tourists as they step off the escalators. Those maps will help you find the Smithsonian museums, the local brewpubs, and Ripley's Believe It or Not — all of which are absolutely worth seeing. But if you want to know where to find a great cheap burger, small music venue, or low-key karaoke joint, your best bet is to ask a local. (For the record, our nominations for all three in D.C. are at the end of this Memo.)

Pro isn't exactly like D.C.; we weren't designed by Pierre L'Enfant, and we proudly answer to exactly zero lobbyists. But we're opening our doors to new members today for a short time, and we think that — like the nation's capital — we're best explained to first-time visitors by a longtime resident. Nobody fits that bill better than RockyTopBob, the community-chosen winner of our inaugural *Pro* Polaris Award. A Fool since 2005, Bob joined *Pro* in January 2011, and he's distinguished himself time and again with his honest, thoughtful, endlessly helpful answers to other members' questions on our discussion boards.

We thought his insights deserved a broader platform, so in today's Memo, we've asked Bob to share his tips for putting your *Pro* membership to best use. We hope they'll serve as an insider's guide for new members and veterans alike.

Without further ado, a Q-and-A with RockyTopBob:

***Pro*: What are the first three places on the *Pro* website to which you would point a newcomer?**

RockyTopBob: No. 1, obviously, is the wonderful Guidebook tab, and I would recommend reading every link (starting with "Meet the Team"). No. 2 is the Community tab, with a quick run-though of the available boards, followed by a post to the Meet & Greet board to introduce yourself. No. 3 would be the Recommendations tab, to review the *Pro* positions, suggested Buy Firsts, and What We Think Now.

RTB: The FAQ

Tennessee resident **RockyTopBob** spent his career in the space program, retiring early at 61 "because of some very good investment results." He's been investing for more than 40 years and loves everything about stocks, owning more than 200. He was born and raised in Chicago and still likes the Cubs! He and his wife and have two rescued golden retrievers and three ex-show Maine Coon cats.

***Pro*: What are the first few pieces of advice you'd give to someone upon joining *Pro*?**

RockyTopBob:

1. Don't be in a hurry to trade anything.
2. Learn the ropes first by getting acquainted with the site's contents and *Pro*'s philosophy.
3. Read the Broker Data link in the Guidebook to determine if you are with the best one for you, and then set up your options permissions.
4. Participate on the discussion boards to learn about the team and members and take advantage of all the information available there.
5. Pay attention to the Catch-Up Reports and ask questions on the discussion boards if you don't understand the trades or the reason behind the position.

***Pro*: What's the best advice you'd give to someone unsure if *Pro* is a fit for them?**

RockyTopBob: Post your concerns to the boards and ask other members what makes *Pro* a fit for them.

***Pro*: You are a past and present member of several TMF services — what do you think distinguishes *Pro* from other Fool offerings?**

RockyTopBob: The investment options, which go above and beyond long stocks, and the quality of the *Pro* team, especially their communication with members and willingness to answer all questions. A managed portfolio is a great advantage over a suggestions service.

To read more about the Polaris Award and Bob's formidable competition, click here. And finally, our favorite things in D.C.:

- Burger: BGR the Burger Joint / Elevation Burger (tie)
- Small music venue: Rock & Roll Hotel
- Hole-in-the-wall karaoke joint: Rock It Grill, Alexandria, Va. (reports of Fools being sighted there regularly are neither confirmed nor denied)

Whether you've just signed up or you've been with us since the beginning, thanks for being part of *Motley Fool Pro*. And thank you — and congratulations — to RockyTopBob!

Best,

Ellen (TMFKabellen), *Pro* editor, and Jeff (TMFFischer), advisor

How to Use Your Jackhammer

Published Jun 17, 2013 at 4:00PM

Fellow Fools,

Jeff's Memo last week reviewed one of his favorite valuation metrics: EV/EBITDA. Obviously, the fact that each of us has his own favorite valuation metric automatically grants us access to the cool kids' table in the lunchroom, but our Certificates of Coolness seem to have been delayed in the mail. So while we wait, let's be sure we really understand how to use the tool Jeff introduced in the broader context of any valuation multiple. After all, it's a great idea to use a jackhammer to bust up some concrete, but it doesn't work as well when trying to polish a diamond.

YGWYPF

You get what you pay for. One way to think about any valuation multiple is like this:

$$Bang\ for\ Your\ Buck = \frac{What\ You\ Pay}{What\ You\ Get}$$

Reward a Fellow Member!

Voting is now open for our As-Yet-Unnamed Pro Community Award. Vote on who should be the inaugural winner — and on what the award's name should be! Click here to cast your ballot.

Jeff's Memo used some successful *Pro* examples to highlight the fact that paying a modest price relative to a known earnings stream (buying at a low multiple) often works out well. (I can hear *Special Ops* Advisor Tom Jacobs screaming "hallelujah!" all the way from Marfa, Texas.) This passes the buy-low-sell-high test, but it isn't always foolproof (small f). If the denominator is inflated — if it doesn't accurately represent the earnings to be realized over the long term — then the low multiple is misleading, because the benefit we're expecting won't materialize.

Multiple Lesson 1: Make sure you understand the reliability and accuracy of the denominator as a measure of future benefit.

Looking Forward

And that point leads us nicely into an alternative way of interpreting valuation multiples:

$$Expectations = \frac{Expected\ Performance}{Realized\ Performance}$$

If the formula above returns a high multiple, the implication is that the future will be better than the past. The inverse — a low multiple – means we can expect the future to be worse than the past. This view fits nicely with Chief Rule Breaker David Gardner's propensity to prefer companies that look expensive to other investors. He's seeking out businesses that are going to change the world, which almost always ensures that future expectations for those companies will be grand — and their resultant multiples high.

Multiple Lesson 2: Think about the future and how it relates to the company's performance history.

Payback Period

A final way to think about valuation multiples is in terms of payback:

$$Payback\ Years = \frac{Payment}{Annual\ Benefit}$$

"Payback" in this context has nothing to do with *The Godfather* – rather, I'm referring to recouping your investment. If you pay $45 for a business consistently generating $3 per year of earnings, that's a price-to-earnings ratio of 15. If we assume that Lesson 1 above holds true — that the denominator ($3) is an accurate and reliable measure of the earnings stream we'll own going forward — it will take us 15 years to recoup our investment, not accounting for the time value of money. Under this framework, it's easy to see why a low valuation multiple is preferred: When buying at a P/E of 15, we earn back 6.7% of our investment each year, but when buying at a P/E of 12, we earn back 8.3% of our investment each year. (It's worth noting here that that long-term government bonds currently have a payback period of about 50 years.) The problem, of course, is that for these calculations to be useful, the benefit has to be sustainable over the entire period. Making accurate predictions is hard enough, but it's even harder when you have to think 10, 20, or 30 years out.

Multiple Lesson 3: Consider the length of time you can confidently rely on the expected benefit.

The *Pro* Bottom Line

Few things in investing are cut-and-dried, and the use of multiples as a decision tool is no exception. So if we can't confidently say that a low (or high) valuation multiple is good (or bad), where does that leave us? Well, a quick review of the lessons outlined above suggests a good starting point: Understand the accuracy of the metric, acknowledge the expectations built into the stock price, and consider the durability of the benefit expected. Mush those together, and you get this:

Invest in companies that can earn higher economic profits than expected, or that can earn economic profits for a longer time than expected.

Measuring the economic profits themselves is fairly straightforward; it's the "higher" and "longer" that gets difficult. That's why we at *Pro* spend so much of our time thinking about industry structure and competitive advantage. Jeff's Memo last week dealt extensively with those matters as they relate to **Intel** (NASDAQ: INTC), **Oracle**

(NASDAQ: ORCL), **BMC Software** (NASDAQ: BMC), and **O'Reilly Automotive** (NASDAQ: ORLY); those companies' strong scores when it comes to industry structure and competitive advantage seem to support our use of EV/EBITDA as a decision tool. On the other hand, **Rockwood Holdings** (NYSE: ROC) – another company Jeff mentioned last week — scores the worst of the group, which is why we wrote covered calls at an EV/EBITDA multiple that no longer looked cheap.

EV/EBITDA succinctly summarizes bang for your buck, expectations, and payback, meaning it can be a very useful tool to inform your investing decisions. But just as you wouldn't use a jackhammer on your fine china, be aware that EV/EBITDA (or any valuation multiple, for that matter) works best in certain circumstances. Always understand the limitations of your chosen valuation multiple, and remember to focus on what really matters: industry structure and competitive advantage.

Onward,

Bryan (TMF42)

Pro Trade Roundup

- Per the June 12 trade alert, we rolled our covered calls on **Tupperware Brands** (NYSE: TUP) to October for a net cost of $2.95 per contract.

Upcoming Expirations

- **Special Note on StoneMor Partners** (NYSE: STON): The 30-day execution window on our recommended June $25 covered calls on StoneMor expires today, and because pricing hasn't offered us a net sell price in line with our guidance ($27), we have not yet executed this transaction. (We likely won't get our pricing today, either.) The June options expire Friday, so if you wrote June $25 calls, your shares will likely be called away – mission accomplished! If you, like us, couldn't match the net sell guidance, keep trying to sell your shares at a net around $27. Pro will issue a new trade alert when the opportunity arises. The stock remains a sell, but ideally at higher than $27.
- **SPDR S&P 500 ETF** (NYSEMKT: SPY):Our June $164 covered puts are near-the-money. Currently, we plan to let our remaining short shares get called away if SPY is at less than $164 on Friday.

Coverage and Community

- **REWARD A COMMUNITY MEMBER!** Help award a free year of *Pro* – and name our new community award. Click here to vote!
- **Test and Learn**: FoolishRob99 updates us on a written-put *Pro* port.
- **Existential exercise**: Why are we *Pro* investors? Bob knows.

- How We Invest
- Our North Star
- **▼ Inside the Portfolio**
  - Allocation
  - Stocks: 70%
  - ETFs: 15%
  - Options: 15%
  - Long vs. Short
  - Cash
  - Reassessment
  - Letting Winners Run
  - Slowly, Slowly, Slowly
  - Allocating Your Dollars
- Finding Great Companies

As your portfolio managers, the *Pro* team is here to help you with allocation, diversification, and reassessing your holdings (many people call that last one rebalancing — a name we don't love, for reasons we'll explain shortly). Luckily, because we're managing a diverse portfolio and we want all of the pieces working in unison, the answer to "How much?" is quite clear.

Allocation: How We Decide How Much

When it comes to a long-term portfolio, the goal is to preserve what you have while boosting it with sensible growth. There's no reason to swing for the fences by throwing half of your savings into just a few equities or by crossing your fingers and taking enormous bets on just a few options.

At *Pro*, when we're right about a position, we want to be amply rewarded — and we want you to be rewarded along with us. When we're wrong, we want us all to easily live to see another day. We can never know everything about the investments we make, so we must remain humble, and we must allocate accordingly. That said, the more we know, the more we may allocate into the strongest opportunities.

Here's how we generally divide our portfolio into strategies, along with the typical starting size for new positions:

Strategy	Portfolio Allocation	Starting Position Size

Strategy	Portfolio Allocation	Starting Position Size
Core Stocks	70%	3% to 5%
ETFs and Indexes	15%	1% to 4%
Options	15%	0.5% to 3%

That works out to 33 to 38 total positions, with an average allocation of 2.5% to 3%.

As you can see, our average starting size will be about 3%. This suggests we could own about 33 positions, along with typically holding 3% to 5% in cash.

Stocks: 70%

The majority of our portfolio will be in stocks that we believe will deliver steady returns over the long run. The size of each position will generally stay in the 3% to 5% range.

When it comes to *Pro*'s core stock holdings — those with truly exceptional potential and an outstanding margin of safety — we may invest up to 5% of the portfolio, most likely over the course of a few purchases. We're confident in any position we buy, but if we decide to make a position larger than 3%, that means we're extremely confident. We often buy a stock across two transactions to spread our timing and volatility risk. You'll know quickly where we stand on a stock buy: if we like it, 3%; if we're ga-ga over it, 4%; if we can't even sleep because we like it so much, 5%. As of October 2015, only seven stocks make up 4% or more of the *Pro* portfolio.

ETFs: 15%

We're going to use 15% of the portfolio to make sector-based decisions via exchange-traded funds. There are hundreds of specialized ETFs, and they offer tremendous opportunities to take advantage of macro and micro trends in the global economy. As you follow along, you'll find that most of the ETF investments will take a long position, but you'll also be able to go short in sectors we believe are mispriced.

These calls could be a bit riskier in nature than the stock portion of the portfolio, particularly if we buy an ETF that uses leverage, but we will be sure to fully explain any added risks in our trade alerts.

Our allocation to exchange-traded funds will average 2% to 3% in size. With ETFs, we're betting on a whole sector — or area of the globe — to move in a certain direction. Where there's more uncertainty involved, we may only invest 2% or less, and when we're very confident in an ETF and its core holdings, we may invest up to 4%. More often, we'll invest 3% or less.

Options: 15%

The final 15% of the portfolio will be reserved for options. This includes the premiums paid as option buyers, the credits we receive as option sellers, and the money we set aside to purchase the underlying stock when we sell puts.

Options are by nature smaller investments, and most of ours will average around 1.75% of the portfolio at the start — sometimes much less, rarely much more. If we do put 2% or more into, say, a call option, we'll do so very carefully.

Long vs. Short

Even though we'll go short with ETFs and options, *Pro* is primarily focused on the long term. Most often, the short positions we take will be used to hedge downside risk. Overall, we don't expect shorts to represent more than 30% of the portfolio.

And Then There Was Cash

We'll also keep about 5% of the portfolio in cash most of the time so we can catch extraordinary opportunities that pop up and write options.

We know what you're thinking: Wait, all this adds up to 105%! It does, but what we're saying is that while we'll keep an overall mix of 70/15/15 in stocks/ETFs/options, we'll save room for a modest but worthwhile cash balance.

Diversification

As we build the portfolio, we're mindful not to have too much exposure to any one industry, sector, or region, and we'll hedge if our exposure to one area is too great. Meanwhile, if we're missing a piece of our portfolio puzzle, we have the luxury of CAPS data to help us find the most compelling opportunities we're lacking. With a maximum of less than 40 positions, we're striving for diversification with focus.

Reassessment

What's the harm in rebalancing? Whenever part of a portfolio gets out of line with the rest, many investors trim it back; if it shrinks, they add to it. Makes sense, but if you're not smart about it, rebalancing can translate to selling your best winners — and buying more of your worst losers. Now *that* doesn't make sense.

At *Pro*, we prefer to call our portfolio upkeep process *reassessment* — flows off the tongue, doesn't it? — and we'll reassess on a regular basis, most ardently after quarterly earnings or any other significant events. But rather than letting a stock's size in our portfolio dictate our investing decisions, we let a stock's valuation and fundamentals guide us.

Our reassessments start with a vigorous study of every filing our companies make, every quarterly report, and every quarterly conference call as well as all the data at our fingertips. We want to know our companies so well that we could recite their business models in our sleep — so when there's volatility (and there will be!), we'll know how it affects our companies and whether it requires action. To us, reassessment is constant — but that doesn't mean trading is.

Letting Winners Run

In the original Motley Fool and Rule Breaker Portfolios, we outperformed the market by buying high-growth companies and letting them grow — while we held on for years. We didn't trim our biggest winners just because they had come to represent more of the portfolio than other positions — though we would trim back our position in a stock if the business started to merit doing so.

We won't be afraid if a 4% position doubles to become an 8% position, and then a 12% position. We want that! But we'll be mindful of our largest positions and do everything to ensure we don't let our biggest gains evaporate. We have the power to hedge or protect our positions, too, which provides us with more breathing room to let them grow.

Slowly, Slowly, Slowly

In "*Slowly, Slowly, Slowly*" *Said the Sloth*, Eric Carle's sloth hangs from a tree in the rain forest while animals scamper by — toucans, peccaries, a jaguar, and a howler monkey — and ask him why he is so slow, so boring, so calm ... and so lazy. The sloth says, "I am not lazy." He just likes to take his time, think about things, and not rush.

It's the same with a portfolio: Build it slowly. Enjoy each step, and make each selection count. Know every selection before you make it. You're embarking on what should be a long-term relationship with a company — even with options, as you can employ the same options, on the same stocks, again and again.

We manage the *Pro* portfolio thoughtfully (with our own money on the line, we're managing our own portfolio right alongside you). Sometimes we'll be rather active, but sometimes we'll be quite quiet. That's how investing works. Regardless of how often we're trading, you can always find us talking stocks on our members-only discussion boards.

Allocating Your Own Dollars

So how do you mirror our real-money portfolio, assuming that is your goal — even if you have $100,000 or less? In most cases, you can simply follow our percentage allocations rather than our dollar-based actions.

If you have a $100,000 portfolio, and we invest 2% of our funds into a certain position, it's easy for you to do the same thing. However, if you have $50,000 or less, you'll want to watch your commissions and try to keep them well below 2% of any trade you make.

If you're using a smaller account, you also may not want to write many options until you have more assets. For put writing, we recommend an account value of at least $75,000. You may write covered calls with considerably less, and you may buy puts or calls with very little money if you wish. That's one of the advantages of options. But put writing typically requires greater funds.

To discuss your situation and how you can best benefit from our investment decisions, please post your questions on our discussion boards. We'll be there to help.

Invest Like a Pro: If You're Free-Range

Published Jun 17, 2013 at 1:00AM

How to build a *Pro* portfolio — if you have money to invest now and are ready to own what we own.

We manage the *Pro* portfolio using a wide range of tools — including long and short stocks, options, and ETFs — to earn absolute returns with reduced volatility. But we know no two members have identical investment situations, and that means not all members will use all of our strategies. That's where we can help you find the best way to use *Pro* for *your* individual situation.

The most important thing to remember is that *Pro* is a portfolio, not merely a collection of investment ideas. All of our positions exist in the context of our portfolio; if you elect to pick and choose *Pro* investments, it is critical that you understand how they fit into *your* portfolio. Our trades are intended to integrate with existing positions and to form a portfolio of assets that keeps our North Star firmly in mind.

Building Your *Pro* Portfolio

Start Here: Portfolio Building Reports

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new *Pro* portfolio.

Part 1: Our Buy First Stocks
Part 2: Our Buy Stocks
Part 3: Our Buy Stocks, Continued
Portfolio Positioning Report
Important: A note on fair value

What's Next?

Once you've matched the guidance in the Building Your *Pro* Portfolio reports, all you need to do is wait for further trade alert emails from the *Pro* team. However, our alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want.

You may decide to modify the strategy we choose for a trade; for example, writing puts instead of buying a stock outright. If you choose to deviate from our recommendation, though, make sure you:

Uniquely *Pro*

If you're joining us from another Motley Fool service, it is critical that you understand what makes *Pro* so powerful. At *Pro*, we are building a portfolio, not simply offering investment recommendations. *Stock Advisor* and *Rule Breakers*, for example, offer stock recommendations from which members can pick and choose.

In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the Pro portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

1. Understand why we chose the strategy we did
2. Have a reason that the modified strategy better fits your portfolio
3. Exercise caution by sizing the position a bit smaller than you would otherwise

If you have any questions about our trades or making a strategy fit your investing goals, drop by our Making Pro Fit You discussion board, where the *Pro* team and community are happy to help.

You'll also receive the team's Monday Memo email every Monday afternoon, with commentary, news, and any updates to our guidance.

If You're Investing in an IRA

IRAs are tax-deferred accounts that usually don't allow shorting and allow only simply options strategies. If you're building your *Pro* portfolio in an IRA, you can follow our stock-buying trade alerts directly. Most IRAs allow you to write covered calls, so you can also follow those trade alerts (check with your broker to see if you have permission). For trades that go further afield, here are several points to consider:

Writing Puts: Some IRAs don't allow put writing (although many do, if they are cash-secured), so you should simply buy shares in these positions over time. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Other Options Trades: If you can't make a trade in your IRA, check our trade alert for a list of alternative trades. For example, when we write puts to try to buy shares of Stock X more cheaply, you might be able to simply buy shares of Stock X. (If there are no alternate trades, we'll say so.)

Shorting: Some inverse ETFs can be purchased in IRAs (purchasing an inverse of something is similar to shorting that thing). As with options, we'll mention suitable alternatives in the trade alerts.

As tax-deferred accounts, IRAs are well suited for income-generating strategies like covered calls, high-yield dividend stocks, and ETFs with large taxable distributions. If being unable to follow all our recommendations leaves a hole in your portfolio, you may be able to fill the gap with additional income-generating strategies — for example, by writing covered calls on *Pro* stocks you'd be willing to sell at your strike price.

Because IRAs do not allow the use of margin or shorting, you will likely find it difficult to follow along with most of our hedging strategies. If that's the case, we recommend keeping an eye on both your cash balance and *Pro*'s hedging strategies. When the *Pro* portfolio adds hedges, increase your cash balance; when we pull hedges off, reduce your cash balance by investing more in our Buy and Buy First stocks.

Finally, you may want to consider opening a separate, non-IRA account if possible. You can then manage both your IRA and non-IRA accounts as a single portfolio, with income-focused and shorter-term strategies in the IRA and more complex, speculative, and short trades in the second account.

If You Can't Trade Complex Options

You can still follow most of our trade alerts directly — except, obviously, those involving complex options strategies. In those cases, we offer simpler alternatives whenever possible, such as writing puts, writing covered calls, or buying or shorting a stock or ETF directly. If we issue a trade alert using an income-generating strategy you're unable to employ and there are no workable alternatives, consider using the strategies you do have at your disposal to generate income elsewhere in your portfolio.

If you want to expand your repertoire, you should continue to request higher options permissions from your broker every couple of months until they are granted. Account size is one factor brokers consider when making this decision, so to up your odds of success, consider consolidating accounts or moving funds to the account in which you wish to trade options.

In the meantime, don't lose sight of the big picture; remember that we're building a portfolio. If you can't make a particular options trade, you may be able to make an alternate trade or you may need to sit that trade out — either way, it's no big deal. That said, you'll want to pay particular attention to any trade alert in which we use options for hedging purposes (for example, a synthetic short or a ratio put spread on an ETF or an index). Trades like these are important to our integrated portfolio, so don't ignore them. If alternatives are available, we'll outline them. If not, you may want to take action elsewhere in your portfolio to meet similar goals. For example, one way to accomplish this would be to raise your cash position by trimming a few holdings. As always, we're available on the Making Pro Fit You discussion board to field your questions.

You'll also receive the team's Monday Memo email every Monday afternoon, with commentary, news, any updates to our guidance, and a roundup of *Pro* coverage from the past week.

If You're Investing in an IRA

IRAs are tax-deferred accounts that usually don't allow shorting and allow only simple options strategies. If you're building your *Pro* portfolio in an IRA, you can follow our stock-buying trade alerts directly. Most IRAs allow you to write covered calls, so you can also follow those trade alerts (check with your broker to see if you have permission). For trades that go further afield, here are several points to consider:

Writing Puts: Some IRAs don't allow put writing (although many do, if they are cash-secured), so you should simply buy shares in these positions over time. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Other Options Trades: If you can't make a trade in your IRA, check our trade alert for a list of alternative trades. For example, when we write puts to try to buy shares of Stock X more cheaply, you might be able to simply buy shares of Stock X. (If there are no alternate trades, we'll say so.)

Shorting: Some inverse ETFs can be purchased in IRAs (purchasing an inverse of something is similar to shorting that thing). As with options, we'll mention suitable alternatives in the trade alerts.

As tax-deferred accounts, IRAs are well suited for income-generating strategies like covered calls, high-yield dividend stocks, and ETFs with large taxable distributions. If being unable to follow all our recommendations leaves a hole in your portfolio, you may be able to fill the gap with additional income-generating strategies — for example, by writing covered calls on *Pro* stocks you'd be willing to sell at your strike price.

Because IRAs do not allow the use of margin or shorting, you will likely find it difficult to follow along with most of our hedging strategies. If that's the case, we recommend keeping an eye on both your cash balance and *Pro*'s hedging strategies. When the *Pro* portfolio adds hedges, increase your cash balance; when we pull hedges off, reduce your cash balance by investing more in our Buy and Buy First Stocks.

Finally, you may want to consider opening a separate, non-IRA account if possible. You can then manage both your IRA and non-IRA accounts as a single portfolio, with income-focused and shorter-term strategies in the IRA and more complex, speculative, and short trades in the second account.

If You Can't Trade Complex Options

You can still follow most of our trade alerts directly — except, obviously, those involving complex options strategies. In those cases, we offer simpler alternatives whenever possible, such as writing puts, writing covered calls, or buying or shorting a stock or ETF directly. If we issue a trade alert using an income-generating strategy you're unable to employ and there are no workable alternatives, consider using the strategies you do have at your disposal to generate income elsewhere in your portfolio.

If you want to expand your repertoire, you should continue to request higher options permissions from your broker every couple of months until they are granted. Account size is one factor brokers consider when making this decision, so to up your odds of success, consider consolidating accounts or moving funds to the account in which you wish to trade options.

In the meantime, don't lose sight of the big picture; remember that we're building a portfolio. If you can't make a particular options trade, you may be able to make an alternate trade or you may need to sit that trade out — either way, it's no big deal. That said, you'll want to pay particular attention to any trade alert in which we use options for hedging purposes (for example, a synthetic short or a ratio put spread on an ETF or an index). Trades like these are important to our integrated portfolio, so don't ignore them. If alternatives are available, we'll outline them. If not, you may want to take action elsewhere in your portfolio to meet similar goals. For example, one way to accomplish this would be to raise your cash position by trimming a few holdings. As always, we're available on the Making *Pro* Fit You discussion board to field your questions.

If You're Already Fully Invested

If you're already fully invested, you may need to sell existing positions to add *Pro* picks. We recommend that you do this gradually and deliberately, and we've offered advice on how to approach this task.

List your existing positions in order from your highest-conviction holding to your lowest-conviction holding. If you own stocks from another Motley Fool service, you can use that service's guidance on those stocks in building your list. If you don't know why you own a stock, that's a good reason to sell it.

Be mindful of your sector and geographic allocations. You don't want to unintentionally end up owning nothing but oil or European stocks just because they were your favorites. If you're struggling with what to sell, post to our discussion boards — the *Pro* team can't give you individual advice, but our community members can and frequently do weigh in with helpful guidance.

When you're ready, incrementally sell your lowest-conviction stocks and use the proceeds to move into our Buy First and Buy stocks. Review your positions and portfolio after studying *Pro*'s mission and reviewing our North Star. Use that analysis to craft your portfolio going forward.

Hungry for more *Pro* goodness? Check out our strategy guide!

Finding Great Companies

Published Jun 17, 2013 at 1:00AM

Nearly three decades of investing have helped us home in on the qualities we seek in each company we consider for *Motley Fool Pro*.

Pro Strategy Guide

Get up to speed in no time with this series of articles that will show you how to invest like a Pro:

Not every business we buy or use options on will possess all eight of these qualities — but for core stock positions, we prefer to see as many of the following strengths as possible. These qualities aren't in order of importance, but you'll often find that one quality builds to the next. They typically all combine to produce a company that could compound our returns.

Quality 1: Sustainable Competitive Advantage

Healthy profits in a business attract competition; everyone wants a piece of the profit pie. The only way a company can maintain its profit margin and grow is to have a sustainable competitive advantage that serves as a protective moat around the business.

You often hear this quality talked about, from Warren Buffett on down, but many investors typically fail to find companies that sustainably meet the bill. That's because it's the rare company that truly has lasting advantages — but they're out there.

They are usually mid-sized or larger and enjoy assets or market share that provide enduring advantages over all others. Think **Gentex**, which commands the market in auto-dimming rearview mirrors; **Broadridge Financial Solutions**, which has provided annual proxy services for 90% of the public companies and mutual funds in the United States since 1999; and **Facebook**, whose network effects have enabled the company to continually occupy the top spot in the social media space -- and buy would-be competitors. Each of these businesses has traits that keep competitors at bay, helping it maintain healthy profit margins.

Quality 2: Pricing Power

We're always on the lookout for companies that enjoy a degree of pricing power, those that can pass on rising costs to customers. The strongest companies may also implement modest price increases every few years without losing or alienating customers. A leading example of this is **Verisk Analytics**, a leading risk-assessment and decision-analytics firm. The company was able to push through annual price increases for many of its offerings to the insurance industry between 2007 and 2010 (some of the worst years for insurers in recent memory) without seeing any negative effects on customer retention. **Netflix** and **Chipotle** have also demonstrated pricing power. Pricing power gives a company one more important arrow in its quiver as it hunts for strong long-term annualized growth.

Quality 3: Dependent Customer Base

A competitive advantage may *not* be worth much if the business depends on only a few customers, or if its customers can get the service provided just as conveniently elsewhere. We're excited to find a captive or at least loyal customer base. In some cases, this might take the form of a product being integrated into customers' daily lives, a la **Starbucks**. It could also be evident in customers' desire to work with that company, as is the case with **Parexel,** a leading biopharmaceutical and medical device contract research organization. Such customer dependence often supports quality no. 2, pricing power.

Quality 4: Predictable Revenue

If a business exhibits the first three qualities and also has significant predictable or recurring revenue, we become even more interested. This means we're looking for sales that repeat all but automatically, often with the same customers again and again, and usually without the company needing to spend more on marketing or reinventing itself or its products.

Some examples from our *Pro* portfolio: **Oracle** and **OpenText** get a majority of their revenue in the form of long-term contracts with high renewal rates. Insurance companies enjoy recurring revenue every time a policy is renewed, which happens more than 80% of the time at the best providers, including our own **AmTrust**. Transaction-based revenue driven by network effects, like with **MasterCard** and **Visa**, also qualifies as predictably recurring; so does "platform access" that is heavily relied upon and not easy to replicate, which is exactly what we have with **American Tower**.

Predictable revenue helps management plan its future better, and it helps maintain a business even during recessions. For a contrast, consider apparel manufacturers, which are constantly battling with one another to win your business and capture fashion that's inherently fickle. This can result in feast-or-famine financial results – which we try to avoid here in *Pro*.

Quality 5: Growing Free Cash Flow With Compounding Returns

The qualities we've mentioned so far will usually lead to strong free cash flow, which is the lifeblood of a company. By definition, free cash flow is cash from operations minus capital expenditures and any other nonoperational cash income, such as tax benefits from stock options.

We're looking for free cash flow that's likely to increase by at least 10% annualized over the long term. No company grows in a straight line, but over time we want expanding free cash flow to drive the value of the businesses we own -- and that cash flow should be investable in more growth for compounding business returns. Free cash flow is a much more important proxy for value at *Pro* than are earnings per share, which are easily manipulated.

Quality 6: Financial Resilience

These first five qualities go far toward building strong financial statements — if not right away, then with time. On the balance sheet, the appropriate amount of leverage and cash on hand will depend on the industry and a particular company's business model; however, we seek to invest in companies that can do more than just weather the storm when times are tough. We want to find companies that can take advantage of turmoil to gain additional market share and maneuver for an even brighter future – and that's difficult to achieve if the financials aren't resilient enough to let management strive to grow even during hard times.

Quality 7: Expanding Possibilities

A company can increase its bottom line either by cutting costs to expand margins or by growing its top line. But there is a limit as to how much fat can be cut out of any business, and being too aggressive in slashing costs can actually be detrimental in the long run. So, in order to find companies poised to deliver North Star-like returns over the next rolling three years, we seek businesses that can both control costs *and* profitably expand operations. Often, that means companies that are riding long-term (rather than cyclical) tailwinds; this can lead to years of above-average growth. And this growth can take the form of increasing market share at home as well as developing new products or entering new markets. **Apple**, **Skyworks Solutions**, **O'Reilly Automotive, Gilead Sciences** -- most of the companies in our portfolio exhibit this characteristic.

Quality 8: The Three C's of Management

Warren Buffett once recommended investing in businesses that even a fool (with a lower-case "f") can run, because someday a fool will be in charge. This may be true, but here at *Pro* we believe you can have the best of both worlds: great businesses that are also run by top-notch management teams. Every situation is unique, but as a starting point, we generally look for the following in company management:

- **Clarity:** Do they have a vision for the company and can they succinctly articulate how they're going to get there?
- **Consistency:** It isn't enough to talk the talk; we want management teams that have also proven they can walk the walk. We avoid revisionist historians and look for managers that achieve what they said they would.
- **Capability:** Are they the right people for the job? Sometimes this means going with a founder-led company early on (the Fool invested in **Amazon** shortly after it went public); other times we're looking for a track record of smart capital allocation decisions (**Verisk Analytics** has generated an average annualized return of about 20% on all of its deals from 2002 to 2012).

Combine our eight qualities, and the company is likely to be a long-term performer on par with -- or stronger than -- our relentless North Star.

We're not making it easy on ourselves by using our North Star as our investing guidepost; however, we wouldn't have chosen to do so if we didn't believe it was possible. One of the keys to this approach is to have a high rate of accuracy when it comes to selecting stocks, and this quality checklist is just one of the many tools we use in our attempt to do exactly that.

To talk about the business qualities we seek — and to share your own — join us on the Philosophy & Strategy discussion board. Invest Foolishly!

Our Guide to Hedging Like a Pro

A hedge is a position that reduces a portfolio's overall exposure to risk. We hedge in several different ways.

How We Invest

Published Jun 17, 2013 at 1:00AM

6 *Pro* Principles: We always want you to know how we're thinking as we invest — and why — so see how we tie together our broad tools into a comprehensive strategy with focus and direction.

Pro Strategy Guide

Get up to speed in no time with this series of articles that will show you how to invest like a Pro:

Motley Fool Pro is here to help you build a diverse portfolio that generates winning returns no matter what the stock market throws our way. You can trust that our team relies on years of investing experience and on our array of tools and collective insight to produce outstanding long-term results — and we're thrilled that you're here investing along with us.

Our *Pro* portfolio has incredible flexibility — we can go long or short and use options and ETFs. We'll invest wherever we see the best opportunities — any sector, stock, country, or option. This makes our overall strategy wide and deep, but we'll do our best to clearly explain the specifics behind our actions.

Pro Principle 1: Accuracy Is Our Top Priority

Some portfolio managers are happy to speculate — and often be wrong — so long as their few big winners more than compensate for the losers. That is not our approach at *Pro*.

Our aim is to be correct the vast majority of the time. We will only put our cash to work when we feel extremely confident about an investment — and on that note, our ambitious goal is to have at least three out of four positions profitable by the time we close them. Yes, that's a sterling 75% success rate — and it includes all of our stocks, options, ETFs, and hedges.

In fact, it's more important to us to achieve absolute gains on each position than beat the S&P 500. Why is that? Because gains are our first goal. Period. But heck, if most of our positions are profitable, we should beat the S&P 500, too, over the years.

Pro Principle 2: When It Comes to Stocks, We Are Focused on Superior Businesses We Can Hold for 3 to 5 Years

Our portfolio primarily consists of long positions. The goal is to hold these stocks for three to five years — or as long as the investment merits. Each stock will have a catalyst (or several) that should kick our returns into gear through our target time frame.

The *Pro* team has found that the stocks that perform the best over the years have a lot in common. These companies have superior business models that we believe will remain strong in any market, strong and lasting competitive advantages, margins ripe for expansion, and growing market opportunities. We like dynamic companies with light business models — they don't need hefty, constant infusions of capital — and plenty of naturally recurring revenue. After we've found a company that makes the grade, we then aim to buy at a price that gives us both ample upside and a solid margin of safety.

Pro Principle 3: When It Comes to ETFs, It's the Big Picture That Counts

For exchange-traded funds, broad is the way to go. Say you want to invest in Brazil, which is growing rapidly. But which companies will lead the way? If you can't devote months to learning Brazil's competitive landscape, you can buy into the entire economy with a Brazilian ETF.

ETFs are an excellent way to invest in the rise or fall of just about any broad category — financials, biotech, China, Brazil — especially when you wouldn't otherwise know where to invest in a sector. These investments, long or short, are more macro-focused than business-focused. We study any ETF we buy to make certain that we agree with its largest holdings, but we'll still be betting on a macro trend — up or down — when we pick up an ETF.

With our ETFs and options, our outlook is usually a bit shorter than with stocks. We may take advantage of a 12-month option opportunity; we may buy an ETF in gold, only to sell it nine months later if the price of gold jumps. ETFs can be long-term macro investments, too; we bought into **Vanguard Emerging Markets** in 2008 to profit on a rebound, selling nearly three years later. Many of our short sales also have a shorter-term outlook, usually measured in months or a year.

Pro Principle 4: We Are Not Options Traders

When we invest with puts and calls, we're not twirling our pretend mustaches, making slick statistical bets, or using formulas and complicated computations. Our options investments are based on extensive knowledge of the underlying stock and its valuation.

So if we believe a stock is priced exuberantly, we can short it by buying a put option. If a stock looks deeply undervalued, we can use long-term call options to capture greater upside. In the end, all of our option trades are based on a full analysis of the underlying equity.

Pro Principle 5: We Won't Over-Diversify

We expect to hold no more than 40 positions. For a carefully constructed portfolio, that's plenty of diversification, especially because we'll use ETFs to gain broad exposure to various categories.

An investor diversifies for safety but still needs to stay focused when hoping to perform much better than the market average. Along these lines, it's likely that we'll usually only carry about 24 to 28 core positions, with open options positions representing other possible buys down the road, and always with stocks coming and going from the portfolio as necessary. With focus, we have an especially good chance of being rewarded strongly whenever we're right with a position.

We prefer to let our winners run as long as merited, so we won't rebalance just for the sake of doing so. But we will continually reassess. As of October 2015, we recommend buying 24 core stock positions — right in our sweet spot.

Pro Principle 6: We Never Want to Lose Money

As we strive for accuracy, we will always try to avoid permanent loss of capital. It's not about avoiding mere paper losses — these are common, as stock prices fluctuate. We're talking about losses you never earn back because you invested in a failing business or paid too much for a stock.

While we're more than comfortable with temporary losses that come about with the market's ups and downs, we'll do everything in our power to avoid permanently losing money — although keep in mind that this doesn't apply to options or shorts, in which permanent losses are part of the risk. So far, as of October 2015, we have only closed a few positions at a loss without recourse.

Putting It All Together — the *Pro* Way

In This Report

Buy First: AIG | Time and even average performance should heal the company’s wounds.

Buy First: Apple | The leader in mobile computing products is cheaper than it’s been in years.

Buy First: Oracle | This old-guard tech giant has more room to grow.

Buy First: O'Reilly Automotive | Exceptional management should deliver impressive growth.

PDF Download this report as a PDF file

A Note on Pricing

We've classified the four stocks in this initial report as "Buy First" positions for *Pro* members, because they are attractively priced and will remain so even if the price moves around a few dollars. As long as these stocks remain listed as Buy First on our scorecard, then we recommend that you buy them first for your *Pro* portfolio. If that status changes, we'll let you know in our Monday Memo and note the change on our scorecard.

Buy First: American International Group

Time and even average performance should heal the company's wounds.

Suggested Allocation: 2.8% stock, 0.7% warrants

Today's **American International Group** is not the same company that disgraced itself so profoundly in 2008. AIG has divested itself of whole business units since the financial crisis, managing to eliminate 95% of its previous exposure to the nasty derivatives that nearly brought down the economy. Left behind are just two steadfast insurance businesses and an aircraft leasing company, and AIG plans to rid itself of the leasing business, too.

What It Does

Insurance is a business of collecting premiums, investing the float, and paying out claims — and AIG is getting ever better at it. Improved underwriting is showing up in a lower loss ratio, which in turn is driving a lower adjusted accident-year combined ratio. All that is a fancy way of saying that we're starting to see underwriting profits for the first time since Q3 2010.

AIG's insurance offerings consist of two divisions: property and casualty, and life and retirement. The former provides casualty, property, financial, and specialty insurance (think aerospace) to commercial clients and consumers, typically through brokers. The life and retirement division offers domestic life insurance and retirement products (annuities, mutual funds, financial planning) through a diverse network of financial-services companies, brokers, agents, and advisors. Overall, AIG is writing fewer premiums at better prices than it was in past years, which is a great indication of underwriting discipline and a hardening market.

How It's Working

When we recommended buying AIG stock and warrants in August 2012, we were confident in the momentum of the company's turnaround, but we underestimated the rapid rate at which our investment thesis would unfold. In late 2012 (after our recommendation), the U.S. Treasury sold another $26.5 billion worth of its AIG shares. Management wisely used the opportunity to purchase billions of dollars' worth of stock at about half book value; that, of course, further increased book value in a virtuous cycle.

What We Expect

Underwriting discipline will continue to drive increased earnings and a higher valuation. That plus a renewed focus on capital management will improve AIG's credit rating, reducing its cost of debt and providing another lever for higher profitability. Management is still ridding the company of non-core assets, including the aircraft leasing business mentioned above; once that's complete and coverage ratios are in check, CEO Bob Benmosche will likely reinstate a dividend (provided the Federal Reserve gives the go-ahead).

More Resources

- *Pro*'s original recommendation (8/24/12)
- Talk about AIG on our discussion board

At Your Broker

- **E-Trade:** AIG.WS
- **Fidelity:** AIG/WS (paste CUSPID 026874156 into the quote page)
- **Interactive Brokers:** Find AIG; select "warrants" from the drop-down menu
- **optionsXpress:** AIGwS
- **Schwab:** AIG/WS
- **TD Ameritrade:** AIG+
- **Vanguard:** AIG_t

Helpful Links

- AIG's explanation of the warrants
- AIG's warrant registration statement filed with the SEC

The *Pro* Bottom Line

We recommend buying 2.8% of AIG stock and 0.7% of AIG warrants (see below for more on those).

Benmosche has cleaned out the business, so by purchasing now, you get in after all the hard work has been done. Book value — the best measure of an insurance company's worth — is growing quickly. And AIG's current share price is two-thirds of book value. That's cheap, especially given the company's momentum. Investors who buy AIG now are positioning themselves for outsized future returns with less risk. That's contrarian investing at its best.

A Note on Warrants

Warrants are similar to call options, except that they are issued by the underlying company. They offer the purchaser the right (but not the obligation) to buy the stock in question at the specified price. The warrants we're recommending on AIG are valid for 10 years from the date of issue (Jan. 19, 2011), and they can be exercised at any point before they expire on Jan. 19, 2021. When exercised, they allow the holder of the warrant to buy shares of AIG at $45 per share, regardless of the market price.

That $45 strike price adjusts favorably in the event of dilution or annual cash dividends greater than $0.675 per share (which would also lower the share price). Warrants are illiquid, and Goldman Sachs is the designated market maker for them; when you buy them, be sure to use a limit order so Goldman doesn't get more than a fair price.

Be aware that if our investment in AIG works out, those who own warrants will earn leveraged returns on them. If we're wrong, though, the warrants will be a total loss, because they're out-of-the-money.

Buy First: Apple

The leader in mobile computing products is cheaper than it's been in years.

Suggested Allocation: 3.3%

There's only one type of apple we like to buy when it's bruised, and it's not a Red Delicious. Once the largest corporation in the world, the **Apple** we want to own has fallen from the market's good graces on investors' worry about declining profit margins, slowing growth, and a lack of innovation.

Is this commonly chirped refrain right? Has Apple lost its edge in the marketplace? We don't believe
so, because the company's uniquely integrated hardware and software have made for a great consumer experience that provides little incentive to switch to a competitor. We do realize the company will have to fight a harder and more expensive battle to win new customers as competitors close the quality and experience gap, but we maintain that Apple shares are one of the greatest deals in the Pro portfolio.

What It Does

Led by its iPhone and iPad, Apple designs computing devices people love to use. Its products tie into the Apple operating system, which centers on its App Store marketplace. Apps turn a piece of hardware into a personalized, go-anywhere computer that gets ingrained into the user's daily life.

The gadget that kicked off the company's renaissance, the iPod, is joined not just by the iPhone and iPad but also by Mac computers, iCloud, software, and the small Apple TV to round out the surprisingly compact product line. By selling relatively few products, Apple can generate production efficiencies to earn higher margins and more effectively guide consumer behavior.

How It's Working

Apple's recent second-quarter results disappointed many investors, even though the numbers were just fine. Total sales were up 11% to $43.6 billion; gross margin, a measure of profitability, decreased to 37.5% from 47.4%; and operating cash flow climbed to $35.9 billion. The quick read is that Apple continues to sell a huge number of devices, but as product cycles ebb and flow, the company's profitability will do the same (because of differing pricing and cost structures for each product). One thing remains consistent: Apple's free cash flow is absurd — more than $45 billion over the past 12 months. That's enough to give $5 and a free iTunes song to every person on earth!

What We Expect

Apple refreshed nearly all of its product lines in 2012, driving sales but dinging margins. The company was unable to meet consumer demand for its two newest iPhone models, its new MacBooks, and its iPad Minis, so it wasn't running as efficiently or profitably as it could have. But it is ramping up production to keep that situation from happening again, which should also soften production costs per unit and set Apple up for a respectable 2013.

More Resources

- *Pro*'s original recommendation (2/14/12)
- Talk about Apple on our discussion board

In the longer term, we (like everyone else) expect more great innovations from Apple. While we wait, we think customer loyalty will drive healthy recurring sales, while new customers, emerging markets, and brand-new products fertilize growth. The resulting earnings should reassure investors that Apple isn't going bad.

The *Pro* Bottom Line

As much as we miss the late Steve Jobs at the helm, we believe he built a company that will continue to delight the world with its products. With investors running scared from one of the most groundbreaking businesses in recent history, we believe now is a good time to put our jester caps on and buy when others are selling.

Buy First: Oracle

This old-guard tech giant has more room to grow.

Suggested Allocation: 4.5%

Leading software sellers can write a program once and sell millions of copies, then provide small but critical updates on a regular basis. These updates drive a subscription business model, which leads to recurring revenue. **Oracle** is no exception, with most of its customers renewing annual software contracts that represent more than 40% of its annual revenue. This is stability on which Oracle can grow.

Where is it looking to grow? To name three areas, Oracle is targeting new cloud software sales, software as a service (SAAS) in general, and groundbreaking data hardware sales — and we're pleased with its progress to date and the prospects of all three.

What It Does

Oracle is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems**, **Dell**, and **Microsoft** — Oracle's stock price has steadily risen as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe. And when it comes to hardware, Oracle's own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

By combining its software expertise (both in the traditional sense and in the cloud) with its young hardware business, Oracle is poised to experience another period of growth. The business is incredibly sticky — companies don't trust their data to just anyone, and it can be tricky and even risky to make a switch. So to add to its revenue base, Oracle mainly needs to cross-sell new products to existing clients, while continuing to rope in new clients with its great breadth of modular software solutions.

How It's Working

In the fiscal year 2013 that just ended May 31, Oracle's new software sales topped a record $10 billion, growing 6% in constant currency. Non-GAAP earnings per share grew 11% to $2.68, non-GAAP operating margin hit an all-time high of 47%, and free cash flow hit a record $13.6 billion. Total revenue was up a modest 2% to $37 billion after very strong growth in fiscal 2010. Such a pause is not unusual, especially given that Oracle has sliced low-margin hardware products from its product line and hired thousands of salespeople to sell cloud software. On June 20, management doubled the dividend and announced a new $12 billion share buyback.

What We Expect

More Resources

- *Pro*'s original recommendation (9/17/09)
- Talk about Oracle on our discussion board

Wall Street loves growth, but it especially loves growth that comes with higher margins. Oracle trades at 10.8 times free cash flow, well below the S&P 500's average in the mid- teens. With management expecting more operating leverage ahead and growth in hardware sales, the stock should produce a North Star-topping, 10%-plus annualized return over the coming three years. We expect the company's hardware and modular software combinations to continue to create a clear value proposition, driving sales and resulting in pleasing growth — even for this large company.

The *Pro* Bottom Line

With 390,000 customers, including all 100 of the Fortune 100, Oracle has few equals in the enterprise software market. Now it's making headway in the related hardware market, and we believe this hard-driving company will continue to reward shareholders.

Buy First: O'Reilly Automotive

Exceptional management should deliver impressive growth.

Suggested Allocation: 3.4%

What It Does

O'Reilly Automotive is America's second-largest auto parts retailer, with more than 4,000 stores. Auto parts are a big business, estimated at $231 billion, and O'Reilly is an exceptional competitor, with an addressable market size of about $131 billion.

Running 24 regional distribution centers and 240 hub stores as part of a two-tiered distribution strategy, the company provides same-day or overnight availability on more than 142,000 items, including many that its competitors don't usually stock. Basic auto parts, tools, and services complement those hard-to- find treasures. As a result, O'Reilly's sales are historically split between "do-it-yourself " retail customers and more lucrative professional-services customers (such as auto repair shops).

Personalized customer service by long- tenured store managers paves the way for continued success. More than 800 managers have worked an average of 13 to 18 years with the company.

How It's Working

Tenured employees share a common history and learn to improve a business in a consistent fashion. Since going public in 1993, O'Reilly has achieved 20 consecutive years of record revenue and operating earnings and has grown same-store sales every single year. Diluted net earnings per share have jumped more than 20% annually over the past decade, with 25% growth in 2012. All signs point to more growth ahead.

O'Reilly plans to open 190 net new stores in 2013, upping its 2012 year-end store count by 4.8%, and same-store sales are expected to increase 3% to 5%. By clustering stores together (one-quarter of its locations are in California and Texas), O'Reilly is able to rapidly achieve economies of scale, and by serving professionals and retail customers, it's able to enter smaller markets where competitors don't often tread. There's also no shortage of independent stores or chains to acquire in this highly fragmented industry. In 2012, O'Reilly acquired 56 locations on top of opening 180 net new stores.

O'Reilly has steadily improved profitability, generated strong free cash flow, and maintained a healthy balance sheet while expanding. Rewarding this consistent showing, the stock has been a steady, top performer over the past five and 10 years.

What We Expect

Management should continue to build value as the auto store retail industry consolidates (O'Reilly may lead the way in acquisitions), and customers will continue to walk through the doors in record numbers as used cars last longer than ever. For every neighbor buying a brand-new car, somebody is buying the used one they're trading in, keeping it on the road. We expect and will demand steady, reliable business performance from O'Reilly over any reasonable time period, or we'll show it a stop sign.

More Resources

- *Pro*'s original recommendation (4/15/13)
- Talk about O'Reilly on our discussion board

The *Pro* Bottom Line

Older cars require more maintenance. The average car in America was 10.8 years old in 2011, near a record high. The number of registered cars in the United States increased 15% in the past decade. Even as more new cars drive off the lots, older cars are rarely being destroyed. O'Reilly is well positioned to be profitably supplying car parts and accessories to your grandchildren, who may very well be driving souped-up versions of today's Lexuses and Acuras decades down the road.

The Motley Fool owns shares of American International Group, Apple, Microsoft, Oracle, and O'Reilly Automotive and has the following options: Long Jan 2014 $25 calls on American International Group. See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Our North Star

Published Jun 17, 2013 at 12:00AM

Our North Star is a guide for our investing behavior, and like the real North Star, we can use it to navigate on our course to a winning portfolio.

Pro Strategy Guide

Get up to speed in no time with this series of articles that will show you how to invest like a Pro:

Motley Fool Pro's mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star.

Pro's North Star: Inflation + 7% annually

This isn't a specific destination; rather, it's an omnipresent fixture that offers us direction and reminds us of what we're striving toward.

Why inflation + 7%? our mission is to grow the real purchasing power of our capital. Therefore, the first competitor we need to beat is inflation, as measured by the Consumer Price Index.

We want to grow our dollars by more than the rate of inflation — that's a given. Exactly how much more is a difficult figure to pinpoint, but history tells us that if we can double the real purchasing power of your dollars every 10 years, we'll be doing what few manage to accomplish.

To double your dollars in a decade, we need to book a compound annual return of about 7%. To double your real dollars, we need to return 7% plus inflation. Thus, this figure is born directly out of our mission of absolute returns — returns that improve your financial standing in the real world.

Our North Star has several important characteristics that make it appropriate, challenging, and aspirational for all of us. It:

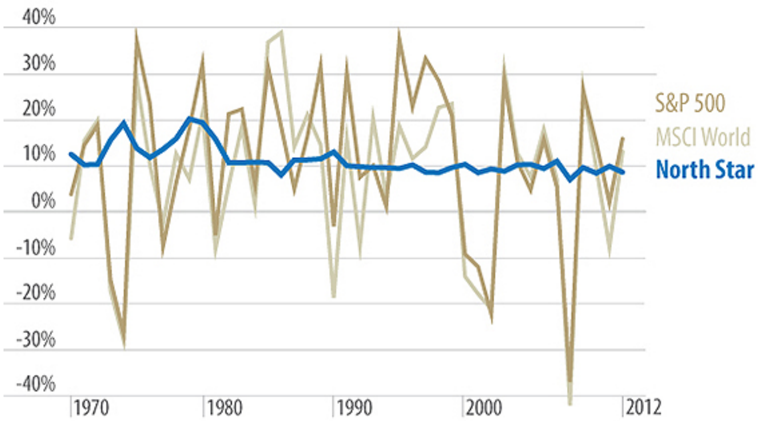
- **Never goes negative.** This lines up with our goal of positive returns over all three-year periods.
- **Is not investable.** It's impossible to lock in a return of inflation plus 7% with some other vehicle.
- **Is not a benchmark.** By definition, benchmarks are investable; they are used for evaluating the performance of a relative-returns strategy. Absolute returns are our goal.
- **Is not a hurdle.** A hurdle is something you must leap over to avoid tripping. Our North Star guides us to make appropriate investment decisions. We're more likely to reach our goals if we let it guide us. If we come close to our North Star, let alone jump over it, we'll be over the moon (sorry!).
- **Is not a gimmick.** We are working to better explain our philosophy and strategy to you, and our North Star will be an ever-present factor in our investment decision-making.
- **Is a challenging reference point.** Historically, our North Star has outperformed the U.S. and world stock markets. Over rolling three-year periods since 1970, our North Star has put up a compound annual return of 11.3%, versus 9.9% for the S&P 500 Total Return Index and 6.4% for the MSCI World index. Our North Star also delivered that return much more steadily than the market indexes, without a single down year.
- **Guides our behavior** as we invest with the tools available to us. It is a framework to explain and reinforce consistent portfolio decisions. Approached consistently over long periods, it should help us and our members achieve strong financial rewards.

Historical Performance

Here's a summary of the past 43 years:

Annualized Return, 1970–2012

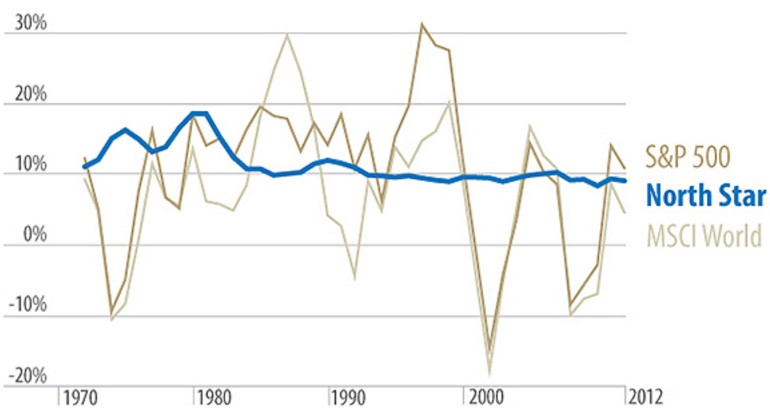
Target	Average	Compound Annual Growth Rate	Best Year	Worst Year
North Star	11.3%	11.3%	20.3%	7.1%
S&P Total Return	11.4%	9.9%	37.6%	-37%
MSCI World	7.8%	6.1%	39.1%	-42.1%



Here are the same data, showing rolling three-year annualized returns. Again, note the lack of volatility for our North Star:

Annualized Rolling 3-Year Return, 1972–2012

Target	Average	Compound Annual Growth Rate	Best 3 Years	Worst 3 Years
North Star	11.4%	11.3%	18.6%	8.4%
S&P Total Return	10.4%	9.9%	31.2%	-14.6%
MSCI World	6.9%	6.4%	29.7%	-17.7%



Note that we look at both average and compound annual historical growth rates. To investors, the one that matters is the CAGR. We include both to show the power of compounding: Even though our North Star has averaged an almost identical annual return to that of the S&P Total Return index over the past 43 years, the North Star — inflation plus 7% — has outperformed the index by about 1.4 percentage points annually. That's because when the index has those deeply negative years, much higher positive years are needed to claw its way back to positive territory. Since it never goes negative, our North Star doesn't have that problem. That is the power of steady, positive returns.

Pro's Performance

Here are *Pro*'s annualized returns lined up against our North Star. (Again purely for education, we've also included the returns for the S&P Total Return and MSCI World indexes.) The chart shows the annualized return as of the end of each month. The data begin one year after *Pro*'s start, because annualized returns based on less than a year of data aren't very useful.

These returns are annualized, not cumulative. Annualized returns are more useful to investors because they allow easy comparisons. Also, a note on the recency of data: The Consumer Price Index (inflation) data is reported with a several-week lag, while Pro's performance is in real time. Inflation is quite stable from month to month, so we use the previous month's inflation figure as an estimate for the current month's until the actual data are released. Any adjustment required is usually negligible, especially given the rolling three-year viewpoint we favor. This approach allows us to keep our performance tables updated all the time. (Updated October 2018; click for larger version.)

More on the North Star

It's a bird, it's a plane, it's our North Star discussion board!

Relive our live chat with members about the debut of the North Star

FAQ About Our North Star

How are you measuring inflation?

We're using the change in the Consumer Price Index. The Consumer Price Index is a measure of the average change over time in prices paid for a "market basket" of consumer goods and services. In plain language, it measures how many more dollars it takes to buy things over time.

Specifically, we're using the CPI-U, or the Consumer Price Index for All Urban Consumers, which covers about 87% of the U.S. population. We're using the "all items" version of the CPI-U, which means that we aren't excluding anything. This is worth pointing out because media-reported CPI figures often exclude food and energy prices.

Wait a second. I'm pretty good at math, and you need to return 7.177346% annually to double your money in 10 years. What gives with your 7% figure?

Yes, to be precise, we'd need to return $2^{(1/10)}$-1, or about 7.177346%, per year to double a portfolio in 10 years. Spelling out our North Star as inflation + 7.177346% doesn't in any way make it more useful as a guide, though.

Is the North Star a hurdle or benchmark?

Our North Star is neither a hurdle nor a benchmark. Hurdles are things you intend to leap over, and benchmarks represent an alternative for your investment dollars. Our North Star is neither of these things. Its purpose is to offer us direction, guide our behavior, and keep our mission front and center.

What is a rolling three-year period?

Rolling three-year returns measure performance over the most recent three years. So the rolling three-year return as of Oct. 31, 2011, measures the return since Oct. 31, 2008. A month later, the rolling three-year return as of Nov. 30, 2011, measures the return since Nov. 30, 2008.

How will the North Star change how *Pro* is managed?

Our strategy will not change, but our implementation of it should improve with the North Star as a guide. Our North Star should remind us to lower our risk when we have large, abnormal returns, or increase our exposure to stocks and income if we're not close to our North Star. Thankfully, this should work well in the marketplace. If stocks are up sharply, we *should* be looking to lower our exposure, as our North Star would suggest. If returns are lackluster, we *should* be looking for more stock values or income strategies. Following a steady North Star should help us make better decisions.

Why is the North Star better than the S&P 500?

Pro has never been an alternative for the S&P 500 index. We use options for income, we short, and we hedge. The index is a long, stock-only vehicle. *Pro* is also not about returns relative to an index; we're about positive gains over any reasonable period. The North Star never goes negative, so it's a much better measure against our goal than is the volatile S&P 500, which can be negative for years.

Inflation is relatively tame lately. What happens when it soars?

Then our North Star's annual return is going to soar, too. Thankfully, stocks typically compete well with inflation, so to follow our North Star, we know we'll need to be largely invested in stocks during periods of high inflation, and we'll likely use fewer income strategies, because fixed income may not keep up with inflation.

What if you don't top your North Star?

We'll be happy if we just stay on track with it — or stay relatively close. If we *can* top it over many years, that would be excellent. But we need to realize the lofty challenge of topping a measure that *never* has a negative year while we're investing in stocks. Our North Star is our aspiration, not a hurdle or benchmark.

Can I measure the North Star against my portfolio at home?

Absolutely. Using the Bureau of Labor Statistics CPI stats, you can obtain historical CPI measures along with a monthly update to compare the CPI+7% to your portfolio. We've already done the 41-year history for you above, and we'll be updating the North Star results monthly for you.

Where can I talk about the North Star with the *Pro* team and other members?

Our North Star discussion board is always shining (sorry!).

[Next Step: Inside the Portfolio →]

Roll Your Covered Calls on Tupperware

Published Jun 12, 2013 at 1:00PM

Is This Trade for You? This is for *Pro* members who (a) already own at least 100 shares of Tupperware and (b) have July 2013 $70 covered calls on those shares as part of our July covered strangle. (We are not rolling the July puts right now.) You need to **roll your calls by Friday, June 14 because of the upcoming dividend,** if you intend to keep your shares and receive the dividend. Any puts you may have written on Tupperware are on track to expire as income, so you don't need to do anything with those. We plan to write new puts in future via a separate trade alert.

Trade Essentials

- **Company: Tupperware Brands** (NYSE: TUP)
- **Scorecard Status:** Hold. Members who own shares can hold them and use options with us or not, as they choose. Those without shares should continue to write puts as we've recommended in the past and will continue to do (for all members) in future.
- **Trade Action:** Using a covered call rolling order, buy ("buy to close") all previously written July 2013 $70 calls, and simultaneously sell ("sell to open") the same number of October 2013 $75 calls.
- **Share Price (June 12, 12:45 p.m.):** $80
- **Option Prices (June 12, 12:45 p.m.):**
  - **July 2013 $70 calls (bid/ask):** $9.40/$10.80
  - **October 2013 $75 calls (bid/ask):** $7.20/$7.70

- **Price Guidance:** Aim to pay as little time value as possible when buying to close your July calls. So, lately, with the stock at $80, aim to pay not much more than $10 to close the July $70 calls. That said, this roll needs to be completed by sometime Friday, June 14 (in advance of the ex-dividend date on Monday, June 17) to potentially avoid having your shares called away. You must pay a debit to roll, and that debit will change as the share price moves. Lately, going somewhere between the options' bid/ask prices, the debit to roll is around $2.50. (Fret not: We plan to make that back writing new puts in the future, and we're well ahead overall with our written options on Tupperware so far.)

- **Allocation:** Roll one covered call for every covered call you already have on Tupperware.
- **Alternative Trades:**
  - If you don't own Tupperware stock yet, it remains on hold. As noted above, we've suggested put-writing trades to try to get shares at a lower price, and we'll do that again in the future.
  - If you own shares but don't have covered calls on them yet, consider writing the October 2013 $85 calls, lately $2.70 (there's not a good reason to write in-the-money calls if you're coming fresh to this trade).
  - If you've written puts already: Again, those are all on track to expire as income. Watch for new put-writing trades from us.

What's New?

Tupperware continues to be an emerging-markets story: Sales are growing sharply in countries many Americans would consider exotic (India, Malaysia, Brazil), but results in developed markets, including North America and Europe, are just puttering along. Because emerging markets now represent a majority of revenue, though, Tupperware's free cash flow is growing.

Feeling flush (and wanting to reward owners), management has become aggressive with automatic, quarterly share buybacks and an ever-higher dividend. The stock's yield now touches 3%. Shares are neither cheap nor dear (at $81.96 as of these calculations), trading at 14.7 times expected earnings this year, 16.1 times trailing free cash flow, and 11 times EV/EBITDA (which is a bit high historically for Tupperware).

The stock is above our $71 fair-value estimate (an estimate that goes up as the business grow — and remember, fair value is an estimate of an attractive *buy* price). Given the ongoing positive developments in Tupperware's financials, we still want to keep our shares for the long haul. But we also want to hedge and monetize them with options. To fulfill these desires, we need to roll our covered calls up now to keep our shares and get the next $0.62 dividend. Following this roll, we'll look to write new puts again, too — especially on a dip in price.

Here's how this roll looks, and our future plans:

This Is How We Roll in *MF Pro*	
Credit received for writing July strangle	$3.48 (many members received $4-plus)
Debit to close July $70 calls (with shares at $80)	(approx. $10)
Net debit to close (what a bull market)	(approx. $6.52)
New credit received for writing October 2013 $75 calls	approx. $7.50
Total credit we're still clinging to	**about $0.98**
The next step in our strategy	As our outstanding puts near expiration, or on a dip in share price, we'll look to write new puts to grow our credit; if shares fall enough, they'd move back to Buy on our scorecard.
The next step for these covered calls	If Tupperware gives back some ground, our calls hedge out that decline by today's $7.50 in value; if the stock continues to hang tough, we'll likely roll our calls again.

Next Steps

When Cheap Is Cheap: Intel, Oracle, and More

Published Jun 10, 2013 at 4:00PM

Dear *Pro* Member:

The surest way to avoid permanent losses in the stock market is to buy healthy companies at discounted valuations. Sticking to this approach should also lead to a high accuracy rate (one of our goals at *Pro*), with few investments ending as losers. One valuation metric I consider in most of our buy and sell decisions is a company's enterprise-value-to-EBITDA multiple.

The As-Yet-Unnamed *Pro* Community Award

Our *Pro* community contest is under way! We're collecting your nominations for the most exceptional poster among the brilliant, funny, helpful, dedicated Fools on our discussion boards. [Click here to read and discuss]() the nominations so far. We also want to hear your submissions for a name for the award (whose winner will receive a free year of *Pro*). [Here are all the details]()!

EV Is Everything

Enterprise value (EV) is a company's market capitalization (its diluted shares outstanding multiplied by the current share price), *minus* its cash and equivalents, *plus* its long-term debt. By including key balance-sheet metrics, it provides a *true cash price* for the business as a whole.

To illustrate, a company with a $10 share price and 1 million diluted shares outstanding has a $10 million market capitalization. But if the business has $1 million in cash and $5 million in long-term debt, its enterprise value is $14 million ($10 million in market value, minus $1 million cash, plus $5 million debt). That, dear Fools, is the cash price you'd pay to acquire the whole business, because you'd be acquiring the balance sheet, too.

EBITDA Is Less Than Everything

The second part of our equation is EBITDA: earnings before interest, taxes, depreciation, and amortization. This number isn't as vital as the free-cash-flow figure we reference so often, but it supplies a meaningful view of a company's earnings power, unclouded by four non-operational or non-cash factors. One example of its utility: In today's international economy, where tax rates vary by country, excluding taxes by using EBITDA allows a clearer apples-to-apples comparison of earnings power between companies.

EV/EBITDA = Enterprise Multiple

Taking a company's enterprise value and dividing by its trailing 12 months of EBITDA gives us its EV/EBITDA multiple (also called the enterprise multiple). Acquiring companies, analysts, and the *Pro* team all use this resulting multiple much like the common price-to-earnings, or P/E, ratio, is used.

Very generally speaking, an EV/EBITDA multiple in the single digits is typically considered reasonable to inexpensive. The higher the multiple climbs into the double digits, the richer the company's valuation. Many premium stocks can trade at P/E ratios in the 20s (or even higher) for years, but EV/EBITDA multiples rarely stay at similar levels for nearly as long; an EV/EBITDA multiple in the mid-teens can be sustainable, but is considered "premium."

Pro Stocks Under the EV/EBITDA Microscope

So, let's look at the valuations some *Pro* stocks have held over the past 10 years. Here are fiscal year-end EV/EBITDA multiples for one of our largest positions, **Intel** (NASDAQ: INTC):

2004	2005	2006	2007	2008	2009	2010	2011	2012	Now
8.6	8.2	9.0	11.7	4.6	8.5	4.9	5.2	4.3	5.6

Source for all: S&P Capital IQ; year-end EV/EBTIDA.

After years in the upper single digits, Intel has failed to command a respectable EV/EBITDA multiple since the financial crisis, even though the company's EBITDA soared to record highs after 2009. Why so depressed? Many investors don't believe the company's current results are sustainable as the traditional PC market shrinks. We believe Intel has much more staying power than today's valuation suggests, and we suggest a multiple of at least 7 would be reasonable today.

Now we'll consider another large company (also one of *Pro's* largest positions). Here are EV/EBITDA multiples for software leader **Oracle** (NASDAQ: ORCL):

2004	2005	2006	2007	2008	2009	2010	2011	2012	Now
14.3	12.0	13.7	13.9	8.8	10.6	11.1	**6.9**	8.4	8.5

Able to grow more steadily than Intel, Oracle has commanded the higher valuation multiples between the two. However, at the end of 2011, Oracle announced a disappointing quarter, sending the stock to a multi-year low multiple (in bold above). We bought our first shares in 2009 (and they remained profitable for us), but we used the opportunity of 2011 to buy more. The stock was too cheap to ignore at 6.9 times EBITDA. Shares have rebounded nicely since then, but the stock's still inexpensive today.

In the same industry, **BMC Software**'s (NASDAQ: BMC) EV/EBITDA multiple is instructive. When we first bought shares in 2011, we suggested that the going price of only about 7 times EBITDA could attract takeover activity, because a buyer could offer a premium to the market price and still get a good deal. Now the company is being taken over at more than 10 times EBITDA. Here's BMC:

2004	2005	2006	2007	2008	2009	2010	2011	2012	Now
17.1	14.5	16.8	12.3	8.9	10.2	11.3	6.3	9.0	10.3

We bought our first shares in 2011, and more in 2012 around 9 times EBITDA. As a business with healthy recurring revenue and strong free cash flow (like Oracle), BMC was too inexpensive to forego – that is, as long as our analysis continued to support the view that BMC's competitive moat would keep cash-flow-robbing foes at bay.

Another business that called me like a siren with its EBITDA valuation was specialty chemicals producer **Rockwood Holdings** (NYSE: ROC):

2004	2005	2006	2007	2008	2009	2010	2011	2012	Now
N/A	7.4	7.9	8.3	5.5	8.8	7.9	5.9	6.9	10.0

The stock was cheap when we first bought in 2011, especially as management was growing EBITDA, paying down debt, and passing along price increases. It remained cheap into 2012, so we wrote puts and bought more shares. Though it's a cyclical business, we argued that it could trade at 9 times EBITDA. Now, around our fair value, it trades higher than that, and we have covered calls on it.

Let's round out our study with an extremely steady performer over the past 10 years, **O'Reilly Automotive** (NASDAQ: ORLY):

2004	2005	2006	2007	2008	2009	2010	2011	2012	Now
10.6	12.6	10.9	9.9	13.5	9.7	10.4	10.9	9.6	11.4

The auto-parts retailer enjoyed an EV/EBITDA multiple higher than 10 during most years in the past decade. Early this year, we bought shares around that same multiple (it's up about 10% since). We're angling for a share price that appreciates as the business grows, maintaining a valuation multiple that's rarely less than 10. Should it fall much below that without good cause, we'll look to add more shares.

I'll EBITDA for Ya

Boy George may tumble for ya, but we EBITDA for ya. You can take your pick. Our guess is that you'll stick with *Pro* and forego membership in Culture Club. (Although, you *could* always enjoy both.)

Fool on! And to discuss this, please visit the Memo Musings board.

-- Jeff (TMFFischer)

Transcript

Chris Hill: Welcome to EP Weekly. I'm Chris Hill joined in studio this week by Jeff Fischer, Bryan White and Robert Brokamp. Good to see you, gentlemen.

Jeff Fischer: Hi, Chris.

Robert Brokamp: Thank you.

Chris Hill: We're going to get to Bro's question of the week in just a moment, but we're going to kick things off with, I've got to say, I was thrilled when we were talking this morning because this is my favorite public company, and it's Starbucks. And there's a lot going on with Starbucks, and Jeff, there are a bunch of things we can get to, but first and foremost, this is a company that has had really strong results lately, and really strong results seemingly everywhere.

Jeff Fischer: Yeah, Chris, and I love that you say "really strong results lately." When this company goes back in the Fool's history, back to 1998 is when David Gardner and I first bought it in the Rule Breaker portfolio. The company was worth around $4 billion then; now it's $47 billion. So more than ten times your money in 15 years, and yet it's still growing sharply now 15 years later.

It reminds me of a point that was recently made on the Fool.com site by Morgan Housel, which was that Warren Buffett has made most of his money, some $57 billion of his $60 billion in wealth, since he was 60, so just in the past 20-some years. That's how compounding works and it works for individuals and it works for companies too. You don't always become too big to keep growing. You become so big that you can then compound much more easily and the absolute returns are great.

So Starbucks right now is really doing well in North America. Sales are up sharply. Loyalty among customers is record high by most any measure you could take. And they're growing sharply overseas too, in mainly China. Not everything is great. They're struggling in Europe, but for the most part…

Chris Hill: Isn't everyone?

Jeff Fischer: Yes, sure. I mean it's hard…

Chris Hill: I mean, not to pick on Europe, but aren't most companies struggling in Europe?

Jeff Fischer: Yeah, when the economy in the EU is that weak, how can you not struggle a bit? But they're making a tiny bit of money in Europe, even as they struggle. But overall, Chris, you're right. They're growing earnings per share around 20% annually right now, and the stock reflects that. The stock has had a great couple of years on top of a great 15 years.

Chris Hill: And Bryan, part of the story here is the packaged goods, the move into grocery stores, which is expanding in ways that probably some people didn't expect.

Bryan White: Well, yeah, during your last conference call, Howard Schultz definitely pounded the table on their ability to grow here in North America. You know most folks, if you just mention Starbucks as an investment opportunity, it's easy to think that they're mature here in the U.S., the growth is done, the stores are all over the place.

But they're really going to attack the home, and what they're doing is they're revamping their loyalty program, their My Starbucks reward program, and right now they're going to launch it within the grocery stores where they feel like they've got about ten times the audience than they do in their individual stores. And what they're going to do is they're going to just spread it out amongst all the products, even Teavana. So you can now use your card when you purchase tea within the Teavana stores. The interesting thing, Chris, is they have 3,000 Starbucks stores within the highest value grocery stores within the country, so it's going to be a huge rollout within those grocery stores. It's going to be interesting. It's going to be very interesting going forward.

Chris Hill: I was probably more excited than I should have been last year when Starbucks announced their acquisition of La Boulange, which is the San Francisco-area bakery, and I'll give credit to our colleague, Bill Barker, who's in Motley Fool Asset Management, who made the point that it's amazing that Starbucks has done as well as it has as a company without ever really getting food right. And that's true.

Jeff Fischer: That's so true.

Chris Hill: They really haven't, and so where are we on the La Boulange acquisition. And now it's about a year later. When is it coming to Alexandria? I know they're going to roll it out to big cities and all that stuff…

Jeff Fischer: All you care about is Alexandria.

Chris Hill: All I care about is when is it coming here?

Jeff Fischer: It is exciting. La Boulange products are now in 439 stores, basically all the San Francisco Bay area, Chris, so you have to fly across the country. But they're rolling them out as we speak throughout the Pacific Northwest, again, sorry, Chris, in June. And then they're expanding to L.A., Chicago and then Boston/New York, so that's the order they gave. So it sounds like we're last on the list. They're spreading east, which makes sense. You have to roll out these distribution networks.

Chris Hill: Sure.

Jeff Fischer: But by the end of 2014, which is sooner than I had anticipated, they should be, La Boulange products should be in all U.S. company-operated stores. So that's only a year and a half from now.

Chris Hill: Well and my own selfish desires and all kidding aside, what do you think that means for the business? Because it seems like whereas once upon a time with Starbucks it was just about how often can we get people to come back and buy coffee? Now there's a significant opportunity to really raise the average ticket price.

Jeff Fischer: Yeah, I think "significant" is right. It's a very big opportunity because as you said Chris, most of us, many of us go in there for the coffee. We don't buy food unless we're starving, because the food has never been up to snuff. If they can get food and coffee right and have these millions of people every day, every morning coming in for coffee, start to add food to their ticket, it could double the average ticket sale.

Chris Hill: Just to wrap up on Starbucks, what do you think of the stock today? Is it cheap? Is it fairly valued? Does it seem a little frothy? Is it something where people should maybe wait for a little bit of a pullback? What do you think?

Jeff Fischer: It seems like it has a little extra whip on it, a little froth on there. It's the low sixties now, which puts it at 29 times estimated earnings for this year and 31 times trailing free cash flow, so 29 times and they're growing around 20%. It's a premium, clearly, for a premium company. That said, if food does as well as it could and consumer packaged goods and China keeps growing, it could maintain a premium for years to come and keep rewarding shareholders. I think over the long term it will.

Chris Hill: Question for our man, Robert Brokamp, from one of our members on the boards who writes, "I've read that investors should choose Roth Retirement accounts since tax rates have nowhere to go but up. my current tax rate is 33%, but in retirement I would probably not withdraw the same amount of money as I'm making today since I expect to pay my mortgage off, plus I'm paying a 9% state tax now, whereas during retirement I may move closer to family in Texas, which does not have an income tax. Does the Roth make sense for me?" What do you think?

Robert Brokamp: Well first of all, just to make sure we all understand what a Roth is, a Roth is when you put the money in, you don't get a deduction on the contribution, but money comes out tax free. Traditionals are the other way around. You get a deduction on the money that goes in, but you pay taxes on the way out.

So the question is, when do you want to pay your taxes? And this person has hit on the key variables, and that is what's your tax rate today versus your tax rate in the future? Of course we don't know the future, but this fellow is in a high tax bracket today, and for retirees, generally spending does go down, as does the tax rate. This person also brought up an interesting point in that he's moving from a state with an income tax, that currently has an income tax, and he's moving to Texas, doesn't have one. Same with Florida, same with Nevada, which are popular places for people to retire.

So in this situation, as much as I love Roth accounts, for this guy, it probably does make sense to stick with the traditional because even though tax rates most definitely will go up, I think retirees will get hit the least by rising rates. And just a reminder, if you're a member of Fool One, you have the benefit of calling an Ayco financial counselor to ask these types of questions. This is the perfect question for them, should you choose a Roth and should you convert to a Roth? You have unlimited amount of calling to those folks.

Chris Hill: All right, we will wrap up there. Robert Brokamp, Jeff Fischer, Bryan White, guys, thanks for being here. Thanks everyone for listening. We'll see you next week.

See Pro's holdings here . See the team's and David and Tom Gardner's holdings here .

You Hedge to Stay Long-Term

Published Jun 3, 2013 at 4:00PM

Dear *Pro* Fools,

This afternoon, *Pro* issued a recommendation to use options to set up a small hedge on the **iShares Russell 2000 Index** (NYSE: IWM) ETF. With that recommendation as context, let's take a few minutes to talk about hedging in general.

The As-Yet-Unnamed
Pro Community Award

Our *Pro* community contest is under way! We're collecting your nominations for the most exceptional poster among the brilliant, funny, helpful, dedicated Fools on our discussion boards. Click here to read and discuss the nominations so far. We also want to hear your submissions for a name for the award (whose winner will receive a free year of *Pro*). Here are all the details!

As today's trade alert also mentioned, you don't need to hedge to succeed with *Pro*. If your investing time horizon is three years or longer, and you don't mind market volatility while you wait — and you also don't mind not having any winners during market declines — then hedging may have little relevance to your investing strategy.

Pro's mission is to earn consistent returns over every rolling three years, so rather than sit back and accept 100% of the market's volatility, we seek smoother sailing by establishing some positions designed to make money when the market falls. As part of our mission, we also manage our market exposure. Lately, we've been around 70% net long (or invested), but only 60% "true long," including our in-the-money covered calls. This accurately reflects the opportunities we see (or don't see) in the market lately. Likewise, the guidance we've given to members who joined in February has added up to about 64% long.

But the *Pro* portfolio is never static. Our long-running 10% hedge in the **SPDR S&P 500** (NYSE: SPY) ETF is covered by puts, so it may be closed this month. If so, that will increase our net exposure to the market by 10%. This is where today's new put ratio spread of 5% comes in — it's simply another part of managing our market exposure. This new position will help maintain the portfolio at between 60% and 70% long, while making sure we have some positions that will profit in a decline. When we find compelling reasons to buy, of course, our market exposure will confidently climb.

Hedging

As we've often discussed, hedging is a way to lower your exposure to the market without having to sell your long-term stock holdings. If the market declines, your hedges will reward you, and you can reinvest the proceeds in stocks at lower prices. Meanwhile, you continue to own your favorite companies for the long haul. In this sense, hedging has a much more long-term focus than the obvious alternative defensive move — selling a stock outright. You hedge so you can keep your stocks for the long haul while maintaining the risk profile most appropriate for the short term. That's really all a hedge is meant to do: decrease your exposure, or risk, while letting you stay invested in what you believe in most. It's a small insurance policy of sorts, meaning you generally don't expect to make money on a hedge — though of course sometimes you do.

Shorting

Shorting is very different from hedging. A direct short of a company reflects a belief that the stock will decline, no matter what the stock *market* does. When we shorted **Sony** (NYSE: SNE) last year, it wasn't a hedge. It was a position of conviction, much like our long investment in **Intel** (Nasdaq: INTC). Selling a company short is a time-intensive activity, requiring at least as much research and attention as something you own. So I'm excited to announce that *Pro* is now working with renowned short seller John Del Vecchio. Starting now, John is delivering his favorite short ideas to us behind the scenes for our consideration. When he suggests — or we find — company shorts that fit in with the portfolio, you'll get a trade alert and full report from us. We welcome John's contributions to *Pro*!

Keep Your Wits About You

If the stock market has a volatile summer, it'll be the first period of market volatility in about a year. That means you — and every other investor — will likely be sensitive to it at first. If and when that happens, remember that in *Pro*, we own strong businesses that we believe will create strong value over the next three years and longer. We have cash to invest in new opportunities, and we'll continue to set up hedges to target smoother returns (though, as always, you don't need to hedge to be successful with us). We're also going to short some stocks directly to profit on an expected decline in their prices. Finally, we'll use options more as volatility goes up, ideally for higher income.

In every case, it's most important that you do what's best for *you*. If you only want to own*Pro*'s long stock positions, just own our stocks and let time be your friend. Keep your emotions in check, your risk measured, and most of your money invested, and we'll reach our long-term goals in style.

You Hedge to Stay Long-Term

Published Jun 3, 2013 at 12:00AM

Dear *Pro* Fools,

This afternoon, *Pro* issued a recommendation to use options to set up a small hedge on the **iShares Russell 2000 Index** ETF. With that recommendation as context, let’s take a few minutes to talk about hedging in general.

The As-Yet-Unnamed
Pro Community Award

Our *Pro* community contest is under way! We’re collecting your nominations for the most exceptional poster among the brilliant, funny, helpful, dedicated Fools on our discussion boards. Click here to read and discuss the nominations so far. We also want to hear your submissions for a name for the award (whose winner will receive a free year of *Pro*). Here are all the details!

As today’s trade alert also mentioned, you don’t need to hedge to succeed with *Pro*. If your investing time horizon is three years or longer, and you don’t mind market volatility while you wait — and you also don’t mind not having any winners during market declines — then hedging may have little relevance to your investing strategy.

Pro’s mission is to earn consistent returns over every rolling three years, so rather than sit back and accept 100% of the market’s volatility, we seek smoother sailing by establishing some positions designed to make money when the market falls. As part of our mission, we also manage our market exposure. Lately, we’ve been around 70% net long (or invested), but only 60% “true long,” including our in-the-money covered calls. This accurately reflects the opportunities we see (or don’t see) in the market lately. Likewise, the guidance we’ve given to members who joined in February has added up to about 64% long.

But the *Pro* portfolio is never static. Our long-running 10% hedge in the **SPDR S&P 500** ETF is covered by puts, so it may be closed this month. If so, that will increase our net exposure to the market by 10%. This is where today’s new put ratio spread of 5% comes in — it’s simply another part of managing our market exposure. This new position will help maintain the portfolio at between 60% and 70% long, while making sure we have some positions that will profit in a decline. When we find compelling reasons to buy, of course, our market exposure will confidently climb.

Hedging

As we’ve often discussed, hedging is a way to lower your exposure to the market without having to sell your long-term stock holdings. If the market declines, your hedges will reward you, and you can reinvest the proceeds in stocks at lower prices. Meanwhile, you continue to own your favorite companies for the long haul. In this sense, hedging has a much more long-term focus than the obvious alternative defensive move — selling a stock outright. You hedge so you can keep your stocks for the long haul while maintaining the risk profile most appropriate for the short term. That’s really all a hedge is meant to do: decrease your exposure, or risk, while letting you stay invested in what you believe in most. It’s a small insurance policy of sorts, meaning you generally don’t expect to make money on a hedge — though of course sometimes you do.

Shorting

Shorting is very different from hedging. A direct short of a company reflects a belief that the stock will decline, no matter what the stock *market* does. When we shorted **Sony** last year, it wasn’t a hedge. It was a position of conviction, much like our long investment in **Intel**. Selling a company short is a time-intensive activity, requiring at least as much research and attention as something you own. So I’m excited to announce that *Pro* is now working with renowned short seller John Del Vecchio. Starting now, John is delivering his favorite short ideas to us behind the scenes for our consideration. When he suggests — or we find — company shorts that fit in with the portfolio, you’ll get a trade alert and full report from us. We welcome John’s contributions to *Pro*!

Keep Your Wits About You

If the stock market has a volatile summer, it'll be the first period of market volatility in about a year. That means you — and every other investor — will likely be sensitive to it at first. If and when that happens, remember that in *Pro*, we own strong businesses that we believe will create strong value over the next three years and longer. We have cash to invest in new opportunities, and we'll continue to set up hedges to target smoother returns (though, as always, you don't need to hedge to be successful with us). We're also going to short some stocks directly to profit on an expected decline in their prices. Finally, we'll use options more as volatility goes up, ideally for higher income.

In every case, it's most important that you do what's best for *you*. If you only want to own *Pro*'s long stock positions, just own our stocks and let time be your friend. Keep your emotions in check, your risk measured, and most of your money invested, and we'll reach our long-term goals in style.

Set Up a Put Ratio Spread on IWM

Published Jun 3, 2013 at 12:00AM

- **What We're Doing:** Using options, we're setting up a new, small market hedge that won't cost us anything if the market keeps rising.
- **Who Should Follow Along:** Our recommended exposure to the market reflects the opportunities we see right now; collectively we're at a comfortable 60% to 70% net (or true) long (or invested in the market). We continue to believe in our stocks for the long term, but we hedge to smooth returns during market declines. You don't need to hedge to succeed, but if you want to and can write naked put options, then you should follow along with us.
- **How We Profit:** We're buying puts to profit on a market decline, and writing puts at a lower strike price to pay for the puts we purchase. This position will make money if this small-cap index ETF declines between 2% and 12% by our August expiration. Our returns will not be affected negatively if the market continues to increase. The catch? If the ETF falls more than 12%, this position is no longer a hedge, but instead becomes a potential obligation to buy shares.

Trade Essentials

- **Action:** Using a spread order, set up a put ratio spread on the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF.
  - For every ratio spread you want to set up, write ("sell to open") two August 2013 $91 puts, and simultaneously buy ("buy to open") one August 2013 $96 put.
  - Recent bid (on two $91 puts): $3.20
  - Recent ask (on one $96 put): $3.05
  - Net credit: $0.15 per spread
  - Recent IWM price: $98
- **Price Guidance:** Barring extreme market changes, you should be able to set this trade up for a **net credit** of $0.10 to $0.20 per spread.
- **Allocation:** *Pro*is setting up a 5% position; we're ready to potentially invest about 5% in the ETF. So we'll write 18 puts and buy nine. It breaks down like so:
  - Portfolio value (June 3): $1,625,000
  - 5% of that value: $81,270
  - Buying to open $96 puts: Nine contracts x 100 x $96 = $86,400 in look-through exposure, or about a 5% hedge on our portfolio value.
  - While selling to open 18 $91 puts (half of which become a potential obligation) finances the purchase of the aforementioned nine $96 puts (and pays us a little income).
  - Simply stated, set up one 2:1 put ratio spread for approximately every $200,000 you're managing.

The Big Picture

Here we go again, Fools! We've set up several put ratio spreads on the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF since 2011, and we made good returns when the market declined (yes, the market *did* decline a few times over the past few years). This ETF tracks the 2,000 smallest companies in Russell's universe. It's highly liquid and has been 21% more volatile than the S&P 500 the past year, making for an effective market hedge.

Hedging with a put ratio spread is advantageous because the position doesn't decrease your portfolio returns if stocks rise. It does have limitations, though. Unless you set up a large allocation, the strategy offers you only modest (but still worthwhile!) rewards when the market falls. Also, if the ETF falls *sharply*, we may want to revert to buying shares of it, meaning the strategy would no longer be a hedge but rather potential long exposure. That's all right, though: We would be content to invest 5% in the small-cap index at prices around 12% lower than today's.

For now, though, let's not get ahead of ourselves. Let's see how this position pays us in a market decline.

Strategy Details

iShares Russell 2000 Index ETF Price	Value of 1 Purchased $96 Put	Value of 2 Written $91 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%) From $98
$96 or higher	$0	$0	$0	Any increase in price or any decline of less than 2%
$95	$1 x $100 = $100	$0	$100	3.1%
$94	$2 x $100 = $200	$0	$200	4.1%
$93	$3 x $100 = $300	$0	$300	5.1%
$92	$4 x $100 = $400	$0	$400	6.1%
$91	**$5 x $100 = $500**	**$0**	**$500**	**7.1%**
$90	$6 x $100 = $600	($1) x 200 = ($200)	$400	8.2%
$89	$7 x $100 = $700	($2) x 200 = ($400)	$300	9.2%
$88	$8 x $100 = $800	($3) x 200 = ($600)	$200	10.2%
$87	$9 x $100 = $900	($4) x 200 = ($800)	$100	11.2%
$86	**$10 x $100 = $1000**	**($5) x 200 = ($1000)**	**$0**	**12.2%**
$85	$11 x $100 = $1100	($6) x 200 = ($1200)	($100)	13.3%
$84	$12 x $100 = $1200	($7) x 200 = ($1400)	($200)	14.3%

The bolded lines above show that we'll earn the maximum profit on the strategy if the ETF declines 7.1% from its recent price, to $91 by our August option expiration. Our break-even on the strategy is $86 per share, or 12.2% below the ETF's recent price.

Any returns here won't occur smoothly or immediately. If the market falls soon, our position will largely retain its current value, with the two sides of the spread largely canceling each other out. As with most spreads, we'll need to wait until closer to expiration to achieve results. With this spread, that's only 75 days away.

Assuming we set this up for a credit, this trade will result in a small profit for us even if the market rises or treads water. But to be safe, you must be ready to fulfill the $91 put obligation if the market falls around 10% or more.. If that does happen, given that many small-cap stocks are relatively illiquid individually, we'd be happy to start a 5% allocation to them through this index ETF..

Next Steps

- **Questions or comments?** Visit our iShares Russell 2000 Index discussion board.
- **Get more ETF info:** See the fund's overview at us.ishares.com.
- **Follow it:** Add iShares Russell 2000 Index to My Scorecard.

Alternative Trade

- **If you're hedging in an IRA or can't write naked puts:** For a cost, you can set up a bear put spread, a strategy with capped risk that most IRAs allow. Using a spread order, buy to open August 2013 $96 puts, and sell to open an equal number of August 2013 $91 puts. Lately, this will cost you around $1.53 ($153) per spread, and that is your maximum risk. This strategy could pay you up to $3.47 ($347) per spread on a market decline to $91 or less, but you should be prepared to lose your $1.53 if the market doesn't decline.

Ugly Can Be Great

Published May 28, 2013 at 12:00AM

Fellow Fools,

The As-Yet-Unnamed
Pro Community Award

Our *Pro* community contest is under way! We're collecting your nominations for the most exceptional poster among the brilliant, funny, helpful, dedicated Fools on our discussion boards. Click here to read and discuss the nominations so far. We also want to hear your submissions for a name for the award (whose winner will receive a free year of *Pro*). Here are all the details!

Every June, many budding oenophiles board their fancy Labradoodles at doggy day care and fly first class to Sonoma, Calif., to sniff, swirl, and sip the area's finest wines. This is not that kind of Memo. Meanwhile, another crowd sets aside the moonshine, postpones the evening stoop session, and makes the trek to Sonoma — "homely" canines in tow — for a very different festival: the annual World's Ugliest Dog Competition. This is most definitely *that* kind of Memo.

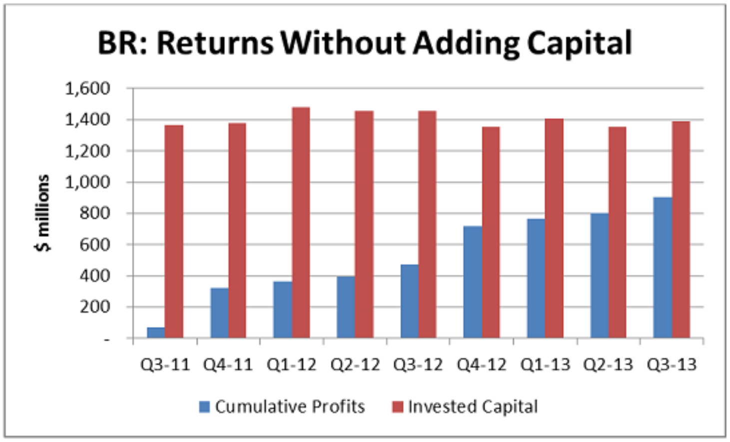
When a Dog Is Ugly ...

Pro holding **Broadridge Financial Solutions** is an ugly dog in our portfolio. I say that because, in a qualitative sense, we've never really been thrilled to own it. Don't get me wrong: We did a lot of homework before recommending members buy shares back on April 27, 2010, and we believed in our thesis. It's just never seemed to distinguish itself as best in show for us. During Broadridge's tenure at *Pro*, one of its partners went bankrupt, it got rid of one business, and another business line's revenue plummeted. Almost from the time we bought it, it's been somewhere on the list of positions we'd consider selling — although it was clearly able to fight off our efforts to that end.

... and Still Scores a Blue Ribbon

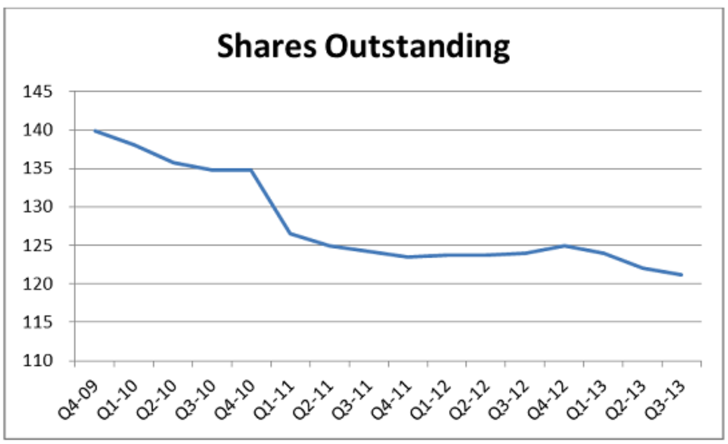
But even ugly dogs win prizes once in a while ($1,500, in the case of this year's World's Ugliest Dog champion). Not only that, they love you just the same as purebreds, and you probably worry less if they roll around in the mud or bring home a dead squirrel every once in a while. Viewed in this light, Broadridge deserves a blue ribbon. After a mere 1,100 days in our portfolio, two rounds of put writing, and a dozen dividend payments, Broadridge has returned a tidy 10% annualized and outpaced our North Star (which has notched 9% annualized). How did this happen?

- **We chose a fundamentally good business with competitive advantages.**
  Broadridge serves a variety of boring niches within the financial services industry, and it has dominant market share in all of them. It's a good business because it generates highly predictable recurring revenue and requires very little reinvestment, meaning it enjoys copious, low-risk free cash flow. The chart below shows that Broadridge's growing earnings (blue bar) have come without additional capital investment (red bar).



Sources: SEC filings and analyst estimates.

- **The company focused on the things it could control.**
  Broadridge's management team graciously thanks its employees on every conference call, and employee happiness seems to be a genuine corporate priority. In 2013, Broadridge was named one of the best companies to work for in New York State for the sixth consecutive year — especially impressive given that this period includes the financial crisis. Customers are happy, as demonstrated by Broadridge's ongoing client retention rates of 98% or more. And management strives to make shareholders happy, too, via share repurchases — the company has bought back 11% of its shares outstanding since we bought ours, and has tripled its dividend since going public in 2008.



Source: Standard & Poor's Capital IQ.

- **Our patience helped us out.**
  Pro is three years into its ownership of Broadridge. That time has passed quickly, so it's surprising to realize we've already owned this company for four times as long as the average mutual fund holds any given position. To complement our naturally long-term mind-set — and in typical *Pro* style — we wrote puts on Broadridge twice, in July 2010 and in May 2011, to generate additional income. Doing so paid us more than $2,200. While that may not sound like much, it represents 15% of the total dollar gains we've logged from Broadridge; without the added income, our position would not have pulled its weight in helping the portfolio seek North Star-like returns.

The Foolish Bottom Line

This is hardly a victory lap. When I recommended *Pro* buy Broadridge three years ago, I thought returns would be higher than 10% per annum; I overestimated its performance over the first few years, and I'm disappointed it hasn't been more rewarding for us. Still, the lesson holds: Even an ugly dog can be prizeworthy. Love your dog for its heart and soul, not the shine of its coat. If it has a snaggletooth, or even spends a little too long sniffing its "newly marked territory," it can still love you back just fine. And when choosing stocks, remember to look for competitively advantaged, fundamentally good businesses that focus on the things that matter. Be patient, spiff things up from time to time with a bit of options income, and you'll have a great shot at achieving your financial goals.

Onward,

Bryan (TMF42)

Short More Direxion Daily Financial Bear 3X Shares ETF

Published May 23, 2013 at 12:00AM

- **What We're Doing:** Financial stocks remain attractively valued, and our short of this inverse ETF has given us a 34% gain this year, shrinking our allocation to only 1%. So, we're increasing our stake to a 1.5% short once again.
- **What We're Thinking:** Shorting this flawed inverse ETF is another way to profit on the financial sector's recovery.

Trade Essentials

- **Action:** Sell short more shares of the **Direxion Daily Financial Bear 3X Shares** (NYSEMKT: FAZ) ETF.
- **Allocation:** Increase your allocation to 1.5% of your portfolio ($1,500 short for every $100,000 you manage).
- **Recent Price:** $33.20
- **Price Guidance:** Use a limit order at the market's going price (we'll make our trade between 1 and 30 days from now).
- **Short Availability:** Interactive Brokers recently showed 400,000 shares available for shorting at a 4.125% annual fee. TD Ameritrade has shares available periodically, with no fee. Other brokers vary, but shares are scarce. We offer some alternative trades at the end of this report.

What's Changed?

The bearish ETF known as Direxion Daily Financial Bear 3X Shares is meant to provide 3 times (300%) the daily *inverse* results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. That means this ETF is betting against *Pro* holdings **Wells Fargo** (NYSE: WFC)and **MasterCard** (NYSE: MA), not to mention several of their peers. We don't believe that's a good long-term call, and so far, our thesis has been true in the short term, too: Since initially selling short this inverse ETF in January, we've achieved a 34% return. That has shrunk our short position from its initial 1.5% stake to just 1% of the portfolio.

Our plan all along has been to steadily add to this short after a meaningful move, aiming to rebuild its size to at least 1.5% (as long as the valuation still merits it). Think of today's recommendation as averaging into a winner because you expect more long-term gains and want ample exposure to it. So, in one to 30 days following this trade alert, we'll increase our 1% short in this ETF back to 1.5%.

The Vehicle

By shorting an ETF that shoots for 3 times the inverse results of the Russell 1000 Financial Services Index, we're effectively going 3 times long that same index. Why not use more traditional methods? You certainly can; see our alternative trades below. But we're choosing to sell short because the ETF's compounding flaws should continue to erode its value in up and down markets, further helping our short. Meanwhile, the index the FAZ is meant to short counts **Berkshire Hathaway** (NYSE: BRK-B), **Visa** (NYSE: V), and other stalwarts among its top 10 holdings; as a whole, it trades at 1.3 times book value as of April 30. That's up from 1.16 times book value when we first shorted it in January, but still low by historical measures. Please see our original report for more on our thesis.

How to Follow Along

Interactive Brokers has shares available for shorting; unfortunately, many other brokers do not. If yours does, when you're ready, "sell short" or "sell to open" enough shares so that your total short exposure to FAZ is once again 1.5%.

Alternative Trades

- **Options (Regular Account):**If your broker doesn't have shares available to short, consider adding to your short using a January 2015 synthetic short on FAZ. Sell to open January 2015 $30 calls, and buy to open an equal number of January 2015 $30 puts. You can also buy fewer puts if you like; this will reduce the amount of capital you need to make the trade, but provides a lower profit potential on the puts, too. (Be careful not to use the "NS" or non-standard options.)
  - **Price guidance:** Shorting the ETF remains a long-term recommendation anywhere around today's prices, so when using options for a syn short, simply aim to split the bid/ask on each option. Set up one syn short for every 100 shares you want to short. (See our guide to synthetic shorts for more on the strategy.)
- **Options (IRA):** There are no strategies to suggest. An IRA allows you to *buy* puts, but the puts are too expensive to suggest today without writing calls to pay for them. See the next alternative!
- **Any account, bullish on financials:** If you can't short this financial index directly or with options, you could instead *increase* your stakes in *Pro* stocks **Wells Fargo**, **MasterCard**, or **AIG** (NYSE: AIG)(or split your capital between them). Our short expresses a bullish stance on large-cap financials, including these; we own a total of 10.6% in these three companies, including calls (or warrants for members). To approximate our 1.5% short exposure in FAZ, own 12.1% in these three companies instead.

What Pretty Eyes You Have

Published May 20, 2013 at 12:00AM

The As-Yet-Unnamed
Pro Community Award

Celebrate our community and help us award a free year of *Pro* to a fellow member! [Click here for more](#).

Dear *Pro* member:

That headline get your attention? Sorry to be a tease, but we're actually talking about the stock market.

All year long, the market has been batting its big green eyes at the world, drawing more and more people into its promising embrace. This is nothing new. For decades, North America's most alluring bazaar for capitalism has been making multitudes of steadfast investors wealthy, while causing heartbreak and loss for many others — often, because of emotional decisions and using leverage.

But for all the headlines and drama, when you get down to it, the stock market is simply an auction house for partial ownership in companies. As an owner, you share in the profits of a business through dividends and appreciation. Sometimes the crowd is willing to bid higher and higher for a stake in these benefits, and sometimes buyers are few and far between.

Introducing Charlie the Bull Market

Next Memo: Tuesday May 28

Fool HQ and the market are closed on Monday for Memorial Day. We'll return with our next Memo on Tuesday — have a great holiday, Fools!

Today, buyers surround us, and we're witnessing history repeat itself. New market highs are earned as the population, businesses, and earnings grow. New highs can go on for years, as they did in the 1980s and '90s. Other times, the market hits a peak and then doesn't touch it again for a decade or longer, as was the case after 2000. Where this fate is concerned, the stock market's price-to-earnings multiple is the largest determining factor.

So, where do we stand on the market's P/E today?

- S&P 500's current P/E on trailing normalized earnings: **18.6**
- Average P/E at the end of a bull market: **19.7**
- Five decade (1949-2009) average P/E: **16.5**
- Average length of a bull market since 1962: **Four years**
- Age of this bull market: **Four years, two months**

Source for P/E: S&P Capital IQ; average data from Bloomberg; bull market length data from Birinyi Data.

The numbers suggest that this bull market — which I would like to name Charlie, after my late grandfather, who lived to be 91, and who was cranky yet funny in his final years — is nearing its end. But Bull Market Charlie could surprise us. Earnings growth, or the lack of it, will almost surely determine its short-term fate.

Analysts are notoriously awful at predicting earnings busts, basically never getting it right. Currently, they expect the S&P 500 in aggregate to achieve $108.52 in normalized earnings per share in 2013, up just 4.6% from last year (with all the growth in the second half). Next year, they're gunning for $116.72 in earnings per share, up 7.6% from this year.

Let's put some multiples on this. With Bull Market Charlie's S&P 500 currently trading at 1,667, we have:

- S&P 500 forward P/E on 2013 estimates: **15.4**
- S&P 500 forward P/E on 2014 estimates: **14.3**

If earnings growth resumes in the second half of this year and accelerates in 2014 as predicted, Bull Market Charlie should continue to enjoy himself. In fact, although the S&P 500 trades at 18.6 times trailing earnings right now, it would need to increase considerably to reach the average bull market's expiration price of 19.7 times trailing earnings by the end of 2014 — if earnings do indeed grow.

But that's the big "if."

Over the past two quarters, earnings growth has been nonexistent, and the average S&P 500 company's revenue actually ticked *lower* year-over-year for the quarter that just ended. In other words, resurgence in earnings growth is far from a slam dunk, and if the second half of this year disappoints, stocks will probably give back some ground. Bull Market Charlie might get cantankerous for the first time in a long time.

What Do We Do? We Do What We Do.

Motley Fool Pro is the Fool's only premium service with a long/short, absolute return dictate that does not use the S&P 500 as its benchmark. With full latitude to be long or short, we've done remarkably well (if we do say so ourselves) during one of the most uncertain times in recent market history.

As of April 30, *Pro* had earned 91.6% of the market's gains since its inception in 2008, while only being about 60% net long at the end of 2009 to about 70% net long on average since then. So, as an absolute returns vehicle carrying lower-than-average risk, we still earned outsized returns of 10.9% annualized. The average hedge fund is nowhere close. Overall, I give us a "B" rating (I know best all the mistakes we've made) and hope to do better over the next five years.

So, what we do from here is: Stick to our mission. We're selling some positions that are priced more richly than the S&P 500, and we're closing (as was suggested in January) our remaining direct S&P hedge. We'll continue to hedge in various ways and continue to add new buys to the portfolio where we see value. It should be comforting that I'm not suggesting drastic strategy changes in the near future. Our strategy works — as long as we're consistent. Bull Market Charlie may thrive for much longer, or he may start getting cranky, but we need to set up the portfolio to benefit either way.

This is not your average market recovery, after all. So when people say, "This can't go on," or, "It's all Fed driven," or, "This isn't real," we know that we can't afford to take such a one-sided stance. We need to play both sides of the coin to earn steady profits and keep our North Star in sight.

Celebrate Our Community and Help Award a Free Year of Pro!

Published May 17, 2013 at 12:00AM

Be impressed ... be very impressed!

We're proud to announce the winner of the first annual *Pro* community award,
henceforth to be known as the Polaris Award:

RockyTopBob

And the charming and talented runner-up:

DangerScott

A very well-deserved congratulations to both Fools for their tireless contributions to our community. Look for new charms on their discussion-board profiles alerting the world to their status as Polaris Award Fools — and stay tuned for next week's Monday Memo for a formal announcement of the results!

Fools,

Longtime *Pro* member and regular discussion-board poster Rich (ADrumlinDaisy) has shared dozens of good ideas in his time with us. At last, we've been able to make one of them a reality. Introducing:

As proposed by Rich, the award is "a *Pro* community analogue of the Feste Award, an annual award given to the member who provides the most value to his or her fellow members." Criteria include a regular, frequent, Foolish presence on the *Pro* discussion boards; helpful, expert-level advice; creativity; and efforts to foster a sense of community.

We loved this idea, and between now and June 12, we want to hear your nominations. Amidst our remarkable community, which members on the discussion boards have truly distinguished themselves to you? Which posts have been most helpful, most thought-provoking, most illuminating?

Rich also suggested a contest for the naming of the award. We loved that idea, too. So without further ado:

Check out **our TAYUPCA discussion-board thread**

If you've never visited our discussion boards (we know you're out there!), we hope you'll consider this an invitation to take advantage of the amazing body of knowledge there. To get you started:

jjayhowe on "Are Jobs Enough?"	**stamleo** on bear attacks and short selling	**FoolishRob99** on how he invests with *Pro*

The winner will receive a discussion-board charm and **a free year of *Pro* membership**; runners-up will receive a discussion-board charm and bragging rights. We'll also follow up with the TAYUPCA winners in *Pro* content, including Monday Memos, interviews, and the like.

Pro has an incomparable community, and we want to reward you, celebrate you, and publicly thank you. Tell us who you want us to honor.

Best,

The *Motley Fool Pro* Team

P.S. Want to talk about this award? You're in good company. And if you've never visited (or never posted), introduce yourself!

CME Group Moves to Sell; Upcoming Options Expiration Guidance

Published May 16, 2013 at 12:00AM

Dear *Pro* Member:

Our May options are set to expire this weekend. Here's a quick review of what we're doing with each, plus a word on future expirations and some thoughts on the stock market.

CME Group Shares to Be Sold Through Calls

CME Group : The stock moves from Hold to Sell as we (and veteran *Pro* members) let our shares get sold this weekend through our May $60 calls. We've only held the shares for 15 months, so we won't win any awards for lengthy ownership. But the stock has delivered a handsome North Star-topping return, including dividends, even though the fundamentals have not yet improved.

At today's valuation, CME appears less likely to meet our desired return over the next three years, so we're content to let it be sold. If the stock price declines, we'll reconsider buying or writing puts on it. Members with $55 written puts on CME (from a past Catch-Up Trade) are in good shape making income; if this is you, there's no need to do anything. And as noted above, the same applies to members who (like us) wrote the May $60 calls: Your shares will be sold automatically this weekend; there's no need to take action. If you own shares without options on them, the stock moves to Sell on our scorecard today. Sell if you're mirroring us.

Other May Option Expirations

CBOE VIX Index (^VIX): This May spread is set to expire without value after Wednesday, May 22 (VIX options expire on a Wednesday). We need not do anything. Volatility did not increase (in fact, it remains very low — around 13), so the spread is ending worthless and at a small loss for us (0.1% of the portfolio is what we risked).

iShares Russell 2000 ETF: Our May put ratio spread is set to expire. This hedge was designed to protect against a downturn, so the market's continual increases rendered it largely unnecessary. But it didn't cost us much of anything — we're considering setting up a new one for a later month.

Medtronic : Late last year, we wrote covered calls on less than half of our Medtronic shares, aiming to sell them to reduce the position size. Thus, we're not doing anything to those May calls now — as with CME, we're going to let them get exercised this weekend. This will reduce our Medtronic stake from 5.7% to about 3%, putting it in line with members who joined in February. We don't need to do anything now.

OpenText : In case you missed it, we already announced last week that we would roll this covered strangle higher before Friday's expiration. Here's that past recommendation. Members with an August expiration strangle can sit tight — we'll address that strangle closer to August.

Future Option Expirations

Of course, we'll have more options expiring in the months ahead, too. We'll address those as they get closer to expiration. Right now, we are staying the course on all of them, and we will until you see a Trade Alert announcing any change.

Market and *Pro* Overview

The stock market's record-strong advance continues to boost valuations more quickly than the average company's free cash flow (or other fundamentals) can grow. In other words, the rapid ascent is taking away from future returns by banking on free cash flow that is yet to come.

Higher valuations today make it less likely that some positions will achieve our future return goals, so we're content to sell those (such as CME). In doing so, we're raising cash that we'll re-invest when and where we find better opportunities. For some stocks, this may be the best market we've seen in five years — for selling, that is. That doesn't mean one should sell indiscriminately, of course. Will stocks go higher in the short term? Nobody knows. But we do know that new opportunities appear on many good stocks every year.

Because *Pro* is about absolute returns, rather than relative, we can — and should — keep our calm in the face of soaring prices. We see our investments as vehicles meant to provide us a desired rate of return, rather than as horses in a race against an index. We're hedged, and only about 60% of our assets are entirely long right now — and we're exceeding our return goal while still keeping our risk profile much lower than average. We'll always strive to earn the best returns that a long, short, and hedged approach can provide, but we have to do so while keeping in mind that stocks don't only go up.

Questions on these May options expirations? Please visit the *Pro* Options Strategies board.

Fool on!

Write Covered Calls on StoneMor Partners

Published May 16, 2013 at 12:00AM

- **Is This Trade for You?** This is only for members who already own shares.
- **What We're Doing**: We're looking to exit this entire position in June as we focus the portfolio further on our favorite buys.

Trade Essentials

- **Action**: Write ("sell to open") one covered call for every 100 shares of **StoneMor Partners** (NYSE: STON)you already own.
  - **Sell to open:** June 2013 $25 calls
  - **Recent bid/ask:** $2.10/$2.80
  - **Stock price:** $27.50
- **Price Guidance**: Use a limit order and **do not accept less than the intrinsic value** for writing these calls. With shares at $27.50, you should accept $2.50 or more to write the $25 calls.
- **Allocation**: *Pro* is covering all of its 1,400 shares.
- **Alternative Trades:**
  - **Own odd lots or a small share count?** The stock moves to Sell today, so use a limit order to carefully and patiently sell odd-lot shares. Try not to accept less than $27.60.
  - **Want to sell sooner?** Write May 2013 $25 calls, expiring tomorrow. Use a limit order to get a price that equates to intrinsic value.

What's Changed?

Several times over the past year, I've written of our desire to focus the *Pro* portfolio on our favorite positions as we steadily critique opportunities. We want to center our energy, time, and knowledge on a universe of stocks we're especially compelled to own, and we expect this approach to result in stronger results in line with our North Star over the years. Of course, not all of our stocks can make the cut as one of those favorites, but until recently, many of our holdings were too inexpensive to sell. That's not the case now, with prices up so much in 2013. Shares of StoneMor have climbed 32% this year, so we're taking this opportunity to exit our entire position.

Because the stock is so thinly traded, we suspect a *Pro* order to sell could push the price down considerably. So we're writing in-the-money covered calls instead, hoping this will have less effect on the price as we attempt to capture today's valuation or better. More than anything, realize that our intent to sell StoneMor is meant to capitalize on today's decent price *and* position us to put greater focus on favored portfolio positions. It's not a sign that our opinion of the company has died. Those who enjoy owning this cemetery and funeral home operator (and who wouldn't!?) with its 8.7% yield should consider keeping it. (Do note, though, that said yield is taxed as income by each state in which StoneMor operates.) To close, if you follow along with us, make sure to use a limit order.

How to Follow Along

We will sell our entire stake if the price remains higher than $25 at our June 22 expiration.

StoneMor units (as a MLP):	$27.50
"Sell to open" June 2013 $25 calls:	$2.50
Trade type:	Intent to sell
Potential sell price:	$27.50 (same as today)
Break-even price:	$25
Days to expiration:	37

There now, we're finished. Kaput. Finito. And we didn't dig up, or throw in, any stiff jokes about mortality.

Next Step

- As you get ready to sell to open one call at a limit price for every 100 shares you own, ask any questions on the rockin' StoneMor discussion board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Write New Covered Puts on the SPDR S&P 500

Published May 16, 2013 at 12:00AM

- **Is This Trade for You?** This is for *Pro* members who are directly short a market index.
- **What We're Doing:** We're again writing covered puts on our short position in the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
- **What We're Thinking:** We have gradually reduced this index short over the past year, and exiting remains our desired course of action.
- **What We're Expecting:** If the S&P 500 index declines below our put strike price by expiration, we'll buy shares through the puts to cover our short, ending the position. We'll keep the premium received from these puts, of course. If the index does *not* decline below our strike, we'll earn income that offsets at least some of the index's gain, and we can consider repeating this strategy.

Trade Essentials

- **Action:**Write puts on your short SPDR S&P 500 position.
  - **Sell to open:** June 22, 2013, $164 puts
  - **Recent bid/ask:** $1.90/$1.92
  - **Recent SPY price:** $166
- **Price Guidance:** Write the puts at the going price. If the index moves significantly before you trade, you can move your strike price up or down to keep it within $2 of the current index price.
- **Allocation:** Write one put for every 100 shares of SPY you're short. For *Pro*, that's 10 contracts. If you own less than 100 shares, you can write one **non-standard** or "mini" option for every 10 shares you're short.
- **Alternative Trade Guidance:**
  - **Own ProShares Short S&P 500** (NYSEMKT: SH) or **ProShares Short Russell 2000**(NYSEMKT: RWM) **instead?** Write near-the-money June covered calls, one for every 100 shares you own. Or, as we've advised previously, just sell your remaining shares.
  - **Directly short the ProShares Russell 2000** (NYSEMKT: IWM) **ETF?** You can write June covered puts near the money, as we are. Write a covered put on every 100 shares you're short. Or, as we've advised before, buy to cover or buy to close your short position.
  - **Short odd lot shares on an index?** We advised closing those earlier this year; that hasn't changed.

What's New?

Like a cockroach you can't kill, our remaining short position in the **SPDR S&P 500** (NYSEMKT: SPY) index has lingered despite our attempts to close it. Once, our covered puts missed being exercised by just a hair (or an antenna). We've recommended "covering," or closing, this position since January 4, but we've attempted to do so by writing covered puts for a better exit price. That strategy often works ... but sometimes — you know — a record-strong stock market leaves your puts far behind.

Though it may seem counterintuitive, we have less need for this hedge as the market runs higher. That's because many of our stocks are now hedged by deep-in-the-money covered calls; some stocks are going to be sold; and one, **BMC Software** (NASDAQ: BMC), is slated to be acquired. In other words, we're raising cash, and several positions are hedged.

Add it up, and *Pro* is about as defensively positioned as it has ever been in this bull market. That's exactly how you want hedges to work as the market goes higher, but at this point as we sell some positions we can stand to remove some hedges and up our exposure. Plus, we're working to add some new direct shorts to the portfolio — ultimately we will; so far, it has been best not to. All that means we maintain our intent to exit the rest of this index hedge, so we're continuing to try to do so — at this point, for a modestly better price.

To be clear, we're not suggesting with this trade that the market will keep going higher in the short term. We don't know. Nobody does (if I had to guess, I'd guess for a summer pullback — but who knows). As always, we're doing what seems best for the portfolio. As our market exposure changes, and we plan other ways to short and hedge, closing this remaining SPY position is still as logical as it was in January.

Next Step

- **Have questions about any of your shorts?** Visit our SPDR S&P 500 board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

3 Qualities of Winning Stocks

Published May 13, 2013 at 12:00AM

Dear *Pro* member:

At *Pro*, we look for three primary qualities in almost every company we consider as a potential investment; then, every quarter, we review those qualities anew. We began to see first-quarter 2013 earnings more than a month ago, and we're still going through many reports — meaning that when we close our eyes lately, these are the traits we dream about.

No. 1: Free Cash Flow Generation

If you ever had a lemonade stand as a kid, then you know the formula for free cash flow success. From your sales, subtract the cost of your supplies (a pitcher, cups, a table), marketing costs (a sign in front of your table), costs of goods sold (lemonade, water), and labor expenses (we'll assume you love lemonade so much you worked for free); what's left over is your operating income. That's a start. But moving to the cash flow statement, what we really want to see is your free cash flow. This is the money left over with which you can do exactly what you wish: pay a dividend, invest in growth, buy back all 10 shares you created when you opened shop, or acquire your neighbor's competing stand, for example.

The formula is simple: Cash from operations *minus* capital expenditures = FCF

You'll often need to adjust the result — for example, by removing one-time cash benefits or expenses. But free cash flow is instrumental to analyzing a business, because unlike earnings per share (which can easily be manipulated) and the lauded P/E ratio, a company's market value divided by its free cash flow offers us a reliable, truthful look at the price we're paying. Almost all *Pro* stocks generate strong free cash flow, which typically leads to both a strong balance sheet and staying power in bad economies.

No. 2: Durable Competitive Advantages

Let's say your highly profitable lemonade stand has attracted competitors who seek to gain market share by undercutting your price. You'll be forced to lower your price, too … unless you have durable competitive advantages. Maybe your lemonade's secret formula gives it a truly special taste, so you can charge more and not lose customers.

In our quest for strong long-term results, durable competitive advantages are as important as free cash flow generation — because without them, a company will eventually be undermined by competitors. Warren Buffett calls this advantage a moat, but however you refer to it, every great business has qualities that hold its foes at bay. In some cases, the moat is as strong as a patent; in others, it can be as nebulous as a trusted brand name. But no matter what, a company needs a moat if it's going to excel.

Watching a company's profit margins is one way to monitor its competitive advantage. If margins are falling because the company needs to lower its price to compete, then the moat is under attack. In contrast, expanding margins can signal a growing moat. But our question every quarter is always, "How sustainable is the moat?"

No. 3: Growth Avenues

Strong free cash flow and durable competitive advantages are great, but they only take a company two-thirds of the way through *Pro's* initial sniff test. We also need to see clear growth avenues ahead. After all, we're not buying bonds — we're investing in stocks that need to appreciate, and doing so almost always requires free cash flow growth and attractive opportunities to reinvest in the business (and earn strong returns doing so). A steady base of *recurring* free cash flow is especially beneficial to future growth, so we favor companies with that outstanding quality.

When it comes to growth objectives at our companies, we gain most of our insights not from the quarterly press releases, but by listening to quarterly conference calls and annual analyst meetings and scouring the company's annual 10-K filing. This is part of why we review conference calls for you every quarter (we link to our latest two below).

In Summary

Given *Pro*'s objective of positive returns on a regular basis, we seek three qualities from our businesses: strong free cash flow generation; durable competitive advantages that protect company profits for the long haul; and clear avenues for growth. Once we see all three in a business, we estimate the company's future value to be as sure as possible that we'll earn an attractive return.

This process lets us find individual investments. Then we put them together in a portfolio, combining allocation, diversification, and market exposure in hopes of reaching our return goals with reasonable risk. The portfolio is always evolving (and some more evolution is just about due), but our principles for finding good investments remain rooted in these tried-and-true qualities.

Thank you for reading! There's more news below — enjoy, and Fool on!

— Jeff (TMFFischer)

Pro Trade Roundup

- **American Tower** : *Pro* purchased 600 shares (a 3% stake) at $83.96.

May 18 Option Expirations

- **CME Group**: A decision on our covered calls will be made this week.
- **CBOE VIX** (VIX): Our May spread is set to expire. We're considering a new one.

- **iShares Russell 2000 Index**: Same as immediately above.
- **Medtronic**: As has been the case, we plan to let some of our shares be sold via our covered calls, to reduce our position to around 3%.
- **OpenText** : We're rolling our May covered strangle higher and to a later expiration, as recommended last week.

Guidance Changes

- **3D Systems**: Our fair-value estimate and Consider Adding More prices both moved up $3, to $24 and $27 respectively. Shares remain on hold.

Roll Your Covered Strangle on OpenText

Published May 7, 2013 at 12:00AM

Is This Trade for You? This is for *Pro* members who have a May 2013 strangle on **OpenText** (NASDAQ: OTEX). Those with August 2013 options should wait until closer to August, when we'll provide guidance for those options. Those who only own the stock should continue owning it.

Trade Essentials

- **Company: OpenText** (NASDAQ: OTEX)
- **Recent Price (May 6 close):** $66.64 ($3.9 billion market value)
- **First Action:**Buy ("buy to close") all previously written May 2013 $60 calls. (We're letting our May 2013 $55 puts expire, but you can close them, too, if they're tying up cash.)
  - **Price Guidance:** Use a limit order, but pay the going price to close the May $60 calls, lately $7.10.
- **Second Action:** Using a strangle order, simultaneously sell ("sell to open") November 2013 $65 puts and November 2013 $70 calls**.**
  - **Price Guidance:** Lately, you can write this new strangle for a credit of $8.80 (exclusive of your cost to close the May calls). Check current prices and then use an appropriate limit order so you don't push them lower.
- **Allocation:** Sell one strangle for every 100 shares of OpenText you own. *Pro* is selling seven strangles on its 700 shares.
- **Alternative Trades:** If you don't own the stock yet, it remains a buy at a 2.9% allocation. If 100 shares is a 2.9% or smaller allocation for you, you can write this strangle after buying shares. Alternatively, you can also just write $65 puts to potentially buy cheaper, using puts that expire in June 2013 or later. Or you can own 2.9% to 5% in OpenText stock without using options on it.

What's New?

Feisty revenue growth from new customers has sent software purveyor OpenText's stock soaring, meaning we need to take action on the call portion of our May 2013 strangle in order to keep our shares. That strangle paid writers, including *Pro* members, about $5.50 originally. (Because *Pro* makes our transactions after we announce them to you, we earned less — $4.73.) So, the strangle allowed us upside until $64.73 per share, meaning it hasn't dampened our gains much compared to the recent share price. But because shares are priced at only 12.5 times free cash flow, and OpenText remains below our $70 fair-value estimate, it makes sense to roll the strangle to higher strike prices to keep our shares. In the process, we'll recapture more credit in the options and more upside in the stock. It's about that simple.

This was the third time we've written options on OpenText, and overall these positions have added meaningfully to our returns, as you'll see below. I knew each time that writing a strangle with covered calls striking *below* our fair-value estimate was a calculated risk — but because the options pay well, we can now roll higher without much difficulty.

Here's how the roll looks:

This Is How We Roll in MF *Pro*	**Price Per Share**
Credit received for writing May strangle	$4.73
Debit to close May $60 calls (with shares at $66.64)	($7.10)
Net debit to close ("What are ya doin' to us, Mr. Market!?")	($2.37)
New credit received for writing November 2013 $65/$70 strangle	$8.80
Total net credit from rolling to the November strangle	**$6.43**
New potential net sell price	$76.43
Potential net sell price improvement from roll	18% higher ($76.43 vs. $64.73)
New net potential second buy price	$58.57 (12.1% lower than recent price)
Earlier Option History	
Credits earned from our two earlier options strategies on OTEX	$6.03
Extra yield earned so far on stock price	9% ($6.03/$66.64)

Returns Times Two

We had two OpenText positions that expired in 2012, for a total earned credit of $6.03 per share. That means we earned an extra 9% on the stock's recent price while it went nowhere last year. This year, we're sitting on a 14.7% gain in the stock — exclusive of our latest strangle. This is a good example of the *Pro* way to use options: Last year, we were able to earn a healthy return while OpenText stagnated; this year, we're able to enjoy the stock's price appreciation and finesse our options as we need to.

Roll May Options Only

As mentioned in the yellow box atop this report, newer *Pro* members who were guided to use August 2013 options should wait until the time value in those options dissipates. We'll provide guidance on the August position later this summer. But our May options expire next week, so it's time we roll them. So ... giddy-up! Close those May calls and write a November strangle, using limit orders.

Next Steps

- Want to know more about covered strangles? We can tell you everything there is to know about covered strangles. (Well, we can come close.)
- If you have questions about strangles or your position in the stock, visit our OpenText board.

Our Machetes Are Sharp

Published May 6, 2013 at 12:00AM

Dear *Pro* Members:

For an image of what earnings season feels like for us every quarter, this is the best I can scavenge:

Image credit: 20th Century Fox, *The African Queen*

To be clear, we *love* the jungle. It's rich with resources, full of excitement, dripping with new things to discover and analyze. But staying healthy and alert in the heat of the moment requires vigilance and dexterity. Most *Pro* companies announce quarterly results within days of one another, and many stocks move dramatically on the news, pushing us to review results as soon as we responsibly can.

In the interest of continuing our earnings coverage and potential trade alerts, I'm going to keep this Memo brief. Consider it a five-second transmission from a shortwave radio somewhere deep in the Congo: "We're still here! We're making progress!" And that's equally true of our companies reporting — so far, none of them have lost their way.

Below is our earnings coverage so far this quarter. Click any company's name to read our take.

- **Apple** : The world's most talked-about company has seen its shares rebound on a higher dividend and a massive share buyback plan. The stock is a buy; we own 3.6%.
- **Gentex** : Performing well in a tough environment, Gentex remains a buy. We own a 3.3% stake.
- **GrafTech International** : Shares are a buy; we own a 2.1% position just waiting for a recovery in steel demand.
- **Intel** : Shares are up nicely this year, but they remain a buy. We have a 5.3% allocation.
- **OpenText** : This mid-sized software company made a rumble in the jungle with 13% license growth, and shares soared. The stock remains a buy, and we're looking to roll our covered options this month. Excluding puts, we own a 2.9% stake.
- **Pacer International** : Although it's on "hold" because the stock is so illiquid, Pacer's turnaround continues and our 1.8% position has been on the rise. The company's debt-free balance sheet, strong cash flow generation and managerial discipline give us confidence to wait for the turn.
- **Rockwood Holdings** : With a stock price that's a bit above fair value for a business that arguably doesn't deserve a giant premium, this one is on hold for now. We'll manage our covered calls and suggest newcomers consider writing puts (see Catch-Up Trades below). We have a 5.6% position.
- **Starbucks** : The coffee king's food opportunities look delicious. Even though the price has risen, the stock's a long-term buy. We have 3% and will look to add more on declines.
- **Tupperware** : Although growing sharply in emerging markets, Tupperware's stock looks a bit above fair value, so it's on hold for newcomers. We'll manage our options on it and will at times suggest newbies consider put-writing for establishing a position.

We're less than halfway through our trek into the earnings jungle, with many more *Pro* companies to cover, including **3D Systems**, **AIG**, **CME Group**, **Facebook**, **O'Reilly Automotive** … and the list goes on.

Our machetes are sharp, we have bug spray at the ready, and we're well-fed on cacao and coffee (don't ask how we're brewing it). So, you'll continue to hear from us all week on the boards! And in my downtime, at night by the campfire, I'll be reading Paul Theroux's latest book: "*The Last Train to Zona Verde*: *My Ultimate African Safari*."

Thank you for being a Fool member — Fool on!

— Jeff (TMFFischer)

Pro Trade Roundup

- **CME Group**: We sold to open 10 May 2013 $60 covered calls for $1.59 each.

Guidance Changes

- **Rockwood Holdings**: Fair value ticked up $1 to $59.
- **Tupperware**: Fair value and Consider Adding More both increased $3, to $71 and $63, respectively.

Catch-Up Trades

These are for members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Rockwood Holdings**: For those lacking a 5.6% position, sell to open August 2013 $60 puts aiming for a minimum of $2.20 each, for a 3.7% yield in just more than three months. Sell one put for every 100 shares you could buy.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Coverage & Community

- **Privacy Please: BMC Software** is reportedly selling itself to private equity for $46.25 per share. Opining on the pending sale, Jeff is happy with the gains *Pro* members have made.
- **TMF42:** Although he's much younger than the number in his moniker, we congratulate Bryan Hinmon on his promotion by The Motley Fool to Senior Analyst!
- **A *Pro* Award?** We like the idea proposed by ADrumlinDaisy. Chime in with your thoughts!
- **Life Is Good!** Is it time to pinch yourself? Jeff argues, "Why, yes; yes it is."
- **Invest in Europe?** MountainTom asks fellow members for thoughts on investing in the beautiful Old World.

Buy American Tower

Published May 6, 2013 at 12:00AM

Trade Essentials

- **Action:** Invest 3% of your funds in **American Tower** (NYSE: AMT)
- **Recent Price:** $82.80 ($32.7 billion market value)
- **Fair Value Estimate:** $100
- **Consider Adding More:** $64
- **Scorecard Status:** Buy
- **Dividend Yield:** 1.26%
- **Price Guidance:** When you're ready to buy, use a limit order to avoid pushing the stock price higher.
- **Alternate Trades:** None, but members who do not want to buy today can consider writing puts instead.

The Big Picture

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Internet traffic from mobile devices in 2012 was nearly 12 times *total* Internet traffic in 2000, and the average connection speed of a mobile device doubled from 2011 to 2012. According to Cisco, mobile data traffic will reach 11.2 exabytes per month by 2017. (An exabyte equals 1 million terabytes, which equals a *whole lot* of people "liking" baby photos on Facebook and uploading pictures of their dinner to Instagram.) That's a 66% compound annual growth rate — a 13-fold increase in just five years. As a U.S.-based communications site operator doing business worldwide, **American Tower** (NYSE: AMT) is positioned to profit from this trend.

The Business

AMT leases antenna space on nearly 55,000 cell sites to wireless service providers. Though most of those sites are towers, it also manages rooftop sites and distributed antenna system networks that provide coverage within malls and casinos. About 60% of its properties are located in 10 different countries outside the U.S., including India, Brazil, Germany, and Uganda, and the international percentage is growing quickly as AMT erects more towers.

Think of AMT as a multi-tenant apartment building that benefits from sweet lease agreements. Instead of families, the tenants are wireless service providers, and instead of rooms, they rent space to house communications equipment. And those sweet lease agreements? They're long-term and non-cancellable, and they have contractual annual price escalations (set at a fixed rate domestically, indexed to inflation internationally). On top of this recurring, escalating revenue, AMT benefits from high switching costs that keep tenants renewing at 98% to 99% annually. And nearly 80% of its current leases don't renew until 2022 or later.

As noted above, wireless data usage is growing exponentially, and tower operators benefit from the organic demand. AMT's customers are continually adding sites and upgrading antennas to improve their coverage or increase its density and capability, making the jump from 3G to 4G LTE to VoLTE (or, as in Africa, from voice to data) possible for *their* customers. And whenever a service provider upgrades its antenna, AMT increases the lease rate — on top of the scheduled price escalations.

Better yet, when AMT is able to add an additional carrier to an already leased tower (essentially just hanging more equipment on what's already there), the additional operating cost is minimal, so the incremental revenue quickly makes its way to cash flow. There are few technical limitations to multiple tenancy, but in practice, each tower can only have as many tenants as there are cellular carriers in the area. In most countries, that's a maximum of four, though actual penetration is currently about two per tower (2.6 in the U.S., 1.5 internationally). And because towers are long-lived assets made from galvanized steel and concrete, they cost little in annual maintenance capital expenditures (a measly $500 to $1,500 per site; Jeff spends more on birdseed every year).

American Tower faces two primary competitors in the wireless infrastructure space: **Crown Castle International** (NYSE: CCI) and **SBA Communications** (NASDAQ: SBAC). CCI, AMT's biggest competitor by market cap and tower base, is focused predominantly on the domestic market, deriving 94% of its consolidated net revenue from its U.S. operations in 2012. SBA Communications is the smallest major player here; it's focused on investing heavily in growing its tower base, both domestically and abroad. Both competitors use more leverage and have lower margins than AMT.

Management

CEO Jim Taiclet began serving as COO in 2001 and transitioned to his current role in 2003. Shareholders have benefited tremendously during his tenure, with shares gaining more than 1,100% in those 10 years. Along with CFO Tom Bartlett, who spent nearly 25 years at Verizon, Taiclet is focused on allocating capital in three ways: building new sites and upgrading existing sites (this offers the highest return); acquiring communication sites (the fastest way to grow); and maintaining sufficient capital to pay the REIT distribution, with excess cash directed toward repurchasing shares.

Financials and Valuation

AMT's revenue rose by 17.7% year over year in 2012; the international division was up 34%, well outpacing the domestic side. We expect revenue to double in the next five years through a combination of price escalations, new towers, and upgrades. After its recent conversion into an REIT, AMT is required to pay out 90% of taxable income to shareholders. It currently distributes $1.04 annually, a 1.3% yield, and management expects to grow the dividend 20% annually for the next five years.

Importantly, only the U.S. portion of the business is organized as a REIT – the international business is a taxable REIT subsidiary (TRS). A TRS isn't required to distribute its net income to the parent REIT, and it's free to reinvest to grow its business; we think that's a good thing in this case because we're less likely to be subjected to frequent capital raises. (REITs can't retain earnings, so they often invest in the business by issuing shares.)

As the TRS grows, we expect AMT to fold portions of it into the parent REIT as reinvestment prospects dim or tax benefits look appealing. In the meantime, if AMT continues to add tenants to its towers (which takes little capital, compared with building new ones), returns on capital will improve. Management also reduces taxable income though the use of net operating losses. And because the useful life of its tower properties exceeds the depreciation schedule, AMT uses a depreciation shield, which reduces taxable income and understates the values of some assets on the balance sheet. All of this is to say that typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

Ignoring the multiples altogether and discounting future cash flows instead, we value AMT at about $100 a share. Today's price provides an acceptable margin of safety for a business of this caliber. This is a great high-margin, recurring-revenue business — one that's able to reinvest at good rates in quickly growing markets — offered at an attractive price.

Risks and What Would Make Us Sell

Telecommunications is a capital-intensive business in which scale matters, so there are usually only a few competitors in each market. This limits AMT's potential customer base: Its largest 15 customers make up 80% of revenue. Over time, some of its customers may undergo mergers, and others — like Sprint and a handful of international tenants — aren't investment-grade credit risks. In either case, coverage redundancies or temporarily tenantless towers could affect profitability. Given the spectacular growth in foreign markets, though, it's likely that these occurrences (should they occur) would be only temporary setbacks. We're also keeping an eye on potential technological disruptions like mini cell phone towers and femtocells, both of which can be used to fill in coverage holes. If any of these threaten to permanently impair AMT's earnings power, we will sell.

The economics of the business are such that each incremental tenant added at very low cost will greatly increase per-tower returns, so we're not likely to sell the second the stock hits our estimate of fair value. Unless other portfolio considerations demand otherwise, we expect to own AMT for many years to come.

The *Pro* Bottom Line

We're buying the best and largest global tower operator, a business with excellent returns on incremental capital that serves a rapidly growing worldwide industry. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network.

Our Machetes Are Sharp

Published May 6, 2013 at 12:00AM

Dear *Pro* Members:

For an image of what earnings season feels like for us every quarter, this is the best I can scavenge:

Image credit: 20th Century Fox, *The African Queen*

To be clear, we *love* the jungle. It's rich with resources, full of excitement, dripping with new things to discover and analyze. But staying healthy and alert in the heat of the moment requires vigilance and dexterity. Most *Pro* companies announce quarterly results within days of one another, and many stocks move dramatically on the news, pushing us to review results as soon as we responsibly can.

In the interest of continuing our earnings coverage and potential trade alerts, I'm going to keep this Memo brief. Consider it a five-second transmission from a shortwave radio somewhere deep in the Congo: "We're still here! We're making progress!" And that's equally true of our companies reporting — so far, none of them have lost their way.

Below is our earnings coverage so far this quarter. Click any company's name to read our take.

- **Apple** : The world's most talked-about company has seen its shares rebound on a higher dividend and a massive share buyback plan. The stock is a buy; we own 3.6%.
- **Gentex** : Performing well in a tough environment, Gentex remains a buy. We own a 3.3% stake.
- **GrafTech International** : Shares are a buy; we own a 2.1% position just waiting for a recovery in steel demand.
- **Intel** : Shares are up nicely this year, but they remain a buy. We have a 5.3% allocation.
- **OpenText** : This mid-sized software company made a rumble in the jungle with 13% license growth, and shares soared. The stock remains a buy, and we're looking to roll our covered options this month. Excluding puts, we own a 2.9% stake.
- **Pacer International** : Although it's on "hold" because the stock is so illiquid, Pacer's turnaround continues and our 1.8% position has been on the rise. The company's debt-free balance sheet, strong cash flow generation and managerial discipline give us confidence to wait for the turn.
- **Rockwood Holdings** : With a stock price that's a bit above fair value for a business that arguably doesn't deserve a giant premium, this one is on hold for now. We'll manage our covered calls and suggest newcomers consider writing puts (see Catch-Up Trades below). We have a 5.6% position.
- **Starbucks** : The coffee king's food opportunities look delicious. Even though the price has risen, the stock's a long-term buy. We have 3% and will look to add more on declines.
- **Tupperware** : Although growing sharply in emerging markets, Tupperware's stock looks a bit above fair value, so it's on hold for newcomers. We'll manage our options on it and will at times suggest newbies consider put-writing for establishing a position.

We're less than halfway through our trek into the earnings jungle, with many more *Pro* companies to cover, including **3D Systems**, **AIG**, **CME Group**, **Facebook**, **O'Reilly Automotive** … and the list goes on.

Our machetes are sharp, we have bug spray at the ready, and we're well-fed on cacao and coffee (don't ask how we're brewing it). So, you'll continue to hear from us all week on the boards! And in my downtime, at night by the campfire, I'll be reading Paul Theroux's latest book: "*The Last Train to Zona Verde*: *My Ultimate African Safari*."

Stop and Smell the Half-Smoke

Published Apr 29, 2013 at 12:00AM

Fellow Fools,

Live From Omaha!

We're sending a team of Fools to cover the year's biggest investing event — the Berkshire Hathaway annual meeting! Follow our exclusive, real-time coverage all week at berkshire.fool.com.

I have some friends who dislike their jobs. In fact, they spend the bulk of each weekend worrying about Monday morning. At a baseball game recently, on one of those spring afternoons with weather so perfect it makes every color seem crisper and more vivid, I found myself square in the middle of one of these conversations, playing the role of listener and optimist. Aided by a full mouth — complements of D.C.'s hometown food, a half-smoke, from the legendary Ben's Chili Bowl — I took in the rant for almost a full inning before interjecting: "Hey, take a deep breath. Stop and smell the half-smoke."

Step 1: Stop

As I write this, we're less than 1% away from the market's all-time intraday high — yet again. On the cusp of May, we're staring at a sixth straight month of gains, and the market has surged almost 11% this year. But there always seems to be something to complain about: Headlines continue to lament that stocks aren't cheap and earnings are disappointing. Before we succumb to the negativity, let's take a moment to ask what each of these claims really mean.

- **Stocks aren't cheap.** Investment theory holds that, if the market is basically fairly valued, stocks should deliver total returns that compensate for their inherent riskiness. Without getting too far into the weeds, this generally means about 10% — so there are definitely worse places to invest than a fairly valued market. (The degree to which the market is overvalued eats away at that expected return, so guarding against owning overvalued assets is key.)
- **Earnings are disappointing**. Investment theory also holds that the value of an asset equals the present value of all its future cash flows. For stocks, which are generally thought of as assets with an indefinite lifespan, this means a quarterly disappointment today should have little impact on value — plus or minus 1%, perhaps. What really matters, of course, is what the current earnings suggest about the *future* earnings, which account for 99% of value.

At *Pro* (hedges aside), we don't care all that much about the overall market valuation or general earnings performance in the short term — we care about the valuation and performance of the *Pro* portfolio over time. With that perspective, let's take a whiff.

Step 2: Smell

We can get a ballpark estimate of the valuation of each *Pro* company by examining its weighted market-to-fair-value ratio. For example, *Pro* owns 2,400 shares of **Oracle**, valued by the market at $77,674 ($32.36 per share, last Friday's close). However, because our fair-value estimate is $35.50 per share, we think those shares are worth $85,200 — giving Oracle a market-to-fair-value ratio of 91%. From today forward, we believe Oracle should earn a return commensurate to its risk (about 10%), plus a little more to make up for the current valuation discount. Here's a quick look at the *Pro* holdings on each end of the spectrum:

3 Lowest Market-to-Fair-Value Ratios	
Apple	0.63
Pacer International	0.70
GrafTech International	0.72
3 Highest Market-to-Fair-Value Ratios	
3D Systems	1.50
Papa John's International	1.44
Starbucks	1.09

Source: *Pro* estimates.

We can look across the entire *Pro* portfolio to get a sense of over- or under-valuation (always keeping in mind that a fair-value estimate is really a range of values, not a precise number). Looking only at our long positions, which have clearly marked fair-value estimates, and adjusting for positions that are neutralized via in-the-money covered calls, the *Pro* portfolio has a weighted market-to-fair-value ratio of 94%. Of course, all else equal, we'd like that margin of safety to be a bit larger, but it does suggest that we think the average *Pro* holding is modestly undervalued, giving it enough juice to achieve North Star-like returns.

As for earnings, you can read our thoughts on Oracle, **Intel**, and **Gentex** so far, with many more on the way. As always, we assess current business performance with respect to long-term future prospects; more earnings updates are on the way.

The *Pro* Bottom Line

It's easy to get so caught up in the bad stuff that we lose perspective and fail to live in the moment. On the whole, *Pro*'s long holdings are superior, undervalued businesses that should grow their value over time; to provide a little more cushion, our net exposure to the market is only about 70%, and we focus on the long-term implications of earnings results. We should enjoy this rising market because we're well-positioned with the right perspective — the "weather" in our portfolio is gorgeous, and the colors are crisp and vivid. And we're also prepared to take advantage of any storms in the form of a market decline, with cash, hedges, and a list of stocks we're ready to buy when the moment is right. The next time you're in D.C., treat yourself to a "half-smoke all the way" from Ben's Chili Bowl, and enjoy the sweet taste of investing the *Pro* way.

Onward,

Bryan (TMF42)

Audio Extra: Why O'Reilly?

Published Apr 23, 2013 at 12:00AM

In today's Audio Extra, Jeff and Bryan discuss *Pro*'s emost recent recommendation, **O'Reilly Automotive**, including why they think management is a competitive advantage, what distinguishes O'Reilly from competitors like AutoZone, and what's in store for the company's future. Listen in below (or read the transcript), then bring questions and comments to our O'Reilly discussion board!

R0bmg0YjrRi08JBMAMwfZLimPSanF64H

Transcript

Bryan Hinmon: Hey there, Fools, thanks for joining us for this edition of *Pro* Audio Extra. I'm Bryan Hinmon joined here with the man, the myth, the legend, lead advisor Jeff Fischer.

Jeff Fischer: Hey, Bryan; good to see you. That was an overly-generous introduction from TMF42.

Bryan Hinmon: You've got to give the people what they want, Jeff. So Fools, we're here today to talk about *Pro*'s most recent recommendation, **O'Reilly**, and Jeff, since O'Reilly is your baby, you're on the hot seat today.

Jeff Fischer: Um-hmm, I'm used to that.

Bryan Hinmon: Well let's dive right into things. Please read the write-up, Fools, if you haven't already, but essentially O'Reilly Automotive, when we boil it all down to it, is a retailer that sells stuff for cars and it competes on some level with Wal-Mart, Amazon and is sort of kissing cousins to some well-known players like …

Jeff Fischer: Nice image, Bryan.

Bryan Hinmon: *(Laughs)* AutoZone, Advance Auto and others, so Jeff, what is O'Reilly's special sauce? What makes them different?

Jeff Fischer: Great question, Bryan. In this highly competitive retail world of ours, ORLY is the ticker and I like it; it's just kind of fun to say "ORLY". But O'Reilly, there are basically four things that make it really different, and the first is what it sells and where it's located.

Now with car parts, it's frequently the case that you want the part right away. You're in the middle of a job; you realize you need an extra part that you didn't know you needed, as Nick Crow, TMFCrow will tell us.

Bryan Hinmon: I bet if you look in their cash register, half of the dollar bills have grease on them.

Jeff Fischer: *(Laughing)* You're probably right. So they're really trying to move toward credit, which helps MasterCard. So what it sells is mostly an on-demand item in many cases, and then where it's located is key. You're going to run to the shop that's nearest you, so O'Reilly locates its locations very carefully, places its locations very carefully where they will have attractive traffic.

Second, they then overlay it with a two-tiered distribution network where they have distribution centers that serve a block of stores. That allows the company to effectively stock about 142,000 units per store. Now they're not all in that store, but they're in a distribution center that's close enough that they can get you a part that day or the very next day in the vast majority of the cases. And these are many parts, Bryan, that other retailers don't carry. O'Reilly's able to carry a lot of hard-to-find parts. So that's two, what it sells, where it's located and how they get you the parts that others don't have.

A third advantage they have is they have a dual customer base. The company serves equally just your average retail customer like me or you, and the professional jobber market, as it's called, all the professional mechanics out there, so their sales have historically been split 50-50 between these two and the jobber market is, as you would image, the more lucrative, higher margin, usually bigger job ticket sales that the company enjoys. But that they're able to serve both customers from the same store really helps them, enables them, to put stores into smaller markets where big chains normally don't go. So they have that location advantage as well.

Fourth, and O'Reilly would probably put this first, is the company's customer service. Now that's pretty boring. Your eyes are probably rolled back. So many companies claim that to be a competitive advantage, whether you're Amazon or at one point even Best Buy, but I think in this case it really is for O'Reilly.

They've always cared about it since they came public in '93. You read their first annual reports; it was front and center on their minds. They invest heavily in their employees so that their employees can answer questions because again, most customers come in with a question about a tool or a part, how to do it, so they help them solve their; they help their customers solve their problems. And retention at this company is stellar, as the report touched on. Much of management has been there for a lifetime, and that success builds on itself.

Bryan Hinmon: So Jeff, I think most investors are very skeptical when they hear "management" as a source of competitive advantage, and honestly I think they're right to be. What we need to remember is it's the exception, not the rule, because we have a very similar line of thinking with The Buckle, right? Usually it's not a source of competitive advantage until you see it across a 20-year track record of incredible operating history.

Jeff Fischer: Right, and then the company really stands out from all the others. I looked, of course, at O'Reilly's competitors and didn't see enough there to want to buy them. I am not the type of guy who gets excited about an auto parts retailer by any means, but this one really, obviously, interested me enough to buy it.

Bryan Hinmon: Great. Let's give the viewer something special here. Can you tell me something that you learned that didn't make it into the "Tremo" as we're calling it, the trade/memo?

Jeff Fischer: I hope members like that. We may do it more, where the trade went out right before the Monday Memo, and then the Monday Memo shared more about the position. One thing I learned, Bryan, that I didn't work into the report was really all about the historical valuation of this company, which is to say that over even the last ten years, it has typically traded at higher multiples than it does right now.

Even during periods where it was not growing as quickly, and that I found very encouraging. Its average basically an enterprise value to EBIDTA multiple of around 9 to all the way up to almost 15, 14, 15, and right now it's around 10.5. And so it's below its long-term average, which is right around 12, even though it's really grown sharply in the past four years, past five years, more than 20% annualized EPS growth. They're accelerating their store growth right now, growing store count more quickly than they have in every recent year. So in this market, I was really encouraged to find it trading at that price.

Bryan Hinmon: Great, let's switch gears here and talk about acquisitions. So a few years back, ORLY made a huge acquisition, its largest ever, acquiring CSK Auto. So it's been a few years now since they've had CSK under their belt. Can you assess for us how you think management did with integration and how has their strategic intent played out? Looking back with a few years under its belt, was this a good decision?

Jeff Fischer: Sure, Bryan. So first of all, it's a much better name, isn't it? "O'Reilly" is a lot more fun than "CSK". So O'Reilly acquired CSK in 2008, is when they announced in April, I think April 1st, 2008, that they were going to acquire them for $500 million in cash and stock, plus an additional $500 million in debt that it was taking on from the company, so it was about a…

Bryan Hinmon: It was a big acquisition.

Jeff Fischer: A $1 billion acquisition. For a company at the time, that was a fraction of its $11 billion market cap today.

Bryan Hinmon: Yeah, I think CSK had a thousand or so stores.

Jeff Fischer: It had 1,349 stores.

Bryan Hinmon: Jeff Fischer with the stats.

Jeff Fischer: But okay, so O'Reilly mainly paid for this acquisition with stock, and when the stock was around mid-20s per share, and it acquired more than 1,300 stores, including the Checker Auto Parts brand in 22 states, but why it made sense for O'Reilly was CSK was mainly in the west, and O'Reilly was mostly in the mid-west and southeast, so it quickly helped O'Reilly leap into a national footprint, which then let it expand and continued to expand into these new markets that have picked up. Because as we talked about earlier, it has a hub strategy, hub and spoke, I guess you could say, where once it puts in a distribution center, it surrounds it by stores and then grows outward from there, as many retailers do, but they do a very good job of it.

So it helped it expand quickly and little did they know that the financial world was about to blow up months later, which actually helped sales increase, auto parts sales for used cars really did well from the end of 2008 until now.

Bryan Hinmon: They held up really well.

Jeff Fischer: Held up well and grew as people put off buying a new car. And at the time, too, CSK had had some internal fraud in the mid-2000; they had some bad apples in management, so they were looking for a fresh start. Everything had been cleared up, bad management was gone, but they needed a fresh start and someone would have bought them if it wasn't O'Reilly, and I think O'Reilly did a good job and didn't pay a rich price as a result of the recent black eye.

So I think all in all, it was a good acquisition, and since then O'Reilly has continued its streak of record sales and earnings each year. The acquisition did add to earnings. They have been able to lower the cost of the stores that they acquired to make them more efficient.

Bryan Hinmon: A sign of good management.

Jeff Fischer: And continue their dual-customer strategy, which they really brought into these stores. So I think overall, it's gone well.

Bryan Hinmon: Yeah, I always question the use of stock, but it really seems like this acquisition was a pretty good one for O'Reilly.

Jeff Fischer: Yeah, especially if the stock had gone down afterwards. You'd say, Oh, good way to spend some stock. Well with stock up so much, it has to be a really good acquisition to justify itself, and I think it has been.

Bryan Hinmon: So Jeff, look into the future for me and what do you think ORLY can look like in ten years?

Jeff Fischer: I'm really hoping they'll branch into ice cream sales. So Bryan, this is what we do, as you know, with our discounted cash flow models when we try to model out how a company's going to look in 10, 20 years. You did it with the buckle, Starbucks, so we do it with all our companies.

With O'Reilly, I estimate that organically, they could have about 5,500 stores in ten years, up from about 4,000 today. So that's about 38% more stores, and that comes to around 3% store growth per year.

Bryan Hinmon: That's really not all that much.

Jeff Fischer: That's not much; it's conservative, I hope. They're growing closer to 5% right now, and keep in mind, this does not take into account any acquisitions that they may make, and I think they'll make some significant ones. As the report shared, it's still a highly-fragmented industry. There are a lot of little individual shops, but better than that for O'Reilly, a lot of small chains of dozens of stores.

Bryan Hinmon: Yeah, I urge any inquisitive *Pro* Fools to go to the O'Reilly investor relations website. They have a bunch of investor presentations there that really outline pretty well the state of the industry, so definitely worth looking into.

Jeff Fischer: That's very true, Bryan. They really organized things well, which is interesting and a whole other topic. Sometimes when you find companies that present their history and their current business success or outlook extremely clearly and have it very well organized, it reflects on how well organized they are in their lives and running the business. But as you just said, O'Reilly has a great investor relations page, so check it out.

So they're growing stores about almost 5% this year is the plan, and over the next ten years, I think around 2.8 to 3% annualized is possible. Add in same-store sales growth, which has been positive every year the past 20 years now.

Bryan Hinmon: It's remarkable.

Jeff Fischer: There will be some slip at some point, and we'll probably be right there in the middle of it, but it'll happen at some point, but I still think they will grow same-store sales low single-digits on average over time. And if you add that all together, and we're looking at around 10% or better annualized returns the next ten years.

Bryan Hinmon: That's great. Well enough rah-rah and patting ORLY on the back, Jeff. Let's turn pessimistic here. Tell me something that you don't like about the company or something that you have your eye on or the key risk. Give me something on the flipside here.

Jeff Fischer: I will go right to the biggest thing that jumps to mind and that is the way cars keep getting better and better and need less and less work. Now that said, when you sell your old car, rarely do you trash it. Someone else takes it and keeps driving it. I just sold a '91 and it's back on the road after someone put a lot of parts into it, so there is that silver lining. But still, cars get more and more reliable, and in the long-term, you would think that would have some influence on used car part business.

Number two, of course is online sales. Car parts, not too unlike books, have all the makings of being the perfect thing to sell online, assuming you don't need it immediately. But even if you need it quickly, nowadays there is same-day delivery becoming more possible or next-day delivery, of course. But it's very easy to categorize car parts online, find what you need, and move on, assuming you know what you need. So they have to keep their eye on online competitors, and they do have an online business, and the good thing is the jobbers, the pros in this business, know to go there to find a part because they know O'Reilly to begin with.

Bryan Hinmon: Great. All right, Jeff, so step back a little bit and tell me about O'Reilly in the context of the *Pro* Portfolio. why is it a good addition to what we already have, and you spell it out pretty well how you think it's going to achieve North Star returns, but tell me how it fits in in general.

Jeff Fischer: All right, Bryan. So one thing I was happy to find in this company is that it has somewhat of a defensive stance. We're all still concerned that the so-called recovery we've had has been largely driven by stimulus and may not be as sustainable as we'd hope, and there may be another shoe to drop. And that's part human nature, to still be concerned after you saw something like 2008-2009, but it's also reality that we haven't really solved our growing deficit problems, let alone our unemployment problems and others.

So if the economy does get worse, we can expect O'Reilly's business to initially weaken, sure, it's a retailer. But in the long run, benefit by more used cars on the road, so there is that defensive nature to it, which I really liked putting it into the portfolio in the context of stocks have been up so much lately, it's hard to find a defensive, reasonably priced company that's also growing more than 20% a year. So it had all those kind of "needs", for lack of a better word, qualities to it.

And it fits in the Monday Memo last week, on April 15th, tax day; we issued this on tax day. The Monday Memo on that day talked a little bit about this, how this historically is a very low beta, low volatility stock, 33% as volatile as the S&P 500, so it will have its big up and down days, of course, but over time it has been much,

much more stable than the market and we like that defensive nature as well. And yet despite being so non-volatile, it has done very well the past five and ten years.

Bryan Hinmon: Great. All right, Jeff, well I have one more question for you, and this is a question that all of our members really would be disappointed if I didn't ask.

Jeff Fischer: I reserve the right to not answer.

Bryan Hinmon: So since O'Reilly has found its way into our portfolio, there have been plenty of discussions on our boards about you and the cars that you love. And it turns out that you have a little bit of a Magnum, P.I. thing. And so I think the question, the direction I want to go with this is will you grow out a Magnum, P.I. moustache and let us post it on the *Pro* site?

Jeff Fischer: *(Laughing)* Oh, I think I need to lose some bet and then I will do it. I won't do it just for the sake of…

Bryan Hinmon: So you're putting the ball back in my court to come up with a bet that you are a surefire loser too?

Jeff Fischer: I'll choose my bets carefully, but it's true, I grew up in the eighties. I was a teenager when Magnum, P.I. had its heyday. And what teenage guy doesn't like the idea of living on an estate in Hawaii, on the ocean, no real responsibilities. I don't even think Magnum paid rent. Just guarded the place and drove a Ferrari free of charge. I'm still aspiring to it, much to my wife's disappointment.

Bryan Hinmon: All right, Fools, that's all we've got for you. Thanks for joining us on this *Pro* Audio Extra. Thanks for tuning in. I'm Bryan Hinmon, speaking for Magnum Fischer. Fool On.

Jeff Fischer: Thank you, Bryan.

The Best of Pro's Early Years

Published Apr 22, 2013 at 12:00AM

Fellow Fool,

As we hope you've noticed, the *Pro* team is always striving to improve our investing process and outcomes. But you may not realize that we're also continually working to better our "on-boarding" process for the new members we welcome every few months. For our most recent reopen in February, we used "Catch-Up Reports" to get members up to speed and invested with *Pro*; these reports detailed our up-to-date investing thesis for each stock and provided instructions on how to implement each trade. We think this iteration of the new-member process is our best yet, but we're still working on ways to improve it for next time. (In fact, thanks to your suggestions, we even made some improvements during the process this time.)

As I considered topics for this week's Memo, though, it occurred to me that there's one thing we *don't* currently do for new members: introduce them to the history of *Pro* through some of our best Memos from the past. Every family has its story that forms a fabric of common experience, and the *Pro* family is no different. In that vein, I offer this Memo to provide some historical context for our new members and a bit of nostalgia for our charter members.

2008: Building a Foundation

- Here and Now: Jeff looks forward into great uncertainty and discusses the folly of calling a bottom, yet makes a couple of prognostications anyway. This memo starts to detail the bedrock of *Pro* investing — absolute returns. The sharing of stock and ETF screens was typical during our early Memos, when the portfolio was still in its infancy.
- Swami Says ...: In its early days, *Pro* used CAPS to leverage the insights of crowd-sourced investment research. This memo captures the way Jeff and former *Pro* Fool Todd Wenning were looking at the market, and the way they leaned on a community of CAPS All-Stars to help them keep a measured pace — unlike many investors at that time, who assumed the market had already permanently bounced off the bottom.

2009: Hitting Our Stride

- Getting Through a Deep, Dark Wood: What's Jeff like under pressure? In a word: mercurial. If I could have a *few* words, I'd say "mercurial with measured optimism" — it's a rare trait. But don't let me be the judge; read this Memo, in which Jeff is at his most introspective. Leading right into the market abyss of early 2009, he muses on the dire state of everything and offers a glimmer of hope through the eyes of a little boy.
- *Pro* Makes a Buffett Move: It's always fun to look back to see when — and why — you bought your most successful investment. In this Memo, Jeff makes like Buffett and talks about buying **AmTrust Financial Services**.
- Mr. Market's Merry-Go-Round: Five months into 2009, the market had fallen 25% and rallied 33%. In the midst of the whirlwind, Jeff gave advice on how to think about market rallies (and how to control your emotions); some things never change. Remember, no one ever knows when the market has bottomed; Jeff's measured approach and detailed plan in this Memo speak well for early *Pro*.
- An Artificially Sweetened Market: Macroeconomic concerns were clearly in focus during 2009, and they were a frequent topic for *Pro*. In this memo, Todd captures many of the concerns surrounding stimulus efforts and how they might affect the economy and *Pro*: Would any of it last?
- A Surprising Short Story: Shorting has its own set of challenges; this memo, more than any other, should help members appreciate *Pro*'s measured, cautious approach to short positions. In it, Jeff discusses what could have been had he shorted 10 weak companies in the fall of 2008.
- So Long to a Down Decade: Jeff always says he dislikes making predictions, but with a little taunting, he's usually game to share one. At the end of 2009, he was goosed into sharing his predictions for 2010. Take look to see how clear (or murky) his crystal ball was.

2010: A Year of Growth

- Don't Sleep on Rising Interest Rates: Ten months into a stock-market recovery, the bond market and interest rates were hot topics, and "quantitative easing" was now a household term. Experts and talking heads (and regular people) were still debating whether stimulus plans would ultimately be inflationary or deflationary; Todd detailed how *Pro*'s holdings would likely fare in this environment.
- Time to Get Active With *Pro*: This Memo marks an interesting inflection point in *Pro*'s history. Stock-picking is one of the skills necessary to manage a portfolio, but it's not the only one; at this juncture, the *Pro* portfolio was now invested enough that Jeff was anticipating the need to sell fairly valued stocks to buy cheaper ones. This marks the end of *Pro*'s honeymoon period.
- How Europe Can Help America: As cracks began to appear in Europe's economic foundations, Jeff taught members how to focus on cash — and how a weak Europe might actually benefit U.S. investors.
- Why Investing Requires Uncertainty: Jeff salutes our members for being part of a small group of investors who actually stayed the course and remained invested through a historically uncertain period in investing history. Uncertainty certainly can benefit investors.
- *Pro*'s Keys to Great Investing: *Pro*'s portfolio was growing, and the team was growing with it. In this Memo, each member shared their top three qualities that make a good investor. This is timeless advice.

- The Dollar's Death ...: As measured by email and discussion-board posts, this Memo was the most controversial in *Pro*'s early history. Discussed within are quantitative easing, inflation, and the end of the U.S. dollar (or not), as well as why fears of hyperinflation are just that: fear.
- What Would Ben Graham Think of *Pro*?: The father of value investing wished to do something foolish, something creative, and something generous every day. So it seems safe to say that Graham was a very Foolish man indeed. But what would he think of *Pro*?
- *Pro* Looks Back — and Forward: In the last memo of 2010, Jeff detailed *Pro*'s overall investing results to date, providing a snapshot of a portfolio still chock-full of many of the original picks. He looked forward to 2011 feeling less guarded and more invested.

The *Pro* Bottom Line

Looking back on our great decisions — and analyzing our mistakes — is fodder for continued improvement and a sense of community. Especially for new members, a look back at *Pro*'s early years during a tumultuous market provides insight into *Pro* investing at its best.

Though I tried to highlight the best Memos from 2008 through 2010 to capture the spirit of the time, I've probably missed one of your favorites. If so, please post a link and give us your take on our Memo Musings board.

Pro Trade Roundup

- Bought 500 shares of **O'Reilly Automotive** at an average price of $99.42.
- Wrote 14 contracts of August 2013 $60 covered calls on **Rockwood** for $4.59 per share.

Buy O'Reilly Automotive

Published Apr 15, 2013 at 12:00AM

Trade Essentials

- **Action:** Buy **O'Reilly Automotive** (NASDAQ: ORLY)
- **Scorecard Status:** Buy First
- **Allocation:** 3%
- **Recent Price:** $100
- **Fair Value Estimate:** $114
- **5-Year Estimated Return:** 11% annualized
- **Consider Adding More:** $90
- **Dividend:** None
- **Options:** We may use them eventually, but options aren't necessary.
- **Price Guidance:** When you're ready to buy, use a limit order to avoid pushing the stock price higher.

What It Does

O'Reilly Automotive (NASDAQ: ORLY) is America's second-largest auto parts retailer, with more than 4,000 stores, one-quarter of them in California and Texas. Auto parts are a big business, estimated at $231 billion, and O'Reilly is an exceptional competitor, with an addressable market size of about $131 billion.

Running 24 regional distribution centers and 240 hub stores as part of a two-tiered distribution strategy, the company provides same-day or overnight availability on more than 142,000 items, including many its competitors don't usually stock. Basic auto parts, tools, and services complement those hard-to-find treasures. As a result, O'Reilly's sales are historically split between "do it yourself" retail customers and more lucrative professional services customers (such as auto repair shops), a luxury many competitors don't enjoy.

Personalized customer service by long-tenured store managers paves the way for continued success. More than 800 managers have worked an average of 13 to 18 years with the company, showing how O'Reilly is accomplishing its mission:

O'Reilly Automotive intends to be the dominant supplier of auto parts in our market areas by offering our retail customers, professional installers, and jobbers the best combination of price and quality provided with the highest possible service level.

In order to accomplish this mission, O'Reilly will provide a benefit and compensation plan that will attract and keep the kind of people that will enable the company to reach its goals of growth and success.

Rarely does a mission statement cite compensation and benefits for employees, but this focus seems right on the money. And it's working.

How It's Doing

Tenured employees share a common history and learn to improve a business in a consistent fashion. Since going public in 1993, O'Reilly has achieved 20 consecutive years of record revenue and operating earnings and has grown same-store sales every single year. Diluted net earnings per share have jumped more than 20% annually over the past decade, and over the last four years, with 25% growth in 2012. All signs point to more growth ahead.

O'Reilly plans to open 190 net new stores in 2013, growing its 2012 year-end store count by 4.8%, and same-store sales are expected to increase 3% to 5%. By clustering stores together, O'Reilly is able to rapidly achieve economies of scale, and by serving professionals and retail customers, it's able to enter smaller markets where competitors don't often tread. There's also no shortage of independent stores or chains to acquire in this highly fragmented industry. In 2012, O'Reilly acquired 56 locations on top of opening 180 net new stores.

O'Reilly has steadily improved profitability, generated strong free cash flow, and maintained a healthy balance sheet while growing. Rewarding this consistent growth, the stock is a steady and top performer the past five and 10 years. Here's the company's vital top line:

Metric	2009	2010	2011	2012
Revenue	$4,847	$5,397	$5,789	$6,182
Gross Margin	48%	48.6%	49%	50.1%
Operating Income	$538	$734	$865	$978

Dollars in millions.

Factors to Watch

Along with strong management, key factors driving O'Reilly's business include the average age and number of cars on the road; the number of miles Americans drive; the economy; and the severity of weather.

Older cars require more maintenance. The average car in America was 10.8 years old in 2011, near a record high. The number of registered cars in the United States increased 15% in the past decade, but the number of total miles driven is slightly lower since 2007 because of a smaller workforce and higher gas prices. When the economy is weak, more people delay repairs if they're able to (though of course many more fixes are unavoidable). Finally, severe weather (hot or cold) leads to more wear and tear on cars.

Ultimately, a weak economy may slow sales, but it also results in more old cars on the road for future business. And that's a blessing in disguise for O'Reilly, because new cars are more reliable than ever.

Next Steps

Pro will invest with a 3% allocation in the next 1 to 30 days. The company reports earnings on April 24; you can choose to buy before that date or after. We don't have a strong opinion, because we hope to own the stock for three to five years to earn our desired compounded return. We'll discuss how this investment fits into our portfolio in today's Monday Memo, issued at 4 p.m. ET. To ask questions, visit our new O'Reilly Automotive discussion board. And think green!

Green Lights for O'Reilly Automotive

Published Apr 15, 2013 at 12:00AM

Dear *Pro* Member:

Today's recommendation to add **O'Reilly Automotive** to the *Pro* portfolio doesn't just bring an aftermarket auto-parts retailer into the fold. It brings us a stock that historically has low volatility with very strong returns.

With a beta of just 0.33, O'Reilly shares have been one-third as volatile as the S&P 500, and yet they're up more than 625% over the past 10 years. That handily tops the results of O'Reilly's largest competitor, **AutoZone**, beats other fast-growing retailers like **Panera Bread**, and clobbers any market index you care to measure — including our own North Star. That last, of course, is what's important to us; I believe O'Reilly can return north of 10% annualized in coming years, matching or topping our always-positive North Star.

How It Fits

The retail sector drives the majority of the U.S. economy, but it's highly competitive. The *Pro* portfolio is invested lightly in retail (stalwart **Starbucks** and steady-handed denim darling **The Buckle** are about it). I think we've found another retailer worth owning in O'Reilly. Though they're not as physically addictive as caffeine, cars are an integral part of Americans' lives, and most of them need repairs — small or large — every year.

That alone wouldn't be enough to lead me to buy an auto-parts retailer, though. I'm leery of retail overall, because customers are fickle and margins are usually low. But O'Reilly's 20-year operating history as a public company points to remarkable, and ever-improving, execution. The company is the Ferrari of retail operators, boasting record sales and operating earnings — and growing same-store sales — every year for the past two decades. It's leveraging its experience and strong free cash flow to open more new stores this year than in each of the last several. Ultimately, if it wishes to, I believe O'Reilly could become the country's largest and most profitable auto-parts seller, someday dethroning AutoZone.

O'Reilly's ability to serve two sets of buyers (consumers and professionals) within the same store allows it to enter smaller markets, those typically not served by large chains, and still generate strong profits per square foot. Meanwhile, its historic ability to pass along price increases to at least keep up with inflation is an important defense.

What It Allows

Bringing a stock with low historical volatility into the portfolio provides potential balance against a stock that's more volatile, too, should we want it. And O'Reilly has passed our safety inspection; at 10.7 times EBITDA, I believe this investment has lower risk than average. Auto parts are not going to change nearly as much as, say, the computer industry over the next five years; even people's tastes in food may be more likely to change dramatically than will replacement car parts. And in many cases, O'Reilly's customers have not just an immediate need for a part, but questions about it — both of which help to protect against competing online sales. Overall, buying a business with an above-average degree of stability allows us to consider different risks with other positions we may take.

Warren Buffett espouses simplicity in investing. But that doesn't necessarily mean simple *businesses* — stocking 142,000 parts, as O'Reilly does, is no easy task. Buffett's point is that you should target predictable sales and competitive moats that guard profits. Businesses in quickly shifting industries have less stable moats, so the stocks are typically afforded lower value multiples. But the leaders in stable and growing industries, with comfortable moats, often enjoy higher-than-average value multiples. Buffett saw early on that boring businesses can be among the most lucrative. It doesn't get much more boring than auto parts, and few stocks have been as lucrative as O'Reilly since it went public in 1993.

We hope to be along for the ride for the next five to 20 years. Enjoy our trade alert, and post your thoughts on our new O'Reilly discussion board!

Foolishly,

— Jeff (TMFFischer)

Pro's First Quarter 2013 Review

Published Apr 8, 2013 at 12:00AM

Dear *Pro* Members:

We just witnessed the S&P 500 gain 10% over the first three months of the year. The Dow gained more than 11%, its strongest first quarter since 1998. And with the market having increased in value every year since 2009 (including dividends), it may be tempting to forget that negative returns do happen approximately one out of every four years — and sometimes, as with 2000-2002, for several years in a row.

Pro investors don't rely on market kindness to earn returns. We want to generate profits on our own in various market environments; however stock indexes behave, we want to make money over every rolling three-year period. This typically means we carry defensive positions to profit from and dampen the effect of falling prices.

We ended this year's first quarter with approximately 71% market exposure (members who joined in February are about 60% invested), with 17% of our portfolio in cash, and nearly 15% short. This profile is obviously less risky than a portfolio that's 100% in equities. In the process, *Pro* earned 71.7% of the broader market's gain this quarter. That's a lower percentage than we've historically captured during a period when stocks are charging higher, but it's exactly in line with our market exposure (again, 71%). Should the market decline, our lower exposure will benefit us on a relative basis and keep our absolute-returns goal within closer reach.

The Market's Q1 2013 Results

Before we look more closely at how we just did, let's consider the "hero and goat" sectors in the market at large from Jan. 1 to March 31.

Q1 U.S. Stock Market Sector Performance	
Health	15.8%
Consumer Staples	13.8%
Utilities	11.1%
Financials	10%
Real Estate	6.9%
Technology	6.8%
Communication	5.8%
Natural Resources	3.8%
Equity Precious Metals	(17.2%)

Source: The New York Times*, April 7, 2013, except consumer staples, which is from S&P 500 Capital IQ.*

The most defensive sectors — health care, consumer staples, and utilities — led the way. Fund managers want market exposure, but they appear cautious in their equity selection. Gold and precious metals had a miserable quarter, and technology was a relative laggard, too. The *Pro* portfolio is heavily weighted in technology and financials. We don't expect both to always lead the pack, but we do expect the baton to change hands; both sectors should ultimately run a strong marathon from today's low valuations.

Pro's Q1 2013

Here's how our 12 largest holdings performed in the first quarter. They're listed below in descending order of allocation (including any options exposure but not dividends).

Q1 *Pro* Portfolio Largest Holdings Performance*	
AmTrust Financial Services	21.3%
Medtronic	14.5%
Rockwood Holdings	33.1%
Oracle	(3.0%)
Tupperware	28.5%
Starbucks	6.6%
OpenText	5.6%
Intel	7%
BMC Software	16.9%
MasterCard	10.2%
CME Group	22.1%
Papa John's International	12.5%

**Dividend-adjusted.*

Eleven of our 12 largest positions were in the green, with Oracle, which reported disappointing earnings, as the lone offender. As glad as we are to see our stocks perform, and as confident as we are in their management teams, three months still means next to nothing to us; we know a weak stock market could flip this positive story on its head (and provide opportunities to add to these stocks). So, what about our shorts?

Q1*Pro* Hedges and Shorts Performance (note that a negative return is good)	
SPDR S&P 500	10.5%
CurrencyShares Euro Trust	(3.0%)
Proshares UltraShort Real Estate	(15.5%)
Direxion Daily Financials Bear 3x	(30.6%)*

*Pro *shorted FAZ on Jan. 23, so has earned less than this full Q1 return.*

In addition to the above, we covered our **Sony** short in late January for a 21% gain — so all four of our shorts provided gains to the portfolio in a strong market. This isn't surprising when it comes to SRS and FAZ, because they're inverse ETFs that actually express a bullish stance on real estate and financials. Meanwhile, we're continuing to wind down our SPY index hedge, which naturally went up this quarter with the market. In January, we recommended closing the position (and all variations) or writing covered puts, which we have done twice since then, offsetting some of the loss. If you, like us, are still hedging with SPY, never fear; we'll continue to manage this hedge until we replace it with more individual shorts.

What's Next for *Pro*?

Since our October 2008 inception, *Pro* has earned 10.6% annualized, tracking ahead of the absolute-returns goal exemplified by our North Star. At the same time, while carrying cash and shorts, and with an average market exposure of only about 70%, we've earned 91.3% of the S&P 500's total return (including reinvested dividends). In sum: In a strong bull market, we've earned most of the market's gains with about 70% of the exposure (which means lower-than-average risk) — and while holding some positions that would profit in a falling market, too.

When stocks do finally decline for a year or two, our defensive positions and our cash (which we'll put to work) will be a benefit. Most importantly, whatever comes our way, we need to stick to our positive-returns goal. The stock market has been giving of late, but it won't always be that way. When weaker years inevitably arrive, we'll need to earn far more of our returns "on our own." This doesn't worry me much — it's just a reality, and it's why we're here. At the same time, we'll continue to enjoy owning strong companies for long-term appreciation. That's Foolish investing at its core.

— Jeff (TMFFischer)

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **CME Group**: Sell to open one September 2013 $55 put for every 100 shares you'd like to buy, up to a 3.9% allocation. Lately, these pay $1.85, or a 3.4% yield in more than five months. This isn't particularly strong, but is worth considering if you are not invested.
- **3D Systems**: Sell to open one August 2013 $25 put for every 100 shares you'd like to buy, up to a 3% allocation. Lately, these pay $2.10, or an 8.4% yield in just more than four months.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Write Covered Calls on CME Group

Published Apr 3, 2013 at 12:00AM

- **Is This Trade for You?** This is *only* for members who already own shares of **CME Group** (NASDAQ: CME). The stock remains on hold for newcomers.
- **What We're Doing**: Following strong stock price appreciation, we're covering all of our shares so we can earn something if they decline.

Trade Essentials

- **Action**: Write one covered call for every 100 shares of CME Group you already own.
  - Sell to open: May 2013 $60 calls
  - Recent bid/ask: $1.85/$1.95
  - Recent stock price: $60.15
- **Price Guidance**: Aim to be paid at least $1.85 initially; you'll have to accept less if the stock declines in coming days.
- **Allocation**: *Pro* is covering all of its 1,000 shares.
- **Alternative Trades:**
  - **Own odd lots or a small share count?** Cover what you can; if we lose our shares, we may write puts to buy again later. So, if you can't write puts on CME Group, consider keeping the odd-lot shares you already own.

What's New?

Shares of global futures exchange **CME Group** (NASDAQ: CME) are up 19% this year amid a rally in financial-exchange stocks in general. The fundamentals don't yet support this jump, given that trading volume at CME remains flat year-over-year. However, we did believe the stock was undervalued, and now it has increased to our fair-value estimate. We're writing covered calls to capitalize on that fact, and to be a little defensive.

How to Follow Along

Over the past year, we've enjoyed North Star-topping returns of 13% including dividends. If we sell our shares via these May covered calls, we'll turn around and consider writing puts to buy shares again cheaper. We still believe CME's trading volume will eventually grow, taking the share price with it, but that may take a few years. Here's more on the covered call trade:

CME Group stock price:	$60.15
"Sell to open" May 2013 $60 calls:	$1.85
Trade type:	Income, defensive
Yield on current share price:	3.1%
Break-even price:	$58.30
Days to expiration:	44
Potential net sell price:	$61.85
Upside to potential net sell price:	2.8%

Next Step

- Before you sell to open one call for every 100 shares you own, ask any questions on the CME Group board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Write Covered Calls on Rockwood Holdings

Published Apr 3, 2013 at 12:00AM

- **Is This Trade for You?** This is *only* for members who already own shares of **Rockwood Holdings** (NYSE: ROC). For newcomers, the stock is still on hold.
- **What We're Doing**: Following strong stock-price appreciation, we're defensively covering all of our shares; this way, we earn a return even if they decline, and can potentially sell higher.

Trade Essentials

- **Action**: Write one covered call for every 100 shares of Rockwood you already own.
  - Sell to open: August 2013 $60 calls
  - Recent bid/ask: $4.20/$4.40
  - Recent stock price: $60.75
- **Price Guidance**: Rockwood's stock is volatile; aim to be paid at least $4.20 initially, though you'll have to accept less if the stock declines in coming days.
- **Allocation**: *Pro* is covering all of its 1,400 shares.
- **Alternative Trades:**
  - **Own odd lots or a small share count?** Cover what you can; because we're writing in-the-money calls, use a limit order at current prices to sell shares you can't cover. Or, if you prefer, hang on to your odd-lot shares and hope to sell them around $64.

What's New?

Shares of specialty chemicals and lithium leader **Rockwood Holdings** (NYSE: ROC) have gained 23% this year, largely thanks to management's promise to divest itself of its titanium dioxide business before year-end (either through a sale or a spin-off). The market now values the company at slightly higher than our fair-value estimate, and at nearly 9 times EBITDA.

Rockwood is a good business, but it's not an outstanding business — so we're allowing it less wiggle room above its fair value than we might for other, superior businesses. We're going to write in-the-money covered calls as a defensive play on our large position.

How to Follow Along

We're prepared to sell our stake if the stock remains higher than $60, but we're also open to the possibility of rolling our covered calls to a higher strike price if that seems appropriate by expiration this summer. Here are some more trade details:

Rockwood Holdings stock price:	$60.75
"Sell to open" August 2013 $60 calls:	$4.20
Trade type:	Income, defensive, possible sale
Yield on current share price:	6.9%
Break-even price:	$56.55
Days to expiration:	135
Potential net sell price:	$64.20
Upside to potential net sell price:	5.7%

Next Step

- As you get ready to sell to open one call for every 100 shares you own, ask any questions on the Rockwood board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

A Cure for the Trading Sweats

Published Apr 1, 2013 at 12:00AM

Fellow Fools,

If your heart rate quickens and sweat beads tremble on your brow when you're about to transact with your online broker, you've got a case of what Dr. Google might diagnose as the "trading sweats." The Internet doesn't list a fix, but I've got the cure for what ails you: Take a dose of DEF 14A and call me in the morning.

You won't find any DEF 14A at your local pharmacy, nor can you buy it in any back alleys. DEF 14A is the fancy name for the proxy statement — the document that so cordially invites you to a company's annual shareholder meeting and presents matters to be voted upon. The proxy, which is mailed to shareholders at the end of each fiscal year, cures the trading sweats in just one dose by reminding you that you own a portion of a real business, not just a ticker. And that transforms each buy or sell from a trade into an investment.

Here's how I tackle the proxy statement, using the 2012 proxy for **Broadridge Financial Solutions** as an example.

Rub Elbows With Your Partners

Somewhere toward the front of the proxy, there's a section that lists and introduces the important managers (pages 17 to 20 if you're following along with Broadridge). After reacquainting myself with the executives, I take note of their tenure and ownership. At Broadridge, the average tenure is 16 years, which represents about 30% of these executives' lives (almost 50% of their working lifetimes) — that's loyalty! Of course, we can't read too much into this, but it does suggest that top brass is emotionally invested in, and committed to, the business' success. In the table that details common stock ownership (page 20), we see that managers and directors own 6.7 million shares, or 5.4% ($167 million worth) of the total company — not too shabby. The combined investment of time, energy, and dollars suggests that Broadridge managers have enough on the line to keep them acting like owner-operators.

Checking the Carrots and Sticks

I then flip forward a few pages to the Executive Compensation section (page 25). Here, the board details how management is rewarded. Typically, their compensation will be split between a base salary, cash bonuses, and longer-term rewards.

- Broadridge CEO Rich Daly's base salary is rising 3% this year — pretty modest, especially considering that it didn't budge in 2010 or 2011.
- Daly's cash bonus is tied to financial goals (pre-tax profits, fee revenue, and recurring revenue), key strategic initiatives (setting a five-year vision), and client satisfaction scores. Importantly, the financial metrics in question have thresholds and aggressive target values — during 2012, Daly didn't receive a full payout because Broadridge didn't hit its targets.
- Longer-term compensation consists of stock options and performance-based restricted stock awards. The options vest over four years and only benefit their recipients if Broadridge's stock rises. The performance-based stock is awarded based on two-year average earnings-per-share results; for the cycle that ended in 2012, only 70% of the potential stock grant was awarded because Broadridge failed to hit its stretch earnings targets.

In this section, you should also find any share ownership guidelines and clawback provisions the board has instituted. In Broadridge's case, executives must own stock that equals between two and six times their base salary, and all bonuses and equity awards are subject to reimbursement if the company's financials turn out to be fictitious. In general, I like it when this section includes reasonable absolute rewards, incentives tied to metrics that align with what I believe drives the business, and a system that's simple in structure but difficult to game.

Get Some Perspective

It's critical to have perspective when reading a proxy. I like to pull up the prior year's DEF 14A and check for consistency; moving targets are a yellow flag that warrants further investigation. In Broadridge's case, everything checks out. The only notable change in 2012 was the addition of customer satisfaction as a determinant of cash bonuses; this was done because customer satisfaction is a performance metric for all other Broadridge employees, so it makes sense to grade executives on it, too.

The Foolish Bottom Line

By now, we've investigated the executive team's ownership mentality and incentive structure; now we get to voice our opinion about whether we think it's acceptable. Remember, the proxy statement solicits the company's owners — us — to give our permission regarding any proposed plans (and opine on other matters). The first few pages of the proxy should identify the proposals to be voted on. For Broadridge, that includes the election of directors, auditors, and the performance scheme. Just like you learned in civics class, your vote matters! You own a fraction of each business whose stock you hold, so behave like an owner and vote. If you need a little incentive, remember that each time you do so, another coin drops into your piggy bank — because if you're following *Pro*'s portfolio, you own Broadridge, the tollbooth that rules the proxy voting highway.

Happy Opening Day, Fools!

Bryan (TMF42)

Alternative Ideas for 3 Shorts

Published Mar 25, 2013 at 12:00AM

Dear *Pro* Members:

During last week's live chat about the newly released portfolio positioning report, we heard from members who couldn't obtain shares to short from their broker, and from others who wanted alternative strategies because, of course, you can't sell short in an IRA. Fear not, Fools: We'll get to the bottom of all this by the end of today's Memo.

The Basics of Shorting

Let's start with a definition of shorting, or selling short: You're borrowing shares and selling them, aiming to buy them back later at a lower price.

Keep in mind that **you do not need to sell short to succeed at *Pro***. Not everyone has the constitution for shorting. But if you do, we think you'll make strong extra returns over the years. Here are a few things to consider as you decide whether shorting is right for you:

Know your broker: To make success more likely, the first step is to use a broker that is friendly to shorting — meaning, a broker that usually has shares available to borrow. Most brokers charge an annualized fee to sell short, anywhere from 1% of the short value to 7%, depending on how difficult (or expensive) the shares are to borrow. We suggest you check out your broker's shorting fees — some don't have them — know the policy, and consider switching to a better broker if yours seems unreasonable.

Speak the language: The trade command to sell short is usually "sell short" or sometimes "sell to open." Your allocation math is the same as with a long investment. If we say to sell short 1% of something, then short $1,000 worth for every $100,000 you manage. When you short, you're paid cash up front that is then marked to the closing value of the short asset each day. Your cash balance rises and falls with the short value, until the day you "buy to cover" or "buy to close," the commands to close a short position. When you buy it back cheaper than where you sold it, you're making money.

Face the risk: Realize that since you're borrowing shares, the true owner of those shares could transact in them, which would require you to return the shares to their rightful owner. If your broker can't find different shares to borrow, you'll be forced to close your position whether you want to or not. In my experience, this is rare — but it happens, and it's probably the biggest potential risk we face when selling short because it's outside our control.

Shorting at *Pro*

When *Pro* issues a trade alert to short a stock, we have looked at the company inside and out before deciding to recommend a particular strategy. While it's true that alternative trades have advantages and disadvantages, it's best to make the official trade and sell short directly if you're able. That's the quickest, clearest trade; you can short as few shares as you like, and it's the easiest position to manage (add to, or reduce) by following directly along with us at *Pro*. One example: When you use options, each contract represents 100 shares, you'll usually pay capital to set up the position, and you'll typically pay high friction costs at the start. In contrast, fees for selling short are annualized.

One other note about our current short recommendations: At the moment, these companies are all described as "hard to borrow" at some brokers, which simply means they can be hard to come by (as opposed to "easy to borrow" shares that are more readily available). In our original reports on these shorts, we offered alternative trades — and we'll always do that when possible. Further, many of our new shorts will be easy and inexpensive to borrow. But for now, the flawed ETFs we're shorting may be hard to borrow. Again, we've given these companies and strategies a thorough look before recommending this course of action — it might seem complicated, but we believe it represents our best chances of success.

Our Current Short Recommendations

That all said (I never said the short story was, er, short), here's a rundown of our existing short recommendations, along with viable alternatives depending on your broker and other circumstances.

1. ProShares Ultrashort Real Estate : Short about 1.8% (we may add more later). We believe U.S. real estate will continue to recover, so we're shorting this bearish ETF that is leveraged 2:1 *against* real estate and has historically tracked its underlying index very poorly. (See our original reports.)

- **Taxable account alternative:** If you can't borrow shares to short, you can use options to set up a synthetic short. Sell to open January 2014 $22 calls, and concurrently buy to open an equal number of January 2014 $22 puts. Using a limit order, this should cost around $2 ($200) per pair of options you set up. Each $22 call you sell represents $2,200, so allocate using that number. This synthetic short will track the ETF as if you're short it, minus your cost to set it up.
- **IRA account alternative:** In a similar spirit to our short, you could instead *buy* about 1.8% in the bullish **iShares Dow Jones U.S. Real Estate** ETF. This diversified real estate fund should continue to appreciate as real estate recovers. In the past year, it's up 11%. That said, the ETF we're shorting is down 31% over the same period — that's why we're shorting it; it's flawed.

2. Direxion Daily Financial Bear 3x Shares : Short about 1.3% (we may add more later). On average, the U.S. financial leaders in the underlying index this ETF is short trade not much above book value, making them ripe for a long-term recovery. So, we're short the ETF that is short U.S. financials. As with the Ultrashort Real Estate ETF, the leverage used by this ETF is a long-term drag on results — helping short sellers like us. We just shorted it in January; see our original report.

- **Taxable account alternatives:**
  - If you can't borrow shares to short, you can use options to set up a synthetic short. Sell to open January 2015 $10 calls, and simultaneously buy to open an equal number of January 2015 $10 puts. Using a limit order, this should lately cost around a net $0.70 ($70) per paired contract. Each $10 call you sell represents $1,000 in short value, so allocate by that number. The synthetic short will track the ETF as if you're short it, minus your cost to set it up.
  - Instead, you could just write ("sell to open") naked calls on FAZ. Your profit is limited to what the calls pay you, but as long as the ETF doesn't rise sharply, you'll make money. For instance, the January 2015 $12 call pays you more than $2 (or 16.7% on your strike price) with a break-even price above $14, while the ETF trades at $10.55. Do not over-allocate when writing naked calls. Your risk is the same as shorting (unlimited), but your potential reward is limited, so size accordingly.
- **IRA account alternatives:**
  - Our short position in FAZ is simply another way to express a bullish position in leading U.S. financials. So, if you can't short FAZ, consider adding another 1.3% to your *Pro* positions in **AIG** and **Wells Fargo**. This is our best long-term alternative for retirement accounts.
  - They're expensive, but you could buy ("buy to open") put options on FAZ. Buy to open January 2015 $18 puts, lately for about $10 ($1,000 per contract). This gives you a break-even of around $8, so it will require patience. This is a viable — if expensive — alternative, but we like increasing your stakes in our financial stocks better.

3. CurrencyShares Euro Trust : Short about 3.6%. This ETF tracks the euro against the U.S. dollar, and our thesis is that the dollar is built on a much stronger foundation than the euro. It deserves to be more valuable compared to the euro than it currently is. (See our original reports.)

- **Taxable account alternative:** If you can't borrow shares to short, you can use options to set up a synthetic short. Simultaneously sell to open January 2015 $127 calls, and buy to open an equal number of January 2015 $127 puts. This should have little net cost per contract, but each $127 call you sell represents $12,700, so allocate by that number — and don't make this trade if it's too expensive. This synthetic short will track the ETF as if you're short it, minus your cost to set it up.
- **IRA account alternatives:**
  - An IRA-friendly trade that requires much less capital is to set up a bear put spread. Using a spread order, simultaneously buy to open January 2015 $128 puts, and sell to open an equal number of January 2015 $118 puts. Lately, this should cost a bit more than $4 (or $400) per spread. Only invest what you can afford to lose. If the euro falls to $118 or lower, your spread will be worth $1,000, more than doubling your money. But if the ETF ends your expiration above $128, your spread expires worthless.
  - Finally, you could just "buy to open" puts on FXE. The January 2015 $150 puts cost about $23 each ($2,300) and give you a break-even of around $127, close to the ETF's current price.

You'll notice that we **do not** recommend buying the leveraged inverse ETFs as alternatives to any of our short recommendations — that's because they have tracking flaws. For example, buying the **ProShares UltraShort Euro** ETF would get you short exposure to the euro, but it is deeply flawed; over the long term, it's down 23% even while the euro is perfectly flat. That is a perfect example of how leveraged ETFs can misbehave, and why we short them rather than buy them.

Shorts Summed Up

One more time: You don't need to short these stocks, or any others, to succeed with *Pro*. If you want to keep your investing simpler, focus on the companies we own and on our basic option strategies (including for income) as we announce new trades. But if you *do* want to short, strongly consider getting a broker that makes it easy for you to succeed. It's vital that your broker has shares available for shorting, both now and especially when the market gets volatile. Brokers that lack short availability on a steady basis are more likely to call you out of your short positions at the worst times.

If you don't want to open another account for shorting, then consider our alternatives above, using options or other investments entirely. Finally, keep in mind that many of our shorts will be simpler than these — they will be company-specific shorts that are cut and dried. These inverse ETF shorts are more counter-intuitive! If you have questions, please visit the new Making Pro Fit You board. We'll be there to help!

Take your time, keep your eye on the long-term prize, and we'll help you get to your investing destination with us.

Foolishly,
Jeff (TMFFischer)

Coverage & Community

No Crying Over Income

Published Mar 18, 2013 at 12:00AM

Dear *Pro* Members:

"How much income will you need?" What I thought was a simple question brought fear, and then a tear, to a fellow parent's eyes. Immediately, I wished that I'd just said "covered calls" when he asked which option strategy was best for earning income in retirement. As Fools, we're accustomed to answering questions on the boards and in live chats where thoroughness and completeness are valued — expected, even — by our members. But on the soccer field, among parents, sound bites and perhaps platitudes would serve me (and possibly them) better.

I learned that my peer in parenting — senior to me in everything else by about 25 years — would be taking a mandatory retirement before our daughters (his youngest) leave for college in four years. He needs to replace the majority of his salary from his investment portfolio but, based on the rough numbers he provided, has less than half the portfolio he'd need to generate that income. Sitting on the sidelines, I realized this guy didn't need a goal — he needed a miracle.

We Build Portfolios, Not Miracles

Consistently and Foolishly using covered calls, written puts, and other income strategies will indeed produce useful income — but not miracles. Without a sufficient asset base, no income-producing strategy can replace a healthy salary. It sounds obvious, but building a large enough asset base should be the primary concern of preparing for retirement. Of course, what is "sufficient" varies from person to person (any income earned through employment will drastically reduce the necessary portfolio size, and being debt- and mortgage-free also helps).

Coming Soon: The Portfolio Positioning Report

Tomorrow, March 19, we'll release a Portfolio Positioning Report that tells you how to short, hedge, and use options to match our exposure and general portfolio position, even if you can't or don't want to engage in every strategy we employ. **We'll also have a live chat at 1 p.m. ET to coincide with the report's release.**Click here to set a reminder!

Here's a tip: It helps to start backward by asking the question that kicked all of this off: "How much income will you need?" With that ballpark number in hand, you can then compare different philosophies about rates of drawdown, dividends, and options to come up with a reasonable way to get there.

Total Return Framework

Like the parent above, you may think that to meet your annual personal liabilities, you should invest in more income-producing assets. Equity investors have long used insights from fixed-income markets to inform their decisions. One of my favorite insights is the Total Return Framework, which is simply the idea — even for bond investors — that maximizing after-tax returns is most important and that investors should be agnostic about whether we earn that return from yield or appreciation.

The interest-rate environment has made all assets with a yield more attractive to investors, some of whom might not otherwise consider them. Many of these investors are thinking about yield first and forgetting about total return. After all, doesn't share ownership grant us our proportional share to all of the firm's earnings? It makes sense to focus on owning as much earnings (or free cash flow) as possible, period. Focusing on owning the highest dividend-yielding stocks often doesn't make the most sense from a tax perspective — plus, for those without current income needs, it makes little sense as a primary consideration because yield is only one component of returns.

When entering retirement, the three most important considerations are

- starting asset base
- income needs
- how long you'll need that income

For current net savers preparing for retirement, growing that asset base (not yield) is the first priority. Capital appreciation and yield both matter, but focusing solely on either one misses the point. It is total after-tax returns that capture the whole picture.

Be Like Buffett ... or Sam

In Buffett's recent annual letter, he closely detailed investor preference for dividends. Many Berkshire Hathaway shareholders are getting on in years, and there have been requests for a regular dividend. His response is clear and thorough — I'll share the conclusion here, but I strongly suggest that you read it too (dividends on page 19).

Buffett begins his explanation with an average business that offers a 12% return on equity and earns the same rate on its reinvested earnings. Shares trade at 1.25 times book value. Even for this average business, it makes more sense — even from an income perspective — to forgo a dividend. To make his point, Buffett offers one investor — I'll call him Don — a 4% dividend, while another investor — Sam — sells 3.2% of the shares to achieve the same annual income in the first year. Both Don and Sam benefit from a growing income. After 10 years, we check back to see who is faring better. Even though Sam sold off some shares every year, the stock will be worth 4% more than Don's because the company reinvested the earnings it would have paid out. And here's the kicker: Sam will also have a 4% larger annual paycheck after 10 years — an advantage that will continue to grow.

Let's get back to assets. It should be obvious that the logistics of selling shares is much more difficult than receiving dividends. Do you own enough shares to sell 3.2% if them every year? The point still stands: Even when maximizing income, a larger dividend isn't necessarily the right answer. Obviously this is another example where having a larger portfolio is better. We need to manage our investment to achieve that goal. If the goal is retirement, the nest egg needs to be large enough to support either strategy (offset a bit with Foolish use of options). At *Pro*, our aim is to achieve North Star-like returns. For most investors, saving and living below their means before retirement — or enjoying retirement with a suitably sized portfolio — North Star-like returns should help make for a comfortable retirement.

Two Businesses Worth Owning

Because we shouldn't care whether we earn after-tax returns through yield or appreciation, it helps to know what we should expect from the managers running different types of businesses.The best businesses earn high returns on capital *and* have the ability to regularly reinvest large amounts of capital at those high rates. A business like that, one with a durable competitive advantage, is a great way to create shareholder wealth — paying a dividend will only slow it down.

The second-best type of business is one that earns high returns on capital, but has little need for reinvestment — cash is a drag here, or at least doesn't really affect future earnings. For this business without solid investment opportunities, cash will build up and should be returned to investors. If shares are cheap, I prefer share buybacks; if they're pricey, a dividend is better. Though the dividend policies differ, both companies will build significant wealth for their owners. Matching policies with business reinvestment needs, not investors' preferences, is actually better for investors.

The *Pro* Bottom Line

Avoid tears and poor long-term strategies by thinking like a total return investor and focus only your total returns. By knowing what really matters, we can always risk our investment dollar where we expect the highest return. Sometime that'll be yielding stock, other times it'll be capital-light businesses that are buying back shares, and still other times we'll use options to earn returns. The key to recognizing the best opportunities is to remain flexible and to avoid a dogmatic approach to investing — it's the *Pro* way.

—Nick (TMFCrow)

Pro Trade Roundup

- Bought 1000 shares of **GrafTech** at an average price of $7.285, increasing our allocation to about 2%.
- Bought 17 shares of **Apple** for $430.16 a piece, increasing our allocation to about 3.5%.

Guidance Changes

- **The Buckle**: Fair value increased to $52.

Pro Catch-Up Trades

- **3D Systems**: If you don't have exposure to this 3D printer company, sell to open August 2013 $22.50 puts, lately for about $1.20 each (that's a 5.3% yield in about five months). Sell one put for every 100 shares that you could buy at a net $21.30, up to a potential 2% stock allocation in your portfolio.

Coverage & Community

- **Apple** and **Starbucks**: Pro Member Cacell makes a splash on the message boards with two excellent posts. One describing Apple as a crusty old sailor and another sharing insight in Starbuck's competitive position in Europe, Middle East, and Africa.

Portfolio Positioning Live Event

Published Mar 14, 2013 at 12:00AM

The final piece of the “catching-up-with-Pro” puzzle, our Portfolio Positioning Report, will be released Tuesday, March 19. In that report, we’ll walk you through all of our current shorts, options positions, and hedges, and explain how you can get on board alongside us now. We’ll also have a live member event on this page that day; the whole team will be on hand to answer any questions you have about those positions specifically or catching up with us in general. Set a reminder below, and we'll see you on the 19th!

Transcript: The Portfolio Positioning Live Chat

Published Mar 14, 2013 at 12:00AM

The final piece of the "catching-up-with-*Pro*" puzzle, our Portfolio Positioning Report, is out now! In this report, we walk you through all of our current shorts, options positions, and hedges, and explain how you can get on board alongside us now.

We also hosted a live chat for all *Pro* members with questions about the positioning and catch-up reports and other timely topics. You'll find the full transcript in the window below -- simply hover your mouse over (or click) the triangle to get started.

Buy More Apple

Published Mar 12, 2013 at 12:00AM

- **What We're Doing**: Increasing our allocation in **Apple** (NASDAQ: AAPL) to 3.5% from its current 3.05%-ish.
- **What We're Thinking**: The number of people buying into Apple's ecosystem continues to grow, and yet the stock is cheaper than it has been in years.
- **What We're Expecting**: Skepticism on Wall Street will ultimately give way to optimism as Apple grows in new markets and maintains attractive, above-average profit margins.

Trade Essentials

- **Action**: Buy more Apple
- **Allocation**: Increase your position to 3.5% of your *Pro* portfolio (*Pro* will buy about 14 more shares — yes, just 14 — for 125 total)
- **Price Guidance**: Use a limit order when you're ready to buy.
- **Recent Share Price**: $431

What's New

In its year ended September 2012, Apple's sales were up 45%. Its gross margins jumped to nearly 44%, while earnings per share leapt 59%. But during the subsequent holiday quarter, year-over-year earnings growth stalled and margins dropped sharply, and the stock has tumbled since that news. CEO Tim Cook explained that the company's inability to meet demand for the iPhone 5, iPhone 4S, and iPad Mini played some role. In addition, Apple's product line was almost entirely refreshed last year, and margins will come in lighter until production efficiencies start in earnest. (For more, see the section on Apple in our recent Catch-Up Report, available here in PDF form.)

That's not the whole story, though. We all know that Apple is selling cheaper, older model iPhones to get into lower-end markets, and that competition from the likes of **Samsung** (NASDAQOTH: SSNLF) and **Google** (NASDAQ: GOOG) is intense. But Apple has staying power: It actually surpassed Samsung during the fourth quarter to become the top smartphone seller in the lucrative United States market, with approximately 34% market share. Judging from its share price, you'd think the opposite had happened. At the same time, iPhone unit sales in China leapt by triple digits last quarter, and worldwide iPad unit sales were up 48% to 22.9 million. Apple remains a growth story, and we expect its profit margins to remain strong thanks to the company's operational expertise — even if lower-price-point products do bring margins down from record highs. Once Wall Street is convinced Apple won't become a low-margin company, the stock — trading at less than nine times free cash flow today — should enjoy a higher valuation.

The Foolish Bottom Line

Apple declined below our "Consider Adding More" price last month, triggering a timely review and a report back to you. Today, our decision is made. We're adding more to our stake, and recommend you do, too, matching us at 3.5%.

Alternative Trade

- **Bull Call Spread:** If you set up a bull call spread on Apple in *Motley Fool Options*, continue to follow guidance from our sister service, but keep your total allocation to Apple in mind before buying more for *Pro*. If you'd rather set up a bull call spread than buy more shares today, you can use a spread order to "buy to open" January 2015 $410 calls, and "sell to open" an equal number of January 2015 $420 calls, for a net debit of around $4.50 ($450) per spread. Each spread will be worth $1,000 if Apple stays above $420 by expiration, more than doubling your money; but the position ends without any value — meaning you'll lose your entire investment — if Apple is below $410 at expiration.

Next Steps

Buy (or Buy More) GrafTech International

Published Mar 12, 2013 at 12:00AM

- **What We're Doing**: Increasing our allocation in **GrafTech International** (NYSE: GTI) to 2%, from its current 1.6%, and recommending that newcomers buy 2% to match us.
- **What We're Thinking**: We think shares are undervalued and GrafTech has the balance sheet to survive near-term headwinds.
- **What We're Expecting**: It'll be a bumpy ride in the short term, but the long-term outlook for graphite electrodes coupled with low market expectations warrant increasing our stake.

Trade Essentials

- **Action**: Buy (or buy more) GrafTech
- **Allocation**: Make your position 2% of your *Pro* portfolio (*Pro* will buy about 1,100 more shares, for 4,600 total)
- **Price Guidance**: **Use a limit order** around current prices, and be patient; this stock is volatile and easily influenced by sudden demand or selling pressure.
- **Recent Share Price**: $7
- **Special Notes**: This report on GrafTech serves as the most current guidance for new members and veterans alike; we won't be commenting on the company in our Catch-Up Reports (though we will link to this guidance from there). Also, we realize some members held written puts that recently resulted in assignment; if this is you, check your allocation and make sure it isn't too far off from our 2% recommendation.

What's New?

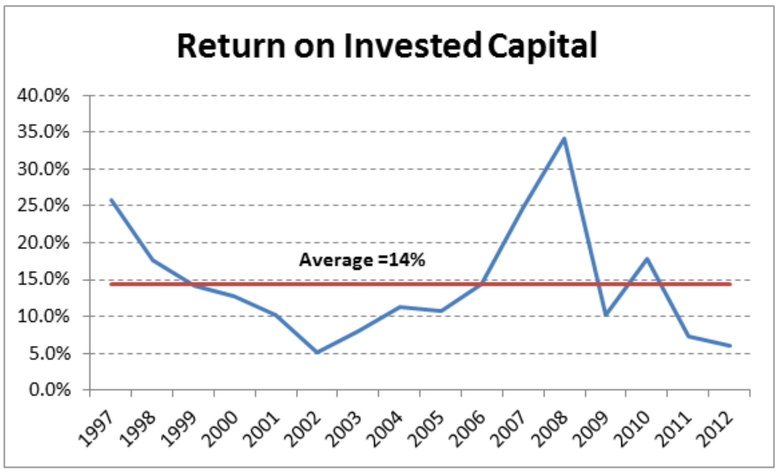
The International Monetary Fund reduced global GDP estimates three times during 2012, an admission that its rosy outlook for the world economy had been too sanguine. The share price of GrafTech International, a leading supplier of graphite electrodes that are used in the production of steel, dances pretty closely with GDP, so 2012 was an electric slide downward for this economically sensitive *Pro* holding, and the new year has yet to bring improvement.

Management's commentary on the recent conference call highlighted the company's Chinese competitors behaving badly, adding capacity in the face of soft demand and showing willingness to export electrodes at a loss. Thanks to those competitive challenges, GrafTech is faced with 10% price reductions instead of the 10% price increases it had expected. Couple that with a capital-hungry business, and our estimate of GrafTech's intrinsic value falls to $9.75.

Additional capacity without pent-up demand is not good for any supplier in the industry, but we don't think the new supply will prove to be oppressive. Up to 100 million metric tons of new electrode capacity will be available this year, and while that number could increase by an additional 130 million over the next few years, not all of that supply is of the typical high grade that GrafTech sells. We estimate that supply will expand by 14% at worst over the next couple of years. We also believe that many of those excess electrodes will find eager buyers in more electronic arc furnaces, driven by ever-higher quantities of scrap steel and a renewed focus on environmentally clean production.

While supply expansion will keep downward pressure on electrode prices, this sort of behavior is not uncommon in the steel supply chain that GrafTech inhabits, and the company has successfully navigated such turbulence in the past. If Chinese suppliers persist in exporting their product at a loss, we think the most likely outcome is that GrafTech's low-quality, high-cost competitors will suffer the most — maybe even go belly up and be flushed out of the market. Meanwhile, as a large, high-quality, low-cost producer, GrafTech is the best positioned in the industry to weather this storm.

GrafTech also has the financial wherewithal to sustain a downturn. True, the company is making use of debt, but that debt doesn't mature for a few years; in the meantime, GrafTech has an impressive history of cash flow generation behind it, plus an extra source of cash in the upcoming release of extra inventory as its disadvantaged take-or-pay needle coke supply contracts roll off. (In order to obtain Department of Justice approval for its acquisition of its main input supplier, GrafTech had to accept disadvantaged, multi-year sourcing contracts from a competing supplier; those contracts should be fulfilled by mid-year, allowing management to better control inventory and working capital.) On top of that, GrafTech's heavy investments in increased quality at its needle coke plant are now complete, so future long-term returns on capital should be attractive. Even in a sloppier competitive environment, GrafTech should still be able to earn attractive full-cycle returns.



Source: Analyst estimates.

The Foolish Bottom Line

The last piece of the GrafTech puzzle is the price we're paying. At about $7 per share, GrafTech is selling for just about the book value of its assets, but it's the electrode kingpin with a history of strong profitability and a portfolio of graphite science patents (graphene!). At today's valuation, we believe it deserves a bigger position in our portfolio.

Next Steps

- Bring your questions to the GrafTech discussion board.

Hedging Vs. Shorting

Published Mar 11, 2013 at 12:00AM

Dear *Pro* Members:

We're almost there! This Thursday, March 14, we will issue our last Catch-Up Report, which will complete our guidance on our long positions for members who joined in February. Then, on Tuesday, March 19, we'll release our Portfolio Positioning Report for all members, in which we'll discuss hedging, shorting, and options and provide you with our most current guidance on those parts of our portfolio. We'll have a live member event to coincide with that report, as well. Finally, we'll be making new trade decisions soon, so it'll be a full March as we roll into another glorious spring in the United States.

As we gear up for all this, let's talk about the difference between hedging and shorting — especially for the uninitiated.

Hedging Is About Market Exposure

Hedging is fundamentally different from shorting. Hedging is about determining how much market exposure you want to have at any given time and setting up your portfolio accordingly. Beautifully, hedging makes it possible to reduce your exposure to market risk without selling any of your stocks.

Here at *Pro*, our goal is to make money steadily, so we want to have positions that work for us in declining markets as well as rising ones. A good hedge serves this purpose, allowing us to stay invested in great businesses while reducing exposure to the market's periodic falls. Here's how that looks in practice: Let's say you're 90%

invested in stocks and 10% in cash, but prices have risen considerably and you want to reduce your market risk. You could set up a 15% short position on a market index that's closely correlated with your portfolio — then, with one simple trade, you suddenly have only 75% net exposure to the market, and yet you haven't sold a single stock.

Hedging in this way ensures that you'll continue to enjoy upside, but at least one position — your large index hedge — is certain to work in your favor when the market declines. You're still 75% net long, and many of your stocks should go up *more* than the index you're hedging with — in other words, if you choose your stocks well, your portfolio will outperform the index when it rises even when you're hedging with the index. Ideally, you'll end up with strong returns but with much less risk than someone who's 100% long, all while holding a diversified portfolio that has positions that will benefit you in a downturn, too.

Hedges like these help you stay calm and focused during market declines, and when you close them at a profit, they're a source of capital you can reinvest. Just remember: Hedging is about determining how much *market exposure* you want, then sensibly positioning your portfolio to match. *Pro* has opted to be majority-long since 2009, and we're here to guide your exposure higher and lower as we see fit, because it will change.

Shorting Is a Directional Investment

Unlike hedging, shorting — selling individual companies (or ETFs) short, aiming to profit when they fall in price — is purely a directional investment. Just as we buy companies because we believe they will increase in value, we sell stocks short when we believe they will decline in value. Shorting is not, by definition, a market hedge (a stock you sell short can easily go *higher* even when the market falls, while a proper hedge cannot). You short a position when you're convinced it will fall in price eventually, but as you've no doubt heard (or even experienced), short sellers often suffer during unexpected bull markets. At *Pro*, we sell short very selectively because of this, and because we're mindful that any shorts must compete for our attention and dollars with long investments, which often have more potential.

For more on hedging and shorting, please visit some past Memos:

- Losing Is Mission-Critical
- Hedging the *Pro* Way
- Sharing Our Shorts
- The Long and Short of It
- See all *Pro* Memos here!

We'll be in touch again soon! Meanwhile, meet us on the Memo Musings board for discussion. Thank you for being a *Pro* member, and Fool on!

— Jeff (TMFFischer)

Coverage & Community

- **AIG Gets Jiggy With It:** Seriously, the business continues to move in the direction we want to see. It remains a Buy First.
- **GrafTech Gives Us the Nitty-Gritty:** The electrode producer for steel mills is going through hard times. Do we have a great buy here? You'll hear our decision soon.
- **"Making Pro Fit You" Debuts!** This brand-new board will help you make *Pro* the perfect service for your personal needs.

Guidance Changes

- **CME Group**: After leaping this year, the stock moves to "hold" while we reassess its attraction for new potential buyers.

Pro Catch-Up Trades

- **3D Systems**: If you don't have exposure to this 3D printer company, sell to open August 2013 $22.50 puts, lately for about $1.20 each (that's a 5.3% yield in about five months). Sell one put for every 100 shares that you could buy at a net $21.30, up to a potential 2% stock allocation in your portfolio.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Alpha Transition Reports

Why We Manage Volatility

Published Mar 4, 2013 at 12:00AM

Fellow Fools,

Pop quiz: Which portfolio would you prefer to own?

Year	Portfolio A	Portfolio B	Portfolio C
Year 1	(20%)	20%	15%
Year 2	(10%)	15%	(20%)
Year 3	10%	10%	(10%)
Year 4	15%	(10%)	10%
Year 5	20%	(20%)	20%

Portfolio Positioning Report Coming March 19

Our Catch-Up Reports are focused on getting you into our long positions, but we haven't forgotten about shorts, hedges, and options (far from it, as this Memo proves). On Tuesday, March 19, we'll release a Portfolio Positioning Report that tells you how to short, hedge, and use options to match our exposure and general portfolio position, even if you can't or don't want to engage in every strategy we employ. **We'll also have a live chat to coincide with the report's release.** We'll email you about this event as it gets nearer, but mark your calendar now!

The right answer, as far as math and reason are concerned, is "it don't matter." A hundred bucks invested in each of these portfolios would be worth $109 at the end of five years — but nonetheless, you were likely drawn to one portfolio over the others. Perhaps you started at A, saw negative performance in the first two years, and hopped to B, which looked good until you realized you'd face a losing streak in years four and five. Or maybe you went with portfolio C, which seems to have gotten its act together after a middling two years. Then again, maybe you saw through my little ruse from the beginning. But even if you did, the return streams shown above had *some* emotional or physiological impact on you, whether you're aware of it or not.

Neuroscience Nuggets

Each time you make an investing decision, you call upon three primary regions of the brain: your wanting system (found in the evolutionarily ancient midbrain), your risk-aversion system (in the newer temporal lobe), and your utility system (in the most recent prefrontal cortex). But don't worry, Fool, your brain is super-efficient; the three sections often do battle without your even knowing it. And it's good at its job — even in the face of many dangers, your brain has kept you, and your portfolio, alive. Still, staying alive and making the best decision are two very different things.

Imagine: You're meandering through a field near your home when you stumble upon a grown lion licking its chops. Upon sighting it, you don't take time to worry about why a lion is near your house or how it escaped from the zoo. You'll ponder those questions later, if you survive, but priority numero uno is not becoming cat food. Instinctively, your brain triggers a few "fight or flight" responses designed to keep you safe: Your heart rate, blood pressure, and breathing pick up, and before you know it you're slowly retreating. You've reacted without consciously having to think.

That's because our brains are highly efficient when it comes to fear. They're always ready to leap into action — and in the presence of a rogue lion, that's great. But your temporal lobe isn't tasked with distinguishing between a hungry jungle cat and stock price volatility; as far as your reaction is concerned, they're effectively the same thing — "threats" to be avoided. The problem, of course, is that the two are completely different, and a sweaty, tense, breathless, reactionary decision to buy or sell is less likely to serve you well in the future than a sweaty, tense, breathless retreat from a lion.

Staying the Course

Pro's efforts to lessen portfolio volatility — through shorts, hedges, and a constant focus on our North Star — are a down payment on better decision-making.

- Lower portfolio volatility lets you make your financial decisions deliberately, not reactively (steady breathing and a less sweaty brow are bonuses).
- When your temporal lobe kicks into auto-pilot, it can call upon past experiences to influence your response. In this way, practice makes perfect: The more volatility you live through, the better your brain can distinguish between volatility and a lion, and the better prepared you are for next time.
- Lower volatility means you're less likely to buy and sell hyperactively, keeping your transaction costs and tax consequences lower.

Making deliberate decisions, accumulating ever more experiences to call on, and avoiding "anti-returns" are all great ways to stay the course and stick to your financial goals. Adding our North Star to the mix reinforces that discipline by providing a constant fixture upon which to orient our focus.

Manage Your Portfolio's Volatility

We've written about behavioral economics (the study of common deviations from rational financial choices) on several occasions. (Clearly, we think it's important!) The budding field of neuroeconomics is bolstering the findings of behavioral economists by applying scientific observations to their results, and both groups are finding evidence that our brains and bodies are hard-wired to work against us in some situations. That means that without the proper defenses, well make bad decisions.

But fear not, *Pro* Fool — we've built those defenses into the *Pro* portfolio, and we're constantly refining our thinking to make sure they evolve as we do. Our portfolio is designed to dampen volatility via cash, shorts, hedges, and diversified business risks. If you're currently catching up with us, you'll have noticed that our Catch-Up Reports are focused on our long stock holdings. That's because we think you need a long portfolio in place before you begin using other strategies to protect it — so after our final Catch-Up Report is released on March 14, we'll issue a Portfolio Positioning Report that tells you how to short, hedge, and use options to match our exposure and general portfolio position, even if you can't or don't want to engage in every strategy we employ. **We'll release the Portfolio Positioning Report simultaneously with a live chat on Tuesday, March 19.** Whether you're a new *Pro* member or a wily vet, this report (and chat) should help make sure you've got the information you need to get aligned with all aspects of our portfolio.

Onward,

Bryan (TMF42)

Join Us on the Pro Tour

Published Feb 25, 2013 at 12:00AM

Fellow Fools,

This week's Monday Memo comes to you in video form, as Jeff explains what to expect from *Pro* over the coming few weeks. Click the player below to watch — the transcript follows!

Enjoy, and let us know your feedback (more videos? Fewer videos? More videos, but with Jeff wearing hats?) on the Memo Musings discussion board.

— The *Motley Fool Pro* team

hsa2FpOTrYw6s2gYEfXleJmZXOe9n9kH

Transcript

Greetings, *Pro* members, and welcome to this week's Monday Memo!

Will YOU Be the ONE?

On March 14, Motley Fool co-founder and CEO Tom Gardner will invite a few top Fools to **give up their *Pro* memberships** and join him in a premier "club" that gives you access to every wealth-building tool, product, and service we've developed over the past two decades — including *Pro*. **Only about one out of every 100 investors**

who apply will be able to join. To see if you qualify and learn more about this one-of-a-kind endeavor, simply click here.

I'm Jeff Fischer, advisor on *Motley Fool Pro*. First, I'd like to welcome our new members. We're delighted that you've made the smart choice to join. Here in *Pro*, we invest to make steady returns in any market. We aim to do this by owning shares of great companies — our "core holdings," usually numbering around 20 or so. But we go further than that. At *Pro*, we also hedge our portfolio to protect our results, and we sell short to profit on falling prices, whether it's a failing company we'll sell short, or a flawed ETF. Last, but certainly not least, we use options — primarily to generate steady income whatever the market does, but also to leverage our upside with much less capital at risk, protect against downside, and smooth out volatility.

This four-pronged approach in our portfolio, an approach that I've been developing for more than a decade, is what makes the Pro strategy such a robust and successful one over the years. And yet, it's simple enough for everyone. To review, we have:

- Core stocks, for long-term compounding
- Hedges, to protect our gains
- Shorts, to profit on falling prices
- and options to generate income, along with their many other advantages

Now, as new *Pro* members start to get up to speed with us, I want to thank our many veteran *Pro* members for helping them on the discussion boards. It has been outstanding to see so many great Fools helping other members on the boards, including — to name just a few — stamleo, RockyTopBob, fullofcarp and BlackLineVestor. Thank you, to these Fools and so many others, for your amazing work helping new members start to invest successfully.

That's obviously why the *Pro* team is here, too — we're here to help all of us reach our financial goals. We know the stock market doesn't always go up; in fact, the so-called "easy gains" of the last few years are sure to wane in strength, and at times the market will reverse. This is why we want to maintain an opportunistic and yet defensive portfolio. We want to own the great companies of our age, to grow value with these leaders over time; but we want to be positioned to have winners when the market falls, too, including our shorts and options; and, we want to see price declines as opportunities. That's easily possible when we have cash on the side, as we do today.

As I tape this, the Pro portfolio is 65% net long, with nearly 20% of our value in cash. We will welcome pricing opportunities, and put our money to work in new ones, whenever we see them. In fact, a few are in the works right now.

At the same time, we strongly believe in the stocks we own and currently recommend, so we expect new members to start to build a *Pro* portfolio to match ours. We'll help you every step of the way. New members should take advantage of the welcome materials we offer, starting with our two Buy First stocks — AIG and BMC — detailed in a special Catch-Up Report.

Next, on Feb. 28, in a live *Pro* event, we'll recommend our next handful of positions that should be bought and why. All members should benefit from this event. We'll send you reminders, but put Feb. 28 on your calendar. After that big day, we'll follow-up with more buys soon after, and then we'll help new members who want to get into our hedges and options, too.

All you need to do is watch your inbox for our guidance. And as you settle into *Pro*, at your leisure you can read our *Pro* Guidebook to see what we believe, how we invest, and much more. And finally, every member will receive our brand-new recommendations to their inbox as soon as we have them. Expect several in just the near future as we position the portfolio for 2013 and beyond.

As always, here in *Pro*, we will move with purpose, but at a reasonable, gradual pace. We invest to build real wealth over time. We're not interested in small short-term gains and losses that come at a high cost, eating up hours of our precious time every week. Instead, we're interested in steady, recurring profits that drive our portfolios ever higher over time, while letting us live our lives Foolishly. That's *Pro*.

To close today: Every Monday, you'll receive this *Motley Fool Pro* Monday Memo in your inbox. It's a great touchstone column (or sometimes video!) exclusively for *Pro* members. The Monday Memo shares our current thoughts, lists our recent trades, points you to great *Pro* community discussions, and recommends "Catch-Up Trades" that you can use anytime to get into a *Pro* position you lack. So, mark off five to 10 minutes every week to read — or listen to — the Monday Memo. It's a good investment, just like *Pro*.

Welcome again to new members! We're very glad you're here — we're glad you want a portfolio that doesn't *only* make money when stocks go up. And thank you again to veteran *Pro*s for welcoming new members into the fold. I look forward to investing very well together in 2013. We'll see you on the discussion boards, and we'll talk to you again soon. Fool on!

Guidance Changes

- **AmTrust Financial Services**: Fair Value rises to $33.50 from $30.45.
- **Rockwood Holdings**: The stock moves to Hold pending a review of earnings, the recent surge in share price, and management's statement that three divisions are up for sale assuming the right buyer.
- **3D Systems**: We're not making any official guidance changes, but the stock split 3:2. Our options on the stock did, too. Nothing changes, except our strike prices will adjust 3:2, along with the share price, our Consider Adding More price, and our Fair Value estimate.

Coverage & Community

- **All Tests Look Normal:** Bryan (TMF42) reviews earnings at medical devices giant **Medtronic**, which we rate a "Buy."
- **Rockwood Rocks the Rumors:** The company is willing to sell three of its five divisions. Jeff reviews results.
- **Meet & Greet:** Say hello to our new *Pro* members as they Foolishly introduce themselves!
- **Getting Started:** Remember when you were just starting out with *Pro*? Now's your chance to help our newest investors start off on the right foot. See if you can answer any questions — and thanks in advance from the *Pro* team!

Pro Trade Roundup

- **SPDR S&P 500** : Our February 22, 2013 $151 covered puts on our index hedge expired as income. We'll look to re-up the position.

See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

6 Ways to Fail at Being a Pro Fool

Published Feb 19, 2013 at 12:00AM

Fellow Fools,

With advisor Jeff Fischer (TMFFischer) returning from Costa Rica as we speak, I have the honor of publishing this, the first *Pro* weekly memo that many new members will see. First, I want to extend a sincere “Welcome to the *Pro* family!” to everyone who’s just joining us. The desire to help all *Pro* Fools invest better and achieve their financial goals — and thereby add a little value to the world every day — is what drives not just the *Pro* team but also many of our amazing members. As you get caught up with us, we hope you’ll see proof of this on our active, thriving discussion boards. There are some thoughtful people on the other side of the screen who spend their free time welcoming, tutoring, debating, teaching, and learning with (and from!) their fellow Fools, and over the years, we’ve genuinely become family and friends.

So in other words, it’s a good time to be a *Pro* Fool! And even better for my purposes, the most helpful topic for this space — how to get the most out of your *Pro* service — has already been written. Whether you’re brand-new or have been with us since 2008, if you’re reading this but haven’t already read the *Pro* Site Directory twice (or, fine, once, but *carefully*), you should click this link and ignore this memo.

Still here? OK, but consider: This Site Directory isn’t like the instruction booklet for your smartphone, or the manual for your car. After all, you already know how to make a phone call and drive a car — but while *Pro* might look like other Fool services you’re already accustomed to, we’re different, and the same rules don’t always apply. You’ll need the Site Directory to get acquainted quickly. Go ahead and get started here.

“Invert, Always Invert”

OK, now that everyone but you is flipping through the directory, let’s steal a page from Charlie Munger and “invert, always invert.” I’m going to detail the easiest ways to fail at being a *Pro* Fool. If we can avoid the common mistakes, we can also improve the outcomes.

1. Use market orders and good-'til-canceled market orders.

Pro members can move the market for a stock or option for several days after we issue a trade alert, so we always recommend using a limit order (which allows you to set a specific buy/sell price). If you want to ensure that you, and others, pay too much, ignore our limit-order guidance and place market orders (which are executed immediately at current prices) instead.

Also, *Pro* is many members’ first experience with options investing. If you’d like to give up a bit of your income so your favorite market maker gets a healthy raise, you should use good-’til-canceled market orders for your options trades. Unlike ordinary orders, which expire at the end of the trading day, good-’til-canceled orders will stay open until they’re filled — and that means those poor enterprising market makers, who stay late to trade after hours, can take a portion of your profits.

2. Over-bet and over-leverage.

If we recommend a mouthwatering investment opportunity, why not invest more than we suggest? You’re more aggressive than *Pro*, after all. Besides, we’re probably understating the reward and overstating the risk, so you can safely ignore our recommended allocation. The same is true for the leveraging power of options; if your portfolio is smaller than you like, just apply more leverage by writing more puts than you can afford. You always have time to start over, right?

3. Only buy our Buy First stocks.

Currently, our portfolio features two Buy First stocks and 16 Buys. If Buy First stocks are the best place for limited capital, isn’t it even better to *only* buy into those stocks and ignore our upcoming Catch-Up Reports, which will help you establish positions in the Buy stocks? For investors who want to have a very un-*Pro* experience, two stocks is diversification at its best.

4. Wait for better prices for our Buy stocks.

Most of the stocks in our portfolio are trading above the prices at which we initially bought shares, so investors looking to miss out on future *Pro* returns should wait until they fall back to our original prices. Such un-*Pro* investors realize that if these were really good buys at this exact second, they’d be Buy Firsts, so why put money toward them now? To these investors, the *Pro* team isn’t managing a portfolio, they’re picking stocks — so it’s OK to buy a few of the ones you really like and expect to get the same benefits as someone following the portfolio to a T. Plus, you still have a bad feeling about this market, and everything will be cheaper soon. You’ll be right this time.

5. Don’t participate

Be a wallflower! Just sit back and observe. Don’t buy into the *Pro* portfolio; taking control of your investing probably isn’t as much fun as it looks, anyway. And for heaven’s sake, please don’t ask or answer questions on the discussion boards. Who has time to learn new skills, achieve better returns, and enjoy some camaraderie?

6. Focus on beating the market

Focus only on beating the market and ignore our North Star. The market is a perfect reflection of your financial goals; when you beat the market, you’ll be able to fund education accounts, pay off the mortgage, retire early, and generate a healthy income in retirement. Plus, everything in life is a race. Steady returns and income-producing tools that beat out inflation have no role in reasonable investors’ tool boxes — ignore them.

The *Pro* Way

By following those six easy steps, you too can ruin your *Pro* experience. But we think it’s more likely that as a *Pro* Fool, you’ll sidestep those mistakes, instead following our guidance to the extent that makes sense for your portfolio. After we close our doors to new members this week, we’ll bring you additional Catch-Up Reports to get you invested alongside us in a sensible, measured manner (and provide some updated thinking for veteran members). Together, we’ll be on our way to earning North Star-like returns.

If you're new, welcome to *Pro*. Either way, we’re very glad you’re here.

Fool on!

Nick (TMFCrow)

Coverage & Community

- **Ubiquitous Bryan:** TMF42 covers earnings for three *Pro* holdings — **AmTrust Financial**Q4 2012; **Broadridge Financial Solutions**Q2 2013; **Pacer**Q4 2012.
- **To CAM or Not to CAM:** A great discussion on *Pro*'s new Consider Adding More price.

Pro Trade Roundup

- **SPDR S&P 500**: February $140 and $145 puts expired.

- **Pebblebrook Hotel Trust**: Sold all shares at an average price of $24.53.

The Motley Fool owns shares of Pebblebrook Hotel Trust. See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

"Invest Like a Pro" Live Event

Published Feb 12, 2013 at 12:00AM

Don't miss our upcoming LIVE event for new *Pro* members (current members welcome too, of course)! On Thursday, Feb. 28 at 1 p.m. ET, Jeff and the *Pro* team will release our second catch-up report for new members — and then answer your questions on video and via a live chat. If you can't participate live, don't fret; the Catch-Up Report and archives of the video and chat will all be available on the *Pro* site immediately following the event.

The live event is a great chance for new and veteran members alike to get to know the *Pro* team and ask your burning questions about the service, how to align your portfolio with *Pro*'s ... anything at all. We look forward to "seeing" you on this page on Thursday, Feb. 28!

"Invest Like a Pro" Live Event

Published Feb 12, 2013 at 12:00AM

At our live event on Thursday, Feb. 28, at 1 p.m., Jeff and the *Pro* team discussed our second Catch-Up Report for new members and answered your questions on video and via a live chat. Relive the magic below!

Watch the video (the transcript is at the bottom of this page):

Transcript

Danny Hsia: Hello Fools, welcome to the Motley Fool *Pro* member chat. My name is Danny Hsia. I'm the publisher on the Motley Fool *Pro* service, and I'm here with an amazing team. Folks, introduce yourselves, please.

Jeff Fischer: Thank you, Danny. I'm Jeff Fischer, advisor on *Pro*.

Nick Crow: I'm Nick Crow, senior analyst on *Pro*.

Bryan Hinmon: And I'm Bryan Hinmon, analyst on *Pro*.

Danny Hsia: And of course, if you're familiar with our process here, right here you're watching us on the live video stream and below the stream you will see what you're familiar with also, which is the text portion of the chat. That's being manned by our illustrious editor, Ellen Bowman, as well as a few other former *Pro* analysts in Jim Mueller and Alex Pape.

Just to set up the hour that we have with you today, for the first probably 15, 20, 30 minutes, we will discuss the Catch-Up Report, which if you are new to Motley Fool *Pro*, and welcome, you would have received an email just a few minutes ago. It's called Catch-Up Report Number Two. It's very creatively named, and we're going to go through the Catch-Up Report. The guys here will talk about the three specific stocks in the Catch-Up Report and what action you should take. Then after that, we want to makes sure Nick and Bryan are able to get to the text questions, because we know not everyone was able to watch or listen to the video stream, so they'll be taking off, heading back to their computers and answering questions and then Jeff will have the unfortunate luck of being in the studio with me for the rest of the hour.

Jeff Fischer: Perfect. And we'll answer as many questions as we can during that hour too.

Danny Hsia: Exactly, we'll also answer as many questions during that time here on the stream. Now you guys want to say hello, say hello to the new members, say hello to the veterans?

Jeff Fischer: It's a great pleasure to welcome you again, new members, and to see you again, veteran members, whether you've been with us since 2008 or any year to follow, we're very glad you're here. We're looking forward to a very good 2013 together, and it all starts right now with these next investing steps that will then lead to more steps next week and so forth. It's all in process. Thank you.

Danny Hsia: Now Nick.

Nick Crow: No, we might as well get started. I know how these live chats go and the questions are rolling in and I can't answer them, so …

Danny Hsia: Sure, well let's get started. So I mentioned the Catch-Up Report number two, so if you're new to Motley Fool *Pro*, when you joined us you should have gotten a link to go to the site and from the site you would have seen a link to the first Catch-Up Report. Nick, why don't you tell us what's the point of these Catch-Up Reports? Why do we have them?

Nick Crow: Well we've been running the *Pro* Portfolio since 2008 and there are lots of wonderful positions there that we want to get our brand new members invested in, and sometimes that's difficult for them to do because they have an existing portfolio and they don't know how do I get started? Are these things still okay to buy? So we write up these reports to let you know, yes, in fact they're okay to buy. It says how much to buy and this is why we like them now at the current prices.

Bryan Hinmon: It can be a little overwhelming at first to walk into a new portfolio, right? You come to *Pro* the first time, you go to our portfolio recommendations page and you see a list of 25 long holdings, four or five short holdings and a handful of options positions. So the Catch-Up Reports are really designed as a systematic way to get new members comfortable with what we own and why we own it.

Jeff Fischer: Yeah, imagine the portfolio as a river that's moving along at a really good pace. We're helping new members step into it where it's very shallow and gradually work their way into it until they're swimming along with us for all the years to come.

Bryan Hinmon: Yeah, a more violent way to look at that is merging onto a super highway, right? What we're trying to do is give members a reasonable merge, an on ramp.

Danny Hsia: Especially if you get one of those guys that are going 40 M.P.H. in the right lane and there's no way you're going to get into the left lane, right?

Jeff Fischer: See, I like the rive analogy.

Nick Crow: I do too, and we once got to drop Jeff in the river out of raft in a very abrupt fashion, so he's sensitive to merging people into the river gradually.

Danny Hsia: And he let you guys back on the team.

Nick Crow: He did.

Danny Hsia: Like we mentioned, we've already released the first Catch-Up Report, which for new members you received when you joined, and just to make a quick point for anybody that's an existing member, if you haven't seen these Catch-Up Reports, just head to the guidebook tab on the *Pro* site and you will see a link to all of the Catch-Up Reports, so you can access those Catch-Up Reports there.

Now the thing we want to make sure we stress is the stocks in any Catch-Up Report are already existing recommendations that the team has made and you should have already seen as an existing member. This is really geared for the new members, but of course as an existing member, feel free to look.

Jeff Fischer: Yeah, it's a great reiteration of why we own what we own, why we believe in it. The first report, Danny, as you mentioned from a week or so ago, was to buy AIG, insurance giant AIG, and BMC Software, which is a software provider, obviously. Two companies we really believe in at current prices, and so they were our two Buy First Stocks. we told you exactly how much to buy in each one, and now we have three new stocks that we're going to recommend to all members to buy in the allocation we recommend, if they don't already have it.

Danny Hsia: And that's a great segue. So we mentioned there are three stocks in Catch-Up Report number two. Let's get right into it. The first one, Gentex, and Bryan, I believe you know the most about this one or this was the one you researched the most, so why don't you tell us a little bit about it.

Bryan Hinmon: Yeah, absolutely. The way I think about how recommendations come through here is the more boring they are, the more likely they are to be one of my selections.

Danny Hsia: This is personal for him, as well, just in life. No, that's not true.

Bryan Hinmon: Fits my personality well. Yeah, very quickly, Gentex operates in the very exciting business of making mirrors for automobiles. Now many people would not think that making mirrors, or any auto part for that matter, is a very good business, but Gentex is really a freak of nature. The company started making smoke detectors. It was in that business for a while. That's obviously not a very good business.

Throughout its entire history, it has invested a lot of money in research and development. Early in its years, that research and development turned out the, somehow they generated the ability to create dimming mirror technology. They kept going with that and in 1987, they were the first to figure out electrochromic mirrors, which basically is a way that takes a reflective mirror and dims it appropriately so that you can; its reflective properties aren't impacted.

So this obviously comes into play when you're driving on the road and someone comes up behind you with their lights on. Their lights go through your rear windshield, bounce off your mirror and they blind you, so it's a safety concern. So Gentex mirrors solve that problem by when the light comes through, the mirror automatically dims to the appropriate level so that the reflection remains clear and you remain safe.

Danny Hsia: You seem very concerned with highway safety today.

Bryan Hinmon: You noticed that I linked to that, right? I'm trying to scare…

Danny Hsia: Highway safety awareness year, is that right?

Bryan Hinmon: I'm trying to scare all of our members onto this highway safety thing so that they rush out and buy cars that have Gentex mirrors in them.

Nick Crow: Excellent.

Danny Hsia: So they're benefiting themselves.

Bryan Hinmon: Yes, precisely. So anyway, these mirrors are better than standards mirrors, but as it turns out, the adoption of them has taken a while. So they introduced it in 1987; today almost 50% of new cars in the United States have these auto-dimming mirrors. Worldwide it's only about 23%. So that adoption we think worldwide, where it stands at 23%, can ultimately get somewhere close to where it is in the U.S. now. And it's important to know that adoption in the U.S. is still growing. Over the past couple of years, Gentex has picked up a couple percentage points of penetration from about 45 closer to 50. So we're coming off of really low car sales. People are putting more of these mirrors in cars, and then we have this global focus on safety where more Gentex mirrors are being put into new models.

So there's a long runway of growth for Gentex. The company is incredibly competitively advantaged, too. It has eight times more market share than its closest competitor. So it invented the technology, it's eight times bigger than its next competitor; it sells the most units and sells them at the best cost. So it's in a really good position to sell to auto manufacturers. And because of its cost advantages, it earns really good returns on capital and profit margins. This is very uncommon for an auto parts supplier, so this is really, Gentex is really a diamond in the rough.

Jeff Fischer: And Bryan, I'll add that Gentex, those following Wall Street closely and Gentex even closer, recognize it as a quality, premium company and historically it's been giving us a premium to the market regarding its valuation. In the past year when we started to buy it, shares had come down to a price where we found them especially attractive and that remains the case today.

Bryan Hinmon: Yeah, that premium valuation was the result of, like I said, the company's ability to generate big profits and high returns on capital, but also because you've got this sort of dual growth trajectory of more cars being made and sold every year and more cars adopting this mirror technology, the company has increased sales close to 20% over a 20-year period. That's really, really remarkable. Few companies are able to compound their sales growth at that high a rate over time. if global penetration can get anywhere close to where it is for the U.S., we see no reason that that shouldn't, that double-digit, close to 20% growth, shouldn't continue for another decade plus.

Jeff Fischer: Right, and what we love too, Danny, is Gentex continues to innovate. Their research and development budget is very healthy and they're working on things, of course, such as auto-dimming side view mirrors, smart beam headlights.

Bryan Hinmon: I want to tell our members as soon as the chat is over, don't do it now, but as soon as the chat is over, go to YouTube and search for "Gentex Smart Beam" and watch a couple of the videos there. The Smart Beam technology is really pretty cool.

Danny Hsia: And is it something that no one else has?

Bryan Hinmon: It is something that no one else has, so the mirror has also become a home for different technologies. So for a while there, you know how mirrors had sort of cardinal directions, like you said. You're going north; you're going south, right? Now it's being homed to, because we look at the mirror so frequently, it's a great place to communicate with the driver, so more and more technology is moving on to the mirror.

So now you're seeing things like road sign recognition, so it tells you that, Hey, the speed limit changed or it's saying, Hey, there's a car ahead of you or, Hey, you just ran out of your lane; what's going on, right? So all of these technologies are; Smart Beam is really cool. Smart Beam is a forward-facing camera that senses everything around you, so there have been all sorts of studies shown that say drivers do not use their high beams and low beams optimally. And so having this camera look forward, it automates the use of your high beams and low beams, so it senses cars in front of you and turns your low beams on instead of your high beams.

And it also senses curves in the road and will move the headlights so that you can sort of see better around those curves. So it's all safety driven, all technology driven, and it all focuses on a better mirror.

Nick Crow: Now I like this, but you were talking about communicating with the driver, and my daughter starts driving in the next few years and I think what she'd really like is like her Twitter feed and Facebook up there, so how long till that happens?

Bryan Hinmon: Well this is why I feel good about knowing that the company is focused on safety improvements.

Nick Crow: Not going the other way.

Danny Hsia: Distraction improvements? That's an oxymoron, right?

Bryan Hinmon: And Danny, the last thing that we really like about Gentex is it's really conservatively managed. The company has no debt, has $4 a share in cash and it's a $19 stock. So it's very conservatively managed and that's important in this industry because as we saw a couple of years ago, auto sales can fall off a cliff and bad things can happen. Not only did our automakers almost go bankrupt or some did, but the auto parts suppliers also had to be bailed out by the government. Gentex sailed through that smoothly. Their sales went down, but they were never in any sort of financial duress.

Nick Crow: We've mentioned that they bought back shares during that period of time, which shows you a management team who's built a business that they're incredibly confident in, even while sales are dropping.

Danny Hsia: That's a good kind of long-term signal, right?

Nick Crow: It's phenomenal, when shares are down and sales are down and you're able to deploy capital into your own shares, it was a really smart move.

Bryan Hinmon: Yeah, management has only bought back Gentex shares three or four times in the company's long history. Each of those, until this recent one, which we don't know yet, each of those has proven to be a really, really smart time. So they're very discerning about when they buy shares back, but they have started buying shares back recently.

Jeff Fischer: And one more quick thing, I don't believe we touched on, Danny, is they also provide rear camera display in their mirrors themselves, which is of course…

Danny Hsia: Right, so you can see as you're backing up from the…

Jeff Fischer: And eventually we don't know yet exactly when the law will pass, but eventually all cars are going to be required to have that sort of display. Bryan, can you quickly tell members how much we believe they should allocate to Gentex, and then add on to that how much we're comfortable with we may add more at other prices. We're always thinking in two steps.

Bryan Hinmon: Yeah, absolutely, sure. So the allocation will bounce around in the past couple days, so I might not get this exactly right, but I think the recommended allocation we put out was 2.7%, so 2.7%. We have purchased Gentex twice now. As soon as we bought it, the company came out with some bad news and the shares got hammered and we jumped in and rebuilt our position there to about 2.7%.

Personally, when I'm looking at a business for the *Pro* portfolio, I like to assess whether or not it's a really, really high quality business or if it's just a really, really good value. Really, really high quality businesses are ones that we're willing to make oversized positions. I look at Gentex and see it in that mold. This is a very, very high quality business that could one day be an oversized position in PRO if the price was right.

So a normal starting position for us is about this, 2.7%. But if we get the opportunity to buy shares really attractively, we would absolutely bump this up to I'd say probably four or five percent.

Danny Hsia: Folks, I think if you're playing along at home and you're looking at the Catch-Up Report, that information is all, of course, in this Catch-Up Report, and if for some reason you lose the link to the Catch-Up Report or you want to look on the site, it's also available on the site. So you can find these things from your email and on the site, so just make sure you check all those places if you're not able to find it.

Bryan Hinmon: The specific guidance for Gentex was buy 2.7% at about current market prices, which is about $19 a share.

Jeff Fischer: Yeah, it's a good price, great starting allocation that we can always add to if we decide to.

Danny Hsia: Okay, are we good on Gentex? Are we ready for the next one?

Bryan Hinmon: I'm good.

Danny Hsia: Okay, now if you're looking at the Catch-Up Report, the next company's Intel, but we're going to hold off because Jeff is going to detail Intel for us, but we'd like to get Nick to talk about MasterCard and then once they're done, we'll let Nick and Bryan get back to the text portion of the chat.

Nick Crow: Do you want to get to the text portion now?

Danny Hsia: No, no, you don't have a choice. I'm sorry; you do have to cover your company.

Nick Crow: No, no, if he wants to, since I'll be covering this one.

Danny Hsia: No, let's let Bryan hang out. He can ask you a couple of questions…

Bryan Hinmon: I've got to grill you on MasterCard.

Danny Hsia: So Nick, please tell us about MasterCard.

Nick Crow: Well I didn't want to say this while Bryan was here. MasterCard is much more interesting than Gentex. And much easier to explain, because members at home are probably very familiar with MasterCard.

Danny Hsia: Rear-facing…

Nick Crow: Rear-facing payments, no. So MasterCard brands and markets, the MasterCard label and banks license this from them basically. They set up an agreement to put the MasterCard label on their cards and then the MasterCard transactions go over their network. This is a beautiful business, so essentially they get a cut of every single transaction that goes over their network. That's phenomenal business.

We talk about toll roads, Buffet's made them famous, financial toll roads are awesome because it doesn't take a lot to set them up; well actually it takes a lot to set them up. Once they're set up, it doesn't take very much to grow the business. You just have to sign up new customers, increase card penetration, which one way to think of that is wallet share.

You want more of your cards in people's wallets than the next guy, and all of that can be very difficult and very competitive business, if your biggest competitor didn't suck. And I just hate to say it, but the biggest competitor isn't Visa; they're actually great also. The biggest competitor is cash. Around the world, 85% of all those types of transactions are still handled in cash, and so that's who you're beating. And when you realize right now that in some countries, it's not always safe to carry a large amount of cash with you. If you're a merchant, you would like to receive payments quickly and cash is great, but as a parent company, taking cash from all of our little outlets and moving them back to the parent company, that costs money also, so it's really nice if you just handled it all electronically.

Bryan Hinmon: Danny, we really like how CEO, Ajay Banga, has framed this competition versus cash versus Visa. He has declared a war on cash. We love it.

Nick Crow: The war on cash is a wonderful way to think of this. So we have a bunch of different warriors. Some have the banner of Visa, some are MasterCard and I like all of them. We have American Express out there too; another wonderful company that we've taken positions in over time, but this in particular here, this is a beautiful business that earns very, very high returns on capital and very, very high profit margins.

They're actually ridiculous, the profit margins that MasterCard's able to earn. And anytime a business earns that type of profits, you always have the eye of regulators, and so the primary risk we always have here are governments taking a look and wanting a larger cut or worried about whether or not competition is even and who's getting most of the value over these networks, and that's going to remain a risk going forward, but MasterCard's navigated that wonderfully, and we expect to see those bumps in the road in the future.

And what's so great is the business is so wonderful and it's providing such a great service and making transactions easier, that we'll continue to profit no matter what happens on that level, short of something that really would make no sense. They'll take those in stride.

Danny Hsia: Great.

Jeff Fischer: Another point, just to make, Danny, is that I believe Nick and I have both followed MasterCard since it came public in 2006 or 2007, so we know it extremely well.

Danny Hsia: Which really surprised me. I really just would have assumed that MasterCard had been public. I mean how long has Visa been public?

Jeff Fischer: Even less time than MasterCard.

Nick Crow: So these were all held under the banks.

Danny Hsia: That's why I don't do these stocks (unclear) and these guys do.

Nick Crow: The banks owned these networks.

Danny Hsia: Okay, I get it, I get it.

Jeff Fischer: So we know them extremely well. We've watched them slowly improve their business, the public-facing side of the business. They came out with an extremely strong business, but they've been slow to reveal exactly how strong their leverage is for the reasons that Nick just mentioned, regulation and whatnot. And they're also still investing in their business because there's so much more room to grow. Nick's exactly right. The vast majority of transactions are still cash, and cash at its basis, is less safe, less transparent, there's less record of it. I think everything in our lifetimes, nearly everything is going to move, certainly in this country and in many parts of the world, to digital transactions, and you need a trusted network and a worldwide network to handle those, and that's where MasterCard, Visa and AmEx are really in the sweet spot there. They have these established networks that all the vendors are plugged into and that all the banks are plugged into and support, so you hear a lot about competitors coming in and disrupting these three giants, but that's very unlikely too. PayPal depends on these networks as well.

Danny Hsia: Right, you can't pay unless you've got…

Nick Crow: There are literally thousands of little payment processors popping up and oftentimes what you see is that some of them are getting financed by the MasterCards and Visas and those types of businesses too.

Danny Hsia: So they're smart enough to kind of get that relationship with these small groups ahead of time.

Nick Crow: Yeah, and you don't tend to hear about those investments upfront. You hear about them once they're kind of paying off in some of those other markets and they kind of are brought under the fold, but they're investing lots of different digital payment networks that go across cell phones and mobile payments primarily is where that innovation has been occurring. But they're wonderful businesses who are going to smartly manage the future as well.

Danny Hsia: All right, sorry, Jeff, go ahead.

Jeff Fischer: No problem. I think one kind of side point that newer members will realize soon enough, but that I'd love to say right now is that in *Pro* we seek to make great money with companies we've known a long time. Bryan has known Gentex for a long time, many years.

Bryan Hinmon: Yeah, close to a decade.

Jeff Fischer: Close to a decade. I've known it nearly that long too, but Bryan's really studied it closely. Same with MasterCard. The company I'm about to talk about, Intel, everyone's heard of it, but I have studied it and known it since the mid-nineties, so nearly, hmm, nearly 20 years.

Danny Hsia: Oh wow. The mid-nineties was almost 20 years ago.

Jeff Fischer: Everyone will tell you, whether it's Warren Buffett or Tom Gardner, you make real money by knowing companies very well and staying with them as long as it's justified, as long as it's merited. We'll have many, many new names come into *Pro*. We always do. Last year we had more than half a dozen, maybe eight or nine new names come into *Pro*, so we'll always have that. And even in those cases, a lot of those names are ones one of us has known for a long time; it's just new to *Pro*.

But the point is, we're going to make very good money by sticking with companies that we know inside and out…

Danny Hsia: And have for a long time.

Jeff Fischer: And have for a long time. And then when we see really great ones that are worth bringing into the fold, we of course do that too.

Danny Hsia: Okay, well so if we…

Male: Let's just review the guidance of today.

Danny Hsia: Yeah, I was going to ask you to review the guidance, and actually I just had a question come in. I wanted Bryan, before you and Nick leave, there was a specific question about Gentex, so I'll just ask that to you after we're done with the guidance on MasterCard.

Nick Crow: Yeah, so to round out MasterCard today, we, in our Catch-Up Report, we're suggesting you take 4.1% of the funds that you're allocating to *Pro* and invest in MasterCard at today's prices. It would be around $515. You can see big dollar changes in MasterCard's price. It might go from 515 to 520, and five dollars seems like a lot in other stocks. That's not a lot in MasterCard because the share is over $500 a piece, so keep that in mind. We're happy at current prices, 4.1% of your money.

Jeff Fischer: And keep in mind, Fools, 4.1%, if you round it to 4% or even up to 4.4%, whatever works for you, just keep it close to that allocation if you really want to mirror our portfolio and our exposure and our hedging; keep it close to the allocation and regarding the odd lots, if you can buy a hundred shares or in 100 share lots of Gentex and it keeps your allocation still close to what we want, then do that because we may use options on it in the future. MasterCard we're much less likely to use options on it.

Nick Crow: Yeah, you'd need over a million dollars to be making that type of purchase in MasterCard. And to his point, there will be some rounding because if you have a more modest portfolio, maybe you're deciding between two or three or four or five shares of MasterCard and so your allocation won't be able to hit that 4.1% mark exactly, don't worry about it. Just get as close as you can.

Danny Hsia: Awesome. Folks, this is such amazing information and this is mostly for the new members; not the only time you're going to get this sort of guidance. You're getting this all the time, every day from this team, so you're really in great hands here.

So Bryan, let me get to this question for Gentex and then Nick, I'm sorry, we don't have a question for MasterCard specifically yet, but I'm sure one will come in. The question was from the text chat from Susan. She wanted to know if the headlights hit a traffic sign, do the high beams adjust down? This technology was used on higher end vehicles many years ago and kind of, sort of worked.

Bryan Hinmon: So the headlight adjustment, so I'm not a smart beam expert, but, the headlight adjustment has to do more with identifying vehicles.

Danny Hsia: Okay.

Bryan Hinmon: Because it's been a long time since I took my driver's test but driver rules say that you have to turn to low beams when you get to within so many hundred feet, right? The processors in the camera and the mirror do that calculation for you. They identify the car in front of you and flip down to low beams in the appropriate way. It's a slightly different technology used for the street sign, road sign identification. It doesn't really have anything to do with the headlights it has to do with the camera coming out.

Danny Hsia: That there's a street sign coming up.

Bryan Hinmon: Correct. Correct. But highly, highly recommend going to watch the videos. Gentex actually has a YouTube channel and so you can get more information on just the base mirrors and the smart beam technology as well as the RCD the rear camera display. And even more entertaining than that, YouTube videos around the MasterCard "Priceless" campaign.

Danny Hsia: So, gentlemen thank you very much, you're welcome to stay or head on over...

Bryan Hinmon: We have to answer questions.

Danny Hsia: So Bryan and Nick will head over to their desks and you can enjoy them digitally on the text portion of the chat and in just a few moments we have our video producer Gail coming in to adjust the camera angle. Now Jeff, while she's doing that, why don't we get into Intel.

Jeff Fischer: Right, a name we all know and some may love. A name that's in many of our computers at home.

Danny Hsia: Sure.

Jeff Fischer: Intel is the largest microprocessor manufacturer in the world and by far the most advanced. It's always a generation or two ahead of the competitors which are generally processor foundries that are located in Asia that produce chips, processors on a mass level for outside customers. Intel owns all that in-house. They own the best processor manufacturing facilities in the world by far and they produce all their own product of course and sell mainly to PC client-based manufacturers, computers, servers, things like that, for data centers, for what you have right there.

Danny Hsia: An iPad and a laptop right there.

Jeff Fischer: Now Intel, you might be surprised to learn that revenue fell 1% last year. Tiny bit (unintelligible) to stay right at its record level of $53 billion which, in the years prior, it had never reached $40 billion a couple years ago. So Intel's much larger on revenue and income than it was a mere three years ago and yet all we hear in the media is the death of the PC. The PC's going away. The PC is not going away. What is happening is our computing devices are evolving. Intel believes, and we happen to agree, that the tablet is not in its final form. There will always be inexpensive tablets that basically just do what the current tablets do which, kind of media consumption. But a lot of people are finding, and we see this around the office Danny, that they want more from their tablet. A lot of people are now reconstructing laptops. They buy a tablet and then they buy the keyboard to attach to it and even a mouse...

Danny Hsia: Before they know it, they have a laptop. It's just not all in one piece.

Jeff Fischer: Exactly. So I think Intel recognized that or got lucky, but either way, what Intel came up with a few years ago was the Ultrabook and they're now shipping, I want to get the number right, it's hundreds, it's much more than a hundred, I have it right in here somewhere. Hundreds of Ultrabook models are shipping now and what these are are a laptop PC, but a lot of them have touch screens like the tablet and a lot of them have screens that come off and you can walk away with as your tablet, so it's the combination product. And thanks to technology becoming smaller all the time, they're extremely light, they can compete with a tablet on size and weight but they're much more powerful than a tablet in processing power and speed, even. So, long way of saying, the number of computing devices that we're all using is growing rapidly and to call things "PC" or "tablet," that's kind of going to merge together. There are going to be all kinds of devices. The name doesn't really matter as long as Intel's processors are in more and more of them. And as the market continues to expand, Intel is now positioned, for the first time, starting last year, they now have products selling to tablet, smart phone, PCs, Ultrabooks, of course, servers, everything that's out there right now they have a product for that's competitive and powerful.

Danny Hsia: And are they, obviously they're focusing on this kind of hybrid tablet-laptop-PC you're talking about but are they just sort of maintaining status quo and there are other areas where they've traditionally (interrupted) or are they doing more?

Jeff Fischer: In the other area like PC in general where those are becoming less important, cheaper models bring in less profit for Intel, so they're really focused on Ultrabooks which are is another way to say a laptop that's superior to ones of the past. And Intel's newest chip, the Haswell chip will launch this year and it will bring the most meaningful performance improvement to PCs, whether it's an Ultrabook or maybe a tablet, since 2003. The best improvement in battery life since 2003, all other kinds of improvements. So they have not backed away at all from just trying to provide the best product they can, whatever the end computational device is. Smartphone standing, they have now chips that compete with ARM Holdings which is the main competitor, on all the various measures you care about--performance, battery life, speed, heat. So, yeah, they're competing on each product level.

Now obviously Intel was slow to get into mobile devices. Part of the reason was that it wasn't profitable in the past when they were just ramping up and they really wanted to continue to lock down their lead in computers and servers. Servers are where they make the highest margins, the most profit and where they're really unmatched right now. PCs, they still have 80% market share. And PCs, the other thing is, in the Catch-Up Report, I hope I'm not rambling too much.

Danny Hsia. No. No, no. Keep it up. That's okay. We've got a lot of questions to get to but go ahead.

Jeff Fischer: PCs, their volume just keeps soaring in China, which is now the biggest PC market in the world. In Brazil, which is becoming one of the biggest markets in the world, I think it's Top 3. And in North America, they're all flat, down maybe 3% last quarter. So it's not dropping off a cliff.

Danny Hsia: That's surprising to hear that, I would have thought that would have dropped off more.

Jeff Fischer: And especially in the face of all the hype around tablets the last couple years and I think that did draw away from PC sales. Everyone wanted a tablet. We bought everyone I know in the office who wanted one, got one, because they're affordable and a fun new thing. But when you put that down and look at what you need to do with a computing device, you come back to your laptop a lot of times. And a lot of us have laptops that are five, six years old now. I do. And we need to refresh. And we're going to go back to these laptops that are very small and slim. The best of a tablet and the best of a PC combined now. And I think that sales are going to at least stay stable if not go up over time.

Danny Hsia: Great. Well, do you want to let the folks know about the guidance for Intel?

Jeff Fischer: Guidance. We have a full position in Intel. It's a 5.1% stake. So about 5% actually now, flat. 5% stake. It's below our "consider adding more" price, so it's a great price to buy it for newcomers. And if Fool's don't have a 5% stake, they can up their allocation to 5%. We're already at 5% so we're going to stick with that.

Danny Hsia: And just to clarify the "Consider Adding More" price, that's what you'll see when you're on the recommendations tab at the *Pro* site for whatever holding you're interested in. That's basically your guidance, the team's guidance on what the price needs to be or near for a member to consider adding more.

Jeff Fischer: Exactly, thank you Danny. So we start with an allocation. We have a current allocation and then we have a "Consider Adding More" price where if the stock falls below that price, we then, it kicks in automatically a thirty day period where the team reviews it and decides whether or not we want to add as a service, more to that position. And then we let you know within that thirty day time period with a trade alert or an update saying "No we're not going to add more now and here's why" or "Yes, let's up our allocation to 5 percent again." So it's a great way to keep all our positions meaningful. We really only want to own things we believe in strongly and then we want to own enough in each to make a difference.

Danny Hsia: Okay. Great. Anything else to add for Intel?

Jeff Fischer: No, I think, I hope all members will read the report and then ask any questions on the Intel board. Let's get to as many questions as we can.

Danny Hsia: Sure. We'll do that right now so we, folks we've got about thirty minutes left on the live stream. And just to reiterate Jeff's point, so we've just gone through Gentex, Intel, MasterCard and then Intel and these are the three latest buy now or buy stocks the team would like you to add to your portfolio in the second Catch-Up Report.

Jeff Fischer: And it makes sense Fools that we're buying larger companies for the most part. As you start to build up a portfolio, it makes sense to us that you start with big blue chip companies. And then over time in the next couple weeks, not a very long time, we'll work in smaller companies and then, once you have a so-called "bullish" or "long" bullish portfolio, then we'll guide you into the hedges and options for those who want to do hedges and options.

Danny Hsia: Which you don't have to do but if you want to you can.

Jeff Fischer: Yes.

Danny Hsia: And like Jeff said, you will be getting more guidance especially for you new *Pro* Fools. And again, for existing *Pro* Fools that have been here, these are all companies that you should be familiar with or at least have seen recommended. And again you can get to the Catch-Up Report either through the e-mail we sent out shortly before the event and from the *Pro* site under the Guidebook tab. Okay let's get to some questions, we have a really really good list here.

Jeff Fischer: Great.

Danny Hsia: Thank you for, to our editor Ellen for queuing these up for me. Let's get right into it. A question from TorFool, I believe it is. "I just sold off my former pre-*Pro* portfolio and am sitting on cash ready to buy the stocks and options to mimic the *Pro* portfolio. I've already bought the first two buy recommendations a week or more ago. My question is, with the market near a record high today, what should I begin buying? Certainly not today. What strategy would you suggest?"

Jeff Fischer: Great, so you're in mostly cash, so you're very well hedged already. Cash is a great hedge. And yet, you're missing up side. What we always try to find in PRO is a balance where we have strong up side exposure and we're hedged, because our goal is, of course, returns in any market. So your hedge is all your cash. You could start to steadily buy and it's great you bought our first two buy first stocks and now today we're recommending these three. So start to buy these. Two of them are, well, one's four percent and one's two point seven percent and one's five percent, so that's about eleven percent of your cash. If that's too much for you to invest right now, do half now and half a week or two from now or whenever you're comfortable doing it. But the goal is we're giving you this roadmap with allocations so that you can get to it at a pace that's comfortable for you and for your situation. A lot of members will point out tomorrow that the sequestration may begin, so we don't know, honestly, how that will go. Prices could be much higher tomorrow for some reason. The market surprises you half the time. Or prices could be much lower tomorrow, or they could do nothing. And so we're not trying to manage for daily prices, we're trying to make investments now that we think will make money over the next year and the next two and the next three and so forth.

Danny Hsia: Great. Next question. This is a little more of a general question that we certainly get from *Pro* members, especially new ones. It's from PaulUC. "Will we be doing a lot of shorting? My account may not allow shorting. Is there an equivalent strategy to use?"

Jeff Fischer: Paul, there's almost always an alternative strategy that we offer in the recommendation in the trade alert itself. If we're shorting something directly, usually you can buy put options on it instead which is identical to shorting with sometimes even identical costs, maybe a little bit more cost sometimes for the put itself. The short answer is there are alternatives and to date we have not done much shorting, we have chosen not to since 2008, 2009. We've always had some hedges and some shorts but we haven't done that much because of the prices we see and the opportunity we see. So the answer to your first question, will there be a lot of shorting, that really depends on what the market gives us. If the market looks overpriced, our shorts will increase. If we continue to see bullish opportunities, we'll stay in mostly bullish, that's paid off well since we launched. But we will always have an alternative to a short whenever we can.

Danny Hsia: Great. Okay, question from G Burke. I've been a member for a little while and pretty much in sync with the model portfolio but he or she does point out "except AIG, I hate those..." I'll just; I'll just use my own word and replace the one that was used, "those people." But I've recently gotten a chunk of money and I want to add it to my designated MF Motley Fool *Pro* portfolio. In general, do you recommend increasing the amounts of the Buy Now buy stocks to get the allocations aligned or just save it and buy new recommendations that the team allocates based up on the increase in portfolio size.

Jeff Fischer: Okay, first I'll say I never thought we'd be buying AIG either. I despise them. (crosstalk) Yeah, very much so, but I love taking that contrarian investment. It's been a good investment for us in the short time we've had it. And we think there's much more fuel in the tank from there. The stock is so far below its book value. It has new management. It's really obviously had to clean up all its horrible businesses that are now gone and it's so on the straight and narrow because it's probably the most scrutinized company out there now.

But I agree with you, we all really disliked AIG for what we saw as gross negligence on their previous management's part but now we believe it's a business that has found its way again and will stay on the straight and narrow and has a great management team now and offers value. But if you don't want to buy it, you should match the allocation that we have right now. We always review our current allocations as shown on the recommendations page and so those are what we're comfortable with and recommend right now.

If you're light on any of those allocations, match them. I don't know that I would say go above them, Maybe to a little bit if you want to, we want all Fools to be confident in what we own, but if you're trying to mirror us then just match what we have and wait for new recommendations and keep in mind we're about sixty-five, seventy percent net long so we have cash as well. So if you have some cash that's okay, that's a good hedge and we look forward to opportunities. We have a few in the works right now. New ones for new buys.

Danny Hsia: Okay, great. Next question from a guest, "What does it mean when the *Pro* team says "PACR or Pacer International is in the middle of a transition"?

Jeff Fischer: PACR is a turnaround story, or even more than that, a revamped business model story. They are changing where they focus in their intermodal; they basically help companies move goods from point A to point B via rail and trucking, and they're changing to become more of an intermediary and less of an executioner. So they're in transition from one business model to another. The new one is much more attractive than the old one and it's taking more time to get grip, for the tires to get grip, than we thought it would.

Danny Hsia: Right.

Jeff Fischer: But we still believe in management, we still believe we have a value here.

Danny Hsia: Okay. Question here from Moley918, "Since I got X amount of money, should I just follow along with your recommendation and ensure the options are funded properly? Also, can retirement accounts be used in certain situations?"

Jeff Fischer: Okay, two things. First, I'll finish up on PACR.

Danny Hsia: Oh, I'm sorry.

Jeff Fischer: No, it's not your fault at all, Danny. I just forgot to say it. It is on hold and the reason that is on hold, that PACR is on hold, is it's such a small company; a hundred some million dollar market cap. It's tiny. We found we can't get into and out of it effectively, ourselves or as a service, so we're just going to keep it on hold. So the question is; let's see.

Danny Hsia: "Since I have a certain amount of money, should I just follow along with your recommendation and ensure the options are funded properly?" And I think by "options" I think the member probably means just the different allocations in the company.

Jeff Fischer: Yeah, or maybe writing put options to get shares.

Danny Hsia: Yeah, we could answer both of those questions.

Jeff Fischer: We haven't done any options recommendations yet, so we are recommending that you follow our stock purchase recommendations…

Danny Hsia: And these are the things in the Catch-Up Report, the first Catch-Up Report and the second, which you just got.

Jeff Fischer: So now that's five companies we're recommending you buy shares of at specific allocations, as you'll see on the site. That's what we can recommend right now. Options we'll get to shortly. Adoptions are timely, of course, so we're going to issue all of our timely and possible or I should say attractive options trades all at once to members soon, so that we can do them all at once and walk you through it at the same time. Again, we want to build up your stock portfolio first and then we'll work in the hedges, shorts and options.

Danny Hsia: And they will guide you along this whole journey, so fear not there.

Jeff Fischer: And everybody has to realize that we have to take our time. We're not here to make money in a week or two; that small amount of money wouldn't make a difference. We're here to make good returns year after year, steadily, so keep your timeframe out several months. You'll be happier for it. You'll make better decisions for it and we'll all do better over time.

Danny Hsia: Okay, great. Question here from Steve, "Has *Pro* considered investing in LLPs, yes or no? And," well why don't you go ahead and answer that question first and then I'll get to the second one from him.

Jeff Fischer: Yes we have and we actually have and yes, so yes we have. I don't know that we will frequently because of the tax implications, but members have told us StoneMor is one we own, that it has not been complicated tax-wise.

Danny Hsia: Okay, good. This is not a follow-up question, but from the same member, Steve, "Why are there," well it is a follow-up question, excuse me. Why are there none in the recommended portfolio, but you just said we do have the one in the recommended portfolio?

Jeff Fischer: StoneMor Partners, STON is the ticker, is an MLP, and it's on hold because it has run up lately and it's on hold because there are other positions that we're considering that we like better, so before we tell new members to get into it, we want to make sure we want to keep it for the long term.

Danny Hsia: I think what Jeff is trying to get at there, Steve and other new members, is really if you follow the guidance that they're giving you in the Catch-Up Reports, we think that that's probably the best path to getting you caught up to the portfolio to where we currently have everything set up that are Buys and Buy Firsts and if and when either Stone or another MLP is a good opportunity, they'll certainly let you know.

Jeff Fischer: Yeah, and if we turn it back to Buy, then we'll tell you with an alert. Anything that's on hold in the portfolio is under consideration, which just means we don't want new investors to buy it right now.

Danny Hsia: Question here. This is kind of related to MasterCard a little bit, so I'll ask it and hopefully Nick gets to it on the text section. The text portion of the chat from Joseph, "Couldn't new smart phone applications change the manner in which payments are made and make the credit card companies obsolete? For example, if companies taking funds were to give a small discount, less than what they're paying to the credit card companies, customers could be convinced to move to ACH-like payment systems directly from their bank accounts."

Jeff Fischer: Sure, that's certainly a threat and something we watch all the time, and MasterCard and Visa and Amex are all watching those threats as well. They actually end up, as Nick mentioned, investing in a lot of these upstarts. Any that get any traction, they're likely to invest in or buy.

Danny Hsia: Oh, so while he was talking about that, it wasn't necessarily investing in small companies that are utilizing a credit card, but it's something like this.

Jeff Fischer: Even things like this.

Danny Hsia: Something that's just not even what they're traditionally known for.

Jeff Fischer: Exactly, and yet the problem these upstarts still have is you need a network that's broad, that reaches all points of contact, and that's accepted by the banks. The advantage that MasterCard and Visa have is the banks have a stake in these companies, and so they want to keep using them and not let in all these little things that would nip at even the banks' profits. The banks make money using MasterCard and Visa, so it's really hard to break into a network this gigantic and this strong, and that keeps growing every year. I mean MasterCard and Visa are growing volumes, 10-20% a year. They get more powerful as they do so.

Danny Hsia: We've got this question a couple of times, "If I don't have the money to buy 100 shares of most of the stocks in the portfolio, am I doing the wrong thing by participating in *Pro*? Will it impede my ability to have the money to make money with options?"

Jeff Fischer: No, not at all. With many options trades, you need to own 100 shares or at least, but not all of them. There are many reasons why we'll use options, precisely because we don't want to buy a hundred shares or more. We bought calls on Facebook instead of buying any stock at all, and you can do that with as little as a few hundred dollars if you want.

With our stocks, we focus on core holdings and it doesn't matter there if you own 50 shares or 5,000. Obviously we'll use options on some of them, but we won't use options on most of them is a pretty safe bet.

Danny Hsia: Just to reiterate, you can participate, be a member, a successful member of *Pro* without participating in options.

Jeff Fischer: Exactly, and that's what wraps it all up, really, is that you don't need to use options to succeed with *Pro*. Many members since we started haven't. They've just bought our stocks and ETFs, and that's a great way to go.

Danny Hsia: All right, here's a question from Dave. This is a little bit more just about general allocation or questions about how we, what we mean when we recommend a stock. "As I make purchases over time, when you recommend 4.1% for a company, is that 4.1% of the current portfolio or 4.1% of the original capital?

Jeff Fischer: It is of your current portfolio, and we do this because every day we review the PRO portfolio and make sure money is where we want it. Now obviously we can't be perfectionists or we'd be tweaking positions by a tenth of a percent day after day and just rack up commissions and taxes. That would be crazy. But we always base it on the current value because we know that's a baseline that we can always all agree on. Rather than say we started with a million dollars and now it's a million and five-something, but let's base our decisions on a million. That's confusing and it would be confusing for you at home too, if you started with X amount and two years from now you had much more. What always matters when you boil it down is where your money is invested today and what it's worth today. So it's all about the current allocation based on the current portfolio value.

Danny Hsia: Okay.

Jeff Fischer: Good question.

Danny Hsia: There's another question that we've gotten a couple of times, and this is kind of actually going back to the previous question about whether you need a hundred shares for options. This member, "It's all me" has just heard about mini options, ten shares. Are those relevant to *Pro*?

Jeff Fischer: They're going to be. I have a big feeling they're going to be. These are new, where these options only represent ten shares of stock instead of one hundred.

Danny Hsia: Is that similar to something like Share Builder?

Jeff Fischer: No, it's an actual option contract that the options listers have gotten wise to, realizing they'll have a lot more volume if the contracts are smaller. So I like it in that it welcomes more smaller investors into options. What we have to be careful about, Fools, is racking up commissions. Generally we're not option trading; we're using options strategically, so we should be fine in *Pro*.

But we're still sussing out how we want to use minis in *Pro*, and I think the short answer is we will provide guidance on them because it makes sense. If we have a million point five portfolio and you at home have a $150,000 portfolio, a mini option, which is ten shares instead of 100, would make perfect sense for you at home. So yeah, we're going to provide guidance on that to any extent that we can.

Danny Hsia: Great. We have ten minutes left in our time with you today, folks, but I just wanted to remind folks. So earlier, in case you missed it, Bryan and Nick and Jeff went through the three companies in Catch-Up Report number two. For new *Pro* members you received an email with a link to it shortly before the live chat started, and that was Gentex, Intel and MasterCard. And when you joined us, you got two recommendations in Catch-Up Report number one. Catch-Up Report number three is coming out on March seventh where the team will give you some more guidance and then there will be one more coming out on March 14th, so please keep an eye on your inboxes for those.

Jeff Fischer: Yup, and then right on the heels of that is the short, hedging and options guidance.

Danny Hsia: Exactly, exactly.

Jeff Fischer: I will say quickly on the mini options, which represent ten shares of stock instead of one hundred, there are not contracts available for most stocks right now. They're still rolling those out.

Danny Hsia: There's a question here from Sara, that she says she, "likes to see fair value figures in the form of probability distributions. Any chance *Pro* will begin to do that?"

Jeff Fischer: We do do that internally and sometimes we provide it to members, and if many members want it, we certainly could. Where we backed away from it was, on a probability here you're weighing your low case scenario, middle case and best case and then a range of possible valuations that result, and the range can be quite large at times. It can, on a stock like 3D Systems say your fair value may range from 20 to 50, and so when you do that, the guidance starts to have less value because you're basically saying a lot of things can happen.

So what we kind of average what we believe is most likely to happen and arrive at a valuation that we believe is most reasonable. And then of course we adjust that. Every quarter we look at results and adjust it if need be, and every year you adjust your fair value for what happened in the past year. Fair value, everyone should remember, will go up every year that the company grows, and fair value is the price from which to expect your desired rate of return. It's not a sell price. It's a fair price for a buyer or a seller, so it's a fair price today, so a price that's worth owning it. So we try to pin that down so members have a good idea of what we expect.

Danny Hsia: Another question from Moley918, "When a recommendation becomes available, i.e., when the team executes a trade alert or sends a trade alert to members, is there a specific timeframe to execute the trade, or should it be that day, the next business day or what kind of timeframe should members be expecting to make these trades?"

Jeff Fischer: In most cases, no, and this answer may be surprising. In most cases I would say the more time you take, the better, because we want you to be comfortable and understand what you're doing and read the report and see what we're thinking. Even if you're mirroring the *Pro* portfolio exactly or very closely, make sure that it's right for you, that this position makes you comfortable. Yes, you're paying us to make those decisions for you and we do. we're telling you what to buy and what to sell all the time, but we want to make sure too that you're comfortable with it, so take your time to read the report, make sure it makes sense to you and then make the trade.

Usually the trade can be made any number of days to weeks later, especially with the stocks that we buy where we're looking out a year, two, three years. With options, the prices may change within a number of days, so options are the ones where you want to be a little more timely on it.

Danny Hsia: And if there is a situation where it's not an options trade, it's a long trade, but maybe the stock is a little more volatile than members are used to, you will probably say, Okay, this one's going to move a little bit more, so we will recommend you making a move in two days, but if you're not comfortable with it, don't. You will provide that guidance for the members.

Jeff Fischer: And what we specifically provide is price guidance. We'll say "try to make this option trade today around these prices. As prices change, accept no less than X because we want to make a certain yield, for example, in a certain number of months. So we'll give you the limit prices to use.

Danny Hsia: Okay, good. Question from It's All Me. I think this is a really interesting one. Like we've been talking about, we've provided Catch-Up Report number one, Catch-Up Report number two is today and the next two are coming in the next couple of weeks and the question from It's All Me is, "At the current rate, it'll take six months or more to catch up to the full *Pro* Portfolio." I don't know that we necessarily think it will take that long, when obviously everyone has their personal situation. But the member is concerned that that current environment is going to be more volatile and risky and that the new members, those are those of them that are catching on the slower catch-up path, they'll be missing out on the hedging possibilities in the portfolio. If they have cash in the portfolio today, is there some way to get caught up more quickly and get hedges in place now?

Jeff Fischer: Well interesting question because if you have cash, that's typically a better, as good a hedge as anything, really.

Danny Hsia: So the member may be thinking hedge.

Jeff Fischer: Although hedges will make money when the market falls, so (unclear; talking at the same time).

Danny Hsia: The member is a little concerned about that volatility (unclear.)

Jeff Fischer: Let me back up and share how we're thinking about it. First of all, it won't take six months. It will take much shorter. Danny just outlined…

Danny Hsia: Yeah, within a month, you'll have all the guidance on what companies you need to have in your portfolio to be caught up.

Jeff Fischer: And the hedges and shorts and options.

Danny Hsia: And the hedges and shorts, right.

Jeff Fischer: I think it's within three weeks to a month from now.

Danny Hsia: From now.

Jeff Fischer: So what we're doing, and I'm aware that we're in a potentially volatile market environment and that prices are up, the S&P is up 5% this year so far, which doesn't sound like that much, but it is. Plenty of stocks are up 10%, what have you. So we're looking at the valuations every day and we're going through earnings right now too, and we feel it is best to start everyone gradually, as we have done with two stocks that we really strongly believed in. Three more now that we really strongly believe in today's prices, and next week more. And at that point, once you get up to be about 50% invested, and then we'll move into the hedges, shorts and options. But until then, you're, as far as we know, you're mostly in cash. As far as our guidance is concerned, you're mostly in cash because we've only offered five stocks that add up to maybe 20% long.

That said, we know many of you came to the service with a full portfolio of stocks, and the way we view that is you are already invested. You're already in the river, so to speak, that we've spoken about, and now you're just going to be moving some of those funds out and replacing them with *Pro*. Within a few weeks, we'll get to the hedges, for those of you who want to hedge and short as well.

Danny Hsia: And again, you don't have to do the shorting and the hedging if you don't want to.

Jeff Fischer: Yeah, you don't have to, but we do recognize it's a delicate time to get members up to speed with us and we want to do it in a reasonable, rational way that minimizes risk and still lets you participate in buying these stocks at prices that we view as being very attractive right now.

Danny Hsia: Great, and it can be a little bit of a complicated question, which is why you have a little bit of a longer answer than normal, and so if on the stream, on this video stream the answer is you're still a little confused, post that question to the boards. I promise you, it'll get answered and hopefully it will be clear for you.

Jeff Fischer: Yeah, we know members arrive to us from all different; they're all over the map. Some are all cash, and that makes it very easy for them to gradually invest with us. Some are fully invested and so we're telling you to sell off your least favorite positions, and the ones you don't even know why you own. You don't want to own those anyway, and move that money into *Pro* stocks as we do so, and know that right around the corner we have the hedges and shorts, but frankly we are right now mostly long ourselves, and our hedges that we have in place are now at price points that are for the most part, quite a bit lower than today's market price.

So that's the short way of saying that we're mostly bullish right alongside you, and we're going to adjust and add hedges very shortly.

Danny Hsia: All right, great. I think we have about two minutes left here.

Jeff Fischer: That's it.

Danny Hsia: I know, two minutes. Sorry folks. Question from KHGuy, "*Pro* has around a third allocation in cash, correct? Are the percentages in the guidance including that amount or are they just for the stock portion of the portfolio?"

Jeff Fischer: Good question, quick answer is it's the entire portfolio value is what our portfolio is worth and what the allocations are about. So if we have, say to make it easy, one million dollars and we're saying $300,000 of it is in cash, we're saying buy 5% of the one million, so buy $50,000 worth of the stock.

Danny Hsia: Question from WYP, "Do recommended option trades always correlate with the stock portfolio in the *Pro*?" And we actually have a surprise guest.

Tom Gardner: Guys, I just wanted to say hi. It's great to see you all. I left my coat in here and I need to make a flight down to Jackson, Mississippi to see the CEO of Middleby.

Danny Hsia: Nice to see you, Tom.

Tom Gardner: I apologize. Excellent.

Danny Hsia: CEO and Co-Founder of The Motley Fool, Tom Gardner.

Jeff Fischer: Have a good trip.

Danny Hsia: Tom never springs surprises on us every day. This is not something we don't come to expect from him every single time we're live on air. Thank you, Tom. Nice to see you.

Jeff Fischer: It's always great to see Tom.

Danny Hsia: Nice to see you. Have a safe flight.

Tom Gardner: Love you guys.

Jeff Fischer: Love you too.

Danny Hsia: Let's go back to the question from WYP, "Do recommended options trades always correlate with a stock portfolio in *Pro*?"

Jeff Fischer: Does he mean The Motley Fool Options service or just options?

Danny Hsia: I think options trades; the question's probably, Do options trades always correlate with a long position in *Pro*, right?

Jeff Fischer: The answer is no, they do not. Many options trades will be on their own, an independent thing. Many of them are hedges to hedge out some of the long positions.

Danny Hsia: Okay, great.

Jeff Fischer: Some will leverage stocks we do own, but again as Danny said, you don't need to use options to use *Pro*. They are a great tool, so I hope anyone who is interested will learn to use them with us. That's why we're here.

Danny Hsia: Okay, last question from Nack, "Could you please explain the positive/negative MOS indications?"

Jeff Fischer: Margin of Safety indications. I don't know where you're seeing those on the *Pro* site.

Danny Hsia: I wasn't sure either, but the question was listed.

Jeff Fischer: That may be on the Special Ops site. They have a margin of safety indication, last I saw on the recommendations page itself. *Pro* doesn't use them publicly, but we do use them as part of our Consider Adding More Price, so we like current prices. We already view the current price has having a margin of safety because it's typically below fair value. Consider adding more as an even greater margin of safety, where we would consider buying even more stock. So we do use it internally and sometimes publicly, but it's another way of saying we want to buy below fair value. That's all we're saying.

Danny Hsia: Okay, great. I think that's all the time. I'm being told our time is up, so folks, thank you very much. Jeff, thank you for your time. Last parting words?

Jeff Fischer: Thank you, Danny. Thank you, members. Again, we're here to help you each step of the way. As you have questions, ask on the boards. We'll continue to be there each day and I really hope you're thinking in terms of the next few months, building the *Pro* portfolio that you want with us and then going forward for the years to come. We're going to make money over the coming months and then really over the coming years, so be patient. Enjoy yourself. Don't feel panicked to do everything all at once. Everything great is built gradually, so thank you for being with *Pro*.

Danny Hsia: Thank you, Fools, and remember, your second Catch-Up Report is in your inbox right now for new Fools, and if you're an existing Fool, *Pro* Fool, go ahead to the guidebook tab on the *Pro* site and keep an eye out for Catch-Up Report number three, which comes out on March 7th. Fool On!

Jeff Fischer: Thank you, Danny.

Danny Hsia: Thank you.

Jeff Fischer: Fool on!

A Fresh Start … Every Day

Published Feb 11, 2013 at 12:00AM

Dear Fellow Fool:

Next Week's Memo Coming Tuesday

TMF HQ (and the NYSE) will be closed Monday, Feb. 18, for President's Day, so our next Memo will hit your inbox at 4 p.m. Tuesday, Feb. 19!

Another morning. As the alarm clock coaxes me out of my warm bed, my eyes quickly adjust to the familiar, refreshing darkness of a nascent new day. I've never been one to remember dreams, so my thoughts soon turn forward-looking; I try to map out my day with enough structure to ensure progress toward my sincerest goals, but enough flexibility to allow for inevitable uncertainties. And so it is — or should be — with portfolio management: Every day, we assess the portfolio's position with respect to its mission and guiding light, but with a bias toward doing little (because over-activity costs money). When it comes to portfolio management, here is how *Pro* rolls.

In my eyes, portfolio management is the process of optimally matching your assets to your objectives, always keeping in mind the costs and risks. It's a science, but it's also an art. In many investment shops, portfolio management involves a lot of math, computing power, and fancy modeling — resulting in both a precise outcome and a false sense of security. In *Pro*, we've made this imprecise process easier by defining a clear-cut mission (to earn consistent, recurring profits with a high level of accuracy) and constructing an aspirational reference to guide our behavior (our North Star). We don't kid ourselves about knowing the future; we simply review our goals and set our course with the hope of being approximately right as opposed to precisely wrong.

Our Big-Picture Framework

At *Pro*'s launch in 2008, Jeff set a baseline allocation for the portfolio — 70% stocks, 15% ETFs, 15% options, and up to 30% short. This division not only fulfilled a general desire for long exposure and reduced volatility, but was also well suited to the team's skill set (we're better at analyzing businesses than making macro, trend-based calls, so we have more stocks than ETFs). Since those early days, we've introduced the concept of exposure as a better way to manage our allocation. Our "default" portfolio (meaning we aren't taking a particular market view) is 70% net long. Typically, if we deviate from that number, it's because of a conscious choice to grab more (or less) market exposure. The 30% of the portfolio in non-long positions (cash, hedges, and shorts), meanwhile, is a function of opportunities and our ability to exploit them.

We determine position size for new long stock positions with a few factors in mind.

- First, we want the position to matter, which generally means it must be at least 3% of our portfolio.
- Second, we look at the position's covariance (tendency to move directionally in tandem) with our existing positions. We also examine its key risk exposures and revenue sources. We may buy a smaller position if we aren't diversifying our risk exposure, or a larger position if we are.
- Then, we consider our expected return in relation to its range of outcomes. Our fair-value estimate and the price we pay figure prominently into our expected return. Further, each business we own has a range of possible futures (ideally from "great" to "holy cow!"), each with its own probability of coming to fruition. The wider the dispersion of those outcomes (the less predictable the company's future), the lower our certainty that we'll experience a good one. The higher the numerator (expected returns) and the lower the denominator (range of outcomes), the larger we're willing to make the position.
- Finally, we make downward adjustments for any peculiarities – for example, low liquidity, a strange share structure, complicated disclosures, etc.

The ideal holding is one that has high liquidity, diversifies our risk exposure, and has a bright and highly certain future — and that we can buy cheap.

Tweaking Along the Way

When considering *Pro*'s Recommended Allocation % for any position, think about the metaphor above: waking up and calibrating your plans for each day in line with your overarching goals. Every day, we pretend the *Pro* portfolio is 100% cash and we get to reconstruct it to be North Star-optimized. Would we put 6.3% in **AmTrust Financial** if we were building our portfolio from scratch? With sensitivity to taxes, commissions, and other opportunities, that is *precisely* the claim that our Recommended Allocation % makes. And that's why the bulk of our positions are rated as Buys: In classifying them thus, we're telling you we'd buy that amount if we were rebuilding our portfolio, so we're comfortable recommending you do the same. The day we feel our allocation is out of whack, we'll adjust it (and our Recommended Allocation %).

Note my caveat above: "with sensitivity to taxes, commissions, and other opportunities." This clause gives us a bit of a fudge factor, which we need because:

- Markets are noisy.
- Our fair-value estimate is a range, not a precise point.
- Commissions eat into our returns.

If we were glued to absolute precision regarding our Recommended Allocation %, we'd end up transacting all day long, racking up massive commissions and ending with no time to analyze our businesses (or live our lives). To guard against such an outcome, we establish a Consider Adding More (CAM) price for every position, which acts as a trigger for reassessment. Once a stock hits our CAM price, we spend (up to) 30 days forcing ourselves to reconsider how the position fits into the portfolio. If our thesis is intact and the opportunity is now more attractive, we'll make the case for increasing our allocation; if the thesis now looks incorrect, we'll make the case for reducing it. (Or, of course, we might just leave it alone!) In any case, we'll communicate our decision to you as quickly as possible — and if an answer isn't readily apparent, we'll move the position to Hold while we dig in.

The Foolish Bottom Line

The final piece of portfolio management is selling, which Nick covered beautifully in this July Memo. As with many things in life, portfolio management can't be reduced to a universal formula. It's nuanced, messy, and involves a bunch of moving parts. *Pro*'s portfolio management process will continue to evolve, and we'll keep striving for improvement in its consistent application and clear communication. We hope this Memo (and the Recommended Allocation % and Consider Adding More columns on our Recommendations page) are the next steps in doing just that. Got questions? Let's chat on the Memo Musings discussion board.

— Bryan (TMF42)

Guidance Updates

- **MasterCard** moves to Buy from Hold.
- **Pacer** moves to Hold from Buy (we'll give you details in our upcoming earnings review).
- **SPDR S&P 500** moves to Hold from Short.
- **StoneMor Partners** moves to Hold from Buy.

Coverage & Community

- **CME Group** : Jeff looks at fourth-quarter earnings for the public derivatives exchange.
- **Facebook** : From zero just a few months ago, mobile advertising revenue is growing quickly.
- **MasterCard** : Nick takes a fresh look at MasterCard and raises his estimate of fair value.

Pro Trade Roundup

- **CBOE VIX** (VIX): We set up 10 May $17/$25 bull call spreads for a $1.45 debit on each.
- **SPDR S&P 500**: We rolled our Feb. 16, 2013, $146 covered puts to Feb. 23, 2013, $151 puts for a net credit of $0.75 each.

Getting Started With *Pro*

1. Catch-Up Report No. 1
2. *Pro* 's Investment Strategy Guide
3. What *Pro* Believes
4. **Use Options Like a Pro**

Back to Guidebook | Site Directory

How Options Fit the *Pro* Portfolio

While we generally seek long-term capital gains from stocks, most of our options are used for *short-term* income or gains. By combining these strategies, along with ETFs and shorts, *Pro* investors can make profits in the coming weeks *and* the coming years, accomplishing our goal of earning steady, recurring profits with high accuracy in both the short and long term.

We use options strategically, as part of portfolio management. Options work hand in hand with stocks, and your *Pro* portfolio should come to reflect that. Finally, although most options do make money in the short term, we're not *traders* of options. We use them tactically and appreciate the fact that they expire in a matter of weeks or months.

The Strategies We Love

Pro will use more than a dozen options strategies, depending on what's most appealing at the time. But we rely on just a handful, and knowing how to use even one or two strategies is enough to change and improve how you invest. In addition to writing puts and writing covered calls — two of our favorite strategies — we will be buying calls to leverage gains; buying puts to protect positions or to short a stock; writing covered strangles (selling both puts *and* covered calls on a stock to double our income); using option spreads to earn large returns on investment with low risk; buying straddles to profit on big price moves in either direction; and more.

How to Learn More

If you are new to options investing, or just need a refresher, we recommend that you take advantage of the great educational resources at *Motley Fool Options* (to which you have unlimited access, as part of your *Pro* membership). Start at the Guidebook, take our quick survey, and then follow the steps to (re)learn the basics.

Catch-Up Reports

Published Feb 8, 2013 at 12:00AM

Ready to Become a *Pro* Investor? These Catch-Up Reports give you everything you need to match your portfolio with ours — quickly, painlessly, and (we hope) enjoyably. Start with Report No. 1, and watch this space for new reports through March 19. (Veteran *Pro* Fool? The guidance in these reports is not new, but if you need some help catching up with us, feel free to peruse them!)

Catch-Up Report 1: Feb. 14, 2013

- Download (PDF) (All in Cash Version)
- Download (PDF) (Currently Invested Elsewhere Version)

Catch-Up Report 2: Feb. 28, 2013

- Download (PDF)

Catch-Up Report 3: March 7, 2013

- Download (PDF)

Catch-Up Report 4: March 14, 2013

- Download (PDF)

Portfolio Positioning Report: March 19, 2013

- This report will tell you how to short, hedge, and use options to match our exposure and general portfolio position, even if you can't or don't want to engage in every strategy we employ. We'll also have a live chat at 1 p.m. ET on March 19 to address any questions you may have about this report.

Roll Your Covered Puts on the SPDR S&P 500

Published Feb 6, 2013 at 12:00AM

- **What We're Doing:** We're again writing covered puts on our short position in the **SPDR S&P 500** (NYSEMKT: SPY) ETF. This trade rolls up the puts we wrote last month, and it will allow us to potentially exit the short or earn income while we wait.
- **What We're Thinking:** We have gradually reduced this index short over the past year, and with the Federal Reserve committed to supporting the market, exiting remains our desired course of action.
- **What We're Expecting:** If the S&P 500 index declines below our put strike price by expiration, we'll buy shares through the puts to cover our short, ending the position. We would keep the premium received from these puts, of course. If the index does *not* decline below our strike, we'll earn income that offsets at least some of the index's gain, and we can consider repeating this strategy.

What's New

Last month, we wrote $146 covered puts on the **SPDR S&P 500** (NYSEMKT: SPY) ETF. Those puts expire Feb. 16, and today they've paid us nearly all they can as the underlying ETF has risen to $151. We'll buy to close these puts and sell to open new ones at the $151 strike, covering all of our short shares again. This time, we're using weekly options that expire only one week later, on Feb. 22. We're simply trying to exit the position at better than current prices (or get paid in the process), in favor of setting up other hedges that drag less on our results when the market rises.

Trade Essentials

- **Actions:** Roll up your puts on your short **SPDR S&P 500** (NYSEMKT: SPY) position (use a single roll order if you're able).
  - Buy to close your Feb. 16, 2013, $146 puts
  - Sell to open Feb. 22, 2013, $151 puts
- **Recent bid/ask:** At market prices, this roll recently results in a net credit of $1.23. That price will change.
- **Price Guidance:** Roll the options at the going price. If the index moves significantly before you trade, you can move your new strike price to keep it closer to the current index price.
- **Allocation:** Write one put for every 100 shares of SPY you're short. For *Pro*, that's 10 contracts.
- **Recent SPY Price:** $151.12
- **Alternative Trade Guidance:**
  - **Are you short fewer than 100 SPY shares, or short an odd lot?** Roll your puts on all your round lots, and buy to cover, or buy to close, any odd-lot shares – ideally on a dip in price.
  - **Own ProShares Short S&P 500** (NYSEMKT: SH) or **ProShares Short Russell 2000** (NYSEMKT: RWM) **instead?** These don't have weekly options, so you'll need to roll to March if at all. If the calls don't pay enough to make this worthwhile, just sell your remaining position, ideally on a rise in price.
  - **Directly short the ProShares Russell 2000** (NYSEMKT: IWM) **ETF?** Roll your covered puts up and forward one week, as we are, to the Feb. 22 options. Write covered puts on every 100 shares you're short, using a strike close to the current ETF price. Or, as advised before, buy to cover or buy to close odd lots, ideally on a drop in price.

Next Step

- **Have questions about any of your shorts?** Visit our SPDR S&P 500 board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Set Up a Bull Call Spread on the CBOE Volatility Index

Published Feb 6, 2013 at 12:00AM

- **What We're Doing:** As a hedge, we're risking a small stake in a low-probability position that will reward us substantially if volatility spikes by our May expiration.
- **What We're Thinking:** The CBOE volatility index closed yesterday below 14, well below its average of about 20. Investors look complacent, so any big surprises could send the VIX back above 20.
- **What We're Expecting:** If the VIX spikes, we'll profit. If not, we expect to lose the full (but modest) amount invested. We should expect to potentially set up this trade several times before profiting.

The Big Picture

The **Chicago Board Options Exchange VIX Index** (ticker: VIX, or ^VIX at some brokers, or $VIX.X) (VOLATILITYINDICES: ^VIX) estimates the S&P 500's volatility over the coming 30 days. Also called the "fear gauge," the VIX has historically enjoyed an inverse relation to the S&P 500 nearly 90% of the time, rising when the market falls. This trait would make "ownership" of volatility via the VIX a good hedge against a falling market.

However, you can't buy the VIX directly, and the exchange-traded funds that attempt to track it are flawed. Options on the VIX are available and liquid, but they're pricey. This is where our bull call spread helps. The spread will lower our cost to set up a bullish VIX position, yet still reward us smartly if the VIX spikes high enough by expiration.

Most of the time, however, **we must expect a VIX hedge to go unused, becoming a cost rather than a benefit**. Our potential payout of 416% tells us that the odds of success are small, but as a hedge, it's worth the small amount of the portfolio we're risking.

Trade Essentials

- **Action:** Set up a May 2013 $17/$25 bull call spread on the **CBOE Volatility Index**(ticker: VIX, or ^VIX at some brokers, or $VIX.X).
  - Use a spread order to:
    - Buy ("buy to open") May 2013 $17 calls
    - Sell ("sell to open") an equal number of May 2013 $25 calls
- **Price Guidance (bid/ask):**
  - **May $17 calls:** $2.40/$2.50
  - **May $25 calls:** $0.85/$0.95
  - Initially, aim for a total net debit, or cost, of $1.55 ($155) or lower per spread. If the VIX rises, you may need to pay more.
- **VIX level (Feb. 5):** 13.72
- **Allocation:** Only invest what you can afford to lose. *Pro* will set up 10 spreads at a cost of $155 each, risking $1,550 total. This is only about 0.1% of the portfolio.
- **Maximum Profit:** $6.45 ($645) per spread if the VIX closes at 25 or higher. That would be a 416% return on our money at risk.
- **Maximum Loss:** $1.55 ($155) per spread if the VIX remains at less than 17.
- **Alternative Trades:** None. If you can't make this trade now, don't sweat it.
- **Follow-Up:** None expected. A spread either pays off or doesn't. However, we may try again with another trade.

Next Step

- Please visit the VIX discussion board if you have any questions.

Editor's note: A previous version of this article listed a potential return of 316%. The correct figure is 416%, and the text has been updated.

Your Guide to Our North Star

Published Feb 5, 2013 at 12:00AM

Like the real North Star, our North Star offers direction and guides our investing behavior. Learn more below.

Pro's Mission

Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years.

***Pro*'s North Star: Inflation + 7% annually**

Our North Star is a guide for our investing behavior. Like the real North Star, we can use it to navigate. It is not a destination; rather, it's an omnipresent fixture that offers us direction and reminds us of what we're striving toward.

Why inflation + 7%?

Our mission is to grow the real purchasing power of our capital. Therefore, the first competitor we need to beat is inflation, as measured by the Consumer Price Index.

We want to grow our dollars by more than the rate of inflation — that's a given. Exactly how much more is a difficult figure to pinpoint, but history tells us that if we can double the *real* purchasing power of your dollars every 10 years, we'll be doing what few manage to accomplish.

To double your dollars in a decade, we need to book a compound annual return of about 7%. To double your *real* dollars, we need to return 7% *plus* inflation. Thus, this figure is born directly out of our mission of absolute returns — returns that improve your financial standing in the real world.

Our North Star has several important characteristics that make it appropriate, challenging, and aspirational for all of us. It:

- **Never goes negative.** This lines up with our goal of positive returns over all three-year periods.
- **Is not investable**. It's impossible to lock in a return of inflation plus 7% with some other vehicle.
- **Is not a benchmark**. By definition, benchmarks must be investable; they are used for evaluating the performance of a relative-returns strategy. Absolute returns are our goal.
- **Is not a hurdle**. A hurdle is something you must leap over to avoid tripping. Our North Star guides us to make appropriate investment decisions. We're more likely to reach our goals if we let it guide us. If we come close to our North Star, let alone jump over it, we'll be over the moon (sorry!).
- **Is not a gimmick**. We are working to better explain our philosophy and strategy to you, and our North Star will be an ever-present factor in our investment decision-making.
- **Is a challenging reference point**. Historically, our North Star has outperformed the U.S. and world stock markets. Over rolling three-year periods since 1970, our North Star has put up a compound annual return of 11.3%, versus 9.9% for the S&P 500 Total Return Index and 6.4% for the MSCI World index. Our North Star also delivered that return *much* more steadily than the market indexes, without a single down year.
- **Guides our behavior** as we invest with the tools available to us. It is a framework to explain and reinforce consistent portfolio decisions. Approached consistently over long periods, it should help us and our members achieve strong financial rewards.

Relive our live chat with members about the debut of the North Star

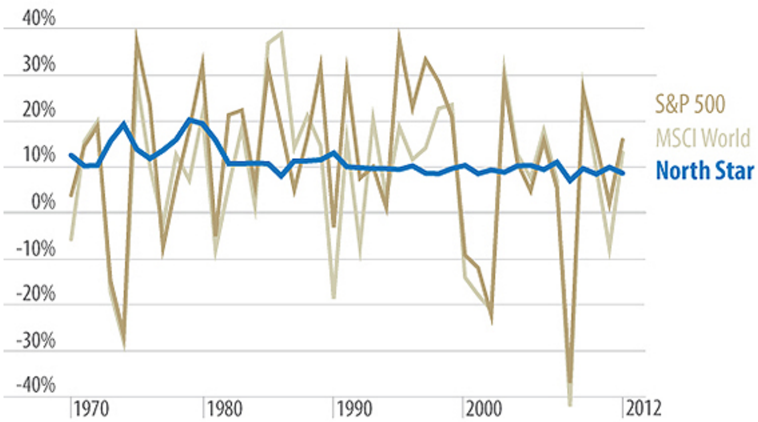
Historical Performance

How has our North Star performed historically? We're glad you asked, and we hope you like data! Here's a summary of the past 41 years. Below that are charts of the full history.

Annualized Return, 1970–2012

	Average	CAGR	Highest	Lowest
North Star	**11.3%**	**11.3%**	**20.3%**	**7.1%**
S&P Total Return	11.4%	9.9%	37.6%	-37.0%
MSCI World	7.8%	6.1%	39.1%	-42.1%

Annualized Return, 1970–2012

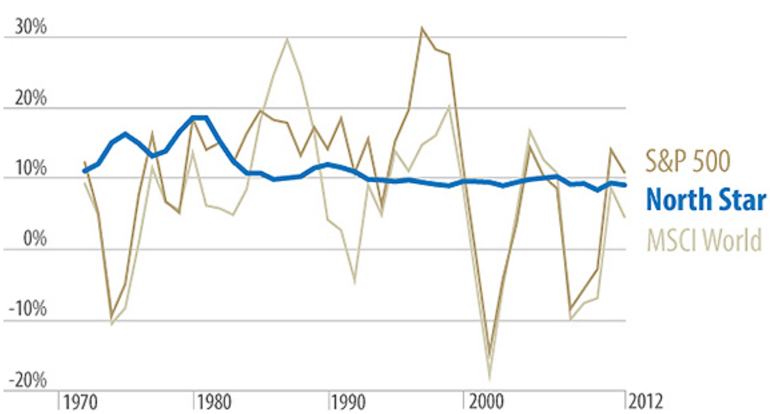


Here are the same data, showing rolling three-year annualized returns. Again, note the lack of volatility for our North Star.

Annualized Rolling 3-Year Return, 1972–2012

	Average	CAGR	Highest	Lowest
North Star	**11.4%**	**11.3%**	**18.6%**	**8.4%**
S&P Total Return	10.4%	9.9%	31.2%	-14.6%
MSCI World	6.9%	6.4%	29.7%	-17.7%

Annualized Rolling 3-Year Return, 1972–2012



Note that we included both average and compound annual (CAGR) historical growth rates. To investors, the one that matters is the CAGR. We included both to show the power of compounding: Even though our North Star has averaged an almost identical annual return to that of the S&P Total Return index over the past 43 years, the North Star (again, inflation plus 7%) has outperformed the index by about 1.4 percentage points annually. That's because when the index has those deeply negative years, much higher positive years are needed to claw its way back to positive territory. Since it never goes negative, our North Star doesn't have that problem. That is the power of steady, positive returns — see below for visual representation.

(We're including the S&P Total Return and MSCI World returns purely for the sake of education. Our investment strategies are not focused on either.)

Performance Since Inception

How has *Pro* performed against its North Star since our start in 2008? We hope you *really* like data: Here are *Pro*'s annualized returns lined up against those of our North Star. (Again purely for education, we've also included the returns for the S&P Total Return index and the MSCI World index.)

These returns are annualized, not cumulative. Annualized returns are more useful to investors because they allow easy comparisons.

A note on the recency of data: The Consumer Price Index (inflation) data is reported with a several-week lag, while *Pro*'s performance is in real time. Inflation is quite stable from month to month, so we use the previous month's inflation figure as an estimate for the current month's until the actual data are released. Any adjustment required is usually negligible, especially given the rolling three-year viewpoint we favor. This approach allows us to keep our performance tables updated all the time.

Annualized Return

To read this chart, remember that the return data are annualized, not cumulative: The chart shows the annualized return since inception *as of the end of each subsequent month*. The data begin one year after *Pro*'s start, because annualized returns based on less than a year of data aren't very useful.

And here are our rolling three-year annualized returns — again, our preferred measurement.

Annualized Rolling 3-Year Return

Date	*Pro* Portfolio Balance	*Pro*	North Star	S&P Total Return	MSCI World
10/6/08	**$1,000,000**				
10/31/08	**$1,001,292**				
...					
11/30/12	**$1,451,264**	**6.90%**	9.23%	11.25%	4.61%
12/31/12	**$1,461,698**	**6.14%**	9.20%	10.87%	4.63%

Questions We Anticipate May Be Frequently Asked

How are you measuring inflation?

We're using the change in the Consumer Price Index. The Consumer Price Index is a measure of the average change over time in prices paid for a "market basket" of consumer goods and services. In plain language, it measures how many more dollars it takes to buy things over time.

Specifically, we're using the CPI-U, or the Consumer Price Index for All Urban Consumers, which covers about 87% of the U.S. population. We're using the "all items" version of the CPI-U, which means that we aren't excluding anything. This is worth pointing out because media-reported CPI figures often exclude food and energy prices.

Wait a second. I'm pretty good at math, and you need to return 7.177346% annually to double your money in 10 years. What gives with your 7% figure?

Yes, to be precise, we'd need to return $2^{(1/10)}$-1, or about 7.177346%, per year to double a portfolio in 10 years. Spelling out our North Star as inflation + 7.177346% doesn't in any way make it more useful as a guide, though.

Is the North Star a hurdle or benchmark?

Our North Star is neither a hurdle nor a benchmark. Hurdles are things you intend to leap over, and benchmarks represent an alternative for your investment dollars. Our North Star is neither of these things. Its purpose is to offer us direction, guide our behavior, and keep our mission front and center.

What is a rolling three-year period?

Rolling three-year returns measure performance over the most recent three years. So the rolling three-year return as of Oct. 31, 2011, measures the return since Oct. 31, 2008. A month later, the rolling three-year return as of Nov. 30, 2011, measures the return since Nov. 30, 2008.

How will the North Star change how *Pro* is managed?

Our strategy will not change, but our implementation of it should improve with the North Star as a guide. Our North Star should remind us to lower our risk when we have large, abnormal returns, or increase our exposure to stocks and income if we're not close to our North Star. Thankfully, this should work well in the marketplace. If stocks are up sharply, we *should* be looking to lower our exposure, as our North Star would suggest. If returns are lackluster, we *should* be looking for more stock values or income strategies. Following a steady North Star should help us make better decisions.

Why is the North Star better than the S&P 500?

Pro has never been an alternative for the S&P 500 index. We use options for income, we short, and we hedge. The index is a long, stock-only vehicle. *Pro* is also not about returns relative to an index; we're about positive gains over any reasonable period. The North Star never goes negative, so it's a much better measure against our goal than is the volatile S&P 500, which can be negative for years.

Inflation is relatively tame lately. What happens when it soars?

Then our North Star's annual return is going to soar, too. Thankfully, stocks typically compete well with inflation, so to follow our North Star, we know we'll need to be largely invested in stocks during periods of high inflation, and we'll likely use fewer income strategies, because fixed income may not keep up with inflation.

What if you don't top your North Star?

We'll be happy if we just stay on track with it — or stay relatively close. If we *can* top it over many years, that would be excellent. But we need to realize the lofty challenge of topping a measure that *never* has a negative year while we're investing in stocks. Our North Star is our aspiration, not a hurdle or benchmark.

Can I measure the North Star against my portfolio at home?

Absolutely. Using the Bureau of Labor Statistics CPI stats, you can obtain historical CPI measures along with a monthly update to compare the CPI+7% to your portfolio. We've already done the 41-year history for you above, and we'll be updating the North Star results monthly for you.

Where can I talk about the North Star with the *Pro* team and other members?

Our North Star discussion board is always shining (sorry!).

Most Stocks We Sell Will Do Well

Published Feb 4, 2013 at 12:00AM

Dear Fellow Fool:

Most of the stocks we sell will subsequently trend higher in price. You may be surprised to read that, but it's exactly the result I expect. Higher prices in the years ahead, including on the stocks we've sold, will stand as a testament to our stock selection process.

What We Think (Right) Now

Fools, we've updated our thinking on every stock on our scorecard — click on over to our What We Think Now page for an at-a-glance view of our positions!

You see, we generally sell a position in order to increase our defensiveness, refocus the portfolio, or raise cash for another investment. In other words, in *Pro*'s four-plus years and counting, we've rarely sold a stock because the company turned from Jekyll to Hyde on us. Our companies are carefully selected for sustainable competitive advantages and recurring revenue, so we shouldn't be surprised if a business we initially lauded continues to grow value – even after we've decided to sell it. Unless something has fundamentally changed, we should *expect* it to keep thriving.

So Why Sell at All?

We're running a portfolio that has no new cash inflows aside from what we make investing, so selling is a large part of our portfolio management process. We aim to sell stocks that appear to have *less* potential compared to our others — but in most cases, they still have plenty of promise. We simply hope (and expect) that the companies we continue to own will do even better.

Since the beginning, we've focused the *Pro* portfolio on a couple of dozen core positions at most. We only want to own positions that we know inside and out, forward and backward, competitors included. I believe a more concentrated portfolio will lead to stronger performance as a result.

Alongside these holdings, we maintain cash to invest in new opportunities (including adding to our positions) and to anchor our shorts and options strategies. So when we sell, we're often saying "this is not quite good enough to keep right now" — but we're rarely saying "this was wrong to own." When we *do* get it wrong, we'll be the first to say so.

To date, of our non-options trades, we've sold 47 positions, 38 of them (more than 80%) for a profit. The majority of them have gone on to still higher ground since.

So, consider this a *Pro* service announcement: Unless we say otherwise in the sell alert, we typically sell a company for portfolio-management reasons, *not* because we no longer believe in it. Valuation plays a key role in some sell decisions, of course, but remember that the valuation of a good company will grow over time. It's not a static number. If we did our job well with the original buy recommendation, most of our sells should do well for years even after we let them go. With our sells, as with every portfolio decision, we're always focused on positioning the portfolio to achieve our rolling three-year North Star goal — and to help ensure gains in various markets.

Portfolio Page Changes

Time for some more good news! You'll soon see some changes to the columns shown on the Recommendations tab of our site, which holds our portfolio performance and guidance. The key changes are**:**

- **Our "% of Port" column is being renamed "Recommended Allocation."** As ever, this shows the percentage of your funds that should be invested in each holding to match us. We always stand behind our current percentage, and we'll change it with a trade alert when we feel an adjustment is needed.

- **Our "Buy Around" guidance is being renamed "Consider Adding More."** Too often, a company's stock price would eclipse our "Buy Around" price soon after a recommendation. Because the stock would still (purposely) be rated "Buy" on our scorecard, this could be confusing for newcomers (and vets!). First and foremost, we *want* members to follow our "Buy" and "Hold" guidance — that's much more important than the "Buy Around" price, which is initially anchored to a specific moment in time (when the recommendation is sent). To remove this confusion and make *Pro* a better service, we've changed the title of this column: "Consider Adding More" makes it clear that the price listed here is an *ideal* price. When the stock hits that level, we ourselves will consider adding more … and we'll tell you our decision within 30 days of the price being reached. We hope this new structure makes clear that all of our positions rated "Buy" are buys today. As for "Consider Adding More," that's the price at which we'll do exactly that — consider it, and then report back to you.

- **Positions will be sorted by allocation, largest first.** Our "long" positions will be displayed largest to smallest, so we all focus on our largest holdings first. You can also re-sort the table by company name, ticker, etc., by clicking on the header of each column.

These changes should appear on the Recommendations page this week (along with an explanation of each at the bottom of that page). We're excited about the increased clarity, and we hope you'll enjoy and profit from the improvements!

Earnings Smorgasbord

For the most part, earnings are coming in strong, especially considering that fourth-quarter GDP growth wasn't impressive (as in, it was negative). Last week, we posted deeper reviews on:

- **Apple** , which is largely a margin story right now.
- **BMC Software** , which needs to grow new sales.
- **Gentex** , which withstood industry headwinds well.
- **OpenText** , which continues to look like a good strangle candidate with long-term upside.
- **Tupperware** , which is growing on share buybacks and jacked up its yield.
- And we'll have coverage on **Facebook**'s results soon; our first take is that things are moving in the right direction and spending to grow makes sense.

To discuss the Memo, please visit the Memo Musings board. Fool on!

— Jeff Fischer (TMFFischer)

Guidance Updates

- **Pebblebrook Hotel Trust**: Moved to sell.
- **Apple**: Fair value moved down to $660. Shares remain a buy.
- **BMC Software**: Fair value estimate moved down to $50. Shares remain a buy.
- **Gentext**: Fair value estimate moved up to $23.50. Shares remain a buy.
- **Tupperware**: Fair value estimate moved up to $68. Shares remains on hold.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **CurrencyShares Euro Trust**: Sell short up to 3.9% exposure if you haven't already.
- **OpenText**: Shares remain a buy, but if you only want to potentially buy the stock lower, sell to open May 2013 $55 puts, lately for $2.20 (a 4% yield), up to a 2.6% initial allocation — and a 5% total allocation (which we'll have if our $50 puts are exercised).
- **Gentex**: Shares remain a buy, but if you only want to potentially buy the stock lower, sell to open June 2013 $17.50 puts, lately for $0.80 (a 4.5% yield), up to a 2.7% total allocation.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Coverage & Community

- **Earnings Smorgasbord!** Please see above for our latest earnings coverage.
- **Exuberance alert?** StamLeo asks if we're seeing the first signs of market exuberance, kicking off an exuberant conversation among *Pro* members.
- **BigOil1 is a Poet:** Enjoy his immortal prose on the **StoneMor Partners** board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Sell Pebblebrook Hotel Trust

Published Feb 1, 2013 at 12:00AM

- **What We're Doing**: We're selling our shares.
- **What We're Thinking**: The risk-to-reward ratio of this investment is no longer compelling.
- **What We're Expecting**: The hotel industry is no longer in distress, shares are no longer mispriced, and our yield expectation proved too optimistic; these factors make North Star-like returns less likely.

Trade Essentials

- **Action**: Sell **Pebblebrook Hotel Trust** (NYSE: PEB)
- **Allocation**: Sell all of your shares; for *Pro*, this frees up 4.2% in cash.
- **Price Guidance**: The stock is thinly traded, so **be patient and use a limit order**; *Pro* may use up our full 30 days to complete the transaction. Sell your shares for more than $24.50.
- **Recent Share Price**: $25

What's New?

When we purchased Pebblebrook in May 2011 (and again in July and September of the same year as the stock price fell), its financial statements were a disaster. What little information was provided was hard to understand, and that fact, combined with the overall uncertainty of the company's future capital allocation decisions, provided a likely source of mispricing in our favor. Our simple thesis hinged on three points: Desperate sellers were selling hotels too cheaply; an industry veteran at the helm provided us an edge; and a rising yield, which we forecasted would be at least $1.48 per share by now, would drive our returns.

Just over 20 months later, our investment is up almost 25% and management is still buying hotels. This investment has exceeded our North Star! So why are we selling?

1. We Were Too Optimistic

This is hard to admit, but all three points of our original thesis have proved only partially true. First, there's evidence that while Pebblebrook did purchase some of its hotels at a discount, it overpaid for others, including its Manhattan joint venture. Management has boasted that the company's reputation for overpaying brings in more off-market deals, but we're not sold — Warren Buffett underpays and still gets private offers. And having a well-connected industry veteran at the helm, while undoubtedly a benefit, is par for the course in the industry; novices don't tend to run REITs. Our largest error, however, was one of potential yield. The low range of our dividend forecast for 2013 was three times higher than the current payout, and it's now clear it will be years before Pebblebrook will meet our previous expectations.

2. We've Already Captured the Upswing

The whole industry benefited from an upswing in revenue per available room (a key metric for hoteliers). Conditions appear to have normalized since the 2009 trough, but REIT managers will continue to do what REIT managers do — namely, raising capital and buying properties. Shares outstanding have tripled since Pebblebrook's 2009 IPO and continued to increase quickly during the time we owned shares. That's a good thing as long the capital raised is invested in properties that earn strong returns, but frankly, we're not optimistic that the current market supports high levels of reinvestment at great rates. Management is targeting an 11% leveraged return on invested capital, not enough to be attractive to us.

3. We Can Better Focus Our Portfolio Elsewhere

Any asset can make a great investment at the right price. Hotels aren't great businesses, but we invested opportunistically and earned a good return. Now it's time to check out and focus our efforts on higher-conviction ideas. At our recent over-or-under meeting, the team agreed that Pebblebrook, at current prices, was likely to perform worse than our North Star. Thus, selling the stock and redeploying our funds was a unanimous decision and will give us a better chance at achieving North Star-worthy returns.

Next Step

- Bring your questions to the Pebblebrook message board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

---

5 Things Every Investor Should Know

Published Jan 28, 2013 at 12:00AM

Dear Fellow Fools,

If you don't keep your wits about you, a rising market can make you almost as anxious as a falling one. Should you sell some positions that have gained ground? If you have cash on the sidelines, should you invest it in stocks, or does it make more sense to add hedges instead? These are questions we're asking every day for you, and thankfully, the answers are typically available if you know the following five things about yourself as an investor.

1. Know Your Time Frame

At *Pro*, we think in terms of three years or longer with most of our core investments: Will a business create enough value over the next three years to make owning it at today's price worth the risk? Whenever the market seems overheated or beaten-down, it pays (and is calming) to remember your time frame before you assess your next step. Your time frame should take into consideration any tax burden you would face when selling, too. In relation to time frame, remember that "fair value" is an estimated fair price for a seller *or* a buyer today, and this value should appreciate annually as the business grows.

2. Know Your Thesis

You should have a clear and up-to-date reason for every position you hold. It's important not to hold so many positions that you don't recall why you own some of them or can't keep current with each business and its competitors. Write the reason down, so you can review it as necessary. (This week, we're going to summarize our thesis behind each position on *Pro*'s "What We Think Now" page.)

3. Know Your Portfolio

First, an investor must last. Your portfolio should be weighted strategically and diversified enough to withstand a potential sharp drop in several positions at once. Don't neglect the importance of building a portfolio that can safely endure a market slide, because setbacks are inevitable. *Pro* is most heavily invested in financials and technology, because we see attractive value and opportunity in both, and our largest long position is **AmTrust Financial** at a still-reasonable 6.4%. We're also maintaining hedges, on some positions and on indexes, to soften declines.

4. Know Your Objectives

When you invest, you don't expect to be right in every choice you make. In fact, you maintain a diverse portfolio because you *know* you'll frequently be wrong. Nobody has enough information to make a perfect decision, and even if they did, that information is always evolving. *Pro*'s objective is to make steady money *overall* with our portfolio, not with every position within it — because try as we might, we know that's not realistic. The portfolio is our true "body of work" — positions in it are the means to make the whole.

5. Know Your Humanity!

Finally, realize that the qualities that make you a good investor also contribute to your mistakes. There are lessons to be learned when positions don't perform as expected, but whatever led you to buy those positions also led you in different ways to buy your winners. Just as you need valleys in order to define mountains, you need mistakes to define your successes. So cut yourself some slack, because perfection is impossible.

For example, our three-year time frame (see No. 1) means we're currently holding some strong winners, including **MasterCard** and **Tupperware**, even as their valuations appear to have gotten a year or two ahead of themselves. We want to grow our gains further as these businesses grow, even though this desire may lead to some missed opportunities to sell before a decline in these positions (or some others). We're fine with that, because we know that on the whole, this patience should help us come out ahead over our time frame.

So, as we focus on getting earnings reviews to you over the coming days and positioning our portfolio for 2013, we continually revisit these five principles. I hope that you will at home, too, whether you mirror *Pro* exactly or (especially) if you only follow our portfolio moderately. To discuss these ideas, please visit our Memo Musings discussion board.

Foolishly,

Jeff (TMFFischer)

Pro Trade Roundup

- **Sony** : *Pro* bought to cover its full position at $13.27, resulting in a 21% gain on the short while the indexes reached new five-year highs over the same period.
- **Direxion Daily Financial Bear 3x Shares** ETF: We sold short 1,900 shares at $12.53, opening a 1.5% short.

Guidance Updates

- **Starbucks** and **AmTrust Financial Services** move to Buy from Buy First due to valuation.

Coverage & Community

- **Earnings Ahoy!** TMFMoosie shares an updated earnings calendar. You can also see earnings dates on the site's alerts tab. This week we'll see results from **BMC Software**, **Facebook**, **Tupperware**, and others. You know what we'll be working on!
- **Starbucks Serves Up Rich Results:** Our favorite mass-market café reported healthy growth.

Short the Direxion Daily Financial Bear 3X Shares ETF

Published Jan 23, 2013 at 12:00AM

- **What We're Doing:** Financial stocks are attractively priced, so we're selling short a bearish financial ETF that is additionally compromised by its use of leverage.
- **What We're Thinking:** Shorting this flawed ETF is a way to profit on the financial sector's recovery. (An added benefit: The ETF's losses could potentially compound daily.)

Trade Essentials

- **Action:** Sell short **Direxion Daily Financial Bear 3X Shares** (NYSEMKT: FAZ) ETF
- **Allocation:** 1.5% (short $1,500 worth for every $100,000 you manage)
- **Recent Price:** $12.80
- **Price Guidance:** Use a limit order at the market's going price.
- **Short Availability:** Interactive Brokers recently showed 500,000 shares available for shorting at a 5.34% annual fee. TD Ameritrade has shares available periodically, with no fee. Other brokers vary, but shares are scarce. We have alternative trades at the end of this report.

The Big Picture

Would *you* like to sell short, or bet against, **Wells Fargo** (NYSEMKT: WFC), **Berkshire Hathaway** (NYSEMKT: BRK-B), **Visa** (NYSEMKT: V), **Goldman Sachs** (NYSEMKT: GS), **American Express** (NYSEMKT: AXP), and **MasterCard** (NYSEMKT: MA) right now? Nor would we. But that's exactly what the **Direxion Daily Financial Bear 3X Shares** (NYSEMKT: FAZ) ETF does — and it levers up three times in the process.

This bearish ETF is meant to provide 3 times (300%) the daily *inverse* results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. The companies mentioned above are six of the index's 10 largest holdings. By shorting this ETF, we'll effectively be three times long, on a daily basis, the U.S. large-cap financial sector — including these leaders.

Less than five years after a banking meltdown the likes of which America hadn't seen in 29,000 days (read: since 1929), many still view these companies with suspicion. But throughout history, banks periodically collapse and are revived. Following the largest bailout in modern times, the financial sector is likely a more sensible investment now than it has been in decades, and yet it trades inexpensively because the memory of 2008 holds strong. As Warren Buffett said last week, "The banks will not get this country in trouble, I guarantee it ... Our banking system is in the best shape in recent memory."

The Vehicle

The FAZ ETF holds nothing but "financial swaps" (and cash equivalents) that give it short exposure to the underlying index (and it charges a 0.95% annual fee for this privilege, which helps our short). The underlying Russell 1000 Financial Services Index is deceptively comprised of only a few hundred stocks; it's a subset index of the Russell 1000 itself. As of Sept. 30, 2012, the index was concentrated in banks (20.4%), insurance (19.3%), real estate investment trusts (18.5%), and diversified financial services (16.9%). Some key statistics as of Dec. 31, 2012:

Russell 1000 Financial Services Index

Average market cap (dollar-weighted)	$66.9 billion
Median market cap	$4.3 billion
Price-to-book value	1.16
Dividend yield	2.08%
Long-term growth forecast (I/B/E/S %)	10%

The index trades at an average valuation of only 1.1 times book value — well below the long-term average of at least 2. The index also sports approximately the same yield as the S&P 500; many of its components' dividends are currently depressed and should slowly grow. For what it's worth, I/B/E/S expects average earnings per share for the index to expand 10% a year for the next five years. More tellingly, we at *Pro* expect return on equity to slowly improve as major financial institutions heal, and net interest income should jump if interest rates start to increase in the next few years, as I believe they will.

As with many leveraged, bearish ETFs, this one has lost the majority of its value since its 2008 inception, but — in a testament to investors' lingering concern — it remains viable and liquid, with $330 million in assets and more than a million shares traded daily. Direxion will likely once again conduct a reverse split if shares decline to single digits; it enacted a five-to-one split in 2011.

How to Follow Along

Despite Buffett's guarantee, there is no guarantee. Plenty of risk remains hidden in the banking sector, so we should not be surprised to see some shocks, such as **JPMorgan Chase**'s (NYSEMKT: JPM) "London Whale" trade loss last year. Banking woes in Europe could rapidly spread to U.S. banks, too. By definition, we can't anticipate every risk, so **it's extremely important that you adhere to our allocation guidance and short no more than a 1.5% position**. That way, even if the ETF *doubles in value* and — for argument's sake — your broker forces you to close your short, you would only lose 1.5% of your portfolio.

On the other hand, if we make money on this short, its allocation will shrink among our holdings. (As a short works in your favor, it becomes a smaller position.) If that occurs, we can consider adding to the position as frequently as we wish to maintain around a 1.5% allocation — as long as shares remain available for shorting and we like the valuation of the index. This way, we could earn very meaningful profits over time even on what starts as a small position.

Because this ETF's shares are leveraged and hard to borrow, one of our largest risks is getting called out of our short on a spike. Should financial stocks fall 20% quickly, this ETF could rise at least 60%, and our shares could be called away at the worst time. Thus, again: **Start with a small allocation, no more than 1.5% (less if you want to test the waters)**.

I'll repeat that this position is not without risks: a possible negative impact on financial firms from the slow but steady implementation of the Dodd-Frank regulations; any changes in the Basel capital requirements; any remaining off-balance-sheet or derivative contracts on the banks' part, which could rear up and bite us. But if you believe, as we do, that further stability and recovery are most likely in the coming years, then short a small amount of shares with us — no more than 1.5% — to get started.

Alternative Trades

A Note on the Opposite ETF

We don't suggest buying it. We don't recommend buying the **Direxion Daily Financial *Bull* 3X Shares** (NYSEMKT: FAS), because like the one we're shorting, this ETF is flawed, even though it's up more than 60% since 2008.

- **Options (non-IRA):**If your broker doesn't have shares available to short, consider setting up a January 2015 synthetic short on FAZ. Sell to open January 2015 $13 calls, and buy to open an equal number of January 2015 $13 puts.
  - **Price guidance:** Lately, this syn short can be set up for a net debit of around $1.70, resulting in a start price of $11.30 per share. That's 11.7% below the ETF price, which nearly equals the fee you'd be charged for shorting for two years. Set up one syn short for every 100 shares you want to short at $11.30 – at 1.5%, that's one syn short for every $75,000 you manage. (See our guide to synthetic shorts for more on the strategy.)
- **Options (IRA):** You could simply "buy to open" Jan. 2015 puts at a strike price and for a total cost that you're willing to risk. With strikes near-the-money, I expect you'll earn a profit before expiration, although the puts are expensive, so this is a "last resort" trade for a small sum. (In other words: Don't allocate 1.5% of your funds, just what you're willing to potentially lose.) Lately, you can buy to open January 2015 $15 puts for about $6 and change. Or, buy to open January 2015 $10 puts and risk about $2.60 each.
- **Bullish on Financials:** If you can't short this financial index, you could instead buy an additional 1.5% in *Pro* stocks Wells Fargo or **AIG** (NYSEMKT: AIG) (or split it between both). Our short is expressing a bullish stance on large-cap financials, after all.

Cover Your Sony Short

Published Jan 22, 2013 at 12:00AM

- **What We're Doing:** Buying to cover, or close, our short on **Sony**.
- **What We're Thinking:** Our hedge on this short expired Friday, and rather than pay to hedge the short again, we'll take our gain.

Trade Essentials

- **Action:** Buy to cover, or buy to close, all of your short shares of Sony.
- **Recent price:** $13.20
- **Price guidance:** Use a limit order to close at current prices; let's not push the stock up.

What's New

We've made approximately 20% being short **Sony** (NYSEMKT: SNE) since April 2012, while the stock market has run to multi-year highs. The company is continuing to lower costs and raise cash by selling assets — including its New York headquarters, for $1.1 billion — and by eliminating 10,000 jobs. At some point this year, Sony believes it could turn a net profit, reversing years of losses. The question is, how weak will the company and its long-term prospects be by that point? Will focusing on higher-margin products pan out?

As of now, we won't be around to ask. Our protective calls expired on Friday, and buying new ones at a reasonable strike price for several months out would eat into a fair amount of our profits, so instead we're taking our money and going home. Recall that last week, we told members who were just short calls to buy to close those calls to end the position, so closing our direct short places us all on the same page.

As speculative stocks such as **Research in Motion** (Nasdaq: RIMM) soar from $6 to $17, Wall Street's appetite for risk appears to be growing. In this spirit, Sony could garner more buying interest as management continues to promise a recovery. Given the more speculative nature of staying short at this juncture, we'll take our profit instead and keep an eye on Sony for future opportunities.

To discuss this position, please visit the Sony board.

What We Believe — 2013 Update

Published Jan 22, 2013 at 12:00AM

Dear *Pro* Members:

Starting each year by reassessing your largest business beliefs can help ensure that your investments are aligned with your deepest convictions. Last January, we first published a list of the core beliefs that drive the *Pro* portfolio; today, it's time to update you on what we believe.

Last year, two of my most significant new beliefs were that housing and auto sales would start to recover. Both theories are so far proving out, but aside from two *Motley Fool Options* positions (**Lowe's** and **Ford**) and *Pro*'s purchase of **Gentex**, we haven't capitalized on them yet. Of course, it's not enough just to have beliefs. The hard work is to invest well alongside them so you profit when they prove to be right.

Beliefs must also remain fluid. Last year, I posited that oil and energy prices could increase. Once that happened, *Pro* sold its two main oil positions, because the *Pro* team and I now believe energy prices are likely to remain stable — or even decline, thanks to the vast new oil and natural gas reserves the U.S. is tapping.

Without further ado, below are many of my strongest big-picture beliefs.

I Believe …	So We Own …
Technology is essential to our world; the sector will grow and become even more important. But tech will remain cutthroat, with players rapidly coming and going, allowing both long and short opportunities.	**3D Systems** , **BMC Software**, **Intel**, **OpenText**, **Oracle**
Well-managed financial companies are still inexpensive and will reward long-term owners.	**AIG** , **Amtrust Financial Services**, **Broadridge Financial Solutions**, **Wells Fargo**
U.S. home construction will continue to recover.	**GrafTech International** , **Rockwood Holdings**
Cash and checks will continue to lose market share to electronic payments.	**MasterCard**
The euro is overvalued compared to the dollar.	Short **CurrencyShares Euro Trust**

The 14 positions listed above represent nearly 60% of the assets in the *Pro* portfolio. We carry the other positions because we believe they'll help us keep pace with our always-positive North Star, or because we believe in management or the notion that (for example) the world could almost never have too many coffee bars. Below are some of my other beliefs that we'll also seek to capitalize on:

- Energy prices will be relatively stable and will potentially decline as the U.S. taps new reserves.
- Flawed ETFs will continue to offer profit opportunities, especially for shorting.
- Auto sales will recover and reach new records, and autos will offer many more technological bells and whistles.
- Our interaction with technology will evolve to commonly include voice commands.
- Most all products will eventually contain a computer chip of some sort.
- Big data will drive ever more pinpointed marketing, and social websites will become still more popular (and profitable).
- Paper media of all forms in the U.S. will come close to disappearing within 10 years.
- Younger generations will want to be memorialized online more than with a tombstone.
- I will live to at least 100 years of age, as will all *Pro* members.
- Healthy eating will remain a growing theme in the U.S.
- Many dominant U.S. companies will thrive, if not lead, in emerging markets.
- Some big retailers will revive and prosper by offering a specialized experience unavailable online.
- Cloud computing — storing files on remote servers — will be an even larger business than expected.
- A sustainable competitive moat will be more important than ever to strong stock performance.
- Interest rates will start to tick up in the next 24 months, but not by much initially.
- Alongside owning great businesses, *Pro* will do well by generating increased income and doing more targeted shorting.

Last year, I also believed "some European stocks look[ed] very cheap." In my estimation, we let ourselves down in 2012 by not investing in European markets that have since rebounded sharply. But with our goal of absolute returns, taking a flier on Greece wasn't in our wheelhouse, and we didn't find a comfortable stock to express our belief. I also suggested that water management and agriculture will be strong investment industries in coming years (not a hard belief to reach). We've owned companies aligned with this belief before, **Flowserve** and **Lindsay**, both of which we sold on valuation. We're seeking new companies through which to express this belief; **Deere** was high on my list of possibilities in early 2012.

Finally, last year, I believed emerging markets were an attractive place to invest. This year, I'm dropping that belief from my list; I *suspect* emerging markets will perform decently, but I believe *Pro* can perform just as well or better, with lower risk, by investing in American companies capitalizing on new markets, such as **Starbucks**.

What Bryan Believes

I asked the team to share their updated beliefs for this year, too. Bryan Hinmon's (TMF42) are below. Nick Crow (TMFCrow), on the other hand, said his job is to talk us *out* of our beliefs. He'd rather not think in terms of beliefs as he looks for investments — a diverse viewpoint we welcome. Here are Bryan's:

- Governments at all levels will begin to peel away conservatism by trying new ways to save money.
- People will try to be healthier, but they will fail and look for quick fixes.
- Web security is a big deal, for companies and for individuals.
- People will see their houses as homes, not investments. (Sub-belief: Kitchens will get bigger and more high-tech.)
- Electronic payments will continue to take share from cash.
- Brands viewed as soulless or "corporate" will suffer as consumers embrace individualism and companies with a heart.
- Chocolate is awesome (the new coffee).
- The impact of "big data" is likely to prove overhyped except in specialized instances, such as targeted advertising or health care (for example, the self-tracking movement exemplified by sites like NutritionData.com). In both cases, the data is relevant not for its size but for what can be culled from it.

What Do You Believe?

There you have it, Fools — many of our beliefs updated and laid bare. What are your key investing beliefs? Share them on *Pro*'s Philosophy discussion board so we can discuss whether and how to put them into play this year.

Foolishly,

Jeff Fischer (TMFFischer)

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **OpenText**: Shares remain a buy, but if you only want to potentially buy the stock lower, sell to open May 2013 $55 puts, lately $2.80 (for a 5% yield), for up to a 2.6% initial allocation and a 5% total allocation (which we'll have if our $50 puts are exercised).
- **GrafTech International**: Shares remain a buy at a 2.2% allocation, but if you want to target modest income with a low probability of getting shares, sell to open June 2013 $7.50 puts, lately paying $0.25. That's a 3% yield (before commissions) in five months — not outstanding, but it has a breakeven price 23.2% below last Friday's closing price.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Coverage & Community

- **Intel Reports and Retreats: Intel**'s stock turned south as PC sales declined. Read our initial take on the company's quarter.
- **Sony Soaring:** It's an upside-down world, with **Sony** and other beleaguered stocks soaring. Jeff explains why the short is still a success, and how *Pro*'s methodical approach should lead to higher gains overall.
- **Earnings Time:** TMFMoosie shares an updated earnings calendar. You can also see earnings dates on the site's alerts tab. This week we have results from **Apple**, **OpenText**, and **Starbucks**.
- **ADrumlinDaisy's 2012:** Rich shares why his 2012 was great in all the ways that matter, but in some ways awful for some of his investments.

The Motley Fool owns shares of Ford. See Pro's holdings here . See the team's and David and Tom Gardner's holdings here .

Keeping Sight of Our North Star

Published Jan 14, 2013 at 12:00AM

Dear *Pro* Member:

Despite tamer earnings growth, a foundering European economy, a slowdown in China, and budget battles in the United States, the U.S. stock market last year had its strongest performance since 2009, treating Foolish owners like you and me to healthy appreciation of between 10% (the Dow Jones Industrial 30) and 16% (the S&P 500).

Last year's concerns are not likely to subside in 2013. Earnings growth is likely to slow further, the U.S. budget battle will continue on Capitol Hill, unemployment in Europe is bleak, and it's easy to question the growth numbers coming from China. In other words, there's plenty of healthy skepticism in the market, and it may serve *Pro* Fools well in the long run by keeping stock prices reasonable. We remain dedicated to finding great businesses to own, because even in the eye of the storm, there's always something thriving.

Past buy decisions paid off for us in 2012, with the *Pro* Portfolio advancing 14.3%. Below is how our returns since inception stack up against our always-positive North Star.

Date	*Pro* Portfolio Value	*Pro* Period Return	*Pro* Cumulative Return	North Star Period Return	North Star Cumulative Return
10/6/2008	$1,000,000	--	--	--	--
12/31/2008	$1,002,558	0.3%	0.3%	1.6%	1.6%
12/31/2009	$1,222,428	21.9%	22.2%	9.7%	11.5%
12/31/2010	$1,382,924	13.1%	38.3%	8.5%	21%
12/31/2011	$1,278,774	(7.5%)	27.9%	10%	33.1%
12/31/2012	$1,461,697	14.3%	46.2%	9.3%	45.4%

We enjoyed a strong 2012 despite having a 30% hedge on the S&P 500 as the year began. We slowly reduced that hedge to 10% by year-end, but on average last year we had net long exposure of only about 75%. In other words, we achieved strong returns with less risk, because we were always hedged — and because we always had cash, which made up 14% of the portfolio at the end of the year.

It's hard to quibble with our raw numbers when comparing *Pro* to the market or to our aspirational North Star — and it's especially hard when comparing *Pro* to other portfolios that hedge. Hedge Fund Research's "Equity Hedge Total Index" showed only a 7.4% average return for hedge funds in 2012, and a five-year annualized return that is actually negative. As has been widely reported, hedge funds have had a rough go of it since 2008.

But quibble we will, because we can always improve. Last year, we struggled to find short candidates to replace our S&P 500 hedge, and we missed a large gain by not being short volatility. For those who weren't with us in 2011, the sole reason we lost value that year was a short volatility position. The short ran sharply against us as the **CBOE Volatility Index** (VIX) soared following the U.S. credit downgrade. Had we been able to wait out the position (rather than being forced out by our former broker's lack of available shares to short), it would have turned into a very large profit last year.We lacked the wherewithal or desire to get back into the position right away, but plan to do so incrementally now that short availability is much less of an issue.

But that's in the past. We always live for the future. Our guiding goal is to keep our losses as small as possible while managing the portfolio for steady gains akin to our North Star/Remember, the North Star (inflation plus 7% annually) historically outperforms the broader stock market and of course does so with much less volatility than the indexes, and nary a negative year. It's a tough taskmaster to come close to, so as we enter our second year following our North Star, we are dedicated to finding even more innovative, sensible ways to build a portfolio that produces strong returns with more modest drawdowns than the market at large.

2012 Summed Up

Last year, *Pro*:

- Issued 53 trade alerts (averaging one per week)
- Thirty of those were options-centric, making 23 stock or ETF-focused
- Welcomed 12 new positions to the service, including **Sony**, **Starbucks**, **The Buckle**, **Facebook**, **ProShares UltraShort Real Estate**, and **AIG**.
- Completely closed eight stock positions, including **Ebix**, **Autodesk**, **L3 Communications**, and **Vanguard Energy**. (I'll write more about our sells early this year.)
- Sent you 50 Monday Memos with countless Catch-Up Trades
- Read and wrote thousands of posts on the discussion boards! (Thank you!)

As Nick outlined last week, our cash winners in 2012 were led by **AmTrust Financial Services** for the second year running, validating our longstanding decision to keep the stock as a Buy First. **3D Systems** was second in our cash returns, but first in absolute gains — in fact, it was one of the biggest gainers across the entire market. In retrospect, the stock's performance proved wrong our initial decision to write covered calls and let some shares go, but I believe our covered strangle is sensible now.

Overall, the reality is that we don't particularly care which positions do the heavy lifting for us in any particular year. We have a portfolio precisely *because* we don't know where our biggest winners will be — we simply want the portfolio to perform as a whole, while letting us sleep well at night. The *Pro* portfolio did that last year. Now it's time to improve all we can in 2013 and beyond.We still want to introduce new shorts, continue to focus our longs, and keep cash for new ideas.

If you'd enjoy a few more thoughts about our portfolio, look no further than Fool member Gunnar Peterson's column on *Pro*'s look-through earnings and yield in 2012.

We'll talk more about the lessons learned in 2012 (and indeed, every year since 2008) as the year goes on. We're glad you're here, and we look forward to another full 12 months of Foolish investing, *Pro*-fashion! To discuss this Memo, please visit the Memo Musings board.

— Jeff Fischer (TMFFischer)

Pro Trade Roundup

- **iShares Russell 2000** ETF: We set up a new put ratio spread at a 10% allocation (on the long puts) by selling to open 34 May 18, 2013, $80 puts, and buying to open 17 May 18, 2013, $86 puts. We received a $0.05 credit before commissions.
- **iShares Russell 2000** ETF: We bought to close our Jan. 19, 2013, $75 puts for $0.01.
- **SPDR S&P 500**: We set up a put ratio spread at a 10% allocation (on the long puts) by selling to open 20 Feb. 16, 2013, $140 puts and buying to open 10 Feb. 16, 2013, $144 puts. We paid a $0.09 debit before commissions.
- **SPDR S&P 500**: We wrote covered puts on our 1,000 short shares, selling to open 10 Feb. 16, 2013 $146 puts for $2.51 each.

Guidance Updates

- **Tupperware**: Shares move from buy to hold on valuation.

Expirations

We have three options expiring after Friday's close this week:

- Our **Starbucks**$47 puts are due to expire for a full cash gain, and we'll look to write puts again.
- We already suggested closing your January put ratio spread on the **iShares Russell 2000 Index**. You should buy to close your $75 puts and, given that there's no bid, you might as well leave your long $78 puts alone. If the market tanks enough this week (no thank you!), they'll become a boon.
- If you still have your January 2013 bear call spread on **Sony**, buy to close your $5 calls, and let your long $22 calls expire. You've made a good return on this bearish spread. We're reassessing our direct short of the stock (which our spread turned into) but I don't currently believe that setting up a brand-new short at today's price is that attractive.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **BMC Software**: Shares remain "buy first," but if you only want to potentially buy the stock lower, sell to open May 2013 $40 puts, lately $1.40, for up to a 4.5% allocation.
- **The Buckle**: If you want to target a purchase price near our $36.50 buy around guidance, sell to open June 2013 $38 puts for around $1.90. That's also a 5% yield in just over five months. Our current stock allocation is 3.1%.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Coverage & Community

- **It's Earnings Time Again!** Reports start this week, and we'll hear from **Intel** first. Many others follow; see TMFMoosie's calendar.
- **Are Bond Buyers' Eyes Open to Risk?** TMFMoosie shares Howard Marks' thoughts on investing in fixed income securities. Then visit our Bond Banter board if you have questions.
- **Is Apple Ripe?** Andy (member hkspike in Hong Kong) shares the market's concerns that Apple's growth could fall short of expectations.

The Motley Fool owns shares of Ebix and L-3 Communications. See Pro's *holdings here. See the team's and David and Tom Gardner's holdings here.*

Roll Your Put Ratio Spread on the iShares Russell 2000 Index

Published Jan 8, 2013 at 12:00AM

- **What We're Doing:** As our January hedge on the small-cap index nears expiration, we're closing it to open a new one at higher strike prices, expiring in sun-washed May.
- **What We're Thinking:** We want to continue to use hedges that won't ding our returns in a rising market; this one allows us to profit if the index falls as much as 14.5%.
- **What You Should Do:** Set up this new hedge to mirror the *Pro* portfolio. If you're not interested in hedging, you don't need to. We believe the companies we own will continue to provide strong returns.

Trade Essentials

- **First Action (Closing Old Trade):** Using a ratio spread order, close your Jan. 19, 2013, put ratio spread on the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF.
  - Buy to close all of your January 2013 $75 puts
  - Sell to close all of your January 2013 $78 puts
  - Recent ask (on two $75 puts) / bid (on one $78 put): $0.02/$0.01
- **Price Guidance:** You'll pay a net debit of $0.01 to close the spread. Because the price is less than $0.05, many brokers won't charge a commission. You could instead let the spread expire next Friday, but that would leave you sitting on a potential obligation if the ETF falls below $75.
- **Recent ETF Price:** $86.60

- **Second Action (New Trade):** Using a ratio spread order, set up a May 18, 2013, put ratio spread on the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF.
  - Sell to open two May 18, 2013, $80 puts
  - Buy to open one May 18, 2013, $86 put
  - Recent bid (on two $80 puts) / ask (on one $86 put): $3.94/$3.81
- **Price Guidance:** Lately you'll receive a net credit of $0.13 per spread. As prices change, just aim to set it up for any credit.
- **Allocation:** *Pro*is hedging nearly 10% of its long exposure and is ready to potentially invest about 10% in the ETF, so we'll write 34 puts and buy 17. It breaks down like so:
  - Portfolio value: $1,500,000
  - 10% of that value: $150,000
  - Buy to open $86 puts (17 contracts, representing 100 shares each) = $146,200 in look-through exposure, or nearly a 10% hedge on our current portfolio value
  - So, sell to open 34 $80 puts (half of which become a potential obligation)
  - Simply stated, hedging 10% of your assets, you would buy one $86 put for every $86,000 you want to hedge
- **Alternative Trades:** Please see the end of the report.

Strategy Details

The **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF tracks 2,000 small companies, and it is one of our preferred vehicles for hedging because of its high historical volatility. This ETF should be especially sensitive to a declining market.

Using a spread order, we're writing $80 puts that obligate us to buy shares of IWM (unless we close the puts beforehand) if they decline below that strike by expiration. We're using most of the money we receive for writing the puts to *buy half as many* $86 puts that expire the same month. The $86 puts will profit if IWM declines, and they cancel out half of our $80 put exposure. Here's how the math and potential returns tally:

iShares Russell 2000 Index ETF Price	Value of 1 Purchased $86 Put	Value of 2 Written $80 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%) From $86.60
$86 or higher	$0	$0	$0	(0.7%) or less, or any increase
$85	$1 x 100 = $100	$0	$100	(1.8%)
$84	$2 x 100 = $200	$0	$200	(3%)
$83	$3 x 100 = $300	$0	$300	(4.2%)
$82	$4 x 100 = $400	$0	$400	(5.3%)
$81	$5 x 100 = $500	$0	$500	(6.5%)
$80	$6 x 100 = $600	$0	**$600**	**(7.6%)**
$78	$8 x 100 = $800	($2) x 200 = ($400)	$400	(9.9%)
$76	$10 x 100 = $1000	($4) x 200 = ($800)	$200	(12.2%)
$74	$12 x 100 = $1200	($6) x 200 = ($1200)	**$0**	**(14.5%)**
$72	$14 x 100 = $1400	($8) x 200 = ($1600)	($200)	(16.9%)
$70	$16 x 100 = $1600	($10) x 200 = ($2000)	($400)	(19.2%)
$68	$18 x 100 = $1800	($12) * 200 = ($2400)	($600)	(21.5%)
$66	$20 x 100 = $2000	($14) x 200 = ($2800)	($800)	(23.8%)

As noted in bold above, we earn our maximum profit if the ETF declines 7.6% to $80 by our May expiration, and we start to suffer losses if it declines more than 14.5%, or below our $74 break-even. To summarize:

If the ETF (i.e., the Market) Does This ...	Then Our Strategy ...
Goes up, stays steady, or declines less than 0.7% (staying at or above $86 at expiration)	Doesn't cost us anything — in fact, we earn any credit paid to us when we initiated it.

Declines between 0.7% and 14.5%, to between $85.99 and $74.01	Earns a partial to full profit, depending on the amount of the decline.
Declines more than 14.5%, to $73.99 or less	Shows a loss by expiration. We can close the options and roll to a new ratio spread; take shares of the ETF to own; close the options and buy calls instead; or set up a synthetic long to lower our cash outlay and turn bullish.

Returns on this strategy won't occur smoothly or immediately. As with most spreads, we'll need to wait until close to expiration to achieve results, because the two opposing options in the spread at least partly cancel each other out until time value in each dissipates. But assuming we set this up for a credit, the position will result in a small profit even if the market rises or treads water — and much more importantly, it will pay us well if the ETF declines about 4% to 10% by May 18.

Alternative Trade

- **If you're hedging in an IRA or can't write naked puts:** For a cost, you can set up a bear put spread, a strategy with capped risk that most IRAs allow. Using a spread order, buy to open May 2013 $86 puts, and sell to open an equal number of May 2013 $80 puts. Lately, this will cost you around $1.90 ($190) per put, and that is your maximum risk. This strategy could pay you up to $4.10 per spread on a market decline to $80, but you should be prepared to lose your $1.90 if the market doesn't decline. We don't recommend just buying puts alone, given how expensive they are.

Pro in 2012: Our Portfolio's Biggest Chutes and Ladders

Published Jan 7, 2013 at 12:00AM

Fellow Fools,

In a coming Memo, Jeff will no doubt offer some thoughtful musings on *Pro*'s 2012, looking at what we learned and where we're going in 2013. This isn't that memo. Instead, I'm playing St. Nick with a *Pro* naughty-and-nice list for 2012, based purely on each position's contribution to the total return our portfolio achieved this year. That return, by the way, was awesome — 14.3%, trouncing our North Star, which came in at 9.3%. Though we should be pleased (and we are!), we're also aware that the real test will come in those years when the broader market is in negative territory.

We're (somehow) supposed to love all our companies equally, but I don't feel that way at all. Still, to avoid hurting any feelings, I'm going to draw from a board game I played as a child, Milton Bradley's Chutes and Ladders. In this game, players who display good behavior are rewarded with the ability to climb ladders, moving them forward more quickly, while those who behave poorly are sent down a chute that hinders their progress. So our stocks will be "Chutes" if they were a drag and "Ladders" if they advanced us toward our goal.

Our Chutes

We task each one of our positions with helping us obtain North Star-like returns, but we realize — and even hope — that some will zig while others zag. In a strong market like 2012's, most positions made money, so I've set the threshold for inclusion on this list at about $3,000 in total mark-to-market losses in 2012. I'm also ignoring our large SPY hedge, which is designed to lose money (and did — $41,000 last year). Under those criteria, only six positions qualified as Chutes:

1. **GrafTech**: ($15,000)
2. **InvenSense**: ($13,000)
3. **Intel**: ($10,000)
4. **Pacer**: ($8,000)
5. **CBOE S&P 500 Volatility Index** (VIX): ($3,000)
6. **CME Group**: ($3,000)

We must have shown good behavior in 2012, because we slid down very few chutes — and those chutes could very well become ladders this year. Only two are permanent losses; having exited the positions, we won't be making our money back in InvenSense or the VIX.

Our Ladders

We had some real climbers this past year! Though I wanted to keep this list concise, it seemed wrong to leave off any position that contributed at least 1% of our starting portfolio's $1 million to our coffers. So here are the 13 companies that made at least $10,000 for us in 2012:

1. **AmTrust Financial Services**: $36,000
2. **3D Systems**: $28,000
3. **EBIX**: $22,000
4. **Papa John's**: $21,000
5. **Oracle**: $19,000
6. **Rockwood**: $16,000
7. **Autodesk**: $15,000
8. **MasterCard**: $14,000
9. **Covanta**: $13,000
10. **The Buckle**: $13,000
11. **Pebblebrook Hotel Trust**: $11,000
12. **Wells Fargo**: $10,000
13. **BMC Software**: $10,000

I know I promised this Memo would be light on the deep thoughts, but I can't help myself: In gathering this data, I noticed some peculiarities about measuring gains in dollars over an arbitrary period of time. First, measuring financial results in actual dollars is superior to coming up with a return figure. Which resonates with you more, "I made $183,000" or "I made 14.3%"? Second, isolating just one calendar year can lead you to some silly conclusions. Some of our big gainers were bouncing back from a painful 2011, and in 2013, some of 2012's winners could end up struggling. It's long-term results that really matter.

To that end, then, let's look further back. Since inception (October 2008), we've made $461,697.75 on that $1 million in capital (as of Dec. 31); that's 9.3% annually, a point better than our North Star's 8.3%. Here's to a 2013 full of similar good behavior.

Happy New Year, *Pro* Fools!

Nick (TMFCrow)

Coverage & Community

- **The Future Looks Bright: Oracle** results shine, suggesting more upside in margins and the long-term stock price.

Trades Completed

- **ProShares UltraShort Real Estate** : *Pro* sold short 650 shares, for a 1% allocation, at $23.36 each. Including our earlier synthetic short, we're now about 2% short this ETF.
- **Tupperware** : *Pro* wrote a covered strangle, selling to open July 2013 $55 puts and July 2013 $70 calls for a combined $3.50. We covered all our shares, writing seven contracts of each option.

Catch-Up Trades

- **Gentex**: If you lack a position, sell to open March 2013 $17.50 puts for up to a 2.8% allocation, lately for at least $0.65 each. That's a 3.7% yield on cash in less than three months.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Set Up a Put Ratio Spread on the SPDR S&P 500

Published Jan 4, 2013 at 12:00AM

- **What We're Doing:** Using options, we're setting up a new market hedge that won't cost us anything if the market keeps rising.
- **What We're Thinking:** Plenty of market uncertainty remains (upcoming earnings results, the pending debt-ceiling and deficit debate), so we want to remain hedged. We just don't want to do so in ways that cost us when the market rises.

Trade Essentials

- **Action:** Using a ratio spread order, set up a put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
  - Sell to open February 2013 $140 puts.
  - Buy to open February 2013 $144 puts
  - Sell two $140 puts for every $144 put you buy
  - Bid (on two $140 puts) / ask (on one $144 put): $1.70/$1.72
- **Price Guidance:** Use a spread order and aim to pay close to nothing to set up the trade — a penny or two at most as your net debit.
- **Recent ETF Price:** $146.20
- **Allocation (based on the uncovered written puts):** About 9.3%. This replaces the 9.5% SPY short we're aiming to exit via written puts (see today's concurrent trade alert). But only write two puts and buy one for every $14,000 in SPY you could afford if you were forced to buy shares; *Pro* will write 20 $140 puts and buy 10 $144 puts.
- **Alternative Trades:** This unique strategy requires put-writing in a margin account. Because we're moving out of inverse index ETFs and direct index shorts, alternatives are not easy to come by. You could simply buy $144 puts on SPY, but that's expensive, and we don't advise it for such a short time period. If you're unable to use put ratio spreads (or don't want to), but still want to be hedged, you could keep your existing inverse index ETFs or direct index shorts.

Strategy Details

Pro veterans should be familiar with this strategy by now, but let's take a look at the profit/loss table on this particular trade.

SPDR S&P 500 ETF Price	Value of 1 Purchased $144 Put	Value of 2 Written $140 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%) from $146.20
$144 or higher	$0	$0	$0	(1.5% or less)
$143	$1 x 100 = $100	$0	$100	(2.1%)
$142	$2 x 100 = $200	$0	$200	(2.8%)
$141	$3 x 100 = $300	$0	$300	(3.5%)
$140	$4 x 100 = $400	$0	$400	(4.2%)
$139	$5 x 100 = $500	($1) x 200 = ($200)	$300	(4.9%)
$138	$6 x 100 = $600	($2) x 200 = ($400)	$200	(5.6%)
$137	$7 x 100 = $700	($3) x 200 = ($600)	$100	(6.3%)
$136	$8 x 100 = $800	($4) x 200 = ($800)	$0	(6.9%)
$135	$9 x 100 = $900	($5) x 200 = ($1000)	($200)	(7.6%)
$130	$14 x 100= $1400	($10) x 200 = ($2000)	($600)	(11.1%)

This spread will earn us a profit at expiration on any decline in the S&P 500 index of between 1.6% and 6.8%, with our maximum profit achieved on a 4.2% market decline. Should the index decline by greater than 6.9%, we would start to lose capital on this trade. In other words, this isn't "disaster insurance" — it hedges against a moderate decline in the SPY over the next six weeks.

Why not go longer-term? As today's concurrent trade alert explains, we're writing puts on our direct SPY short in an attempt to close that short over the same six-week time period, which limits its effectiveness as a hedge to just a few dollars per share. This put ratio spread is meant to hedge several *more* dollars per share over the same period, replacing some of the hedge we're losing by writing puts on our SPY short.

Additionally, our January put ratio spread on the **iShares Russell 2000** (NYSEMKT: IWM) ETF is less effective now that the index is so far above our strike price, so we're looking to roll that position to a later month at higher strike prices. That, along with today's trade, will give us hedges that run to February and beyond.

Must You Do This?

As always, not every *Pro* member needs to hedge. We feel strongly about all of the stocks we own and believe we'll earn strong returns over time. So if you'd rather not hedge your positions, then don't worry about our hedging trades like this one.

Next Step

Write Covered Puts on the SPDR S&P 500

Published Jan 4, 2013 at 12:00AM

- **What We're Doing:** We're writing puts on our short position in the **SPDR S&P 500** (NYSEMKT: SPY) ETF as a way to potentially exit the short or earn income while waiting to do so.
- **What We're Thinking:** We have gradually reduced this index short over the past year, and with the Federal Reserve newly committed to supporting the market, exiting completely remains our desired course of action. We'd rather target weak companies for our short positions.
- **What We're Expecting:** If the S&P 500 index declines below our put strike price by expiration, we'll buy shares through the puts to cover our short, ending the position. We would keep the premium received from these puts, of course. If the index does *not* decline below our strike, we'll earn income that offsets at least some of the index's gain, and we can consider repeating this strategy.

Trade Essentials

- **Action:** Write puts on your short **SPDR S&P 500** (NYSEMKT: SPY) position.
  - Sell to open Feb. 16, 2013, $146 puts
  - Recent bid/ask: $2.41/$2.42
- **Price Guidance:** Write the options at the going price. If the index moves significantly before you trade, you can move your strike price up or down to keep it within $2 of the current index price.
- **Allocation:** Write one put for every 100 shares of SPY you're short. For *Pro*, that's 10 contracts.
- **Recent SPY Price:** $146.19
- **Alternative Trade Guidance:**
  - **Are you short fewer than 100 SPY shares, or short an odd lot?** Write puts on all round lots, and buy to cover, or buy to close, any odd-lot shares – ideally on a dip in price.
  - **Own ProShares Short S&P 500** (NYSEMKT: SH) or **ProShares Short Russell 2000** (NYSEMKT: RWM) **instead?** Write February 2013 covered calls with a strike near the current ETF price. If the calls don't pay enough to make this worthwhile, just sell your remaining position, ideally on a rise in price.
  - **Directly short the ProShares Russell 2000** (NYSEMKT: IWM) **ETF?** Write covered puts on every 100 shares you're short, using a strike price close to the current ETF price. Or buy to cover or buy to close odd lots, ideally on a drop in price.
  - **Have a put ratio spread on IWM, as we do?** Leave that alone. We're keeping that.

What's New

Veteran *Pro* members know we've been reducing this direct index short (which serves us as a hedge) for the past year. As we eliminate it, we'll continue to replace it with other options-based hedges (like our put ratio spreads) and with direct company shorts. Why?

Well, because I'd like our market hedges to ding us minimally — or not at all — when the market goes up. That's not possible when you short the whole index. Plus, shorting the S&P 500 was always an intermediate-term solution; we chose it as an "alternative" trade when liquidity in many other vehicles was lacking.

We could simply close our short on the heels of recent gains, but we'd rather write covered puts to target a lower closing price or earn income if the index doesn't decline. Meanwhile, as you'll see in your inbox, we are concurrently recommending a new put ratio spread on SPY to replace the hedge we're effectively removing here.

Next Step

Have questions about any of your shorts (or pants, slacks, or knickerbockers)? Seriously, visit our SPDR S&P 500 board.

See Pro's *holdings here. See the team's and David and Tom Gardner's holdings here.*

Update Your Beneficiaries

Published Dec 31, 2012 at 12:00AM

Chances are, your account has a beneficiary designation. That is, when you set the account up, you answered the question: "Who should get my dough if space matter falls from the sky and makes me one with a crater?" That person, or entity, is your beneficiary, and now is a great time to make sure it is accurate. Life changes quickly and these things can be outdated. Your broker will have a beneficiary designation form that should be simple to fill out and submit.

Back to Invest With Us

Request Options Permissions

Published Dec 31, 2012 at 12:00AM

Ask your broker (via an Options Permissions section in the account application, or just call them to request a form) for full options approval. Typically, this means level 2 or level 3 approval (it can vary by broker). The "levels" refer to what type of options strategies are allowable, so the higher your approval level the more strategies you'll be able to participate in. Fill out, sign, and mail in the simple document and after a few days you'll be approved. If you aren't granted a high level, be sure to submit another request after a few weeks with an account. You should be able to get promoted to higher levels over time and as your account size and experience grow.

12 Resolutions Supporting Pro’s Mission

Published Dec 31, 2012 at 12:00AM

Dear *Pro* Members:

News Returns Next Week

There are no completed trades to report thanks to the holiday lull, and we don’t want to offer catch-up trades before we know what Washington is going to do (or not do) about the fiscal cliff. Those features will return next Monday – in the meantime, you’re invited to talk holiday traditions with the team on the discussion boards. Happy New Year!

We hope you’re enjoying the holidays and festivities that wrap up 2012. As we begin a new year together, it’s important to know what we’re aiming for over the next 365 days, so to that end, let's revisit *Pro’s* mission statement:

Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years.

This comes from our North Star document, where we outline why inflation plus 7% is the number that guides our decisions.

But did you know that we also have an internal mission? We call it *Pro*’s road map:

Equip *Pro* members with tools and coaching to invest well in all markets.

And our supporting strategies to achieve this are:

1. Manage the *Pro* portfolio with the North Star as a guide.
2. Communicate Foolishly to encourage members to invest the *Pro* way.
3. Build an active and vibrant community on the discussion boards by being ever-present, value-adding, and responsive.

Behind the scenes over the past year, we’ve been building frameworks around these goals to improve our investing and our service to you. The groundwork we’ve laid over the last 12 months should help make 2013 an even more efficient, more effective year for *Pro*.

For example, the North Star guided us for the first time in 2012, and it should become an ever-brighter light that helps with our decisions in 2013 and beyond. We’ll provide a review of *Pro’s* 2012 in January, but as Dec. 31 draws to a close, the portfolio is up 13% year-to-date -- a strong showing, especially given our lower-than-average risk. We were hedged all year, rarely being more than 80% net long (and we’re ending the year around 70% net long).

We look forward to reviewing our full results soon, and continuing to build on those results in 2013. For today, I’ll leave you with 12 Foolish resolutions from Bruce Jackson and Scott Phillips. Many of you will recall Bruce as a great *Pro* analyst in our first two years, before he left to successfully launch Motley Fool Australia (where you can now find him every day). Today, Bruce and Scott published the following list of resolutions in their popular *Share Advisor* subscription newsletter. Reading it this morning, I knew I wanted to share it with you. Take it away, Fool Australia -- you will be ringing in the New Year long before us, after all!

We'd love you to stop smoking and get fit (we want to have you around for many years to come), but if you're looking to add some financial resolutions to the list, here are a dozen we think you'll benefit from:

1. I will live below my means -- spending less than I earn.
2. I will save money into a rainy-day fund so I'm ready for what life might bring.
3. I will invest money I don't need for at least 3-5 years to build my nest egg.
4. I will regularly add to my investment account.
5. I will learn more about investing, taking control of my financial future.
6. I will invest in quality businesses, buying a slice of the company, not just a code on a screen.
7. I will buy shares in a company with the intention of holding them for the long term.
8. I will sell when my investment thesis fails, the company is overvalued or I have a better idea.
9. I will avoid anchoring my decisions to the price I paid for my shares.
10. I will remember that the market can be moody and over-react, both on the upside and the downside.
11. I will expect volatility, and I won't let it spook me into selling.
12. I will let the market offer me prices (be my servant), not dictate my mood or actions (be my master).

… At The Motley Fool we're in the 'time in the market, not timing the market' camp. Investing regularly and letting the creative power of capitalism do the heavy lifting works for us.

It's an approach decried as unsophisticated and 'old-fashioned', but that's okay with us. Warren Buffett has been accused of that many times -- he ignored the jibes and was proven right. We're not comparing ourselves to the Oracle of Omaha in terms of investing results, but we're happy to follow in his footsteps when it comes to ignoring the so-called 'smart money'."

Have a wonderful New Year’s Eve, and let’s have a great 2013 together!

Foolishly,

Jeff Fischer (TMFFischer) on behalf of the *Pro* team

Write a Covered Strangle on Tupperware

Published Dec 27, 2012 at 12:00AM

What We're Doing: Generating income with the potential to buy more shares cheaper, sell our existing stock higher, or roll our options to a later date at their July expiration.

- **Action:** Use a strangle order to write options on **Tupperware** (NYSE: TUP)
  - Sell to open July 2013 $55 puts
  - Sell to open July 2013 $70 calls
  - Options' combined bid/ask (Dec. 21, 4 p.m.): $4/$4.70
- **Price Guidance:** Aim for a **combined credit of $4.30** or higher. As prices change, ideally accept no less than $4, or a 6% yield on the current share price in 7 months.
- **Recent Stock Price:** $63.50
- **Buy Around/Fair Value:** $56/$65
- **Allocation:** Write one call for every 100 shares you already own, and one put for every 100 additional shares you could buy. *Pro* is writing seven contracts of each, covering our 700 shares and potentially increasing our position from 3.1% to around 5% (accounting for depreciation).
- **Alternative Trades:**
  - If you don't own shares, aim to buy up to 3.1% by selling to open July 2013 $60 puts for close to $4, or July 2013 $55 puts for above $2. Or, just look to buy shares if the stock drops to around $56.

How to Follow Along

We've written options on **Tupperware** (NYSE: TUP) for income several times, and today's strangle is no different. Revenue is still growing strong in emerging markets, which are now a majority of sales, while it's struggling to grow in North America and developed markets. Overall, non-GAAP earnings per share should clock in 11% higher in 2012 compared with last year, and the stock trades at a P/E of about 13 times that estimate. We could still enjoy North Star-like returns over the long term, but we can increase our returns with options.

Writing a covered strangle combines writing covered calls on a stock you own with writing puts to potentially add to your stake.

- **Strategy type:** Bullish to neutral; income with upside potential
- **Maximum gain:** The credit received plus upside in the stock to your calls' strike price
- **Maximum loss:** The same as stock ownership, minus what the calls pay you

Here's more on how to place the trade:

- **Requirement:** You must already own at least 100 shares, with an ability to double that
- **Sell to open:** July 2013 $55 puts/$70 calls using a strangle order
- **Allocation:** Sell one of each option for every 100 shares you own
- **Receive credit of around:** $4.30 combined (this is all "time value," so it decreases by the day unless volatility increases)

And here's more on the numbers:

- **Days to expiration:** 205 (6.8 months)
- **Time value per day:** $0.02
- **Yield on share price ($4.30/$63.50):** 6.7%
- **Yield on share price and 30% cash ($16.50 of $55) to hold open puts:** 5.3%
- **Net potential sell price on existing shares:** $74.30
- **Net potential buy price on new shares:** $50.70
- **Recent share price:** $63.50
- **Upside to net sell price:** 17%
- **Downside to second net buy price:** 20%
- **Range in which to earn total income:** $55-$70

Next Steps

- **Want to know everything there is to know about covered strangles?** We can tell you everything there is to know about covered strangles. Or Santa Claus can tell you next year.
- **Discuss this trade:** Get our latest update on Tupperware, and post any questions.
- **Can't participate?** You don't need to make every trade in *Pro* to benefit. Own our core positions in sizes suitable to you — that's our core strategy. Tupperware remains a buy, although we'd prefer you buy closer to $56.

See Pro's *holdings here. See the team's and David and Tom Gardner's holdings here.*

Short ProShares UltraShort Real Estate

Published Dec 20, 2012 at 12:00AM

- **What We're Doing:** We believe in a recovery for commercial U.S. real estate, so we're shorting shares of a flawed, leveraged, *bearish* real estate ETF. We will also keep our synthetic short option position on this ETF that we set up in July. So, by shorting shares directly (now that they're available for shorting), we're increasing our allocation.

Trade Essentials

- **Action:** "Sell to open" or "sell short" (more shares of) **ProShares UltraShort Real Estate** (NYSEMKT: SRS) ETF
- **Allocation:** 1% (short $1,000 for every $100,000 you manage); this will give us about 2% total exposure including our synthetic short from July that expires January 2014.
- **Recent Price:** $24.41
- **Price Guidance:** Use a limit order at market prices on this thinly traded ETF. The "bid" is the relevant price because you're selling shares that you've borrowed from your broker.
- **Short Availability and Cost:** Interactive Brokers shows 500,000 shares available for shorting, at a 6.37% annual fee with a 6.19% rebate rate.
- **Alternative Trades:**
  - **Options:** If your broker doesn't have shares available to short, or you can't short, consider setting up a January 2014 synthetic short on SRS as we did in July. At a total allocation no larger than 2%, sell to open January 2014 $25 calls, and buy to open an equal number of January 2014 $25 puts. Lately, you may be able to set this up for a net cost of around $2.30 to $2.60 per synthetic short, given you a break-even of around $22.50. (See our guide to synthetic shorts.)
  - **Bullish Real Estate:** In similar spirit to our short, but not leveraged, you could *buy* 2% in the long, bullish **iShares Dow Jones U.S. Real Estate** (NYSEMKT: IYR) ETF.

What's New?

The **ProShares UltraShort Real Estate** (NYSEMKT: SRS) ETF is meant to provide 2 times (200%) the daily *inverse* results of the Dow Jones U.S. Real Estate Index, which has been flat since our July synthetic short trade on the ETF. Despite its sleepy performance since July, we think the index will once again recover in 2013 and beyond, making our short profitable.

Using derivatives, this inverse ETF is in effect 2 times short the 83 companies that make up the underlying index, which is chock-full of dividend-paying real estate investment trusts (REITs). The underlying index trades at 2.3 times book value and yields 4.1%, and the ETF has an expense ratio of 0.95%; these numbers help our short, although we won't collect the dividend. By betting against the ETF that is 2 times inverse this index, we'll effectively be 2 times long its companies on a daily basis.

Our bullish position on real estate got a boost from the news that the Federal Reserve intends to buy bonds until unemployment declines to 6.5%. In other words, the Fed is likely to keep interest rates low at least into 2015, which in turn should help real estate prices improve. Mortgage rates are already at record lows, and most commercial real estate metrics — including rental rates and occupancy — are on the mend. Meanwhile, REITs on the whole are attractively priced as investors lick their wounds from 2008, and the ETF we're shorting is deeply flawed, losing value every year since its 2007 inception (except its first partial year).

How to Follow Along

Shorting shares outright requires a margin account, and most brokers do not have shares of this ETF available for shorting. If yours doesn't, consider our alternative trades above in the yellow box. As we short this ETF, perhaps our greatest risk is having our short closed early against our will. If the market declines and this inverse ETF jumps sharply, we may be forced by our broker to buy back our short at the worst time. We're keeping the position small as a way to manage this risk. Please revisit our original report from July if you want to learn more about the flawed ETF that we're comfortable shorting, directly and with options, up to 2% today.

Waiting on Washington

Published Dec 17, 2012 at 12:00AM

Dear Fellow Fools,

No Monday Memo Dec. 24

We're taking a break for the Christmas holiday, so there will be no *Pro* Memo next Monday, Dec. 24. We'll be back in your inbox Monday, Dec. 31!

Many great insights have been shared on our discussion boards over the years. I print and keep at my desk some of the posts I find most meaningful, including messages about how the service has helped you, ideas on how we can improve, and your thoughts about life in general. One post I highly value was written by ADrumlinDaisy in 2011, when he posted as MazonCreekRich. In part, he wrote:

I honestly would give everything I have to see my father again. Many of you still have that opportunity, and you are thus far wealthier than I, at least in the coin that I recognize.

After Friday's horrific loss of life in Connecticut, this sentiment sadly has a new and painful meaning for even more people today. So many of us would instantly give everything we own to have a loved one back with us again. There's no question what matters most in life, and it isn't anything that can be bought or sold. As we pause at this time of year for the holidays, we hope you're able to spend time with those you value above all else.

Year-End Market Machinations

As the year comes to a close, it's likely that markets in 2013 will be affected by the recent uncertainty in Washington, D.C. Many companies have apparently slowed spending and investment while waiting for a resolution to the fiscal cliff, meaning we should already expect a soft quarter to end 2012. Additionally, some companies have doled out large special dividends ahead of presumed tax increases. This is discouraging in one sense, because it means some companies would rather return funds to owners than invest in employees and growth. That suggests a lack of strong growth opportunities.

I had planned to close our remaining 10% hedge in the **SPDR S&P 500** ETF before year-end, but given the uncertainty on Capitol Hill, as of today, we're planning to keep this hedge open a little bit longer. (Please note that SPY goes ex-dividend on Dec. 21, so close your short before then if you wish to avoid paying the estimated $0.88-per-share dividend; that said, realize the ETF will adjust its price lower by the same amount.) If a favorable fiscal-cliff resolution is reached, we'll likely be inclined to close this hedge despite its probable higher price. But if there's no resolution, the market could easily decline. In that case, we'll be glad to still have this 10% hedge (and our **iShares Russell 2000** hedge) — and we'll likely close the SPY hedge after the market declines.

So, for now, we are waiting on Washington.

In other portfolio news, our 3.4% stake in **Covanta Holdings** was recently called away through our covered calls, and our 1.2% stake in **InvenSense** is on track to be called away after this Friday. These two moves would increase our cash balance to 15%. Given the uncertainty we face in the New Year, we'll be content to have that level of cash coupled with our hedges. We look forward to continuing to bring greater focus to the *Pro* portfolio, and investing our cash in attractive opportunities.

Taxes on Your Mind?

We do still plan to close our remaining SPDR S&P 500 hedge soon in favor of more options-based hedges that won't ding us if the market rises, as well as more shorts of specific companies. So if you're adjusting some of your positions before 2013 for tax reasons, you can consider closing your SPY hedge for the capital loss this year. Just keep in mind that it may be weeks before we close ours; we just don't know. And capital gains tax rates are almost certain to rise in 2013. That means it may be more valuable for you to keep — and use — your capital losses starting *next* year, because on gains you take this year, you'll likely pay a lower rate than in future years. We are not tax experts, though, so please bring any questions to the Fool's public Tax Strategies discussion board.

In closing, we'll review *Pro*'s complete 2012 in early January, once we have our final year-end returns.

We wish you a peaceful holiday season — and a 2013 that brings us all forward.

Foolishly,

Jeff Fischer (TMFFischer)

Pro Trade Roundup

- **Medtronic**: We sold to open May 2013 $44 covered calls on nearly half our shares (nine contracts), potentially reducing our position from 5.6% to around 3% if these shares are called away. We were paid $1.27 per call, or $1,143 before a $5.53 commission.
- **Covanta**: All of our 2,700 shares were called away last week via covered calls at $17.50. Including our call proceeds, we received $17.90 per share (members generally received $18.10 or higher) and sold with a long-term gain.

Guidance Updates

- **Covanta Holdings**: Shares move to Sell as our shares were called away.
- **The Buckle** : Fair value was reduced to $48.30 and Buy Around to $36.50 to account for the large, $4.70-per-share special dividend we'll be paid later this month. The stock remains a buy.

Expirations & Dividends

- **Covanta Holdings** December 2012 $17.50 covered calls: As planned, we suggest you let these shares be called away this week if they haven't been already. We'll consider future positions on this stock at lower prices or by writing puts.
- **InvenSense** December 2012 $10 covered calls: As planned, we're ready to let our whole position be called away as we focus the portfolio further.
- **SPDR S&P 500** goes ex-dividend Dec. 21: Close your short by Dec. 20 if you want to avoid paying an estimated $0.88-per-share dividend. Keep in mind that the ETF price automatically adjusts lower by the dividend amount at the market open the next day.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Apple**: With shares back around $500, buy up to 3.9% in stock if you haven't already. If you only want to buy lower and a $50,000 position remains a reasonable allocation, sell to open any puts that look attractive to you.
- **BMC Software**: Buy up to 4.6% in shares if you haven't. Or, if you only want to buy lower, sell to open February 2013 $40, $39 or $38 puts.
- **ProShares UltraShort Real Estate** : Interactive Brokers reports 500,000 shares available for shorting, with a 5.8% rebate rate and a 6% fee rate. As long as that holds true, if your broker has shares available, you can sell short up to 1% to start. (Revisit our original report.)

Questions on these? Visit our "Catch-Up Trades" discussion board.

Coverage & Community

- **Who Do We Owe?** We're a country of debtors; who do we owe big-time? Nick points the way.
- **Apple Getting Cored?** Members discuss the stock's decline. We mainly view it as the old Apple volatility returning.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Write Covered Calls on Medtronic

Published Dec 13, 2012 at 12:00AM

- **What We're Doing**: Trimming a 5.6% position to 3%, or earning income if the stock price pulls back.
- **What We're Thinking**: Medtronic is still undervalued, but not dramatically, so we're attempting to size the position based on today's risk and reward.
- **What We're Expecting**: A few more quarters of solid performance should help the market realize the stock deserves to be valued higher, but we wouldn't be shocked if shares took a breather.

Trade Essentials

- **Action**: Write covered calls on *some* of your **Medtronic** (NYSE: MDT) position.
  - Sell to open May 2013 $44 calls
  - Recent bid/ask: $1.48/$1.51
- **Price Guidance**: Aim for $1.48 per contract; as prices change, ideally accept no less than $1.40.
- **Allocation**: Leave a 3% allocation to Medtronic uncovered
  - *Pro* has 1,900 shares. A 3% allocation for us is about 1,000 shares, so we we're covering 900 shares (writing nine contracts).
  - If a 3% allocation to Medtronic leaves you with fewer than 100 shares remaining, take no action, but read the alternative trade below.
- **Recent Stock Price**: $42.50
- **Stock Rating**: Buy
- **Alternative Trades:**
  - **Working with odd lots or a small share count?** Don't fret. We believe Medtronic can still deliver North Star-like returns from here forward (our fair-value estimate is 13% higher than today's price), but the certainty of those returns is lower after the stock's steady rise. Hold your shares, just as we're holding *at least* a 3% position.
  - **Want to more aggressively manage your position and earn higher income?** The May 2013 $43 calls are also attractive, lately paying $1.90.
  - **Don't own any shares?** You can buy up to a 3% position in Medtronic at today's prices.

What's New?

- **Recent Recommendation**: In August 2011, we recommended buying more Medtronic. Since then, shares have risen 25%.

Like a jolt from one of the company's famous pacemakers, CEO Omar Ishrak has shocked **Medtronic** (NYSE: MDT) back on course. Although the company's product breadth, clinical expertise, and pails full of physician relationships were never in question, execution had become sloppy, focus obfuscated, and growth stalled. After analyzing Medtronic's end markets, general demographic and health-care trends, and the company's pipeline, we concluded that its ability to generate free cash flow was top-notch, and that once a few overhanging clouds burned off, the market would wake up to Medtronic's leading competitive position.

And in fact, the stock's near-20% rise over the past year and recent analyst upgrade do suggest that Medtronic may be sitting at the cool kids' lunch table again. Fiscal second-quarter revenue increased 5%, with international growth leading the charge. Business lines that have dogged results for well over a year are finally showing signs of stabilizing, the remaining business segments have been growing at a healthy clip, and the product pipeline is robust.

But Medtronic now trades near the bottom end of our fair-value range, prompting us to write these covered calls. Medtronic's customers remain very cost-conscious, insurance companies and the government are closely monitoring reimbursements, and competition is fierce. We have a 5.6% position today, and we're happy to own an unencumbered 3% allocation, but we want to protect (via call option income) or trim the extra 2.6%. We still believe in Medtronic, and we think it's worth $48 — but we only want to own 5.6% if we can do so with a larger margin of safety than today's price gives us.

How to Follow Along

Writing covered calls will achieve one of two outcomes: If shares are higher than our $44 strike price at expiration, we'll sell 900 shares at a net $44.95 (touching the lower end of our fair-value range), leaving us with 1,000 shares. If shares are less than $44 at expiration, we'll retain our entire 1,900-share position and get to keep the option income. Here are the details:

Medtronic stock price:	$42.50
"Sell to open" May 2013 $44 calls:	$1.48
Trade type:	Income, defensive
Yield on current share price:	3.5%
Breakeven price:	$40.99
Days to expiration:	155
Upside to $44 strike price:	3.6%
Potential net sell price:	$45.48
Upside to potential net sell price:	7.1%

Next Steps

You'll first need to calculate your allocation to Medtronic. If yours, like ours, is well above 3%, write these covered calls on round lots (100-share groups) above that allocation to potentially trim your position.

- Page Dr. Pro with your questions about allocation or trade execution by dialing 1-555-CHATMDT.

See Pro's holdings here . See the team's and David and Tom Gardner's holdings here .

2+2=3: A Framework for Acquisitions

Published Dec 10, 2012 at 12:00AM

Fellow Fools,

We Want Your Thoughts!

Take this short survey to tell us what you love about *Pro* and what could be better. We really do listen to your feedback, and we'd genuinely appreciate your thoughts!

Charlie Munger often speaks of developing a "latticework" of mental models as a way to think through problems. Having automated processes for approaching challenges helps us meet them more capably; stringing together a series of those processes helps us do so more efficiently. And as long as we remain open to the uniqueness of each problem, we don't risk dangerous mental shortcuts. With that said, I'd like to share my framework for analyzing acquisitions, using the recently announced **Starbucks** acquisition of **Teavana Holdings** as an example.

Filter No. 1: Guilty Until Proven Innocent

Mergers and acquisitions are commonplace in business: Over the past 20 years in the U.S., there have been more than 12,000 of them worth more than $1 million apiece. But as your mom told you, just because it's popular doesn't mean it's a good idea. Large acquisitions destroy value in the short term — about $0.06 for every $1 spent, according to one study, for a total of $226 billion over the past 20 years. And the long-term picture isn't much better: The stocks of companies who engage in M&A underperform the stocks of those who don't by 26% in the following five years, and between 50% and 80% of business combinations ultimately end up destroying value. Corporate marriage ain't easy, so when we analyze the merger activity of the businesses we own, we should take off our rose-colored glasses and put on our skeptical shades.

Pro Trade Roundup

- **OpenText**: We wrote a covered strangle on our shares, selling to open seven May 2013 $50 puts (for $2.29 per contract) and seven May 2013 $60 calls (for $2.44 per contract).

Guidance Changes

- Following the analysis in this Memo, we're raising *Pro*'s fair value estimate for **Starbucks** from $53 to $55.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the *Recommendations* *page.*

- **GrafTech International**: If you don't own shares yet, it may be a good time to buy a 2.2% allocation to match us.
- **Pacer International**: If you don't own shares, you can match our 1.3% allocation in this turnaround micro-cap. Just use a limit order to buy.
- **CurrencyShares Euro Trust**: If you're not short shares with us, you can try to sell short up to 3.9%. Some brokers have availability.

Filter No. 2: Key Considerations

All that said, some mergers do work out. Here's what I consider when determining whether management's move was blockhead or bombshell.

1. **Size.** In M&A, size matters. I don't think there is a true linear continuum, where super-small is best and super-big is worst; instead, what we're looking for here is "not huge." Immense acquisitions have too many moving parts and massive integration risks, and while promises of significant "cost synergies" are often used to justify a high price tag, empirical evidence shows that profitability tends to worsen in the years following a merger. Cost synergies are far from automatic, and we should be skeptical of very large transactions.
2. **Strategic rationale/vision.** There are some good reasons to combine businesses. The most common include (1) radical improvement in costs or cash flow; (2) accelerated marketing or distribution for a promising product; (3) access to a technological or comparative advantage; or (4) to better balance supply and demand in the industry. Visionary (or lucky) managers can sometimes also pinpoint and acquire winners-to-be early in an industry's life cycle, but this requires *Rule Breakers*-like mastery. If I find one of the above reasons behind a particular merger, I don't automatically assume it's a slam dunk, but I do think the odds of success are greater than otherwise.
3. **Performance and price.** As stock investors, we know the price you pay for an investment matters greatly to your future returns. And that may be extra-true for mergers, because they're 100% investments — there is no way to lower the average price paid. A low takeover premium often indicates bad business performance from the target company, so any improvements the acquirer makes to generate meaningful returns right away will require some expensive changes. And the opposite scenario — paying top dollar for a company firing on all cylinders — makes subsequent business improvements a tall order. Furthermore, a merger paid for with stock may dilute existing owners' positions — is the acquisition really worth a lower ownership stake in the combined business?
4. **Culture and people.** I generally believe great people are worth paying up for, so in any merger, I take particular note of the target company's management team: Are they staying on board after the acquisition, or are they running for the door? Are the companies' cultures compatible? This variety of integration risk is tough to quantify, but it's worth thinking about, especially when there is a clear cultural divide. The human case can make or break the business case.
5. **Opportunity cost and experience.** Most investors (and business folk) don't focus on this enough. There's rarely just one solution to a problem, and an acquisition isn't always the best option. It's important to consider the what-ifs: Could the acquiring company have built its own in-house solution? Would a joint venture have been more appropriate? Is bigger always better? Does the future potential benefit justify the risk? Does the post-acquisition balance sheet still allow for optimal financial flexibility? Would patience have offered up a better price? Does the management team have any experience completing successful integrations?

A Rooibos Latte: Yum or Yuck?

So how does Starbucks' proposed acquisition of Teavana fit this framework?

- **Filter 1:** Most acquisitions destroy value, so let's be skeptical. Guilty until proven innocent, remember?
- **Filter 2:**

Key Consideration	Details	My Take
Size	Starbucks is paying $620 million in cash for Teavana's 300 stores and less than $200 million in annual sales. (Starbucks has 18,000 stores and $13 billion in annual sales.)	The price is less than 25% of the cash Starbucks has on its books and less than the $894 million in free cash flow it generated last fiscal year. Teavana is a small, but not negligible, bet.

Key Consideration	Details	My Take
	Cost: Teavana has excellent loose-leaf tea sourcing and buying experience, which could give it a cost advantage. **Marketing/distribution:** Starbucks does not plan on selling Teavana-branded teas in its existing coffee bars.	**Cost:** Starbucks could get good at loose-leaf tea quickly, or it could just hire the person who currently does this stuff for Teavana. **Marketing/distribution:** Starbucks will use its knowledge of social marketing to help drive sales, and it will eventually use its distribution prowess for grocery stores, too.
Strategic Rationale / Vision	**Technological advantage:** N/A **Industry balance:** We're not suffering from tea or tea bar saturation. **Visionary investment:** It took Starbucks 25 years to make espresso-based beverages a routine part of American life. Teavana barely sells any prepared beverages, so it's safe to say the business is early in its life cycle.	**Technological advantage:** The technology involved here is measure, steep, drink. **Industry balance:** Nope. **Visionary investment:** Starbucks CEO Howard Schultz is a visionary. He knows the recipe for democratizing an uncommon drink, and more importantly, he knows how to build an experience people are willing to pay for. He'll make delicious, approachable beverages, and he'll deliver a great experience.
Performance and Price	Teavana has tripled revenue over the past few years by opening stores. It has achieved excellent store-level profitability, too. Still, its shares are down almost 50% from its 2011 IPO high.	Teavana was once valued at more than \$800 million; Starbucks made its offer when that number was closer to \$500 million. Still, 21 times pre-tax operating profit is a rich price. With more operational experience, it's likely Starbucks can improve profitability.
Culture and People	Teavana founder and CEO Andrew Mack is staying on board to run day-to-day operations.	These cultures should blend well — both hinge on the in-store experience. Starbucks will likely work to create more repeat visits and stronger bonds with customers, although without prepared beverages (particularly addictive ones), this may prove challenging.
Opportunity Cost and Experience	Starbucks is far from a serial acquirer, but it still has sufficient resources and people to pull this off. The company generates sufficient cash to grow, pay a growing dividend, and buy back shares. Its balance sheet remains healthy.	What else could Starbucks have done with its cash? It could have paid a \$0.83 special dividend. It could have repurchased 1.7% of its shares. It could have done nothing and waited for Teavana's shares to fall further. It could have built its own tea bars using its Tazo brand, or developed a super-premium brand.

The Foolish Bottom Line

Starbucks didn't bet the farm. I think Schultz believes the Teavana brand has already captured mindshare in the premium tea category and that acquiring an established leader is less risky than developing a competing brand. Also, the Teavana brand becomes more valuable when combined with Starbucks' expertise in the development of prepared beverages and the distribution of consumer packaged goods. The odds say this merger is unlikely to be a winner, but I believe it can be. Following this analysis, we're raising *Pro's* fair value estimate to $55 because the potential benefits of this working out far outweigh the losses that would result if it doesn't.

Nassim Taleb on Motley Fool Money: Options, Volatility, Hedges, and Washing Machines

Published Dec 7, 2012 at 12:00AM

Chris Hill of the *Motley Fool Money* radio show recently interviewed best-selling author and NYU professor Nassim Taleb. The transcript of that interview is below — if you'd prefer to listen in, click here! (The interview is from the Dec. 7 edition of the show and begins at about the 18:50 mark.)

Introduction

Chris Hill: Welcome back to Motley Fool Money. I'm Chris Hill. Nassim Taleb is Distinguished Professor of Risk Engineering at NYU's Polytechnic Institute. He is also the best-selling author of books like *The Black Swan, Fooled by Randomness* and his latest book is *Antifragile: Things That Gain from Disorder*. He joins me in-studio now. Wonderful to see you.

Nassim Taleb: Thank you. Thank you for inviting me. But to get the book, you have to describe what I am. When you tell people, "He's a professor," they think I'm some professor. But in fact, I'm an options trader disguised as a professor …

Chris: [Laughing]

Nassim: … in a second career.

Volatility Is Key

Chris: I was going to get to that eventually, but let's start there, then. I mean, you're not the typical professor. You did really start out as an options trader. What got you out of options trading?

Nassim: Because when you're an options trader — and this is why this book is directly linked to my experience, rather than the other one, which is more intellectual efforts — an options trader views the world in two categories: things that are long volatility and things that are short volatility. Things that gain from volatility, and things that are harmed by volatility.

"An options trader views the world in two categories: things that are long volatility and things that are short volatility. Things that gain from volatility, and things that are harmed by volatility."

So, you have this black-and-white bimodal view of the world, and it's very hard to communicate, outside options, that concept. And the word *antifragile*, for me, is long volatility. It's nothing else. If I explain it to an options trader, they find this trivial, but it takes me hours to try to drill it into other people's minds that it's not robust. It's not resilient. It's not adaptive. It's just something that loves volatility.

Chris: And that gets to the first thought I had in looking at your book. If someone had asked me what the opposite of fragile is, I would have used a word like resilient or robust. And in fact in the book, you put things into these three categories: fragile, robust, and antifragile. What puts something — or, in this case, since this is a show for people who are interested in business and investing, what puts a particular industry in one of those three categories?

Nassim: You can see very clearly to which category you belong if we define fragility. I define fragility (and it took me 25 years to do so) as *what does not like volatility*. You see this cup on the table? This coffee cup? Actually, I was looking at a coffee cup when I figured it out. This coffee cup does not like earthquakes. There's nothing that can help it. It has absolutely no upside for random events — nothing but downside. Therefore, it's like short volatility. So, once you're able to define fragile as short volatility, then automatically, you can identify and measure fragility. You can measure it. Of course, you can figure out what's robust, and you can figure out what is antifragile.

What is fragile is something that has an exposure that is asymmetric to random events. You have more downside than upside if an event happens. For example, the market. Say your sales go down 10%. You're harmed a lot more than you gain. If your sales go up 10%, then you are fragile. You have an asymmetry. So we can multiply the examples in identifying them, but there's an asymmetry. Or you could look at it another way — another way to view it. If the sales go down 10%, you're harmed; but if they go down 20%, you're harmed more than twice. Then you're fragile.

It's just like an options position. If the market moves down 10%, you're harmed more than twice than if the market moves down 5%. And this is how I figured out that anything that we have that has survived is not linear to random events, but is asymmetric. And once you can prove it (mathematically it's elaborate, but you can sort of prove it) then from there, you can identify the fragile; identify the robust; identify the antifragile.

Unexpected Antifragility

Chris: One of the examples I saw you make grouped two industries that I wouldn't have necessarily grouped as being antifragile: one was restaurants, and on the other side you had banking. Typically what you hear about the restaurant business is it's a very tough business, and so I would automatically put it, just reflexively, in the fragile category. But, in fact, you make the case that restaurants are very antifragile.

Nassim: Exactly. Have we had any bailout of the restaurants in Washington, here …

Chris: [Laughing]

Nassim: … or the government had to step in? No. Why? Simple. Because just like transportation, a mistake is never wasted by the system. So, an individual restaurant is fragile …

Chris: So, an airline industry …

"Every time a plane crashes, the probability of the next plane crashing is lower. That's a good system. You exploit the mistake — the fragility of the individual plane — to make the individual system more robust."

Nassim: Exactly. Or air transportation. The airline may not financially benefit. But let me use the airline and then go to restaurants. Every time a plane crashes, the probability of the next plane crashing is lower. That's a good system. You exploit the mistake — the fragility of the individual plane — to make the system overall more robust. Whereas every time a bank crashes, the probability of another bank crashing is higher. Or a bank crashing in the U.S. increases the probability of a bank crashing in Western Siberia. You see the connectedness? So it's not a good business. It's not a good industry.

You can generalize the long volatility to anything that converts error for the improvement of individuals or the improvement of the collective of the system. So, you need the fragility of the restaurant individually for the sake of the stability of the overall system — because if restaurants were not fragile, we'd be eating Soviet-style cafeteria food. And believe me, I've tried it once. Not very good. I'm still trying to recover from it.

Uncertainty Is Desirable

Chris: [Laughing] You're listening to Motley Fool Money. Talking with Nassim Taleb. His book is *Antifragile: Things That Gain from Disorder*. One of the other things that you touch on in the book counteracts this common phrase we hear about investing in Wall Street all the time, which is that "the market hates uncertainty." And one of the cases that you make is that uncertainty is a necessary thing, and maybe even a desirable thing.

Nassim: It's actually immensely desirable. People in trading understand it. Outside of trading they don't. Let me start with an example of the careers of two brothers, where you realize that variability and volatility helps one of them. From there, we can translate that to markets.

In the book I have the example of two brothers. One is a taxi driver, and his twin brother (who is actually born in the same place — Cyprus) works as a clerk in a bank, doing something that earns about the same amount of money. They both live in London, the same suburb.

The taxi driver has a volatile income. The one employed in the personnel department has a very stable income. He has been employed with the same bank for 38 years, and you get a gold watch every 25 years …

Chris: Yes, right.

Nassim: The taxi driver has very small risk of ending up with zero income or being unemployed, because every day he adjusts to the exact needs of the environment. Every error he makes and every wasted afternoon teaches him something about neighborhoods. He converts error, and his variability converts into activity and information. A complex system or anything organic communicates with the environment via stressors. A stressor teaches you something. This is how we learn, not through lecturing.

Now, his brother has no idea …

Chris: By the way, that's hilarious. You're a professor, and you're saying we don't learn through lecturing. Have you passed that onto your students, as well?

Nassim: I actually teach students that — that optionality is vastly more important than intelligence. Other academics don't like it, and I can predict the review of my book and the emotion in the book review based on the name of the reviewer. I don't have to read the reviews. I can tell you exactly how angry and what he is going to say based on this idea of intelligence. Anyway, the second brother, therefore, is much more fragile.

So, let's compare it to political systems and then to economic systems. Saudi Arabia — zero political volatility. Zero. Zero variability. Compare it to Italy, where since the Second World War we've had about 65 to 75 governments. Nobody counts anymore. Italy is much more volatile. Saudi Arabia is much riskier.

It's the same thing with markets. We have tried currency controls, exchange controls, everything. It destabilizes. Markets are information. The problem in finance is that people want to fear volatility, so they do a Greenspan. A Greenspan …

Chris: [Laughing]

Nassim: … or Greenspanization is you try to artificially stabilize everything. And just like a forest in which you repress every small fire to stabilize it, the flammable material and hidden risks accumulate, and then the big one is monstrously bad.

So, this is what happens in an economic system. You have to learn to love volatility for the sake of the system, because variability, if you embrace it, gives you information that makes you adapt very quickly; and, of course, it protects from big tail events. And you can apply it to so many things. Like in life. You can have no variables in your life by spending six years in bed. Hopefully you are reading my books. I have 600 pages of math, so you can probably do that …

Chris: That would take me about six years to get through.

Nassim: Whatever. Or you can have *The Sopranos*, the entire episode. But, anyway, you spend six years in bed. You have no volatility. Now, what happens to you when you get out of bed, and someone invites you …

Chris: Atrophy …

"If you embrace volatility, you get a lot more out of it than if you fear it."

Nassim: You could break a limb very easily, your bones would be brittle, and you may not survive a subway ride, particularly in New York. So this is the illusion. If you embrace volatility, you get a lot more out of it than if you fear it. And I know that people who invest in fixed-income instruments and sell tail options — their income is so steady because they want steady income — and all these people end up blowing up. They say, "Oh, I only lost money once."

Like the banking system. Like Citibank. In 1982, they blew up and lost everything. The money that Citibank lost everything made the history of banking in one ... They said, "We only had one down quarter." That's what they said. And it happened to them again, of course, in 2007 and 2008.

The Cat Vs. the Washing Machine

Chris: You're listening to Motley Fool Money. Talking with Nassim Taleb. His book is *Antifragile: Things That Gain from Disorder*. You mentioned big events and how they come up. All you have to do is pick up the newspaper or turn on CNBC to know that we've got our own sort of big event that we're facing here in the United States and that is the fiscal cliff. What do you think of that?

Nassim: I have so little clue, it's not even funny …

Chris: [Laughing]

Nassim: … but let me tell you one thing, honestly, about the fiscal cliff. People talk about it as if they're panicking. They're afraid of variation. I'd rather have the market deal with problems than politicians. The little bit of volatility would shake people up and would cause solutions, rather than this artificial stabilization we have had with this quantitative easing (which continues, in fact, what Greenspan did, and weakens the system even further).

"When the world was smarter (in other words, when economists were confined to doing moral philosophy), the world was great. People never mistook the cat for a washing machine."

Let me get into the fundamental problem we have. When the world was smarter (in other words, when economists were confined to doing moral philosophy), the world was great. People never mistook the cat for a washing machine, and let me explain. The washing machine is a machine. It needs continuous maintenance. It's never going to get better on its own, and you don't want volatility for the washing machine.

But something organic needs volatility. The problem is when they started teaching economics to people, they started teaching the world how to blow up. Economists are trained, mentally, to mistake the cat for a washing machine — in other words, to mistake the economy for something mechanical rather than organic, and something that doesn't respond to stressors. Take the textbooks. Economists have problems with particular textbooks, and you realize that they don't get the point, and everything they've done is fragilized. This is why I call them in the book *fragilistas*.

Chris: Have you patented that? Do you have a trademark going on all of the versions of antifragile?

Nassim: No, it's OK. I don't need it. If you patent this, you guys can take it. Like Motley Fragilista.

Mistakes Should Harm Their Makers Most

Chris: We talked earlier about your career in options trading. I am curious. What has been your biggest shift in thinking when it comes to investing over the last, say, 25 to 30 years?

Nassim: I started viewing the world again, as I told you, and I took my ideas to their natural conclusion and started to realize one thing — I'm becoming obsessive about *skin in the game*. So, I will tell you in a minute about my investments. I have a rule that the reason the economics profession or people make bad forecasts, without anything changing, is because those who make the forecasts are never harmed by their mistakes. And as an ethical rule, I don't think that anybody should give forecasts. People should tell you first what they have. So, I don't respond. I'll tell you what I do.

In the book, I talk about never asking a doctor what you should do. Ask him what *he* would do if he were *you*. Just psychologically switch, and he will give you a different answer. So, I don't say what people should be doing or my view of the world. I will tell you what I would be doing, or what I would do, or what I am doing. This is like an ethical shift, and I feel a lot better, because I don't feel guilty if I make a mistake. I'm harmed first. I should be harmed more by my mistake than any other individual.

Chris: That's something that we've talked about on our show plenty of times: the whole notion of, when it comes to company management, and all things being equal, tending to lean towards companies where the management, the CEO, etc., have much more significant skin in the game. They have a greater ownership of the company. They're probably going to be better stewards of the shareholders' money as a result.

Nassim: Definitely. I mean, there's still a game. If the company is listed, you already have something unfavorable going; that they may benefit from impressing the security analyst. Where if the company is not listed, it's just really cash flow out of the business. Like someone owns a bakery or something like that. It's cleaner.

But you're right. Skin in the game is necessary. In the book, I started looking at skin in the game as optionality. Someone has a free option, and someone shorted the option. And people package things because we don't understand options. The executive of the company has all upside and no downside.

"When Adam Smith thought of what we now call capitalism, his idea was skin in the game, and he used to call entrepreneurs *adventurers*."

When Adam Smith thought of what we now call capitalism, his idea was skin in the game, and he used to call entrepreneurs *adventurers*. He did not like the joint stock company that limited liability, on the grounds that people would game the system. I'm not against limited liability. You can have limited liability, but you've got to have skin in the game. They're not incompatible.

Removing Moral Hazards With Heuristics

Chris: I wanted to ask you another question about banking. Earlier this year, I believe it was the former head of Citi came out and said that he thought the big banks should be broken up. Obviously that was not his position when he was the head of Citi …

Nassim: [Laughing] Yes, of course …

Chris: … but when you look at the big Wall Street banks, if someone gave you the power to wave the magic wand to make some sort of fundamental systemic change to improve Wall Street banks, what would you do?

Nassim: I belong to the school of heuristics. Heuristics means find rules of thumb (like learn from your grandmother) that have a big impact with minimum side effects. We call them less is more — more impactful heuristics. That's my school. There are very simple rules of thumb. I came with seven or eight rules of thumb to remove what I call the *moral hazard* option, the free option.

The first one is as follows: If a company (not just a bank — any company) is to be bailed out by the taxpayer in the event of failure, then automatically that company is de facto owned by the taxpayer. Therefore, the taxpayer should decide the salary of the executive.

Now, if you have a law or rule like that — it's a very simple rule. Instead of a thousand regulations, you say, "If you're going to be bailed out because of a national emergency, if Tesco fails in the U.K. because of disruption in the food chain, executives are no longer allowed to earn more than civil servants at the same rank. What would it do? It would force people to go under the radar. They'd have to think, No, I can't be bailed out if I fail.

Chris: It's a simple rule. It makes a lot of sense. That's probably why it's never going to happen.

Nassim: Probably. And I have two or three rules like that. Let me give you another rule. You know, when you work for a government, a lot of people use it as a revolving door. Again, there's corruption. I mean, in a lot of African countries, there's outright corruption. Here, corruption is you end up working for an investment bank later, or an industry, or Boeing, or something.

So the rule should be — I call this one the Tony Blair rule. If you're going to work for government, it should not be an investment strategy. What you earn later should no longer come from the taxpayer above a certain amount. There's two, three or four simple rules, called *less is more* rules, that can have a lot of impact on things.

"Small Is Beautiful"

Chris: The whole notion of less is more, I was thinking, fits into one of the other things you touch on in the book—this notion of companies and their size. You make the point — I think the way you put it is *small is beautiful*. You seem like someone who is very much against the notion of mergers — or certainly the notion that mergers and making a company bigger automatically makes it stronger and more anti-fragile.

Nassim: Well, sometimes you have gains from size, but you should let the market decide. When governments get involved, you have a problem, and let me explain. I was debating once at a public library (and not even a debate, but a discussion) and there was the chairperson of PepsiCo, I think, or one of those companies.

Her argument was, "I employ 700,000 people." That was the argument. So I looked at her and I said: "You're hijacking the system now, because you employ 700,000 people. Someone who owns a nail salon can't make that claim. Therefore, we're going to bail you out, not the nail salon owner. And this is my money that's going to be used to bail you out."

"Corporations like to become large, because the state takes care of them."

You realize that corporations like to become large, because then the state takes care of them and it becomes part of the state, like in France and in Europe. Executives — it's very incestuous. There are effectively some market economies of scale; but as companies become large, they become much more vulnerable to errors. Errors in the system blow up much faster than with smaller companies.

In addition, the larger the company, the less the skin in the game of the executives, because they have an option. They can cash out and go to Florida. The company blows up 10 years later, and they don't care. And you can see it in a lot of data. For example, a £100 billion project in the U.K. has 30% more cost overruns from errors than £5 million projects. You can see it right there …

Chris: Yes …

Nassim: You have economies of scale way offset by effective errors in the system. This applies to anything top-down where you have decision-making that's concentrated, versus distributed bottom-up. The same thing pervades everywhere.

And moral hazard also appears at another level. If something is big … Say you no longer have the soul in the game — the artisan has his ego in the product. An author is an artisan, so he has his pride in it — you no longer have that. It becomes a spreadsheet. And the same thing with government. If you're mayor of a small village, you're put to shame when you go to church on Sunday if you make a mistake. If you're someone five miles away from here, sending information …

Chris: Just across the river …

Nassim: Exactly. In Washington, it's a spreadsheet. The spreadsheet doesn't look at you and shame you; at least not the ones we make so far. So, the whole thing is not favorable, yet people still believe in the economies of scale and that bigger is better. You see, the *small is beautiful* used to be a romantic idea. I tried to prove (this has an appendix of 400 pages amassed so far, with 200 more coming) where there's fragility, there is short volatility. A big company has vastly more short volatility than a small company.

"No Such Thing as a Wine Connoisseur"

Chris: Your last book was *The Black Swan,* which refers to unexpected events. My final question is in that notion — it's a bit of a *Black Swan* question. One of the things I read about you is that you are something of a gourmand. This weekend I'm going to dinner at a friend's house and I know he likes wine, but I don't know what's being served. I don't really know anything else. Can you recommend a good bottle of wine that's not going to break my bank account?

Nassim: This is a very interesting question, because I'm actually not that into fancy wine.

Chris: That's good. I'm not into buying fancy wine.

Nassim: Very good. Put the cap on a bottle of wine, all right? No more than $20 …

Chris: No more than $20 …

Nassim: No more than $20, and your odds are, empirically, you'll do a lot better than if you go higher. You know, there's also something more you should know about me — that I don't like (let me try to find a polite way to describe them) the people …

Chris: Snooty?

Nassim: There's a word that unfortunately I can't say on the radio …

Chris: [Laughing]

"Good wine is a wine your taste buds love, and typically odds are you'll find it under $20."

Nassim: … that describes the class of people that are overly sophisticated a little bit more than necessary. And usually you find them into wine. When you have a lot of money, what do you do? You can spend it on wines, or vacation, or with your decorator, or on a swimming pool, that kind of stuff. So, that class of people is into wine. Good wine is a wine your taste buds love, and typically odds are you'll find it under $20. So, put that limit on it.

Chris: The book is *Antifragile: Things That Gain from Disorder*. He's not just a bestselling author. He is also a wine connoisseur …

Nassim: No, no, no. I'm not a wine connoisseur at all …

Chris: I was just trying to broaden your resume — not that it needs broadening …

Nassim: No, no, no. Plus there's no such thing as a wine connoisseur.

Chris: There isn't?

Nassim: No! I mean, if you take experts, and you have them taste wine, their ability to predict the price of a bottle between $9.99 and $999 is uniform. It's like almost random. So, there are a lot of pseudo-connoisseurs. I mean, they may be able to tell you where it's from vaguely, but not necessarily similar to your taste.

Chris: I think your next book needs to be an exposé of the wine industry. I'm picturing like a blockbuster investigative journalism piece.

Nassim: Oh, let me think about it …

Chris: [Laughing]

Nassim: … but if you volunteer to write half of it, I may consider that.

Chris: I volunteer to write a blurb on the back. [Laughing]

Nassim: That's done. Then deal done.

Chris: Nassim Taleb. Thanks so much for being here.

Nassim: Thanks for having me. Thanks.

Gold, Real Estate, and Hedges

Chris: How do you invest your own money?

Nassim: I'll tell you what I have, and I'll tell you what I'd like to have. I got nervous with gold. I bought gold after the crisis and a few years of monetary policy. I want a repository of value, of things not to worry about; and gold scares me a little bit. So, I'm getting out, progressively, from gold.

I bought real estate for rentals, where you get cash flow. I'm mostly motivated by hedges against inflation. I own some stocks, visibly, but mostly as hedges against inflation. I have some hedges against long-term interest rates rising — some complicated hedges, but that will pay me if that happens. I own land visibly, also, as a hedge against printing money. And I would do a deal with anyone — if I could get 95% of my purchasing power back 20 years from now; I'm done.

The problem is that I'm nervous that what I own doesn't really track my consumption inflation. Since it's a very difficult environment today, you don't know where your inflation rate is. Some things are going up in price, others are not. I mean, companies are doing very well in the United States (for the time being) and this is a lot better than government bonds. They have cash flow.

So, I own some. I'm not worried about owning companies, but I'm really worried about the situation we're in — in which the 1% of the 1% are getting richer while, at the same time, the median American or Westerner is getting poorer. This is not a long-term steady situation, so, I think there may be social unrest. I have no hedge against that.

(Want to talk Taleb? Bring your thoughts to the *Pro* Philosophy & Strategy discussion board!)

Write a Covered Strangle on OpenText

Published Dec 4, 2012 at 12:00AM

What We're Doing: Generating income with the potential to buy more shares cheaper, sell our stock higher, or roll our strangle by its May expiration.

- **Action:** Use a strangle order to write options on **OpenText** (NASDAQ: OTEX):
  - Sell to open May 2013 $50 puts
  - Sell to open May 2013 $60 calls
  - Options' combined bid/ask: $5.35/$5.80
- **Price Guidance:** Aim for a combined **credit** of $5.50 or higher. As prices change, ideally accept no less than $4.30.
- **Recent Stock Price:** $56.40
- **Allocation:** Write one call for every 100 shares you already own, and one put for every 100 additional shares you could buy. *Pro* is writing seven contracts of each, covering our 700 shares and potentially increasing our position from 2.7% to around 5% (accounting for depreciation). You need a portfolio size of approximately $200,000 to strangle a potential 5% position around $50.
- **Alternative Trades:**
  - If you don't own shares, buy a 2.7% stake and then write the strangle with us (assuming you're managing $200,000 or more).
  - If you're managing less money, just buy a 2.7% stake or sell to open May 2013 $55 puts for up to around 5%, lately paying you $4.40.

How to Follow Along

We wrote a covered strangle on OpenText in August using the same strike prices as today's recommendation. In November, that option position expired as full income, and we published our review of the company's quarterly results. The only other recent news that might affect OpenText was **Hewlett-Packard**'s (NYSE: HWP) admission that results at Autonomy (a software company it acquired) were weaker than had originally been stated, suggesting dishonesty on Autonomy's part. Although disturbing, that's a potential positive development for OpenText, perhaps sending some of this competitor's business our way. Our recent strategy remains unchanged, though; we're strangling the stock again to potentially earn more income.

Writing a covered strangle is a combination of two strategies: writing covered calls on a stock you own, and simultaneously writing puts to potentially add to your shares. It provides meaningful income and a wide share price range in which to earn it.

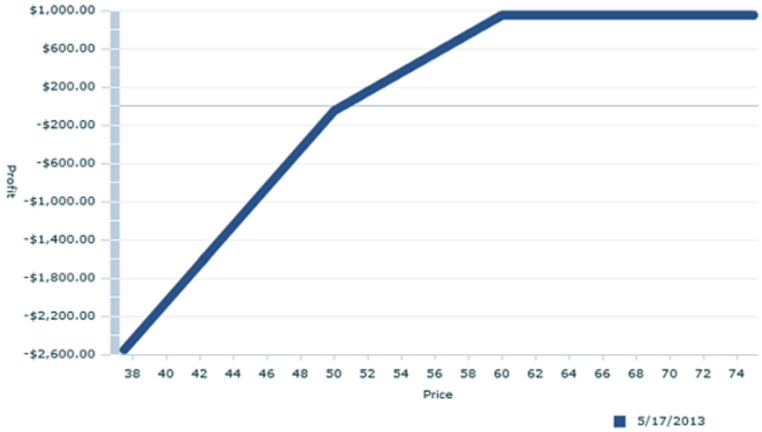
- **Strategy type:** Bullish to neutral; income with stock upside potential
- **Maximum gain:** The credit received plus upside in the stock to your call strike price
- **Maximum loss:** The same as stock ownership, but starting at a lower price on any new shares

Here's a look at the numbers on this trade (along with a profit chart, which assumes a strangle of 100 shares bought today):

- **First:** Own or buy at least 100 shares, with the ability to double that number to 200
- **Sell to open:** May 2013 $50 puts/$60 calls using a strangle order
- **Allocation:** Sell one of each option for every 100 shares you own
- **Receive credit of around:** $5.50 combined (this is all "time value," so it decreases by the day unless volatility increases)
- **Days to expiration:** 165 (5.5 months)

- **Time value per day:** $0.033
- **Yield on share price ($5.50/$56.40):** 9.7%
- **Yield on share price and 30% cash ($15 of $50) to hold open puts:** 7.7%
- **Net potential sell price on existing shares:** $65.50
- **Net potential buy price on new shares:** $44.50
- **Recent share price:** $56.40
- **Upside to net sell price:** 16.1%
- **Downside to second net buy price:** 21%
- **Range in which to earn total income:** $50-$60

The chart below shows your potential profit or loss, assuming you buy shares today to write the strangle.



Next Steps

- Want to know everything there is to know about covered strangles? We can tell you everything there is to know about covered strangles. (Well, we can come close.)
- If you have any questions about writing this strangle or starting a position, visit our OpenText board. You don't need to make every trade in *Pro* to benefit. Own our core positions in sizes suitable to you — that's our core strategy. OpenText remains a buy.

Losing Is Mission-Critical

Published Dec 3, 2012 at 12:00AM

Take this short survey to tell us what you love about *Pro* and what could be better. We really do listen to your feedback, and we'd genuinely appreciate your thoughts!

Pro Trade Roundup, Guidance Changes, and Catch-Up Trades

- Nothing this week. Not a single thing!

Fellow Fools,

I'm glad investing isn't an Olympic sport. It's not just that playing at an Olympic level takes titanic levels of commitment and sacrifice — did you know that Olympians can't even lose on purpose if it increases their odds of earning a medal? Eight female badminton players from three countries were disqualified from the London games this year for sandbagging in an attempt to manipulate the tournament structure. But isn't winning a medal the point? Is it ever OK to lose on purpose to achieve the higher goal? Perhaps not in sporting events, but investors can lose on purpose with good results (and without disqualification!).

Losing Is Mission-Critical

Pro's mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To do this, we focus on our North Star: inflation + 7% annually.

Given this mission, hedging is a necessary part of our approach. To achieve positive returns over *every* rolling three-year period, we need to profit when stocks are down as well as up. Sure, asset prices have marched upward for the past three years, but we only know that with the benefit of hindsight; the next three years are always unknowable. Elroy Dimson of the London Business School may have said it best: "Risk means that more things can happen than will happen." We make portfolio decisions based on our forecasts for the future. That isn't to say that we know what *will* happen, only that we make the very important effort to detail the things that *may* happen. Most of those things — good and bad — won't come to pass.

What does this have to do with losing? When we establish a portfolio hedge, like the **SPDR S&P 500 ETF** short, we are planning for a range of outcomes and hoping — yes, hoping — to lose money on the position. Heck, if it were up to me, I'd love to lose a boatload of money on SPY. No, I'm not trying to give you (or Jeff) a heart attack; it's simple math. If SPY were to double, it would reduce our portfolio's value by 10% (on top of what we've already lost). But our 90% long positions in some great companies would likely double, too, and at nine times the size of our short … well, the resulting North Star-crushing returns could hardly be called a bad result.

Some observers (and members) might think our SPY hedge hasn't worked out as hoped. There's certainly merit in that critique; we would have higher returns, and more money, if we had never hedged our portfolio. Specifically, by Stamleo's count (thanks, Leo!), we'd have $53,091.75 more in our account without the SPY position, meaning it's been a nearly 4% drag on our portfolio. But we don't hedge for returns alone — we do it to lower risk. Our SPY position was meant to reduce market risk, which allowed us to keep a higher percentage of our portfolio invested in *Pro* stocks. To that end, it's worked out nicely.

Counterfactually Thinking

Because hedging is a risk-reducing measure and risk is "all those other things that could have happened," any evaluation of a hedge's effectiveness also needs to consider the hypothetical results if things had turned out differently. In the case of SPY, if the market had gone down instead of up since we established the position, we'd have made money on the short but lost even more money on our long positions (because of their higher allocation). Sure, this would make hedging feel like a smart move, but it's actually a suboptimal outcome when compared with losing money on the short.

That said, there is another layer of nuance to this scenario, and it has to do with how we plan to use our hedged positions. If the market dropped significantly, we'd likely deploy the money earned from the hedge into some really cheap stocks that we'd expect to offer higher future returns. That's the real beauty of a hedge — it gives you liquidity without having to sell your (now cheaper) core holdings.

Targeted Shorts

In *Pro*, we talk a good deal about targeted shorts like **Sony**, and I wonder if this creates some confusion. To me, a targeted short like Sony is no more a hedge than a long position like **Covanta** is. Yes, both can buffer us a bit in a down market and we appreciate that, but neither is a true hedge; to meet that description, a position must neutralize a risk factor (price risk, commodity exposure, etc.) to which our portfolio is exposed.

One thought experiment I like to use when determining whether a position is a hedge: Look for offsetting price movement. As mentioned, it'd be highly unlikely for SPY to double in price (a large loss for our short) without our long positions doubling as well. That's not the case for Sony. If Sony surprised the world by announcing a return to profitability and margin expansion, the stock price would shoot up (a loss to us), but we wouldn't automatically see corresponding gains in our other positions. In fact, such news could signal more competition for our consumer tech companies. And what if Google were to offer $20 billion in cash and stock for Sony, giving Big G access to its patent portfolio? Shares would double, again without similar movement in our other portfolio positions. These admittedly implausible examples show that Sony offers its own risk exposures that aren't offset by our portfolio. Therefore, it is not a hedge; it is a high-conviction position like any other on our scorecard.

Putting It All Together

Pro investors prefer to lose money on their hedges, because their offsetting positions will gain even more. Hedging is like having sandbags ready *before* the storm: You're prepared for the worst, but you still hope they're ultimately unnecessary. This preparation gives you a higher probability of a good outcome. So if you've been bummed by the history of our SPY short, be glad that we didn't need it. In fact, Jeff identified this potential outcome when we initiated the hedge: "Remember that when things look bleakest, stocks may be poised to perform the best they have in years (because everyone has already sold and valuations are too cheap). Are we at that point yet? Possibly not. But either way, we want to set our portfolio up to hedge a macro-driven decline, allow our selectively chosen businesses to outperform, and keep a cash balance that lets us be opportunistic."

In investing, it's OK to lose on purpose. In fact, for the right reasons, it is the *Pro* way. And if we approach North Star returns while hedged, you'll know the strategy is a success.

Best,

Nick Crow (TMFCrow)

Make 2013 Your Most Focused Year Yet

Published Nov 26, 2012 at 12:00AM

Dear *Pro* Members,

We Want Your Thoughts!

Take this short survey to tell us what you love about *Pro* and what could be better. We really do listen to your feedback, and we'd genuinely appreciate your thoughts!

I hope you all had a refreshing holiday with your loved ones. Most of the *Pro* team traveled to see family, putting us all around the country:

- Our intrepid editor, Ellen, and her husband (who is also a Fool!) left their newly purchased first home for a trip to the New River Gorge of West Virginia, where they met up with family and confirmed that their 14-month-old niece is the smartest, cutest, sweetest baby in human history.
- Bryan gave thanks with his in-laws near the original Thanksgiving site in New England. Much of the rest of his trip was spent on intense doses of family time and helping his mother-in-law bring her town's Christmas program for the less fortunate into the 21st century. (Ideally, this will automate much of his future involvement and free up time for playing in the leaves.)
- Nick spent Thanksgiving with his in-laws in wild Montana. He was able to visit Yellowstone Park, where he learned that buffalo will chase you if you get too close (see below). He recovered — from the in-laws, not the buffalo — by soaking in the "Boiling River." Luckily, the park's wolf packs stayed at bay.
- Much more tamely, I spent Thanksgiving with family and friends at home in Washington, D.C., after which we moved to a house that's closer to our son's school. So we spent the weekend opening boxes and ordering Thai food and pizza for delivery.

We hope you had a memorable weekend, too! As our thoughts start to turn toward 2013, I'd like to use this holiday-infused Memo to touch on some ways of preparing for the year ahead.

Set Your Compass True

I started this year knowing that I wanted to end it much better organized and more effective.

To get the ball rolling, I created a new personal mission statement, which I hoped would complement *Pro*'s and *Motley Fool Options*' missions while including the much broader scope of life. Having these missions in one prominent file on the computer desktop makes them easy to refer to, reminding me of my goals and values every day.

I also asked my wife and son to list the things they'd love to do or accomplish over the next one, three, and five years; then we consolidated our lists. Our seven-year-old son wants to see a hippopotamus attack a giraffe, so perhaps not everything will be checked off the list. But with work and family road maps in place, we're much more likely to achieve things that otherwise would never come to fruition.

These short documents (I call them "one-pagers") also include things that remind us how to live better. For instance, our family one-pager has a list of five of the favorite days of our lives. Looking at them reminds us why they were so great — many are very simple memories. The page also lists some of our least favorite periods in life, reminding us that there are big ups and downs.

As part of my investing one-pagers, I listed "What I Believe" early this year. As you may recall, this year's list included a belief in a housing recovery and growing auto sales. I'll update the list for 2013 soon (with input from the rest of the team), and *Pro* will work to invest alongside our beliefs. On my investing one-pager, I also list my most respected companies of all time (including 20 I'd love to own at the right price), and my best and worst past investments (they serve as great reminders). Eventually, we may share more of our thinking along these lines as part of *Pro*.

For both *Pro* and *Options*, I keep running lists of top trade considerations and other research to conduct, and I finish each Friday with a look at what I hope to accomplish in the week ahead, so I'm already thinking about it. Finally, wherever I list my investment positions (whether on My Scorecard, our new What We Think Now page, Google Finance, or at my broker), I list them by allocation, *largest to smallest*, so my attention is always drawn first to the positions that matter most. This alone can change how you view your portfolio.

All this (and a bit more) is coming together into a compact working document that helps ensure I'm on task every week, while also making certain I'm working toward bigger, long-term goals for our investing services and life in general. As we roll into 2013, you might enjoy taking some time to do these exercises yourself. List out your beliefs and goals in life and in investing, and create some guiding "one-pager" documents of your own. Store them all on your desktop in a single folder, so they're never far away. To talk about this or share your best practices for staying true to your goals (true to your North Star, we would say here), please visit our Philosophy & Strategy board.

Thank you for being a *Pro* member. Stay Foolish!

— Jeff Fischer (TMFFischer)

Pro Trade Roundup

- **iShares Russell 2000 Index**: We set up a new put ratio spread, selling to open 56 January 2013 $75 puts and buying to open 28 January 2013 $78 puts (one ratio spread for every $50,000 we manage), for a net credit of $0.12 per spread ($336 total).
- **InvenSense**: We sold to open December 2012 $10 calls for $0.60. On all our 1,600 shares, this brought us $960 and a potential sell price of $10.60 next month.

Guidance Updates

- InvenSense moved to "Sell" last week (technically, "Aim to sell via covered calls").

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **ProShares UltraShort Real Estate** : Interactive Brokers reports 500,000 shares available for shorting. If that holds true tomorrow, you can sell short up to 1% to start. (Revisit original report.)
- **Rockwood Holdings**: With shares at $43.65, if you don't own at least 4.4%, you can buy shares. If you only want to buy lower, sell to open January 2013 or February 2013 $40 puts.
- **AIG**: Buy up to 2.3% in shares, or if you only want to buy lower, sell January, February, or May 2013 puts, from a $33 strike on down, depending on what looks appealing to you.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Set Up a Put Ratio Spread on IWM

Published Nov 20, 2012 at 12:00AM

- **What We're Doing:** Using options, we're setting up another market hedge that won't cost us anything if the market keeps rising.
- **What We're Thinking:** We're hopeful for political resolution on the "fiscal cliff" before January, but if nascent negotiations stall, the market could decline in response.

Trade Essentials

- **Action:** Using a ratio spread order, set up a put ratio spread on the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF.
    - Sell to open January 2013 $75 puts
    - Buy to open January 2013 $78 puts
    - Sell two $75 puts for every $78 put you buy
    - Bid (on two $75 puts) / ask (on one $78 put): $2.60/$2.30
- **Price Guidance:** Initially, use a spread order for a **net credit** of around $0.30; as prices change, ideally initiate the spread for, at worst, zero net cost.
- **Recent ETF Price:** $78.86
- **Allocation (based on the written puts):** Thirty percent, half of which is insured by our purchased puts, making our true exposure 15%. Write two puts and buy one put for every $50,000 you manage. *Pro* is writing 56 puts and buying 28.
- **Alternative Trades:** None like this. This is a unique strategy that requires put-writing in a margin account. You could instead just buy to open the $78 puts with your own capital, but that's relatively expensive, with a break-even point 3% below $78. You could short shares of the ETF directly if your broker has shares, but realize that hedge will cost you if the market rises.
- **Your Other Index Hedges (including SPY, SH, and previous iterations of IWM) Remain Unchanged:** This put ratio hedge can be set up in addition to any index hedges you already carry. *Pro* has a 10% short on SPY (and has been advising just 10% in direct index shorts since this summer).

The Big Picture

We recently closed the prior iteration of this hedge for an $8,200 gain, adding about 0.6% in extra value to the *Pro* portfolio while the **iShares Russell 2000 Index** (NYSEMKT: IWM) index itself declined about 5%. We chose a put ratio spread as a hedging strategy because it won't drag on our returns if stocks rise, and we chose the IWM index — which tracks the 2,000 smallest companies in Russell's universe — as our underlying hedge because of its highly liquid options and because it has historically been 35% more volatile than the S&P 500.

Such volatility potentially benefits us because this put ratio spread is a "frictionless hedge," meaning it won't cost us anything if stocks rise, but we can expect a larger relative drop in the ETF if the S&P 500 falls. Meanwhile, the Russell 2000 looks overpriced compared with the S&P 500, with the profitable companies in this small-cap index trading at an average 24.9 times earnings (the average P/E for the larger companies in the S&P 500 is 14). The many *unprofitable* companies in the Russell 2000 are left out of its valuation altogether.

Strategy Details

Using a spread order, we are writing $75 puts that obligate us to buy shares of IWM (unless we close the puts beforehand) if they decline to less than that price by expiration. These puts expire in two months (on Jan. 19, 2013). We're using the money we receive for writing these puts to *buy* half as many $78 puts that expire the same month. That's where our hedge comes in: The $78 puts will profit if IWM declines, and they also cancel out half of our $75 put exposure, lowering our total break-even point on the strategy. Here's how the math and potential returns tally:

iShares Russell 2000 Index ETF Price	Value of 1 Purchased $78 Put	Value of 2 Written $75 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%) from $78.86
$78 or higher	$0	$0	$0	N/A
$77	$1 x 100 = $100	$0	$100	(2.3%)
$76	$2 x 100 = $200	$0	$200	(3.6%)
$75	**$3 x 100 = $300**	**$0**	**$300**	**(4.9%)**
$74	$4 x 100 = $400	($1) x 200 = ($200)	$200	(6.1%)
$73	$5 x 100 = $500	($2) x 200 = ($400)	$100	(7.4%)
$72	**$6 x 100 = $600**	**($3) x 200 = ($600)**	**$0**	**(8.7%)**
$71	$7 x 100 = $700	($4) x 200 = ($800)	($100)	(10%)
$70	$8 x 100 = $800	($5) x 200 = ($1,000)	($200)	(11.2%)

The bolded lines above show that we'll earn the most profit on the strategy if these puts expire with the ETF at $75, down 4.9% from its recent price. Our break-even on the strategy is $72 per share, so the ETF can decline 8.7% before our strategy starts to show a loss by expiration. To summarize:

If the ETF (i.e., the Market) Does This ...	Then Our Strategy ...
Goes up, stays steady, or declines less than 1.1% (so it's at or above $78 at expiration)	Doesn't cost us anything — in fact, we earn any credit paid to us when we initiated it.
Declines between 1.1% and 8.7%, to between $77.99 and $72.01	Earns a partial to full profit, depending on the amount of the decline.
Declines more than 8.7%, to $72 or less	Shows a loss by expiration. We can close the options and roll to a new ratio spread; take shares of the ETF to own; close the options and buy calls instead; or set up a synthetic long to lower our cash outlay and turn bullish.

Any returns here won't occur smoothly or immediately. If the market falls a long time before expiration, our spread will largely retain its current value, with the two sides of the spread mostly canceling each other out. As with most spreads, we need to wait until closer to expiration to achieve results. With this spread, that's only 60 days away, but there's a trade-off — we have less downside room until our break-even price than in spreads we've set up in the past. Although nobody can be a market genie, with this timing, we're trying to target any end-of-year or early January political risk. By early January, we should be able to close this at a profit (if we wish) if the market is lower by around 7% or less.

Finally, assuming we set it up for a credit, this trade will result in a small profit for us even if the market rises or treads water. But to be safe, you must be ready to fulfill the $75 put obligation if the market falls out of bed and we don't want to keep the strategy going.

Putting Your Best Positions in Play

Published Nov 19, 2012 at 12:00AM

Fellow Fools,

Guidance Updates

- **Thanksgiving:** We're moving Thanksgiving up to Buy First. Enjoy!

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **ProShares UltraShort Real Estate** : Interactive Brokers reports shares available for shorting. If that holds true tomorrow, you can sell short up to 1% to start. (Revisit our original report.)
- **Rockwood Holdings**: With shares at $43, if you don't own at least 4.4%, you can buy shares. If you only want to buy lower, sell to open January 2013 $40 puts, lately for $1, or a 2.5% yield in two months. Or sell February 2013 $40 puts for $1.60.
- **AIG**: Buy up to 2.3% in shares. Or, if you only want to buy lower, sell January, February, or May 2013 puts, from a $32 strike on down, depending on what looks appealing to you.

Questions on these? Visit our "Catch-Up Trades" discussion discussion board.

Imagine you're the manager of a baseball team. You have 40 talented players in the dugout, and you like them all — so much so, in fact, that instead of just putting nine players on the field, one day you decide to send *30* of them out to the diamond. The crowd is stunned, waiting and watching to see what happens.

It doesn't take long for the air to leave the stadium. The field is too crowded with your players — trying to play the same position, chasing the same ball, and running into each other. It's a true case of "Who's on first?" Before long, you're not sure who is bringing value to the team and who is in the way; after all, even the most talented players in the league are only as good as your focus in using them. Making matters worse, when you want fresh players, there's almost nobody in your dugout — and no room on the field.

You can see what I'm getting at. To achieve excellence in most anything, you need a focused, tactical strategy. *Pro* is no different; to better manage for our North Star, we need a concentrated portfolio. We want a reasonable number of skillfully managed players on the field; more power in the dugout; and the nimbleness to jump into action whenever we want to swing at a fat pitch, or (here's where the baseball metaphor starts to unravel) hedge, or change the long-short exposure of the portfolio.

Getting More From Your Core

This isn't a new idea; we've been working to concentrate the portfolio (and keeping you posted on our progress) since this summer.

Focusing our assets in "core" positions (those that make up 3% to 5% of our portfolio) will help us leverage our best knowledge in pursuit of our always-positive North Star. Instead of spending days researching a decision on a mere 1% position, we can redirect that effort toward our core positions — learning more about them and setting up extra strategies on them to earn more profit with less risk. After all, while stocks generally move up and down together, out-of-the-money options can earn us returns even when markets are flat or declining. Our strangle on **OpenText** did just that between August and last week's expiration.

But consider a new example: **Rockwood Holdings**' share price has recently declined to the low $40s, displaying its usual volatility amid minor news events. We already have a 4.4% stake in Rockwood, but with its shares down, we might want to capitalize by setting up a bull put spread. For little equity and no cost, we could sell $40 puts and buy to open $35 puts, capping our risk and positioning ourselves to earn extra income (and a strong 29% return on risk) as long as Rockwood stays above $40 by expiration.

And another: **Tupperware** stock is nearing our $65 fair value, and we plan to hang on to our shares for more upside — but we could also set up a bear call spread to earn some income if the stock cools off or stays below $65. If shares keep rising, the spread (set up by writing $65 calls and buying $70 calls) has capped risk, and our stock still rewards us.

I'm calmly excited about the extra returns that strategies like these, efficiently implemented as part of a focused portfolio, could bring. For me, this is somewhat of a new way to view the *Pro* portfolio, one I've arrived at this year thanks to the North Star and its relentless gains. Of course, if you can't or don't want to use options: Our core stock strategy remains in place the same as ever, and our increased focus on a more concentrated portfolio should benefit those positions, too.

Sum It Up: Focus Matters

Absolute or positive returns have been my personal investing goal for years, but I never specified an annualized number — I just always aimed to earn "enough" for my circumstances. *Pro* is more systematic than that; we're seeking a strong annualized return that keeps pace with (or tops!) our North Star, right now running at around 10%, as much as possible. Here are some actions I believe will bring us much better odds of achieving our goal:

- We want to concentrate our attention on around 20 core, long positions — ones that are large enough to matter. (We have 26 long positions right now.)
- We need to patiently sell small positions that require as much analysis as our large positions but don't offer dramatically more potential.
- We need to capitalize on our core positions more often than we have in the past, using options, incremental buy and sell decisions, and other strategies to take advantage of price changes in the positions we know best.
- Finally, we need to short weak companies and flawed ETFs, and use option hedges that don't drag on our upside potential much (or at all!).

This is the path we're on, and it's one we're excited to really put into in place in 2013. We'll patiently sell the few small positions we're not eager to build on. We'll get to know our core positions better all the time — and we'll recommend more strategies on them for incremental returns, with a focus on generating profits even in wayward markets. And expect us to pursue smart short strategies, including more focused shorts like **Sony** and **CurrencyShares Euro Trust**, *Pro*-style hedges (like put ratio spreads) that don't cap our upside potential, and other positions offering protection when we want it.

As we reflect this week on family, friends, and how fortunate we are to have the means to invest, we wish you a joyful Thanksgiving holiday with those you care about. If you want a break from food and family, visit the Memo Musings board. We'll keep the light on for you!

Stay Foolish!

— Jeff Fischer (TMFFischer)

Pro Trade Roundup

- **iShares Russell 2000 Index**: We closed our entire put ratio spread for a net credit of $2.86 per spread, earning around $8,250. We're looking to set up a new one.
- **OpenText**: Our short November 2012 $50/$60 strangle expired for the full profit, netting us $2,360 total. We're looking at new strangles.

Write Covered Calls on InvenSense

Published Nov 15, 2012 at 12:00AM

- **What We're Doing:** Aiming to sell our 1.2% position via covered calls.
- **What We're Thinking:** The founder/CEO has been ousted, and the young company is trading at an above-average valuation after less growth than expected.
- **What We're Expecting:** With new management at the helm and new competitors on the horizon, InvenSense may be a rocky ride even from today's price.

Trade Essentials

- **Action:** Write ("sell to open") December 2012 $10 calls
- **Allocation:** Write one call for every 100 shares you own
- **Recent option price (bid/ask):** $0.80/$0.95
- **Recent share price:** $10.25
- **Price guidance:** Use a limit order. Aim to be paid at least $0.85 to start; as prices change, ideally accept no less than $0.70.
- **Alternative Trade:** With this announcement, the stock moves to a Sell on our scorecard — specifically, "sell via covered calls." If you can't write calls, use a limit order to sell your shares at $10 or higher (be patient).

What's New?

When we purchased **InvenSense** (NYSE: INVN) in March, our thesis featured estimated sales growth of about 50% annually over the next few years (similar to what the company had recently reported, and as management projected), as well as even faster operating earnings growth as leverage kicked in. Instead, the motion-processing sensor provider grew sales just 28% last quarter and income from operations only 16.5%. That's a large difference. Couple that with the surprise ouster of the CEO, who was instrumental in developing the company's technology (and who does remain on the board of directors), and we aren't resting easy even with our small 1.2% position.

In the last conference call, management mentioned the possibility of new competition in the motion-sensor market from the likes of Bosch and Kionix. If others do enter the market aggressively, all players may experience pricing pressure — including InvenSense, despite its head start with the technology. The motion-sensor market should continue to grow handsomely, and if InvenSense one day wins a major client like **Apple** (NASDAQ: AAPL) away from leader **STMicroelectronics** (NYSE: STM), we might regret selling. But based on what we know today, the stock appears likely to lose to our North Star. Considering the slower-than-expected growth, today's valuation of 32 times free cash flow looks aggressive — especially in the semiconductor industry, where stocks too often settle at single-digit multiples to free cash flow once the hyper-growth phase subsides.

How to Follow Along

This trade is at least partially a *portfolio* decision, as well. As the year ends, we're reconfirming our commitment to every *Pro* position. If we can't confidently stand behind a holding given its latest quarterly results, we're aiming to sell it before 2013 begins, or as soon as reasonably feasible. This investment has been a large loser for us, down 46%, and it's dinged the portfolio for about 1% in the process. We knew when we went in that young companies are riskier, more volatile investments, so we kept it small; the broad thesis behind the investment still makes sense to us, but the growth we expected to drive the share price hasn't occurred, and new risks have emerged.

Sell to open one December 2012 $10 call for every 100 shares you own. At a recent bid of $0.80, the calls afford us a 7.8% downside cushion from today's $10.25 share price. Our break-even on this trade is $9.45 per share, but we hope to have shed these shares by the end of the year. These calls will do the trick for us if the stock stays above $10 by Dec. 22 expiration. If you have questions, please visit the InvenSense discussion board.

Close Your Put Ratio Spread on IWM

Published Nov 14, 2012 at 12:00AM

- **What We're Doing:** Taking our profit before Friday's expiration.
- **What We're Thinking:** With the index near our $80 strike price, most of our gain could quickly disappear if the index jumps.
- **What We're Expecting:** Given the uncertainty surrounding the "fiscal cliff," we'll look to set up a new hedge like this one shortly (prices willing).

Trade Essentials

- **Action:** Using a ratio spread order if you're able, "sell to close" all of your November 2012 $80 puts and "buy to close" all of your November 2012 $75 puts.
- **Nov. 13 Closing Prices (bid/ask)**
  - Sell to close November 2012 $80 puts: $1.41/$1.45
  - Buy to close November 2012 $75 puts: $0.02/$0.03

- iShares Russell 2000 Index : $78.87
- **Price Guidance:** These options are liquid, so you can close them at the going price. Because we wrote twice as many puts as we bought, on the above prices, you would close the position for a combined net credit of $1.35 per spread (accepting $1.41 to sell your $80 puts, and effectively paying $0.06 to close twice as many $75 puts).

What's New?

As of Tuesday's closing prices, we have a nearly $4,000 gain on our hedge using the iShares Russell 2000 index of small-cap stocks. Since we recommended this position Aug. 29, the index has declined 3% from $81.33, enough to put our long $80 puts in-the-money. We were paid a small credit to set up this hedge, so we'd be closing it out with a tiny profit even if the index had gone up (we like that kind of hedge!). Because the index declined instead, a few days out from expiration, we currently stand to see a much more significant profit. Although we could profit more if the index declines further, we risk losing most of our profit if it rises by expiration. So we'll take our gain and aim to recommend a new hedge soon.

Alternative Trades

If you only own the November 2012 $80 puts, we suggest you sell to close those along with us if you want to lock in your profit by Friday. If you're short the index directly, whether you close that position depends on how hedged you want your portfolio to be; we have a 10% index hedge ourselves with the **SPDR S&P 500**. If you have a direct IWM short, you don't have a clock ticking the way we do with options, so taking action now is not critical.

Expirations, Reviews, and What We Think Now

Published Nov 12, 2012 at 12:00AM

Dear Fools,

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Covanta Holdings** : Write covered calls. Sell to open December 2012 $17.50 calls, lately for around $0.45, writing one call for every 100 shares you already own and are willing to sell. This would get you into the same trade *Pro* already has.
- **3D Systems**: Write ("sell to open") January 2014 $30 puts, one each for every 100 shares you could buy, up to a 3% potential allocation. Aim to be paid at least $3, or around 10% on cash you set aside between now and expiration; that return rivals our North Star, and is in fact much higher than itwhen writing puts on some of your buying power instead of all cash.

Questions on these? Visit our "Catch-Up Trades" discussion board .

We hope you've made time for something memorable to honor Veterans Day, either today or over the weekend. The official holiday was Sunday, meaning the NYSE was open today — and so, of course, is the Fool.

There are just four more market days until November options expiration, meaning our put ratio spread on the **iShares Russell 2000 Index** and our short covered strangle on **OpenText** are both set to expire this week. Both are performing well for us: We're making at least some money on the defensive IWM spread, with the $80 puts we own just in-the-money. And our written $50 put / $60 call strangle on OpenText is set to earn us the full profit from its premiums upon expiration — that's a great 8.4% yield on the starting share price from our August recommendation. (We earned about 6.7% ourselves.)

Around expiration, I'd like to set up both strategies again. That shouldn't be a problem for the OpenText covered strangle (after some more due diligence), but put ratio spreads like the one we have on IWM aren't nearly as attractive right now. Pricing is skewed defensively, with puts remaining expensive even as you move to lower and lower strike prices. But I think we'll be able to find a strategy we like — and we want to do it this week, so I'm headed off to continue work on that as soon as I wrap up this short Monday communiqué with you.

Other things on my agenda this week: I'm reviewing earnings from **IBM**, specifically its content management software division, before we decide on our next OpenText strangle. IBM is OpenText's largest competitor, and given the recent soft sales of new licenses at OpenText, I of course want to see how IBM is faring. Also, I'm going to review results from key **Intel** competitor **ARM Holdings**. We want to see Intel break into ARM's mobile stronghold, and we must make sure ARM doesn't make headway into the lucrative server microprocessor market dominated by Intel. So even though we just posted reviews of both OpenText and Intel on the discussion boards (links below!), our work isn't done. I don't expect our thoughts on either company to change, but if they do, you'll know about it right away.

What We Think Now

We strive to always improve *Pro* and communicate clearly and efficiently with you, so you always know exactly why your money is invested how it is. To that end, on Friday, we launched a new page called "What We Think Now." This always-current page tells you our latest thoughts on each position in the portfolio. The positions' default order on the page is by allocation, with the largest at the top, so we all focus on the most important positions first. Please visit this new What We Think Now page (accessible from the top of the Recommendations tab, too), read our intro, bookmark the page, and post any feedback! Members have been doing so all weekend, and we appreciate it.

Our latest quarterly reviews and guidance changes are below. We should see you again this week with some trade alerts. In the meantime, Fool on!

— Jeff (TMFFischer)

Pro Trade Roundup

- **Vanguard Energy**: We sold all our shares at $105.05, for an 84%, 52%, and 42% gain on our various lots of shares bought at different times.
- **3D Systems**: We bought to close all of our November 2012 $35 calls and sold to open a January 2014 $30 put / $55 call covered strangle.

Guidance Updates

- **BMC Software**: Moves up to Buy First from Buy as license sales resume growth; also, the company is likely to buy back about 10% of its shares this quarter. The stock is lagging because it no longer appears that BMC could potentially engage in a sale of itself. We're fine with that.
- **CME Group**: Fair value moves down to $60 from $62 as trade volume lags. Buy Around remains $52.
- **Intel**: Moves up to Buy First from Buy, now trading at less than 5 times EBITDA and yielding more than 4%. But fair value moves down to $27 from $29 and Buy Around moves down to $23 after stalled growth in the second half of this year.
- **Pacer International**: Moves down to Buy from Buy First. The turnaround is taking longer than hoped and still involves uncertainty. It's a tiny company and a tiny position.

The Quarterly Shuffle

Published Nov 5, 2012 at 12:00AM

Dear Fools,

Pro Trade Roundup

- Pending: We still need to sell **Vanguard Energy** and roll our calls on **3D Systems** into a covered strangle.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Tupperware**: Though we still rate the company a "buy," shares (at $62) are above our buy-around price. If you'd prefer to potentially nab shares cheaper, then write ("sell to open") April 2013 $55 puts, lately for around $2.15. Write one put for every 100 shares you could buy, up to a 3.1% allocation. This option offers a 4% yield in more than five months — not outstanding, but not awful.
- **Intel**: Buy up to 5.6% if you haven't already, or write puts to potentially buy cheaper. Sell to open February 2013 $21 puts, lately for around $0.80. That's a 3.8% yield in just more than three months.

Questions on these? Visit our "Catch-Up Trades" discussion board.

As the links at the end of this Memo will attest, we're in the heart of earnings season. The activities — dare we say festivities? — surrounding this period are enough to rival the annual holidays, at least if you're an investing geek (or Fool) like us. As the news keeps rolling in, we'll have several more earnings reviews this week, followed by investment decisions and/or trades. Today, I'll outline a few of the factors that will inform those determinations this (and every) quarter.

What Is *Pro* Looking At Every Three Months?

When a company reports earnings, the first thing I look at is usually the cash flow statement. I want to see how money is moving through the business, and ideally I'll find increasing cash from operations. A free cash flow calculation is the simplest way to calculate the actual money a business is generating. Here's the base calculation (all inputs can be found on the cash flow statement):

Operating Cash Flow (or cash from operations)
— Capital Expenditures
= Free Cash Flow

Sometimes you need to factor out non-cash items (such as tax benefits from stock options) from operating cash flow. Either way, once you have your free cash flow number, you can compare the company's market capitalization to its free cash flow, arriving at a P/FCF number that's similar to (but more relevant than) the price-to-earnings ratio.

But there's more to do. From the cash flow statement, I head to the balance sheet. There, we want to see how the cash and debt balances are trending, whether anything unusual has appeared, and if accounts receivable or accounts payable have changed meaningfully in relation to sales. One easy but deceptive way a company can grow free cash flow is to delay paying its accounts payable; sharply growing receivables can be a danger sign, too, because some of that money may never be paid to our company. We also review the goodwill numbers on the balance sheet; this is important at companies that make frequent acquisitions, such as **Oracle**.

After the balance sheet, I head to the income statement. There, I look at gross and operating profit margins — are they holding steady or improving? What is the company spending money on? Is the research and development budget adequate? What's happening with diluted shares outstanding? These days, most companies *Pro* owns are steadily buying back shares, lowering the share count, and increasing earnings per share for shareholders. We need to make sure we agree with those stock purchases — do the cash flow statement and the balance sheet easily fund share buybacks? And of our companies that are issuing *more* shares, is the dilution reasonable?

After a preliminary first pass over these items and others on the cash flow statement, balance sheet, and income statement — and after looking at metrics like return on equity and return on capital — I'll have a good idea of how the latest numbers are shaping up at one of our companies. But that's just the start. We need to review the narrative, too. So next, we dig into the conference-call transcript, going through management's opening remarks (which can run for pages) and the analyst Q&As. This sometimes lengthy process is worth it if you gain even a few nuggets of new insight — and you usually do. (For instance, last week **Tupperware** said India and Indonesia were likely to eventually become its largest markets.)

But even scouring our companies' conference calls isn't enough. We want to go through their key competitors' conference calls and look over their numbers, too.

Finally, once we've done all this, we can review the company's quarterly 10-Q SEC filing as it gets filed (or, once a year, the 10-K annual report instead). We labor (a kind word) over that extremely thorough document for still more numbers, news, and the beloved footnotes that almost never get mentioned in press releases or conference calls.

No Two Are Identical

Like children (or apple souffle!), no two investments are identical, so each one needs to be approached on its own merits. On the *Pro* scorecard, **AIG** and **AmTrust** are companies whose book value is more important than traditional free cash flow. With some of our other companies, we need to keep an eye on their ability to keep paying dividends. With still others, growing margins are instrumental to our thesis.

Whatever the situation, earnings are always interesting, and we get to enjoy them four times a year! So if you're wondering what we're doing every three months when we fall quieter for awhile … this is it. We're going through results one company at a time, reporting back to you, and preparing to make new investment decisions.

Have questions? Please visit the Memo Musings board. Stay Foolish!

Roll Your Covered Calls on 3D Systems Into a Covered Strangle

Published Oct 31, 2012 at 12:00AM

What We're Doing: This expensive-looking stock still has more long-term potential, so we're rolling our covered calls into a long-term covered strangle to capture more upside and potentially buy more shares much cheaper.

Trade Essentials

- **Company: 3D Systems** (NYSE: DDD)
- **First Action:** Buy ("buy to close") your November 2012 $35 calls
- **Second Action:** Using a strangle order, simultaneously write ("sell to open") January 2014 $30 puts and January 2014 $55 calls
- **Allocation:** Write one strangle (total) for every 100 shares you already own and every 100 additional shares you could buy — for *Pro*, that's six contracts of each option. We own 600 shares (representing 1.8% of our assets), and we're willing to double our share count at a lower price; doing so would grow our allocation to around 2.5% (given the price decline) if exercised.
- **Limit Order Guidance**: Pay the current price to close your November $35 calls; separately, aim to write the January 2014 strangle for a $10 credit. As time goes by, you'll need to accept a lower credit unless the stock's volatility increases.
- **Recent January 2014 $30 put/$55 call bid/ask**: $9.50/$11
- **Share Price:** $43
- **Stock Status:** Hold, and write puts or covered strangles.
- **Alternative Trades:** See the end of this report.

What We're Thinking

Selling printers that allow manufacturers, professionals, and consumers to print three-dimensional objects, **3D Systems (NYSE: DDD)** is at the forefront of an exciting technological revolution. Management is working to sell as many printers as possible, at moderate prices if need be, in order to earn greater profits from recurring materials and services. But while the technology has received scads of media attention, the 3D printing industry is still minuscule — and it's growing relatively modestly, with 3D Systems reporting 24% organic growth year to date.

That's why we believe there's much more growth potential ahead. Even though the company's stock trades at a premium price today (see our latest quarterly update on the 3D discussion board), the potential size of its market means we'd like to stay invested.

This expensive stock that still has long-term potential places *Pro* in a unique position. With our absolute-return North Star as our goal, we don't want to own a stock whose valuation may leave it treading water for three years, earning us little to nothing. But we want to be invested — and enjoy the upside — when long-term appreciation does occur. Also, because our stock is covered with in-the-money calls that capped our gains at $35, we want to recapture upside we've already missed. This leads us to the rare decision to strangle our shares with options that expire in more than one year, rather than our usual time frame of several months. Sometimes longer-term options suit your purposes better; in this case, they position us for North Star-type returns even if shares stagnate and allow us much greater upside.

What We're Expecting

Closing our November 2012 $35 calls to write January 2014 $55 calls increases our upside potential by $20 per share, or 57%. Shares are lately $43, so by rolling our calls (on a steady stock), we're in effect recapturing $8 in upside that has *already* occurred — a 23% gain from $35. Even if the stock goes nowhere between now and our January 2014 expiration, we would achieve this North Star-topping return by rolling our calls. Our new strangle, meanwhile, offers us even greater potential returns, and it'll cushion us from a decline before our new put obligation kicks in. Here are more details analyzing the strangle in isolation:

January 2014 $30 Put/$55 Call Strangle	If Our Credit Is $10
Potential second share buy price	$20
Potential net sell price	$65
Upside to net sell price from current $43	51%

Upside to $55 call strike price	28%
Potential net new buy price	$20
Downside to potential net new buy price from current $43	(53%)
Downside to $30 put strike price	(30%)

By writing options that expire in 444 days, we buy ourselves a large amount of wiggle room. That fits in with our objective here: To capture much more upside we're currently locked out of, while continuing to cushion against a potential stock decline. We want long-term exposure to 3D Systems still at today's price, and 15 months from now, we could roll this strangle in either direction — bullish or defensive — if desired. In the meantime, we should expect the stock to remain volatile.

How to Follow Along

First, buy to close any existing November calls you have on 3D Systems (but don't sell the shares). Then, make sure you can afford additional exposure to the stock; keep your total potential allocation around 3% or lower. Then write ("sell to open") this January 2014 covered strangle, using a strangle order. If your situation differs from *Pro*'s, see our Alternative Trades below, and ask questions on the 3D Systems board.

Alternative Trades

- **Already had your shares called away, or never took a position?** You can start to establish a position by writing ("sell to open") May 2013 $30 puts, lately more than $2, for a 6.6% yield on cash in just more than six months. Write one put for every 100 shares you're willing to buy, up to 3% of your assets.
- **Can't afford 100 or 200 shares without going over 3% of your portfolio?** 3D shares are on hold in our portfolio. Those who only own shares should keep holding; those who don't own any and can't use options should wait for a lower buy price (our "Buy Around" is $27).

Bring any questions to our 3D Systems discussion board!

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Fiddlin' With Your Process

Published Oct 30, 2012 at 12:00AM

Hey, Fools! Here's your *Pro* Monday Memo, delayed a day because of Hurricane Sandy. TMF HQ remains closed today (as does the NYSE), so in today's Memo, we're skipping our usual Catch-Up Trades, Guidance Changes, and Trades Complete sections. We will provide updates on those, and more, as soon as HQ is back up and running. Thanks for your patience, and we hope you and yours made it through the storm unscathed! -- The *Pro* Team

Fellow Fools,

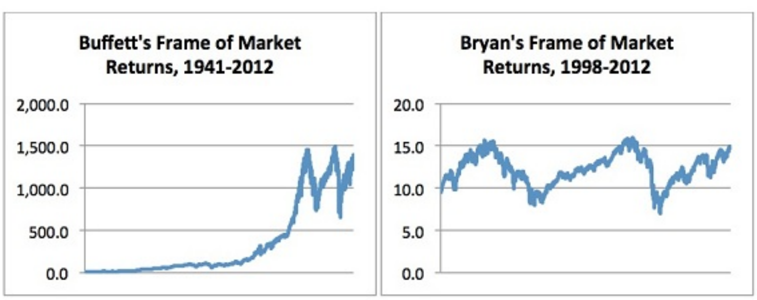
Last Wednesday, the Oracle of Omaha (Mr. Warren Buffett) spent a couple of hours hanging out on a makeshift CNBC set. As usual, he offered some great thoughts on the state of the world, touching on QE3 and even **Facebook**. (Surprise: He said he wouldn't buy it because he doesn't understand the business – and no, you can't friend him, because he's not one of the site's billion-plus members.)

Overall, though, the Oracle's message was simple: Just buy. Stop worrying and buy. Investors could do worse than simply following that advice blindly … but at *Pro*, we want to dig deeper. If we consider the context around Buffett's situation – and our own – as we parse the meaning of his words, we can improve our investing process. We can increase the chance that we'll do what he means, not just what he says. So: Let's fiddle with our process, shall we?

Frame

The human brain is a tricky thing. It constantly assesses every experience we have, using each one as input to develop the unconscious rules of thumb that feed the split-second decisions that help us survive. I can't argue that survival is great, but if we're not careful, this process can hijack our investing decisions … with suboptimal results. Your experiences – the "frame" within which you formulate your rules of thumb – can affect your decisions, sometimes without your even realizing it. It's important for investors to be aware of this tendency and combat it if necessary.

For example, Buffett bought his first stock when he was 11 – way back in 1941. Since then, the S&P 500 is up 13,657%, or 7.1% annualized (this data doesn't include dividends). Within his frame, buying stocks clearly looks awesome. I bought my first stock in 1998; since then, the S&P is up 48%, or 2.7% annualized. Within my frame, researching stocks looks like a lot of wasted time and energy.



The Fix
Given our frames, it would be easy for Buffett to think stocks always go up, and for me to think that stocks always go sideways. I'm not sure whose frame is closer to the truth (we *could* live in a fundamentally different world today than in 1941), but it behooves both of us to have a solid understanding of the history of risky assets, even pre-1941. Investors will make better decisions by stepping out of the frame of our own experiences and rounding out our understanding of history. Pick up a copy of *Against the Gods: The Remarkable Story of Risk* by Peter Bernstein (if you haven't already) for a bit of help.

Factors

There’s another reason it’s easy for Buffett to say “buy” – he has more money than any of us can imagine. All of his needs are met and his estate is squared away; there’s a good chance that the biggest line-item expense on his monthly budget is Cherry Coke. Because of this, he can invest for bequests and for the future of his company, which is in no danger of disappearing anytime soon; there are few constraints on his investing strategies. My wife and I, on the other hand, are paying down student debt, saving for a house, planning vacations, and building a larger nest egg. Each of these factors affects our risk-taking abilities.

The Fix
Before we decide to "just buy," we need to make sure we have a cohesive, diversified financial plan that includes a rainy-day fund and insurance. There’s room in such a plan for a “risky assets” category, and in that category, we can follow Buffett to the letter – but only within the context of a thoughtful, big-picture strategy. Make sure you've got one.

Follow-Up

Early in his investing career, Buffett became majority owner of Berkshire Hathaway, a Massachusetts textile manufacturer that looked cheap. It subsequently got cheaper as its business worsened, but he maintained the textile operations long after he realized the business was dying. In 2010, Buffett admitted that buying the failing textile business was his largest investing mistake ever. His lesson: Buy good businesses. The moral: Study your mistakes and learn from them. Buffett has made it a habit to publicly share his largest mistakes (see page 8 of his 2007 letter to shareholders, for example) every few years.

The Fix
Keep a journal. Write down why you made each investment (or didn’t), and check back later to see how the progress of each one compares with your initial thoughts. When things go awry (or well!), investigate why; when you can diagnose errors, be sure to put procedures in place so you don’t repeat them. Buffett's inventory of his own mistakes has helped him classify his three most common errors: misjudging the future economics of a business; partnering up with poor management teams; and paying too much. It's no coincidence, therefore, that his investment philosophy now has a three-pronged approach: Buy good businesses run by honest, capable management teams for a reasonable price.

The Foolish Bottom Line

Investing is a journey. The improvements we make today compound for the rest of our journey, so it's worth a little time and effort to tinker with our process. At *Pro*, we want to help by adding tools to your toolbox and by continually challenging you to improve. We’d love to hear about your investing frame, the general outline of your larger financial plan, and how you've learned from your mistakes on our Memo Musings discussion board.

Onward,

Bryan (TMF42)

Audio Extra: Interview With StoneMor CFO Tim Yost

Published Oct 26, 2012 at 12:00AM

Motley Fool Income Investor advisor James Early recently interviewed StoneMor Partners CFO Tim Yost, a limited partnership whose units (or shares) yield nearly 10% today and are rated a buy in *Pro*. But the company is not without controversy — as you know from our original buy report and follow-up reviews on the company discussion board. Why are the company's financials so difficult for most to understand? Is the dividend sustainable? We believe so, and you can hear why straight from the CFO's mouth.

Counting Cash

Published Oct 22, 2012 at 12:00AM

Fellow Fools,

Miscounting cash almost got me fired. I worked as a bank teller for three months in a former life, and on my first day out of training, the branch received a newly printed batch of $100 bills, which is pretty rare. As cashiers and bank tellers know, new bills are dangerous. Sure, they smell wonderful, but without the benefit of having passed through many hands, they’re a little rough … and they stick together like Velcro. At the end of my shift, it became clear — because my drawer was short a hundred bucks — that I’d given an extra bill to one lucky patron. I kept my job, but not without a heightened awareness of the importance of accounting for every penny.

Sticky bills or not, miscounting plagues tellers and investors alike. Let’s review how to count *Pro*’s cash positions so we’re never short of cash when we need it most.

Short Stock, Puts, and Calls

First, a quick review. When we sell a stock short, we borrow shares from another investor, then simultaneously sell those shares on the open market (meaning a negative entry shows up on our brokerage statement) to yet another investor, who pays us cash (meaning a positive entry shows up). These entries offset one another, so our portfolio value stays the same (minus transaction costs). The same thing occurs when we sell options, only instead of borrowing shares, we actually write a brand-new contract. The portfolio value remains flat, and our cash balance increases to offset the negative value of the short option. These transactions can present a problem for new *Pro* investors unaccustomed to counting cash in a long, short, stock, and options portfolio.

$306,795.70

Though a glance at our Recommendations page would make it appear that we have more than $300,000 of cash waiting to be invested, much of that cash is already accounted for. To find out how much cash is free to use without employing leverage, we need to back out the cash that came from our short positions:

Cash	**$306,795.70**
subtract cash offsetting our **SPDR S&P 500** short	$143,360.00
subtract cash offsetting our **CurrencyShares Euro Trust** Short	$56,900.80
subtract cash offsetting our **Sony** short	$20,655.00
Cash Ex-Shorts	$85,879.90

Source: *Pro* portfolio as of close 10/19/2012.

You can find this "Cash Ex-Shorts" figure on the bottom of our Recommendations page under the "Exposure" heading. Using the above figures, you'll see that 6.1% of our portfolio is in cash ex-shorts.

Leveraging Options

Spreadsheet ninjas at home will note that we haven't accounted for the obligations of our written puts. For U.S. investors using an IRA, written puts need to be secured, dollar for dollar, with cash. As such, they won't benefit from portfolio leverage. That's not the case for the *Pro* portfolio, where we're using a conservative amount of portfolio leverage through options. Under a worst-case scenario, the following is our portfolio's obligation for written puts. Remember that we have diversified our expiration dates, and that we can roll or buy to close puts early to reduce our obligation.

Written Puts	Strike Price	Contracts	Shares	Potential Obligation
iShares Russell 2000 Index	$75	28	100	$210,000
OpenText	$50	7	100	$35,000
Starbucks	$47	8	100	$37,600.00
Total Potential Obligation				$282,600.00

Source: *Pro* portfolio as of close 10/19/2012.

With about $282,600 in potential, albeit unlikely, obligations (remember, Jeff has stated that we'd likely roll or close the Russell 2000 short if it came to that) and $85,879 in cash (again, after backing out our shorts), you can see that we are using a bit of leverage — and that the stated cash balance doesn't reflect the full reality of the portfolio. That said, we have enough cash to fulfill the puts we seek to fulfill, namely $72,600 in OpenText and Starbucks, and (again) would roll the puts on the Russell 2000 if needed.

Of course, the cold hard numbers above aren't fluid enough to capture the nuanced reality of our exposure. One obvious example is the huge short position we have on SPY: If the market crashes, forcing us to make good on some of our written put obligations, we could use the resulting considerable profits on our SPY position to that end.

The Foolish Bottom Line

Don't be a miscounter like poor young Nick; fire up your calculator to see how much of *your* cash is free to deploy and how much is being used to leverage your portfolio. For *Pro* Fools, counting cash isn't as simple as looking at your cash balance.

Fool on,

Nick (TMFCrow)

Guidance Changes

- **Vanguard Energy** moves to Sell as we focus on better situating our portfolio with respect to our North Star.

Trades Complete

- **American Express**: We closed our October $60 calls and October $55 puts for $0.29 per spread, capturing most of our potential profit. Our protective October $65 calls expired over the weekend.
- **Tupperware**: Our October $55 puts expired as full income.

Catch-Up Trades

- None this week as we wait for more earnings reports; we expect more activity on existing positions afterward.

Coverage & Community

- **Earnings from Intel:** Jeff reviews the third quarter.
- **Getting Existential:** Where are we? Where are we going? Discuss.
- **A full calendar:** It's earnings time for real!

See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Close Your Strangle on American Express

Published Oct 16, 2012 at 12:00AM

- **What We're Doing:** Closing our strangle a few days early, before American Express reports earnings.
- **What We're Thinking:** We've earned 96% of the available profit.
- **What We're Expecting:** Barring business surprises, we aim to write a new strangle for more income soon after Wednesday's earnings report.

Trade Essentials

- **Action:** Buy to close your existing strangle (October 2012 $55 puts and October 2012 $60 calls) for as little cost as possible, lately about $0.15 combined. Leave your long October 2012 $65 calls alone to expire (they have no bid price anyway).
- **Price Guidance:** Use a **limit order** aiming to pay a net debit of $0.15 or less (less is better); if the stock price moves meaningfully, you may need to pay a bit more.
- ***Motley Fool Options* Member Guidance:** If you've written a January 2013 covered strangle on American Express in *Motley Fool Options*, continue to follow that strategy with me in that service.

What's New?

- **Recent share price:** $58

When we originally presented our option trade on **American Express** (NYSE: AXP), we called it a written $55 put plus a $60 / $65 bear call spread. The same set of options can also be viewed as a written strangle ($55 put / $60 call) plus a purchased $65 call.

In June, we were paid $3,500 to write the strangle on American Express (we wrote eight contracts). Less than four months later, we can close these two options at a cost of about $120, so we'll keep more than 96% of the premium we were paid.

Why Close?

With shares trading squarely between our strike prices, you might wonder why we're closing the strangle a few days early. The answer is earnings, which American Express is due to report Oct. 17 (tomorrow) after the market closes.

If the stock were to move more than 3.4% up or 5.1% down, it would break through one of our strike prices. Not a big deal, because we could still just roll the strangle on Friday before expiration — but it's potentially more profitable, and it affords us more flexibility, to take our healthy gain today and set up a new strangle after we go through Wednesday's earnings. Thus, we'll close this iteration of the trade and look to write a new one soon.

How to Follow Along

We recommend you:

- Buy back ("buy to close") your October 2012 $55/$60 strangle for as small a net debit as possible, lately $0.15 combined.

Next step: If you have questions before you close your strangle, visit our American Express discussion board.

Savor Your Time

Published Oct 15, 2012 at 12:00AM

Dear *Pro* Member,

There are dozens of investing strategies — long and short — that *Pro* has not yet employed, but eventually plans to. One option income strategy you'll likely see us tee up one day is a neutral calendar spread. You set this up on a stock or index by buying an option that expires in about four months or longer, and writing (or selling) a similar option that expires in just a few months or less. The near-term option you write will lose value more quickly than the longer-term option you purchase, and as the first option nears expiration, you can close both and keep the difference as your profit.

Last Call ...

... to snap up a never-to-be-repeated deal on *Million Dollar Portfolio*.

For a large number of Motley Fool members, better and more confident investing often comes down to knowing *when to buy stocks* ... how large a part of your portfolio to *allocate to each* ... and *when to sell*. That's why until midnight Tuesday, Oct. 16, you can get into *Motley Fool Million Dollar Portfolio* on the easiest and most generous terms ever. Watch your inbox for your invitation!

It's called a neutral calendar spread because you're basically neutral on the underlying stock or index, and you're "spreading" your options over a few months to profit via "time value" arbitrage. You'll typically earn a healthy profit on your capital at risk with this strategy, even if the underlying investment moves in a wide price range. That said, if the stock or index falls sharply below your strike price, you can lose the entire net debit you paid to set up the spread, but no more.

As mentioned in *Pro*'s guide to neutral calendar spreads (which features examples and charts!), you could set up such a spread on the **SPDR S&P 500** if you're neutral on the index over the next few months. The market's most popular index currently trades at 15 times trailing earnings, and although Bloomberg says the average bull market ends with said index at 19.7 times earnings, perhaps you're neutral in the near term. Options on the SPDR S&P 500 are popular, so they're typically a bit overpriced. But that doesn't really matter with a calendar spread, since you're simultaneously buying and selling options on the index.

As an example, with SPY recently at $143, you could buy to open March 2013 $144 calls for $4.95, and write (sell to open) January 2013 $144 calls for $3.64. Your net cost is $1.31 per spread ($131). As the expiration of the January option nears, if SPY hasn't moved too meaningfully in either direction, the March calls you own should still hold much of their value, and the January calls you wrote will be worth little. You could close both and have a profit overall, perhaps even double your $131 cost per spread.

For much more on this strategy before you consider it on your own, see our guide. You'll likely find *Pro* employing calendar spreads as another income strategy in coming weeks and months; in our current period of low market volatility, neutral calendar spreads can be a good strategy. And if volatility goes up and options premiums increase, the change is largely neutralized, because this strategy involves two opposing options.

Earnings Redux, Part 3

Third-quarter earnings begin in earnest this week, with **Intel** reporting on Tuesday after market close. As ever, we value quarterly reports for the updated insight they provide. We invest with a focus on the long term, but we still want to see our businesses performing well quarter by quarter on measures that matter to us. In other words, we're not investing with blind faith that they'll eventually do well; we want our companies to be doing well *today*, too.

Oracle's recent healthy results reassured us about new cloud software offerings and about hardware revenue — two concerns of ours that management focused on in the conference call. With Intel, we'll want to see how adoption of its mobile processors is growing and how server microprocessor sales are holding up, as they're the most lucrative part of the business. **American Express** also reports this week; there, we'll watch delinquent loan and charge-off numbers, among other things. And the list goes on. We're always eager to dig into each of our companies' results for you as we get updated numbers. We want our businesses to be on the path to create value for all of us the coming few years — and ideally beyond.

Make Your Week Memorable

We recently held a contest on the boards challenging members to have an exceptional week (or day) and share the experience with all of us. Four members officially stepped up to the plate, and following member voting, we have our winners! Congratulations to first-prize winner BlackLineVestor, followed by Wantingmaxvalue in second, then latimerburned and antmark. Click on each member's name to relive their great experiences! Prizes (gift cards to **Apple**, **Starbucks**, and **Papa John's Pizza**) will be in the (e)mail this week. Thank you for participating and for making our community even more Foolish!

See you on the boards,

Jeff Fischer (TMFFischer)

Catch-Up Trades

- **Covanta Holdings**: If you don't own at least 3.4% in the stock yet, sell to open March 2013 $17.50 puts, lately around $1, or December $17.50 puts for at least $0.50. (To be clear, we own shares and have written December $17.50 calls on them. Writing puts generates similar income.)

Coverage & Community

- **Savor Your Time, Reiterated**: Paladin306 shares his advice after suffering a heart attack.
- **Swanky Stays**: nrlbuild details his stay in D.C.'s Hotel Monaco, a **Pebblebrook Hotel** property.
- **Puts for Writin'**: alex340 shares more puts that members can consider selling to target buying *Pro* shares at lower prices.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here*.

Checking In on DGS

Published Oct 8, 2012 at 12:00AM

Dear *Pro* Members,

Guidance Changes

- The **WisdomTree Emerging Markets SmallCap Dividend Fund** moves to Buy from Hold.

Trades Complete

- **Wells Fargo**: We bought to close 12 October 2012 $33 puts at an average price of $0.096.

Catch-Up Trades

- Invest up to 2.4% of your Pro funds in the **WisdomTree Emerging Markets Small Cap Dividend Fund**.

In a way, owning a diversified fund like **WisdomTree Emerging Markets Small Cap Dividend Fund** is a luxury. Sure, we have to pay attention to global trends and how the fund performs (in particular, its contribution to our North Star), but that takes much less time than following quarterly earnings and conference calls. Like all luxuries, this one does come with a price: an expense ratio of 0.64%, which we think is a tiny sum compared with the difficulty of following 532 holdings ourselves.

DGS may not require as much care and feeding as some of our other positions, but we still keep a watchful eye on it. So how is our investment doing? We're glad you asked!

In Jeff's original recommendation, he cited three factors *Pro* wanted to capitalize on using this investment:

1. Small companies outperforming large companies
2. Dividend-payers beating non-dividend payers
3. Emerging-market investments outpacing those in developed markets

For their part, the fund's managers are focused on one objective: achieving investment results that correspond to the price and yield performance, before fees and expenses, of the index with which the fund shares a name. There are 623 companies represented in the index, but the fund managers use representative sampling to narrow this list down. Each position is weighted based on the annual cash dividends paid; the larger the dividend, the larger the allocation. Rebalancing annually based on this strategy, the fund's managers sell higher-priced stocks in favor of cheaper ones.

Emerging Performance

Pro Fools know that DGS is a 2.4% allocation for us, and that it's currently down about 10%. What Fools might *not* know is that DGS's managers are actually steering the fund to pretty exceptional performance when measured against other emerging-market investments. Morningstar has given DGS its coveted five-star rating, and it's the fifth-highest-rated fund in its category over the past three years. As Patricia Oey, the Morningstar analyst covering DGS, put it:

"Although this is a small-cap fund, since its inception in October 2007, its volatility has been slightly lower than that of the broad market, capitalization-weighted MSCI Emerging Markets Index. Over the same time period, it has also earned higher absolute and risk-adjusted returns than the market-weighted MSCI Emerging Markets Small Cap Index."

She notes that this may indicate that dividends are a viable strategy in emerging markets, a statement with which your *Pro* team agrees.

Digging In

With so many index components fighting for a place in this portfolio (that is these companies' only goal, right?), let's take a look at how the holdings have changed since we first bought in.

Top 10 Countries of Exposure

Country	Fund Allocation, 11/22/2010	Fund Allocation Now
Taiwan	19.19%	24.62%
South Africa	11.04%	7.19%
South Korea	10.54%	10.45%
Thailand	9.80%	10.24%
Turkey	9.04%	5.28%
Israel	8.29%	Not in the top 10
Brazil	7.78%	7.85%
Hong Kong	5.95%	Not in the top 10
Malaysia	4.59%	9.32%
Chile	4.23%	4.77%
Indonesia	Not in the top 10	4.33%
China	Not in the top 10	4.39%

Source: WisdomTree.

Taiwan, South Korea, Thailand, and Malaysia together account for 54.6% of the fund's holdings. The once-touted kings of emerging markets, the BRIC countries (Brazil, Russia (1.08%), India (0.91%), and China), come in at a lowly 14.2%.

Exposure by Sector

Sector	Fund Allocation, 11/22/2010	Fund Allocation Now
Industrials	23.43%	18.91%
Financials	18.99%	21.52%
Consumer Discretionary	17.60%	14.43%
Information Technology	10.91%	12.57%
Materials	9.07%	13.28%
Consumer Staples	6.96%	7.54%
Utilities	6.42%	4.77%
Health Care	2.87%	2.03%
Energy	2.21%	2.33%
Other	1.54%	1%
Telecommunications	N/A	1.62%

Source: WisdomTree.

The fund's heavy weighting toward financials, industrials, and the consumer discretionary sector leaves it well positioned to benefit from an economic recovery if and when one comes along.

None of the fund's top 10 holdings from 2010 remain today, so I won't provide the "before" list. As fund assets have grown, so has the number of companies in the portfolio, from 486 to 532; below are today's top 10.

DGS's Top 10 Holdings

Company	Industry	Country	Allocation
Tauron Polska Energia SA	Utilities	Poland	1.34%
Magyar Telekom Telecommunications plc	Telecommunications	Hungary	1.21%
Administradora de Fondos de Pensiones Provida SA	Financials	Chile	1.2%
Synthos SA	Basic Materials	Poland	1%
IPATH MSCI India Index ETN	Diversified India ETF	India	0.91%
Tofas Turk Otomobil Fabrikasi	Consumer Cyclical (Autos)	Turkey	0.9%
AFP Habitat SA	Financials	Chile	0.79%
MRV Engenharia e Participacoes	Homebuilding	Brazil	0.75%
Turk Traktor ve Ziraat Makineleri Anonim Sirketi	Industrials	Turkey	0.74%
Macronix International	Technology	Taiwan	0.72%

Sources: WisdomTree, S&P Capital IQ.

With portfolio turnover clocking in at 53% — much higher than 2010's 38% — it isn't surprising to see a whole new top-10 list. It's also worth noting that for many foreign companies, each dividend payment is often based on the company's current earnings (unlike here in the States, where companies try to maintain the same dividend no matter what). Earnings, and therefore dividends, can be quite variable, which might contribute to turnover if the fund manager chases the companies with the highest recent dividends. Current portfolio turnover is still relatively low, and I expect it to decline if global economies stabilize.

Valuation

If I were to attempt to value each of the fund's holdings, we'd be here until 2022, so we'll rely on summary valuation statistics for the fund as a whole. These are coarse numbers, but they show that the index:

- has a value bias.
- provides exposure to countries with the potential to grow GDP faster than developed nations.

These numbers are for the underlying index, *not* the DGS fund that tracks it:

Metric	Number
Dividend Yield	5.26%
Price to Earnings	10.7
Price to Book	1.0
Price to Cash Flow	7.1
Price to Sales	0.7

Source: WisdomTree Q2 Fact Sheet, 6/30/2012.

The *Pro* Bottom Line

Overall, DGS provides cheap diversification and income for us, and it remains a well-run fund that has earned its place in the *Pro* portfolio. All that said, it needs to do its part in helping us achieve North Star-like returns over the coming years if it wants to stick around. We still believe that income and value within growing economies are worth investing in.

Bring your thoughts to the Memo Musings discussion board.

Best,

Nick (TMFCrow)

Transcript

Joe Magyer: Hello, Fools! This is Joe Magyer from *Inside Value*, and I am joined here today with *Special Ops* and *MDP*'s Mike Olsen and Bryan Hinmon from *Motley Fool Pro* and *Options*. Gentlemen, hello.

Mike Olsen: Cheers.

Bryan Hinmon: Hello, Joe.

Joe: Cheers! So we are fresh back from New York, where we were enjoying Italian food and craft brews, but also the Value Investing Congress, which is the biggest investing event this side of the Berkshire meeting every year. It was a lot of fun in a very nerdy sense. Some of the best minds in investing, specifically value investing, were there. Bill Ackman, John Malden was there, David Einhorn and a lot more really smart guys who, unless you're hardcore nerds like us, you wouldn't recognize, but they were there and very thoughtful and pitched a lot of great ideas.

So we are back from our trip, ready to talk about some of our impressions of the trip and some specific stocks and pitches that we thought were really compelling.

Before we get to the meaty part of actual stock ideas, though, I'm just curious for your general impressions, maybe anything that stuck out to you as being particularly interesting. Mike, maybe if you want to kick things off.

Mike: Sure. So one thing that I thought was particularly interesting, one guy who is not so much a household name, but is indeed a stellar investor, is a guy named Alex Roepers. He is the founder of Atlantic Investment Management. He is privy to show this awesome chart where he depicts his fund's performance, the S&P's performance, and Berkshire Hathaway's performance, and you might guess that the reason he depicts that chart is because his fund exceeds all of those measures since inception. They have earned 18.5% annualized returns. At the fund itself, they have a focus on investing with great businesses with recurring and significant cash flows, strong competitive advantages.

One thing that he brought up, these guys are kind of known to be soft activists: They like to engage with the companies they are invested in to realize value. He said it was an environment which is great for shareholder activism, and by that he means companies should be thinking about how they allocate their cash and allocating it effectively. Cash balances are near record highs, interest rates are very low and companies have been earning near record profits, on a nominal basis at least. And so when you think about managers and their sort of proclivities to throw good capital after bad, a guy like Roepers is good to have on your side as an investor.

Joe: Yeah, you know another good point that he made I hadn't really thought about was all the pent-up money that LBO Funds, private equity funds, have in store where basically they've done a lot of fundraising over the last couple of years and they haven't put all that money to work and at some point they've actually got to get out there and buy something. He specifically pointed to that style box at companies, and especially between one billion and ten billion in value, that are very hot targets for private equity funds. It could be natural hiccups for them.

Mike: Right. I think another thing that was interesting within that context is these funds, they aren't earning fees if they don't put that money to work and so that's pretty important. Another great quotation he had within the confines of the whole activism idea was, "Of course we would prefer to invest in companies with great managers, good leaders." He said, "You know, if you don't manage your company well, someone else will manage it well for you," which I thought was pretty funny.

Joe: Yeah, when he puts up that chart of his outperformance, you almost hear a sinister laugh in the back of your head. It's really pretty impressive.

Bryan: Those are just the blades of his private helicopter.

Mike: Which actually does exist.

Joe: So the thing that stuck out to me was there were at least three presenters who spoke in some form about time arbitrage, and time arbitrage is simply the ability to take a long-term perspective when other people are taking short-term perspectives. And really what this does for value investors is it allows them to look at ugly, really warty businesses, sort of see through what might be temporary, but what could be on the other side.

The reason this was interesting to me, not just taking it on face value was it struck me that equities are probably richly priced right now. People are having a real hard time finding ideas and so many of them are having to look at really ugly, really warty companies and so keeping the idea of time arbitrage front and center is becoming more and more important.

Mike: Right. I think one thing that is important strategically speaking, when you think about the idea of investing. In the age within which we exist, there is no shortage of information and as an investor, the odds of you finding some informational advantage is almost nil.

Where you can find an advantage is by looking at time horizon that other people are not. Most funds and institutional investors, they're concerned with making that return this year because otherwise money is going to lose them. We as individual investors and Fools, we have the liberty to think longer term, and that is certainly a huge advantage to us.

Joe: Yeah, we're coming up on one of my favorite examples of time arbitrage, which is Christmas tree sales and after-Christmas sales. I'm always amused that people will rush out and buy Christmas trees, the real ones that smell nice and need water and die on you and then you have to haul away, and they pay a lot for that; they pay a premium, but they oftentimes will skip over the plastic ones that will last you forever. And the amazing time component is that just a month after Christmas, you can buy these artificial Christmas trees for 75% off and companies end up throwing a lot of them away because they can't find people to come in and buy them. the ultimate test in it to me, an example of where you've got a durable asset that's selling at a price that it will quadruple in value in the next 11 months and that you can use forever, but people will walk right by because they can't get utility out of it in the next 11 months.

Mike: I thought you were going to bring up superhero tights on Nov. 2.

Joe: No.

Bryan: That's a close number two, Mike. Jeff Ubben of ValueAct actually spoke about how he built ValueAct Capital around time arbitrage in a sense because he spoke about the triangle of alignment where he needed to find long-term investors, take a long-term mindset in his investments, but also structure the incentives for himself and his other employees around that long-term performance.

Mike: I think Ubben is one of the more thoughtful and skilled value investors out there, and certainly he has put a lot of thought into how he can most effectively accomplish his and his investors' ends, and one of those was being able to invest in great businesses with a very long-term mindset. That works quite well.

Joe: So cutting to specific ideas, what were your favorite pitches coming out of the day or the two days? Bryan, you want to go first?

Bryan: Sure. So Mike spoke about Alex Roepers and he is an impressive, impressive guy. One of his pitches that I really liked was Rockwood Holdings. Rockwood is in the process of streamlining its business. Right now you can think of it as sort of a conglomerate of strange chemical businesses. They have a titanium oxide business that sort of dominates the headlines and he pointed out that the company trades on this commodity-like business, the swings of the commodity prices, but they're trying to sell it off, and once they do, the gems of the business are really going to be brought forward. And the gems are it is the second largest lithium producer. Lithium is a market that's growing about 8% a year without any benefit from electric cars at the moment, so …

Mike: Less manic that titanium oxide.

Bryan: Far less manic and they also have an incredible business, ceramics business, and right now those ceramics are used in a lot of healthcare applications. The ability for that ceramic business to grow within the healthcare industry I think is highly overshadowed by the titanium oxide business. So Rockwood is actually a company that we own in *Motley Fool Pro* and so we sort of share his belief and the company's balance sheet is going to look a heck of a lot better once they get rid of the titanium oxide business, and I think management is really doing the right thing there and it could be thanks to Mr. Roepers.

Mike: I don't think that's too far flung, to hop on Roepers' train, and certainly we don't want to make this the Roepers love fest, but another idea that was quite interesting was the company called Joy Global. To give kind of a sense of what they do, they are a supplier of underground and surface mining equipment. These are basically new age picks and shovels, and their primary market, about 75% of the revenues, come from global coal mines or the global coal market.

Quite understandably, as natural gas prices have fallen, utilities producers have opted to use natural gas instead of coal; 20-25% of the revenues come from the U.S. The market has kind of taken that as a negative. The stock has fallen quite substantially, and Roepers, in true form, got up there and said quite boldly that while coal may be a declining market within the United States, it is a growth market internationally. Seventy percent of Chinese power or Chinese electric power is from coal. They are a relatively undersupplied market. If electricity is the thing you're thinking about, India is also a growth market within that context. And Germany, they recently swore off nuclear, and so they're going to need to fill that power vacuum.

Joe: We'll see if they stick to that.

Mike: Right, but if they do, they're going to need to fill that power vacuum in some way shape or form.

The other thing that's pretty interesting about this business is 60% of their revenues come from maintenance and overhaul of their existing mining equipment, which creates a strong degree of recurrence in cash flows.

Bryan: They have about a $25 billion installed base right now to service, so it's a pretty long stream that they'll be able to service.

Mike: Exactly. As the stock itself trades at about nine times earnings and you think about the growth potential which is inherent in this business, it's quite attractive. One thing I might add to the end of that is you could say a lot of things about U.S., or the U.S. and coal, but the fact o the matter is, absent some sort of legislation, if natural gas prices move higher, which I believe they will, some of that coal and that gas switching, the demand will come back for coal.

Bryan: It's also worth noting that a few years ago, I think a year or so ago, Caterpillar bought Bucyrus, which is the major competitor to Joy Global. They paid a pretty hefty multiple. I think it was like 13 times pre-tax profits and Joy Global trades well, well, well below that. And so yeah, it looks like Cat sort of acted at the peak of the mining cycle, but still, they saw a lot in that business that they liked and so we can't ignore that altogether.

Joe: Yeah, well I thought one of the most compelling was a stock that I've recommended … Surprise! … was from David Einhorn on General Motors. It's essentially the same pitch that I've been banging the drum on for a while now, how recovery in U.S. vehicle sales will be lifting the fortunes of all the players involved, but specific to GM, there's kind of a GM hatred penalty out there in the market.

A lot of people are steering clear of the stock because they're anchoring on old GM, but new GM is a much cleaner balance sheet. They've got $32 billion in cash. They've done a lot to shore up their off-balance sheet items as well, lower cost structure. Done a great job of streamlining the business, closed a lot of brand lines that were non-core. They were wasting dollars in manufacturing capacity around that, and there's a lot to love; the stock is hated. I still like it. Unfortunately, we're about two years too early on GM and I think that's obviously not worked out as well as I'd like, and it was interesting because later there was a good talk from Boyd Conner, who I'm actually going to talk about one of his ideas in a second, but he's a turnaround specialist who got up there and mentioned that as a turnaround investor, you want to wait until the car, so to speak, is actually well into the turn before diving in because it can take a long time for both results to come through from a management team that's affecting change, but also for the market to respond to that.

So on a personal level, that's maybe a bit of a lesson there on GM. Fortunately, I think we're already well into the turn because of a lot of changes they've been making, but one of the ideas that came up that's fresh was actually Jamba, as in Jamba Juice. Total no-moat business…

Mike: Very fresh.

Joe: Very fresh. Not really my cup of OJ, terrible?

Mike: Too bad, too bad.

Joe: Yeah, it's not profitable, and they've had a bumpy ride, total no-moat business, again, so it's not really something I'd usually be interested in, but I'd definitely buy the upside range potential here where I think management, from what Conner said, has done an excellent job of coming in, cleaning up the business literally and figuratively, cutting costs and when you look at same-store sales, they're on a nice upward trajectory at 12% in the latest quarter. Pretty solid, and I think there's a good chance for a real fulcrum shift in how people think about this business from being a no-moat loser to something that's actually earning money, and I think they're coming up on turning the corner there.

Another thing that I really like is they're finding some great ways to kind of leverage the brand outside of just the store experience. One is consumer goods actually in stores are selling Jamba Juice at your local grocer, for example. That's a great, high-margin brand extension. Another is this thing called Jamba Go. It's basically just kind of a big box of juice that would be *(laughs.)* It's basically …

Bryan: I'm sure the CEO would love to hear you say that.

Joe: I'm sure. I've looked at the devices and I was just trying to think of the best way to describe it, but it's basically a mobile unit and a dispenser of Jamba Juice.

Bryan: It's a Jamba Juice without any employees. That's what it is. It's not a big juice box.

Joe: It is. You can see what I'm saying. It's a box with juice in it. It's very large and it has juice. I think that while it's not going to be a major driver for them anytime soon, there's a good chance for some high margin, long tail revenue here. They're hoping to have around 500 of these installed, mostly in schools, by the end of this year, and schools are kind of a natural target because we're all fattening up our children with terrible food at public schools. I know; I went to them and they fattened me up. It's a nice opportunity to get something healthy in school locations and it's a nice opportunity for Jamba to take advantage of that.

In terms of the size of the opportunity, if 500 sounds like a lot to you, there are 100,000 U.S. public schools out there, and I'm just talking about public schools, excluding colleges, so there is a lot of room to run.

Bryan: I think a really important part about that effort is what it could do for the brand. You sort of win the hearts of mothers and students and that builds some brand power that they can then transfer into their consumer products themselves.

Mike: Another thing to note, which is very interesting in the context of the restaurants themselves, is Conner noted that the restaurant-level margins are 20% to 23%, which to provide a little bit of context, who are the best restaurant operators? Chipotle, they do 25% restaurant-level operating margins, and that hasn't yet started to show in the results because they are dealing with a relatively small restaurant base, but as that restaurant footprint does indeed grow, you're going to start to see that in the cash flow, and those are just extremely compelling economics.

Joe: So, Mike, I'm going to pin you down on Chipotle. I know you've owned the stock before, made a lot of money on it.

Mike: I still do.

Joe: Well, David Einhorn came out, and as a lot of people probably heard, made a short case for Chipotle, basically talking about competitive rivalry coming on from an improved Taco Bell experience and valuation. Any thoughts on this?

Mike: I don't think there's any arguing that it is a pricey stock. It is priced to do excellent things, and so indeed if there is any threat at the margin, they could be due for some downside. That being said, I think this is a very interesting circumstance where you and I have discussed this before where somebody can be right in the short term, but wrong in the long term. And right here this is a circumstance where I think Chipotle is an excellent enterprise and they may well prove able to justify this valuation in the long term, but right now, I don't think it's anything; it's much of a stretch to say that they're exposed on the downside.

Bryan: Yeah, Einhorn's case was shockingly devoid of catalysts. The main crux of his argument was rising food costs, which they've been dealing with.

Joe: And it's true of every restaurant company.

Bryan: And it's true, yeah, and customer switching because of the new and improved Taco Bell and general industry dynamics. And none of those things seem to have a deadline on them or seem like they're going to — that they're any stronger at this moment than they were three months ago.

Mike: I would not be shorting this stock at these prices. I mean for the very reasons you say, I think another thing that that fails to acknowledge is he very much harped upon the fickle-minded nature of restaurant attendees and those consumers, but it ignores the extent to which Chipotle has been able to build a narrow moat, and a very narrow one, around the operational capacities and the economics variable to extract from the restaurants, which does provide some level of support on valuation relative to their competitors.

Joe: Rockin'. All right, well we're going to cut it off there. I'm Joe Mayger and I was here just now with Mike Olsen and Bryan Hinmon. Thanks everybody for listening. Guys, thanks for going to New York and coming on our little thing today. Good times.

Bryan: I had fun. Good times.

Joe: Thanks again for listening, folks, and Fool on!

Close Your Covered Strangle on Wells Fargo

Published Oct 2, 2012 at 12:00AM

- **What We're Doing:** Closing our strangle early.
- **What We're Thinking:** We've earned about 90% of the available profit.
- **What We're Expecting:** We'll keep our eye out for profitable new strangles in the future.

Trade Essentials

- **Action:** Buy to close your existing covered strangle (October 2012 $36 covered calls and October 2012 $33 puts) for as little as possible, currently about $0.42.
- **Price Guidance:** Use a **limit order**, aiming to pay $0.45 or less (less is better).

What's New?

- **Recent price:** $34.70

In March, we were paid more than $5,000 to set up our current covered strangle on **Wells Fargo** (NYSE: WFC). We can now close that position for $504, so we've earned about 90% of the potential income.

Why Close?

With shares trading evenly between the two strike prices, you might wonder why we don't just wait a few more weeks and earn the last 500 bucks. The answer is earnings, which Wells Fargo is due to report Oct. 12; while I can't forecast whether the team will beat the Street's expectations, the risk of bridging earnings for $0.45 per strangle contract isn't worth it to us.

Volatility on the stock is eerily low, so written puts and new strangles no longer pay well. That's rare because of the healthy dividend and the fact that financial companies' puts typically fetch attractive prices. Because of this, we're closing early instead of rolling; we'll look for better premiums before continuing this strategy.

How to Follow Along

We recommend you:

- Buy back ("buy to close") your October 2012 $33/$36 strangle for about $0.45.

Next step: If you have questions before you close your strangle, visit our Wells Fargo discussion board.

Sharing Our Shorts

Published Oct 1, 2012 at 12:00AM

Fellow Fools,

Invest Better, All Over Again

Did you miss Worldwide Invest Better Day on Sept. 25? Our replay will catch you up on the excitement.

I'd be tearing out my hair if I weren't so vain: Since Jeff wrote about moving into targeted shorts one whole human gestation period ago, the *Pro* team has just not made as much progress as we'd like toward that end. To be fair, we've identified **Sony** as a dead man walking (dead Walkman?) and added to our bet on the euro's decline, but those two results don't accurately reflect the amount of effort we've put in. In today's Memo, I'd like to share some of the work we've done identifying and vetting short candidates — and explain why we haven't yet put any of these shorts on. (Sorry.)

Caribou Coffee: Acquisition Risk

In February, I dug into **Caribou Coffee**, which was percolating near $18 at the time. Caribou has more than 400 company-owned coffeehouses and another 175 or so franchised units, and as you may have seen during your latest grocery-shopping trip, it also sells bagged coffee and K-Cups at 9,000 retail stores. My short thesis was simple:

- While Caribou has a strong brand and presence in the Midwest, its new store expansion plans will find some fierce competition from national darling **Starbucks** and Northeastern powerhouse **Dunkin' Brands**. If new stores struggle, investor expectations won't be met.
- Nearly a quarter of Caribou's revenue comes from coffee sold at grocery stores, and the company guides for 15% to 20% growth in that division. But in my trips to local supermarket chains, I found Caribou had failed to secure prime shelf space; more often than not, it was relegated to the bottom. That makes those robust growth rates look less probable.
- Long-term, Caribou wants its average store to generate $1 million in sales, up 68% from today. To get there, it plans to introduce new products and expand existing offerings. The problem, I posited, is that the company's small revenue base can't support the research and development investment needed to do this — and if Caribou did spend that money, investors wouldn't like the impact on near-term margins.

Despite all that, the premium coffee industry is hot: It's growing rapidly, aspirational consumers love it, and it's tied to the burgeoning healthy food movement. Even at a lofty valuation (I thought shares were worth closer to $10), I was scared that Caribou would be acquired, so *Pro* took a pass. That acquisition fear has proved correct … sort of. In July, competitor **Peet's Coffee & Tea** received a $1 billion acquisition offer, and it was already trading for 50 times earnings at the time. Caribou could be next, and with shares now down to $14, that outcome looks even more likely.

Discount Stores: No Catalyst

The terrible economy has been great for discount stores like **Dollar General**, **Family Dollar Stores**, **Dollar Tree**, **Fred's**, and **Big Lots**. Cash-strapped consumers have been migrating to these lower-end retailers in spades, and they've been market darlings through the downturn, expanding their store bases and consistently beating earnings. So why consider a short in the first place? As I saw it, the issues are competition and real estate.

- The five discounters named above have more than 21,000 stores combined. That is a lot of stores. Well-heeled competitors, including **Wal-Mart**, **Target**, **CVS**, and **Walgreens**, themselves boast a combined 20,000 stores — and they appeal strongly to bargain-minded consumers, too. I doubted the discount stores' growth would continue so easily.
- I also posited that the companies' share prices reflected too-aggressive assumptions about new store openings. Viewed on its own, each company could make a reasonable case for doubling its store count. But *all* of them thought they could do that — which would translate to more head-to-head battles, higher costs for the best locations, and closer proximity to the big guns listed above.

So why did *Pro* stay away? In the end, we didn't have a catalyst. We couldn't bank on an improving economy (and the more splurge-friendly consumers it would bring); it was hard to pinpoint when discount-store market saturation might occur; and frankly, most of the store locations were so lousy that we feared management could go after some low-hanging fruit to goose short-term same-store sales. Four of the five discount stores we looked at are up since March, and we continue to monitor the group.

Dunkin' Brands: Price Isn't Enough

In June, **Dunkin' Brands** traded near $34. At 7.7 times sales and 21 times expected free cash flow, it seemed priced for perfection to me — so if *Pro* wanted to short Dunkin', we needed to figure out what would stop investors from paying such a high price for this very good business. Here's what we thought could do the trick:

- Difficult comparables: Post-recession same-store sales could mean lower-than-expected growth for that metric. Plus, Dunkin's newest food offerings were uninspiring, and its efforts to draw lunch traffic didn't seem to be taking hold.
- Westward expansion: While Dunkin' doesn't have much of a presence west of the Mississippi River, coffee drinkers on the left coast aren't hurting for options. In fact, there are so many coffee joints per capita in its targeted expansion areas that to make inroads, Dunkin' would have to change the coffee drinking habits of its future consumers — and that isn't easy.
- Tough franchisee environment: Many franchisees use loans to fund their franchises, and those loans are becoming harder to get.
- Donuts ain't healthy: Americans' slow but (hopefully) steady move toward healthier food choices does not play to Dunkin's strengths.

Dunkin' has a fundamentally good business — we just thought investors were paying too much for it, given the risks we saw. That said, we weren't convinced they were paying *absurdly* too much, so we began to look elsewhere. In hindsight, the bear put spread we were toying with would have worked well. Shares have fallen 15% since we identified the holes in Dunkin's donuts.

The Foolish Bottom Line

Pro has fewer targeted shorts than we would like, but that's not because we haven't been working on finding them. These three tales are from my storybook — Nick and Jeff have similar stories. We simply refuse to put our capital (and more importantly, *your* capital) at risk without a fat pitch. Finding long positions is a bit easier: The market trends upward over time, so even random selections will drift higher (though for the record, we do not choose long positions randomly). I hope this memo pulls back the curtain a bit on how we think about building a short thesis, and why we haven't rushed to put our shorts on immediately. (Didn't think I was going to do it again, did you?)

Have you identified some lousy, overvalued businesses? Share them and your thesis on the [Stocks You'd Like to Short] discussion board.

Onward,

Bryan (TMF42)

Pro [Trade Roundup]

- **Covanta**: As our 30-day trading window closed, we sold to open 27 December 2012 $17.50 calls for a $0.40 credit on each. We wrote calls on all our 2,700 shares.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the [Recommendations] page.

- **3D Systems**: Sell to open February 2013 $25 puts, lately around $1.40, for a potential buy price of around $23.60 (shares this morning were $34.06). Sell one put for every 100 shares you would buy, up to a 1.4% allocation.

Coverage & Community

- **Bad Press**: Just because [*Barron's* says so] doesn't make it true.
- **Coffee Buzz**: Are you going to buy a [Verismo]?

- **Time for a Market Plunge**? Jeff is taking a well-deserved vacation, which usually means a market crash — consider yourself warned. Take his "Make Your Week Memorable" challenge anyway.

Sizing Up Pro's 10 Top Holdings

Published Sep 24, 2012 at 12:00AM

Greetings, *Pro* Fools!

Invest Better!

Don't miss the Motley Fool's first-ever Worldwide Invest Better Day! The big day is tomorrow, Sept. 25, and it runs all day long on investbetterday.com (or just visit Fool.com), with live roundtables, stock ideas, education, Q&A, and much more. There will also be in-person events around the world. Click here to see if you can meet a hearty group of Fools near you, including *Pro*'s own senior analyst, Nick Crow, in Portland, Ore.

Foolish investing is all in the name of long-term business ownership and growing wealth with some of the best companies on Earth. We're happy you're along for the ride, and we hope you find a little Foolishness tomorrow!

If anything keeps my mind running at night, it's allocation decisions (that, and dreams of living in a guest house on a Hawaiian estate with free use of a Ferrari). A great deal of thought, time, and consideration goes into where we decide to allocate our — and by default, *your* — money. Our 10 largest investments account for nearly 50% of the *Pro* portfolio, so if most of these companies are not long-term winners, it's unlikely that we'll love our total performance.

Although we have more than two dozen positions today, at least *half* of our attention should go to our top 10 holdings, because half our capital is with them. If we're confident in the long-term potential and valuation of these 10 investments, then we have much more freedom to buy smaller positions elsewhere where our confidence is less sure but we like the possibilities. And when we're comfortable with our largest positions, we effectively buy ourselves time and mental space to generate more income with options and seek poor companies to sell short (and daydream about palm-fringed beaches).

In summary, your largest holdings are the bedrock of your portfolio, and of your financial future, so only when your foundation is strong and tight should you consider adding additional, smaller positions on top of it. Here are *Pro*'s 10 largest positions and recent returns as of Friday.

Pro's 10 Largest Investments	Allocation	YTD Return	3-Month Return	Annual Dividend Yield
Medtronic	5.7%	13.3%	13.6%	2.4%
Intel	5.7%	(4.5%)	(14.1%)	3.9%
Oracle	5.4%	26.5%	15.9%	0.7%
Apple	5.4%	73%	20.3%	1.5%
AmTrust Financial (Nasdaq: AFSI)	5.3%	19.7%	(1.8%)	1.4%
BMC Software	4.7%	30.3%	(0.4%)	0%
Rockwood Holdings	4.7%	24.1%	8.5%	2.8%
Pebblebrook Hotel Trust	4.4%	29.3%	9.5%	1.9%
CME Group	4.0%	19.1%	6.6%	3.1%
MasterCard	3.8%	23.2%	5.6%	0.2%
Total Allocation and Average for the Rest	**49.1%**	**25.4%**	**6.3%**	**1.8%**

Dividends are not included in returns. Allocations and returns as of closing prices on Sept. 21, 2012.

Returns and yield taken from Google Finance, allocation from Pro*'s Recommendations tab.* Pro *has not owned Apple and CME all year (just much of it), but we're showing YTD performance for all stocks to make this an apples-to-apples comparison.*

Nine for 10

The first thing we should be very happy about is that nine of our 10 largest positions have made money this year. Peter Lynch says a 60% success rate with stocks is exceptional, so 90% is outstanding in any market. This is only a short-term result, but it suggests our due diligence and focus on buying quality at good prices for absolute returns is paying off. We're much less concerned about returns relative to the market, but eight of our 10 largest positions are up more than the S&P 500 this year, giving us a strong result:

Year-To-Date Average

- Pro Top 10: 25.4%
- S&P 500 Index: 16.1%

We invest with our always-positive North Star as a goal, so every month we ask ourselves if our stocks appear positioned to challenge a metric that's running at around 10% annually right now and essentially never lets up. We also hedge our portfolio, so ideally our largest positions will be strong enough to help compensate for our hedges in a rising market. In Pro, that's the main reason to track and point out this comparison to the S&P 500 at all.

Seven for 10

Over the past three months, though, only 70% of our largest positions have risen, despite an exceptional S&P 500 that's soared more than 9%. Intel is our largest loser, down 14% after lowering third-quarter guidance in the face of weak PC sales; and AmTrust Financial treaded water this summer after big gains in 2011, a 10% share dilution, and a nearly 20% advance so far this year.

Given the three-month performance of our top 10, and that we've been hedged, too, *Pro* hasn't gained as much ground as the market the last three months. Here are our top 10 over the summer, excluding dividends:

Past-Three-Month Average

- Pro Top 10: 6.3%
- S&P 500 Index: 9.3%

Why Most Investors Fail

If our top 10 stocks are looking a little mediocre in aggregate the last quarter, what should we do? As long as we continue to believe in the businesses, valuations, and our allocations, then we should do nothing. Most investors fail because they swap out of positions to chase something hotter, and then inevitably the hotter stocks cool and the abandoned tepid ones perform better.

I'd say one of the most Foolish columns I've written the last year was about this very topic, called "Why Most Investors Fail, and How We Avoid It." Rather than always leading the pack, a full 93% of top-rated money managers rank in the *bottom third* of all performers for at least one three-year period. They only remain great money managers because they stick to their knitting — just as Buffett did in the 1990s — even when it appears they're "lagging." If your investment process is proven, your returns will eventually follow, even if you need to wait through tepid years to get there. You can't rest on your laurels — you'll always have mistakes to learn from in a portfolio — but you still have to let your process have time to work.

Today, we're talking about our 10 largest stocks only going up 6% in average in three months, so it's hardly something to lament. But it still makes the point: If your portfolio isn't performing as well as you'd like lately, assuming you still like every position, more patience is usually your best course of action. Investing returns are not steady, consistent, or omnipresent; they tend to arrive in bursts and get interspersed with weakness. It's only after looking back at five or 10 years of holding a stock does it start to feel that it only ever went up.

In a future Memo, I'll review the rest of our holdings — because they, of course, make up the other half of the portfolio. In the meantime, we'll see you tomorrow for Worldwide Invest Better Day!

Foolishly,

Jeff (TMFFischer)

Pro Trade Roundup

- **Facebook**: We bought to open 26 January 2014 $20 call options at an average price of $6.81, for a 1.1% allocation.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **3D Systems** : Sell to open February 2013 $25 puts, lately around $1.40, for a potential buy price of around $23.60 (shares this morning were $34.55). Sell one put for every 100 shares you would buy, up to a 2% allocation (*Pro* has a 1.4% current allocation but would look to add at lower prices like this).

Questions on these? Visit our "Catch-Up Trades" discussion board.

Buy Calls on Facebook

Published Sep 18, 2012 at 12:00AM

- **What We're Doing:** We're giving a "like" to Facebook's 2014 call options, buying them to profit on the growth of the business.
- **What We're Thinking:** Market skepticism presents an opportunity to invest in an exceptional Internet brand.
- **What We're Expecting:** The company will earn more revenue on its enormous audience than estimated.

Trade Essentials

- **Action:** Buy ("buy to open") January 2014 $20 calls on **Facebook** (NASDAQ: FB). (As a reminder, these calls will appreciate with the stock; they give you the right to buy the shares for $20 any time before expiration if you so choose. Need a refresher on when and why we buy calls? Click here.)
- **Price Guidance:** Use a **limit order** at the current price you see. Ideally, you'll pay $5.80 or less per contract, but if the stock rises, you'll need to pay more.
- **Recent Option Price (bid/ask):** $5.60/$5.80
- **Recent Share Price:** $21.50
- **Allocation:** Invest approximately 1.2% of your *Pro* funds. In other words, buy around $1,200 in calls for every $100,000 you manage; at recent prices, this most closely equates to buying two call options for every $100,000 you manage, or 30 contracts for *Pro*. Were we to turn these calls into stock, it would lead to a 5.3% position. However, we may not choose to exercise any — let alone all — of these calls, and unless we do, we only risk 1.2%.
- **Maximum Gain:** Unlimited as Facebook rises.
- **Maximum Loss:** Our entire 1.2% investment if Facebook stock is less than $20 at the January 2014 expiration.
- **Break-even:** $25.80 at expiration.
- **Potential Follow-Up:** If the stock declines further, we may write puts to earn back option premium and target another lower buy price. We may also consider buying some 2015 calls when they debut in November. And come expiration, we may roll our 2014 calls to 2016 calls or buy some stock if we want to stay invested. Finally, if our call purchase is nicely profitable, we may eventually write diagonal calls against it or turn it into a bull call spread.
- **Alternative Trades:** If you don't want to buy calls for some reason, invest 1.2% directly in stock. Realize you won't have the leverage calls provide, although you will have a better break-even price and no expiration.

The Big Picture

Early this year, the world's largest social networking site was valued at more than $100 billion. Now, **Facebook**'s (NASDAQ: FB) enterprise value (including $10 billion in IPO cash) sits at about one-third of its recent peak. We're not going to argue that $100 billion was the right price for Facebook (it wasn't), but today's much lower price likely isn't, either.

With 955 million active users at the end of June, and $922 million in advertising revenue that quarter (up 28%), Facebook is essentially earning less than $1 in advertising revenue per user. Wall Street laments this, but I love it. Why? Because this metric will almost certainly improve, surpassing today's low expectations.

The Business

It's easy to forget how young Facebook is. In 2008, it sported just 100 million unique visitors. As it grew, CEO Mark Zuckerberg remained intent on keeping the social site free of intrusive advertising, but now that Facebook is public, even he realizes it's time to increase ad revenue. Wall Street seems willfully ignorant of this short history, punishing the stock because Facebook isn't monetizing its audience nearly as well as its more established peers, even though management's focus has been elsewhere. Now that Facebook is intent on growing ad revenue (including on mobile devices), we believe its growth will ultimately surprise Wall Street.

Early statistics may already support this belief. Take it with a grain of salt, but Facebook's advertising partners are claiming much more lucrative results — up to four times the return on ad dollars — on the new Facebook Exchange platform compared with other real-time bidding systems such as **Google** (NASDAQ: GOOG) AdWords. Facebook's platform (debuted in June and taken out of beta last week) allows companies to produce, monitor, and tweak advertising campaigns in real time, bidding for the words that are found most effective and placing ads where desired. ComScore estimates that more than 25% of the entire Internet's display ad inventory could be served on Facebook. As these ads become more effective, competing advertisers will need to pay higher rates for them — from today's basement-dwelling $0.25 per 1,000 page views, some estimate the cost will increase to as much as $2.50 per 1,000. Without falling prey to hype, it appears the upside potential in Facebook's revenue growth is not linear, but exponential.

Ad dollars as a whole continue to transition from old media to the Internet, with online ad spending up 15% year-over-year to $8.4 billion in just the first quarter of 2012. (Last quarter, Facebook's revenue grew 32% to $1.18 billion.) Advertisers seek a steady, large, targeted, and engaged audience and trackable results. In 2011, 16.6% of all time spent online was spent on social sites, naturally led by Facebook. This year, social media is on track to surpass search portals as the most popular activity online.

The number of daily Facebook visitors dwarfs that of most other websites (Google aside — its numbers are similar) and the audiences of all the most popular TV shows. Plus, the average Facebook user stays on the site much longer than users of other sites. It may surprise you that Facebook registers 1 billion search queries per day, rivaling Google — even though Facebook isn't considered a search engine. Although many users are searching for people, others are searching for restaurant or hotel recommendations, general information, companies, brands, and social or political movements. Facebook is intent on improving, growing, and monetizing its search capabilities, and ad dollars should grow as a result.

Key Facebook Stats

- **Monthly Users:** 955 million
- **FB Banner Ad Inventory:** Estimated to be 25% of the entire Internet's
- **FB Exchange Ad Rates:** Lately $0.25 per 1,000 clicks (compared with estimates of up to $2.50 per 1,000 clicks in the future)
- **Company Focus:** Grow ad revenue in desktop and mobile; improve search.

Recently, Zuckerberg spoke with the press, admitted mistakes, shared the company's focus, and reassured investors. Facebook is not working on a mobile phone (thank goodness), but it is intent on building out its search functions and earning much more revenue on mobile applications. (To that end, Facebook figures prominently in the most recent iPhone operating system.) The company foresees a day where 4 billion to 5 billion people have a smartphone, and its mission is to connect everyone with the people and things they care about every day.

Overall, the business potential of a site with nearly 1 billion engaged users looks much larger than the downside risk — as long as Facebook keeps its audience engaged. And this longtime skeptic believes it will. Unlike MySpace before it (which peaked at 75.9 million monthly U.S. visitors), Facebook has likely reached critical mass. Even if you tire of the site and leave it periodically (as many of us probably have!), you're likely to return eventually because enough of your friends and family are there, even if some of *them* are coming and going at times, too. Facebook's sheer mass gives it a gravitational pull that keeps bringing people back.

Additionally, users are building lifelong "Timelines" under the latest site format, making Facebook a homepage for their life stories, past and present — thus increasing its stickiness. In fact, today Facebook is *the* online identity for hundreds of millions of people, so as long as management continues to build on the user experience, the company has a strong chance of maintaining its position.

Valuation

Given how little Facebook is earning per user so far, it's not surprising that the stock is cheaper than its key Internet peers on an enterprise-value-to-user basis. But rather than increase our skepticism about Facebook's ability to create value, these older, more successful peers should suggest to us that Facebook has the potential to do exactly that. The company is only now starting to monetize its audience, a process it took several years for Google, **eBay** (NASDAQ: EBAY), and others to perfect. After these earlier online giants started to grow sales, their free cash flow and margins headed higher, and the same sequence of events should happen at Facebook as advertising dollars begin to flow.

With an enterprise value of $33.2 billion (as of Sept. 13), Facebook trades at 58 times 12-month free cash flow of $571 million. This result is depressed by the company's soaring (growth-oriented) spending and the fact that advertising is still novel on Facebook. But there's a lot of growth potential ahead as Facebook unlocks the value of its audience. If all goes well, eventually the business could command a valuation per monthly user that's much closer to its more successful peers (**Yahoo** (NASDAQ: YHOO) is included here as an example of a laggard):

Metric	Facebook	Google	Yahoo	eBay
Monthly Active Users	955 million	1 billion	500 million	217 million
Share Price*	$20.70	$706	$15.60	$49
Enterprise* Value	$33.2 billion	$192.1 billion	$16.5 billion	$58.7 billion
EV per User	$34.76	$192.10	$33	$270
Minutes Spent on Site per User per Month	413	101	151	N/A

*Enterprise value and share price figures as of Sept. 13, 2012; financial data compiled from S&P Capital IQ. Monthly active users for Facebook and eBay as of the quarter ending June from press releases; for Google and Yahoo as of September from Comscore and eBizMedia. Minutes per user estimates from Nielsen.com as of May 2012.

The market is granting every Google visitor *more than five times the value* it places on a Facebook user, even though Facebook users spend four times as long on the site each month. Right now, this is fair — Google has cracked the advertising nut. We're buying calls on the belief that Facebook will start to crack it, too.

How to Follow Along

Buying calls is as simple as buying a stock, except the command is usually "buy to open." You should pay cash — not use margin. If we own the calls for more than one year, they'll be taxed at a long-term rate. Buying calls is our way to risk less capital (our business thesis is unproven, after all) and still benefit from much of the upside.

We're able to invest just 1.2% of our funds but have a position that, if exercised, would equate to about 5% in stock, while risking just 1.2%. Here's how buying the stock at $21.50 compares to buying the $20 calls for $5.80, assuming one contract or 100 shares:

Facebook Share Price	Call Gain (Loss) on $580 Invested	Call % Return	Stock Gain (Loss) on $2,150 Invested	Stock % Return
$5	($580)	(100%)	($1650)	(77%)
$10	($580)	(100%)	($1150)	(53%)
$15	($580)	(100%	($650)	(29%)
$20	($580)	(100%)	($150)	(4%)
$25	($80)	(14%)	$350	16%
$30	$420	72%	$850	39%
$35	$920	158%	$1350	60%
$40	$1420	244%	$1850	86%
$45	$1920	331%	$2350	109%
$50	$2420	417%	$2850	133%

If Facebook fails to launch its advertising business in grand fashion, its stock price could end up closer to $10 than $20, but our loss with calls is capped, and it's much less than it would be with stock. If Facebook succeeds, these calls capture 85% of the profit we would have had on the stock should it increase to $50 ($2,420 gained on each call, compared to $2,850 owning 100 shares).

Put another way, our unlimited profit and limited loss potential looks like this, starting at $5.80 for every January 2014 $20 call we buy:

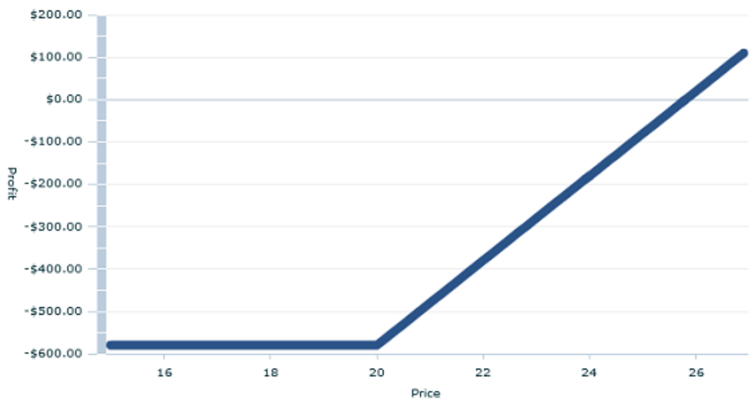

Chart courtesy of OptionsXpress

We recommend buying two calls for every $100,000 you manage, which will lately cost you $1,160, meaning nearly a 1.2% allocation. Ultimately, if the worst occurs and Facebook fails to monetize its users well, we can stomach a 1.2% loss by 2014. Along the way, as share lock-up expirations arrive (allowing employees to sell stock), we may add to our small position if prices are more appealing, perhaps by using the 2015 options that debut in November.

In the best-case scenario, Facebook will deliver effective ways to advertise, and the market will begin to realize that its free cash flow and margins will turn much higher as the business grows. If those events start to unfold, investors will rush into this top-tier Internet company — just as many did earlier at twice the price.

Next step: Visit our new Facebook discussion board, where we'll post more analysis and where you can ask questions (and tell us what you had for breakfast, share pictures of your dog ... OK, not quite).

Retirement Expert Robert Brokamp on Trusts, Bonds, and More

Published Sep 17, 2012 at 12:00AM

Greetings, *Pro* Fools!

Want More Bro?

If reading this Memo makes you think, "This Robert Brokamp sounds like a charming, intelligent fellow, and I would like to subscribe to his newsletter" — well, you're in luck! Through Groupon, we're currently offering a year of *Rule Your Retirement* for $15. Click here to sign up (and hurry; the deal expires Wednesday).

Earlier this month, we opened our Retirement Revelry discussion board as a place to discuss retirement — both preparing for it and enjoying it. So far, the board has raised at least as many questions as answers; luckily, TMF has a retirement expert at the ready. In today's Memo, my friend (and *Rule Your Retirement* advisor) Robert "Bro" Brokamp, CFP, tackles your questions — those you posted on the message board, and some I received via email. Bro lives and breathes this stuff, as you'll soon see. Let's go!

The Care and Feeding of Your Financial Advisor

Nick: If a member doesn't subscribe to *RYR*, I imagine they'd have to get most of their financial planning information from a financial advisor or the Internet. What questions should members ask their financial advisor?

Bro: Well, they should subscribe!

Nick: Ha ha, I agree — I believe you are the best deal in town.

Bro: First, they should ask, “How are you compensated?” If [the financial advisor] receives their compensation from someone other than you — e.g., payments or commissions from fund companies, brokerages, or insurance companies — then there’s a conflict of interest, and you can’t be sure if their recommendations are best for you or for them. If they get paid as a percentage of assets under management, anything above 1% is too much. For pure financial-planning help — help with deciding when you can retire, whether you have enough insurance, when you should begin Social Security benefits — look for an advisor who charges by the hour, such as those in the Garrett Planning Network.

Nick: What else?

Bro: Ask, “Are you a fiduciary?” An advisor who is a fiduciary is legally obligated to put your interests first, and you have more legal options if they do you wrong. Most of the advisors who work for the big-name brokerages are *not* fiduciaries, and any disputes with them must be resolved through the industry-run arbitration process.

Nick: If the advisor’s first obligation isn’t to their client, we’ve got to assume their priority is their own wallet, right?

Bro: Exactly. Members should also ask, “What services will you provide?” Some advisors just manage investments, whereas others provide complete financial plans that cover insurance, taxes, retirement savings, estate planning, debt, and other topics.

Health Care: What Should You Expect?

Nick: On a recent *Pro* live chat, health care seemed to be a primary retirement concern. What’s the future of health-care costs? How can members protect themselves?

Bro: Health-care costs will continue to be a huge wild card. It’s safe to assume that costs will rise at a rate greater than inflation in the near future. Of course, that’s unsustainable. Otherwise, we’d spend just about every dime we have on doctors and medicine. One way costs will be contained is by reducing benefits; in the meantime, here’s how to figure these costs into your plan.

Most experts assume that a person’s expenses will drop dramatically after they retire, and that is what happens for most retirees these days. However, future retirees should not assume a drop in expenses, because they'll likely have to spend more on health care than current retirees. Also, it’s important to remember that much (if not most) of our health-care costs are the consequences of poor lifestyle choices — smoking, eating and drinking too much, and not moving enough. Reduce your future health-care costs by living a healthy life. I’ve lost 40 pounds over the past few years. If I can do it, you can, too.

Annuities and Trusts

Nick: Who needs a trust?

Bro: Creating a trust establishes a legal entity that holds property or assets for the person who created it. The three biggest reasons to own a trust are:

1. To avoid probate, which is the legal process of settling an estate according to a will. Assets in a trust bypass the probate process. Some people want to avoid probate because it can be time-consuming and public. A trust is more private and efficient, but setting it up can also be more expensive.
2. To maintain control over assets, perhaps because other family members are incapable (e.g., mentally disabled) or irresponsible (a spendthrift).
3. To shelter assets from estate taxes. This one is trickier because the laws regarding estate taxes change frequently, and putting money in a trust isn’t necessarily a “free lunch” when it comes to tax savings. Everyone should see an estate planning attorney regardless of net worth, but those whose assets exceed $1 million should discuss possible estate-tax strategies.

Nick: Who are annuities the right product for?

Bro: "Annuity" is a broad term applied to a varied collection of insurance products, with very different characteristics. The pure form — a monthly or annual income payment for life, which doesn't vary regardless of what happens in the markets — can make sense for some investors, especially those who won’t receive a traditional defined-benefit pension.

The types of annuities that are used as savings vehicles are the type we really don’t like, given their high expenses and limited investment choices. And a new breed of annuities that offer so-called “living benefits,” such as guaranteed withdrawals, sound good in theory, but tend to be too expensive and too complicated in practice.

Nick: It sounds like you’re not a fan of using an income annuity to hedge longevity risk.

Bro: Oh, good point. Yes, that’s the other benefit of an annuity. Most withdrawal rates assume a 30-year retirement, but if you live longer — which is generally a good thing — you can risk running out of money. So if you don’t have a defined-benefit plan, you can purchase one in the form of an income annuity.

Bonds, Bonds, Bonds

Nick: One of our members, Ed, wanted me to ask you this next question as sort of a litmus test so that he knows whether to continue reading.

Bro: Hah, OK.

Nick: Should people be investing in bonds right now?

Bro: Traditionally, bonds had two main purposes: to provide income, and to provide diversification to a stock portfolio. Now, with interest rates so low, bonds don’t offer much income, so the only reason to own them is to have something in your portfolio that won’t plummet the next time the stock market drops. On the other hand, when interest rates rise, the value of existing bonds falls. So for money that you must keep absolutely safe — such as money you need to spend in the next year or two — the best bet is cash or a very short-term bond fund.

It’s also important to remember how bond prices work. Let’s say you pay $1,000 for a newly issued bond, and it matures in five years, at which point you get your $1,000 back. But in the meantime, interest rates rise and the bond drops to $900. That’s no fun, but as long as you hold the bond to maturity and the company is still in business, the price of the bond will gradually move back to $1,000 as the maturity date approaches.

Nick: And then there is the ability to reinvest coupons over time.

Bro: Right. The value of your bond investment will also depend on what you do with your interest payments. Let’s say you own a bond fund, and interest rates rise. The value of your shares in the bond fund will drop, but if you’re reinvesting your payments, you’ll be buying more shares of the fund at a cheaper price; on top of that, these shares now have a higher yield, which can then be used to buy even more shares. In fact, while rising interest rates aren’t good for bonds in the short term, they can actually be better for bonds over the long term. (To learn more about the history of bond-market declines, read this excellent report from Vanguard.)

Nick: Another member, Bob, wants to know: What bond allocation do you recommend for a member in or close to retirement?

Bro: Start by keeping any money you need in the next five years out of the stock market. For retirees, that means building an "income cushion." If you're looking for income but don't need to touch the principal for many years, a diversified portfolio of high-quality, blue-chip, dividend-paying stocks is more attractive than bonds right now, especially since dividends have historically grown at a rate that exceeds inflation. But just know that even corporate stalwarts can cut their dividends (as we saw in 2008 and 2009), and these stocks can drop 50% or more, just like any other stock.

Nick: What investments do you like for diversification and risk abatement in retirement?

Bro: If you're looking to lower the volatility of your portfolio but don't need to spend the money in the next few years, then a low-cost, diversified, short- to intermediate-term bond fund will fit the bill, such as **Dodge & Cox Income** (DODIX), **Managers Pimco Bond** (MBDFX), and **DoubleLine Total Return** (DLTNX).

Nick: I'd just like to point out that in *Pro* we use hedges and options to reduce portfolio volatility, too. Back to Bob, who likes specifics: Do you have guidelines for allocation as a percentage of the portfolio?

Bro: As a very general recommendation, investors near or in retirement should consider having 30% to 40% of their portfolios in bonds, with that amount adjusted for net worth, risk tolerance, and the amount and security of other sources of retirement income (such as a pension).

Social (Not So) Security?

Nick: We have many members who are still growing their portfolios, too. How should younger investors think about Social Security in their plans?

Bro: Americans in their 50s and older will likely receive all or most of their projected Social Security benefit. Younger Americans should expect to receive half of their projected benefit. If I had to make a prediction, I'd say that most people will get closer to 75% of their projected benefit, with wealthier retirees receiving less. It's also likely that Americans will have to work longer to receive their benefits. The challenges facing the Social Security program are not nearly as daunting as those confronting Medicare.

A Worldwide Perspective

Nick: What are your thoughts on diversification across countries and currencies?

Bro: A good starting point is to invest a quarter of your equity allocation in non-U.S. companies. That provides both business and currency diversification. Younger investors might invest more; those near or in retirement might invest less. Many income-seeking investors are looking to international bonds for extra yield, which can be fine for a slice of your bond allocation. But non-U.S. bonds have additional risks, so for money you must keep safe, stick to highly rated U.S. issuers.

Saving Us From Ourselves?

Nick: A member noted that "*RYR* seems to recommend an index-based approach to investing. Is this in part a nod toward the inevitable cognitive decline that is associated with age — a decline that might, for example, manifest itself in an ill-advised short?"

Bro: *RYR* has model portfolios based on actively managed funds, index funds, and ETFs. We like the actively managed funds because we believe it's possible for great managers to beat their respective benchmarks and outperform their peers.

Nick: Well, we agree that a talented team can add value through active management.

Bro: However, we also know this is difficult, so we think index funds and ETFs make sense because they're a hedge against "manager risk" and they're very low-cost, and we're fundamentally cheapskates. And their low costs are one of the biggest reasons why they outperform approximately two-thirds of similarly invested funds.

As for the possibility of cognitive decline, that is a real risk that most people don't account for. Approximately half of people in their 80s suffer from some kind of cognitive impairment. Last summer, I interviewed Harvard professor David Laibson on this topic. His solutions didn't include index funds, but they did include income annuities, updated estate-planning documents, and heart-to-heart discussions with family members.

Should You Literally Set Money on Fire?

Nick: I've received this question in a number of different forms: What should we do with cash?

Bro: Smoke it!

Nick: There goes your health-care advice.

Bro: Otherwise, there's not much to do. Some online banks offer slightly higher interest rates. Some advisors have recommended long-term CDs that don't have onerous early redemption penalties. A short-term bond ETF, such as **Vanguard Short-Term Bond**, offers a higher yield than cash, but also the possibility that the investment will decline if rates rise. However, your money is likely in cash for a good reason: You want to keep it very safe. Thus, while earning nothing on your cash can be frustrating, at least it's safe, and that's your priority for that money.

Nick: Bro, thank you for meeting with me and answering our questions.

Members, if you'd like more, please give Bro's *Rule Your Retirement* newsletter a try. Bring more questions to the Retirement Revelry board!

Fool on,

Nick (TMFCrow)

Pro Trade Roundup

- **Starbucks**: We purchased 400 more shares at an average of $51.53 and sold to open four more January 2013 $47 calls at $1.54 each, bringing our total allocation to 800 shares and eight written puts, or around 5% total, as intended.
- **SPDR S&P 500** : We bought to cover 665 shares at an average cost of $146.14, reducing our *stock-based* index shorts to just 10% of our invested assets.

Guidance Updates

- **Pacer International**: Moves to Buy First from Buy on price.
- **Oracle**: Moves to Buy from Buy First on valuation and pending earnings Sept. 20.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **CurrencyShares Euro Trust** : Sell short directly with a 3.9% allocation in your portfolio. Alternatively, set up a synthetic short by selling to open January 2014 $131 calls and buying to open an equal number of January 2014 $131 puts. With the ETN around $130.40, aim to pay around a $1.40 net debit for each synthetic short you set up. Set up one synthetic short for every 100 shares you want to be short. (For more, revisit our original reports.)
- **ProShares UltraShort Real Estate** : Set up a synthetic short with a 1% allocation by selling to open January 2014 $23 calls and buying to open an equal number of January 2014 $23 puts. With the ETF around $23.50, aim to pay around a $2 net debit or less per synthetic short. Set up one synthetic short for every 100 shares you want to be short. (For more, revisit our original report.)
- **iShares Russell 2000** : If you haven't set up a put ratio spread yet, with the ETF at $85.80 this morning, you could sell to open two November 2012 $78 puts for every one November 2012 $82 put you buy. You'll pay a small credit to set up this trade, but you'll profit on declines to around $74, your break-even price. Set up one put ratio spread for every $50,000 you manage. (For more, revisit our original reports.)

Questions on these? Visit our "Catch-Up Trades" discussion board.

Coverage & Community

- **Why'd We Close More of Our SPY Short?** Jeff explains the trade in the context of the *Pro* portfolio. Here's the original report again.
- **Stock Performance Got You Down?** Focus on the business performance and think long term.
- **Foolish Feet on the Street:** ChuckVester gives us the lowdown on the enterprise content management market.

The Motley Fool owns shares of iShares Russell 2000 Index (ETF). See Pro's holdings here . See the team's and David and Tom Gardner's holdings here .

Reduce Your Stock-Based Short Index Positions to 10%

Published Sep 12, 2012 at 12:00AM

- **What We're Doing:** For the second time this year, we're reducing our short of the S&P 500 index, this time down to a value of 10% of our invested assets.
- **What We're Thinking:** We continue to reduce our long exposure and favor different hedges (including our IWM put ratio spread), thereby reducing our need for this S&P 500 short.
- **What We're Expecting:** We'll continue to exit this position in favor of targeted shorts of individual companies and option hedges.

Trade Essentials

- **Action:** Buy to close (or buy to cover) enough of your short position in the **SPDR S&P 500** (NYSEMKT: SPY) (or other stock-based index shorts — see our Alternative Trades below) to match our updated 10% allocation. For *Pro*, this means closing about 600 shares.
- **Allocation:**
  - **If you're a veteran *Pro* member** with stock-based (not options-based) short positions on market indexes, you should reduce them to no more than 10% of your long assets. In other words, you want $10,000 worth of stock-based index shorts for every $100,000 you have invested long.
  - **If you're a new member** and/or you don't have any stock-based index hedges, you can ignore this trade. (Everyone who wants to hedge should already have our put ratio spread on the **iShares Russell 2000** (NYSEMKT: IWM).)
- **Limit Guidance:** You can buy to close or buy to cover at the going price.
- **Alternative Trades:**
  - If you're short *any* equity index directly (not using options), or if you own shares of an inverse index ETF, reduce those total positions to bring them to 10% of your invested assets. If your hedges are already less than that, you don't need to do anything. And no matter what, leave your ratio put spread on IWM alone. (After reading this report carefully, if you have questions, please visit our SPY discussion board.)

What's Changed?

- **Last trade:** We closed one-third of this hedge in late January.
- **Price change (from 1/26/12):** The index is up another 8.7%, but the *Pro* portfolio is up about as much despite our hedge.

Despite a recession in Europe and stalling economic growth in the United States, second-quarter earnings and guidance from S&P 500 companies have proven resilient, bringing the index higher. Any sign of economic progress, or any promise of more federal stimulus, could add to that advance — and more economic stimulus already appears likely.

We seem to be entering a new period in economic and fiscal policy, one in which Western governments have broad freedom — and practically a mandate — to stoke economic activity when needed, potentially for years. The European Central Bank just announced open-ended bond purchases to keep borrowing rates "reasonable" for any EU country, and the U.S. Federal Reserve is strongly hinting at a third round of liquidity stimulus in as many years. Although such policies may not result in more jobs, the Fed's liquidity has proven a forceful driver of stock prices: As interest rates scrape bottom under a flood of federal funds, investors seek higher returns on their assets elsewhere.

It made sense to hedge by shorting this market index as the Federal Reserve's latest liquidity program came to a close earlier this year. It makes less sense to keep the position unchanged as the threat of a new stimulus program builds. Further, the market often reacts positively to bad economic news because it suggests more stimulus will be on the way — while actual good news is also seen as positive because it promises earnings growth. In other words, shorts are between a rock and a hard place, and that may be the case as long as Europe and the U.S. continue to provide liquidity whenever economic numbers (or borrowing costs, in Europe's case) look threatening.

It also makes sense to reduce our SPY short because most of our long stock positions are valued attractively in light of recent earnings. Although ups and downs are certain, our buy-rated stocks appear ready to challenge our North Star from today's prices over the next two to three years. We do plan to put other hedges in place, because there's always the risk that the Fed disappoints or ultimately does as much harm as good. But those will be more targeted positions, using more dynamic hedges and shorts.

The direct index shorts *Pro* members are carrying are legacy positions, taken last year when shorting alternatives at our former broker were limited. These hedges continue to serve a purpose; in fact, they've let us stay almost fully invested, bringing comfort during volatile times. But we want to systematically reduce direct index shorts (or inverse ETFs, for those who have them) in favor of more targeted shorts and lower-risk option hedges.

How to Follow Along

Some members used alternative vehicles to effectively short various indexes. If that's you, follow along by adding up the value of your stock-based index shorts and inverse ETF positions, whatever flavor they are (other than options). Maybe you own the **ProShares Short S&P 500** (NYSEMKT: SH) ETF or the **ProShares Short Russell 2000** (NYSEMKT: RWM) ETF, or are short the iShares Russell 2000 ETF directly (not just with our put ratio spread), or maybe you are just short the SPDR S&P 500 directly like us.

In every case, compare the combined value of all of your stock index shorts (not your targeted shorts in things like **Sony** (NYSE: SNE) and the euro) against your long stock and long ETF positions. Decrease your relevant index hedges to around 10% of your invested assets. If you are 16% hedged with the SPDR ETF, as we are, you will simply need to close a bit more than one-third of the position to get down to 10%. You will "buy to close" or "buy to cover" the appropriate number of shares.

In summary, members wanting to mirror *Pro* should have these positions when it comes to hedges:

- **Veteran members** should have 10% in a direct index short like SPY; the put ratio spread on IWM; and shorts of **Sony** (NYSE: SNE) and the **CurrencyShares Euro Trust** (NYSEMKT: FXE).
- **Members who joined this summer** should have the put ratio spread on IWM; they can also set up the CurrencyShares Euro Trust short per Monday's Catch-Up Trade. That's it; there's no need to set up a 10% short on SPY because we plan to close it before long, and Sony is too low to short now.)

The Foolish Bottom Line

We'll reduce our position at some point after our 24-hour waiting period but before our 30 days are up. This index hedge has lost more than 16% for us, but the portfolio overall (which is what matters!) is up sharply since we initiated the short. We've kept pace with a rising market despite being hedged, which is a coveted result. But now, as promised, we're fine-tuning our hedging and shorting strategies.

Next Step: Questions about your shorts (or pants, slacks, or knickerbockers)? Seriously, visit our SPDR S&P 500 discussion board.

The Motley Fool owns shares of iShares Russell 2000 Index (ETF). See Pro's holdings here . See the team's and David and Tom Gardner's holdings here .

Worldwide Fool Meetups on Sept. 25

Published Sep 11, 2012 at 12:00AM

As you know, The Motley Fool is dedicated to helping the world invest better. We think one of the best ways to do that is to have the support and help of a community around you — so this Sept. 25 (Invest Better Day), we encourage you, our members, to meet fellow Fools in your local community and make some Foolish connections offline.

In fact, we are sending our investing team to 12 different cities on Invest Better Day. They'll be sharing their thoughts on how to invest better and discussing some companies on their radar. Join them and your fellow Fools in these locations:

Washington, D.C.	New York	Chicago
Los Angeles	San Francisco	Miami
Seattle	Boston	Denver
Philadelphia	Minneapolis	Portland, Ore.

Meetups in these locations are filling up fast, but if your local meetup is at capacity — or if you're not near one of those cities — you can still participate. There are enthusiastic members starting meetups in cities all across the globe. Check here to find your local Fool meetup, then scroll down for tips on how to host it!

Host Your Own Motley Fool Meetup

As a Fool, you're already part of our awesome online community — but we want to help empower Fools to get to know each other offline, too. Here are some tips for putting together your own Motley Fool Meetup for Invest Better Day on Sept. 25:

Time and Place
The date should remain Sept. 25 to be connected to Invest Better Day. Set the time and place for your meetup as early as possible, as scheduling is a big determining factor for attendees. If someone already has a meetup in the same general location you're considering, contact that organizer and see if you can collaborate.

Promotion
By **solidifying the time and place early**, you leave ample opportunity for grassroots promotion. You can simply by sharing the event details with your local friends and colleagues who invest (non-Fools are welcome, too!). Creating a Facebook event can help you reach an audience; you can also send interested investors to your local Motley Fool Meetup page, where they can RSVP.

Format
An Invest Better Day meetup can be **just about any shape and size**. It could be a packed house listening to prominent local keynote speakers. Or (perhaps more likely) it could be an informal get-together of investors at a coffee shop, bookstore, or bar, discussing how they invest now and how to get even better.

Steps to Take

Here's exactly what to do to create your own Motley Fool Invest Better Day event:

1. Visit The Motley Fool's Meetup Everywhere page.
2. Your location will display directly below the map. If this is where you want to host your meetup, click the "Start a new community in…" link. (If you want to use a different location, type it into the search box at the top; that location will then display atop the list of nearby locations.)
3. Enter a name for your new community in the input field. Just use the name of your city (for a meetup in Des Moines, simply enter "Des Moines"), and hit the "Create" button.
4. Click on the "Needs a location, Got one?" link just below the event title. Add the event's location and time. You also can share details and comments about the event.
5. Consider getting the word out by sharing your Motley Fool Meetup on Twitter, Facebook, and the Fool's message boards. Let us know about it, too! Send a note with the details to meetup@fool.com.

6. Check your location's Motley Fool Meetup page frequently to answer questions and start the conversation with attendees before the event begins.

Live Chat: Friday, Sept. 14

More on Market Index Hedges

Published Sep 10, 2012 at 12:00AM

Dear *Pro* Members,

Live Chat Coming Up!

Got questions about our Ketchup Reports, our recommendations, our strategies, or anything else? Bring them on! Jeff, Nick, and Bryan will be available from 2 to 3 p.m. Friday, Sept. 14 for a live chat. Click here to set a reminder!

Last week, I wrote about hedging market indexes in your retirement accounts. This led to many great discussions on the *Pro* boards, in which I was able to better clarify my meaning: In my opinion, the need to hedge your account grows as the balance of the account surpasses 50% of your retirement goal.

In other words, if you're younger than 40, have $50,000 in an IRA, and hope to save $350,000 over the next 20 years, then your time is best spent improving your investing and adding regular savings to your account, rather than hedging the market to sustain your relatively modest balance at the cost of more upside.

But once you've saved around 50% of your ultimate goal, you should start to at least consider hedging to protect what you're building. Say you're 55 years old and you have most of the money you need to retire, but you remain fully invested in stocks. In that case, you certainly should consider selective market hedging in order to keep your principal balance healthy.

Of course, every situation, personal preference and comfort level is different. We know that many investors succeed wildly without ever hedging (or trimming positions, for that matter), and in this service, you don't need to use our hedges and options if you don't want to. Our core stocks are meant to be an exceptional portfolio on their own. Beyond them, we're here to help you grow your investment dollars no matter what over shorter time frames, too. Our specific goal is long-term annualized returns at least 7% higher than inflation — and positive returns over any rolling three-year period regardless of the market environment.

But outside that context, how much time you spend hedging the market by shorting indexes should depend on how much money you personally want to protect today. Weigh that against how much longer you plan to keep saving money to grow what you have. If you're lucky enough to be early in your journey, then don't spend much time worrying about hedging until you've built up more in assets. If you're lucky enough to be close to living off your funds (yes, both groups are lucky!), and you aren't pulling cash out of the market for that purpose, then strongly consider hedging to protect cash you'll want for certain in the coming three to five years.

Finally, keep in mind that hedging a market index differs from shorting weak companies directly. Shorting a stock, as we've done with **Sony**, is an investment choice much the same as buying a stock. No matter what the broader market does, our choice will work out for us or it won't, on its own merits. But when you hedge a market index, as we've done with the SPDR **S&P 500**, it's *guaranteed* that the hedge is going to work against you whenever the market goes up. So you only hedge a market index when you truly want to protect some portion of your invested assets. That's all an index hedge boils down to. I hope this makes your choice at home clear.

In *Pro*, our always-positive North Star is our taskmaster, so hedging remains high on our list of priorities. As we strive to offer our members creative, lower-cost ways to hedge, we're working to get every member who wants to follow our hedges on the same page regarding our index positions. We recently set up a put ratio spread on the **iShares Russell 2000**, for example; expect other low-cost hedges to replace our S&P 500 hedge and the inverse index ETFs that many of you have bought as alternative trades. As you already know, expect more direct shorts, too.

If you'd like to discuss this topic some more, please return to the Memo Musings board. We'll see you again soon — let's have a great five days!

Foolishly,

Jeff Fischer (TMFFischer)

Trades Complete

- **Bristow Group**: We sold all our shares at $49.57 for a 63.6% gain, raising 4.1% in cash.

Guidance Changes

- **StoneMor Partners** : Moves to Buy with a 2.2% allocation recommendation. Please see our last Ketchup Report for tax concerns and other caveats. This stock may not be worth a 2.2% allocation for you if you don't want to deal with the tax implications.

Catch-Up Trades

- **CurrencyShares Euro Trust** : If you haven't already — and if your broker has shares available for shorting — sell FXE short up to a 3.8% position. Ask questions on the FXE board.
- **OpenText** : If you haven't sold to open the November 2012 $50 put/$60 call covered strangle on your shares, you still can, despite lower pricing. Lately, the strangle pays a $3.30 credit.

Coverage & Community

- **Income or a Lower Buy Price?** See Alex340's puts that match *Pro* criteria.
- **Active Retirement:** Our new Retirement Revelry board is off to a fast start.

Pro's Seventh Ketchup Report: Our Final Three Buys

Published Sep 7, 2012 at 12:00AM

Dear *Pro* Member:

Today's three stocks mark the end of our Ketchup Reports, meaning you should now be armed with the information you need to get invested in our core holdings (those rated "Buy" or "Buy First" on our scorecard). We've now recommended that you build your *Pro* portfolio with 19 of our longstanding stocks and two new buys — **Starbucks** and **American International Group** — along the way, bringing you to 21 total. Here is the full list:

- **Ketchup One: The Buckle** , **Oracle**, **AmTrust Financial**
- **Ketchup Two : Gentex** , **Intel**, **Pacer**
- **Ketchup Three: Rockwood Holdings** , **Tupperware**
- **Ketchup Four: CME Group** , **Broadridge**, **Wells Fargo**
- **Ketchup Five: Apple** , **OpenText**
- **Ketchup Six: BMC Software** , **GrafTech**, **Pebblebrook Hotel Trust**

From here, we'll focus on getting everyone on the same page with our shorts and hedges, and we'll continue to recommend new, timely options trades. We'll also watch for opportunities to get you into the *Pro* stocks currently on hold because of price, suggesting them to you when better price opportunities come along or when we see appealing options strategies.

You're well on your way to building a strong *Pro* portfolio! And in the coming weeks and months, we will see it all come together very nicely. Now, on to today's three companies!

— Jeff Fischer (TMFFischer), *Pro* Advisor

InvenSense

- **Industry:** Microprocessor chips
- **Allocation:** Invest 1.4% of your funds ($700 for every $50,000 you manage in *Pro*)
- **Recent Price/Dividend Yield:** $12.22 / NA
- **Click For:** Original Recommendation; Recent Update

Summary: Motion tracking may have begun as a living-room craze, with family members bowling and playing tennis on their Nintendo Wiis, but the technology is now moving into smartphones, tablets, and even TV control interfaces. InvenSense designs the industry's leading motion-tracking sensors, making it the *de facto* provider for Android, Microsoft, and other (non-Apple) companies. Although games remain important, most of the company's revenue now comes from phones and tablets, and that revenue is jumping year over year. As motion-tracking sensors spread into health-care devices, manufacturing, and even tools, InvenSense has the makings of a long-term winner — as long as it maintains its competitive edge. We're starting with a small position and will add more as the company matures.

Medtronic

- **Industry**: Medical technology
- **Allocation**: Invest 5.4% of your funds ($2,700 for every $50,000 you manage in *Pro*)
- **Recent Price/Dividend Yield**: $41.58 / 2.5%
- **Click For:** Original Recommendation; Recent Update

Summary: Medtronic is the world's largest pure-play medical technology company, manned by 45,000 global employees who generate $16 billion in annual sales. The company furthers its mission ("Contributing to human welfare by the application of biomedical engineering to alleviate pain, restore health, and extend life") with products and technologies to treat heart problems, spinal disorders, diabetes, and a variety of other chronic conditions. Historically, Medtronic invests 9% of sales in research and development, the fruits of which keep its offerings on the cutting edge.

The struggling global economy has crimped procedure volumes and caused Medtronic's customers to demand lower prices. Even so, the company still earns impressive profit margins and returns on equity, though sales growth has been hard to come by lately. Shares are priced as if Medtronic will never grow again; we disagree, given America's aging population (the 60-plus crowd will grow at a 2.9% annual clip over the next decade) and the likelihood that medical care in emerging markets will evolve dramatically. We think shares are worth $48 and believe there is a lot to like about the company.

StoneMor Partners

- **Industry:** Real estate (well, sort of … specifically, cemeteries)
- **Allocation:** Invest 2.2% of your funds ($1,100 for every $50,000 you manage in *Pro*)
- **Recent Price/Dividend Yield:** $23.38 / 10%
- **Click For:** Original Recommendation; Recent Update

Summary: The second-largest cemetery owner in the country, StoneMor Partners has almost 300 properties in nearly 30 states. Thankfully, death care is not a high-growth business, but it is slow and steady, with revenue at the average cemetery going up about 3% a year. StoneMor is set up as a master limited partnership, meaning it pays out its earnings to unit holders (the MLP term for shareholders). This results in a 10% annual yield at current prices, rivaling our North Star even if the share price doesn't budge. However, we want to focus on the caveats here — as an MLP, StoneMor has special tax considerations. You'll need to file a K-1 form every year (members have said it wasn't difficult this year), and when you finally sell your stake, you'll need to pay income tax on the adjusted proceeds. If these tax requirements sound unappealing to you, then don't buy these shares!

This isn't our very favorite position to own, so we may be writing options soon to potentially sell our shares in the upper $20s — but shares have declined lately, so they are attractive for those who don't mind the tax implications (and who don't mind a potential sell in the upper $20s). We do not recommend buying StoneMor in a tax-advantaged account, since that can actually become a disadvantage with a MLP. You should buy it in a regular account if you're able.

Conclusion

Although we're ending on a somewhat subdued note with a cemetery operator (focus on that 10% yield instead!), we hope you've enjoyed our Ketchup Reports. Think of this not as a conclusion but as an exciting beginning: Now that you're catching up at your own pace, we'll be ready to manage our *Pro* portfolio together and work in more new positions, shorts, and options. We're glad you're here, and we're excited to move forward! Of course, if you have any questions, please visit our Office Hours board.

Fool on!

The *Pro* Team

Sell Bristow Group

Published Sep 5, 2012 at 12:00AM

- **What We're Doing**: We're selling our shares.
- **What We're Thinking**: During the 2010 Deepwater Horizon disaster in the Gulf of Mexico, this was an opportunistic investment in the leading offshore helicopter services provider. Our thesis has since played out.
- **What We're Expecting**: Flight hours (and Bristow's fleet) will grow thanks to higher demand, but the business's economics are unlikely to change enough to make this one worth owning forever — or even at modestly elevated levels. We'll reconsider it on price dips.

Trade Essentials

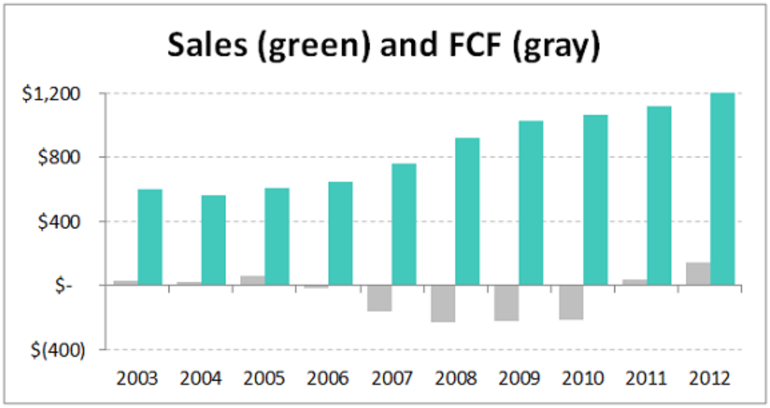
- **Action**: Sell **Bristow Group** (NYSE: BRS)
- **Allocation**: Sell all your shares; for *Pro*, this frees up 4% in cash.
- **Price Guidance**: The stock is volatile and thinly traded. Use a **limit order**, and sell your shares at $48 or higher. There is no rush to sell at any cost; *Pro* will be patient and aim to sell sometime over the next 30 days at $48 or higher.
- **Recent Share Price**: $48.50
- **Alternative Trades**:
  - If you prefer to wait patiently for a better price and are OK with the possibility that you might not sell your shares, you can sell to open December 2012 $50 covered calls.
  - If you wrote $40 puts via our Catch-Up Trades, your expiration month may vary. You have three choices:
    - Buy to close your puts when you've earned about 85% of their value.
    - Let your puts run to expiration and attempt to capture all of the time value.
    - Buy to close your puts today (you should be able to do so at a good profit!). Just know that if Bristow shares dip to around $40, we'll be looking for put-writing opportunities as income trades and to get shares again — in other words, you may have company if you choose not to close your position!

What's New?

In our last review of Bristow Group, we wrote:

"Our Bristow shares are on HOLD. We were attempting to sell them at our $50 estimate of fair value via June $50 covered calls. Now at $40, that possibility seems highly unlikely. [Our] long-term assessment of Bristow holds: BRS is a leader in a growing business but it suffers structural difficulties that will keep it from earning excess returns over the long run. We will continue to look for ways to milk income from this position as we look to redeploy our funds in more dynamic, higher-return opportunities that we want to own for the long run."

Today, shares are bouncing around the upper $40s, up 20% over the past few months, and the option strategies available to us aren't as attractive as we would like. Given the capital-intensive nature of the company's business and its low historical returns on capital, Bristow becomes far less attractive if we can't effectively use it as a (flying) vehicle for income generation. We prefer to own businesses that have an easy go of generating free cash flow, and Bristow simply doesn't fit that mold.



Sources: Analyst estimates and company filings.

The company's recent announcement that it will take a minority investment in Cougar Helicopters should add another stable, contract-based income stream, but it doesn't meaningfully impact our estimate of Bristow's value. Management has done an admirable job putting the company on a successful course; we simply think we can find businesses with better economics that can fly higher.

To that end, we're happy to sell our entire stake in Bristow and deploy that cash toward better long-term opportunities. We will sell at some point over the next two to 30 days, using a limit order (around $48). When we do sell, we'll exit this position with a healthy profit (today we're up 55% in just more than two years, adding $20,400 in portfolio value before dividends and options), and we'll continue to keep tabs on the business and its options.

Next Step

- Bring your questions to the Bristow discussion board.

Shorting Market Indexes in an IRA

Published Sep 4, 2012 at 12:00AM

Dear *Pro* Member,

Trades Complete

- **American International Group**: We bought 1,000 shares at $34.53 for 2.5% stock exposure, and six January 2014 $25 call options at $12, for total AIG exposure of about 3%.
- **OpenText**: We wrote a November 2012 $50 put/$60 call covered strangle on all of our shares, receiving a $3.70 credit.
- **iShares Russell 2000 Index**: Setting up a put ratio spread, we sold to open 56 November 2012 $75 puts and bought to open 28 November 2102 $80 puts, for a combined net credit of $0.09 each.

Guidance Updates

- **AmTrust Financial**: Buy Around and Fair Value decline 10% only in direct relation to the 10% stock dividend paid to us — so, no actual change. See "Coverage & Community" for more!
- **The Buckle**: Moves from Buy First down to Buy on valuation.
- **Pebblebrook Hotel Trust**: Fair Value moves down to $28 from $35 as Nick becomes the analyst covering it, but Buy Around stays at $24.

Catch-Up Trades

- We've published six Ketchup Reports for members in the last six weeks. These should conclude this week! Then we'll resume more options-focused Catch-Up Trades right here every Monday.

I hope you had a great Labor Day weekend and are enjoying the remaining days of summer! Here in Washington, D.C., near Fool HQ, the weather remains hot and muggy — but I spent the weekend in northeast Pennsylvania, where signs of fall are already starting to show in the Pocono Mountains. It was another reminder that there are only four months remaining in 2012, and in that time, we have goals for the *Pro* portfolio that necessitate steady progress on our part and should set us up to do very well in the years ahead.

With that in mind, today I'm going to write briefly about one topic: shorting, or hedging the market, in your IRA. When members ask how to follow one of *Pro*'s shorts in an IRA, we provide a method that's IRA-friendly if possible, but I don't believe that shorting always makes great sense in your IRA.

Why We Short and Hedge

Pro shorts weak companies or flawed ETFs to profit no matter what the market does. If you can do *that* in an IRA with us, you should. But we hedge and short *market indexes* — like the S&P 500 — simply to protect some of our gains should the market decline. Shorting a major index is like locking in a profit we already have by taking the opposite position on the market. If the market keeps going up, then the un-hedged portion of our portfolio should keep us firmly in the green. But if the market declines, we know our index short will turn profitable, off-setting losses elsewhere to the extent we're hedged.

Our stated objective in *Pro* is positive returns over any rolling three-year period, but even when the portfolio is up over a much shorter period, we may be inclined to hedge some recent gains. Our North Star (inflation plus 7%) has historically never had a negative year, and this year it will run at around 10%. If we want to stay close to it, we need to perform as consistently as possible. Therefore, we'll often hedge our shorter-term gains in hopes of staying green if the market doesn't. This is why we set up market index hedges.

The *Pro* portfolio is up about 11% this year. If the market were to decline about 8% from here, our portfolio — without hedges — would likely turn back to red on the year, because most of our stocks are more volatile than the S&P 500. We want to stay green, so we hedge. Today, we're more than 30% hedged, so even if the market falls about 10% from here, we *should* remain in the green on the year. This is why we have basic index hedges in place right now (while seeking more specific shorts). We are aiming to invest true to our stated objective of absolute returns; we're aiming to stay positive the same way our North Star does.

Does it make sense for you to do the same in your IRA if you're 10 or 20 years from retirement? Probably not; you likely don't need to worry about hedging the tax-advantaged, long-term IRA savings you don't plan to touch for another decade or two. Why not? Because your IRA money is (presumably) your ultimate retirement nest egg, so you want it to grow as unencumbered as possible. You want it to compound — not necessarily today or tomorrow, but over the next decade or two. So why bother crimping it with index hedges today?

Pro for Now, IRAs for Later

Pro is a "living" portfolio, not a retirement portfolio. It's managed in much the same way I've managed my own living portfolio over the past 10 years. I've used it to earn income, and I've sought to protect its capital because it's a foundation for the many things I want to do *before* retirement: places I want to travel, experiences I'd love to have, schools to pay for, parents to help, cars and a home to maintain, charitable gifts, emergencies, and any shortfalls. All of that comes from my living portfolio, which is a savings account that is actively invested — long, short, and for income. My IRA accounts, on the other hand, I'm setting aside until at least 20 years from now (I'm 42), so they're 100% invested long. They're by far the least actively managed accounts I have. I buy great businesses, watch them, but mostly let them be.

I wanted to share my approaches to these different accounts because I realized last week more than ever that many *Pro* members are hedging market indexes in IRAs. If you have a good reason to, please continue. But if this Memo makes you rethink that approach, then do so. If you want to short weak companies directly to profit in an IRA, that's one thing, and I support it, but I'd typically advise against hedging with market indexes unless you need a certain amount of money from your IRA, guaranteed, over the next few years. And if that's the case, then you should just set that cash aside right now anyway, outside the market! In short (sorry), I urge you to rethink shorting market indexes in your IRA (and buying inverse ETFs for that matter, too). To my way of thinking, vanilla hedges don't make great sense in a long-term retirement account.

If you want to discuss this topic, please visit the Memo Musings discussion board. We also set up a new board today for members to discuss retirement issues, tips, challenges, and strategies: Enjoy *Pro's* new Retirement Revelry board.

— Jeff Fischer (TMFFischer)

Coverage & Community

- **Pebblebrook Streams Along:** Nick provides an update on the hotel REIT's operations.
- **AmTrust's Stock Dividend:** Bryan has the scoop on the 10% in additional shares we all just received as a special stock dividend.
- **Stock Market Looks Attractive?** Member FoolSolo launches a great discussion on this topic.
- **Putting on the Puts:** alex340 shares put-writing trades meeting our pricing guidelines.
- **Do You Know What You Need to Know?** Nick shares what everyone ought to know.

Pro's Sixth Ketchup Report: Three More Buys

Published Aug 31, 2012 at 12:00AM

Dear *Pro* Member,

Welcome to our penultimate Ketchup Report! You can access our five previous reports here, here, here, here, and finally here. This week's report contains three more stocks, leaving us with one more report for next week; then, once all of our core investments are made, we'll move into more hedges and shorts. (We already issued one brand-new hedge for all members this past week, on the **iShares Russell 2000**.) As always, take your time. We invest to grow our money over the coming years, not just months.

Now, on to this week's stocks! Today's attractive lineup consists of a diverse batch of businesses to add to your *Pro* portfolio: a software provider, a well-run steel industry company, and an owner of new, upscale hotels (which you may want to visit!). On to your recommended investments!

— Jeff Fischer (TMFFischer), *Pro* advisor

Your Next Buys

BMC Software

- **Industry**: Enterprise software
- **Allocation**: Invest 4.7% of your funds ($2,350 for every $50,000 you manage in *Pro*)
- **Recent Price/Dividend Yield:** $41.20 / N/A
- **Click For:** Original Recommendations; Latest Update

Summary: Named after the initials of its three founders, BMC counts most Fortune 500 companies among its customer base. It sells software and services that tie together corporate mainframes, computing clouds, applications, and databases so they work smartly and efficiently as one; by optimizing hardware performance, BMC helps technology run smoothly. The company's young cloud-computing and Software as a Service (SaaS) divisions are growing rapidly, but its older enterprise server management software sales have been weak. However, recurring maintenance revenue helps keep total revenue steady, and we expect stronger results from the core older divisions over the next 12 months.

You may have noticed that the *Pro* portfolio is a bit "overweight" in software stocks. This is intentional: Software businesses have strong recurring revenue, healthy margins, and staying power, and we're investing in leaders in different key niches of the enormous industry.

GrafTech International

- **Industry**: Graphite products
- **Allocation**: Invest 2.3% of your funds ($1,150 for every $50,000 you manage in *Pro*)
- **Recent Price/Dividend Yield**: $9.36 / N/A
- **Click For:** Original Recommendation; Latest Update

Summary: GrafTech International is a low-cost producer of high-quality graphite electrodes. Those electrodes are used for high-efficiency steel production in electric arc furnaces (EAFs), and that steel helps build things like automobiles and replicas of Jeff's steely eyes. We believe EAF steel production will continue to grow in popularity because it's greener and cheaper than traditional methods, which should pull along demand for GrafTech's electrodes.

GrafTech is a volatile stock that bobs and weaves based on expectations for the global economic cycle (and steel demand in particular), but we believe the company's cost structure, know-how, and scale provide it lasting advantages over competitors. Shares are currently priced as if our stalled economy will never regain a forward push, making now a great time to start a position in GrafTech. Today's prices should reward patient buyers — we think shares are worth $16, and will consider adding to our small position over time. (We'll send new trade alerts in that case, of course.)

Pebblebrook Hotel Trust

- **Industry**: Real estate investment trust, focused on hotels
- **Allocation**: Invest 4.3% of your funds ($2,150 for every $50,000 you manage in *Pro*)
- **Recent Price/Dividend Yield:** $23.52 / 2%
- **Click For:** Original Recommendation; Latest Update

Summary: Pebblebrook CEO Jon Bortz knows hotels, so when he saw the fire sales in the industry during the financial crisis, he came out of retirement to start Pebblebrook Hotel Trust. The company has since busied itself buying cheap, marquee, luxury urban hotels in foreclosure and giving them new life. Pebblebrook now owns 18 hotels and has a 49% stake in six others. Several of them have been renovated and revamped to become strongly profitable, and we expect that to happen to all of Pebblebrook's properties in time. These profits should materialize into a growing dividend for shareholders. At the same time, Bortz continues to scout for more upscale hotels at temporarily cheap prices.

Still enjoying its early growth stage, the trust trades at a reasonable 18 times adjusted funds from operations (a measure of a REIT's cash flow) and at a discount to our $28 fair value estimate. Bank lending for large real estate deals remains tight, so even upscale property prices are attractive for those who *are* able to buy, like Pebblebrook, which launched opportunistically with zero properties in 2009. This recommendation is a good way to get some real estate diversification into your portfolio.

Questions?

You may make these investments at any time. And we'll have one more Ketchup Report for you next week, with a few more positions to recommend. If you have questions on this one, please post on the Getting Started discussion board. And we're available every weekday from 3 to 4 p.m. ET to answer your questions on the Office Hours board! We're very glad you're a *Pro* member. Enjoy your long weekend!

Set Up a Put Ratio Spread on IWM

Published Aug 29, 2012 at 12:00AM

What We're Doing: Using options, we're setting up a market hedge that won't cost us anything if the market keeps rising.

Trade Essentials

- **Action:** Set up a put ratio spread on the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF
  - Sell to open November 2012 $75 puts
  - Buy to open November 2012 $80 puts
  - Sell two $75 puts for every $80 put you buy
  - Bid (on two $75 puts) / ask (on one $80 put): $3.08/$2.98
- **Price Guidance:** Use a spread order for a **net credit** of $0.10; as prices change, ideally initiate the spread for, at worst, zero net cost.
- **Recent ETF Price:** $81.33
- **Allocation (based on the written puts):** Thirty percent, half of which is insured by our purchased puts, making our true exposure 15%. Write two puts and buy one put for every $50,000 you manage. *Pro* is writing 56 puts and buying 28.
- **Alternative Trades:** None like this. This is a unique strategy that requires put-writing in a margin account. You could instead just buy to open the $80 puts with your own capital, but that's relatively expensive, with a break-even point 5.3% lower, so we don't advise it. You could short shares of the ETF directly if your broker has shares, but realize that hedge will cost you if the market rises.
- **Your Other Index Hedges (including SPY, SH, and previous iterations of IWM):** This put ratio hedge can be set up in addition to any index hedges you already carry. We'll have separate guidance on those another time.

The Big Picture

We want to have hedges on the stock market, but we don't want all of those hedges to drag on our returns if stocks continue to rise. To achieve these goals, we're returning to a strategy we've used before — a put ratio spread — on an ETF we've hedged with before: the **iShares Russell 2000 Index** (NYSEMKT: IWM). This ETF tracks the 2,000 small companies in the Russell 2000 small-cap index, a vehicle whose components sport a median market value of only $473 million; that small size explains why the ETF tracking them has been 35% more volatile than the S&P 500.

Such volatility potentially benefits us because this put ratio spread is a "frictionless hedge," meaning it won't cost us anything if stocks continue to rise, but we can expect a larger relative drop in the ETF if the S&P 500 falls. Meanwhile, the Russell 2000 looks overpriced compared with the S&P 500, with the profitable companies in this small-cap index trading at an average 24.4 times earnings (the average P/E number for the larger companies in the S&P 500 is 15). The many *unprofitable* companies in the Russell 2000 are left out of its valuation altogether.

Strategy Details

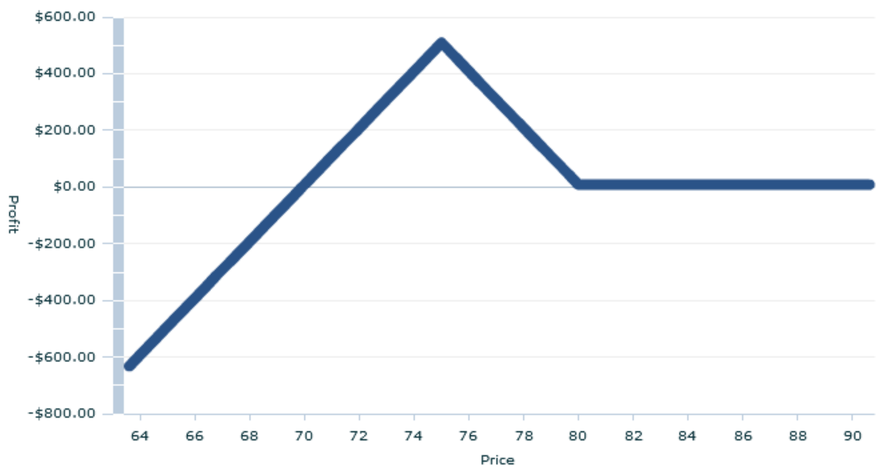
Using a spread order, we are writing $75 puts that obligate us to buy shares of IWM (unless we close the puts beforehand) if they decline to less than that price by expiration. These puts expire in November. We're using the money we receive for writing these puts to *buy* half as many $80 puts that expire the same month. That's where our hedge comes in: The $80 puts will profit if IWM declines, and they also cancel out half of our $75 put exposure, lowering our total break-even point on the strategy. Here's how the math and potential returns tally:

iShares Russell 2000 Index ETF Price	Value of 1 Purchased $80 Put	Value of 2 Written $75 Puts	Our Total Return (or Loss) on 1 Ratio Spread	ETF Price Change (%)
$80 or higher	$0	$0	$0	N/A
$79	$1 x 100 = $100	$0	$100	(2.8%)
$77	$3 x 100 = $300	$0	$300	(5.3%)
$75	**$5 x 100 = $500**	**$0**	**$500**	**(7.8%)**
$73	$7 x $100 = $700	($2) x $200 = ($400)	$300	(10.2%)
$71	$9 x $100 = $900	($4) x $200 = ($800)	$100	(12.7%)
$70	**$10 x $100 = $1,000**	**($5) x $200 = ($1,000)**	**$0**	**(13.9%)**
$68	$12 x $100 = $1,200	($7) x $200 = ($1,400)	($200)	(16.4%)
$65	$15 x $100 = $1,500	($10) x $200 = ($2,000)	($500)	(20%)

The bolded lines above show that we'll earn the most profit on the strategy if these puts expire with the ETF at $75, or down 7.8% from its recent price. Our break-even on the strategy is $70 per share, so the ETF can decline 13.9% before our strategy starts to show a loss by expiration. To summarize:

If the ETF (i.e., the Market) Does This ...	Then Our Strategy ...
Goes up, stays steady, or declines less than 1.6%	Doesn't cost us anything — in fact, we earn any credit paid to us when we initiated it.
Declines at least 1.6% and as much as 13.9%	Earns a partial to full profit, depending on the amount of the decline.
Declines more than 13.9% to less than $70	Shows a loss by expiration. We can close the options; take shares of the ETF; close the options and buy calls; or set up a synthetic long to lower our cash outlay and turn bullish.

For visually minded Fools, here's the profit graph on the smallest position possible, writing two puts to buy one:



The above returns won't occur smoothly or immediately. The chart represents returns *at expiration*. If the market falls before then, our spread will largely retain its current value, with the two sides of the spread mostly canceling each other out. As with most spreads, we need to wait until close to expiration to achieve results; we'll see our full profit in November if the ETF is down 7.8%. If the ETF falls more than 13.9%, the defensive benefit of this strategy disappears and we'll need to be ready to buy shares of IWM, or take other action. Basically, we're hedging against a market decline of less than 13.9% by November expiration.

Perhaps best of all, assuming we set it up for a credit, this trade will result in a small profit for us even if the market rises or treads water. But to be safe, you must be ready to fulfill the $75 put obligation if the market falls out of bed and can't get up.

Write Covered Calls on Covanta Holdings

Published Aug 28, 2012 at 12:00AM

What We're Doing: Seeking option income on our sleepy waste-management company.

What We're Thinking: We've owned Covanta for more than a year, and writing covered calls (followed by writing puts if our shares are called away) is likely the best way to squeeze more returns from it right now.

What We're Expecting: Unless natural gas prices soar, the stock will probably stay in a range conducive to option income — in addition to its 3.4% dividend.

Trade Essentials

- **Action:** Write covered calls on **Covanta Holdings** (NYSE: CVA)
    - Sell to open December 2012 $17.50 calls
    - Recent bid/ask: $0.65/$0.80
- **Price Guidance:** Aim for $0.70 per contract; as prices change, ideally accept no less than $0.60.
- **Allocation:** Write one call for every 100 shares you own (for *Pro*, that's 27 contracts).
- **Recent Stock Price:** $17.30
- **Stock Rating:** Hold
- **Alternative Trades:** If you own fewer than 100 shares, do nothing and continue to hold. If you don't own any shares, you can sell to open December $17.50 puts, one for every 100 shares you could buy, up to a 3.1% allocation (so, sell one put for every $52,000 you manage). This nets you a potential buy price of around $16.50, close to our $16 "Buy Around." Or, wait and buy shares closer to $16 if they decline and we return it to "Buy."

What's New?

- **Original Recommendation:** On July 15, 2011, we recommended a 3% stake. Since then, we've moved our Buy Around price down $1.50 to $16 and our fair-value estimate down to $22.

Covanta Holdings (NYSE: CVA) turns trash into energy, burning millions of tons of daily refuse and selling the steam to utilities. With its facilities running near capacity and approximately three-quarters of its waste revenue under long-term contracts (with inflation clauses), the business is stable and reliable. But it's also fairly sleepy.

Revenue and free cash flow are flat this year, which is actually a tribute to strong management in the face of multiple headwinds (lower trash volume, lower energy prices, lower metal recycling prices, and lower tip fees -- cash collected when trash is accepted for incineration without a contract). By cutting costs, recovering more metals, and adding to plant capacity, Covanta has generated healthy cash flow, bought back shares, and doubled its dividend this year for a current yield of 3.47%.

Despite all this, shares are likely to remain range-bound given the slow nature of the business. And importantly, Covanta's recent large investments in new plants and contracts have lessened the likelihood of it being an acquisition target or being taken private at a premium. We continue to admire the company and are comfortable holding shares, but in seeking a better chance for North Star-challenging returns of at least 10% annualized, we're adding options to the stock.

How to Follow Along

If, like us, you've owned shares for longer than one year, you can write any covered calls (even near-the-money ones like these) and have the whole trade qualify for long-term tax treatment if your shares are sold via your calls. "Sell to open" one call for every 100 shares you already own. Here are some details:

Covanta Stock Price:	$17.30
Sell to open December 2012 $17.50 calls:	Receive $0.70 per share
Trade Type:	Income; Defensive
Yield on Current Share Price:	4%
Downside Cushion:	The same -- 4%
Days to Expiration:	116 days (nearly four months)
Upside to $17.50 Strike Price:	1.1%
Potential Net Sell Price (including premium):	$18.20
Upside to Potential Net Sell Price:	5.2% (from current price)

If you don't own any shares of Covanta, you can wait for the price to dip closer to $16 to consider a 3.1% stake, or write December $17.50 puts to set up a potential start price of around $16.50. Sell to open one put for every 100 shares you would buy. If our shares are ultimately sold through covered calls, then — assuming we have space in the portfolio — we'll next consider writing puts. This slow but stable, steady business with its healthy yield should remain a lower-risk income target for *Pro* compared to many other stocks out there.

Next Steps

- If you have questions, please visit the Covanta Holdings discussion board.
- There you'll also find our latest Covanta company review.

Write a Covered Strangle on OpenText

Published Aug 27, 2012 at 12:00AM

What We're Doing: Generating income with the potential to buy more shares cheaper.

- **Action:** Use a strangle order to write options on **OpenText** (NASDAQ: OTEX):
    - Sell to open November 2012 $50 puts
    - Sell to open November 2012 $60 calls
    - Options' combined bid/ask: $4.25/$4.75
- **Price Guidance:** Aim for a combined **credit** of $4.50. As prices change, ideally accept no less than $4.
- **Recent Stock Price:** $53.50
- **Allocation:** Write one call for every 100 shares you already own, and one put for every 100 additional shares you could buy. *Pro* is writing seven contracts of each, covering our 700 shares and potentially increasing our position from 2.6% to around 5% (accounting for some depreciation). You need a portfolio size of approximately $200,000 to strangle a potential 5% position around $50.
- **Alternative trades:** If you don't own shares, buy a 2.6% stake and then write the strangle (assuming you're managing $200,000 or more). If you're managing less money, just buy a 2.6% stake and add more if we do (if shares fall below $50).

The Big Picture

An astounding 90% of content on the Internet is private, kept behind firewalls on corporate and government servers. And all of it is begging to be managed effectively. Luckily, there's a software industry here to save the day: Enterprise information management (EIM) is its name, and its leader is OpenText, a young company helping the world to organize and utilize its data-stuffed hard drives. Not only that, OpenText software ensures that the company's clients adhere to the numerous rules and regulations governing them, and its efficiency saves them money.

Analysts expect the EIM industry to grow by about 10% annually, and OpenText trades at 10.1 times expected non-GAAP earnings for the fiscal year ending June 2013, making it an attractive long-term investment. We analyzed its recent results on the discussion boards, so today, let's focus on the trade.

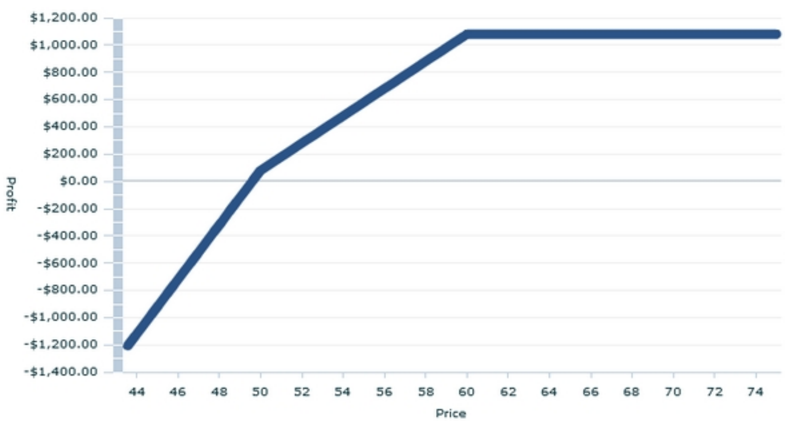
How to Follow Along

Writing a covered strangle is a combination of two strategies: writing covered calls on a stock you own, and simultaneously writing puts to potentially add to your shares. It provides meaningful income and a wide share price range in which to earn it.

- **Strategy type:** Income with stock upside potential
- **Maximum gain:** The credit received plus upside in the stock to your call strike price
- **Maximum loss:** The same as stock ownership

Here's a look at how the numbers on this trade play out (along with a profit chart, which assumes a strangle of 100 shares bought today):

- **First:** Own or buy at least 100 shares with an ability to double it to 200
- **Sell to open:** November $50 puts/$60 calls using a strangle order
- **Allocation:** Sell one of each option for every 100 shares you own
- **Receive credit of around:** $4.50 combined (this is all "time value," so it decreases literally by the day unless volatility spikes)
- **Net potential sell price on existing shares:** $64.50
- **Net potential buy price on new shares:** $45.50
- **Recent share price:** $53.50
- **Upside to net sell price:** 20.5%
- **Downside to second net buy price:** 14.9%
- **Range in which to earn total income:** $50-$60
- **Yield on share price ($4.50/$53.50):** 8.4%
- **Yield on share price and 30% buying power to hold puts:** 6.5%
- **Days to expiration:** 82



Remember that every option represents 100 potential shares of stock, which is why you need to have about $200,000 under management to set up a 5% covered strangle on OpenText. You would own 100 shares at a cost of about $5,350, and you'd write puts to buy 100 more shares at a cost of around $5,000 more ($10,350/$200,000 = 5.1%). If you're investing with less, just buy enough shares for a 2.6% allocation to start, as we mentioned in last week's Ketchup Report. Finally, a $4.50 credit is an ideal start price today if you can obtain it, but it's likely you'll need to accept less — eventually down to $4 — as time ticks away and option sellers (including our members) appear.

Next Steps:

- Want to know everything there is to know about covered strangles? We can tell you everything there is to know about covered strangles.
- If you have any questions about writing this strangle or starting a position, visit our OpenText discussion board. Remember, you don't need to make every trade in *Pro* to benefit. Own our core positions in sizes suitable to you — that's our core strategy.

The Easy, Breezy Lowdown on Coming Trades

Published Aug 27, 2012 at 12:00AM

Fellow Fools,

Your Next Memo: Tuesday, Sept. 4

We're squeezing one last day out of summer, Fools — Fool HQ is closed for Labor Day, so watch for your next Monday Memo on Tuesday, Sept. 4. Happy grilling!

With earnings season all but behind us, I've turned my focus to reviewing everything we learned in the latest quarter — and the *Pro* portfolio decisions that will arise as a result. Last week, we announced two new buys: **Starbucks** and **American International Group**. Over the coming days and weeks, expect several more trades in your inbox. We've analyzed this quarter's results, and we're ready to align the portfolio more closely with the renewed objectives we outlined in our recent Monday Memo video.

Speaking of which, let's review our **broad portfolio objectives**. We want to:

1. Maintain a **focused portfolio** of about 20 to 24 core holdings — positions so strong that if all you do with *Pro* is own these, you should do very well.
2. Profit from sensible, steady **income trades**, averaging around 12 a year (at least).
3. Build out a **focused short portfolio,** betting against failing companies and ETFs and using **low-drag option hedges**.
4. Keep **cash** on the sidelines for the opportunities that always — inevitably, joyfully — arrive.

When considering these objectives, keep in mind that *time frame is everything*:

- We buy stocks with at least a two- to three-year outlook; we expect our companies to do well over that period (and ideally longer). But we have no idea how stocks will perform over the coming year or so — short-term results can be driven by any random market force.
- Our income trades should usually pay us within three to six months; once we have enough of these trades in place, we should generate income most months.
- We usually target our hedges and shorts for 12 months or less; however, some shorts (of failing companies or flawed ETFs, as opposed to most option hedges) may be held for years.

A Foolish reminder as more *Pro* Trade Alerts magically appear in your inbox: Take your time. Don't fret. Ask any questions about the trade on its dedicated discussion board, or on our Office Hours discussion board. Don't let investing add any extra stress to your life — instead, remember that we're here to build real value over time (just as many of us have for decades!), and small day-to-day price changes don't matter. And if circumstances don't allow you to make every trade right now, don't worry. I'll repeat: If you just own the majority of our stocks, you should do very well. And when you're ready to use options and shorts, we're here to help you make money with those strategies, too.

Alongside Trade Alerts, expect another (perhaps final) Ketchup Report this week. (You can see the most recent one here, with links to the previous four.) After this week, we'll have highlighted all of our current Buy First and Buy stocks in these reports, so we'll move on to shorts and hedges that can be placed now, as well as new options trades. As for stocks currently on hold, we'll get you into those positions at better prices when possible — if we don't sell them first. Watch your upcoming Monday Memos for individual "Catch-Up Trade" opportunities down the road.

Finally, in weeks ahead we'll continue to address Memo topics you've requested. If you have others, please share them. Thank you for being a *Pro* member! Have a great week; we'll see you in your inbox and on the boards!

-Jeff Fischer (TMFFischer)

Trades Made

- **Starbucks** : *Pro* purchased 1.4% (400 shares) of its pending 2.5% stock position at $47.47, and we "sold to open" four of our pending eight January 2013 $47 puts for $3.35 each. We have more than three weeks remaining to complete these trades.

Guidance Updates

- **Covanta Holdings**: Moves from Buy to Hold on valuation.

Catch-Up Trades

- None this week. Watch for a new Ketchup Report in your inbox.

Coverage & Community

- **Fools Ring the NYSE Bell!** To celebrate The Motley Fool's upcoming Worldwide Invest Better Day, David and Tom Gardner joined a motley clan of smiling Fool members to ring the NYSE opening bell Friday. Check out the video!
- **Earnings:** Sleepy dividend stock **Covanta Holdings** is executing very well, but we're moving it to Hold on valuation.
- **AIG's Price:** Members discuss fair value.
- **Consider Your Options:** Alex340 shares put options that match *Pro* criteria.
- **Bryan Recommends Brian:** Our own Bryan Hinmon gives a thumbs-up to Brian Stoffel's short column on keeping your priorities in life aligned.
- **Get the Buzz:** Jeff shares the advice he once gave to Starbucks CEO Howard Schultz and celebrates lower coffee bean prices (for Starbucks, not for consumers!).
- **Planning Ahead:** Earnings again? TMFMoosie is already providing the calendar for next quarter. It can help you with any independent option trades you're considering.

Buy AIG Stock and Warrants

Published Aug 24, 2012 at 12:00AM

- **What We're Doing:** We're buying an unpopular insurer for less than its book value.
- **What We're Thinking:** We'll earn North Star-thumping returns just for holding while time and average business performance heal AIG's wounds. We'll do even better if it regains a shadow of its former brilliance.
- **What We're Expecting:** AIG will slowly improve its underwriting, buy back shares from the U.S. Treasury at a discount to book value, and earn average returns on equity.

Trade Essentials

- **Action:** Invest 2.5% of your funds in **AIG** (NYSE: AIG) and 0.5% in **AIG warrants** (NYSE: AIGWS), investing 3% of your funds in total. ***Pro* will buy calls, not warrants**; for details, please see our alternate trade and the "Warrants" section of this report.
- **Buy Around:** Shares, $34.50; warrants, $13 (but you must use a **limit order** at current prices for the warrants, which are thinly traded)
- **Stock Fair Value:** $50
- **Status:** Buy First
- **Alternate Trade:** If you're not buying the warrants, use 0.5% of your funds to "buy to open" January 2014 $25 calls on AIG (**because we can't track warrants on our scorecard, this is the trade *Pro* will be making**), alongside your 2.5% stock purchase.

The Big Picture

Not long ago, insurance behemoth **American International Group** (NYSE: AIG) helped to nearly bring down the world's financial system. Four years later, this former disgrace is a very different company — and we're ready to buy shares.

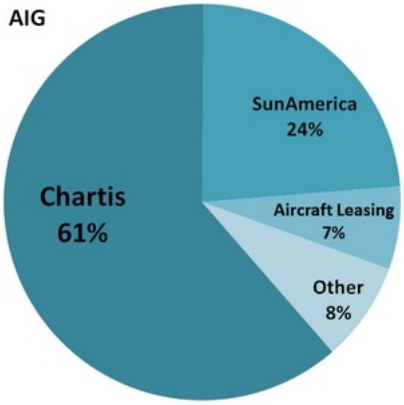
To prove we're not crazy, let's briefly review how AIG became the business it is today. Before the crisis, financial companies insured risky investments (for example, mortgages with high potential for default) with AIG. They then off-loaded those risky investments to AIG through swaps and other derivatives. AIG, for its part, linked and greatly concentrated those risky investments, destabilizing the whole system.

At the height of the crisis, the Federal Reserve (and later the U.S. Treasury) provided $182 billion in bailout funds to support the financial system through AIG. As an insurance company, AIG was a primary conduit for linking banks; in total, 16 banks' credit default swaps (instruments used to insure against bad debt) were made whole thanks to the intervention. In other words, by bailing out AIG, the Fed also supported the world's largest, most interconnected banks. When the dust settled, U.S. taxpayers owned the majority of AIG — and the financial system survived.

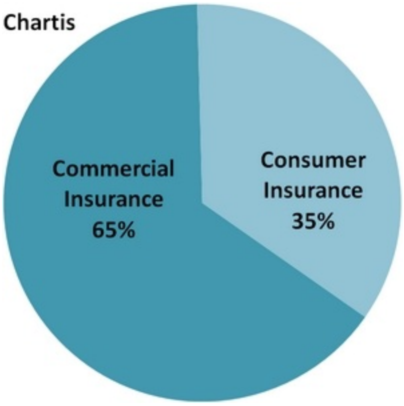
Today, we're able to buy shares from a motivated seller. The Treasury is only interested in making a small profit (along with appeasing other political concerns), so it's actively selling its large stake for less than what we think AIG is worth (not to mention less than book value).

The Business

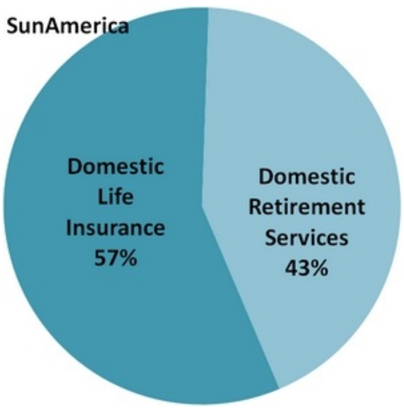
We can't stress it enough: Today's AIG is not the same company it was in 2008. The nasty derivatives that nearly brought down the financial system are gone; to reduce its exposure to derivatives and pay off the Fed and the Treasury, AIG has divested itself of whole business units, managing to eliminate 95% of its previous exposure to derivatives. Left behind are just two steadfast insurance businesses and an aircraft leasing company.



The first insurance company, Chartis, offers property and casualty insurance to commercial clients and consumers. Commercial products and services are typically sold through brokers; offerings there include casualty, property, and financial insurance, as well as specialty insurance like aerospace, environmental, and marine. AIG is focusing on growing the smaller but more profitable consumer division, where offerings include accident and health and life insurance policies, sold through agents and directly to consumers online.



The other insurance company is called SunAmerica; it provides domestic life insurance and retirement products including annuities, mutual funds, and financial planning. Products are distributed through a diverse network of financial-services companies, brokers, agents, and advisors.



Aircraft leasing, at 7% of AIG's total revenue, is the third largest single division. We (and many others) believe that AIG will eventually monetize this profitable business, potentially spinning it off in an IPO, or possibly sell it.

Management

The guys who blew a hole through AIG in 2008 aren't the same ones cleaning it up today. The entire company has been turned over; even Edward Liddy, the former Allstate chief the Fed picked as CEO and chairman during the bailout, resigned just eight months into the job. Former MetLife CEO Bob Benmosche continued where Liddy left off — and he's exactly what AIG needed. Benmosche knows insurance inside and out following a lifelong, successful career; he's tough, he's scrupled, he's brash, he speaks openly and honestly ... in other words, his style matches perfectly with the high level of disclosure expected of AIG from now-strict regulators and the company's largest shareholder, the U.S. taxpayer.

Benmosche is currently undergoing treatment for cancer, and while he's still running 15 to 20 miles a week, we count his health and future tenure as risks. We benefit the longer he stays on, but CEOs are in place at each of AIG's major businesses, too, so there's unlikely to be much disruption if the worst does occur.

Financials and Valuation

Neither of the insurance companies within AIG match the caliber of beloved *Pro* holding **AmTrust Financial Services** (NASDAQ: AFSI), but that shouldn't surprise you. AIG is still emerging from the crisis, and it's much larger — AmTrust did $1.4 billion in revenue last year, whereas AIG rang up nearly 46 times that much. That large size keeps AIG away from niche insurance, which is AmTrust's profitable edge; instead, it writes much less attractive policies in more competitive arenas. Check out AIG's combined ratio below, a measure of insurers' profitability — lower is better, so you can see that AIG has struggled at 102 (AmTrust compares at a recent 89).

Metric	Q2 2012	Q1 2012	FY2011	FY2010	FY2009
Total Revenue	17,123	18,443	64,255	77,798	76,645
Operating Income	2,716	5,558	5,806	8,526	3,132
Net Income	2,332	3,208	17,798	7,786	-10,949
Book Value	105,641	104,465	114,329	113,673	99,035
Book Value per Share	$60.58	$57.68	$55.33	$52.25	$34.46
Loss ratio	68.9	68.0	78.3	85.7	78.6
Expense ratio	33.5	34.1	30.7	31.1	29.4
Combined ratio	102.4	102.1	109	116.8	108
Excluding Catastrophic Losses			99.8	113.5	

Source: S&P Cap IQ. Numbers in millions, except per share.

But Benmosche is turning that around. A recent partnership with Johns Hopkins University is helping AIG analyze its tremendous data troves, leading to more accurately priced insurance. With time, we expect the combined ratio to improve, bringing earnings up and the share price with it.

Metric	Multiple
P/E	2.96
P/B	0.56
ROA	0.9%
ROE	8.9%

Source: S&P Capital IQ.

Even after all this, you may still be wondering: Why is *Pro* buying an average insurer with a history of financial mass destruction? The answer is simple: Any asset can make a great investment at the right price. AIG is trading at $0.56 per dollar of trustworthy book value, and the market is undervaluing its turnaround because it's afraid of past complexity and of the potential difficulties of the Treasury's still-enormous stake in AIG. But that overhang isn't a long-term ceiling on the share price — it's a source of future profit for us.

Again, the Treasury only wants to sell at a profit; it isn't interested in maximizing value. The government's breakeven price is $28.72, so it's been selling at $29 and above. AIG has been buying billions of dollars' worth of its own stock at those prices — and every dollar AIG allocates to buying back those discarded and discounted shares increases book value.

We used a number of different methodologies to value AIG. So many insurance companies are trading at less than book value that — even with regulators deeply involved — we didn't feel comfortable giving AIG credit for its full book value. Instead, we viewed the company as the combination of an average property and casualty insurer, an average life insurer, and an average aircraft leasing company, and gave no credit for buybacks. Under those parameters and using an average multiple for the comparable pure-play companies, AIG should trade for just more than 0.9 times book value, or about $55.

But until AIG can generate consistent underwriting profits, that figure is arguably too high. Next, I (Nick here) turned to an excess-return valuation model, which uses return on equity, book value, and an implied dividend-discount model. This allowed us to ding the company's valuation because AIG's returns are lower than its cost of capital. Under this model, one conservative scenario values AIG at $46. AIG is currently trading at about $34, meaning both models give us a hefty margin of safety for a purchase today — and demonstrate the value AIG is getting on its repurchases.

Warrants

In addition to shares, we originally planned to purchase 0.5% worth of AIG warrants. As it turns out, our scorecard doesn't have the technological capability to track warrants (we're told it would break the software), so we can't buy them — but that doesn't mean you can't. A quick explanation of warrants: In this context, they have nothing to do with criminality; rather, warrants are like call options, except they're issued by the underlying company. In January 2011, AIG paid shareholders a dividend in the form of warrants, allowing for the purchase of $75 million worth of shares at $45 each. That $45 strike price adjusts favorably in the event of dilution or annual cash dividends greater than $0.675 per share (which would also lower the share price). These warrants don't expire until Jan. 19, 2021 (!), and they trade on the NYSE under the symbol AIGWS. Warrants are illiquid, and Goldman Sachs is the designated market maker for them; when you buy them, be sure to **use a limit order** so Goldman doesn't get more than a fair price (recently near $13).

Be aware that if our investment in AIG works out, those who own warrants will earn leveraged returns on them. If we're wrong, though, the warrants will be a total loss, because they're out-of-the-money.

Instead of warrants, *Pro* is going to purchase ("buy to open") January 2014 $25 calls on AIG alongside our 2.5% stock purchase. There is, of course, a big trade-off here: With the call options, there are less than 18 months left for the thesis to play out, compared with 8.5 *years* for the warrants. And the calls don't benefit from anti-dilution adjustments. Because of these disadvantages, in-the-money call options make the most sense for us. Here is a comparison between the warrants, our soon-to-be purchased $25 calls, and the January 2014 calls with the same strike price ($45) as the warrants we suggest you buy.

Metric	January 2021 $45 Warrants	January 2014 $25 Calls (*Pro* Will Buy)	January 2014 $45 Calls
Strike Price	$45	$25	$45
Days Till Expiration	3,070	511	511
Premium	$12.95	$11.75	$2.38
Time Value Per Day	$0.004	$0.005	$0.005
Breakeven	$57.95	$36.75	$47.38
Maximum Loss at $33	$12.95	$3.75	$2.38

Source: Analyst calculations.

You'll notice the breakeven prices are very different, but keep in mind that they occur in very, *very* different time periods. The warrants are the way to go, but if you're more comfortable mirroring our trade, you can purchase the same calls we will instead. Please know we don't want to confuse you — we want you to make the best, most profitable trade possible. We think that means buying the stock and the warrants, even though *Pro* can't make the second part of that trade ourselves right now. As mentioned, we'll buy the stock and the January 2014 $25 calls instead.

What Would Make Us Sell

Our thesis hinges on buying AIG for less than it's worth. It is bolstered by our expectation that AIG will continue to buy back its own shares from the Treasury at a discount, which increases book value. If we later learn that book value is overstated and the shares are thus no longer discounted, we will want to sell. This investment could be very volatile during periods of economic uncertainty or financial crisis; we're willing to hold through price volatility, but could sell or hedge if we have portfolio management concerns. We'd also sell if we see an opportunity to buy higher-quality companies at a similar discount.

The *Pro* Bottom Line

AIG has been gutted of its ugly innards, so little remains of the pre-financial-crisis version of the company. What remains is the heart of what made a once-attractive business. But money managers concerned with guilt by association won't buy it, and the Treasury is selling its majority stake as steadily as it can. Both of these factors contribute to the market's mispricing of AIG shares. We expect the market's shortsightedness to be our long-term gain.

Next Step

Bring any questions to our AIG discussion board!

The Motley Fool owns shares of Amtrust Financial Services. See Pro's holdings here . See the team's and David and Tom Gardner's holdings here . Special thanks to analyst Scott Hall, who contributed to our thinking on AIG.

Pro's Fifth Ketchup Report: 2 More Buys

Published Aug 24, 2012 at 12:00AM

Dear *Pro* Member,

In our ongoing effort to make sure all members are aligned with the *Pro* portfolio, today we're recommending that you "catch up" with two technology companies. You're doubtless very familiar with one of them — in fact, you may be surprised we're recommending it! The other company, based in Canada, is less of a household name, but it's an industry leader with a bright future.

This report continues the process of building out your core *Pro* investments. Unsurprisingly, the stock market is becoming more volatile as summer vacation ends and trading volume increases. We should expect yet more volatility as Europe returns to the headlines, the U.S. election nears, and our own country's budget woes persist. Remember, though, that we consider at least a two-year outlook for every stock we recommend. The market's whims may mean ups and downs in the short term, but we believe our businesses will create enough value to grow the share price over the coming few years.

You can access our four previous Ketchup Reports here, here, here, and finally here. This week's report only contains two stocks because we also recommended two brand-new buys, **Starbucks** and **AIG**, to all members this week. Once your core investments are made, we'll get into hedges and shorts. Now, on to the stocks!

Foolishly,

Jeff Fischer, *Pro* advisor

Your Next Buys

Apple

- **Industry**: Technology hardware
- **Allocation**: Invest 5.1% of your funds ($5,100 for every $100,000 you manage in *Pro*)
- **Recent Price/Dividend Yield:** $662 / 1.6%
- **Click For:** Original Recommendation; Most Recent Update

Summary: As the world's most valuable company, Apple is no stranger to skepticism. Can it possibly remain a good investment? Can the business grow enough to propel the stock higher? Can the company still debut products that surprise and excite consumers? These are excellent questions, and we're actually comforted by the masses' skepticism about Apple's growth prospects.

That's because, despite its size, we believe Apple could become considerably larger for two primary reasons:

- The mobile computing revolution is still young; few people in the world own tablets, and most don't yet own a smartphone. (Plus, those who *do* own a smartphone are much more likely to upgrade to the next model than downgrade.)
- Apple is finally breaking into the enormous corporate (or enterprise) market. Fortune 500 companies are making iPads an integral part of daily operations. If there's truth to the rumors that Apple will offer a smaller tablet soon, that could drive still more adoption.

iPhones and iPads make up the majority of Apple's revenue now, but despite strong long-term growth prospects for both products, risks do exist. Profit margins could come down as lower-cost competitors hack away at Apple's lead, and Apple's lucrative partnerships with U.S. wireless carriers could eventually be renegotiated with less favorable terms for Apple — among other risks.

If you ever doubt that one person can make a difference in the world, consider Steve Jobs: Today's Apple isn't the same junkyard dog it was with him at the helm. Time will tell if the company can guard its profit margin as well as it did when Jobs called the shots. But we're optimistic Apple can continue to grow as wireless devices proliferate around the world. The Apple operating system is second to none, and it should prove effective at drawing in new customers and keeping the hundreds of millions it already has.

Apple is above our ideal Buy Around price, but the stock remains a Buy. From its fair value of $680, we model a North-Star-challenging 10% annualized return over the coming three years. Consider buying a 5% position in halves if that suits you better than buying all at once — 2.5% to start and the rest after this fall's new product debuts or the next quarterly report. Just realize that *Pro* already owns 5.1%.

OpenText

- **Industry**: Software (specifically, for information management)
- **Allocation**: Invest 2.6% of your funds ($2,600 for every $100,000 you manage in *Pro*)
- **Recent Price/Dividend Yield:** $54 / N/A
- **Click For:** Original Recommendation; Latest Update

Summary: OpenText is the largest independent provider of software used by corporations and governments to manage their sprawling electronic content. Such software (known as enterprise information management, or EIM) is expected to increase in popularity by the year as companies need to organize, protect, and manage ever-growing reams of e-data. (Fun, and relevant, fact: Only 10% of the Web's content is public; the other 90% is private, owned by businesses and organizations.)

If OpenText can maintain and grow its industry lead, we should expect its winning streak to continue — to the tune of 10% annual growth or more. In the year just ended, OpenText grew revenue 17% to more than $1.2 billion. The stock trades at an inexpensive 10 times adjusted earnings expected in the year ending June 2013. We have a 2.6% position to start, and may add more later as our confidence in management grows.

Questions?

You may make these investments at any time. If you have questions, please post on the Getting Started discussion board. And we're available every weekday from 3 to 4 p.m. ET to answer your questions on the Office Hours board! You'll hear from us again soon. Enjoy!

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Buy Shares of Starbucks and Write Puts

Published Aug 22, 2012 at 12:00AM

- **What We're Doing**: Buying one of our favorite businesses and leveraging our insight to earn extra income.
- **What We're Thinking**: Starbucks should percolate higher and we want to be along for that caffeine rush, so we're buying shares. We're also writing puts.
- **What We're Expecting**: The coffee brings 'em in, the quality and experience builds trust in the brand, and the brand's reach will eventually extend far beyond what seems possible today.

Trade Essentials

- **Actions:**
  - Buy 2.5% of Starbucks ($2,500 for every $100,000 you manage)
  - Write ("sell to open") January 2013 $47 puts for a potential 2.5% more (that's one contract for about every $200,000 you manage; *Pro* will write eight contracts)
- **Price Guidance:**
  - Buy shares near our Buy Around price of $48
  - Use a limit order to write January 2013 $47 puts, aiming for a credit of $3 or higher
- **Buy Around/Fair Value:** $48/$52
- **Scorecard Status:** Buy First

The Foolish Bottom Line

"Tall Americano."

"Decaf solo espresso."

"Doppio con panna."

That's how it goes on many weekdays. Your *Pro* team has conquered the morning, eaten lunch at our desks, and finally broken out into the fresh air to talk shop, discuss progress, or relive the latest absurd office antics. We inevitably end up at one of the two green-logoed coffee shops within two blocks of the office; we love our coffee and spend too much money on it (though Nick and Bryan have mastered the art of looking at the ceiling when the tab comes due). Today, we're aligning the *Pro* portfolio with our wallets and buying **Starbucks** (NASDAQ: SBUX).

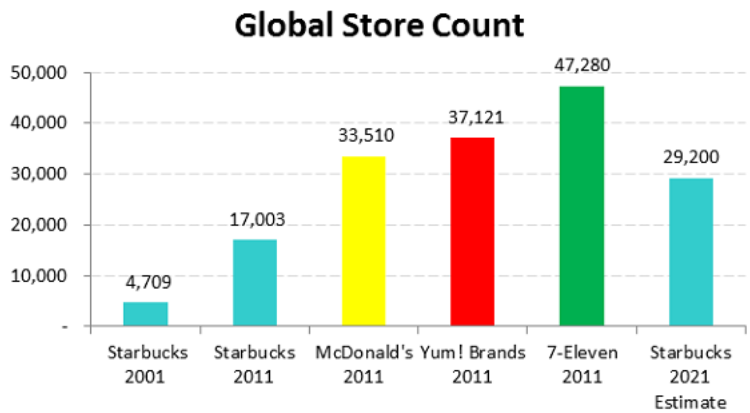
Shares of the java giant have been French-pressed lately — down 22% since their April high — yet the company's vision seems clearer and more likely to succeed than ever. It's rare that a widely loved stock's price declines significantly while your confidence in its future value simultaneously increases. Starbucks is one of our favorite businesses, and buying at today's price could set us up to earn North Star-like returns for years to come. Furthermore, we're confident in our knowledge of the business and hope to earn option income while patiently building out our position. You likely know Starbucks well, so we'll focus our digital ink today on the ways our view may differ from the consensus; then we'll explain the option-income component of the position.

The Siren's Song: Opportunity

You may not realize it, but "Starbucks" is no longer a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, coffee will be a major driver of the business for decades to come, but in a sense the java is just a front (although founder and CEO Howard Schultz would shudder to hear that). The coffee exists to allow the company to repeatedly sell us an experience, one rooted in comfort, quality, health, community, and conscience. We think we're coming for the coffee, but those clever green aprons have been planting the magic beans of a simple *experience* that lives up to caffeine in its addictive qualities and our love of it. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand and driving its valuation higher.

So far, Starbucks hasn't had trouble finding buyers for the experiences it peddles. Here's what we expect from the company:

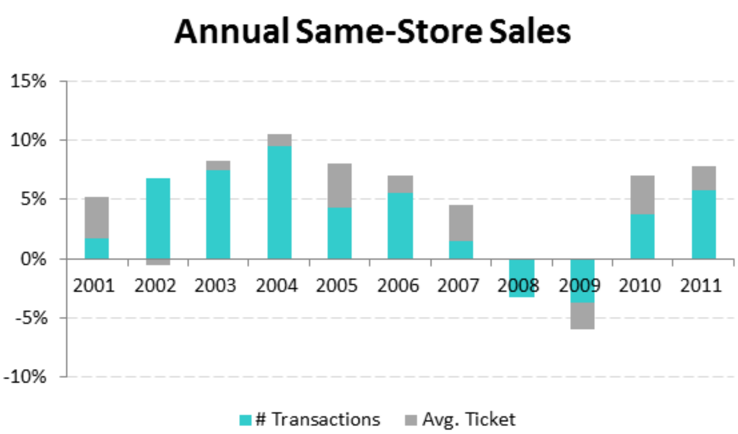
- **Platform growth.** We expect Starbucks to grow its store base, and we contend that it has plenty of room to do so. If you think there's already a Starbucks on every corner, think again: With only about 17,000 stores worldwide at the end of fiscal 2011 (through September), the Bucks' ubiquity pales in comparison to other convenience-focused food-and-beverage sellers like **McDonald's** (NYSE: MCD), **Yum Brands** (NYSE: YUM), and 7-Eleven.



Sources: S&P Capital IQ and company websites; 2021 estimate is Pro*'s*.

Store growth is critical because stores are the primary touchpoint for Starbucks to communicate its brand and build trust with customers. We believe the company can add 12,000 locations, and millions of new customers, over the next decade.

- **Product depth.** Product innovation is alive and well at Starbucks. Recent innovations (Bistro Boxes, Blonde Roast, and Refreshers, to name a few) have driven impressive same-store sales growth even as the global consumer is struggling. Historically, Starbucks has proven its ability to drive traffic through new innovations.



Source: Company filings.

More impressively, the company has plenty of new ideas in the works. Starbucks' recent acquisition of La Boulange bakery should do wonders for its food offerings over time — one-third of coffee purchases made in Starbucks already include a food item, so just wait until the food is even better and more varied.

- **Brand Expansion.** Since 1984, Starbucks has been on a quest to democratize premium coffee beverages. Now it owns the Evolution Fresh (juice) and Tazo (tea) brands, which present similar opportunities for like-themed stores in enormous markets (Evolution Fresh juice bars are now opening on the West Coast). The formula for success with these (and future) brands is simple: Introduce the products through the coffeehouse platform, refine the brands in that trusted environment, and branch the concepts out from there. In some instances, this means a separate restaurant concept, an experience that's built on the same pillars as Starbucks coffeehouses (comfort, quality, health, community, and conscience). In others, it may mean a prime spot on grocery-store shelves; consumer packaged goods, sold mostly through grocery networks, now make up nearly 10% of Starbucks' sales.

Starbucks-branded products will likely look very different a decade from now. But the common thread — a valued brand, built on the experience sold in today's Starbucks stores — will remain. And coffee, which is the world's third-most popular drink, will remain central to the Starbucks experience. The largest risk to our investment is that the brand's authenticity falls and its message becomes muted. We'll be watching this closely with plenty of firsthand store visits.

We believe Starbucks has the financial wherewithal to fund its ambitious growth plans and the management team in place to execute them. Shares are most likely worth around $52 now, and we expect average growth of about 10% a year; from today's level, then, the stock represents a solid chance at North Star-like annualized returns. And with so many opportunities brewing, we can make a case for shares being worth up to $67 in the more immediate future if plans unfold as hoped. We're happy to buy today with an eye on the future.

Writing Puts to Buy More

We're starting our position in Starbucks by buying a 2.5% allocation, but we'd be happy to refill our cup at a lower price — we do expect these shares to be volatile at times. To that end, we are selling put options that would have us purchasing a second shot of shares at about $44. In a sense, we're setting a limit order to buy more shares at a price we like, and we'll earn income while we wait to see if our limit order is hit. Here are the specifics on the put options:

Sell to open January 2013 $47 puts, one for every 100 additional shares of Starbucks you could buy. Lately, you'll effectively be paid around $3.10 per share to write these puts, for a 15.7% annualized yield. If Starbucks declines below $47 by our expiration in January, we'll be able to buy more shares at a net start price of $43.90.

Stock price	$48.22
Strike price	$47
Put premium received	$3.10
Days to Expiration	150
Strike vs. stock price	$1.22
Strike vs. stock %	2.5%
Capital at risk / 30% cash to hold trade	$47 / $14.10
Maximum option reward	$3.10
Option yield / leveraged yield	6.6% / 22%
Annualized yield	15.7%
Breakeven	$43.90
Downside protection in dollars	$4.32
Downside protection %	9%

Alternative Trades

We want to own shares, so we're buying a partial allocation outright and writing puts for the potential to purchase more.

- If your portfolio size doesn't allow you to buy shares *and* write options (you need at least a $200,000 portfolio), you should buy 2.5% today and hope for shares to drop near $44 to buy more.
- You can also write January 2013 $46 puts; these offer a lower payment and lower likelihood of being assigned.
- You can also write October 2012 $46 or $47 puts and write a second round for January's expiration if you aren't assigned.
- If you own Starbucks with a covered call in *Motley Fool Options*, make sure your allocation to the stock remains below 5% total as you add the company to your *Pro* holdings. We may or may not use covered calls on some of our *Pro* shares in the future.

Next Steps

- **Questions?** Please bring any questions about the business or options strategies to our velvet-chaired Starbucks coffee-lounge discussion board.
- **Foolish Blast From the Past!** For a fun distraction, read Jeff Fischer and David Gardner's *original* Starbucks buy report ... from 1998. The company was worth $4.6 billion then, compared to today's $36.6 billion. (Bryan penned most of today's report because Jeff's hands are still smarting from that endless 1998 report — where the guys got a lot of things right, if we do say so ... even though they're just Fools.)

The Motley Fool owns shares of McDonald's and Starbucks. See Pro's holdings here . See the team's and David and Tom Gardner's holdings here .

Calculating Covered Calls

Published Aug 20, 2012 at 12:00AM

Fellow Fools,

Recently, we outlined how to calculate returns with a put-writing strategy. When you "sell to open" put options, you arrange to potentially buy a stock cheaper and earn income while you wait.

Writing Puts and Covered Calls 101

- **Writing ("selling to open") puts:** Allows you to earn option income while waiting for a stock to decline to your desired buy price. Each put you write obligates you to buy 100 shares if the stock price is below your put strike price by expiration.
- **Writing ("selling to open") covered calls:** When you already own at least 100 shares of a stock and are willing to sell them, you can write covered calls to earn income while waiting for your sell price. Each covered call you write obligates you to sell 100 shares if the stock price rises above your call strike price by expiration.
- **Follow-up:** In either case, if you decide before expiration that you want to take more time, aim for more income, or adjust your buy or sell price, you'll often be able to "roll" your written option to a later expiration date or a different strike price. You simply "buy to close" the option you have outstanding and "sell to open" a new one.
- **For more:** See our guides to writing puts and writing covered calls.

Today we'll examine a similar strategy, but with an inverse outcome: writing covered calls. When you write covered calls, you already own at least 100 shares of the stock, and you're willing to sell them at a predetermined price. You can write covered calls on your shares to earn income while waiting for your desired sell price.

The key points to remember (please see our sidebar for more) are that writing puts potentially obligates you to *buy* a stock, and writing covered calls potentially obligates you to *sell* a stock you already own.

Calculating Covered Calls

Writing covered calls is a common income strategy, steady enough that retirees rely on it. When you do this, you want the income you receive to be worthwhile on an absolute basis — in other words, big enough that it doesn't get eaten up by commissions and fees. Otherwise, it's not worth capping the upside on your stock. It also helps to calculate a handful of other numbers; let's use an example.

Imagine you bought 200 shares of **CME Group** at $53 last week. In this example, you're willing to sell your shares if they hit $60. While waiting for that possibility, as of Friday (with the stock at $54), you could sell to open March 2013 $60 calls for $1.30 per share. If you own 200 shares and write covered calls on all of them, you'll write two calls (because each option represents 100 shares) and receive $260 before commissions. In return, you're obligated to sell your shares at $60 by next March 16 if the stock is $60 or higher at the option's expiration.

In other words, even if CME reaches $70 by expiration, you'll still be required to accept $60 for your shares unless you close your calls early. If CME is anywhere below $60, you keep your shares at expiration and can write new calls if you wish. In either case, you keep the option premium you were paid. Here's some math to consider as of Aug. 17 (this is **not a recommendation,** just an example):

CME Group Buy Price	$53
CME Group Current Price	$54
Sell to open March 2013 $60 calls	Receive $1.30 per share
Yield on Current Share Price	2.41% ($1.30/$54)
Downside Cushion	The same, 2.4%
Yield on Buy Price	2.45% ($1.30/$53)
Upside To $60 Strike Price	11.1%
Potential Net Sell Price (incl. premium)	$61.30
Return to Potential Net Sell Price	13.5% (from current price)
Days to Expiration	208

This trade provides a decent 2.4% yield in just over six months, while providing 11.1% upside in the stock before it reaches the $60 strike price of the calls. Add in the option income and the trade has 13.5% upside to the potential net sell price set up by the covered calls. Over these six months, CME will pay another $1.35 in dividends (assuming it holds constant), bringing the total potential return from the current price to more than 16%.

The closer your strike price is to the share price, the more the covered calls will pay (a $55 call would pay us much more income), but of course, this limits the upside on how far the stock could run. We're not eager to sell CME Group, so this example has a strike price 11.1% above the current share price. Unless the stock rallies, this hypothetical trade would serve to provide income and provide a small downside cushion or hedge.

You most often want to write covered calls when:

- You're truly ready to sell a stock at a determined price and don't believe waiting to sell it is risky.
- You buy a stock specifically to write covered calls on it. This is called a buy/write trade, and because it's clear from day one that the position is for income, you shouldn't be upset if your shares are called away. This is usually the best, *least conflicted* way to use covered calls.

If you have questions about this column or the CME example, let's discuss it on the All About Options board. Fool on!

— Jeff Fischer (TMFFischer)

Trades Completed

- **ProShares UltraShort Real Estate**: Setting up a synthetic short, we sold to open six January 2014 $25 calls and bought to open six January 2014 $25 puts for a net debit of $2.70.
- **OpenText**: Our August $70 covered calls expired as full income.

Guidance Updates

- **Apple**: Fair Value moves up to $680 and Buy Around to $570; the stock remains a Buy.

Coverage & Community

- **Earnings Coverage Continues:** We have reviews of **CME Group**, **The Buckle**, **Apple**, **OpenText**, **AmTrust Financial Services**, and **MasterCard**.
- **Keep On:** etagordon shares his expertise in trucking, seeing dropping volume.
- **Call This, Put That:** Alex340 lists covered calls and puts one could consider writing.
- **Nightly Firmament:** ADrumlinDaisy muses about ancient evening skies and our minds.

Pro's Fourth Ketchup Report: 3 More Buys

Published Aug 15, 2012 at 12:00AM

Dear *Pro* Member,

Welcome to our next installment of trades to get you invested in our *Pro* portfolio! With this edition, we're investing in three very different companies in the financial sector, each attractive in its own way. Combined, we recommend that you invest 9.9% of your assets here — this sector remains enormously important, and standout companies are still attractively priced as investors' confidence slowly heals. This report continues the process of building out your core investments; once those are in place, we can start to address options for income and shorts for hedging (for members interested in those strategies).

Check out the three previous Ketchup Reports here, here, and finally here if you need them. And now, on to the stocks!

Foolishly,

Jeff Fischer, *Pro* advisor

Your Next Buys

CME Group

- **Industry**: Financial exchange
- **Allocation**: Invest 3.7% of your funds ($3,700 for every $100,000 you manage in *Pro*)
- **Recent Price/Dividend Yield:** $52.60 / 3.3% (excluding special dividends)

- **Click For:** Original Recommendation; Latest Update

Summary: CME Group is the largest public futures exchange in the world, offering businesses, governments, institutions, and investors a way to hedge interest-rate risk, currency risk, commodity risk, and more. Futures contracts allow a holder to buy or sell an underlying asset at a set price by a set expiration. CME Group makes money on all of the transactions that take place on its exchange, so it grows by expanding into international markets and introducing new contracts on different assets. *Pro*'s thesis is that trading volumes, which have been depressed since the financial crisis, will grow over the long haul — especially when interest rates start to rise — and CME's strong profit margins will hold steady.

We *may* write covered calls for additional income on at least some of our CME shares in the future, so if you can buy shares in 100-round lots while maintaining a reasonable allocation, that's advisable, though not necessary.

Broadridge Financial Solutions

- **Industry**: IT outsourcing
- **Allocation**: Invest 3.3% of your funds ($3,300 for every $100,000 you manage in *Pro*)
- **Recent Price/Dividend Yield:** $22.50 / 3.3%
- **Click For:** Original Recommendation; Latest Update

Summary: Broadridge Financial Solutions helps the global financial system work. The company operates behind the scenes to run the plumbing behind worldwide fixed-income and equity trading, as well as communications between banks, brokers, funds, and their shareholders. It ain't sexy, but Broadridge dominates its niches, has remarkably steady recurring revenue and cash flow, and recently broadened its suite of products and services via a number of small acquisitions. We expect the company to be a slow grower, but consistent earnings growth and a healthy 3.3% dividend should help the position achieve North Star-like returns over time.

Wells Fargo & Co.

- **Industry**: Diversified financial
- **Allocation**: Invest 2.9% of your funds ($2,900 for every $100,000 you manage in *Pro*)
- **Recent Price/Dividend Yield**: $34.15 / 2.9%
- **Click For:** Original Recommendation (though it's a bit dated); Latest Update

Summary: It may be the fourth-largest U.S. bank by assets, but Wells Fargo is No. 1 in customer satisfaction for American large banks, so it's no surprise that it also leads in mortgage and small-business lending. Its community banking, wholesale banking, and wealth, brokerage and retirement divisions provide services through more than 9,000 branches and 12,000 ATMs.

Shares are trading below fair value and yield a growing 2.9% dividend. Revenue growth will be slow until U.S. loan demand resumes, but we'll profit through earnings growth as management continues to cut costs and drive efficiency. At *Pro*, we're currently using options to generate even more income from this position; after buying the 2.9% we recommend above, keep an eye out for a new strangle alert on Wells Fargo in your inbox later this year so you can do the same.

Questions?

You may make these three investments at any time. If you have questions, please post on the Getting Started discussion board. And we're available every weekday from 3 to 4 p.m. ET to answer your questions on the Office Hours board! Welcome again to new members, and thank you again to our great veterans. You'll hear from us again soon. Enjoy!

— The *Pro* Investing Team

Monday Memo: Video Roundtable on Pro's Future

Published Aug 13, 2012 at 12:00AM

Fellow Fools,

Guidance Updates

- **GrafTech International**: Remains a Buy, but fair value moves down $1 to $16, and "buy around" moves down $1 to $12.50.

Today's Monday Memo is coming at you in video form for your viewing pleasure (we hope!). In this nine-minute roundtable, we discuss the direction of our investment recommendations for you during the rest of this year and beyond. Whether you're a new member or an old salt, you'll benefit from the five key initiatives guiding us. We want to:

1. Focus the portfolio on about 20 key, core positions
2. Use steady income trades to generate returns, whatever the market does
3. Focus our short positions on companies and strategies that should drag less when the market goes up, and protect us when it falls
4. Keep a cash cushion for new opportunities and continued flexibility
5. Use our proprietary North Star to work toward positive returns over any reasonable time frame

Enjoy the video (or read the transcript) as we elaborate on all five topics, then follow along with us as we put them into action with new trade alerts over the coming weeks, moving steadily forward for better returns.

If you have any questions or comments afterward, please visit the Memo Musings discussion board. Fool on!

— Jeff Fischer, advisor (TMFFischer)

{% ooyala id="F0YnFsNToHsMy9cfDzWzcgM4KsB--8zS" width="580" height="326" %}

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **ProShares UltraShort Real Estate** : Set up a synthetic short with a 1% allocation by selling to open January 2014 $25 calls and buying to open an equal number of January 2014 $25 puts. With the ETF around $26, aim to pay around a $2 net debit per synthetic short. That's about an 11% premium to short at this point (you get a $23 start price versus a $26 ETF price). This isn't ideal, but it's the best the options are offering on an ETF that's nearly impossible to short. Alternatively, you could just buy to open January 2014 $32 puts aiming to pay around $10, but realize that is more expensive, with a $22 break-even price. (Revisit our original report.)

Video Transcript

Jeff Fischer: Welcome, Motley Fool *Pro* members. Thank you for joining us for a Motley Fool *Pro* roundtable. The team is here with you today. Two seats down is Nick Crow. Right next to me is Bryan Hinmon, and I'm Jeff Fischer, and thank you for joining us.

We're going to talk about five focus points for the *Pro* portfolio in the future, what we're working on to really make our returns shine in up, down, and flat markets. Nick, let's start with having a focused portfolio. How important is that?

Nick Crow: It's very important. We've been talking about it for the past year. We have nearly 30 positions now, and some of them we like better than others, as you can tell through Buy Firsts, Buys, and Holds. And we want to focus in the coming year on getting that closer to 20. Twenty positions, as you know, will help us spend more time on each of those, get to know their competitors better and we might actually be able to trade around the fringes a little better also. And what I mean by that is when a stock is down on no news, a little bit cheaper sometimes, we might be able to add to that and make some money on that mispricing. And then as things get a little bit richer, like we have in the past this year with Papa John's — selling a little bit of it when it was pretty rich — we could do that more frequently with a more focused portfolio. You'll note that the best investors in the world tend to be focused investors and that's … I hold you [Jeff] among that group.

Bryan Hinmon: Some members might hear fewer positions and think that that's increased risk, but we really think that the tradeoff there is that by having fewer positions, we're really going to be able to know our positions that much better, and having that knowledge is going to make us, help us make better decisions with each position instead of spreading ourselves a little too thin.

Jeff Fischer: And the bottom line, too, is things change. We've owned some things two or three years, and we look every quarter, really every week, and say are we compelled to own this? Do we feel we need to own this? And if not, that's a very serious question that we ask ourselves. If not, then what's better than it? Let's get it out and let's refocus our efforts, so going from positions that are in the high 20s right now to closer to 20 is our long-term goal for the portfolio as we increase our focus.

Now, right alongside that are more income trades. That speaks just to what Nick was talking about. For more focus we have more time and ability to add more income trades, and Bryan, let's talk about a few of those that we could be doing regularly.

Bryan Hinmon: Yeah, so we've been kicking around the idea of trying to introduce one income trade a month, so 12 a year. And really that stems from our guiding light, our North Star. With our focus on earning stable returns, positive returns every rolling three-year period, we really like the stability that income can bring to the portfolio. And so we're going to make a more concerted effort of generating one income idea per month so that we can have that steady stream …

Jeff Fischer: Sometimes more.

Bryan Hinmon: Yeah, and it's going to depend on market conditions and what is available, but we're definitely going to have just a more concerted effort to introduce regular occurring income trades.

Jeff Fischer: And that began the end of July, so August is the first month where that's really in place, and we've been working on that the past several weeks.

Bryan Hinmon: Yeah and I really see sort of probably two angles we're going to attack from most often, and that's either the use of options, which we will continue to do, but probably do at an increased rate. And then we'll also look for sort of stealth dividend plays. You've got something like CME Group that pays a special dividend, or The Buckle, one of our recent acquisitions, a company that is different than anything we have in the *Pro* portfolio, but we really liked the possibility there to earn that beefed-up dividend.

Jeff Fischer: Yeah, most people may not know outside of *Pro* that The Buckle has a 2%-some dividend, so when you draw it up on Google Finance or Yahoo, that's what it shows. But every year of the past several years, they've paid a special dividend in the fall, so that's coming up now. That brings the yield closer to 7%, 8%, and there's some serious income right there, along with appreciation potential.

So we also are working into the portfolio more specific shorts. We want to short companies, or in some cases overpriced indexes, where we have a specific reason to believe that it's going to go down or not go up that much, so it works as a hedge that doesn't drag on the portfolio as much as a direct index short does.

So we've been working on this all year, getting more focused shorts into the portfolio, like Sony, like other companies that are languishing. And ideally we'll have shorts that go down even when the market goes up, and that's the holy grail of shorting; that's what we're shooting for in the long term.

Nick Crow: Yeah, and if the market does go down, it'll be a sweet buffer because those crummy companies fall at a time when the market's under pressure.

Bryan Hinmon: Yeah, it's been a little bit of a point of frustration for us this year with our SPY hedge. The *Pro* portfolio is still reasonably correlated to the S&P 500, so having that hedge in place does make sense, but we just don't like that the S&P 500 is comprised of 500 of the best, largest and strongest companies, and we're choosing to hedge our portfolio by making a bet against those companies, and we just think we can do a better job finding more targeted shorts, companies that we don't believe in.

Jeff Fischer: Definitely so. More focus, more income trades, very targeted shorts and another thing to talk about is just cash. Cash on the sidelines for opportunities. Nick, what can you add to that?

Nick Crow: I love cash. Who doesn't love cash?

Jeff Fischer: That sums it up.

Nick Crow: But cash is an investment, and it's investment in the future. So when we have a cash position, maybe we equitize it by writing puts like we have, some strangles and just written puts in general. Or perhaps it's an investment in, "Hey, there's good opportunities in the market right now, but there aren't great opportunities," as a hypothetical. And so we will keep some cash there in order to invest in those future great opportunities that we know are likely around the corner.

Jeff Fischer: And Bryan spoke to our North Star, which I'll just review quickly. It's our goal, it's what we're shooting for. It's a construct that we came up with that's inflation plus 7% every year, so it's averaging about 10% right now, and since the '70s, it has averaged about 11% annualized. It's actually done better than the S&P 500. Our North Star has done better than the S&P 500 since the '70s.

But that's not why we chose it. We chose it because it historically has never been negative; it's always up, and that makes it one heck of a goal for us to shoot for as an absolute-returns portfolio. Our goal is, as Bryan said, as you know, to make money all the time. And to us, "all the time" means every rolling three years, if we can't do it every year. Because we may not be able to every year, but every rolling three years we want to make money whatever the market does. And so our goal is something that will do that no matter what. That's our North Star.

That's what we're investing for, and that frankly is why we need the five points we just spoke to. We need to be focused. We need steady income. We need very targeted shorts, and we need cash on the sidelines, too. By combining all these things, that's how we believe we will continue to make absolute returns that are extremely pleasing and rewarding and have less risk in the process. So that is …

Nick Crow: How many investors doubled their money in the last 10 years? At the current rate of the North Star, that's what that would represent. The doubling of the actual money in your portfolio and its buying power …

Jeff Fischer: After inflation.

Nick Crow: After inflation, right. That's huge.

Jeff Fischer: Yeah, the market the last 10 years is basically flat. So we have our work cut out for us, but it's a goal, and if we can get even close to it, we know we'll be doing very well. Because as you've seen in up markets, we're not giving up upside; we're running this portfolio to capture upside. What we need to focus on, by being focused and having income and shorts, is doing better in down markets as well.

Bryan Hinmon: And keeping focus on that North Star really allows us to do that. We've implemented that as part of our investing process where, as we're running through the criteria that we look for, we always have in front of our mind: Is this consistent with the North Star? Will this help us track the North Star? And we really feel like the points that we identified are the direction that we need to go in with the North Star as our guide.

Jeff Fischer: So we're excited you're with us. We thank you for being with us. It's going to be an active end to 2012, and we're looking forward to a great 2013 and beyond as we really keep managing this portfolio for superior returns with less risk. Thank you guys for being here.

Nick Crow, Bryan Hinmon: Thanks, Jeff.

Jeff Fischer: Thank you, members. We'll see you on the boards, and Fool on!

Audio Extra: Earnings From 4 Pro Companies

Published Aug 9, 2012 at 12:00AM

Listen in with the *Pro* team in a new Audio Extra as they discuss recent earnings from buy recommendations **Gentex**, **Pacer International**, and **Tupperware**, as well as pizza purveyor **Papa John's International** (which is tasty, but currently on hold).

{% ooyala id="FiZDRsNTr7sitb0A7B4ngWgIRHnEy3AC" width="580" height="326" %}

Transcript

Jeff Fischer: Welcome to a new edition of Motley Fool *Pro* Audio Extra. I'm advisor Jeff Fischer and joining me in studio today is senior analyst Nick Crow and analyst Bryan Hinmon.

Male: Hi, Jeff.

Jeff Fischer: Guys, great to see you here. We're going to talk about many *Pro* companies that are reporting earnings as we burn through this earnings season, so let's kick it off, Bryan, with Gentex.

Bryan Hinmon: Sure thing. The funny part about this is that earnings actually were an afterthought to the story, but sales were good. They're up 15% in the quarter, 16% through the first six months, but again, like we said, those earnings were an afterthought to the news that I relayed on the board and there was actually really great conversation about on the discussion boards.

So the thesis here has changed a little bit, but the crux of the thesis still remains, and basically that crux of that thesis is that Gentex is in a growing market and is gaining increasing penetration within that market. And some numbers behind that, roughly 77 out of every 100 driving-age persons in the U.S.; there's an automobile for 77 out of every 100 driving-age persons. So that's sort of, if you think about that, like 77% of people have a car.

Jeff Fischer: That's quite an affluent country.

Bryan Hinmon: It is, and if you look at Tier One cities in China, that number is seven out of 100. Tier Two cities in China are three out of 100. Now I am not saying that China in Tier One or Tier Two cities will ever be anything close to what the United States is, but that is a huge differential. We're talking a 7X difference just in Tier One Chinese cities. So my point is simply that there is a lot of room for more automobiles to be sold globally.

Now within that, Gentex auto-dimming mirrors are in the 45% of U.S. cars, only about 25% of European cars and about 10% in Asian cars, so when you put these two things together, we've go the potential for a really large growing market and the potential for Gentex to grow penetration within those markets.

Jeff Fischer: Two things we of course believe will happen over time, and we see value in the stock, so we just bought more shares.

Bryan Hinmon: Absolutely. We have the shares rated at a Buy right now. We recommended a 2.5% allocation. That's up to 2.7 now, and we're quite pleased with that. And Gentex yields 3.1%, so as the market is casting doubt on this, we're getting paid to wait. We really like the management team.

Jeff Fischer: Exactly. So thank you, Bryan. Nick, let's talk about a stock that's on hold, but we still of course want to cover it, Papa John's Pizza.

Nick Crow: Yeah, Papa John's been an exciting name for us this year. It's up about 40% year-to-date, and for good reason. This last quarter was also excellent. Thirty percent year-over-year increase in earnings per share for us; most of that was on increased comp sales and new store openings, so honestly, this management team is just executing perfectly. A lot of the restaurant industry has kind of struggled in the last quarter, and they looked phenomenal.

Still, it's not a cheap stock right now. It's only generated about $50 million in free cash flow year-to-date, so free cash flow yield isn't that attractive, which is why it's on hold, but we have it valued still currently at about $43. I could make some arguments if this quarter's momentum continued to the rest of the year to raise that a bit, but not enough to put this on Buy, given that it's currently trading at 52.

Our allocation's healthy at 3.3%, and if the stock keeps risking, I'll actually trim it further down to about 3%. But there's reasons to hold this stock, even though it looks richly valued. CEO John Schnatter mentioned that — they have 4,000 stores right now, and he can envision a future with 10,000 stores, based on international growth. And as quickly as international's growing and as nice as those comp sales are, I think that might be a bit of pizza pie in the sky, if you will, but possible.

Jeff Fischer: But they're selling a lot of pizzas right now. Great execution, great promotions to move these pizzas and their maintaining margins throughout.

Nick Crow: Yeah, and getting better in lots of cases. I think they're taking share.

Jeff Fischer: So, members, we will look for better chances to buy in at a lower price. Maybe some options strategies, but right now it's on hold for those who do not own it. For those who own it already with us, we're holding.

So I will talk about Tupperware for a moment. Tupperware, which we all know since the '50s is selling food storage products, it's really a tale of two markets right now. About 60% of their sales now occur in emerging markets where growth is very strong. The rest occurs in developed markets where growth is slower and sometimes even negative. So in emerging markets, Tupperware offers a career path for thousands of people who otherwise wouldn't have one, and it offers products for a growing income class that can now afford to store food. They now have some disposable income.

So in these developed markets ... I'm sorry. Let's go back to developed markets. In developed markets, which are, as I said, about 40% of sales, Tupperware keeps the brand fresh by inventing new products all the time. Today only about one-third of sales are actually storage products. The rest are kitchen tools and utensils and the company aims to have new products account for about a quarter of sales every year.

But it's the emerging markets that are taking off. Brazil, China, India, all growing 30%, 40% year over year now the last couple of years and running. And there's still a very long runway there to continue to grow, so Tupperware is really — we should view it in the portfolio as an emerging-markets position, really, because that's some two-thirds of revenue, and it's the part that's growing strongly by double digits a year.

Overall, Tupperware aims to grow sales 6% to 8% a year, and that's with emerging markets leading the way, and they look to continue to improve operating margins every year and steady share buybacks and a rising dividend that goes up with earnings. So put it all together and you have a well-run company that is unique in its space, doesn't compete with others with its direct sales force and has really strong margins, and it trades around 11 times expected non-GAAP earnings for this year. So it remains a Buy. It's in the Ketchup Report as well as a Buy, and it yields about 2.7%, so I think it's a good, long-term holding.

Let's move on to another stock we've told all members to buy again recently, and that's Pacer.

Bryan Hinmon: Sure thing. Pacer International, so two businesses here on Pacer; the first is the intermodal business. This is the meat of the business right now, and it's growing, but it needs to execute a little better. This is the business that over the past two years the company has been turning around, and that turnaround sort of looks to be completed at this point, and now they're just sort of getting their sea legs. They need to execute a little better, but the business is growing. Profitability is okay, and it's really the crown jewel in the business.

The second business is the logistics segment. And what we found out this quarter was that the logistics segment is a little worse than we thought. It's more of a mess. So anyway, Pacer hired this guy named Bob Noonan to come in and right the ship, and he has basically come in with guns blazing. He's done three very notable things so far. He's put new people in place, new leadership in place and four strategic new managers.

He's also reset expectations prior to his arrival. The sales force was focused on hitting sales targets, and that sort of sounds like common sense, but Noonan came in and said, Hey, let's take a step back and let's focus on profitable sales, not just sales. So let's get more profitable, not just bigger.

And then finally, he began cutting fat and realized that in order to cut that fat, he was going to need to make some efficiency improvements and he picked out a new IT system for logistics to run on. So those three things are now sort of in the works, but they're probably going to take a little longer to play out than we had hoped for.

So that was a similar strategy to how the intermodal segment was turned around, so at this point we're giving the Pacer management team the benefit of the doubt. We are resting on the fact that the company's business is itself growing; the company's market, excuse me, is itself growing, and so while it'll be a bumpy ride as Pacer turns around the logistics business, we think it should grow into that growing market.

Jeff Fischer: All right, thank you, Bryan. So that's four companies we've covered now. Three are rated Buys and we've recommended everybody buy them in the very recent past, and right now they're rated Buys. Papa John's remains on hold for right now.

But to wrap this up, let's go around the table really quickly. I'll put you guys on the spot and tell me one thing about your company. Now Bryan, you spoke of two, so you'll have to do two.

Bryan Hinmon: Great.

Jeff Fischer: The one thing…

Male: Sweet.

Jeff Fischer: … of many that are possible, but one thing that's going to drive this stock higher that Wall Street may not expect, what is the catalyst that may; we'll start with you, Nick, because Bryan (unclear). Papa John's, what's to (unclear).

Nick Crow: So now that I've said that the stock is already high, we're looking for higher.

Jeff Fischer: Exactly. We still own it.

Nick Crow: And I already mentioned that the huge growth that we could see in store count, which is nice because the franchisees actually financed the growing stores. But I'll just mention something else that people might not recognize, but Papa John's this year won Brand of the Year in the pizza chain category from the 2012 Harris Poll, and they were No. 1 for the 11th time in 13 years in Prestigious American Customer Satisfaction Index, and they got the highest rating ever by an individual brand. I think Papa John's quality …

Male: Papa's in the house.

Nick Crow: Papa's in the house, and I think …

Jeff Fischer: It's crushing Starbucks even, because they're always way up there on the brand survey.

Nick Crow: Well there you go.

Jeff Fischer: Nice. All right.

Bryan Hinmon: I'll circle back with Pacer, because it's fresh on my mind.

Nick Crow: Pacer, top that.

Bryan Hinmon: Give myself some time to think about Gentex.

Jeff Fischer: You tackle Pacer; I'll do Tupperware, and then you're back on Gentex.

Bryan Hinmon: Fair enough. With Pacer, what I think we really need to keep an eye on is container turns, and basically this is a measure of efficiency, about how well the company is optimizing its root structure, how well it is planning a head on orders. And basically you should think of this almost like an airline. The less time that an airline stays grounded, the more efficient the operation is going to run and the more profitable the business will be.

It's the same thing with Pacer's containers. If they sit idle in a shipyard for a long time, they're not earning money, and so this is something that Pacer has a large degree of control over, and it is a metric that the company tracks and has said that it needs to get better at. So I think there's a focus there and we may see that clouded by what's going on with the logistics turnaround, but we need to dig deep and make sure that the company is doing well with what it can control.

Jeff Fischer: All right, thanks, Bryan. Tupperware, so two things people may not give it any credit for, is the developed markets that it sells in. The key ones are Germany, the U.S., France and Australia. And at times they have outstanding year-over-year growth, like close to double digits at times in Germany or France when the company goes in there and runs promotions and gets the sales force out there. What Tupperware is really about is motivating and keeping its sales force extremely productive, not unlike the containers. If they're not in use, they're not making money. So Tupperware has a large sales force foundation that it can get more leverage from if it motivates them and moves them in the right direction.

So I think the market is largely discounting — and in our valuation, too — that developed markets do not grow much at all, when there's a very good chance that they can, because the company shows how innovative it is and how when it moves from levers to sales force, sales force really kicks in and amps the sales up.

So now last one, Bryan, Gentex. What's it going to do to surprise investors to the upside?

Bryan Hinmon: Well I think what people are forgetting about with Gentex is that the company is an R&D powerhouse. They spend about 8% of sales annually on R&D, which is easily 3X what the typical auto parts supplier spends, and the company says that typically these developments take two to three years to work through and become commercialized. And then the automakers, because cars are designed on sort of six-year cycles or so, or six- to eight-year cycles or so, adoption is pretty slow.

All of this is to say that for the past 20 years, Gentex has been investing heavily in R&D, and so they have many more new product innovations waiting in the wings, and all the focus right now is on what's going on with the rear camera displays. But Gentex I don't feel like is worried about it that much because they have all of these other innovations that are sort of waiting to take center stage.

Jeff Fischer: All right, thank you, Bryan. Thank you, Nick. Thank you members for listening in. That's four companies we are very happy to own and recommend right now. If you have any questions, visit the boards. We'll be there to answer. We'll be talking to you again soon. Fool on!

Pro's Third Ketchup Report: 2 More Buys

Published Aug 9, 2012 at 12:00AM

Dear *Pro* Member,

We have two more stock recommendations today for members continuing to build out the equity portion of their *Pro* portfolio with us. In coming weeks, after you're all caught up on our stock buys, we'll start to add shorts and options to round out your holdings. You won't *need* to use these other vehicles if you don't want to, but they're part of *Pro's* absolute returns strategy for up and down markets. (For those ready to get rolling, we offer one possible option trade along with our second stock below.) If you're one of our many veteran members, please use these Ketchup Reports as recaps of why we like what we own and suggestions for catching up on your own allocations if you're lacking.

Check out the previous Ketchup Reports here and here if you need them. And now, on to the stocks!

Foolishly,

Jeff Fischer, *Pro* advisor

Your Next Buys

Rockwood Holdings

- **Industry:** Specialized chemicals and lithium
- **Allocation:** Invest 4.5% of your funds ($4,500 for every $100,000 you manage)
- **Recent Price/Dividend Yield:** $45 / 3.1%
- **Click For:** Original Recommendation; Latest Update/Discussion Board

Summary: Most people have never heard of Rockwood Holdings, but the company's products surround you in your everyday life. The lithium in your cell phone's battery, the fibers in your clothing, the coating on your car's disk brakes, the paint on your walls: Odds are high that Rockwood played a role in each product. The company is one of the largest miners of lithium in the world, and it produces synthetic chemicals used across a broad swath of industries, from pharmaceuticals to home construction and food packaging.

Management's focus on cost controls and its ability to raise prices on its highly specialized products has led to rising margins and profit, with about 10% earnings growth expected the coming year. The stock trades at just more than 8 times earnings and only 6.1 times EBITDA (9 times would be closer to fair). It also pays a new yield of 3.1%. Rockwood's earnings in Europe have been dinged in the conversion back to a stronger U.S. dollar, bringing investors a new buy opportunity.

Tupperware Brands

- **Industry:** Food storage and kitchen tools
- **Allocation:** Invest 2.6% of your funds ($2,600 for every $100,000 you manage)
- **Recent Price/Dividend Yield:** $53 / 2.8%
- **Click For:** Latest Update/Discussion Board (our original reports date us: they go back to 2009)
- **Alternative Trades:** If you're ready to use options, you can buy shares *and also* "sell to open" October 2012 $50 puts, lately around $1.20 per share, for a 2.4% yield in about 70 days. Sell one put for every 100 additional shares you could buy at $48.80 if the stock declines 6%; sell enough total puts to double your potential Tupperware position to 4.8%.

Summary: This is not your mother's Tupperware. With 61% of sales coming from emerging markets and only 30% of its products focused on food storage, Tupperware has come a long way from the parties that made it famous in 1950s American suburbia. Today, Tupperware is mainly an emerging-markets investment selling all kinds of kitchen tools. More than 85% of the world's population lives in emerging markets like China, India and Brazil, where Tupperware sales are growing strong. In those markets, the company has distinct advantages: It offers a viable career to people (mostly women) entering the workforce; it sells directly to the population, so it can grow rapidly in urban areas at low cost; and it sells affordable products perfect for families whose disposable income is growing, allowing them to begin storing food.

Growth is slower for Tupperware in developed markets, but those remain vibrant and filled with extra potential. Sales in Germany, a very large market, grew 8% last quarter, and the leading cookbook in France (yes, France!) is actually a Tupperware cookbook (so much for *haute cuisine*). Management buys back stock every quarter and increases the dividend with earnings growth, which is expected to reach 9% this year. The stock is down on worldwide economic concerns and the stronger dollar. It trades at 10.6 times expected non-GAAP earnings for 2012 and yields 2.8%.

Questions?

You can make these two buys at any time. Meanwhile, *all* of our active positions are listed on the Recommendations tab (click a ticker there to get more info). If you have questions, please post on the Getting Started board. And we're available every weekday from 3 to 4 p.m. ET to answer your questions on the Office Hours board! Welcome again to new members, and thank you again to veterans. You'll hear from us again soon. Enjoy investing!

David Gardner on *Pro*

In this new video, Fool co-founder David Gardner welcomes new members to the *Pro* service and [explains why he thinks it's so special].

Fellow Fools,

Successful investing means having a process that works and being disciplined enough to follow it. In my 25 years as an investor, I've seen many great examples of investments that deliver — and my fair share of those that don't.

Taking a high-level look at the lessons you learned from your past investments allows you to frame your questions around those lessons and discover the parallels between your holdings. Say you pinpoint the five stocks that have been your strongest over the past decade. What similarities do those businesses share? What has made them so successful? Find the common themes … and then do the same with your losers.

Live Chat Coming Up!

The *Pro* team is having a live chat this Thursday, Aug. 9, from 3 to 4 p.m. Join us with any questions you have about the service!

This exercise ideally will inform how you look at future investments, leading to better choices. In *Pro*, we want to make you money, true — but we also want to build you an intellectual framework for investing, something members can pass on from generation to generation in much the same way great investments are passed down. We want to build something that lasts, show you how to do it, and have you share it with those you care about, and we're still in the early stages of accomplishing all this.

Reframe, Fool

One key factor in success has to do with how you frame your investments. So many people throw companies into near-arbitrary buckets — technology, for example, or retail — without acknowledging that even for businesses in the same sector, revenue sources can differ tremendously. It's a much better strategy to frame your investments by *revenue source*. Whose money becomes the company's revenue? Why do they hand that money over? And how will it grow?

This exercise can illuminate how different, or similar, your positions may be, and how broad their revenue sources. That in turn helps you better diversify and manage your holdings. Let's run half a dozen *Pro* companies and two other favorites (**Google** and **Starbucks**) through this framework. Take your time thinking about each question and my provided answers (which can always be improved upon).

Company	Who Pays the Revenue?	On What Does It Depend?	How Does It Grow?
Covanta	Municipalities, utilities	Garbage disposal, energy consumption	Building more energy-from-waste facilities; higher energy prices
Gentex	Automobile manufacturers	Seeing value and utility in Gentex products	Selling to more manufacturers; developing new products
Google	Advertisers	Internet traffic; effective ad clicks	More traffic, more clicks, and higher click fees
GrafTech International	Electric Arc Furnace owners; other graphite electrode producers	Steel demand	More construction and industrial activity
InvenSense	Mobile electronics device manufacturers	A belief that motion-tracking sensors improve products	Getting motion-tracking sensors in more devices
Oracle	Corporations, governments, educational institutions	A need for database management	Adding new clients, cross-selling, price increases
StoneMor Partners	Families of the deceased; wills and trusts	Burials	Higher mortality rates; acquiring more cemeteries
Starbucks	Coffee drinkers	Enjoyment of Starbucks coffee	Adding more locations, greater beverage and food offerings

What Can We Draw From This?

For a start, we have three tech companies listed here — Google, InvenSense, and Oracle. But they sell to completely different parties, so the factors that lead to success will be independent for each. Is it instructive to lump them all under that broad tech label? Not really. They may all move with "tech stocks" in the short term, but in the long run they'll rise or fall on their own merits. We need to focus on who is paying these companies, and how well the businesses are growing that revenue. Risks are laid out in this table, too — just take the opposite of our "How Does It Grow?" answers: Google would suffer from lower click rates; InvenSense risks too few products attaching new motion sensors; Oracle risks market saturation.

Let's take a deeper look at Covanta, at the top. Our answers to "On What Does It Depend?" tell us this is a stable business as long as municipalities and utilities can pay the bills. Society is always disposing of trash, and people will always need energy. And Covanta isn't stupid: If a municipality backs out of a multi-year contract, in some cases Covanta takes ownership of the disposal facility the municipality paid to build. But our final question gets at Covanta's growth challenges: It takes time to build new energy-from-waste facilities, as the company is doing in Hawaii today. So Covanta offers us a stable but low-growth business; there's a place for that in our portfolio if long-term catalysts and a decent yield exist (and with Covanta, they do).

Extending this practice across an entire portfolio may show you more long-term overlap in revenue sources than you'd like in some places. *Pro* has some overlap of our own; our portfolio contains not just Oracle but also **BMC Software** and **OpenText**, both of which also sell software to corporations, governments, and educational organizations. Each company offers solutions for different needs, but owning all three puts our portfolio at risk if information technology budgets decrease. We know this, but we believe the valuations we're paying compensate for this intermediate-term risk, and we think IT budgets will ultimately grow as technology becomes ever more indispensible.

Overall, I recommend you get a nice notebook — I like the Moleskine ones — and make it your investing journal. Write down why you're buying something the day you buy it, so you can go back to your reasoning later, especially during tough times. Next, start to sketch out your whole portfolio with exercises like the one above. We'll have others later.

Earnings and Ketchup Reports Continue

We continue to work through earnings reports from *Pro* companies (see our latest coverage below), and we have another weekly Ketchup Report planned this week for new members and those who haven't taken positions yet. (See parts one and two.) We hope members are feeling as confident as we are as they start to build a *Pro* portfolio with us. Ask questions whenever they arise; we look forward to a long, profitable (and fun!) investment road ahead.

Foolishly,

Jeff (TMFFischer)

Pro Trade Roundup

- **3D Systems**: August $30 covered calls were exercised, selling 600 shares for a net $32 per share. We still own 600 shares (1.7%).
- **Gentex**: We bought 600 more shares at $16.44, bringing our total position back to 2.5%.

Guidance Updates

- None this week

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page. Questions on these? Visit our "Catch-Up Trades" discussion board .

- None this week. All Buy Firsts and Buys on our Recommendations page can be purchased now, but to avoid earnings surprises, you'll want to continue following our weekly Ketchup Reports in your inbox.

Coverage & Community

- **Earnings Galore:** We have coverage of **Pacer International**, **3D Systems**, and **Tupperware**. We'll have more this week.
- *Pro* **Calendar:** Who reports earnings next? See it in bold here.
- ***Pro* Office Hours:** We're here to answer your general questions; see our answers every weekday between 3 and 4 p.m. ET.
- **Working to Start Investing?** Ask any questions about your launch on our Getting Started board.

Reduce Your Market Index Short Positions to 10%

Published Aug 6, 2012 at 12:00AM

Tickers: SPY, SH, RWM, IWM

Reduce Your Market Index Short Positions to 10%

By Jeff Fischer

What We're Doing: For the second time this year, we're reducing our short of the S&P 500 index by about one-third.

What We're Thinking: The time is right to trim our index hedge for higher-conviction individual shorts.

What We're Expecting: We'll continue to exit our index hedge in favor of targeted short positions on individual companies and option hedges.

Trade Essentials

- **Action:** Buy to close (or buy to cover) enough of your short position in the **SPDR S&P 500** (NYSE: SPY) to match our reduced allocation. For *Pro*, this means closing about 600 shares.
- **Allocation:** About 16% of our invested assets are currently hedged with this index short. We're reducing our position to around 10% of our invested assets ($10,000 for every $100,000 you have in long positions).
- **Limit Guidance:** You can buy to cover at the going price.
- **Alternative Trades:**

    1. **If you're short *any* equity index, or if you own shares of an inverse ETF, reduce those positions by the appropriate amount to leave you about 10% short. If you have questions, please visit our SPY discussion board.**

  What's Changed?

  - **Last trade: We closed one-third of this hedge in late January.**
  - **Price change (from 1/26/12):** The index is up another 5.6%.

Despite a recession in Europe and stalling economic growth in the United States, second-quarter earnings and forward guidance from S&P 500 companies have so far proven resilient. As a result, the S&P 500 is only a few percentage points below its 52-week high, and any sign of economic progress, or any promise of more federal stimulus, could lead to higher prices. Our stock positions are also valued attractively enough in light of recent earnings that reducing our **SPDR S&P 500** index short again makes sense.

The index shorts *Pro* members are carrying are legacy positions, taken last year when shorting options at our broker were limited. These hedges continue to serve a purpose, and they're a comfort during volatile times, but we want to continue to systematically reduce them in favor of more specialized, targeted shorts and option hedges.

How to Follow Along

Some members used alternative trades to short various vehicles. To follow along with us, add up the value of your index shorts or inverse ETF positions, whatever flavor they are; maybe you own the **ProShares Short S&P 500** ETF or the **ProShares Short Russell 2000** ETF, or are short the **iShares Russell 2000** ETF, or are just short the SPDR S&P 500 like us.

In every case, compare the combined value of all of your index shorts (not your targeted shorts in things like **Sony** and the euro) against your long stock and long ETF positions. (Do not include cash.) Decrease your index hedges to around 10% of your invested assets. If you are 16% hedged with the SPDR ETF, as we are, you will simply need to close a bit more than one-third of the position to get down to 10%. You will "buy to close" or "buy to cover" the appropriate number of shares.

The Foolish Bottom Line

We'll reduce our position at some point after our 24-hour waiting period but before our 30 days are up. This index hedge has lost more than 13% for us, but the portfolio overall (which is what matters!) is up sharply since we initiated the short. We've kept pace with a rising market despite being hedged, and we can't complain about that. But replacing our vanilla index hedges with specific shorts and option hedging strategies is our preferred plan.

Next Step: Questions about your shorts (or pants, slacks, or knickerbockers)? Seriously, visit our SPDR S&P 500 board.

See Pro*'s holdingshere. See the team's and David and Tom Gardner's holdingshere.*

Buy More Gentex

Published Aug 2, 2012 at 12:00AM

- **What We're Doing**: Bringing our allocation to **Gentex** (NASDAQ: GNTX) back up to 2.5%.
- **What We're Thinking**: We still believe in the company's business, and we like the price.
- **What We're Expecting**: The company's manufacturing advantages and know-how will keep it firmly atop the growing market for automagically dimming mirrors.

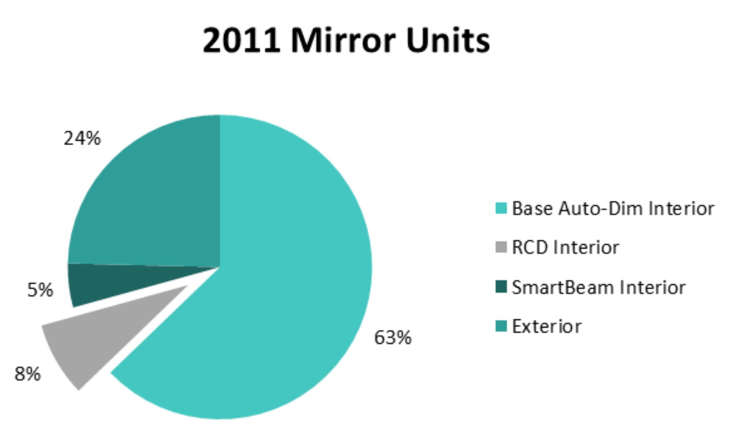
Trade Essentials

- **Action**: Buy more Gentex
- **Allocation**: Bring your position back up to 2.5% (*Pro*, will buy 600 more shares, for 2,200 total)
- **Price Guidance**: Use a limit order and buy below $17
- **Recent Share Price**: $15.85
- **Alternative Trade**: If you prefer to wait patiently for a lower share price and are willing to possibly miss out on buying more shares, you can sell to open December 2012 $15 puts, lately for around $1.15.

What's New?

Pro's first auto-related investment blew a tire in its first earnings announcement since we purchased shares. **Gentex** (NASDAQ: GNTX) makes fancy mirrors that include rear camera displays (RCDs), improving vehicle safety. The company shared that four out of 10 customers who currently use these mirrors would prefer the rear camera display on the radio screen instead. Automakers believe the radio option (while not yet commercially available) is less expensive than Gentex's mirror option and more in line with customer preferences. In our original recommendation, we mentioned a pending law that will require all new vehicles to be equipped with a rear camera display; no longer can we consider this a windfall of new business to Gentex, because at least 40% of its current customer base is going to choose the alternative radio-screen solution.

If RCD mirrors are no longer the lowest-cost way to ensure immediate compliance with the new law, adoption rates *will* slow, and our thesis on Gentex must change to reflect this new reality. That said, don't let the news blind you to the fact that RCD mirrors represent just 8% of total mirror units sold by Gentex.

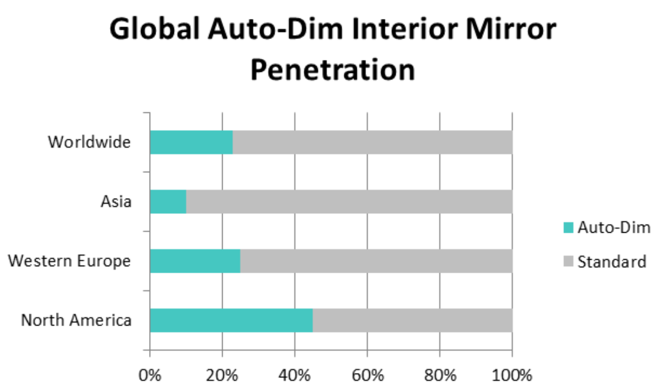


Source: SEC filings.

So how much will this change affect revenue and profit? Had it taken effect in 2011, we estimate that both numbers would have been 6% to 14% lower than was reported. The fact remains: The bulk of Gentex's business — and thus the bulk of its intrinsic value — is driven by global adoption rates of its more basic, but still unique, self-dimming (or auto-dimming) interior mirrors; they make up 63% of total units sold. In other words, *at least 92% of the company's unit sales should be relatively unchanged by last week's announcement*.

The key to our updated thesis is the belief that automakers will continue to include the company's base auto-dimming interior mirrors in new vehicles. Worldwide, only 23 of every 100 new cars has a Gentex auto-dimming mirror; we believe adoption worldwide should approach North American penetration rates (45%-50%) over the next 12 to 15 years as:

- the global middle class increases in number;
- cars get smarter and more technologically advanced; and
- more cars on the road bring an increased focus on driver safety.



Source: Gentex documents.

We believe the value proposition of auto-dimming interior mirrors stands on its own, regardless of what happens with RCDs. We're also confident of the value in the company's SmartBeam technology (which uses sensors and algorithms to optimize the use of high beams and low beams based on surroundings), and we love the ongoing R&D spending: Gentex regularly spends 8% of sales on research and development to bring additional features (like SmartBeam) to its auto-dimming mirrors. The company's product line is more diverse than it has ever been, it retains cost advantages in manufacturing, and it has the experienced management to carry out its plans. The price looks right for *Pro* to buy more shares and new members to initiate a whole 2.5% position.

Next Steps

- Bring your questions to the Gentex discussion board.
- For more details on the Q2 2012 announcements, see this post.

Pro's Second Ketchup Report: 3 More Buys

Published Aug 2, 2012 at 12:00AM

Dear *Pro* Member,

As you build a strong portfolio with us to bring you increasing value over the years, remember that success comes with an appropriate time frame. Sadly, there's no magic elixir that can double your dollars in a fortnight. But by investing in attractive businesses, you can make that magic happen nonetheless, doubling your money and beyond over longer periods. At *Pro*, we sweeten the recipe by adding option income, and we use hedges and shorts to score victories on falling prices. But it all starts with your core stock holdings.

Last week, we shared our three Buy First stocks. This week, we follow up with three Buys, and we'll have even more in the weeks to follow. If you're new to *Pro*, we recommend buying these stocks now or when you're comfortable; if you're a veteran hand, consider this a recap of the reasoning behind our holdings (and our suggested allocations). As always, take your time, use our Guidebook, ask questions on the discussion boards, and form your own personal plan to use *Pro* … and then stick to it. That's how you'll succeed with *Pro*, and whether you're a brand-new member or just catching up after being with us awhile, we're here to help you every step of the way.

Foolishly,

Jeff Fischer (TMFFischer), *Pro* advisor

Your Next Buys

Gentex

- **Industry:** Automobile parts supplier
- **Allocation:** Invest 2.5% of your funds ($2,500 for every $100,000 you manage)
- **Recent Price/Dividend Yield:** $15.85 / 3.28%
- **Click For:** Original Report; Most Recent Update; Discussion Board

Summary: Gentex makes fancy mirrors that improve the safety of vehicles. Most of those (more than 60%) are auto-dimming interior mirrors, which properly mute headlight glare during night driving. Another 25% of sales comes from are side mirrors with added electronic features, and super-premium auto-dimming interior mirrors make up the rest. This low-cost producer has nearly 90% market share in its core business, and it invests heavily in research and development to find new ways to add convenience and safety to its products. Only 23% of new vehicles are currently equipped with auto-dimming interior mirrors, and we expect that figure to grow significantly over the next decade — with Gentex leading the caravan.

Intel

- **Industry:** Microprocessors
- **Allocation:** Invest 6.8% of your funds ($6,800 for every $100,000 you manage)
- **Recent Price/Dividend Yield:** $25.85 / 3.48%
- **Click For:** Latest Update/Discussion Board (our original report from 2008 is exceedingly well-written, of course, but no longer current)
- **Alternative Trades:** If investing 6.8% of your funds at once isn't appealing to you, consider buying just half of a position to start. You can add the second half later or consider writing puts. Lately, you can "sell to open" October $25 puts for income of $0.87 per share, earning a 3.3% yield in less than three months. Sell one put for every 100 shares you can buy.

Summary: Intel is the world's leading manufacturer of computer microprocessors. The company's high-performance chips drive the powerful servers in data centers proliferating around the world. Its processors also power 80% of the world's personal computers, both desktops and notebooks, and those sales are growing in emerging markets. As if that weren't enough, Intel is now entering the enormous mobile space, too, with tablet and smartphone chips shipping in several new products this year. By investing billions in cutting-edge chip fabrication, Intel is able to steadily cut costs and improve performance, staying at least one generation ahead of the competition. Trading at less than 11 times earnings and yielding nearly 3.5%, with competitive advantages, this tech bellwether is an attractive foundation for a *Pro* portfolio.

Pacer International

- **Industry:** Transportation
- **Allocation:** Invest 1.5% of your funds ($1,500 for every $100,000 you manage). Please **use a limit order** at market prices so you don't push the price higher.
- **Recent Price/Dividend Yield:** $4.15 / N/A
- **Click For:** Original Report; Latest Update/Discussion Board

Summary: Pacer International is a broker of the shipping world, matching up small, disparate loads of cargo with empty capacity aboard various vehicles (usually trains and trucks). As an intermodal transport company, Pacer benefits from improving rail efficiency, lean inventory management trends, increased international trade, and a focus on the environment. We expect Pacer to become a larger player by capturing its fair share of this growing market and by turning around its third-party logistics business. This is a very small-cap company implementing a turnaround — it will be a bumpy ride, but one we think will end profitably.

Questions?

All of our current positions are listed on the Recommendations tab (click a ticker there to get more info). If you have any questions, please post on the Getting Started board. And we're available every weekday from 3 to 4 p.m. ET to answer your questions on the Office Hours board! Welcome again to new members, and thank you again to veterans! We'll see you again next week.

See Pro's holdings here . See the team's and David and Tom Gardner's holdings here .

Putting on the Ritz With Our Returns

Published Jul 30, 2012 at 12:00AM

Fellow Fools,

It's been a turbulent earnings season so far, with many stocks rising or falling 20% or more right after reporting results. In most cases, the company in question hasn't actually created or destroyed 20% in business value over the previous quarter, so this volatility mainly reflects the market's skittish mood. This, too, shall pass. In the meantime, as veteran *Pro* members know, we comb through every quarterly result to get an updated read on the health of every *Pro* company. We then report back to you with a summary posted on the company's discussion board and link to it in the Monday Memo. Last week, it was **Gentex**, **Intel**, and **InvenSense** (click the company name for our review).

We post these earnings rundowns to give you quick and useful news on your companies, but these days we have one more purpose in mind: Prioritizing our guidance to members who are still getting up to speed. Suppose you see we have a positive take on a company's earnings and you notice we've rated the stock as "Buy" on our scorecard. Good place to start if you're building out your *Pro* portfolio, right? Well, we might have a better one for you — one that we'll bring you in our weekly "Ketchup Report" (not to be confused with the Catch-Up Trade ideas you'll find in these Monday Memos).

Why wait for the emailed Ketchup Reports? Because we're more likely to issue brand-new trades and make portfolio adjustments soon after earnings, so new members joining during this opportunistic time may avoid unnecessary trades by following our weekly emailed guidance — like last week's — rather than rushing ahead. We'll selectively build your core *Pro* positions over the coming weeks, and then move to shorts and options.

So far, we've recommended you buy **Oracle**, **The Buckle** and **AmTrust Financial Services**. Our next buys will be sent to you within a few days. Keep watching!

A Popular Option

Pro Trade Roundup

- **3D Systems**: Rolled half of our August $30 calls to November $35 calls for a net debit of $1.85 each. We left the other half alone.

Guidance Updates

- **Oracle** : Buy First; Buy Around and Fair Value prices move up to $30 and $35.50, respectively.
- **Intel**: Moves from Hold to Buy; Buy Around price moves up to $25 and Fair Value to $29.
- **InvenSense**: Buy; but Buy Around and Fair Value move down to $14 and $20, respectively.
- **StoneMor Partners**: Moves from Buy to Hold pending portfolio decisions and member education.
- **CME Group**: Buy; but Buy Around and Fair Value move down to $52 and $62, respectively.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page. Questions on these? Visit our "Catch-Up Trades" discussion board.

- **ProShares UltraShort Real Estate** : Set up a synthetic short with a 1% allocation by selling to open January 2014 $25 calls and buying to open an equal number of January 2014 $25 puts. With the ETF at $25, aim to pay around a 6% to 7% premium, or $1.50 to $1.80 debit per synthetic short, or less. Shares aren't available for shorting (members are being called out at Interactive Brokers) and cost more than 4% a year to short if they were. (Revisit our original report.)

We will all have our fill of earnings reviews as they continue to roll out, so let's take a scenic detour in this Monday Memo and discuss another key part of investing: Calculating returns. Specifically, let's talk about put options that you write.

For the uninitiated, when you "sell to open" (or write) a put option, you're obligating yourself to buy shares of the underlying stock at your option's strike price if the stock declines below that price by your option's expiration date. For writing this contract, you're paid a premium up front that's yours to keep. Put-writing is a popular income strategy because the worst-case outcome is you're obligated to buy shares of a stock at a price you chose on day one.

Calculating the return on your written put is, of course, different from buying a stock and measuring its gain or loss. With put writing, the return is initially calculated based on the cash or account equity that you need to set aside to hold the trade open in your account. Remember, each put you write represents a potential obligation to buy shares, so that's why they require at least some cash set aside. Let's run through a simple real-life example (this is not an official recommendation).

The Particulars

- "Sell to open" December 2012 $10 puts
- Amount: Sell 1 put for every 100 shares you can buy
- Days until Dec. 22 expiration: 145
- Option bid price: $1.00
- Stock price: $12.50

In this example, the newly public company, which makes tiny motion tracking sensors for mobile devices, is trading around $12.50. The Pro portfolio holds a small position in the stock already (1.4%), but if we wanted to potentially buy more at a lower price, we could sell one December $10 put for every 100 shares we're willing to buy. Lately, these $10 options will pay us an even $1 per share that we get to keep. Then, if InvenSense declines below $10 by our December expiration, we would be "put" — or sold — shares of the stock. Our net start price would be $9, since we get to keep the $1 the puts paid us. So, let's calculate the return on this in the few ways that are most relevant.

Return on Cash

- Cash set aside to keep puts open: $10
- Payment received for writing puts: $1
- Return on cash set aside ($1/$10): 10%
- Time to return: 145 days
- Annualized return: 25.2%

If you're using an IRA or non-margin account, your broker will require all of the cash for your potential stock purchase be set aside for the duration that your put is open, so $1,000 for every $10 put you write (because every option represents 100 shares of stock). Since you were paid $1 on your $10 buy price commitment, you're making 10%, or more than 25% annualized, given that this expires in less than five months.

Calculated even more accurately, you actually only need to set aside $9 because you're paid $1 up front to write the put. In this case, your return on cash set aside is 11.1%, or 28% annualized. Of course, if InvenSense declines 20% or more to $10 or less by expiration, you're obligated to buy shares (unless you "buy to close" your puts before then at some cost).

Return on Buying Power

Now assume that you write puts in a margin account that mainly uses your equity rather than cash to hold open your put obligations. Most brokers require only 10% to 20% of a stock's potential purchase price set aside in cash the day you write puts on it, because your account value backs up the rest of your potential purchase obligation. But in Pro and in Motley Fool Options, we conservatively assume that you always need to set aside 30% of your potential purchase price — and you should always have the ability to easily buy the stock in entirety if it comes to that. Using your equity (or buying power) alongside just some cash, your return is much higher than the previous example.

- 30% cash set aside to keep $10 puts open: $3.33
- Payment received for writing puts: $1
- Return on cash set aside ($1/$3.33): 30%
- Time to return: 145 days
- Annualized return: 75.6%

You stand to earn a 30% return on the cash you set aside for this trade as long as InvenSense doesn't decline 20% or more (from today's $12.50 to below $10) by Dec. 22. This trade pays an annualized return of more than 75%. Realize that you're not borrowing any money to write puts even when you do the trade on buying power like this. You're simply using some of your equity to hold the trade open.

You can see how put-writing offers very attractive returns on your cash and equity. The key is you need to be ready to buy the stock with cash if it declines, and with a recent IPO like this one, volatility isn't unusual.

The Foolish Bottom Line

We'll have new put-writing trades for everyone in the future, of course; meanwhile, please ask any questions about today's column on the Memo Musings board. We'll see you later this week with more earnings coverage and a new Ketchup Report with a handful of select buys. Thank you for being a *Pro* member!

Foolishly,

Jeff Fischer (TMFFischer)

Coverage & Community

Ketchup Report: Motley Fool Pro's 3 Buy First Stocks

Published Jul 26, 2012 at 12:00AM

Dear *Pro* Member,

It's a day to celebrate! With this report, our newly extended *Pro* family takes its first official step together in investing for rewarding profits for years to come.

Below, we review for newcomers and veterans alike our three current "Buy First" stocks. If you're just joining us, think of these as recommendations for getting started. And if you've been with us a while, this is a reminder of why we own what we do — and where we think it's most important for you to match our allocations. We plan to send you weekly recommendation updates like this for all of our current "buys" over the next several weeks — along with any brand-new trades, of course. We're in the middle of earnings season, so we suggest that you wait for these reports before you begin buying most of our stocks.

We'll focus on building your core holdings first, then add shorts and options for all those interested. We have more tips for you at the end of this report, but first, here are our three Buy Firsts.

Foolishly,
Jeff Fischer, *Pro* Advisor

Start Here

The Buckle

- **Industry**: Retail
- **Allocation**: Invest 3.1% of your funds ($3,100 for every $100,000 you manage)
- **Recent Price/Dividend Yield**: $38.23 / 2% normally; nearly 8% annually the last five years including special annual dividends
- **Click For**: [Original Report](); [Discussion Board]()

Summary: The Buckle walks the fashion runway with low fashion risk by selling timeless jeans and tops from several popular external brands, as well as its own brand. The Buckle's management team is properly incentivized, has meaningful insider ownership, and runs the business wonderfully. We expect measured growth from 10 to 15 new stores per year and online expansion. We do not expect further operational improvements — if that were to occur, it would be pure upside. The Buckle should continue to pay its regular dividend and we expect it to pay out excess cash distributions, too, as it has for several years. We stepped up to buy shares after a tepid retail environment sent the stock lower, offering us a value stock along with a strong annual yield, too.

Oracle

- **Industry**: Enterprise Software
- **Allocation**: Invest 5.1% of your funds ($5,100 for every $100,000 you manage)
- **Recent Price/Dividend Yield**: $29.26 / 0.82%
- **Click For:** [Original Report](); [Most Recent Update](); [Discussion Board]()
- **Alternative Trades:** If you'd rather target a lower buy price for some of your Oracle shares, you can write ("sell to open") September $29 puts and lately receive nearly $1 per share in income, or write December $29 puts for about $2 per share in income. Write one put for every 100 shares or Oracle you would buy at a net $28 or $27 (since you keep the option income) if the stock is below $29 by expiration.

Summary: Oracle stands tall as the world's leading data management software provider for business and government. With diverse software offerings across multiple industries, an enormous customer base, and strong renewal rates, Oracle enjoys breadth and scale that provide sustainable advantages. Now Oracle's software leadership is propelling its new, high-margin enterprise hardware sales as the hard-driven company works to surpass **IBM** as the leading business hardware vendor. All this is trading at less than 11 times free cash flow, making Oracle the third Buy First in the *Pro* portfolio right now, with a healthy 5.1% allocation.

AmTrust Financial Services

- **Industry**: Insurance
- **Allocation**: Invest 5.8% of your funds ($5,800 for every $100,000 you manage)
- **Recent Price/Dividend Yield**: $29.56 / 1.35%
- **Click For:** [Original Report](); [Most Recent Update](); [Discussion Board]()

Summary: AmTrust Financial Services is a specialty insurer focused on writing low-hazard policies, specializing in small-company workers comp insurance. The company was designed to scale quickly and provide efficient capabilities to agents. We expect AmTrust to continue to renew policies at a high rate, expand geographically, selectively enter new markets where it can lead, and keep a tight rein on expenses. "Business as usual" should lead to great results as AmTrust continues to build niche leadership in its business lines and grow book value. This very steady performer is still very unknown, and it offers excellent value to devoted owners like us.

Next Week: More Pro Buys to Your Inbox

Next week, we'll send you our *next* handpicked "buys" for your portfolio. Meanwhile, you can see all of our positions on our [Recommendations tab](). You'll notice on this page that we list Buy Around and Fair Value guidance for every stock we own. Buy Around means you should aim to buy within 5% to 7% of the price listed. Fair Value indicates our estimated fair price for the stock today. From a stock's fair value, we expect to earn our desired rate of return, typically around 10% annualized.

In other words, fair value does not mean a sell price in most cases. The most likely reason we'd sell right at fair value is if we want to own a different stock trading at a discount to its fair value (the new stock would embody a higher margin of safety).

Clicking any ticker on the recommendations page gets you to our original buy reports. The reports have a link to the company's discussion board. Finally, we consolidate all guidance changes and company updates and mail them to you in the weekly [Monday Memo]().

Welcome again to new members, and thank you again to veteran members! If you have any questions, please post on the [Getting Started board]() or [*Pro* Philosophy board](). And remember, we're available every weekday from 3 p.m. to 4 p.m. ET to answer your questions on the [Office Hours board]()!

— The *Pro* Team: Jeff Fischer (TMFFischer), Nick Crow (TMFCrow), Bryan Hinmon, CFA (TMF42)

See Pro'*s holdings [here](). See the team's and David and Tom Gardner's holdings [here](). The Motley Fool owns shares of Oracle.*

Roll Half Your Covered Calls on 3D Systems

Published Jul 24, 2012 at 12:00AM

What We're Doing: Allowing for more upside on half our shares by rolling half our covered calls up and out; we're leaving the other half of our covered calls alone.

What We're Thinking: Earnings are due the morning of July 26, and if shares jump for a good reason, it will be difficult to attractively roll our calls then.

What We're Expecting: We're content to potentially sell half our shares at a net $32 if it comes to that, retaining an investment in the company with the chance at more upside.

Trade Essentials

- **Company: 3D Systems** (NYSE: DDD)
- **Scorecard Status:** Hold
- **Action:** Ideally with one rolling trade, "buy to close" half your August $30 calls and "sell to open" the same number of November $35 calls.
- **Recent Prices (bid/ask):**
    - August $30 call: $4.90/$5.20
    - November $35 call: $3.50/$3.80
    - Share Price: $34.40
- **Price Guidance:** Roll before July 26, but aim for the lowest debit possible.
- **Allocation:** Of our 3% stock position, half will still be covered by August $30 calls, the other half by new November $35 calls. Of *Pro's* 12 covered calls, we're rolling six.
- **Alternative Trades:**
    - **Don't have any 3D position? Or had your shares called away?** Do nothing. We'll watch for put-writing opportunities closer to our $21 "Buy Around."
    - **Own just 100 shares or fewer?** Leave your covered calls or your stock alone. You can consider rolling your calls or potentially selling half your stock after earnings. The stock is on Hold.
    - **Own an odd number of covered calls?** Roll enough covered calls to leave you with as close to a 1.5% allocation in the stock as possible if some shares are called away at $30.

What's New?

- **Previous Recommendations:** We wrote August $30 covered calls in April; we bought shares in April 2011.
- **Price change:** The stock is up approximately 50% from the time we covered our shares.

3D Systems (NYSE: DDD) has acquired seven companies this year in its quest to bring 3D printing to the home and office, and it sold $100 million worth of stock at $27 (our fair value) in June, but this activity has not slowed down its ascent. 3D printing has become a hot topic in the media, propelling related stocks to new highs. Above $34 today, 3D Systems trades at 47 times free cash flow and 29 times expected non-GAAP earnings for 2012, putting the stock price above our fair value estimate.

Given how the printing industry has historically been diffused by numerous machine producers, we expect 3D printers will eventually be as commonplace as color printers are today, which isn't necessarily a good thing for profit margins. But for now, 3D Systems is making a land grab to lead the consumer market. Just as we recognize the risks behind rapid acquisitions and investing in unproven markets, we share 3D's enthusiasm for the long-term potential for the technology.

This dichotomy drives our two-pronged approach: We'll keep half our August $30 covered calls in place, and depending on how earnings look Thursday, we may let half our shares be called away at a net $32 in August if the stock remains above $30. But we're rolling the other half of our covered calls to the next higher strike price, and out several months, to set us up for more potential upside and a better chance to roll again if that makes sense by November.

How to Follow Along

Ideally, use a "roll" order to make this trade with one transaction, simply "buying to close" half of your August calls and "selling to open" the same number of November calls. Here's how *Pro*'s math works out at recent prices:

Rolling Our 3D Systems Covered Calls	Credit/(Debit)
Payment received for writing August $30 calls	$2.00
Cost to buy to close August calls (splitting the bid/ask)	($5.20)
Gain/(Loss)	($3.20)
Payment received for writing November $35 calls (bid)	$3.60
Net credits received	$0.40

This increases our potential sell price on these shares from $32 to $35.40, or 11%. Following earnings, we'll decide what we want to do, if anything, with the remainder of our August covered calls. For now, it's more defensive to not roll them all.

Finally, we realize some members only received $0.70 to $0.80 to write the August $30 calls. If that's the case, you'll need to invest a bit more to make this roll. Assuming you were paid $0.75 to write the August calls, your math is like this:

Rolling Your 3D Systems Covered Calls If You Were Paid Less Than *Pro*	Credit/(Debit)
Payment received for writing August $30 calls	$0.75
Cost to buy to close August calls (split bid/ask)	($5.20)
Gain/(Loss)	($4.45)
Payment received for writing November $35 calls (bid)	$3.60
Net credits received	($0.85)

In this case, you're paying a net $0.85 in incremental capital for a potential sell price that's $5 higher, a worthwhile investment assuming 3D Systems rises or holds its ground. If not, then just like we are, you're giving up $1.60 in downside protection ($5.20 vs. $3.60 in current covered call value).

Next Steps: Have questions about this trade? Visit our 3D Systems board.

Welcome to Opportunity Season

Published Jul 23, 2012 at 12:00AM

Fellow Fools,

It's a fortunate time for new members to join *Pro*, because earnings season and European concerns are creating opportunities to buy great companies for less. Clear and Foolish thinkers can look ahead a mere year or two, past the horizon of most market traders, and pretty safely surmise that Europe will find some stability. More importantly, they know that great companies create value through thick and thin. This has always been true, and it's why the world's best investors — the likes of Warren Buffett and Peter Lynch — swear off obsessing with macro analysis and instead focus on knowing superior businesses.

We want you to own the best companies for years to come. That's how you grow wealth. Since we have an absolute returns goal, we also hedge and seek to generate steady income in any market.

New Member Guidance

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page. Questions on these? Visit our "Catch-Up Trades" discussion board.

- None this week as earnings roll in. Watch your inbox as we begin entire "Catch-Up Reports" on our stocks.

For newcomers who are also members of other Fool services, such as *Supernova*, we suggest that you manage the two services, and thus your money, separately — in your mind, at least. *Pro* is a standalone service and portfolio. Set aside an appropriate sum of money for *Pro* and manage *that* as your *Pro* portfolio. Treat your other Fool services as a diversification in investment strategies and manage each as an individual sleeve of your assets.

To start the great journey ahead of you, follow our Guidebook experience and focus on building your core stocks first. We'll be sending two to three attractive buy updates per week to everyone, so new members can build their holdings and veterans can be especially confident in what we own. As new members, you do not need to sell short until you're more fully invested; we'll catch you up once you are.

So start with the buys we'll send you to build your *Pro* portfolio. And if you don't want to use options — don't! (By the way, did you take your new member survey?) Each option alert usually has an alternative stock trade, and the ones that don't are just in addition to our core holdings. See more guidance at the end of this Monday Memo.

Earnings Rollin'

It's a pleasure to start to see quarterly earnings reports roll in, and especially nice to see some stock prices dip. Our companies are fundamentally strong, so any slowness now due to Europe is likely to lead to stronger growth in the year to follow as demand creeps up again. The stock market looks ahead, so once it believes the slowdown is playing itself out, it'll see things our way, too. As veteran members know, we post full quarterly reviews on each company's discussion board, and we'll link to them in each weekly Monday Memo, along with any updates to our buy guidance.

Let's check in on a couple now.

Intel Chips Ahead

Intel kicked things off by announcing 4.6% second-quarter revenue growth to $13.5 billion. The chipmaker — our largest long position, at 6.5% — continues to profit from server microprocessor sales as corporations build data centers. Emerging markets are driving growth while established markets tread water — for now. Spending billions to maintain its manufacturing and technology advantages, Intel is moving ahead more quickly than I've ever seen, confident its newest chips are going to continue to dominate servers and PCs — including Ultrabooks that launch this year — and start to take market share in mobile devices. With Windows 8 around the corner, the company expects sales growth of 3% to 5% in 2012 — not stellar like the last few years, but we'll take it in this difficult environment, especially as a stepping stone to better years ahead.

At $25, Intel's stock trades at less than 11 times earnings and yields 3.3%. Modestly above our $23.50 "buy around" guidance, the stock is currently on "hold," but we're reviewing results and there's a good chance our fair value and buy around guidance will increase soon. Stay tuned.

Covanta Offers Stability

Energy-from-waste recycler **Covanta** helps landfills by burning millions of tons of waste each year, turning the steam into energy. For 2013, about 75% of the company's waste revenue is due to remain under long-term contracts, and these contracts include inflation adjustments. This makes Covanta's revenue reliable *and* safeguarded.

Meanwhile, the energy generated in the process is largely sold under contract, too, with three-quarters of 2012 energy revenue already contracted or hedged. This stability allows Covanta to confidently predict $250 million to $280 million in free cash flow this year. The $2.2 billion company trades at just 8.3 times the mid-point of that free cash flow estimate, making it nearly 50% cheaper than the average S&P 500 stock. At the same time, the stock yields 3.6%. It's a stable, 3.2% allocation in our portfolio that remains a "buy."

Pro Speed Ahead

Earnings will roll in from several more companies this week, so new members should follow our Guidebook experience and Catch-Up trades rather than jump ahead; ask questions on the Getting Started board (or our new Office Hours board) and take your time to acclimate yourself to our happy corner of the investing world. An outstanding community of fellow investors is here to help you, too.

So watch your inbox for our Catch-Up trades, and you'll soon be on your way. You joined *Pro* to make money the coming few years and longer. Now make sure you follow through with us. We're glad you're here!

See you on the boards this week,

Jeff Fischer (TMFFischer)

Coverage & Community

- **Meet & Greet:** *Pro* members are welcoming newcomers. If you just want to introduce yourself and tell us your investing goal, this is the place to do it. Please do!
- **Good friends:** It's great to see old *Pro* Fools back in the fold, including ADrumlinDaisy (formerly MazonCreekRich) and 4stree. This makes us very happy!
- **Pro Calendar:** Get it at the top right of this page. Get even more calendar details from TMFMoosie's weekly post. We are looking forward to a great rest of 2012 and a terrific 2013.
- **Pro Guidebook:** Here's a groovy consolidation of *Pro* resources.

See Pro's *holdings here. See the team's and David and Tom Gardner's holdings here.*

Ketchup Reports: Terms to Know

Published Jul 20, 2012 at 12:00AM

As you use our Ketchup Reports to get, well, caught up with the *Pro* portfolio, make sure you're familiar with the terms on this page. As always, if you have any questions, ask us on the discussion boards — we are available from 3 to 4 p.m. ET every weekday through the end of August on our Office Hours board!

Terms to Know

- **Buy First:** These are the investments you should make first, setting a foundation for your *Pro* portfolio. In our opinion, these stocks usually have the best risk-to-reward profile, offering healthy upside and low downside.
- **Buy:** We like these as much as our Buy First stocks over the long haul, but they may be more volatile, and they may offer more downside risk while we wait for our thesis to play out.
- **Hold:** We currently have 10 stocks on hold, and we won't cover them in this report. They're always listed on the Recommendations page. We don't suggest buying our stocks on hold today, but if you already own them, hold them. In every Monday Memo, we'll share "catch-up" trades to help you get into stocks on hold at lower prices.

The Recommendations page is your "King of Guidance." That page is always kept current, so if something is listed there as a Buy First or Buy, we believe it can be bought today, period. The moment we no longer believe that, we'll move it to Hold on that page and announce that change on the *Pro* home page, as well as in the following Monday Memo.

You'll also need to know these terms:

- **Buy Around:** This is the ideal price around (or below) which you'll buy our recommendations, give or take 5% or even 10%. Investing is not a precise science; if we like a company enough to buy it, a 5% price difference is not going to change the outcome meaningfully. We provide this guidance to give you an initial guidepost, but if a stock is listed as a Buy or Buy First on the Recommendations page, that guidance applies regardless of the Buy Around price.
- **Fair Value:** This is the fair price for the stock — what we believe it's worth today. It is not the automatic sell price. In fact, a stock that's reached its fair value should proceed to achieve our desired rate of return (typically 10% or higher annualized). We only sell at fair value if we want a margin of safety (occasionally, there are stocks we only want to own below fair value) or we see something at a discount we like better.
- **Allocation:** We recommend each position as a percentage of the total amount you're investing in *Pro* stocks (exclude your fixed-income investments). If we say to buy 4.5% in something, then invest $4,500 in that stock for every $100,000 in your *Pro* stock portfolio. There is wiggle room here, and you should allocate in a way that makes you comfortable. Keep in mind, though, that our future guidance will assume you're matching our current allocation.

Set Up a Synthetic Short on the ProShares UltraShort Real Estate ETF

Published Jul 17, 2012 at 12:00AM

- **What We're Doing:** We're bullish on commercial real estate, so we're using options to short an *inverse* real estate ETF. By shorting this bearish ETF, we will profit as the commercial real estate market stabilizes and related real estate stocks go up.

Trade Essentials

- **Trade:** Synthetic short on the **ProShares UltraShort Real Estate** (NYSEMKT: SRS) ETF
- **Actions:**
  - Sell to open January 2014 $25 calls
  - Buy to open an equal number of January 2014 $25 puts
- **Allocation:** 1% (one contract of each option for every $250,000 you manage)
- **Price Guidance:** Aim to set up the $25 synthetic short at a net cost that equates to the current ETF price as closely as possible, paying just some premium. So, if the ETF is $24, aim to set up the $25 short for not much more than a $1 net debit. If the ETF is right at $25, aim to pay dimes, not dollars. You may need to attempt various limit prices until filled.
- **Alternative Trades:** Short the ETF directly if shares are available (they're scarce), or if you're trading in an IRA that doesn't allow shorting, just buy to open January 2014 $35 puts, aiming to pay less than $2.30 in time value.

The Big Picture

Commercial real estate in the United States is shaking off some malaise, with vacancy rates falling, rental rates ticking higher, and sales prices increasing across a broad spectrum of properties. Businesses are always interested in owning top-tier commercial properties thanks to their inherent utility, steady rental income, and long-term appreciation potential. And with little new commercial construction going on, the cornerstone for a slow recovery in this sector appears to be in place.

Apartment properties are already benefiting from more renters (along with tight credit for would-be homebuyers). According to realtor.org, apartment vacancies are expected to decline to just 4.4% this year, and the average rent is expected to increase 4%. Vacancies at office properties are projected to slip nearly half a percentage point, with rent potentially rising by 2%, and industrial spaces should see vacancies fall a full percentage point and rent increase about 1.6%. Despite the struggles of some high-profile retailers, even retail vacancies are projected to drop, and retail rent is headed up, too.

Commercial Vacancies	2011 (Actual)	2012 (Forecast)	2013 (Forecast)
Multi-Family	5.2%	4.4%	4.3%
Office	16.6%	16.2%	15.8%

Industrial	12%	11%	10.7%
Retail	12.5%	11.2%	10.7%

Commercial Rent Growth	2011 (Actual)	2012 (Forecast)	2013 (Forecast)
Multi-Family	2.2%	4%	4.1%
Office	1.6%	2%	2.5%
Industrial	(0.5%)	1.6%	2.4%
Retail	(0.2%)	0.8%	1.3%

Source: Realtor.org

The Vehicle

The **ProShares UltraShort Real Estate** (NYSEMKT: SRS) ETF is meant to provide two times (200%) the daily inverse results of the Dow Jones U.S. Real Estate Index (from here out, "the index"). In other words, if the index goes up 1% in a day, the ETF will decline 2%, and vice versa. By setting up a short position on this inverse ETF, we are setting up a *bullish* position on the underlying index, and thus on U.S. commercial real estate.

The ETF is "two times" short the 83 companies comprising the index, which is chock-full of dividend-paying real estate investment trusts (REITs). The underlying index trades at 2.2 times book value and yields 4%, and the ETF has an expense ratio of 0.95%; all of these numbers help our short, although we won't collect the dividend. By betting against the ETF that is two times inverse to this index, we'll effectively be two times long its companies on a daily basis.

Top 10 Index Holdings	% of Assets	Business
Simon Property Group	9.1%	Retail malls, outlets, community-lifestyle centers
American Tower	5.6%	Owns communication sites and towers
Public Storage	4.1%	Storage facilities
Equity Residential	3.8%	Multi-family properties
HCP	3.7%	Healthcare properties
Ventas	3.6%	Senior housing and health-care properties
Boston Properties	3.2%	U.S. office properties
Annaly Capital	3.2%	Owns, finances real estate investments
Vornado Realty	3.1%	Office and retail properties
Prologis	2.9%	Industrial real estate

As of July 13, 2012. Source: iShares.

We're confident in the outlook for commercial real estate, and we want to profit on that thesis. But we also want to profit from the flaws in this "ultra" — meaning leveraged — ETF. Because the ETF compounds leveraged results daily, it has not actually tracked its index over time. Like many other leveraged ETFs, ProShares UltraShort Real Estate ultimately lost value even during periods when it would be expected to gain, and it has obliterated value over five years.

Annual Return	2007*	2008	2009	2010	2011	2012**
ProShares UltraShort U.S. Real Estate (SRS)	63%	(49%)	(86%)	(52%)	(33%)	(30%)
Dow Jones U.S. Real Estate Index (DJUSRE)	(28%)	(43%)	23%	21%	1%	15%
Maximum 1-Year Loss on SRS Short***	(89%)	(134%)	(77%)	(15%)	(15%)	(3%)
Maximum Loss on DJUSRE Long	(30%)	(47%)	(41%)	(7%)	(21%)	N/A

Source: Yahoo! Finance. *Since Feb. 1, 2007. **To July 10, 2012.
***Maximum loss based on year's chronological low vs. high or high vs. low point.

According to ProShares, the ETF lost 49% annualized between its February 2007 inception and March 31, 2012. Over the same time, the underlying index *declined* 2.3% annualized, suggesting the inverse ETF should have generated a positive return of 4.6% annualized. But leverage, compounded daily (especially during periods of high volatility), decimates value because it means ever-larger gains are necessary to make up for any compounded losses. That was how the ETF managed to lose 86% in 2009 even though the index went up just 23%; and after soaring initially, the inverse ETF still lost 49% in 2008 even though its index *declined* 43%.

While it has performed poorly in all years except 2007, the ETF can gain steeply at times, pressuring short sellers like us. The "maximum loss" line above shows the negative return people who shorted the ETF could have suffered in any particular year had they shorted at the bottom that year and closed at the top. This part isn't shown, but if you had the misfortune to short the ETF at its 2007 low and close at its 2008 high, you would have lost 306% as the ETF soared. By the year's end, though, the ETF was actually down from where it started. We don't expect a repeat of 2008, but if you're following along, be ready to wait through spikes.

Next Steps

- **For More Discussion or to Ask Questions:** Visit our new ProShares UltraShort Real Estate discussion board. We'll hold the door open for ya.
- **To Learn More About This Strategy:** Visit our guide to synthetic shorts.
- **To Place Your Trade:** Revisit our "Trade Essentials" above and follow the oh-so-Foolish guidance.

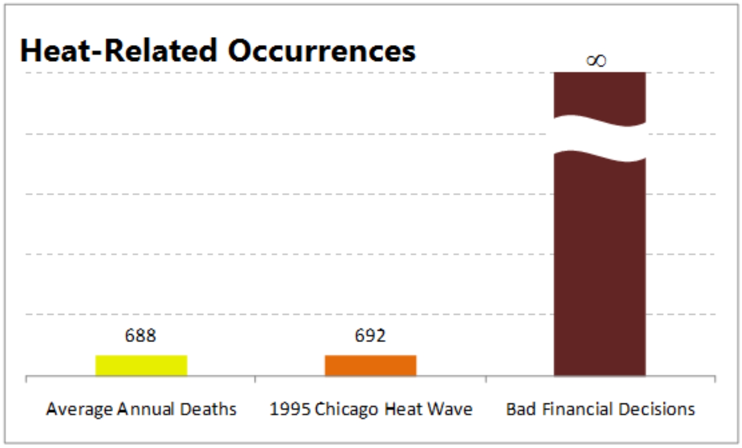
Apply Your Financial Sunscreen

Published Jul 16, 2012 at 12:00AM

Fellow Fools,

It’s hot. Washington, D.C. (and thus Fool HQ) recently sweated through our longest-ever period of temperatures higher than 95 degrees: 11 consecutive days. And the prior record was shattered, not just broken — we were treated to those 10th and 11th days even though nine was enough to set the new record. The average maximum temperature over the span (99.5°F) was also the highest ever, eclipsing that sweltering summer of 1930 we've all tried so hard to forget.

What's the big deal? Well, extreme heat is responsible for an average of 688 deaths each year in the United States. In ill-prepared areas, the toll can be much higher — the 1995 Chicago heat wave, for example, resulted in 692 deaths in 50 days. Secondly, extreme heat was the cause of 1.6 kajillion poor financial decisions in the last year alone.



Sources, left to right: Centers for Disease Control and Prevention; National Institutes of Health; analyst's extremely fertile imagination.

Weather Affects Your Financial Decision-Making Ability

Guidance Updates

- **Medtronic** moved down to from Buy First to Buy as we refocus our Buy First list.
- **WisdomTree Emerging Markets Small Cap Dividend** moved from Buy to Hold as we consider new investments.
- **Tupperware Brands** moved from Buy First to Buy in the face of greater currency headwinds.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page. Questions on these? Visit our "Catch-Up Trades" discussion board.

- None this week. Watch your inbox next week for the first "Ketchup Reports" on our stocks.

I don't mean to shock you, but I made up the 1.6 kajillion figure above. I'm also not out to make light of heat-induced death — but I did want to get your attention. As a recent academic publication ("Projection Bias in the Car and Housing Markets") shows, weather — whether extreme heat or extreme cold — impacts our ability to make rational decisions.

The study looked at records from 40 million automobile purchases and 4 million home purchases to establish baseline purchasing behaviors. It then applied a weather overlay (temperature, precipitation, and cloud cover) and found:

- When it's extremely hot, we buy more convertibles.
- When it's snowy, we buy more vehicles with four-wheel drive.
- When cloud cover is minimal, we buy more vehicles with black exteriors.
- When it's extremely hot, we overpay for houses with swimming pools (by about $1,600).
- When it's extremely hot, we overpay for houses with central air.

All that might seem logical at first glance, but think a bit deeper. Buying a car or a house is a major financial decision that can affect your life for years, maybe decades. Most of us work hard to be well-informed before taking on such momentous decisions — we do hours and hours of research, we build spreadsheets, we forego other purchases. All of that, and then a hot day rolls along and our brains betray us! The study goes on to show that cars purchased during times of extreme weather are more likely to re-enter the market via trade-in or resale — a telltale sign of regretting the purchase.

Where the Road ~~Melts~~ Meets the Rubber

Economics has a name for this behavior: projection bias. It's defined as the tendency to overweight the degree to which one's future desires will resemble one's current desires. The most common example of this is grocery shopping on an empty stomach: We project our current desires (being hungry) into the future (we shop like we will *always* be hungry). And while we might think we're smart enough to act differently when house-hunting than we do in the soda aisle, the results of the study suggest otherwise: "Projection bias may be prevalent in other important decisions ... that are similarly distinguished by having large stakes, state-dependent utility, and low-frequency decision-making." Everyone reading this is familiar with at least one "important decision" distinguished by "large stakes, state-dependent utility, and low frequency": investing.

Apply Financial Sunscreen

I'm not convinced the weather always causes terrible financial decisions, but I *do* believe the climate (both physical and economic) can do kooky things to our brains. I recently read an academic paper that showed investors take more risk when prior market performance has been good; in conjunction with the car-buying study, that news has me in SPF 70 mode. The current environment offers reason for concern: It has been physically hot this summer; fears of a Eurozone disaster have calmed at least a bit; and the S&P 500 has notched solid 8% gains so far this year. But we don't have to let the climate affect our investing decision-making. Here's how to avoid financial heatstroke:

1. *Use a cooling-off period*. Ready to plunk down some moolah on an asset (or in an investment) that seems like a great idea? Sleep on it (maybe even wait for a day with normal weather conditions), then ask yourself if your mind may be playing tricks on you. At *Pro*, we have an in-house contrarian constantly helping us assess the logic that underpins our decisions.

2. *Assess the decision in the context of your larger financial plan*. The investments we're discussing here are a bit higher-stakes than an impulsive pack of Tic-Tacs, so consider them in the proper context of a holistic financial plan. Is a philosophical fit? Ultimately, is it a net addition to your portfolio?
3. *Consider the cost of making a mistake*. Being wrong about whether you want a new car can really cost you – the vehicle depreciates significantly as soon as you drive it off the lot. Somehow a few thousand bucks disappear over the course of one tire rotation. With investing, you're putting capital at risk; there are also margin considerations and liquidity risk. Before taking the plunge on an investment, consider the costs involved if you were to change your mind.

The Foolish Bottom Line

Our brains are often wired to work against us, Fools. Acknowledging this fact puts us ahead of the crowd. A bit of financial SPF in the form of the steps above, combined with an investing journal that documents the results of previous decisions, can help us get us even closer to winning the battle with our minds.

Stay hydrated,

Bryan (TMF42)

Our Doors Are Open

Pro has reopened for a limited time, so you veteran Pros will be seeing some new handles on the boards. Please extend our new members a warm welcome as they get acquainted with their new service and start their *Pro* journey!

What Pro Believes

Published Jul 12, 2012 at 12:00AM

Getting Started With *Pro*

Back to Guidebook | Site Directory

Our investment mission and our North Star guide our portfolio decisions. But our portfolio itself is a reflection of the key beliefs we have about the world and investing. We attempt to make those beliefs come to life in the *Pro* portfolio, though some beliefs don't yet have a voice.

Below are many of Jeff's strongest big-picture beliefs in 2013.

Jeff Believes …	So We Own …
Technology is essential to our world; the sector will grow and become even more important. But tech will remain cutthroat, with players rapidly coming and going, allowing both long and short opportunities.	**3D Systems** , **BMC Software**, **Intel**, **OpenText**, **Oracle**
Well-managed financial companies are still inexpensive and will reward long-term owners.	**AIG** , **Amtrust Financial Services**, **Broadridge Financial Solutions**, **Wells Fargo**
U.S. home construction will continue to recover.	**GrafTech International** , **Rockwood Holdings**
Cash and checks will continue to lose market share to electronic payments.	**MasterCard**
The euro is overvalued compared to the dollar.	Short **CurrencyShares Euro Trust**

The 14 positions listed above represent nearly 60% of the assets in the *Pro* portfolio (as of Jan. 22, 2013). We carry the other positions because we believe they'll help us keep pace with our always-positive North Star, or because we believe in management or the notion that (for example) the world could almost never have too many coffee bars. Below are some of Jeff's other beliefs that we'll also seek to capitalize on in 2013:

- Energy prices will be relatively stable and will potentially decline as the U.S. taps new reserves.
- Flawed ETFs will continue to offer profit opportunities, especially for shorting.
- Auto sales will recover and reach new records, and autos will offer many more technological bells and whistles.
- Our interaction with technology will evolve to commonly include voice commands.
- Most all products will eventually contain a computer chip of some sort.
- Big data will drive ever more pinpointed marketing, and social websites will become still more popular (and profitable).
- Paper media of all forms in the U.S. will come close to disappearing within 10 years.
- Younger generations will want to be memorialized online more than with a tombstone.
- I will live to at least 100 years of age, as will all *Pro* members.
- Healthy eating will remain a growing theme in the U.S.
- Many dominant U.S. companies will thrive, if not lead, in emerging markets.
- Some big retailers will revive and prosper by offering a specialized experience unavailable online.
- Cloud computing — storing files on remote servers — will be an even larger business than expected.
- A sustainable competitive moat will be more important than ever to strong stock performance.
- Interest rates will start to tick up in the next 24 months, but not by much initially.
- Alongside owning great businesses, *Pro* will do well by generating increased income and doing more targeted shorting.

What about the rest of the *Pro* team? Well, Bryan Hinmon's (TMF42) beliefs are listed below. Nick Crow's (TMFCrow), on the other hand, are not; he said his job is to talk us *out* of our beliefs. He'd rather not think in terms of beliefs as he looks for investments — a diverse viewpoint we welcome. Here are Bryan's:

- The number of flawed ETFs will grow.
- Outsourcing will slow, but jobs won't necessarily return to the U.S.; plant and factory automation (robots) will play a big role in productivity.
- Governments at all levels will begin to peel away conservatism by trying new ways to save money.
- People will try to be healthier, but they will fail and look for quick fixes.
- Web security is a big deal, for companies and for individuals.
- People will see their houses as homes, not investments. (Sub-belief: Kitchens will get bigger and more high-tech.)
- Electronic payments will continue to take share from cash.
- Brands viewed as soulless or "corporate" will suffer as consumers embrace individualism and companies with a heart.
- Chocolate is awesome (the new coffee).
- The impact of "big data" is likely to prove overhyped except in specialized instances, such as targeted advertising or health care (for example, the self-tracking movement exemplified by sites like NutritionData.com). In both cases, the data is relevant not for its size but for what can be culled from it.

What Do You Believe?

There you have it, Fools — many of our beliefs updated and laid bare. What are your key investing beliefs? Share them on *Pro*'s Philosophy discussion board so we can discuss whether and how to put them into play in 2013.

Catch-Up Trades

Published Jul 12, 2012 at 12:00AM

First introduced in our Jan. 23, 2012 Monday Memo, Catch-Up Trades are our weekly suggestions for members who aren't yet entirely aligned with the *Pro* portfolio. As Jeff wrote then:

> Every week, when we see attractive trades, we'll share them in the Memo so members who are not already fully allocated to the position in question can follow along. (Assume that we, too, would be making these trades if we weren't fully allocated!) We hope the Catch-Up Trades will help you catch up with the *Pro* portfolio, or at least make money trying. We'll also single out stocks that have been freshly moved back to a Buy rating.

As well as in the Monday Memo, you'll always find the most recent Catch-Up Trades on our discussion board for the topic. Fool on!

What Pro Believes

Published Jul 12, 2012 at 12:00AM

Getting Started With *Pro*

1. Catch-Up Report No. 1
2. *Pro* 's Investment Strategy Guide
3. **What *Pro* Believes**

Back to Guidebook | Site Directory

Our investment mission and our North Star guide our portfolio decisions. But our portfolio itself is a reflection of the key beliefs we have about the world and investing. We attempt to make those beliefs come to life in the *Pro* portfolio, though some beliefs don't yet have a voice.

Below are many of Jeff's strongest big-picture beliefs in 2013.

Jeff Believes ...	So We Own ...
Technology is essential to our world; the sector will grow and become even more important. But tech will remain cutthroat, with players rapidly coming and going, allowing both long and short opportunities.	**3D Systems** , **BMC Software**, **Intel**, **OpenText**, **Oracle**
Well-managed financial companies are still inexpensive and will reward long-term owners.	**AIG** , **Amtrust Financial Services**, **Broadridge Financial Solutions**, **Wells Fargo**

U.S. home construction will continue to recover.	**GrafTech International** , **Rockwood Holdings**
Cash and checks will continue to lose market share to electronic payments.	**MasterCard**
The euro is overvalued compared to the dollar.	Short **CurrencyShares Euro Trust**

The 14 positions listed above represent nearly 60% of the assets in the *Pro* portfolio (as of Jan. 22, 2013). We carry the other positions because we believe they'll help us keep pace with our always-positive North Star, or because we believe in management or the notion that (for example) the world could almost never have too many coffee bars. Below are some of Jeff's other beliefs that we'll also seek to capitalize on in 2013:

- Energy prices will be relatively stable and will potentially decline as the U.S. taps new reserves.
- Flawed ETFs will continue to offer profit opportunities, especially for shorting.
- Auto sales will recover and reach new records, and autos will offer many more technological bells and whistles.
- Our interaction with technology will evolve to commonly include voice commands.
- Most all products will eventually contain a computer chip of some sort.
- Big data will drive ever more pinpointed marketing, and social websites will become still more popular (and profitable).
- Paper media of all forms in the U.S. will come close to disappearing within 10 years.
- Younger generations will want to be memorialized online more than with a tombstone.
- I will live to at least 100 years of age, as will all *Pro* members.
- Healthy eating will remain a growing theme in the U.S.
- Many dominant U.S. companies will thrive, if not lead, in emerging markets.
- Some big retailers will revive and prosper by offering a specialized experience unavailable online.
- Cloud computing — storing files on remote servers — will be an even larger business than expected.
- A sustainable competitive moat will be more important than ever to strong stock performance.
- Interest rates will start to tick up in the next 24 months, but not by much initially.
- Alongside owning great businesses, *Pro* will do well by generating increased income and doing more targeted shorting.

What about the rest of the *Pro* team? Well, Bryan Hinmon's (TMF42) beliefs are listed below. Nick Crow's (TMFCrow), on the other hand, are not; he said his job is to talk us *out* of our beliefs. He'd rather not think in terms of beliefs as he looks for investments — a diverse viewpoint we welcome. Here are Bryan's:

- The number of flawed ETFs will grow.
- Outsourcing will slow, but jobs won't necessarily return to the U.S.; plant and factory automation (robots) will play a big role in productivity.
- Governments at all levels will begin to peel away conservatism by trying new ways to save money.
- People will try to be healthier, but they will fail and look for quick fixes.
- Web security is a big deal, for companies and for individuals.
- People will see their houses as homes, not investments. (Sub-belief: Kitchens will get bigger and more high-tech.)
- Electronic payments will continue to take share from cash.
- Brands viewed as soulless or "corporate" will suffer as consumers embrace individualism and companies with a heart.
- Chocolate is awesome (the new coffee).
- The impact of "big data" is likely to prove overhyped except in specialized instances, such as targeted advertising or health care (for example, the self-tracking movement exemplified by sites like NutritionData.com). In both cases, the data is relevant not for its size but for what can be culled from it.

What Do You Believe?

There you have it, Fools — many of our beliefs updated and laid bare. What are your key investing beliefs? Share them on *Pro*'s Philosophy discussion board so we can discuss whether and how to put them into play in 2013.

Next Up in Pro: More Income, More Shorts

Published Jul 9, 2012 at 12:00AM

Dear *Pro* Member:

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Bristow Group**: Sell to open December 2012 $40 puts, lately $2.70 or higher, for up to 3.6%.

Questions? Visit our "Catch-Up Trades" discussion board.

As we enter the second half of 2012, the market is hounded by the same concerns investors had as early as 2010 … only worse. Greece's debt is now larger, Europe's monetary union is shakier, the U.S. economy is still struggling, and China's economic growth rate is now lower. And yet U.S. stock prices are broadly *higher* since then, because leading companies have been able to grow earnings and free cash flow.

I believe we may face this narrative, or one like it, for years to come. There are no easy fixes to federal debt burdens, and an aging population — especially in Europe and China — means a smaller tax base and larger social costs. Investors' worries about government obligations will periodically tug at the market, pulling prices into a seeming abyss — but as we've seen, leading companies will grow anyway, and the market will follow them higher.

We'll make most of our money in this tug-of-war by owning exceptional companies at attractive prices. We should also do very well shorting flawed companies and ETFs, and we'll add to our gains with options. But first, we need to get through second-quarter earnings.

Earnings Headed Lower?

A predicted 1% dip in the average earnings of companies in the S&P 500 this quarter compared to last year would break a 10-quarter streak of net income gains. Companies as diverse and dominant as **McDonald's**, **Procter & Gamble**, **Tiffany & Co.**, **Ford**, **Nike**, and **Starbucks** have all offered softer outlooks, citing economic realities in Europe (much of which is in recession) and China.

A majority of *Pro* companies are still expected to post higher year-over-year earnings when they step up to the plate beginning this week. But whatever the outcome, remember that slowdowns are common even during periods of long-term growth. No company, and no economy, grows in a straight line. Even the strongest bull markets in history have contained periods of weak earnings and lackluster economic growth. Investors who sell on weak earnings forget that disappointing quarters make it easier for the company to grow later — and the market is forward-looking.

Near-Term *Pro*

Changing gears, here's what to expect from *Pro* over the next few weeks:

- **Reopen:** *Pro* is opening to new members for a handful of days beginning July 16; this will be the second and final time *Pro* opens this year. Thank you in advance for welcoming new members with us!
- **Buy Updates:** Concurrent with the reopen, we plan to briefly review every Buy and Buy First stock we own to help everyone get invested with us. We'll e-mail you our updated thoughts on these stocks beginning in late July, focusing on a few companies a week. For veteran *Pro* Fools, we expect these reports to serve as an updated reinforcement of our thesis and a reason to reconsider any purchases you haven't yet made.
- **Sister Service:** *Motley Fool Options* will have many July expiration trades hitting your inbox soon. Keep in mind that *Options*' recommendations are separate from *Pro*'s.
- **Memo Topics:** You've suggested many good topics for the Memo. Thank you! We look forward to covering as many as possible.
- **Guidebook:** You'll see a Guidebook tab on the *Pro* homepage soon! This new section of the site will highlight the most important features of *Pro* at a glance, including our guiding philosophies, investment tutorials, and more.

And now, some portfolio notes I think you'll be especially happy to hear:

- **Monthly Income:** In deference to our North Star (and because taxes on dividends may head higher in 2013), we're stepping up our income trades. Our goal is to issue an *average* of at least one income trade each month (approximately 12 a year, when opportunity presents itself; some months will have a few income trades, some months none). Many of these trades will use neutral options strategies that require little capital. But purchases like **The Buckle**, with its high dividend yield, also count toward boosting our income. *Pro*'s new "income trade" initiative starts now!
- **S&P 500 Hedge:** Depending on how the market reacts to earnings this month, I hope to continue to decrease our S&P 500 hedge as we move toward more company and ETF-specific shorts. We have several other bearish or defensive positions under consideration.

Longer-Term *Pro*

It never hurts to keep a close eye on your desired destination. We want much of the *Pro* portfolio invested in great long-term holdings; we want to short flawed ETFs and failing companies; and we need to use options to generate income as we seek to follow our always-positive North Star. The portfolio is always a work in progress, and ideally its holdings — and our management of them — will always improve.

Thank you for reading, and posting if you like!

Foolishly,
Jeff

On Selling

Published Jul 2, 2012 at 12:00AM

Fellow Fools,

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Bristow Group**: Sell to open December $40 puts for around $3.40, for up to 3.5%.
- **Tupperware**: Sell to open October $55 puts around $3.50, or October $50 puts around $1.70, for up to 5.5% (or just buy shares).

Questions on these? Visit our "Catch-Up Trades" discussion board .

Bryan supported his Memo last week with a discussion-board post called "15% Sales Growers." Unsurprisingly given the many bright contributors here at *Pro*, what began with a simple list has grown into a 59-post collaboration (even Tom Gardner chimed in), with Fools discussing how long to hold a stock, the resultant portfolio turnover, and the ways actively managing a portfolio can add value. This memo is my contribution to that thread, so if you haven't read it, do so now — I think you'll find those posts at least as valuable.

When you manage your portfolio, make sure every decision is made with opportunity costs firmly in mind. In other words, it's important to hold an investment until you have a better one; the challenge is dealing with the very human desire that biases us toward more action. If we can do that successfully, opportunity costs alone should slow portfolio turnover to a healthy level.

That said, we know empirically that some investors add value to their portfolios by actively managing them — but most do not. We are here, as I assume you are, because we believe we are in the former group. And as the title of this memo suggests, I think the difference, in part, boils down to selling. We've written at length about the types of businesses we prefer to buy — those with stable, recurring revenue, high returns on capital, and strong competitive advantages. But selling is harder. Perhaps that's because we buy such good businesses, or maybe it's because it means the opportunity to be wrong twice (the sell itself, then the potential reallocation of capital). Perhaps we become attached to the businesses we own.

I don't know, but I do know that investors, on average, sell winning investments too soon and hold their losers too long. It follows, then, that we need to consider our sell decisions rigorously, and if we err, we should err on the side of selling too infrequently. Here (again) are my top five reasons to sell an investment, in ranked order. (This refers to full sales, not allocation adjustments.)

1. **Error.** As investors, we will make errors. As soon as we discover an error in our analysis that impairs the value of our thesis, we should sell.
2. **Fundamentals.** If the fundamentals of the business decline or fail to support our thesis or valuation, we should sell.
3. **Opportunity cost.** We should sell when we find a better risk-adjusted opportunity in another investment. (Cash is sometimes better; consider taxes as well.)
4. **Valuation.** If we buy a crummy business when it's mispriced, making it an attractive investment, we should sell that below-average business around fair value.
5. **Life.** If you have a pressing use for the capital in real life, consider selling.

It's also worth noting the following, from the last time I shared this list: "I try very hard not to sell great businesses at fair value (remember, it's ever-increasing) or because I have large gains. Instead, I remind myself that when you find great compounding machines, you should let them run and only sell when you have a better place for the money."

Making Adjustments

I admit I copped out a bit in my list above. I left out allocation adjustments, which made things simpler — and, unfortunately, less reflective of reality. Actual active management is more nuanced. I don't subscribe to the idea that I should know my holding period when I make an initial investment. Ideally, that holding period is forever. But the harsh reality is that few businesses last a lifetime, and even fewer last generations. If you own a company that's an exception to that rule (and you can somehow be sure of that), I suggest never selling it. In the meantime, knowing the reality of competition, we buy the best businesses we can at good prices and then keep our eyes on them. In fact, about half my research time is spent monitoring the businesses we've already purchased and their competitors.

Here's the process I use:

1. **Fair Value.** If shares reach our fair-value estimate, we review our estimate.
   a. If there is no further upside: We will sell or consider writing a covered call.
   b. If the long-term prospects are strong, but the risk-to-reward ratio is less favorable: We will reduce our allocation.

c. If more upside appears likely, and the business has grown even stronger, we'll keep our shares and may even add to them.
2. **Material Information**. We update our estimate of the business's value and its competitive advantage based on new corporate, legal, and macro information.
3. **Surprise.** When we're surprised by a stock-price move, we review the situation and incorporate any new information into our estimate.

Over time, businesses will either strengthen their advantages or lose them. The three checkpoints above allow us to update our holding period in real time with the benefit of new information not available when we first made the investment decision. If our review shows us that a business's prospects are improving, we won't sell. On the flip side, even our favorite companies risk having their profits and advantages eroded by able competitors; by keeping tabs on them, we can sell before it's too late — even if in a perfect world, we would have preferred to hold forever.

The Foolish Bottom Line

To keep the tax man at bay — and to benefit from our compounding machines' ability to reinvest capital at returns not available to us in the public markets — we need to hold our investments as long as we can. But even the leading businesses of today, some of which we own in *Pro*, may not always enjoy economic profits in the future. Keeping a keen eye on our businesses allows us to stay on top of any changes, which in turn helps us wisely allocate our capital to the investments we think offer the most attractive risk-adjusted returns. It's the *Pro* way!

— Nick (TMFCrow)

Coverage & Community

- **Infamous:** Put an hour to good use by reading and contributing to the 15% sales growers thread.
- **Where We Stand:** Jeff shares his thoughts on *Pro*'s year so far.
- **That's So Weak: Oracle** remains inexpensive after a weak Euro has a negative impact on results.

See Pro's *holdings here. See the team's and David and Tom Gardner's holdings here.*

Making Pro Fit You: If You're Fully Invested Elsewhere

Published Jul 2, 2012 at 12:00AM

Members joining Pro *from another Fool service and those who are already fully invested will need to consider changes to both their portfolios and their mindsets. Here's how to begin.*

As You Get Up to Speed

If you're already fully invested, you'll need to sell existing positions to add *Pro* picks. We recommend that you do this gradually and deliberately.

- List your existing positions in order from your highest-conviction holding to your lowest-conviction holding.
- If you own stocks from another Fool service, you can use that service's guidance on those stocks in building your list.
- If you don't know why you own a stock, that's a good reason to sell it.
- Be mindful of your sector and geographic allocations. You don't want to unintentionally end up owning nothing but oil or European stocks just because they were your favorites.
- If you're struggling with what to sell, post to the discussion boards — the *Pro* team can't give you individual advice, but our community members can and frequently do.
- When you're ready, incrementally sell your lowest-conviction stocks and use the proceeds to move into our Buy First and Buy stocks. Keep an eye on the Catch-Up Trades section of each Monday Memo for timely ways to enter our positions on Hold.
- Review your positions and portfolio after studying *Pro*'s mission and reviewing our North Star. Use that analysis to craft your portfolio going forward.

Once You've Settled In

Once you've built your Buy First and Buy positions, all you need to do is wait for further trade alerts from the team. Remember, though, that trade alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — one gradual step toward shaping the portfolio we want. You may decide to modify the strategy we choose for a trade; for example, you may wish to write puts instead of buying a stock outright. If you choose to deviate from our recommendation, make sure you (a) understand why we chose the strategy we did, (b) have a reason that the modified strategy better fits your portfolio, and (c) exercise caution by sizing the position a bit smaller than you would otherwise.

Your *Pro* Perspective

If you're joining us from another Fool service, it is critical that you understand the differences between *Pro* and some other Fool services. At *Pro*, we are building a portfolio, not offering investment ideas. *Stock Advisor* and *Rule Breakers*, for example, offer stock ideas from which members can pick and choose. In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the *Pro* portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

Next Steps

- **Got questions?** Bring them to our Making *Pro* Fit You discussion board.
- **Second opinion?** To see how we recommend you approach *Pro* under other circumstances (say, if you're building your portfolio in an IRA), download the entire "Making *Pro* Fit You" PDF by clicking here.

Making Pro Fit You: If You're Free-Range

Published Jul 2, 2012 at 12:00AM

So you're new to Pro *and able to follow every* Pro *portfolio move to a T? Here's what to do.*

As You Get Up to Speed

Match our portfolio positions and allocations, starting with the Buy First and Buy positions — and do so at your own pace. We'll be sending you four Catch-Up Reports designed to help you do just that, one per week through March 14. You'll find them in your inbox and on the Pro website, and they will include everything you need to know to make the trades. If you're comfortable with options, you can also consider writing puts to try to buy some of our stocks cheaper. Post on the discussion boards to get the community's feedback about any trades before you make them, if you like. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions. You can find a review of our most timely entry strategies for positions on hold in the "Catch-Up Trades" section in every Monday Memo.

Once You've Settled In

Once you've built your Buy First and Buy positions, all you need to do is wait for further trade alerts from the team. Remember, though, that trade alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want. You may decide to modify the strategy we choose for a trade; for example, you may wish to write puts instead of buying a stock outright. If you choose to deviate from our recommendation, make sure you (a) understand why we chose the strategy we did, (b) have a reason that the modified strategy better fits your portfolio, and (c) exercise caution by sizing the position a bit smaller than you would otherwise.

Your *Pro* Perspective

The most important thing to remember is that *Pro* is a portfolio service, not a collection of investment ideas. All of our positions exist in the context of our portfolio; if you elect to pick and choose *Pro* investments, it is critical that you understand how they fit into your portfolio. Our trades are intended to integrate with existing positions and to form a portfolio of assets that keeps our North Star firmly in mind.

Next Steps

- **Got questions?** Bring them to our Making *Pro* Fit You discussion board.
- **Second opinion?** To see how we recommend you approach *Pro* under other circumstances (say, if you're building your portfolio in an IRA), download the entire "Making *Pro* Fit You" PDF by clicking here.

Let's Get Growthy

Published Jun 25, 2012 at 12:00AM

Fellow Fools,

Pro Trade Roundup

- **American Express**: We wrote eight October 2012 $55 puts for $2.73 per share. We also established a bull call spread by selling eight October 2012 $60 calls (receiving $1.65 each) and buying eight October 2012 $65 calls (paying $0.47 each), for a net credit on the spread of $1.18. Our total net credit was $3.92 per share, earned in entirety if the stock is between $55 and $60 at expiration.
- **The Buckle**: We invested 3% by buying 1,100 shares at $38.16. Shares are a Buy First.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Intel**: Sell to open October 2012 $24 puts, lately $0.75, for up to 6.9%.
- **Vanguard Energy** ETF: Sell to open December 2012 $85 puts for $4.20 or higher, for up to 3%.

Questions on these? Visit our "Catch-Up Trades" discussion board .

I spend a lot of time with our summer interns here at Fool HQ, managing (with the help of an entire gaggle of Fools) the educational part of their experience. This has been a high-return way to invest my time over the past few years; plus, it's fun, and it helps me stay on top of the current slang among those crazy kids today. Past interns have indicated that they enjoyed their time here (no threats were made in the collection of this data) and that the experience helped them make significant progress as investors and business thinkers.

Earlier this week, I was talking to this year's interns about companies that grow quickly, and they seemed stunned when I challenged their assumption that growth, by default, is good.

Getting Caught Up in the How Much

Companies that grow quickly are exciting. They make for compelling news stories, and very occasionally, they create great wealth for their founders and investors. They're fun to talk about at cocktail parties and create a sense of regret if you missed out. And generally, the higher the growth rate, the bigger the hype. It's easy for investors to anchor on the loudest stories, even if they are incredibly rare: Just 11 companies currently in the Russell 3000 index have increased their revenues at or above 15% over each of the past 10 years.

In his book *Innumeracy*, John Allen Paulos writes, "There is a strong general tendency to filter out the bad and the failed and to focus on the good and the successful." Our psychology has us wired not to care that impressive, 15%-plus yearly growth has a low likelihood of persisting for 10 years. How low? Try 0.4% over the most recent decade. Ouch.

Focus on the How ...

I pressed our interns to let go of how *much* growth was being achieved and to instead focus their energy on assessing *how* that growth was happening. Very simply, growth can come in four ways:

1. Sell more stuff
2. Sell new stuff
3. Raise prices

4. Acquire sales

Not all of these are created equally, of course. Selling more stuff is easiest to do when the economy is strong. Selling new stuff is easiest when a company has resources — R&D, marketing and capital spending — focused on incremental and/or revolutionary improvements to its current product lines (or on creating new demand). It's easier to raise prices with the help of product differentiation or brand power. And acquired sales often come with a hefty price tag that makes them economically inferior to the other avenues of growth.

… And Focus on the How Long

The source of growth also affects its sustainability and duration. Acquired growth, of course, is a one-off. But pricing power can be an annual occurrence. An R&D engine can provide a lasting pipeline of new products to sell. And long-range trends that transcend the ebbs and flows of economic output can create decade-long tailwinds.

A quick look back at *Pro's* beliefs shows that we spend time thinking about just such trends, and we have our eye on companies that stand to benefit. What really matters for our purposes is having an informed opinion, one that differs from the consensus, on the potential duration of any growth. An extended period of above-average growth was the case given to me when I was pitched **Under Armour**. Internally, we've used such thinking to bolster our arguments in favor of **Apple** and **Papa John's International**.

The Foolish Bottom Line

Don't focus on outsized growth, however tempting it may seem. Growth is an outcome of a company's strategy, competitive position, and industry environment. As investors, we should instead turn our attention to the decisions and factors that allowed for the growth — and what might make it last.

Working with our interns is a great opportunity to review some of the vital basics of investing, stuff that can get lost in the day-to-day of being a portfolio manager and Fool. While my role as a teacher (or preacher, if you ask them) may put me front and center, this time of year I retreat back to the role of student more than they realize.

Happy summer, Fools,

Bryan (TMF42)

P.S. Come to the Memo Musings discussion board to see the list of 11 companies with 10 consecutive years of 15% revenue growth.

Guidance Updates; *Pro* Reopening in July

- **GrafTech International** , **Rockwood Holdings**, **OpenText**, and **Pacer International** all move down to Buy from Buy First. Why? Primarily because *Pro* is reopening to new members on July 16, so I'm fine-tuning what we end up telling our new members to buy first. Cyclical stocks (the first two), a stock with a new CEO (OpenText), and a stock in a turnaround (Pacer) are all worth owning for patient investors, but won't be suggested *first* to newcomers. We may return them to Buy First when we do tell new members to buy them, or after earnings are reported in July. *—Jeff Fischer*
- **Oracle**, which just reported satisfying earnings, moves up to Buy First from Buy.

Coverage & Community

- **Our Newest Rec:** *Pro* members are having great discussions on the merits of our latest stock buy — our first clothing retailer — and why we chose to act now.
- **Growth and Long-Term Buy and Hold:** *Pro* members discuss both in advance of today's Memo.
- **Our Hotel REIT Buying Again?** Member cnunlist does some investigative work and learns that **Pebblebrook Hotel Trust** is buying two new West Coast properties soon.
- **Positively Oracular:** Jeff has a drive-by post on an early earnings release from **Oracle**.
- **Battle Joined:** A proxy fight has begun at **BMC Software**. *Pro* is assessing.
- **Rules of the Game:** *Pro* Fools discuss margin requirements.
- **More Puts for Writin':** alex340 lists puts that meet *Pro* criteria.

The Motley Fool owns shares of Under Armour. See Pro's *holdings here. See the team's and David and Tom Gardner's holdings here.*

[Get Oriented]
[Manage Your Email]
[The *Pro* wiki]
[Getting Started & Help discussion]

- **What We're Doing:** Adding low-risk domestic retail exposure, a solid dividend, and plenty of upside.
- **What We're Thinking:** This company doesn't have to do anything out of the ordinary to generate North Star-like returns.
- **What We're Expecting:** The Buckle will conservatively grow its store base, execute admirably, and generate sufficient cash to reinvest in the business, grow its regular dividend, and routinely pay out special dividends.

[Use Options Like a Pro]
[Options U.]
[Options Glossary]
[Options discussion]

Trade Essentials

- **Action:** Buy 3% of The Buckle
- **Buy Around:** $41 or less (but you must use a **limit order** at current prices; the stock is thinly traded)
- **Fair Value:** $53
- **Dividend Yield:** 2.1%
- **Scorecard Status:** Buy First

The Foolish Bottom Line

Your *Pro* team doesn't know much about fashion, but we can read financial statements. And if the next decade of business performance by specialty retailer **The Buckle** (NYSE: BKE) looks anything like the last one, we'd be willing to wear whatever getup the company suggests.

The Buckle sells jeans, other apparel, and accessories at more than 400 retail locations across the United States, and we think the fantastic management team has figured out a formula that works: measured growth, middle-of-the-road merchandising, and great service. We're typically leery of the risks of investing in retail, especially fashion, but the proof is in the numbers for The Buckle. Shares are undervalued, the store concept is in the middle of its life cycle, and the company's financial prudence and operational acumen should lead to a growing stream of free cash flow, dividends, and extra payouts — all of which can help the *Pro* portfolio in our pursuit of our North Star.

A Great Operator With Room to Run

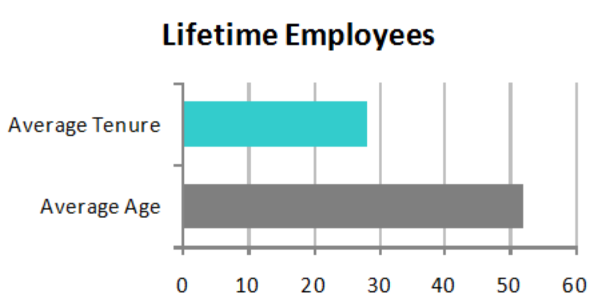
From 431 stores at the end of fiscal year 2011 (ending 1/28/12), we believe The Buckle has plenty of room to grow as it expands from the middle of the country to both coasts; it should be able to achieve wonderful store economics with the between 650 and 850 locations we expect. The table below outlines the key metrics we monitor for a retailer, and as you can see, The Buckle has fit into its jeans pretty well over the past decade. Not only has the company's footprint grown by 127 stores, it has sold more — and *earned* more — at each location thanks to its tight control over operations.

($ figures in thousands)	2002	2011	Annual Growth Rate
Stores	304	431	4.0%
Sales per store	$ 1,339	$ 2,498	7.2%
FCF per store	$ 57	$ 406	24.3%
Sales per square foot	$ 274	$ 462	6.0%
Inventory turnover	4.7x	6.2x	3.0%

Source: SEC Filings, S&P Capital IQ, and analyst estimates
Per store calculations are based on average stores open during the period

Management Who "Get It"

Another key factor we look for when assessing a retailer is its "soul." Anyone can sell jeans; Buckle's soul — what makes customers choose it over hundreds of other retailers — comes from its culture. Employees are trained extensively in providing service, from helping customers find the appropriate fit for the shape of their body (this is a bigger deal than many of us fashion-ignorant individuals realize) to offering lifetime hemming. Customers enjoy the special treatment, so they come back; employees enjoy being empowered fashion consultants, so they stay. In fact, the company's executive ranks are packed with staffers who started their careers folding T-shirts and cleaning dressing rooms. The key executives at The Buckle have spent, on average, 54% of their lives with the company.



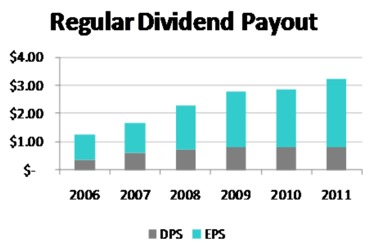
Source: Company filings.

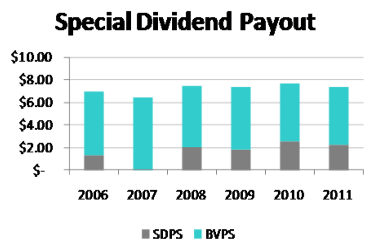
And insiders aren't just investing their time with The Buckle; they have their money invested there, too. Collectively, insiders own 43% of The Buckle's shares outstanding, and management's bonuses are tied to substantive performance measures like same-store sales, gross margin, and net income. We admire that executives are compensated for making The Buckle *better*, not bigger, and with management's interests tied so clearly to ours, we don't expect The Buckle to over-expand or engage in other practices that often get specialty retailers in trouble.

A Regular Dividend and So Much More

The Buckle began paying a dividend midway through 2003, and after quadrupling its annual dividend since 2004, it still pays out just 25% of its earnings. The company is funding its expansion with internally generated cash, but even accounting for this growth spending, the dividend eats up only 22% of free cash flow. On today's share price, the company's dividend yield of 2.1% is higher than the average (1.9%) yield on the *Pro* portfolio, and we think it has plenty of room to grow.

Now for this fashion show's big reveal: For five of the past six years, The Buckle has paid out special dividends. The total of these payouts comes to $9.88 per share, or 26% of today's share price. The company can afford to do this because it generates enough cash to keep its stores current (and fund new openings) and still has plenty left over — with no debt. At the end of 2011, 44% of The Buckle's total assets were cash and investments.





Source: Company filings.

To us, The Buckle has two sides: a very healthy operating business and a bank account. We trust management to allocate the cash in that bank account appropriately, and we appreciate their propensity to return any extra to shareholders. While we can't count on special dividends, it is worth noting that the average yield over the past five years, including these payouts, has been 7.9%. Meanwhile, the company's operating business has grown bigger, more profitable, and more valuable: Over the past six years, shares have doubled from $20 to $40.

An investment in The Buckle suits *Pro*'s penchant for superior businesses, steady income, and a favorable risk/reward profile. Shares can be purchased for only 9.8 times free cash flow – you won't see a sale this good at its retail locations. We recommend you try on some shares today.

Trade Options on American Express

Published Jun 20, 2012 at 12:00AM

Trade Essentials

- **Purpose:** Earn income or buy shares if they fall
- **Trades:**
  - Note that some members may be able to complete all three actions in one trade. If you can't, do the following:
  - Sell to open October 2012 $55 puts, lately around $2.40.
  - Then in *one*other separate trade:
    - Sell to open October 2012 $60 calls in a number equal to the puts you just wrote, lately for about $1.95.
    - Buy to open an equal number of October 2012 $65 calls, lately costing about $0.55 (this sets up a bear call spread for a credit of about $1.40).
- **Price Guidance**: On the three legs combined, target a net credit of around $3.80 to $4.00. As prices change, accept no less than $3.50.
- **Allocation:** Three percent (if the $55 puts are turned into shares, for a net cost of around $51). Trade one contract of each option for every $170,000 you manage; for *Pro*, that's eight contracts.
- **Alternative Trades:**
  - Just write the October $55 puts, one for every 100 shares you would buy, lately paying you about $2.40.
  - If you can't write puts, aim to buy shares if they decline to about $52.
- ***Motley Fool Options* Member Guidance:** If you're already writing a covered strangle on American Express in *Motley Fool Options*, just continue to follow that strategy with me in that service.

How to Follow Along

We're interested in becoming investors in **American Express** (NYSE: AXP), one of Warren Buffett's largest equity holdings. But we're not buying outright today, because we have the tools to target a lower buy price — or earn income if our desired price isn't reached.

As with many large financial stocks, options on American Express enjoy healthy premiums, but unlike most large banks, the company is in excellent shape. The credit card giant was profitable throughout last decade's financial implosion and now enjoys historically low delinquency and charge-off rates. We'll talk more about the business below. First, here's how to follow along, and how the trade may play out:

- Sell to open one October 2012 $55 put for every 100 shares you're willing to buy ($5,500 worth). We're targeting a 3% allocation if we get shares.
- Using a spread order, set up one spread for every put you just wrote. Sell to open October 2012 $60 calls, and buy to open the same number of October 2012 $65 calls to cap your risk on the written calls. This sets up a bear call spread.

Here are our possible outcomes at Oct. 20 expiration:

American Express Stock	$55 Puts	$60/$65 Bear Call Spread
Below $55	We let the puts get exercised for a net buy price around $51, or we close early to write new puts	Expires as income
Between $55-$60	Expires as income	Expires as income
$60-$64	Expires as income	We can close the spread and enjoy a partial profit on the three options up to $64

$65 and higher	Expires as income	Overall, we lose a maximum of just $1 per contract at any price above $65

(Options pros will recognize this as a partial iron condor; the only part missing is the purchased puts to cap our downside on the $55 written puts. In this instance, we're confident enough to buy the shares instead if they decline.)

From its recent price of $57, the stock can move considerably and we'll still profit:

- American Express needs to fall more than 10%, to less than $51, for us to end up with a loss by expiration.
- The stock can increase by 12% before we start to see a loss on the upside.
- No matter what, our maximum loss if Amex soars higher than $65 is $1 per contract, because we have a $5 bear call spread and about a $4 credit to set up our positions.
- On the downside, our losses will mimic those of stock ownership if the price hits $51 by expiration.

Follow-up: Writing $55 puts leaves us ready to buy a 3% position, and we plan to strangle it (write more puts *and* calls on it) if we become shareowners. Over the long term, we view American Express as an "option income" stock with substantial upside. Once we have shares, we will likely want to roll our strangles to higher strike prices as the stock climbs, allowing us to keep our investment and enjoy the price appreciation. This business is worth owning.

The Business

- **Share Price:** $57
- **Buy Around:** $52
- **Fair Value:** $61

In the quarter ended March 31, American Express had 98.7 million credit cards in use, up 7% from a year ago — half in the United States and the rest spread around the world. Customers swiped their Amex cards to the tune of $211 billion in transactions last quarter (an average of $3,770 per card member), making its customer base the most lucrative per capita of any credit card.

Management's "spend-centric" business model drives up revenue by spurring customers to spend more on their "Amex" card. Finance charges and card fees make up most of the rest of revenue, but even so, customer loyalty runs deep and brand equity is top-notch. Card users appreciate the superior customer service and rewards, and merchants appreciate that Amex users on average spend more per purchase than other card users.

American Express operates what it calls a "closed-loop network," letting it capture more of the value chain in each transaction. The company issues and manages its card base, originates loans to users, manages its network with merchants, and runs the network. At competitors **Visa** (NYSE: V) and **MasterCard** (NYSE: MA), by contrast, independent banks issue cards and originate loans. That means American Express isn't as removed from its end users as these two giants are, making its hands-on customer service even more of a competitive advantage. For instance, the company is able to closely monitor customer spending and drive results where needed. The setup also helps Amex capture more revenue from each transaction, gives it control of its brand, and provides income on loans it makes.

American Express	2007	2008	2009	2010	2011
Net Interest Income	$3,443	$3,646	$3,124	$4,869	$4,641
Commissions and Fees	$18,939	$19,342	$16,571	$18,684	$20,974
Revenue Before Loan Losses	$27,559	$28,365	$24,337	$27,582	$29,962
Provision for Loan Losses	$4,103	$5,798	$5,313	$2,207	$1,112
Total Revenue	$23,456	$22,567	$19,024	$25,375	$28,850
Net Income	$4,126	$2,871	$2,137	$4,057	$4,899

Dollar amounts in millions. Source: S&P Capital IQ.

While transaction and card fees represent about 70% of Amex's revenue, loan losses can balloon during a crisis, punishing the stock. As the table indicates, this is what happened in 2009, when charge-off rates leapt from the mid-single digits to nearly 10%.

Today, accounts more than 30 days past due amount to just 1.4% of the total, and the net write-off rate is a historically low 2.6%. True, another financial crisis could disturb this calm and hit the stock. But we expect American Express to again prove its resilience in the face of any future adversity; since 2008, management has only become more stringent with its lending standards.

Finally, American Express is perpetually engaged in countless lawsuits around the world, including one with our own Department of Justice. We'll stay informed about these issues, but we don't expect them to disappear; that's the cost of running a dominant business that's so tightly tied to commerce.

Next Step: We can help you set up this options trade and answer questions on the business at *Pro's* new American Express discussion board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Where We Yield and Where We Stand

Published Jun 18, 2012 at 12:00AM

Fellow Fools,

We're nearly halfway through 2012, the U.S. stock market is up modestly, and we're keeping a close eye on the *Pro* portfolio. Here's what we're watching and what it means.

Pro Trade Roundup

- **Pacer**: We bought 1,900 more shares through our June $7.50 puts, for a net cost of $6.70 each. This brings our total allocation to 2.3%.
- **Pacer**: June $5 puts expired as income.
- **Bristow**: June $50 covered calls expired as income.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Bristow Group**: Sell to open August $40 puts, lately $2.40, for up to 3.4%.
- **CurrencyShares Euro Trust**: Short up to 4% of your portfolio if you haven't.
- **Vanguard Energy** ETF: Sell to open December $89 puts around $4.50, for up to 3.1%.

Questions on these? Visit our Catch-Up Trades discussion board .

Where We Yield

GrafTech International is the only one of our companies to offer weak guidance lately. The reason — soft demand for the graphite electrodes used in steel production — is beyond the company's control, and it's not having operational issues, so we'll simply wait through this downturn in a cyclical industry. We believe steel demand will eventually grow again, and GrafTech should experience a nice upturn when it does (at which point we'll be attuned to selling). Shares look inexpensive while we wait, and the stock remains a Buy.

Specialty chemical purveyor **Rockwood Holdings** initiated a 3% dividend last week, continuing a trend we generally like to see — companies are increasing dividend payout ratios, or rolling out dividends for the first time, in numbers I haven't seen before. There are two main reasons: Managers know investors want yield in a nearly yield-free world, and businesses are flush with cash. A dividend benefits investors indirectly, too, because management tends to be more prudent with capital when they know they have a payout to make. Rockwood has been saying since last year that it would consider a dividend once its cash and receivables balance exceeded $500 million, so its generous 3% yield arrives right on schedule.

Our waste-disposal expert, **Covanta**, is riding the same wave; it recently doubled its payout, giving it a 3.8% yield. And global futures exchange **CME Group** hiked its dividend 59% this year, providing investors with a 3.2% yield that grows to nearly 5% when you include the special annual dividend it paid in March. And, of course, **Apple** is getting on board too, initiating a dividend of 1.8%.

Finally, **Pebblebrook Hotel Trust** increased its dividend 300% this year (and will continue to do so as income grows), giving us 2.2% today. And **MasterCard**'s dividend recently doubled — but the stock still yields just 0.3%, and the company only pays out 8% of its net income. It and **Oracle** — which pays out 12% of its income to yield 0.9% — could easily grow their dividends severalfold and not miss a beat.

Including our ample cash balance, the *Pro* portfolio as a whole is paying us 1.9% right now, on par with the S&P 500. Our dividend payers yield an average of 2.7% each. (Click here for a recent summary.) This is a good start, but we want more income.

Sideways, Snaky-Slithering Market Ahead?

Europe appears to be nowhere near a resolution to its debt and structural currency problems. At home, the United States is barreling toward a contentious election cycle; unemployment remains stubbornly high, and if action isn't taken this year, we'll face a "fiscal cliff" of tax increases and spending cuts in 2013. Income investments are important to us in this context; how else should we invest?

- We continue to own superior companies trading at prices that offer healthy, North Star-topping upside with reasonable risk. We're looking for new businesses that meet those criteria, too, and we're ready to hold through some volatility to get the results we seek.
- We are newly targeting a *steady flow of income trades*, so keep an eye on your inbox. Expect more income ideas of all shapes and sizes (though most won't require much capital, because we want to keep cash available for buying opportunities even while we earn income).
- We continue to carefully seek more companies (and ETFs) for shorting to join our lonely **Sony** short position.
- The **SPDR S&P 500** ETF serves as our general market hedge while we look for more companies to short (some members have other indexes as hedges, too).
- And we're still skeptical about the euro in its current format, so we remain short **CurrencyShares Euro Trust**.

What's It Mean?

We always want our *Pro* portfolio to work together, long and short, options and hedges. And it's always a work in progress, even though we work to keep our turnover low — we know active trading is a costly burden rather than a boon. Dividends aside, though, the income side of our portfolio has been light this year. We are looking to remedy that on an ongoing basis starting this month, whenever opportunities exist.

We'll keep buying and holding companies with strong upside (many with dividend yields to boot), shorting weak companies, hedging, and using options for strategies that include income. As a result, our portfolio should achieve what we all want over time: Healthy value, growing in numerous ways, with less risk than someone who is 100% invested long.

Please visit the Memo Musings board to discuss this weekly feature, and thank you for being a part of *Pro*! We care about your financial future, and that's what we're investing for.

How Is Pro Performing?

Published Jun 11, 2012 at 12:00AM

Fellow Fools,

There's only one way to learn how your portfolio performs in good markets and bad: Hold the same positions through various market conditions, and let time pass.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Bristow Group**: Sell to open September 2012 $40 puts for about $2.70 or higher, or September 2012 $35 puts for about $1 or higher, for up to 3.6% of your portfolio.
- **Vanguard Energy**: Sell to open December 2012 $85 puts for around $4 or higher, for up to 3.1% of your portfolio.

Questions on these? Visit our "Catch-Up Trades" discussion board.

As we at *Pro* aim to follow our always-positive North Star, we work to manage risk despite our inevitable exposure to stocks' ups and downs. We want the *Pro* portfolio to match or exceed the market when it rises and to decline less than the market — or even earn a profit — when stocks fall. Time must pass and market conditions must fluctuate before we can ascertain how close we are to accomplishing either goal. If we're not, we can change our strategy — always remembering that this, too, takes time.

We should also note that our past performance may not reflect how we'll do the next time the market changes. Even if we're exceeding our expectations at any given moment, we may need to steadily adjust our holdings according to where we think the market will be strongest *next*. Over the last few years, we've seen strong value in technology, small stocks like **AmTrust Financial**, and health care.

The S&P 500 is not our benchmark, but it's still worth watching as we consider how our decisions are panning out. Again, we want to match or exceed the market when it rises and hold up better, or even profit, when it's down. We're always focused on our North Star (inflation plus 7%), because it's a much steadier performer than the market index over the last four decades. But because it's not investable, the North Star can't be our only tool for judging performance. We use the stock (and options) market to form a portfolio strategy that could mirror or exceed our North Star, and that means we need to contrast our results with both stocks *and* the North Star. So, here's how *Pro* has performed on a monthly basis this year in relation to the S&P 500 while in pursuit of our North Star.

Month End	*Pro*	S&P 500	2012 *Pro* Cumulative	2012 S&P Cumulative
Jan. 31	6.5%	4.5%	6.5%	4.5%
Feb. 28	2.4%	4.8%	9.1%	9.5%
March 31	1.3%	2.4%	10.5%	12.2%
April 30	1.0%	(0.3%)	11.6%	11.9%
May 31	(4.4%)	(6.0%)	6.7%	5.2%

Sources: Pro*'s results are from our month-end Interactive Brokers brokerage statements. S&P 500 numbers are from the S&P 500 Total Returns Index, which reinvests dividends daily.*

We're very happy to have kept pace with the S&P during its steady ascent, especially because *Pro* was 20% to 30% short and held some cash to boot (meaning we kept up with the index with less risk). And our portfolio is down less than the market since April, a combined result we know many funds would love to have. But we want to do better, and we think we can over time. Meanwhile, the North Star is up 5.1% as of May 31, compared with *Pro*'s cumulative 6.7% return. (You can see the North Star numbers at the bottom of the recommendations page.)

Nick, Bryan, and I joked in April that we should sell everything, take our North Star-topping 11.6% return, and call it a year. So far, the joke's on us. Commissions, taxes, and impracticality aside, *Pro* would be about 5% richer (so far) had we executed that rash idea. But we'd also be anxiously watching to start buying again, and history has proven repeatedly that selling everything in response to the market's whims is a losing way to invest. (In fact, it's not really investing at all.)

As investors, not traders, our goal is to build a portfolio that will do the hard work for us (in other words, for *you*). We want the portfolio to be constructed for healthy returns in both good and bad markets. We can't trade the majority of our assets in and out of the market rapidly, and we know it wouldn't pay off even if we could. The *Pro* portfolio has served us well by outpacing the market's rise year-to-date. Now how do we make it better?

How Can We Steadily Improve?

Maybe it's all those hours behind the controls of a Boeing 777 talking (I joke), but managing the *Pro* portfolio could be a bit like flying a plane. We want to find the right speed for a gradual ascent; we want to manage risk so we don't break up when we hit turbulence; and during a drop in altitude (or a decline in the market), we want to maintain enough height to stay above ground (and near our North Star). We want to rise ever higher over time, manage our risk, and maintain altitude even when the market doesn't.

To accomplish this, we need a sophisticated portfolio with low-cost, high-reward hedges and shorts that kick in when needed; stable investments in great companies that will grow; and steady yield from dividends and options strategies that don't tax our assets. The *Pro* portfolio has performed admirably so far this year, the first year following our North Star strategy, but I want to perform much better in falling markets, and we also need more income. In other words, we need to continue to work on improvements. As we strive to deliver results and then improve upon them, we're grateful you're putting your trust in *Pro*.

A Great Article on Investing

I'll close today by pointing you to an excellent article by Fool writer Brian Stoffel in which he demonstrates the folly of trading, the superiority of long-term thinking, and what Warren Buffett *really* meant when he wrote about fear and greed. This is right up *Pro*'s alley.

To discuss the Memo, visit the Memo Musings board. Thank you again for being a *Pro* member.

As Stocks Fall, Comfort Grows

Published Jun 4, 2012 at 12:00AM

Fellow Fools,

Pro Trade Roundup

- **Gentex**: We bought 1,600 shares at a cost basis of $21.47.
- **CBOE Volatility Index** (Index: ^VIX): We closed our call ratio backspread, buying to close our June $19 calls and selling to close our June $26 calls, for a net debit of $1.50 per contract.

Guidance Updates

- **Rockwood Holdings** moves up to Buy First from Buy on valuation.
- **Tupperware** moves up to Buy First from Buy on valuation.
- **Oracle** moves down from Buy First to Buy as earnings approach.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Bristow Group**: Sell to open September 2012 $40 puts for around $3 or higher, or September 2012 $35 puts for around $1.25 or higher, for up to 3.6% of your portfolio.
- **Intel**: Sell to open July $24 puts for around $0.67 or higher, or August $24 puts for around $1, for up to 6.8% of your portfolio.
- **MasterCard**: Sell to open October 2012 $380 puts for around $29 or higher, providing a 7.6% yield in around four months; allocate up to 3.6% of your portfolio.

Questions on these? Visit our "Catch-Up Trades" discussion board.

The first thing to remember with the market is that earnings — specifically free cash flow — drive stock prices over the long term. Ideally, companies build their earnings quarter by quarter, and stock prices eventually follow. In the meantime, though, prices zig and zag as investors try to estimate how earnings will unfold based on macro information. A weak manufacturing report might mean decreased earnings estimates; the market responds by selling first and finding out later. Strong employment report? Earnings may grow more than hoped, so stock buying commences.

Once we've been investing long enough, we discover that the monthly economic reports themselves zig and zag, and stock prices follow suit — fluctuating more dramatically than the actual earnings usually do. This makes sense, since these reports are monthly (some even weekly), making them overly sensitive, while earnings are measured over longer stretches of time. This means market declines on shorter-term economic reports, especially during times of heightened anxiety, present opportunities. We clearly think as much, since we've recently moved many more of our stocks to "Buy" ratings as they've become cheaper.

Lower Prices, Higher Comfort

As the S&P 500 has declined more than 10% from its April high, several of our stocks have fallen at least halfway out of bed. But none of our *businesses* have done so — in fact, in most cases, recent earnings exceeded expectations. Will earnings come up shy next quarter? Maybe for some of our companies. But will the *businesses* face lasting trouble? We don't think so, not by a long shot. And this makes it easier for us to remain focused on our job: managing the *Pro* portfolio.

Every day, we look at what we own in the portfolio and make sure we're comfortable with it as it stands. As stocks fall, we tend to become *more* comfortable. Falling prices today mean higher returns from current levels in the future. That math is apparent and simple. Inversely, when the market is soaring, it's only stealing from future returns.

Returns Are Limited Over Time

Because earnings can only grow by so much each year, and stocks follow earnings, a falling stock market promises higher future returns, just as a rising market is taking away from future returns. As deep as the recession may be in the Eurozone, we already know from the 2009 crisis that strong companies will find ways to grow, and any weak earnings today should lead to strong growth later.

What about *our* returns? At *Pro*, we care most about our North Star (inflation plus 7%), which is running toward a 10% gain this year. As of Friday, five months into the year, the *Pro* portfolio has a 4.9% gain. If we hope to get near, or exceed, our guiding North Star, then we need to grow the portfolio at least another 5.1% this year. We're net 65% invested long, so we're obviously counting on rising share prices to help us. Every day we look at our businesses' valuations and ask, "Is appreciation a reasonable assumption?" The answer today is yes, and more so now than two months ago.

At the same time, we know we can only control our *process*, and not the short-term *outcome*. If our investing process and decision-making are sound (we aim for "exceptional"), we should reach our goals over time. But barring a magic share-price genie, we can't control the near term; the inevitable ups and downs will happen, and we'll do our best to make strong decisions as it all unfolds.

We feel good being 65% long right now. That doesn't seem too aggressive. However, we will add more longs *or* more shorts if that's where opportunities reside. Right now, opportunities seem fairly evenly split between longs and shorts, but we have a growing preference for longs as prices decline. The main risk we see is political, and that's hard to manage for: We don't know what European governments will do next. They could launch Euro bonds and send markets soaring, or the Eurozone union could start to dissolve and send prices lower. Given the potential for a binary near-term outcome, being something closer to 50% long and 50% short might be logical.

What We'll Do Next

Where we end up investing next depends on how quickly prices move and what looks best. Although we're seeking shorts and hedges, we also have a list of favorite positions to potentially buy — or buy calls on, spreading our cash around — if prices reach a certain level. There are also ETFs that move inversely to the indexes; we'll want to short those if the market falls enough. So we've formed a plan. Although we're not market timers (that way folly lies), we want to capitalize on dramatic market moves, and if we can't do that to our satisfaction during the slide because our portfolio is majority long and the decline is swift, then we certainly want to capitalize on the recovery.

My Strongest Investing Beliefs

A horror novel about the stock market could be titled *The Rising, the Falling, and the Rising*. In the midst of all the sunny peaks and shadowy valleys, we as investors need to be steady. I recently asked the *Pro* team to outline their strongest investing beliefs, and then shared mine. Mine are:

1. You must not get emotional.
2. You must hold good companies for years.

3. Income and shorting strategies must be disciplined.
4. Your portfolio must be focused so you can make informed decisions and execute.

Many more exist, to be sure: Don't borrow money to own stocks; keep a cash cushion; focus on industries you know best; don't expend energy studying the unknowable; and others. These are all important. In the end, it's key to remember that (again) we control process, not near-term outcome; we invest to be right in coming years, not coming weeks. Process is all we have, and we need to get it right. We see value in what we own today, and we'll use our process to aim for our North Star over the rest of the year.

Published May 30, 2012 at 12:00AM

What We're Doing: Closing this option position because expiration is approaching.

What We're Thinking: Unfortunately, the VIX isn't yet high enough for us to profit, but waiting to close the trade increases our risk that the position works against us.

What We're Expecting: We'll keep watching the VIX for new possible positions.

Trade Essentials

- **Action:** If your broker allows it, use a spread order to buy to close all of your June 2012 $19 calls and sell to close all of your June 2012 $26 calls on the **CBOE Volatility Index** (ticker: VIX, or ^VIX at some brokers, or $VIX.X). (If not allowed in one trade, do both legs separately.)
- **Price guidance:** Use a limit order aiming to pay a **net debit of $1.50** or less, combined, to close both positions. If making the trades separately, still aim for this net cost.
- **VIX level (May 30):** 23.4
- **Option prices (May 30):**
  - June $19 call: $6.10
  - June $26 call: $2.30 (we own twice as many, so this works to $4.60 for us)

What's New?

- **Previous recommendation:** We announced this rolling position on April 17.

- **Change (as of May 30):** The VIX is up 23% since April 17, and it's now up 56% since we started these trades in March; but that's still not enough to turn our spread profitable.

We were correct in March to be concerned about Europe and to be perplexed by the low level of the **CBOE Volatility Index**, (VOLATILITYINDICES: ^VIX) or the "fear gauge," when it was only at 15 back then. But we still haven't profited. The VIX is up sharply, to above 23, but that's still not much above its long-term average of about 20. We need *real fear* — signified by a VIX of at least the mid-to-upper 20s, if not the 30s — to earn a profit on this strategy. The VIX has historically spent about 10% of its time above 30, so history says we have a 1-in-10 chance of a bigger VIX spike and a profit. But our spread position is running out of time and needs to be closed.

There's actually a risk that Greece will leave the Euro and Spain's borrowing costs may become too high to sustain, but rather than roll this month's VIX trade immediately into a new month, we're going to pause and reconsider the strategy. Is this the best way to profit on the potential for higher market volatility? Should our time and energy go into other strategies instead? Is the way VIX options are priced today hamstringing this trade?

While seeking answers, we'll close our VIX position, because if we don't, option pricing could steadily work against us as expiration draws closer. This strategy is never meant to be held to expiration, and unfortunately, the VIX is hanging around exactly where we don't want it, at 23. This level gives our short $19 calls ample value and our long $26 calls not enough. And barring a VIX change, it would worsen. We need to close, because if we don't, we risk the VIX being at 25 by our expiration, for example, and then we would owe $6 to close rather than today's $1.50.

All told, we've been approaching profits on these spreads a few times, but the VIX has stubbornly refused to go into the mid-and-upper 20s, let alone higher. It could jump that high tomorrow for all we know, but time dictates we close this expiring spread soon and actively seek whether we want to try again soon. Pricing will be the key factor in our decision, but either way, we have to close our June 20 spread on the VIX.

Next step: If you have questions about closing this trade, please visit the VIX discussion board.

Buy Gentex

Published May 29, 2012 at 12:00AM

- **What We're Doing**: Investing in a growing, debt-free, best-of-breed auto-parts supplier.
- **What We're Thinking**: Delayed domestic safety regulations and fears of a deep European recession have put one of our most-respected companies on sale.
- **What We're Expecting**: A rebound in auto sales and new models will drive demand for the company's products.

Trade Essentials

- **Action**: Invest 2.5% in **Gentex** (NASDAQ: GNTX) (for *Pro*, about 1,500 shares)
- **Buy Around**: $22.50 (use a limit order)
- **Fair Value**: $27.50
- **Dividend Yield**: 2.3%
- **Scorecard Status**: Buy
- **Alternative Trades:** We want to buy shares now, but if you choose, you can instead sell to open July or September $22.50 puts to potentially buy shares more cheaply.

The Big Picture

In a Monday Memo in January, we laid out many of the beliefs that guide us at *Pro* and explained that we'd be looking for opportunities to invest alongside them. At the time, we listed the following as a belief that wasn't yet reflected in our portfolio: "U.S. automobile sales will return to their normal upward trend line, while auto sales will continue to grow in emerging markets." We feel even more strongly about that statement today, and that's why we want to buy auto-parts supplier **Gentex** (NASDAQ: GNTX). Consider these tailwinds, which could act more like a jet stream for global auto sales:

- **U.S. auto sales are terrible.** (In unison: "How terrible are they?") On a per-capita basis, fewer vehicles were sold and produced in 2009 than in any year since 1951 (the earliest data we can find). While things have since recovered a bit, sales and production remain more than 20% below long-term averages.
- **We see pent-up demand.** The tough economy has Americans driving their cars longer. The average vehicle is now a record 10.8 years old, up from 8.9 years in 2000. And we're no longer building them faster than we're scrapping them — since 2008, the ratio has been one new car for every hoopty sent to the great junkyard in the sky, far below the historical rate of 1.3:1.
- **The environment is ripe for new purchases.** Have you seen the fantastic new designs hitting the market lately? Plus, borrowing rates are still low and dealer incentives have returned.

The case for non-U.S. auto sales is also strong (well, everywhere except Europe) thanks to a generally rising middle class, improving infrastructure, and cars simply becoming more of a necessity. Looking out 20 years, we see a superhighway of growth potential in global automobile production.

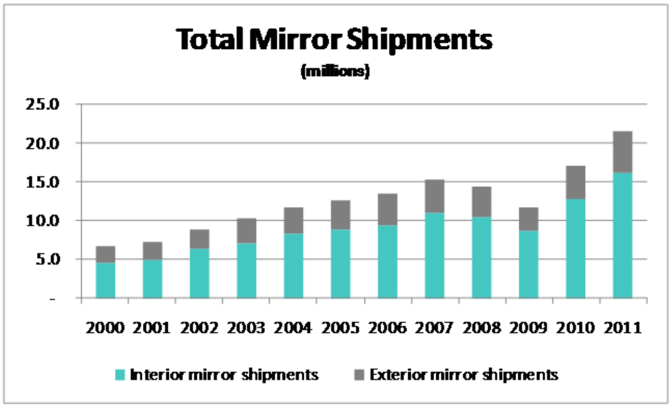
The Business

You know that road-rage moment when some joker driving way too fast approaches you from behind with his high beams on? There's no time to reach up to the rearview and flip the day/night knob (and you always knock the mirror out of place when you do that, anyway). As the glare bounces off your rear- and side-view mirrors and bores a hole in your retinas, you close your eyes in defense — only you're still driving, so that isn't safe. All that's keeping you from cursing loudly are the kids sleeping in the back seat.

It doesn't have to be this way. Gentex has your back. In 1982, the company invented the auto-dimming interior mirror; it revolutionized the product in 1987 using electrochromic technology, and it has since extended it to external (side-view) mirrors as well. Glare? Begone.

But saying "Gentex makes automotive mirrors" is like saying "Elvis was a singer." Both statements are true, but say either one to the wrong person and you're likely to be pelted with peanut butter and banana sandwiches. Gentex's technologically advanced interior and exterior mirrors serve as a strategic electronic module for advanced features, helping drivers monitor tire pressure, facilitating hands-free communication, sending blind-spot alerts, and warning of abnormal lane departures. (Compasses and temperature readings are *so* 2000.) So, yes, they're mirrors, but they're also an optimally positioned platform for the other information and safety features that we believe drivers will increasingly demand.

Today, trading at a market value of $3.2 billion, Gentex has an installed base of more than 180 million tech-enabled mirrors, and it has 88% market share in the auto-dimming mirror global market. That said, fewer than 1 in 4 light vehicles produced globally is equipped with an interior auto-dimming mirror (which is why that road-rage moment still happens so often). A rebound in global auto sales, an increase in demand from emerging economies, and more cars produced with auto-dimming mirrors should keep the production lines at Gentex whirring for years to come.



Source: SEC filings.

There are two promising, immediate features that will help drive accelerated adoption for Gentex mirrors: Rear Camera Display (RCD) mirrors and high-beam assistance.

- Rear blind spots cause 18,000 injuries and more than 290 deaths in America every year. In response, a new law in the works will mandate that all new light vehicles sold in the U.S. come equipped with a rear camera system. (While not yet finalized, the current version phases in over the next 2.5 years.) One possible location for the image display? That's right — the rearview mirror. Gentex shipped 1.7 million RCD mirrors in 2011 and should sell many more as the mandates are phased in; we could get final word on that process by the end of this year.
- The company's revolutionary SmartBeam feature embeds a forward-facing camera in the interior mirror. Sensors in the camera optimize the use of high beams and traditional headlamps during nighttime driving, recognizing other cars, the shape of the road, and other objects and dramatically improving driver vision and safety. Auto-dimming mirrors equipped with SmartBeam are currently installed on 66 vehicle models from 12 automakers, primarily in Europe.

Gentex behaves much more like a technology company than an auto supplier. The company invests 8% of sales in R&D and conducts all of its own manufacturing (right here in the U.S., no less). The novel, technical nature of Gentex's products has meant it's often had to invent the processes and machinery needed to make them, and this end-to-end control has resulted in unmatched quality, fantastic relations with the global auto community, and superb production capabilities. We expect new car models to continue featuring the company's products, and we believe Gentex's competitive advantages over its competitors will widen over time.

Financials

Gentex has a long history of impressive results. Over the past 25 years, it has grown sales by an astounding average of 20% annually. Its revenue and profit are less sensitive to economic fluctuations than many auto-parts suppliers, thanks to still-low penetration rates and high-tech products protected by patents, know-how, and economies of scale. Operating margins are consistently higher than 20%, and since 2000, more than $0.10 of every sales dollar has been counted as free cash. All those dimes add up, and Gentex retains nearly $4 per share in cash on its debt-free balance sheet — in addition to paying a 2.3% dividend.

(in millions, except per share)	2008	2009	2010	2011
Revenue	$623.8	$544.5	$816.3	$1,023.8
Operating Income	$108.8	$94.6	$191.0	$231.4
Net Income	$67.6	$64.6	$137.7	$164.7
Free Cash Flow	$75.1	$89.5	$81.7	$21.7
Dividends per share	$0.43	$0.44	$0.44	$0.48

Source: SEC Filings

Free Cash Flow = Cash Flow from Operating Activities-CapEx

What Would Make Us Sell

Gentex supplies more than 30 automotive customers, but some are bigger than others; sales to VW, GM, Toyota, Hyundai/Kia, and Mercedes all amount to more than 10% each. We don't have much fear of these customers defecting, but they do flex their muscles annually, demanding pricing concessions on the order of 3% to 5%. If Gentex can't offset these pressures with scale, manufacturing improvements, or new product introductions, we'll reconsider our stance. Also, 45% of the company's products are shipped to automakers headquartered in Europe, and more worrying, nearly 25% of global auto production comes from Europe. If the Continent implodes, we'll take note (to consider *adding* to our "starter" 2.5% position). Finally, lasting supply chain issues would tarnish the company's reputation as a reliable supplier and give us pause, and the company spends a large amount on capital expenditures whenever it builds new plants (as it has recently); we'll make sure its return on investment remains high.

The *Pro* Bottom Line

Gentex is a classic *Pro* company: Its revenue base is highly recurring as cars are replaced, it has a dominant competitive position, and over the years it generates steady free cash flow. On top of that, it is well-run by a sensible management team focused on the long run. We're excited to add shares of this premium business to our portfolio, and we expect to hold on through the inevitable potholes along the way.

Next Step: Visit our Gentex discussion board to let us know if you have a Gentex mirror in your car or to ask questions about the business.

Next Next Step: Check out some of Gentex's great products by watching these videos. If your car doesn't feature this technology, we recommend selling it and buying one equipped with a decked-out Gentex mirror.

- Auto-dimming mirror in action.
- RCD mirror in action.
- SmartBeam in action.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- As of last week, 18 of our 24 long holdings were rated Buy or Buy First, so there are plenty of *Pro* stocks you can buy outright, matching our current allocation.
- **Bristow Group**: Sell to open September $40 puts for $1.80 or better, for up to 3.8%.
- **Intel**: Sell to open August $25 puts for around $0.80 or better, for up to 6.7%.

Questions on these? Visit our "Catch-Up Trades" discussion board.

The stage was set for a Memorial Day weekend free of stock talk — just how my wife likes it. And I was on board. I had a long drive through the rural Delaware landscape to empty my mind, a happy copilot singing out of tune to the jams on the radio, and a refreshing wind blowing through my ears and clearing out the place in my head that usually holds diagrams of business models, earnings scenarios, and ticker symbols. By the time we were sprawled on our beach towels, my only to-dos were related to sunscreen, salt water taffy, and soft serve.

And then it happened. Barely sun-kissed, my wife turned to me and said, "So what the heck is going on with Facebook?" Two sentences into my explanation of what an initial public offering was and why **Facebook** needed to give up its private status, she snapped the conversation back to what many investors have been wondering themselves: Why was Facebook going down?

Class on the beach? Now in session. Here's what I told her.

Now Arriving at Valuation Station

Facebook stock was given the opening price of $38. Because stock represents a claim on a company's earnings, investors commonly assess value by looking at how the offering price compares to the earnings the company already generates. In Facebook's case, with a P/E ratio of 97, a $38 price tag represented 97 years of future earnings. In other words, if Facebook just kept on keeping on, investors at $38 would earn their money back in 97 years.

"That doesn't sound like a good deal," my bargain-hunting wife quipped.

Of course, it's a bit silly to take a snapshot of Facebook today (or any company, really) and assume no change in earnings for 97 years. Furthermore, markets consist of individuals, institutions, and gremlins trying to divine the future. Prices reflect their prognostications. Price, the P, is therefore a estimate based on *expected* earnings that have not yet been recognized in *current* earnings, the E. Another way to look at the P/E is as a ratio of future expected earnings relative to current earnings. If future earnings are expected to be massive, the P/E ratio will be high.

"How does anyone know what future earnings will be?"

I knew that I was running the risk of her thinking I was a complete quack, but I gave the honest answer: We don't have a clue.

Smart Bets

And that's the problem with Facebook. The offering price implies immense earnings growth far into the future, and the uncertainty around those earnings makes some IPO investors uncomfortable. The resulting selling pressure whacked the share price down to $31 or so as of Friday. Even investors who waited to buy shares are now paying a P/E of 82.

"Did we buy shares at $38?" she asked in a concerned tone.

Nope, I assured her. I don't even pretend to know what Facebook's future earnings might look like. We try to invest in situations where the future, though by definition unknowable, offers a little more certainty. She quickly grasped the stability of **Papa John's International** and the recurring revenue of **AmTrust Financial Services**. We place our chips on the table when the price offered is low for the expected future earnings, and in order to take a guess at that, we need reasonable clues. We know we'll misjudge the future, but we like our chances of making money over the long run if we stick to situations where we think we have a greater chance of being close to right.

My Wife's Takeaway

At this point I sensed her attention wandering to the crashing waves and the sandcastle construction going on around us, so I quickly finished up. Even though I know she hates it when I do this, she expects it, so I asked what her takeaway was.

"P/E is a bunch of baloney. It only tells you the relationship between what people think will happen — but don't know — and what has already happened."

I couldn't hide my smile, even though she said this completely cavalier, supine, and with more of her attention directed at optimizing her sun exposure. She nailed it.

P/E doesn't mean much on its own. What matters is our confidence in future earnings. Paying a high P/E is A-OK when the market is mispricing the magnitude or duration of elevated future earnings. **MasterCard**'s P/E of 26 is not high in our eyes given the size of the existing cash transaction market and our confidence in the company's ability to win share and maintain operating leverage by keeping costs down. **3D Systems**' P/E of 45 may reflect the annuity stream attached to its installed base of printers (as customers keep buying supplies) and possibly underestimates the size of the end market for three-dimensional printers.

High price-to-earnings ratios don't scare us at *Pro*, and they certainly don't scare my wife. Don't let them scare you either: Just make sure your assessment of the size and shape of future earnings is well founded.

Onward,

Bryan Hinmon (TMF42)

Hunting for Great Ideas

Published May 21, 2012 at 12:00AM

Only a Few Spots Remain!

On May 15, Motley Fool co-founder and CEO Tom Gardner opened his exclusive new all-access service, *Motley Fool One*, to the Fool community. Days later, fewer than 12% of spots remain — meaning this may be your last chance to be among the select few investors who will get to witness Tom's unprecedented "all in" move on June 1 and profit from *Motley Fool One*. Click here to claim your spot before it's too late!

Fellow Fools,

Pro Trade Roundup

- **Plum Creek Timber** : All 1,000 shares were called at $39.42, eliminating Plum Creek from the portfolio.
- **Expeditors International of Washington**: We bought to close our 13 May 2012 $42.50 puts for $4.70. We let the remainder of our broken wing butterfly expire last Friday.
- **Tupperware Brands**: Sold to open six October $55 puts for $3.20, netting us a potential price on new shares of $51.80, which would double our position to about 5.4%.
- **Papa John's Pizza**: We pared our allocation down to 3% by selling 500 shares at $47.73.

Guidance Updates

- **Rockwood Holdings** moves up to Buy from Hold on valuation.
- **Wells Fargo** moves up to Buy from Hold on valuation.
- **Plum Creek Timber** moves down to Sell as we let our shares get called away.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **InvenSense**: Buy up to a 1.2% allocation if you haven't already.
- **Rockwood Holdings**: Buy up to a 4.7% allocation if you haven't already.
- **Wells Fargo**: Buy up to a 2.7% allocation if you haven't already.

See You Tuesday

The *Pro* Monday Memo will publish on Tuesday next week because of the Memorial Day holiday. Keep an eye out!

Questions on these? Visit our "Catch-Up Trades" discussion board.

Perhaps my favorite part of The Motley Fool (as a company) is its unabashed embrace of continuous improvement. For any Fools who dream up a better way to do something, little stands in their way as they give it the old college try.

To that end, the 250 or so employees at Fool HQ were divided into 20 teams this year and set loose on a company-wide improvement project dubbed "The Great Idea Hunt." The guidelines were simple: Find a business in the region that your team admires, visit it and speak with its leaders, and find one takeaway that would make the Fool better. The exercise was inspiring. I'm convinced it will prove lucrative for our business. And in that same spirit, I'm extending the Great Idea Hunt to you, our *Pro* Fools.

I Say 'Best Practices,' You Say 'Stealing'

You may think of the Great Idea Hunt as a hands-on best-practice pilfering, to which we'd say: Absolutely! In fact, executives at Living Social, **Markel**, AARP, and Dogfish Head (just to name a few) rolled out the red carpet for Fools and happily shared their inner workings. With notes in hand, each team produced a short video that captured its key takeaway, and the videos were unveiled at our company-wide annual meeting last week. When all was said and done, the Fool was left with 20 fantastic ways to make its business better, plenty of laughter-induced tears from the videos, and thought-provoking admiration for the passionate business leaders who share our geography.

Your *Pro* Team's Great Ideas

Jeff and his team visited the member services department at the Washington Capitals, who have a wonderful understanding of their most rabid and loyal fans. Nick's group interviewed Andy Shallal, the owner of Busboys and Poets, a restaurant and coffee shop with four locations in the D.C. area that sees itself as a gathering place and public forum for the issues of the day. My team and I (Bryan here) visited with a handful of bigwigs at NPR — a pretty spectacular organization that feeds on knowledge and tries to take full advantage of its staff's expertise.

All three of these businesses share something important with us, and we think the ideas we took away will help us do a better job of helping Fools like you down the road. While we can't go into much detail out in public, we think we've given our colleagues plenty to think about in making more connections with longtime members, getting more active in personal finance education, and putting the intellectual capital at HQ to more efficient use.

The winning idea came from our intrepid U.K. Fools, who visited the CEO of Hargreaves Lansdown, the largest fund supermarket in the United Kingdom. Hargreaves has put a lot of effort into meeting customers on their own terms, both in the services they receive and how they interact with the company. The Great Idea here? Make it easier for folks to become Fools! The specific plan our U.K. squad came away with sounded obvious at first, but it wasn't until these Fools were removed from their comfy surroundings and invaded an outside business that they had their a-ha! moment.

Remember, there were 20 of these ideas, and all of them had a healthy dose of Foolishness. The exercise was a welcome reminder that a great company's greatest elements may be more transferable than we may first realize. That's one of the reasons why the Fool prizes innovation and why we love to see it in the companies we recommend.

Great Idea Hunting for *Pro*

It's your turn, Fools. With years of work experience under your Foolish belts, countless business experiences, and some level of exposure to thousands of successful companies, you must have Great Ideas of your own. **So, your task, should you choose to accept it:**

1. Rack your brain, find a best practice from a great business that you've been exposed to, and translate that practice into a Great Idea that we might be able to implement at *Motley Fool Pro*.
2. Bring your idea to the Memo Musings discussion board and join the Great Idea discussion thread.
3. Check back through the week and provide feedback on any Great Ideas that you think are especially great.

If we get any traction with this, I'll host a poll to vote on the top ideas. In the end, I'll try and convince the team to do everything in our power to implement our member-suggested Great Idea. Together, we can make *Pro* even better.

Better every day,

Bryan Hinmon (TMF42)

Buy to Close Your Puts on Expeditors International

Published May 15, 2012 at 12:00AM

What We're Doing: We're closing the one leg of our May butterfly that's in-the-money.

What We're Thinking: We only have a small profit on this income position, but pending expiration is forcing us to close it.

What We're Expecting: We'll likely set up a new income trade soon.

Trade Essentials

- **Action and Price:**
  - **Buy to Close:** May 2012 \$42.50 puts on **Expeditors International**, paying as little time value as possible. For example, if shares are \$38.50, aim to pay as close to \$4 as possible to close the puts (\$42.50 - \$38.50 = \$4).
- **Allocation:** Buy to close every May \$42.50 put you wrote. Let all other options in the spread expire Friday.

What's New?

- **Last Action:** In January, we set up a butterfly spread with \$42.50 center strike prices. We were paid a net credit of \$4.90.
- **Change:** Lately, we need to pay about \$4.30 to close the \$42.50 puts, so we're left with about a \$0.60 profit per contract.

After weeks trading near our \$42.50 strike price, where our maximum profit would have been achieved, our flighty **Expeditors International** butterfly spread has drifted off, leaving us disappointed. We still have a small profit of more than \$700 on our 13 contracts, but that's not nearly the amount of income we were hoping for. Butterfly spreads (like any straddle) can be tricky: You need the stock to end close to your center strike price in order to earn strong rewards, and a volatile market makes that more challenging. That said, we're glad to have some profit, and we're looking at setting up a new trade soon.

Disappointing first-quarter results at the shipping logistics company sent Expeditors stock lower. Management does not hold conference calls to provide details, but the press release suggests that volume was simply light. Customers are still shipping all around the world — they're just shipping fewer items, because they're cautious about the economy in light of Europe's upheaval. CEO Peter J. Rose went on to say that Expeditors will institute smart cost savings, as it did in 2009, and continue to focus on delivering the best customer service possible while waiting for a rebound in shipping volume.

We have no doubt a rebound will occur, and the stock of this premium business will likely find a higher valuation when it does. But, of course, we don't know when this will happen. Our fair-value estimate is in the low \$40s (where we wrote the butterfly). If your puts were already exercised and you now own shares, you can keep holding them, or simply sell them to stay on the same page as *Pro*. One commission aside, selling your new stock is the same outcome as buying to close the \$42.50 puts at this point. And then you could prepare to set up our next income trade with us.

Next Steps: Please visit the Expeditors discussion board to post questions.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Alphabet Stock Talk: BMC and CME, Plus PCL and EXPD

Published May 14, 2012 at 12:00AM

Fellow Fools,

Pro Trade Roundup

- None completed last week.

Guidance Updates

- **AmTrust Financial** moved up to Buy First from Buy.
- **Oracle** moved up to Buy First from Buy.
- **Tupperware** moved up to Buy from Hold.
- **InvenSense** moved down to Buy from Buy First for reasons explained here.

Pro Catch-Up Trades

For members lacking a position or full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **OpenText**: Buy up to 2.5% in shares if you haven't already.
- **CME Group**: Buy up to 3.7% in shares if you haven't already.

Questions on these? Visit our "Catch-Up Trades" discussion board.

One of our goals is to be ever more transparent with you, the members for whom we work. You should never have to guess what we think about any position, and because our thesis may evolve a bit with every quarterly report, we seek to share any updates as efficiently as possible. To that end, we post those updates on the discussion boards and link to those posts in every Monday Memo, along with sharing any guidance changes. When we want to convey our conclusions even more directly, we'll use the body of the Memo; we did that last week with **InvenSense** and **OpenText**, and this week, we'll touch on **BMC Software** and **CME Group**. We also have options expiring this week, so we'll update you on **Plum Creek Timber** and **Expeditors International**.

Business Runs on BMC

BMC Software has historically provided information technology management solutions for large companies; its recent acquisition of Numara, which provides IT management for smaller companies, is helping BMC expand to new markets. In layman's terms, BMC's software is designed to make all facets of a company's technology work well together. The company sums up its large opportunity with its slogan, "Business runs on IT."

Last quarter, BMC capitalized on this opportunity with strong revenue growth in cloud software, where bookings nearly doubled over last year, and Software as a Service (SaaS), where bookings nearly tripled. That said, its core Business Service Management business has seen weak new sales, which created the opportunity we saw in the stock price. Management now reports encouraging improvement as it grows the sales staff, and BMC expects new license revenue to move upward this year and non-GAAP earnings per share to grow about 9%.

Yet the stock looks inexpensive, trading at less than 10 times free cash flow and well below our $56 fair-value estimate (which would still value shares at only 12.6 times realized free cash flow). And some hedge funds agree — at least one fund has been building a large enough stake in the stock that BMC this morning announced a "poison pill" clause to guard against an unsolicited takeover offer. Given the low share price, I don't disagree with management's desire to be defensive, even if it involves some self-interest. Still near our $43 buy-around price, BMC Software remains a Buy.

CME Awaits Market Volatility

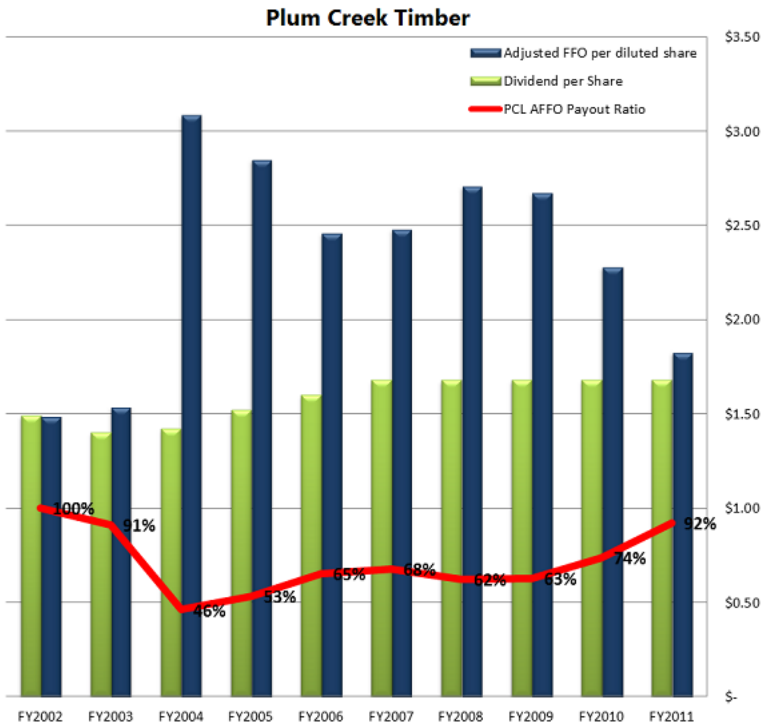
The world's leading futures exchange, CME Group, believes it's in a "cyclical low" for trading volume, and that's weighing on results. Just as **MasterCard** depends on transaction volume growth to fuel its business, CME needs increased trading volume — but for many good reasons, that's been in short supply. With interest rates in the basement and refusing to budge, the usually lucrative trading of contracts to guess where rates are headed next is understandably tepid. Other assets have been stretched, too, with oil recently near record highs, natural gas at record lows, and food commodities richly priced — yet none of these assets have been moving much in price. Add in the low volatility for stocks in the first quarter, and it's not surprising that CME's trading volume was down 11% from a year ago, when Greece and Japan shook up volatility. (Encouragingly, volume did grow 5% from the December quarter, when MF Global's collapse scared investors out of the futures market.)

The good news is we know pricing volatility will return (in fact, Europe has made sure of that already this month). That should lead to more trading on CME's exchanges, driving profits. And with its margins among the highest of S&P 500 companies, additional trading on CME brings dollars right to the bottom line. In this way, CME is a modest hedge against a volatile, trade-frenzied market.

Meanwhile, the company continues to roll out new products and invest to expand in Dubai, Brazil, and China. At this presumed cyclical low for trading volume, shares trade at a reasonable 15 times estimated earnings, and those earnings could leap once volume grows. Yielding 3.4% while we wait, the stock remains a Buy. (See more in our recent summary.)

Options Ahead: Harvesting Plum Creek Timber

It was a tough choice, but we plan to let our **Plum Creek Timber** stock get called away, sold, taken from us … adios, goodbye. We've owned it since 2009, and we've enjoyed the dividend and strangle income, but not enough is going in the company's favor to make us want to keep it, let alone write more puts on it. We're seeking new income positions as we raise additional cash with this sale. Why let it go? With Plum Creek's Adjusted Funds From Operations (AFFO) payout ratio up to 92%, there's some risk to the size of the dividend if operations don't improve (or if they weaken). Nick Crow (TMFCrow) put a chart together to illustrate. The converging blue and green lines, and the rising red line, tell the story:



The last time Plum Creek cut its dividend was in 2002, when the payout ratio was 100%. Likely or not, we wouldn't want to see that happen on our watch.

Our shares should get called away through our May $38 covered calls on Tuesday, May 15, the ex-dividend date. Our May $33 puts should expire Friday, May 18, after which we'll be out of the position entirely. If you wrote August $33 puts for around $1 as one of our Catch-Up Trades, you can buy to close them around $0.40 today (capturing 60% of the profit), or keep them open if you're comfortable with the position through August. We don't expect any potential risk to the dividend until the very end of the year at the earliest, and even then we don't want to overstate this risk.

Rolling Expeditors International

Finally, our butterfly spread on Expeditors International expires Friday; we have a small profit. We plan to buy to close our May $42.50 puts, let everything else expire, and set up a new spread soon. If you have shares put to you before then, you can sell them (one extra commission aside, it's no different than buying to close the puts), then set up the new spread with us when the Trade Alert arrives. Or keep your shares; we like the stock for the longer haul, and estimate fair value in the $40s.

Write Puts on Tupperware

Published May 11, 2012 at 12:00AM

- **What We're Doing:** Writing puts for income or to potentially add 2% to our stock position, bringing it to 5%.
- **What We're Thinking:** The stock's recent decline represents an opportunity.
- **What We're Expecting:** We'd be happy to buy additional shares in the low $50s.

Trade Essentials

- **Action:** Sell to open October 2012 $55 puts on **Tupperware Brands**.
- **Allocation:** About 2% more, enough to potentially bring our stake to 5%. *Pro* will write six contracts. Each represents a $5,500 stock purchase.
- **Recent Price:** $58.40
- **Buy Around/Fair Value:** $56/$65
- **Option Price (bid/ask):** $3.00/$3.20
- **Price Guidance:** Use a limit order for $3.10 to start. As prices change, ideally accept no less than $2.75.
- **Alternative Trades:**
  - Write July 2012 $55 puts instead, lately around $1.40.
  - Buy shares directly. They're lately only 4% above our Buy Around, so we're moving the stock to Buy. Start with 3% to match us, and build to 5% on a decline to less than $55.

What's New?

- **Last action:** In March 2011, we recommended buying 1% more around $55.65.
- **Results:** We've been investing in Tupperware since 2009, earning yield, option income, and 19% on our stock position.

It may be an institution in the United States dating back to the days of *Leave it to Beaver*, but Tupperware is a novelty in emerging markets. Tupperware Brands CEO Rick Goings is fond of pointing out that only 14% of the world's people live in developed markets, and many of the rest reside in emerging behemoths like China, India and Brazil. Tupperware's sales have been soaring in these "new" markets as income grows and families are able to store food. In developed markets, sales have been holding steady, and the company does benefit from a softer economy when more people are eager to join its sales staff. So the investment offers a rare combination of defense and new opportunity at once.

This year, management expects adjusted earnings per share growth of around 13%, to about $5.05 per share. The $58.40 stock trades at 11.5 times that estimate and yields 2.5%. Today's valuation looks reasonable, so we're especially comfortable setting up an option position that would net us shares 11% lower.

How to Follow Along

Write (sell to open) one October $55 put for every $5,500 in stock you'd be willing and able to purchase if the share price declines below $55 by expiration. Use a limit order, splitting the current bid/ask (lately $3.00 bid, $3.20 ask). *Pro* will write six contracts to potentially grow our 2.9% stock stake to around 5% if we get shares.

- Share price: $58.40
- Strike price: $55
- Distance to strike: 5.8%
- Option premium: $3.10
- Yield if position is held on 100% cash: 5.6% in 5 ½ months ($3 in premium/$55 share price; yield is much higher using buying power)
- Break-even price: $51.90
- Cushion to break-even: 11.1%
- Estimated P/E at $51.90: 10.2
- Yield at $51.90: 2.8%

To summarize:

- We're writing puts to potentially build our 2.9% position to 5%.
- With the price just 4% above our Buy Around, we're moving the stock to Buy.
- Those new to the stock, who haven't already written puts as a Catch-Up Trade, can buy up to 3% to match our existing position or write puts for up to 5%.

Next Step: Please post any questions on the Tupperware discussion board before writing your puts. Then head over and buy some Tupperware for your kitchen.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Sell a Slice of Papa John's Pizza

Published May 10, 2012 at 12:00AM

- **What We're Doing:** Selling 1.8% of our 4.8% position in **Papa John's Pizza** (NASDAQ: PZZA).
- **What We're Thinking**: After a jump in share price, we're feeling a bit over-allocated. Selling part of our position allows us to manage our risk while profiting from future growth.
- **What We're Expecting**: We're happy to raise cash to eventually put toward more attractive opportunities.

Trade Essentials

- **Action:** Sell enough shares to bring your allocation down to 3% ($3,000 worth for every $100,000 you manage), using a limit order near current prices. For *Pro*, at current prices, that means selling 525 of our 1,400 shares. We'll round that down to 500 shares to keep our position in even lots.
- **Recent Price**: $48
- **Revised Fair Value**: $43
- **Price guidance**: Use a **limit order** so our selling doesn't push the price down.
- **Alternative Trade**: For a higher sell price (in exchange for the risk of a share price decline), sell to open covered calls with a strike price near the current share price, writing one call for every 100 shares you're willing to let go.

What's Changed?

- **Last action**: In October 2011, *Pro* recommended closing your covered calls on the shares.
- **Total return**: 100% (not counting option income) since our July 2010 purchase.

Nothing has changed at Papa John's since our last earnings review on May 4. The market has reacted very positively to the reported business momentum, driving shares much higher than our fair-value estimate. Speaking of which: Fully discounting the last two quarters of new information, I'm (Nick here) raising my fair-value estimate to $43 from $35.

But in a fixed portfolio, a rapidly rising share price can come to mean increased risk — which you can see in our rising allocation to this stock. Papa John's is now our fifth largest holding, and while our outlook for the company is still positive, it isn't our fifth best idea. So we're selling enough shares to bring our allocation back down to 3% — but we're holding on to most of our shares for the longer haul, and we hope you do, too. After all, the company has plenty of room to keep adding new locations around the world. In fact, at much lower prices, we could recommend new investors buy in, and we would consider adding more shares again.

How to Follow Along

This is a portfolio management decision. We don't foresee an imminent drop in share price. So be patient! Using a limit order, we'll sell enough shares of Papa John's in the next one to 30 days to bring our allocation back to 3%.

Next Step: Visit the Papa John's discussion board to post questions.

Tech Time: OpenText and InvenSense

Published May 7, 2012 at 12:00AM

Pro Fools,

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the [Recommendations]() page.

- **AmTrust Financial Services**: Buy up to 5% around $28 and lower.
- **Tupperware**: Sell to open July $55 puts, lately $1.20, for up to 3%, or a 2.1% yield on cash in 74 days. Or sell to open October $55 puts for around $2.80 and a 5% yield in 5.5 months.

Pro [Trade Roundup]()

- **3D Systems**: Sold to open 12 August 2012 $30 calls, at $2 each, covering all of our shares.

Guidance Updates

- **AmTrust Financial Services** moves up to Buy from Hold.
- **BMC Software** moves down to Buy from Buy First prior to May 9 earnings.
- **OpenText** moves up to Buy First from Buy on price, but the buy-around price moves down to $56 from $58.50, reflecting more uncertainty.

This is turning out to be a particularly interesting earnings season, with nearly all of our companies announcing Foolish tidbits that demonstrate how management is driving toward extra value. For example:

- **3D Systems** grew revenue from health-care / medical-device printers by 93% to $12 million; this important niche was 15% of first-quarter revenue.
- **Covanta Holding** is deriving extra earnings from its new program to capture more recyclable metals from the trash streaming to its incinerators. Trash-diving may not be glamorous (the jury is still out, right?), but it's adding to the bottom line.
- **MasterCard** now has a presence on about 50% of the debit card platforms in the country, up from 25% last year, as the Durbin Amendment opens competition with debit powerhouse **Visa**.
- **Papa John's International** opened 50 new stores last quarter, ahead of expectations, and bought back 44 stores from franchisees (the economics are stronger with company-owned stores). Meanwhile, same-store sales soared 8% overseas.
- **Rockwood Holdings** is building a plant to double its lithium production as demand for battery-grade material increases.

You can get all of this news, and much more, in our quarterly summaries, which are posted on each company's discussion board and [consolidated here](). Now, let's give two tech companies with made-up names, **OpenText** and **InvenSense**, a CloserLook to see why they disappointed.

OpenText Is an OpenPage

New license revenue at digital-data wrangler OpenText declined 10% last quarter, knocking shares for a loop even though total revenue and net income grew 11%. New CEO Mark J. Barrenechea put the blame solely on the company, which didn't execute on big sales. (Most of those were pushed back, so competition wasn't the issue, just execution.) Meanwhile, OpenText is undergoing a major shakeup. In his first 120 days, Barrenechea has replaced several top executives, reorganized the sales staff, and is broadening the company's software scope from Enterprise Content Management (ECM) to Enterprise Information Management (EIM). This grows OpenText's addressable market from $5 billion to $13 billion.

An incredible 90% of the Internet is not public — it's kept privately on government and corporate servers — and it needs to be organized, utilized and managed. That's EIM in a nutshell. OpenText already has its foot in the door in most of the five software segments that make up EIM, but now it aims to become a *leader* in all five niches. To get the gritty details, visit our [conference call summary]().

Despite a clear vision laid out by the new CEO, the market is shying away from the uncertainty of change, along with weak license revenue. Trading at less than 11 times expected earnings for the year ending next month, OpenText looks attractive. That's especially true given that management expects sequential improvement in license revenue this quarter and continued progress on that front over the year. **OpenText moves to Buy First today** on valuation; just realize a lot is changing at the company, and its risk profile is higher.

InvenSense Is Making Sense

Our favorite motion interface chip producer grew sales 38% in the seasonally quiet fourth quarter to $33.1 million. For the year, cash from operations soared 462% to $44.4 million, pricing this young, fast-growing company at 25 times free cash flow. Wall Street clobbered the stock Friday, sending it down 25% after management lowered first-quarter revenue guidance. That change? From a range of $38 million to $42 million in sales, to a new range of $38 million to $40 million.

The culprit? **Qualcomm** is suffering a shortage of processors for a new LTE smartphone, which gums up the whole operation for everybody. InvenSense's motion interface chip is attached to this phone, sales of which are constrained by the number of components the phone maker can get its paws on. In this instance, Qualcomm's gaffe is applying the brakes to sales of the new LTE phone. The hope is that Qualcomm can increase chip production soon, but there's still risk in InvenSense's revenue guidance for the quarter if that doesn't happen. InvenSense, meanwhile, now has the capacity to produce 300 million to 400 million chips a year using two different foundries, and still expects a 40% to 50% jump in revenue this year. There's more to be found in my [notes from the conference call]().

InvenSense is a recent IPO, meaning only time will tell us how good management is at providing guidance, and in this case, the Qualcomm problem is frankly outside of their control. But as long as the company maintains its grip on the hugely growing Android market, it should achieve much larger sales volume in years to come — and that's even without any success getting motion sensors into all kinds of other products. Shares remain a Buy First, but the stock *may* move down to Buy in the near future. We're reassessing all of our stocks against one another right now.

AmTrust Back to Buy

Finally, for those who don't yet have shares: **AmTrust Financial Services** has moved back to Buy for good reasons described in the link below. You can buy up to 5% around $28 and lower.

We Recommend This Earnings Cheat Sheet

Published Apr 30, 2012 at 12:00AM

Pro Fools,

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Tupperware**: Sell to open October $60 puts, lately around $3.60, for up to 3% in shares. If exercised, this nets a start price near our new Buy Around; if expired, it pays a 6% yield on cash in six months.
- **Wells Fargo :** Sell to open July 2012 $33 puts, lately paying you $1.53, or a 4.6% yield in less than three months. This results in a $31.47 potential buy price. Sell one put for every 100 shares you are willing to buy, up to 3% of your portfolio.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Pro Trade Roundup

- **CurrencyShares Euro Trust**: Sold short 140 more shares at $131.83, bringing our total short allocation to 4%.

Guidance Updates

- **Rockwood Holdings**: Moves from Buy to Hold on price, while its fair value moves up to $58 from $56.
- **Tupperware**: Buy Around and Fair Value both move up $1, to $56 and $65 respectively.

Despite the title, this memo isn't about earnings cheats or manipulation. We're not going to highlight a special tool for uncovering aggressive revenue recognition. But I think what we are offering is even better: I'm going to share a tool that will save you time, increase your enjoyment of your *Pro* membership, and help you invest. Better.

I'll get to that in just a minute, but first let's discuss the goings-on here at Fool HQ. We're about halfway through earnings season, which is generally characterized by lots o' hoopla after which nothing happens. When you're invested in good businesses you understand well, a quarterly checkup often just isn't that useful. Unlike 10-K Day — you know, the day shiny annual reports, courtesy of **Broadridge Financial Solutions**, start showing up in your mailbox — there's not even something to unwrap. That said, this particular earnings season feels a little different. At least our stock prices moved! I hate it when there's a blowout earnings report and nobody notices.

Did you notice? If not, click here to see a quick rundown of *Pro*'s earnings season to date.

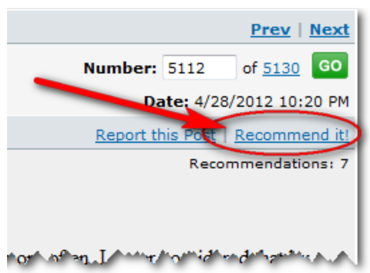
So What?

Over our investing time horizon — typically rolling-three-year periods — a single quarter is usually meaningless. Bryan (TMF42) aptly describes the weight analysts put on a single quarter's meet-or-beat status as a circus. He's right … but circuses are fun. Personally, I enjoyed watching Apple add $50 billlion in market value after announcing another blowout earrings report, and as a shareholder, you should have too. Jeff (TMFFischer) has opined that strong earnings drive our results; I'll add that we benefit most from strong earnings that are underappreciated by the market. That's what makes earnings season, despite the hundreds of pages of press releases, conference-call transcripts, and 10-Qs, a little fun.

Wall Street analysts small-f foolishly try to forecast earnings for just a few months out, basing their calculations largely on management guidance. The chart shows the consensus estimate for the companies in the *Pro* portfolio, their actual results, and the market's reaction. More importantly, I've linked to our reviews of the earnings results posted on the *Pro* discussion boards. Our wonderful editor, Ellen, willing (*Ed. Note: She's willing. Flattery will get you everywhere*), we'll update the page with new results and new links as we have them. And that brings me to the *Pro* community: Earnings reviews like those are just one thing you're missing if you don't participate on our discussion boards.

Recommendations: The Currency of the Boards

The *Pro* discussion boards are among the most active in Fooldom thanks to the selfless contributions of our loyal members, many of whom spend quite a bit of their free time answering questions, telling stories, sharing investment ideas, running contests, and even critiquing and challenging the *Pro* team. Without these contributions, your *Pro* subscription would be (in my opinion) less valuable — and this serious business of investing would be a whole lot less fun. We've recently thanked several of our most Foolish members with a small gift, but there many others we would have loved to thank personally. Fortunately, you can help us by using the "Recommend it!" link in every post that you find useful.



If you've never posted, or if you've never "rec'd" a post (as the cool kids say), don't feel bad — you're not the only one. Pro member fizzed101 recently shared:

I read the boards a lot (1-2 hours per day), and I feel bad that I don't post more often. I never considered that by using the Rec button I could show my appreciation and involvement even as a "lurker" - a term I prefer a whole lot more than "voyeur" :-)

I find the analysis and discussion to be incredibly helpful and entertaining. I mentioned to my wife just last night that the Fool site, though a bit antiquated, is the ONLY site where I can count on finding intelligent, in-depth, and polite discussion.

I can relate. I myself joined the Fool's discussion boards under the moniker THRLSKR all the way back in 2000, but didn't make my first post (under a new username) until 2005. I like to think I did a lot of recommending, but I'm honestly not sure.

When you recommend a post, you communicate your thanks or interest without writing a word. And if you're the author, seeing your post recommended provides a little jolt of energy that spurs additional high-quality posts, which may then earn their own recs. This virtuous cycle helps sustain a virtual but very real community like ours.

Don't spend much time on the discussion boards? Still not convinced that more recommendations benefit you as a member? Consider that recs are just as helpful for busier community members (like yourself, perhaps) because they allow you to filter for only the best posts. By recommending a post, you tell other members it's useful, getting good information in front of the most people possible.

Reasons to Rec a Post

1. Learned something new or provoked thought
2. Saved time
3. Appreciate the effort
4. Strongly agree
5. Strongly disagree, but are glad the viewpoint was shared
6. Made you smile

In closing: Our trades and Monday Memos fill us with pride and joy, but they're not the only valuable part of your *Pro* subscription. Please drop by the discussion boards. Poke around, introduce yourself, start or join a conversation. And if, while you're there, you read something you find useful or enjoyable … recommend it!

If you'd like to discuss any specific earnings results, please visit the company's discussion board. To talk about this memo, as always, please visit us on the Memo Musings board.

Fool on!

Short More CurrencyShares Euro Trust

Published Apr 25, 2012 at 12:00AM

- **What We're Doing:** Increasing our short position in the CurrencyShares Euro Trust.
- **What We're Thinking:** We want a larger allocation to benefit from any decline.
- **What We're Expecting:** Europe could get much uglier, and even if it doesn't, the euro's upside is likely modest.

Trade Essentials

- **Action:** Sell short (more shares of) **CurrencyShares Euro Trust**
- **Allocation:** Bring your short exposure up to 4% (we're currently at 2.8%); *Pro* will sell short about 130 more shares.
- **Price Guidance:** Use a limit order and ideally short above $130.50.
- **Trust Price:** $131.40
- **Alternative Trade:** Set up a January 2014 $131 synthetic short (sell the calls, buy the puts, one each for every $13,100 you wish to short); aim to pay less than $2 to set it up. If the trust price moves before you set it up, use the strike price nearest the current trust price.
- **IRA Account Alternative:** Set up a January 2014 $120/$131 bear put spread. Buy to open $131 puts and sell to open $120 puts in equal amounts, for a net debit of around $4 or lower. That's a $400 cost per spread. The most you can make is $700 per spread (if the trust ends below $120), and the most you can lose is $400 per spread (if it's above $131 by expiration).

What's New?

Since we first recommended this short in December 2011, the euro's value has declined less than 1%, proving resilient against the U.S. dollar. These past five months have brought us a rip-roaring market rally and optimistic tidings, so given the general giddiness, the short has served us well simply by not rising.

But the mood in Europe seems to be darkening. Elections in France suggest President Nicolas Sarkozy could lose. The Dutch government collapsed Monday over budget arguments. Spain's bond yields are going up. Throw in rising unemployment and slowing growth, and from our distant perch, Europe continues to look like an economic and political mess.

Over the past several months, the European Central Bank lent roughly 1 trillion euros ($1.31 trillion) to at least 800 banks, flooding the region with cheap capital and bringing down many bond yields in the process. Analysis suggests that most of this money has been invested, and now banks lack spare cash to buy government bonds in bulk. Banks are extremely leveraged in Spain, France, and elsewhere in the zone and are already overexposed to sovereign debt, making the situation more precarious. If bond demand in Spain or Italy declines further, either country might require a bailout to bridge short-term budget gaps. Meanwhile, Greece has more debt than it did two years ago, and the situation there is proving to be a powerful argument against future austerity programs in the region. Even so, Germany continues to press for spending reductions as a solution to the eurozone's record debt. But we must ask, without GDP growth, how does a country's debt-to-GDP ratio sustainably improve?

The answer is it probably doesn't. Meanwhile, the euro could come under increased selling pressure. In our fiat money system, currently dominated by low interest rates as it is, currencies trade on GDP output, economic stability, and the confidence people have in the institutions underlying the paper. Although the United States is no bastion of smart spending, the foundation upon which the world's reserve currency is built looks rock-solid compared to the eurozone. Plus, the U.S. economy is competitive and expanding. In Europe, several countries are in a recession that could conceivably spread.

How can Europe solve its problems? It could initiate a highly expansionary monetary policy, which would likely lower the value of the currency, or it could forgive massive amounts of debt, which could topple banks and undermine confidence in the euro. Or weak countries could abandon the euro and recapitalize with their original currencies. Whatever happens, any additional cracks in the eurozone's facade could lead to a weaker euro against the dollar — perhaps much weaker, if investors move to the relative safety of greenbacks. As we noted in our original thesis, this short offers ample upside and reasonable-looking downside risk. The risk includes the reality that Europe's governing bodies will continue to consider new policies to right the ship — assuming the countries can reach agreement.

How to Follow Along

You need a margin account to sell short, and the trade order is usually "sell" or "sell to open." This trade will bring our total allocation in this short up to 4%, so your short position in the trust should ultimately be around $4,000 for every $100,000 you manage. If you can't short or you only trade in an IRA, consider our alternative trades in the "Trade Essentials" section above. You'll pay a modest premium to short using options, but you won't have ongoing shorting fees.

For those shorting directly, realize that being "called out" early is always a risk should the euro jump. And everyone should remember that a currency is a *relative* investment; in this case, the euro is battling the dollar. If the dollar dives, we could be correct in our thesis but still fail to make money. More likely, if the euro weakens again, the paper sporting the faces of Franklin, Grant, Jackson, Hamilton, Lincoln, and Washington is the currency that will benefit.

Allocation Matters

Published Apr 23, 2012 at 12:00AM

Dear *Pro* Fools,

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **AmTrust Financial Services**: Sell to open September 2012 $25 puts for $1 or higher in credits, one for every 100 shares you're willing to purchase up to 5%.
- **Covanta Holdings**: Income trade. Sell to open June 2012 $15 puts, lately for $0.30 — that's a 2% yield in 54 days. If exercised, this would net a potential buy price below our Buy Around. Be ready to own up to 3%.
- **Wells Fargo :** Sell to open July 2012 $32 puts, lately paying you $1.65, or a 5.2% yield in three months. This results in a $30.35 potential buy price. Sell one put for every 100 shares you are willing to buy, up to 3% of your portfolio.

Questions on these? Visit our "Catch-Up Trades" discussion board.

With the market up five months straight, it's more difficult today to find buys we like — and we don't want to force any, especially because we know the landscape will change if we're patient. Thus, we're likely to have more options and short-selling trades in the near future than stock purchases. Of course, that could change anytime; perhaps the new earnings season will shake out some new buy opportunities, and irrational drops could also allow us to increase our stake in existing positions, as we did last quarter with **BMC Software** and **Oracle**.

I bring this up for a simple reason: If *Pro* begins using options more heavily for income (in a market that may go sideways) or shorting more frequently to be defensive, remember you don't need to follow these trades if you don't short or use options. The *Pro* portfolio is 91% long in stocks (net 70% long including shorts), and we have about 10% cash. Our gross long exposure should be more than enough for investors who only invest long, and it still leaves cash for new ideas. So, if you see more options and short-selling trades hitting your email inbox the coming weeks and you don't use these strategies, don't sweat it. The vast majority of our portfolio is in long positions, and we continue to seek new ideas and manage our long portfolio to make money the next few years and beyond.

Allocation Matters

When it comes to those long positions — again, 91% of our portfolio — how we allocate is instrumental. We typically put the most capital into ideas in which we have the most confidence. Riskier investments we're less sure about demand less capital, at least to start; over the years, perhaps we'll add to them as the outlook becomes clearer. So how are we doing with our allocation decisions? Pretty well so far. Here are our long stock and ETF positions, largest to smallest, and how they've performed (as of April 19).

Company	% of Port	Return
Intel (INTC)	7.1%	+35.1%
Medtronic (MDT)	5.1%	+5.3%
AmTrust Financial Services (AFSI)	5.1%	+156.6%
Oracle (ORCL)	5.0%	+26.9%
Rockwood Holdings (ROC)	4.9%	+7.5%
Apple (AAPL)	4.7%	+18.2%
BMC Software (BMC)	4.6%	+3.1%
Pebblebrook Hotel Trust (PEB)	4.3%	+15.5%
CME Group, Inc. (CME)	4.0%	-3.0%
Bristow Group (BRS)	4.0%	+54.6%
Papa John's Pizza (PZZA)	3.8%	+61.0%
MasterCard (MA)	3.7%	+34.6%
Broadridge Financial Solutions (BR)	3.4%	+1.8%
Vanguard Energy (VDE)	3.3%	+53.7%
Covanta (CVA)	3.1%	-5.9%
Tupperware Brands (TUP)	3.1%	+25.9%
OpenText (OTEX)	3.0%	+2.0%
Plum Creek Timber (PCL)	2.9%	+28.4%
GrafTech International (GTI)	2.8%	+32.7%
Wells Fargo & Company (WFC)	2.8%	+9.3%
StoneMor Partners (STON)	2.5%	-12.5%
WisdomTree Emerging Markets SmallCap Dividend Fund (DGS)	2.5%	-9.3%
3D Systems (DDD)	2.3%	+9.0%
InvenSense (INVN)	1.7%	-20.2%
Pacer International (PACR)	1.5%	+46.7%

Key Takeaways

- Our largest position, **Intel**, is the top-performing Dow Jones stock over the last 12 months, so we're happy to celebrate this allocation decision with our veteran members.
- On a whole, our largest positions are in the green; only one stock that makes up 4% or more of the portfolio is in the red. That's new holding **CME Group**, down a few percent.
- Most of our losers are our smallest positions. This suggests we were right to start small.
- We have 25 positions listed, so the average size would be 4%. If we had blindly put 4% in each, our performance would be weaker, so the effort we're spending on allocation is worthwhile.

Obviously, some of our best-performing positions are our largest in part because they *have* gone up, and in those cases we can't entirely credit our allocation decisions. But that's rare. For example, **AmTrust Financial Services** is up the most for us, but we've long had at least 5% invested there (remember, we recently cut this winner down from nearly 8%). And some large positions have done relatively very poorly. **Medtronic** is a 5% stake that's only up 5% (excluding dividends and options) over all the years we've owned it. Many stocks have clobbered that. This looks like a poor relative investment so far.

A Bizarre Request From Our Co-founder and CEO

On May 8, Tom Gardner will ask our most dedicated Fools to give up their *Pro* membership and join a one-of-a-kind "club" that gives you access to every wealth-building tool, product, and service we've developed over the past two decades — including *Pro*. Thousands will apply, but only a fraction will be able to join. To see if you qualify — or to simply learn more about this exciting new development — go to one.fool.com.

Among our smallest positions, it's a shame that we've only invested 1% so far in **Pacer International**, as it's already up 46%. We're writing puts to try to get more shares, and we've made some income, but in a perfect world we'd have more allocated to the stock already. Pacer is so tiny that we were concerned about a "*Pro* bounce" in the stock price after our recommendation, so we started small and used put options. Also don't forget that **GrafTech International**, once a 5% holding, has fallen by half. That was a poor allocation decision in reverse: We considered selling at least some shares in the $20s and didn't (we may next time).

Sum It All(ocation) Up

Add it all up, and our allocation decisions have added to our results. There's always room for improvement, though, and the knowledge that we can do better is continually driving us. We allocate our capital based on our beliefs about a company's risk versus reward and the likelihood of its success. We think this is a successful formula, and while we're always scoring ourselves and working to improve, we don't plan to fundamentally change our approach to allocation. To discuss the topic, visit the Memo Musings board.

Fool on!

Jeff Fischer (TMFFischer)

Pro Trade Roundup

- **CBOE Volatility Index** (VIX): We closed our May $20/$27 call ratio spread for a $0.50 debit. We opened a June $19/$26 call ratio spread for a $0.16 credit, selling to open 15 June $19 calls and buying to open 30 June $26 calls.
- **Sony**: We set up a January 2013 $5/$22 bear call spread for $11.15 in credit, trading 17 contracts each, for a 2% look-through allocation.

Guidance Updates

- **Rockwood Holdings**: We moved the stock back to "Buy" Friday when it declined to our $49 Buy Around price.

Set Up a Bear Call Spread on Sony

Published Apr 18, 2012 at 12:00AM

4/19/12: Update

Hey Fools — it looks like some members are already being assigned short shares through the $5 calls we're writing. That's perfectly fine, assuming you're setting this up in an account that's capable of shorting and your broker has shares available to short (and it seems all do right now). We wanted to be short shares, either through calls or directly, and we expected the exercise of our $5 calls would happen at some point — just not so soon.

However, **you should not set this trade up in an IRA**, because it is effectively a short, and direct shorting is not allowed in IRAs. If you can only trade in an IRA, simply buy to open January 2013 $22 puts, one for every 100 shares you want to invest against.

Also realize that **nothing has changed at all**. We want to be short Sony, and this recommendation is one way of getting there (quickly, as it turns out!). Just make sure you're shorting in an appropriate, short-enabled account.

For more, see this discussion-board post, and please ask any questions you may have on the board.

- **What We're Doing:** Profiting if Sony's stock declines, while capping our risk.
- **What We're Thinking:** The struggling electronics conglomerate has lost its way.
- **What We're Expecting:** Timely business improvements will be difficult to deliver.

Trade Essentials

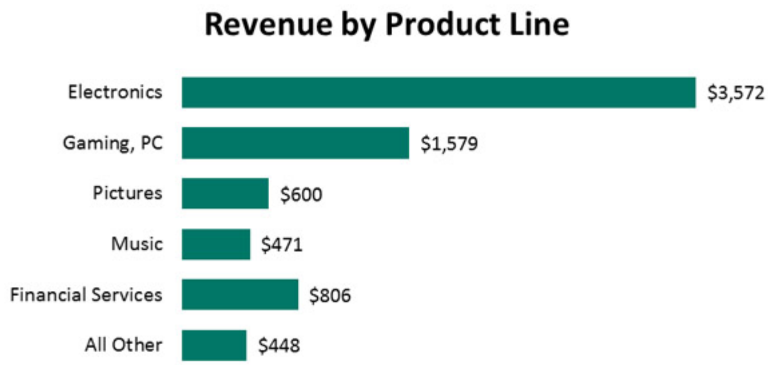
- **Actions:**
  - Sell to open January 2013 $5 calls and ...
  - Buy to open an equal number of January 2013 $22 calls
- **Price Guidance:** Aim for a net credit of $11.20 or higher, using a spread order. As prices change, aim to set up the spread a $0.60 or smaller discount to the share price (see details in "How to Follow Along" below).
- **Share Price:** $16.80
- **Allocation:** Measured from a short price of around $16.20, 2% (for *Pro*, that's 17 contracts of each option, or 1,700 shares). Roughly, set up one spread for every $80,000 you manage.
- **Potential Profit:** $11.20 per share if Sony falls to $5, but we don't expect such a large decline.
- **Potential Loss:** $5.80 per share if Sony rises above $22.
- **Strategy Guide:** Bearish Spreads
- **Alternative Trades:** At some brokers, you can short the stock directly for a small fee plus the 1.9% annual dividend; if you do this, don't write the $5 calls, but do buy January 2013 $22 calls with us (one for every 100 shares you short) to cap risk.

The Big Picture

With revenue down nearly four fiscal years in a row, **Sony** is sick — and not in the hip, cool way the kids use that word. The Japanese consumer electronics, gaming, and entertainment company makes much of its revenue from products that could soon be on display in Smithsonian history museums: DVD players, dumb TVs, home video recorders, compact digital cameras (what, with no phone function?), and old-school gaming consoles, including the PlayStation 3. The company has attempted several restructuring plans, but it hasn't generated positive net income for a fiscal year since the year that ended in March 2008. Its latest recovery attempt, outlined last week, involves layoffs of up to 10,000 people, cutting deeply into its staff base of 16,600.

What happened to the company that brought the world the Walkman (and, more recently, Blu-ray)? Well, **Apple**, for one thing. But the real problem is that Sony is playing catch-up. The company offers hundreds of different run-of-the-mill electronics products, but consumers are living amidst an amazing convergence of technology that allows them to do most of what they want with just a few. The world is moving to powerful mobile, server-based cloud computing, getting its entertainment in new ways, taking pictures with phones, and gaming on the fly.

It isn't that Sony isn't trying (you probably didn't know that it sells e-readers or that it launched a small Sony Tablet P that's more expensive than an iPad), but it hasn't captured enough consumer interest. And now that the tide has turned against Sony, it may be much harder to find the next wave to ride, because last week's layoff news won't help company morale or stem a likely exodus of talent. Although Sony has some divisions that aren't struggling, including its film and music offerings, they're a small part of the pie.



Revenue in billions of Yen for the fiscal year ended March 31, 2011. Source: 2011 Form 20-F SEC filing. "Pictures" is Sony Pictures Entertainment.

New CEO Kazuo Hirai laid out his turnaround vision on April 13, but we're unconvinced. Rather than outlining strategy per se, he listed product lines. His areas of focus are, in order: the core business (which he defines as digital imaging and image sensors in the semiconductor division, as well as digital imaging products for consumers and businesses); the games business; and mobile, including Sony's Xperia smartphones, tablets, and the Sony VAIO PC. After that comes the large TV business (where per-unit prices keep declining), which Hirai hopes to lead back to profitability after years of losses. Then there's growth in emerging markets, "creating new businesses and accelerating innovation," managing spin-offs and possible partnerships, and finally a new management team.

The CEO's plan was not clearly presented in the conference call, and his answers to pointed questions were scattered. Meanwhile, it's counterintuitive to us that a company that's laying off thousands of employees nonetheless hopes to create new businesses, accelerate innovation, and revive many struggling product lines. Our bearish position reflects our belief that it will be extremely difficult for Sony to turn its massive electronics business around in a timely or highly profitable fashion, yet shares already trade at an expensive 19 times earnings that *might* be achieved in an expected (guessed-at) return to profitability by March 2013.

How to Follow Along

We're writing deep-in-the-money calls to profit on a continued decline in Sony stock. Our written calls mirror a short of the stock down to $5 per share. The second part of our spread, buying $22 calls, caps our risk at $22. So, our trade looks like this:

- **Actions:**
  - Use a spread order to sell to open January 2013 $5 calls and ...
  - Buy to open an equal number of January 2013 $22 calls
- **Share Price:** $16.80
- **Potential Spread Price:** Net credit of $11.20 or higher, resulting in a $16.20 short price
- **Maximum Profit:** $11.20 if Sony declines to $5
- **Maximum Risk:** $5.80 if Sony increases to $22
- **Potential Return on Risk:** 193%
- **Break-Even at Expiration:** $16.20

As prices change, aim to set up the spread for no more than $0.60 less than the current share price. In other words, if Sony stock is $16 as you're setting up the spread, you should net a total credit of at least $10.40, for a break-even of $15.40 or higher. (The math: It's a $5 short strike, you'll get $10.40 in credits on the spread, and that equals $15.40 as a break-even while the stock is $16.) This discount to the current short price is the cost of capping our risk with $22 calls. We want to cap risk because if Sony does begin to master a turnaround, the stock could have plenty of upside. Sony could also sell assets to promote stock appreciation. A final risk we can't control is the early exercise of our short $5 calls. If that occurs, we'll need to borrow shares to short or adjust our position to maintain it.

Next Step: To discuss this bearish spread, visit our new Sony discussion board.

Roll Out and Down Your Call Ratio Backspread on the CBOE Volatility Index

Published Apr 17, 2012 at 12:00AM

What We're Doing: Rolling our volatility hedge from May to June and down one strike price.

What We're Thinking: The VIX has increased from 15 to a recent 19, but any number of risks could send it much higher by May.

What We're Expecting: Our loss should remain modest if the VIX treads water, but if volatility spikes enough, we'll profit.

Trade Essentials

- **First Action (assuming you followed last month's trade):** Buy to close your May 2012 $20 calls and sell to close your May 2012 $27 calls on the **CBOE Volatility Index** (ticker: VIX, or ^VIX at some brokers, or $VIX.X).
- **Price Guidance:** Use a limit order aiming to pay a net debit of $0.40 or less, combined, to close both May options.
- **Second Action (or first action if you're new to this trade):** Sell to open June 2012 $19 calls, and buy to open *twice as many* June 2012 $26 calls.
- **Price guidance:** Use a limit order and aim to set up the June spread for a combined debit as close to $0.00 as possible.
- **Allocation:** Set up one 1:2 call ratio backspread for approximately every $100,000 you manage. *Pro* will sell 15 June $19 calls and buy 30 June $26 calls.
- **VIX level (April 16 close):** 19.5
- **Alternative Trades:** None. If you can't make this trade, don't sweat it. Our short positions also provide hedges.
- **Follow-Up:** We plan to roll or close this position one month prior to its June 20 expiration. We will not hold to expiration, and if we see a profit, we may close.

What's New?

- **Previous recommendation:** We issued our first spread on the VIX on March 14.
- **Change (as of April 16):** As of Monday, the VIX had jumped 26% since our recommendation, to 19.5, but this wasn't enough for call owners with strike prices in the 20s (like us) to make a profit. However, unlike straight call buyers, our loss is small thanks to our strategy.

The **CBOE Volatility Index** (VIX) didn't stay around 15 for long. Within a couple of weeks of our March trade alert, the VIX had climbed to its long-term average of 20, but we needed a still higher level for our bullish call option spread to show a profit. Because the VIX remains depressed after a five-month stock rally, and we can set this trade up cheaply, we'll roll this position into a new month. We consider it an ongoing volatility or "shock" hedge — with a caveat.

Today, the trade we set up last month for $0.09 needs to be closed for a cost of around $0.40, meaning we'll lose around $0.50 per spread. That's a small, but not inconsequential, $750 loss on our position (about 0.05% of the portfolio). Going long volatility on a regular basis is a systematic way to lose money, even with a cheap spread like this. So we're only going to use the strategy when it *seems viable* that volatility could spike over our necessarily short time frame. And with presidential elections looming in France, bond yields in Spain rising almost as much as its unemployment, India due to launch its first missile capable of reaching China, and North Korea playing with malfunctioning fireworks itself, any number of factors could send the VIX above 20 over the coming month.

Our aim is to again set up a backspread for around zero cost. We'll profit if the market falls and volatility sends the VIX into at least the low 20s. If it doesn't, we're probably looking at another $0.50-per-spread or so loss a month from now. It is, of course, not our intention to lose money (even small amounts) on this strategy month after month — we covet every profit we earn, so we won't dither our gains away with bullish volatility options. But right now, at least decent odds for a spike in the VIX make us want to re-initiate the trade and roll it into May.

How to Follow Along

If you participated in our May spread, close it entirely. Buy to close the May 2012 $20 calls and sell to close the May 2012 $27 calls, using a spread order with a limit price. At recent prices, you can target a $0.40 combined debit to close this spread. That shouldn't change much over the next few days, but we won't list individual options prices because they *will* change steadily (though the total spread cost shouldn't).

Once the deck is clear, set up a new spread: Sell to open June 2012 $19 calls, and buy to open twice as many June 2012 $26 calls. We're moving the strike prices down by a dollar apiece; ideally, we'll benefit from slightly more sensitive $26 calls, and our $19 calls will largely shed their time value if the VIX spikes. At recent prices, you should be able to set up this new spread for around zero net cost. We plan to close or roll this spread a month before its June 20 expiration, so our potential loss should again be modest if the VIX isn't much higher or lower by late May.

Next step: Please be sure to visit our VIX discussion board if you have any questions before you make these trades.

See Pro's *holdings here. See the team's and David and Tom Gardner's holdings here.*

Partnering Up With StoneMor

Published Apr 16, 2012 at 12:00AM

Dear Fools,

Pro Trade Roundup

- **Pacer International**: We wrote 19 June 2012 $7.50 puts for $0.80 each, to bring our potential holdings in Pacer to 4%.

Guidance Updates

- **StoneMor Partners**: With a better understanding of the tax implications and a juicy yield, we're moving the stock from Hold to Buy.

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **StoneMor Partners**: Using a limit order, buy up to 2.5% around $27 or lower.
- **AmTrust Financial Services**: Sell to open September 2012 $25 puts for $1.10 or better, one for every 100 shares you're willing to purchase up to 5%.
- **Rockwood Holdings** (NYSE: ROC): Sell to open May 2012 $50 puts, recently $2.25 one for every 100 shares you're willing to purchase up to 5%. If put shares, this trade will net a purchase price of $47.75, below our $49 buy-around price. This is an in-the-money put write, so expect to get shares.

Questions on these? Visit our Catch-Up Trades discussion board.

We placed **StoneMor Partners** on hold at the beginning of the year because we wanted a better understanding of the tax implications that come with owning shares in this master limited partnership (MLP). With tax reporting season almost over, many of you have indicated to us that we needn't have worried.

As a partnership that operates in more than two dozen states, StoneMor is capable of earning income that requires a partner (meaning unit holder, or shareholder) to file income taxes in many different states. But for various reasons, that income proved to be immaterial last year (and should continue to be), or it was easily dealt with by tax software or one's own accountant. So with this tax concern largely out of the way, we're able to refocus our attention on the business itself — and return it to buy status.

StoneMor is one of the country's largest cemetery operators — it owns more than 270 spread across the nation. The company makes money by providing the inevitable services that arise when someone passes away. It's one of the largest "pre-need" sellers in its industry, providing customers the peace of mind that comes with pre-planned and pre-paid plots, crypts, and funeral services.

However, as you may have guessed from the tax questions, StoneMor has a unique business model that requires us to look at it like a financial company. The complexities in its cash flow keep many investors at bay, allowing the stock to trade with a sustainable 9.7% dividend yield that we're happy to suggest you lock in.

Before we get into more details, let's outline the basics for new buyers.

- **Action: StoneMor Partners** moves from "Hold" to "Buy"

- **Allocation:** We have 2.5% of our funds invested in StoneMor
- **Fair Value:** $32
- **Recent Price:** $24.10
- **Dividend Yield:** 9.7%
- **Type of Holding:** Yield
- **Next Payment:** Likely to be $0.585 per share (or "unit" in a partnership), due in early May
- **Buy Around:** $27 and lower (use a **limit order** at current prices; the stock is thinly traded)
- **Original Buy Report:** Read here

The Market's Limited Perception

StoneMor's business is steady and reliable; the company has been running its operations much the same way for 30 years. In the "unintentional gallows humor" department, CEO Lawrence Miller said in the last conference call, "We're confident that we'll have a nice year." Indeed, death and taxes are two certainties in life.

Even so, Wall Street is skeptical. The stock took a knock last year following third-party reports regarding the company's weak cash flow up against its high dividend obligation. Standard & Poor's didn't help matters when it put out a mixed review of the company's debt and credit rating. Both instances have StoneMor management seeking to clarify its financial story to investors; they know they have an image problem, and they wish to correct it.

The issues involve massive trusts that StoneMor operates, and the borrowing or fundraising the company does to fuel operations. In a nutshell: StoneMor continues to grow assets by acquiring more cemeteries. With more plots, it can make more pre-need sales, which then increases the amount of cash it'll be one day able to book (it holds those accounts receivable in a trust). The business uses those receivables as collateral to draw on working capital loans. As CEO Miller says, "We haven't changed that model since the early '70s." StoneMor is required by law to put pre-need revenue aside and can't recognize most of it until the services are provided. This is why its cash flow from operations typically appears weak, especially when the company is spending to acquire more properties.

As the vice chairman says, "In a no-growth scenario, we don't burn cash." But for now, StoneMor looks like it's operating at a deficit, even though it has more than ample means to keep servicing the dividend and business. In fact, the company has much more in trusts than it will need to deliver to customers. If StoneMor fulfilled all of its pre-need contracts today, it says, it would have $250 million left over, along with another $130 million in reliable accounts receivable. The annual dividend is about $45 million. Yet a 9.7% yield implies that Wall Street believes the payment is unsustainable.

Management could stop the growth and close the apparent financing gap that way. But to the executives' credit, they believe the better way to operate is to grow when they see opportunities, using money in trusts as collateral to fund growth and operations. StoneMor is likely to acquire more cemeteries this year, and to keep running the books and business the same way it has for three decades.

Partnering Up

As in our original buy report, we're recommending this stock because it sports a very high yield backed up by a stable business that we believe will continue to deliver. The market should eventually gain more faith in the company, and that should push the price up until the yield isn't so egregiously large.

Realize that if you buy shares (or units), you may need to report income from this master limited partnership in various states. *Pro* members have said doing so took anywhere from two minutes (the income wasn't material) to 30 minutes. Also, try to buy shares in a *non*-tax-advantaged account. Owning shares in an IRA may not afford you as many tax benefits as a traditional account.

Finally, understand that the market could still *lose* faith, sending the stock lower, or something in the financials might not work out as analyzed, putting the dividend at risk. We believe those risks are small, and that's why we're comfortable making this high-yield stock a Buy again. Use a limit order to buy up to 2.5% in shares.

Are you ready to dig in to StoneMor? Talk about it on our discussion board!

Foolishly,

Jeff Fischer (TMFFischer)

Write Puts on Pacer International

Published Apr 12, 2012 at 12:00AM

- **What We're Doing:** Selling puts to obtain an attractive buy price on shares.
- **What We're Thinking:** Pacer's stock is undervalued, and continuing to ease into a position will help us track our North Star.
- **What We're Expecting:** Our existing June $5 puts will likely expire as income, but we expect these new puts to result in owning more shares.

Trade Essentials

- **Action:** Sell to open a 1% position in June 2012 $7.50 puts (for *Pro*, that's 19 contracts), resulting in a potential 4% total allocation.
- **Recent Options Price (bid/ask):** $1.05/$1.40
- **Limit Price:** We don't write options for free, so set a limit to earn at least $0.10 of time value. At current prices, that means a limit of $1.15 or more. As prices change, remember that time value is any amount above the difference between the share price and your strike price (for example, if the stock is $7, the $7.50 puts should pay you at least $0.60 for $0.10 in time value).
- **Share Price:** $6.45
- **Buy Around:** $7.50
- **Fair Value:** $11.40

- **Scorecard Status :** Moving from Hold to Buy First
- **Alternate Trades:** If you don't use puts, you can buy shares using **a limit order at the current price** up to a 4% allocation. But note that we expect our June $5 puts to expire and these June $7.50 puts to be exercised, which would leave *Pro* with just a 2% allocation to Pacer. We'll only get to the full 4% if both puts are exercised (meaning the stock is below $5). So newcomers who don't write puts may only want to buy 2% total in the stock for now, using a strict limit order.

What's New?

- **Previous recommendations**: In December 2011, we wrote puts to potentially acquire 1% in stock; we ended up buying shares at a net $4.66 in December, and those shares are up 38% today. We currently have June $5 written puts for 2% more; those are likely to expire as income.
- **Updated guidance**:
  - We are moving **Pacer International** to Buy First.
  - We are increasing our Buy Around price to $7.50.
  - We are lowering our estimate of fair value to $11.40 from $12.
  - For more details, click here.

We think inter-modal is inter-esting. The domestic economy is slowly and steadily recovering. Railroads are expected to spend $13 billion this year improving their service and tracks and building out intermodal depots. And gas prices continue to rise. All of this makes rail transport increasingly more attractive than truck transport — and encourages shippers to call a little intermodal transporter named Pacer to make the switch. The intermodal value proposition is real and growing.

And Pacer continues to show us that its turnaround efforts are not in vain. In 2011, it tripled operating income, grew its core intermodal business, and continued to rein in costs. Over the past three years, Pacer has removed 28% of its overhead costs. Management is now turning its attention to rebuilding its smaller logistics segment, where it will revamp the IT infrastructure, put new leadership in place, cut costs, and make its offerings more competitive. Pacer doesn't need to work miracles — it simply needs to make the outfit more efficient and funnel business to its intermodal network.

How to Follow Along

We expect our June $5 put options to expire worthless, but they still represent a potential 2% obligation that we take seriously. When combined with the 1% we own outright and the additional 1% we are likely to be put by writing these in-the-money $7.50 options, our total potential exposure to Pacer will be 4%.

For those who may have September $5 put options after following a Catch-Up Trade, consider adding the June $7.50 puts to bring your total potential allocation in line with ours.

If you don't use options, you can simply buy shares outright. **However, remember that Pacer is a very illiquid stock, and we will all benefit from a little patience — please use limit orders**. Tread lightly.

Next Steps

Write Covered Calls on 3D Systems

Published Apr 11, 2012 at 12:00AM

- **What We're Doing:** With our absolute-returns North Star in mind, we're seeking income on our shares.
- **What We're Thinking:** The stock price has risen, meaning we can write far out-of-the-money calls above fair value for a decent yield – one way to monetize a dividend-less stock.
- **What We're Expecting:** 3D Systems is likely to remain below our $30 strike price by August.

Trade Essentials

- **Action:** Sell to open August 2012 $30 calls (one for every 100 shares you already own).
- **Limit Price:** Aim for at least $0.85 per contract; as prices change, ideally accept no less than $0.70.
- **Option Price (August $30 call, bid/ask):** $0.75/$0.95
- **Share Price:** $23
- **Buy Around:** $21
- **Fair Value:** $27
- **Scorecard Status:** Hold (and write covered calls if you use options)

What's New?

- **Previous recommendations**: On Feb. 3, we recommended new investors buy shares around $21; *Pro* bought shares in April 2011 at $24.95.
- **Change (as of April 10)**: The stock is up 9% since Feb. 3 and down 9% since *Pro*'s initial purchase.

Revenue was up 44% in 2011, to $230 million, at **3D Systems** after the number of printer units sold increased by 242%. Recurring revenue, made up of printing materials and services, grew to 71% of sales. We love to see that — with the caveat that customers need to keep buying those materials to make the number reliable. Despite this growth, though, shares are down modestly since our initial purchase one year ago, underlining the fact that we paid a premium for a young company that needs time to grow into its valuation. Its valuation multiple has already contracted greatly.

The stock trades for 20 times management's estimate for 2012 non-GAAP earnings per share (we're using the midpoint of the $1 to $1.25 guidance), which are expected to grow 39% versus last year's EPS. Shares are below our fair-value estimate, but the stock is volatile, and it's up enough over the past six months that we're able to write covered calls with a 30% higher strike price and still capture a healthy payment. Odds suggest this trade will become income, serving our North Star goal of absolute returns. But if shares soar 30% and are called away, we'll have a healthy profit as we sell more than 11% above our fair value (leaving us open to writing puts for a lower re-entry price).

How to Follow Along

Pro purchased its 3D shares exactly one year ago, on April 11, 2011, so by setting up this trade **tomorrow or later**, we're guaranteed a long-term tax rate whatever happens next. Check your statements to see when you bought 3D shares (we issued our trade alert on April 7, 2011). At the same time, realize that *whenever* you bought, since we're writing calls that are far out-of-the-money, your position still qualifies for long-term gains *if you own it for more than a year* before selling the stock (and we doubt we'll be selling the stock via these options). If the options you write aren't exercised, they are always short-term gains. Bottom line: If you bought the stock about one year ago, like us, check your purchase date and write the calls at least **a year and a day** after your purchase date, just to make it clear to Uncle Sam. If you've owned the stock much less than a year, this covered call doesn't change your ability to pursue long-term gains on the shares, unless, obviously, your stock is sold before you've owned it for a year.

When you're ready, sell to open one call for every 100 shares you already own (for *Pro*, that's 12 contracts). Further details:

- **Option yield (at $0.85 on a $23 share price):** 3.6% in just over four months (about 9.7% annualized)
- **Distance to $30 strike price (from $23):** 30.4%
- **Distance to net sell price:** 34.1%

Next Step: If you have questions, please visit the 3D Systems discussion board.

Our Hedge-Fund Smackdown; Four Investing Rules

Published Apr 9, 2012 at 12:00AM

Dear Fools,

In last week's Memo, Bryan Hinmon (TMF42) outlined *Pro*'s first-quarter performance, detailing our winners, our laggards, and our overall returns (10.7%, while the S&P 500 gained 12%). Though of course we will always work to improve our processes and results, we're nonetheless pleased with this admittedly short-term performance. We've stayed modestly defensive and focused on our North Star this year, leaving us invested about 70% net long, on average; we've been more than 20% short all year, and we currently hold about 10% cash.

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **3D Systems**: Sell to open August 2012 $22.50 puts, currently $2.40, one for every 100 shares you're willing to purchase up to 2%. Or, sell to open August 2012 $20 puts, lately $1.40. If put shares, either trade provides a net purchase price below our $21 Buy Around.
- **Bristow Group**: Sell to open September 2012 $40 puts, recently $1.60, one for every 100 shares you're willing to purchase up to 4%. If put shares, this trade provides a net buy price of $38.40, below our $39 Buy Around.
- **Rockwood Holdings**: Sell to open May 2012 $50 puts, recently $2.50, one for every 100 shares you're willing to purchase up to 5%. If put shares, this trade will net a purchase price of $47.50, below our $49 Buy Around. Or, sell to open August $50 or $45 puts for a higher payment.

Questions on these? Visit our "Catch-Up Trades" discussion board.

That 70% net long gives us another way to look at our returns: A result on par with the S&P 500's 12% gain would be 70% of its return, or 8.4% (12 * 0.7). Our 10.7% return is well above that, showing outperformance in the stocks we've chosen to buy. Viewed another way, we achieved 89% of the index's return while holding 30% shorts and cash. That's a strong result, even though (as always) our focus remains on the always-positive North Star and not on relative returns.

As another reference point, I keep a close eye on the hedge-fund industry, because these exclusive vehicles share our same goal of absolute profits. According to Bank of America Merrill Lynch, the average hedge fund gained 2.3% in the first quarter, earning a fraction of our results. The average hedge fund is typically 40% or greater net long, according to BarclayHedge — but even at just 40% long, a performance on par with the S&P 500 would be a gain of at least 4.8% (12 * 0.4) last quarter. Hedge funds underperformed even this measure, suggesting subpar investments.

In fact, our hedge-fund brethren have performed poorly over the past few years. *Pro* is much more committed to long-term ownership of great companies, so we should be able to continue to outperform the vast majority of these high-rolling funds over time through lower turnover (less trading), staying committed for years to growing businesses, and continually seeking more companies positioned to deliver exceptional, recurring results. Long-term stock ownership is two-thirds of our approach. The other third is sensible options strategies (often with income in mind) and shorting.

Now let's gain some altitude and consider investing from a higher perspective.

Four Rules of Investing

First printed in *Financial Analysts Journal* in 1974, Charles D. Ellis's *The Loser's Game* (PDF) is just as relevant to investing today. It seeks to explain why most professional money managers fail to attain a goal — topping a benchmark, usually, or achieving absolute returns. The sweeping explanation is there are too many fund managers doing the same thing, and simply put, they're trying too hard, mistaking activity for results. The article offers four takeaways:

1. **Be sure you are playing your own game.** Know your strengths and your game plan, and keep them in mind for every decision. For instance, some *Pro* members only buy our long-term stocks and don't short or use options.
2. **Keep it simple.** Know what you're best at, and do it again and again. *Simplicity, focus, and efficiency are key attributes in achieving excellence over a lifetime.* Incidentally, The Motley Fool has five company-wide core values, and every employee is also asked to name one of their own, called their "motley." Nick Crow's value happens to be "Focus." Bryan Hinmon's is "Better Every Day." Mine is "Simplify."
3. **Concentrate on your defenses.** *The Loser's Game* suggests most money managers focus intently on buy decisions; therefore, few make good sell decisions. If you focus on being a great seller, you may find an edge. At *Pro*, we're focusing more energy on opportune sell decisions. We want to be reluctant but excellent sellers when it seems we should. We've already sold three stocks this year and written covered calls to potentially sell two others. We're seeking other ways to concentrate on our defensive edges.
4. **Don't take it personally.** *The Loser's Game* ends on a high note. People who manage money, whether it's you at home or us at The Motley Fool, are typically high performers who have succeeded in other areas of life (if we may say so!). You come into money management thinking you'll continue your winning streak, believing you can perform much better than not only your peers but a bloodless stock market. But investing is much more random than pursuing a degree or even running

your own business. You always invest with partial information, and randomness will play a role in your results. When you have weak years, don't take them personally. Learn what you can, and keep working to simplify, focus, and be efficient at achieving your goals.

That's what we're here striving toward for members. If you have thoughts on this Memo, or a personal value to share, please post on the Memo Musings discussion board!

A Q1 Q&A, Plus What's in Our Queue

Published Apr 2, 2012 at 12:00AM

Fellow Fools,

Pro Trade Roundup

- **InvenSense**: We purchased 800 more shares at $17.85, filling out our position at about 2% of the portfolio.

Guidance Updates

- **CME Group**: Following price appreciation, the stock moves from Buy First to Buy.

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Rockwood Holdings**: Sell to open August 2012 $50 puts, currently $3.60, one for every 100 shares you are willing and able to purchase. If put shares, this trade will provide an effective purchase price of $46.30, below our $49 Buy Around.
- **3D Systems**: Sell to open August 2012 $22.50 puts, currently $2.10, one for every 100 shares you are willing and able to purchase. If put shares, this trade will provide an effective purchase price of $20.40, below our $21 Buy Around.

Questions on these? Visit our Catch-Up Trades discussion board.

The first quarter of 2012 was great for stock investors. The S&P 500 notched an impressive 12% gain, marking its best quarter since 1998. Our North Star, which tends to have a much steadier, constant climb throughout the year, clocked a 2.8% advance over the first quarter (remember, it will likely continue its ascent independent of the market's advances or declines).

Q: But How Did *Pro* Do?

A: The *Pro* portfolio was up 10.7% over the quarter, keeping pace with the market and outpacing our North Star. Of the 25 long stocks in our portfolio (ignoring the options strategies overlaying some of these positions), only two were in the red: **GrafTech International** and our newest recommendation, **InvenSense**. Impressively, 16 of our 25 stocks have outperformed both our *annual* rough estimate of the North Star (approximately 10%) and the smokin' returns of the S&P.

In short: The *Pro* portfolio performed well, especially considering we have hedges in place.

Q: Were These Our 10 Best Stocks?

A: Jeff rang in the new year with a Memo called "Are These Our 10 Best Stocks?" In it, he identified 10 stocks he, Nick, and I all agreed would outdistance our North Star over the next three years. To keep us honest, I'm looking back to see if we've gotten off to a good start. The verdict? A rising tide lifted almost all of our boats. We've since sold **Autodesk**, and eight of the nine remaining stocks are ahead of the North Star (and ahead of the S&P 500 — we mention that metric only because we're focusing on one quarter's return). For you curious Fools, **Medtronic** was the one laggard, but we're not concerned; although the company's turnaround will take time, it seems to be setting off on the right foot.

In short: Eight of the nine remaining stocks we identified are off to a quick start. Our three top performers from that list were **3D Systems**, up 63.5%; **WisdomTree Emerging Markets SmallCap Dividend Fund**, up 24.1%; and **Wells Fargo**, up 23.9%.

Q: What About the Five Duds We Identified?

A: In the same Memo, Jeff highlighted five stocks we unanimously believed would be laggards. With one quarter in the books, we were right on four of the five: **Bristow Group**, **Ebix**, **L-3 Communications**, and **Vanguard Energy**. **Covanta Holdings**, meanwhile, has advanced 19%. (Again, we added the criterion of keeping up with the S&P because of the very short time frame.)

Berkshire 2012 Will Not Be Televised

But we *are* sending a team of Fools to Omaha to analyze Warren Buffett's latest moves and what they mean for investors. Get your free dispatches here!

In short: Our dud radar seems to have been operational. We're now attempting to sell Bristow via covered calls, and the story with Covanta has changed a bit because the company has decided to double its dividend.

Q: Did We Make Wise Portfolio Moves?

A: This is a complicated question.

On one hand, we have definitely upgraded the *Pro* portfolio over the past quarter. A 30,000-foot flyby shows that we sold L-3, Ebix, and Autodesk and purchased **Apple**, **CME Group**, and InvenSense. (Notably, the three stocks we sold have not been impressive performers since.)

As for our decision-making, two of the three stocks we sold (L-3 and Ebix) were on our "laggards" list from January. (Autodesk simply eclipsed our estimate of intrinsic value.) We've also moved to sell Bristow via covered calls. From this standpoint, we're pleased with the decisions we made.

But mistakes of omission are just as costly as mistakes of commission. Your advisors all agreed in January that 3D Systems, **MasterCard**, **Pacer International**, and DGS would be long-term winners — and they all had small allocations in the *Pro* portfolio. With consensus in hand, did we add to our positions? Nope, we sure didn't. Thumb-sucking and fiddle-farting are euphemistic ways of describing our inaction. That said, though, MasterCard jumped while we were discussing it, we have puts open on Pacer, and we made a decision to add different growth companies to the portfolio — starting with InvenSense — rather than investing more in 3D Systems. We also bought more **BMC Software**, with strong results so far.

In short: We made some good decisions in the first quarter, but we missed some opportunities to potentially add to a few small positions that were down.

Q: What Have We Learned?

A: We don't place too much weight on a single quarter's performance. For that matter, we don't place too much weight on a single *year's* performance — after all, what does planetary orbit have to do with an investment thesis or business development? But regularly reviewing our actions and performance can help us improve our portfolio management process, and the calendar serves as a good reminder.

In short: Our clear takeaway from this review is that when we feel strongly about an investment, we should act on it appropriately in as timely a fashion as possible, whether that means buying *or* selling positions.

Foolish Final Thoughts

While we will (alas) never be error-free in our decision-making, we will strive to get better every day, learn from our mistakes, and look to do the next right thing. We plan to regularly reassess our positions relative to our North Star, and we will of course keep you updated on what we find. No matter what, we'll be sure to keep our focus on the long term and our compasses set to our true North.

How was your first quarter? Bring your tales of wins and losses to the Memo Musings discussion board.

Managing Madness

Published Mar 26, 2012 at 12:00AM

Fellow Fools,

Pro Trade Roundup

- **Autodesk**: We sold all of our shares at $41.
- **Wells Fargo**: We rolled our covered strangle out and up. We now have 12 written October 2012 $33 puts and 12 written October 2012 $36 calls. We incurred a modest debit to roll.

Guidance Updates

- **MasterCard** moves to Hold following price appreciation.

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **3D Systems**: Sell to open August 2012 $20 puts, lately around $1.45, for a 7% yield in five months or a lower buy price. Sell one put for every 100 shares you are willing to buy, up to 2% of your portfolio.
- **Wells Fargo**: Sell to open July 2012 $33 puts, lately paying you $1.50, or a 4.5% yield in four months. This results in a $31.50 potential buy price. Sell one put for every 100 shares you are willing to buy, up to 3% of your portfolio.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Last week, I read a mind-blowing article on memory that mentioned the potential for a pill that could erase individual memories forever. It turns out our memories are reconstructed every time we access them, and after a few recollections, they can become only loosely related to reality. The thought that memories are more impressionist painting than photorealism was as mad to me as Van Gogh cutting off his own ear (and incidentally, like memories, that story might not be accurate either).

Of course, this is just more evidence that our brains are not to be trusted. If you, like me, are having trouble adjusting to that idea, then you may be suffering from cognitive dissonance, the mental discomfort that occurs when new information conflicts with previously held beliefs.

Warning: Thinking May Impair Judgment

The idea that our brains are imperfect tools for estimating probabilities and making rational investment decisions is not a new one for *Pro* investors. Striving for continual improvement is part of being a lifelong investor, and because most investing errors are born out of temperament and behavior, studying the ways and reasons we deviate from making rational decisions should be a top priority.

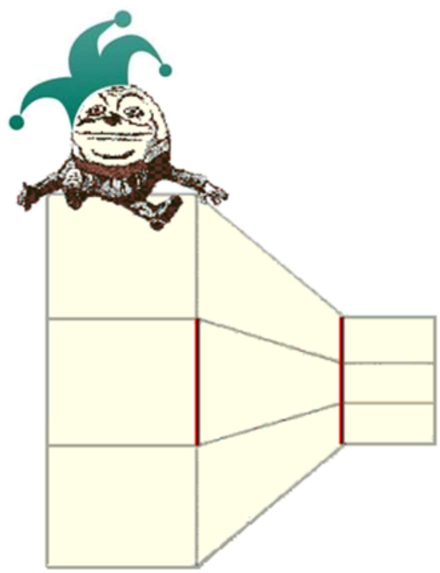
Most behavioral biases fall into two categories: faulty cognitive reasoning (cognitive errors) and decisions based on feelings or attitudes (emotional biases). Of the two, cognitive errors are the most easy to correct through identification and education, so in this memo, I'll focus on errors resulting from faulty reasoning — not those based on impulse, intuition, or emotion.

Of course, Jeff, Bryan, and I might be more susceptible to cognitive errors than you are — but if you make your own investment decisions and perform your own due diligence to any extent, what I'm saying will affect you, too.

Know Thy Enemy (and Know Thyself)

As longer-term *Pro* members know, I like to use pictures a lot, especially to demonstrate the faultiness of our brains. Here today to help me demonstrate is old-school Fool Humpty Dumpty, sitting on a wall.

Which of the two red line segments in the wall appears longer?



If you perceive things like most people, the line on the right looks longer, even though they are exactly the same size. Your brain is expecting the lines to conform to its preconceived, learned idea of what a wall is, so its perception of perspective is influencing — and incorrectly estimating — the length of the two lines. Go ahead, measure; I'll wait.

Humpty Dumpty's lines are an illustration of belief perseverance biases — a subcategory of cognitive errors in which we unwittingly ignore some information, modify the information we do see, and only remember the information that confirms our beliefs. Here are some of the ways our brains can trick us.

Confirmation Bias
When we seek information as evidence to support our preferred viewpoint or thesis, we're experiencing confirmation bias. Unfortunately, our desire to avoid cognitive dissonance can be stronger and more complex than our attempts to contain it. Even when we consciously seek out contrary evidence because we're aware of confirmation bias, we will unconsciously underweight — or outright ignore — strong evidence that's contrary to what we expect to see. In investing, this can manifest as an underdiversified portfolio with too much risk; worse yet, it can convince us of the merits of a single company or stock, ignoring negative news and gathering only positive information that confirms our glowing expectations.

- ***Pro* Tip:** Make an overt, conscious effort to disprove each of your investing theses. Take special care to fully consider negative information.

Conservatism Bias
It's natural to overweight the importance of our initial beliefs about an investment. After all, most research and analysis occurs before we make an investment decision. Compounding this is the human tendency to under-react to new information. But if we fail to modify our beliefs or theses based on the analysis of new information, we put ourselves at a disadvantage to those who do correctly incorporate those facts. Sometimes this bias expresses itself when an investor holds a losing investment too long after the initial thesis proves incorrect (that's conservatism and anchoring teaming up against you). The larger the change, the less likely we are to accurately incorporate the information.

- ***Pro* Tip:** Instead of using new information to justify your original thesis or belief, ask, "How does this information change my forecast?"

Representative Bias
Quick minds are often tempted to classify new information based on past experiences. Though expedient, this tendency can lead our brains to subconsciously interpret difficult-to-analyze data incorrectly — without alerting us to the complexity or chance for error. This reflex deceives us into believing we know more about a situation or investment than we really do, which can mean incomplete analysis and incorrect decisions. Perhaps we've stereotyped an investment as a growth stock or a value play, or a company as belonging solely in the technology or banking sector. Or maybe our opinions are based on personal experience or otherwise give too much weight to a small, non-representative sample size.

Berkshire or Bust!

Can't make it to Omaha for "Woodstock for Capitalists"? We've got your back! Register for our free trip dispatches from 2012's Berkshire Hathaway meeting.

- ***Pro* Tip:** Be aware of statistical mistakes — particularly if the underlying information is difficult to process (for example, if you've surveyed thousands of people). Ask yourself if you're overlooking or oversimplifying the reality of the investment situation.

Illusion of Control Bias
All it takes is a couple of successful put writes for an investor to succumb to this bias, but the belief that we can control or influence investment outcomes is irrational. Sure, we can do our due diligence, value the business, and make educated decisions, but the outcome — whether our options end up in or out of the money — is not ours to decide. This bias shows up as underdiversified (and sometimes overleveraged) portfolios and excessive trading.

- ***Pro* Tip:** Keep good records, including transaction costs. Ask yourself in advance, "Why am I making this investment? What do I expect will happen? Is this part of my plan?" Check back regularly to recalibrate your perception of control.

Behavioral finance for investors is often oversimplified. There is more to controlling our temperament — and our decisions — than understanding the effects of fear and greed. Being aware of known cognitive errors is an important step in becoming a better investor and overcoming the inherent limitations of our minds.

If you enjoyed this memo or would like to discuss cognitive errors or discuss the "mind-blowing" article I linked to, please visit us on the Memo Musings board.

Roll Your Covered Strangle on Wells Fargo

Published Mar 20, 2012 at 12:00AM

- **What We're Doing:** Seeking income on our shares.
- **What We're Thinking:** The stock price has appreciated greatly, and we need to take action before the March 22 ex-dividend date.
- **What We’re Expecting:** We’ll either roll or close this position when expiration comes.

Trade Essentials

- **Action:** Buy to close your existing covered strangle (April 2012 $29 covered calls and April 2012 $21 puts) for about intrinsic value, currently $5. Then, using a strangle order, write ("sell to open") a new strangle: October 2012 $36 covered calls (one for every 100 shares you own) and an equal number of October 2012 $33 puts.
- **Price Guidance:** Use a **limit order**, aiming for a net debit of about $0.75.
- **Alternative Trades:** See the end of this report.

What's New?

- **Recent price:** $34

Four of the country’s largest 19 banks failed the Federal Reserve’s most recent stress test, but not **Wells Fargo**, which not only passed but also had its capital plan approved. Though the stress test is imperfect, passing is no small feat; to do so, a bank must prove it could survive a 50% drop in the stock market, a 21% drop in housing prices, unemployment peaking at 13%, and a worsening recession in all leading countries. For the second year in a row, the company’s capital plan included a special dividend to “true-up” the previously announced $0.12 first-quarter dividend to match the new dividend amount of $0.22, an 83% increase.

Why Roll?

The rising stock price and the special dividend (which provides an incentive for the owners of our call options to exercise them and buy our shares) mean we’ll need to roll this position if we are to keep our shares. When we established the covered strangle, we detailed this scenario in the trade alert:

> “At expiration, if shares are … higher than $29: Our covered calls could be exercised, forcing us to sell our shares at a net $31.79 (5% above our cost basis) if we don’t take action.
>
> "[This would violate] Rule No. 1 of writing covered calls: Don’t write calls on shares you don’t intend to sell. While we want to continue to hold Wells Fargo and we’d prefer to roll this strangle, if we are forced to sell our shares, we’ll do so at a 27% premium to today’s market price — not such a bad outcome.”

When we wrote that in November, the stock price was about $25. It’s now near $34, 36% higher. We need to buy back our calls at a loss so our stock isn’t sold at expiration, but the rise in stock price more than makes up for that loss. Overall, this has been a very profitable trade – albeit not as profitable as share ownership alone. This is a good example of trading maximum profitability for higher probability of an acceptable profit.

This Is How We Roll in *Pro*	Price Per Share
Payment received for writing previous strangle	$2.57
Estimated cost to close previous strangle	($5.00)
Net cost to close	($2.43)
Estimated payment received for writing October $36/$33 strangle	$4.28
Total net credit/(debit) from rolling into a strangle	**$1.85**
Original Net Sell Price	$31.57

New Net Sell Price	**$37.85**
Net Sell Price Improvement From Roll	**19.9%**

How to Follow Along

We recommend you:

- Buy back ("buy to close") the April 2012 $29/$21 strangle for about intrinsic value, currently $5.
- Then, using a strangle order, write ("sell to open") October 2012 $36 covered calls, and write ("sell to open") October 2012 $33 puts.

Remember: To write a covered strangle, you must own at least 100 shares of the stock, and you should be happy to buy at least 100 more at a lower price. In this case, write one covered call for every 100 shares of Wells Fargo you own, and write one put for every 100 additional shares you would be willing to buy.

Alternative Trades

- **If you don't own a 3% allocation in Wells Fargo yet:**
  - Sell to open (*do not buy*) July 2012 $33 puts, lately paying you $1.84, or a 5.6% yield in four months. This results in a $31.16 potential buy price. Sell one put for every 100 shares you are willing to buy.

Next step: If you have questions before you set up your trade, visit our Wells Fargo discussion board.

Sell Autodesk

Published Mar 19, 2012 at 12:00AM

- **What We're Doing**: We're selling our shares of **Autodesk** (NASDAQ: ADSK).
- **What We're Thinking**: The stock is now valued as if it will execute every business initiative perfectly.
- **What We're Expecting**: We're happy to raise cash to eventually put toward more attractive opportunities.

Trade Essentials

- **Action**: Sell all shares using a limit order at current prices (assuming the stock stays above $38).
- **Recent Price**: $41.50
- **Alternative Trades**: Sell at-the-money covered calls expiring in April or May if you're comfortable holding your shares and wish to target at least a modestly higher potential sell price.

What's Changed?

- **Last action**: In September 2011, *Pro* purchased 1,400 shares.
- **Total return**: 49%

Oh, that silly roller coaster of a stock market. In January 2009, Mr. Market thought **Autodesk**'s (NASDAQ: ADSK) business was worth less than $17. We disagreed and happily purchased shares, later selling for higher than $30 via covered calls. Last September, Mr. Market thought Autodesk's business was worth $25 per share, and we were once again glad to step in and purchase shares. Now, after a few quarters of solid business results and a 49% gain in the stock price since our purchase, we're cheerfully cashing in our chips to wait for the next market mispricing. Whether that'll be Autodesk or another great business, we don't know.

We've decided to sell Autodesk for a few reasons:

- **Price**: The company's stock price is above our estimate of fair value, and we don't think its potential returns from here justify the risk of continuing to hold.
- **Risk**: Autodesk is historically highly correlated to several other positions in our portfolio, including **Rockwood Holdings** (NYSE: ROC) and **GrafTech** (NYSE: GTI)— and more important, we believe it has exposure to similar macroeconomic risk factors. What's more, we expect many of those other positions to offer better potential returns from today's valuations.
- **Cash**: After this stock's sharp appreciation, we are happy to raise cash for portfolio protection and to deploy into undervalued opportunities, now or later.

How to Follow Along

Although we still respect Autodesk's business, we can't ignore the stock price. Using a limit order, we'll sell all of our shares of Autodesk in the next one to 30 days. If you're comfortable owning shares longer, consider writing at-the-money covered calls for a higher potential sell price, but remember that shares can be volatile.

Next Steps: Visit the Autodesk discussion board to post questions, and then make your trade.

The Long and Short of It

Published Mar 19, 2012 at 12:00AM

Dear Fools,

Pro Trade Roundup

- **CBOE Volatility Index** (VIX): Ratio call backspread. Sold to open 15 May 2012 $20 calls; bought to open 30 May 2012 $27 calls. Net debit: $0.09.
- **InvenSense**: Bought 800 shares at $20.20, for 1% of a planned 2% allocation. We have three more weeks to fill the rest of the order, hoping to average in closer to our $18 Buy Around price, but putting a stake in the ground in case lower prices don't happen in time.

Guidance Updates

- **GrafTech International** moves from Buy **to Buy First** following a price decline.
- **Apple** moves from Buy First **to Buy** following price appreciation.
- **Wells Fargo** moves from Buy to Hold following price appreciation.

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **AmTrust Financial Services**: Sell to open September 2012 $25 puts, lately around $1.20, for a nearly 5% yield in six months or an attractive buy price, up to 5% of your portfolio.
- **3D Systems**: Sell to open August 2012 $20 puts, lately around $1.45, for a 7% yield in five months or a lower buy price, up to 2% of your portfolio.

Questions on these? Visit our "Catch-Up Trades" discussion board.

A relentless pursuit of improvement is one of humankind's better qualities, but sometimes our desire for perfection makes us miss the bigger picture. In the original *Jurassic Park*, billionaire John Hammond is intent on building a perfect theme park ("not a single expense spared") populated with dinosaurs. In pursuit of this ideal, he neglects to consider all that could go wrong with hundreds of giant creatures set loose on an island, not to mention the greed of others who might want to capitalize on the dinosaurs.

Believe it or not, this ties into our hedging strategy — and into our collective pursuit of a kind of investing perfection we'll never achieve. As the stock market continues its record-strong ascent, *Pro's* 16.5% short position in the **SPDR S&P 500** (or, for some members, other market indexes or inverse ETFs) feels like a thorn in our sides. Down 14%, this large position sticks out as our only *certain* loser whenever the market is up, and therefore there's a strong desire to close it after months of a rising market.

This desire for something closer to portfolio perfection overlooks the fact that the portfolio probably wouldn't exist in its current form if it weren't for this decent-sized hedge. At last count, we were 95% invested long (see our exposure table at the bottom right of the linked page). But if we didn't have this 16.5% hedge, we probably would *not* be comfortable being 95% long, given our goal of steady returns in various markets. Instead, we would likely be closer to only 80% invested (at most), with the rest in cash.

In other words, our S&P 500 hedge is at least partially responsible for us having another 15% invested in long stocks, and that 15% has made us a healthy return. In this light, our 14% loss in this hedge equates to a smaller opportunity cost for the portfolio, because this loss has allowed us to profit elsewhere instead of keeping more cash.

Meanwhile, as Alex Pape wrote so well last November in "Hedging the Pro Way," you typically *don't* want to make money on your market hedges, as that means the rest of your portfolio is going down. An index hedge is a form of insurance; it is one position you can be certain will make money if the market falls. But you want your portfolio to increase in value as a whole, as ours has been — so we'd rather have our hedges losing money than have our hedges green and everything else red.

The question must be asked, though: When do you close a hedge that is working against you? When I joined David and Tom Gardner in 1996 to work on the original Fool Portfolio, our rough rule was that any short position on a company should be closed at a 20% loss, because why let a short potentially run against you much more than that? When shorting market indexes, I considered this rule and then cut the loss limit in half, to about 10%, because that's a significant move for an index to make in a short time.

Today, though, I question whether that's the right way for me to think about an index hedge. After all, our whole portfolio has gone up strongly despite the hedge, and now that the S&P 500 is up 14% against the hedge, we should probably be considering *adding* to the position, rather than closing it. The portfolio is worth much more now, and the stock market is at a higher valuation.

Hedging vs. Shorting: Like Brontosauruses vs. T-Rexes

A hedge is quite different than a direct short of a company. A hedge is a low-conviction, somewhat slow and lazy position that serves to cushion our downside risk, even as we aim to make money overall by being mostly invested in stocks. In contrast, a short is an aggressive, high-conviction, targeted position that says "company X will decline." Although we're looking at company-specific shorts to initiate, for now we should continue to view our hedge in isolation and aim to make the best choice in regards to it and the rest of the portfolio. If we closed our index hedge, would we feel comfortable being 95% invested right now? Given our goals, and given what we've said above, the answer is no. Lacking this hedge, we'd want to raise more cash. Therefore, we shouldn't close our hedge until we have shorts to replace it with — shorts we like better.

So that's where we stand right now. Meanwhile, the index hedge offers us some cushion if (should I say "when"?) the S&P 500 declines, and at the same time allows us to be invested in our current number of stocks for upside. Year-to-date, the *Pro* portfolio is up 11%, and the S&P is up about 12%, so we're keeping up despite the hedge. We are also already above our annual North Star, which today is at about 10% per year, so we need to be mindful about protecting our gains even as we aim to earn much more in the coming years.

The bottom line: Remember that our hedge has made it reasonable for us to own more shares than we otherwise would, and therefore its loss needs to be compared to the gains it has simultaneously allowed us elsewhere, not to mention the gains we've enjoyed overall (the portfolio only matters as a whole).

Second, although I wrote in the original trade alert that we may close the hedge at around a 10% loss, the thoughts behind that idea are evolving. I believe we should only close the hedge if: (1) we don't want any hedges at all; (2) we find direct shorts we like better; or (3) we have more cash. Simply closing the hedge today would, in a way, be aiming for perfection: It would mean we expect the market to keep going up and that we want every position in the portfolio to be green when it does.

I can't help but believe this kind of thinking would lead to folly. Nobody would get eaten by a Tyrannosaurus (probably), but we'd be even more exposed to market declines. The market will not keep rising in a perfect line forever, so our portfolio shouldn't be invested as if it will. After all, when the market falls, the only position that *will* be perfect will be the hedge.

Visit us on the Memo Musings board, or let us know some stocks you'd like to short. And Fool on!

Jeff Fischer (TMFFischer)

Coverage & Community

- **Apple** announces a new dividend that amounts to a 1.79% annual yield and a $10 billion share buyback program (about 1.7% of shares outstanding).
- *Pro* members talk about Greg Smith's very public resignation from **Goldman Sachs**.
- Fools look forward to direct shorts, while Jeff wants to short flawed ETFs at opportune times and talks about a short he's glad he didn't make.

- April earnings are a month away. TMFMoosie provides a great earnings and dividend calendar.

Transcript

Jeff Fischer: Welcome to a new edition of Motley Fool *Pro* Audio Extra. In the studio we have Nick Crow, Bryan Hinmon, and I'm Jeff Fischer, so AKA, your *Pro* team is here. Thank you for joining us. We're taping this on Wednesday afternoon of March 14^{th}, and we're here to talk about, you guessed it, the stock market. The stock market, Bryan and Nick, has been up a lot; members as well. Since the New Year, the S&P is up approximately 12% as we tape this.

Bryan Hinmon: Not a bad start.

Jeff Fischer: Not a bad start at all, and in fact, a little heated for us, for our tastes maybe. It makes it a bit harder to set up options trades, a lot of things have kind of run away, but at the same time, we're doing fine. We've been hedge; we're going to talk about that. Our hedges, our shorts, and just our strategy in general going forward, should the market ever have a down couple of months, which it certainly will. Bryan first, what's gotten us here, since last fall?

Bryan Hinmon: Three things, I think. It's pretty easy to sum up. The first thing is we know what Greece's default's going to look like. The second thing is …

Jeff Fischer: And it ain't pretty.

Bryan Hinmon: Yeah. The second thing is the ECB is making it rain in the European banks. They basically have said you can have as much money as you need for the next three years.

Jeff Fischer: That is a great point, because that really seems to have been the pivot point, the market just has really taken off after that, along with also the U.S. Fed saying, We'll keep rates low through 2014.

Bryan Hinmon: A couple of times they've come out and said it now, so they are;

Nick Crow: They keep extending it.

Jeff Fischer: You know, we take that with a grain of salt. They're throwing fuel onto this fire, but is this fire something we really want to burn so hotly? That's the question. Okay, so Bryan…

Bryan Hinmon: The third thing is if we look on our shores, earnings by and large were really, really solid. Everyone makes a big deal out of record profit margins and say that they can't last, they can't last, they can't last. Well, companies are lean right now and they are executing really well, by and large. So those three things have led to a stock market that has gone in one direction for the past three months.

Jeff Fischer: All right, so what could change that direction then is the next logical question, and the answer, of course, would be lower earnings, new problems emerge in Europe, whether it's Greece or, probably not Greece or the moment, but Portugal or Spain.

Bryan Hinmon: Things over there are not just rosy just yet, and there are other geopolitical events that will not go away, so there are still things that could lead to big problems.

Jeff Fischer: Always a surprise (unclear).

Bryan Hinmon: Yeah, one of the new fears is China, a major slowdown in China, so there's always something new to worry about.

Nick Crow: Yeah, they recently had a trade deficit after years and many quarters of having major trade surpluses, so ...

Jeff Fischer: Yeah, that was shocking; "Shocking" was the headline. Everyone's shocked by Chinese trade deficit.

Nick Crow: Yeah, I don't follow that that closely, but I was surprised.

Jeff Fischer: Yeah, so this all said, we're not sitting here worried and ruining our lives with macroeconomic thoughts. We own great companies for the long term, and we use shorts and hedges to try to buffet the downdrafts that the market inevitably will have.

Now lately we've been short; well the market has gone up, and as much as that single short in market indexes; we all have different ones. We are in (unclear) ourselves. It can't hurt; the thing to remember is the portfolio has gone up much more as a whole than the short has dinged us. The short has dinged us about 3% performance since last October, while the portfolio was up; I don't have the latest numbers, but above 15%.

But Nick, let's talk about now. We're not thinking about the market being up; we're trying to think are we ready for when it goes down, because it will go down for a few months.

Nick Crow: Sure. I know you don't like me to say this, because you've scolded me in the past, but if the market were to crash, we all would have a place.

Jeff Fischer: That's such a loaded word.

Nick Crow: It is loaded, but I like to frame things as worse case first, and then we'll move back from there.

Jeff Fischer: See, I would say "steadily declined." If they market goes into a small decline of 10, 15% ...

Bryan Hinmon: And there you get the differences between Nick and Jeff. *(Laughter.)*

Jeff Fischer: All right, so a decline or crash of; and members know we don't try to juggle around 5%, 7% moves. You can't do much with those, but a decline of 10%, 15%, a crash; as Nick would say, what are we doing?

Bryan Hinmon: We have a few things we can do. First in my mind, of course, is we have those short positions that you just mentioned. We can always reduce that short and move any names that dropped that we might have on our watch list now that we'd like to buy at lower prices, or add the things that we love that are currently in our portfolio. And so that's a primary way you can see if those shorts provide a whole bunch of extra liquidity for us, if they worst is to come.

Jeff Fischer: And a second thing we can do is we have about 5% cash right now, so not that much, but we're very flexible even so, because if the market falls, some of our shares are going to fall more than others. We have many companies on hold that we may look to sell to then buy companies we like better, buy more shares of companies we like better that have hopefully fallen more.

Nick Crow: Yeah, absolutely. If we were to have a crash or major drop, it's nice to move out of names that you were in for maybe a shorter period of time, things that you knew you didn't want to own for the next ten years, but they were mispriced, to go ahead and sell those and buy things that you'd really love holding for the rest of your investing life.

Jeff Fischer: And now you could say, our members should say well, why not sell some of those right now, before the prices fall? And that is certainly on our to-do list and radar, potential names to sell. That could happen before you know it, but in the case it doesn't, we'll still; we have enough positions, two dozen positions, that we should have ones that lend themselves well to a sale later on, to selling to move the money somewhere we like better. Bryan, do you have thoughts on market up, market down?

Bryan Hinmon: Yeah, I was just going to comment while you guys were going up there, that some members know that we from time to time do an exercise where we talk about, amongst ourselves, our favorite businesses, the ones that we want to own forever.

Jeff Fischer: And we are going somewhere with that list. It will become more of a PRO document, I believe.

Bryan Hinmon: And it's when those dislocations happen that that is one of the first places that we turn. The first place we turn is what we already own, because we own them for a reason. Then the second place is we pit those hold stocks against those favorite businesses that aren't in our portfolio, and we sort of do a battle royale there to see which one offers the better opportunity at the time, so that's where my default goes in times like that.

Jeff Fischer: That makes good sense, because then you're able to pick up these super high quality businesses at if not a discount, a much better price than previously. So let's talk about our few shorts that we have right now, primarily the CurrencyShares, Euro Trust, which we are comfortable with, remain comfortable with. It's interesting the Euro has not rebounded despite Greece having a temporary resolution, a bailout package. That's only about a 3% position. It's possible we'll add to it over time.

And we also own, or short, about a 16% position in the Spyders S&P 500 SPY, which is our direct hedge, something that obviously when the market goes down sharply, we would look to harvest the money that we have there and then reinvest it in stocks. That said, we're down as of taping, about 13% on that position. So it's been, as Nick said this morning, almost all pain from the start; that short has almost never been green. So what do we do from here? We already reduced that short by a third about a month ago at a much lower price, and at this point, we have this discipline where a short we typically want to close around a 10% loss. There are always factors where you won't follow that discipline. There are cases where you would actually add to the short at that point. And that's where we are with SPY right now. Lately with volatility so low and with, it seems, bullishness so high, we're not in a hurry to close our one large hedge at this point. In fact, if the market has a much higher, a move higher, we may actually add to this short.

Now at the same time, we're look; to the SPY short. At the same time, as you all know, we've been looking for specific shorts to replace SPY with, and that continues and those shorts, as we pick up shorts that we like better, we'll move out of the SPY short or the index shorts that you have and into these targeted shorts that we like better.

Now this said, Nick is smiling because he knows what I'm going to say next.

Nick Crow: I'm not sure, but I know it's coming my way.

Jeff Fischer: Most individual company shorts, lower quality companies, high beta stocks, have done really well in this market rally, so it's a good thing we're not short those instead of SPY. As well as SPY has done, a lot of the shorts out there that we would target, have gone up even more.

Nick Crow: I can almost assuredly say that if we were short those individual names, we'd be losing more than our SPY short.

Bryan Hinmon: And they don't work as well as a hedge sometimes. They're more of a high-conviction idea. This, we own a lot of companies that move in line with the S&P, and so when it goes up, we profit and hopefully profit more, and so we're truly hedged in that way. There's a cost to this hedge; we sleep well at night knowing that if something were to happen in Europe that were unexpected or even expected, that we would have liquidity to move into cheaper names.

Jeff Fischer: That's exactly right, so I'll just point out again that yes; we had this 10% discipline. We still have it in mind and we're aware of it, but for now we're keeping our index shorts and we are actively looking to replace them, but while we are doing that, we do not want to remove our shorts at this point. *(Laughs.)* Or our jeans. So Bryan and Nick?

Nick Crow: Jeff is red right now; this is awesome. Doesn't happen very often.

Jeff Fischer: Thank you guys for joining us. Let's wrap it up right there. Thank you, members, for being here as well. We'll see you in the Monday Memo where we will continue to talk about long-short strategies. Thank you, and Fool on!

Set Up a Call Ratio Spread on the CBOE Volatility Index

Published Mar 14, 2012 at 12:00AM

What We're Doing: Hedging the bullish stock market with an investment in the "fear index" — the VIX — using its call options.

What We're Thinking: The VIX index closed yesterday at 14.7, far below its average of about 20.

What We're Expecting: If the VIX spikes, our position should start to profit. If the VIX doesn't jump, the position is costless to set up and should lose relatively little.

Trade Essentials

- **Action:** Set up a 1-to-2 May 2012 $20/$27 call ratio spread on the **CBOE Voaltility Index** (ticker: VIX, or ^VIX at some brokers, or $VIX.X).
- **Allocation:** Set up one ratio spread for approximately every $100,000 you manage. *Pro* will sell 15 $20 calls and buy 30 $27 calls. The maximum potential loss is $700 per spread ($10,500 in our case) if the VIX lands right at 27 at expiration, but we will roll or close this position a month before expiration, so even in a worst-case scenario, we won't lose nearly that much. (One-fifth to one-third of that amount, or between $140 and $233 per spread, is more likely as a potential downside.)
- **How This Works:** Up until a month prior to the May 16 expiration, the spread acts like a long call on the VIX. If the VIX spikes, our two long calls should increase in value more than our one short call. We don't need the VIX to increase dramatically to earn a profit; a figure in the high teens or low 20s could put this trade in the green a month from now.
- **Trade:**
  - Write ("sell to open") May 2012 $20 calls
  - Buy ("buy to open") two May 2012 $27 calls for every $20 call you write
  - Use a ratio spread order if your broker allows it
- **Prices (Bid/Ask) and Guidance:**
  - May $20 calls: $4.80/$4.90 (sell one)
  - May $27 calls: $2.35/$2.45 (buy two)
  - Aim for a total net cost of around $0 or even a small credit; use a spread limit order. As prices change, you can pay a small debit and still be in the spirit of the trade.
  - VIX level (March 14): 15.4
- **Alternative Trades:** None. If you can't make this trade now, don't sweat it.
- **Follow-Up:** We plan to roll or close this position around one month prior to the May 16 expiration, in mid-April. Again, we will not hold this to expiration.

The Big Picture

Disclaimer

The VIX moves rapidly, so this report will be short. We'll discuss it and take your questions on the new VIX discussion board. If you don't make this trade initially, and the VIX changes, you'll want to visit the board for the latest guidance or to ask questions. Finally, this trade is not key to a long-term investment portfolio. It's for those who want a "low-probability, high-volatility" hedge.

The Chicago Board Options Exchange VIX Index seeks to estimate the S&P 500's volatility over the coming 30 days. Called the "fear index," the VIX usually spikes when the market declines. Historically, the VIX sports an inverse relation to the S&P 500 nearly 90% of the time, and it can spike anywhere from 10% to 60% in a single day if the market tumbles even a few percent. A few times in 2011, the VIX spiked 35% on one-day declines in the S&P 500 of less than 5%. Theoretically, this makes "ownership" of volatility via the VIX a strong hedge against a falling market.

However, you can't buy the VIX directly, and the exchange-traded funds that try to track it are flawed. Options on the VIX are available and highly liquid, but they're pricey. This is where the call ratio spread comes in handy. It lowers the cost to next to nothing, and becomes profitable if the VIX soars. Most of the time, you **must expect** this hedge to come up snake eyes (typically resulting in a small loss by closure), but it is good protection against a spike in the VIX. The VIX has been higher than 30 roughly 10% of the time since 1990, but even a lesser jump over the next month could cause this position to turn green.

How It Works

If the VIX rises, because of the way VIX options move, the two options we own will start to gain more value than the one option we wrote. As volatility goes up, the premium on far out-of-the money options typically increases more than it does on near-the-money options, because the latter already carry an ample premium to account for a spike in the VIX. Additionally, out-of-the-money VIX calls hold a decent premium until close to expiration, because there is always the potential for a spike in the index. In our case, if the VIX goes nowhere, the trade should stay fairly close to breakeven (the calls we wrote will give us value, and the ones we own will lose value), and we'll close it a month before expiration for reasons explained below.

In technical terms for those with options experience, the attraction of this strategy is that the delta, gamma, and vega on the position are all flat right now. If the market were to fall sharply, the flat profile of this position would change rapidly as the VIX's delta and implied volatility increased and the vega sensitivity of the out-of-the money call soared. Translation (again): The two call options we own would gain value more quickly than the one we're short.

Again, to talk about all this further, please visit the VIX discussion board.

Setup and Follow-Up

Facts to Know

- VIX options settle on a cash basis; they are not "exercisable."
- VIX options expire on a Wednesday, and we'll close these about a month before they do.
- **Maximum Profit:** Unlimited as the VIX rises
- **Maximum Loss:** The maximum loss of $700 per spread would occur only if we went to the beach without closing the position first and thus mistakenly held it to expiration — and the VIX happened to end at 27. We plan to close a month early, so any loss will be less than that. In many scenarios, the loss is nominal. For example, the April $19/$26 spread would result in about a $0.90 loss per spread right now, assuming you had you set it up a month ago at similar prices with $7 at risk.

When setting up this particular strategy, you always want to use the options expiring two months in the future. This maximizes the position's responsiveness to changes in the VIX. Until about a month before expiration, the profit and loss on the spread will be similar to a long call. However, we never want to hold this position to expiration, because the delta on the position begins to turn negative. (Translation: If the VIX goes up as expiration nears, the short calls could begin to add more value than the long calls, the opposite of what we want.)

This should always be a one-month strategy, using options that expire two months after you initiate the position. We can roll this position every month if we like the strategy, prices, and its effectiveness, or we can just end it at any point. Ideally, we'd only want to set up such a position when the VIX is in the lower teens, or when we really want a volatility hedge. In this case, the VIX has fallen 20% in the last week to the lowest level since 2007.

Please revisit the Trade Essentials section above to see again how to set up this position (it's not complicated, but be methodical), and then ask questions on our new VIX Index discussion board. Do not rush. If you haven't used options much, you can watch how this works over the next month and get on board the next time the VIX is low.

Buy InvenSense

Published Mar 12, 2012 at 12:00AM

- **What We're Doing:** Starting a position in a new company with strong promise in the mobile computing industry.
- **What We're Thinking:** Motion-processing sensors for mobile devices will experience surging demand.
- **What We're Expecting:** As the industry leader, InvenSense will profitably sell hundreds of millions of motion-processing solutions the coming years.

Trade Essentials

- **Action:** Invest 2% in InvenSense
- **Buy Around:** $18 (use a limit order near current prices)
- **Fair Value:** $26 (a rough estimate)
- **Alternative Trades:**
    - **Seeking a lower buy price?** Sell to open April $17.50 puts (lately $1.50); June $17.50 puts (lately $2.75); or June $15 puts (lately $1.45).

The Business

If you've seen a Nintendo Wii in action, you're familiar with **InvenSense** (NYSE: INVN). The company is a leading designer of motion-processing solutions for consumer devices, selling single-chip microprocessors that make a device respond to physical and geographical inputs. It's InvenSense chips that make Wii games like *Just Dance* so gloriously interactive.

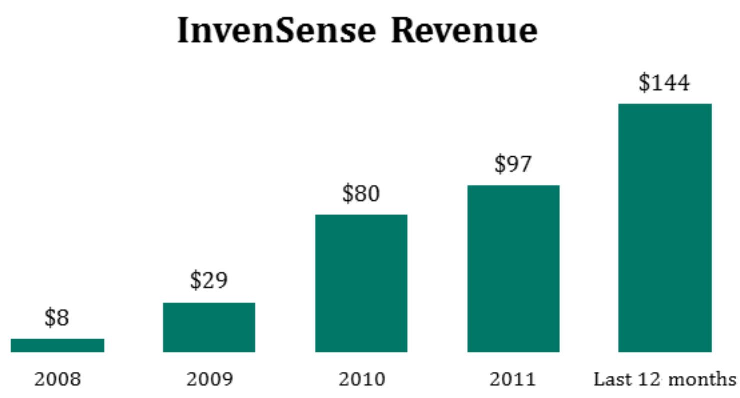
InvenSense Is a Buy First

We're buying InvenSense instead of adding to one of our other stocks, so that makes it a **Buy First**. It will appear that way on our scorecard as soon as we make our purchase.

InvenSense's most robust motion processing units are gyroscopes that include an accelerometer and a compass, all in a single chip. It's the accelerometer-gyroscope combination that enables real-time motion tracking in virtual 3-D space (as with the Wii), and that capability will soon make its way to smartphones and tablets, which in turn will make it possible to navigate with Google Maps in 3D, for example. InvenSense is targeting those devices, as well as gaming, smart TVs, 3-D mice, cameras, and portable navigation devices. But its affordable, tiny products have appeal outside traditional tech, too, including in medical devices, for industrial uses, toys, and in the military.

The company believes it was the first to provide motion-processing solutions for consumer devices. It began selling them in 2008, and it had shipped more than 184 million units by 2011. InvenSense now has more than 140 customers, including Nintendo, HTC, LG, Samsung, and Acer, and its technology is found in more than 100 devices, with many more in the works. The company believes its small form factor (or size), integration of multiple processes in a single package, performance, reliability, and reasonable cost all set it apart from the competition. Plus, it's first-to-market with technological breakthroughs: Latest is the world's first nine-axis motion tracking unit (gyro, accelerometer, compass) in a single package, shipping later this year.

InvenSense had $144 million in revenue during calendar 2011. Analysts at market research firm IHS iSuppli estimate that motion interface sensors for consumer devices will be a nearly $2.5 billion market by 2015. If InvenSense can capture even a portion of such sales, the opportunity is large, and because software drives hardware, the promise is beginning to unfold. **Google** (NASDAQ: GOOG) just made all 10 motion-sensing axes part of the latest Android operating system (that's a three-axis accelerometer, a three-axis compass, a three-axis gyroscope and a pressure sensor). **Microsoft**'s (NASDAQ: MSFT) Windows 8 is making nine-axis motion sensing a requirement, as well. InvenSense views these new software standards as "very positive" developments for its business.



Dollars in millions. Source: S&P Capital IQ. Numbers through the end of March, except last 12 months, which are through January 2012.

Amidst this emerging industry, InvenSense CEO Steve Nasiri says his company has "the lion's share of [the] Android ecosystem market, both in tablets and smartphones ... And we expect it to continue. We have a very strong pipeline ... We are engaged with all major handset makers, Android, Windows, both tablets and handsets. And ... we are one of the primary providers of these solutions. And ... the entire market is going in this direction."

Further, the $2.5 billion market estimate from iSuppli excludes pressure sensors and image stabilization, both areas in which InvenSense also has expertise. iSuppli estimates that close to 1 billion handsets will have at least 8-megapixel image sensors by 2015, and InvenSense conservatively estimates 50% of these will have image stabilizers attached. InvenSense already offers advanced stabilization technology for smartphones and has customers in the digital camera industry. Finally, the company also sees strong interest from "smart" TV makers who want remote controls and screens driven with a motion interface (like the Wii). In short, InvenSense provides technology that makes devices responsive and aware of their position in the world, and that makes countless applications possible.

Financials

InvenSense turned a profit as soon as it began to sell its products and has maintained high margins even while spending to grow. Management targets a 55% to 57% gross margin, which is close to the level **Intel** (NASDAQ: INTC) enjoys, and a stellar 30% to 34% operating margin (it was 33% last quarter). Expecting a steady decline in average selling prices for older chips, InvenSense still suggests it "expect[s] to live within those [margins] easily." Management also mentioned "significant potential for further leverage in the business model and our earnings capacity."

InvenSense Annual Results (in thousands)	Last 12 Months (to Jan. 1, 2012)	Year-End 2011 (April 3)	Year-End 2010 (March 28)	Year-End 2009 (March 29)
Revenue	$143,700	$96,547	$79,556	$29,025
Operating Income	$44,700	$21,478	$21,971	$300
Net Income	$33,600	$9,347	$15,142	$196
Free Cash Flow	$34,800	$5,700	$18,000	$(1,700)

Sources: Company SEC filings, S&P Capital IQ.

It only went public in November 2011, but InvenSense already produces strong free cash flow. This young, fast-growing business is priced at 40 times trailing free cash flow and 27 times estimated earnings for the fiscal year ending in March 2013, so it's not inexpensive by traditional measures — the price reflects some of its growth potential. InvenSense recently had $140 million in cash and no debt. It's a young technology company, though, so we do need to watch share count dilution.

What Would Make Us Sell

Handsets and tablets accounted for 47% of InvenSense's revenue last quarter, but gaming still accounts for most of the rest. As recently as fiscal 2009, Nintendo accounted for 80% of annual revenue, but thankfully that has declined to 34% as tablet and smartphone sales accelerate. Three customers do still account for more than 10% of sales: Nintendo (with its big 34%), HTC, and Samsung. Nintendo's Wii is due for a complete refresh as soon as this year, which could either drive new sales or disappoint. The overall market for motion-processing solutions, image stabilizers, and pressure detectors should prove large enough that InvenSense's concentration among a few customers will fade, but if it doesn't, we'll reconsider this risk.

Despite InvenSense's early lead, competition will be fierce. InvenSense's primary competitor is **STMicroelectronics** (NYSE: STM), which provided the gyroscope for the **Apple** (NASDAQ: AAPL) iPhone 4S. Whether it can court Apple or not, we need InvenSense to win multiple product proposals, maintain margins, and vastly grow its customer and product base. Finally, InvenSense outsources its manufacturing, so it needs dependable partnerships to ramp up volume and maintain quality. It currently works with some of the most dependable manufacturers, like Taiwan Semiconductor, but failings on any of the above measures may cause us to sell early.

There's no question that this recent high-tech IPO is a riskier investment than we usually recommend, so go in with your eyes open. Aware of the risks, we face strong potential rewards as this industry rapidly grows.

Wake Up to Daily Progress

Published Mar 12, 2012 at 12:00AM

Dear Fools,

Guidance Updates

- **CME Group** moves up to Buy First on price.
- **Covanta Holdings** moves back to Buy after doubling its yield to 3.6%.
- **Oracle** moves down to Buy on price and as earnings approach.
- **Pebblebrook Hotel Trust** moves down to Buy as we work to update fair value.

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Papa John's International**: Sell to open July 2012 $34 puts, lately around $1 or higher, for up to a 3.7% stock allocation (sell one put for every $100,000 you manage).
- **3D Systems**: Sell to open May 2012 $20 puts, lately around $1.15, for a 5.7% yield in just more than two months, or a potential 1.9% stock purchase in your portfolio.
- **Rockwood Holdings**: Sell to open April 2012 $50 puts, lately around $1.80; or sell to open May 2012 $50 puts, lately around $2.80, for up to a 5.1% allocation.

Questions on these? Visit our "Catch-Up Trades" discussion board.

Too often, the stock market gets a bad rap. Throughout history (and especially since 2008), people have talked about it with some trepidation: "Are you in the market? Should I get back in?"

We all hear the horror stories: "Joe lost all of his family's money in the market." Or, "The market wiped them out." This invariably means someone used leverage or sold when prices were down.

We rarely get to hear the long-term stories of success, precisely because they *are* so long-term; they don't make great headlines. These are the stories of people who stayed invested and steadily bought more stock, like my late Great-Aunt Mary, who bought stock throughout the Great Depression. She ended up a millionaire by retirement — along with all of her best friends who, like her, worked at Sears in Chicago and invested steadily in the company.

Instead, we're made to believe that the market is always risky, even though an alien viewing a chart of the market's returns over almost any 10-year period would have to conclude it's practically certain to go up over time.

Despite that truth, do you ever wake up in the morning feeling anxious about the market? Does your pulse tick higher as the opening bell rings and prices are down?

If so, it comes back to those questions that are often asked with a touch of fear: "*Are you in the market?*" As if the market were a giant roulette wheel with no long-term rhyme or reason. But, of course, it's all about rhyme and reason over the years, and Fools like us who use the market for the long run understand that — and profit by it.

So the question shouldn't be, "Are you in the market?" It should go more like this: "Are you sharing in the profits of the best companies on the planet? Are you *invested* in great businesses?"

Every day, companies like **MasterCard**, **Oracle**, and **Broadridge Financial Solutions** bring in more money than they spend — much more. Every day, these businesses are building value, value that over years should amount to greater wealth for owners.

When the market opens down one morning and MasterCard's stock is down $10, do this: Instead of staring at the share price with dismay, picture thousands of people getting up and going to work at the company that morning, just to make it a little bit better than it was yesterday. Picture tens of millions of people pulling out their MasterCard that day to buy anything from a cup of coffee to a round-the-world airplane ticket. With every purchase, a tiny sliver of value goes to MasterCard's growing coffers.

When the market is down, picture **GrafTech International** taking more orders for graphite electrodes that morning from steel producers who steadily need more product. Picture**Intel** breaking ground on the world's first high-volume 14-nanometer wafer fabrication plant, while its 15 existing plants around the world crank out tens of thousands of perfect microprocessors that day.

When **OpenText**'s volatile stock is down, remember that last quarter it grew new license revenue 13% (with half of that coming from brand-new customers), and its maintenance revenue grew 21%, with a 92% renewal rate. The company is finding more ways to sell content management software to businesses and governments. The share price will be down at times, but the business continues to grow.

As the market goes up and down, remember that every day **Covanta** is firing up its 44 furnaces and burning 54,000 *tons* of our trash, turning it into energy that very day. The business is so strong and stable that last week management doubled the dividend payment, giving the stock a 3.6% yield. Nothing smelly about that!

You get the picture. The stock market will swing up and down, sometimes violently, but the businesses we own are anything but volatile. We own some of the most stable, steadily growing businesses out there, many with gobs (that's a technical term) of naturally recurring revenue, and some of that revenue is contracted for years to come. These companies will create value through higher dividends, growing earnings, and higher share prices as the future unfolds.

Our companies are stronger than any human: They tend to make progress daily. They never have a bad day and stay home in bed. They're never too tired to show up. As long as U.S. and worldwide GDP doesn't turn negative, most of our companies will steadily grow, and typically grow much more quickly than the economy. And when the economy *does* slip into recession for periods, we'll ideally be hedged and have cash — and we'll be reminded that to enjoy growth, you sometimes have to experience the flipside.

When the market is down, picture all of those people getting up and going to work, just like every other day, moving our companies forward, making it their life's work.

Raising the Pro Bar

Published Mar 5, 2012 at 12:00AM

Dear Fools,

Pro Trade Roundup

- **OpenText** : Sold to open August 2012 $70 calls for $2.35, covering all shares

Guidance Updates

- **Covanta Holdings** is moved to Hold, as explained, with buy-around price moved down to $16, and fair value to $22

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Rockwood Holdings**: Sell to open April 2012 $50 puts, lately around $2; or, sell to open May 2012 $50 puts lately around $3 or higher. Sell one put for 100 shares you can buy, up to a 5.4% allocation (one put for every $100,000 you manage)
- **AmTrust Financial Services**: Sell to open June 2012 $25 puts, lately around $0.85 or higher, for up to 5% (one put for every $50,000 you manage)

Questions on these? Visit our Catch-Up Trades discussion board.

Your *Pro* team continues to comb through our companies' annual SEC statements, taking time to learn all we can about the state of these businesses. As April earnings approach, you can expect us to start adjusting the portfolio to reflect what we're seeing — and as we begin to do so, today's Memo provides you with an overview of four key things worth watching.

The Market's Up ... for Now

Up almost 9% for the year as of Friday, the S&P 500 is off to its strongest start since 1991, when Johnny Carson still hosted the *Tonight Show*. A 5% to 7% decline in the next month or two would not be surprising or necessarily unhealthy, even though this would likely clip many stocks 10% or more. The *Pro* portfolio is 75% net long (you can always see our long/short exposure at the bottom of the Recommendations page), so we're considering adding shorts — but we're not trying to outmaneuver small market moves. It's not realistic to predict and make plays against swings of less than 10%.

Even if a slip seems in the cards, a large market decline appears unlikely given the reasonable-looking stock valuations as interest rates hover at zero (the S&P 500 trades at 15 times reported earnings, 2.3 times book value, and has an average return on equity of 15%) and U.S. GDP growth sits at 3% as of last quarter. For now, we're holding onto our hedges, looking to add new shorts, looking at moderately defensive covered calls, and considering other changes as we wrap up earnings.

Volatility Ahead?

At only 17, the market's expected volatility as measured by the Chicago Board Options Exchange's VIX, is dangling below its long-term average of about 20 and is down from its 23.4 start to the year. Since 1997, the VIX has traded above 30 (often far above it) at *some point* during every calendar year except three. So, odds are high that the VIX will be above 30 some point this year, too. When it rises, we plan to begin a significant position shorting VIX futures because volatility — as always — will wane with time.

Fair Value Is Fluid

I want to reiterate an important point from last week's Memo. Nick wrote that *from* its fair value, a rewarding stock should earn your discount rate, or your desired rate of return, on an annualized basis. This being the case, your estimate of fair value for a growing company should march steadily upward. Fair value is not a static number — it's just a snapshot in time. When a company's cash flow rises, the stock's fair value (the fair price today for a seller *or* a buyer) should go up, too, all else being equal.

So, when investors sell at fair value and then see the stock double over the next seven years because earnings increased 11% annualized, it shouldn't be a surprise. This is why we don't hear Warren Buffett talk about selling stocks at fair value. He talks about never selling. Fair value is "fair" for *today*. And we invest for the future. We will sell lesser companies at, or even below, fair value to buy stocks we like better. However, it would be shortsighted to always sell outstanding companies at fair value.

Activity and Improvement

I still expect *Pro* to engage in significant selling this year (prices willing) as we invest the portfolio to our changing ideal. Investing is a work in progress, and we never reach our ideal, at least not for long.

This earnings season has been insightful, and since we only have 5% in cash, we'll be selling positions we like less for new ones we like better. When we were initially building the portfolio, cash was our bogey. Did a new stock look far better than cash? Now that we're invested, we've raised the bar, asking, "Does a new stock look better than one we own?" We must pursue this one-upmanship consistently, ideally replacing our good companies with ones that are better, and improving our positions over time.

Audio Extra: GrafTech, Pebblebrook, and Tupperware

Published Mar 1, 2012 at 12:00AM

In today's Audio Extra, Jeff Fischer and team members Nick Crow and Bryan Hinmon discuss earnings from **GrafTech**, **Pebblebrook Hotel Trust**, and **Tupperware**, as well as how *Pro* companies are investing for the future. Just click below to listen in!

piNGltMzrn0qRLvg01TYoq2-jFDpDDo4&videoPcode=t2ODk6HGlEZalkq7_3DtwCpPXzhE

The full unedited transcript appears below.

Jeff Fischer: Welcome to a new edition of *Motley Fool Pro* Audio Extra. I am Jeff Fischer and in the studio today are Nick Crow and Bryan Hinmon, so we have the whole Pro team here today. We are here to talk about three companies, GrafTech, Pebblebrook and Tupperware, but we are going to start with one, big macro thought, and that is free cash flow and capx. What's going on out there with these companies?

Bryan Hinmon: Yeah, I think what we're seeing, Jeff, is we are seeing companies are not afraid to spend their money right now.

Jeff Fischer: That's certainly what I'm seeing; Intel, Tupperware, Rockwood are all spending increasing amounts of cash flow on capital expenditures. They are investing for the future. Why I find this interesting is companies look reasonably priced right now, especially Intel as well as Rockwood and Tupperware, despite spending all this money. So we have seen free cash flow flatten at these companies the last year, in some cases two years, and yet prices are reasonable and they should prosper in the future because of this.

Bryan Hinmon: Yeah, what we care about is if that capital spending leads to stronger business, more efficient business in the future, then our free cash flows down the road are going to be even stronger. So if they are reasonably priced now, maybe investors aren't really paying attention to the capx that's going on right now, or they just don't believe that it's smart spending.

Jeff Fischer: Right, and it's good to see management looking forward with optimism and investing for it. Nick, what do you think? You are probably one of the most cautious persons among us.

Nick Crow: Which surprises most people. Like Bryan said, as long as they are making economic profits from these investments it makes me happy, so if they can earn a return greater than their cost of capital, that should enrich shareholders. So if those capital expenditures are spent on great projects, I'm all for it.

Jeff Fischer: Excellent. Well let's move in now, speaking of that, to GrafTech.

Bryan Hinmon: Yeah, that's a perfect segue for what's going on in GrafTech right now. So I will give you the quick overview of the recent earnings call. What everyone was tuned in to was how GrafTech was doing with filling up their book because they sign contracts at the beginning of each year at certain prices for a certain number of electrodes, and we expected that book building process to be difficult, but we expected them to have some success in passing on prices, and they did. They built about 50% of their book at rates that are 10-15% higher than they did last year, and that's reflective of rising costs really, so it's not as though this is going to drop directly to GrafTech's bottom line.

There were two other pieces of news really. The first is everyone is sort of admitting a recession in Europe now, so GDP growth estimates are coming down. Steel demand is coming down, which basically hurts GrafTech, one of the reasons that they have only built about 50% of their book so far and they are slow to build the rest of it. All of that though is not that troubling. The real news that came from GrafTech was just like we were talking about with capx spending. The company let on, almost as an afterthought at the end of the call, that investors should expect capx to be about double of what I was thinking it was going to be.

Jeff Fischer: Wow, that's huge.

Bryan Hinmon: And they also noted that that was sort of what we should expect for a while, so it wasn't as though they just said, Hey, we have got some really interesting projects that we want to invest in this year; it's going to be higher than you thought. They basically said for the foreseeable future, we are going to spend about twice as much money as you thought we were, and the math of all of that means that what I was expecting to be free cash for us as investors is now being plowed back into the business. And like Nick said, if we don't think that that is smart spending, then that's really just taking money out of our pockets.

So the punch line here is I don't think that it's smart spending. I'm not convinced that the projects that they have announced have good returns associated with them. And so really what has happened is the fundamentals of GrafTech as a business have changed in my opinion. The reinvestment rates just jumped dramatically, and we went from a company that earns pretty decent returns on capital now to one that earns much more pedestrian returns on capital. In my view, that makes the company a little less attractive.

Jeff Fischer: Which all makes sense. The flipside of that, the positive side, is we are in a very weak period still for steel demand, and we have been since 2008, 2009 when we first bought GrafTech. We expected a recovery to start to happen last year, it really, it wasn't as strong as we hoped. Now this year is much weaker than we expected, and largely that's due to Europe. The good news is we have a company that's still nicely profitable, even if it's somewhat on a pedestrian level, and that when things get better, such that demand is very strong, the shares and the profitability, not margins so much, but net profits should jump quite a bit, the shares with it. And that's the time when you want to sell a cyclical business like this, is at the top when everything's looking great.

Bryan Hinmon: Yeah, everything that I mentioned, it's not lost on the market. GrafTech shares have taken a little beating recently, and I think the shares are still pretty cheap at sub $13 right now; I just updated the fair value to the company for about $17, so the company still isn't getting any love, and that's because of what you said with the economic slowdown and steel demand down. These companies just get beaten down. When everything is going bad or when expectations are low, that's when you want to be a buyer of these companies. The bottom line is GrafTech remains an okay business. We really like management; they're smart. They have built the business model so that it's a highly flexible cost structure, so they don't lose money, even when things are bad, they still make money. For a deeply cyclical industry, that's pretty impressive.

Jeff Fischer: And it's nice to have a position or two or three like this in the portfolio because it should be; at this point it's already beaten down. It should be a more defensive holding if the stock market takes a turn. Now granted, there's no guarantee, of course, but you invest for the future, not for right now. We are well aware that GrafTech's business is slow right now, but is it worth holding this company for when things really pick up two or three years from now? That's what we have to ask ourselves every day, or is there a better place for this 3% of our capital to go? And you could say, Well, throw it into something that's growing right now, but the market is priced whatever is growing right now for that, and if things turn, you are throwing decent money after (unclear) into a bad place. It's good to have not all of your stocks moving at once.

Bryan Hinmon: I think we still have a margin of safety here. We could have additional upside if I'm wrong and the capital spending that's happening now results in higher sales and profits in the future, well then that's pure upside based on what I'm thinking.

Jeff Fischer: And one extra tidbit for those who are newer to *Pro*, GrafTech has been really interesting because early on they made two key acquisitions, whereas they used to just make these electrodes with needle cope that they purchased. They bought the needle coke suppliers. So for a long time, veteran members will recall, we have been waiting to see how this newly merged business came together and worked out. And in one sense, we are still waiting for that, but it doesn't appear now that it's going to be as attractive as we hoped, at least under all market conditions. Maybe in boom times they will really rake it in, but right now, GrafTech has been; we have been a long time waiting to see how this plays out, and in a sense, we are still there waiting, but there should be a good floor on the stock and it's still a well-run business.

Bryan Hinmon: Right.

Jeff Fischer: Nick, let's jump into hotels, which of course have a lot of steel in them, but Pebblebrook is buying hotels that are already on the market, already built, already have a brand and they're cheap, at a discount. How did their quarter look?

Nick Crow: Well their quarter's hard to compare. The whole year's hard to compare because they are buying so many hotels, like you mentioned. In 2011 alone, they bought six properties, like full-on properties, for over $500 million, so those capx expenditures you are talking about fits here too, as we expected. I mean Pebblebrook just became public in 2009, and they need to buy a bunch of hotels just to build the business. They also took on a joint venture in Manhattan, and that joint venture gives them exposure to another six hotels with a 49% exposure to those, and that cost another $150 million, so lots and lots of expenditures here.

What's been great though is RevPAR has been growing quickly. RevPAR is one of the more important metrics to look at in the hotel industry, and it's really easy for you to think of as an investor. It's the average daily rate, so the average rate you can rent a room times the occupancy rate. So it makes sense. How full are those hotels and what are they charging? Put those together and you get RevPAR. And RevPAR is growing faster than industry RevPAR, so that's exactly what we expect to see here, if they are operating well under John Bortz.

Jeff Fischer: So overall in the quarter, was there anything that stood out as a warning flag or anything that concerned you?

Nick Crow: You know me, Jeff. I always see more things that concern me than (unclear).

Jeff Fischer: (Unclear) ask you question. (All speaking at once; unclear).

Nick Crow: Yeah, everything concerns me always. Specifically here though…

Jeff Fischer: Your poor wife.

Bryan Hinmon: Oh yeah, tell me.

Nick Crow: Tell me about it. So first off, I thought that we were kind of starting the cyclical upswing here in hotels, and some things that John Bortz said over the quarter made me think that maybe 2011 is as good as it gets. Fortunately, it was really good for Pebblebrook, but it makes you wonder. He mentioned that the cyclically advantageous period to purchase hotels might be over, or nearing over. And it seems to me that the way he frames that is if new supply is coming online, you have missed the period to buy. So you want to buy when no one is willing to build a new hotel. Makes sense; that's an indication that you are at the worst portion of the cycle, but I thought maybe we had some more of that to go.

He also said something else that concerned me, though he's not concerned, so take my thoughts as you will. He says he's been accused by many people in the industry as overpaying for hotels consistently. That's completely at odds with our thesis here, that John underpays for these hotels, gets them at less than replacement costs. He sees this as an advantage because he gets invited to more of those off-market transactions. I'm thinking to myself, well yeah, if you're paying too much, I'll sell you something too.

That was a red flag to one extent. What he said on face value, it would bother me, but when I look at the hotels that he's purchased, the prices that he's got, it doesn't seem like he paid a lot for them. And then he's been able to improve their performance almost immediately, so you have got to kind of balance those two together in your head.

Jeff Fischer: Yeah, you would think they do pay a bit more because it's an off-market exchange, if they wanted to wait to have other bidders come into the process, they might end up paying even more after that. and they are also, in my view, kind of in a way, to bring up David Gardner's service, they are targeting Rule Breaker hotels, or the best of breed, best of the best, like The Drake and The W and The Monaco, that have a strong brand and for which you may have to pay up a bit.

Nick Crow: Yeah, they look for a sweet spot, so like the very, very best hotels, he would classify as a luxury hotel. Luxury hotels I guess kind of suck, because you have to keep them in perfect shape, perfect experience…

Jeff Fischer: Oh sure, they're upper upscale. If you are paying $500, there better not be a smudge on your door.

Nick Crow: But if you can get upscale right before the luxury, that seems to be the sweet spot. You seem to benefit during the good economic times. You seem to drop off less when times get tough, and you can provide a really great experience, but you don't have to have as heavily a renovation expense, if you will, over time.

Jeff Fischer: So Pebblebrook is still a Buy First. We didn't see anything in the report that would change that. We are waiting for the yield to go up. The dividend yield is around 2%, and as a REIT, the more income Pebblebrook has, the more it has to, by law, it has to pay it out.

Nick Crow: He has to pay out 90% of its net income, if it's taxable income, in order to stay qualified as a REIT, so we can be sure that management's going to do that. Since yield is so important for us, he's not expecting to raise the yield beyond the minimum requirements that way any time soon. As long as they are a net acquirer of hotel assets we shouldn't expect them to use cash flows or basis for repayment, which is; so when we will see net income grow and we'll see our yield grow with that. But for the real big pop, we'll have to see a slowdown on acquisitions in order to get that benefit. Because we want them to make those acquisitions now to generate that yield engine.

Jeff Fischer: Although that may come sooner than we think, if they are seeing the window closing right now, which frankly I don't think any of us would mind. If they own a baker's dozen of really outstanding hotels and can make them more and more profitable.

Nick Crow: Yeah, they have exposure to 20 hotels now, if you consider their partnership too. Not a bad portfolio.

Jeff Fischer: I'd much rather them stop and just focus on what they own than keep buying, of course, at less attractive prices. So great, sounds good. I'm going to talk about Tupperware, which is currently on hold as we tape this, because it's around 62. It is still though, below our $64 fair value. Our Buy Around Price is in the mid-fifties though, because it's a volatile stock, about 1.5 times as volatile as the S&P historically, so we think by writing put options, our being patient members can pick up shares at lower prices. But rather than just have me monologue this, do you guys have any questions on Tupperware? And this is unscripted, so you want to try to stump me?

Male: How was their quarter? You told me earlier it was mixed, so talk a little bit about the mixed results.

Male: Let me focus that a little more.

Jeff Fischer: That's a good question, how as their quarter.

Male: Which quarter?

Male: So really one of the most attractive parts of Tupperware is their overseas exposure, so let's take next question, but direct it more at what's going on internationally.

Jeff Fischer: So only about 10% of sales now are from North America, and some 60% is from emerging markets, and Europe is the rest, of course. So Tupperware is very big in Europe and Asia and South America, and in almost all of those areas uniformly they are growing very strongly, whether it's India or Malaysia or China.

What's happening is the middle-income class, middle-income group is growing in all these markets, and as they do, Tupperware is actually an aspirational brand. It's better quality than the junky little items you can get at a store, and it's also a part of their social network, if you can believe it. These parties are kind of a sign that you're on the rise in Tupperware, which is to my understanding, frankly how they were in the 1950s as well in suburban America. A Tupperware party was a small sign of some affluence, actually.

What Tupperware does is they market products for each market they're in and they price it accordingly. They serve the local food needs, and they're not just kitchen storage anymore, but they're kitchen utensils, kitchen tools, as well as baby tools and utensils and some beauty products as well.

Nick Crow: Did they make any comments about Europe specifically?

Jeff Fischer: They did. They are holding up well in Europe. Germany is strong, France is strong, and Italy has been very strong lately. When there's less certainty in the environment, two things happen. One, sales persons are more driven to make sure they have adequate income, so their sales force, which is 2.5 million people strong, tries harder during uncertain times, and it also grows. When unemployment is up and it's above 20% in Greece and Spain, I believe, if my memory serves me. When unemployment grows, of course Tupperware has a better time recruiting strong employees to sell their wares. Also Tupperware is not that expensive to buy the products, and it's about conserving food more smartly.

Nick Crow: And you get to feel like you're helping your neighbor out by purchasing some Tupperware from them.

Jeff Fischer: That's true. It's a feel-good purchase. So the quarter was good. They are spending a lot more on free cash flow, but unlike GrafTech where there's not much clarity to us how the returns are going to be generated there, and if they'll be attractive, but Tupperware it seems that they certainly will be. They are spending on more production, more factories overseas so that they can supply the demand that is growing very quickly, like 50, 60, 70% sales growth in places like Brazil and India.

So it's much easier to model Tupperware and how their capx dollars turns into a strong return on capital down the road. But as a result of increased spending the last few years, the shares have gone up quite a bit for us, which is great, of course. Well, to an extent it's good. As long-term investors, it'd be great if they were flat and we could buy more and more at lower prices, but anyway, the stock trades now at around 17 times free cash flow. When we first bought it, it was around 11 times. because shares have gone up quite a bit, free cash flow hasn't, and this year's more of the same somewhat, although free cash flow should go up 10, 15%, so that's good to see. And shares trade at 12 times expected earnings per share this year, while earnings per share should grow about 13%. So the stock looks reasonably priced. It makes sense. It's right around its fair value. The yield is 2.3%. They increased the yield 20% this year, and they are on track to grow the yield along with income growth year after year. That's the way they want to operate, so as earnings grow, our yield should grow as well.

So Tupperware could very well be, continue to be, a strong three-to-five-year holding, and we look at all our core stocks as with at least a three-year outlook. Tupperware could be quite larger in three years. That's the hope. Does that answer your question, Nick?

Nick Crow: Yes.

Jeff Fischer: Now not everything is roses at Tupperware. Their beauty department, beauty products continue to suffer. That's very competitive. They are trying to…

Nick Crow: What brand is that? Like how is that branded?

Jeff Fischer: Beauti Control is the name of it, B-E-A-U-T-I Control. Creative spelling.

Nick Crow: Zing.

Jeff Fischer: And they are focusing on skincare products because there they can really hone their message and they have a competitive advantage, they believe they do, and they are selling to the key demographic, which are women in their forties and fifties.

Nick Crow: Preserve your face like we preserve your food. I get it.

Jeff Fischer: You should run that by the CEO, Mr. Rick Goings, he may like that. They might go with that. So Tupperware is on hold, thought, and it is recently a catch-up trade where you can sell to open put options, so check out the Monday memo for that.

And to wrap it all up, GrafTech remains a Buy; Pebblebrook remains a Buy First, Tupperware right now on hold. Guys, anything else you want to add? Happy March, as we roll into March?

Male: Happy March.

Jeff Fischer: Final thought, our North Star is above 10% right now. As you know, this is our Pro's goal, to return at least the North Star on an annualized basis, every rolling three years. It's above 10%, so as we get into month three of this year, we are looking at every position in the portfolio to see if they are likely, it is likely to give us at least our North Star return, and if not, if we don't think so, how do we possibly generate that with options, or do we move the money into something we like better? So the year's going pretty fast, but it's only early March, so I feel like we have gotten a lot done this year. Including this Audio Extra, which may take us into 2013, if we…

Male: See when this gets (unclear).

Jeff Fischer: All right, well thank you guys and thank you to PRO members for being here. Thank you, Nick and Bryan. We will see you again soon, and we'll see you on the boards and in the Monday Memo, so Fool On!

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here*.

Our Fair Advantage

Published Feb 27, 2012 at 12:00AM

Fellow Fools,

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Rockwood Holdings**: "Sell to open" April 2012 $50 puts for $1.10 or more, or sell to open May 2012 $50 puts for $2 or more. Sell one put for every 100 shares you can buy, up to a 5.3% allocation (approximately one put for every $100,000 you manage).
- **Tupperware** : "Sell to open" July 2012 $55 puts for $2 or more, up to a 3.1% allocation.
- **Pacer International** (Nasdaq: PACR): "Sell to open" June 2012 $5 puts for at least $0.35, or September 2012 $5 puts for at least $0.50, up to a 3% allocation.

Questions on these? Visit our "Catch-Up Trades" discussion board.

A market crash is the hardest time to make investment decisions. But a rising market is the second-hardest. During a rally, every day brings higher prices — and regret at not buying cheaper yesterday. The market's recent upward moves, coupled with a cohort of new members who are still getting acclimated to the *Pro* way, make this a great time to clarify our buying and selling disciplines and our estimate of fair value.

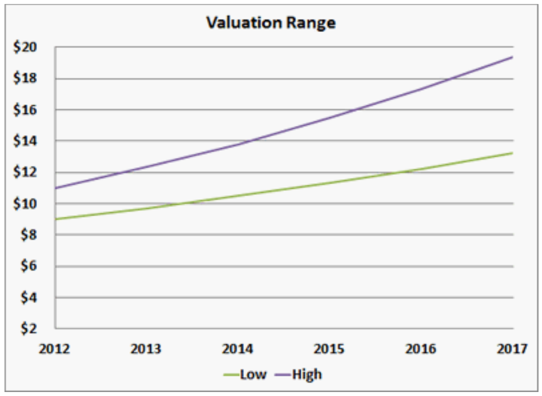
You're Disposed to Lose

A well-known tenet of behavioral finance (the study of how we actually, and often irrationally, make decisions) is the disposition effect. This principle applies to most investors, but especially to those focused on value. It states that investors sell their winners too soon and hold on to their losers too long, hoping to get back to even. I know our members appreciate fair-value and buy-around guidance, but I fear that providing those numbers without the proper context makes it too easy to anchor on specific values. A better understanding of valuation will provide that context and mitigate this effect.

Estimating Fair Value

Over long periods of time, owning great businesses is the best way for investors to build wealth. That's why we invest in stocks. Of course, investing is the act of risking capital now in return for the potential of more capital later — but there are no guaranteed returns. Thus, in order to be well compensated for risking our capital, we need to know the fair price for each stock we buy.

Think of a stock's "fair value" as the price at which you'd be OK with being a buyer *or* a seller, because each party is getting an equally good deal. There's nothing wrong with buying at fair value, except that every fair-value price is only an estimate — and all estimates are actually a range of values. Short-term predictions are usually more accurate, so the range of possible correct fair values gets wider as we expand our forecasts further into the future.



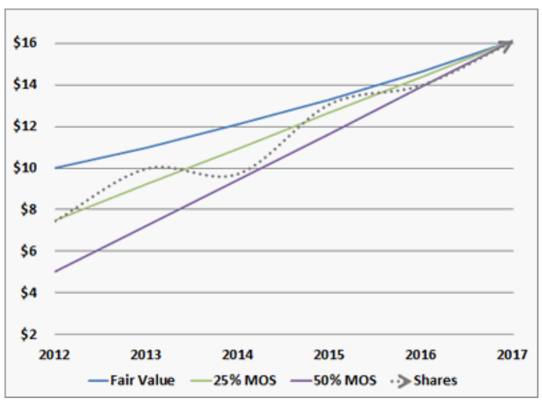
The chart above illustrates a reasonable range of values for a hypothetical company to which we might assign a fair value of $10 (the range right now being $9-$11). As you can see, the spread between low and high widens with the passage of time, adding further uncertainty to the art of valuation.

Every company's worth is equal to the present value of all future free cash flow. To arrive at present value, we discount forecasted free cash flow; as the future becomes the present, then, we should earn our discount rate (assuming our forecast was accurate). An example: You value a stock at $10 per share today and assume a 10% discount rate and a constant rate of growth. One year from now, you revalue the shares again, with nothing changing except the passage of time. The revised valuation would be $11 a share.

The lesson here is to avoid anchoring to our initial fair-value estimate as time passes. Further, great businesses with recurring revenue and higher returns on capital — you know, the type of business we want to own for a long time -- have a way of exceeding our conservative estimates of free cash flow growth … but we'll save that topic for another memo.

Buy-Around Price

Every *Pro* recommendation includes a buy-around price. This price is always at a discount to fair value, providing a margin of safety (MOS — a term borrowed from engineering) meant to provide some protection if our fair-value estimate turns out to be wrong. And it's not just a risk-reduction measure; the buy-around price also has a way of increasing our returns, i.e., when we correctly estimate the worth of a business and the market later agrees with us. Let's look at another visual example using our hypothetical business with a fair value of $10 per share.



In this example, we purchase stock today at our $10 fair-value price and hold it for five years. We expect to earn a 10% compounded annual growth rate (CAGR). Great — but what are our returns if the market gives us the opportunity to buy shares for $7.50 (or we create the opportunity ourselves by writing puts)? If we still believe the stock is worth $10, buying at $7.50 provides a 25% margin of safety. If we then hold our investment for the same five years and sell at fair value, we'll have earned a 17% CAGR — with less risk. Fortunately, we're often able to find opportunities offering a 20% to 25% margin of safety. The price you pay is a primary factor in determining future returns.

Sell Discipline

Deciding when to sell is perhaps the most difficult dilemma investors face. The disposition effect suggests we need a better framework for making sell decisions; because Tom Gardner favors ranked lists, here are my top five reasons to sell an investment, in ranked order (full sales — not allocation adjustments).

1. **Error.** As investors, we will make errors. As soon as we discover an error in our analysis that impairs the value of our thesis, we should sell.
2. **Fundamentals.** If the fundamentals of the business decline or fail to support our thesis or valuation, we should sell.
3. **Opportunity cost.** We should sell when we find a better risk-adjusted opportunity in another investment. (Cash is sometimes better; consider taxes as well.)
4. **Valuation.** If we buy a crummy business when it's mispriced, making it an attractive investment, we should sell that below-average business around fair value.
5. **Life.** If you have a use for the capital in real life, consider selling.

I try very hard not to sell great businesses at fair value (remember, it's ever-increasing) or because I have large gains. Instead, I remind myself that when you find great compounding machines, you should let them run and only sell when you have a better place for the money. It's all part of a framework that supports good decisions, helping us overcome our biases and providing a fair advantage with seemingly unfair results. It's the *Pro* way.

Income Matters

Published Feb 21, 2012 at 12:00AM

Fellow Fools,

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **AmTrust Financial Services**: "Sell to open" June 2012 $25 puts for $0.75 or higher (at least a 3% yield in four months) for up to 5% of your portfolio. Sell one put for every 100 shares you could buy.
- **Intel**: "Sell to open" May 2012 $24 puts for $0.40 or higher (at least a 1.6% yield in less than three months) for up to 6.9% of your portfolio if you lack our full allocation.
- **Pacer International**: "Sell to open" September 2012 $5 puts for $0.50 or higher (at least a 10% yield in seven months), for up to 3% of your portfolio.

Questions on these? Visit our "Catch-Up Trades" discussion board.

At *Pro*, we hold some things to be self-evident:

1. We're always seeking excellent companies to own at good prices.
2. We seek positive returns even in weak markets, so we must use certain strategies accordingly (including option income strategies and hedging).
3. Income is important to long-term results.

Point No. 3 too often gets lost in the market's noise, when the truth is that over the last 80-some years, approximately 44% of the S&P 500's total return has come from reinvested dividends. In other words, dividends matter — a lot.

Granted, plenty of investors do well buying growth companies without concerning themselves with dividends, but because *Pro* is guided by an always-positive North Star, and because our goal is consistent gains that we can take to the bank, income is certainly part of our mix. With that in mind, let's review our income-paying positions.

Pro's Income Lowdown

We own 15 stocks and ETFs that pay us a yield and nine that do not. More than $900,000 of our portfolio is invested in dividend payers. The current yield on the entire *Pro* portfolio is 1.55%, while the average yield on positions paying a dividend is 2.4%. One of our goals for 2012 is to get our yield on the entire portfolio closer to 2% without forfeiting growth.

Below, you'll see the latest annual per-share dividend our companies pay, how much the dividend has grown the past year, today's yield, and — based on *Pro*'s allocation — how much each company should pay us this year on absolute terms. In order of highest to lowest yield:

Company	Dividend	Year-Over-Year Growth	Yield	Annual Dividend Value for the *Pro* Portfolio
StoneMor Partners	$2.33	4%	9.3%	$3,262
Plum Creek Timber	$1.68	0%	4.3%	$1,680
WisdomTree Emerging Markets SmallCap Dividend Fund	$1.69	31%	3.5%	$1,268
Intel	$0.84	8%	3.1%	$3,024
CME Group	$8.92	59%	3%	$2,384*
Broadridge Financial Solutions	$0.64	7%	2.6%	$1,344
Medtronic	$0.97	3%	2.4%	$1,843
Tupperware	$1.44	20%	2.4%	$1,008
Pebblebrook Hotel Trust	$0.48	300%	2.2%	$1,248
Covanta	$0.30	New	1.8%	$810
Wells Fargo & Company	$0.48	140%	1.5%	$576
Vanguard Energy ETF	$1.61	29%	1.5%	$741
AmTrust Financial Services	$0.36	13%	1.3%	$1,404
Bristow Group	$0.60	New	1.2%	$720
Oracle	$0.24	9%	0.8%	$576
MasterCard	$1.20	100%	0.3%	$144

Numbers as of Feb. 17, 2012. Sources: company filings, S&P Capital IQ, Google Finance. *CME Group's dividend value includes its special $3-per-share payment due in March.

Filling in some context, **StoneMor Partners**, a cemetery owner, has the highest yield on our scorecard. It's on Hold for new members as we talk with an accountant to ascertain the tax implications behind this master limited partnership (MLP). Although I don't believe those implications will be daunting, owners may need to file income taxes in several states where StoneMor operates. Because of this, we're making certain we want the stock in *Pro* before moving it back to Buy. Elsewhere, **Plum Creek Timber** pays a tall yield, but it hasn't increased it since 2006, and its payout ratio (something we keep a close eye on) is 141%.

As expected, **Pebblebrook Hotel Trust** has a fast-rising dividend (up 300% over the past year) as income at this new hotel owner rises. As a REIT, Pebblebrook *must* pay out most of its income to shareholders, so we believe its yield has plenty of room to grow. **CME Group** just increased its dividend 59% as it moves to pay out about 50%

of its free cash flow to owners; this increase *excludes* the special $3-per-share distribution we'll be paid in March, although we added that to our expected cash income above.

MasterCard just doubled its tiny dividend, and **Wells Fargo** boosted its own by 140%, en route (we hope) to much more. **Tupperware Brands** raised its dividend 20% in January, in line with earnings growth, and plans to adjust it annually to maintain a 30% to 35% payout ratio on its income. Finally, **Covanta** and **Bristow Group** have new dividends.

Wrap It Up, We'll Take It

Add up all those payouts, and we're looking at $22,000 in dividend income this year, or 1.55% of our current portfolio value. Again, we'd like to edge that toward 2%. We also know many new members don't have positions in many of our dividend payers yet. We'll work to get you into them cheaper using options (watch our "Catch-Up Trades" in this and every Monday Memo) or when their prices decline. Speaking of options, we of course supplement our dividend income with option income. We would ideally like our *annual combined income* to total 4% to 6%. If we can earn that kind of income, then our North Star (lately running above 10% annually) should be within reach most years.

However, it's going to require much more option income (without big capital requirements on our part) to reach our total desired income yield. We'll discuss how we expect to do that in another Monday Memo soon. To discuss this Memo, please visit the Memo Musings board! And don't miss our earnings coverage and more below.

Foolishly,

Jeff Fischer (TMFFischer)

Guidance Updates

- **AmTrust Financial Services**: Buy Around moves up to $24 and fair value up to $32 following strong book value growth. For now, the stock remains on Hold.
- **Rockwood Holdings**: Moved to Hold at $55 due to price and pending earnings. We'll review this morning's earnings and reassess our guidance, but we're happy to own it today.

Pro Trade Roundup

- **Apple**: Bought 4%, or 111 shares (in a little homage to Steve Jobs, who famously kept one share after being fired) for an average price of $503.56.
- **AmTrust Financial Services**: Bought to close 27 March 2012 $25 calls at $2.50 per contract, keeping 5% exposure to the stock uncovered.
- **Ebix**: Sold all shares at a net $24.09 through February 2012 $23 covered calls.

Coverage & Community

- We summarize results from **OpenText**, **AmTrust Financial Services** and **Tupperware**.
- **Rockwood Holdings** and **Medtronic** reported earnings this morning. We'll have coverage soon.
- Greece gets a bailout. Does it matter?
- Earnings are still flying at us! TMFMoosie posts a full, detailed calendar. You can also view our *Pro* calendar on the site.
- Fools talk about the **SPDR S&P 500**hedge and where we're at.
- How are new members doing? Getting started well? How can we help? The conversation is lively.
- What truly *is* Fair Value? What is the Buy Around price? Don't miss this essential Memo from last year.

Advisor Roundtable: Are Things Looking Up?

Published Feb 17, 2012 at 12:00AM

Duke Street *advisor Rich Greifner chatted recently with a group of Foolish advisors and analysts about whether this year's market rally is the beginning of a turnaround.* Pro*'s Jeff Fischer joined Fools from* Stock Advisor*,* Special Ops*, and more to share their thoughts — read on!*

Fueled by record-low interest rates and last Friday's better-than-expected jobs report, the stock market is off to its best start since 1987. Is this rally just beginning, or could European rainclouds wash out the parade? I turned to a motley group of Foolish advisors and analysts to find out.

Question 1: Temperature Check

Rich: Let's start with how warm you are on stocks: On a scale of 1 (quaking with fear) to 10 (trembling with greed), how excited are you to invest in stocks right now?

Jeff Fischer, *Motley Fool Pro*, *Motley Fool Options*: Given some reasonable valuations on great companies, I'm around a 7. But given that the Western world is overleveraged, it's likely that we'll face recurring economic challenges as far as the eye can see. Stocks will climb a wall of worry, and periodically fall off. But the reality is, where else can you invest today for returns?

Andy Cross, Motley Fool CIO; *Stock Advisor*, *Hidden Gems*: Count me as an optimist too. We're seeing some healthy business momentum right now, especially in the United States. Europe continues to lurk in the dark corner, but investors can still find high-quality companies selling at discounts to the earnings they will generate over the next five years. Investors just need the courage to look out beyond a quarter or two.

Tom Jacobs, *Special Ops*: So Andy, what's your number?

Andy Cross: I'll one-up Jeff and say 8.

Tim Beyers, *Rule Breakers*: I'm an 8 too. Tech balance sheets have never been as strong as they are now (cough, **Apple**, $97 billion, cough), which should help keep the R&D investment engine humming regardless of macroeconomic conditions. Valuations are askew in some areas, of course, but overall, I'd say between the pace of innovation and promise of dividends from rich tech mega-caps, now is a wonderful time to be investing.

Nate "The Snake" Weisshaar, *Global Gains*: I'll rate myself a 4. There have been some encouraging signs out of the U.S., and the fear of emerging markets has diminished in the past two months, but I can't get past Europe. The E.U. will not solve its problems anytime soon, and that will negatively affect many companies, including consumer staples (once thought invincible, even **Unilever**, **Coca-Cola** and **Philip Morris International** are seeing Europe drag on their results). It will also negatively affect companies that call the E.U. a major trade partner — I'm looking at you, U.S. and China.

Tom Jacobs: I'm a 3. The rise is all in go-go mo-mo stocks of low quality. But this can go on a long time because of Fed [monetary] policy and the fact that, as awful as other places are, people buy Treasuries, driving investors to higher-risk, low-quality investments (you know that's happening when my brother and friends ask me where to find higher yield). There are two large risks that make me happy to focus on what can be lost, not gained (which leads to "3"): The effect that a potential China slowdown would have on commodities, and further deflationary effects from the eurozone because it is metaphorically on the gold standard (individual countries can't devalue their currency to get out of the mess). This can turn any market bloody quickly (no matter how cheap the S&P might be).

Jim Mueller, *Stock Advisor*: I'm leaning toward a 7, maybe an 8. Things have run up pretty quickly in a short time frame. Is that mo-mo? Is that people ignoring European troubles? Am I anchoring on lower, recent prices and wanting those to return before buying? Perhaps. But I think most times are decent times to invest in stocks — if you have a long investing horizon. Short-term buying and selling could very well be a bad decision now, especially if there's another drop to come. But for the long term, I'm still buying.

Charly Travers, *Million Dollar Portfolio*: While I agree with some of my fellow Fools that there are bargains to be had, I find myself sitting at a 3. Act 2 of the financial crisis is well under way in Europe, with Greece quite likely to default next month and Portugal watching the machinations of that event closely to see what its next move should be. The repercussions of these events are neither easily predictable nor controllable by policy makers. My cautious stance is more a call on a high level of volatility, which will present ample buying opportunities on downswings, than it is on catastrophe because at heart I'm optimistic that these issues will resolve with time.

Question 2: European Woes

Rich: What advice would you give to members that are spooked about Europe? Is there a smart way to protect your portfolio from any potential fallout?

Snake: I think the best way to ease worries about Europe is to close your eyes and plug your ears. You might want to plug your nose, too. For those that still want to invest, I will riff off Tim and say that companies that continue to invest heavily in R&D and have a history of rolling out innovative products that make life easier or cheaper for consumers, governments, and other companies will be the best way to win as we wade through this debt mess.

Tom Jacobs: I don't see Europe as a specific problem except for deflationary pressures and an aging population. Nobody in the E.U. or eurozone is having babies. Ditto Japan or China. So where do you hide? The U.S. — because you can understand the accounting and the rule of law. Protection is about managing risk. Be prepared for lower portfolio returns on an annualized basis for five to 10 years. Focus on not losing money. Buy asset-backed values cheap. And expect both deflationary (shorter-term, favors cash and cash-rich companies) and inflationary pressures (longer term, favors commodities and debtors).

Jim Mueller: If Europe leads to more downturns in the market, those could be excellent opportunities to buy strong companies on the cheap, again. If you need money for the next few years, though, keep that money out of the market. For specific strategies to get through the downturn (other than gritting your teeth), talk to Jeff.

Jeff Fischer: I have to agree with Tom. Europe has a debt problem, but the fact that most eurozone countries are not competitive is just as big an issue. Unemployment is high and aging populations are going to put social systems under severe strain. In *Pro*, we're short the **CurrencyShares Euro Trust** (click here to read the recommendation) because the euro's foundation remains vulnerable, and I really doubt fiscal union among these 17 countries can ever happen.

Andy Cross: If Europe really craps out (if one of the big economies, like France, tumbles) then any asset without an atomic symbol is in trouble over the short-term. But even if that happened I would want to be an owner and buyer of solid, financially-stout, well-run, innovative companies right here in the good-ol' US of A. I look for companies that have proven their mettle through the test of time and have a management team ready to jump at opportunities. We saw stocks of such companies plummet in 2008 and 2009, and look where they are today: multi-baggers. So over a few months or a year it will hurt a bit, but it's so hard to tell when things will turn that it's difficult jumping in and out of stocks. Who thought that March 2009 was the bottom of the Great Recession when we were in it? Yet when prognosticators were calling for the end of the world, patient, forward-thinking investors were buying stocks. And they were rewarded for it.

Tom Jacobs: If you buy based on valuation, you don't have to pick market bottoms (like March 2009). A lot of people knew stocks were cheap and that there was maximum fear. Warren Buffett's *New York Times* op-ed in October 2008 (click here) said he was buying hand over fist. He didn't know when the bottom would be. But when valuations are low — especially relative to tangible book value — you buy. And eventually, there is nothing cheaper or better. If you buy when others are fearful, you don't have to know how bad it is. If you sell when others are greedy, you don't have to know how *good* it is. But no one at The Motley Fool, I believe, is a market timer. We buy on valuation regardless of strategy. What I love about this discussion is that everyone here seems to be saying: Stay focused. The macroeconomic picture may be totally crazy, but every one of us here practices something that will work given enough time, and members can find something that works for them among us.

Tim Beyers: Tom has it right. There's really never an excuse to fall out of love with a strategy that works. Document your process and run your best ideas through it. And when you find something that measures up, buy. At *Rule Breakers*, we're perfectly willing to bet on stocks others won't because they meet specified criteria designed to predict multi-baggers in the making. Macroeconomic conditions don't figure into the formula.

Lightning Round: Pick a Stock

Rich: On that note, it's time for the lightning round! Give me one company from your service's scorecard that you think looks especially attractive right now.

Andy Cross: I really like what I'm seeing from the folks at **Quality Systems**, one of our best-performing *Stock Advisor* recommendations. Electronic health record legislation is just starting to ramp up and the tailwinds for the company are blowing hard. Quality Systems generates high returns on capital, the balance sheet is solid, and I think we have more upside to come as doctors and hospitals implement their EHR systems by 2015.

Jim Mueller: I'm going to go with **Cognex**, which is below most people's radar. Helping machines see better during manufacturing coupled with improving the ability to read bar codes (e.g. when they're bent or dirty) may not sound sexy, but it's been a solid performer for David Gardner's side of the scorecard and I think it has a lot of room to grow.

Charly Travers: Despite its recent run I still like **Microsoft**. Mark my words, this company is going to surprise a lot of people this year with its new products!

Jeff Fischer: Being defensive, **Medtronic** looks healthy. The medical devices giant trades at 11.8 times expected earnings this year and yields 2.4%. The stock has gone nowhere for years as its value multiple contracted, but given how the company continues to innovate, I think it's finally at a level where investors will benefit the next three years.

Tom Jacobs: Primero Mining . A self-funding gold and silver miner with almost no debt, selling for less than 2 times operating cash flow, and run by a jockey CEO. What more do you want?

Snake: I have to go with **GDF Suez**. Sure, it's a utility based in Europe, where regulations are a complete mess; and sure, its dividend (providing a chunky 7% yield) is paid in the wobbly euro; but its massive presence in the European gas market (the cleanest fossil fuel) positions it well as countries abandon nuclear. Additionally, it has fast been developing its presence in the gas and renewable energy markets in Latin America and Asia — two great places to be in coming years.

Tim Beyers: I'll be the crazy one and say **Riverbed Technology** , a stock Duke Streeters have heard me talk about before (click here) that trades for 27 times estimated earnings. **Cisco** has had more than a decade to kill this up-and-comer, yet today Riverbed controls more than half the worldwide market for accelerating data delivery over geographically dispersed private networks. Revenue is up an average of 29.7% over the past three years; returns on capital have more than tripled over the same period.

The Foolish Bottom Line

Whether the stock market is up, down, or sideways, we Fools keep our eyes fixed on the horizon. Despite the looming dangers in Europe, our panel of advisors and analysts are still finding plenty of bargains out there for long-term-oriented investors.

You've heard from us; now we want to hear from you, Fool! On a scale of 1 (quaking with fear) to 10 (trembling with greed), how excited are you to invest in stocks right now? Head on over to our Philosophy & Strategy board and let us know!

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here. Andy Cross owns shares of Philip Morris International and Microsoft. Tim Beyers owns shares of Apple and Riverbed Technology. Jim Mueller owns shares of Apple, Cognex, Coca-Cola, and Philip Morris International and has the following options: long JAN 2013 $22.50 calls on Microsoft and short JAN 2013 $25 calls on Microsoft. Nate Weisshaar owns shares of Philip Morris International. The Motley Fool owns shares of Apple, Coca-Cola, Medtronic, Microsoft, Philip Morris International, Primero Mining, and Riverbed Technology and is short CurrencyShares Euro Trust.*

Calculate

Write Covered Calls on OpenText

Published Feb 16, 2012 at 12:00AM

- **What We're Doing:** Seeking income on our shares.
- **What We're Thinking:** These call options pay decently and still allow us ample upside for the stock.
- **What We're Expecting:** We don't expect the stock to rise enough to lose our shares by August, but wouldn't regret our sell price if we do.

Trade Essentials

- **Action:** Sell to open August 2012 $70 calls, one call for every 100 shares of OpenText you own.
- **Price Guidance:** Use a **limit order**, aiming to receive $3 or higher — or nearly a 5% yield on the $61.40 stock in about six months
- **Strategy Tip:** You write covered calls to earn income on a stock you own by promising to sell it at a higher share price if that price occurs by expiration. For more, see our guide to writing covered calls.
- **Alternative Trades:** See the end of this report.

What's New?

- **Last action:** In August 2011, *Pro* invested 3% in the stock at $58.75
- **Recent price:** $61.40

Canada's largest software company, **OpenText** (NASDAQ: OTEX), has not gained much ground for us since we bought shares in August, but writing covered calls for additional income has been on our radar from the start.

A new development makes us comfortable to write covered calls even though they cap our upside on the stock. In January, OpenText hired a new CEO: Mark Barrenechea, 46, who hails from **Silicon Graphics** (NASDAQ: SGI) and **Oracle** (Nasdaq: ORCL). OpenText has long been rumored as a takeover candidate (namely by Oracle), but now that John Shackleton has retired after 13 years as CEO and young Barrenechea has taken his place, an imminent takeover appears much less likely (otherwise Shackleton would have made a buyout his swan song). Instead, the new CEO is already speaking with Oracle about possible *partnerships*, further dampening the possibility that OpenText will be acquired soon.

OpenText just delivered a healthy second quarter, sporting 20% revenue growth and a 14% gain in non-GAAP earnings per share. We're also impressed with Barrenechea's plans to expand OpenText's reach as its software helps businesses manage content and regulatory needs. However, the $61.40 stock trades at 19 times free cash flow — not expensive, but not dirt cheap, either — because cash has yet to flow as robustly as we hoped. Plus, the covered calls we're writing provide 19% upside to a potential sell price that's above our $70 fair value estimate and equates to 23 times free cash flow. Although we expect big things from OpenText in the long run, and we hope to be owners for years, we're ready to target option income on the belief the stock won't likely exceed our call's $70 strike price by August.

How to Follow Along

As new CEO Barrenechea gets comfortable, and the stock ideally trades in the $60s during the next six months (although two earnings reports will come and go before our calls expire), let's earn short-term income. Here are more details behind our trade:

- **Trade:** Write ("sell to open") August 2012 $70 calls, one for every 100 shares you own (for *Pro*, seven contracts)
- **Option yield (at a recent $3):** 4.8% on the $61.40 stock in 184 days
- **Upside from today if called away at a net $73:** 18.9%
- **Total return on position if exercised:** 24.2%

Alternative Trades

- **If you don't own a 3% allocation yet:**

- With our rating on the stock a buy, you can purchase shares, aiming to pay $61.50 or lower, or within 5% of our buy around price.
- **If you only want to buy shares lower:**
  - Sell to open (*do not buy*) May 2012 $60 puts, lately paying you $4.10, or a 6.8% yield in three months. This results in a $55.90 potential buy price. Sell one put for every 100 shares you are willing to buy.
  - To be more defensive, sell to open May 2012 $55 puts, lately $2.20 (a 4% yield), for a $52.80 potential buy price. Sell one put for every 100 shares you are willing to buy. (See our guide to writing puts.)
- **If fewer than 100 shares is a 3% or greater allocation:**
  - You can't write covered calls or puts, but continue to own your shares, or buy a 3% stake.

Buy Apple

Published Feb 14, 2012 at 12:00AM

- **What We're Doing:** Investing in the world's largest technology company.
- **What We're Thinking:** Shares are cheap because enough people doubt Apple's staying power and ability to keep growing.
- **What We're Expecting:** Mobile computing is small relative to its future size.

Trade Essentials

- **Action:** Invest 4% of your portfolio in Apple ($4,000 for every $100,000 you manage). For *Pro*, that's about 100 shares. (Remember, it's not the number of shares you buy that matters, but the dollar amount you invest.)
- **Buy Around:** $520
- **Fair Value:** $635
- **Alternative Trades:** See the end of this report.

The Big Picture

Apple has changed how we use our phones, how we view mobile computing, even how we *feel* about the technology in our lives. But our recommendation today has nothing to do with feelings and everything to do with potential. To that end, let's get a few things out of the way:

Apple is a Buy First

We consider Apple a Buy First stock — it will appear that way on our scorecard as soon as we make a purchase.

- Yes, Apple is one of the most widely held stocks in the market. That doesn't matter; we believe the business will grow enough to attract more investors.
- Yes, Apple is the most valuable publicly traded company on the planet. This shouldn't deter us; while size can be a challenge, it can also lead to a compounding advantage.
- Yes, we know shares are at new highs. That also shouldn't matter. The stock's valuation multiple to cash flow is lower today than at almost any other time in the last 10 years.
- Yes, we know today's valuation is only attractive if Apple *maintains* and then grows its profits. We believe it will.

The Business

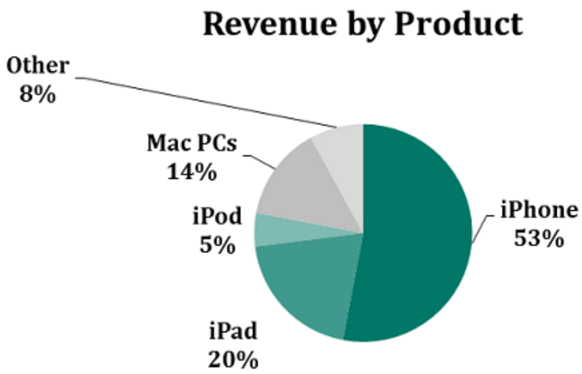
The mobile computing industry is still in its infancy, but many investors doubt that Apple can ride the crest of its own giant wave much longer. We differ. We believe a growing reliance on Apple's operating system, iOS, will lock in customers for years to come. New customers are lured in daily, and Apple is obsessed with staying at least two years ahead of its competitors. In addition, Apple's market is growing before our eyes.

With 62 million Apple iOS units sold last quarter, consumers are embracing Apple in record numbers. But the *newest* massive group turning to Apple is — drum roll, please — business customers. Nearly all Fortune 500 companies now support the iPhone on their networks, and according to Apple CFO Peter Oppenheimer, "Nearly all of the top companies within major Fortune 500 markets" are starting to use the iPad after test programs in 2011. From pharmaceutical sales reps to airline pilots, from retailers to real estate agents, from waiters to doctors, the iPad is improving daily business (and education and government). One reason: Purchase managers believe Apple's operating system is more secure than **Google**'s Android. Connect the dots, and if Apple wins the corporate tablet war, it's likely to sell many more Mac computers.

According to Bloomberg, Apple sold just 3.8 million Macs to corporations last year, accounting for a mere 3% of the business market. In the U.S. overall, Apple only has 10.9% PC market share, and worldwide, that number is in the single digits. The PC industry is expected to ship 371 million units this year, a fraction of them made by Apple.

But Apple CEO Tim Cook believes that more tablets will eventually be sold every year than PCs. In addition, if you count tablets as part of the PC market, then research firm Canalys predicts that Apple will soon be the world's largest PC vendor. In other words, Apple may finally lead the PC market by reinventing it.

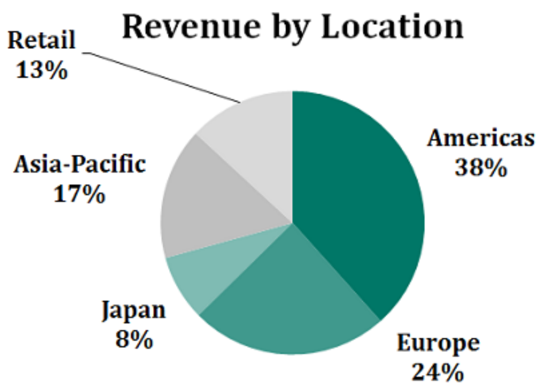
For today, though, Apple remains an iPhone story. That tiny rectangle of magic accounted for 53% of revenue last quarter, with a record 37 million units sold, compared with 15 million iPads, 15 million iPods, and 5.2 million Mac computers.



Q1 2012 ended Dec. 31, 2011. “Other” is music, hardware, and software, with music accounting for roughly half.

Despite the iPhone’s success since its launch in 2007, Strategy Analytics reports that it only holds about 6% of the worldwide mobile phone market. In smartphones, Apple’s market share was up 128% last year, landing it in the top spot with 23.9%. But more than 60% of mobile phone owners have not yet upgraded to smartphones, so the market will grow much larger. Apple increased the number of retail stores the iPhone can be bought by 35% last quarter, to 130,000 locations, but there’s plenty of expansion ahead, including in China, Brazil, Russia, and India. Apple phones aren’t yet offered on some of the largest phone carriers in the world, and CEO Tim Cook says he’d like to get into “all of them over time.”

There’s a good reason for that. Once customers buy an iPhone, Apple sees much higher odds that they’ll later buy an iPad, and finally a Mac computer. So, as with the iPod before it, every iPhone sold seeds the market for additional Apple sales. If this trend holds true in the $3.8 trillion business market, then the rapid proliferation of iPhones and iPads in the corporate world, not to mention with consumers, may fuel Apple’s business for years.



Q1 2012 ended Dec. 31, 2011. Apple reports 13% of revenue as “Retail” — that is, from various retail locations. Most of that additional 13% is from the Americas and Europe.

Meanwhile, the world is Apple’s oyster. The planet’s most populous region, Asia-Pacific, represented just 17% of revenue last quarter, so Apple is merely scratching the surface there. Overall, as large as Apple is today, its existing products (along with regular refreshes) should make the company much bigger three and five years from now. As *Pro* senior analyst Nick Crow put it, “A large market value is not an impediment to growing your sales.” But growth *will* require continued execution in innovation, design, manufacturing, and marketing.

Financials

Apple has grown earnings so rapidly that investors are actually paying a lower multiple to free cash flow now than they had to anytime the last 10 years.. The company is valued at 11.4 times $41 billion in trailing free cash flow. Include Apple’s $97.6 billion in cash and investments, and the stock fetches just 9.1 times free cash flow. Both multiples are below the S&P 500’s average in the mid-teens, and the S&P is growing earnings at less than one-twentieth the rate of Apple. (The S&P saw 5.5% average earnings growth this quarter, compared with Apple’s 115% — and Apple drove much of the S&P 500’s gains.)

Speaking of growth, analysts on average expect Apple to report an earnings-per-share jump of 54% for the current fiscal year (which will end Sept. 30) and just 10.4% in fiscal 2013. Wall Street has been making this mistake for years, assuming Apple’s growth will suddenly drop off. It’s more likely that Apple will surprise the Street again in 2013 with at least 20% growth — and much more if a new product (rumors suggest a potential TV) goes well.

Apple Results	TTM*	2011 (ended Sept.)	2010	2009	2008
Revenue	$127,841	$108,249	$65,225	$42,905	$37,491
Operating Cash Flow	$45,310	$37,529	$18,595	$10,159	$9,596
Free Cash Flow	$40,943	$33,269	$16,590	$9,015	$8,505
Weighted Diluted Shares Outstanding	938.7	936.6	924.7	907.0	902.1

*TTM (trailing 12 months) to Dec. 31, 2011. Every other year is the year ended late September. All amounts in millions. Source: S&P Capital IQ.

Apple’s diluted share count is only up 4% since the end of fiscal 2008, a reasonable climb given how much value the company has created. Cash flow is up fourfold over the same period, leading to Apple’s record balance sheet of nearly $100 billion in cash and investments (or $104 in cash per share). That giant cash hoard means Apple is widely expected to start a dividend or issue a special cash distribution, perhaps soon. A dividend should create more demand for shares, and invite a giant new class of investors, including certain mutual funds that can only invest in dividend-paying stocks.

On conservative growth assumptions, we calculate a fair value about 27% higher, at $635.

What Would Make Us Sell

Apple employs 60,400 people, including design genius Jonathan Ive, but for years Steve Jobs made the final decision on every product. Without Jobs, will Apple make mistakes or compromise in a way Jobs never would have allowed? Jobs insisted that even the insides and backsides of products looked appealing. Few personalities can hold a company to such high standards, because the desire to cut corners and save money permeates all corporations. Hopefully Apple will keep asking itself, “What would Steve do?” when it comes to such matters.

More standard risks include rising costs, falling margins, supply shortages, production problems, quality issues, failed new products (without Jobs to debut them, will they be as exciting?), or customers tiring of paying an “Apple premium” as competitors offer comparable products at lower prices. Apple needs to maintain a technological *and* design edge to keep its products on the most-desired list. If Apple starts to lose any of its edges — including the lucrative subsidies phone carriers pay to offer Apple phones — we will consider selling.

Pro’s Bottom Line

Many people believe Apple can’t get much larger. We believe it can and will. To discuss the company, head to *Pro*’s Apple board.

Alternative Trades

- If $50,000 is around a 4% allocation for you:
  - You can sell to open any put option you like to earn income or potentially buy shares lower. The April $500 put lately pays around $24 (4.8% in a few months). If you are able to write puts, you can also consider a synthetic long instead, selling puts to buy calls with a strike price near the current share price.
- If you want to invest less money and profit smartly if Apple rises:
  - Set up a January 2014 bull call spread. First idea: Buy to open Jan. 2014 $500 calls and sell to open an equal number of Jan. 2014 $600 calls, for a net debit of about $39 ($3,900 per spread). You’ll earn 156% on your investment ($61 per share) if Apple ends expiration above $600 (up 19%), but you’ll lose all $39 if Apple ends below $500. Your break-even is $539.
  - You can also set up spreads at higher or lower strikes, for higher or lower risk, depending on what makes you comfortable. For example, idea two: Buy to open Jan. 2014 $400 calls and sell to open an equal number of Jan. 2014 $500 calls for a net debit of approximately $54 per spread, leaving you a potential profit of $46 each (an 85% return) even if Apple just stays at its current price, modestly above $500.

The Earnings Circus

Published Feb 13, 2012 at 12:00AM

Fellow Fools,

Presidential Postponement

The market is closed Feb. 20 for Presidents' Day, so your next Monday Memo will hit your inbox Tuesday, Feb. 21, at 4 p.m.!

Pro Trade Roundup

- **CME Group**: Bought 200 shares at an average price of $286.55.

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Intel**: "Sell to open" July $24 puts at $0.85 or higher, for up to 6.7% in shares if you lack this allocation. Sell one put for every 100 shares you could buy.
- **Pacer International**: Sell to open September 2012 $5 puts for $0.55 or higher, for up to 3% in shares.

Questions on these? Visit our "Catch-Up Trades" discussion board .

The funny thing about quarterly earnings is that they happen regularly — my experience points to four times a year — and yet they're like a circus every time. There's much hoopla around earnings on Wall Street, where trillions are made and lost based on $0.01 beats or misses and analysts on conference calls study managers' voice inflections for clues. Those managers often take great pains to explain which numbers are worth focusing on (the good ones) and which should be ignored (the bad ones).

But while Jeff has a fondness for the bearded lady, Nick refuses to trapeze without his blindfold, and I can't stop laughing at the clown car, your *Pro* team tries its best to avoid the earnings circus, because quarterly earnings don't matter. Here's why:

Pondering the Earth's Orbit

We all learned in grade school that it takes the Earth 365 days to orbit the sun (a 940-million-kilometer journey). The Mayans, popular these days for their calendar, used both 260-day cycles (tied to the length of a pregnancy) and 365-day ones. But what do either of these measurement periods have to do with the progress of a business? Should we, as business owners and mature investors, give a hoot about the relationship between arbitrary measurement periods and the numbers reported over those fragments of time? Nope. Companies will almost certainly manage to develop their businesses, delight their customers, and reinvest their profit independent of planetary travel and human gestation periods.

Getting All Finance-y

It is widely accepted that the value of a company is attributable to the discounted present value of its future cash flow. In other words, a company's value today is a function of how much leftover cash it can generate from now until the end of time (speaking of which, we hope the Mayans were wrong about Dec. 21, 2012). That's why you hear us trumpeting businesses that generate circus tents full of cash, and why we obsess over companies that have the competitive advantages to protect their cash-printing operations. If we're focused on the excess cash the company can generate over the next 50, 100, or 200 years (or more), what affect will a single quarter have? Mathematically, and fundamentally, almost none.

Have You Ever Budgeted?

Read up on personal finance and you'll hear one tip more than any other: "Make a budget." It's good advice, but it sure does oversimplify things. For example, anyone who's ever made a budget knows month-to-month variations are the norm, not the exception. Quite often, your budget can't accurately predict when fantastic bargain opportunities will arise, or when that hot water heater will go kaput. The result is that you'll "miss your number," even though you may have done so with good reason (to buy a stock you know is cheap, or to keep your home warm). It's close to impossible to predict opportunities and problems in a household budget — we shouldn't expect it to be any easier for the businesses we own.

What *Does* Matter?

Let me be clear: We care very much about the progress of our businesses. It's the specific numbers reported over entirely arbitrary measurement periods that don't matter. If we've done our jobs — if we've found businesses with wonderful economics and competitive advantages — the numbers will take care of themselves. When we review the quarterly earnings calls and financial data for *Pro* companies, here are the things we focus on instead:

- **Assessing long-term market trends and business progress.** We focus on the fundamental forces of supply and demand for a company's product or service and the key drivers of its business strategy. These usually change gradually, and we like to monitor that evolution and how our businesses position themselves with respect to those trends.
- **Why were certain business decisions made?** As much as possible, we get comfortable with process before we obsess about outcomes. In the long run, we believe a management team with sound processes that lead to intelligent decision making will yield great long-term results, even if the short term is bumpy. As long as management appears to have a grasp on its business, competitors, and market, we'll let out slack on our leash.
- **Where is the company spending its time and energy?** Our recommendations spell out in great detail the reasons we like our businesses. Naturally, we like to see management allocating its scarce resources to protect, develop, and enhance those assets. To determine this, we typically assess the level of strategic defense and offense the management team appears to be playing.

Of course, we don't entirely ignore short-term results. But keeping our long-term perspective helps us digest those interim reports and make educated portfolio decisions in response. Keep an eye on the discussion boards for our quarterly coverage, but be sure to read those posts through the lenses of a long-term business owner.

Pro's February 2012 Ketchup Report

Published Feb 10, 2012 at 12:00AM

Dear *Pro* Member:

Download!

Click here to download the
PDF.

Please read this report with your full attention. We'll keep to the point, promise! This Foolishly named Ketchup Report is meant to catch you up to all the *Pro* stocks that are currently recommended as Buys or Buy Firsts. Following our allocations to these stocks will get you well on your way to mirroring the *Pro* portfolio.

If you've already bought our Buy Firsts and the first set of Buy stocks we sent you, then this report fills out the rest of our Buys. If you haven't started at all, this report is the only guide you need today. That said, if you haven't invested since you joined us, we recommend you space out your buys from this list over the coming few weeks. Buy five at a time or so, as we've suggested over the past two weeks. (And if you'd like guidance about using IRAs, not using options, or other ways to make *Pro* fit you, check out our aptly titled article, "Making *Pro* Fit You.")

Before we get to the list of recommendations, let's cover some vitally important ground.

Terms to Know

- **Buy First:** These are the investments you should make first, setting a foundation for your *Pro* portfolio. In our opinion, these stocks usually have the best risk-to-reward profile, offering healthy upside and low downside.
- **Buy:** We like these as much as our Buy First stocks over the long haul, but they may be more volatile, and they may offer more downside risk while we wait for our thesis to play out.
- **Hold:** We currently have 10 stocks on hold, and we won't cover them in this report. They're always listed on the Recommendations page. We don't suggest buying our stocks on hold today, but if you already own them, hold them. In every Monday Memo, we'll share "catch-up" trades to help you get into stocks on hold at lower prices.

The Recommendations page is your "King of Guidance." That page is always kept current, so if something is listed there as a Buy First or Buy, we believe it can be bought today, period. The moment we no longer believe that, we'll move it to Hold on that page and announce that change on the *Pro* home page, as well as in the following Monday Memo.

You'll also need to know these terms:

- **Buy Around:** This is the ideal price around (or below) which you'll buy our recommendations, give or take 5% or even 10%. Investing is not a precise science; if we like a company enough to buy it, a 5% price difference is not going to change the outcome meaningfully. We provide this guidance to give you an initial guidepost, but if a stock is listed as a Buy or Buy First on the Recommendations page, that guidance applies regardless of the Buy Around price.
- **Fair Value:** This is the fair price for the stock — what we believe it's worth today. It is not the automatic sell price. In fact, a stock that's reached its fair value should proceed to achieve our desired rate of return (typically 10% or higher annualized). We only sell at fair value if we want a margin of safety (occasionally, there are stocks we only want to own below fair value) or we see something at a discount we like better.
- **Allocation:** We recommend each position as a percentage of the total amount you're investing in *Pro* stocks (exclude your fixed-income investments). If we say to buy 4.5% in something, then invest $4,500 in that stock for every $100,000 in your *Pro* stock portfolio. There is wiggle room here, and you should allocate in a way that makes you comfortable. Keep in mind, though, that our future guidance will assume you're matching our current allocation.

And Now, the List

Below are the positions we recommend to begin your *Pro* investment portfolio. All together, the following 14 Buys and Buy Firsts will account for about 53% of your funds — 52.8%, to be precise. That said, you needn't be precise! If you want our future allocation guidance to be relevant to your position, just aim to be close.

Buy First

- **BMC Software**, 4.5%
- **Medtronic**, 5.4%
- **Oracle**, 5%
- **Pebblebrook Hotel Trust**, 4%

Buy

- **3D Systems**, 1.7%
- **Broadridge Financial Solutions**, 3.6%
- **CME Group**, 3.5%
- **Covanta Holdings**, 3%
- **GrafTech International**, 4.3%
- **MasterCard**, 3.4%
- **OpenText**, 3%
- **Rockwood Holdings**, 5.4%
- **Wells Fargo**, 2.5% with covered strangle options (or just buy the stock if you're not using options)
- **WisdomTree Emerging Markets SmallCap Dividend Fund**, 2.5%

Short

For those who wish to short and hedge, we have two current positions:

- Short ("sell to short" or "sell to open") **CurrencyShares Euro Trust**, 3%
- Short **S&P 500 Depository Receipts** at a level that hedges 20% of the funds you have invested in long stocks. (So, if you have invested $100,000 in long stocks, short $20,000 in SPY to hedge.)

The S&P 500 ETF is our largest hedge. We may be closing it within a month or so as better opportunities present themselves, but you can still short the index if you want to hedge up to 20% of your long stock exposure over the next several weeks. You needn't short to participate successfully in *Pro*'s long-term performance.

Summary

After you've added these 16 positions in your portfolio over the coming days and weeks, we'll work to get our 10 stocks on Hold into your portfolio, too, at better prices. To that end, we'll feature Catch-Up Trades in each Monday Memo, and we will of course send official trades if prices dictate.

Remember that investing is not a sprint. It's a marathon. So don't sweat this Ketchup Report. Take your time. Ask questions on the Getting Started discussion board. Buy and short only when you're ready for and comfortable with the transactions you're making, and go at your own pace. We're here to help each step of the way.

Finally, to get our most timely Buy First, Buy, or Hold recommendation on any position in this report after today, just click on the always current Recommendations tab.

Foolishly,

Jeff Fischer, advisor (TMFFischer)

More on Our Buy Firsts, Buys, and Shorts

Listed in alphabetical order.

3D Systems (DDD)

- **Industry:** 3-D printers
- **Allocation:** Invest 1.7% of your funds ($1,700 for every $100,000 you manage)
- **Full Report**

Summary:3D Systems is working to change the world. Selling printers that actually print perfectly usable 3-D objects — from replacement kidneys to car dashboards — the company could both revolutionize and personalize manufacturing. Its latest award-winning printer, Cubify, is for retail customers who wish to print jewelry (or shoes, or toys … you name it) right at home based on designs they can find online or create themselves. The stock may be a growth story, but 3D Systems is already making a nice profit selling its machines and printing materials. We have a small stake now and may look to add more after seeing earnings in mid-February.

BMC Software (BMC)

- **Industry:** Business software
- **Allocation:** Invest 4.5% of your funds ($4,500 in BMC for every $100,000 you manage)
- **Full Reports:**

- Buy
- Buy More

Summary: Selling to 81% of the Fortune 500 companies in the world, **BMC Software** provides software that lets corporate mainframe computers, computing clouds, databases, applications, and servers all work smoothly and efficiently together. Despite recent sales weakness, BMC expects earnings per share to grow about 9% in the year ending in March and operating cash flow to increase about 8%, to $825 million. We see business improving and the stock returning to the $50s in time.

Broadridge Financial Solutions (BR)

- **Industry:** Data processing and outsourced services
- **Allocation:** Invest 3.6% of your funds ($3,600 for every $100,000 you manage)
- **Full Report**

Summary: You may have never heard of it, but **Broadridge Financial Solutions** is indispensable to the financial industry. It has a near-monopoly on the equity proxy distribution and vote tabulation business (which, by law, occurs every year), and it's happy to take on the kind of outsourced back-office work that financial firms deem a technologically cumbersome waste of time. Sure, it's boring, but it's also a highly stable, super-sticky, and very profitable business.

CME Group (CME)

- **Industry:** Financial exchange and clearing
- **Allocation:** Invest 3.5% of your funds ($3,500 in CME for every $100,000 you manage)
- **Full Report**

Summary: As the largest public exchange for trading and clearing futures, **CME Group** enjoys high margins and growing profits as futures volume grows. Manufacturers, governments, producers, and traders use futures to hedge currencies, energy prices, metals and commodities, equities and interest rates. The larger the market, the more liquid it is, helping provide giant CME with a competitive moat that also draws in new customers.

Covanta Holdings (CVA)

- **Industry:** Waste management, electricity generation
- **Allocation:** Invest 3% of your funds ($3,000 for every $100,000 you manage)
- **Full Report**

Summary: With landfill space limited, trash generation limitless, and electricity demand constant, **Covanta Holdings** gets a green ribbon for how it turns (burns) waste into energy. Covanta, which gets paid to deal with its primary resource (trash), controls roughly two-thirds of the domestic energy-from-waste industry via its 40-plus plants which can process up to 2,500 tons of refuse per day and turn it into power that feeds homes and businesses. The company won't grow to the moon, but its revenue is stable thanks to very long-term contracts and equally sustained demand for energy. Covanta is a cash cow that should serve as a steady performer, paying growing amounts back to shareholders.

CurrencyShares Euro Trust (FXE) (Short)

- **Vehicle:** This ETF only holds physical euro
- **Allocation:** Short 3% of your funds ($3,000 for every $100,000 you manage)
- **Full Report**
- **How to Short:** We suggest either a synthetic short using options or a direct short if your broker has shares. We are short directly.

Summary: The euro is under siege, and the bailout packages that Greece or other eurozone countries receive shouldn't matter in the long run. More important, many countries in the eurozone are not competitive economically. And because it's built on a fractured foundation, we believe the euro should trade cheaper to the dollar than it does. With this short of the **CurrencyShares Euro Trust** ETF, we'll profit if the euro declines in value.

GrafTech International (GTI)

- **Industry:** Carbon and graphite products, focused on the steel industry
- **Allocation:** Invest 4.3% of your funds ($4,300 for every $100,000 you manage)
- **Full Reports:**
  - Buy
  - Buy More

Summary: GrafTech International is the low-cost producer of high-quality graphite electrodes, which steelmakers use to melt and form the steel they use to build our world. Demand for steel continues to be driven by growing infrastructure in emerging markets and a rising global middle class, and as more steely things (like cars, planes, and buildings) are produced, we believe steel producers will be popping graphite electrodes like Tic-Tacs. GrafTech is well-positioned to feed their need.

MasterCard (MA)

- **Industry:** Consumer financial services
- **Allocation:** Invest 3.4% of your funds ($3,400 for every $100,000 you manage)
- **Full Report**

Summary: The second-largest payments processor in the world, **MasterCard** is enjoying the ride as payment cards steal market share from cash. The market recognizes the potential of the highly profitable business model and respects the company's quickly growing revenue, and thus, shares aren't cheap. Fortunately, the stock still trades below our $425 estimate of its fair price. Resist the temptation to anchor yourself to *Pro*'s lower entry price entry. Short-term price movements don't matter; just ask yourself where you see MasterCard five years from now.

Medtronic (MDT)

- **Industry:** Medical devices
- **Allocation:** Invest 5.4% of your funds ($5,400 for every $100,000 you manage)
- **Full Reports**
  - Buy
  - Buy More

Summary: With more than 40,000 employees and $16 billion in annual sales, **Medtronic** is a global leader in the medical technology field. A few recent small missteps, tough competition, and uncertainty surrounding future regulation have left investors questioning the company's future growth. But at this price — less than 11 times coming earnings? C'mon. The company's growth is powered by its massive research and development budget, its impressive new product pipeline, and its excellent footprint in emerging markets. With the distribution and scale to win business, we think Medtronic is well positioned to grow.

OpenText (OTEX)

- **Industry:** Business software
- **Allocation:** Invest 3% of your funds ($3,000 for every $100,000 you manage)
- **Full Report**

Summary: OpenText sells software that lets businesses manage growing reams of online data, communicate better, stay in bounds in regards to regulatory needs, and improve office efficiencies. By helping companies save money and perform better, OpenText has a strong selling point even during tight economic times. And it is No. 2 in its business, barely trailing **IBM**.

Oracle (ORCL)

- **Industry:** Business software
- **Allocation:** Invest 5% of your funds ($5,000 for every $100,000 you manage)
- **Full Reports:**
  - Buy
  - Buy More
  - Buy Even More

Summary: We recommend two large software providers among our Buy First stocks with good reason: They're inexpensive and they're strong businesses, with high recurring revenue, low costs, and gushing free cash flow. **Oracle** is the granddaddy of business software, and yet it's consistently among the fastest-growing software giants, too. Last quarter, some contracts didn't close as hoped, providing investors a lower buy price. We'll take it, and we suggest you do, too.

Pebblebrook Hotel Trust (PEB)

- **Industry:** Hotel ownership
- **Allocation:** Invest 4% of your funds ($4,000 for every $100,000 you manage)
- **Full Reports:**
  - Buy
  - Buy More
  - Buy Even More

Summary: CEO Jon Bortz knows hotels, so when he saw the fire sales taking place during the financial crisis, he came out of retirement to start **Pebblebrook Hotel Trust**. The company has since busied itself buying up cheap, marquee, luxury hotels in foreclosure and giving them new life. As Pebblebrook finishes renovating and revamping all the hotels it has purchased over the past 18 months, those hotels should become strongly profitable (as past ones have), and these profits should materialize into a growing dividend for shareholders. At the same time, Bortz continues to scout for new opportunities to acquire upscale hotels at temporarily cheap prices.

Rockwood Holdings (ROC)

- **Industry:** Specialty chemicals, TiO2, lithium
- **Allocation:** Invest up to 5.4% of your funds ($5,400 for every $100,000 you manage). Start smaller if a more volatile stock concerns you.
- **Full Report**

Summary: The disc brakes in your car, the airplanes you fly in, the paint on your home, the fibers in your clothing, the batteries in your electronics, and the pharmaceuticals in your cabinet — even the packaging around your groceries — all may contain **Rockwood Holdings**' specialty chemicals and engineered materials. Rockwood Holdings runs several divisions that all lead in their respective niches, from advanced ceramics used for hip replacements to titanium dioxide for paints and coatings. Rockwood is also one of the world's largest producers of lithium for the quickly growing lithium battery market. This is a volatile stock, but we're comfortable with its prospects.

SPDR S&P 500 (SPY) (Short)

- **Vehicle:** This massive ETF tracks the S&P 500.
- **Allocation:** Short enough to hedge 20% of the funds you have invested in stocks ($20,000 in a SPY short for every $100,000 you have invested in stocks).
- **Full Report**

Summary: This is a simple hedge, and you can employ it or not depending on your preferences and your individual situation. We have hedged 20% of our long stocks with this short of the **SPDR S&P 500** index. We will be moving out of this short this year, perhaps very soon, but it remains a worthwhile hedge if you're concerned about the market in the short term.

Wells Fargo & Company (WFC) (With a Covered Strangle)

- **Industry:** Diversified financial company
- **Allocation:** Invest 2.5% of your funds ($2,500 in WFC for every $100,000 you manage). That's half of a potential 5% allocation.
- **Full Reports:**
  - Buy
  - Write Covered Strangle

Summary: Having just completed the largest merger in banking history, **Wells Fargo** now boasts 6,239 retail banking locations and the highest customer-service rating in the industry. We expect management to continue to "out-local the nationals and out-national the locals" by providing the breadth of service expected of a major bank while building the relationship depth expected from a community bank. We predict the stock will stay in a wide range as the financial industry continues to recover over the next few years; while that happens, we own half a full potential allocation in Wells and have set up an options position on it — writing a strangle — in hopes of regular income with stock upside. So:

- Buy 2.5% of a potential 5% allocation in WFC stock around $30ish, in 100-share round lots.
- Use a "strangle order" to "sell to open" April 2012 $27 puts and April 2012 $31 calls, one of each option for every 100 shares you own, lately for a combined credit of around $1.68 per share.

This position will be profitable if the stock remains at or below $32.68. It gives us about 5.5% in a potential income yield in just over two months, and it provides 5.5% in downside protection, too. We'll take that!

The strangle above is different from our earlier official recommendation (we currently have lower strike prices, because we set ours up earlier), but in April we'll "roll" to a new strangle and everyone will be on the same page. This is the best trade for today.

If you're not using options, you can start by just buying 2.5% in the stock.

WisdomTree Emerging Markets SmallCap Dividend Fund (DGS)

- **Industry:** Diversified international ETF (industrials, financials, consumer discretionary)
- **Allocation:** Invest 2.5% of your funds ($2,500 for every $100,000 you manage)
- **Full Report**

Summary: We believe emerging markets have growth potential that makes their extra risk acceptable. To pursue this belief while guarding carefully against that risk, with this investment we've chosen to buy a basket of growing emerging-market companies that are financially sound enough to promise a healthy dividend. **The WisdomTree Emerging Markets SmallCap Dividend Fund** offers us not just a yield but also ownership in a few hundred small, growing, and promising companies in countries including South Korea, Malaysia, India, and Brazil. Given all that, it's easy to see why we like this ETF for the long haul. It's also a great way to diversify. We may add to our position in the future, but right now buying 2.5% will match us.

The Final Word

Build these 16 positions into your Pro portfolio to start to match us (or use the positions you like best and that mesh well with your other holdings), and you'll be well on your way to investing with Pro. Watch each Monday Memo for Catch-Up Trades on stocks on Hold, and watch your inbox for future trades on new stocks and options. We're here to answer your questions. For any company-specific question, please enter its ticker on the Pro site for our reports and to visit its discussion board. We're here to keep you investing Foolishly for regular income and long-term gains. Thank you for being a Pro member!

— The *Pro* Team (Jeff Fischer, Nick Crow, Bryan Hinmon, CFA)

Reduce Written Calls on AmTrust; Let Some Shares Be Sold

Published Feb 9, 2012 at 12:00AM

- **What We're Doing**: We're uncapping the upside on the bulk of our **AmTrust Financial Services** (NASDAQ: AFSI) shares by buying to close some of our covered calls.
- **What We're Thinking**: We don't want to sell all of our shares, but if we don't take action, we'll be forced to at March expiration if the stock remains higher than $25.
- **What We're Expecting**: AmTrust will continue to be a solid performer and will grow to become an even larger part of the *Pro* portfolio.

Trade Essentials

- **Action**: "Buy to close" a portion of your AmTrust Financial Services March 2012 $25 call options. Do nothing with your owned March 2012 $20 put options.
- **Allocation**: After these options expire March 17, we want our allocation to AmTrust to be 5% (that's $5,000 for every $100,000 you manage). You need to buy back the number of contracts that allows you to maintain a 5% position in your portfolio. For *Pro*, that means we are buying to close 27 of our 39 call options. For the math behind that number, read on.
- **Limit Guidance**: These options have a wide bid/ask spread; aim to pay somewhere in the middle of that range. The current asking price is $1.75.

What's New?

- **Last trade:** In October 2011, we set up a protective collar on all of our AmTrust shares.
- **Change:** Shares are up about 20% since then.

Back in October, we believed the debt situation in Europe was unsettling enough that investors might "throw out all stocks in the financial sector — babies and bathwater alike." To guard against the effects of such a crisis on **AmTrust Financial Services**, our largest position at the time, we set up an insurance policy in the form of a protective collar.

The cost of that policy wasn't cheap (buying put options outright never is), so we defrayed the cost by capping the upside on our shares at 14% via written $25 call options. At the time, we couldn't identify a catalyst that would send AmTrust shares above $25. So naturally, shares have marched steadily north of $26 for no apparent reason (besides, of course, the fact that AmTrust is a solid, quickly growing business), and they remain in that general range today.

If we don't take any action before our protective collar expires March 17 and shares remain above $25 at that time, we'll be forced to sell our entire position in AmTrust. We don't want to do that. However, we are content to trim our position from 7.3% to 5% for three reasons:

1. We still can't figure out the precise reason for the company's $175 million debt issuance back in December.
2. Our portfolio's exposure to the financial sector has grown.
3. We believe AmTrust will be a long-term winner, but sometimes we prefer a bird in the hand (taking some profits) to two in the bush.

As defensive investors, and in light of these factors, it seems prudent to trim our AmTrust position to 5% (big, and still a top five holding) from 7.3% (super-big).

How to Follow Along

We are attempting to do two things here:

1. Repurchase most of our March 2012 $25 call options, freeing us from the obligation to sell our shares at $25 and allowing us to regain control of the potential upside in a 5% position in AmTrust, and
2. Acknowledge willingness to let some of our shares go (the amount exceeding a 5% position) in March if they are above $25.

For *Pro*, that means we want to buy to close 27 of our 39 March 2012 $25 calls. (The remaining 12 calls represent 1,200 shares subject to a likely sale at $25 in March.) Your thinking should go something like this:

	Ask Yourself ...	If Yes ...	If No ...
(1)	Do I have AFSI March 2012 calls?	Continue to (2)	Relax, smile, and count all the money you're making in AFSI
(2)	Does my AFSI position exceed a 5% allocation?	Continue to (3)	Buy to close ALL of your March 2012 $25 calls
(3)	Determine what a 5% allocation is for your portfolio, then buy to close the number of March 2012 calls that corresponds to that position. Leave your remaining March 2012 $25 calls alone.	See "The Math" below.	

The Math

Here are the calculations:

a. Portfolio Value x .05 = Dollar value of AFSI you want to hold after you complete this trade
b. (a) / $26.25 = Number of AFSI shares that dollar value represents
c. Round (b) up or down to even blocks of 100 and buy to close that number of contracts

The Foolish Bottom Line

Unfortunately, we'll likely have to pay more to close these calls than we were paid to open the position. However, we've still made money on the position overall since we opened this option trade, and this booked loss pales in comparison to the upside we believe long-term shareholders will receive. Furthermore, Europe is still enough of a concern that we want our disaster insurance (the March 2012 $20 puts) in place in case something very bad happens (and we wouldn't get much from selling them now, anyway). But with the company releasing earnings Feb. 15, and given our general long-term bullishness on the shares, we want to remove the calls covering our core 5% position in AmTrust.

We know this one could be confusing, so come on over to our AmTrust discussion board for guidance and to further discuss our thinking.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Getting Started With Options: The Essential First Steps

Published Feb 8, 2012 at 12:00AM

Fellow Fools,

Download!

Click here to download the PDF.

Motley Fool *Pro* uses stocks for the long term and options for the short term. Options are a perfect, logical complement to a long-term stock portfolio, providing near-term income, hedging, insurance, and leverage, while also allowing you better buy and sell prices on your stocks. But as versatile as options are, you can start to use them with just one simple strategy; later, if you desire, you can add more to your arsenal. In other words, one option strategy is enough to make a difference in your financial future. In this document, we'll show you how. Fool on!

— Jeff Fischer, *Pro* Advisor

Selling Put Options

The steadiest, simplest income and stock strategy is to write (or “sell to open”) put options. This is how I started using options more than 10 years ago, and it remains one of the strategies I use most. When you sell a put option, you are agreeing to buy a stock cheaper if it declines to your buy price, or lower, by the expiration of your option. You’re paid for the option you sell, and no matter what, you keep that money. Why are you paid to sell these options? Because you’re selling someone an insurance policy. By selling a put option, you’re telling someone, “If your stock falls below $25 by July (for example), I’ll buy it from you at $25.” They pay you for that insurance.

Options and Strategies

An option gives its buyer the right to buy or sell at a stock at a set price by a set expiration date. The option writer (or seller) is obligated to buy or sell the stock at the option’s strike price if the stock reaches that price at expiration, and is paid for that potential obligation. Each option represents 100 shares of a stock. You write (“sell to open”) puts to potentially buy a stock cheaper. You write (“sell to open”) covered calls to potentially sell a stock you own higher. Both are common income strategies. See more on writing puts and writing covered calls in our guides.

Let’s use a real-life *Pro* example. Here’s a trade you can consider right now.

Sell to Open Puts on Intel

Computer chip giant **Intel** is the second-largest position in the *Pro* portfolio, at 6.8%. Even as the company grows its business around the world, shares are affordable at 11 times earnings and boast a 3.1% yield. The stock has run up recently to near $27, but with any luck, it will dip sometime this year, allowing new buyers a better entry price. You could wait and hope, or you could write put options today, get paid while you wait, and set up a lower potential buy price. Today, you could:

- Sell to open July 2012 $25 puts. Sell one put for every $2,500 in Intel you can afford to potentially buy (each option represents 100 shares of a stock).
- Target an allocation that works for you. Our Intel allocation is 6.8%. You can target this large of a position or less. You would sell to open one put (potentially $2,500 worth of stock) for every $37,000 you manage.
- Collect $1.05 per share. Each July 2012 $25 put recently pays you $1.05 per contract ($105).

So you're agreeing to buy Intel at $25 if the stock falls to that price or lower by the time your options expire on July 21.
(Options are rarely exercised before expiration, but they can be.) For this agreement, you're being paid $1.05 per share. On your potential $25 purchase price, that equates to a 4.2% yield ($1.05/$25) in about five months. That's a healthy yield for this potential obligation. Here are the possible outcomes:

- Intel's stock is higher than $25 at expiration: Your put options expire. You keep the $1.05 per share, earning a 4.2% yield in just more than five months. It's income! You have no further obligation and can write new puts.
- Intel's stock is at $25 or lower at expiration: You can buy to close your puts and end your obligation before expiration if you like, earning a profit if you can buy them back for less than you were paid. If you keep them open, you're obligated to buy Intel at $25. But you still keep the $1.05 you were paid, so your start price is $23.95; that's 10% below today's price of $26.66. Nice!

In the simplest terms, selling puts is an income strategy that lets you buy stocks cheaper if they decline. When they don't decline, it results in income again and again. Income-oriented investors look to write puts each month on safe,
strong companies. We will often recommend this strategy in *Pro*.

The Flipside: Writing Covered Calls

Writing covered calls is a similar income strategy to writing puts. The key difference here is that with covered calls, you already own the stock (and you collect its dividend payments). In this case, let's say you own shares of Intel, trading at $26.66 today. If you want to generate extra income on those shares, you can "sell to open" July $28 call options on Intel — selling one call for every 100 shares you already own. Like a written put, this option pays you income. But in this case, you're agreeing to sell your existing shares if they end at or above your strike price.

Recently, the July 2012 $28 covered calls on Intel would pay you $0.91 per share ($91 per option contract), for a 3.4% yield on the current share price in more than five months. If the stock stays below $28 by expiration, you keep that income and have no obligation. You can repeat the trade for more income if you desire. If shares of Intel rise above $28 by expiration and you don't buy to close your covered calls, your shares are sold automatically at $28. You still keep the $0.91 you were paid, so your net sell price is $28.91, for an 8.4% gain plus a dividend payment. Covered calls are a popular income strategy on stable stocks, including ones with strong dividends.

To Get Started

Every week in the *Pro* Monday Memo, we'll outline "Catch-Up Trades" you can use to potentially buy into *Pro* positions at cheaper prices by selling put options. To follow along, you need to get your broker's approval to use options. Apply for level 2 or 3 options permission at your broker. It's an easy process, but it can take several days to receive approval. Then ask any questions on the Catch-Up Trades discussion board.

More Options Resources

Of course, *Pro*'s got you covered! You can learn from all of our options guides here. We use many strategies, and our guides explain each in detail. (For example, combining put writing and covered calls at the same time results in a covered strangle, a double-income position on a stock you expect to stay within a wide price range.) And because you receive membership to Motley Fool Options free with your *Pro* membership, you can also partake in our sister site's Options U. program. Finally, you're always welcome to ask any options questions on our All About Options discussion board.

Options are a powerful, logical and sensible tool, and *Pro* is here to make sure they become a highly profitable part of your investing life, making you a better investor in the process. Fool on!

Buy CME Group

Published Feb 7, 2012 at 12:00AM

- **What We're Doing:** Buying shares of the world's leading futures exchange.
- **What We're Thinking:** Trading volume will keep growing, and highly profitable CME Group will continue to lead its industry.
- **What We're Expecting:** As CME grows, management will return more profit to shareholders.

Trade Essentials

- **Action:** Invest 3.5% of your portfolio in CME ($3,500 for every $100,000 you manage; for *Pro*, that's 200 shares).
- **Buy Around:** $278
- **Fair Value:** $327
- **Alternative Trades:**
  - Seeking a lower buy price? Sell to open any puts that appeal to you, selling one put for every $26,000 or so in stock you can afford.
  - Want upside with less capital? Set up a synthetic long. Sell to open January 2014 puts and buy to open January 2014 calls. Use the same strike price (near the current share price) for both. Each contract represents 100 shares.
- **Special Considerations:** CME yields 3.3% through quarterly dividends, and 1.3% more with a $3-per-share extra dividend in March. We may use options on this stock later, but they aren't essential.

The Business

This Stock Is a Buy

CME is a Buy, and it will be reflected on our scorecard as soon as we make our purchase.

CME Group (NASDAQ: CME) operates the world's largest exchange and clearinghouse for futures contracts that financial institutions, corporations, governments, and traders use to manage risk. As a mostly electronic intermediary, the company requires few physical assets to run its business, and as a result, it's one of the most profitable companies in the S&P 500.

Investors use CME's exchange because of its size, liquidity, transparency, safety, and sheer breadth of products. The company creates trading instruments, provides a market for them, matches prices, ensures settlement, and serves as the counterparty to every transaction to help reduce credit risk. In 2011, nearly 3.4 billion contracts traded on CME's exchange, up 10% from 2010. The six investment areas currently served are:

Product Line	Average Daily Volume (in thousands)*	Percentage of Total (rounded to nearest integer)
Interest Rates	4,729	40%
Equities	3,147	27%
Foreign Exchange	820	7%
Energy	1,704	15%
Agricultural Commodities	1,004	9%
Metals	315	3%
Average Daily Volume	11,719	100%

*Q4 2011, ended Dec. 30.

Last year, 83% of CME's revenue was earned from transaction and clearinghouse fees; 13% came from market data and information services; and 4% came from market access, communications, and other fees. The company's expenses are largely fixed, so its profit goes up (or down) with trading volume. CME grows its business by introducing new products (the company has launched hundreds over the past few years), attracting more investors, and expanding to new markets. The company also offers *options* on futures — for those who *really* love exotic investments.

What Are "Futures"?

A futures contract is a standardized agreement between two parties to trade a specific asset or instrument at a set price (the "future" price) by a set date (the delivery date). Futures have been used for hundreds of years, initially allowing farmers to ensure a specific price for their crops. Today, companies, governments, farmers, producers use them to hedge any number of costs: fuel costs, metal costs (in manufacturing), food prices, currencies, interest rates and more.

Who Is CME Group?

CME Group owns the Chicago Mercantile Exchange (CME), the Chicago Board of Trade (CBOT), the New York Mercantile Exchange (NYMEX), and the Commodities Exchange (COMEX). It also owns 90% of the Dow Jones' namesake market indexes (Dow Jones retains a 10% stake).

While we expect U.S. trading volume to grow in the coming years, we are also keen on the large opportunities that remain in Europe, Asia (including China, where the company is making inroads), and Latin America. In 2010, non-U.S. hour and international hub trading (the way CME tracks non-U.S. trading volume) was 21% of CME's total volume. This grew 16% in 2011, and CME expects more growth ahead. The company's European clearinghouse was approved in May 2011, and business is taking off; in January alone, CME Clearing Europe saw nearly 75% as many contracts trade as it had hosted from May to December last year. Soon, CME will launch interest rate swaps and new metals contracts in Europe, among other new products.

Financials

CME's operating profit tops 60%, the highest of any holding in the *Pro* portfolio. Its large marketplace provides customers liquidity that smaller competitors can't match, helping to ensure its profit margins. CME owns 90% of the Dow Jones Industrial Average namesake market indexes, and it has exclusive contracts to offer equity futures on Nasdaq indexes through 2019 and S&P indexes through 2016. (CME will almost surely seek to extend both.) Approximately two-thirds of CME's business is conducted by exchange members who pay fees to take part. In 2010, 12% of trade and clearing revenue came from one large member customer, and 13% from another, so it's important that CME maintains healthy relationships with its members. Here's a snapshot of CME's five-year financials:

CME Group	2011	2010	2009	2008	2007
Revenue	$3,280	$3,004	$2,613	$2,561	$1,756
Operating Cash Flow	$1,506*	$1,356	$1,083	$1,197	$814
Free Cash Flow	$1,350*	$1,196	$925	$997	$651
Total Trading Volume	3,385,000*	3,078,149	2,584,891	2,978,459	2,249,632

Figures in millions.
*Estimated. Estimates based on these facts: 2011 operating income grew 11% and trading volume grew 10%, while capital expenditures were $156 million. Sources: 2010 CME 10-K filing, 2011 year-end CME earnings release, S&P Capital IQ, and analyst estimates.

With $18.3 billion in market value, shares trade at an estimated 13.5 times free cash flow. Our conservative fair-value estimate is nearly 20% higher, resulting in a price of 15.6 times free cash flow. This assumes continued healthy gains in Europe and single-digit volume growth in the U.S., but no income from China or Latin America — that potential growth is all upside.

Management affirmed confidence in its free cash flow Feb. 2 by increasing its quarterly dividend 59% to $2.23 per share and adding a one-time $3-per-share dividend payable in March. In a new policy, CME will assess its cash position every January and announce a special dividend if merited. CME's aim is to return more cash to shareholders and maintain a yield that attracts more investors. As of last week, the stock yields 4.6% (including the annual dividend), double last year's average yield.

What Would Make Us Sell

CME's competitors include:

- **NYSE Euronext** Liffe Clearing
- Eurex, in Europe
- **IntercontinentalExchange**
- **Nasdaq OMX**
- LCH.Clearnet
- Electronic Liquidity Exchange (ELX), launched by 12 financial institutions in July 2009 to trade Treasury futures
- Interbank Market, a giant, private, decentralized futures exchange system used by institutions

CME runs the largest public market for futures trading, and it doesn't compete directly with any single competitor across all its product offerings. Instead, it competes in various (but still not all) product lines with the competitors listed above (and others). With Europe now blocking **NYSE Euronext**'s acquisition of Deutsch Boerse, merger activity is likely to slow. This is good news for giant CME, which would rather have smaller competitors. Management says it took market share from its three most direct competitors (the first three listed above) in 2011, but if CME's trading volume enters a lasting decline, we'll have to consider selling.

In addition, we'll keep a close eye on regulatory issues. The Dodd-Frank Wall Street Reform and Consumer Protection Act promises tighter regulation of futures trading, and although CME is ready for this (and believes parts of the bill will actually provide it new opportunities), the Act could still crimp trading volume or increase costs if it isn't implemented smartly. CME continues to partake in discussions with lawmakers. If any new regulations demand that trade clearing activities be completed by independent entities, we would need to sell.

The recent debacle involving bankrupt brokerage MF Global also remains a serious concern. CME was MF Global's auditor, and its reputation has been damaged; although management has taken steps to repair investor trust, this story isn't over yet. Futures volume was dinged industrywide when MF Global, which was a futures giant, went belly up. Trading volume at CME began to recover in January, but if trust in CME's marketplace diminishes permanently, or if its competitive position weakens, we would move to sell.

Pro's Bottom Line

Next Steps

- Visit our CME Group discussion board to ask us questions or discuss it.
- Add CME Group to My Scorecard.

CME is a strong business at a good price. Volume in options trading has grown steadily for years, and we believe trading volume in futures contracts is likely to do the same as investors, corporations, producers and manufacturers seek more ways to manage risk — whether it's commodity risk, currency risk, energy costs, or interest rate risk (and higher interest rates in the future are one catalyst for more volume). Meanwhile, we expect CME to lead its industry with new offerings and to continue to expand in new markets.

Transcript

Jeff Fischer, advisor: I started investing young as an interest, and realized early on that it's one of the best ways to grow your financial resources and independence, without a doubt. I think that's why most of us get into the stock market. We are not there to just get by; we are there to get ahead.

Pro has a very steady approach because we buy equities for the long term. We are buying great companies for the long term. We go into those knowing, Hey, we want to own MasterCard, say, and we want to compound with it the next five to ten years, as long as the stock is worth owning. So we have long-term stocks, and we complement those with short-term options where we are making income typically every month. All of us have it, this need for short-term gains. Options do that perfectly, and that lets us own our stocks for the long term then.

Then we also have hedges and shorts, which profit in down markets, which means we are not so prone to panic during down markets because we have positions, shorts, hedges and options, that are making money in the down market. We then harvest that profit and reinvest it into stocks that are cheaper.

Bryan Hinmon, CFA, analyst: When I am choosing a stock for *Pro*, I look for three things. First I look for a good business. It's a heck of a lot easier to invest in good businesses than bad businesses because you don't have to always make sell decisions. The second thing I am looking for is good management, and really with management what I am concerned about is how are they incentivized? Do they think long term, do they act long term and are they incentivized for long term? The third thing I am looking for is a variant perception. When every transaction is made, there is a buyer and a seller, and over time one person is proven right and one person is proven wrong. So when I come to the table to take one of those buy and sell transactions, I want to have a well thought out reason to know why I am not the patsy in that transaction.

Jeff Fischer: I began to use options more than 10 years ago to generate steady income, and I found them to be the perfect complement to a long-term stock portfolio, and that's why *Pro* uses them. They are great for income, they are great for leveraging returns and they are great for protecting what you already have.

We also use ETFs because they are a good way to get into certain sectors or areas that just a few years ago were virtually impossible to get into. Commodities, for instance, or if you wanted to easily buy into Brazil or Singapore or Malaysia, there's an ETF there for that, and to also make money on volatility.

Nick Crow, senior analyst: But in general, we like businesses with recurring revenue streams. They are more predictable over time, which allows us to get a tighter evaluation on it, and it increases our confidence in the overall business, but we like businesses with durable competitive advantages, so that recurring revenue stream that we are so attracted to, we have higher confidence that that will be sustainable over a long period of time and we can keep that stock in the portfolio for three, five, 10, 15 years, and keep that compounding machine to reward our members over the long term.

Bryan Hinmon: The thing that makes the three of us work really well together is that we complement one another. Nick is calculated and data-driven, Jeff invests from the gut, and I am somewhere in between. Each of us approaches every company from a little different manner.

Nick Crow: I am a more skeptical investor than either Bryan or Jeff. You give me any piece of information and the first thing I am thinking is one, is this in fact information or is it an anecdote? Will it continue? Where are the holes in this? What's the worst thing that can happen? That's my first look at any stock; so incredibly skeptical about everything.

What that allows me to do relative to the other guys would be just I pick up more risk factors, both in their picks and in mine, probably slows down the process too. Whereas Jeff's more optimistic, and so he will go ahead and find stocks and really see the future promise in it over a long period of time. If you put those two things together, someone very skeptical with someone with a great vision for the future, you can have a very well-rounded pick that makes it through both those filters.

Bryan on the other hand, he carries a bit of both of those, but also just a great brain for financial analysis and just finding new metrics to look at, but one more lens to overlay on our analysis. So as a team, I think we are incredibly strong at picking stocks.

Jeff Fischer: I made my first investment in 1987, the day after Black Monday when the S&P fell more than 20%. I was only 17 at the time, but I had been following markets since I was about 12, and charting stocks and reading about investing. And I had worked as a caddy, and then on the maintenance crew at a golf course near my parents' home, near the home where I grew up outside of Chicago. So I had some money saved and I had a brokerage account open, and the day after Black Monday after the market crashed, I went and bought my first two stocks.

It worked out really well for one company. It was CitiGroup and the other company went bankrupt. It was a small Florida real estate firm that I bought simply because I like the tropics in Florida and I thought, oh, it would be great to own some real estate in Florida. It was a $3 stock.

Bryan Hinmon: I got into investing as a kid. I used to collect baseball cards. The correlation really between baseball card trading and investing is you are really at an advantage if you are able to remove emotion from the situation. So with baseball card trading, my friends were always partial to the players that were on their favorite teams, but this didn't really play into the determination of the value of the trading cards. It was the players' performance that mattered.

Nick Crow: So my first memory of investing was eighth grade. It was a stock-picking contest where we could win a pizza party if we had the best portfolio. So I had a thousand dollars, could pick stocks to bet and I won that contest, but really what resonated with me was the fact that it took very little work relative to my paper route at the time, or refereeing soccer, so I could make money with the money that had already accumulated. That was a new concept for me and was like, wow, this is powerful.

I feel very strongly about the *Pro* portfolio. I think that we could withstand a tumultuous market and do very well as the economy improves in the U.S. and around the world. We have got some leading companies there. And the flexibility through options and ETFs too, truly manage the portfolio no matter what happens. Of course, to some extent that we will fall with the tide as well, but we can mitigate that more than most.

Jeff Fischer: The purpose is very specific. We are here to help Fool members make money and have better financial lives, and just be financially smarter as a whole. It's very easy to get up every day and know that's why you are coming to work, to help people improve their lives.

Bryan Hinmon: Deep down, what really drives the three of us is the passion to learn about business and the passion to help our members take control of their financial lives. You can see that in the way the team interacts with our membership base and it's really a joy and a pleasure to work alongside them, towards that central goal.

Jeff Fischer: Every day there are members helping members. Every day the team is out there helping members, so if you have a question and you post it, it's rare that you don't have an answer within 24 hours, an answer to your specific question. We are here to help Fool members make money and have better financial lives, and just be financially smarter as a whole. It's very easy to get up every day and know that's why you are coming to work, to help people improve their lives.

3 Things Important to Pro

Published Feb 6, 2012 at 12:00AM

Fellow Fools:

These three things are of lasting importance to *Pro*, and to members, as we all invest together.

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock listed on the Recommendations page.

- **Intel**: "Sell to open" July $24 puts, lately above $0.80, for up to 6.7% in shares if you lack this allocation. Sell one put for every 100 shares you could buy.
- **Pacer International**: Sell to open September 2012 $5 puts for $0.45 or higher, for up to 3% in shares.
- **Plum Creek Timber**: Sell to open August $35 puts for $1 or more, for up to 3% of your portfolio (you'll need to select "view all strike prices" to see these puts).

Questions on these? Visit our "Catch-Up Trades" discussion board.

- Our mission, philosophy, and North Star
- What we believe as we invest
- How we think about and measure returns

I call these *Pro*'s Trifecta, and you'll see us refer back to them often. More details are available about the first two through the links above, and we'll flesh out the third, our returns philosophy, in an upcoming article. We'll then put all three together into one document for you, to serve as a one-stop reference point for the foundation upon which *Pro* is built.

Our Mission, Philosophy, and North Star

Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to meaningfully increase the real purchasing power of capital over every rolling three-year period and to double our real purchasing power every 10 years.

In other words, our mission is absolute, positive returns, whatever the market does. We would prefer positive returns each and every year, of course, but we focus *more* on achieving results over every rolling three-year period. This is more "controllable," and more importantly, it will lead to better decisions on our part than managing for just one-year returns.

Our philosophy espouses that you can't live on relative returns (returns relative to a market index — especially true when that index is flat for 10 years) and that you don't want to draw funds early from your stock holdings. You want to let your stock investments compound. So we use options for short-term gains and income, and we use shorts to hedge and potentially earn intermediate-term gains we can then reinvest after the market has slipped.

Our North Star is our guiding light; it's what we aspire to. Measured as inflation (CPI-Urban, including food and energy) plus 7% a year, the North Star has gained 11.4% annualized since 1970, and has never had a negative year. Its worst year was 7.1% growth in 2008. If we can keep losses to a minimum and follow our North Star, let alone rocket past it, we'll do extremely well.

What We Believe

What we believe about our world, specifically the business world, directs where we invest. Our list of beliefs is a living document; it will be steadily refined following last week's introduction. We have more beliefs to add and others to tweak, and we intend to keep these beliefs front and center so we can be certain our investments follow our convictions. You might want to consider creating your own list at home: Write down what you believe, then ask yourself if you're invested in your strongest beliefs.

How We Think About and Measure Returns

Pro Trade Roundup

- **SPDR S&P 500**: Bought to close 835 short shares, one-third of our position. We remain 15.8% short in these shares.

Guidance Updates

- **Rockwood Holdings** moves down to Buy due to price.
- We are raising **MasterCard**'s Fair Value estimate to $425.

On our Recommendations tab (which shows you our portfolio), the table below our holdings will always feature our returns since inception, over the last rolling three-year period, and year-to-date. In a future article, we'll provide more color about our returns, including our desire for less volatility, our best and worst months, how correlated we are to the market, and more. We want to avoid large drops in portfolio value, but at the same time, we don't view 10% declines in the market as meaningful or easily maneuvered around. We focus on protecting against potential market moves that are larger than that.

Buy First, Buy, and Hold

Finally, as new members get started and veteran members stay current, all *Pro* Fools should keep in mind that our Buy First, Buy, and Hold guidance is always up to date on the Recommendations page. And this guidance is king! If we think something can be bought today, it's listed as a Buy First or Buy. Remember, our "Buy Around" guidance has flexibility. New members have already seen our Buy First stocks to purchase, and four Buys to start with as well.

We'll be sending more soon, but take your time. If you don't feel ready, just remember that investing is a marathon, not a sprint, and that we'll always have several active buys and new ones on the way. We'll also help you to potentially buy some stocks on Hold at lower prices by writing simple put options for income with our "Catch-Up Trades" displayed in every Monday Memo. (To get more information about any holding, click its ticker on the Recommendations page or head over to its dedicated discussion board.)

Many *Pro* companies are reporting earnings right now; we'll post our analysis of the results on each company's discussion board, and we'll highlight them in these Monday Memos, too. If you're getting started with us this week and have questions, drop by our Getting Started discussion board. Thank you for being a *Pro* member!

Foolishly,

Jeff Fischer (TMFFischer)

Your Downloadable Guide to Pro's North Star

Published Feb 6, 2012 at 12:00AM

Dear Fellow Fools,

Download!

Click here to download the
PDF.

Since *Pro* opened its doors on Oct. 7, 2008, absolute returns have been our goal. We've crafted a portfolio with that goal in mind, we've worked to educate members on what an absolute-returns strategy is all about, and we've detailed our aim to earn you consistent, recurring profits with a high level of accuracy.

But how do you know how well we're doing? What exactly is guiding our investing behavior, and what should guide it? Can we quantify consistent profits in a way you can measure?

Today, we are proud to share with you *Pro*'s North Star — a way to answer those questions and provide that quantifiable information. It also serves as a guiding light for the decisions we make at *Pro*. In this document, we'll first explain *Pro*'s mission, then tell you how the North Star helps us achieve it. (We've also included a "cheat sheet" at the end for quick reference.) Enjoy, and bring any questions to our North Star discussion board!

— The *Pro* Team

3 More Buy Stocks and 1 Income Position

Published Feb 3, 2012 at 12:00AM

Dear *Pro* Fool,

Haven't Bought our Buy Firsts Yet?

If you're new to *Pro* and haven't yet caught up with our Buy First stocks, please do so before moving on to this report!

But I'm Already Fully Allocated, and I Have an IRA ...

No worries: *Pro* is here for you. Check out our Making *Pro* Fit You guide for expert advice on how to make our portfolio work for your individual situation.

To get you started investing with *Pro*, we recently provided you with our current thinking about our five Buy First stocks and advised you to buy each in the allocation suggested. As the next step in this journey toward profit, in this report we offer three more *Pro* Buy stocks you can purchase today and one "strangle" stock that we're using options on for income.

The allocations we suggest below will match you exactly to the *Pro* portfolio's current allocation in each holding. Realize that we're likely to later increase allocations on any position that is currently less than 3% (because we want to stay focused and make each position count), but we'll issue new trade alerts before we take any such action. For now, we assume you've already caught up with our Buy Firsts, and we suggest you continue by matching what we currently own in each Buy-rated *Pro* position, starting with these three.

We may use options in the future on any position, so buy in round 100-share lots if possible — but do realize this isn't mandatory. Do what's best for your portfolio. Finally, if you're not using options yet, you can bypass the final recommendation below, which includes options. You can start to use options when you're ready. If you have questions, visit our Getting Started discussion board!

— Jeff Fischer (TMFFischer)

3D Systems

- **Industry:** 3-D printers
- **Share price:** Low $20s
- **Allocation:** Invest 1.8% of your funds ($900 for every $50,000 you manage)
- **Full report:** Buy

3D Systems is working to change the world. Selling printers that actually print perfectly usable 3-D objects — from replacement kidneys to car dashboards — the company could both revolutionize and personalize manufacturing. Its latest award-winning printer, Cubify, is for retail customers who wish to print jewelry (or shoes, or toys … you name it) right at home based on designs they can find online or create themselves. The stock may be a growth story, but 3D Systems is already making a nice profit selling its machines and printing materials. We have a small stake now and may look to add more after seeing earnings in mid-February.

GrafTech International

- **Industry**: Carbon and graphite products, focused on the steel industry
- **Share price**: Mid-teens
- **Allocation**: Invest 4.2% of your funds ($2,100 for every $50,000 you manage)
- **Full reports**: Buy; Buy More

GrafTech International is the low-cost producer of high-quality graphite electrodes, which steelmakers use to melt and form the steel they use to build our world. Demand for steel continues to be driven by growing infrastructure in emerging markets and a rising global middle class, and as more steely things (like cars, planes, and buildings) are produced, we believe steel producers will be popping graphite electrodes like Tic-Tacs. GrafTech is well-positioned to feed their need.

WisdomTree Emerging Markets SmallCap Dividend Fund

- **Industry**: Diversified international ETF (industrials, financials, consumer discretionary)
- **Share price**: High $40s
- **Allocation**: Invest 2.5% of your funds ($1,250 for every $50,000 you manage)
- **Full report**: Buy

We believe emerging markets have growth potential that makes their extra risk acceptable. To pursue this belief while guarding carefully against that risk, with this investment we've chosen to buy a basket of growing emerging-market companies that are financially sound enough to promise a healthy dividend. The **WisdomTree Emerging Markets SmallCap Dividend Fund** offers us not just a yield but also ownership in a few hundred small, growing, and promising companies in countries including South Korea, Malaysia, India, and Brazil. Given all that, it's easy to see why we like this ETF for the long haul. It's also a great way to diversify. We may add to our position in the future, but right now buying 2.5% will match us.

Wells Fargo & Company With a Covered Strangle

- **Industry:** Diversified financial company
- **Share price:** Low $30s
- **Allocation:** Invest 2.5% of your funds ($1,250 in WFC for every $50,000 you manage). That's half of a potential 5% allocation.
- **Full Reports:** Buy; Write Covered Strangle

Having just completed the largest merger in banking history, **Wells Fargo** now boasts 6,239 retail banking locations and the highest customer-service rating in the industry. We expect management to continue to "out-local the nationals and out-national the locals" by providing the breadth of service expected of a major bank while building the relationship depth expected from a community bank. We predict the stock will stay in a wide range as the financial industry continues to recover over the next few years; while that happens, we own half a full potential allocation in Wells and have set up an options position on it — writing a strangle — in hopes of regular income with stock upside. So:

1. Buy 2.5% of a potential 5% allocation in WFC stock around $30ish, in 100-share round lots.
2. Use a "strangle order" to "sell to open" April 2012 $27 puts and April 2012 $31 calls, one of each option for every 100 shares you own, lately for a **combined credit** of around $1.78 per share.
3. This position will be profitable if the stock remains at or below $32.78. It gives us about 5.8% in a potential income yield in just over two months, and it provides 5.8% in downside protection, too. We'll take that!

The strangle above is different from our earlier official recommendation (we currently have lower strike prices, because we set ours up earlier), but in April we'll "roll" to a new strangle and everyone will be on the same page. This is the best trade for today.

Pro Summary

By purchasing shares in 3D Systems, GrafTech International, and WisdomTree Emerging Markets SmallCap Dividend Fund — and setting up a covered strangle on Wells Fargo if you're ready for options — you've made another step toward investing profitably with *Pro*. We'll see you again soon to take the next step. In the meantime, we also have brand-new trades in the works for all *Pro* members as we invest for steady profits over the coming months and years. Watch your inbox! And if you have questions as you get the ball rolling with *Pro*, please visit our Getting Started discussion board. Fool on!

Making Pro Fit You

Published Feb 1, 2012 at 12:00AM

Dear Fellow Fool,

Prefer to Print?

Download a PDF copy of this report here.

We manage the *Pro* portfolio using a wide range of tools — including long and short stock, option, and ETF strategies — to earn absolute returns with reduced volatility. But we know no two members have identical investment situations, and that means not all members will have access to every portfolio strategy. That's where this report comes in. Its purpose is to help you find the best way to use *Pro* according to your individual situation.

We'll address four possible scenarios in detail. You may find that more than one applies to you:

- **Free-Range:** For members with free range to employ all the same tools as *Pro*.
- **IRA:** For members building a portfolio in an IRA account.
- **No Complex Options:** For members who lack broker permission to execute complex options strategies.
- **Old Fool, New to *Pro* / Fully Invested:** For members joining *Pro* from another Fool service or members who are already fully invested.

Whatever your situation, we recommend all members first read the "Free-Range" section. Bring any questions to our discussion boards, and Fool on!

— The *Pro* Team

Free-Range

So you're new to Pro *and able to follow every* Pro *portfolio move to a T? Here's what to do. (Again, we recommend you read this section even if you are not entirely "free-range.")*

As You Get Up to Speed
Match our portfolio positions and allocations, starting with the Buy First and Buy positions — and do so at your own pace. We recommend following along with our Buy Firsts today, or as soon as you get comfortable with the positions. You can also match our positions in all of our Buy stocks, or you can wait for summary instructions from us over the next couple of weeks. If you're comfortable with options, you can consider writing puts to try to buy some of our Buy stocks cheaper. Post on the discussion boards to get the community's feedback about any trades before you make them, if you like. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions. You can find a review of our most timely entry strategies for positions on hold in the "Catch-Up Trades" section in every Monday Memo.

Once You've Settled In
Once you've built your Buy First and Buy positions, all you need to do is wait for further trade alerts from the team. Remember, though, that trade alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want. You may decide to modify the strategy we choose for a trade; for example, you may wish to write puts instead of buying a stock outright. If you choose to deviate from our recommendation, make sure you (a) understand why we chose the strategy we did, (b) have a reason that the modified strategy better fits your portfolio, and (c) exercise caution by sizing the position a bit smaller than you would otherwise.

Your *Pro* Perspective
The most important thing to remember is that *Pro* is a portfolio service, not a collection of investment ideas. All of our positions exist in the context of our portfolio; if you elect to pick and choose *Pro* investments, it is critical that you understand how they fit into your portfolio. Our trades are intended to integrate with existing positions and to form a portfolio of assets that keeps our North Star firmly in mind.

IRA

IRAs are tax-advantaged accounts that usually prohibit shorting and all but the simplest of options strategies.

As You Get Up to Speed
Learn about our Buy First stocks and buy them, well, first. You can buy our Buy stocks right away as well, or you can build positions as you're comfortable. (There's no rush; we'll communicate with you about these stocks during the first couple of weeks of your membership.) Some IRAs don't allow put writing (though many do, if they are cash-secured), so you should simply purchase shares of these positions over time. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions. Keep an eye on the Catch-Up Trades section of each Monday Memo for timely ways to enter our positions on Hold.

Once You've Settled In
You can follow our simple stock-buying trade alerts directly. Most IRAs allow you to write covered calls, so you can also follow those trade alerts directly. Check with your broker to see if you have permission. Other options trades may not be possible in an IRA. In that case, check the trade alert for a list of alternate trades; for example, when we write puts to try to buy shares of Stock X more cheaply, you might be able to simply buy shares of Stock X. (If there are no alternate trades, we'll say so.) As for shorting, some inverse ETFs can be purchased in IRAs (purchasing an inverse of something is similar to shorting that thing). As with options, we'll mention these alternatives in the trade alerts if they exist and we approve of them.

Your *Pro* Perspective
IRAs are tax-deferred accounts, so they're great for income-generating strategies like covered calls, high-yield dividend stocks, and ETFs with large taxable distributions. They do have limitations, though, and you may find that the inability to follow all of our recommendations leaves a hole in your portfolio. If that's the case, you may be able to fill the gap with additional income-generating strategies — for example, by writing covered calls on *Pro* stocks you'd be willing to sell at your strike price.

An Important Note About IRAs

Their tax-deferred status means that IRAs are not great for high-risk, high-reward trades — losses in an IRA cannot be used to reduce the taxes on other gains. And because IRAs do not allow the use of margin or shorting, you will likely find it difficult to follow along with most of our hedging strategies using only an IRA account. If that's the case for you, we recommend keeping an eye on both your cash balance and *Pro*'s hedging strategies. When the *Pro* portfolio adds hedges, increase your cash balance; when we pull hedges off, reduce your cash balance by investing more in our Buy and Buy First Stocks. Consider opening a separate non-IRA account if possible. You can then manage both your IRA and non-IRA accounts as a single portfolio, with income-focused and shorter-term strategies in the IRA and more complex, speculative, and short trades in the second account.

No Complex Options

You need permission from your broker to undertake complex options strategies, which not all members have upon joining. Here's what to do in the meantime.

As You Get Up to Speed
Follow along with our "Free-Range" instructions for getting up to speed — match our portfolio positions and allocations, starting with the Buy First and Buy positions. Make sure you do so at your comfort level. If you're comfortable with options, you can consider writing puts to try to buy some of our Buy stocks cheaper. Post on the discussion boards to get the community's feedback about any trades before you make them, if you like. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Once You've Settled In
You can follow most of our trade alerts directly — except, obviously, those involving complex options strategies. In those cases, there's often a simpler alternative, such as writing puts, writing covered calls, or buying or shorting a stock or ETF directly. We outline possible alternatives in every trade alert. If we issue a trade alert using an income-generating strategy you're unable to employ and there are no workable alternatives, consider using the strategies you do have at your disposal to generate income elsewhere in your portfolio.

Your *Pro* Perspective
First of all, you should continue to request higher options permissions from your broker every couple of months until they are granted. Account size is one factor brokers consider when making this decision, so to up your odds of success, consider consolidating accounts or moving funds to the account in which you wish to trade options.

In the meantime, don't lose sight of the big picture; remember that we're building a portfolio. If you can't make a particular options trade, you may be able to make an alternate trade or you may need to sit that trade out — either way, it's no big deal. That said, you'll want to pay particular attention to any trade alert in which we use options for hedging purposes (for example, a synthetic short or a ratio put spread on an ETF or an index). Trades like these are important to our integrated portfolio, so don't ignore them. If alternatives are available, we'll outline them. If not, you may want to take action elsewhere in your portfolio to meet similar goals. For example, one way to accomplish this would be to raise your cash position by trimming a few holdings. As always, hit the discussion boards with questions about any particular situation.

Old Fool, New to *Pro* / Fully Invested

Members joining Pro *from another Fool service and those who are already fully invested will need to consider changes to both their portfolios and their mindsets.*

As You Get Up to Speed
If you're already fully invested, you'll need to sell existing positions to add *Pro* picks. We recommend that you do this gradually and deliberately.

- List your existing positions in order from your highest-conviction holding to your lowest-conviction holding.
- If you own stocks from another Fool service, you can use that service's guidance on those stocks in building your list.
- If you don't know why you own a stock, that's a good reason to sell it.
- Be mindful of your sector and geographic allocations. You don't want to unintentionally end up owning nothing but oil or European stocks just because they were your favorites.
- If you're struggling with what to sell, post to the discussion boards — the *Pro* team can't give you individual advice, but our community members can and frequently do.
- When you're ready, incrementally sell your lowest-conviction stocks and use the proceeds to move into our Buy First and Buy stocks. Keep an eye on the Catch-Up Trades section of each Monday Memo for timely ways to enter our positions on Hold.
- Review your positions and portfolio after studying *Pro*'s mission and reviewing our North Star. Use that analysis to craft your portfolio going forward.

Once You've Settled In
Follow the "Free-Range" instructions for this step — once you've built your Buy First and Buy positions, all you need to do is wait for further trade alerts from the team. Remember, though, that trade alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — one gradual step toward shaping the portfolio we want. You may decide to modify the strategy we choose for a trade; for example, you may wish to write puts instead of buying a stock outright. If you choose to deviate from our recommendation, make sure you (a) understand why we chose the strategy we did, (b) have a reason that the modified strategy better fits your portfolio, and (c) exercise caution by sizing the position a bit smaller than you would otherwise.

Your *Pro* Perspective
If you're joining us from another Fool service, it is critical that you understand the differences between *Pro* and some other Fool services. At *Pro*, we are building a portfolio, not offering investment ideas. *Stock Advisor* and *Rule Breakers*, for example, offer stock ideas from which members can pick and choose. In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the *Pro* portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

Jeff Fischer: Hello and welcome to Motley Fool *Pro*. I am Jeff Fischer, Motley Fool *Pro*'s lead advisor, and I am very pleased that you have joined us. Our mission at *Pro* is to make you money in up, down, and sideways markets by teaching you how to implement a variety of smart investment strategies. I'd like to take a few minutes to familiarize you with the service and help you get started.

The first thing you'll want to do is get to know *Pro*. Visit our Getting Started Guide to learn more about our investing philosophy and what to expect as a new member, including how to set up your brokerage account and when to expect updates and trades. We'll also show you how to jump right into investing with Motley Fool *Pro*, as well as our take on investing with options. If you are new to options, we highly recommend our Options for Beginners handbook to get your crash course on this profitable strategy.

When you are ready to invest, check out our portfolio and read more about our Buy Firsts and our Buys. For each recommendation, you will get our full analysis, buy-around pricing, target allocation and much more. Every company we recommend has its own detailed snapshot, which includes our full recommendation, history, performance data and an archive of everything we have written about that company. You can also add the company to My Scorecard with just one click.

With My Scorecard, you can track stocks in which you have open positions or that you simply want to keep an eye on. And that's whether they are *Pro* recommendations or not. Not only will My Scorecard track the movements of the stock, it will also pull in all relevant articles and community discussions on that company.

Finally, as you get acquainted with *Pro*, we highly recommend that you drop by our friendly community of investors just like you. Learn what our analysts and fellow *Pro* members are saying about our stocks, ask questions about our strategies and dig deeper into *Pro* investing. The team and I are on the boards frequently, so if you have any questions, this is a great place to get answers.

We encourage you to take your time getting familiar with *Pro* and to work at your own pace. We are here to help you every step of the way. And coming soon is New Member Orientation Week, where we'll go into detail about our service, our philosophy, how to trade like a pro and everything else you'll need to make the most of your new service. In the meantime, if you have any questions about our service, our investments or our strategies, feel free to post on the discussion boards. The entire *Pro* team, as well as a robust community of smart investors, is ready to answer your questions.

Thank you again for joining *Pro*. We look forward to profiting alongside you for many years to come. Fool on!

What Pro Believes

Published Jan 30, 2012 at 12:00AM

Fellow Fools:

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note, you can always buy any Buy First or Buy stock from the Recommendations page.

- **Pacer International**: Sell to open September 2012 $5 puts for $0.50 or higher, for up to 3% in shares.
- **Intel**: Sell to open July $24 puts, lately about $0.95, for up to 6.9% in shares if you lack our full allocation.
- **Wells Fargo**: Buy 2.5% of a potential 5% allocation in stock around $29 or lower, and use a "strangle" order to sell to open April 2012 $27 puts and April 2012 $31 calls, one of each option for every 100 shares you own, lately for a combined credit of $1.52. You must be new to this trade to make it, and you must make it by Tuesday's close to get the next dividend, which is why it's listed here today.

First, a big welcome to our new *Pro* members! We're glad you've joined us, and we look forward to great investing success with you. Our mission is to earn absolute returns in good markets and bad. We buy strong stocks for long-term compounding; we use options for short-term income and other strategies; and we "sell short" in an attempt to profit on intermediate-term declines in price. We also focus on profiting from ETFs, long or short.

Using these strategies, we aim to earn absolute returns by following our North Star: inflation plus 7% annually. The North Star has grown 11.4% annualized since 1970, it has never experienced a negative year (its *worst* was a 7.1% gain in 2008), and it will rise as inflation does. It's a guidepost, not a benchmark, and it's one we'd be happy to meet, let alone exceed. Currently, our North Star is running around 10.3% annually.

Our investment mission and our North Star guide our portfolio decisions. But our portfolio itself is a reflection of the *key beliefs* we have about the world and investing. In this Memo, we summarize what we believe and show the ways those beliefs come to life in the *Pro* portfolio through our investments. Just as interesting are our many beliefs that don't yet have a voice (or a position) in the portfolio.

The *Pro* Portfolio Reflects Our Beliefs

First, let's account for the beliefs we have that are already reflected by at least one *Pro* investment today.

We Believe …	So Our Portfolio Contains …
Technology is essential, and the sector has plenty of growth ahead. Hardware product cycles are short, so software has more advantages, but both merit attention.	**3D Systems** , **BMC Software**, **Ebix**, **Intel**, **OpenText**, **Oracle**
Strong financial companies are inexpensive today and will reward long-term owners.	**Amtrust Financial Services** , **Broadridge Financial Solutions**, **Wells Fargo**
Oil prices are not likely to fall below $70 a barrel, and may rise.	**Bristow Group** , **Vanguard Energy**
Activity in construction, manufacturing, and building (including homes) will recover in the U.S. and grow around the world.	**Autodesk** , **GrafTech International**, **Plum Creek Timber**, **Rockwood Holdings**
Emerging markets have growth potential that makes their extra risk acceptable.	**WisdomTree Emerging Markets SmallCap Dividend Fund** , **Tupperware**
Strong health-care companies are inexpensive today, and demographics (in both mature and emerging markets) will grow industry revenue.	**Medtronic**
Cash is losing the battle to electronic commerce.	**MasterCard**
The long-term stability of the euro is at risk because the eurozone lacks a fiscal union.	Short **CurrencyShares Euro Trust**
We need to generate steady income to follow our North Star and achieve our goal of absolute returns.	**StoneMor Partners** yield, **Expeditors International** butterfly, Plum Creek Timber and Wells Fargo covered strangles — and more spreads, put and call writing, diagonals, etc., are needed ahead
We need to be hedged or sell short to ensure some gains during a falling market.	Short **SPDR S&P 500** — for now, but evolving
Miscellaneous. (Some companies don't fit a single belief, but they're compelling investments for various reasons, including valuation, management, acquisition targets, etc.)	**Covanta** , **Pacer International**, **Papa John's International**, **Pebblebrook Hotel Trust**

Of course, several positions serve dual purposes. Autodesk reflects both technology and construction, but it's most correlated with construction, so it's listed there. Plum Creek Timber is both income (with dividends and options) and construction. Rockwood Holdings serves the auto market as well as manufacturing, housing, and construction — and Rockwood sells high-grade lithium for batteries, putting it firmly in technology as well. Covanta is in the waste *and* energy industries, but we're drawn most by management's desire to unlock value through share buybacks and larger dividends.

Qualifications like these aside, I hope the table gives you a good idea of how we're thinking. Just looking at it also reminds us of something we already knew: After the sale of two industry stocks last year, we're light on health-care companies and seeking replacements.

Now for the fun part. Here are some of our beliefs that are *not yet* reflected in the portfolio, so we're seeking possible investments.

Things We Believe … and May Want to Invest In

[*Pro* Trade Roundup]

- **BMC Software**: Bought 500 shares at $34.47, for 4% total.

- U.S. automobile sales will return to their normal upward trend line, while auto sales will continue to grow in emerging markets.
- Several young ETFs and ETNs are deeply flawed; we seek to short them on their weaknesses.
- Large consumer trends (in retail, tech, and restaurants) are lacking exposure in the portfolio, both long and short.
- Water management for people and agriculture will become increasingly important.
- Some European stocks look very cheap.
- Natural gas and alternative energy have vast potential, but relatively few companies will win big.
- Web security is a big deal for companies and individuals.
- The airline industry remains a poor choice for investors; we may seek shorts there.
- Agriculture (the growing and transporting of crops) will continue to grow in importance as more middle-income earners in emerging markets acquire more demanding food habits.
- Governments will seek new ways to save money and be more efficient.

With 21 beliefs above, we need to focus on the ones we believe in most — and, most importantly, on those that offer the most compelling investment opportunities. Then, over time, we need to assess whether we're over- or under-allocated to each belief and adjust from there. We want our dollars to reflect our strongest beliefs, the ones we think represent the best profit opportunities.

Finally, keep in mind that every belief above has a flipside. If we think there's a compelling investment somewhere, there may also be a compelling short that is fueled by the same belief.

What do *you* believe? What should we add to our list? Share your strongest investing beliefs on the *Pro* Memo Musings discussion board. Welcome again to new members and thank you to veterans! We look forward to our future together. Foolishly,

Jeff Fischer (TMFFischer)

Community

Reduce Your Market Index Short Position by One-Third

Published Jan 26, 2012 at 12:00AM

What We're Doing: We're reducing our short of the S&P 500 index by one-third.

What We're Thinking: We need to maintain portfolio discipline and limit losses on this position.

What We're Expecting: We'll gradually exit our index short in favor of targeted short positions on individual companies and other strategies.

Trade Essentials

- **Action:** Buy to close (or buy to cover) one-third of your short position in the **SPDR S&P 500**. For *Pro*, this means closing 835 shares.
- **Allocation:** We hedged 30% of our invested assets (excluding cash). We're moving this hedge down to 20% of our invested assets ($20,000 short for every $100,000 you have in long positions).
- **Limit Guidance:** You can buy to cover at the going price.
- **Alternative Trades:**
  - If you're short any equity index, or if you own shares of an inverse ETF, reduce those positions by a total of one-third, to follow our allocation guidance. (If you have questions, please visit our SPY discussion board.)

What's Changed?

- **Last trades:** In October and November, we shorted 2,500 shares.
- **Price change (as of 1/26/12):** An average loss of 9.4%.

Europe's debt crisis has yet to be resolved, but the U.S. seems to have avoided a double-dip recession for now. That fact has sent the market steadily higher since December. But we are *not* closing one-third of our S&P 500 hedge because we believe stocks will continue to go higher in the near term. We don't make short-term stock market guesses. Instead, we're beginning the process of closing this hedge for a handful of much more tangible, disciplinary reasons:

- Yesterday, this short reached a 9.7% loss for us. In our initial report, we said we'd look to exit if it moved 7% to 10% against us. We simply need to limit our losses, even if we might disagree with the market (many people grow their losses disagreeing with the market).

- Also yesterday, the Federal Reserve suggested that it would keep interest rates near zero for nearly twice as long as previously expected — all the way through 2014. By making money cheap (and punishing savers), the Fed is hoping to increase lending and push people's assets out on the "risk curve" — into stocks and other investments that pay a return. There's at least a chance this will help prop the market up.
- We sold our 5% position in **L-3 Communications**on Monday, and we're on track to sell our nearly 5% stake in **Ebix** via February covered calls. We do plan new buys, but as we decrease our long exposure and raise cash, we can dial down our hedges.
- We moved to a new broker last week (Interactive Brokers), so we now have a full new array of shorting possibilities that should serve us better than the SPDR S&P 500 ETF. We plan to gradually move to targeted shorts and continue using options to hedge.

Since Sept. 30, 2011 (just before we started to hedge with SPY), the *Pro* Portfolio has gained a healthy 14%. Being 30% hedged has cost us three percentage points in additional upside performance (and we'll lock in 1% of that loss by closing one-third of our short). That's a price we're content to pay during such an uncertain time, especially because our total portfolio — the only number that matters — has done well anyway.

How to Follow Along

Add up the value of your index short (or inverse ETF) positions. Compare that to the value of your long stock and long ETF positions (do not include your cash!). Decrease your hedge to just 20% of your invested assets. If you are around 30% hedged, as we are, you will simply need to close one-third of your short positions. Unless we fail to find ample new hedges, we will likely close the remaining two-thirds well before SPY's next ex-dividend date in mid-March. We will need to pay a 0.5% dividend on all of our short shares on Jan. 31 (the ex-dividend date was in mid-December) — that dividend will be deducted from our account.

The Foolish Bottom Line

Europe is still at risk of implosion as the Greek debt debacle drags on, and Italy, Spain, Portugal, and Hungary are paying onerous interest rates on new debt. Banks also aren't lending in Europe, and it's likely a recession is around the corner in many uncompetitive eurozone countries. The United States is also whistling past its fiscal problems right now.

However, when we considered this short in the context of a disciplined investment approach, we concluded it's best to close one-third of it as it bumps up against our loss limit. Also, now that we can short specific companies and flawed ETFs, we're likely to find better opportunities there. We'll close one-third of this position in the coming 30 days, following our 24-hour waiting period so members can act first.

Next Step: Questions about your shorts (or pants, slacks, or knickerbockers)? Seriously, visit our SPDR S&P 500 board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

New Member Orientation Live Chat

Published Jan 24, 2012 at 12:00AM

Hey, *Pro* Fool! Whether you're new here or you've been with us awhile, we want to make sure you know all there is to know (or, at least, all you want to know!) about the *Pro* service. Advisor Jeff Fischer (TMFFischer) and analysts Nick Crow (TMFCrow) and Bryan Hinmon (TMF42) will be answering your questions live from 2 to 3 p.m. ET on Friday, Feb. 10 — bookmark this page or set an email reminder below. See you then!

Pro's Buy First Stocks Today

Published Jan 24, 2012 at 12:00AM

Dear New *Pro* Member,

Ready for Another Go?

If you're all caught up with these Buy Firsts, check out the stocks we suggest you buy next.

But I'm Already Fully Allocated, and I Have an IRA ...

No worries: *Pro* is here for you. Check out our Making *Pro* Fit You guide for expert advice on how to make our portfolio work for your individual situation.

Welcome to your premier investment service, *Motley Fool Pro*. Below are the five companies we believe you should invest in first with us. We expect each to create value that matches or exceeds 10% annualized returns, keeping up with the current pace of our absolute-returns North Star measure.

BMC Software

- **Industry:** Business software
- **Share price:** Low $30s
- **Allocation:** Invest 4% of your funds ($2,000 in BMC for every $50,000 you manage)
- **Full Reports:** Buy; Buy More

Selling to 81% of the Fortune 500 companies in the world, **BMC Software** provides software that lets corporate mainframe computers, computing clouds, databases, applications, and servers all work smoothly and efficiently together. Despite recent sales weakness, BMC expects earnings per share to grow about 9% in the year ending in March and operating cash flow to increase about 8%, to $825 million. Recently $33.50, the stock trades at only 6.8 times free cash flow and 10 times earnings — in other words, cheap. We see business improving and the stock returning to the $50s in time.

Medtronic

- **Industry:** Medical devices
- **Share price:** High $30s
- **Allocation:** Invest 5.5% of your funds ($2,750 for every $50,000 you manage)
- **Full reports:** Buy; Buy More

With more than 40,000 employees and $16 billion in annual sales, **Medtronic** is a global leader in the medical technology field. A few recent small missteps, tough competition, and uncertainty surrounding future regulation have left investors questioning the company's future growth. But at this price — less than 11 times coming earnings? C'mon. The company's growth is powered by its massive research and development budget, its impressive new product pipeline, and its excellent footprint in emerging markets. With the distribution and scale to win business, we think Medtronic is well positioned to grow.

Oracle

- **Industry:** Business software
- **Share price:** Upper $20s
- **Allocation:** Invest 5% of your funds ($2,500 for every $50,000 you manage)
- **Full reports:** Buy; Buy More

We recommend two large software providers among our Buy First stocks for a reason: They're inexpensive and they're strong businesses, with high recurring revenue, low costs, and gushing free cash flow. **Oracle** is the granddaddy of business software, and yet it's consistently among the fastest-growing software giants, too. Last quarter, some contracts didn't close as hoped, providing investors a lower buy price. We'll take it, and we suggest you do, too.

Pebblebrook Hotel Trust

- **Industry:** Hotel ownership
- **Share price:** $20
- **Allocation:** Invest 4% of your funds ($2,000 for every $50,000 you manage)
- **Full reports:** Buy; Buy More

CEO Jon Bortz knows hotels, so when he saw the fire sales taking place during the financial crisis, he came out of retirement to start **Pebblebrook Hotel Trust**. The company has since busied itself buying up cheap, marquee, luxury hotels in foreclosure and giving them new life. As Pebblebrook finishes renovating and revamping all the hotels it has purchased over the past 18 months, those hotels should become strongly profitable (as past ones have), and these profits should materialize into a growing dividend for shareholders. At the same time, Bortz continues to scout for new opportunities to acquire upscale hotels at temporarily cheap prices.

Rockwood Holdings

- **Industry:** Specialty chemicals, Tio2, lithium
- **Share price:** Mid-$40s
- **Allocation:** Invest up to 5% of your funds ($2,500 for every $50,000 you manage). Start smaller if a more volatile stock concerns you.
- **Full report:** Buy

The disc brakes in your car, the airplanes you fly in, the paint on your home, the fibers in your clothing, the batteries in your electronics, and the pharmaceuticals in your cabinet — even the packaging around your groceries — all may contain **Rockwood Holdings**' specialty chemicals and engineered materials. Rockwood Holdings runs several divisions that all lead in their respective niches, from advanced ceramics used for hip replacements to titanium dioxide for paints and coatings. Rockwood is also one of the world's largest producers of lithium for the quickly growing lithium battery market. This is a volatile stock, but trading at 11 times free cash flow, we're comfortable with its prospects.

Summary

Buying these five companies at our suggested allocation will mean investing about 23.5% of the funds you set aside for *Pro*. It's a healthy start, but one that also leaves you much more room for our coming new trades and our Buy stocks (expect a similar report on those stocks shortly). If you have questions, please post on the Getting Started discussion board. We look forward to investing success with you. Fool on!

— Jeff Fischer, Advisor

When Stocks Attack … in Groups

Published Jan 23, 2012 at 12:00AM

New Members, New Weekly Trades

Dear *Pro* members: Tomorrow (Tuesday, Jan. 24), ***Pro* will open its doors to new members** for the first time since August. The service will be open for one week, and we plan to get new members up to speed with the portfolio quickly, so we thank you in advance for any help you can provide our newest fellow investors on the discussion boards. Also, if you have any family or friends who could benefit from *Pro*, be sure to send them our way this week.

Also, we're excited to announce a new feature in your weekly Memo: **"*Pro* Catch-Up Trades."** Every week, when we see attractive trades, we'll share them in the Memo so members who are not already fully allocated to the position in question can follow along. (Assume that we, too, would be making these trades if we weren't fully allocated!) We hope the Catch-Up Trades will help you catch up with the *Pro* portfolio, or at least make money trying. We'll also single out stocks that have been freshly moved back to a Buy rating. Now, on to the Memo! — Jeff

Fellow Fools:

In last week's Memo, Nick wrote about levels of correlation among the stocks in the *Pro* portfolio. Analyzing correlation can help us improve portfolio decisions, and therefore performance, as we seek to earn absolute returns in various market environments. After all, if every stock we owned moved in lockstep, we'd have no hope in a down market.

As Nick showed, correlation on Wall Street has shown record strength since last August, negating some of the advantages of diversification, but we have several stocks in the portfolio that *aren't* closely correlated (as well as several that are). Let's talk through the implications of what we see.

The *Star Trek* Table

First, let's bring back Nick's colorful table. You'll remember it as the one that looks like it could double for the dashboard on a spaceship. Remember, the columns (or rows) that feature the most orange and red show positions that move similarly to most other stocks in the portfolio. The columns and rows with the most green, meanwhile, show our most independent movers — stocks more likely to trade their own way. (Click on the table to see a larger version.)

Our Least Correlated Stocks

Among our greenest — or least correlated — stocks, you'll find these five:

- **BMC Software**
- **Covanta Holdings**
- **StoneMor Partners**
- **MasterCard**
- **Pacer International**

Pro Catch-Up Trades

For members lacking a position or a full allocation. Please note: You can always buy any Buy First or Buy stock on the recommendation page.

- **MasterCard**: Moved freshly to Buy. Purchase up to 3% in stock around $340 or lower (that's close enough to our $325 Buy Around price). Or, sell to open April $330 puts, lately $15 each, if a $31,500 position doesn't over-allocate you.
- **Intel**: Sell to open July $24 puts, lately above $0.90, for up to 5% in shares if you lack our initial allocation.
- **Tupperware**: Sell to open July $55 puts, lately around $3.20, for up to 3% in stock if you haven't matched our allocation.

Guidance Updates

- **Ebix** moves to Sell on price around $24 (we're aiming to sell via covered calls).
- **MasterCard** returns to Buy on price.
- **Tupperware** moves down to Hold on price.
- **Intel's** Buy Around moves up to $23.50 and fair value up to $27, but shares remain a Hold.
- **GrafTech** Buy Around moves down to $16.50, but shares remain a Buy.

Others, including **OpenText**, **AmTrust Financial**, **Ebix**, and **Papa John's International**, are more green than not, too. AmTrust and Papa John's gained nearly 40% last year while the typical stock was flat. Of course, **BMC Software** is down 39% since last summer (down 19% since we bought it), while most stocks are flat, so low correlation can manifest itself in both directions. But why are these stocks less correlated to the rest of the portfolio?

To get an answer, it may help to find a common bond between our stocks that *are* highly correlated.

Our Most Correlated Stocks

The stocks we own that have been moving together the most are:

- **GrafTech International**
- **Rockwood Holdings**
- **Autodesk**
- **Vanguard Energy**
- **Bristow Group**
- **Plum Creek Timber**
- **WisdomTree Emerging Markets SmallCap Dividend**

Surprisingly, former holding **L-3 Communications** belongs squarely in this "red" group, too. That defense contractor aside, what do all of these companies — from a software provider to a timber owner — have in common?

The answers are oil and construction.

GrafTech sells electrodes used in steel production, but oil is also such a key input in its costs that its product prices can be tied to the price of oil. Rockwood sells synthetic chemicals that compete with organic chemicals like oil, so demand for Rockwood products tends to rise as oil prices go up. Autodesk sells construction-related software, and ironically, construction is more likely to increase as oil prices rise, because rising oil prices suggest rising economic activity. Vanguard Energy is all about oil, as is oil-platform helicopter provider Bristow. And Plum Creek's timber is mostly used for construction.

WisdomTree Emerging Markets SmallCap Dividend ETF is the only holding on this list that doesn't appear directly tied to construction or oil prices. But looking deeper, we see that small companies in emerging markets are likely to excel when the economy is strong — and when the economy is strong, oil prices tend to trend higher.

That may be a tenuous connection, and stocks move for all kinds of reasons, but there's no arguing that oil prices are a common thread for *many* stocks on the market. We know that, but have we pinpointed it in our portfolio until now? Loosely, but not explicitly.

So Now What?

In general, when oil prices go up, so do these stocks (at least in recent years). And vice versa. In other words, we own seven stocks that appear more sensitive to oil prices than the others we hold. Knowing this, we may want to hedge them by taking contrary (and controversial) positions. For example, we could buy an airline stock, which should benefit on a drop in oil. Or we might want to short an oil-tracking ETF, a vehicle we know has flaws to begin with, and one that would hedge our results if oil falls.

Meanwhile, if oil goes up, we should make good money overall. But this makes an extra demand of us: We need to follow the oil industry closely, so we're not blindsided by much cheaper long-term pricing. Cheap oil prices would help construction, so companies like Autodesk and Plum Creek should still benefit, but Rockwood, Vanguard Energy, and Bristow would all likely face a harder road.

What's Covanta's Correlation?

I'll close today with Covanta, our "greenest" company (in a few ways). It gets paid to incinerate trash in urban areas and sells the energy thus generated. What a steady business, right? Trash is a constant, and so is energy demand. So why has the stock drifted lower since July, and why does it trade at only 7.6 times free cash flow?

Consider this: From nearly $5 last summer, natural gas has declined to just $2.47 per British thermal unit (MMbtu), hitting a 10-year low. Covanta's energy sales, which represent just shy of one-third of revenue, compete with natural gas on price. This is why the stock has followed gas prices down month by month. The good news is that so far, we own just one stock that moves with natural gas prices, and it (and therefore we) should benefit when gas prices recover. And don't you feel better just knowing the correlation?

Correlation is important not just to understand how your positions will move in relation to one another, but in relation to outside factors, too. With the knowledge it brings, we can find ways to hedge or leverage our information if we want to, add to positions if we think external factors are changing for the better, or sell if we don't.

Pro Catch-Up Trades

Be sure to look up and to the right for our new Memo feature, *Pro* Catch-Up Trades. These trades represent ways to get on board with *Pro* positions you're lacking. We've opened a new board for it, too — you got it, Catch-Up Trades.

Foolishly,

Jeff Fischer

Pro Trade Roundup

- **Cisco Systems**: Sold to close 30 January 2012 $15 calls and bought to close 30 January 2012 $20 calls (closing our bull call spread) for a net credit of $4.85, or a 34% gain.
- **L-3 Communications** : Sold 1,000 shares at $70.67, ending our position at a 6.4% loss.
- **Pacer International**: Sold to open 58 June 2012 $5 puts for $0.35 each.
- **CurrencyShares Euro Trust**: Sold short 300 shares at $129.77 each.

Community

- Rayneufeld asks, "Add to **SPDR S&P 500** shorts now?" Jeff explains where we are on shorts.
- Earnings are heating up. Don't forget TMFMoosie's full calendar (and our "Happenings" calendar above).
- Alex Pape (TMFPapester) says "au revoir" and the *Pro* community shows its support. We'll miss you, Alex, but we know where you work.

- TMFJazzysay reports on his day spent with **3D Systems**. He was blown away.
- Looking for rain clouds? We've got plenty. Can Wall Street continue to climb a wall of worry? We'll take it either way.

Trade Alert Adjustment: CurrencyShares Euro Trust

Published Jan 20, 2012 at 12:00AM

- **What We're Doing:** We're shorting shares directly instead of setting up a synthetic short. Our strategy remains the same.
- **What We're Thinking:** Our new broker (Interactive Brokers) has shares available for shorting at a 2% annual fee.
- **What We're Expecting:** The costs of the two approaches will likely be similar, but a direct short should be easier to exit.

Trade Essentials

- **Action:** Sell short 3% in **CurrencyShares Euro Trust** (NYSEMKT: FXE). (That's $3,000 worth for every $100,000 you manage; for *Pro*, it's about 300 shares.)
- **Recent Price:** $128.80
- **Price Guidance:** Short above $125.
- **Alternative Trade:** You can continue to hold or set up a synthetic short; lately, selling to open January 2014 $125 calls and buying to open January 2014 $125 puts looks best. See our former alerts for price guidance. (Our first trade alert on FXE can be found here.)

What's New

The market is taking a breather from its concerns about Europe as interest rates drop for short-term debt in Italy and Spain, helped along by the European Central Bank's new cheap money policy. However, long-term debt rates are still lingering near 7% in Italy and 6% in Spain; Italy, in fact, is only a stone's throw away from the 7% danger zone (where refinancing debt becomes too costly). Additionally, the core issues behind the crisis – too much debt and austerity programs that slow revenue — remain across much of the eurozone.

And this backdrop doesn't change our core argument that the euro is built on a flawed foundation. The 17 participating countries share a currency, but lack financial unity *and* financial autonomy. Countries don't have the right to print their own money when they need to stimulate growth, devalue the currency, and inflate away debt. Thus handcuffed, weaker countries like Greece and Portugal slip into a death spiral they can't export their way out of. Even Greece's planned default doesn't get it out from under the weight of crushing, likely unsustainable long-term debt. Something else must give.

Long story short, we continue to believe in shorting the **CurrencyShares Euro Trust**, which only holds actual euro. A synthetic option short (our original recommendation) or a direct short both work; now that we're able to short directly, we'll do so only because it's been difficult to set up the synthetic short the past month at reasonable prices. We expect limited risk with our short — it's unlikely the currency could gain more than 25% to eclipse its old all-time high — and potentially healthy rewards if the euro situation becomes still less stable. Supporting our thesis, interest rates are likely to head lower on the euro, and cheap lending is likely to continue for at least a few years to keep banks solvent and liquid. This should keep the euro's value relative to other currencies — including the U.S. dollar — subdued, if not send it lower. We hope to keep, and benefit from, this short over the next year or two.

Buy More BMC Software

Published Jan 20, 2012 at 12:00AM

- **What We're Doing:** We're buying more stock following a decline.
- **What We're Thinking:** At 6.8 times free cash flow, shares are cheap.
- **What We're Expecting:** BMC will improve revenue, reassuring investors.

Trade Essentials

- **Action:** Buy 1.3% more to bring your current allocation to 4%. (That's $1,300 more for every $100,000 you manage, up to a $4,000 value.)
- **Price Guidance:** Use a limit order around market prices.
- **Recent price:** $33.50
- **Buy Around:** $43
- **Fair Value:** $56
- **Alternate Trade:** Although we're content to buy today, you can write various put options to attempt to buy shares cheaper.

What's New?

- **Last trade:** In September 2011, we bought a 3.5% stake at $41.88.
- **Change:** At $33.50, the stock is down 20%.

Disappointing second-quarter results and weak guidance in October have **BMC Software** performing poorly since our purchase. Although operating cash flow improved by 27% and earnings per share gained 6% on an 11% increase in sales, the company's new license revenue in its enterprise service management (ESM) division dropped 13% last quarter compared to a year ago. (On the bright side, it was up 25% from the prior quarter.)

Management had previously expected license booking gains in this key ESM division this year, but now foresees a single-digit year-over-year decline. One culprit was slower-than-expected hiring in its sales force; attrition was also a factor as BMC lost some key sales staff to higher-paying competitors. The company has since ramped up hiring of sales staff and is addressing its compensation package, so we expect to see business results start to improve during 2012.

Revenue has been left on the table lately because of these problems, but BMC's financials remain strong. The stock trades at only 6.8 times free cash flow, making it one of the cheapest software stocks we know. Other key divisions are doing well, too, including Cloud and SaaS (software as a service). Bookings for both are well above plan, suggesting BMC hasn't lost its competitive edge. For the year ending in March 2012, BMC expects non-GAAP diluted earnings per share to grow about 9% year-over-year, and operating cash flow to increase about 8%, to $825 million. At $33.50, the stock currently trades at 10 times expected earnings.

Quarterly results are due Feb. 1, and they may be rocky; it takes time to hire and train sales staff. But management said last October that its guidance was intentionally cautious, and the stock already looks washed out at this low multiple to free cash flow. The software sector in general is in Wall Street's doghouse at the moment after soft sales at **Oracle** and **JDA Software**. Investors rightly remain concerned about government spending in the face of austerity programs, but given BMC's strong recurring revenue, low cost structure, high cash flow, and plenty of growth potential ahead, this is a good time to buy in with a longer-term mindset. Then, all we need to do is wait for the storm clouds to pass and more reasonable valuations to return.

- Next step: Visit the BMC Software discussion board with any questions.

Sell L-3 Communications

Published Jan 19, 2012 at 12:00AM

- **What We're Doing:** We're selling our shares of **L-3 Communications**.
- **What We're Thinking:** Cuts in defense spending now seem inevitable; the only question is how deep they'll be.

- **What We're Expecting:** Defense spending will remain an easy target on Capitol Hill for years to come.

Trade Essentials

- **Action:** Sell all shares.
- **Recent price:** $70.50.
- **Limit Guidance: Sell as close to the current market price as possible.**

What's Changed?

- **Last action:** In February 2011, *Pro*'s Charter and 2011 Portfolios wrote April 2011 $80 puts.
- **Total return:** -3.5%

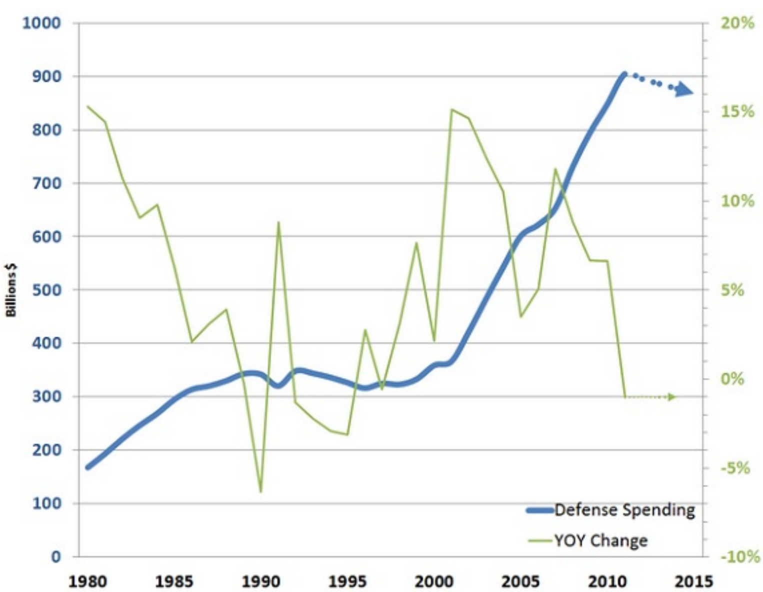
Investing, to the extent that you disagree with the crowd, is an arrogant act. And that's fine, as long as you can articulate why the market is wrong and why you are correct (and provide facts to support your case). When it comes to defense contractor **L-3 Communications**, three things over the past year have changed our thesis:

1. The debt-ceiling debacle, which made cuts to defense spending likely.
2. The subsequent failure of the congressional supercommittee on debt, which made cuts to defense spending *very* likely.
3. L-3's own management, which is now guiding for poorer performance in 2012.

After incorporating these events into our analysis, we find our view of L-3 no longer significantly differs from the market's pessimistic view. The company's free cash flow yield is mouthwatering, but we have less confidence in the stability of that cash flow, making it a less reliable pillar of our investment thesis. And modeling a likely range of operating performance now gives us a fair-value range of between $56 and $78 — much lower than the $100 fair value we placed on the shares when we first recommended the company in November 2010. The wide fair-valuation range is the result of too many potential outcomes with defense spending.

Ordinarily, we might write covered calls to exit this position at higher prices, but the upcoming spinoff of L-3's government-services operation, Engility, makes that more difficult. As L-3 shareholders, we would receive shares of Engility after the split (expected to be completed in the first half of 2012), and we'd see a commensurate reduction in LLL's share price. Engility's operating performance is worse than L-3's consolidated results, but both businesses are in decline — at least temporarily. The split could make L-3 more attractive to future investors, but as current shareholders, we'd be responsible for selling the shares of the new company on the open market. All that makes us more inclined to exit the position cleanly with a simple and direct selling of our shares.

Central to our original thesis was the idea that defense companies are less correlated to the economy than most other sectors. That was certainly the case during the defense-spending boom that followed 9/11, but is less true now given the sluggish economy, the ongoing conflict over the debt ceiling, never-ending budget revisions, base closures, general wacky political machinations, and a new commitment to lowering U.S. troop counts worldwide. Budget constraints drive fiscal decisions, and we can no longer confidently conclude that defense spending is safer than the market predicts.



Source: USgovernmentspending.com and analyst calculations.

The blue line on the graph above shows the incredible ramp up in U.S. defense spending after 2001 to its current level of $900 billion a year. Such big numbers mean that even a small annual decrease in overall defense spending could have a significant impact on defense companies' valuations. In other words, those companies' valuation multiples currently look cheap on a historic basis — but they may not be cheap when looking to the future.

In the end, politicians' decisions, budgetary realities, and — starkly — new conflicts will determine the fate of the defense industry. But right now, defense spending is under fire, making growth less likely. And we know we can invest in companies that are growing instead.

How to Follow Along

We'll sell all of our shares of L-3 in the next one to 30 days. If you're comfortable owning shares longer and are willing to accept (and later potentially sell) the shares you may receive in the Engility spinoff, consider writing near-the-money covered calls for a higher sell price. Also realize that L-3 is expected to report earnings Jan. 31; we have little insight into those results, but expectations are low.

Next Steps: Visit the L-3 Communications discussion board to post questions, and then make your trade.

Close Your Bull Call Spread on Cisco Systems

Published Jan 18, 2012 at 12:00AM

- **What We're Doing:** We're closing our **Cisco Systems** bull call spread, which expires Friday.
- **What We're Thinking:** This was never intended to become a stock position, and we can lock in a gain by closing the spread**.**
- **What We're Expecting:** Cisco's stock may become more volatile after Intel reports earnings Thursday night, so we'll aim to close before then.

Trade Essentials

- **Actions:** "Buy to close" all January 2012 $20 calls; "sell to close" all January 2012 $15 calls (use a single spread order).
- **Price Guidance:** Use a **net credit limit order** that's as close to current intrinsic value as possible. This means that with Cisco stock lately at $19.55, you would aim to close the $15/$20 spread for around a $4.50 credit. (The current share price minus the $15 strike is your barometer for measuring the intrinsic value of the $15 calls you own; but you'll also need to pay a few pennies to close the $20 calls.)
- **Follow-up:** Although *Pro* won't have a position in Cisco, the discussion board will still be accessible if you did an alternative trade and own shares.

What's Changed?

- **Last Action:** In August 2010, *Pro* set up 30 spreads at a cost of $3.36 each.
- **Price Change:** Worth $4.40 today, our investment is up 31%, even though the stock is down 11.6% since our trade.

I like option spreads. You sell one option, then use the proceeds to buy the same type of option at a different strike price but the same expiration. Then, having capped your risk, you look to pocket the difference between the two prices by waiting for time to do its thing. Spreads are ideal when you want to profit on a modest move in a stock (or, as we see here, even no move at all) without much extra effort. Once you set up a spread, it's usually best to leave the trade alone until very close to expiration. In fact, it can be costly to act earlier. And even if the position doesn't work out, you know your risk is limited to your initial small investment.

As the giant in the networking business, **Cisco Systems** demanded little of our attention during the course of our bull call spread. It did report some weak quarters last year, but we knew shares were a value trading at a single-digit multiple to free cash flow, and we were confident that the breakeven price in our spread ($18.36) was reasonable.

However, we're not inclined to turn our spread into 3,000 shares of Cisco stock at that price, mainly because our portfolio has a high level of exposure to technology already — including bellwethers **Intel** and **Oracle**, two businesses we believe we understand better than Cisco. In fact, we're looking to close our Cisco spread before Intel reports earnings after market close Jan. 19. Sometimes Intel moves the whole tech sector, and although good news could send Cisco stock higher, weak news could wipe out much of the profit on our spread before Friday's expiration. So we'll take our gain and go.

Is another Cisco spread in our future? Perhaps. It's one way to invest in this inexpensive stock without committing much capital or taking much risk. What is certain is more bull call spreads on various companies are in our *Pro's* future.

Next step: If you have questions, please visit the Cisco Systems board.

Earn Higher Returns With Less Risk

Published Jan 17, 2012 at 12:00AM

Pro Fools,

In last week's Memo, Jeff discussed how the *Pro* team started the year with an aspirational eye on our North Star. Forecasting our expectations for each *Pro* position's three-year returns, then comparing those numbers to our North Star, was (and is!) helpful in informing our portfolio decisions — but it's just one factor in our process. Every stock has a role to play in our portfolio, and in the coming weeks, we'll be working on communicating those roles more plainly.

Pro Trade Roundup

- **Ebix**: Sold to open 27 February 2012 $23 covered calls for $1.10 each (covering all shares).
- **Intel**: Sold all 10 of our January 2013 $10 calls for $15.80, a 38% gain.

No Such Thing?

Don't yell "Fire!" if you want me to leap out of my chair; yell "Free lunch!" Nothing — not even a snowstorm — gets me vertical as fast as the announcement of free food at Fool HQ. In our office, no one is dumb enough to offer complimentary eatables without being able to make good on the offer. But in the investing world, there's no shortage of pitchmen offering the investing equivalent to free chow — higher returns with less risk. Such strategies, I suspect, succeed at separating investors from their money and little else.

That said, investing may actually offer a free lunch in the form of diversification. "Diversify" may be the most well-worn bit of investing advice out there, and for good reason. If you hold a range of assets, some of which zig while others zag, you should always have winners to offset temporary losers — in other words, higher returns with less risk. That seems simple enough, but how do you know how much something will zig? Or when it will zag?

Measuring Zigginess and Zagginess

Correlation is the statistical measure of how two things (in this case, two stocks) behave (zig and zag) in relation to one another. This relationship is expressed as a correlation coefficient with a value between -1 and +1. If both stocks rise and fall together, never deviating in direction, they exhibit perfect positive correlation: +1. If there is no relationship between their movements whatsoever, the coefficient is zero. And -1 means the stocks always move in opposite directions. Most stocks exhibit a correlation between 0 and +1.

Typical diversification advice is of the "don't place all your eggs in one basket" variety: Invest in eight to 30 stocks, ideally in different sectors, to avoid related business risk. This is good advice, to be sure, but it's not sufficient for *Pro* investors. The best strategy, and our goal, is to invest in uncorrelated assets, which is why it is important to actually measure correlation and not just assume it. When choosing between two stocks with similar risk and return tradeoffs, choose the one with lower correlation to your portfolio.

Pro's Correlation Matrix

The graphic below shows all the possible correlations between each pair of stocks (pairwise correlations) — omitting shorts and options — for our portfolio. (Click to make the table larger.)

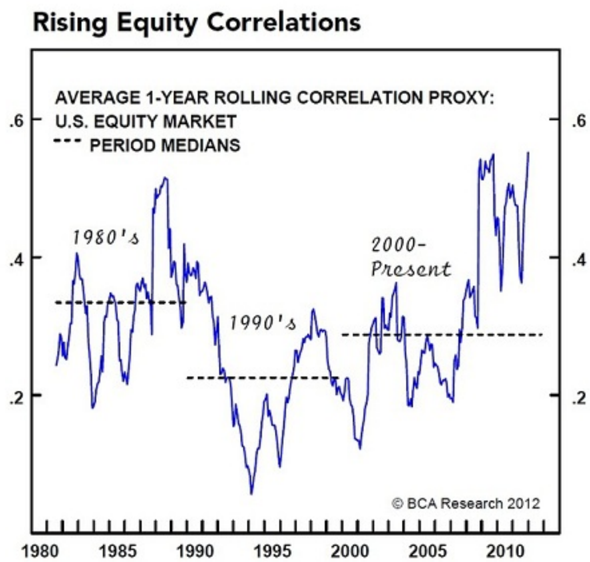
Source: Portfolio Lab Pro and analyst calculations

After last week's Memo, some members on the discussion boards expressed their concern about our modest return expectation for **Covanta**. In reply, Jeff gave his take on the company's cheapness, and Bryan explained: "We consider every stock's place within the portfolio, not just on its own. Covanta is one of our least correlated (to the other stocks in the portfolio) holdings, so it provides wonderful diversification benefits. And we care about both reward *and* risk." The matrix above offers visual representation of this diversification — it's hard to miss Covanta's lovely green color throughout, indicating a low to nonexistent correlation with the other stocks in our portfolio.

Perhaps more striking, and not to our benefit, are the reddish hues representing strong correlations between positions. (Ignore the red squares moving diagonally across the matrix; they merely state that each stock is perfectly correlated to itself, which, of course, we already knew.) As we continue to adjust our portfolio with our North Star in mind, you may notice us moving away from lower-conviction ideas, especially those that are highly correlated to our portfolio. We'll do this to remove risk without, we hope, affecting return.

How High Is High?

Jeff has quipped over the past year that all stocks are moving together, and he is correct — correlations are getting stronger.



This image from BCA Research shows that the median correlation between any two U.S. equities over the past decade is about 0.3. More recent rolling correlations are closer to 0.5 or 0.6, which is high – and that shouldn't be surprising. We're investing in a very uncertain environment in the wake of a severe credit crisis and on the back of a stock market crash. When you hear the now-popular term "risk on, risk off," know that this is, in part, what it refers to. In the "risk on" phase, investors are happy to own risky assets and bid up the prices, but when the "risk off" mood hits, they quickly change their mind. No longer wanting to own risky assets, they sell at lower prices. This leads to higher correlations between stocks — and higher volatility — than the underlying business factors would suggest. And increased correlation is bad for investors, because it makes diversification more difficult and somewhat less useful.

What's a *Pro* to Do?

Fortunately, we follow a flexible, absolute-return investing strategy that allows shorts and options. Our portfolio is well diversified, and our current S&P 500 short offers significant negative correlation to our holdings, further reducing overall riskiness. Moreover, as options investors, we build strategies with non-normal return profiles — in plain English, we hedge and collect premiums in exchange for the obligation to sell shares higher or buy shares cheaper. That means we can manage our risk *and* profit through a wide range of outcomes.

Nick Crow (TMFCrow)

A New Role for Analyst Alex Pape

Please join us in congratulating Alex Pape (TMFPapester), who will be leaving his role as an analyst on *Pro* and *Motley Fool Options* to lead product development for the Fool. It was admittedly a tough decision, but Alex has decided he can best help the Fool pursue its purpose ("To help the world invest. Better") by working to create new and improved investment services and structures. Since Alex will still be in-house, we'll have access to him as a backup to the backup for the stocks he covers. (Every *Pro* investment is followed by at least two team members, so there will be no interruption in coverage.) We appreciate everything Alex has brought to *Pro* over the past year! To bid him farewell (or pitch your idea for a new investment vehicle), please visit our Meet & Greet discussion board.

Community

- *Pro* has made a lot of options trades lately, but it's not necessary that you use options to do well with *Pro*.
- Alex34 posts puts that match *Pro* criteria.
- Dagoddar59 is starting to deploy his assets Foolishly and asks the community for help.
- Palindrome1 is writing covered calls on **ProShares Short S&P 500**. Jeff tells all members we're aiming to wind down our index shorts in favor of company-specific shorts.

Trade Update: CurrencyShares Euro Trust

Published Jan 13, 2012 at 12:00AM

Dear *Pro* Fools,

A month has passed since we recommended that you short the **CurrencyShares Euro Trust**. Our guidance was to use a synthetic short option strategy or (assuming your broker had shares to borrow inexpensively) to short the trust directly. As always, we provided pricing guidance in the original recommendation; we said to set up the synthetic short for around a 1.5% cost to the trust price. It'd be impossible to make this trade without paying a bit of a premium to start (view it as a commission), but 1.5% was a reasonable ding to accept. So the stage was set.

Downgrades for the Euro Zone?

News is bubbling up today concerning an S&P downgrade of France's credit rating, and potentially that of other euro zone countries, too. This isn't surprising. We had certainly *hoped* to be short the euro before the downgrade, but even with it, our short thesis doesn't weaken. The downgrade actually supports our original thesis regarding the difficulties the region faces.

However, the euro began to decline quickly following our report. (We take no credit!) With its drop, the premiums on the options grew, and despite trying for four weeks, we haven't been able to place our trade at, or even near, our recommended limit. At the same time, we're in the process of moving *Pro*'s account to a new broker, and we know our new broker currently has shares available for shorting. A direct short is much easier, perhaps cheaper in the end, and remains our preferred alternative.

So here's where we stand: Even though the price of the trust has declined, our recommendation to short it has not changed.

- **If you've already set up the synthetic short, or have shorted FXE directly:** Maintain your position. Our recommendation hasn't changed, and we'll be joining you as soon as possible.
- **If you haven't established a position in FXE yet:** With the trust recently hugging $126, aim to set up the $125 synthetic short for a $1 debit, equating to a short price of around $124. Just as before, as prices change when you're initiating the trade, use the strike prices nearest the current trust price, and aim to pay only around a 1.5% penalty to set up the trade. The ugly math: $1.89 = 1.5% of $126, meaning your synthetic short can have a start price of around $124.11 when the trust trades at $126.

In other words, our suggested trade still stands: Aim to set up the synthetic short for a 1.5% cost above a straight short at the current trust price. If you're raring to get this trade done, up to a 2.5% cost is acceptable assuming you plan to hold to expiration (so you won't need to pay more friction costs to close the options early).

However, if you can short shares *directly* at no cost (they are available to short free of charge at TD Ameritrade) or for low cost (Interactive Brokers is lately charging 1.8% a year — preferable to the option trade because it'll be much easier to close the short than the synthetic short), then you should short FXE directly. That is what *Pro* will do once we've changed brokers (which should happen literally any day), if we haven't been able to execute the option trade yet at our price guidance. (Of course, we'll send a new trade alert to you before taking any action.) In the meantime, we'll continue to try to set up the synthetic short for around a 1.5% cost.

If you have questions about our FXE short, please visit the CurrencyShares Euro Trust discussion board. Fool on!

Sell to Close Your Calls on Intel

Published Jan 10, 2012 at 12:00AM

- **What We're Doing:** We're taking the gain on our January 2013 $10 calls on Intel.
- **What We're Thinking:** Intel will remain our largest stock position at 7%, and profits in calls can be ephemeral, so it's often wise to take them when you can.
- **What We're Expecting:** Share-price volatility may increase after Intel reports earnings Jan. 19.

Trade Essentials

- **Action:** Sell to close all January 2013 $10 calls on Intel
- **Price Guidance:** Use a limit order and try to sell for intrinsic value — so if Intel's stock is at $25.55, look sell your calls for about $15.55
- **Follow-up:** We'll still have a 7% stake in Intel stock

What's Changed?

- **Last Relevant Action:** In November 2010, *Pro*'s Charter Portfolio bought 10 calls.
- **Price Change:** Up 34%

Don't Own Intel Calls?

Former followers of Portfolio 2011 don't own Intel calls; if this is you, ignore this trade, but keep holding Intel stock.

Our **Intel** (NASDAQ: INTC) calls are up 34% since our November 2010 purchase, earning us a long-term capital gain. And most members should have considerably higher returns than we do, given the required delay between our trade alerts and purchases. In 2011, Intel's business performed as *Pro* expected, growing earnings per share an estimated 15% even as the rest of Wall Street anticipated flat results. This growth led to a 22% gain in the stock, and a 34% gain in our calls.

At 11 times trailing earnings and with a 3.3% yield, Intel still looks reasonably priced, so we're content to keep our large 7% allocation in the stock. Wall Street (again) expects flat earnings in 2012, but we believe the company could (again) pleasantly surprise. However, we're content to sell our 1% stake in the call options now that they offer us a meaningful return. The calls don't provide a dividend, of course, and they expire in just more than a year. A recession in Europe could easily weigh on Intel and bring the stock price lower this year, and if that happens, our long calls will feel twice as much pain as the stock.

The year will be pivotal for Intel in other ways, too: Will the company start to infiltrate the mobile market? It expects to, as smartphones begin to ship with Intel chips. Intel is also banking on super-thin Ultrabooks to revitalize the computer notebook market and compete with tablets. We believe corporate upgrades and emerging markets should drive most of Intel's profits, although a slowdown in China remains a risk. In short, Intel remains a favorite long-term stock of ours, but we're happy to lock in a profit on the more sensitive — and more timely — call options we own.

Next Step: If you have questions before you sell to close your calls, please visit the Intel discussion board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Write Covered Calls on Ebix

Published Jan 10, 2012 at 12:00AM

- **What We're Doing:** We'll earn income while setting ourselves up for a higher potential sell price.
- **What We're Thinking:** The stock is near its $24 fair value, and we don't want to keep it once it exceeds that price.
- **What We're Expecting:** We're likely to continue writing covered calls, when possible, until we sell our shares.

Trade Essentials

- **Action:** Sell to open February 2012 $23 calls, one for every 100 shares of Ebix you own.
- **Price Guidance:** Aim to receive $1.20 or higher. As prices change, accept no less than $1 (a 4% yield on the share price in five weeks).
- **Alternate Trade:** If you own fewer than 100 shares, you can't write calls, but you can sell the stock when it's near $24.

What's Changed?

- **Last action:** In June 2011, *Pro*'s Portfolio 2011 bought shares around $18.
- **Recent price:** At $22.55, Ebix is near our $24 fair value.

Shares of **Ebix** (NASDAQ: EBIX) have gained 70% from their October low, 

which is why we're writing covered calls today. This steep climb, which doesn't seem to be based on any significant business news, has the stock within striking distance of our $24 fair value — and despite steady improvements in cash flow, accounting methods, and management, this isn't a stock we want to own at higher than its fair value. Thus, covered calls are a natural, proactive strategy at this price.

The *Pro* portfolio is heavily invested in software and technology, and we feel we know the sector well. By selling Ebix at a fair price, we believe 

we'll be able to reinvest the proceeds in cheaper, more robust companies in the same sector — or elsewhere if desired.

If we receive $1.20 to write these calls, we'll set up a potential sell price 7% higher than today's share price. In the meantime, we'll receive a 5% yield on the current share price between now and expiration in five weeks.

Next step: If you have questions before you sell to open these covered calls, visit our Ebix discussion board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Write Puts on Pacer International

Published Jan 10, 2012 at 12:00AM

- **What We're Doing:** We're seeking a favorable buy price on more shares of Pacer.
- **What We're Thinking:** We'll be happy to fill our position out to 3% around our initial price of $4.60.
- **What We're Expecting:** Either the share price of this volatile micro-cap will come back down, or we'll need to settle for income.

Trade Essentials

- **Action:** Sell to open June 2012 $5 puts
- **Allocation:** 2%, for 3% total (for *Pro*, that's another 58 contracts; for members, it's four contracts for every $100,000 you manage)
- **Price Guidance:** Aim to receive $0.45 or higher. As prices change, ideally accept no less than $0.40 (for an 8% yield on the share price in five and a half months).
- **Alternate Trade:** Sell to open March 2012 $5 puts for $0.20 or more; they expire sooner and pay less, but may be superior if you have a large portfolio and pay low commission rates.

What's Changed

- **Last action:** Last month, we sold to open December 2011 $5 puts; the puts were converted to shares at about a net $4.60.
- **Recent price:** $5.71, up 28%.

There's nothing new to report about **Pacer International** (NASDAQ: PACR) over the past month, but shares are up 28% anyway. Bulls project a continued turnaround for the tiny intermodal transporter of goods, bears are banking on stagnation or worse, and the company's stock price is volatile as a result.

We remain in the bullish camp, but we prefer to buy the stock more cheaply if possible. Thus, we're once again recommending writing puts to try to buy more shares at a discount. Pacer is 1% of our portfolio already, and we'll continue to write puts until it reaches 3% (or we'll just keep earning income in the meantime) — that is, as long as the stock price remains reasonable. If you don't own any shares yet, you can write enough puts for 3% this go-around.

Next step: Before writing your puts, ask any questions on the Pacer discussion board.

See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Are These Our 10 Best Stocks?

Published Jan 9, 2012 at 12:00AM

Fellow Fools,

The *Pro* team met three times last week to measure every investment we've recommended in the context of our service's North Star, which is currently returning 10.4% a year (inflation, recently at 3.4%, plus a never-wavering 7%). Independently, each member of the team rated every *Pro* position on this question: Do you believe it will gain more than our aspirational North Star over the next three years, or will it fall short of the North Star?

Monday Memo Skips a Day

Fool HQ is closed Monday, Jan. 16, for Martin Luther King Jr. Day, so expect next week's Monday Memo at 4 p.m. ET Tuesday, Jan. 17!

The good news is that we unanimously agree that 10 positions (nearly half the *Pro* portfolio) appear likely to closely follow or outdistance the North Star over the next three years. From recent prices, we estimate at least 10.4% annualized returns from these:

1. **3D Systems**
2. **AmTrust Financial Services**

3. **Autodesk**
4. **MasterCard**
5. **Medtronic**
6. **Oracle**
7. **Pacer**
8. **Plum Creek Timber** (with accompanying strangle)
9. **Wells Fargo** (with accompanying strangle)
10. **WisdomTree Emerging Markets SmallCap Dividend Fund**

This list naturally leads you to some questions. For instance, if we expect strong returns from Autodesk, why is it on Hold right now? The answer is twofold: We expect those returns to be earned with higher risk than average, and we assume members have already bought shares around $27, 15% lower than today's price. That said, our unanimous conclusion means we need to revisit our rating on the stock. Similarly, we need to consider removing our collar on AmTrust if its March expiration isn't soon enough and targeting more shares of Pacer, among others.

Let me be clear: This is a list of companies we unanimously agreed are strong competition for the North Star that guides us. If a company is not on this list, in most cases just a single team member predicted it would come up short of the North Star's likely performance. For example, I rated recent buys **BMC Software** and **OpenText** to outshine the North Star, but at least one *Pro* analyst disagreed. After discussing BMC and reviewing the company's prospects and its discounted valuation (at 6.2 times free cash flow, BMC is one of the cheapest companies in our portfolio), we're happy to keep it a Buy First. In other words, companies not on this list still have our confidence until you hear otherwise; context matters. Our hopes for **Rockwood Holdings**, **GrafTech**, **Tupperware**, and others haven't changed overall.

Note that two of the positions on the list are strangles. In 2011, we earned approximately a 15% return on Plum Creek Timber even though the stock price was flat — that's well north (sorry) of our North Star, thanks to the income from our strangle positions and the stock's 5% dividend. We'll generally target annualized gains at least as large as our North Star (currently 10.4% and likely to go higher) on each position we hold, however we can achieve them. (Also, the short-term income from positions such as strangles is special because you can spend it, or live on it, and keep your stock positions unchanged. For this reason, we will tabulate our income from all related income strategies every year; we remain fans of strangles, with plans to add more.)

What Might Stray Off Course?

The *Pro* team also unanimously agreed that five stocks currently in our portfolio are more likely to fall short of the North Star's 30%-plus estimated return over the next three years. That said, these stocks still might merit a place in the portfolio, at least for the time being. Not every position has to be a double-digit return generator. Some serve other purposes — low correlation to the rest of our stocks, for example, or buyout potential, or hedges and paired trades. But here are five we agreed may lose sight of the North Star from time to time:

1. **Bristow Group**
2. **Covanta Holdings**
3. **Ebix**
4. **L-3 Communications**
5. **Vanguard Energy**

We respect Bristow, but helicopters are expensive toys, so we're content to sell our shares around our $50 fair value. As a result, we recommended covered calls last week to make money on Bristow while we wait to potentially sell it by June. Trash-to-energy barn-burner Covanta Holdings is a steady cash-flow generator as a business, but without higher energy prices or a buyout offer (which may be reason enough to hold it), it may struggle to return more than 30% over the next three years. We plan to keep this bargain-priced company for now, but we're looking at potential ways to squeeze more income from it.

Live Chat on Wednesday!

Join renowned international affairs expert Niall Ferguson of Harvard University and Jeff Fischer of Motley Fool *Pro* from 1:30 to 2:30 p.m. ET this Wednesday, Jan. 11. They'll be live, answering your questions about the ongoing crisis in the eurozone, including relevant investment strategies. (Alex Pape, a Motley Fool analyst, will moderate the discussion.)

Insurance commerce facilitator Ebix is near our $24 fair value, so it's not surprising to find it on this list. Meanwhile, the story at our lone defense-industry investment, L-3 Communications, is changing as the government threatens to curtail its defense budget for the long haul. L-3 already expects lower sales and earnings next year, so we're reconsidering the investment. Finally, Vanguard Energy has done well with oil near $100 a barrel, but if oil doesn't rise higher than $130 in three years, the ETF may not grow by 30%. That said, I like this ETF as a "call option" on a spike in oil prices, even if it may not follow our aspirational North Star to the digit.

What's Next?

The 10 other portfolio positions we assessed each received at least one dissenting vote, so we're in discussion about each one. We have two goals: to concentrate on positions we believe will adhere closely to the straight path that's lit by our North Star, and to either further monetize or close positions we believe could wander off course. Expect our upcoming trade alerts to accompany the conclusions we reach. We have work to do! To talk about this Memo, visit our Memo Musings discussion board.

Fool on!

Jeff Fischer (TMFFischer)

Pro Trade Roundup

- **Expeditors International of Washington**: We set up a put broken wing butterfly income position for a net credit of $4.90 before commissions. We sold to open 13 May 2012 $42.50 puts and 13 May 2012 $42.50 calls for $5.90 per contract combined. We bought to open 13 May 2012 $30 puts and 13 May 2012 $50 calls for $1.00 per contract combined.
- **Bristow Group**: We sold to open 12 June 2012 $50 calls for $2.35 each, covering all shares.

Guidance Updates

- **L-3 Communications** moves down to Hold pending portfolio decisions.
- **Covanta** moves down to Buy following our re-evaluation, as we wrote in this Memo.
- **StoneMor Partners** moves down to Hold just while we clarify everyone's long-term tax implications with a CPA. No worries, though. We'll report back.

Write Covered Calls on Bristow Group

Published Jan 6, 2012 at 12:00AM

- **What We're Doing:** This strategy is meant to earn us income while we wait to sell shares near or above our estimate of fair value.
- ### Don't Own 100 Shares of Bristow?

  If you own fewer than 100 shares, look to sell them above $50. If you don't own any or would like to build out your position if shares fall, stay tuned: We'll start to get interested if this volatile stock sinks to the low $40s.

- **What We're Thinking:** Bristow operates in a tough business, and it's hard for the company to consistently book high profits. As shares reach fair value, we're willing to let them go.
- **What We're Expecting:** Bristow has great growth prospects ahead, but that growth won't be profitable enough to propel the stock price much higher.

Trade Essentials

- **Business: Bristow Group** (NYSE: BRS) ferries crews and cargo to oil exploration and production platforms far offshore using its sweet fleet of helicopters.
- **Action:** Sell to open June 2012 $50 calls, one for every 100 shares you own (for *Pro*, that's 12 contracts).
- **Limit order guidance:** As prices change, aim for a net selling price (strike price plus premium received) of $52.50 or higher, or 5% or more above our $50 fair value. At current prices, try to sell the call options for a price greater than $3.

The Strategy

Writing covered calls turns an owned stock into an income producer, offering an attractive net sell price if shares rise and providing an income cushion if they fall. We're choosing a strike price that corresponds with our estimate of fair value ($50), and if shares are above that price by the time they expire in June, we'll bid them *bon voyage* at a price 14% above today's. If the stock stagnates or declines, we've allotted ourselves 6.5% downside protection, in the form of income, by writing these call options.

What's Changed?

- **Last Action**: We wrote December 2011 put options in Port 2011 in an attempt to buy shares at $40.
- **Recent Price**: At $46.50, Bristow's stock is only 7% below our estimate of fair value.

We've said on several occasions that Bristow's stock looks attractive below $40 and fairly valued near $50 — and lately, it's flying near $50. But before deciding to potentially sell a good company, we took a fresh look at the valuation and business. That review has us more confident that Bristow *will not* be able to earn the dramatically improved returns we think are needed to justify a much higher valuation. Here's why:

- We don't believe Bristow's power to negotiate contract prices will improve, particularly as it does more business with state-owned oil companies (which operate under less public scrutiny and have lower switching costs).
- Competition will likely continue to erode the attractive margins Bristow currently enjoys in many international regions.
- Bristow's cost of growth (acquiring new helicopters, training local pilots) is high, and opportunities to lower the cost of acquisition (improved cost of capital, leasing instead of buying) won't tip the scales in the company's favor.

Bristow has recovered nicely since being unfairly punished during the Gulf oil spill disaster — the original reason we bought in. We like Bristow as a company, too. It has done a great job positioning itself in a difficult industry, and it may have a hidden asset in the form of pricing power it's not currently taking advantage of. Its assets and safety record are hard to replicate; at the right price around $40 or lower, members should look to buy. But we don't think it's likely the business will improve enough to justify an upside much higher than $50, so we're trading that upside for option income.

- **Next Steps:** Buzz on over to the Bristow discussion board to ask your questions and discuss our current strategy.
- **Need Background on Bristow?** See the full archive of our coverage.

See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Set up a Put Broken Wing Butterfly on Expeditors International

Published Jan 4, 2012 at 12:00AM

- **What We're Doing:** We'll earn income if the underlying stock, currently at $41, stays in a range between $37.20 and $47.80.
- ### An Iron Butterfly by Another Name

  An iron butterfly is the combination of two spreads: a bear call spread and a bull put spread. If you're unable to set up a four-legged butterfly trade in one order with your broker, you could set up the $42.50/$50 bear call spread, and $42.50/$30 bull put spread, as two trades.

  #### Butterfly Flying?

If Expeditors' stock moves sharply before you're able to make the trade, please consult the discussion board for new potential strike prices.

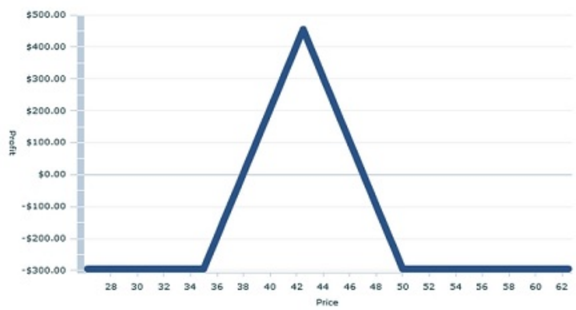
- **What We're Thinking:** We want more income as we follow our always-positive North Star.
- **What We're Expecting:** This strong company looks fairly valued, so its stock is more likely to be range-bound.

Trade Essentials

- **Business: Expeditors International** (NASDAQ: EXPD) facilitates the global transport of goods.
- **Action and Price:**
  - **Sell to open:** May 2012 $42.50 puts *and* calls (a short straddle), for a combined credit of around $6.30. As prices change, accept no less than $5.50.
  - **Buy to open:** May 2012 $30 puts and $50 calls (a protective strangle), lately for a combined cost of around $1; use a limit order.
  - **Total credit:** Around $5.30 net on the four options; no less than $4.90.
- **Allocation:** Our written put obligation will represent 4% of the portfolio at our break-even price of $37.20. For *Pro*, this means 13 contracts of each option.
- **Potential Profit:** A maximum of $5.30 if the stock is at $42.50 at expiration and a partial profit if the stock is anywhere between $37.20 and $47.80.
- **Potential Loss:** The same as a short starting at $47.80, but with losses capped if the stock reaches $50 (a potential loss of $2.20 per share); the same as stock ownership starting at $37.20, but with losses capped if the stock reaches $30 (a potential loss of $7.20 per share).
- **Follow-up:** We may buy shares if they decline to the mid-$30s or roll the butterfly to a new month before expiration.

The Strategy

With this position on Expeditors International, we aim to generate healthy income with low capital investment and reasonable risk. An "iron butterfly" is a neutral income strategy that involves selling calls and puts at the same strike price (this is called a straddle), then buying calls at a higher strike price and puts at a lower strike price (a strangle) to cap your risk in both directions. The nearer the stock price is to your straddle's strike price at expiration, the more income you keep. Here's the profit chart on a standard iron butterfly featuring a $42.50 straddle and long $35 puts and $50 calls that cap your potential loss. (Click to see larger.)

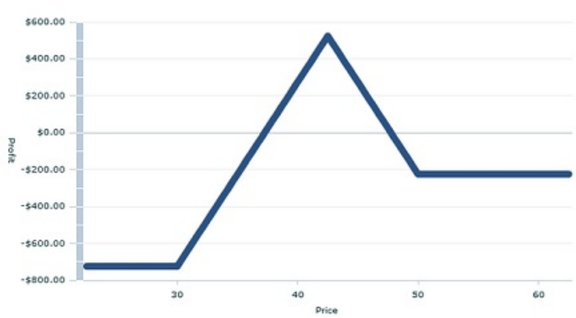


Current Price: $41.1

Price	Profit / Loss
26.25	($295.00)
33.21	($295.00)
35.00	($295.00)
37.95	$0.00
40.53	$258.00
42.50	$455.00
47.05	$0.00
47.85	($80.40)
50.00	($295.00)
55.18	($295.00)
62.50	($295.00)

Source: OptionsXpress.

Our position on Expeditors International, however, isn't a straight iron butterfly, where the wings are nicely even (see them above?). Instead, this "put broken wing" butterfly entails buying puts that are farther from our straddle strike price than the calls we purchase. This lowers the cost of our puts, increasing our potential income, but gives us less downside protection. We're comfortable with this compromise because we're ready to buy shares if they decline. The profit chart on our put broken wing butterfly looks like this (click to see larger):



Current Price: $41.14

Price	Profit / Loss
22.50	($725.00)
30.00	($725.00)
30.18	($707.30)
37.25	$0.00
38.26	$100.80
42.50	$525.00
46.34	$141.20
47.75	$0.00
50.00	($225.00)
54.42	($225.00)
62.50	($225.00)

Source: OptionsExpress.

Poor butterfly! Its left wing is hurt.

OK, back to business. If Expeditors' stock price declines, we're buying shares in the mid-$30s to wait for a recovery. We will, however, buy $30 puts to limit the capital we need to set aside for this trade, and to mitigate the risk of any surprise that might take shares below $30. And we're buying $50 calls to protect against the stock soaring.

To review, if the stock is between approximately $37 and $48 by expiration, we'll earn at least a partial profit on this income strategy. We're hoping the shares stay close to our $42.50 straddle price, where we'll earn the most premium possible. The May expiration sounds distant, but we want to collect a large enough combined option premium that we have a wide share price range in which to profit.

The Business

Expeditors keeps the wheels of commerce turning worldwide, particularly in Asia (where it generates 57% of its revenue) and the United States (24%). Rather than owning costly airplanes, whale-harassing ocean freighters, or diesel-guzzling trucks, the company buys space on these carriers at wholesale prices and resells it in smaller chunks at retail rates.

About one-third of Expeditors' customers are moving basic retail items, and another third are shipping more sensitive consumer electronics and tech products; the remainder runs the gamut from pharmaceuticals to business and government products to general consumables. A true headache-saver, Expeditors handles all the logistics and navigates the cumbersome customs laws for its shipping customers. The company is cash-rich, debt-free, and run by no-nonsense management. Veteran members will recall that *Pro* has owned — and strangled — Expeditors in the past.

Wall Street expects Expeditors to grow earnings per share 13% annually and is pricing the stock at 21 times expected 2012 earnings and 21 times free cash flow. Asset-light, well-run, and with competitive advantages in Asia (where it first put down roots in 1981), Expeditors commands a premium valuation, but in today's uncertain economy, shares look more likely to be range-bound.

Next Steps: Visit the Expeditors discussion board to post questions, and then make your trade.

5 Pro Resolutions for 2012

Published Jan 3, 2012 at 12:00AM

Greetings, Fools,

Trade Roundup

Portfolio 2011

- **Oracle Corp**: Bought 230 shares (2.7%) at $25.50, for 5% total.

Guidance Updates

- Oracle was moved to Buy First.

The New Year promises to be at least as interesting as 2011. For starters, the euro's problems may finally come to a head; the presidential election is likely to be pivotal — and I'm talking about France as much as the United States; and any slowdown in the Chinese economy could slug commodity prices worldwide. And those are just the potential shakeups on the radar; add in any number of surprises, and it's doubtful we'll have a dull month the entire year.

When it comes to investing, our work is cut out for us in 2012. Whatever the economic environment, our guiding North Star (the Consumer Price Index, including food and energy, plus 7% annually) does not go negative, and it's currently running above 10% per year. Although stocks could gain more than 10% this year, to my eye there's a 50-50 chance they could go nowhere, or even down. So we'll want to sell short selectively and generate steady income, aiming to earn positive returns even if the market doesn't. I expect an active year for us.

To help us reach our goals, here are five items on our road map for 2012:

1. **Communicate efficiently, with a focus on our strategy and reasoning.** Rather than try to answer all possible questions in advance with long trade reports, we seek to write (or record, using multimedia) tight reports, later answering any and all questions on the discussion boards.

2. **Move into targeted shorts.** I'd much rather be short five hand-picked, faltering companies at 5% each than have 25% of the portfolio short the S&P 500, which is generally filled with healthy companies. This year, with a more flexible broker, we'll be able to make the switch.

3. **Generate higher income.** In 2011, our income positions were relatively few. We seek to increase them substantially in 2012 and to add new strategies as we follow our North Star.

4. **Buy the best.** Some of the best investments you'll ever make are "one-sided" decisions: You buy and hope you never need to sell. We have several companies in the *Pro* portfolio that fit the bill, including **MasterCard** and **Oracle**, but the ideal (income positions aside) is to own *nothing but* world-beating companies you're unlikely to need to sell. We want more of those in the portfolio, and we'll gradually replace names that don't pass the test.

5. **Short the obviously flawed.** The demise of stodgy retailers could be a theme of our short positions this year, but shorting terminally flawed ETFs and ETNs is just as compelling. Many ETFs are hamstrung by futures prices or the leverage they employ. Shorting opportunities on these doomed instruments are compelling for those who do their homework and allocate appropriately.

This year in *Pro* should be defined by action more than talk; our communications with you should be direct, clear, and to-the-point, and our discussion-board presence stronger than ever as we answer your questions. We should Foolishly enjoy the year together as we strive to grow value, ready ourselves to ride out or benefit from volatility, generate income, and practice patience as our stock investments play out.

What are your resolutions for 2012? Share them on the Memo Musings board.

Fool on in the New Year!

Jeff Fischer (TMFFischer)

Community

- *Pro* member dollarfor40cents shares programs that let you screen for attractive put writing, covered call writing, and strangle writing candidates, just by entering a ticker. It looks nicely done! Thank you, dollarfor40cents.
- *Pro* is still trying to set up a synthetic short on **CurrencyShares Euro Trust** for a price that's inferior to the current trust price by only $2 or less. We'll update as needed.
- MCR, per usual, speaks of sunshine, giggles and happy times.

Happy New Year From the Pro Team

Published Jan 2, 2012 at 12:00AM

Dear *Pro* Fools,

Welcome to 2012!

The ball in Times Square has dropped, the Rose Bowl parade is under way in Pasadena, and (in a nod to Europe's dominance in the headlines) the Spaniards just ate 12 grapes for 12 months of good luck.

Here in Alexandria, Va., the *Pro t*eam and I wish to take a moment this holiday to thank you for being a *Pro* member, and to share our excitement as the New Year begins. We have a lot to look forward to in 2012 as we continue to employ the investing strategies we know work over time. Our new North Star, which is returning more than 10% annually, is here to guide our decisions. With the natural end of Portfolio 2011 behind us, we can unite the entire community behind just one portfolio, the Charter Portfolio (soon to be renamed the *Pro* Portfolio). And we see greater flexibility ahead for the portfolio as we adjust our broker this month.

We're also going to amp up the interactive nature of our service. But rather than spill the beans early, we'll let you see our new features as we roll them out as part of your *Pro* content. At the heart of it all is our desire to deliver more profitable investment recommendations to you in 2012, in a more compelling and efficient way, and to manage the portfolio toward healthy absolute profits over any reasonable time period.

On behalf of the *Pro* content team, thank you again for being a member of *Pro*! We look forward to starting the New Year with you. For now, enjoy the holiday, and Fool on!

Jeff Fischer (TMFFischer)
Pro Advisor

... and the whole team!

What's Next for Portfolio 2011

Published Dec 28, 2011 at 12:00AM

Portfolio 2011 was launched in January 2011 with $250,000 of the Fool's money. The goal was to help our newest members catch up to the Charter Portfolio. Click here to download a **snapshot of our holdings and performance** when the portfolio reached its natural end in January 2012.

Greetings, *Pro* Fools,

We launched *Pro*'s Portfolio 2011 when we welcomed new members to *Pro* in early 2011. Its purpose has always been to help new members build positions in as many of the stocks we love from the Charter Portfolio as feasible. Now, as 2011 draws to a close, you'll see an important change in your *Pro* service: **In the final days of 2011, all followers of Portfolio 2011 will officially graduate to the Charter Portfolio.**

Commence the Commencement!

Over the course of this year, we've built Portfolio 2011 positions in all of our Buy and Buy First stocks. And now, except for four stocks on hold — **Bristow Group**, **Papa John's Pizza**, **Plum Creek Timber**, and **Vanguard Energy** — the two portfolios are aligned on stock positions. We have written puts in Portfolio 2011 on Plum Creek Timber and, in the past, Bristow Group to try to buy shares cheaper, and we'll continue to remember that many members don't own these stocks yet, offering guidance when prices are attractive.

So, it's time to say goodbye to Portfolio 2011 and ask those of you who have been following it to now follow the Charter Portfolio. There, you'll see all of the same stocks you own, with the same allocations (or very close), and our same Buy Around guidance. Although you'll no longer be able to track Portfolio 2011, we'll document it at market close the day we shutter the portfolio, and that information will remain archived on the *Pro* site.

Rest assured that the coverage, analysis, and buy and sell guidance you've come to expect from the *Pro* team and me will remain unchanged, as will our mission: We aim to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to increase the real purchasing power of capital over every rolling three-year period and to double our real purchasing power every 10 years.

To the Future

Investing has its ups and downs, and 2011 was *Pro*'s first difficult year. We failed to meet our absolute-returns goal — but we're not disheartened by any means. We know this happens over short periods, and we're excited about the opportunities ahead in 2012. With our new North Star to guide us, with the community all aligned around one portfolio, and with a dedication to offering you exceptional investment ideas in concise and educational reports, we know healthy gains are ahead.

Portfolio 2011 served its purpose in aligning new members with our existing positions, and now that the two portfolios are largely the same, we're happy that all members will be unified behind a single portfolio as we move forward. The team and I are working to make this transition as smooth as possible for you, and we're prepared to answer any questions or concerns you may have. We've put together a Q&A about the upcoming changes below, or feel free to email me directly.

Happy 2012! I look forward to years of investing and profiting together.

Fool on!

Jeff Fischer
Advisor, *Motley Fool Pro*

Portfolio 2011 FAQ

Q: Portfolio 2011 is down, and now you're taking it away. Are you still confident in the portfolio?

A: Portfolio 2011 was never meant to be an independent portfolio — it was meant as a way to help new members buy Charter Portfolio stocks, so it focused on buying those stocks one by one. Portfolio 2011 is down over its 11 months (largely because of one large loss), but this is far too short a time period to measure investment results. We're confident that *Pro*'s holdings — now represented by the Charter Portfolio — will do well over the time frame that matters: the coming few years and beyond.

Q: Why are you shuttering Portfolio 2011?

A: Portfolio 2011 wasn't created to be an ongoing, managed portfolio. It was created to help our newest members start their portfolios with us from scratch, while we committed new Fool capital to every recommendation we made. Now that Portfolio 2011 has completed its mission, it's time to close it and ask all *Pro* members to follow the Charter Portfolio.

Q: Will there be a Portfolio 2012?

A: No. Portfolio 2011 served its purpose, but it also taught us some lessons — and one of them is that we believe we can better and more efficiently serve all members by focusing on just the Charter Portfolio (which will be renamed the *Pro* Portfolio). In the future, we'll simply direct new members to buy all of our Buy First and Buy stocks incrementally. Our VXX short is one high-profile example of the effects of having two portfolios. Portfolio 2011 was called out on that position, and since the portfolios are meant to match, the Charter Portfolio had to close it, too. Such a situation can quickly get complex. Going forward, we know we can provide a stronger service when all members are following one portfolio.

Q: What will happen to Portfolio 2011?

A: We will no longer track its performance, but we will document it at market close the day it is ended, and that information will remain archived on the *Pro* site. You will still be able to evaluate the *Pro* team's performance in the Charter Portfolio. It is our experience that most members are concerned with their own scorecards and our analysis of our positions rather than the Portfolio 2011 scorecard itself. Although we've been trusted with managing some of The Motley Fool's money, our primary concern is *your* scorecard over the coming few years — because we succeed when you succeed.

Q: Are you folding the stocks and cash in Portfolio 2011 *into* the Charter Portfolio?

A: No. Portfolio 2011, including the stocks and the cash in the brokerage account, will be returned to The Motley Fool. The positions will be liquidated at the discretion of The Motley Fool's chief financial officer with no input from the *Pro* team.

Q: Will the prices of the stocks *members* own be affected by the liquidation of Portfolio 2011?

A: That's very unlikely because Portfolio 2011 doesn't own enough shares to move the market in any meaningful way.

Q: Which trade alerts should I follow now?

A: All members will receive and follow all trade alerts, since we'll only be managing one portfolio. Once Portfolio 2011 closes, trade alerts will be sent to all members as we manage the Charter Portfolio, which will be renamed the *Pro* Portfolio.

Q: I've been following Portfolio 2011 trade for trade, and the percentage of my portfolio in cash doesn't match the Charter Portfolio. How will that affect me?

A: If you have a larger cash balance than the Charter Portfolio, that's OK. Over time, the four stocks on Hold in the Charter Portfolio — which you don't own as a follower of Portfolio 2011 — will likely be sold. This will increase the cash position in the Charter Portfolio so that it will eventually come close to matching yours.

Q: I have options open on stocks I was trying to buy as I followed Portfolio 2011. What do I do?

A: Don't change your options. Let them play out. The stocks you're trying to buy are already in the Charter Portfolio, so you'll continue to receive guidance on these companies. Eventually, we hope you'll own shares at good prices. We will also offer guidance on the four stocks from Charter Portfolio that Portfolio 2011 followers don't yet own, including put-writing guidance or advice on when to buy the stock. You'll find that guidance on the discussion boards, on the recommendations page (where you'll see a stock moved to Buy or Buy First), and in our Monday Memos.

Q: When will all of this happen?

A: By year-end, we will stop actively tracking Portfolio 2011 and archive it on the *Pro* site, and the Port 2011 brokerage account will be put in the hands of the Fool's CFO.

Q: What if I have more questions?

A: If we didn't answer your question, please ask on *Pro*'s Philosophy & Strategy discussion board, and the team will get you an answer.

Portfolio 2011: Buy More Oracle

Published Dec 27, 2011 at 12:00AM

What We're Doing: Filling Portfolio 2011's allocation to Oracle.
What We're Thinking: A lower share price after a rare quarterly earnings miss is an opportunity.
What We're Expecting: In 2012, Oracle will reassure investors with stronger results.

Trade Essentials

- **Business: Oracle** is the world's largest corporate software and integrated hardware provider.
- **Action:** Buy 2.7% (in Portfolio 2011, that's 230 more shares), for 5% total.
- **Buy Around:** $27 or lower.
- **Alternate Trade:** Sell to open puts with a $26 or lower strike price.

What's Changed?

- **Last Buy:** Aug. 10, 2011
- **Price Change Since:** Down 2%

Who spiked the eggnog? Oracle tripped and stumbled last week after earnings missed expectations for the first time in years. Customers were slow to close large orders as Europe teetered and tottered, so revenue only increased 2%, less than the 7% sought by Wall Street. More optimistically, though, net income grew 6% (non-GAAP; the number was 17% under GAAP), and Oracle expanded its operating margin despite hiring 1,700 new sales staff. Oracle's CFO, Safra Catz, also suggested the next quarter will be "much more normal" because order flow started to improve after the quarter ended.

Even if it ends up taking several quarters for Oracle to get back on its horse, we're content to invest at today's discounted price of 10 times free cash flow. A 45% surge in FCF over the last 12 months (to $12.6 billion) was driven by software sales, but as companies build cloud services, Oracle's hardware business has much more growth potential than the market seems to believe.

In fact, light sales today could make the growth we expect (starting at least a few quarters from now) much more pronounced. That's because despite "more normal" patterns in the current quarter, management is guiding for just 7% growth in earnings per share; a year ago, Oracle grew EPS 40% in non-GAAP terms (75% under GAAP). Wall Street is lamenting tepid growth today, but analysts are missing the forest for the trees: Low numbers make sense at the moment compared with last year's blowout.

Oracle is still growing, and growth will accelerate year-over-year in future quarters, even if that growth is lumpy. Given the company's strong product line, healthy pipeline of orders, recurring revenue of nearly 50% of sales, proven leadership, and growing profit margins, we're happy to put more shares in the portfolio for the long haul.

- **Next Steps:** Visit our Oracle board to ask questions. Make sure more Oracle suits your portfolio, then visit your broker to make your buy.

The Motley Fool owns shares of Oracle. See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Pro's Year in Review

Published Dec 19, 2011 at 12:00AM

No Memo Next Week: Fools, there will be no *Pro* Monday Memo the week of Dec. 26, but we'll be back in your inbox on Tuesday, Jan. 3. Have a wonderful holiday!

Dear Fellow Fools:

Big *Pro* Stories in 2011

- We lost on our **iPath S&P 500 Short-Term VIX Futures** short despite continued belief in our thesis. We learned that smaller short positions are less stressful — and that brokers matter. In January, the *Pro* portfolio will be moving from Schwab to Interactive Brokers, where it's easier to short and stay short.
- **Intel** surprised Wall Street (but not us) with strong earnings growth. Analysts went into 2011 expecting flat results, but Intel has grown earnings exactly according to our estimates. I believe Intel can surprise in 2012 as well, since Wall Street again expects a flat year.

- Short-sellers publicly attacked **Ebix** online, sending the stock down sharply, and it has yet to fully recover. Management has changed its communications strategy, bought back large blocks of shares, and reported strong results in November, and lately the stock is clawing its way back.
- With our community (that's you!), *Pro* was able to help thousands of investors learn how to generate their own income with options and hedge by shorting market indexes for the first time.
- Two of our two dozen companies were bought out at healthy premiums. Nice! We own others that are potential takeover candidates, including **OpenText** and **Covanta**.

Many money managers already want to forget 2011. Big names from John Paulson to Bill Gross suffered setbacks this year, with Paulson losing 44% on his flagship hedge fund through November. And they're far from alone: According to Bank of America Merrill Lynch, only 23% of mutual funds are doing better than the S&P 500 in 2011. The market's record-strong volatility has made it easy to lose ground on any ill-timed buys or sells, and this marks the second year in a row of significant underperformance by most mutual and hedge funds.

At *Pro*, our investing performance languished in 2011 largely because of one position. We were doing well until August; buyouts of **TradeStation** and **Kinetic Concepts**, strong gains in **AmTrust Financial** and **Intel** (our largest holdings), and strength in our defensive health-care and utility companies drove *Pro*'s results well into the green by summer.

Then came August. We were short volatility, in the form of the **iPath S&P 500 Short-Term Futures** ETN , as the U.S. credit rating was downgraded and Europe began to melt down. After two months of historically strong volatility, our broker called our short on us in late September, we lost a scalding 9% of the portfolio, and we haven't reinitiated a position on VXX yet. (We plan to.)

Because of that loss, we are down year-to-date, so we're failing our absolute return goal in 2011. But unlike many funds, we won't need to engage in acrobatics in 2012 to recover. Below, you can see our results as of Nov. 31. We have a relatively modest loss. From the most meaningful numbers to the least, left to right, here are our results:

Pro Performance

	Annualized, Since Inception	Rolling 3-Year	2011 Year-to-Date
***Pro*'s Charter Portfolio**	9.2%	9.9%	(4.5%)
North Star	8.1%	9.2%	9.7%
S&P 500 Total Return Index	7.7%	14.1%	1.1%
MSCI World	3.2%	9.9%	(7.5%)

Returns through Nov. 30, 2011, per Schwab brokerage statements.

As you can see, our newly introduced North Star — which we calculate as inflation plus 7% — scored yet another outstanding year. Going into 2012, our North Star is running north of 10%. The S&P 500 and MSCI World indexes are both shown for reference only; the former was flat in 2011 and the latter was down more than *Pro*.

What Did What?

Many of our positions are ending the year not far from where they started. We didn't set up as many option income positions this year as we have in years past, but in retrospect, we should have — high volatility that ultimately leads nowhere is ideal for writing market-neutral option income, as long as you don't expect the market to make a decision and soar or tank. Here are some stock positions that did move meaningfully:

Position	Year-to-Date Return With Dividends
AmTrust Financial	34%
Papa John's Pizza	33%
Tupperware	16%
Intel	14%
3D Systems	(43%)*
GrafTech International	(34%)
Covanta Holdings	(20%)*

*Denotes return since our 2011 purchase; measured from Dec. 30, 2010, to Dec. 16, 2011.

This wasn't a year for blowout returns. In fact, 2011 was a year of prominent *blow-ups* in the market. *Pro*'s largest loser on the year, 3D Systems, is one of our smallest positions, so its struggles haven't influenced the portfolio much. And we still like the company: The 3D printer's strong management team is expanding the business in several directions, and if margins improve in 2012, the stock could sing a different tune. We are considering adding to the position.

Another stock that's down for us, Covanta Holdings, is simply cheap. Like **BMC Software**, Covanta trades at a single-digit multiple to free cash flow, despite a strong and steady business. I can recall similar situations in which valuations were this low, and in those cases, patience led to healthy returns. Stocks as a whole aren't expensive right now, suggesting that 2012 could deliver strong results for investors, particularly if Europe is able to avoid a recession.

Cheers to 2012

I admit that I'm already looking forward to the New Year — 2012 should bring many of positive changes. The team is excited about our North Star, as you can probably tell, and we're glad to see members sharing in that excitement on the discussion boards. We're also changing brokers in January, moving to Interactive Brokers, which should make shorting *much* easier, including short positions on individual companies. I expect *Pro* to initiate steady income strategies on established leaders in the coming year, as well as invest in younger companies with an eye toward strong capital appreciation. And bonds are not out of the question given our goal of absolute returns.

This is the last Monday Memo of 2011, so I'd like to take this moment to thank you for being a *Pro* member. You make our work possible, and we start every workday with the knowledge that we (happily!) work for you and your families. From the whole team, a sincere thank you. We will always work to make *Pro* a profitable and enjoyable experience for you, and we want both of those values to grow over the years.

We expect to issue some new trades to close out the year, and we'll of course be available on the discussion boards.We wish you a joyful holiday season; Fool on!

— Jeff Fischer (TMFFischer)

Pro Trade Roundup

Charter Portfolio

- **Pacer International**: Sold to open 30 December $5 puts for $0.35. We were then "put" the 3,000 shares (1%) at a net start price of $4.66.

Portfolio 2011

- **Pacer International**: Sold to open five December $5 puts for $0.35. We were then "put" the 500 shares (1%) at a net start price of $4.66.
- **Plum Creek Timber**: Sold to open four May 2012 $33 puts (5%) for $2.05.

Community

- Fools talk about our new North Star on its discussion board.
- Alex (TMFPapester) explains why **Pacer International** and the intermodal transportation industry in general are experiencing a boon. Although many Fools were put shares like us, many weren't, so we'll share guidance soon.
- **Amtrust Financial Services**' stock price declined after the company sold convertible debt. Bryan (TMF42) has our initial take; the short version is that we're holding steady.
- **OpenText** announced the retirement of its longtime CEO, and the market wasn't happy. The new CEO has been named.
- Raleigh1208 shares his experience with iPath S&P 500 VIX Short-Term Futures (VXX to its friends), with an eye on the future.
- TD Ameritrade has shares of **CurrencyShares Euro Trust** to short directly if you like (that's easier than a synthetic short).
- MazonCreekRich shares his holiday thoughts!

Your Guide to Our North Star

Published Dec 15, 2011 at 12:00AM

Like the real North Star, our North Star offers direction and guides our investing behavior. Learn more below.

Pro's Mission

Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years.

***Pro*'s North Star: Inflation + 7% annually**

Our North Star is a guide for our investing behavior. Like the real North Star, we can use it to navigate. It is not a destination; rather, it's an omnipresent fixture that offers us direction and reminds us of what we're striving toward.

Why inflation + 7%?

Our mission is to grow the real purchasing power of our capital. Therefore, the first competitor we need to beat is inflation, as measured by the Consumer Price Index.

We want to grow our dollars by more than the rate of inflation — that's a given. Exactly how much more is a difficult figure to pinpoint, but history tells us that if we can double the *real* purchasing power of your dollars every 10 years, we'll be doing what few manage to accomplish.

To double your dollars in a decade, we need to book a compound annual return of about 7%. To double your *real* dollars, we need to return 7% *plus* inflation. Thus, this figure is born directly out of our mission of absolute returns — returns that improve your financial standing in the real world.

More Guidance

It's a bird, it's a plane, it's our North Star discussion board!

Relive our live chat with members about the debut of the North Star

Our North Star has several important characteristics that make it appropriate, challenging, and aspirational for all of us. It:

- **Never goes negative.** This lines up with our goal of positive returns over all three-year periods.
- **Is not investable**. It's impossible to lock in a return of inflation plus 7% with some other vehicle.
- **Is not a benchmark**. By definition, benchmarks must be investable; they are used for evaluating the performance of a relative-returns strategy. Absolute returns are our goal.
- **Is not a hurdle**. A hurdle is something you must leap over to avoid tripping. Our North Star guides us to make appropriate investment decisions. We're more likely to reach our goals if we let it guide us. If we come close to our North Star, let alone jump over it, we'll be over the moon (sorry!).
- **Is not a gimmick**. We are working to better explain our philosophy and strategy to you, and our North Star will be an ever-present factor in our investment decision-making.
- **Is a challenging reference point**. Historically, our North Star has outperformed the U.S. and world stock markets. Over rolling three-year periods since 1970, our North Star has put up a compound annual return of 11.3%, versus 9.9% for the S&P 500 Total Return Index and 6.4% for the MSCI World index. Our North Star also delivered that return *much* more steadily than the market indexes, without a single down year.
- **Guides our behavior** as we invest with the tools available to us. It is a framework to explain and reinforce consistent portfolio decisions. Approached consistently over long periods, it should help us and our members achieve strong financial rewards.

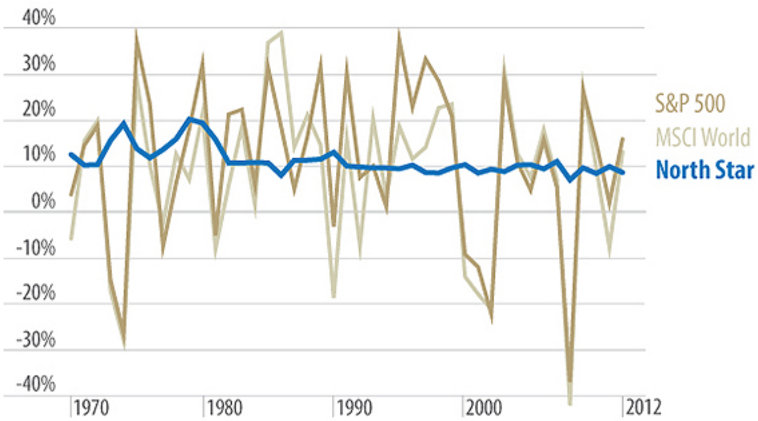
Historical Performance

How has our North Star performed historically? We're glad you asked, and we hope you like data! Here's a summary of the past 41 years. Below that are charts of the full history.

Annualized Return, 1970–2012

	Average	CAGR	Highest	Lowest
North Star	**11.3%**	**11.3%**	**20.3%**	**7.1%**
S&P Total Return	11.4%	9.9%	37.6%	-37.0%
MSCI World	7.8%	6.1%	39.1%	-42.1%

Annualized Return, 1970–2012

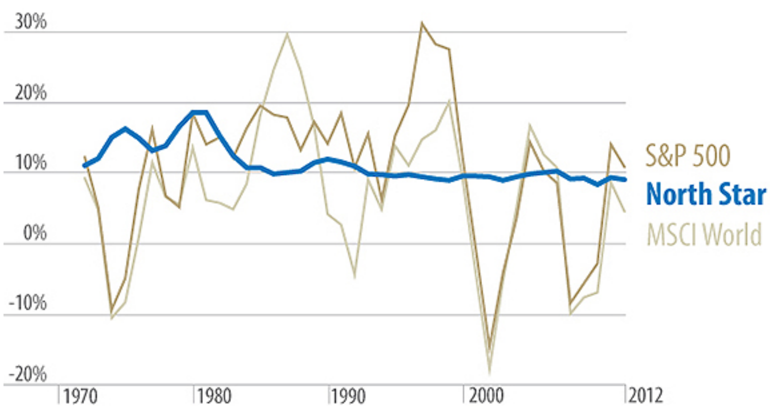


Here are the same data, showing rolling three-year annualized returns. Again, note the lack of volatility for our North Star.

Annualized Rolling 3-Year Return, 1972–2012

	Average	CAGR	Highest	Lowest
North Star	**11.4%**	**11.3%**	**18.6%**	**8.4%**
S&P Total Return	10.4%	9.9%	31.2%	-14.6%
MSCI World	6.9%	6.4%	29.7%	-17.7%

Annualized Rolling 3-Year Return, 1972–2012



Note that we included both average and compound annual (CAGR) historical growth rates. To investors, the one that matters is the CAGR. We included both to show the power of compounding: Even though our North Star has averaged an almost identical annual return to that of the S&P Total Return index over the past 43 years, the North Star (again, inflation plus 7%) has outperformed the index by about 1.4 percentage points annually. That's because when the index has those deeply negative years, much higher positive years are needed to claw its way back to positive territory. Since it never goes negative, our North Star doesn't have that problem. That is the power of steady, positive returns — see below for visual representation.

(We're including the S&P Total Return and MSCI World returns purely for the sake of education. Our investment strategies are not focused on either.)

Performance Since Inception

How has *Pro* performed against its North Star since our start in 2008? We hope you *really* like data: Here are *Pro*'s annualized returns lined up against those of our North Star. (Again purely for education, we've also included the returns for the S&P Total Return index and the MSCI World index.)

These returns are annualized, not cumulative. Annualized returns are more useful to investors because they allow easy comparisons.

A note on the recency of data: The Consumer Price Index (inflation) data is reported with a several-week lag, while *Pro*'s performance is in real time. Inflation is quite stable from month to month, so we use the previous month's inflation figure as an estimate for the current month's until the actual data are released. Any adjustment required is usually negligible, especially given the rolling three-year viewpoint we favor. This approach allows us to keep our performance tables updated all the time.

Annualized Return

To read this chart, remember that the return data are annualized, not cumulative: The chart shows the annualized return since inception *as of the end of each subsequent month*. The data begin one year after *Pro*'s start, because annualized returns based on less than a year of data aren't very useful.

And here are our rolling three-year annualized returns — again, our preferred measurement.

Annualized Rolling 3-Year Return

Date	*Pro* Portfolio Balance	*Pro*	North Star	S&P Total Return	MSCI World
10/6/08	**$1,000,000**				
10/31/08	**$1,001,292**				
...					
11/30/12	**$1,451,264**	**6.90%**	9.23%	11.25%	4.61%
12/31/12	**$1,461,698**	**6.14%**	9.20%	10.87%	4.63%

Questions We Anticipate May Be Frequently Asked

How are you measuring inflation?

We're using the change in the Consumer Price Index. The Consumer Price Index is a measure of the average change over time in prices paid for a "market basket" of consumer goods and services. In plain language, it measures how many more dollars it takes to buy things over time.

Specifically, we're using the CPI-U, or the Consumer Price Index for All Urban Consumers, which covers about 87% of the U.S. population. We're using the "all items" version of the CPI-U, which means that we aren't excluding anything. This is worth pointing out because media-reported CPI figures often exclude food and energy prices.

Wait a second. I'm pretty good at math, and you need to return 7.177346% annually to double your money in 10 years. What gives with your 7% figure?

Yes, to be precise, we'd need to return $2^{(1/10)}$-1, or about 7.177346%, per year to double a portfolio in 10 years. Spelling out our North Star as inflation + 7.177346% doesn't in any way make it more useful as a guide, though.

Is the North Star a hurdle or benchmark?

Our North Star is neither a hurdle nor a benchmark. Hurdles are things you intend to leap over, and benchmarks represent an alternative for your investment dollars. Our North Star is neither of these things. Its purpose is to offer us direction, guide our behavior, and keep our mission front and center.

What is a rolling three-year period?

Rolling three-year returns measure performance over the most recent three years. So the rolling three-year return as of Oct. 31, 2011, measures the return since Oct. 31, 2008. A month later, the rolling three-year return as of Nov. 30, 2011, measures the return since Nov. 30, 2008.

How will the North Star change how *Pro* is managed?

Our strategy will not change, but our implementation of it should improve with the North Star as a guide. Our North Star should remind us to lower our risk when we have large, abnormal returns, or increase our exposure to stocks and income if we're not close to our North Star. Thankfully, this should work well in the marketplace. If stocks are up sharply, we *should* be looking to lower our exposure, as our North Star would suggest. If returns are lackluster, we *should* be looking for more stock values or income strategies. Following a steady North Star should help us make better decisions.

Why is the North Star better than the S&P 500?

Pro has never been an alternative for the S&P 500 index. We use options for income, we short, and we hedge. The index is a long, stock-only vehicle. *Pro* is also not about returns relative to an index; we're about positive gains over any reasonable period. The North Star never goes negative, so it's a much better measure against our goal than is the volatile S&P 500, which can be negative for years.

Inflation is relatively tame lately. What happens when it soars?

Then our North Star's annual return is going to soar, too. Thankfully, stocks typically compete well with inflation, so to follow our North Star, we know we'll need to be largely invested in stocks during periods of high inflation, and we'll likely use fewer income strategies, because fixed income may not keep up with inflation.

What if you don't top your North Star?

We'll be happy if we just stay on track with it — or stay relatively close. If we *can* top it over many years, that would be excellent. But we need to realize the lofty challenge of topping a measure that *never* has a negative year while we're investing in stocks. Our North Star is our aspiration, not a hurdle or benchmark.

Can I measure the North Star against my portfolio at home?

Absolutely. Using the Bureau of Labor Statistics CPI stats, you can obtain historical CPI measures along with a monthly update to compare the CPI+7% to your portfolio. We've already done the 41-year history for you above, and we'll be updating the North Star results monthly for you.

Where can I talk about the North Star with the *Pro* team and other members?

Our North Star discussion board is always shining (sorry!).

Introducing Pro's North Star

Published Dec 15, 2011 at 12:00AM

Pro Fools,

What's This All About?

At *Pro*, we've always strived for absolute returns, and today we're introducing **two improvements to the service** that should help us do an even better job of achieving them. These features should also help you better measure our performance. This article will tell you more about our updated mission statement and the guiding light we're calling our North Star.

Can We Talk?

We'd love to! Bring questions, comments, and feedback to our new North Star discussion board.

Can We Talk ... in Real Time?

We'd love that, too! The *Pro* team is hosting a North Star-themed live chat at 2 p.m. Friday, Dec. 16, to answer any questions you might have. You can set a reminder here, and we hope to see you then!

I Want to Know More!

We want to tell you more! Check out Your Guide to Our North Star for more data than you can shake a guiding light at.

Today is an exciting day to be a *Pro* investor.

Since *Pro* opened its doors on Oct. 7, 2008, absolute returns have been our goal. We've crafted a portfolio with that goal in mind, we've worked to educate members on what an absolute-returns strategy is all about, and we've detailed our aim to earn you consistent, recurring profits with a high level of accuracy.

But how do you know how well we're doing? What exactly is guiding our investing behavior, and what *should* guide it? Can we quantify consistent profits in a way you can measure?

Today, we are proud to introduce *Pro*'s North Star as a way to answer those questions and provide that quantifiable information — and to serve as a guiding light for the decisions we make at *Pro*. But first, we'd like to share our updated version of *Pro*'s mission statement. The former statement read: "To earn members consistent, recurring profits with a high level of accuracy using a combination of stocks, options, and ETFs." Our new and improved version is below.

Pro's Mission

Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to ***meaningfully increase the real purchasing power of capital over every rolling three-year period and to double our real purchasing power every 10 years***.

We're adding the bolded clause to our mission to clarify and improve it. There are four new bites to chew on:

1. **"Meaningfully grow":** If we are able to fulfill our mission, we will help *Pro* members achieve their investing goals with absolute gains measured over any rolling three-year period.
2. **"Real purchasing power":** We don't just want to increase the purchasing power of our — and your — portfolio; we want to increase its *real* purchasing power. That means taking explicit account of the pesky inflation that eats away at a dollar's value. If your portfolio is down less than a stock index, you can't spend that outperformance; similarly, if the prices of things you need or want rise faster than your portfolio's returns, your investments are losing to your real-world costs.
3. **"Every rolling three-year period":** We invest in stocks with the long term in mind, and we think any tool used to help guide our decision-making should be equally long-term in nature. Our income strategies (such as some options positions) may be shorter-term, but in investing, results as a whole are better measured over rolling three years; there is too much noise in shorter periods.
4. **“Double our real purchasing power every 10 years”**: This is an aspirational goal; we'll be doing very well in the world if we can double our buying power every 10 years.

To be clear, we are not introducing a change in our strategy, even though we *are* likely to make better investing decisions if we continue to keep these concepts, and our new North Star, front and center. Instead, our goal is to bring more clarity and transparency to the journey we are taking together as investors. And to that end, we're thrilled to introduce to you our North Star, our new way to measure our goal of absolute returns.

Pro's North Star

***Pro*'s North Star: Inflation (as measured by the Consumer Price Index) + 7% annually**

Our North Star is a guide for our investing behavior. Like the real North Star, we can use it to navigate. It is not a destination; rather, it's an omnipresent fixture that offers us direction and reminds us of what we're striving toward.

Why is inflation + 7% annually our North Star?

Our mission is to grow the real purchasing power of our capital. Therefore, the first competitor we need to beat is inflation.

We want to grow our dollars by more than the rate of inflation — that's a given. Exactly how much more is a difficult figure to pinpoint, but history tells us that if we can double the *real* purchasing power of your dollars every 10 years, we'll be doing what few manage to accomplish.

To double your dollars in a decade, we need to book compound annual returns of about 7%. To double your *real* dollars, we need to return 7% *plus* inflation. Thus, this figure is born directly out of our mission.

Our North Star has several important characteristics that make it appropriate, challenging, and aspirational for all of us:

- Our North Star **never goes negative.** This lines up with our goal of positive returns over all three-year periods.
- Our North Star is **not investable**. It's impossible to lock in a return of inflation plus 7% with some other vehicle.

- Our North Star is **not a benchmark**. By definition, benchmarks must be investable; they are used for evaluating the performance of a relative-returns strategy. Absolute returns are our goal.
- Our North Star is **not a hurdle**. A hurdle is something you must leap over to avoid tripping. Our North Star guides us to make appropriate investment decisions. We're more likely to reach our goals if we let it guide us. If we come close to our North Star, let alone jump over it, we'll be over the moon (sorry!).
- Our North Star is **not a gimmick**. We are working to better explain our philosophy and strategy to members, and our North Star will be an ever-present factor in our investment decision-making.
- Our North Star is a **challenging reference point**. Historically, our North Star has outperformed the U.S. and world stock markets. Over rolling three-year periods since 1970, our North Star has put up compound annual returns of 11.5%, versus 9.8% for the S&P 500 Total Return Index and 6.3% for the MSCI World index. Our North Star also delivered those returns *much* more steadily than the market indices, never experiencing a down year.
- Our North Star serves as a **guide for our behavior** as we invest with the tools available to us. It is a framework to explain and reinforce consistent portfolio decisions. Approached consistently over long periods, it should help us and our members achieve strong financial rewards.

Tracking Our North Star

The table below shows our results since we opened to members the morning of Oct. 7, 2008. You can already see: our North Star takes no prisoners, never gives up ground, and we like it that way. We'll be posting the performance of Pro's North Star alongside the performance of *Pro*'s portfolio, of course — in a permanent table on our scorecard page, where we'll show you our annualized return since inception, our rolling three-year return (our preferred measurement period), and year-to-date returns. The first iteration of that information is presented below.

Performance, Oct. 6, 2008, through Nov. 30, 2011

	Annualized, Since Inception	Rolling 3-Year	Year-to-Date
Pro's Charter Portfolio	9.2%	9.9%	(4.5%)
North Star	8.1%	9.2%	9.7%
S&P 500 Total Return Index	7.7%	14.1%	1.1%
MSCI World	3.2%	9.9%	(7.5%)

For much more information on our North Star — including detailed historical performance — check out our new North Star information page.

Questions? Ask Us!

Our North Star is all about guiding our behavior — and helping you understand that behavior to become a better investor as well. It's also about quantifying our goal of absolute returns; it's a true measure to guide us, one that never wavers or stagnates. If you've got questions about our North Star, including what it means for you, we're hosting a live chat at 2 p.m. (ET) Friday, Dec. 16, to answer them. Please watch your inbox for the chat reminder, and in the meantime, enjoy a plethora of data on our North Star information page. We also invite you to visit the new North Star discussion board with your comments, advice, and feedback.

Charter and 2011 Portfolios: Write Puts on Pacer International

Published Dec 13, 2011 at 12:00AM

Trade Essentials

- **Action:** Write ("sell to open") December 2011 $5 puts for a 1% position in **Pacer International** (NASDAQ: PACR).
- **Allocation:** 1% in look-through stock. In Charter Portfolio, we'll write 30 contracts; in Portfolio 2011, we'll write five.
- **Recent Stock Price:** $4.50
- **Recent Options Price:** December 2011 $5 puts (bid/ask): $0.40/$0.60
- **Preferred Price:** Initially, aim to split the bid-ask price (lately about $0.50). As prices change, ideally accept no less than $0.30 to write these puts.
- **Why Write Puts?**
  - Pacer is pulling off a well-orchestrated turnaround and is once again producing positive earnings and cash flow.
  - The share price, however, remains depressed.
  - We want to own shares, but the stock is illiquid. Writing puts offers members a much more attractive entry method.
- **Alternate Trade:** Writing puts is the best way to enter this position. If you are absolutely unable to do so, you can purchase shares directly — but **use a limit order**, and pay no more than $4.60 per share.

The Big Picture

First Things First

- **Company: Pacer International**
- **Website:** http://www.pacer.com/
- **Market value:** $161 million
- **Investment type:** Micro-cap, value
- **Options:** Yes; we're using them to avoid influencing the share price.

In the first *Pirates of the Caribbean* movie, cursed immortal pirates battle fearlessly — as immortals are wont to do — with British soldiers. During the battle, the curse is lifted, making the pirates both mortal and suddenly less inclined to carry on the fight. All they can manage is to eke out a pitiful, "Parlay?"

And that's why we are writing puts on **Pacer International** (NASDAQ: PACR).

OK, OK, we'll connect the dots for you. (Jeez, we have to do *everything* around here.) Just like the pirates, Pacer not too long ago found itself suddenly disarmed and seemingly doomed. Unlike the pirates, however, Pacer has managed to swim to shore — but the market is still pricing it as if it's sinking to the depths. Let us explain.

The Beginning: A Good Place to Start

Pacer is an asset-light intermodal transportation company. In layman's terms, customers hire it to transport large freight from endpoint to endpoint — think of it as a **FedEx** (NYSE: FDX) for giant industrial companies. If you want to get your mother's birthday present to her on time, you ship it FedEx. If you need to get 10,000 drivetrains from L.A. to Detroit — swinging through Memphis at a specific time to pick up 40,000 tires en route — you call a company like Pacer.

Pacer is an *intermodal* transporter because it uses multiple modes of transportation to get its cargo where it needs to be. Most commonly, this entails a combination of railroads and trucks. And Pacer is *asset-light* because it doesn't own any of the railroads, trucks, or even containers it uses to transport stuff. Instead, the company has relationships with railroads allowing it to use their rail networks and with trucking companies to handle that portion of the transportation, and it leases its containers.

Rough Seas

Until recently, Pacer had a crown jewel: an exclusive contract to handle all of rail behemoth **Union Pacific**'s (NYSE: UNP) wholesale intermodal business. With no competition, Pacer did what many monopolists before it had done: It got lazy. The company didn't aggressively go after new business, and management paid itself fat bonuses for performance that was uninspiring at best. Pacer let its costs gradually creep up.

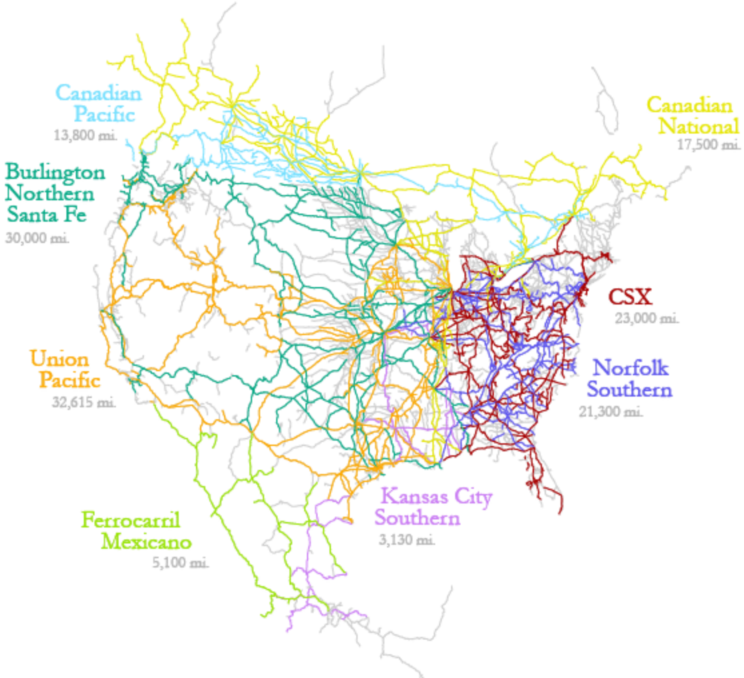
And then, abruptly, Union Pacific cancelled its contract — and this happened in 2009, a miserable time for even the best of transportation companies. Overnight, a huge hole was blown out of Pacer's revenue pipeline, and the company suddenly found itself in danger of violating its debt covenants. Earnings went deeply negative, and management cancelled the dividend. The stock cratered, and rightfully so, because bankruptcy seemed a likely outcome.

Righting the Ship

Just when it looked like the gig was up for Pacer, the company hired a new CEO who arrived with a plan. The newcomer, Dan Avramovich, paid about as much respect to the old Pacer way of doing things as John McEnroe paid to umpires. He slashed entire divisions, including Pacer's entire wholesale division, which had previously been the company's focus and had housed the Union Pacific deal. Instead, he focused on just one small, previously marginalized business: retail intermodal transport.

Avramovich realized that though Pacer doesn't own anything, it does *have* something of tremendous value: its relationships with the railroads. Such relationships are rare because railroads, which have massive fixed costs, only want to deal with large, predictable customers. This creates a chicken-and-egg scenario: An intermodal transporter that wants relationships with railroads must have lots of freight — but to get lots of freight, such a company needs relationships with railroads.

In this regard, Pacer was royalty: This small company's previous wholesale business, which involved shipping very large volumes on predictable routes for small profit margins, had landed it relationships with most of the major railroads on this continent. All told, Pacer has access to more than 60,000 miles of rail track and a whopping 41% of all shipping containers in the U.S. — more even than intermodal front-runner **J.B. Hunt Transport** (NASDAQ: JBHT), which has access to just 25%.



This map from freebase.com shows all Class I (major) railroads in North America. Pacer has relationships will all of them except Canadian Pacific and Ferrocarril Mexicano.

Armed with this asset, Avramovich decided to focus on retail intermodal transport — catering to individual customers, handling all of their shipping needs, and often effectively managing most of their supply chain for them. (For example, moving 10,000 drivetrains from L.A. to Detroit and swinging through Memphis to pick up 40,000 tires en route.) This business involves close ties with customers and customized transportation services, both of which Pacer, with its massive network of transportation assets, can deliver — and those services come with higher margins.

Financials and Valuation

The loss of the Union Pacific contract derailed Pacer's income statement, yes: Revenue shrank 25% in 2009 and then another 5% in 2010. But don't miss the forest for the trees. Removing the wholesale business (which is no more), revenue actually *increased* 15.4% last year, and earnings and cash flow are once again positive. That trend has continued this year as Avramovich's turnaround really begins to take hold. In the third quarter, Pacer's intermodal revenue was up 18%, operating income more than tripled, and earnings more than quintupled. On top of all that, the company is now debt-free. Yet shares remain depressed..

We expect intermodal revenue to continue to grow at 5% to 8% annually, and margins should gradually increase as that higher-margin business grows. Because Pacer doesn't own any of the transportation assets it uses, very little cash needs to be reinvested in the business. To value Pacer, we use a discount free cash flow model, allowing margins to gradually grow to about 12% over the next eight years, which the company should be able to accomplish (potentially and then some) with the new business model. All told, we value Pacer at more than $12 per share, making this stock an outsized long-term opportunity.

Catalysts, Risks, and How to Follow Along

As the market realizes Pacer's new business model is viable and the company isn't going bankrupt, shares should appreciate toward fair value. Strong earnings reports should help along the way; for example, we expect Pacer to report over 100% year-over-year earnings growth for 2010. A reinstatement of the dividend would also likely boost the share price.

Of course, Pacer remains a mis-valued and under-followed microcap stock. With an enterprise value of just $140 million, this is a tiny company — and that comes with heightened risk. On average, only about a million dollars' worth of its stock trades each day (thus the importance of limit orders), so even small news can move the stock meaningfully, and that can cut both ways. Because the company's market cap is so small, we are writing puts to try to buy shares without running into liquidity issues; these options expire this Friday, so barring a sharp jump in share prices, we'll own shares by the end of the week. Expect Pacer's stock to be much more volatile than the broader market — and also know that we may not be able to nimbly change course. . For all these reasons, we are targeting just a 1% position today and do not recommend you allocate more than that.

To begin, sell to open December 2011 $5 puts, aiming for at least $0.50 per share. Sell one put for every 100 shares you're willing to buy for a gross $500.

The Foolish Bottom Line

The market still thinks Pacer is on a track to nowhere, but this small company has fought its way back from the brink and is now poised for profitable growth. We're taking advantage by writing puts to open a 1% position.

Talk about this trade on our new [Pacer discussion board](#)!

The Motley Fool owns shares of FedEx and Pacer International. See Pro's holdings [here](#). See the team's and David and Tom Gardner's holdings [here](#).

Charter Portfolio: Set up a Synthetic Short on CurrencyShares Euro Trust

Published Dec 12, 2011 at 12:00AM

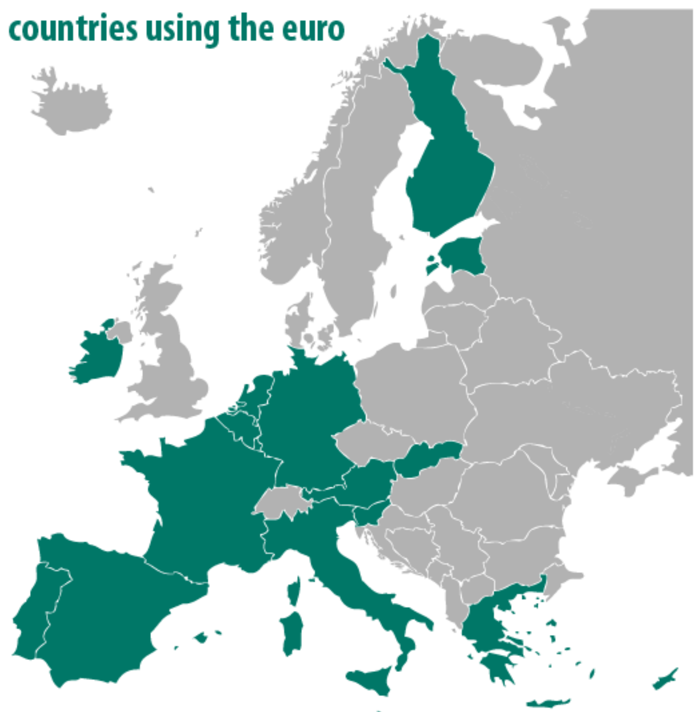
Trade Essentials

- **Action:** Set up a 3% synthetic short on **CurrencyShares Euro Trust**.
  - **Sell to open:** January 2014 $132 calls (midpoint of bid/ask: $10.33)
  - **Buy to open:** January 2014 $132 puts (midpoint of bid/ask: $12.37)
  - **Trust price:** $132
  - **Euro/U.S. dollar exchange:** $1.32
- **Price Guidance:** Use the strike price closest to the current trust price, and aim to set up the synthetic short for about a $2 net debit or less. We must pay some premium to set this up (about a 1.5% premium to the euro price), partly because this trust pays a dividend that is reflected in the call and put prices. But we think a 1.5% premium is reasonable for a currency position we intend to hold for two years.
- **Allocation:** Set up one pair of options for every 100 shares (roughly $13,200) you wish to short. For *Pro*'s Charter Port, that's three contracts of each option. (See the sidebar for Portfolio 2011 and smaller portfolio guidance.)
- **Why Short?**
  - The foundation upon which the euro is built is flawed.
  - Despite this year's trauma, the euro is *flat* with the dollar year-to-date. European banks have been bringing overseas investments home (repatriating them for liquidity), which creates extra demand for euros that should subside.
  - Interest rates in Europe are ticking lower, decreasing the euro's relative attractiveness.
- **Alternative Trades:**
  - If your broker has shares of the trust available for shorting without a fee, you can short them directly, but realize you'll be responsible for paying dividends. Our broker (Schwab) has offered shares to short for a 9% annual fee, which isn't worth it.

The Big Picture

We recommend making a two-year investment shorting the **CurrencyShares Euro Trust** (NYSEMKT: FXE) to profit if the euro loses value against the U.S. dollar.

The ink on the first euro banknotes issued in 2002 is barely dry, and already the currency is in crisis. Seventeen countries use the euro: Austria, Belgium, Cyprus, Estonia, Finland, France, Germany, Greece, Ireland (pause for breath!), Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovakia, Slovenia, and Spain. The euro represents the eurozone's ambitious attempt to unite vastly different economies with a common coin to improve trade and strengthen the European Union. The weaker economies in the south, however, are threatening the stability of the common currency and putting the strongest nations — Germany and France — between a rock and a hard place: Find a way to save their neighbors, or risk the young euro union.



First Things First

- **Vehicle: CurrencyShares Euro Trust** (NYSEMKT: FXE)
- **Assets Under Management:** $617 million
- **Holdings:** 100% euro
- **Annual Expense Ratio:** 0.40%
- **Annual Interest Rate (TTM):** 0.46%

Five times since 2009, European leaders have held summits to address economic challenges plaguing the euro, and five times the solutions have come up short because there is no easy fix. The foundation upon which the euro was built needs to be torn down and rebuilt. To form a true economic bond, all participating countries would need to agree to strong fiscal oversight (basically from Germany and France), invoking a loss of sovereignty and suggesting hard years of austerity ahead for many. But austerity programs cut economic growth and threaten recession, which raises the odds of a default — a classic downward spiral. Add to this brouhaha a lack of competitiveness and costly social programs that prop up aging populations, and the pressure builds higher.

Meanwhile, the European Central Bank has refused to go "all in" to buy more meaningful amounts of government debt or to lend to governments, because neither action is allowed in its treaty. Today, the ECB seems unlikely to change this stance. It probably won't unless Germany insists on it, but the Germans have been arguing against it, too, fearing inflation and arguing that bailouts send to the wrong signal to debtor nations.

The headlines are changing daily, but the bottom line seems to be that Europe lacks the will or the *means* to fix the flaws in its currency union in a timely fashion. It has a fiscal problem, with several eurozone countries drowning in debt and unable to sell bonds at attractive or sustainable rates; it has a banking problem, with banks hoarding cash; it has a competitive problem, which makes it harder to grow GDP to pay down debt; and it has a structural problem, where weaker countries *can't* print their own money to improve exports and grow, so they must cut costs, which hurts GDP. Furthermore, although 330 million people live in the eurozone, they're not nearly as mobile as Americans, because most are unwilling to move to a new country in the zone even if that's where jobs may be. Add all this up, and Europe makes your typical family reunion look easy and fun in comparison.

The Strategy

What About Portfolio 2011?

This trade is too expensive for Portfolio 2011 at our 3% allocation, because one contract would be about 5% of that $250,000 portfolio. Members should determine their allocation comfort at home dependent on portfolio size. A $400,000 portfolio is necessary for one synthetic short contract at $132 to equal about 3% of the portfolio on a look-through (or exercise) value. You could set up the trade never intending to turn it into shares, just as we don't, but realize the risk of potentially over-allocating if you do, and go small.

We're shorting the euro against the dollar using January 2014 options, so we have more than two years to potentially benefit. This is an asymmetrical investment. The euro may strengthen against the dollar, but likely only by so much (assuming the U.S. doesn't go belly-up). So even if the euro returns to its all-time high against the dollar ($1.60), the risk on our short will be only about 20%. Meanwhile, our possible upside — hard as it is to believe — may be as much as 100%. If the worst happens, the euro could fall apart. The trust we're shorting only holds physical euros, so it could end with negligible value. We don't hope for that calamity, but we can view this position as disaster insurance with relatively low downside risk.

Year-to-date, the euro is modestly higher against the dollar despite the dramatic headlines. We suspect this is because European banks have been bringing foreign investments home and converting them back into euros, which creates enormous extra demand for the currency. This sort of demand should prove temporary. Plus, with the ECB cutting interest rates on the euro by half a percentage point in the past five weeks, and with lower rates likely in 2012, euro demand in general may soften.

That's especially likely given the hurdles immediately ahead: According to Bloomberg data, eurozone countries need to pay back $1.45 trillion in debt next year, with nearly half of this due in the first half of 2012, and they'll need to raise new debt to do so. So far, the eurozone's central bank isn't eagerly offering to help. And even if it wanted to, the central budget in Europe is only 1% of GDP, compared to a much more effective 25% in the United States.

Historically, the euro has averaged $1.20 to the U.S. dollar. It reached a high of $1.60 in 2008 and a low of $0.86 nearly 10 years ago. Today's $1.32 exchange to the dollar puts the euro toward the higher end of its historical range. This suggests that even if investors begin to calm down about Europe, the euro could still deflate against the dollar in the next two years — especially if the U.S. shows the political will to contain its own debt problem. It's key to remember that all currency investments are relative. In this case, we're hoping the euro will decline against the dollar, and vice versa, so on a relative basis we need the euro to weaken, or the U.S. dollar to strengthen, or both.

With the grip of austerity tightening across Europe as new measures slowly work through the system, the continent faces the risk of recession in 2012. The pending downgrade of banks, countries, and the ECB from Standard & Poor's may not help either (at least the U.S. already got that over with!). Meanwhile, on this side of the pond, the U.S. has mandatory deficit cuts kicking in in 2013, so Congress may be motivated to work toward a more palatable resolution before then. But either way, the U.S. has a clearer path to addressing its economic problems than do the 17 euro nations, and its currency relative to the euro may come to reflect that over the next few years.

Unemployment: People 25 and Younger

- **Spain**: 49%
- **Greece**: 45%
- **Portugal**: 30%
- **Italy**: 29%
- **France**: 24%

Source: *The Economist*

Regarding the "worst-case" scenario for the euro: It seems most likely the euro would splinter *if* weaker countries with high unemployment rates (see sidebar) tire of austerity and simply conclude they can't compete with Germany's uber-strong economy. Instead, the best hope for a healthy economy in these countries may be to return to a weaker currency, which would boost exports. On the flipside, Germany wants the euro to survive mainly out of self-interest: Giving poorer countries the euro was a boon to its exports. Ultimately, poorer countries could hold this self-interest against Germany and even use it as a scapegoat to exit the euro.

How to Follow Along

To set up a synthetic short, you sell to open calls and buy to open puts, one of each, with the same expiration and strike price. For this trade, we will:

- **Sell to open:** January 2014 $132 calls
- **Buy to open:** January 2014 $132 puts
- **Pricing:** Aim to set up the short for as small a net debit as possible, but realize that since these options debuted last month, they've entailed a premium of $2 or so to set up this trade. This 1.5% premium partly reflects the dividends the trust pays over two years and is a reasonable cost for this two-year holding.

- **Allocation:** One contract of each option for every 100 shares ($13,200) you wish to short.

To measure our risk, we're looking at the position on a look-through basis — based on the value of the underlying trust. Each synthetic short represents a short of $13,200 worth of the trust. **Even if you're setting up the position on a nominal (or real-cost) basis, with no intention of converting the options to shares (which is not our intention, either), keep the look-through value in mind so you don't over-allocate.**

What Would Make Us Close

We're expecting to be in this trade for the two-year duration. Currencies fluctuate, and crisis or not, it seems likely that we'll see a profit on the dollar-to-euro exchange rate at some point over the next two years — again, unless the U.S. blows it. Should Europe's situation worsen, though, and the euro tumbles while still in use, we may take our profit early. Finally, recognize that this position could surprise us. For instance, if a weak country leaves the euro, the currency may actually grow stronger. Or if Germany does an about-face and begins to sanction Eurobonds backed by all member countries, or if the ECB becomes a lender of last resort with unlimited funds, then we are likely to end our bearish investment. But our risk should be reasonable throughout, and we'll close early only if we believe the story has changed meaningfully in the eurozone *or* in the United States.

The Foolish Bottom Line

The euro is in trouble. An easy solution is elusive. Unless the member countries, driven by Germany, get everything just right, odds seem to favor the euro weakening against the dollar the coming few years. We're shorting the euro against the dollar with the belief that our risk is acceptable and our potential profit is attractive — this is the type of asymmetrical investment we often seek. Who's Buying Stock? Companies, That's Who

Published Dec 12, 2011 at 12:00AM

Fellow Fools:

Pro Trade Roundup

Charter Portfolio

- **Plum Creek Timber**: Sold to open a covered strangle, writing 10 May 2012 $33 puts and 10 May 2012 $38 calls, for a combined average net credit of $3.01 per share.

We have some exciting things planned for the end of 2011 in *Pro*. Before the year is out, we'll review our performance over the past 12 months, announce some new recommendations, and reveal our absolute-return metric, which we're calling our North Star. Watch for more on our North Star in your inbox soon; we don't want to be hyperbolic, but it may just change how you think about investing for the rest of your life. In the meantime, let's turn our attention to the companies currently making the largest share buybacks, in case there are any opportunities to be found.

Record Buybacks: Good or Bad?

Companies in both the S&P 500 index and the small-cap Russell 2000 are buying back shares at a near-record pace. And of the 20 companies buying back the most shares, three of them are in the *Pro* portfolio. Read on to find out which — but first, a word on share buybacks, which can be good or bad or both. They're good when they decrease a company's share count, and when the stock subsequently goes up because management bought at a fair price. Share buybacks are *not* good when they merely cover up share dilution from employee stock grants, when the stock subsequently declines because it was too pricey, or when the company could have used its money more strategically.

Companies have different approaches to buybacks. Steve Jobs famously hated them, so **Apple** never made any. **Netflix** bought back hundreds of millions of dollars' worth of stock at much higher prices than it trades today, and the company now finds itself needing to raise cash at much lower prices, destroying shareholder value at both turns. Warren Buffett's **Berkshire Hathaway** recently announced the company's first buyback, and he's ready to step up to the plate whenever the stock declines to near book value.

And then there are these companies, which are buying back shares like there's no tomorrow.

Top These Buybacks

In the 12 months that ended in September, these companies were buying back shares with a vengeance. Here are the top spenders in dollar terms:

Company	Total Value of Buyback (in billions)	Percent of Market Cap
ExxonMobil	$22.39	6.07%
IBM	$15.07	7.05%
Intel	$11.70	9.73%
ConocoPhillips	$10.59	11.74%
Hewlett-Packard	$10.12	20.10%
Microsoft	$9.09	4.35%
JPMorgan Chase	$8.69	7.99%
Coca-Cola	$6.57	4.37%
Goldman Sachs	$6.24	13.71%
Cisco Systems	$6.08	6.38%

Here are the companies buying back the largest amount of outstanding shares as a percentage of total shares on the market (as of a year ago). The leader, Novellus, bought back a whopping 52% in the past year.

Company	Total Value of Buyback (in billions)	Percent of Market Cap
Novellus	$1.09	51.83%
Gap	$2.62	29.14%

Kohl's	$2.96	21.18%
Hewlett-Packard	$10.12	20.10%
R.R. Donnelley	$0.50	19.75%
Torchmark	$0.79	19.54%
DirecTV	$5.92	18.60%
L-3 Communications	$1.17	18.43%
LSI	$0.50	17.54%
Cintas	$0.58	16.04%

Sources: Barron's, S&P, Bloomberg.

What Does It All Mean?

The three *Pro* companies appearing above are Intel, Cisco Systems, and L-3 Communications. So far over the past 12 months, Intel is the only one with positive returns. In each case, though, our analysis tells us valuations should increase given more time, so hopefully our companies are making a good choice by buying shares.

The massive buyback at Hewlett-Packard, on the other hand, is a massive mistake, with shares plumbing new lows this year. We'll be looking over the *rest* of the list to see if any other companies catch our interest; for example, uniform rental company Cintas has a long track record of creating shareholder value, and it has bought back 16% of its stock over the past year. (Thoughts on which companies you like best? Visit our Stocks that Interest You board.)

A Broad Buyback Frenzy

Companies in the S&P 500 bought back $132 billion of stock last quarter, the most since the market's peak at the end of 2007. The 2008 market implosion shows us that buybacks don't always promise higher prices ahead. No management team, however talented, knows what the economy will do next, and a buyback can be done for reasons that have nothing to do with the stock market's next move.

I suspect three reasons for today's high level of buybacks: Companies are flush with cash, they don't know where to invest it, and they're diluting shareholder value with stock grants and trying to hide it. In most cases, it's likely some of all three — but in other cases, a large buyback may truly be an opportunity. Some companies actually are buying back a cheap stock that is likely to appreciate in the future, and we're going to look more deeply into the preceding lists to see if any of the companies there are among them. (Aside from three companies already in the *Pro* portfolio, of course. We already believe there's value to be had there.)

Please post any questions on the Memo Musings board. Until next time, thank you for being a *Pro* member!

A Winning Formula

Published Dec 5, 2011 at 12:00AM

Fellow Fools,

As we've lamented time and again, finding mispriced stocks is hard work. At last count, American investors could choose from 669 companies peddling 8,545 mutual funds, 624 closed-end funds, and 950 exchange-traded funds. That means a lot of people out there are scouring the same investments and placing gobs of money into long or short positions on them — and *that* means that on the whole, most stocks in the market end up priced just about right. With all that cash and all those brains chasing successful investing performance, how's a Foolish investor supposed to win?

Guidance Updates

- **Papa John's International** remains on hold, but we're raising the valuation from $28 to $35 and the buy-around price from $24 to $28.
- **StoneMor Partners** moves to Buy First; we don't agree with S&P's downgrade.
- **Ebix** and **MasterCard** move to Hold on valuation.

Know Where You Differ

If we believe most stocks are priced fairly at any given time, it makes sense that we focus our investment dollars on positions where our view differs from the prevailing one; that's how we expect to achieve performance independent of the general market. If the market expects solid execution and rapid growth at **Nick's Fighter Jets**, the shares will be priced accordingly — and without an opinion that differs meaningfully, we'd stay away. Your *Pro* team focuses its research efforts on garnering insights that, when pieced together, give us a different picture than a stock's current price may reflect.

Sometimes it's easy to see where we differ from the prevailing opinion. For example, we bought **Bristow Group** in the midst of the Deepwater Horizon disaster because we believed its sector, deepwater offshore drilling and production, was too vital to the global economy to stay down for very long. In other cases, our dissenting view can be more obscure. Our investment in **StoneMor Partners** represents a bold claim that the investing public doesn't understand the company's accounting and is thus wrong in believing StoneMor's dividend is not sustainable. In each case, the opportunity to earn outsized returns is based on our research-supported views that happen to be meaningfully different from the norm.

Focus on What Matters

For each investment we make, we identify a few key factors we think will drive improvement in the business. Then we focus like heck on following the progress of those elements, paying less attention to any other stuff going on. We let the media whip up frenzies for no reason if they choose — for example, in August 2010, when **Tupperware Brands** shares plunged after the company announced an accounting error in its Russian operations and some foreign-exchange challenges. But we'd already identified our key areas of focus for Tupperware (attracting and training its army of reps, maintaining share in mature markets, achieving success in emerging markets, and containing costs), and they had little to do with Russian exchange rates. That meant we were able to largely ignore the problems in Russia; we made sure we still believed the company was executing on the things that mattered most, and then we tried to buy more shares via written puts. The Russian issues later subsided, and Tupperware shares continued their upward move.

Hang Tight … or Change Your Mind

We know the ways in which our views about our investments differ from the consensus, and we focus on analyzing the factors we believe matter most. That gives us the confidence to sit tight when things that *don't* matter as much go awry, and it gives us the heads-up to change our approach if one of our key factors isn't progressing as planned. Importantly, we relish the ability to change our minds if we find our view falling into lockstep with the market's — or if we turn out to have been just plain wrong about how our key factors would play out.

Earlier this year, for example, we sold **Quanta Services** for that very reason: We were mistaken about one of the main catalysts for the company. We weren't worried about project delays for the king of power transmission lines, but we were concerned that Congress hadn't made any progress in drafting or passing an energy bill. We knew that without such a bill to boost Quanta's results, our money was better invested elsewhere.

The *Pro* Bottom Line

Good investing is like watching paint dry: a lot of sitting around doing nothing. Identifying a framework of key factors for each investment we make helps us invest for the long term, remove emotion from our decisions, and ignore much of the jibber-jabber that pours forth from daily market commentators. It's how we remain calm and dispassionate about the goings-on in Europe, and it's how we stack the deck in our favor to win over the long run.

Foolishly,

Bryan (TMF42)

Audio Extra: MDT and STON

Published Dec 2, 2011 at 12:00AM

In our latest Audio Extra, Jeff Fischer talks with Bryan Hinmon about **Medtronic**'s earnings and with Alex Pape about a Standard & Poor's downgrade of **StoneMor Partners**. Hear why Medtronic remains a healthy buy and how the company should grow in developed markets, not just emerging ones. And get our initial take on StoneMor's downgrade, which suggests that Standard & Poor's doesn't understand the company as well as it could.

Transcript

Jeff Fischer: Welcome to a new edition of Motley Fool PRO Audio Extra. In the studio are analysts Bryan Hinmon and Alex Pape. I am Advisor, Jeff Fischer. Thank you, PRO members, for joining us. We are going to talk about Medtronic and Stonemor Partners today. Bryan, let's start with Medtronic. They reported earnings recently. They are, of course, the largest medical devices company in the country, and we know this. Legend has it the company was founded in the founder's garage.

Bryan Hinmon: They have come a long way since then, Jeff.

Jeff Fischer: It's amazing. Apple, Nike, Medtronic, garage businesses. The Motley Fool was founded in David Gardner's shed. This made me realize, I live in a row house on Capitol Hill. I don't have a garage or a shed. I have all these great ideas and nothing I can do about it. So where's Medtronic today, Bryan? Can you summarize the recent results?

Bryan Hinmon: Sure. They have come a long way from their garage days, but there was very little that was new in this quarter. The story remains that 60% of their business is doing really well, growing about 8%, and 40% of their business is shrinking, about 5% this quarter. And so that sort of netted out to 3% growth, which is not bad, but uninspiring, and so Medtronic is still sort of stuck in the mud where it wants to return to its days as a growth company. The market wants that as well, but like you said, it's a large company. It's the largest Medtech Company, pure play, and it takes a little while to turn things around.

Jeff Fischer: Domestic revenue was flat; overseas revenue grew 6% with the emerging market revenue a strong 19% jump. So what is going to be the catalyst that will make domestic revenue rise again?

Bryan Hinmon: Yeah, well they have some new products that are coming through the pipeline here, and the very encouraging thing is that typically they release their new products in Europe first, and so they have a really nice proving ground, just because it's a little easier to get products launched there. Our FDA is; they're a wet blanket if you were to ask the medical device (unclear).

Jeff Fischer: They are just being cautious, Bryan.

Bryan Hinmon: Yeah, they are just being cautious. So for instance, the company has a drug-eluting stint called the Resolute Stent that has been selling like gangbusters in Europe. They are expecting that it will get past the FDA this fiscal year, and they expect almost immediately that they'll sell 200, 250 million dollars of this one product. So they will sort of one day the FDA will say, Okay, and the next day, Medtronic will begin taking market share. So it's new products that are going to catalyze the domestic growth again.

Jeff Fischer: And Bryan, international sales are a minority of overall revenue and emerging markets are an even much smaller minority. How large can emerging markets become for this company in the next five to ten years? Do they talk about emerging markets someday rivaling the sales in North America?

Bryan Hinmon: Well, specifically no. But what the company does say is they like to communicate about populations. And so obviously if you look at the population of the emerging markets versus the population of the mature markets that they are in, the scale tips towards the sides of the emerging markets clearly. It's not an apples to apples comparison, but the point is that the numbers are in favor of emerging markets, and the thing that gives me confidence that one day those emerging markets or international markets will rival the more mature markets is the fact that the company brought in a CEO that didn't necessarily have experience in the specific product lines Medtronic was in. They brought in a CEO that had experience in international operations, and so they are clearly focused on growing the company in that direction.

Jeff Fischer: Okay, Fools, Medtronic is a buy, it's buy rated. It's in the mid-thirties lately. We have a buy-around price of up to 39, and the shares yield about 3% dividend yield right now, and trade around ten times earnings and free cash flow, so it's a value stock, very clearly a value stock, with, we believe, substantial upside in the coming few years and beyond. So if you don't have a 5% allocation, it's at a fair price where you can add shares or sell to open put options to add to your position. Thank you, Bryan.

Bryan Hinmon: Sure thing, Jeff.

Jeff Fischer: Alex, let's talk about Stonemor Group.

Alex Pape: Just as exciting news…

Jeff Fischer: Stonemor Partners, I should say.

Alex Pape: So yesterday Standard & Poor's downgraded Stonemor's publicly-traded debt from…

Jeff Fischer: This was Tuesday afternoon, to be clear. It really hit the market Wednesday.

Alex Pape: And so they downgraded from a BB- to a CCC+, so today the shares are down about 15% at the lowest point. They have come back up a little bit, so now they are down about 12%.

Jeff Fischer: That's right, and Fools, we are taping this Wednesday afternoon.

Alex Pape: I should specify these things.

Jeff Fischer: That's okay. Hopefully they'll be up 10% by the time this comes out.

Alex Pape: Hopefully this will be irrelevant by the time it gets published.

Jeff Fischer: So what does this downgrade mean?

Alex Pape: So Standard & Poor's is concerned about two things. The underlying business for Stonemor, which I take some serious beef with, and the financial statements, which I don't really blame them for misunderstanding the financials for Stonemor. Standard & Poor's and Moody's have pretty much missed every major blow-up in the last decade, so I can't blame them for getting this wrong as well. I am still digging through the report, but I don't have a lot of credence to put towards what they are saying.

Specifically what they are saying about the business though, this is a quote from the report, they said, "Stonemor has a weak business profile in the highly fragmented and competitive cemetery services industry." This is kind of silly. Stonemor is the second largest cemetery owner in the country, and by far the most profitable. They have a very unique sales process. They sell contracts for burial properties and merchandise in advance of the time of death rather than at the time of death, and this results in higher margins and more predictable cash flow. So even though they are the second largest and not the largest, they are actually more profitable than the largest.

And also the fact that it's highly fragmented is a really good thing for them because that's how they grow. They are buying up constantly small cemeteries from sort of mom and pop cemeteries all over the country, and that's what's fueling the growth of the business and their dividend.

Jeff Fischer: Right. That S&P statement struck me as very odd as well. It's how so many software companies, which I always go back to; sorry. They love fragmented industries for that very reason. That's how you grow.

Alex Pape: That's sort of why we own this, actually. It's a great thing here, so that just signaled to me a somewhat of a misunderstanding. And they also cited rising cremation rates, which is also a misunderstanding. Well first of all, cremation is a lot more popular on the west coast of the U.S. than it is on the east coast. It's a dramatically more popular thing to do there. And Stonemor is really heavy on the east coast, so 76% of their properties are in the northeast of the U.S., with another 10% in the southeast, so it doesn't affect them as much, but even there, they make money on this too. They sell urns and they have mausoleums on their properties, so it actually helps them. It's a lower dollar amount sale, but it's a much higher margin and it doesn't use up as much land because you can build up with mausoleums rather than having to acquire more properties. So neither of these things are something that concerns me.

Then on the financial side, I am still digging through the exact numbers, and it's probably more than is worth going into in an audio, but the one thing that they cited was, they cited interest coverage ratios, which is basically how easy is it for a company to pay, make the interest payments on their debt. They said that these are going down, but they cited GAAP figures, and GAAP is the accounting standards, and by those figures, Stonemor looks awful.

Jeff Fischer: That was why we bought it.

Alex Pape: Yeah, that was the whole point, is that GAAP doesn't do justice to this company, and if you look at what's actually happening in the underlying business, it's a very different story. So yes, by GAAP standards, actually they don't make enough money to pay their interest payments.

Jeff Fischer: Right.

Alex Pape: Somehow, magically they have managed to do so anyway, and that's because that by any real measure of profitability or operating profits, they are actually comfortably able to make their interest payments. So I am still digging through the details, but this does not concern me.

Jeff Fischer: All right, so Fools, thank you, Alex. That was the take-away I had as well, that I don't think the S&P analysts spent the hour speaking with the company management the way you did. Maybe they did, but this short report kind of brought to light several misunderstandings, I would think.

Alex Pape: Several iffy statements. And now the question is, stock is down to about $25. It is yielding almost 9.5%. The question is, is this the time; if you don't already own our allocation of 3%, this is probably the time to do so. The question that we'll be answering in the next couple of days is is this the time to buy more?

Jeff Fischer: Yeah, so check the board because, as Alex said, this news just really broke today, and we still wanted to make this tape today to get it out by Friday, but we are still going through the numbers and Alex will post his final thoughts on the board, very likely by the time this audio is issued to you, so it should be there by the weekend.

So thank you both, and thank you PRO members for joining us today. We'll see you in the Monday Memo, and we'll see you on the boards. Fool On!

3D Systems and Stratasys: Fight!

Published Dec 1, 2011 at 12:00AM

This article first appeared as a Motley Fool Duke Street *exclusive on Aug. 24.*

Imagine printing a complex, customized object — a replacement gasket for your '67 Mustang, or a hearing aid molded perfectly to your ear's contours — as easily as you can print out a copy of this article. It may sound like something out of a science fiction movie, but three-dimensional printing is real — and it's going to revolutionize the manufacturing industry.

There are two companies leading the 3-D printing revolution: *Motley Fool Pro* holding **3D Systems** and **Stratasys**, a *Rule Breakers* and *Hidden Gems* recommendation. Below, I'll examine every dimension of these fast-growing companies, but first, let me provide a little background on how 3-D printing works and why this market opportunity is so enormous.

The Next Dimension

Unlike in Hollywood movies, where 3-D technology adds little value to the end product (Michael Bay, I'm looking at you) and results in higher ticket prices, 3-D printing helps manufacturers produce items more efficiently and at a lower cost. The process is similar to ink-jet printing, only instead of spreading ink over paper, a 3-D printer deposits layers of ultra-thin material on top of each other and fuses them together to form a three-dimensional object. This results in less material wasted, lower manufacturing costs, and a quicker path from design to production.

Engineers and designers have been using 3-D printing techniques for over two decades, primarily to build prototypes. But as 3-D printers have become more capable and less expensive, the machines are increasingly being used to make final products. According to industry researcher Terry Wohlers, more than 20% of the output of 3-D printers is now final products rather than prototypes. He expects that figure to reach 50% by 2020. That forecast is great news for 3D Systems and Stratasys, since selling the material consumed by 3-D printers is a much higher-margin business than selling the printers themselves. As an added bonus, those materials sales are recurring in nature and much steadier, since they are tied to printer usage and not capital spending.

But while the potential for 3-D printing technology in the automotive, aerospace, and health sectors is immense, both 3D Systems and Stratasys have seen their share price flattened recently. I turned to *Rule Breakers* analyst Karl Thiel and *Pro* analyst Bryan Hinmon to determine whether these fast-growing companies might be a good fit for your portfolio.

Tale of the 3-D Tape

Company	3D Systems	Stratasys
Newsletter(s)	*Pro*	*Hidden Gems*, *Rule Breakers*
Market Cap	$821 million	$483 million
Focus	Low-end users	High-end users
Technology	Offers six "print engines," each with a different method of fusing materials	All printers use the same fusing technology; users can choose from nine different modeling materials with differing properties
Founder	Charles Hull serves as chief technology officer	Scott Crump serves as chairman and CEO
Growth Strategy	Acquired 17 companies in the last two years	Partnered with HP to distribute low-end printers

Rich Greifner: History is full of new technologies that have been wonderful for productivity but lousy for investors, like railroads, airplanes, and fiber-optic cable. Why do you believe that 3-D printing will be beneficial for shareholders as well as users?

Karl Thiel: I'm not sure investors in **Corning**(NYSE: GLW) between, say, 1985 and 2000 think fiber optic cable was a lousy investment. But in any case, those are all examples of largely public infrastructure. 3-D printing is, I believe, a different beast entirely. The razor and blade model is a lot more reminiscent of traditional printing, which launched, say, **Hewlett-Packard**(NYSE: HPQ) on an awfully nice 15-plus year run before evolving into a different sort of commodity business. The same fate could await 3-D printing, but it's a long way off.

Bryan Hinmon: 3-D printing creates the ability to customize almost anything — adding an element of self expression and individuality that consumers can't get enough of (witness the rise of boutique fashion labels, custom **Nike**(NYSE: NKE) shoes, and people making their own soda for crying out loud!). The consumer opportunity provides an added dimension that those other technologies you hit on simply didn't have.

As for the durability of the profits for shareholders, I think the key lies in the patented, or at least highly engineered supplies business. The supplies for 3-D printing are much less susceptible to knock-offs than ink cartridges.

Rich: Serving the consumer market has been a recent point of emphasis for 3D Systems. The company has made numerous acquisitions to increase its exposure to casual users — a strategy that has dinged short-term results, since these printers are less expensive and the users consume fewer materials. Is this a smart strategy?

Karl: This is the way these companies need to be thinking. Both 3D Systems and its arch-rival Stratasys have the benefit of still having their founders — and the inventors of their respective technologies—in executive positions. They both have a clear vision for where this technology can go and don't want to sacrifice long-term success to short-term performance.

3D Systems has pushed harder on the low end of the market and has been more agnostic about different 3-D printing technologies (the company offers six different "print engines"). Stratasys is likely watching to see how 3D Systems opens this market before it gets more aggressive.

Rich: Stratasys has taken a different approach to serving the consumer market: the company has teamed up with Hewlett-Packard to manufacture a line of HP-branded, low-end printers. This strategy will crimp margins, but should increase both revenue and earnings, as the company can move many more units through HP's massive distribution network. However, sales have lagged expectations, and there are questions about HP's commitment to this initiative — is this a cause for concern?

Karl: It's a concern but, at this point, not an overwhelming one. Management recently described HP as "distracted" and said it needs to increase its commitment. However, with U.S. sales of HP-branded printers beginning in the first quarter, it's reasonable to expect that commitment to increase. In the meantime, many of Stratasys' resellers are actually upselling customers to the company's high-end Fortus line, which carry better margins. That's an indication that while the future of 3-D printing may be personal, right now it's still about high-end prototyping.

Rich: OK guys, here's the $10,000 question: Which one of these companies is the best investment right now?

Bryan: I like 3D Systems because of its diversified approach to the still-evolving market. It has the largest installed base which helps with re-sales, up-sells, and recurring supply sales. And the company has been hard at work at democratizing the space too — developing less expensive printers to expand the market beyond its core manufacturing applications. It has also invested in "service bureaus" that act as outsourced printing partners. It reminds me of **VistaPrint**(Nasdaq: VPRT) — you design your own business cards, t-shirts, or mugs, submit your order on line, and they print them and ship it to your doorstep. The service bureaus do the same thing, just for items much cooler and more complex than business cards. It is just one example of how 3D Systems is spreading its bets and building the industry on many fronts.

Karl: Stratasys just went on sale after its second quarter revenues came in a little lighter than expected. The worry is that HP isn't committing enough time or resources to its marketing partnership, but at *Rule Breakers*, we believe HP will get more committed once U.S. sales begin next year. We also like the company's vision of the future. Stratasys has more focus than 3-D Systems on additive manufacturing as opposed to prototyping, and it has excelled there because its technology allows objects to be printed out of a wide range of functional materials, including durable ABS plastics. That's where we see 3-D printing going: From examples to objects you can use.

The 3-D Bottom Line

Not surprisingly, both Bryan and Karl favored the 3-D printing company recommended by their respective services. Now we want to know, Fools — which company do *you* prefer? Do you admire Stratasys' focus or 3D Systems' broad-based approach? Stop by the *Motley Fool Pro* 3D Systems discussion board and let us know!

The Motley Fool owns shares of 3D Systems and VistaPrint.

Charter and 2011 Portfolios: Plum Creek Timber

Published Nov 29, 2011 at 12:00AM

Trade Essentials

- **Actions:**
  - **Charter Portfolio: Write a covered strangle.** Write ("sell to open") May 2012 $33 puts (to potentially double your position to 5%); write ("sell to open") May 2012 $38 covered calls (one for every 100 shares you already own).
  - **Portfolio 2011: Write puts.** Write ("sell to open") May 2012 $33 puts only.
- **Allocation:**
  - **Charter Portfolio:** 10 contracts of each option; we'll potentially double our position to 5%
  - **Portfolio 2011:** 5% (for Portfolio 2011*,* that's four put contracts)
- **Recent options price (splitting the bid/ask prices):** May 2012 $33 puts: $2.15; May 2012 $38 calls: $1.30
- **Preferred strangle limit price:** $3.35 credit, combined (higher is better — check current prices and aim for at least $3.35 initially; as prices change, accept no less than $3)
- **Preferred $33 put-writing limit price:** $2.14 or higher (as prices change, no less than $2)
- **Recent share price:** $35.22
- **Buy around:** $34
- **Fair value:** $40
- **Alternative trades:**
  - **Charter Portfolio: Want a larger premium?** If you're willing to take on more risk (of either having your shares called away or being required to buy more) in exchange for a higher option payment, you can consider moving your strangle strike prices up and down, closer to the current share price with either option.
  - **Portfolio 2011: Want a better chance to buy shares?** You can write puts at a higher strike price to earn a higher premium and increase the likelihood that you will be required to buy shares — but to manage risk, make sure your strike price is only $1 or $2 higher than ours.

What's New?

Watching **Plum Creek Timber** (NYSE: PCL) is a lot like watching trees grow, gently swaying with the wind, but with little change quarter after quarter. A key driver for domestic lumber demand — and with it Plum Creek's saw logs — is new housing starts, which came in at 628,000 annualized in October, a full 18,000 (again annualized) higher than Bloomberg estimates. That may not sound like much, but construction housing permits were at their highest level since March 2010, so there is hope that the pace will quicken. We'll continue strangling Plum Creek until hope becomes reality, so we're writing our fifth covered strangle on the stock, a move that may end with us buying more shares below our original purchase price or selling our current shares for more than our estimate of fair value. For Portfolio 2011, meanwhile, we can write puts to potentially buy shares much cheaper.

Why These Strategies?

With a 4.8% yield (5.3% on cost) and our frequent option writing, Plum Creek has generated steady income for our Charter Portfolio since 2008.

- **Charter Portfolio:** This strangle provides members with a potential net buy price on new shares of $29.65, below our $34 preferred buy price. And if the stock stays between our two strike prices (a range of $33 to $38), we'll earn the full premium of around $3.35 per share (a 9.5% yield on the current price), plus two $0.42 dividend payments (not yet announced, but expected in February and May) for another 2.4% in yield. If the stock rises above $38, we enjoy a potential net sell price of $41.35, more than 17% above the current price and above our fair value estimate.
- **Portfolio 2011:** Writing puts alone nets us a potential buy price around $31 — below our preferred buy price and below Charter's cost basis. The yield on cash for the put trade is an attractive 6.5% in a low interest rate environment.

How to Follow Along

- **Charter Portfolio:** To write a covered strangle, you must own at least 100 shares of the stock, and you should be happy to buy at least 100 more at a lower price.
- **Portfolio 2011:** To write puts alone, you need to be ready and able to buy 100 shares for every put you write if the stock is below your strike price ($33 in this case) by expiration in May.

Members following Portfolio 2011 might feel a little "yield envy" because they'll miss out on the dividend provided through share ownership. If this is you, remember that the upcoming dividends are already part of the calculations behind the put premium we're getting.

Seven Principles for Investing Success

Published Nov 28, 2011 at 12:00AM

Dear Fellow Fools,

We hope everyone had a happy Thanksgiving and is ready to enjoy investing again. Wall Street has most investors on edge, but ironically, this is a much better time to invest than when the market is euphoric. Need a reminder? In 1999, the market consensus was so bright it was blinding. More than a decade after investor optimism peaked, the Nasdaq Composite remains more than 50% below its high. We'd much rather be investing when the outlook is grim, like now.

Seven Time-Tested Principles

To help everyone stay the course in a rocky market, let's review seven great investing principles from Davis Advisors.

No. 1: Accept that uncertainty is the rule, not the exception.

If you're looking for certainty in the economic world, forget it. It has never existed. Whether it was World War I, the Great Depression, World War II, the inflation of the '70s, the S&L crisis of the '80s, the Asian meltdown of the '90s, or any other number of challenges, every decade has thrown major roadblocks in front of the stock market. Yet over those decades, the market created fortunes. Investing during "certain" times is an illusion, and in rare instances where most investors have high confidence (such as 1999), your returns are likely to disappoint.

No. 2: Focus on what is important and knowable.

The stock market creates wealth over decades, so it's not a question of whether or not to invest — it's a question of *how* to invest. Nobody can consistently predict GDP growth, interest rates, commodity prices, wars, or countless other economic events. But we can hone our ability to recognize sustainable competitive advantages, attractive share prices, competent management, and strong earnings potential. We want to spend our time researching what is discoverable and knowable, rather than wasting time analyzing the unknowable.

No. 3: Be patient.

Superior businesses will create value through thick and thin if you're patient. Using turnover (or active buying and selling) as a proxy for patience, generally the more turnover in your portfolio (or the less patience demonstrated), the weaker your performance. Generally speaking, you should probably not be turning over more than 30% of your portfolio, if that, in a year. As Warren Buffett said, "For investors as a whole, returns decrease as motion increases." We want to adapt as the times change, but not change our timeless investing principles.

No. 4: Expect periods of disappointment.

All of us experience good stretches of life as well as challenging years. It's irrational to expect something different from our investments. Even the world's best investors are ranked among the very worst on average *at least* 30% of the time. So, don't expect your investments to perform all the time. Expect weak years, but have the confidence to keep using a strategy that works over the long run. We know *Pro's* strategy has rewarded handsomely over long periods.

No. 5: Engage in healthy investor behavior.

Money is part of our emotional well being, so investing can be emotional if you let it. You need to guard against this, Fools. I wrote in a recent Memo that the average investor performs *much worse* than the average mutual fund he owns, because he trades in and out of the fund based on emotion. Investors tend to give up, chase hot sectors, try to time the market, and change strategies at the *worst* times (imagine a professional golfer trying to change his swing mid-tournament). Healthy investing behavior means staying true to long-term strategies that work. It's easier to do this when you accept that you'll have periods of disappointment.

No. 6: Invest systematically (and I'll add: don't put everything in stocks).

A steady process helps you avoid emotionally tense investing. Invest on a regular basis, or dollar-cost average if that suits your income. And consider keeping a meaningful sum *out* of the stock market if that will help you maintain an even emotional keel. You may not earn much on funds you keep out of the market, but those funds could *more* than pay their keep if they enable you to stay on track with your invested assets. You'll find strong psychological benefits to having a few years' worth of living expenses stashed away in cash savings.

No. 7: Historically, periods of low returns for stocks have been followed by periods of higher returns.

The masses rush in to buy rising stocks and get frightened out of falling stocks, because it's human nature to extrapolate recent events. But events always change. Today, people are giving up on stocks even though rising prices are ultimately going to reward those who stay invested. Davis Advisors reports that every weak 10-year period of 5% annualized returns or less since the 1920s (and there are 12 such instances) is historically followed by a strong 10-year period that averages 13% annualized returns. We're investing on the heels of one of those weak periods. We may see a few more weak years, but history is already on our side for the next 10 years.

For a PDF that provides more details on these seven principles, visit this link. To talk about the Memo, take it to the Memo Musings board.

Three Investing Megatrends

Published Nov 21, 2011 at 12:00AM

Fellow Fools:

Complete Your Portfolio ...

A sustainable environment supports a strong economy — and the reverse needs to be true as well. For either to succeed, these two goals must go hand in hand. I saw evidence of this last Thursday in Washington, D.C., at the World Wildlife Fund's "Conservation Forward" symposium, where there was more talk about business than you might expect. Though the developer of **Google** Earth, Michael Jones, did take the podium for a great presentation on how we perceive the world, most of the speakers were scientists, and it was these scientists who inadvertently offered the most investment ideas. Here are three I found particularly compelling.

Agriculture (Wheat and Soy)

After decades of growth in wheat yields, key regions of the world may be nearing their capacity for wheat production. Institute on the Environment director Dr. Jonathan Foley drew on data from a brand-new study to explain that major global breadbaskets (including North America) have seen flattening improvement in wheat yields over the past 10 years. This is surprising news that has yet to be published. While many poorer regions of the world could still increase yields with improved technology (if only they could get it), the study's conclusion is stark, especially as the world's population grows.

This revelation was all the more striking because it followed a speech by Earth Policy Institute president Dr. Lester Brown on the difficulty of feeding the world today. Seven billion people call our planet home, and 219,000 more are born every day; already a billion people — three times the population of the U.S. — are chronically hungry. Wheat supplies are vulnerable to adverse weather, and the price of wheat is up 40% since 2007. Brown believes a major food crisis is likely by 2020; you'll get a better idea why when we go into our next theme on water below. At the same time, skyrocketing demand for soybeans — used in China to feed animals for a population that's eating more meat — has turned Brazil and North America into major exporters. But much of that crop is being grown on thin soil that won't likely sustain soy for more than a few years, and unlike other crops, soy isn't very responsive to fertilizer.

Food is clearly an investing megatrend for the next decade and beyond: growing it, storing it, transporting it. (Indeed, the same day I saw these presentations, a story broke that Warren Buffett's Burlington Northern Santa Fe railroad is investing in surging grain and soy demand from China.) At *Pro*, we're responding by researching major food producers such as **Archer Daniels Midland**; farming-related businesses; agriculture ETFs; ways to invest in wheat, soy and related commodities; and transporters, including Buffett's **Berkshire Hathaway**.

Water

Water received even more attention at the symposium than food, with several speakers outlining the likelihood of severe water disruptions around the world at any time. More than half of the world's population lives in regions (including North America) that are drawing aquifers down more quickly than they can replenish; further, Dr. Brown's new book, *World on the Edge* (which speaks to economics as much as conservation), cites a World Bank estimate that at least 18 countries are currently enjoying "food bubbles" made possible only by overpumping water from aquifers.

Pro Trade Roundup

Charter Portfolio

- **Contango Oil & Gas**: We sold all shares via covered calls for a net $61 per share.
- **Wells Fargo & Company**: We set up a covered strangle, selling to open April 2012 $21 puts and April 2012 $29 calls for a combined credit of $2.55 per share.
- **Plum Creek Timber**: Our November covered strangle expired for the full profit.

Portfolio 2011

- **Wells Fargo & Company**: We set up a covered strangle, selling to open April 2012 $21 puts and April 2012 $29 calls for a combined credit of $2.55 per share.
- **Plum Creek Timber**: Our November puts expired for the full profit.
- **GlaxoSmithKline**: Our November puts expired for the full profit.

Saudi Arabia's 3-million-ton annual wheat harvest has recently been decimated after the depletion of that country's fossil aquifer, sending officials scurrying to buy land in other countries to raise food. And that's small compared to the trouble that could result if the same thing happened in India, where the World Bank estimates that overpumping makes it possible to feed an additional 175 million people every day. In China, that number is 130 million, and farmers in some provinces have had water supplies cut by 30% since 2008. The world's population is growing by 80 million per year, and if irrigation water grows scarce, food supply is the first item to suffer. A massive quantity of water is also necessary to create most forms of energy; a full 20% of water used in China goes to produce energy from coal. And large amounts of water are essential in many manufacturing and construction processes.

At *Pro*, we're diving into the water situation by considering former holdings **Flowserve**, which makes valves, pumps and seals and has a promising desalination business, and **Lindsay**, which makes efficient irrigation equipment (we've been on to this trend since our beginning).

Declining Use of Coal in Developed Markets

Between 2007 and 2010, coal use in the United States declined 8%. Coal-fired power plants are being closed here at an increasing rate, replaced by natural gas and wind, and the country has a "near de facto moratorium on the licensing of new" ones, as Brown put it. Denmark and New Zealand have banned new plants, and the province of

Ontario (where 39% of Canadians live) plans to phase out coal entirely by 2014. True, China is building coal plants like there's no tomorrow, but most developed nations are moving away from it.

I've just started to look at U.S. coal companies (those that don't export to China) to consider for possible long-term *short* positions (betting on their decline), so I can't name names, but I think there's something here.

Big, Motley Trends Abound

Humans are exhausting the world's resources at an intensifying rate, and we've put ourselves on a path where change in our behavior will be inevitable — our hand will be forced. Most change is ultimately for the better, but transitions are always rocky. Other long-term investment trends to consider include:

- **Sustainable fisheries (aquaculture).** The majority of wild fisheries are so overfished that industrial fishing on the high seas may mostly be replaced by more efficient fish farms in the next 10 years.
- **Wind energy.** Obviously, energy remains a major theme of the coming decade, and the symposium offered compelling arguments that wind energy is much more viable than I personally thought (and is already proving itself in the field).
- **Transportation**. Are electric cars the future?

Ultimately, the symposium reminded me that investing applies to all parts of life, and business needs to give back as much as it takes. Otherwise, it ultimately isn't sustainable. I'll close with another quote from Dr. Lester Brown's persuasive book: "We used to think it would be our children who would have to deal with the consequences of our deficits, but now it is clear that our generation will have to deal with them. Ecological and economic deficits are now shaping not only our future, but our present."

Transcript

Jeff Fischer: **Welcome to a new edition of Motley Fool *Pro* Audio Extra. In the studio today is *Pro* analyst Bryan Hinmon.**

Bryan Hinmon: Hey, Jeff.

Jeff Fischer: And I am Jeff Fischer, advisor, and we are glad you are here. We are here to talk about four companies today that recently reported earnings and other news. Bryan, let's start with you.

Bryan Hinmon: Sure.

Jeff Fischer: You were going to talk helicopters with us. Bristow.

Bryan Hinmon: Aw, excellent.

Jeff Fischer: Give us a rundown of the latest quarter. What should we take away from it?

Bryan Hinmon: Sure. The big story here with Bristow is we have a business that we bought really cheap and we bought it at a depressed time. The company has since recovered because people are realizing we are in fact going to continue to drill for oil in the deep sea.

Jeff Fischer: BP even just received permits to drill back in the Gulf.

Bryan Hinmon: Yeah, the Gulf. They are starting to trickle through and Bristow is actually seeing some increased business from that.

Jeff Fischer: Get your waders ready if you live near the Gulf. They will do a better job this time.

Bryan Hinmon: Let's hope so. They should at least be on tighter watch.

Jeff Fischer: So Bristow is flying these crews out to these rigs and back.

Bryan Hinmon: Crews and cargo, yeah, and they really specialize in going deep, deep, deep offshore. It's really where they have the advantage. A couple of years ago, they went through this massive fleet regeneration where they got rid of some older helicopters, some smaller helicopters, bought brand new state-of-the-art ones. It was a huge capital outlay, but it's really put them in the best position to capitalize on going further off shore, and it has really put them in the good graces of the companies that are doing this exploration, and also their production.

So what's really going on with Bristow is now we have that silly valuation that we paid. That has disappeared. The company is sort of fairly valued now and what we are waiting for is we are waiting to see if Bristow can really start to run its operations well. It's a tough business because it's so capital-intensive.

Jeff Fischer: Right, and they cannot skimp on their costs. They are all about safety, so everything has to be done right.

Bryan Hinmon: It has to be, and that's the other thing that gives them their competitive advantage is if they are safe, they are not having to spend a lot on insurance. They are not having to spend a lot when things go wrong. They are able to make more money and they are able to be pretty profitable.

Jeff Fischer: And when things do go wrong, as we saw this quarter, they had one accident.

Bryan Hinmon: One accident.

Jeff Fischer: And that hits the bottom line.

Bryan Hinmon: Yeah, so really the key takeaway here is the company does what it does really well. It does what it does better than anyone else. It's safer than anyone else by a factor of five. They just blow away the industry. They way that they have rolled out their safety program has been so effective that they have actually applied that to different areas in the business to really just make sure everything is tight and efficient.

Jeff Fisher: Lunch, like no one is going to choke at lunch.

Bryan Hinmon: That's correct. They probably have hall monitors too.

Jeff Fischer: So Bryan, it's in the high $30s or very low $40s; we put it back to Buy, a *Pro* members' Buy. It has hit $50 a few times. Let's talk about how we view it in the low $50s. What are we thinking?

Bryan Hinmon: Yeah, so the way I am thinking about Bristow is it's a "show me" story at this point. It's a business that I want to like, but I have to say [I am] dispassionate about, and I am only really going to like it if they can be incredibly profitable. At this stage in the game, they are in a mediocre way, profitable. They are sort of just earning their cost of capital and we don't like to buy businesses that are mediocre.

I do think they have some hidden pricing power that they can take advantage of. They sign fantastic contracts. The makeup of the contracts are great. That's one of the things we like about them. They make money without even flying.

Jeff Fischer: Right, these long-term, recurring revenue …

Bryan Hinmon: Right, and if oil prices stay high, oil companies are making decent profits, Bristow should be able to charge more for their services. They should also be able to charge more if in fact their services are distinguished from their competitors. And because of their safety record and because of their fleet, they are. We just have to see that flow through. They have to show me.

Jeff Fischer: Yup, that's a good company to always have on the *Pro* radar at the same time. It's in the mid-$40s right now; like I said, when it dips low $40s, high $30s, we are going to talk about writing put options for those who don't have a position yet, or buying shares. Next time it gets into the $50s, Bryan and I are always talking about possibly writing covered calls or selling if we find something we like much better.

Bryan Hinmon: Yeah, and it's important to tell members, too, that the reason we always move it to Buy when it gets down to that low valuation is the company has a really hard asset base to replicate. These helicopters are state-of-the-art. They don't just come off a factory line. They have a very unique asset base and a very unique position in the industry, and so when we feel the valuation gets silly, then we think it's a great time to buy. But at the same time, we are not likely to raise our target price on the company unless they really start to improve the way that their business is run.

Jeff Fischer: That's well said, and that's one great thing about the company, is it's such a book value decision when the price comes down, it's at or below book value; get some shares for members. So Bryan, thank you. I will talk about Ebix now, everyone's favorite dog to kick the last six months or so.

Bryan Hinmon: Let us have it, Jeff.

Jeff Fischer: It was having a great year, up until March when short sellers played some role in knocking the price down, but Ebix brought some of it on itself as well with kind of cloudy reporting, a CEO who dominated the conference calls, and some acquisitions that were hard to kind of model into the financials of the company. But the good news is in this latest quarter, I see some rays of sunshine. The CFO and the VP of investor relations led the conference call. Robin, the CEO, is still there, but he kind of took a back seat.

Bryan Hinmon: That is unlike him.

Jeff Fischer: And it was great to hear voices and opinions from other managers. The results were strong, one of Ebix's best quarters in their history. Just looking purely at the financials, not the headlines, not the press release, but at the cash flow and the way money is moving through the business and the growth that they were able to achieve, the other interesting thing is they are out shopping for new acquisitions. They see low prices right now. They have a large credit line to buy good companies at good prices, and just as we tape this, they announced that they are buying HealthConnect, an acquisition that the market has smiled upon. Short-term moves don't mean much of anything, but shares jumped on this news that Ebix is acquiring HealthConnect, which will allow it to create the first end-to-end health and benefits network in the U.S., so whether you are an insurance carrier or an agent, an employer, an employee, you can use this network for your health insurance needs. It looks like a good acquisition. Ebix says it will add to profits immediately. The company has 85% recurring revenue streams.

Bryan Hinmon: Got to like that.

Jeff Fischer: Love to see that, consistent margins. They have been around since 1991 at consistent profits and their software architecture complements and melds well with Ebix's. So looks like another good acquisition that really puts Ebix at the forefront in the online health exchange world.

Bryan Hinmon: All right, Jeff, so walk me through this. Back when the short sellers attacked, one of the claims that they were making was that when Ebix was making its acquisitions, they were not treating their acquirees very well. They were sort of gaming the books and that sort of thing. This just seems ... if companies are willing to sell to Ebix, continue to sell to Ebix, that seems like a really positive sign to me.

Jeff Fischer: It does. That's a great point. This company has been around a long time, profitable. Terms were not disclosed because it is a private company, but I think you are right; a successful company as this HealthConnect seems to be, why would they sell to a company that seems to game the system?

Ebix, to its defense, has always said that the plaintiffs filing against Ebix are incorrect. They had very clear terms where they would acquire a company; if the company then made certain revenue or profit goals within a certain time frame, the company members would get a bonus. And Ebix in these cases said no, the numbers weren't met, or just missed, so you only get part of the bonus.

Months later, employees came out and said, No, your accounting is wrong, we did make these numbers. But the lawsuits haven't gone anywhere to my knowledge. Ebix settled a couple out of court. It's not something we know with certainty, so we have to, if we are going to keep owning the stock as we are right now, give Ebix the benefit of the doubt and watch for more successful acquisitions like this one. This one looks good.

Shares are pretty inexpensive. You can see, as with Bryan's review of Bristow on the boards, you can see that Ebix review that we put up on the Ebix board and get more information there, but shares are trading at about nine, 10 times free cash flow. The market does not expect Ebix to grow earnings next year because they are paying taxes. Revenue will grow, but they started to pay taxes, which is another thing we are very glad to see. They had all these years of operating losses that they were carrying forward, but it kind of showed their earnings power through an inaccurate prism and now we are going to see what they really make with taxes, so I am glad they started that early. They intentionally did that. It's a good sign. So the market expects revenue growth next year, flat earnings, but I think with acquisitions and with more greater efficiencies, Ebix could grow earnings next year as well, even if a modest amount.

Bryan Hinmon: I think time also is something that really matters in the Ebix story. As time progresses and there isn't bad news and these allegations sort of fade away, we are going to be able to see Ebix be valued on its business and not on all of these clouds in the sky.

Jeff Fischer: Right, and *Pro* members have been on a rocky ride since the beginning. Shares soared for us, then they came all the way back down. Now they are kind of in this holding pattern. It's like we are watching the CEO grow up. He had a cat by the tail. It's a small company. It's one of the fastest growing of the past several years, and suddenly they look around and realize, Wow, we are a serious operation with great cash flow and we can really grow this thing if we ... let's slow down now and do it right. It's kind of the sense I am getting from them.

So members know that it's one of our lower-quality earnings companies, when we look at earnings and try to rank it against all the others, but it's improving, and so for now, we are happy for that. It remains a Buy. And let's talk about our next company. Bryan?

Bryan Hinmon: All right, sure. I'll talk a little bit about Autodesk. They reported yesterday; by the time this airs, I will probably have the update on the boards, and this should be a quick one to talk about. Earnings were great. They were strong across the board; they were strong across geographies. We were very opportunistic with Autodesk. It's a company that we knew well and we acted smartly on it, I think. The market was throwing out the baby with the bathwater. We knew this was an incredibly high-quality company that was trading at a less-than-average-company price, so we bought it and it's up 30% for us. Really, this is the first earnings release. Earnings were good. It's a recovery.

I think there are a couple of takeaways here. The couple of takeaways are the company is just not seeing that we are going to enter back into a recession. Even though they play into the construction market a little bit, it hasn't gone to zero. It's just not going away.

Jeff Fischer: It's, as you said, shares got clocked because of fears of a recession and construction and manufacturing and engineering would all slow down again. Autodesk, you told me just recently before the taping, Bryan, they see nothing; it's nothing like 2009 right now, having gone through the conference call …

Bryan Hinmon: Yeah, nothing. They said they can't promise we are not going back into a recession, but if we are, it looks nothing like the last one.

Jeff Fischer: So the results out just hours before this taping where it looked very good and license revenue was strong, which leads to strong maintenance, recurring revenue. They are expanding into new software lines and seeing strong demand from existing customers, which is always great. So the shares …

Bryan Hinmon: The shares are on hold right now. That 30% run-up happened really quick. They are about $36 now after a good day, and I have got a target price, or a fair value of about $38, and there could definitely be upside to that. But again, this is a company that we feel really strongly about. This is a great business, one that we think can be a great compounder over time, so we are in no hurry to sell it.

Jeff Fischer: That's so true. And it's so well-run, and we got to see that through the 2008-2009 downturn, so that gives you some piece of mind that they know how to navigate through very rocky periods.

Bryan Hinmon: Yeah, and I think one interesting thing too is anytime you build something, there's a good chance you are using Autodesk software. Only 16% of the company's sales come from emerging markets. So you think about all the infrastructure build and all of the eventual manufacturing capacity that could come from emerging markets, there's still a really big runway for Autodesk.

Jeff Fischer: Right, right, what they have to tackle there, and they are working on it, is all the pirating, software pirating.

Bryan Hinmon: Yeah, 80% to 90%, actually, of software that is in emerging markets is pirated. It's crazy; astounding.

Jeff Fischer: That's worse than New York City. All right, well thank you, Bryan, for being here.

Bryan Hinmon: Sure thing.

Jeff Fischer: And Motley Fool *Pro* members, thank you for listening. We will see you on the boards and we'll see you in the Monday Memo. If you didn't see the Monday Memo from Nov. [14], go back, take a look at that. There's a Davis Report in there that I really like. It outlines the keys to successful investing that we try to follow. One is to, of course, be prepared and expect rocky, difficult periods like we have right now. Another is to have the right perspective, time perspective, and three, of course, buy what you know to be high-quality. We are buying businesses. All right, thank you everybody. We'll see you on the boards, and Fool on!

Why Most Investors Fail, and How We Avoid It

Published Nov 14, 2011 at 12:00AM

Fellow Fools,

Guidance Updates

- **AmTrust Financial Services** and **Vanguard Energy** move down to Hold on valuation.
- **BMC Software** moves up to Buy First for the same reason.

This Week's Expirations

Charter Portfolio

- **Plum Creek Timber**: Our covered strangle is on track to expire for the full profit on both options.
- **Contango Oil & Gas**: Our covered calls are on track to be exercised (meaning our shares should be sold, as we wished).

Portfolio 2011

- **Plum Creek Timber**: Our written puts are on track to expire for the full profit.
- **GlaxoSmithKline**: Our written puts are on track to expire for the full profit.

Reliability and steadiness are essential to any successful career, whether you're a teacher, a doctor, an engineer, or a barber. That's because these qualities are directly tied to long-term performance. You won't achieve success over the years if you don't stick to your principles, if you fail to learn from your mistakes, or if you regularly change your approach without good reason. We know this to be the case in our working lives, but when it comes to investing, studies show that a majority of individual investors are just the opposite: They unreliably change course all the time, and not surprisingly, the results are dismal.

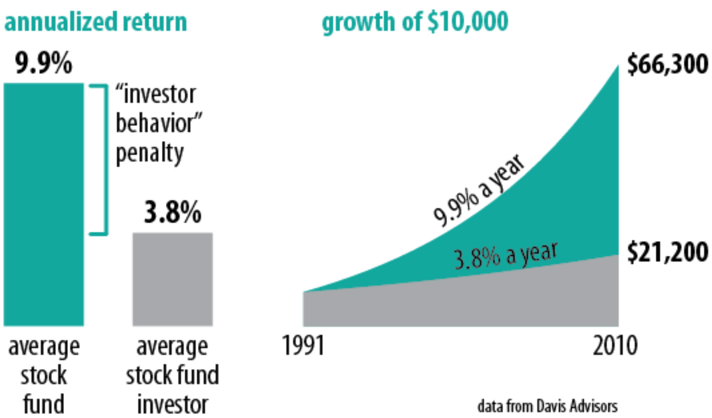
Missing Most of the Upside

The best-performing mutual fund from 2000 to 2010 was the CGM Focus Fund (CGMFX), which returned more than 18% annualized despite a flat S&P 500. The fund's outstanding track record would have turned $100,000 into more than $500,000 over those 10 years. The only problem? According to Morningstar, the average investor in the fund actually *lost* 11% annually over those same very successful 10 years. That is not a typo: The fund gained 18% annualized, but its average investor lost 11% annualized. You're not crazy to ask how that is possible.

The answer is that many fund holders tried to time the market. For example, the fund soared 80% in 2007, so hordes of investors poured money into it in 2008 — only to see it fall 48% that year. That decline led investors to pull money out in 2009, taking losses soon before the market doubled from its low. Investors were making emotional decisions based on recent events, changing their stance repeatedly, and as emotion would have it, at the most inopportune times.

Not Just One Fund; It's Universal

According to an outstanding investing study from Davis Advisors (we'll provide a link at the end of the Memo, Fools), the average stock-holding mutual fund returned 9.9% annualized from 1991 to 2010, but the average fund owner earned only 3.8% on average per year.



Not pretty. And it hurts even more if we put this performance into dollars. By trading in and out of funds, the average fund owner increased a $10,000 investment to just $21,200 over nearly two decades — while the average *fund* turned that $10,000 into $66,300. Now imagine the continuing effects of compound returns on both of those amounts and the growing difference between them over a lifetime. Feel the pain. Remember it next time you're tempted to make a trade: Davis also finds that the less trading a fund itself does, the better the fund's results tend to be. What's true for individuals is true for funds, too.

Successful Investing Includes Many Bad Years

All great investors suffer years of poor results, bar none. It's just how the market is. Warren Buffett's partner, Charlie Munger, has an outstanding lifelong record, but his annual results lagged the S&P 500 index 29% of the time. An impatient investor would have left Munger during some of his down years and missed out on riches later.

And Munger is far from alone. According to Davis Advisors, investors who achieve the strongest records aren't always at the top of the performance list. Over a 10-year period, Davis studied 192 large-cap money managers who had previously ranked in the top 25% for performance. They found that:

- A full 93% of them spent at least one three-year period in the bottom half of all performers.
- Sixty-two percent of them spent at least one three-year period among the lowest 25% of all performers.
- And 31% of the best money managers spent at least three of 10 years among the very worst 10% of all performers!

In other words, over this 10-year period, you could expect most of the best investors to be ranked among the *very* worst about one-third of the time.

This data clearly illustrates why impatient investors lose out: They go from vehicle to vehicle seeking results based on recent performance. They sell when one asset is down only to buy another asset that may be up recently, but is just as likely to go down next — because nearly *all* investments and *all* investors have weak periods. As we showed above, chasing performance by looking in the rearview mirror can turn a 9.9% annualized return into 3.8%. Sitting tight would be so much better.

Stay the Course

As with any career, steadiness and persistence are necessary for successful investing. But don't take that to mean you'll always do well. There will be years in which your results disappoint you, and years in which your successes are far greater than you thought possible. That's why it's vital to invest in ways that truly make you comfortable, so you don't lose faith during rocky periods. Because the final point to remember is that historically, 10-year periods of weak stock-market performance (like those we've just had) are followed by 10 years of much stronger results. That's the final data point in this Davis report we promised to link to, and it's a hopeful one.

Even now (especially now!), investing is a lifelong pursuit. At *Pro*, we own companies we believe will grow value over the next three years and beyond; a net 73% of our portfolio is currently invested in such businesses. We're hedged, too, because Europe is a crazy mess. But we continue to believe that good companies will drive most of the profits we generate in the coming years, and we look forward to the value we'll generate together by staying the course.

Charter and 2011 Portfolios: Write a Covered Strangle on Wells Fargo

Published Nov 11, 2011 at 12:00AM

Trade Essentials

- **Actions (both portfolios):** Write a covered strangle.
  - Write ("sell to open") April 2012 $21 puts (to potentially double your position to 5%)
  - Write ("sell to open") April 2012 $29 covered calls (one for every 100 shares you already own)
- **Allocation:** Each strangle you write represents 100 shares of Wells Fargo you own and 100 more shares you're willing to buy.
- **Recent Option Prices (bid/ask):**
  - April 2012 $21 puts: $1.60/$1.63
  - April 2012 $29 calls: $1.19/$1.22
- **Recent Stock Price:** $25
- **Limit Price:** Aim for at least a $2.79 credit; as prices change and time passes, accept no less than $2.50.
- **Alternative Trades:**
  - If you don't yet have a 2.5% position in Wells Fargo, you can just buy shares.
  - You can write just the puts (with modestly higher strike prices if you like) to buy up to 5% in shares.
  - We don't recommend just writing the covered calls, because the sole premium they provide isn't worth capping upside.
- **Why Write a Strangle?**
  - This income-generating strategy could earn us an 11% yield on shares.
  - It allows us to potentially buy shares 27% cheaper.
  - We can hedge against a small drop in share price.

What's Changed?

You've heard of buy-and-hold, but are you familiar with buy-and-hope? This very popular (and at times very profitable) investment strategy is tantalizingly simple: Buy a stock and hope that its price goes up. Overreliance on this strategy can leave an analyst clinging to a thesis despite new information — but I'm not that analyst, and that is not the *Pro* way.

We welcomed **Wells Fargo** (NYSE: WFC) into our portfolio in December 2010. Eleven months later, both the nation's largest traditional bank and the future of the overall economy look a little different, and our strategy needs to reflect that reality. Our ongoing analysis of Wells Fargo has given us four reasons to modify our thesis:

1. We expected that loosened federal regulation of Wells Fargo's dividend would be a catalyst for a return of dividend-seeking shareholders, general investor confidence in the shares, and a rising share price. It wasn't.
2. Now-ex-CFO Howard Atkins departed the company earlier this year without a discernable reason.
3. The Fed renewed its commitment to low interest rates through mid-2013, and its policy decisions continue to crimp bank profit margins.
4. The ongoing European debt crisis has further hurt public confidence in banks and the economy.

All of this hurts Wells Fargo's share price and increases uncertainty in the financial sector as a whole. Earlier this year, we responded to some of these factors by using a ratio put spread to hedge our position, which brought comfort over the volatile months of August and September and added a little cash to our portfolio. Our goal with that strategy was twofold, however; we also would be happy to fill out this position to a full 5% at cheaper prices, and in that the ratio put spread was unsuccessful.

Why a Covered Strangle?

A covered strangle is an income-generating strategy that allows us to profit within a wide range of stock prices. Specifically, at expiration, if shares are …

- Less than $21: We'll be assigned to buy new shares at a net price $18.21.
- Between $21 and $29: Our covered strangle will earn us the equivalent of an 11% yield on the current share price.
- Higher than $29: Our covered calls could be exercised, forcing us to sell our shares at a net $31.79 (5% above our cost basis) if we don't take action.

Note that the third bullet point above violates Rule No. 1 of writing covered calls: Don't write calls on shares you don't intend to sell. While we want to continue to hold Wells Fargo and we'd prefer to roll this strangle, if we are forced to sell our shares, we'll do so at a 27% premium to today's market price — not such a bad outcome.

This Wells Fargo position is opportunistic; we're taking advantage of current high volatility and uncertainty, along with a greater chance for a range-bound stock, and when the outlook changes, so will our strategy.

How to Follow Along

To write a covered strangle, you must own at least 100 shares of the stock. You should be willing to sell them at a higher price, and you should also be happy to buy at least 100 more at a lower price. Use a "strangle" order with your broker to sell to open April 2012 $21 puts and April 2012 $29 calls on Wells Fargo, aiming for a credit slightly higher than the combined bids of the put and call options (around $2.79 as of the day we issue this trade; realize that it will change and we recommend you accept no less than $2.50).

Transcript

Jeff Fischer: Welcome to a new edition of *Motley Fool Pro* Audio Extra. The whole team is here. We will introduce them one by one as we talk about four *Pro* companies today. Everyone, how are you doing?

All: Doing well, doing great.

Jeff Fischer: Good, good. Nick, we will start with Nick Crow, senior analyst, and Nick is going to talk about Papa John's Pizza. Good topic to start on.

Nick Crow: Absolutely, very tasty. Papa John's reported last week …

Male: Is it really? I mean, Papa John's? It's fairly good.

Nick Crow: I think they have great pizza, but I also think Budweiser is good beer, so what that says about me. *(Laughter.)* This was an awesome quarter for Papa John's, much like the first quarter this year, and we had some; first quarter, we had awesome revenue growth and great comp sales come in and we got a little nervous in the second quarter when that didn't occur.

Well so far this year results are great, this quarter being the best of the three with revenue growing about 12% overall, and most of that is driven through more stores. They have got 5.5% more stores than this time last year, plus great comp sales, so that's the individual increase in the stores sales that have been open for at least a year. so that has been awesome both on an international level and domestically here, which is a little bit of a surprise because the economy is hurting, you have the MBA lockout, lots of reasons where you think maybe pizza sales would be slow, but they have done really, really well. It's impressive.

Jeff Fischer: Yeah, Papa John's has been a very steady performer since we bought it. Well, we don't regret anything here, but we learn and we could have had it on as a Buy a bit longer, but it did touch up to our fair value pretty early on and we have held it ever since, and fair value has inched up a bit to the low thirties.

Nick Crow: Yeah, right now I think our fair value on the site is a lower than I actually feel like it is. We will have to update that soon. One of the key drivers there is actually store count, and over all this year it is supposed to open up 210 to 230 stores, which is a big increase over the last guidance they gave us. That's really great news, because it's happening on both ends: fewer closures and more openings than expected.

Jeff Fischer: And Nick, we were talking before the taping that store openings is really what drives this long-term story, and it is what we are thinking about as we think about this company in the long term. They have a small footprint still, relatively speaking.

Nick Crow: Absolutely. They have about 4,000 stores opened total, sometime early next year we would expect. Right now there is like 800 internationally and the rest of that is domestic, whereas their main competitor, Domino's, has over 9,000 stores, so there's a lot of room to grow.

Jeff Fischer: So Fools, we are still holding Papa John's, and we view it as a stable, steadily growing company with a long runway ahead of it, but at the same time, if we find something we like much better, Papa John's may be a place to raise cash, but right now it is on hold, and we will have the most recent valuation update up on the site soon. Thank you, Nick. What a great topic before we go on to Alex's. Here's Alex Pape, analyst Alex Pape. You are going to talk to us about StoneMor Partners.

Alex Pape: Sure, not nearly as exciting as pizza.

Jeff Fischer: They run carnivals, right?

Alex Pape: That's exactly what StoneMor does. StoneMor is the second largest cemetery owner and operator in the U.S., so not nearly as fun a topic as pizza, but a good cash flow generator business, nonetheless. So the accounting numbers around StoneMor are incredibly difficult to analyze, but the number that moves the needle the most is adjusted operating income, which is sort of a look at how much cash their operations actually brought in for the quarter after you remove all the noise. And that was down slightly in the quarter, and there were a few reasons. One was that Hurricane Irene came through and 76% of their properties, their cemeteries, are in the U.S. northeast, and so there were a lot of cleanup costs with flooding and fallen trees and things like that, so one time higher than expected costs.

Jeff Fischer: They were raking, a lot of raking going on.

Alex Pape: There were a lot of laborers out there raking the leaves up. The other thing that was happening is in times of economic uncertainty, there is an interesting thing that happened to StoneMor's sales, so people will buy less merchandise, which are things like gravestone markers and really fancy caskets and things like that, but the rate at which they sell actual burial plots usually goes up slightly. That's because of how they train their sales force. They want to keep the number of people coming into their cemeteries, the plots that are being bought very steady, because there is a really high correlation between once you have one family member in a cemetery, the other family members want to be there. I realize this is a fairly dismal topic, but it …

Jeff Fischer: No, it's fascinating at the same time.

Bryan Hinmon: I want to be buried next to all three of you.

Nick Crow: We should do this last so we don't have to listen to it. *(Laughter.)*

Jeff Fischer: Skip out now if you want to. No, but this stock has nearly a 9% yield.

Alex Pape: Yeah, and the bottom line is, when we are looking at this stock, we are not so much looking at is it poised for phenomenal growth; it's just can they sustain a dividend and one quarter of a little bit higher costs is not going to change that. They can still easily pay off that dividend and I think that over the next couple quarters we'd probably even expect them to raise it slightly. So this is a stock that remains a Buy. It is below $28, so it's a pretty great deal right now. That's about as exciting as you can get for news on StoneMor.

Jeff Fischer: All right, sounds good, Alex. I missed one thing you said. The economy is weak, of course. People are worried and a lot of anxiety out there, but that does not result in more cemetery goodies being sold.

Alex Pape: Yeah, they are doing …

Jeff Fischer: Cemetery goodies. *(Laughter.)* Trying to liven it up!

Bryan Hinmon: StoneMor just announced a burial Groupon. *(Laughter.)(Whisper)* Too soon?

Jeff Fischer: Yeah, Groupon is really scraping the bottom of the barrel there. People are worried and yet they are not planning ahead.

Alex Pape: So most of the sales that StoneMor makes are for people buying burial plots and merchandise before the time of death, so they are preparing; most of the people who want to not have their families burdened with that cost when they do pass on, and so those people are less willing to pay up for fancy stuff, the goodies, but they are equally or even more willing to pay up for the actual plot because in times of economic uncertainty, they are even more concerned about overly burdening family members later on.

Jeff Fischer: Excellent, all right, thank you, Alex. Now we will move on to an equally exciting company. Another *Pro* Buy right now, Broadridge Financial Solutions, and here is analyst Bryan Hinmon to give us the latest on earnings they had just released recently.

Bryan Hinmon: I really like to bring home the excitement (unclear).

Jeff Fischer: Hey, it's about profits, not excitement.

Bryan Hinmon: Last week it was graphite electrodes; this week, (unclear) statements.

Jeff Fischer: If your investing is too exciting, you are doing something wrong. Look at Mr. Buffett. You have got to; slow and steady wins the race.

Bryan Hinmon: Slow and steady wins the race. Well, that's pretty much what we saw from Broadridge this quarter. It was a pretty good quarter. First quarter, their first fiscal quarter, is always their smallest contributing quarter, so it is important not to get too excited by seeing the good results, but I think there are really two take-aways from this quarter. Neither of them really were big news this quarter, but it is more of the absence of what else is going on.

The first thing is the risk in this name has dissipated and no one is really talking about it, but a year ago we were talking about how the SEC and FINRA were looking into how the proxy business is done and basically looking at Broadridge as a monopoly, a monopolist, and saying is this sustainable? Do we need to change the way that proxy voting is done? People feared, investors feared that that was going to change Broadridge's business dramatically. All of that noise has died down now. Broadridge has done a ton of work hand-in-hand with FINRA and the SEC to basically prove their value. They proved that if Broadridge was out of the market, the amount of money that companies would have to pay to run their proxies would be probably twice as much. So with that risk gone, that cloud removed, I really think that that now creates a clear path for Broadridge to succeed.

And the second thing is there is also a clear path now to upside to the shares. Some of their acquisitions are really starting to perform, they are starting to streamline them in with their sales process, and they are getting some pretty good results. So as that continues to happen and we see the financial metrics come into line with that, there could be some upside that we didn't originally count on in the shares.

Jeff Fischer: That's a good summary, Bryan. We have owned shares a while now and they have been pretty range-bound, and a few times they dipped into the teens were good opportunities. We tried to point out to members, of course. You can also write put options on it right now to try to nab shares a bit cheaper, but I think this is one position that while flat for us so far, is one day over a short period of time, suddenly going to make its move 20, 30% higher, and that's where it will be (unclear).

Bryan Hinmon: Yeah, I think you are right. It is going to come like that, and it's important to realize too, we have written puts, excuse me, twice on Broadridge, and they pay a stable dividend, so even though the share price hasn't moved much, we have done pretty well being opportunistic about generating some income off this guy.

Jeff Fischer: That's true too.

Alex Pape: Bryan, I just want to thank you for choosing a company that is almost as boring as

StoneMor.

Bryan Hinmon: I just made StoneMor look good; that's incredible.

Jeff Fischer: Well you guys, if they make us money, no one will complain, and I'm going to talk about another company that we all love, an old PRO favorite, Tupperware. Do any of you own Tupperware or your wives, girlfriends?

Nick Crow: We own their competitors, Jeff.

Jeff Fischer: All right, Nick, you can leave the studio.

Nick Crow: That's only because we have no friends selling Tupperware.
