Let's walk through an example. Suppose a retail company that sells poorly made, overpriced products is trading at what you deem a too-high $30 a share. The stock appears ripe for a decline, so you set up a bear put spread, buying $33 puts, which cost $5, and writing $28 puts, which pay $2.50, for a net debit of $2.50 per share. Since $5 separates the two strikes, the most you can make is $2.50 per share ($5 minus the $2.50 debit), or double your investment. The most you can lose is $2.50 per share as well. Your break-even price is $30.50, and if the stock falls below $28 by expiration, you make the full 100%; if it trades above $33, you lose your full investment. By choosing your strikes carefully and making sure the options pay a reasonable price, you've set up a bear put spread with strong profit potential.

To be especially defensive, you could set up a bear put spread with strikes *above* the current share price: In this case, you could buy $36 puts and write $32 puts on the $30 stock. As long as shares stay below $32, you'll earn the full amount possible on your spread. However, defensive spreads usually don't pay much. On the flipside, an aggressive bear put spread would use strike prices *below* the current share price, such as buying $28 puts and writing $25 puts. The $30 stock needs to fall below $25 for you to earn the full profit, but the profit will be handsome.

Usually, we'll write moderately minded bear put spreads, similar to our first example.

Yes, Fools, you can use *call* options to make outright bearish investments. Bear call spreads have a compelling draw: You start with a net credit to your account. To set one up, you buy calls at a higher strike, and then write calls at a lower one. (Since lower-strike calls are always worth more, you always start this trade with a net credit.) As with all spreads, one side of your trade protects against the other, capping your risk.

Bear Call Spread Specifics

Action: Buy ("buy to open") calls with a higher strike, and write ("sell to open") calls with a lower strike.
Trade type: Net credit; you're always paid to set up the trade.
Maximum loss: The difference between your two strike prices, minus your net credit.
Maximum profit: Your original net credit.
Break-even price: The lower strike price plus the credit received.

Let's assume you set up a bear call spread on the same $30 retailer from our bear put spread example. You buy calls at $33, which cost you $2, and then write calls at $28, which pay you $4; your net credit is $2 per share. If the stock ends below $28, both calls expire and you keep the $2 per share. If it rises above $33, you'd close both calls before expiration, and your cost would be the difference between the two strikes, or $5. Given your $2 credit, you've lost the maximum $3 per share.

Stock Price at Expiration	Buy $33 Call for $2; Value at Expiration	Write $28 Call for $4; Value at Expiration	Bought Call Profit at Expiration	Written Call Profit at Expiration	Total Spread Profit at Expiration
$28 or lower	$0	$0	($2)	$4	$2
$29	$0	$1	($2)	$3	$1
$30	$0	$2	($2)	$2	$0 (break even)
$31	$0	$3	($2)	$1	($1)
$32	$0	$4	($2)	$0	($2)
$33	$0	$5	($2)	($1)	($3)
$34	$1	$6	($1)	($2)	($3)
Every price above $34					($3)

To be most defensive, you would use strike prices above the underlying share price, or both out-of-the-money. This way, even if the stock goes up, as long as it stays below the lower of the two strikes, the spread will end profitably. Aggressive bear call spreads are rare (since bear put spreads work better for strong bearish cases), but these are initiated with both strikes *below* the share price.

Bear call spreads are popular because they start with a net credit, but they have disadvantages compared with bear put spreads. First, if you write an in-the-money call (which your lower-strike call often is), an early exercise will derail your strategy. Second, calls tend to hold time value longer than puts. A bear call spread will not respond as quickly as a bear put spread to a favorable move in the stock, thus forcing you to wait longer before you can close the trade for your desired profit. Finally, bear call spreads still require buying power. The difference between your strikes minus the credit you receive will be locked out of your account. Still, for the hedge- or short-minded investor, bear call spreads have merits.

Calendar spreads are also called "time spreads," because you're using different expiration dates on your two trades. Selling a near-term put (expiring in a few months) and buying a longer-term one (expiring at least a few months later), both with same strike price, sets up a bearish put calendar spread. The idea is the near-term put that you write will lose value more rapidly than the longer-term put that you buy *and* finance the purchase of your put, especially if you're able to write near-term puts a few times while waiting for your longer-term puts to pay off. But this strategy comes with a caveat.

You're generally hoping that the stock or index holds up long enough for your written puts to expire and *then* declines, making your purchased puts profitable. In other words, you're bearish, but you want some time before prices decline — so perhaps you see a catalyst for decline on the distant horizon. That said, if the underlying investment falls rapidly, your long-term puts will have more value than the ones you wrote, and you could close both for a net profit.

Bearish calendar spreads using puts can be set up for very little cost. Your expectation should be that most times, you'll lose your entire investment, but when it *does* work out, it will more than compensate for every loss. If your net cost for a put is $0.50, when the stock falls sharply, your profits will soar.

Bearish Calendar Spread (using puts)

Action: Write ("sell to open") puts expiring soon, and buy ("buy to open") the same strike puts expiring much later.
Trade type: Net debit. You pay to set up the trade.
Maximum loss: Your net debit.
Maximum profit: Once your written puts expire, your potential profit on the puts you bought is unlimited, until the stock goes to zero.
Break-even price: N/A.

Building upon what you've learned, a calendar spread that uses the same strike prices and different expiration dates is called a *horizontal* spread. One that uses different strike prices and different expiration dates is called a *diagonal* spread. For example, you might write near-term puts at a higher strike for a larger payment and buy long-term puts at a lower strike to set up a diagonal bear put calendar spread. (Yes, it's a mouthful!)

You usually want to close the vulnerable leg of your spread soon before expiration to avoid it being exercised. Furthermore, if the underlying stock makes a dramatic move that makes one side of your trade especially profitable (generally, the written side), you can consider closing it early and writing new options at a more advantageous price for another payment. A dramatic move that earns you much of your spread's potential profit long before expiration may merit closing the trade out entirely, although in many cases you'll need to wait until right before expiration to achieve your maximum profit. A dramatic move against you may severely limit your potential responses, other than to salvage what value still remains.

There are many other follow-up possibilities with spreads — including turning them into entirely different option strategies. We'll have a guide devoted solely to the topic ahead.

Our next three guides in this series will cover neutral spreads, bullish spreads, and follow-up action on spreads. Stay tuned! And if you have any questions, please visit *Pro*'s Complex Options board.

Buy and Set Up a Covered Strangle on Expeditors International of Washington

Published Nov 18, 2009 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Recent share price:** $33
- **Estimated fair value:** $38
- **Preferred buy price:** $30
- **Recent option prices:** Calls $2.50 bid, puts $2.05 bid
- **Limit order:** Aim to write the strangle for around $4.50 *combined*
- **Type of holding:** Core growth; Transportation
- **Dividend yield:** 1.2% (semiannual dividend of $0.19)
- **Alternate trades:** Place a limit order at $30 per share; or only write $30 puts; or buy shares and only write covered calls.

The Big Picture

Financing greases the wheels of global commerce. So, when credit markets froze during the recent economic turmoil, international trade withstood its sharpest decline since World War II. Now, with credit starting to flow again, trade is recovering, and emerging markets have resumed their high-octane growth. Yet inventory levels remain low. As a result, production will eventually need to ramp up, leading to a renewed expansion in global trade..

Rather than invest in an asset-heavy transportation company like **FedEx** (NYSE: FDX) or **DryShips** (NASDAQ: DRYS) to profit from this trend, *Motley Fool Pro* is looking to tap one of the most unique — and Foolish — companies out there: **Expeditors International of Washington** (NASDAQ: EXPD).

Unlike other transporters, Expeditors doesn't actually own any airplanes, trucks, or ships — instead, it buys space on carriers at wholesale prices, portions it out, and resells it at higher prices. The company also provides services that make moving goods easier for its customers, offering custom brokering services, cargo insurance, and distribution management. Meanwhile, the company is run by one of the most Foolish, transparent CEOs in the business — but more on that in a bit. Let's start with how Expeditors gets the job done.

Ships Ahoy!

Say you're an asparagus canner, and you need to ship two tons of your green goodies from the U.S. to China. Moving your product across an ocean is about as difficult as it sounds. For instance, do you know the customs rules for two tons of canned asparagus? How to negotiate a price for space on the freighter? Which Chinese port to deliver to? How to track your shipment?

Probably not. Anyway, your time is better spent honing your asparagus-canning craft than figuring out logistics and customs laws. Expeditors can handle all this for you. Plus, by filling larger shipping containers with products from multiple customers, the company can negotiate a better price than you could on your own. What's more, freight operators appreciate Expeditors because it buys space on their ships or planes by volume, reducing the uncertainty and inconsistency of unfilled loads. It's a win-win for all parties.

And because Expeditors' scope is truly global, those parties can be shipping to and from almost anywhere in the world. By contrast, competitors like **UPS** (NYSE: UPS) and FedEx do less than 30% of their business outside of the United States, are focused on smaller parcels (under 150 pounds), and have airplanes to manage. Moreover, Expeditors has established tremendous relationships in Asia over the past three decades. That's right: The company's had sales offices in Hong Kong and Singapore since 1981, long before Asia was the "it" place to be.

Expeditors' 252 offices can be found on every continent except Antarctica, though operations are highly concentrated in Asia:

Region	Percentage of Sales
United States	27%
Other North America	3%
Latin America	2%
Asia	49%
Europe and Africa	15%
Middle East and India	6%
Australia	2%

Data for the nine months ended September 2009; not adjusted for inter-company accounts and transactions.

Meanwhile, Expeditors' top 200 accounts, which make up about half of overall sales, represent the following sectors:

Sector	Percentage of Sales

Retail	33%
Hi-Tech and Consumer Electronics	31%
Manufacturing and Consumer Products	20%
Pharmaceutical and Health Care	7%
Automotive	5%
Oil and Energy	3%
Other	1%

Data as of March 2009.

This focus on Asia and consumer goods allows Expeditors to participate in the economic story of the century so far: the growth of the Chinese middle class. And management isn't just focused on Chinese *exports*; it's also expanding its services for moving goods *within* China. All told, if Chinese consumers start to spend more, Expeditors is well positioned to benefit.

A final point about Expeditors: This isn't a "one-way" business. Behind China and Germany, the U.S. exports more merchandise than any other country. So, when the dollar slides and U.S. goods are cheaper, Expeditors benefits from the uptick in exports. On the flip side, when the dollar is stronger, American consumers can buy imports at better prices. Benefiting from trade going in any direction, Expeditors has been able to grow for nearly three decades straight.

One Unique CEO

Get Personal With Expeditors

- **Founded:** 1979
- **Headquarters:** Seattle, Wash.
- **Website:** expeditors.com
- **Employees:** 12,000
- Q&A with Management
- Most recent 10-Q quarterly filing

Now about that Foolish culture. At the helm of Expeditors sits Peter J. Rose (no, not the guy banned from baseball), who has been leading the company since 1981. A former hockey player (he nearly went pro) and 44-year shipping industry vet, Rose has a well-documented distaste for Wall Street analysts and their opinions on running Expeditors' business. Consider this gem from the 2008 annual report: "When the investment community routinely disconnects the ties between accomplishment and reward, you might understand why at Expeditors we trust our own values, learn from our own experience, and take our own advice more seriously than what the make-believe analysts call 'analysis.'" Instead of conference calls, Rose collects analysts' questions in advance and answers them in 8-K SEC filings, allowing him to respond more thoroughly. Though we appreciate his spirit, this attitude doesn't win him many fans on Wall Street; but overall, we're pleased with Rose's experience and Expeditors' trajectory since he began his stint.

Financials and Valuation

Rose likes debt about as much as he likes Wall Street analysts, and it shows on the balance sheet — Expeditors is fortified with nearly $1 billion in cold, hard cash and zero debt. It does have some operating leases on its books, but they are largely inconsequential relative to the company's size. Though being this cash-rich muffles return on equity figures and frustrates analysts, Rose is proud — and justifiably so — that Expeditors didn't need a bailout and was able to invest in the business when everyone else was panicking.

Given its stellar balance sheet, significant barriers to entry (namely, international regulatory and licensing requirements), and dominance in its space, Expeditors rarely trades at a deep discount. At the nadir of the recession, Expeditors traded only 25% below current prices. Fortunately, with lingering concerns about a Department of Justice investigation (more on that in a moment) and the vitality of the global economy, shares currently trade for 18.6 times free cash flow versus the level of 50 times free cash flow it commanded on average between 2004 and 2006.The current multiple isn't cheap, but it's reasonable.

We used a discounted cash flow model to estimate a value for Expeditors. Using a discount rate of 9%, our estimates assume 12% sales growth from the recent bottom, followed by 8% growth in later years, and ending in 3% terminal growth. Tossing in the $4-plus per share of cash puts a fair value on Expeditors between $35 and $38, but possibly higher if global trade rebounds more than expected.

Why This Strategy?

The Community's Take

Expeditors scores a strong 5 stars in CAPS, with more than 90% of All-Stars expecting outperformance. On the *Pro*CAPShot, it scores a respectable 7 of 12, coming up shy on trailing growth numbers because of the recession. It's also a lower-margin business than we normally target, but given its focus on asset-light services, we're OK with this.

Buying shares of this healthy business around $30 is a compelling long-term investment, so if that's all you aim to do, we support it; but we're also going to use options to ideally increase our returns, generate shorter-term profits, or lower our cost basis. Strangle writing lets us be defensive and at the same time participate if market gains keep coming.

With Expeditors recently skimming $33, the covered strangle we intend to write for about $4.55 *combined* per share positions us to either buy the second half of our position near a net $25.45 or sell our existing shares around $39.55 — a wide range for a stable stock, even over 185 days (or about 6 months).

The option income represents a 13.7% yield on our $33 purchase price (not including the buying power set aside for the puts we'll write, which lowers our yield), while offering a 19.8% gain if our shares are called away in six months at the upper end of our valuation range. If the stock declines, we'll effectively be buying our next shares about 20% cheaper — at 15 times free cash flow.

Here's the math behind the trade (prices as of market close Nov. 17):

- **Action:** Buy 3% of EXPD, around $33
- **Action:** Write May 2010 $35 covered calls, for about $2.50
- **Action:** Write May 2010 $30 puts representing another 3%, for about $2.05
- **Potential second 3% net buy price:** $25.45
- **Average buy price if we get all shares:** $29.22
- **Potential sell price on our first 3%:** $39.55

- **Effective options yield:** 13.7% over 185 days
- **Stock gain if sold:** 19.8%

What Would Make Us Change Our Strategy

There are a few risks we'll be keeping our eye on with Expeditors. The main risk is a drawn-out global recession, with consumer and international trade growth that slogs along, or even slows again. There's also a legal risk, as Expeditors is a named party in an ongoing DOJ investigation into price-fixing fuel surcharges with airlines. Little information is available, and we don't know how this investigation will end, but we take comfort in the fact that Expeditors has the balance sheet to absorb a litigation shock.

Additionally, Expeditors needs to adjust its business whenever shipping companies raise rates; usually, it passes higher costs onto its customers — but to maintain good relations, it sometimes raises its rates slowly and accepts lower margins. While a refreshing change of pace, Expeditors' insistence on avoiding conference calls and selecting which questions it wants to answer is also a risk. Fortunately, the company is traditionally forthcoming in its formal responses, but if that changes and management goes mum, we'll need to reevaluate.

Finally, the shares aren't exactly cheap. Even at our potentially cheaper start price (via our puts), the stock carries a premium to its growth rate — although on free cash flow it does trade at a discount to the market average.

Pro Bottom Line

Expeditors is a financially strong, well-run, and globally diversified business that provides us with exposure to consumer growth in emerging markets, as well as the promise of recovering global trade overall. To discuss Expeditors, please jet over to its new board. And let us know which trade you're making: Are you writing a covered strangle like us, or just writing puts, or a limit order on the stock? Chime in, and Fool on!

Meet a Fellow Pro: A Visit With Protovist

Published Nov 17, 2009 at 12:00AM

Mike and his wife Chryssa in Alaska.

You've heard fullofcarp share his tale. You've gotten the dish on spinningwood. Now, in our third installment of Meet a Fellow Pro, it's time to meet another prolific *Pro* poster, Protovist — real name, Mike. Always cool-headed, goal-oriented, and helpful on the boards (if you haven't seen his handy options calculator yet, you're missing out), Mike is an exemplary member of the *Pro* community. I was fortunate enough to catch up with him recently and learn more.

Jeff: I want to thank you for all the value you've added to the *Pro* community over the past year. To start things off, I've got to ask: What is the meaning of your screen name, "Protovist"?

Mike: It's a combination of *proto* (meaning original or earliest form) and *atavist* (throwback, reversion). I like to think of myself as a "net.atavist," harkening back to a simpler time — before the Internet was completely full of spam and phishing scams. Of course, then we wouldn't have all the great online investing tools and information resources that are available to us now.

Jeff: Fools can certainly be thankful for that. Can you tell us a bit about your background? How did you become interested in technology and investing?

Mike: I grew up in Salt Lake City. My father is an antiquarian book dealer and somewhat of a Luddite at heart, so it's unclear how my technology and investing interests developed. But I do share a healthy appreciation of books and a penchant for acquisition.

After graduating college with a degree in computer science, I decided that Silicon Valley was the place to pursue a technology career. I moved to California just in time to ride the crest of the dot-com wave — and watch it come crashing down. Now in the San Francisco Bay area, I have worked mostly on software tools and automation at several technology companies, as well as an animation studio, where I met my wife. I've continued to indulge my passion for technology and finance, though demands on my time are about to increase, as we are expecting our first child in December.

Jeff: Congratulations! Now that you'll have more responsibilities, let's talk investing. What's your overall approach?

Mike: My strategy has always been to take control of my own finances, learning as much as I can and trying to profit from putting it into practice. I discovered The Motley Fool early on, so I was heavily influenced by the long-term, buy-and-hold philosophy. Buying quality companies at reasonable prices just made sense. Of course, determining what constitutes "quality" and "reasonable" is the tricky part, as I've learned the hard way on more than one occasion. After being exposed to employee stock options for the first time, I branched out into options and had some limited success with writing covered calls.

Jeff: Do you have a favorite investment strategy?

Mike: I can't resist "free" money, so credit card arbitrage — taking advantage of zero-percent balance-transfer offers by investing the proceeds in short-term CDs or MMAs — has been one of my more enjoyable endeavors, though the profits are limited by available credit. More traditional arbitrage opportunities are harder to find, but I was able to profit nicely from the acquisition of ProBusiness by **ADP** some years back.

Since joining *Pro*, my favorite strategy has been aggressively selling naked puts for additional investment income and potential stock acquisition, holding the stock (or selling covered calls if overweight) when assigned, and then repeating the process as appropriate.

Jeff: I know that's a lucrative income strategy, as long as you can fulfill the put obligations — which goes without saying — and also own enough stocks to enjoy long-term appreciation. Shifting gears, since we obviously aren't perfect, how do you think we could improve the *Pro* service?

Mike: I have a strong technology bias, but I firmly believe that the Fool needs to invest significantly more resources into its own online infrastructure. It's an unfortunate blemish for an otherwise excellent service.

Jeff: The Fool's CEO, Tom Gardner, loves reading this feature, so he's going to see your recommendation. Now, for the flip side: What do you like best about *Pro*?

Mike: The focus on accuracy and absolute returns. Last fall, as the markets were collapsing, I started thinking about taking advantage of the investing opportunities that were being created. The invitation to join *Pro* serendipitously arrived in my mailbox and provided the impetus to proceed with my somewhat risky plan. It has been a turbulent ride, but with *Pro* as a guide, over the past year my portfolio has grown 85% in value. What's not to like about that?

Jeff: We're glad to hear it. And yes, although we've taken more speculative positions lately — calls on the U.S. Natural Gas Fund and on Electro-Optical Sciences — accuracy and absolute returns remain our focus. In closing, Mike, what drives you to invest? What's your ultimate aim?

Mike: While I certainly enjoy the challenge of investing, I think what ultimately drives me is the desire for independence. I would eventually like to build enough wealth to allow myself and my family to focus on what makes us happy, without having to worry about financial obligations like a mortgage in California.

Jeff: I certainly hope the Fool helps you get there. Thank you again, Mike. Best of luck this winter, keep us posted, and Fool on!

Have friendly parenting advice for Mike and his wife? Or just well wishes? Share them with him on our Meet & Greet board.

Monday Memo: Pro Takes Some Lumps

Published Nov 16, 2009 at 12:00AM

The S&P 500 scored a new 12-month high last week, and *Pro* was close to achieving the same. That's the good news: Our portfolio has largely held its own. However, we've taken some hits lately. Since opening positions in **Abercrombie & Fitch**, the **U.S. Natural Gas Fund**, **Ebix**, **Electro-Optical Sciences**, and **ProShares Short S&P 500**, each has moved against us. What's going on? Let's start with the short story.

My kingdom, for a hedge! Two of our uncooperative positions — Abercrombie and ProShares Short S&P — are shorts. Unless investors agree with our view that Abercrombie is overvalued, and unless the S&P 500 turns south, we can't expect the shorts to work for us.

However, after landing shares this coming Friday, we'll likely write covered calls against our S&P short ETF soon. Our ultimate aim will be to end that short profitably. Abercrombie, meanwhile, has moved far against us, and we're currently considering our alternatives. The stock market has had a record-breaking advance, so fortunately our shorts and hedges have been a modest part of our strategy this year.

Price volatility is also throwing us for a loop. Since we set up our synthetic long on the U.S. Natural Gas Fund, the price of gas has declined about 20%, the ETF has declined nearly 30%, and our options have fallen a bit more. But our options don't expire until 2012, so this volatility is something we can wait out.

The last time we bought a commodity, via **iShares Silver Trust**, we originally saw a price decline. But by being patient and using follow-up option strategies, we've earned a nice profit. Down the road, we could use new options to help us on the U.S. Natural Gas Fund, too (writing calls on our purchased calls, for example). We'd like to see a bounce in natural gas before considering this.

Electro-Optical Sciences rivals natural gas for its volatility, and is even more challenging to price. The medical-device wannabe is waiting on the FDA to approve its sole product, the skin cancer-detecting MelaFind. With full approval, $160 million Electro-Optical could be a $300 million to $400 million company just on the initial hopes for sales of the new device. But a lack of approval, or a significant product setback, will mean this investment is all but a lost cause for at least a few years, if not indefinitely. We recognize this, and thus have only risked 0.6% of the *Pro* portfolio (less than we're slated to make in dividends over the next year). Since we bought our calls a few weeks ago, the stock has fallen on news that an FDA ruling isn't likely to happen until 2010.

Finally, when *Pro* welcomed Ebix into the room, it was like letting a hyperactive puppy into a room full of — if we do say so — proven, well-behaved growth stocks **Medtronic** and **Oracle**. But Ebix may mature and fit right in. Already, the majority of its revenue is recurring and high margin, and its customer base is growing. We're simply not used to its level of volatility here in *Pro*.

We've taken our stable portfolio and introduced a bit more speculation in recent weeks because we saw compelling opportunities. These have added volatility and some quick losses on paper — something we haven't really experienced before. Overall, though, we remain focused on absolute returns and more than 75% accuracy. This won't change. While we will take some riskier positions, these are an exception rather than the norm. Accuracy, absolute gains, and smoother returns in both up and down markets remain *Pro*'s *modus operandi*.

This is your service. What do you want most from us? Speak up on the Memo Musings board.

Fool on!

Jeff Fischer

Buy More of Ebix

Published Nov 12, 2009 at 12:00AM

At a Glance

- **Action:** Buying 2% (for 5% of our 6% target)
- **Recent share price:** $52.45
- **Price guidance:** On this thinly traded stock, please use a limit order at your desired buy price or near the current ask price.
- **Alternate trade:** Write December 2009 $50 puts (IFQXJ), recently near $2.70, or March 2010 $50 puts (IFQOJ), recently near $5.75.

What's New

In the mere three weeks we've owned **Ebix** (NASDAQ: EBIX), the stock has already moved quite a bit, peaking near $68 before falling back to around $52 a share. This is the kind of volatility we need to expect given the company's small size, share float, and the high expectations of investors. But despite these choppy waters, we can keep our eyes on the horizon and take comfort in the fact that the shares are reasonably priced and the business is strong.

Ebix's third quarter was healthy, and management expects the business to continue to advance in 2010. The company is growing, with two promising new acquisitions and the signing of several substantial clients (which remain undisclosed due to confidentiality terms). Recently trading near $53, shares fetch 15 times our free cash flow estimate for this year and 15 times estimated 2010 earnings per share — inexpensive considering that 20% earnings growth is expected.

By buying another 2%, we're hoping to take advantage of volatility and in the process lower our cost basis. A final note: Keep in mind that Ebix plans a 3-for-1 stock split around Dec. 10, so every share we own will become three at one-third the price. This doesn't affect the business or its valuation. As we add to our Ebix position, let us know if you have questions.

Buy More of NextEra Energy

Published Nov 12, 2009 at 12:00AM

At a Glance

- **Action:** Buying 2% (for 3% of our 6% target)
- **Recent share price:** $51.19
- **Price guidance:** Use a limit order at your desired buy price or near the current ask price.
- **Alternate trade:** Write January 2010 $50 puts, recently bidding $1.60.

What's New

Regulatory clouds and a weak Florida economy continue to hover over **FPL Group** (NYSE: NEE), keeping shares near their lowest price-to-book value and best dividend yield (3.7%) in years. If you're interested in owning a well-run utility, *this* is the time to be a buyer — rather than when everyone is paying a higher price and singing FPL's praises. So, although it's been only two weeks since we bought our first 1%, we're ready to pick up another 2%.

There are a few reasons we're buying more now. Since our first purchase, FPL has released quarterly results that show the business remains under pressure due to Florida's housing and economic woes. But with shares recently trading at $51, the stock price is a reasonable 12 times updated 2009 earnings guidance of $4.10 to $4.20 per share. Meanwhile, Florida's governing body has moved the FPL rate-hike judgment from January to at least March, so the outcome no longer hangs directly over the company's head. Finally, the company's woes are well-known, and we want to steadily buy shares while FPL is still in the dog house rather than after it's recovered — similar to our strategy with **Procter & Gamble** (NYSE: PG) when it traded in the $50s earlier this year.

Keep in mind, we view this as a long-term investment that we'll ideally hold for years, enjoying both the dividend yield and capital gains. Speaking of the dividend: FPL goes ex-dividend on Nov. 24, so you'll have to pick up shares before then to get the next $0.47 quarterly payment. Questions? As always, swing by the FPL board.

Buy to Close Covered Calls on Plum Creek Timber

Published Nov 11, 2009 at 12:00AM

At a Glance

- **Action:** "Buy to close" all November 2009 $35 calls (PCLKG) on Plum Creek Timber, using a limit near the ask price.
- **Recent November 2009 $35 call bid/ask:** $0.10/$0.25
- **Follow-up action:** We may initiate a new covered strangle in the future.

Our latest strangle on **Plum Creek Timber** (NYSE: PCL) is nearing expiration, but with the stock recently above $34, we're going to "buy to close" our November 2009 $35 calls early. At this point, we've earned most of what we can on the calls, and with the stock going ex-dividend on Nov. 12 and trading near $35, there's the added risk that call holders will exercise early, grabbing our shares and the dividend from us if we keep this call open.

Meanwhile, we'll allow the other leg of our strangle — our November $30 puts — to expire next Friday for the full cash gain.

To review, a covered strangle has two components, or legs: You write ("sell to open") covered calls on shares you already own and also write puts that could potentially net you additional shares if the stock falls below the puts' strike price by expiration. You can make both trades at once (as we did last time with Plum Creek), or "leg into" them, making one side of the trade at a time, sometimes weeks or months apart (as we did for our first Plum strangle).

As we consider setting up a new covered strangle, our main concern now is to avoid selling our shares too cheaply, especially if a strong recovery in the sector is on the horizon. We'll address that in our next trade decision.

By closing our covered calls, we'll keep our shares and pocket the upcoming dividend payment. We're happy to own Plum Creek, which is proving to be an excellent income-generating stock as well as a solid investment in American timberland. If you have questions about this trade, please let us know on the Plum Creek Timber board

---

Monday Memo: Knuckling Down Through Those Daily Dips; Plus, 6 Helpings of Earnings

Published Nov 9, 2009 at 12:00AM

Though it's easy to forget, most daily stock movements are simply noise — and volatility is part and parcel of investing. Take one of our newer positions, **Ebix**. Jeff recommended the insurance software company when it traded around $60. Not long after, it rose to $68, before slipping all the way back to around $54 after earnings. All in the space of 15 trading days.

Over the long term, Ebix's recent 20% drop should turn out to be the tiniest of blips. But right now, it's hard not to get fixated on the share price or the paper loss it's showing in our portfolio.

There are two ways you can look at it. You can lament your bad timing, wishing you had waited to buy. Or you can consider yourself lucky — now you can fill out your Ebix position at much cheaper prices.

When these dips happen, it's also worth reminding ourselves why we bought the stock. In his original Ebix trade alert, Jeff wrote, "With a large potential market, outstanding margins, and the advantages of network effects, Ebix has a chance to grow from a $660 million company to one worth a few billion dollars or more over the coming decade." That's right: *decade*.

As Warren Buffett says, "Only those who will be sellers of equities in the near future should be happy at seeing stocks rise. Prospective purchasers should much prefer sinking prices."

Pro stands firmly in Buffett's camp: We don't desire a sharply lower market, but we're happy when individual stocks are beaten down to what we think are irrationally low prices. When you view investing as a multi-year endeavor, it makes withstanding these bumps much easier.

Earnings season is almost over, and the good news is that we've had no blowups. None of our companies missed earnings estimates by a large margin or disappointed on its outlook. That's just the way we like it — steady as she goes. Meanwhile, your faithful analysts here at *Pro* have been burning up their keyboards covering earnings releases and conference calls:

- **AmTrust Financial** , our small specialty insurer, reported commendable third-quarter earnings, with book value jumping 12.4% in the quarter. Jeff covers the conference call in this post, saying *Pro* Fools can consider writing in-the-money puts to potentially net a lower buy price.
- Everyone's favorite uranium company, **Cameco**, slightly missed analyst expectations. Nevertheless, it had a solid, if unspectacular, quarter. You can read my similarly solid but unspectacular summary of the conference call here. The trend for uranium is positive, so Cameco should continue to grow and prosper in the years ahead. Our remaining shares are currently rated a Hold.
- **Ebix** had another record quarter, with higher revenue, net income, and net margin than ever before, continuing a long streak of growth. As Jeff says in this summary of the conference call, the stock now trades at about 15 times the 2010 earnings estimate, with about 23% growth expected. All in all, things appear to be on track. With the stock down a bit, we may look at buying more, possibly via writing some puts.
- **Jack Henry & Associates** , our financial software and data-processing company, had a decent quarter, especially given the spending constraints from banking customers. Todd took a timeout from the Fool's game room to post his summary of the earnings call. On the whole, we're pleased with Big Jack's progress.
- **Nasdaq OMX Group** reported third-quarter results in line with expectations. Despite competitive pricing pressure, the business is showing stability. *Pro* has written December 2009 $19 puts, so with the stock trading around $18, there's a chance we will get the shares. If we do, as Jeff explains in his conference call summary, we may take follow-up action, such as writing covered calls, or wait to see more improvements.
- **Abercrombie & Fitch** released yet another dire trading update, with October same-store sales down 15%. You'd have thought such news would be enough to finally bring down the stock price of this richly valued teen retailer of yesteryear (OK — we're biased). But no. Nothing seems to stick to this Teflon stock. Still, as Todd says, it's important to stick to the original investing thesis and stay patient.

Once we've had a chance to regroup from this earnings onslaught, we'll summarize the portfolio's holdings. Stay tuned. In the meantime, I urge you to read and participate on the very lively *Pro*discussion boards (and don't forget to give posts you like a "rec"!). There's much more to *Pro* than the trade alerts and Monday Memos.

Set Up a Synthetic Long on ProShares Short S&P 500

Published Nov 3, 2009 at 12:00AM

At a Glance

- **ETF price at original recommendation:** $57
- **Target allocation:** 4%
- **Type of holding:** Short/hedge (non-core)
- **If you're new to this trade:** You can purchase shares of this ETF outright. We recommend starting with a half-position (2%), and depending on how much stock exposure you already have in your portfolio, eventually matching our 4% target allocation.

The Big Picture

Nov. 3, 2009

The stock market's advance since March is the stuff of legend. We haven't seen such a rapid and steep ascent — the S&P 500 has climbed more than 50% in seven months — since the Great Depression. However, volatility of this magnitude rarely moves in just one direction, so we expect some gains to be surrendered as reality sets in: Unemployment remains high, housing is fragile, consumers are pinched, and both local and national governments are constrained by record deficits. The tea leaves for an economic recovery don't read "strong" — tepid is more like it.

Much uncertainty still lies ahead, so we're looking both to profit if the S&P 500 declines and to hedge our portfolio and the many positions we hold that are included in the index: **Autodesk** (NASDAQ: ADSK), **Flowserve** (NYSE: FLS), **FPL Group** (NYSE: FPL), **Medtronic** (NYSE: MDT), **Oracle** (NYSE: ORCL), **Plum Creek Timber** (NYSE: PCL), **Procter & Gamble** (NYSE: PG), and **Waters** (NYSE: WAT). With this trade, we're using a synthetic long option strategy — which equates to *bullishly* *buying* the underlying investment — on the **ProShares Short S&P 500** (NYSEMKT: SH) ETF. If the S&P declines, this inverse ETF will appreciate, in which case both options in our synthetic long will earn value.

With analysts expecting strong earnings growth in 2010, the S&P 500 is currently priced at about 19 times expected operating earnings for 2009, putting it at a premium to its historical average in the mid teens. Even if earnings deliver, we may have a profitable way out of this hedge — but if it looks like they will come up short, then *being* short will pay off.

Synthetic Long: Why This Strategy?

Tip: It's Not a Spread

Remember, Fools, a synthetic long isn't a spread. It's simply selling a put to buy a call. Most brokers will require you to enter the trades separately, writing the puts first, then buying the calls.

With a synthetic long you:

- Write ("sell to open") puts with a strike at the current share price
- Buy ("buy to open") calls with a strike at the current share price

This gives you an effective long position without having to own shares outright, and it can usually be set up for little or no out-of-pocket cost. In this trade, if the S&P 500 advances and ProShares Short S&P 500 *declines*, shares of the ETF will be put to us, and we can then consider writing covered calls down the line.

At *Pro*, we try to avoid "trap door" investments — in which there's only one way in, and there's no profitable way out if the trade goes against us. Unfortunately, most shorts work that way: Prices need to go down, or your investment is cooked. But a synthetic long on a short ETF gives us a few more chances to be right. If we're wrong initially, we merely end up owning shares of ProShares Short S&P 500 at today's price. Then, we can write covered calls against it — for example, the February 2010 calls would currently provide us with about 5% downside protection and room for a 5% profit to the upside, for a 10% range. That's a wide profit range to play with on the index. Looking closer, December call options would provide us 3.2% downside protection and an exit price that's 3.5% higher.

Here's a roundup of the possible scenarios:

If ...	Then ...
The S&P 500 falls	Our puts expire as a full gain. With our calls, we break even if the index falls around 2%, and we double our money if it falls about 4% — earning more the further the index falls.
The S&P 500 rises	Our puts are exercised (unless we close early), and we end up owning shares of the ETF, starting at a loss that equals the S&P's gain. We will then consider writing covered calls. Our initial calls expire without value, but this isn't a concern since we didn't pay out of pocket for them.
The S&P stays flat	Both our puts and calls could expire with little to no value — making the trade a wash. We may repeat.

The best-case scenario for this trade (but not what we're necessarily hoping for, big-picture!) would be the index tanking rapidly, making our puts expire for a full gain and our calls appreciate several times over. We could then "sell to close" the calls and take our gains, or exercise them and hold the ETF if we believe the market will continue to decline. But we're not banking on this. Rather, while seeking a short, we're glad that we've found a way to short the S&P 500 while still having a back-up plan for profits if the trade doesn't go our way.

Managing a Short-Term Trade

When you go short, it's usually a *short-term* endeavor, so currently only the November options have ample volume and reasonable bid/ask pricing for the ProShares Short S&P 500 ETF.

With so little time before expiration, the position will be actively managed — the way shorts usually are — and we'll alert you of any follow-up decisions ahead of time. If the S&P 500 declines by Nov. 21, we'll have profitable options on our hands and can let the puts expire, sell the calls, and then open a new synthetic long if desired. If the S&P appreciates, we're ready to be put shares of the ETF and go from there.

What Would Make Us Change Our Strategy

If the market dances another happy jig, bounding higher, it may be difficult to exit this position profitably even using covered calls. And while we're waiting for covered calls to play out, the market could continue to increase — so we may need to cut our losses, as with any short.

Additionally, ProShares Short S&P 500 has tracked well against the S&P over the past six months, but less accurately over other time periods. The ETF invests in S&P 500 swaps and faces pricing and counter-party risks. Also, the 0.95% annual fee will eat into its value. So to avoid fighting a headwind, and because it's a short, we don't plan to hold the position longer than one to six months, max.

Time Frame	ProShares Short S&P 500 Change	S&P 500 Change
1 day	(0.7%)	0.7%
5 days	2.2%	(2.3%)
1 month	(2.2%)	1.7%
3 months	(6.7%)	5.6%
6 months	(18.8%)	18.8%
Year-to-date	(21.2%)	15.5%

As of Nov. 2, 2009. Source: Google Finance charts.

Finally, if we end up owning the ETF, we may receive distributions that are taxed as income. Any gains shouldn't be significant given the market's ascent this year, but be aware.

Setting Up the Trade

For every 100 shares of ProShares Short S&P 500 you'd be willing to buy ($5,700 worth), write ("sell to open") one put. Use the proceeds to buy ("buy to open") a call at the same strike price, with the same expiration date. Most brokers will require you to enter the trades separately, writing the puts first, then buying the calls. Keep in mind our alternate trades are to just buy the ETF, or just write puts. Just buying the calls is possible, too, but not recommended given the cost. If you finance the calls yourself, you need at least a 2% fall in the index to break even by Nov. 21, and you forfeit the money you invested in the calls if they end out-of-the money.

Pro Bottom Line

In times of high volatility, a hedge can provide comfort and profits when most other positions won't. Shorting often requires good timing, but with this position, we have more tools at our fingertips to make the trade profitable even if timing works against us. To discuss our synthetic long on ProShares Short S&P 500, visit its new board.

Monday Memo: Market Behaving Badly? Plus, Earnings Everywhere

Published Nov 2, 2009 at 12:00AM

On the boards, *Pro* member Foolfor7 asked how far the market might drop. Many investors are now nervous any time stocks decline because the last bludgeoning is still a recent memory. It's highly unlikely, though, that we'll return to the level of fear and uncertainty we saw last October through March. Any giveback would likely be much more contained — perhaps a 15% or so decline, putting the S&P 500 back around 900 — a reasonable-looking valuation if everything just stays steady-state.

For tax-paying Fools, some quick math shows that a 15% or even 20% decline in stocks is a smaller hit than you'd pay in short-term taxes if you sold any *Pro* positions held less than a year. So, if our businesses are still promising, selling them, paying taxes, and eradicating any upside potential doesn't pass the mathematical sniff test. Even if you're investing in a tax-free account, selling good businesses at reasonable prices is an iffy proposition: You don't know if you'll have ample opportunity to buy them back cheaper down the road. And will you actually do so?

Although the question of what's next must remain unanswered, what we *can* do is be prepared for a variety of outcomes. If the economy shows signs of progress, next year could easily bring more gains. A range-bound market would be a welcome opportunity for more option writing. And if the recovery is slower than hoped — assuming it is coming — we could see reasonable losses.

Since Mr. Market is so fickle, we hope to initiate some modestly bearish-to-neutral positions soon, balancing out the *Pro* portfolio after months of mostly long positions. Doing so, we're acting on our belief that the market could indeed give back some ground, or at least stay in a range, as the new economic reality settles in. We like what we own, and we like being optimistic — but we're keeping an eye on that pit bull in the corner.

Several *Pro* companies reported earnings last week. When earnings season wraps up, we'll update all of our guidance (Buy First/Buy/Hold, preferred buy price, etc.) as necessary.

For now, we haven't seen any surprises. Results and outlooks looked satisfactory to quite good at:

- **Flowserve** (NYSE: FLS): The valve and pump leader improved margins yet again. Its market share continues to be healthy, but bookings and revenue leaked slightly below estimates. Management expects bookings to improve next quarter. As with all of our companies so far, Flowserve appears to be climbing out of a trough — but how long that climb will take remains to be seen. Read more.
- **GrafTech International** (NYSE: GTI): Management raised guidance, calling for operating income of $80 to $85 million this year (up from its previous guidance of $60 to $70 million), along with cash flow of about $150 million. The company is still profitable even though the steel business remains record slow, and management expects improvement next quarter. Read more.
- **Plum Creek Timber** (NYSE: PCL): The timber giant topped revenue and earnings estimates, and price and demand improved. If our existing covered strangle expires this month, we'll likely leg into a new one as we hang onto our shares. Read more.
- **Procter & Gamble** (NYSE: PG): With $19.8 billion in quarterly sales, billions of dollars in debt getting refinanced to much lower rates, and $1.06 in quarterly earnings per share (6% above the top end of management's guidance), the consumer products behemoth appears to righting the ship. In line with that, the company's outlook has brightened. Read more.
- **Waters** (NYSE: WAT): Moderately improving demand and recurring revenue helped Waters net a fine quarter. If our shares are called away this month, we'll likely write puts or set up a new covered strangle. Read more.

Meanwhile, our newest addition to the portfolio, **FPL Group** (NYSE: FPL), lowered earnings guidance (read more). We've only bought 1%, so we have a long way to go, and we may use options to buy more of Florida's green energy producer.

We have many more earnings reports this week (please see the sidebar), and we'll summarize the portfolio's holdings after we do our due diligence.

Fool on!

Buy Calls on MELA Sciences

Published Oct 26, 2009 at 12:00AM

The Big Picture

Oct. 27, 2009

One of the most widespread cancers in the U.S., melanoma is also one of the deadliest. Once this type of skin cancer reaches advanced stages, there is no cure — but if caught early, it's nearly 100% treatable. Now, **Electro-Optical Sciences** (NASDAQ: MELA) (now called MELA Sciences), a $200-million medical devices company, has a product in development that could revolutionize how doctors diagnose the disease.

MelaFind, a handheld skin scanner, uses multiple wavelengths of light that look 2.5 millimeters *under* the skin (allowing for early detection), spot abnormalities, and immediately compare the findings with the company's proprietary database of malignant and benign cancer cells for quick initial diagnosis. In Phase 3 studies, the non-invasive instrument was found to be much more efficient and accurate in detecting skin cancer than doctors; plus, thanks to its speed, MelaFind allows doctors to see patients more quickly (reducing appointment delays that can otherwise stretch weeks) and prevents countless unnecessary biopsies. Best of all, because it spots skin cancer early, it can save lives.

Currently under expedited FDA review, with approval MelaFind would begin to generate recurring revenue for Electro-Optical Sciences, which plans to collect a fee on every patient tested. Although needing additional approval, the company also has its sights on selling the product overseas, starting with Europe. Millions of people worldwide visit the doctor for skin cancer, and the World Health Organization estimates that 2 to 3 million cases of melanoma occur annually. In development for more than a decade, an FDA decision on MelaFind is expected between December 2009 and early 2010.

The Business

MelaFind on the Web

To see the device in action, take two minutes to watch this Sept. 27 *ABC World News* report.

Lacking any revenue today, Electro-Optical's only hope for developing its business is approval and market acceptance of MelaFind. Nothing is ever certain with the FDA or in the medical industry, but MelaFind's odds for success appear as strong as one could hope.

The American Cancer Society cites more than 68,000 new cases of deadly melanoma per year in the United States. Doctors may miss spotting the disease as often as a third of the time (cited in the report in the sidebar) to 40% of the time (cited by doctors in an Electro-Optical conference call), while MelaFind identified the disease 98% of the time. Additionally, the product cuts unnecessary biopsies by 90%, reducing the cost of care, let alone the pain and suffering of patients.

The Community's Take

Electro-Optical Sciences rates 5-stars on CAPS. It's not enough of a going concern to rate well or meaningfully on the *Pro* CAPShot, but it scores a 5 — better than some going concerns (amusingly).

In its final Phase 3 clinical trial this year, 1,383 patients participated in the largest melonoma detection study to date. MelaFind was also able to rule *out* disease in patients with 2.5 times more accuracy than doctors (who might otherwise perform biopsies). In addition, MelaFind detected 125 of the 127 potential melanomas (the 98% accuracy reading), and half of these melanoma were the easiest to cure but the most difficult to detect. Melanoma kills one American every hour, and its occurrence is on the rise among young people — yet many patients avoid doctor visits because they so often result in biopsies that prove benign.

An estimated 650,000 U.S. patients a year visit the doctor for skin cancer checkups; melanoma is the most common cancer, and leading killer, among women in their 20s and 30s. MelaFind provides a quick, painless scan, finally catapulting the detection of the disease into the modern age, away from the "ABCD" visual-scan protocol used by doctors for decades. When it's found early, melanoma can usually be cured. This is why the American Cancer Society is recommending everyone starts to get an annual scan.

Finances

Electro-Optical raised $13.7 million this summer with share dilution, and today has an estimated $19.5 million in cash — that's just over 10 month's worth of cash at recent burn rates of $3.9 million per quarter. Even if MelaFind receives FDA approval, Electro-Optical will need to raise more funds to commercialize the product. On the plus side, the company — which went public in 2005 — does not carry debt.

One analyst covering the company expects sales to reach $10 million the year following approval and $40 million the next — but this is a wild guess. Sales could be much stronger, or much weaker. Remember, this company is a speculation. Management plans to primarily be paid on a per patient case, effectively earning a portion of the doctor's fee for performing each scan with MelaFind. The company's continually updated computer database is the lifeline or connection that doctors will rely on for diagnosis.

Management

The mostly middle-aged management (click "Team") has years of experience in biotech, medical devices, and the commercialization of products. This gives us confidence that Electro-Optical has put together a team that can execute on sales if product approval is granted. Management — directors and officers — have been buyers of the stock over the past year.

Risks

The risks are many. Commodities like silver and natural gas aside, this is *Pro*'s first pure speculation; that's why we're only allocating a portion of the portfolio that can be lost if bad news hits. The FDA is the first wild card: They may demand more trials before approving the product, and that would set Electro-Optical back months, if not years, and require more funding. Or, approval may not be as broad as the company hopes, limiting the market potential. If the company wants greater commercial uses down the road, it would need to conduct more trials. Even with full approval, risks include market acceptance — doctors are often slow to change — and Medicare and insurance reimbursement decisions. If insurance companies don't reimburse the cost of MelaFind scans, the product may never take off. There's also liability risk. If MelaFind misses a cancer, the company could be sued.

Furthermore, there's competition. Electro-Optical's management doesn't know of any direct competition that offers the full diagnosis package offered by MelaFind, but the broader market for optical imaging devices themselves is extremely competitive, and large competitors the likes of **General Electric** (NYSE: GE) or **Raytheon** (NYSE: RTN) could target MelaFind. Already, at least half a dozen small competitors have various related products in development or on the market, and someone could develop something superior to MelaFind. The company needs commercialization soon, and needs to grab market share quickly if it's going to succeed.

Why This Strategy

We're buying in-the-money call options on Electro-Optical to lower the cost of our investment while enhancing our possible returns. Additionally, with the $5 calls, we have better odds of being able to convert to stock by April expiration (as long as shares are $5 or above) if we want or need to. An FDA decision is likely by December 2009 or early 2010, and shares will likely respond strongly to the news (good or bad), but even if approval is delayed, they're unlikely to fall below $5 (risking our full investment). Meanwhile, a jump to the high teens would about double our investment in the calls. As alternates, you could buy shares of the stock straight out if you're seeking a stock speculation, or buy calls at other strike prices to increase or decrease your risk and/or your cost.

Pro Bottom Line

The medical field is strewn with the hopes and dreams of thousands of small companies, many of which never succeed. Electro-Optical hopes to be one of the few to commercialize a product successfully enough to become a going (and growing) concern. Given the product's ease of use, success rate in trails, and need for modern skin cancer detection and diagnosis, odds for success appear much stronger than average. However, we can't take that for granted. We invest knowing that this is a speculation that may work out wonderfully, or may go completely bust. To discuss the company, please visit its *Pro* board.

Monday Memo: Why Stocks Reign Supreme; Plus, Earnings News From KCI and LNN

Published Oct 26, 2009 at 12:00AM

By Todd Wenning

On Wednesday, the market sent shares of **Kinetic Concepts** down 7.6% on concerns about growth in the company's regenerative medicine business. The relative slowdown in these sales — which were actually 17% higher than last year — was due to higher-than-expected demand for the Strattice and Alloderm products; Kinetic's inventory thus fell short. But high demand is a good problem to have — and one I expect to be corrected over the next two quarters. Meanwhile, I remain impressed with the company's smart international expansion plans and its launches of innovative products that complement its vacuum-assisted closure therapy. The balance sheet again improved as CFO Marty Landon, whom I spoke with two months ago, continues to pay down debt with free cash flow. You can read my full report on Kinetic Concepts' earnings on the boards. Kinetic remains a Buy First stock, recently trading near our preferred buy prices.

Lindsay's full-year earnings were weak, as we expected — sales down 29% and profits down 65% from record levels last year. Fortunately, we didn't buy Lindsay last year when it was ringing in record sales and profits at the height of the agriculture boom. Instead, as is our aim with cyclical stocks like Lindsay, we buy when things look bad. Eventually, higher crop prices will return, and when they do, farmers will be more willing to invest in irrigation equipment. As with any small cap, and especially one as volatile as Lindsay, patience and deliberate investing are the keys to success. So, with shares of Lindsay near our buy-below guidance of $34.50, we're moving Lindsay back to a Buy on the scorecard. Please see our full report on Lindsay's earnings on the boards.

To discuss our Memo or ask us questions, please visit the Musings board.

Todd owns shares of Kinetic Concepts.

Buy NextEra Energy

Published Oct 21, 2009 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Recent share price:** $53
- **Estimated fair value:** Mid-$50s
- **Preferred buy price:** $55
- **Type of holding:** Core income; Utilities
- **Dividend yield:** 3.5%
- **Alternate trade:** Write puts that net you a buy price of $55 or lower
- **Follow-up strategy:** We may write puts to buy future shares. Later, at a higher price, we may write covered calls in order to generate additional income.

The Big Picture

Oct. 21, 2009

Get Personal With NEE

- **Headquarters:** Juno Beach, Fla. (nice digs!)
- **Website:** fplgroup.com, nexteraenergy.com
- **Employees:** 15,000

Until the power goes out, most of us don't realize how much we rely on electricity. Without it, life quickly shuts down — and where there's a necessity, there's often a good investment.

Over time, utility conglomerate **NextEra Energy** (NYSE: NEE) (formerly FPL Group) has certainly delivered results. Its stock is up 59% over the past five years compared with a small loss for the S&P 500. Extend that to the past 10 years, and NextEra has gained a hefty 123% while the S&P has lost 12%. This year, however, the stock is relatively flat, up just 8% — and we're glad. Utilities have been left behind in the rally, remaining reasonably priced and providing *Motley Fool Pro* with a good opportunity to add exposure to the sector.

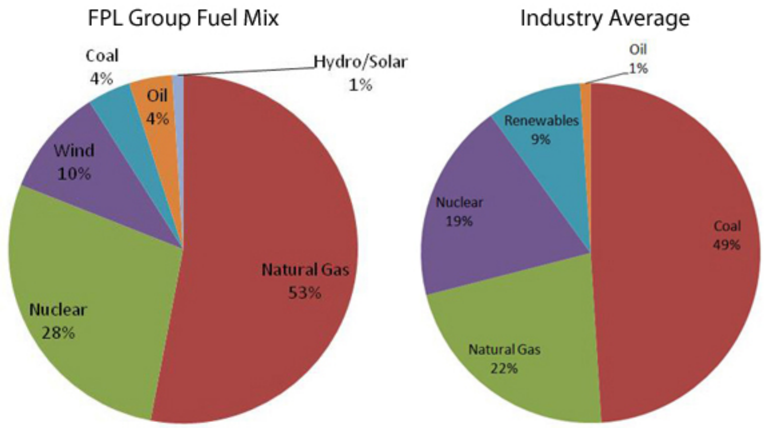
Looking ahead, we expect more steady gains from the company that *Fortune* named one of the "most admired" in America thanks to its strong financials and leading position as a producer of clean, renewable energy. But first, let's take a look at how this $22 billion company operates.

Running on Two Cylinders

NextEra operates two divisions. Representing 71% of 2008 sales, Florida Power & Light is a regulated utility that provides electric power to some 8.7 million residents in Florida's east and lower west coasts. Over the past three years, the division has consistently generated about half its operating revenue from residential customers and another 40% from commercial customers. As with any regulated utility, its rates are controlled by a state agency — in this case, the Florida Public Service Commission — to ensure that energy generation and distribution is reliable, affordable, and safe for consumers while allowing for a reasonable level of profits for the utility company. The division hasn't seen a rate increase since 1985, so it's lobbying for a 31% price increase in 2010. More on this a bit later.

Checking in with 28% of 2008 sales is NextEra Energy Resources, a wholesale power generator. Unlike Florida Power & Light, NextEra isn't regulated; rather, it owns and operates power plants and sells the output to companies, power cooperatives, and municipalities for a total of 96 operating projects in 25 states and Canada. NextEra is the nation's leading renewable-energy provider, with 17,000 net megawatts of capacity, 95% of which is derived from renewable sources.

Together, Florida Power & Light and NextEra produce an energy profile that's quite different from the typical competitors:



Source: FPL presentation, September 2009.

Let There Be Light

As you can see, NextEra Energy is heavily weighted toward cleaner energy sources — 39% of its power generation produces zero emissions, ranking the company first in the nation for energy efficiency. Moreover, NextEra is larger than the next three wind-power generators combined, and it's the country's largest solar energy producer. This emphasis on clean energy gives NextEra important advantages:

- **Natural gas leadership:** Converting a coal plant to natural gas can cost upwards of $1 billion, but NextEra is well ahead of its coal-heavy competition. Its primary energy source is natural gas, which is inexpensive, emits half the carbon of coal, and is plentiful in the U.S. — the domestic supply is 1,800 trillion cubic feet, equivalent to 320 billion barrels of oil (by comparison, Saudi Arabia has 264 billion barrels). These natural gas benefits allow NextEra to charge lower rates than competitors.
- **Regulatory tailwinds:** If economics don't force utilities to move toward lower-carbon energy sources, the government just might. The 2009 stimulus package provides tax credits and cash grants for companies building wind, solar, and hydro properties — up to 30% of a project's qualified costs, much to NextEra's benefit. We expect the government's focus will continue to be on clean, renewable, and domestic energy sources. NextEra is in a strong position to profit from this trend.

Leadership-wise, NextEra's respected management team has helped the company win numerous industry awards each year. The company has a long reputation for being a "clean" and admired business — case in point, NextEra's 53-year old CEO, Lewis Hay III, was invited to privately dine and discuss climate change with President Obama recently.

And then there's the dividend. We want to boost the *Pro* portfolio with another income-generating investment while also gaining exposure to the steady-natured utilities sector. With a 3.5% dividend yield and a track record of regularly boosting payouts (15 consecutive years of dividend increases and 8.5% annualized dividend growth since 2004), NextEra meets the bill. Add potential stock price appreciation and income from covered calls down the road, and the picture is complete.

Financials and Valuation

NextEra's balance sheet is in the upper echelon of utilities — it's one of only three with a credit rating of A or better. This is encouraging because the rating gives NextEra the opportunity to borrow funds at lower interest rates than competitors and then use that money to invest in higher-return projects — a win-win for investors.

In 2006, NextEra set a goal to grow adjusted earnings per share by at least 10% per year through 2012. With 2009 guidance near $4.20, that would equate to 8% to 9% remaining annualized growth through 2012 to achieve that goal. Although a 2010 rate hike remains to be seen, we believe the goal is achievable, but we're still staying on the conservative side of guidance. Using growth rates between 6% and 8%, our free cash flow model pegs a fair value range for the company in the low $60s.

Why This Strategy

Our strategy here is to build slowly, beginning with just a 1% position, because of a significant event on the horizon: As noted, NextEra has sought a 31% rate increase from customers, and Florida's governing body is weighing the case. There are a few things in NextEra's favor. First, it hasn't had a rate increase since 1985. Second, NextEra provides some of the lowest-cost energy in the country, so even with a rate increase, the company expects its average customer bill will actually go *down* $9 per month in 2010. In addition, management argues, NextEra needs a rate increase to help the business continue to invest in clean energy.

So far, Florida's governor has bumped heads with NextEra, calling the proposed rate hike excessive — so expect some sparks. A ruling is expected as soon as January 2010. An unfavorable outcome could send NextEra's stock lower at that point, but the stock may climb beforehand (making it a potential wash). A favorable ruling could benefit the stock. We may continue to build our position, but we likely won't exceed 3% (half our eventual target of 6%) before the ruling to be cautious.

What Would Make Us Change Our Strategy

There are a few other risks that could lead us to alter our investment thesis, and even possibly sell:

- The economy, on both a national and local level, could take another turn for the worse, further reducing demand for energy. Florida has already been hit hard by foreclosures, and NextEra has closed thousands of inactive accounts. Still, this is well-known and seems to be priced into the stock.
- Higher interest rates could lead to less investor demand for utility stocks as well as increase the company's cost of capital.
- Similarly, an inability to access reasonable capital to finance investments would dampen growth prospects.
- Unusually warm winters or cool summers in Florida could reduce energy demand.

Finally, there's the chance that future public policies may not benefit renewable energy investments. If this happened, or if NextEra nears full value, we'd consider changing our strategy.

Pro Bottom Line

A healthy dividend, a solid balance sheet with smart use of debt, and a respected business with substantial growth opportunities in greener power generation make NextEra an electrifying (work with us here) addition to the *Pro* portfolio — while providing us with our first exposure to the steady utilities sector. Now that's something every investor should consider. Have any questions? Post away on our new NextEra Energy board.

Write Puts on Medtronic

Published Oct 20, 2009 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") January 2010 $37 puts (JIWMB.X)
- **Allocation:** 2.5% (for *Pro*, seven contracts)
- **Option's recent bid/ask:** $1.90/$2
- **Preferred limit price:** $1.90 or higher to start; later, no lower than $1.50 (4% of the strike)
- **Alternate trade:** Write December 2009 $37 puts (JIWXB.B), recently $1.50; or, write December 2009 or January 2010 $36 puts to be more defensive. If you're unable to write puts, consider buying stock outright with a limit order near $36.

What's New

We last wrote puts on **Medtronic** (NYSE: MDT) in September, and they expired as a full cash gain on Oct. 16. We're happy for the income, but we're still aiming to increase our 2.5% position to 5%. So we're writing new puts in another attempt to net shares of this medical-device king at $36 or below.

Since last month, Medtronic has not reported any news of note, but competitors have. **Boston Scientific** (NYSE: BSX), **St. Jude Medical** (NYSE: STJ), and **Johnson & Johnson** (NYSE: JNJ) all reported lower-than-expected medical-device sales or weak outlooks, primarily in heart-related devices, citing soft hospital demand. Following St. Jude's news — as shared by *Pro* member stamleo — Medtronic stood by its quarterly revenue guidance and noted that it had already lowered its sales growth guidance early in the year to reflect expected weakness. Additionally, management believes it's maintaining, and possibly gaining, market share in the cardiovascular business. All in all, we remain comfortable with our target valuation (for a refresher, see our Sept. 1 update).

How to Follow Along

You write ("sell to open") puts when you're ready to buy a stock if it declines below the strike price by expiration. This trade is more aggressive than our put-writing guidelines generally suggest, but that's because we're making the trade with a strong desire to buy more shares and we're comfortable with the valuation.

- **Option payment or yield (at $1.90 bid):** About 5.1% in three months (more than 20% annualized)
- **Option strike price:** Close to Medtronic's current stock price ($37.25)
- **Break-even price:** 5.7% lower, at $35.10
- **Cash or buying power needed:** Each put option you write represents a potential purchase of $3,700 in Medtronic.

Why This Strategy

We're writing January puts partly to diversify our exposure — we already have several puts expiring in December. In addition, if January options expire, the income won't be taxed until 2011. But the main reason is that the January 2010 $37 puts pay nearly $2, offering us both an attractive potential start price and the opportunity to invest defensively following the market's record rally.

Can't Write Puts?

If you're unable to write puts and still need to buy your first shares of Medtronic (or your second 2.5%, like us) consider placing a limit order near $36 to potentially get shares on a downdraft. Remember, buying shares a bit above our preferred price is also acceptable.

We'll make this trade in the next one business to 30 calendar days. To discuss this trade or ask questions, please visit our Medtronic board.

Monday Memo: A Stock That Got Away

Published Oct 19, 2009 at 12:00AM

As it turned out, March 9 marked the *very bottom* of the market. Within a week, TSC had jumped 13%; a week after that, another 11%, to about $37. Having experienced a very bumpy market during the winter, we patiently waited for another chance -- we weren't about to chase a retail stock higher in that environment. But before long, our window of opportunity was slammed shut. Since March 9, TSC shares have risen 80%, to $52.50 a share -- well above my original fair value range.

Yes, we missed out on some nice gains, but we made a cautious and deliberate decision not to chase the stock higher. In a highly volatile market, this approach is a double-edged sword: It can work for you, or it can work against you. And in this case, it worked against us.

Tractor Supply is a fine company with good growth prospects, but as with any company we consider for the *Pro* portfolio, we don't want to overpay for those prospects. Though we loved TSC at $30, we liked it less at $40 -- and now trading above $50 a share, we'll just shake our heads. (Interestingly, the CAPS community has dropped its rating on TSC from 5 stars in March to just 2 stars today. Is a price decline coming?)

As we've said from the beginning, accuracy is one of our top priorities at *Pro* -- and paying dearly for a stock only increases your odds of being wrong. What's more, our concern for consumer spending remains strong -- witness our recent bear put spread on **Abercrombie & Fitch** (NYSE: ANF). We aim to stay consistent by investing alongside our convictions, even if it means missing some gains. Although, next time I go digging into a company like Tractor Supply, I'll remember to pick up some mulch.

Have thoughts to share on Tractor Supply or on any stocks *you* missed? Visit the Memo Musings board.

Todd owns shares of Home Depot.

In case you missed it, we've gathered a few *Pro* community highlights from the past week:

- Member alex340 shares new option trades meeting *Pro* criteria.
- Bruce (TMFGoogly) posts several good articles on the economy and why many remain cautious.
- Following Jeff's Memo last week on making sense of the market, *Pro* members share their own thoughts on the boards. The slant? Cautious.
- In his latest This Week in CAPS, Russell (TMFEldrehad) shines his spotlight on some top CAPS stops.
- Todd (TMFPhila) recommends an article on what to do if bond prices fall.
- Jeff (TMFFischer) shares an update on **iShares Silver Trust** (NYSE: SLV) (and **Medtronic** (NYSE: MDT), whose puts just expired for *Pro*).

Buy EBIX

Published Oct 16, 2009 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Estimated fair value:** $24
- **Preferred buy price:** $18
- **Type of holding:** Technology/Software
- **Alternate trades:** Write puts that net you a buy price below $18.

The Big Picture

Oct. 16, 2009

Get Personal With Ebix

- **Headquarters:** Atlanta, GA
- **Website:** ebix.com
- **CEO:** Robin Raina since 1999; 42 years old
- **2008 revenue:** $74 million
- **2008 net income:** $27 million
- **Employees:** About 650

When it comes to what I (Jeff here) look for in a business, **Ebix** (NASDAQ: EBIX) hits nearly every mark: It has high margins, strong recurring revenue (almost 80% of its total), and beneficial network effects — meaning the more customers it adds, the stronger its offerings and deeper its competitive moat. Meanwhile, if there's a company moving more aggressively to become the dominant software provider to the insurance industry, we haven't found it — making this $660 million business an intriguing growth story as well.

The hunting ground for Ebix's potential growth is the enormous — yet fragmented — global insurance industry. Major customers in every insurance category — including property and casualty coverage, health and employee benefits, and life insurance and annuities — look to Ebix's software to manage their transactions and data. In addition, banks, financial advisors, and more than 300,000 brokers and agents use the company's niche offerings of risk-management software and business-process outsourcing. Currently, Ebix generates close to $100 million in annual sales; but if the company can tap even a fraction of the (perhaps hyperbolic) $60 billion market potential that management sees in the U.S. alone, there's still plenty of opportunity to expand.

Diving Into a Platform

Community and CAPS Insight

Ebix has scored 4 to 5 stars since CAPS began to track it, with nearly every All-Star rating it to outperform. On *Pro*'s CAPShot, the company grabs a strong 9 of 12, coming up short on CAPS industry rating, current ratio, and revenue per employee (which we want to see increase).

Where Ebix is most established is also where it's most promising. Its largest offering, EbixExchange, generates more than 50% of revenue and provides e-commerce solutions for insurance agents, brokers, carriers, consumers, and third-party providers. EbixExchange allows customers all along the chain to instantly communicate all necessary data for any transaction. By providing this backbone, Ebix is building a deep competitive moat, evidenced by its nearly perfect customer retention rate. Meanwhile, the antiquated insurance industry is in need of standardization, giving Ebix a large opportunity to help clients modernize. Plus, the platform has strong network effects, growing more valuable and profitable as more customers take part. As management explains, Ebix is striving to be the airport rather than the airplane — the hub upon which all its customers rely.

The highly fragmented nature of the industry means Ebix has no direct competition spanning all of its business lines, but there are many small niche competitors — the best of which are ripe for the plucking. Ebix can "roll up" these companies, making frequent acquisitions and bringing more clients under its wing as a result.

All of these factors add up to a strong competitive position and bright future that's only bolstered by the company's recurring revenue. But that doesn't mean this is an investment without risk.

Financials and Management

3-for-1 Stock Split Coming

With just two analysts covering the stock and only 12 million shares available, Ebix will execute a 3-for-1 stock split in early December. It did this last year, too, and the goal is to increase liquidity and garner more mutual fund interest — and perhaps more analyst coverage. The split will not affect the company's total valuation, but you'll own three shares for every share previously owned, at one-third the previous share price ($20 to today's $60). Option prices and contracts will also split accordingly.

Ebix represents a first in the *Pro* portfolio: We're buying a stock without offering a fair value estimate. Trying to put a fair value on such a fast-growing company (something I'm familiar with from years of working with David Gardner on the original Rule Breaker portfolio) this early on is suspect; instead, we're looking for a high ceiling — a large potential market opportunity compared with current sales. Ebix offers this in spades. However, there's also higher risk, so you shouldn't buy this stock unless you can tolerate high volatility for many years if necessary — and don't mind facing potential losses.

That said, we're not just speculating. Recently $60, Ebix trades at 16.5 times the December 2010 earnings estimates from two analysts, while earnings per share is expected to grow about 23% over the next year. The stock currently fetches 22 times trailing earnings, a discount to its recent growth rate. More important, for a company of its size, Ebix enjoys healthy free cash flow, which neared $30 million over the past 12 months; that puts the stock at about 22 times free cash flow. It is not inexpensive today, but continued growth could later make this price seem like a bargain.

Meanwhile, the balance sheet doesn't raise any red flags, with about $15 million cash and investments, $25 million in short-term debt, and $15 million in convertible debt. The company may grow debt to make more acquisitions, or it could issue new shares and add dilution (nothing unusual with a small, growing company). However, management is committed to making acquisitions that add shareholder value and grow earnings quickly. Young, hard-driven Robin Raina has been at the helm for a decade, and he's hungry to change the world. His total annual compensation was recently $2.7 million, reasonable given the hundreds of millions in shareholder value he's helped create. Ebix has grown sequentially (quarter-to-quarter) for the last seven years running; revenue jumped 74% in 2008, while diluted earnings per share grew 90%.

What Would Make Us Change Our Strategy

As a small, high-growth company, Ebix is one of our riskier investments. We'll keep a close eye on share dilution and acquisitions because the company needs to maintain momentum. Given its nearly perfect customer renewal rates, if these numbers tick lower, we'll quickly try to figure out why — New competitors? Product dissatisfaction? — and decide on a course of action.

While accepting the lumpiness that sometimes comes with small companies, we want to see revenue grow in all of Ebix's four business lines year-over-year, or we'll reconsider our growth thesis. Finally, there are the tax benefits Ebix enjoys from years of rolling operating losses forward. Over the next few years (management is unsure how soon), these losses will likely be used up, and the company will start to pay more taxes.

Pro Bottom Line

With a large potential market, outstanding margins, and the advantages of network effects, Ebix has a chance to grow from a $660 million company to one worth a few billion dollars or more over the coming decade. And while it presents more risk than most *Pro* stocks, the risks are at least mitigated by Ebix's 80% recurring revenue among its dedicated, interconnected customer base. We hope to grow our money alongside Ebix in the years ahead. Questions? Please post on *Pro*'s new Ebix board.

Monday Memo: Making Sense of the Market

Published Oct 12, 2009 at 12:00AM

Last Thursday, retail stocks soared on news that average same-stores sales in September were positive for the first time in a year, up a modest 0.6%. In other words, shoppers returned in large enough numbers to make top-line results a little better than they were a year ago (though we can't help but note that two-thirds of last year's Labor Day shopping weekend actually occurred in August, making this year's comparison even easier). Many investors are interpreting this uptick to mean the economy is sustainably on the mend.

Maybe. Or, it may just mean that the economy bottomed out, and off those lows, more consumers are emerging from their bunkers to do some shopping. But credit remains tight, unemployment is still ticking up, manufacturing is still in contraction, there's record debt everywhere (personal and federal), and foreclosures are still going higher. (Wait, did someone turn out the lights? Sorry — back on again.)

But a "things-aren't-as-bad-as-they-were" dynamic seems to be a growing influence on the whole market regardless. And with third-quarter earnings starting to roll in, this dynamic is probably about to kick up a notch. Why? Quarterly results could look quite good compared to the end-of-the world numbers of a year ago. Now and in the coming few quarters, investors will see what *looks* like heady growth, choosing to ignore the fact that we're comparing results with the very depths of the economic bottom. So stocks are bid higher.

At the same time, we have other market dynamics at work, namely supply and demand. So-called "weak hands" sold their stocks early this year. But strong hands held on. They didn't sell when the world was on fire, so they're not going to sell now (unless they become concerned about valuation).

Now, as prices increase, emotional investors who sold are capitulating and buying again from more reluctant sellers, pushing stocks higher as trillions of dollars flow back in. Many send their money to mutual funds, which are then obligated to put it to work — so the buying continues despite some fund managers' reluctance. So stocks are bid higher. And now, many stocks are breaking to new 52-week highs, attracting momentum buyers.

Just as we were in a heavy selling cycle for about six months, we're now in a buying cycle. And buying cycles can typically last much longer than selling cycles; the market is built to go up, not down, and down periods are usually relatively quick. So if this ascent is going to subside, what would bring it about?

What the Market Faces

It's likely that 2010 will answer the biggest questions we face today:

- Will this be a V-shaped economic recovery, or much more tepid?
- How likely is a double-dip recession? The current bounce is stimulus-driven.
- Will this be a jobless recovery in the U.S.? What would that mean?
- If earnings estimates are met in 2010, stocks will likely head higher. If the size of the recovery misses expectations, stocks will likely decline and languish.

People often think in terms of years. For almost all of this year, Wall Street has been focused on 2010. ("Let's just get through this junky year; the economy will be better in 2010!") This means *any* news that has suggested 2010 will be better has been good for stocks. (Another answer to the "why.") Once 2010 gets here, though, there's a chance it won't live up to the hype.

I wasn't going to talk about valuation, but stocks are priced for exceptional earnings growth in 2010. There's scant evidence yet that these expectations will be met — the economy may have bottomed, but robust sales growth is not yet on the horizon. If disappointment ensues, 2010 may be a lot like 2003: Then, earnings grew as we emerged from a recession, but stocks declined more than 20% because results weren't as strong as hoped.

That's one possibility. The other: The recovery could turn out *stronger* than hoped, and everyone buying stocks this year will be rewarded sooner rather than later.

Usually we wouldn't be quite so obsessed with the macro economy, but at no time do I remember it looking so black and white. Our going investments at *Pro* aim to straddle these two possible outcomes. We want strong rewards if 2010 is a good year. But we want to be defensive in case it's not — because if a recovery is pushed back, or if it's too tepid, then stocks will pay a price and probably be lower for a long time to come. The stakes look high as we approach 2010 — we aim to make sure *Pro* and its members are prepared and ready to react.

Jeff Fischer

Enact a Synthetic Long on United States Natural Gas Fund

Published Oct 7, 2009 at 12:00AM

At a Glance

- **ETF price (Oct. 7, 2009):** $12
- **Target allocation:** 3%
- **Type of holding:** Energy

The Big Picture

October 7, 2009

Look out: We're getting gassed up about natural gas. But not because it's the popular market sentiment. Rather, we're looking to capitalize on a commodity that's been beaten down, and we'll use a long-term, low-cost strategy that gives us plenty of time to see gas rebound.

Natural gas prices hit seven-year lows recently as supply has outstripped demand. Much of the natural gas used in the U.S. is domestically mined and stored, and the country's storage is nearing capacity. Hitting this ceiling, as producers reduce natural gas output, we expect prices of the commodity to gradually rebound, returning to a level that makes more economic sense. At recent prices, natural gas is less expensive to burn than coal, and it's selling at prices that don't reflect the true cost of mining it.

In the November futures market (a good way to measure prices), natural gas recently topped $5 per MMBtu (million British thermal units), roughly 35% below last year. As competing energy sources, oil and natural gas usually maintain an average price difference. For most of this decade, oil was six to 15 times more expensive than natural gas (demand is much higher for oil, and transporting it is easier), but lately, there's a big disconnect: This ratio recently jumped as high as 27, making natural gas the much cheaper fuel source. This spread should ultimately tighten, either by oil prices falling, or natural gas prices rising, or both. A rebound in natural gas prices is the most likely outcome because market forces are already at work. The number of drilling rigs seeking gas has decreased by some 56% in the past year, as more producers wait for higher prices. Additionally, more power plants are considering using cheaper natural gas. Overall, we believe natural gas recently hit bottom, or close enough to make for a compelling investment.

More UNG on the Web

- The latest natural gas prices
- Visit the UNG site for its recent NAV
- See a chart of the recent natural gas story
- Learn all about natural gas and you

For this thesis, we've chosen to set up a synthetic long (see Options 501) on the **United States Natural Gas Fund** (NYSEMKT: UNG) ETF. Founded in 2007, it seeks to mirror natural gas prices by purchasing futures contracts on the commodity and rolling them monthly. (Conveniently, UNG recently traded near its net asset value.) Buying LEAP call options gives us more than two years to see a rebound in gas prices and could leverage our returns if we're right; writing puts to pay for the calls lets us set up the trade for little out-of-pocket cost. From $5 per MMBtu, it would be reasonable to see gas prices gain at least 50% in the next few years, back above $7.50 per MMBtu. If it does, our calls could about double, and our puts would expire as 100% income.

What Makes Gas Go

The Community's Take

UNG rates 4 out of 5 stars on CAPS as of Oct. 5, with a gushing 96% of All-Stars rating it to outperform (more than 570 bulls versus 21 bears). On *Pro*'s ETF CAPShot, it only scores a 5 of 12. This poor showing is logical given that gas prices, and the ETF, have cratered, with UNG down 60% the last year. This is not an investment in momentum. It's a contrarian position, investing for a rebound.

Several forces aside from oil can drive natural gas prices up or down:

Production. The more natural gas produced without increased demand, the lower you can expect prices to go. It's supply and demand. In 2008, production jumped more than 8% as new drilling techniques tapped into giant shale beds in North America. As new supply came online, prices fell, until finally production began to decline as it is now, and mines are being capped. Burned once, producers likely won't make the same mistake twice if they can help it.

Inventory. Natural gas inventory is at a record high. With U.S. storage now near capacity, these peak inventories will eventually be used, even partly burned off, until supplies reach levels that support price stability. It makes sense to invest in a commodity when it's at maximum supply, and thus prices are likely near a bottom.

Imports. Liquefied natural gas imports to the U.S. declined 23% in 2008 and are expected to decline again this year due to the high transportation expense, plenty of domestic supply, and a greater demand for the gas in the local competing markets of Europe and Asia. The trend toward lower gas imports in the U.S. isn't likely to reverse, leaving more room for domestic gas prices to recover.

Demand. Natural gas demand will increase if industrial production increases in an economic upturn, and as power plants turn to this cheap alternative.

Politics. Natural gas can be domestically produced, and it's a much cleaner fuel than oil or coal (dare we say "greener"), hence the cries to use more of it ringing through Capitol Hill.

New uses. Major car manufacturers, including Honda and Mercedes Benz, are producing natural gas vehicles, and more than 1,500 natural-gas fueling stations have been quietly built in the U.S. Need to fill up? The average price was just $0.63 per gallon in 2008. The U.S. government offers large tax incentives for buyers of natural gas vehicles, and the credits will likely be extended beyond 2010.

Weather. Cold winters increase gas demand and prices, and vice versa. Obviously, we have no control over this, but it could affect our investment. Hurricanes can also affect supply and pricing of natural gas.

Of course, some of these factors present downside risk. The economy could enter a double-dip recession, sending industrial gas demand — and therefore gas prices — even lower. There's also a possibility we'll see warmer-than-expected winters.

But overall, we see greater potential reward than risk today. Natural gas prices aren't likely to fall much further from multi-year lows — though they may stay weak for quite some time. Restoring the equilibrium of supply and demand is likely to move prices upward, as could an economic recovery, inflation, and simple gains in demand due to current beneficial prices. In other words, most factors suggest that natural gas prices could recover over the next two years and beyond, while few factors suggest even lower prices would sustainably occur.

Why This Strategy?

Setting Up the Trade

- **Action**: Write ("sell to open") January 2012 $12 puts (KANML), recently $3.60/$4
- **Action:** Buy ("buy to open") January 2012 $10 calls (KANAJ), recently $4.40/$4.80

When you're bullish over a period of a few years, but don't want to invest much cash up-front, a synthetic long just may be the ticket. We can place this trade for little out-of-pocket cost (although our broker will set aside buying power on the puts we write). We'll write puts, buy calls, and profit on both if UNG increases. With no price changes, both options could end with little lost or gained.

The worst-case scenario is UNG goes down sharply, and we're on the hook to buy shares in January 2012 around $12 (plus the $0.80 or so cost of setting up the trade), a bit above the current price. As with any put-writing trade, we'd be ready for that and could then wait for the ETF to increase. If natural gas prices rebound well before 2012, our calls should earn a much higher return — assuming UNG does its job tracking gas prices (which it has to date, with some amplification on the downside) — and our puts would become full income.

Note that a straight synthetic long involves writing puts and buying calls at the same strike price. Here, we're "splitting the strikes," writing puts at a higher strike than the calls we're buying. The $10 January 2012 calls are $4.80, while the $12 calls are $4. We'd rather pay a bit more and have a more conservative strike price on our calls so there's less chance of them expiring without value (and ultimately, there's more upside potential).

Alternate Trades

You could simply buy the calls; but if the ETF doesn't increase enough by 2012, you will lose on the investment and not have any recourse. Or, you could simply buy the ETF near its NAV. It has a 0.97% expense ratio and has unusual tax implications, so visit its website. Finally, you could just write puts. In that case, start by writing puts that expire much sooner, in early 2010.

What Would Change Our Strategy

We're likely to let the trade go to completion if it's working against us, taking shares of UNG at $12 in January 2012 to then wait for appreciation. So large that it may be influencing the natural gas market, UNG has faced scrutiny, but it has addressed recent issues. UNG also faces counter-party risk in its investments (it holds contracts that would harm the ETF if the counter-party to the contracts defaulted — but that is not at all likely). If the fund's viability comes into question, we'd likely exit our position quickly — but we obviously don't expect this outcome. That said, our primary risk here isn't likely the long-term fate of natural gas; it's any adverse events at UNG itself. However, in the time we've been reviewing the ETF, natural gas has rapidly doubled from its recent lows around $2.50 MMBtu. It's still inexpensive, but it may be exceptionally volatile from here. Patience may be required to ultimately see more gains.

Pro Bottom Line

We believe the current view on natural gas — a commodity with obvious and growing utility — is so bearish that it will pay to be contrarian. With new 2012 LEAP options available, we can take a position for little out-of-pocket cost and stand to profit if natural gas recovers some of its odor-free, invisible attractiveness. Questions? Please post on our new UNG board.

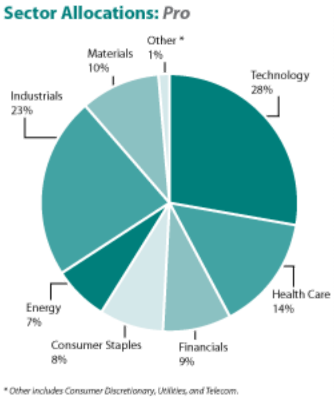
Pro's First Year: One for the Record Books

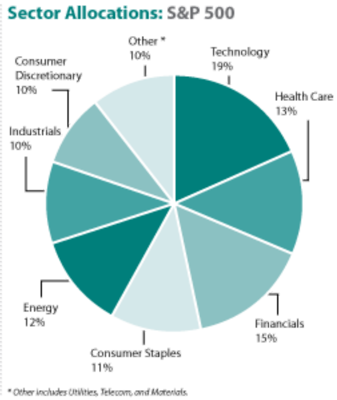
Published Oct 7, 2009 at 12:00AM

A year passes quickly; gone are 365 days, of which only about 250 were trading days. With 65 transactions in our first year (including all open and closed options), *Pro* averaged about one every four trading days. Sounds extreme when you put it that way ("What are you guys, day traders?"), but as you know from spending time with us, our process has actually been calculated and gradual — at times, it may even seem downright slow.

For those 65 trades, a strategy we often used to help build the portfolio was writing puts, either to get better buy prices on stocks we want to own or to earn income if prices continue to climb. Of our $560,000 cash, a full $220,000 is potentially obligated for stock purchases between now and January via existing open puts. We'll either be happily buying new shares of companies including **Tupperware** (NYSE: TUP), **Medtronic** (NYSE: MDT), and **Lindsay** (NYSE: LNN), or earning income if the puts expire unexercised, keeping us about 50% in cash.

Investing gradually and using options defensively, we're managing *Pro*'s money as we would our own — it's the Fool's real money, after all. For me, a key part of the process is preserving what you have and, therefore, only taking risks when you have a high level of confidence. Given this, we're secure in how we've invested so far and in the progress we're making, step by step.





To see how we're faring so far, let's revisit the main goals we had when *Pro* launched:

- **Absolute returns:** We want positive gains overall, no matter what the market throws our way, as measured over any reasonable amount of time (generally, any trailing year or two). So far, we've booked 13 realized gains, one loss, and are looking at mostly unrealized profits with the rest of our positions.
- **Accuracy:** We want at least 75% of our positions to close profitably. I'd actually like us to achieve much better than this, and we're off to a good start. Almost all of our positions, including 94% of those we've closed, are profitable.
- **Low volatility:** Although this isn't a stated goal, we want to achieve our returns with less volatility than the market overall. We're achieving this so far by using strategies that profit in both up and down markets (writing strangles, covered calls, and shorting), smoothing out returns when the market falls. As we add more options strategies to the mix, we'll have more ways to achieve this.
- **Buying great companies at good prices:** We've been targeting companies with sustainable competitive advantages, strong recurring revenue, expanding free cash flow, and healthy cash management. Of course, these stocks also make for strong option-trading candidates.

We also managed to earn steady income, picking up about $4,300 in dividends (a 0.43% return on the portfolio) and $27,000 (2.7%) in realized option-writing profits, for more than 3% income altogether. We hope to earn 3% to 5% a year in income of this sort. As we mark our first anniversary, we're happy to have earned upwards of 3% this way, and we expect that number to grow as we put much more of our cash to work.

By sticking to our strategies and remaining focused on what we've set out to achieve from the start, we fully expect to continue to reach our goals at *Pro* and compound our profits over time.

The past 12 months has been an amazing and challenging time to be an investor, one that's offered some incredible opportunities — but we believe our second year will be just as interesting and challenging, if in different ways.

It's too early to write a history of what happened in the global economy over the past year; the many ramifications are still unfolding. But perhaps we'll be able to do that when we bring you our five-year review — in 2013, when we hope the portfolio will be at least $2 million.

Right now, we just want to thank you again for sharing an unforgettable year with us — and welcome you to year two with Pro. To get started, let's review each position in the *Pro* portfolio.

By Jeff Fischer and Todd Wenning

We currently have 13 stocks, three ETFs, and 14 option positions in the *Pro* portfolio. Most of our stocks are considered core, long-term investments. We have relatively more exposure to health care, industrials, and software, while we want to put more money in small-cap emerging markets, technology (hardware), and energy, and we'll be adding many more option strategies.

Our largest position is **Kinetic Concepts** (NYSE: KCI), with a market value of about $64,000 (representing 6.4% of our original million). Kinetic also has the distinction of being one of our top performers, alongside **GrafTech International** (NYSE: GTI), **Cameco** (NYSE: CCJ), **Vanguard Emerging Markets** (NYSE: VWO), and **Flowserve** (NYSE: FLS). Kinetic has always looked inexpensive, and the market has started to agree with us. Meanwhile, our belief that emerging markets, commodities, and industrial materials would be the first areas to lead the market higher has held up well, boosting our portfolio along the way — and it's likely that these areas will continue to perform.

We currently have two small losers: **Oracle** (Nasdaq: ORCL), a new holding we'll discuss below; and **Plum Creek Timber** (NYSE: PCL), down 6% while the S&P has gained 33%. But factor in our options strategies, and we've made money on Plum Creek; and as an investment in hard assets and an inflation hedge, it isn't necessarily a stock we expect to lap the S&P 500. We're likely to always have *some* losers — that comes with investing. But by maintaining our discipline and using our best strategies, we hope to remain consistently profitable and grow over time.

Below you'll find our latest take on every position that currently resides in the *Pro* portfolio, along with advice on how you can invest in them today.

AmTrust Financial Services (Nasdaq: AFSI) (target 5%; current allocation 4%): This small workers' comp and warranty insurer hasn't reaped recent gains along with the market, but its book value jumped last quarter and should continue to grow. As a defensive play, it will likely hold up well if the market declines, and meanwhile, the shares still offer plenty of value. Below our preferred buy price recently, AmTrust remains a stock you can Buy First.

- Preferred buy price: $12 or less
- Fair value estimate: $17
- Alternate action: Write $12.50 or $10 puts

Kinetic Concepts (NYSE: KCI) (target 5%; current allocation 4%): Despite lingering competitive concerns regarding Kinetic's negative pressure wound therapy patents, management continues to impress by growing the bottom line, paying down debt, expanding its portfolio of vacuum-assisted closure products, and integrating LifeCell's regenerative medicine business. We still predict healthy growth, and the stock still looks inexpensive. Since we own a large amount already, our preferred buy price is more conservative for additional shares, but it's still a Buy First; all *Pro* members should consider owning some even today. (In fact, our My Scorecard data — which is gathered anonymously — shows that Kinetic is also the most widely held stock among *Pro* members.)

- Preferred buy price: $34 or less
- Fair value estimate: $48
- Alternate action: Write $35 puts

Medtronic (NYSE: MDT) (target 5%; current allocation 2.5%): This leading medical device seller aims for double-digit earnings-per-share growth. Uncertainty surrounding health care reform weighs on the stock, but that could lift once the fog clears and the government comes to some decisions. We're aiming to buy more just below $36 via our October $37 puts, so recent prices — on down days — represent a good time to pony up and grab a piece of this medical giant.

- Preferred buy price: $36 or less
- Fair value estimate: Up to low $50s
- Alternate action: Write puts in the mid $30s

Oracle (Nasdaq: ORCL) (target 5%; current allocation 2.5%): The largest software company to grow free cash flow strongly over the past five years, Oracle is a competitive powerhouse and the world's leading business software provider. Management believes a **Sun Microsystems** (Nasdaq: JAVA) acquisition will put Oracle on the path to a leading position in business hardware, too. For now, investors await Europe's approval of the merger, keeping the stock depressed — so we're taking the opportunity to start a position. Today, you can buy shares, write $20 puts, or both.

- Preferred buy price: $22.50 or less
- Fair value estimate: Upper $20s
- Alternate action: Write puts in the lower $20s

Waters (NYSE: WAT) (target 5%; current allocation 2.5%): Spending on scientific instruments, such as Waters' liquid chromatography systems and mass spectrometers, retreated in 2009. This was in large part because drug companies, which make up about half of Waters' sales, pulled back spending. Government spending on scientific research, on the other hand, is on the rise — a good sign for Waters' products in 2010 and beyond. The stock bounced up from $51 immediately after our recommendation, but it remains a good option-writing candidate. We also hope to own shares for the long haul.

- Preferred buy price: $52.50 or less
- Fair value estimate: $60s
- Alternate action: Write puts in the $50s or buy half and write a covered strangle

Autodesk (Nasdaq: ADSK) (target 4%; current allocation 4%): The 3-D design software leader continues to wait for a recovery in construction, but 2010 should see many more government stimulus programs kick in, especially in North America. The stock is a bit above our preferred buy price, and we're content with our stake for now, waiting to see how the next quarter goes. You can write puts if you're looking to add to or open your position.

- Preferred buy price: $22.50 or less
- Fair value estimate: Up to low $30s
- Alternate action: Write puts in the lower $20s

iShares Silver Trust (NYSE: SLV) (target 5%; current allocation 3%): This ETF is a hedge against inflation, the dollar, and a weak stock market, but our core strategy here is to generate option income. We've written covered calls and a covered strangle, which we recommend if you're looking to pick up more shares. We don't foresee this repeatable strategy, which has been successful for us so far, changing anytime soon, although prices will naturally fluctuate.

- Preferred buy price: $14.25 or less
- Fair value estimate: N/A
- Alternate action: With Silver Trust recently above $16, a February or April $14/$17 (or close to that) put/call strangle may be applied to new positions

Jack Henry & Associates (Nasdaq: JKHY) (target 5%; current allocation 5%): Capital spending at small- and mid-tier banks may continue to come under pressure over the next few quarters as the FDIC considers ways to replenish its depleted funds. Nevertheless, Jack Henry remains in fine financial shape, continues to generate substantial free cash flow, and is profiting from the growth of electronic banking transactions. Its high level of recurring revenue lends us confidence in the business, and if we didn't already own our full allocation, we would be buyers on dips near our preferred price range, or write $22.50 puts to get there.

- Preferred buy price: $21 or less
- Fair value estimate: Up to $30
- Alternate action: Write $22.50 puts

Plum Creek Timber (NYSE: PCL) (target 5%; current allocation 3%): In what one industry CEO called "the most severe depression in the wood products industry since the 1930s," Plum Creek management has stayed focused on the long-term drivers of the industry while stemming short-term losses by selling non-strategic lands in Montana. Although volatility in the shares has slackened, this remains a strong option-writing candidate, and the stock pays a 5% yield. We like writing covered strangles on Plum Creek, generally writing puts when shares are near or below $30 and covered calls when it nears the mid $30s.

- Preferred buy price: $34 or less
- Fair value estimate: Around $40
- Alternate action: Write $30 puts if you'd like to buy shares or add to your shares; wait to write covered calls right now

Procter & Gamble (NYSE: PG) (target 5%; current allocation 5%): Management was slow to react to a shift in consumer spending patterns, but it's beginning to correct for its oversight. We're also encouraged by new CEO Robert McDonald's international focus; P&G has lagged competitors, including **Unilever** (NYSE: UL), overseas. Meanwhile, P&G continues to be a strong dividend payer. We're happy to own this stalwart for its long-term potential and growing dividend. Newcomers can consider buying on dips or writing puts anytime.

- Preferred buy price: $55 or less
- Fair value estimate: Mid $60s
- Alternate action: Write $55 puts

Vanguard Emerging Markets (NYSE: VWO) (target 5%; current allocation 2.6%): China, Brazil, and other emerging markets have strongly outperformed the U.S. market this year, making this ETF one of our top winners. Emerging markets look more expensive now, but they still offer long-term potential and belong in a well-rounded portfolio. Look to buy on a decline, which may pop up on occasion thanks to the volatility that typically visits emerging markets.

- Preferred buy price: $32.75 or less
- Fair value estimate: N/A
- Alternate trade: Write puts in the mid $30s

Vanguard Energy (NYSE: VDE) (target 3%; current allocation 3%): An ETF investment in the largest oil and gas producers in the world, Vanguard Energy was our way to buy industry giants when oil prices were much lower. Today, watch for dips to gain exposure to leaders in some of the world's most vital commodities.

- Preferred buy price: $74 or less
- Fair value estimate: N/A
- Alternate trade: Write $75 puts

Cameco (NYSE: CCJ) (target 3%; current allocation 1.6%): The world's largest uranium producer continues to prepare its giant Cigar Lake mine for production, but results are at least a few years away. China is stockpiling uranium as more nuclear plants move toward construction. Long-term demographics suggest strong uranium demand — but at current share prices, Cameco may offer limited upside for the time being.

- Preferred buy price: $21 or less
- Fair value estimate: Mid $20s (but under review)
- Alternate action: Write puts in the mid to low $20s

Flowserve (NYSE: FLS) (target 4%; current allocation 3%): This pump, seal, and valve leader has been a phenomenal story of execution, even in a tough market. Flowserve boasts strengthening margins, healthy free cash flow, lower debt, and expanding market share. But as a volatile industrial stock that's run up recently, Flowserve remains a Hold at least until we see next quarter's results.

- Preferred buy price: $75 or less
- Fair value estimate: Mid $90s
- Alternate action: Write puts in the $80s or lower

GrafTech International (NYSE: GTI) (target 5%; current allocation 3%): Management has paid down debt and generated free cash flow during its most challenging year in decades. When steel demand increases, GrafTech should benefit smartly, but we prefer lower buy prices on this volatile stock.

- Preferred buy price: $12 or less
- Fair value estimate: High teens
- Alternate action: Write $12.50 puts, or write $15 puts if they pay enough to net a $12 buy price

Lindsay (NYSE: LNN) (target 5%; current allocation 1%): In what has proven to be a miserable year for agricultural spending — farmer net income is expected to fall 38% in 2009 — Lindsay has maintained balance sheet discipline and costs, and the company is poised to profit once the economy recovers. Global stimulus spending on infrastructure in 2010 should help drive sales in road and traffic safety products. Recently above $40, it became a Hold on valuation. We've written $35 puts to potentially get shares much cheaper.

- Preferred buy price: $34.50 or less
- Fair value estimate: $40s
- Alternate action: Write puts in the $30s

Rounding out the portfolio, we also have a few options-*only* positions, including puts on **Nasdaq OMX Group** (Nasdaq: NDAQ) and **Tupperware** (NYSE: TUP) — perhaps these will be stocks in the portfolio before our year two review — and a new bearish options strategy on **Abercrombie & Fitch** (NYSE: ANF).

Meanwhile, we look forward to adding more high-caliber businesses to the portfolio in the coming year: some you've heard of and some you probably haven't; some small and promising and others large and successful — all with the goal of growing our profits smartly. Care to discuss a company with us, or ask a question about it? Visit the *Pro* boards. And thank you for being with us!

Jeff owns shares of AmTrust Financial, Nasdaq OMX Group, and Oracle. Todd owns shares of Kinetic Concepts and Procter & Gamble.

Monday Memo: A Stock We Skipped

Published Oct 5, 2009 at 12:00AM

Endo first blinked onto our radar in late 2008 thanks to a strong CAPShot that bounced between 10 and 11 (of 12), along with a perfect 5-star rating on CAPS and a 100% outperform ranking from All-Stars. Even if you don't realize it, you probably know this purveyor of powerful prescription painkillers; Endo produces both pain patch Lidoderm and the well-known drug Percocet. When I first started looking into the company last November, it had grown its $1 billion in annual sales by more than 18% in the third quarter, and its adjusted income from operations clocked in 39% higher year-over-year. The company had also just increased its earnings guidance for the year, to $2.30 per share. Wonderful!

The stock traded at $23 -- only 10 times management's 2008 earnings guidance. It also fetched only about 10 times free cash flow, and the company held twice as much cash as debt. All in all, it appeared to be a small, healthy pharma trading at a reasonable price.

But after looking further, we balked. We had to.

Sometimes you analyze a company and everything looks good, but you continue to have concerns. Heed that hesitation. In this case, I was having a hard time getting past the fact that one drug, Lidoderm, accounted for $550 million of the $900 million in sales achieved in Endo's previous nine months (remember, it's late 2008).

This might be OK if Lidoderm's patents had years before they ran out, but its five patents would start expiring in 2009, and would all expire by 2015. Given this, we would need a severely lower valuation on the stock -- mid-single digits on free cash flow -- before we'd consider it.

Add to this a recent management shakeup, and we had to turn away. The company had one basket and, basically, one egg in it. And that egg was slowly starting to rot. So we left the stock at $23 and moved on.

By early 2009, Endo's shares were around $16. The stock was now cheap enough that -- despite the businesses' weaknesses -- it merited another look; it traded at about 7.5 times free cash flow. What happened? The market didn't like a pending acquisition, and in the first quarter, Lidoderm sales showed a surprising decline that management chalked up to customers eating through inventory before placing new orders. Endo was convinced sales would tick higher again.

Adding to the risk, however, was the remaining aftermath of the wide shakeup at the top. The CEO had been there less than a year, and the whole company was being restructured for the acquisition of Indevus Pharmaceuticals, which added product lines in urology and oncology, diversifying Endo away from pain. No, the market didn't like the acquisition; but by making it during the financial meltdown, it appears Endo got an excellent price. And I actually liked the acquisition because it allayed some of our concerns about Endo being a one-product company. I also believed, after looking at past years, that Lidoderm sales would indeed rebound. Suddenly, I was getting interested again.

But then, news broke that the FDA was considering additional regulations on powerful opioid pain killers, including Percocet. These drugs are highly addictive and need greater oversight, the FDA said. And that was it for me.

Despite the acquisition and two new drugs close to launching, nothing was going to end Endo's reliance on a few key painkillers anytime soon -- the largest of which faced patent expirations, and the other a named plaintiff in FDA reports. The stock was cheap, but not worth the risk -- even my idea of writing $15 puts wilted. As the market rallied into the summer, Endo stayed stuck in the mid teens.

On July 1, an FDA panel urged the U.S. to ban Percocet. I wrote Todd that night, thinking the stock would be toast the next morning and celebrating that we had truly made the right decision to pass on the stock (maybe we'd even short it now). But Endo hovered around $17 on the news. The market had already priced in such a potential disaster, apparently.

Today, shares of Endo sit at $22, right back where they were about a year ago, and they've underperformed the market. I still wouldn't buy, but it's been an interesting stock to follow. My conclusions:

- Passing on it at $23 was the right choice -- soon after, we instead bought companies like **GrafTech International** (NYSE: GTI) and **Autodesk** (Nasdaq: ADSK); and in health care, we continued to build our position in **Kinetic Concepts** (NYSE: KCI) and eventually picked up **Medtronic** (NYSE: MDT), too.
- Still, reconsidering Endo in the mid teens was merited due to valuation. And if the FDA hadn't stepped into the picture, we might have bought some shares or at least written puts, turning a stock we originally passed on into a profitable trade or two. We were actually looking to buy around $16 with plans to sell around $23 -- a nice gain.
- If Endo falls into the mid teens again, we'll probably look at it again. *Probably*. But we'll have to take its pulse anew -- see how the acquisition is going, see how the new drugs are doing, and check that basket of eggs.

Ah, yes -- the time you spend flirting without dating. It adds up. But it's a big part of the work we need to do as investors. In our second year at *Pro*, we'll regularly share reports like this with you to make use of the trades we *don't* make. Have comments or suggestions -- or want to share the story of a stock you've skipped? Please post on the Memo Musings board!

Fool on!

Jeff Fischer (TMFFischer)

Enact a Bear Put Spread on Abercrombie & Fitch

Published Oct 2, 2009 at 12:00AM

At a Glance

- **Strategy type:** Bear put spread (write a lower-strike put and buy a higher-strike put)
- **Preferred option prices:** Try to pay a net debit for the two trades of around $3.50, allowing for a 100% potential return.
- **Maximum amount to pay:** Paying a net debit of $4 provides a potential 57% gain.
- **Recent option prices:** $2.15 bid for the February 2010 $27 puts you write, and $5.30 ask for the February 2010 $34 puts you buy, or a net debit price of $3.15 ($315 before commissions to set up this trade with one contract of each)
- **Recent share price:** $31.40
- **Potential benefits:** You earn the full profit if the stock declines below the lower strike by expiration.
- **Potential risks:** You lose your full investment if the stock increases above the higher strike by expiration.
- **Allocation:** 0.3% (for *Pro*, a net debit of about $3,150 — or 10 contracts of each)
- Trade requirements: You need a high level of options approval to create spreads. You can enter the trade using your broker's spread order entry page, saving on commissions. Set up the trade as a "net debit" spread; your limit price is the maximum net payment you're willing to make for the trade.

The Big Picture

You can't miss **Abercrombie & Fitch** (NYSE: ANF) at your local mall. (Warning: Cranky tone from Todd ahead.) From the store's Adirondack-inspired decor to its thumping music, wall-sized prints of scantily clad models, and the crushing stench of cologne, its 9,000 square feet of sensory overload. And that's intentional: The company is proud of its store "experience," which is designed to capture — in the words of management — "the essence of privilege and casual luxury." During the early 2000s, this approach worked well, and Abercrombie's high-priced, All-American casual style was all the rage with teens.

But privilege and luxury is for now a bygone era. Combine the ever-fickle teen consumer with high teen unemployment (25.5% in August), parents whose net worth has been clocked over the past 18 months, and a secular shift in spending habits, and you have a toxic brew that could hamstring a teen-apparel retail company like Abercrombie, which built its brands to "compete on quality, aspiration, and the unique store experience ... not on price."

Breaking the Brand

Abercrombie management readily admits that it missed the massive change in consumer behavior, but it's been too proud to make real price cuts or offer sales promotions throughout the downturn. Last December, chairman and CEO Mike Jeffries (more on him in a bit) called discounting a "short-term solution with dreadful long-term effects." Even after Abercrombie folded its Ruehl brand (designed for 22- to 35-year-old males) in June, it still wasn't budging on prices in its other stores, which include Abercrombie & Fitch, Hollister (a Southern California style), abercrombie (kids), or the new Gilly Hicks (women's lingerie) line.

Management wants to protect the brand and its high-cost image, banking on having a strong enough balance sheet to weather a temporary storm. A worthy notion, but it's probably the wrong bet to make as the consumer pullback lingers. Abercrombie's recent same-store sales figures (year-over-year sales at stores open at least one year) versus lower-priced competitors **American Eagle** (NYSE: AEO) and **Aeropostale** (NYSE: ARO) illustrate the error:

Company	May 2009	June 2009	July 2009	August 2009
Abercrombie	(28%)	(32%)	(28%)	(23.9%)
American Eagle	(7%)	(11%)	(11%)	(7%)
Aeropostale	19%	12%	6%	9%

Other value competitors in the youth market, including **Ross Stores** (NASDAQ: ROST), **Buckle** (NYSE: BKE), and **TJX Companies** (NYSE: TJX) (T.J. Maxx, Marshalls) also showed positive same-store sales figures in August — so it's apparent that younger shoppers are opting for lower-priced alternatives. The price difference between Abercrombie and its competitors is stark:

	Abercrombie	Aeropostale	American Eagle
Graphic t-shirt (men)	$30	$10	$19.50
Hoodie (men)	$90	$24.75	$39.50
Skirt (women)	$70	$20	$29.50
Jeans (women)	$90	$24.75	$39.50

Data from company websites as of Sept. 24, 2009.

Abercrombie contended for the longest time that it had enough cash on hand — $522 million in January — to avoid discounting, but in mid August, with that war chest shrinking quickly to $367 million and sales continuing to plunge, the company finally changed its stance on pricing and agreed to reduce price points. But here's the kicker: The prices in the table above are from late September — *after* the price reductions. They're still well above the competition and arguably too high for today's average teen shopper.

Successful CEO, or Willy Wonka of the Fashion Industry?

Despite the troubles brewing at the company over the past few years, chairman and CEO Mike Jeffries — a 64-year-old stuck in a world of perpetual adolescence — has made no effort to sacrifice his generous benefits package. According to The Corporate Library, in 2008 Jeffries was the tenth-highest-paid CEO in the U.S., raking in $71.8 million in realized compensation, including $1.1 million for personal use of the company-owned aircraft.

In the past, *maybe* you could make the argument that Jeffries was worth that much. He improved the company's gross margin from 38.5% in 1998 (the year he became CEO) to a high of 67% in 2007. Oddly enough, despite that dramatic improvement in gross margin, operating margin only improved about 340 basis points because non-sales-based expenses, including salaries, credit, and advertising, ballooned out of control, growing 1,421%.

What's Ahead for Abercrombie

With sales under pressure and sales prices ticking lower (even if modestly), we're skeptical that the company can meet current analyst estimates and grow earnings more than 70% over the next year. This looks especially challenging given that 598 of its 1,125 stores (about 53%) are in states where the unemployment rate is over 9.5%, including 140 stores in California where unemployment is 12.2%. Nor do we believe that same-store sales will tick positive next year, as abysmal same-store sales figures — down more than 20% year-over-year — continue, indicating little-to-no renewed interest in Abercrombie products.

The best case for Abercrombie is luring in more customers with lower prices, and consequently, dealing with lower margins going forward. There's some international growth potential, but it's still in its infancy — outside the U.S. and Canada, there's one Abercrombie & Fitch and five Hollister stores in the U.K. Abercrombie plans to open more stores in the U.K. this year, as well as one in Tokyo and another in Milan. While these operations may do well, they will not be able to completely offset the massive losses from the U.S. operations.

Valuation

At first glance, Abercrombie appears to be a financially strong company — it pays a dividend, it's free cash flow positive, and it has a decent amount of cash on the balance sheet with only a small amount of long-term debt. Dig a little deeper, though, and the holes begin to show.

1. **The dividend**. Currently, it pays $0.70 per share annually, for a trailing earnings payout ratio of 132%. This means Abercrombie's profits over the past year haven't been enough to cover its payouts.
2. **Free cash flow.** Sure, free cash flow appears sufficient to cover the dividend and fund international expansion, but if you strip out temporary inventory reduction and substantial stock-based compensation benefits, Abercrombie's ability to organically generate free cash appears questionable.
3. **Balance sheet.** Ever wonder why so many retailers appear to have little or no long-term debt? In general, retailers rent their stores rather than own them, and according to GAAP, those rent payments are considered operating expenses rather than interest expenses. This is off-balance-sheet financing and should thus be accounted for when measuring a company's value. At the end of fiscal 2008, Abercrombie operated a total of 1,125 stores, most of which are mall-based and leased. If those operating leases were instead treated as financial expenses (as if Abercrombie owned the stores), it would have a *profound* effect on the balance sheet, adding approximately $2 *billion* to the debt load, lifting interest expenses much higher, and likely pushing the already-thin return on capital and equity figures into negative territory.

With the market currently valuing the company at more than 20 times next year's aggressive-looking earnings expectations, Abercrombie doesn't have a lot of room to disappoint. The upside risk to our trade, then, seems reasonable relative to the potential benefits from continued weakness. If meaningful sales improvements don't materialize this fall and winter, expect to see more analyst downgrades and lower earnings estimates for calendar year 2010. If these things happen, we think Abercrombie could easily trade in the mid-to-low $20s again, low enough to make our bear put strategy 100% profitable.

Why This Strategy

We considered all kinds of ways to bet against Abercrombie — from trying to short shares outright, to doing a synthetic short (write calls to buy puts), to just buying the (rather expensive) puts — before deciding to set up a bear put spread. This strategy limits our downside to only the net amount we invest, although it also caps our upside. With a bear put spread, you write a lower-strike put and use the proceeds to buy a higher-strike put. The most you can make on the trade is the difference between the two strike prices minus what you paid to set up the trade. If the stock falls below the lower strike price by expiration, you'll earn the full profit. Ideally, we can set up this trade to earn about a 100% profit on the capital we invest. Take a look:

- **February 2010 $27 puts (ANFNC):** Recently bid $2.15
- **February 2010 $34 puts (ANFNL):** Recently ask $5.30
- **Spread:** $7 between strike prices
- **Cost:** $3.15 net debit to place the trade
- **Potential profit:** $3.85 (the difference between the net credit and strike prices), or more than 100% on your $3.15 cost. Paying up to $3.50 to place this trade, with a $7 spread between strike prices, gives the potential of a 100% gain on your investment. You can pay a bit more, but your potential profit decreases.

The $34 strike price gives us about 10% breathing room above the current stock price before we risk losing our full investment. The $27 strike price is achievable, especially by February, if the company's year-end sales don't match or exceed expectations. Meanwhile, the spread between the two allows us fairly ample room for profit. If the stock ends near $30.85, we break even on the trade; below that price, we have a net profit before commissions; above that price, and we have a net loss. We make the full profit if the stock is below $27 and risk the full investment (if we don't close early) if it ends above $34.

What Would Change Our Strategy

Abercrombie's same-store sales have been dismal since April 2008 — so even a lackluster improvement from here could make investors believe the chain is on the mend. This perception alone could send shares of this strong brand much higher.

If same-store sales do improve meaningfully, and sales start to recover overall, we may need to close our position early and at a loss. The struggles at the chain are well-known already, so mere weakness won't surprise investors. We need the weakness to continue on the same scale as it has been, or worse. If it doesn't, we may try to cap our losses before February.

Pro Bottom Line

When you take on the risk of betting against a company, you're hoping that you know something the market doesn't. And the way Abercrombie is being valued, analysts seem to believe the consumer of yore will soon return and international expansion projects will help drive sales. But we don't believe these are realistic expectations. Much more likely, in our opinion, Abercrombie will continue to limp along as lower-priced competitors draw in the teen crowds that the chain has always been so reliant upon — because this time, it *is* different. To discuss this trade, please visit our new Abercrombie & Fitch board.

Monday Memo: A Surprising Short Story

Published Sep 28, 2009 at 12:00AM

On Nov. 21 last year, we highlighted several weak companies that weren't likely to see better financial results anytime soon. Indeed, most of these businesses haven't improved at all since then, yet their stocks have soared. Generally, stocks of weak, speculative companies have jumped the most this year, signaling that an appetite for risk remains alive and well among some investors (for better or worse). Consider these results**:**

Company	11/21/08	9/25/09	Change
Wynn Resorts (Nasdaq: WYNN)	$32.02	$70	+119%
Abercrombie & Fitch (NYSE: ANF)	$14.22	$31	+118%
Brinker International (NYSE: EAT)	$3.82	$15	+292%
Collective Brands (NYSE: PSS)	$4.73	$17	+259%
CRBL Group (Nasdaq: CBRL)	$11.36	$34	+199%
Darden Restaurants (NYSE: DRI)	$14.01	$35	+150%
DineEquity (NYSE: DIN)	$8.24	$25	+203%
Winnebago Industries (NYSE: WGO)	$5.01	$12	+140%
Radio Shack (NYSE: RSH)	$8.50	$16	+88%

If you had invested in a debt-heavy casino operator, a struggling clothing retailer, a mall restaurant company (malls and restaurants are both suffering!), a shoe retailer, Cracker Barrel's owner, Red Lobster's owner, iHop and Applebee's, a slumbering RV seller, or Radio Shack, your stock has rocketed since last November.

This tells us a few things: First, it was indeed too late to go short, even last November, which was well before the market hit its low in March. Second, either these companies were beaten down far too much, or they've since risen too much. I suspect the answer is somewhere in between. They didn't deserve to be so low (they were priced to fail), but they don't deserve today's prices, either.

Where do we stand today with the stock market and the economy?

- Investor optimism has been growing since March
- Stocks are at historically high valuations, with the S&P 500 trading at 19.8 times estimated 2009 operating earnings -- a new high since 2004
- Expectations for an economic rebound are running high
- Consumers are saving more but still carry historically high debt
- Investors expect and want strong financial improvements starting *now*

Overall, *this* is a much more enticing market in which to consider going short than last November. Even so, it's not ideal. The economy is in a trough -- obviously not at a peak. As a short seller today, your thesis needs to hold that the economy will not recover as quickly or as sharply as most investors are estimating. If that proves true, stocks would likely surrender a good portion of their recent gains, and speculative stocks would likely give up the most. If the recovery is strong and arrives soon, however, the painful squeeze of short sellers would likely continue.

However, shorting individual stocks today seems much more feasible and reasonable than at any time in *Pro*'s short history. Short sellers need to move cautiously and use strategies that limit downside risk -- including put buying or bear put spreads -- but today's market is more interesting for shorting individual stocks than last year. And that's surprising.

Options 801: Introduction to Spreads

Published Sep 22, 2009 at 12:00AM

No matter what kind of spread we're setting up, usually we'll aim for at least a 50% return — ideally, 100% or more — to make the risk, which is a full loss of the investment, worthwhile. Here are some of the spreads you'll encounter most often:

Bull call spread: A bullish strategy in which you write a call with a higher strike price (usually above the underlying stock's current price) and buy a call with a lower strike price. You earn the full potential profit if the stock increases above the higher strike by expiration; you lose the full investment if the stock falls below the lower strike by expiration.

Bull put spread: A bullish strategy, even though it uses puts; you purchase lower-strike puts and write higher-strike puts, for a net credit. If the stock ends above the higher strike at expiration, you earn the maximum profit.

Bear put spread: A bearish strategy in which you write a put with a lower strike price (usually below the stock's current price) to buy a put with a higher strike price. You earn the full profit if the stock declines below the lower strike by expiration; you lose your full investment if the stock increases above the higher strike by expiration.

Bear call spread: A bearish strategy that uses calls; you purchase higher-strike calls and write lower-strike calls, earning the full profit if the stock ends below the lower strike at expiration. Bear *put* spreads are generally superior to bear call spreads if you're exceptionally bearish, but bear call spreads are attractive because they start with a credit and can use less buying power.

Butterfly spread: This neutral strategy combines a bull spread with a bear spread (there are four possible ways to set it up); you profit most if the underlying stock does not rise or fall much by expiration. Like all spreads, it has limited risk and limited profit potential.

Calendar spread: A generally neutral strategy in which you write a nearer-term option and purchase the same option (in this case, at the same strike price) but with a much later expiration date. Time erosion should cause the value of the nearer-term option (which you wrote) to decay more quickly than the longer-term option that you bought; if it works as intended, you'll show an overall profit as the near-term option reaches expiration.

Ratio spreads: Also a generally neutral strategy, here you buy a certain number of calls (called a ratio call spread) or puts (called a ratio put spread) and then write a *larger* number of calls or puts (say, two for every one you've bought) that are out-of-the money. Your profit is maximized if the stock ends exactly at the strike price of the written options. Ratio spreads have increased risk because not all of your written options are "covered" by purchased options.

We'll get into these and other spreads in greater detail in future *Pro* guides; for this introduction, we just want you to become familiar with the many terms and basics behind spread strategies. And — if you need to — you can take this opportunity to apply for approval to use spreads at your broker (it's usually Level 4).

When setting up a spread trade, the combined premiums are labeled like so:

- **Debit spread, or net debit:** Here, you pay more in premiums to set up the spread than you collect.
- **Credit spread, or net credit:** Much less common than a net debit, in this case, the spread's total option premiums collected pay you more than you need to pay out. In other words, the options you write pay you more than you need to shell out to buy the other options to complete your spread.
- **Spread order:** This kind of special order allows you to make two or more options trades (usually for a lower commission) with your broker at the same time — thus setting up your spread. Usually, the trade is entered as a limit order at the maximum net debit you're willing to pay or the minimum net credit you want to receive. This is similar to using a limit price when trading a stock.

Moreover, spreads can be described more precisely depending on where the strike prices and expiration dates fall:

- **Vertical spreads:** The most common spreads fit this description, including basic bull and bear spreads. In a vertical spread, the options have different strike prices but the same expiration date. It's called "vertical" because the strike prices are above and below one another in an option-quote chain.
- **Horizontal spreads:** In this case, the options have the same strike price (so they're horizontal to one another in a quote chain) but different expiration dates.
- **Diagonal spreads:** Here, the options you buy have a later expiration date than the options you write, along with a different strike price. You can set up diagonal bull spreads, diagonal bear spreads, and diagonal butterfly spreads, to name a few. We'll address why and how in later guides.

Now let's illustrate what we've covered so far with a real-life (OK, a very fake) example.

As the result of a questionable federal government-backed merger, a new company comes into existence called **Fannie Madoff**. Most investors are optimistic, pointing out that anything the Fed does, it does well, so they're sure the firm will be a resounding success.

You, on the other hand, are fairly certain this house of cards will topple. The company has questionable management and is crippled with debt — yet investors continue to bid the stock higher. Since you don't want to risk your net worth going short, you set up a bear put spread, limiting your potential losses.

With the stock trading at $34, to set up a bear put spread, you could write $32.50 puts for a $1.50 payment and use the proceeds to buy $35 puts for $2.50. Your net debit is $1 per share. That's the most you can lose. How much can you make if Fannie Madoff faces the music? Since the difference between your strike prices is $2.50, and the trade cost you $1, the most you can make is the difference between the two, or $1.50 per share. That's great, given that you only paid $1 to set up the trade. It's a potential 150% return on your investment.

What are the possible outcomes? If the stock falls anywhere below $32.50 by expiration, you capture the maximum gain. For example, let's say it falls to $30. The $35 puts you bought will be worth $5 per share, while the $32.50 puts you wrote will be worth ($2.50). You hold a net $2.50 profit following your $1 net investment, so you've cleared $1.50 per share while only risking $1.

On the flipside, if the Fed gives our fake Fannie another boost, and the stock is above $35 at expiration, your whole investment is lost -- but at least you only paid a net $1 per share. Other possible outcomes: If the stock trades at various price points between the two strikes, you'll have either a partial profit or partial loss when you exit the trade at expiration. (When to close a spread early is a topic for another day.) This is the essence of how a spread works: You limit your risk while potentially earning a large — though capped — percentage return on a lower out-of-pocket cost.

To sum up, spreads involve both buying and writing the same type of option on the same stock, usually with different strike prices, while aiming to profit on the difference in strike price, after your net cost, between the two. Your maximum profit is capped to these price differences, and your maximum loss is the net debit that it takes to set up the trade. Spreads have numerous variations, so we'll enjoy discussing different ways to set them up, and why, in future *Pro* guides. Meanwhile, we plan to start with some real-money spreads in the *Pro* portfolio, so get ready — and please post any questions on the All About Options board.

Jeff owns no shares in Fannie Madoff.

Monday Memo: Pro's Approach to Valuation

Published Sep 21, 2009 at 12:00AM

According to Aswath Damodaran, a professor at New York University's Stern School of Business, relative valuation is "pervasive" on Wall Street. His data show that:

- Almost 85% of equity research reports are based on valuation multiples and comparables.
- More than 50% of all acquisition valuations are based on multiples.
- Rules of thumb based on multiples are not only common but are also often the basis for final valuation judgments.

If this doesn't scare you, it should. Why? Because if most stocks are trading at 30 times earnings, relative valuation could make a stock trading at 25 times earnings appear undervalued and therefore worth buying. But if it turns out that all stocks are overpriced and should be trading at just 15 times earnings, you'll lose money along with everyone else when the market declines. Your stock wasn't undervalued at all.

Despite its flaws, it's easy to see why relative valuation is prevalent on Wall Street. Using relative numbers, analysts can always find undervalued stocks, and portfolio managers can always justify being fully invested at all times. Because money managers make their bread by having assets under management, Warren Buffett aside, you won't find many of them saying, "I can't find anything to buy, so it's time to cash out."

Finally, when your own performance is judged *relative* to other analysts' and portfolio managers', it's much safer to ride with the herd and make relative valuations. After all, you only need to be marginally better than your peers to become a red-carpet star in the financial media and ratings-agencies circles. Similarly, if you use relative valuations and you're wrong, you'll have lots of company; on the other hand, if you deviate from the herd and are proven wrong, you're often wrong alone and your time as an analyst will likely be short-lived.

The biggest problem with relative valuations is that they're based on what other people are doing, not on fundamentals. To borrow a theme from many an after-school special, remember that what's right is not always popular, and what's popular is not always right. If the herd chooses to do something, it's going to do it. Whether it's the right thing to do is an entirely different matter.

The inherent volatility spawned by this irrational behavior creates opportunities for business-focused investors with longer time horizons.

At *Pro*, we stick to the business fundamentals -- think profits and cash flows -- to estimate a stock's fair value. By taking this approach, though, we implicitly assume three things:

1. That the market can be irrational in the short term.
2. That we have something the market doesn't have.
3. That the market will eventually correct itself.

I think we can all agree on the first point that the market can be irrational. As for the second point, we think our greatest advantage over the market is our ability to be patient and remain focused on an investment's underlying business, regardless of the market's happy days or temper tantrums.

This type of patience is uncommon. The average holding period for a stock on the NYSE is *months,* not years, according to Agora Financial. When we buy a stock at *Pro*, we plan to own it for at least three years, or as long as the valuation and business make it worth owning. In fact, the longer our time horizon, the better our chances of being proven correct -- by giving the market more time to revert to the company's proper value (and meanwhile, a growing company will continue to add value). So as long as we can stay patient, we have a distinct advantage over other investors.

This leads us to our third point, which is the biggest assumption because it requires a catalyst that's beyond our control. Whether it's a positive earnings report, a change in management, or an unexpected event, an undervalued stock can't reach its fair value without *something* knocking some sense back into the market.

Admittedly, the longer we need to wait for the market to recognize a company's fair value, the more trying it becomes to hold onto the position, especially if the stock continues to underperform. To resist our human tendencies to follow the herd, we deliberately review our businesses' fundamentals to determine whether we should keep holding our stocks.

In all of our *Pro* buy reports, we give you our fair-value range for the company and a preferred price range in which to buy the stock. The numbers are our best estimates at the time -- so they're not set in stone. Sometimes following good results our forecast will improve later, and we'll tell you when that happens -- as was the case with **Kinetic Concepts** (NYSE: KCI). Sometimes it will decline, as with **Procter & Gamble** (NYSE: PG).

There's no such thing as a precise valuation, which is why we're comfortable setting a fair-value range that includes good and bad scenarios. If our worst-case scenario still reveals an undervalued stock, as with **Autodesk** (Nasdaq: ADSK) when it was in the mid-teens, our margin of safety from sizeable losses is greatly increased.

Our preferred buy price can change, too. If a stock is trading just above our preferred buy price, that shouldn't stop you from buying it if you want to. Remember, the Buy First, Buy, Hold, and Sell ratings shown on our Portfolio tab are our final word on any position at the time. (If you really want to buy a stock that's on Hold, you can often write puts on it to buy shares closer to our preferred buy price.)

By taking a long-term, business-focused approach to valuing stocks, we should have a distinct advantage in an irrational market. Over time, it will help us build a diverse portfolio that generates winning returns.

Todd owns shares of Kinetic Concepts and Procter & Gamble.

Last week, *Pro* member alex340 kindly posted a host of put-writing trade suggestions that meet our guidelines:

- **Nasdaq OMX Group** (Nasdaq: NDAQ): right here
- **Lindsay** (NYSE: LNN): right here
- **GrafTech International** (NYSE: GTI): right here
- **Flowserve** (NYSE: FLS): right here
- **Cameco** (Nasdaq: CCJ): right here
- **Vanguard Emerging Markets** (NYSE: VWO) right here

Thank you, alex340! *Pro* members, let us know if you'd be interested in this as a regular feature. Two other notable discussions:

- This Week in CAPS, Russell (TMFEldrehad) highlights a new feature that will make getting CAPS blog information on stocks that interest you a whole lot easier.

Buy Oracle

Published Sep 17, 2009 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Recent share price:** $21.50
- **Estimated fair value:** $29
- **Preferred buy price:** $23.50
- **Type of holding:** Core; Software, Technology

The Big Picture

Sept. 17, 2009

I've (Jeff here) followed **Oracle** (NYSE: ORCL) for years, and I've come to view it as one of the hungriest, most competitive companies on the market. With a ruthless focus on being No. 1 in any business it enters, Oracle has left countless rivals in its wake, acquired those that didn't fall easily, and expanded its revenue, margins, and profits along the way.

Oracle has more than 320,000 corporate customers who primarily use its database software to manage, utilize, share, and protect information. But the title of world's largest business software company isn't enough for Oracle. Management is intent on becoming the world leader in at least two more enormous markets: The first is "middleware," which allows two or more existing programs or systems to work together, bridging what would otherwise be a gap in software communication. Here, Oracle Fusion addresses everything from content management to developer tools. Second, there's Oracle's business-related applications, which include software built for customer-relationship management (Siebel), human resource management (Peoplesoft), industry-specific offerings such as Oracle Health Science, supply-chain management, governance, risk and compliance management, and much more.

Additionally, last year Oracle launched its first hardware product, the Exadata database machine. Running at speeds 10 to 50 times faster than previous setups on **IBM** (NYSE: IBM) or **Hewlett Packard** (NYSE: HPQ) systems, Exadata is taking market share rapidly. Meanwhile, Oracle's pending acquisition of **Sun Microsystems**

(UNKNOWN: JAVA.DL) will only improve its hardware offerings.

Put it all together, and Oracle is the largest one-stop solution for business software, with a foot in the door in business hardware, too. And thanks to its diverse — and *dispersed* — customer base, the company has grown right through the recession.

Oracle's Divine

Get Personal With Oracle

- **Founded:** 1977
- **Headquarters:** Redwood Shores, Calif.
- **Full-time employees:** 86,000
- **Market cap:** $109 billion
- **Website:** oracle.com

There are several key characteristics that make Oracle stand out as both a software and technology company and an investment.

Strong, recurring revenue and free cash flow: Of the more than $23 billion in revenue Oracle generated in fiscal 2009 (ended May 31), 50% was subscription based. Most Oracle customers pay an annual fee to receive software license updates and product support, and this recurring revenue provides the company with a fire hose of cash — about $1 billion a month on renewals alone. And for the trailing 12 months (to Aug. 31), the company's total free cash flow grew 14% in U.S. dollars, to $8.49 billion — and this period included two of the most challenging quarters the economy has seen in years.

High, expanding margins: Oracle achieved the highest operating profit margin in its history in fiscal 2009, up 2.4 points to 51%. And that wasn't all due to cost cutting, as we've seen with many other companies in this downturn — Oracle spent more on research and development than any competitor last year. What's more, the company expects margins to continue inching upward thanks to its growing base of recurring revenue.

A diverse customer base and broad opportunities: Oracle's products are unsurpassed in a range of industries around the globe: the top 20 banks and the top 20 telecom companies in the world run its software; so do the world's top 10 universities, more than 1,500 public sector organizations, and all 100 firms in the Fortune 100, according to the company. Oracle serves more than 320,000 customers in 145 countries — name a business and it's likely a customer, whether it's **China Telecom** (NYSE: CHA) or 7-Eleven, **Lockheed Martin** (NYSE: LMT), **Perry Ellis** (NASDAQ: PERY), **Norfolk Southern** (NYSE: NSC), or **Johnson & Johnson** (NYSE: JNJ). What's more, Oracle claims it's taking market share from competitors such as **SAP AG** (NYSE: SAP), **Salesforce.com** (NYSE: CRM), **Teradata** (NYSE: TDC), and IBM thanks to its aggressive worldwide sales staff. Even better: Given Oracle's diverse product offerings, cross-selling business software to existing customers is an enormous and lucrative opportunity.

An innovative culture: Since its founding, Oracle has developed creative ways to make business software more profitable and useful for customers. Today, it's continuing along that path by providing services under three operating models: (1) buy Oracle programs to run yourself on location in your data center; (2) run programs yourself on-demand, hosted in Oracle's data center; or (3) run programs on-demand in your own data center while Oracle manages and oversees it. The last model is the newest and the one Oracle finds most compelling. Few if any competitors provide all three alternatives, let alone a full suite of integrated software options to meet a full array of business needs.

Valuation

The Community's Take

After scoring a solid 4 stars for two years, Oracle recently dipped to 3 stars, so we're investing a bit against the community trend — but we expect star No. 4 to return eventually. The vast majority of All-Stars who have rated the stock think it will outperform, at 707 bulls to 35 bears.

On our proprietary CAPShot report, Oracle rates a 7 out of 12, coming up short on three of the CAPS-specific ratings, but clearing most of our fundamental hurdles. It would score a 10 with more support from the community.

At a recent $21.50 per share, Oracle trades at 13.9 times earnings estimates for the year ending May 2010 and 13 times current free cash flow (excluding tax benefits from options, which pushes the multiple to 14). Analysts expect the company to grow earnings 7% this fiscal year (nine months remain) and nearly 10% the following year. However, these estimates appear a bit conservative. This summer, management stated that Oracle has "a lot of company-specific momentum," and existing customers are adopting more Oracle-integrated products to save on costs. Says management, "We're in a very good position, and our pipelines are growing faster than our reported revenue."

Using a discounted cash flow model with an 11% discount rate projecting near-term growth rates near double-digits, followed by high-single digits over the intermediate term, we get a fair value for the stock near $29, or 35% higher than current prices. What makes this possible return attractive is the high margin of safety accompanying it, since it's unlikely that Oracle would trade more than 10% to 15% below current prices, and if it did, then not for long. Plus, our growth estimates may prove conservative: Oracle grew free cash flow 38% to 50% each quarter in 2008 when measured year-over-year on a trailing 12-month basis, and grew this free cash flow 14% to 20% each quarter in 2009 — until the final quarter, when growth dropped to 8%, before rebounding to 14% in the first quarter of 2010. Free cash flow growth could average in the mid teens, and even reach higher rates in a stronger economy, well surpassing our estimates.

Why This Strategy

As a $109 billion company — one set to digest a multi-billion dollar acquisition of Sun Microsystems — Oracle should perform well, but we don't expect it to blow the doors off. We believe we can buy the stock alone to profit over time, but we also expect we'll be able to take advantage of Oracle's steady performance with options strategies in the future. Before long, we may write puts to buy more Oracle, or use a covered strangle, writings puts and covered calls — that's a strategy we continue to like in this market. But for now, we're happy to start with a half position in the stock and potentially leg into options on it down the road.

What Would Make Us Change

Oracle keeps a long-running tab of its acquisition conquests. The company has a proven history of making billion-dollar acquisitions that benefit the whole, but each buyout presents a new challenge. Certainly, its pending $5.6 billion net acquisition of Sun will be another hurdle, leaving Oracle to integrate Java and Solaris software across its products. Oracle and Sun have long been partners, however, so odds favor success. In fact, Oracle expects the acquisition to add at least $0.15 per share ($1.5 billion in operating income) in non-GAAP earnings in the first year. However, the acquisition is still being reviewed in Europe, and certain qualifications may be attached. Also, Oracle expects Sun to temporarily decrease its overall margins modestly, before moving them higher again. If it appears Oracle is having problems integrating Sun, we may need to revisit our investment case. Another concern: new software license revenue remains weak in today's economy, so we'll be watching to see if pipeline improvements, as outlined by management, translate into new sales.

Pro Bottom Line

Oracle has long seemed like the forgotten software behemoth, always playing second fiddle to **Microsoft** (NASDAQ: MSFT). Yet it arguably faces more growth opportunities — and fewer competitive threats — than Bill Gates' company. At current prices, Oracle offers ample upside and limited long-term downside, while giving the Pro portfolio exposure to one of the world's foremost technology leaders. To discuss this trade, please visit our new Oracle message board.

Jeff owns shares of Oracle.

Close Puts and Write New Puts on Tupperware

Published Sep 15, 2009 at 12:00AM

- **Option's recent bid/ask:** $3.70/$3.90
- **Preferred limit price:** $3.80 or higher to start; no lower than $2 later (5% of the strike price)
- **Alternate trade:** Write January $35 puts (TUPMG) around $1.75 if you're more defensive. Write October $40 puts (TUPVH) if you're more aggressive; they'd net you a buy price above $38. If you're unable to write puts, consider buying stock outright using a limit order near $36.

What's New

You might say **Tupperware** (NYSE: TUP) is the **Apple** (NASDAQ: AAPL) of the plastic container business. If you think that sounds over the top, consider that Tupperware gets higher prices for its products thanks to smart design; it has a unique sales environment; and it has a growing history of surpassing expectations. Last quarter was no exception, as earnings per share clocked in 41% above expectations. While we estimated the company's results would top Wall Street's numbers, we didn't foresee such a blow-out quarter while the world is hobbling through a recession.

This generations-old product leader is positioned to continue to grow handsomely as it keeps reinventing itself and expanding around the world. Following Tupperware's recent results, we've moved our conservative valuation estimate on the business 30% higher, to $45 per share. Today, we can write $40 puts on Tupperware that should give us room for error and will pay us very well (again) if we're right about the stock. Worst-case scenario, we end up with shares at a price near $36, equal to 13 times 2009 earnings-per-share estimates.

Why This Strategy?

Tupperware's stock jumped so quickly this summer that we didn't have time to react with a new trade while still doing our due diligence on its numbers. Today, though, we can write puts to potentially get our 3% allocation in the mid $30s, a reasonable price. And if we don't get shares, we won't fret, since we continue to view Tupperware as a strong candidate for option-writing profits.

With today's trade, we chose the January $40 puts even though the stock isn't trading much above that strike price — making this a bullish move that allows us to earn a higher premium from the options. A few valuation numbers:

- Our potential $36 buy price is 13 times 2009 earnings estimates and 11.8 times 2010 estimates.
- A $36 buy price is 16 to 17 times our estimated 2009 free cash flow, in line with the market average; yet Tupperware arguably has below-average risk.
- Analyst earnings estimates continue to look a bit too conservative.
- At $36, the stock yields a dividend of 2.4%.

How to Follow Along

Write ("sell to open") puts when you're willing and ready to buy the stock if it declines below the strike price at expiration. This trade works out as follows:

- **Option payment or yield (at $3.70 bid):** About 9.2% in four months (123 days to Jan. 16), or more than 27% annualized.
- **Option strike price ($40):** Very close to Tupperware's recent $40.70 — so this is a more bullish trade than discussed in our guide to writing puts.
- **Break-even price:** About 10% lower, near $36
- **Cash needed:** Each put option you write represents a potential stock purchase of $4,000.

Can't Write Puts?

If you're unable to write puts on this position, consider placing a limit order near $36 to potentially get shares if the market weakens. Our target allocation for this trade is 3%.

We'll make this investment in the next one business to 30 calendar days. To discuss this or ask questions, please visit our never plastic, always real Tupperware board.

Write Puts on Kinetic Concepts

Published Sep 15, 2009 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") December $35 puts (KCIXG)
- **Allocation:** 1% (for *Pro*, three contracts)
- **Option's recent bid/ask:** $1.90/$2.05
- **Preferred limit price:** $1.95 to start; later, no lower than $1.40 (4% of the strike price)
- **Alternate trade:** Write January 2010 $35 puts (KCIMG); if you're unable to write puts, consider buying stock outright using a limit order at $34, our preferred buy-below price.

What's New

Quarter after quarter, **Kinetic Concepts** (UNKNOWN: KCI.DL) has proven doubters wrong. First, the company has succeeded in the face of increasing competition in the negative-pressure wound therapy business. What's more, Kinetic has used its substantial free cash flow to deleverage its balance sheet from the debt it incurred acquiring regenerative medicine-maker LifeCell in 2008.

Kinetic has been particularly impressive when it comes to innovation. In the past nine months, the company has launched two commercially viable complements to vacuum-assisted closure (VAC) therapy: the GranuFoam bridge dressing for foot ulcers and the AbThera open-abdomen dressing. The medical community's rapid adoption of LifeCell's AlloDerm and Strattice products, especially together with VAC therapy, validates why Kinetic was so excited to acquire LifeCell in the first place. We're also encouraged by the company's recent announcement that it expects regulatory approval to enter the lucrative Japanese market, with reimbursement potentially beginning in the first half of 2010.

Year-to-date, Kinetic shares are up more than 80%, but we still consider the stock a value around current prices. At $36, for instance, Kinetic trades for just eight times forward earnings and about eight times trailing free cash flow. Shares are still undervalued, in our opinion, due to lingering concerns about negative-pressure wound therapy competition, patent disputes, and more generally, health-care reform in the U.S. We think all of these concerns are already priced into the stock, so we're adding to our current position with a nice margin of safety.

Why This Strategy?

By writing puts, we're attempting to fill the remaining 1% of our targeted 5% position in Kinetic Concepts at a net buy price of $34 or better (in this case, about $33). If exercised, this would increase our average buy price only slightly, from $22.79 to about $24.25; our fair value estimate remains in the mid-to-high $40s, and our preferred buy price remains up to $34.

Why not buy 1% outright? Thanks to appreciation, our current position in Kinetic is worth more than our targeted 5% already. But keep in mind, we've only bought 4% in Kinetic, and we base our 5% target allocation on what we'd *like* to invest in a business, not including money gained through appreciation. So although we'd be comfortable bumping Kinetic up to 6% in terms of *Pro*'s market value after adding more shares around $36, we want to maintain price discipline and only add our final 1% in our preferred buy range. If we don't get more shares (just making option income), we remain happy with our current allocation.

How to Follow Along

You write ("sell to open") puts when you're ready to buy the stock if it declines below the strike price. Here's how the trade works out:

- **Option payment or yield (at $2 bid):** About 5.7% in three months (more than 20% annualized)
- **Option strike price:** About 3% below Kinetic 's current stock price ($36), so this trade is modestly more bullish than usual
- **Break-even price:** 8% lower, at $33
- **Cash needed:** Each put option you write represents a potential purchase of $3,500 in Kinetic.

Can't Write Puts?

If you're unable to write puts or are just beginning to build a position in Kinetic, consider buying at least some shares outright even now (it remains an attractively valued Buy First position); or, place a limit order near $34 (our ideal buy range) to potentially get shares on a downdraft.

We'll make this trade in the next one business to 30 calendar days. To discuss the trade or ask questions, please visit our Kinetic Concepts board.

Monday Memo: New Q&A With the Pros

Published Sep 14, 2009 at 12:00AM

Cameco Calling!

Our covered calls on **Cameco** (NYSE: CCJ) expire on Friday, and 1,000 shares (about 62% of our stake) are due to be sold from our portfolio at a net $26.70. We'll let you know ahead of time if we're going to take action, or we'll keep quiet if we're just letting the shares get called away.

On the Boards

- Member 00jane posts thoughts on an article about the hope rally of the 1930s.
- Jeff offers a quick recap of *Pro*'s recent **Waters** (NYSE: WAT) trade.
- Russell (TMFEldrehad) checks in with his weekly CAPS take, calling out the TMFInsideFoolHQ blog and asking for your favorite CAPS blog.

In the spirit of our new Meet a Fellow Pro series, today's Memo features *Motley Fool Pro* team members Jeff Fischer and Todd Wenning answering key questions about today's market, the best way to approach investing now, what they're avoiding, and what's ahead for *Pro*. Over the next month, we'll continue to take stock of the *Pro* portfolio as we close in our first anniversary, looking back on the year that was and previewing the year ahead. Let's jump in.

Allyson (*Pro* editor): Todd, you were telling me that the market has actually been about flat over the past month. Has the rally finally stalled?

Todd: Though it's slowed down over the past few weeks, it's been an incredible -- and unlikely -- six-month rally. I found some Deutsche Bank analysis saying that since 1928, the most common stock market gain over any six-month period is 2.5% to 5%. Gains like we've seen since March 9 -- more than 50% in six months -- are incredibly rare, about a 1-in-200 event. The only other time the market gained so much in six months was 1933.

But this rally's been fueled primarily just by improvements in investor expectations -- or mere hope -- and artificial stimulus, not by organic fundamentals like customer demand and sales growth. I think we're at a crossroads here. If fundamentals, particularly revenue, don't begin to improve, expectations will wilt and drag the market lower. But regarding a stall right now: We can't be so sure. On Thursday (Sept. 10), the U.S. market set new highs for the year, so the rally may still be on.

Allyson: Jeff, what's your take on the rally?

Jeff: Analysts have exceptionally high growth expectations for 2010 -- they're calling for about a 25% jump in earnings for the S&P 500 next year. I read on Bloomberg that many analysts believe most of this growth will come from emerging markets, and the U.S. and Europe will keep limping along.

As Todd said, for that kind of earnings growth to occur, we'd need large gains in revenue -- and I don't see where that's coming from on the demand side, especially in a sustainable way. And with stocks trading at a forward P/E of 14 -- a valuation right near the historical average -- based on 2010 operating earnings estimates that are *six quarters* ahead, strong expectations are already priced in. It may be reminiscent of what happened in 2002: We were rebounding from the 2001 recession, so earnings jumped 19% that year -- yet the S&P 500 fell 23% over the same period. Could such an outcome repeat next year? Sure, if earnings don't increase enough to please investors.

Allyson: So if things are so tenuous right now, what's the best approach to investing?

Jeff: Remember that you're not investing for just one year. The word "invest," to me, implies a multi-year outlook. That said, we remain *defensively* bullish. We're still bullish on the strong companies that we're buying at reasonable prices, but we're defensive in terms of what the market might throw our way in the near term. We expect some giveback. At *Pro*, we're writing more defensive options, like covered strangles; these give us a downside cushion but also pay us well right from the start and offer plenty of upside in case stocks keep rising. I will say that the market in general is doing what we expected, just to a *much* greater degree. We expected -- I think we all did -- a bounce after last winter's rout. But the bounce has been much higher than what I expected so soon. Next, I would expect (and love to see) a range-bound market. That would be ideal for things like more strangle writing and averaging into great businesses. We'll see if we get it.

Allyson: I'll do what I can. OK, back to Todd: Name an investment you're avoiding right now.

Todd: Long-term bonds. Interest rates are near record lows, and inflation is looming, so long-term fixed income is a risky place to be putting your money right now. And whenever the economy begins to recover in earnest, monetary policies will need to be tightened quickly. The president of the Philadelphia Fed said that interest rates will have to rise very rapidly in order to prevent inflation -- this is part of the reason I'm so wary of the government stimulus. Swift interest-rate hikes would spell disaster for long-term bond prices. If you're looking at bonds, I'd look at higher-quality, short-term corporates or inflation-protected TIPS.

Allyson: Jeff, what investments are you keeping at a distance these days?

Jeff: Most big banking or large financial stocks. I've never loved them -- they're opaque at best -- and I think they're still a gamble that most investors don't understand. There are exceptions, of course, including the two big ones that Warren Buffett owns -- **Wells Fargo** (NYSE: WFC) and **Goldman Sachs** (NYSE: GS) -- but they're already priced as standouts. Either way, it's good to stick to your core competencies.

Allyson: One final question for you, Jeff. We're coming up on our one-year anniversary at *Pro*. What's next?

Jeff: Well, it's been a fun first year -- I think we're ready to hang it up. Kidding! Seriously, we'll get into this question more in the coming weeks. I can tell you that as we become more fully invested, we're going to introduce more options strategies since we won't primarily be in build-out mode anymore. And allocation-wise, our portfolio is getting closer to being fully allocated in health care -- a key, underpriced sector (at 11 times earnings estimates) with demographics in its favor -- but we're lacking technology exposure. That'll change this year. Also, we're still bullish on commodities and basic materials. Emerging markets need these commodities, and in greater volume than today's supply can fill.

We'll have more on the year ahead soon, along with a full portfolio review in early October. That'll be our shareholder letter, so to speak.

Allyson: Great. Thanks, Jeff and Todd.

Jeff: Thanks!

If you have questions about the market or what's next for *Pro*, you can ask the *Pro* team yourself -- just head over to our Memo Musings board. Fool on!

Sell ProShares Short SmallCap600

Published Sep 11, 2009 at 12:00AM

At a Glance

- **Action:** Selling all shares
- **Recent ETF price (9/10/09):** $42.59
- **Recent ETF NAV (9/10/09):** $42.52
- **Limit price to use:** Since Short SmallCap600 is so thinly traded, you may want to use a limit order at a price within 1% or so of the current market price.
- **Why we're selling Short SmallCap600:**
    - Our shorting on valuation thesis has not played out.
    - We originally said we'd aim to cap our loss on this short at 20%, and we're at that point now, so we're staying disciplined and sticking to our thesis.

As Kenny Rogers sang, "You got to know when to hold 'em, know when to fold 'em ..." Alas, we are taking his advice and closing out this short position, even though it pains us to do so. Here's why.

When we re-recommended the **ProShares Short SmallCap600** (NYSEMKT: SBB) ETF on May 11, the S&P 600 index had rallied nearly 50% in two months. The market, it seemed, had gotten too expensive too quickly on a move that was unsubstantiated, lacking economic fundamentals, instead being driven by investor enthusiasm or hope.

Our biggest risk with going short was, we wrote, "a continued resurgence in market confidence," adding that "in bull markets, valuation takes a back seat to excitement and hope, and short-sellers who are short based on valuation get clobbered." Well, that's what has happened — and given that one of our portfolio objectives is to avoid permanent, irrevocable capital losses, it's time to take our 20% hit with this investment and move on. Although we still believe the market is ahead of itself, capping losses on shorts is an important discipline to maintain.

This small short position was a fair insurance policy to have while we went about adding more long exposure to the *Pro* portfolio over the summer. Though our thesis didn't play out — yet — we continue to believe that making defensive moves like this is a good tack in an uncertain market.

What's Next

Even though we are saying goodbye to ProShares Short SmallCap600, that doesn't mean we've given up looking for new short positions. In an artificially sweetened market such as this one, though, where government spending is propping up whole industries and words from officials' mouths can send the whole market higher, we're targeting specific individual companies for our next shorts.

We will make this trade in the next two business to 30 calendar days. To discuss this sell, please visit the ProShares Short SmallCap600 board. To review our general reasons for selling, check out *Pro*'s Guide to Selling.

Meet a Fellow Pro: From the Top With spinningwood

Published Sep 10, 2009 at 12:00AM

Ed enjoying some free time on the water.

In this second installment of our new feature spotlighting some of our favorite members of the *Motley Fool Pro* community, we're bringing you our chat with another one of the most helpful, generous Fools in all of *Pro*-dom: Ed, known on the boards as spinningwood. How did Ed become an expert investor -- and what makes him tick? Read on to get the lowdown on this friendly and humorous Fool from Florida.

Jeff: Thanks for taking time to chat, Ed. First, please tell us a little about yourself.

Ed: I grew up in South Florida with the ambition of becoming an oceanographer. In the mid '70s, I graduated with a degree in chemistry and math and no desire to spend years in school to get the Ph.D. necessary for a career in oceanography. But I didn't want to leave South Florida, so I worked for two years running a Bridgeport mill in a machine shop. The money was good, but I quickly realized milling wasn't what I wanted to do for the rest of my life. So I invested a year and a chunk of my savings to get an MBA in finance, then spent the following year touring the U.S., burning through the remainder of the money I had saved up.

The money ran out in 1980, and I ended up taking a job in the oilfield services industry in Houston. This provided me with a post-graduate education in bare-knuckle capitalism and was the most valuable life experience I've ever had. The money I earned was fantastic, and my lifestyle was even grander. Then, in the mid '80s, the oil boom went bust, and I found myself broke, divorced, and working for a company in Chapter 11 bankruptcy that looked to be heading for Chapter 7.

Jeff: Probably like many *Pro* Fools, you've had some up-and-down decades! What happened next?

Ed: Hitting rock bottom was a liberating experience, and it provided me the opportunity to reboot my life. I ultimately got a great new job, a great new wife, and a new outlook on money and investing.

My wife (the good one) and I lived substantially below the very generous compensation we received from my new job (at AT&T). We saved the surplus and invested profitably. By the late '90s, I was struggling with the question of how much money was "enough" -- and my wife and I decided we had surpassed it. I retired in 1999, and we returned to South Florida, where we happily find ways to fill up our days. My favorites are woodworking, scuba diving, photography, investing, and pontificating in the *Pro* forums.

Jeff: Woodworking -- a rare talent these days, and now everyone knows where your "spinningwood" moniker comes from. Can you tell us about how you invest? Do you have a favorite strategy?

Ed: My style is eclectic. I believe that no single strategy is the right choice all the time. My favorite strategy involves analyzing vast amounts of data looking for that elusive "tell" that will give me an edge in short-term trading. That said, the degree of enjoyment I get from any particular strategy is completely irrelevant. I believe you have to use all the tools available to you to maximize your chances for success.

Jeff: Speaking of finding investing success, do you have a stance these days -- bullish? Bearish? Neutral?

Ed: I find this question impossible to answer. I'm a little bit of everything at the moment.

Jeff: I like that answer. Regardless of the market, what are your top pieces of investing advice?

Ed: Don't put too much weight on what has worked (or not worked) for others. Use what you can from what people are willing to share, but find your own voice.

Add as many tools to your strategy toolbox as you can, but only use those tools that you are willing or able to master. An appropriate but poorly executed strategy will often underperform a less appropriate but well-executed strategy.

Finally, don't discount the impact of luck in the success of your role models (particularly true for anyone foolish enough to use me as a role model). Many people achieved their success largely as a result of being in the right place at the right time. This is acknowledged a lot less than it should be. Results will not be easily duplicated by those who try to follow the same path.

Jeff: Well said. And now a self-serving question: In terms of your time with *Pro*, what would you say is your favorite part of the service?

Ed: I particularly enjoy the forums and the sense of community. I have benefited from some very generous mentors in other aspects of my life, and these forums provide an opportunity for me to give back a little.

Jeff: You've certainly played a key role in helping countless others in our community. Frequenting *Pro* as much as you do, is there anything you'd want us to improve?

Ed: I would like to see *Pro* consider developing a series of tools that would be available to members to address common issues faced by the members. I think many would benefit and it would increase the bond between *Pro* and its subscribers.

I also would like to see the introduction of interactive simulations as training tools. These could be single user or community wide competitive type "games." There are almost limitless possibilities that could be introduced that would enhance member learning.

Jeff: That sounds a bit like CAPS, the Fool's first step in that direction. Want a job helping to build CAPS out? Maybe our last question will answer that -- personally, my favorite question: If you could wake up anywhere in the world tomorrow, where would you want to wake up, and why?

Ed: In my own bed in South Florida. I have the luxury of being able to live pretty much anywhere I want, and I am where I want to be. That said, I've always been happy anywhere I found myself in the world. Happiness is a lifestyle choice -- and, with few exceptions, independent of location and circumstances.

Jeff: Ed, thank you for being with us, and for your hundreds (perhaps thousands) of contributions in the community the past year. We hope to see you on the boards whenever you're not on your boat, enjoying the outdoors, or simply spinning wood.

To chat or post a message to spinningwood, visit *Pro*'s Meet & Greet board.

Buy Waters and Write a Covered Strangle

Published Sep 8, 2009 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Recent share price:** $59
- **Estimated fair value:** $66
- **Preferred buy price:** $55
- **Type of holding:** Core; Healthcare and industrials

The Big Picture

Sept. 8, 2009

Get Personal With Waters

- **Founded:** 1958
- **Headquarters:** Milford, Mass.
- **Full-time employees:** 5,100
- **Revenue per employee:** $300,000
- **Website:** waters.com

What do the health-care industry, the industrial sector, education, and the government have in common? They all use an abundance of laboratory equipment for research and development. Walk around a biotech lab, and you'll be sure to find high-end precision equipment like liquid chromatography instruments, mass spectrometers, and thermal-analysis devices.

These rather expensive machines identify and measure characteristics of materials and chemicals (i.e., how much oxygen is in a formula). For the industries served, this equipment isn't "nice to have" — it's "need to have." Government-backed laboratories use the machines to test for food, water, and environmental safety; industrial chemical companies use them to perfect new alloys and substances; pharmaceutical and biotech companies, as well as universities, use them extensively in research. And in case you were wondering how the forensic scientists on *CSI* dramatically discover that a suspected killer had traces of zinc oxide on his overcoat, now you know — they use liquid chromatography and mass spectrometers.

Along with the hobbling economy, spending on this precision equipment has naturally slowed. But thanks to billions of dollars in grants being poured into scientific research by the government, along with slowly thawing pocketbooks at large research-based corporations, better times may be just around the corner. This is good news for **Waters** (NYSE: WAT), the leader in liquid chromatography in the United States, Europe, and Asia — and a manufacturer of many other kinds of fancy analytical equipment. Following a hibernation in new spending and government grants, Waters will benefit as the world reawakens to the importance of scientific research.

Waters Works

The Community's Take

Waters earns a solid 4 stars on CAPS, and as of Sept. 8, an impressive 104 of the 107 All-Stars who ranked the stock called it an outperform. Among all CAPS members, 282 of 292 rate it outperform.

On our proprietary CAPShot report, Waters rates a respectable 7 out of 12, coming up short on our lofty revenue benchmarks, the industry ratings, and debt-to-equity ratio. The debt level is manageable, and we think the other measures could turn positive in a year or two.

The scientific equipment sector is competitive, but we believe 51-year-old, $4.8 billion Waters is tops in the field for four major reasons:

- **International exposure.** Waters has been more aggressive in its global expansion than competitors such as **Thermo Fisher Scientific** (NYSE: TMO), particularly in Asia. In 2008, Waters conducted just 30% of its sales in the U.S., while Thermo Fisher did 68% of its business in the U.S. Being a first-mover in the Asian markets has allowed Waters to establish relationships with regulatory agencies, especially in China, where such ties are critical to success. As testing requirements strengthen in the emerging Asian economies, Waters stands to capitalize.
- **Consistently strong margins.** Waters' gross margin has remained in the 57% to 60% range over recent years, while its operating margin is consistent, too, ranging from 24% to 26%. Not only do these steady margins show a strong understanding of the products in demand in the industry — and cost control by management — but they're well ahead of industry averages. According to Capital IQ, the median gross margin for Waters' comparables — including Thermo Fisher, **Life Technologies** (NASDAQ: LIFE), and **Affymetrix** (NASDAQ: AFFX) — is 50%, with an operating margin of 14%.
- **Strong recurring revenue.** Another compelling business attribute is Waters' high level of recurring revenue. In 2008, recurring sales made up 43% of the company's total revenue. Long-standing customers sign maintenance service contracts on Waters equipment and steadily replace consumable Waters test materials.

- **Track record of benefiting shareholders.** Waters does not pay a cash dividend, but it repurchases stock each year to reduce the outstanding shares on the market — another way to complement shareholder returns. From 2003 to 2008, Waters spent a net $1.65 billion repurchasing shares. The investments are paying off, as Waters' stock is trading higher than its average purchase price.

Valuation

With about 50% of Waters' business coming from the global pharmaceutical and biotechnology industries, it's easy to understand why the market might be concerned about negative effects from potential health-care reform in the U.S. Fortunately, Waters' business is globally diversified and will benefit from increased government spending on scientific research. In fact, the National Institutes of Health has a whopping $10 billion in funds from the economic stimulus package to spend on R&D, in particular toward cancer research.

Waters' shares have recovered from March lows, but are still trailing the S&P 500 over the past year. Despite this recent run, Waters is still trading near multi-year low valuations based on earnings, book value, and cash flow:

Metric	Current	5-Year Average
Price to earnings*	15.8	25
Price to book	6.6	7.2
Price to free cash flow*	16.3	17.5

*Source: Capital IQ. *Trailing 12 months.*

Using conservative growth estimates of 8% to 10% over the next five years, a discount rate of 11%, and assuming Waters continues its steady repurchase program, we can peg a fair value for the stock between $66 and $70, representing a 30% to 38% premium from today's prices.

Why This Strategy?

Buying shares of this healthy business around $50 is a compelling long-term investment, so if that's all you do, excellent; but we're also going to use options to ideally increase our returns, generate a near-term profit, or lower our cost basis. This decision is partly driven by market conditions. Following a 49% gain in the S&P 500, we're feeling defensive, but at the same time we want to continue to participate in market gains if stocks don't relent. Buying Waters and writing a covered strangle is a way to have it both ways, making the covered strangle a strategy we favor in today's market.

With Waters recently skimming $51, the covered strangle we intend to write (which will net us near $4 combined per share) positions us to either buy our second 2.5% near $46 or sell our existing shares near $59. That's a wide range for a stable stock, especially over just 73 days. Although we value shares in the high $60s over the next three years, if we can sell near $60 in just a few months, we would be capturing most of our potential gains very soon — and could, ideally, redeploy the money elsewhere to better effect. In addition, keep in mind that, even if Waters is $58 by November, we could close our covered calls early if we want to keep our shares and still earn a small profit on our combined options. So the strangle gives us flexibility.

Here's the math behind the trade (prices as of market close Sept. 4):

- **Action:** Buy 2.5% in WAT at $50.70
- **Action:** Write November $50 puts, for another 2.5%, for about $2.75
- **Action:** Write November $55 covered calls for about $1.30
- **Potential second 2.5% buy price:** $45.95
- **Average buy price if we get all shares:** $48.32 (13 times 2010 EPS estimates)
- **Potential sell price on our first 2.5%:** $59.05 (16.4 times 2010 EPS estimates)
- **Effective options yield:** 7.9% over 73 days
- **Stock gain if sold:** 16.3% over 73 days

What Would Change Our Strategy

Waters adds to its organic growth strategy via acquisitions of complementary companies. If management makes unwise acquisitions or starts paying too much, we'll need to revisit our valuation estimates.

Meanwhile, innovation is king in a market of formidable competitors, including Thermo Fisher, Life Technologies, and **Varian** (UNKNOWN: VARI.DL). Right now, Waters is ahead of the curve with its ultra-high performance liquid chromatography machine, which is superior to existing HPCL equipment — but that advantage won't last forever. Waters can't rest on its heels, so we'll expect to see more commercially viable products in the next year or two. Fortunately, the current pipeline is promising, including a new mass spectrometry platform due in the second half of the fiscal year.

Finally, since its core sales come from the health-care sector — as well as industrials and education — Waters is often seen as a more defensive investment. So while we expect it to perform well in a strong stock market, one advantage we see here is the likelihood that it will hold up better than more aggressive stocks in a poor market.

Pro Bottom Line

Waters complements the existing Pro portfolio well -- it's a high-margin, well-established, generator of strong recurring revenue and free cash flow. An industry leader, it also offers a way to invest in the growing worldwide need for more scientific research. To discuss Waters and this investment, please visit our Waters board, where we'll also post some additional research thoughts.

Monday Memo: Pro Begins to Take Stock

Published Sep 8, 2009 at 12:00AM

Pro Board Highlights

As usual, *Pro* members kicked off outstanding discussions in the past week:

- See the highest-rated *Pro*-proprietary CAPShot stocks
- We talk about the possible depth of a market correction.
- What do you do when you're near-term bearish but long-term bullish?

- Fools are asking, "Why not short China?"
- This Week in CAPS, Russell (TMFEldrehad) digs into new data and checks on two of his screens.
- Can stocks continue to rally without gains in revenue?

Given this turbulence, we're glad we kept our heads and hands inside the roller coaster car at all times. We didn't zig when we should have zagged, or stand up when we should have ducked. We have 13 closed positions — each one profitable. Twelve of our 15 current stock and ETF holdings are profitable, on their own and including options strategies on some of them. We're above our 75% accuracy goal so far (actually, we're about 90% accurate, not counting live option trades), and we haven't greatly sacrificed returns in the process. Most of our holdings have performed better than the index, and we still have more than $500,000 to put to work.

In sum, we probably couldn't have asked for a much better first year without taking much bigger risks than we did, which isn't our style. If we know we can make money while keeping risks manageable, we'd be lowercase-f fools to do otherwise. After all, a key piece of making investing a lifetime pursuit, in my opinion, is learning how to make money without taking unnecessary risks. In other words: Learn the most consistent, reliable, and successful ways to make money, apply that knowledge time and again, and the miracle of compounding will do the rest for you.

And if you *enjoy* the challenge of investing — as we do — then so much the better. You're essentially paying yourself to partake in a pursuit you love. Think about that when you compare your returns with an index's. If you've come out on top, or if you typically do over the years, that's wonderful. But if you're trailing an index at times, remember why you're investing in the first place — because you love it. It's like tennis: Few of us win every match we play, but we still love the game. In the meantime, you're getting other benefits from investing: You're enjoying it, you're learning, you're staying sharp and connected. And down the investing road, you'll probably be beating an arbitrary index again (assuming you care much about that). Because if you love what you do, you're bound to do it well.

We're honored by everyone who has been with us through *Pro*'s first year — you've already shared an unforgettable part of history with us. And this wild ride can't be over yet — but I'm getting ahead of myself. Our review *and* preview will go during this entire month. We'll bring you reviews of each *Pro* holding, ideas about our next investments, our thoughts on the market and how to best invest today, we'll introduce new strategies, and much more. So, here we go — again.

As always, chime in with any thoughts on the Memo Musings board.

Fool on!

Jeff Fischer (TMFFischer)

Write Puts on Medtronic

Published Sep 1, 2009 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") October $37 puts (ticker +JIWVB)
- **Allocation:** 2.5% (for *Pro*, seven contracts)
- **Option's recent bid/ask:** $1.20/$1.30
- **Preferred limit price:** $1.20 or higher to start; no lower than $1 if possible
- **Alternate trade:** Write November $36 puts (ticker +JIWWA); if you're unable to write puts, consider buying stock outright using a limit order at $36.

What's New

Medtronic (NYSE: MDT) had a solid quarter, with sales and earnings up 10% over last year excluding currency fluctuations and non-operating charges. The $42 billion medical-device manufacturer now trades at just over 13 times trailing free cash flow, which was strong at more than $3 billion. Shares appear to be a good value, trading at 12 times the average earnings estimate for the year ending April 2010, well below the market average of 15. Management's latest guidance for the year is 5% to 8% sales growth (excluding currency changes) and 8% to 12% growth in earnings per share (excluding unusual items). Meanwhile, the stock has jumped 18% from our $32.50 July buy price, and although we're pleased to have grabbed a good value, we don't want to chase the stock — it could easily give back some ground. We believe the stock looks reasonably priced considering today's uncertain health-care environment, and we're maintaining our preferred buy price of $36 or below.

Why This Strategy?

By writing puts, we're attempting to fill the remaining 2.5% of our targeted 5% position in Medtronic at a net buy price of around $36. This will potentially bring our average price paid to about $34; our fair value remains in the mid $40s to low $50s. If we get to buy these shares, 9% of *Pro*'s $1 million will be invested in health care (including **Kinetic Concepts** (UNKNOWN: KCI.DL)); eventually, we may allocate as much as 15% or more of our funds to this industry, buying other strong companies, too. Healthcare has a number of things working in its favor: demographics (an aging population), a greater need for care, and stocks trading at reasonable valuations.

We chose the October $37 puts specifically because:

- We're happy with a potential $36 buy price — it's equal to a valuation of 11.3 times earnings estimates for the year ending April 2010 and about 11 times likely free cash flow.
- We want to write options that expire soon in order to get our shares before next quarter's earnings release, or else to be free to write new options by mid October. So, while these options pay less than we usually seek, they fit our strategy.
- The *Pro* portfolio has a growing list of options set to expire in November and December, and we want to make sure we diversify our risk across more than just two months.

How to Follow Along

You write ("sell to open") puts when you're ready to buy the stock if it declines below the strike price. The numbers behind these puts fall short of our put-writing guidelines, but we're comfortable with the trade because of the reasonable valuation at our potential buy price and the fact that the options expire in just 46 days, on Oct. 17.

- **Option payment or yield (at $1.10 bid):** About 3% in 1.5 months (more than 20% annualized)
- **Option strike price:** About 3% below Medtronic's current stock price ($38)
- **Break-even price:** 5% lower, at $36
- **Cash needed:** Each put option you write represents a potential purchase of $3,700 in Medtronic.

Can't Write Puts?

If you're unable to write puts due to the size of the trade, and still need to buy your first shares of Medtronic — or your second 2.5%, like us — consider placing a limit order near $36 to potentially get shares on a downdraft.

We'll make this trade in the next one business to 30 calendar days. To discuss the trade or ask questions, please visit our Medtronic board.

Monday Memo: An Artificially Sweetened Market

Published Aug 31, 2009 at 12:00AM

To illustrate, say we had researched a potential investment in **Ford** (NYSE: F) in April 2009. (Fat chance, right? But bear with me.) We would have pored over data and calculated valuation estimates on Ford's stock for the next few years — but just three months later, those figures would have gone out the window when the government first announced the (then $1 billion) cash for clunkers program. Such a juicy incentive enticed otherwise-hesitant buyers into auto showrooms, but it also enticed folks planning on buying later this year to move up their purchase.

If this quarter is huge for automakers, what will the same quarter next year look like? Ditto for the $8,000 first-time home buyer credit, set to expire in December: What will happen to home sales after this program ends?

These programs beget lumpy results — "mini-bubbles," if you will — in the economy that disrupt the normal cycle of business, thus fueling and perpetuating uncertainty in the market. Unfortunately, we find it unlikely that these programs will end anytime soon; mid-term elections coming next fall mean that politicians will want a stable economy come election time. Indeed, only about a quarter of the $800 billion stimulus package has been spent so far. Until these programs end — and the mini-bubbles begin to pop — we cannot say with conviction that we've returned to a normal business cycle.

So again, we'll ask the question, where *does* it end? If history teaches us anything, it's that government actions taken during an economic crisis will continue to influence the economy after the crisis subsides. Consider the legacies of FDR's New Deal that remain with us today, including Social Security, market regulation, minimum wage, and the FDIC. No matter what you think of them, you can't deny that these programs permanently transformed the American landscape. In fact, the late Alexander Heard, former advisor to three presidents and chancellor of Vanderbilt University, who worked in the Civilian Conservation Corps as a young man, once reflected, "In a sense, what remains of the New Deal is the United States."

It stands to reason that one day we'll look back on these times and similarly remark, "What remains of the bailouts and stimulus programs is the United States." What our country will look like then is anyone's guess, but the specter of mounting deficits, a weaker dollar, higher taxes, and slower economic growth looms large.

Of course, we continue to believe in the U.S. economy for the long term, but as investors, we must prepare our portfolios for any scenario. And that's exactly what we've been doing for you at *Motley Fool Pro*. How? By staying conservative with our growth estimates, ensuring that we make investments at the right prices, and diversifying into non-dollar-based investments like **Vanguard Emerging Markets** (NYSE: VWO) and inflation-fighting assets like timber, uranium, and steel (**Plum Creek Timber** (NYSE: PCL), **Cameco** (NYSE: CCJ), and **GrafTech International** (NYSE: GTI)). As we build out the portfolio, we'll keep on top of these developments and position ourselves for success now and in the future. What are your thoughts on investing in this economy? Come share your view on the Memo Musings board.

Fool on!

Todd Wenning (TMFPhila)

- *Pro* Buy First stock and medical-device giant **Medtronic** (NYSE: MDT) announced healthy first-quarter 2010 results, with sales growing in each key division and earnings pumping higher, too. *Pro* analyst Bruce Jackson (TMFGoogly) covered the news for members, and TMFKitKat also posted analysis of the results.
- *Pro* member ChrisBuehler shares his published paper analyzing the U.S. crude oil-importing biz.
- When the market bottomed in March, more CAPS All-Stars were bearish than in other months. Say what? Todd starts the discussion.
- This Week in CAPS, Russell (TMFEldrehad) asks for your thoughts on how to improve CAPS. Plus, see three new biotech selections from a CAPS All-Star.
- Todd asks, "Is the market at a crossroads?"

Write a Strangle on Plum Creek Timber

Published Aug 25, 2009 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") November 2009 $35 calls (ticker +PCLKG) on existing shares of Plum Creek
- **Second action:** Write November 2009 $30 puts (ticker +PCLWF) for 2% more shares
- **Preferred limit price:** $3 or more *combined* for the calls and puts (or nearly 10% of Plum Creek's current price)
- **Recent November $35 call price:** $0.90/$1.10
- **Recent November $30 put price:** $2.20/$2.30

Now that our strangle (which we "legged into," writing the calls and puts weeks apart) on **Plum Creek Timber** (NYSE: PCL) has expired as income, it's time to revisit the strategy anew. To review, when writing a covered strangle, you write ("sell to open") covered calls on the shares you already own and simultaneously write ("sell to open") puts that could potentially net you additional shares if the stock falls below the put's strike price by expiration.

In the *Pro* portfolio, we already hold a 3% allocation in Plum Creek shares and seek a target allocation of 5%. With this trade, then, we'll be writing covered calls on our existing 3% position and writing puts that could ultimately fulfill our 5% goal.

At current prices, we'll be paid a *combined* $3.10 or so from writing the calls and puts, which we keep no matter what. Here are the potential outcomes of the trade:

If Plum Creek shares ...	Then ...
Fall below $30 by expiration	The puts are exercised and our effective net buy price on 2% worth of new shares would be $26.90
Remain between $30 and $35	We keep our shares, the options expire, so we notch a nice $3.10-per-share income gain (10% in three months)
Jump above $35	The calls are exercised and our effective net sale price on the current 3% position would be $38.10

All three scenarios should work in our favor. A 100% income gain is always welcome, and is probably our ideal outcome. But we'd also be happy to buy more shares of Plum Creek below $30 if our puts are exercised; similarly, with our fair value estimate of Plum Creek between $36 and $40 a share, we'd be content parting with our shares in that range. Overall, the trade provides us a comfortably large range in which to profit: from $26.90 to $38.10. If the stock is anywhere between those prices before expiration, we could also consider closing our options early for a total profit and keeping our existing stock position the same as it is today. The biggest risk with this strangle? If Plum Creek takes off in either direction (below $26.90 or above $38.10) between now and expiration on Nov. 20. With a stock as volatile as Plum Creek, either scenario is possible, but we believe the benefits of this trade outweigh the risks.

While there's been mounting sentiment against the timberland sector from the likes of *Barron's* in recent months, we think those concerns are overblown and mostly without merit. Moreover, in the first quarter of 2009, management seized the opportunity to scoop up 3.3 million shares of Plum Creek at an average price of $26.60. Given that we consider Plum Creek management to be the best in the business, its decision to buy back $87 million worth of shares at those prices — in what was then a highly uncertain environment — was reassuring. If Plum Creek falls below $30, and we buy another 2% at an effective net price of $26.90, we're in good company.

The other risk — that the shares surge above $38.10 before November — is perhaps the greater one at the moment. That's a 22.6% increase from current prices. With significant short interest on shares persisting over the past few months, Plum Creek hasn't participated in the broader market rally. If the construction markets show signs of improvement, and Plum Creek reports better-than-expected earnings in late October, shares could be in store for healthy gains. Fortunately, by writing the $35 calls *alongside* the $30 puts, the combined premiums give us significant breathing room and a wide range in which to profit.

Specifics on Writing Covered Calls and Puts

The command to write covered calls and write puts is "sell to open." You write one covered call for every 100 shares of the underlying stock you own and write one put for every 100 shares you'd like to potentially buy. With some brokers, you can enter this trade as an actual "short strangle" — doing both trades at once through a special order entry window, lowering your commissions.

Don't forget to use a limit order at or near the current bid price, if that price is attractive enough for you. Or, if entering the trade all at once, use a combined premium limit of $3 or higher. Combined, these option payments easily meet the guidelines we provide in our covered call and put-writing guides.

How You Fit In

- If you don't own any shares of Plum Creek, consider matching our 3% allocation (if that's 100 shares or more). Then write covered calls on that 3%, and write cash-secured puts for the next potential 2%.
- If you already own shares of Plum Creek and don't want to potentially buy more, consider writing covered calls, but only if the shares increase closer to $35 and provide better premiums. There isn't an urgency to write covered calls today with the stock $31 if you're not also writing puts. The November covered calls only pay about $1.
- If you already own shares of Plum Creek, and they're covered by calls already: Consider writing puts, as we are, if you're comfortable potentially buying more and increasing your allocation.

If you have any questions about this strangle, please post on the Plum Creek Timber board.

Monday Memo: How We're Staying on Top; Jack Henry and Plum Creek News

Published Aug 24, 2009 at 12:00AM

Our latest company to pedal to the podium and declare its worth is financial software vendor **Jack Henry & Associates** (Nasdaq: JKHY). Results showed stability in sales, margins, earnings, and cash flow, leaving Jack Henry strong and ready for a rebound. The stock increased more than 5% following the news, striking a new 52-week high. For its upcoming fiscal 2010, Jack Henry expects revenue to grow 3% to 5% and operating income to grow 6% to 8%. In a comment you rarely hear, management said that if the economy continues to stabilize, it could hopefully raise guidance down the road.

What's more, the 125 or so bank failures across the country this year won't have a material impact on Jack Henry's business, says management. Meanwhile, about 75% of revenue this quarter could be chalked up to recurring sales -- a nice sign of stability. The $23 shares trade at about 17 times forward earnings estimates, but the company is at a more modest 9 to 10 times estimated cash from operations. So if you don't own shares yet, Jack Henry remains a reasonably priced Buy, with our recommended allocation steady at 5%.

- On the boards: Bruce (TMFGoogly) offers a summary of the conference call.

Autodesk's (Nasdaq: ADSK) software business is stabilizing (as we noted last week), and it looks well positioned for the recovery. After reviewing the conference call, we've gathered some more details on how the business is performing. Management is not convinced the world is on a path to a sustainable recovery, but it believes China, India, and Brazil are bouncing back. However, the Americas are skipping along a bottom, Europe is a point of concern, and Russia isn't good. Knowing that, we'll want to see sales increase at Autodesk next year. You can still write puts to potentially net shares in the low $20s.

- On the boards: Read my full summary of the conference call.

Flowserve (NYSE: FLS) keeps rocking the pump and valve world. The company is executing extremely well, gaining market share, and growing margins. Plus, recent strength in pump sales means more valve and seal sales are close behind. As we shared in the Aug. 10 Memo, we've increased our fair value on the stock and upped our preferred buy-price range. Hold onto this puppy.

- On the boards: Get my mercifully condensed take on the (very) long conference call.

Nasdaq OMX Group (Nasdaq: NDAQ) is busier than ever, with new initiatives and growing businesses, including its options and commodities exchanges, expansion into Europe, and a pending interest rate swap exchange. What's more, the company sees its U.S. equity volume market share on the Nasdaq exchange stabilizing. We continue to support at least writing puts on the stock; in fact, the December $19 puts that we wrote actually pay as much or more today.

- On the boards: Our summary gives you the full scoop.

Finally, the calls and puts we wrote on **Plum Creek Timber** (NYSE: PCL) both expired for 100% cash gains over the weekend. The company has been under a steady attack from *Barron's* and others, so I went through the conference call again — and I do believe these barbs are unfounded. Management is executing well and minding the long-term value of it assets.

We "legged into" this strangle on Plum Creek, and it turned out favorably — both the calls and puts expired as income, as the stock stayed within a large range over our options' time frame. Now, we can take our money and consider a new options strategy on Plum Creek. Meanwhile, if you're looking to pick up shares outright, the stock remains a Buy and is below our preferred buy price.

- On the boards: Get my renewed review of Plum Creek as well as a great post from member ricklorim on what he calls the "best option play and maybe the best overall stock pick" from *Pro*.

Stay Foolish!

Jeff Fischer

Monday Memo: Get Set for Motley Fool Options; Cameco and Autodesk News

Published Aug 17, 2009 at 12:00AM

In Case You Missed It: Community Highlights

- How are you doing with *Pro*? SilverHawk27 weighs in, noting that he's up more than 30% and is applying what he's learned at *Pro* to his preexisting portfolio, too.
- Bruce (TMFGoogly) kicks off a discussion about consumer spending.
- On the **Plum Creek Timber** (NYSE: PCL) board, members chat about Barron's recent article on trouble in the forest; meanwhile, *Pro* member and tree insider 4stree offers commentary.
- On the **ProShares Short SmallCap600** (NYSE: SBB) board, member CaveatEmptorFool shares thoughts on the ecomony -- do you agree that the robins are singing "horribly off-key?"
- On the **Lindsay** (NYSE: LNN) board, there was a good discussion about following along with our trade.
- Finally, Russell (TMFEldrehad) talks about boosting your CAPS score in his regular This Week in CAPS post.

Our argument that growing demand for nuclear energy will boost **Cameco**'s (NYSE: CCJ) fortunes is coming true at a fever pitch -- even Cameco can't keep up. Sure, the uranium-mining giant had a respectable second quarter, growing revenue 25% from a year ago, although adjusted earnings per share were flat. However, while the company increased its revenue projection for 2009, to 5% to 10% growth, it projects that its uranium costs will increase 20% to 25% from last year, rising more than sales. Why? Namely, because Cameco's mining output can't keep up with demand -- so it's been buying uranium on the open market, where it's more expensive.

Blame at least some of this soaring demand on China. The country has been stockpiling millions of pounds of uranium, not in a move toward world domination (we hope!), but because it has more than 10 nuclear reactors under construction and its existing plants are running at full capacity. Cameco could probably *double* its mining output and still barely meet the demand for uranium in coming years -- but it has no means to double output until well beyond 2011, and that assumes its flooded Cigar Lake mine comes into operation by that time.

The company's finances will soon benefit from the uranium contracts it signed a few years ago at much higher prices, but at the same time, it's pouring big cash back into operations in hopes of increasing output. It's looking to take on more debt, too. Cameco has an indisputable strength -- the world's best and probably largest uranium mines -- but it's going to need to spend big money to extract more of it.

We'll be happy to book a profit by selling some shares in September via our covered calls if the stock is above $25, but given Cameco's dominance, industry trends, and fairly priced (although not cheap) stock, we're also happy to keep nearly half our shares. If you don't own shares yet, you can write ("sell to open") puts to net shares below $21 -- look for options that expire in early 2010.

- On the boards: Bruce (TMFGoogly) has more thoughts on Cameco

Things are stabilizing at **Autodesk** (Nasdaq: ADSK). The creator of 2-D, 3-D, and 6-D imaging software (OK, not 6-D -- *yet*) met revenue expectations for its second quarter, clocking in at $415 million, while adjusted earnings per share of $0.24 beat expectations by a nickel. Although results continue to be down sharply from last year's levels, third-quarter guidance is flat -- and that's good news! This is the first time the company hasn't lowered its quarter-to-quarter guidance since late 2008, which suggests that Autodesk's markets are finding a floor -- and growth may be down the road.

Meanwhile, even during the dismal first half of the year, Autodesk raked in $50 million in free cash flow and added a bit to its nearly $1 billion in cash and investments. Again, as with all of our companies, Autodesk is remaining profitable despite the recession -- cutting costs and positioning itself to emerge stronger. The company remains a Buy, but since it's currently trading a bit above our preferred prices, you can attempt to write puts to net prices in the low $20s or below.

- On the boards: Watch the Autodesk board for my conference call summary later this week

As always, please post any questions or comments (or share your life's dreams!) on the Memo Musings board. No post is left unread.

Invest Foolishly,

Jeff Fischer

Adjust Puts on Lindsay

Published Aug 13, 2009 at 12:00AM

At a Glance

- **Adjusted action:** Writing ("sell to open") December $35 puts (ticker +NRRXG)
- **Recent option price:** $1.75/$2 bid/ask
- **Preferred limit price:** $1.50 or higher (use a limit order at the current market bid if that's enough for you)
- **Recent share price:** $45
- **Alternate trade:** Write January 2010 $35 puts (ticker +NRRMG) for a higher payment
- **Note:** *Pro* must make this trade on Aug. 14 to meet our 30-day trading rule

Option Specifics

- **Share price:** $44.50
- **Option bid/ask:** $1.75/$2.00
- **Option strike:** $35, about 21% lower than today's price (clearing our 7% hurdle)
- **Break-even price:** $33.25
- **Option yield (at $1.55):** 4.4% of $35 strike price (this is lower than our desired payment for an option expiring in four months, but the strike price is much lower than our hurdle)

We have good news and bad news. The good news is that our stocks continue to find favor with investors. **Lindsay** (NYSE: LNN) is up more than 35% in the past month — even though the only announcement has been a 7% dividend increase. The bad news? We're still building our position in the stock, and the best five-month stock market performance since 1938 has put serious distance between Lindsay's price today and our desired buy price. The rally has also negated the value of our intended option trade announced last month — in fact, it did so from day one, making us miss our trade.

We're adjusting our trade to write the December $35 puts, which would net us a buy price close to $33.50, within our preferred buy range of below $34.50. Our update below still holds: Management is doing an outstanding job in this economy, but results will likely remain lumpy. We think the few analysts covering Lindsay are being too conservative on both margin stability and earnings estimates — meaning surprisingly good results in the future could send the stock higher still. However, we don't want to rush to buy shares on that hypothesis yet, so we're willing to patiently write put options on the volatile shares while owning some outright already from our initial purchase.

If You Already Wrote the September $30 Puts

If you got last month's "Make the Trade" at our desired prices, congratulations! Those September $30 puts options currently ask just $0.15, so you should consider closing them early ("buy to close") in order to write these new puts for a much higher new premium. You can chalk that trade up as a success already.

Questions?

Remember, when you write put options, you must be ready to buy the underlying stock. Each option contract represents 100 shares. If you have questions about this "Make the Trade" adjustment, please us know on the Lindsay board.

Audio Extra: Pro Chats With Kinetic Concepts

Published Aug 13, 2009 at 12:00AM

We're thrilled to bring you exclusive access to one of our companies (currently a Buy First) in our latest Audio Extra. Listen in as *Motley Fool Pro* Analyst Todd Wenning chats with the chief financial officer of *Pro* holding **Kinetic Concepts** (NYSE: KCI), Marty Landon. The two discuss the wound-therapy manufacturer's deleveraging process as well as its plans for geographic expansion, product innovations, and potential health-care reform. Just click the player below to listen in!

4ydDdyOiuPIwhKfHmhRYXDkeFDHaULH8

After you listen, let us know what you thought on our Kinetic Concepts discussion board.

The unedited transcript is below:

Todd Wenning: Welcome to a special edition of *Motley Fool Pro Audio Extra*. I am Todd Wenning and I am excited to be joined over the phone by Kinetic Concepts' Chief Financial Officer, Marty Landon, who has been gracious enough to spare us some of his time this morning. As *Pro* Fools know, KCI was the first stock recommendation for the *Pro* portfolio and it is one of the most widely-held recommendations among *Pro* members.

Before we get started, I do need to mention that this call this morning may include forward-looking statements about KCI's business, including guidance on future plans, revenues and earnings. These statements are based on the company's current expectations and are subject to a number of risks and uncertainties which could cause actual results to differ from our expectations. More information about potential risk factors may be found in KCI's filings with the SEC. Whew!

All right, with those formalities out of the way, welcome to the call, Marty.

Marty Landon: Good morning, Todd.

Todd Wenning: So before we get to the business questions, let's start with a very Foolish question: what book are you reading right now?

Marty Landon: *(Laughs.)* That is a good question. It is actually a book about the history of the central Texas area written by Robert Caro.

Todd Wenning: OK, is it any good?

Marty Landon: It is kind of deep for me. I try and keep things simple, but it is a good read so far, yeah.

Todd Wenning: Have you read any good business or financial books recently?

Marty Landon: You know, keeping track of KCI keeps me pretty busy on that front, but I will tell you I am paying attention to the activity around healthcare reform.

Todd Wenning: Excellent. That is one of the questions I have for you today, so we will get to that in a moment. But first I just wanted to talk about why we got into KCI in the first place. Normally we prefer companies with lower levels of debt, but we were very impressed with your experience of deleveraging the business before, back between 2003 and 2007, and that increased our confidence in this position.

You noted in last year's *Analyst Day* that you hoped to be net-cash positive by the year-end 2012. A few quarters have passed since that outlook. Has anything changed and how is this process different than the last one?

Marty Landon: So not a lot has changed in terms of how we see the business operating. Thank you for your comments around our ability to deleverage something that we are proud of. We like to think of ourselves as good stewards of capital and we have a business that is not highly capital intensive, so we have had a well-established history of good cash flow generation and we see that continuing. We have kind of made a priority around financing our initiatives internally, so we take our cash flow and we use it to fund innovation and development and then assuming that we have gotten the things done that we need to for growth of the business, then we certainly take those monies and delever as quickly as possible. We think that is a good use of cash. And we will continue that focus going forward.

Todd Wenning: That's great, that's great. We were always impressed with your ability to generate cash and it seems over the last few quarters, the market has begun to recognize that and it has really helped us as investors.

So obviously competition has stepped up in the negative pressure wound therapy arena, both here in the U.S. and in European and Australian markets, investors are somewhat concerned it seems that new entrants will be able to take away a lot of the market share by offering lower prices. What is KCI doing to maintain and increase its competitive advantages?

Marty Landon: You know, a lot of the things that we have done for some time now, what we are; maybe one of the misconceptions that we think there are in the marketplace is that these are generic-type products and that you put foam and tubing and a vacuum source together and you have negative pressure wound therapy.

Todd Wenning: Right.

Marty Landon: There is a lot more to this than the materials and we think it is around the things that we have developed over a long history, in 15 years with the product, including the clinical support and the clinical research that goes with the product to know the right kinds of wounds to place the product on, the right placement of the product, so education of physicians and caregivers so that you make sure that we are always focused on the patient and getting a differentiated outcome and by getting that differentiated outcome, we believe and we have studies to show that we actually do save real healthcare dollars and we think that that is what helps us continue to lead.

Just given our history, we have learned a lot about what happens in that wound bed in terms of physiologically and so that has helped us in terms of our innovation. So you see us bring out new products and offerings that actually address real, unmet clinical needs and I think that hopefully will help us maintain a leadership, regardless of the number of competitors in the market.

Todd Wenning: Right, and I remember when I was down for the Analyst Day in October and I saw the ABThera. I don't think it was called "ABThera" at the time, but some of the new innovations that I saw in your R&D facility were pretty impressive.

Marty Landon: Well thank you, and they are really just getting to the point of commercialization, so we are all looking forward to them with great expectations and I would tell you that the early indications around the ABThera product on the first placements are getting good reception from physicians and really seeing a difference in the outcomes associated with the open abdomen, so we look forward to that continuing to progress as well as the other new products that we will bring to market in early 2010.

Todd Wenning: That's great, that's great. Geographic expansion into developed markets is already well underway, both in Europe and Asia and in the U.S. Could you give some idea of where you currently stand in Japan and Germany or emerging markets in your sights after you penetrate the developed markets?

Marty Landon: Sure. In terms of; we don't really have a large, established presence in Asia to this point. We have been doing a lot of work around getting regulatory and reimbursement approvals in the Japan marketplace, which we think is a very good market for us. It is a market that is hoping to get access to negative pressure wound therapy, and in particular the V.A.C., and so we think we are tracking well there.

I certainly don't want to get ahead of the Japanese agencies. They are doing the work and asking us to meet their requirements in terms of clinical research, etc., so we think that gives us a pretty good head start in terms of the competition in that area and so we hope to be on the market there sometime in 2019, as we have said. The entire Asia-Pac region as a whole remains attractive for us in terms of the negative pressure therapy platform franchise, as does bringing the regenerative matrices and regenerative medicine outside the U.S. as a whole and just speaking to outside the U.S. and Germany in particular, you know we have been after homecare reimbursement there and that is a very competitive market for us. We continue to grow there for those reasons that I enumerated earlier in terms of that value 360, 360 degrees of value.

The product, the clinical set, the support, the service that comes with that, even in a difficult environment such as Germany today, that is, for us, we have continued to grow units and we have our highest number of units out at any point in time in Germany's history and naturally with a growing company, that is going to continue, hopefully, but the point there is that in very competitive environments, we continue to lead.

Todd Wenning: That's great. And for our members out there who may not understand the differences between the U.S. healthcare system and say Japan or Germany, can you give us a brief idea of what differences there are when you try to go into these types of markets?

Marty Landon: Sure. Probably the biggest difference is that the U.S. healthcare area has made use or has come to recognize the lower cost of care and the importance of a patient to be mobile and to be able to receive treatment in the home. In the U.S., you see a business that has both an acute care as well as a post-acute environment, both in nursing homes, skilled nursing facilities and the home environment. Outside the U.S., it historically has been more of an acute care environment. They are moving more towards what they will call the "community offering", but still primarily an acute care offering and so we are developing markets in terms of home care reimbursement.

We'd tell you that in Asia we will primarily focus on the acute care right out of the box, but over time we think in all these markets there is an opportunity to build business in the home care environment again. Again, we think that reduces costs and is good for patients because a mobile patient tends to have better physiology around the body.

Todd Wenning: I agree with that. The potential synergies between V.A.C. and LifeCell are pretty obvious, but the synergies with the therapeutics support systems segment are less clear to me, so how does the TSS segment really fit into the future of KCI?

Marty Landon: Well certainly it is our heritage business. It is how we grew up. I think the one thing it did very well for us was establish the clinical relationships that were important as we brought new products to market like the V.A.C. and even with LifeCell. Many of those physician relationships were established many, many years ago and in terms of servicing the market, it also helped us from a points-of-contact standpoint. I think that that business, it is important to note that while it is a little bit different, that business continues to be profitable. So for us, we have said that is a more mature business.

The right thing to do here is to continue to focus on profitability and make selective investments where it makes sense. I think in terms of longer term, well that kind of depends upon what the portfolio ultimately develops into and we discussed that a fair amount here, but for the moment we think there are selected opportunities for growth, particularly in critical care where we have an expertise and so we look at those selected areas where we can grow, grow profitably and bring improved levels of outcomes to patients. If we can have a differentiated therapy, not a supply, but a therapy, then we can tend to be a market leader and therefore produce growth. So that is kind of the strategy there is manage that business for profitability with selected investments where it makes sense.

Todd Wenning: Right, and I remember seeing the Rotoprone put on display at the Analyst Day and that was a pretty impressive machine itself.

Marty Landon: It is a lifesaving machine is what we have found and so it is one of those deals that it is not for every patient, just like V.A.C. is not for every patient, but for those patients who really need it and can benefit for it, it saves, in Rotoprone's case, lives; in V.A.C.'s case, certainly limbs and oftentimes lives. Those are the kinds of things that will continue to help you be successful as you look into the future.

Todd Wenning: All right. So going back to what we were talking about earlier about the healthcare reform, a lot is hanging over the healthcare sector when it comes to what is going to happen with potential healthcare reform. There has been a lot of debate in the news recently, pretty vocal debate, so in recent calls, you have noted that the patient mix has changed towards more government pairs, like Medicaid. You are looking at lower prices for KCI and that stems from larger unemployment through private insurers. Could you give us some general information about how KCI might handle more government-funded payers in the future?

Marty Landon: Yeah, I think that, once again, just kind of important to note that within the majority of our payers, whether they be acute care facilities, skilled nursing facilities or let's say managed care in the home, we are not seeing pricing declines, per se. It is, as you mentioned, Todd, more of a mix issue as where do those patients fall. We continue to work with the payers, all the payers really, to ensure that they understand the value proposition around V.A.C. therapy and how it is differentiated from other products and that how they can actually save real healthcare dollars by utilization of the product.

We are certainly having dialogues with the Obama administration and with Congress and with industry leaders to ensure that our voice and position as an innovator and leader in the field are heard. As you know, it is quite a dynamic environment right now and you are starting to see people have quite strong reactions to where it might go. We are just trying to make sure and ensure that people have access to quality healthcare, that innovation, real innovation is rewarded so that you can afford to continue to invest and improve outcomes and then we are certainly going to make sure that our infrastructure, to the request of the administration, that our infrastructure is as lean as possible such that we can be as cost efficient in how we bring our products and therapies to market and we are going to do that and then we hope just to receive an adequate return for our shareholders so that we can continue to innovate. And so it all makes sense if it is all focused around improved outcomes and so that has kind of been our message to the administration is if you focus on outcomes-based alternatives, we are absolutely in. Please don't just cut price at the cost of quality.

Todd Wenning: Marty, that is great and thanks so much for your time today. We do appreciate it. Are there any final thoughts or anything you would like to say to the KCI shareholders out in the *Pro* community?

Marty Landon: Certainly we thank everybody for any interest and their interest in KCI. We are here trying to work hard for them and hopefully we will provide a good investment and return on their investment and hopefully we do that, again, through focusing on the patient, which is how we grew up.

Todd Wenning: Thanks so much. And that wraps up this special of *Pro* Audio Extra. I hope you have learned as much as I have about our investment in KCI from CFO Marty Landon. Until next time, Fool on!

Todd owns shares of Kinetic Concepts.

Monday Memo: Your Post-Rally Guide to Pro; FLS, GTI, LNN, and SBB on Hold

Published Aug 10, 2009 at 12:00AM

These businesses have done well under tremendous pressure. Management has reduced costs, focused on the customers, improved balance sheets, and positioned these companies to thrive once the economy turns around -- all while maintaining profits. However, as much as we like these companies, we're moving them to Hold. This is based solely on stock price. While we're not recommending you sell, our Buy First and Buy stocks offer better risk-to-reward potential for your new money at today's prices. If you want to buy more shares of these new Holds, or if you haven't bought yet, consider writing put options to net lower potential buy prices within our preferred buy range. Here's a closer look at these outperformers:

- **Flowserve** (NYSE: FLS): This company is surpassing our expectations, and recent strong pump sales -- a leading indicator -- should mean even better valve and seal sales down the road, according to management. We're happy to be Flowserve shareholders, and our new fair value estimate is around $95. At that figure, the company would trade at only about 12 times this year's earnings estimate (below the market's average), and adjusted earnings per share have grown an impressive 8% the first half of this year despite the dismal economy. We've increased our preferred buy price to $75 because risk has diminished as the company has proven to be a strong operator in this tough economy. This should make it easier for you to get shares via puts (you can write $80 or $75 puts) or buy on dips.
- **GrafTech International** (NYSE: GTI): Again, management is doing superb work here. Gross margin increased by 5 percentage points last quarter, and that should be sustainable. That means when the economy recovers, GrafTech should do very well. But now trading at $15, the stock sits at about 15 times 2010's earnings estimate -- a little aggressive for us here -- so we've moved GrafTech to Hold, though our preferred buy range has ticked up to $12. As with Flowserve, risk here has diminished, so buy shares via puts or on dips in our new higher range. You can write $12.50 puts for a start.
- **Lindsay** (NYSE: LNN): We increased our preferred buy range to $34.50 partly due to the high margins and free cash flow of the last quarter. But with the stock recently above $41, there is less upside for our risk, so we've moved Lindsay to Hold for new purchases. Write $35 or possibly $40 puts to potentially net a buy price in the mid-to-low $30s on this volatile small cap.

With data on the economy at large -- including manufacturing activity and unemployment -- coming in better than expected of late, we must revisit our macro short and valuation argument for **ProShares ShortSmallCap600** (NYSE: SBB). So for now, we're putting this ETF on Hold. Investing against an improving economy is becoming an increasingly suspect proposition. If economic fundamentals continue to improve the slightest bit, shorting even an expensive-looking stock index may invite excess risk -- after all, if investors see better days ahead, they could price stocks aggressively for a long time. We've lost about 16% on this ETF this time around and may want to cap our losses soon if we don't see a meaningful change in economic sentiment based on hard data.

We're bumping **Jack Henry & Associates** (Nasdaq: JKHY) and **Vanguard Emerging Markets** (NYSE: VWO) down to Buy based solely on price. We're awaiting earnings on Jack Henry next week, so stay tuned. Meanwhile, we've raised our preferred buy price on Vanguard Emerging Markets. With emerging markets up anywhere from 60% to 70%, you should tread carefully here; but if shares fall about 20%, to the low $30s, the ETF becomes more attractively priced. Consider writing puts to net shares in the low $30s if you haven't bought yet.

As we adjust some of our preferred buy prices, please keep in mind that this guidance is not rigid (just as fair value estimates can't be) and assumes flexibility of around 5%. So even if a stock is a bit above our preferred buy price, it should still be on the table for a purchase -- or you can write puts to get within our range. Ultimately, valuations are by nature imprecise. This is why we believe it's vitally important to buy the best business models we can find, run by management that can adapt to change. We definitely believe we're doing this so far at *Pro*.

We've knocked our preferred buy price on **Procter & Gamble** (NYSE: PG) down to about $55, and we've lowered our fair value estimate to the mid $60s. P&G is struggling in the current economy, which will weaken its earnings power for at least the next year. We still like this behemoth as a core holding in consumer staples, and we think it's still worth owning thanks to its healthy dividend yield, low valuation, and the likeliness that P&G will recover as consumer confidence returns -- and be even stronger when it does.

We've gathered a quick summary of our buying guidance for you in the table below:

Investment	Recent Price*	Preferred Buy Price	Fair Value Estimate	What to Do	Quick Take
AmTrust Financial Services (NYSE: AFSI)	$11.70	Moving from $11.50 to $12	$18	Still a Buy First	Increased preferred buy price given the 18.7% per share jump in book value this quarter
Autodesk (Nasdaq: ADSK)	$23.76	$22.50	$32	Still a Buy	Q2 results on Aug. 13
Cameco (NYSE: CCJ)	$30.21	$21	Mid $20s	Still a Hold	Q2 results on Aug. 12
Flowserve (NYSE: FLS)	$87.89	Moving from $70 to $75	Moving from $88 to mid $90s	Moving from Buy to Hold on price	Strong Q2 results; write puts to net lower buy prices
GrafTech International (NYSE: GTI)	$15.25	Moving from $9.50 to $12	$17 (a move higher is pending)	Moving from Buy to Hold on price	Write puts to net lower buy prices
iShares Silver Trust (NYSE: SLV)	$14.39	$14.25	N/A	Still a Buy	Buy and write covered calls or covered strangle
Jack Henry & Associates (Nasdaq: JKHY)	$21.90	$21	$30	Moving from Buy First to Buy on price	Q2 results Aug. 18
Kinetic Concepts (NYSE: KCI)	$32.64	$34	$48	Still a Buy First	Still looks like a value
Lindsay (NYSE: LNN)	$40.92	Moving from $31.50 to $34.50	Low $40s (a move higher is pending)	Moving from Buy to Hold on price	Write puts to seek lower buy price on this volatile stock

Medtronic (NYSE: MDT)	$35.33	$36	$52	Still a Buy First	Earnings out Aug. 25
Plum Creek Timber (NYSE: PCL)	$35.09	$34	$40	Still a Buy	Good income and option-writing stock
Procter & Gamble (NYSE: PG)	$52.03	Moving from $62 to $55	Moving from $70 to mid $60s	Still a Buy	Strategies not working great in current economy, but remains a powerhouse
ProShares Short SmallCap600 (NYSE: SBB)	$43.98	N/A	N/A	Moving from Buy to Hold	We're reviewing our investing thesis on this macro short
Vanguard Emerging Markets (NYSE: VWO)	$35.98	Moving from $30 to $32.75	N/A	Moving from Buy First to Buy on price	Write puts to net a lower buy price on emerging markets after this record run
Vanguard Energy (NYSE: VDE)	$74.32	$74	N/A	Still a Buy	Oil has rebounded sharply, so add patiently to this ETF

*As of market close Aug. 7, 2009.

Meet a Fellow Pro: Our Fishy Friend fullofcarp

Published Aug 7, 2009 at 12:00AM

Bill T., a.k.a. fullofcarp

We're excited to introduce a new feature at *Motley Fool Pro* in which we'll spotlight some of our highest-profile members from time to time. These *Pro* Fools go the extra mile on the boards, offering round-the-clock insight, never hesitating to lend a hand to a Fool in need, and cracking jokes when we could all use a laugh. Our first guest of honor has been with us from the start: Bill T., a.k.a. fullofcarp. What makes Bill such a diehard Pro? Read on for a closer look at the man behind the fish.

Jeff: First, please tell us a little about yourself.

Bill: I grew up in California in a redwood forest (my father was a forest ranger). I have a degree in math and a PhD in business with a minor in finance. I've worked in a variety of vocations (college professor, business consultant) and now work as a safety analyst in the field of aviation. I'm basically a quant/spreadsheet jock and safety data analyst. My main hobby: gardening (nicknames at work include "townhouse farmer" and "worm rancher"). And for anybody who hasn't noticed yet, I feel that life wouldn't be worth living if it wasn't for a bit of sarcasm now and then (hence my self-deprecating user ID). If you aren't sure how to interpret something strange that I say on the boards, please give me the benefit of the doubt and assume that I'm simply exhibiting lame middle-aged humor and that I didn't actually intend to insult anybody.

Jeff: We would never think differently! Turning to investing, how would you describe your strategy?

Bill: I've been a member of The Motley Fool for many years but was never very active until I proved my amazing talent for market timing and began seriously investing in *Million Dollar Portfolio* in December 2007. After losing quite a bit during the market collapse, and thanks to inspiration from *Pro*, I've now developed a primarily option-centric approach, where I am overleveraged, but only to a level that I'm comfortable with and using techniques that I understand. I've now grown my money back to the balances of 2007!

Jeff: Today, if you could give one piece of advice to a fellow investor, what would it be?

Bill: During the dot-com boom-and-bust, I turned $30,000 into $200,000 then into $5,000 in a matter of months. I learned two lessons the hard way: know when to take profits, and know your limits. The latter lesson was reinforced this past spring when I had trouble sleeping a few consecutive nights and decided that I would back out of some riskier strategies since obviously my subconscious wasn't comfortable with them. The fact that they would have turned out very very well is not important. Only do things that you're comfortable with.

Jeff: We certainly preach that at *Pro*. Speaking of which, is there one thing you like most about this service?

Bill: The power of the group. For me, the mathematics of options is instinctive, like breathing, but I am far from normal in that regard. However, I believe that everybody has their own strengths and weaknesses and the power of the group is in sharing our own distinctive abilities, and I'm highly impressed with the combined abilities and power of the group. I've learned a lot from people who've shared their thoughts on the boards, even as I have tried to help out with what I consider to be the more mundane mechanics of things.

Jeff: Turning to the big picture, where do you stand on the market right now?

Bill: I feel that the market has overreached based on a bit of irrational exuberance. However, I've grown to feel more comfortable with the saying, "the market can remain irrational longer than you can remain solvent." As a result, I am taking my positions very cautiously, but not bailing out of anything. I am taking profits when it makes me feel more comfortable, and I am using more long calls as substitutes for long positions — or else buying protective puts for long positions — in order to protect myself in case of a serious snap back. Options are so cheap now compared to last winter that it's cheaper to be careful now than then. In the medium term (i.e., one to three years) I'm neutral, as I feel that the overall economy won't snap back to levels supporting stock prices much higher than this for a while. I expect that this will be a slow recovery.

Jeff: Well said — it sounds like we agree. For *Pro*, as we work through earnings reports, we expect to discover where we need to be more defensive. Now one last question for you: If you could wake up anywhere in the world tomorrow, where would you be, and why?

Bill: On a beach somewhere near the equator, where I could enjoy warm ocean breezes, ocean sunrises or sunsets, and wonderfully fresh tropical fruits every day. And where I could have an interesting garden year-round without worrying about winter freezes.

Jeff: That sounds ideal. I noticed in your picture you're wearing a shirt from Costa Rica, a favorite country of mine, and it sounds like you just described it! Thank you for joining us, fullofcarp, and thank you a hundred times over for your great contributions to the *Pro* community. I know our appreciation is shared with hundreds of members out there.

To chat with fullofcarp — about investing, gardening, whatever — hop on over to our Meet & Greet board. Fool on!

Adjust Your December Puts on Nasdaq OMX Group

Published Aug 6, 2009 at 12:00AM

At a Glance

- **Adjusted action:** Writing ("sell to open") December $19 puts (ticker +NQDXL)
- **Recent option price:** $1.15 bid/$1.25 ask
- **Preferred limit price:** $1.15 or higher
- **Minimum limit price if necessary:** $1.00 (use a limit order at the current market bid if that's enough for you)
- **Recent share price:** $21.50
- **Alternate trade:** Write December $17.50 puts (ticker +NQDXT) for $0.70 or better (more defensive)
- *Pro* must make this trade on Aug. 7 to meet our 30-day trading rule

Nasdaq OMX Group's (NASDAQ: NDAQ) second-quarter results met Wall Street's expectations, although revenue declined 13% from last year and profit margins on equity transactions shrank again. Small, cutting-edge competitors with much lower cost structures, including BATS and Direct Edge, have been eating away at Nasdaq OMX's market share in this space: In the past year, Nasdaq OMX has dropped from hosting 30% of all U.S. equity trades to just 20% — a large enough decline to give us serious pause.

On the plus side, Nasdaq OMX is pursuing new growth avenues. Its newer options exchange is growing rapidly (see how trendy you are?), and the company's International Derivatives Clearing group has been testing its interest rate swaps-clearing platform. In this potentially huge business, Nasdaq has already cleared $450 billion in contracts and signed on 12 large participants. But while management estimates revenue could be in the hundreds of millions annually, that outcome is likely years away, and competition from **CME Group** (NASDAQ: CME), among others, could be stiff.

Looking at the valuation, the stock is down 12% this year (while the S&P 500 is up 10%) on concerns about market share and profit margins. At our potential buy price of $17.85, the stock trades at 9.6 times earnings per share estimates for the year. Though competition is rising, Nasdaq OMX is pursuing new growth avenues, and its loss of market share in equity trading should diminish once profit margins find a sustainable level among all competitors. In sum, despite the challenging situation, the shares are inexpensive enough and the possibilities good enough to keep our put-writing thesis attractive.

Option Specifics

Last month, we announced a Make the Trade to write December $15 puts for $0.80 or higher. The trade got away from us, but Fool rules obligate us to make the trade or a similar one within 30 days. Our adjusted trade still involves the December options (thus we'll be on the same calendar as the many *Pro* members who *did* get our earlier trade), but we'll now write puts with a $19 strike price instead. They're the only ones currently paying well enough, meeting most of our hurdles, and still netting us a potential buy price in the mid-teens. Take a look:

- **Share price:** $21.50
- **Option bid/ask:** $1.15/$1.25
- **Option strike:** $19, or 11.6% lower than today's price (clearing our 7% hurdle)
- **Break-even price:** $17.85, or 17% lower (within our 14% to 17% hurdle)
- **Option yield (at $1.15):** 6% of $19 strike price (just misses our 7% hurdle for options expiring in 4 months or more)

As an alternate trade, the December $17.50 options can be written for $0.70 a share. They don't clear as many of our desired hurdles, but are still attractive and more defensive. We're choosing the $19 options because they recently pay 50% more than the $17.50 options while netting a break-even price just 6.3% higher. This sort of comparison isn't always valid — the percentage difference between different option payments will always dwarf your potential underlying share price difference. But this is enough of a difference in the option payment, with a relatively modest difference in our potential start price on the stock, to make us choose the higher strike price. Especially considering we still see value at the break-even price of $17.85, or 9.6 times 2009 earnings.

If You Already Wrote the December $15 Puts

If you got last month's Make the Trade at our desired prices, congratulations! Those options currently ask just $0.35, so you can consider closing them early ("buy to close") in order to write these new puts for a higher premium. If you write the new puts for $1.15, for example, you'll have a net credit of $0.80 per share after closing your old puts, effectively more than doubling what you could still earn on this strategy between now and December. The trade-off: You'd be on the hook to buy Nasdaq OMX shares around $17.85 rather than a current $14.20 — a meaningful difference. Also keep trading commissions in mind. If you're only looking to close one or two contracts early in order to write new ones, it may not be worthwhile after commissions.

Questions?

Remember, when you write put options, you must be ready to buy the underlying stock. Each option contract represents 100 shares. If you have questions about this Make the Trade adjustment, please let us know.

Monday Memo: Flowserve, GrafTech, Kinetic, and Plum Creek Serve Up the Goodies

Published Aug 3, 2009 at 12:00AM

Shares of **Flowserve** (NYSE: FLS) (recent price $81; click the ticker for our original buy report) blew a gasket on Thursday, surging 11% after solid second-quarter earnings were announced. Revenue at the pump, valve, and seal manufacturing giant fell a modest 6% from last year, to $1.1 billion, but earnings per share hit $1.92, well above the $1.79 estimate. Management increased earnings guidance for the year to a range of $7.15 to $7.75 per share, putting the stock at about 10.5 times this year's guidance. Backlog stands at a strong $2.7 billion, essentially flat with Dec. 31, 2008, while management said new bookings improved markedly in the second quarter compared to the first. We're currently crunching the numbers because our fair value estimate of up to $88 -- based on cautious estimates -- may prove too low.

- **What's next:** Flowserve is still a Buy, but we're reviewing our investment strategy and will report back in next week's Memo.
- **Alternate trade:** You can still write puts ($75, $70, or even $65 puts going out to January) that will potentially net you a buy price well below our preferred buy range, which is up to $70.

Second-quarter sales at **GrafTech International** (NYSE: GTI) (recent price $13.80) increased 18% from the first quarter to $158 million, but that's still half last year's number. On a 5-point gain in gross margin, a lower tax rate, and fortuitous order timing, earnings per share clocked in at $0.12, tripling the $0.04 estimate. Management foresees a weaker third quarter (about breakeven), typical of the steel mill shutdown that occurs every summer in Europe, followed by improvement in the final quarter of the year. Free cash flow for 2009 so far is still a strong $30 million, and management continues its incredible balance sheet improvement, knocking net debt down to $48 million (it was $370 million at the end of 2007). Overall, management is performing exceptionally well in the worst environment it has ever seen.

- **What's next:** Following a steep jump in the stock, we're considering moving it to Hold. We need another week to go through the facts. Stay tuned.
- **Alternate trade:** You can still write $10 puts (recently, January or March 2010) to net a potential buy price in our preferred range below $10. We may increase this range marginally next week, which would incidentally make it possible to write $12.50 puts for a much better payment.

Despite increasing competition in the field of negative pressure wound therapy and a legal brouhaha with U.K.-based rival **Smith & Nephew** (NYSE: SNN), **Kinetic Concepts** (NYSE: KCI) (recent price $31) is proving to the market with each passing quarter that it's committed to being the market leader -- and delivering on that. Kinetic's potential synergies between its wound healing and closure business and its regenerative medicine unit, LifeCell, appear boundless and could provide Kinetic with another competitive advantage down the road. Recurring revenue and free cash flow remain strong -- while management continues to deleverage the balance sheet. For more, see this post. We'll speak with Kinetic's CFO on Aug. 6 and report back to you soon after.

- **What's next:** Kinetic is still a Buy First. Given its free cash flow growth, which has been much stronger than we cautiously modeled last October, we're increasing our fair value estimate to $48, up from our previous high-end estimate of $39. This also means our preferred buy price increases, to $34 or below. Realize that Kinetic's recent strong performance means the stock could give back some ground in the near term, but we still see long-term value.
- **Alternate trade:** You can write $30 puts to potentially buy more shares or earn income.

During what's been called "the most severe depression in the wood products industry since the 1930s" by a rival CEO, **Plum Creek Timber** (NYSE: PCL) (recent price $31) is doing a bang-up job. The timberland management company is navigating the economy's deep, dark wood by selling off non-strategic lands, allowing it to pay down debt and reward long-term shareholders by funding its generous dividend. Plum Creek's focus on prudent, long-term capital management is impressive, and we expect it to recover with more verve than its competitors once the economy turns around. For more, see Todd's post on what he calls not a "peaches and cream" quarter, but not a terrible one, either.

- **What's next:** Plum Creek is still a Buy. The stock is below our preferred buy price and offers more than a 5% dividend yield, making it attractive today.
- **Alternate trades:** You can write ("sell to open") $30 or lower put options if you'd like to potentially buy shares at a lower price, or consider writing $35 covered calls on a stock bounce above $33.

We'll have earnings from **Procter & Gamble** (NYSE: PG) on Aug. 5, and **AmTrust Financial** (Nasdaq: AFSI) and **Nasdaq OMX Group** (Nasdaq: NDAQ) on Aug. 6. Visit our boards for a post on how we're going to approach our pending option trade on Nasdaq OMX, announced July 8, which needs to be completed by the end of this week. As for our pending**Lindsay** (NYSE: LNN) option trade, we have until mid August to reassess that trade. Given how volatile the stock is, we may still get our price. At any rate, you'll hear more from us this week regarding Nasdaq OMX.

Invest well, and Fool on!

Jeff owns shares of AmTrust Financial and Nasdaq OMX Group. Todd owns shares of Kinetic Concepts.

Write a Strangle on iShares Silver Trust

Published Jul 31, 2009 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") January 2010 $15 calls (ticker +SLVAO)
- **Second action:** Write January 2010 $13 puts (ticker +SLVMM)
- **Allocation:** Increasing from 3% to 5%
- **Preferred limit price:** $1.50 or more *combined* for the calls and puts (or about 10% of Silver Trust's current price)

What's New

In the next one business to 30 calendar days, we'll be writing a strangle on our shares of **iShares Silver Trust** (NYSEMKT: SLV).Writing a covered strangle is simple: We write covered calls to sell shares of a stock we already own if the price goes much higher, and also write puts to buy more shares if the price declines. Meanwhile, we collect more option premiums and grant our investment greater flexibility and room for profit. Here, we're also increasing our allocation to Silver Trust from 3% to 5%, so we're ready to potentially buy more should shares of the ETF sink below $13.

We'll be paid (at recent prices) $1.85 *combined* to write these covered calls and puts, and we keep this premium whatever the outcome. That means our potential net buy price on new shares (via our puts) would actually be about $11.15 per share. Since 2005, silver has averaged $11.25 per ounce, starting with an average price of $8.60 in 2005 and steadily climbing. This provides us comfort in potentially adding to our position a bit above $11.

On the other side, our potential net sell price (via our covered calls) would be about $16.85 per share. With Silver Trust currently trading around $13.40, this gives us a wide range in either direction. And if we don't want an outcome that involves buying or selling shares by our January expiration, we may still be able to close the options early and profit on them within this range of roughly $11 to near $17.

This strangle provides much more flexibility than just writing a covered call. The January $15 calls pay just $0.90 per share, so we're about doubling our potential premium income by also writing puts. The combined payment of the strangle actually serves to increase our potential upside while offering a comfortably low potential new buy price *and* increasing our overall option income.

As for the big picture, that hasn't changed since our original February report on silver. The commodity has performed largely as we expected: When the market was falling, silver often moved opposite the index, as a hedge. As the market soared, silver didn't do much (it declined about 7%), but our option income has made the overall position profitable regardless. We still believe a strong recovery in the economy will ultimately sustain and possibly lift silver prices as demand for this high-utility metal increases; inversely, a continued downturn in the economy could increase the attractiveness of silver as a hedge. Silver also remains an inflation hedge. However, since we're not silver bugs, we like the position best as an option-income holding.

Specifics on Writing Covered Calls and Puts

The command to write covered calls and write puts is "sell to open." You write one covered call for every 100 shares of the underlying stock or ETF you own and write one put for every 100 shares you'd like to potentially buy. With some brokers, you can enter this trade as an actual "strangle" -- doing both trades at once through a special order entry window at your broker, lowering your commissions.

Don't forget to use a limit order at or near the current bid price, if that price is attractive enough for you. In this case, with the combined options currently bidding $1.85 per share ($0.95 on the puts, and $0.90 on the calls), we're hoping to earn $1.85 -- or, at least $1.50 if option premiums keep declining. However, this combined income of $1.85 should not change much over the next few days, since whichever way the ETF moves, one of the options should become more expensive and the other cheaper, balancing out. Combined, these option payments easily meet the guidelines we provide in our covered call and put-writing guides.

How You Fit In

- If you don't own any shares of Silver Trust, consider matching our 3% allocation (if that's 100 shares or more). Then write covered calls on that 3%, and write cash-secured puts for the next potential 2%.
- If you already own shares of Silver Trust and don't want to potentially buy more, just consider writing the covered calls.
- If you already own shares of Silver Trust and they're covered by calls already, consider writing puts, as we are, if you're comfortable potentially buying more and increasing your allocation.

If you have any questions about this strangle, please post on the iShares Silver Trust board.

Options 703: Strangles

Published Jul 29, 2009 at 12:00AM

Here's how to initiate a strangle (no necks necessary):

- To buy a strangle, buy to open an equal number of calls and puts, typically out-of-the money by one or two strike prices, with the same expiration date.
- To write a covered strangle, sell to open puts and calls, also out-of-the money and usually with the same expiration date. However, the number of puts you write is dependent on how many additional 100 share blocks you'd like to potentially buy, and the number of calls you write will depend on how many 100 share blocks you already own and would be willing to sell at your higher price.

For example, we've had a covered strangle on *Motley FoolPro* holding **Plum Creek Timber** (NYSE: PCL) for most of 2009. We wrote $22.50 puts and $40 covered calls on the stock. This obligates us to buy more shares if Plum Creek falls below $22.50 or to sell our existing shares if the stock exceeds $40. We profit on both options if the stock stays within this wide price range by expiration.

Usually, you write (or if it's a buying strategy, buy) both sides of your strangle at the same time, but sometimes you can increase your option payments by "legging into" the strategy — setting up one side of your trade at a different time than the other; for example, writing calls on your targeted stock when it's near the high of your expected range and then writing puts when it's nearer the low end. We did this with Plum Creek, writing calls when the shares were $33 and writing puts when the stock slid to $26 — legging into our strangle over the course of a few months.

Buying a strangle (also called a long strangle) is a low-cost way to profit if the stock makes a dramatic move in either direction. Since you're buying out-of-the money options that have relatively small value attached, your cost can be marginal. Your potential gains are unlimited, but it's easy to lose most or all of your investment.

For example, *Pro* stock holding **GrafTech International** (NYSE: GTI) recently traded at $12.50. Say you believe it will be exceptionally volatile in either direction. Recently, you could purchase a $10 put expiring in eight months (the longest-dated available) for $1.20, and purchase a $15 call option expiring in eight months, also for $1.20. If you buy one contract of each, you've invested just $240 to enter the strategy. That's the main advantage of a long strangle: low costs to initiate.

However, because your options are far out-of-the money, GrafTech needs to make a dramatic move in either direction for you to ultimately make money by expiration, either falling below $7.60 or rising above $17.40. Because you paid $2.40 for your options, your $10 puts don't really end profitably unless the stock falls to $7.60 or lower, and vice versa on the call side. And if the stock doesn't move much, your options will steadily lose value and expire worthless.

Buying a strangle works best if a stock makes a meaningful move quickly. This way, your calls or puts can see a significant percentage gain long before expiration, more then offsetting the loss on the other side of your strangle, so you can book an early profit. But it's not easy. Using out-of-the-money options makes buying a strangle cheaper than buying a straddle (which uses more expensive at-the-money options), but it also means you're more likely to lose your full investment.

It follows, then, that *writing* a strangle puts the odds in your favor.

Writing a covered strangle (also called a short strangle) is a way to profit on a stock you own and would be willing to either buy more of or sell at the right price. Writing strangles can be superior to writing straddles because splitting the strike prices provides more flexibility and room for profit, as our Plum Creek example above illustrates. The options won't pay as much as a straddle, but the stock has more room to roam.

For example, say you own shares of *Pro* holding **iShares Silver Trust** (NYSE: SLV), and you're willing to buy more if the ETF declines meaningfully (potentially doubling your position, we'll suppose); or, you're willing to sell your existing shares higher. With the ETF recently near $14, you could write the $13 puts expiring in six months for $1, and write $15 covered calls expiring at the same time for $1 as well, collecting $2 in total option premiums (or 14% of the current share price).

Consider the possible outcomes:

- **SLV ends the expiration period between $13 and $15:** You keep the whole $2 per share the options paid you, and keep your shares, and can consider your next move.
- **SLV increases above $15 by expiration:** You're on the hook to sell your existing shares for a net $17, including the $2 the options paid you.
- **SLV falls below $13:** You're obligated to buy new shares at a net $11, again including the $2 the options paid you. You've now doubled your ownership in SLV, and lowered your cost basis. (It might be time to write covered calls!)

Of course, in most cases you could also "buy to close" your options early or upon expiration, and still have a profit on the combined option trades assuming the ETF hasn't moved too dramatically (in this case, as long as it's between $12 to $16).

As you can see, a covered strangle can give you a wide profit range, and it's more powerful and flexible than a covered call strategy alone — as long as you're ready and willing to buy more shares if it comes to that. As with any time you write puts, you need to be confident in the stock or ETF you're exposing yourself to and ready to buy it. With a covered strangle, you also must be ready to sell your existing shares if they increase in price. However, given how much the two combined options pay you, you also have more flexibility — or possibility — to close your options early if you wish, keep your shares, and still have a profit.

Some daring investors write uncovered strangles when they strongly believe a stock won't break above or below a certain (generally wide) price range, aiming to profit via option premiums on both ends. We're unlikely to partake in this risky strategy without buying calls to protect ourselves — otherwise, the losses can be unlimited.

Buying a strangle is a way to profit if a stock makes a severe move in either direction — but if it doesn't, you risk whatever you invested in the calls and puts. On the other hand, writing a covered strangle is a way to generate option profits on a position if you already own at least 100 shares, would be happy to add at least 100 more shares at a lower price, or sell your existing shares at a higher price. More flexible than just writing covered calls, strangle-writing can provide a wide window of profit using options on a strong company that you believe will stay in a stable range.

Monday Memo: Is This Market Inferno Too Hot?

Published Jul 27, 2009 at 12:00AM

Many stocks have pushed the market higher by reporting second-quarter earnings above drastically reduced estimates. They've accomplished this mostly through cost cutting, while revenue is still coming in light. On July 23, Standard & Poor's reported that of the 197 S&P 500 companies that have announced results so far, as-reported GAAP earnings declined 4.5% from a year ago (and 30% including "one-time" events). But sales fell even further, averaging a 9.7% drop.

A near-10% decline in sales is nothing to sneeze at when you're talking about any business, let alone 500 of the country's largest. That's the past, though. What I'm more concerned about are the earnings estimates for *next* year: According to Bloomberg, Wall Street stock analysts (as opposed to economists) are projecting S&P 500 companies to earn a combined $74.55 per share in 2010 — representing ambitious growth of 25% over this year. Recently priced at 980, the S&P 500 trades at 13 times that $74.55 estimate; so for the index just to reach its historical average P/E of 16.5, it would have to jump 26%.

Break out the bubbly — that gain sounds fantastic, right? But those estimates come from Wall Street analysts who base their projections on recent net earnings (they're "bottom-up," or company-centric, estimates), while economists and portfolio strategists who calculate estimates with an eye on the broad economy first ("top-down") have a more pessimistic view of 2010. According to Standard & Poor's, top-down estimates for next year put the S&P 500 at a forward P/E around 20, or well above the 50-year average.

Whose estimates will prove correct? If history is any guide, top-down economists are usually closer to the mark, while the auspicious Wall Street analysts are prone to over-reaching and then needing to backtrack — as they did in 1999 to 2002 with tech companies, pharmaceuticals, biotechs, and others. More recently, 2009 estimates made by top-down economists in November are proving correct — while those of bottom-up analysts have needed to come down by 33%.

As we saw above, average earnings are down 5% this quarter while sales are down 10%, so cost-cutting measures are keeping earnings afloat. Management can't keep cutting costs indefinitely, and — by any measure — the only way for S&P 500 companies to average that 25% earnings growth predicted by optimistic Wall Street analysts next year is through strong increases in revenue. But how will large companies achieve that kind of growth?

Unless results we're seeing now are greatly and artificially depressed due to economic fears and frozen credit, it's hard to fathom where heady revenue growth could come from so soon. Companies are reluctant to rehire the millions who have been laid off because that would increase expenses and tamp down any earnings growth. However, if one in 10 Americans remains unemployed next year, and the rest of the population is cautious about keeping a job, how can you expect strong sales growth across much of the economy? And without strong sales growth, how can you expect 25% earnings growth when you've already cut costs to the bone?

In my opinion, much more modest growth is the likely scenario next year because the world will still be licking its economic wounds. Rather than the sharp V-shaped recovery that some Wall Street analysts project, economists' estimates suggest we're likely to bounce around meagerly for a while. If that's the case, the public earnings estimates for 2010 appear to be too high, in which case stocks already look fairly valued.

Just as we have an aversion to two-headed parrots, we have an aversion to expensive-looking stocks. However, we continue to believe in the companies we're buying, most of which are trading at earnings and free cash flow multiples well below average, and we'll continue to seek ways to hedge prices when they get out of line. Additionally, we would happily welcome a market that bounces around a year or longer, as we could generate increased option income and continue to average into good companies at good prices.

So overall, it may be business as usual at *Pro* even though we're cautious on what Wall Street analysts are projecting — and therefore the market's valuation as a whole. If 2010 earnings jump as much as these analysts suggest, it's going to be a banner year, and we'll be participating. But if the 2010 estimates start to look too high, we want to make some money on the market's subsequent decline, continue to profit with options if the market stagnates, and scoop up high-quality, beaten-down stocks that could result. Patience, value, option strategies, and hedging remain our modus operandi.

Last week, we saw glowing results from **Kinetic Concepts** (NYSE: KCI), and **Tupperware** (NYSE: TUP) blew the lid off earnings estimates. Both are strong businesses at good prices, so we'll keep targeting both for profits. Todd posted analysis of Kinetic's results, while Bruce shared Tupperware's highlights. Despite the recent jump in Kinetic's share price, it remains a Buy First stock at current prices. Following two strong quarters, we're going to officially raise our fair value estimate soon. Shares trade at a lower free cash flow multiple today than when we first bought them! Also watch for more on Tupperware soon — our existing puts have earned much of their potential profit already, so we could benefit with a new strategy.

Please post any comments on the Memo Musings board.

Onward, Foolishly!

Jeff Fischer (TMFFischer)

Write Puts on GrafTech International

Published Jul 23, 2009 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") December $10 puts (ticker +GTIXB)
- **Allocation:** 2% (for *Pro*, about 20 contracts)
- **Option's recent bid/ask:** $0.75/$0.90
- **Preferred limit price:** $0.70 or higher (7% of the strike price)
- **Acceptable limit price if necessary:** $0.60 or higher

What's New

GrafTech International (NYSE: GTI) has remained profitable despite what may have been the darkest period for steel production in years. Now demand for steel is increasing in China and the U.S., infrastructure programs continue to roll out, steel prices are lifting, and steel mills are running at more than 50% capacity after falling below 40% early this year. Meanwhile, KeyBanc Capital Markets suggests mills could be running at 65% capacity in the coming months. Overall, the emerging facts suggest that the steel business — being so essential to industry in general — bottomed out in the first quarter.

Where We Stand on GrafTech

The *Pro* portfolio has strong exposure to GrafTech already (our $30,000 investment has grown to more than $42,000, or about 4.2% of the initial portfolio), so we're writing the December $10 puts to earn additional option income on a situation we know well, or to buy new shares — but only at a price in our preferred buy range.

GrafTech announces earnings on July 30 — so why are we writing the puts now? First, with the stock 20% above our options' strike price, we have ample downside cushion. Only if management provides especially weak guidance for the second half of 2009 is GrafTech likely to fall below $10. Judging from industry trends, that appears unlikely, but if it does happen, we'd want to buy more stock on weakness via these puts. It's just a matter of time before this dominant company sees a recovery.

Analysis suggests earnings will be a slight improvement from last quarter, and guidance will improve upon that, in which case these puts would likely become income — a way to leverage a stock we already know and own. If this analysis is wrong, and a recovery is delayed, we'll be happy to fill out our remaining allocation in the stock below $10.

Where You Stand on GrafTech

If you don't own any shares yet, the best approach right now is to write puts for a *partial* position, getting you at least some exposure to the company (we suggested writing $10 puts in the Monday Memo a few weeks ago, too).

Then, if GrafTech declines after earnings, buy your remaining allocation to the stock outright if the share price gets attractive enough, falling to $10 or below. If GrafTech holds up or rises after earnings, consider writing more puts (perhaps $12.50 puts at that point, if the stock is near that price or higher, for income or to potentially get shares on a later decline). Finally, if you already own shares of GrafTech (it's been a Buy all along), sit tight just as we are. We think there's plenty of long-term potential, but if we're buying additional shares, we don't want to chase the stock.

Put-Writing Specifics

You "sell to open" puts when you're ready and willing to buy the stock if it declines below the strike price. The numbers here meet our put-writing guidelines:

- **Option payment or yield (at $0.75 bid):** 7.5% in five months ($0.75/$10)
- **Strike price (with GTI at $12.50):** 20% below the stock's recent price
- **Break-even price:** 26% lower, at $9.25

We'll make this trade in the next one business to 30 calendar days. To discuss this trade or ask questions, please visit our GrafTech board.

Options 702: Writing Straddles

Published Jul 22, 2009 at 12:00AM

A straddle involves an identical number of calls and puts with the same strike price and expiration date on the same underlying stock or index. As you know from Options 701: Buying Straddles, you *buy* the calls and puts to profit in either direction from high volatility. Inversely, *writing* the calls and puts is a way to profit from low or declining volatility. How? Simply by collecting option premium payments on either side of a potentially sleepy position. There are risks, however. Let's start with the basics:

- Write ("sell to open") an equal number of puts and calls on the same stock or index.
- Use the same strike price and the same month of expiration on both options.
- The strike price with a straddle is "at-the-money": as close to the current underlying stock price as possible.
- When you write an *uncovered* straddle, you don't own the underlying stock, so your risk is high (more on this in a minute).
- When you write a *covered* straddle, you own the stock, lowering your risk. Here the straddle works like a covered call strategy — but your returns are potentially goosed with additional put-writing income.
- The most you can earn writing straddles is what the options pay you initially.

When writing an uncovered straddle, you usually don't intend to get the underlying stock involved. You're just looking to profit on the value erosion of the options you write, and you'll plan to "buy to close" them (or let them expire) once you've earned your targeted profit. (Note: You need a margin account to write an uncovered straddle.)

As an example, suppose a recently volatile stock just announced earnings, and you expect its volatility will now all but cease. The options still pay well, though, so you'd like to capture the option premium as income. The stock is trading at $25, so you write $25 calls and $25 puts and get paid $2 for each contract — that's $4 total in option premiums per straddle. This means as long as the stock ends the expiration period between $21 and $29 ($4 above or below $25), you'll at least break even before commissions — and in most cases, earn a profit on the trade. (We'll call this the "profit range.")

- For example, if the stock ends the period at $27, the puts you wrote expire (giving you the full $2 value), and the calls break even, so the trade pays you $2 per share overall.
- If the stock ends lower in our profit range, let's say $23, the calls expire and the puts break even, so you profit $2 per share overall here, too.

However, outside your profit range, it's another story. You face unlimited potential losses as the stock rises above $29 per share, and you facing growing losses (along with an obligation to buy the stock and wait for a recovery) the further it falls below $21.

As the table below shows, the maximum profit from an uncovered straddle occurs when the stock ends exactly at the strike price; you keep the entire $4 per share you were paid in this example. Your total profit *declines* as the stock moves away from the strike price in either direction — which is why you want minimal volatility whenever you write straddles.

Take a minute to study the table and grasp how this works. As the stock rises, the naked (or uncovered) calls you wrote increase in value, working against you. As the stock declines, the puts you wrote work against you, but you'll still profit anywhere between $22 and $28, and break even at $21 or $29. Remember, you were paid $2 for each call and put, or $4 total. But since you *wrote* the options, your desired outcome is that their value goes to $0, or as low as possible:

Ending Call Value	Stock Price at Expiration	Ending Put Value	Your Total Profit per Share
$0	$20 and lower	$5 and higher as the stock falls	($1) and worsening as the stock falls
$0	$21	$4	Break-even
$0	$22	$3	$1
$0	$23	$2	$2
$0	$24	$1	$3
$0	$25 (the strike price)	$0	**$4**
$1	$26	$0	$3
$2	$27	$0	$2
$3	$28	$0	$1
$4	$29	$0	Break-even
$5 and higher as the stock rises	$30 and up	$0	($1) and worsening as the stock rises

To help achieve a successful uncovered straddle, you want the widest possible profit range (in other words, you want to capture generous option premiums). In our example, the range is significant — $4 in either direction — assuming the underlying stock isn't exceptionally volatile and your options expire in two to five months (rather than longer). But remember, the trade creates unlimited potential losses outside the profit range.

One way to greatly mitigate that risk: When you write your straddle, use some of your option proceeds to simultaneously *buy* far out-of-the-money calls and/or puts, too — with strike prices at the two ends of your profit range (for this example, you might buy $30 calls and $20 puts; or just buy calls to protect you on that side and be ready to buy the stock via your written puts if it falls). Doing so, you've hedged and "covered" your written straddle, and because buying these options generally costs little, you'll still begin with a net credit from your option writing and keep that profit if the stock stays in a now slightly tighter range. For example, if you paid $0.80 total for the protective calls and puts, your profit range decreases by that amount on either side of the strike price. If you *don't* buy protective options initially, be ready to do so if the trade starts to work strongly against you.

Given that a steady stock can suddenly make a big move for any number of reasons, it's risky to write uncovered straddles without this added protection. However, another route is to simply own the underlying stock outright. Let's take a look.

Owning the underlying stock takes away all of the naked call option risk when writing a straddle. In fact, a covered straddle-writing strategy is basically a covered call strategy (as simple as Options 201), but it generally offers more profit potential because you're also writing puts on the stock. The key difference with a straddle is that both options are at-the-money, so you're more likely to see your options exercised. As with a covered call, it's important that you're ready to sell your stock if it rises. And as with writing puts, you need to be ready to buy more stock if it declines (or close the options early). The benefits of writing a covered straddle are two-fold:

1. Your profit can be higher and your profit range wider than with a mere covered call.
2. You have more ways to close your options profitably — and still keep your stock if you like.

Continuing our earlier example, let's assume you want to write a straddle on a steady $25 stock — but in this case, you own the underlying shares. You write $25 calls and puts, getting paid $2 each, with the same expiration date. Since you own the stock, no matter how high it climbs, you're covered on that side of your trade. Let's consider some potential outcomes:

- You end up selling your stock via the covered calls, but you keep the $4 option premium you were paid on the puts and calls, netting a sell price of $29 (compared with just $27 if you'd only done a covered call and not a straddle).
- The stock declines below $25. You end up buying more shares, but at a net $21 given the option premiums you were paid. You've added to your existing stock holding.
- The stocks holds steady, around $24 to $26. You can "buy to close" both the calls and puts by expiration and capture much of the profit while keeping your existing shares. Nice!
- Finally, as an example of the added flexibility here: Assume the stock increases to $28 by expiration, and you decide you want to keep your shares. Since you were paid $4 per share in option income, you could close your calls for $3, still have a $1 per share profit on your straddle, and keep your stock. If you had only written covered calls and not a straddle, you'd need to book a loss if you wanted to keep your stock.

Writing *uncovered* straddles requires keeping a close tab on your trade. If the stock is moving sharply against you in either direction, you may want take action to limit your losses. One way to do so is to close the losing side of your straddle when the stock reaches your break-even price. In our example, if the stock rises to $29, you might close your call options for a loss and let your puts go, presumably to expiration, keeping your overall losses marginal. If the stock falls, just be ready to buy it via your puts. Uncovered straddles don't usually lend themselves to rolling forward (to a later expiration date), rolling up (to higher strike prices), or rolling down (to lower strike prices), so you can't depend on these defensive follow-up moves being available to you. As mentioned above, if you *buy* out-of-the money protective calls (and puts, if you like) when you set up your straddle, your potential profit on the straddle is lower, but you won't need to consider follow-up action.

Writing covered straddles is much less risky and requires less upkeep, but you still want to keep a watchful eye on your strategy, since only your calls are truly covered. You need to be ready to accept more shares if the stock falls below your puts' strike price. For this reason, some investors will use a lower strike price on the puts they write, providing more leeway — but once you start to stagger strike prices on your calls and puts, you're not using a straddle anymore, you're using a *strangle* — and that's next in our series!

At *Pro*, we're not likely to write uncovered straddles without using some protective options as well. Writing covered straddles, however, is a sensible way to increase option profits on a covered call strategy as long as you're also willing to buy more shares if need be. With this strategy, you have another tool to profit no matter what the market throws your way — in this case, even if the market goes nowhere.

Please post your questions on our All About Options board.

Next in this series: Strangles

Monday Memo: A Close Look at Pro's Double-Digit Gains

Published Jul 20, 2009 at 12:00AM

From a sector standpoint, *Pro* measures up against the composition of the S&P 500 index like so (and note that the S&P is just a point of reference, not an aspiration):

Sector	***Pro*** **Stock**	***Pro*** **Allocation (excluding cash)**	**S&P 500 Allocation to Same Sector**
Technology	**Jack Henry & Associates** (Nasdaq: JKHY), **Autodesk** (Nasdaq: ADSK)	20.1%	18.8%
Health care	**Kinetic Concepts** (NYSE: KCI), **Medtronic** (NYSE: MDT)	14.1%	13.8%
Financials	**AmTrust Financial Services** (Nasdaq: AFSI)	10.9%	13.7%
Consumer staples	**Procter & Gamble** (NYSE: PG)	11%	12.1%
Energy	**Vanguard Energy ETF** (NYSE: VDE)	7.4%	12.1%
Industrials	**Lindsay** (NYSE: LNN), **Flowserve** (NYSE: FLS), **GrafTech International** (NYSE: GTI)	15.1%	9.9%
Consumer discretionary	n/a	0.2%	9%
Utilities	n/a	0.2%	4%
Telecom	n/a	0.7%	3.3%
Materials	**Plum Creek Timber** (NYSE: PCL), **Cameco** (NYSE: CCJ), **iShares Silver Trust** (NYSE: SLV)	20.3%	3.2%

All data as of 7/17/09.

A few notes: This includes the **Vanguard Emerging Markets** (NYSE: VWO) ETF's allocations, but we didn't include any outstanding options contracts (so no **Tupperware** (NYSE: TUP)). Also, you can divide our allocations by half given that our portfolio is still 50% cash -- for example, we're *overall* about 10% invested in technology rather than 20%.

Two things jump off the page: It looks as if we're relatively underexposed to consumer discretionary stocks and relatively overexposed (though we disagree) to materials. If you know how we think at *Pro*, neither of these things should come as a surprise -- we've been wary about consumer spending since last fall and were first bullish on commodities last winter. We still believe commodities and materials-related stocks will be among the first to lead us out of the recession.

Looking ahead, we also want significant exposure to technology (at the right price, of course), so we may want to double our allocation. We also want more international exposure, especially to smaller companies that are serving consumers. These present strong potential as enormous consumer populations in emerging markets garner more buying power. Speaking of size, let's look at the average value of the companies we've been buying.

Here's the *Pro* market-cap breakdown:

Invested Market Cap	***Pro*** **Portfolio**	**U.S. Stock Market***
Large (> $10 billion)	23%	68%
Mid ($2 billion-$10 billion)	33%	25%
Small (< $2 billion)	38%	7%

Source: MSCI U.S. Broad Market Index as of 6/30/09.

We're fairly evenly spread between large, mid, and small caps (if you include the **ProShares Short SmallCap600** (NYSE: SBB) ETF, which brings our net exposure to small caps closer to 33%). However, the median market cap of our holdings is $4 billion, so we're slightly skewed toward the smaller end of the spectrum. That's fine with us: Larger companies tend to be less volatile overall, but they typically sport slower growth; small caps are generally more volatile but have higher potential returns. So in the quest for handsome returns, we should benefit from having a bit more small-cap exposure than average, especially given that we're buying companies that generate strong free cash flow.

Yet there's a case for large-cap companies too, especially now. Large-cap valuations, primarily in the U.S., look cheaper than other areas of the market, so we're assessing the opportunities there. We're also looking at large caps in part to add more dividend payers. Our total dividend yield is currently 1.67% -- below the S&P 500 average of 2.2% simply because we've bought some companies that don't pay any dividends. But add to this about $20,200 in realized option income and another $5,100 in unrealized (but likely) option income, and we're well on track to "yield" 4% to 5% combined in our first year -- and that's with half of the portfolio still in cash. Despite this strong option and dividend income, we still want to increase our dividend income while yields remain attractive at some large companies.

All in all, we're pleased with the current positioning of the *Pro* portfolio -- and to be up by double digits today. In fact, excluding our cash, we're up more than 20% on what we've invested since October, while the market is relatively flat overall. But a portfolio cannot remain static, and we'll continue to make investment decisions for the long run. You can likely expect more exposure to large-cap dividend payers, international small caps, technology, and perhaps even some consumer discretionary companies. And remember: Stocks don't only go up, of course! We continue to seek shorts and hedges, and we're also focused on new option trades, including new strategies we haven't used yet. Meanwhile, where do you see the most opportunity today? Come weigh in on our Memo Musings board!

Fool on!

Jeff Fischer (TMFFischer) and Todd Wenning (TMFPhila)

A Smorgasbord of Discussions

- *Pro* Fools discuss trying to write puts on Nasdaq OMX.
- Todd shares his thoughts on the market from a technical perspective.
- Jeff shares some thoughts on **Intel** (Nasdaq: INTC).
- Which sectors will lead the next bull market?
- Russell posted his weekly CAPS analysis, focusing on the community's favorite sectors of late.

Portfolio Upkeep

- We bought another 2% stake in **Flowserve** (NYSE: FLS) at $63.34 and 1.5% in **Autodesk** (Nasdaq: ADSK) at $20.17 via our puts that were exercised over the weekend.
- Our July covered calls on **iShares Silver Trust** (NYSE: SLV) expired for a 100% cash gain. We'll look to write more calls for income soon.
- Finally, there's a lot going on at *Pro*, but always remember: We're calm, focused, and playing to win the both in short and long term -- there will always be new opportunities in stocks and options. And if you've posted questions that we've missed on the boards, please post again!

Audio Extra: Talking Shop With the Pros

Published Jul 17, 2009 at 12:00AM

In our latest Audio Extra, Jeff Fischer and Todd Wenning sit down for a casual chat about what they're seeing in the market, what lies ahead, and how *Pro* is taking advantage. Plus, earnings season is right around the corner -- get a preview of what's to come. Just click the player below to listen in!

83c2RwOgrjL3_9AG_M5rvaXyjr321pxj

The full transcript is below.

Jeff Fischer: Welcome to a new edition of *Motley Fool Pro*'s Audio Extra. I am Jeff Fischer. With me here is Todd Wenning.

Todd Wenning: Hey, Jeff.

Jeff Fischer: Hi, Todd. We are here to talk to you today about the market, about the *Pro* portfolio, what we have done recently, what we are looking at doing in the future, and about the coming earnings season. Let's start with the market, Todd. It was down five weeks in a row; it is up recently, these past several days.

Todd Wenning: It has been a really funny market, Jeff. Over the past nine months or so, if you take out that crazy pessimistic period between mid-February and early March, we are pretty much where we were back in early November. We have been trading sideways for the most part; it has been a pretty volatile ride. We have been saying that for a while now on the boards and we have been investing appropriately.

Jeff Fischer: That is true. It has been a 30%-40% swing, up and down, to get back to where we started. So if you were making the wrong moves at the wrong time, it could be really painful; if you were moving methodically and patiently and focusing on the quality of the companies that you are buying, then you should be OK; focus on the quality and the price.

Todd Wenning: That's right. And the investors have had a funny reaction to the volatility of the past 18 months or so. Recent data that I have pulled to show that over the past six months, $140 billion has been put into bond mutual funds while there has been a net outflow, a very small net outflow, into equity funds.

Jeff Fischer: Which I find fascinating, we find fascinating.

Todd Wenning: Yeah.

Jeff Fischer: Despite the market rallying so much since March, there is an outflow.

Todd Wenning: And it is sort of almost like investors are falling into two camps. One of them is they don't want to experience the same trauma they had experienced last year, so they are going into a lot more conservative investments like fixed income. On the other hand, there is also a school that is trying to get their money back and taking extremely high risks. Through May, there was $4.9 billion of inflow into emerging market funds and $12.6 billion into junk bond funds while there was an $11.2 billion outflow from large-cap U.S. stocks. So people are trying to get this money back as quick as possible and we don't think that is the right approach.

Jeff Fischer: That is interesting it mirrors the market pretty much, very volatile market up and down and now we have two sets of investors: those going for safety, and those taking the risk to presumably get back what they have lost.

Todd Wenning: Right.

Jeff Fischer: And I guess I would put us right in the middle.

Todd Wenning: I think that is the best place to be right now.

Jeff Fischer: I think so too and speaking of that, we have more option guides on the way, regularly and we are going to start to be able to introduce to you as more option strategies. We are only nine, ten months old; we have been focused on building the portfolio and of course those first many months, being very defensive given what we were seeing happen. But now that we have a foundation and we begin to have some companies where we own them at a good price and we have some stability and some profits there, we can start to introduce more option strategies on top of those and expand our portfolio that way, as well as continuing to buy good companies at good prices.

I think what we all need to do is remain calm and focused. You don't want to get excited when the market is up sharply, just as you don't want to become fearful when the market is down. So much of investing, as Warren Buffet says, is about temperament and just keeping your calm and keeping your system and your strategy in place.

Todd Wenning: And there is still a lot that is going on in the market that has yet to really reveal itself. You are still dealing with a lot of government stimulus in the market that could be playing with the natural ups and downs of the reports that we are reading, so personal income was up, but they hedge it by saying, well there was money put in by the stimulus and there is also unemployment checks.

Jeff Fischer: Right, the bounce that we are seeing is perfectly logical, but we expected to see a bounce after a descent of that magnitude, but we are not seeing any strength yet to carry any momentum forward.

Todd Wenning: There is no traction.

Jeff Fischer: Right; it would just be a bounce, period. But let's hope not. We are investing to do well either way, ideally. And speaking of that, we will have earnings coming up all this month and next month. Most of our companies are announcing results: **KCI** (NYSE: KCI), **Flowserve** (NYSE: FLS), **GrafTech** (NYSE: GTI), **Proctor & Gamble** (NYSE: PG), and we will be covering them on the boards and in the Monday Memos, so we hope to see you on the discussion boards. Todd, any closing thoughts?

Todd Wenning: These will be really interesting earnings reports because now you are dealing with the second quarter. The first quarter was sort of a wash. People expected it to be really bad. Now we are hoping to see some better signs from these companies, so we are hoping to see them deliver on those expectations.

Jeff Fischer: Right, like we saw from **Intel** (Nasdaq: INTC) recently and stronger results, a lot of it is inventory has been run down at their customers and so customers are now starting to buy inventory again. I think a lot of companies will see that. It is good to see. It means there is some bottom to the economy. It doesn't necessarily mean that there is growth about to follow, but still, it is a step in the right direction.

So thank you for being with us here at *Motley Fool Pro* and we will see you on the discussion boards and Fool on!

Write Puts on Lindsay

Published Jul 16, 2009 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") September $30 puts (ticker +NRRUF)
- **Target allocation:** Increasing from 4% to 5%
- **Trade allocation:** 3% (for *Pro*, 10 or 11 contracts)
- **Existing allocation:** 1%
- **Option's recent bid/ask:** $1.40/$1.60
- **Preferred limit price:** $1.20 or higher (4% of the strike price; please use a limit order at the going bid or higher — not lower — if that bid is acceptable)
- **Alternate trade:** Sell to open December $30 puts, recently bidding $3.10

We continue to see attractive long-term potential with **Lindsay** (NYSE: LNN), but we're building our position gradually because a recovery may take time. This round, we're writing ("sell to open") puts to potentially get an additional 3% at a cheaper price.

Lindsay's recent earnings were encouraging. Although third-quarter revenue fell 41% to $85 million from a year ago, margins held their ground, and net earnings totaled $5.3 million, or $0.42 per diluted share. Lindsay has shown superb cash management during this recession, increasing cash and equivalents by $19 million over the past year, decreasing long-term debt by $6 million, and achieving $18 million in free cash flow over the past nine months. Management has cut administrative costs, savings it suggests will remain intact even when the economy recovers.

As with many small companies, it's the ability to maintain profits despite severe adversity that suggests much more potential when the economy recovers. Lindsay's cost structure suggests profits will balloon as soon as orders start to increase and the company signs significant, large-ticket deals — either in infrastructure or irrigation. What's more, management believes that today's irrigation system prices are about the best farmers can expect (due partly to low steel prices), so many buyers are watching the market and likely preparing to make a move. With corn prices up 25% in the past quarter, farmer confidence may gradually return.

With today's announcement, we're also increasing our target allocation on Lindsay from 4% to a full 5%. It isn't often you find a superbly managed small-cap company that thrives on big-ticket orders yet remains nicely profitable even in an economic rut. Although shares don't look dirt cheap based on the past year's depressed results, they do look inexpensive on even modestly better results that we're likely to see in the future.

Put-Writing Specifics

You write ("sell to open") put options when you're willing and ready to buy the underlying stock should it decline below your strike price. Each put option represents a commitment to buy 100 shares of stock. With volatile Lindsay recently trading at $34.50, the September $30 puts are bidding $1.40 per share. The numbers meet our put writing guidelines:

- **Option payment or yield:** 4.6% in 64 days ($1.40/$30)
- **Strike price:** 12% below the stock's recent price
- **Break-even price:** 17% lower than $34.50, at $28.60

We'll make this trade in the next one business to 30 calendar days. To discuss this trade or ask questions, please visit our Lindsay board.

---

3 Put-Writing Candidates From CAPS

Published Jul 15, 2009 at 12:00AM

So how do you find a company that fits the bill? A great tool is the CAPS screener, which scours the CAPS community's 132,000 investors and 3 million stock picks (and counting) to find investment ideas. At *Pro*, we use CAPS to help us search for both long and short opportunities, and in conjunction, options. We can also use it to find strong candidates for a writing puts. I screened for stocks with a:

- CAPS rating of 4 or 5 stars (improving our odds for finding a good company)
- Market cap of more than $500 million
- Price-to-earnings ratio below 13 (the S&P 500 average)
- Price-to-book ratio below 2 (the S&P 500 average)
- 3-year beta greater than 1.2 (higher volatility equals higher option premiums)
- Long-term debt-to-equity below 50%
- Return on equity greater than 10%

This screen spit out 44 companies -- but for now, let's take a closer look at three of the more well-known businesses (keep in mind that these are not formal *Pro* recommendations):

Company	Industry	CAPS Rating	CAPShot Score

Corning (NYSE: GLW)	Technology	5 stars	8 of 12
Baker Hughes (NYSE: BHI)	Oil and gas equipment and services	5 stars	8 of 12
General Dynamics (NYSE: GD)	Aerospace/defense	4 stars	5 of 12

Data as of July 15, 2009.

While these companies are from diverse industries, they've all fallen on tough times along with the broader market. Corning generates the majority of its sales from display technologies, such as LCD screens for computers and TVs. As consumer spending on these big-ticket items declined over the past year, Corning's share price fell with it -- as low as $7.36 in late November. Meanwhile, Baker Hughes is involved in all stages of oil and natural gas extraction -- exploration, drilling, completion, and production -- so unsurprisingly, its business prospects are very reliant on expectations of oil and gas prices, which can be quite volatile. And General Dynamics generates most of its sales from government defense spending for things like combat vehicles and weapons systems, but also manufactures Gulfstream business-class jets, sales of which can be more sensitive to global economic changes.

Each of these companies also shares some of the characteristics we look for when evaluating put writing candidates. They're each free cash flow positive over the past 12 months, carry manageable levels of long-term debt, are undervalued relative to the market, and are supported by the CAPS community at large.

Next, let's check out some of the current put options available on the three stocks:

Company	Recent Share Price	Option Exp. Month	Strike Price	Premium (or Option's Bid)	Income % (Premium/Strike)	Break-even Price on the Stock
Corning	$15.75	August	$15.00	$0.50	3.33%	$14.50
Corning	$15.75	November	$15.00	$1.25	8.33%	$13.75
Baker Hughes	$37.00	August	$35.00	$1.35	3.86%	$33.65
Baker Hughes	$37.00	October	$35.00	$2.50	7.14%	$32.50
General Dynamics	$53.00	November	$50.00	$2.65	5.30%	$47.35
General Dynamics	$53.00	January	$50.00	$3.40	6.8%	$46.60

Data as of July 15, 2009 from Yahoo! Finance.

Again, none of these should be taken as formal *Pro* recommendations, but only as starting points for further research. That said, the Baker Hughes puts best satisfy the criteria set forth in Options 301. When we're looking at put options expiring in three months or less, we want the strike price to be more than 4% below the current market price, and we want to receive a premium that's higher than 4% of the strike, together giving us a break-even price at least 8% below the current market price. Both the August and October puts currently meet this requirement.

If this piques your interest, the next step is to do a business valuation on Baker Hughes to determine whether or not you'd be comfortable owning the stock at these potential buy prices. This is what we're always doing for you behind the scenes at *Pro* before we make any trade recommendations, and it's a crucial part of the investing process.

Hopefully this has helped shed some light on how *Pro* approaches put writing as well as how you can use CAPS to find additional ideas. As always, if you have any questions about options, please post them on our All About Options board.

Fool on!

Todd Wenning (**TMFPhila**)

Monday Memo: A Portfolio Review

Published Jul 13, 2009 at 12:00AM

These *Pro* stocks have attractive upside along with the most reasonable downside risk at recent prices.

AmTrust Financial Services (Nasdaq: AFSI) (target: 5%; current allocation: 4%)

Our niche insurance provider continues to sport outstanding performance numbers. With book value expected to grow nicely this year, the stock still looks inexpensive.

- Alternate action to buying stock today: Write ("sell to open") December $10 puts

Jack Henry & Associates (Nasdaq: JKHY) (target: 5%; current allocation 5%)

With software tailored to small- and mid-tier banks and credit unions (all of which may gain customers following the financial meltdown at the banking giants), a stellar balance sheet, high recurring revenue, and shares still trading at about 12 times free cash flow, Jack Henry remains a healthy risk-to-reward stock.

- Alternative to buying the stock today: Write December $17.50 or $20 puts

Kinetic Concepts (NYSE: KCI) (target: 5%; current allocation: 4%)

The majority of Kinetic's recurring revenue comes from renting its vacuum-assisted closure, or VAC, wound therapy system -- but its acquisition of regenerative medicine company LifeCell in 2008 gave the company myriad opportunities for future products. We love the results we're seeing from LifeCell so far this year.

- Alternative to buying the stock today: Write $25 or $22.50 puts

Medtronic (NYSE: MDT) (target: 5%; current allocation: 2.5%)

A *Pro* newcomer, this medical device giant will benefit from the aging of the baby boomer population and has significant competitive advantages that should support healthy profit margins for years to come.

- Alternative to buying the stock today: Write $32.50 or lower puts

Vanguard Emerging Markets (NYSE: VWO) (target: 5%; current allocation: 2.6%)

This low-cost ETF provides owners with wide exposure to mostly large companies located in rapidly developing economies like China, India, and Brazil. Emerging markets have been on a tear in 2009, so we recommend buying on dips. It remains a Buy First because we believe all portfolios should have some exposure to emerging markets.

We like our Buy recommendations as much as our Buy Firsts -- remember, we're building a portfolio that's meant to work as a whole. Some of these stocks may actually present more upside potential than the five stocks above, but they're also likely to be more volatile and present a bit more risk.

Autodesk (Nasdaq: ADSK) (target: 4%; current allocation: 2.5%)

Sluggish sales of Autodesk's ubiquitous AutoCAD software drew us to this beaten-down stock, as we believe business will rebound over time. So far we're up 20%, but we still see plenty of upside here. This high-margin business should begin to see orders recover in the design, construction, manufacturing, and engineering industries it serves, especially as government stimulus plans take hold and employment rates return to normal.

- Alternative to buying the stock today: Write $17.50 or lower puts

Flowserve (NYSE: FLS) (target: 4%; current allocation: 1%)

An investment in infrastructure, energy, water, and more, Flowserve still trades on the cheap -- about 10 times earnings. Margins continue to be strong for this valve, pump, and seal leader, and we look forward to seeing how backlog is holding up in the next quarter.

- Alternative to buying the stock today: Write $60 or lower puts

GrafTech International (NYSE: GTI) (target: 5%; current allocation: 3%)

As global demand for steel has cooled over the past year, we were able to start buying our graphite electrode maker on the cheap. GrafTech is an industry leader with a diverse global customer base, so we have great expectations for this stock as the economy recovers -- though as we've seen, it may be a rocky ride until then.

- Alternative to buying the stock today: Write $10 or lower puts

iShares Silver Trust (NYSE: SLV) (target: 3%; current allocation: 3%)

We continue see an opportunity to hedge inflation with this ETF, which owns actual silver bullion. But we're not silver bugs, so we only recommend this holding as part of an option strategy. Recent prices around $12 could be appealing for newcomers.

- Trades we like today: Write $12 puts or buy Silver Trust and write $13 or $14 covered calls

Lindsay (NYSE: LNN) (target: 4%; current allocation: 1%)

This maker of agricultural irrigation systems and road safety equipment stands to profit from a number of macroeconomic trends, including increasing demand for food, new infrastructure in emerging market countries, diminishing usable water supplies, and biofuels as an alternative energy source.

- Alternative to buying the stock today: Write $30 puts

Plum Creek Timber (NYSE: PCL) (target: 5%; current allocation: 3%)

A somewhat volatile stock, Plum Creek has fallen along with commodity prices, from $34 last month to below $30 today. But our opinion hasn't changed: With more than 7 million acres of timberland, Plum Creek is a solid commodity and asset play and an inflation hedge. Its solid (and tax-advantaged) 6% dividend doesn't hurt either.

- Alternative to buying the stock today: Write $25 puts; when the stock is back in the mid-$30s, consider writing $35 to $40 covered calls, as we've also done

Procter & Gamble (NYSE: PG) (target: 5%; current allocation: 5%)

The consumer staple giant remains best-of-class, but it's been struggling to grow in today's tough economy. A strong dollar and cautious consumer have made for headwinds since we bought. However, the stock looks inexpensive -- any lower and we'll be tempted to move it to Buy First status.

- Alternative to buying the stock today: Write $50 puts

ProShares Short SmallCap600 (NYSE: SBB) (target: 3%; current allocation: 3%)

We recently started a position in this ETF for the second time, as we still think small caps look expensive. What's more, Short SmallCap600 provides the *Pro* portfolio with a hedge against potential market declines. We'll continue to track this near-term investment closely.

Vanguard Energy (NYSE: VDE) (target: 3%; current allocation: 3%)

Over the past few months, the price of crude oil has recovered from lows (though it remains highly volatile) -- and so has this ETF, which holds dominant names like **ExxonMobil** (NYSE: XOM) and **Chevron** (NYSE: CVX) that should withstand the volatility nicely. Any real economic recovery or a slide in the dollar should bring oil prices higher -- so it may be a win-win for patient oil investors.

We don't recommend new purchases at current prices here, though you can still consider writing puts at lower strike prices for a potential purchase.

Cameco (NYSE: CCJ) (target: 3%; current allocation: 3%)

After a 40% gain, we put this company on Hold back in May. The world's largest uranium producer sees increasing interest in nuclear power and steadily growing demand for uranium. The company also has a controlling interest in Centerra Gold, which provides our portfolio with marginal exposure to the gold mining industry, another inflation hedge. We've written covered calls on part of our position due to valuation, but given Cameco's industry dominance, we'd also like to hang onto some exposure here.

- Trade we suggest: Write $20 or lower puts to buy Cameco in the high teens

So far, our companies are performing as well as we could hope in today's environment. All remain profitable and are cutting costs through the economic implosion. We look forward to the next batch of earnings starting this month (see the sidebar) and will keep you posted with the latest updates. Meanwhile, as we invest more of the portfolio with you, we anticipate plenty of new opportunities and strategies to come.

Stay Foolish!

Jeff Fischer (**TMF Fischer**) and Todd Wenning (**TMF Phila**)

Options 701: Buying Straddles

Published Jul 10, 2009 at 12:00AM

Before we walk you through an example, let's go over what can go right or wrong. On the plus side, when you buy a straddle, your profit potential is unlimited — the more the underlying stock moves in one direction, the more you can profit on that side of your trade. However, as with any option you *buy* (as opposed to writing options), you can lose your whole investment — in this case, if the stock stays tightly range-bound, the options would eventually expire with little or no value.

The clock also plays a large role, as the biggest drag on a straddle purchase is the *time-value erosion* of the options. Buying a call and a put, you've paid two option premiums, and with each passing week their value erodes unless the stock's volatility increases. If the underlying stock doesn't make a significant move in either direction, your options will steadily lose value. Plus, the underlying stock needs to move *enough* so that one side of your straddle (either the calls or puts) gains enough value to offset the losses on the other side.

Now let's "straddle up" and see how the strategy works. Here are the basics:

- You buy ("buy to open") an equal number of calls and puts on the underlying stock or index (usually you'll do this as a stand-alone strategy, so you won't own the underlying stock).
- The strike prices of the calls and puts should be the closest available to the current price of the underlying stock or index (also called "at the money").
- The expiration month on the calls and puts should be the same, and usually you'll choose an expiration up to four months ahead if you expect volatility soon, or six months or more if you want more time. Having more time for the strategy to work can be an advantage, but will cost more up front.

Let's use a real world example. *Motley Fool Pro* holding **Autodesk** (Nasdaq: ADSK) has been volatile as investors try to determine when business will improve. Suppose you believe the stock will move aggressively, in one direction or another, depending on the company's outlook in its next quarterly report. With shares at $17.50, you could set up a straddle that expires in three months, buying the October $17.50 puts for $1.65 each and the October $17.50 calls, also for $1.65 each. Your combined cost per contract is $3.30 ($330) — so, if you buy three contracts of each, your up-front investment is $990.

Say management sees business improving, and the stock returns to $22.50 the next month. Your calls are now worth at least $5 each, up from $1.65 each, while the puts are worth very little — you're losing money on them. Overall, though, your $990 investment is worth more than $1,500, a gain of more than 50%. On the flipside, if Autodesk's guidance is weak and the stock falls to $12.50, your puts are worth more than $5 each and your calls have little value. Your profit in this case, as with the opposite side of the spectrum, is 50%.

What if your thesis is wrong, and Autodesk stays within a few dollars of $17.50 for a few months? You're losing money on both the calls and puts in this case, and you might want to close them ("sell to close") early to get some capital back — unless you believe volatility will increase significantly and soon.

Straddles can benefit from more active management once the position is in place. There are two ways to potentially boost your profits while being defensive:

- If the price of the underlying stock increases to the next higher strike price (compared to the strike price you used to set up the trade), you may want to — depending on the number of contracts in play and your commission costs — close your existing puts and buy puts at that next-higher strike price to increase your profit potential. This is called "rolling up" the puts.
- Inversely, if the underlying stock *declines* to the next lower strike price, you should consider selling your calls and buying new calls at that next-lower strike price. This is called "rolling down" the calls.

While increasing the total cost of your strategy, these follow-up moves increase your chance for higher profits on any subsequent stock move. Roll up and roll down sparingly, though — reacting to every zig and zag in the stock can be a detriment when you consider the commissions, option premium costs, and the fact the stock could easily swing the other way again.

If your original thesis holds true and a stock makes a big move, you'll make more money on one side of your options than you'll lose on the other. If you believe volatility is subsiding, consider closing ("sell to close") both of your positions at the same time to lock in your profit. If you wait until expiration, you may slowly lose extra value in your options, or the stock may reverse on you again.

If your strategy isn't working in time, you may want to close both positions early to recoup some capital and rethink your strategy. Your calls and puts serve to hedge each other in the early going. However, both options will steadily lose value if the stock isn't making a move one way or another.

Finally, although it's unorthodox, if you earn a quick profit on one side of your straddle, you may want to lock in that profit and let the losing side stay active. You won't have much value left on that side anyway, and if the stock reverses, you may regain some of the losing option's worth without risking the profits you've already secured on the closed side.

If you believe a stock is going to move significantly — but you don't know which way — buying a straddle is a way to profit on either side. The enemy of the straddle-buying Fool is a stable or merry-go-round stock price, as the value of your purchased options will steadily erode unless the stock makes a lasting, meaningful move in one direction or another. But when you expect a big move either up or down, consider buying a straddle. Questions? Please visit our All About Options board.

Next in this series: Options 702: Writing Straddles

Write Puts on Nasdaq OMX Group

Published Jul 8, 2009 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") December $15 puts (ticker +NQDXC)
- **Allocation:** 5% if we get the shares (about 36 contracts for *Pro*, for a potential $50,000 stock purchase)
- **Recent option price (bid/ask):** $0.85/$0.95
- **Preferred limit price to use:** $0.80 or higher (*use a limit order*)
- **Minimum preferred limit price:** $0.70
- **Recent share price:** $18.90
- **Estimated stock fair value:** Mid-$20s
- **Strategy:** Puts pay you while you wait for a lower buy price. Please see Options 301 for details.

- **Special requirement:** You must be ready and willing to buy at least 100 shares (representing one put option) of Nasdaq OMX at $15 anytime between now and the option's expiration date.
- **Alternative trade:** Instead of writing puts, if you'd rather buy shares of Nasdaq OMX outright, we recommend entering a limit order at $15.

If You're New to *Pro*

We write ("sell to open") put options when we'd like to buy a stock, but at a lower price; we use this strategy often to build positions at better prices, or generate income. If the shares decline, our puts buy us the stock at our strike price by the option's expiration date. Meanwhile, the puts pay us a premium — income — that we can keep whether the stock declines or not.

Pro writes *cash-secured* puts, meaning you must have the money ready to buy the stock if it is put (sold) to you. You need permission from your broker to write put options, and getting that permission may take a few days. Once you have it, you can follow along using our guidelines in Options 301.

These instructions may look different from your broker's trading page. If *at any point* you're confused, just pick up the phone (or fire up a live chat) and have your broker walk you through the trade — better safe than sorry.

- First, make sure you have the means to buy at least 100 shares of Nasdaq OMX in case the put options are exercised. Given our strike price of $15, you need $1,500 in buying power for each put contract you write.
- **Do not buy these puts**.The order you want to make is "sell to open," "sell," or possibly "write" one put for every 100 shares of Nasdaq OMX common stock you're interested in buying. If 300 shares of Nasdaq OMX would be a 5% allocation for your portfolio, write three puts.
- The most you can profit from selling options is the amount you're paid to write the contract. That's it! So make sure it's worthwhile.
- The only possible outcomes here are that you buy shares at $15 (if the stock falls to that price or lower) and your options disappear (you still keep the option premium you were paid), or the stock ends the period above $15 and the options expire for a 100% cash gain. So don't sweat any big option swings between now and expiration.

Once your trade is made, your account will be credited cash for the puts you wrote, and you're on the hook to buy shares of Nasdaq if the stock drops below $15. If the stock holds steady or increases, your put options will show a bigger profit for you week by week. This option position will show up in your portfolio essentially as a short (a negative number) and your desire is that it is eventually worth $0, meaning you keep every dollar you were paid to write the put.

Questions? Visit our Nasdaq OMX board!

This is the third time that we'll write ("sell to open") put options on **Nasdaq OMX Group** (NASDAQ: NDAQ), the largest electronic stock exchange in the world. Since we first wrote puts in December, shares have been stagnant, and we've pocketed a nice chunk of income (see our closed positions) using a strategy of writing $15 puts while the stock traded in the high teens.

Today is more of the same. By selling puts with a strike price of $15 that net us a potential stock price of about $14.15, we're taking a cautious approach on the company and expect — most likely — the trade to become more income for the *Pro* portfolio. Our potential start price on the stock is just 7.5 times the average 2009 earnings estimate, so even if estimates decline modestly (as they have the past two quarters), we would be netting an inexpensive start price if we get the shares. In fact, it's inexpensive enough that we're willing to allocate up to 5% of the portfolio to the position at this price.

There are a few new developments this time around. First, Nasdaq OMX is seeing the first uptick in IPOs since the financial meltdown, a sign of a pending thaw. Following successful IPOs from **Rosetta Stone** (NYSE: RST) and **OpenTable** (NASDAQ: OPEN), among others, Nasdaq remains "cautiously optimistic" about IPOs the rest of the year and suspects greater strength in 2010. The best IPOs can attract significant trading volume and restart investor interest in other stocks, too.

Second, Nasdaq OMX's trading results for May show that its average daily trading volume in U.S. securities was up 16% year over year. It grew volume elsewhere, too, but market share battles and pricing wars with multiple competitors still keep us cautious, so we're sticking to our $15 puts. Plus, if a strategy is working, there's no reason to change it.

Put Specifics

If you're new to writing puts, please read our Options 301 guide. You write puts on stocks you're happy to buy at a cheaper price if that price comes along. Each option contract represents 100 shares of stock, so you must be willing and able to buy at least 100 shares of Nasdaq OMX ($1,500 worth) if your option is exercised. In this case, writing these options at recent prices would pay $0.85 per share per contract into your account. So if you write 10 contracts, you'll be paid $850 and you need to be ready to buy 1,000 shares ($15,000) if Nasdaq OMX declines below $15 by Dec. 19.

These options easily meet our put-writing guidelines, with the strike price more than 20% below the stock's current price. The options offer an effective 5.6% yield (more than 11% annualized) on the money you'll set aside for this potential buy (an $0.85 payment on a potential $15 purchase). Our break-even price of approximately $14.15 is 25% below the stock's current price. If you accept our lowest preferred option payment of $0.70 per contract, the yield is still an acceptable 4.7% over less than six months (about 10% annualized).

Pro Bottom Line

Investing is sometimes about building knowledge in a business and then leveraging that knowledge. If you can pull the same profit lever again and again, you should. Ideally, we'll be writing puts on Nasdaq OMX for a long time to come — or we'll get shares at an excellent price. We'd be happy buyers in the mid teens. Barring that, we'll take the income.

If you have questions about this trade, please post on the Nasdaq OMX board!

Buy ProShares Short SmallCap600

Published Jul 6, 2009 at 12:00AM

At a Glance

Short selling is usually a near-term endeavor (measured in months rather than years), so we've already developed some history with this ETF. **ProShares Short SmallCap600** (NYSEMKT: SBB) shorts, or moves inversely to, the daily performance of the SmallCap 600 index, thus serving as a meaningful hedge against our bullish positions. We first bought shares in January, only to sell them all for an attractive gain in March. In early May, we returned to the ETF and took a new 2% stake, and in the next two business to 30 calendar days, we'll be filling out our targeted 3% position with another 1% stake.

Since May, the U.S. market — and this ETF — has remained flat. So we're still looking at the same valuation today as we enter the July earnings season — and the public's doubts about an imminent economic recovery begin to resurface. Meanwhile, the S&P SmallCap 600 index continues to look expensive: It's heavily weighted in industrials (17%) and financials (18%), and after rising nearly 50% from March to May, it's trading at a lofty 26 times earnings. Looking ahead, analysts are calling for 15% earnings growth in the index, while we believe earnings will likely decline.

Our total 3% investment in ProShares Short SmallCap600, about $30,000, will represent 6.6% of the *Pro* portfolio's currently invested value ($455,000), a meaningful hedge. As before, we seek to earn 10% to 15% here and will consider closing if the ETF works against us by 10% or more. If earnings in July are surprisingly strong, we may be inclined to close the hedge.

Feeling defensive? Want to own a position that goes up when the market goes down? Remember that to do this short, you only need to *buy* the ETF. The ETF is designed to move inverse to the SmallCap 600 index. If you have questions, please post on the SBB board.

Monday Memo: Get Up to Speed With Pro

Published Jul 6, 2009 at 12:00AM

1: When does *Pro* announce its moves?

First, we announce our trades — about four to six per month — before we make them ourselves. You'll get these "Make the Trade" emails at any time during normal market hours along with a link to details on the reasoning behind our trade. Then, in the following two to 30 days (for stocks and ETFs) or one to 30 days (for options), we'll make our actual trade and send you a "Trade Complete" email at market close (4 p.m. ET) that day. We preannounce our trades so you can invest before us if you wish.

Tip: Only when you get the "Trade Complete" email is the position added to *Pro*'s real-money portfolio. At that time, you can see our start price, commissions, and other trade details on either the Portfolio page or on the stock's History tab.

2: What do I do with my losers?

If, like most Fools, you already own an array of stocks and want to sell some to buy *Pro* stocks, move gradually. We don't recommend going all to cash at once; instead, sell your least favorite stocks when you need funds to buy *Pro* stocks and ETFs you like better.

Tip: If you own stocks recommended by other investment services and need to sell some, first sell those that are not core holdings or recent recommendations. And sell those you simply like least.

3: How quickly should I get invested?

All of our holdings that are rated "Buy First" and "Buy" on the portfolio page can be bought at will; we believe in all of 'em. But in this volatile market, we also believe you should gradually average into anything you're buying. In fact, *we're* still in the process of averaging into most of our holdings — so we're patiently investing right alongside you.

Tip: Take your time and don't sweat price swings — we'll let you know if something is no longer attractive. Keep in mind that you're also learning option strategies you can use to buy our stocks more cheaply down the road.

4: What is a "preferred buy price," and how firm is it?

All of our trade reports (the tab labeled "What We Think") on stocks include a preferred buy price in the "At a Glance" section atop the report. However, paying modestly more won't make the investment a poor one. The preferred range is an *ideal*.

Tip: Also look at our fair value estimate for any stock (in the "At a Glance" section) and use that to help you determine whether the current price is attractive enough for you.

5: Can I make options trades with an IRA?

Most likely. Many IRAs will allow you to buy options and write covered calls, and some will let you to write cash-secured puts. Ask your broker.

Tip: Writing options is an especially savvy IRA move, since the income you generate is tax-free.

6: Should I make the options trades that are already in play?

Option trades are timely and opportunistic even when you use them strategically in relation to an underlying stock, as we do. Thus, new *Pro* members should typically wait for new option trades from us in order to get started. We'll have our first new option trades in a matter of days, so if you're ready to jump in (if not, that's fine — keep following along with our 7-step plan!), make sure your brokerage account is approved for options trading (and brush up with our how-to video). Ask your broker for options permission — typically, level two or three is ample. For now, you want to be able to buy calls and puts, write covered calls, and write cash-secured puts.

Tip: Each option trade we announce (with a "Make the Trade" email) will clearly explain the trade we're going to make and how you can follow along.

7: What can I expect as I start to trade options?

Profits can arrive regularly with options, but remain patient as you get started. A few months into this new way of investing you're going to realize that these strategies are available to you the rest of your life — and they're "renewable," so there are always new option opportunities. The key is to find great businesses, at fair prices, and use what you know about them to put together sensible options strategies. (And of course, we're here to help you with that.)

Tip: When writing options, let them be your shorter-term ATM machine; let the stock be your retirement-minded holding.

8: What is the meaning of life?

OK, we can't help with that one today. But the name of the game here at *Pro* is all about working with what the market hands us. As I wrote last week, we *welcome* a fair amount of volatility. It allows us to buy shares more cheaply and use more lucrative option strategies. For investors who know businesses well, price volatility presents opportunity.

Hey, old-school Pros! For those of you who got all of our questions right, take this opportunity to chime in on our Member Suggestions & Help board with the No. 1 thing you've learned during your months with *Pro* that's made your time here easier. We'll share the best tips in the next Memo.

Recent *Pro*recommendation Lindsay released encouraging results last Wednesday, with gross and operating margins holding strong in a difficult quarter (March through May) for both irrigation and infrastructure, the company's two business lines. Food prices have rebounded since April, but most farmers will wait to see if these levels hold before making a big-ticket purchase like a center-pivot irrigation system.

Lindsay management did a masterful job with the balance sheet, increasing net cash by more than $50 million year over year on the back of a cash-flow positive quarter. If Lindsay is operating this ably while the economy is in the dumps, we expect great things when it turns around. Looking ahead, China will be a huge growth opportunity for Lindsay, and stimulus funds earmarked for road improvements are only starting to have an effect. Most money will start to flow from the U.S. stimulus package in 2010. For more from Todd, please see his recent post.

Let the Pro Times Roll!

Please post your comments and questions on the Memo Musings board. You'll hear from us again soon. Fool on!

Jeff Fischer (**TMFFischer** on the boards)

Buy Medtronic

Published Jul 1, 2009 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Price when we released our original intent:** $34.60
- **Estimated fair value:** High $40s
- **Type of holding:** Core; Healthcare
- **Dividend yield:** 2.3%
- **Alternate trades:** Write puts.
- **Why buy:**
  - Medtronic leads five of six key medical-device markets, including pacemakers and other cardiac devices, and it has growing product lines to treat diabetes, spinal conditions, and more.
  - An aging population means an increasing number of people with cardiovascular and other health problems.
  - Trading at 1998 levels, Medtronic offers investors an opportunity to buy shares at just 10 times forward earnings estimates, a discount to average market prices.

The Big Picture

July 1, 2009

As we strive to anticipate — and take advantage of — emerging trends, the shifting global population is always on our radar. One of the biggest changes ahead is something we can all relate to: getting older.

According to the latest U.S. census figures, the world's 65-and-older population has increased 23%, to 516 million, over the past decade — and another huge influx is under way. Over the next five to 10 years, as Baby Boomers hit their golden years and China's 1960s generation follows suit, the percentage of elderly people in the world will continue to rise. Meanwhile, people are increasingly reliant on medical treatments to prolong and improve life — exactly the needs **Medtronic** (NYSE: MDT) delivers.

Although best known for its advancement of pacemakers, there's much more to Medtronic's business today. This $38 billion company has become the world's largest independent provider of medical technology, treating a range of chronic conditions with products and services such as deep-brain spinal cord stimulators, heart valves, implantable cardioverter-defibrillators, and drug delivery systems.

The company's reach and depth give it strong competitive advantages. Medtronics' 250-plus facilities, from research to manufacturing to education, serve customers and patients in 120 countries. The company aims to grow sales by 5% to 8% per year and hike earnings per share by at least 10% annualized over the long haul. Shares of the company trade at 11 times free cash flow (inexpensive by industry standards) and pay a healthy dividend yield of 2.3%.

Medtronic combines strong margins, a dominant market presence, and exposure to favorable demographics and emerging markets — not to mention an aim of growing earnings by double digits annually. At these prices, Medtronic is an enticing way to increase our portfolio's exposure to health care in the niche — medical devices — that has the most sustainable competitive advantages.

Our Take

In 1949, inspired by the workings of a metronome, Earl Bakken sat in his garage determined to build a better pacemaker — and so Medtronic was born. Over the years, the company's co-founder worked with leading surgeons to make huge strides in medical device technology. Today, Bakken's mission remains intact — and the company has grown to six major divisions, each focused on a specific condition or therapy:

1. **Cardiac Rhythm Disease Management** (34% of FY09 revenue, or $5 billion): Products include implantable pacemakers and implantable cardioverter-defibrillators, or ICDs. ICDs represent the company's biggest product line, generating $3 billion in fiscal 2009.
2. **Spinal and Biologics** (23% of revenue, or $3.4 billion): Products include artificial disks and bone graft stimulants.
3. **Cardiovascular** (17%, or $2.4 billion): Stents, heart valves, and open heart surgery grafts.
4. **Neuromodulation** (10%, or $1.4 billion): This division treats diseases and conditions of the nervous system. Products include neurostimulation systems and implantable drug delivery systems for chronic pain, movement disorders, and urologic and gastrointestinal disorders.
5. **Diabetes** (8%, or $1.1 billion): Medtronic has the world's leading prescription insulin pump, and its glucose-monitoring device is one of the company's fastest-growing products, with a 30% uptick in sales last year.
6. **Surgical Technologies** (6%, or $0.9 billion): Products for the diagnosis and treatment of ear, nose, and throat diseases as well as cranial, spinal, and neurologic conditions.

As you can see, Medtronic is pursuing multiple avenues of long-term growth. It's the market leader in five of its six divisions (and a still-impressive No. 2 in Cardiovascular offerings). Management has a strong focus on product innovation (it spent a massive $1.3 billion on R&D last year), targeting its fastest-growing markets, including diabetes and spine treatment. The company is looking to broaden its global footprint while making selective acquisitions, most of them small companies offering medical devices that complement and add to Medtronic's range. As CEO Bill Hawkins said recently, "Although we have much work to do, we still have the most comprehensive line of innovative products in the market ... No one can compete with the breadth of our portfolio."

Hawkins knows what he's talking about: Although he's only been chairman and CEO since 2007, he began his medical technology career back in 1977; his stint at Medtronic actually dates back to 2002, when he joined the company as president and chief operating officer. In his roles, he's proven to be a steady leader with a talent for making acquisitions. Overall, management has long been shareholder-friendly, consistently paying a growing dividend. Nearly half of the company's free cash flow was returned to shareholders via dividends and share repurchases over the past year, in line with management's long-term objective.

The Community's Take

Medtronic has fluctuated between 4 and a perfect 5 stars on CAPS over the past year, while the vast majority of top players — 98% — expect it to outperform. The company scores only a 6 out of 12 on *Pro*'s CAPShot; however, it was an 8 until a few days ago, when its CAPS industry rating and its rank in the industry ticked down. Medtronic also comes up shy on our aggressive growth hurdles (which most companies will miss in a recession), but overall it just misses on a few metrics that would otherwise kick it up to a 10. Thus, we're comfortable with its score.

Valuation and Financials

Medtronic's financial performance is impressive. We're especially drawn to the company's double-digit bottom-line growth rate and its strong gross and operating margins. But management isn't content to sit on its laurels, committing to finding $1 billion in cost savings by fiscal year 2012. Good news: They're already 40% of the way there.

For fiscal year 2010, Medtronic forecasts revenue growth of 5% to 8%, with earnings per share of $3.10 to $3.20, reflecting growth of 8% to 12% — strong in today's environment. We expect free cash flow, which clocked in at a solid $3.4 billion over the past 12 months, to grow in kind. This strong free cash flow also makes the $6.7 billion in debt on the balance sheet — versus $3.9 billion in cash and investments — easier to accept.

At a recent $34.60, Medtronic trades at a forward P/E (on April 2011 estimates) of 10. Looking ahead and assuming a modestly stronger market and an improving economy, a company with Medtronic's dominance, margins, and growth rate should merit a P/E closer to the market's historical average, which is in the mid teens. Assuming a P/E of 15 on 2011 EPS forecasts of about $3.45 gives us a stock price of $51.75, some 50% higher than today. Using an 11% discount rate, our discounted free cash flow model puts fair value in the high $40s to low $50s. Looking at all the possibilities, we put a fair value on the stock around $50 to $51.75.

What Would Make Us Sell

Product recalls and pricey litigation are rampant in the medical device industry, and Medtronic hasn't been immune. In October 2007, Medtronic voluntarily recalled its Sprint Fidelis defibrillation leads, which may have been responsible for 13 deaths. The recall shrank the company's market share in implantable cardiac devices from 53% to 46% as competitors such as **Abbott Laboratories** (NYSE: ABT) prospered.

In fiscal 2009, Medtronic booked a post-tax $364 million charge for litigation, including the settlement of royalty disputes with **Johnson & Johnson** (NYSE: JNJ). In fiscal 2008 the corresponding figure was $274 million — so these are ongoing costs, though Medtronic excludes litigation when calculating normalized earnings.

We'll also eyeball future acquisitions, making sure the company doesn't overpay or take on an excessive level of debt. We'll be particularly wary of a mega merger or acquisition, as it may signal Medtronic is worried about its organic growth prospects. We do expect steady small acquisitions, however, as a way for it to stay ahead in a highly competitive field. **Boston Scientific** (NYSE: BSX) is half the size of Medtronic, but still a formidable foe, while J&J's $150 billion market cap is four times larger than Medtronic's.

The Obama Health-Care Plan

As with most health care companies, Medtronic will feel the effects of changing U.S. government regulation. However, CEO Hawkins says the company is part of the solution to rising health-care costs — and that it "has and will take a leadership position in enabling more efficient and effective health care."

Right now, some 46 million Americans lack insurance and are unable to receive the care they deserve — in a perfect world, reform will benefit both health-care companies and patients. For the time being, we believe health-care reform should not materially affect Medtronic's sales or profitability. In the future, reform may even expand Medtronic's addressable market base.

The Foolish Bottom Line

Medtronic is an expanding, recession-resistant company with solid operating margins and substantial free cash flow. Its international growth is impressive in emerging regions such as China, Central and Eastern Europe, Latin America, and the Middle East and Africa.

Meanwhile, Medtronic remains a technology leader. Thanks to solid free cash flow, it continues to invest big in research and development. And the company is shareholder-friendly, with a strong commitment to share buybacks and its dividend. With an inexpensive stock price, Medtronic is poised to generate healthy returns in the years ahead.

To welcome and discuss the newest entrant to our portfolio, please skip on over to our new Medtronic board.

Monday Memo: Your "Aha!" Investing Moment

Published Jun 29, 2009 at 12:00AM

Speaking of making money, on the *Pro*portfolio page, you may see five or six positions in the red — but nearly all of our strategies are going our way. For example, our iShares Silver Trust ETF holding is down a few percentage points, but the covered calls we wrote on it from day one have made us money on the position overall. Plum Creek Timber's stock is down about 8%, but the position as a whole is well in the green when you include the simple puts and calls we've written.

In fact, every *Pro* strategy has made money overall so far except one. Our only turkey? Mighty **Procter & Gamble** (NYSE: PG), down about 7%. Given P&G's dominance, management, and price, we don't think we need much more than patience, and we're happy to just hold the stock. Patience is an investor's best ally, so we'll "buy and watch" many of our core holdings like this — but we're always mindful of other tools at our disposal to ensure we keep booking gains. With each new position, we ask, "How much downside is possible here, and how do we repair that downside if it comes about?" If patience isn't the answer, we want to have a Plan B.

Do you have an "Aha!" investing moment? Tell your story on our Memo Musings board. Meanwhile, here's hoping for some volatility this summer!

Fools in China

Buy Lindsay Corporation

Published Jun 25, 2009 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Price when we released our original intent:** $31
- **Estimated fair value:** Low $40s
- **Preferred buy price:** $34.50
- **Special note:** This small-cap stock is thinly traded, so we request that you use a limit order and only buy at that set price.
- **Type of holding:** Core; Agriculture machinery
- **Dividend yield:** 1%
- **Why buy:**
  - Major macroeconomic and demographic trends favor Lindsay's two product lines: efficient irrigation systems for agriculture and highway equipment to build and repair infrastructure.
  - A strong balance sheet, smart management, healthy margins, and a diverse customer base combine durability with potential.
  - Although Lindsay shares often move in sync with prices of commodities and basic materials — where we have ample exposure — they are most closely tied to agriculture prices, where we're looking to gain exposure.

The Big Picture

June 25, 2009

In the coming decade, the greatest macroeconomic challenge will be managing the world's growing masses. The U.N. predicts the population will balloon to 7.3 billion by 2015 (a 500 million increase in just six years), placing enormous strain on resources and infrastructure — everything from food and water to transportation and energy. **Lindsay Corporation** (NYSE: LNN), a small manufacturer of agriculture irrigation systems as well as road safety and traffic management equipment, is an excellent way to invest in these two major, growing areas of need the world over.

Rapidly advancing economies including China, India, and Brazil are leading to higher incomes and a greater rate of consumption of food — especially protein, which is highly dependent on grain production. Simultaneously, roughly 15% of the world's population — more than 1 billion people — receives fewer calories than are necessary to remain healthy. Not all hunger is supply related, but all hunger requires more food being available in the right places. As a producer of irrigation systems that increase efficiency of land use, food productivity, and longevity of water resources, Lindsay provides a solution in a world that needs to greatly increase its arable land and crop production in a sustainable fashion.

When it comes to roads and rails, Morgan Stanley reports that emerging economies are expected to spend more than $22 trillion building infrastructure over the next decade. Since its stimulus was announced in November, China has already built more than 12,000 miles of rural roads and 276 miles of highway. Though road safety equipment is a new and smaller part of Lindsay's business, accounting for one-fifth of sales, it's growing — and it represents a second catalyst for value creation at this mere $380 million company.

Add it up, and we have a well-managed, small business positioned to profit from two key markets.

What We Think

From its origins as a sleepy farm equipment business in 1950s Omaha, Nebraska, Lindsay has grown into one of the top makers of irrigation systems in the world. Over the decades, it has learned to adapt to the volatile demand for food by expanding its business overseas, focusing on efficiency, and growing through acquisition. New technology is a recurring theme for Lindsay — in 2007, for example, it launched the Web-based FieldNet software suite, which allows farmers to manage their irrigation systems from anywhere in the world.

Water Works

Irrigation equipment accounted for 79% of Lindsay's sales in fiscal 2008 — but these aren't your average backyard sprinkler systems, folks. A typical Lindsay center-pivot system is approximately 1,300 feet long and irrigates up to 135 acres of a land (in circles, like so). There are three primary drivers for farmers to pick up Lindsay's pivot systems:

1. **Replacing antiquated equipment:** Lindsay estimates that half of the center-pivot systems in North America are more than 10 years old — and the typical life span of a system is 20 years. Replacing these represents a large market opportunity of about $5 billion.
2. **Switching from wasteful and labor-intensive irrigation methods:** The predominant irrigation system in the U.S. is gravity flow (aka flood irrigation), which uses ditches and pipes to distribute water across fields. Though popular, this method is extremely inefficient, is unable to irrigate uneven terrain, and wastes water and chemical treatments. Since the late 1970s, gravity flow has been in decline in favor of center-pivot systems, which have increased their market share from 17% in 1979 to more than 40% in 2003 (the most recent data).
3. **Converting from dry-land farming (where rain is scarce) to irrigated farming:** Only 13% of the total cropland in the U.S. (about 53 million acres) is irrigated at all. Because irrigation improves yields and profits, the appeal of adopting these systems is strong — and grows stronger as agriculture prices increase, which is likely over time.

Internationally, Lindsay has only just started to penetrate the irrigation market. A whopping 91% of the estimated 563 million irrigated acres overseas still use a form of gravity flow. Over the past five years, Lindsay has seen promising success abroad, increasing its international revenue more than four-fold, from $38.4 million in 2003 to $165.9 million in 2008. Lindsay has production and sales operations in four continents, and opened shop in China, the world's second-largest agriculture market, in 2005.

On the Road

Since agriculture prices — and thus irrigation sales — can be cyclical, we want to see Lindsay's infrastructure division steadily grow in size, too. In fiscal 2008, this branch represented 21% of Lindsay's revenue and grew 53% from 2007. In 2006, Lindsay made two acquisitions to build upon its own nascent infrastructure business: California-based Barrier Systems, a manufacturer of movable traffic barrier systems and road-safety equipment such as crash cushions, and Snoline, an Italian outfit specializing in road marking and safety.

The bulk of Lindsay's infrastructure business is conducted in the U.S. and developed Europe, but its next logical step is expanding further into emerging markets, including China, South Africa, and Brazil, areas it has existing offices. As countries around the world build, improve, and safeguard their roads and rails, Lindsay only needs to capture a tiny portion of the overall market to greatly increase the company's earnings power. Though a recent moveable barrier project in Mexico City has been delayed, the $19.6 million contract shows that the opportunities in infrastructure are lucrative.

Buffett on Board!

Lindsay's executive team is led by CEO Richard Parod, who has been in charge since 2000. He has extensive experience in agricultural irrigation, having served as an executive at Toro Irrigation prior to arriving at Lindsay. Parod has overseen seven acquisitions for Lindsay in the past eight years while keeping the balance sheet healthy, and expanded operations into Brazil, South Africa, and China.

And then there's Howard Buffett — son of the one and only Warren Buffett — who is himself a farmer and has graced Lindsay's board since 1995. Although Howard has stated that he'll let his term expire in January 2010 to focus on the family foundation and charitable organizations, the connections and experience he has brought to Lindsay over these 15 years are no doubt immeasurable and increase our confidence in management.

The Community's Take

Lindsay's CAPS score has been on a rapid ascent in recent months, moving from 2 stars on Jan. 2 to 4 stars today. Some 90% of CAPS participants expect the stock to outperform. The company scores a respectable 9 out of 12 on *Pro*'s CAPShot report. In fact, Lindsay was first spotted as a potential research candidate during a regular *Pro* team CAPShot analysis looking for companies with scores from 9 to 12.

Valuation and Financials

Lindsay's growth opportunities are intriguing, and the company's financial health lends us confidence as we wait. As of February, Lindsay sported $41.1 million in cash and equivalents versus $22.5 million in long-term debt; it's historically free cash flow-positive; and despite the cyclical nature of the agriculture business, it has turned in a profit each year for more than a decade.

Using a three-stage discounted cash flow model (to help determine the present value of estimated future cash flow) and conservative growth estimates for the next 10 years with 3% terminal growth, we estimate a fair value for Lindsay between $39 and $42. This gives us a strong upside from current prices of $31 a share.

Shares currently trade for just over 14 times trailing free cash flow and 12 times earnings, a discount to Lindsay's peers in the machinery industry. However, 2009 and 2010 earnings are expected to significantly lag 2008's strong results, making the stock look more expensive on a forward basis. This is partly why we're going to average into Lindsay shares slowly. At the same time, we recognize that when a turnaround arrives and irrigation orders begin to resume in greater numbers, Lindsay's earnings could easily catapult much higher than now expected.

Here are the company's long-term financial goals:

	Goal	Past 5-Year Average
Revenue growth	10% to 15%	25%
Operating margin	9% to 14%	8%
Return on equity	9% to 15%	10%

Considering the growth potential in emerging markets, we consider these goals attainable over time. How efficiently management can control operating costs and maintain balance sheet discipline will be the bigger question. We'll keep tabs on Lindsay's progress here.

Competition and Risks

Lindsay is not a well-known name on Wall Street — only five analysts currently cover the stock. That's somewhat surprising given that it controls an estimated 30% of the global pivot and lateral irrigation market. Its main competitor, the larger **Valmont Industries** (NYSE: VMI), controls 43%, but Lindsay's irrigation business has been growing faster — from 2003 to 2008, its irrigation division grew 148% versus Valmont's 94%. Valmont has a host of other businesses to tend to, including metal coatings, engineering support (for stadium lighting poles, microwave communications, and wireless towers), and utility support structures, that together constitute about 70% of sales. So Lindsay is the more focused company in its space, which should help it maintain a technological lead.

Another major competitor, so to speak, is Mother Nature herself. The more it rains, the less need there is for large-scale irrigation equipment, hurting Lindsay's sales. Lindsay's operations are primarily located in areas where rain is less abundant — in the U.S., that's west of the Mississippi River, and in China, the northern and western provinces. It's no surprise, for example, that Lindsay's Chinese operations are based out of Beijing, in the northeastern part of the country.

There's also the cost of Lindsay's products and the lumpiness of its sales: A center pivot will set you back about $50,000, and the average payback time is five to seven years — a significant investment for most farmers. But as crop prices rise, as we expect they will over time, upgrading to a center-pivot system becomes more attractive. It's important to remember, however, that farmers read the same headlines as everyone else, so in the short-run they may delay large purchases. Eventually this, too, shall pass. Meanwhile, large agricultural businesses (as well as governments) have the deep pockets to invest in watering systems even during a downturn, but we're still prepared for choppy results from quarter to quarter given that these are big-ticket items.

What Would Make Us Sell

Hunger is at its core a political issue (*see Revolution, French*), and one that world leaders can't afford to ignore. A global effort to increase crop yields is the best way to sustainably combat rising food prices, but political issues could pressure world leaders into fixing prices to keep food affordable. Artificially low prices for agricultural commodities would provide less incentive for farmers to upgrade to Lindsay's irrigation systems. A sustained global economic slowdown could have a similar effect on commodity prices. Additionally, most of the world's infrastructure projects are funded by government spending, so if these funds are reduced or delayed, it could impede Lindsay's road-safety business.

Significant and lasting challenges on any of these fronts could be enough to make us sell our stake. However, the more hopeful outcome is that the stock reaches or exceeds fair value in the coming years as orders resume and grow and commodity prices increase. Since cyclical stocks often overshoot on the upside, we'd view that as an opportunity to sell.

Foolish Bottom Line

Even assuming conservative growth over the next decade, Lindsay's stock presents an attractive opportunity at current prices — and a great way to invest in two global macroeconomic trends through just one small, well-managed company. If you have questions about Lindsay, please post on its new discussion board. And if you buy shares, *please use a limit order* at your desired buy price.

For more information on Lindsay, visit our board post on the topic.

Monday Memo: Pro Gears Up for the Future

Published Jun 22, 2009 at 12:00AM

Our strategy is designed to produce results in any market. We're working to build long-term wealth with core stock holdings, and our returns are greatly complemented with steady option income. In addition, we seek to capitalize on global trends, overpriced sectors, and market volatility with ETFs, hedges and shorts, and potentially bonds, too. We'll have slow and challenging periods, too, but the positive results we generate should compound over the years, packing on more and more heft — to allude to Warren Buffett's snowball analogy — as we roll along.

We're doing this first by buying strong companies that are undervalued — building and diversifying our portfolio. We've been augmenting this process with two key option strategies so far: writing ("sell to open") puts, which pay us income or net us a lower buy price on a stock we want to add; and writing covered calls on select stocks in order to sell shares at higher prices, or earn income if higher prices don't materialize. Both of these strategies continue to create income for the portfolio while we buy companies positioned to produce long-term rewards, too.

Here's a peek at some of what's in store for coming weeks:

- We'll add brand new stocks and ETFs to the portfolio (don't miss our newly updated ABCs of ETFs guide).
- We'll continue to average into our favorite existing positions (letting you get in first with "Make the Trade" emails).
- We'll write new put options to potentially build stock positions or generate income (get a refresher with our newly updated Options 301 guide). We just had three positions expire this weekend for full cash gains.
- We'll continue to write covered calls on some positions bought for that purpose, including the **iShares Silver Trust** (NYSE: SLV) ETF (our Options 201 covered call guide is also newly updated).
- We're seeking potential shorts in order to profit on a possible decline in stocks or indexes that we believe have become overvalued since March.
- We'll highlight a market trend we're seeing unfold with a new CAPS screen in the coming weeks, among other things.

But despite the abundance ahead, I want to remind everyone that we remain patient and disciplined. We're ultimately focused on the long term, even as we use near-term income strategies. And of course, the whole *Pro* team is here to help you. So take your time, get to know us and our strategies, and enjoy yourself.

Our FAQ pages cover much more, but here's a start:

- **Can I make option trades in an IRA?** Yes, you can buy options and write covered calls in an IRA, tax free. Some IRAs will also let you write cash-secured puts. Ask your broker.
- **What level of options permission do I need to follow *Pro*?** It varies by broker, but level 2 to 3 (the ability to buy and write calls and puts) is typically sufficient for now.
- **How much of each *Pro* stock do I buy?** If you want to mirror *Pro*'s portfolio, see our buy reports and buy our committed (or actual) allocation so far, rather than our full target allocation (unless we've met that target already). In most cases, we're still averaging into our positions.
- **What is a good broker to use?** From Scottrade to TD Ameritrade, ThinkorSwim to OptionsXpress, Schwab, Interactive Brokers, and others, *Pro* members use 'em all. If you're looking to trade options, just about any discount broker will work, but some have stricter options permission policies than others, and IRA policies differ. The Motley Fool's Broker Center is also a great resource.
- **Should I buy every stock right now?** We typically buy positions gradually, especially in a market this volatile. You might consider buying partial positions in our Buy First stocks each week, gradually building. Keep your existing positions, only selling them gradually when you like a *Pro* buy better.
- **How are trades announced**? "Make the Trade" emails come to you at least two business days (one day for option trades) and no more than 30 calendar before we make our trade. This gives you the chance to beat our price. After we execute a trade, we will send you a "Trade Complete" email alert with details after market close (4 p.m. ET) on the day the trade was made to keep all our members on an even playing field.
- For more of the most common *Pro* questions, please see our FAQ.

We're ready to have an active summer, but we're never too busy to help you grow as a Foolish investor. Please ask us your questions on the boards (no question is too basic) — we're here to help.

Invest Foolishly,

Jeff Fischer (**TMFFischer** on the boards)

Step 7: Make Your First Options Trade

Published Jun 15, 2009 at 12:00AM

Part of our **Profit With *Pro* in 7 Steps** series. Return to start page

Now that you're approved to trade options, it's time to put our strategies to work. If you're just beginning to use options, we're here to help (ask any question on our All About Options board). Here's a brief review of the strategies we've used so far at *Pro*.

Our Members Say ...

"I'm excited to say that my *Pro* subscription has been worth every penny so far. I did not expect I would become this experienced this soon in options." - **K. Willis, San Jose, Calif.**

Writing Puts

- When you'd be happy to buy a stock at a lower price, you can write puts. The option's strike price is your desired buy price for the stock.

When you write puts, if the shares do not decline to your buy price or lower, you keep the option income and can write more puts. If the shares *do* decline enough by your option's expiration date, you still keep the option income, but you also get to buy the shares at your desired price (they're automatically sold to your account by the time the option expires). The option income lowers your cost basis in the shares even further.

Writing Covered Calls

Important Options Tip!

Sell, don't buy: You're not buying these options; you're the seller! Please be careful and make sure the command you use when writing covered calls and puts is "sell to open, "sell," or "write."

- When you already own at least 100 shares of a stock and would be willing to sell at a higher price, you can write covered calls at your chosen strike price.

With covered calls, it's just the reverse of writing puts: You already own a stock, and you write calls on it that pay you income. If the shares do not increase to your desired sell price before the option expires, you keep the option income and can write calls again. If the shares *do* jump to your sell price, your shares are sold ("called away") from your account at the strike price by the option's expiration date. You still keep the option income, which increases your net sell price.

In both cases, the options pay you income while you wait for your desired outcome.

On the surface, both of these strategies are quite simple once you become comfortable with them. What takes more work is choosing strong buy and sell prices on exceptional companies and then making sure the options pay you enough. Follow our trades and guidelines for a helping hand as you learn.

What's Next?

If you're ready to put options to work in your portfolio, we suggest you begin with our covered call trades, such as **iShares Silver Trust** (NYSE: SLV), keeping in mind our price guidance — which you can find in the "At a Glance" section of the buy reports (a.k.a. our "What We Think" reports). Next, watch for new put-writing trades (or visit those recently added to our portfolio). Writing puts is a great way to start building your *Pro* portfolio.

Once you've made your trade, come to our All About Options board and let us know how it went! Remember, you're never out there alone: On our boards, you can find the *Pro* team and an entire community of Fools to help answer questions as you go.

Completed all seven steps? Now you're ready for our bonus step!

« Previous Bonus »

Step 1: Get to Know Pro

Published Jun 15, 2009 at 12:00AM

Part of our **Profit With *Pro* in 7 Steps** series. Return to start page

Ready to start building a robust portfolio, learn smart new investing strategies, and profit in any market? It's easy to begin. Here are the key things you can expect as a new *Pro* member.

Our Members Say ...

"For those new to *Pro*, this stuff really works. I've generated steady streams of income in the past few months as this market has gyrated up and down."

– S. Busco, Simi Valley, Calif.

"I'm so impressed by the dedication of the staff (and members as well) at *Pro*. This is the first TMF service that actually teaches us how to fish rather than just just laying fish at our feet."

– B. Spurlock, Gainesville, Fla.

Pro, Straight to Your Inbox

All the important news from *Pro* gets delivered directly to you via email. Here's what to expect in your inbox:

"Make the Trade" emails: We announce all of our trades *before* we pull the trigger so you can get in before we do. We send these alerts during normal market hours. If it's a brand new stock or ETF, you'll get access to our full buy report, too.

"Trade Complete" emails: On the day we make our actual trade, we'll notify you soon after market close (4 p.m. ET) with an email that includes all the transaction details.

Monday Memos: Stay on top of *Pro* happenings — every Monday at 4 p.m. ET, we'll send you stock news, market insights, and trade ideas. It's your Monday must-read!

Guides, Audio Extras, special updates: Become a better investor! Learn about *Pro*'s strategies, listen to the team talk stocks, and get the latest on happenings in your portfolio.

Get to Know the *Pro* Site

Watch Our Site Walk-Through

Though you'll probably start at Home, the *Pro* site has four main areas that we'd like to call attention to:

- Portfolio: Find out how our stocks, ETFs, and options are performing, get transaction details, and see Buy First, Buy, Sell, and Hold guidance. Then track your own performance with My Scorecard.
- CAPShot: Get proprietary, in-depth reports on our holdings or enter a ticker into our tool to analyze any stock according to *Pro*'s 12 key criteria.
- Features: Here you'll find all our Memos, Audio Extras, guides, and other articles. We'll of course email you any time there's something new for you to read.
- Community: Our discussion boards are home to investors of all levels, from beginner to expert. *Pro* Fools come here to talk stocks, share advice, and have fun.

What's Next?

Now that you know us, help us get to know you! We have a vibrant community at *Pro*, so don't be shy — come introduce yourself on our discussion boards. Let us know where you're from and how long you've been investing, ask a question, or just say hello. (New to the boards? Watch our how-to video on *Pro*'s community page!)

We can't wait to hear from you and welcome you to the *Pro* community!

Step 6: Become an Options Pro

Published Jun 15, 2009 at 12:00AM

Part of our **Profit With *Pro* in 7 Steps** series. Return to start page

Our Members Say ...

"With the help of *Pro*, I stopped the bleeding and reversed the flow. With options added in with stock purchases, I have made close to 30% since I signed up."

– Barry M. Buford, Ga.

You'll notice that a big part of what sets *Pro* apart from other Fool services is our use of options and short selling to improve returns. Whether the market is up, down, or flat, we have strategies that will help you generate profits — and hedge your *Pro* positions, too.

That doesn't mean we're option "traders." Our use of options is tied to a Foolish understanding of the underlying holding, and our approach is valuation based. We thoroughly analyze and value businesses first and foremost before determining the best options strategy to take. Ready to add options to your investing toolbox? Let's get started!

Print Our Options Guide: It's easy on the eyes! Learn options basics the *Pro* way with our printer-friendly version of Options 101, 201, and 301.

Choosing a Broker

Our members say Scottrade, TD Ameritrade, ThinkorSwim, OptionsXpress, Schwab, and Interactive Brokers are all good choices. Some discount brokers have stricter options permission policies, and IRA policies differ, so just take a minute to dig a little and find the broker that's right for you.

Get Your Account Approved

If you want to trade options along with *Pro*, first you'll need to get approval from your brokerage. It's easy!

1. Ask your broker for full options approval, typically level 2 or 3 (it can vary by broker).

2. Fill out, sign, and mail in a simple one-page document.

3. After a week or two, you'll be approved!

Slide on over to our All About Options board if you have any questions.

Pro Video: Options in 3 Steps

As a bonus, we've put together a short video for you to help kick off your options experience. Watch as *Pro*'s own Jeff Fischer and Todd Wenning explain the basics of options trading, show you how to apply for approval, and even walk you through an online options trade step by step:

What's Next?

While you wait for approval, read those options guides (a printer-friendly bundle of Options 101, 201, and 301 can be found here) and become familiar with calls and puts. Then, come chat about what you've learned on our All About Options board.

Profit With Pro in 7 Steps

Published Jun 15, 2009 at 12:00AM

Now that you're a full-fledged member of *Motley Fool Pro*, it's time to start making money. The best way to be successful with *Pro* is to invest alongside us as we build a winning portfolio of long-term stock holdings, ETFs, and options.

Our **Profit With *Pro* in 7 Steps** plan is designed to help you begin investing with us at your own pace — though we recommend mastering one step a week. To keep you moving, we'll send you a gentle reminder and bonus tip in each of our upcoming Monday Memos.

Ready? Let's get started!

Print it! For a printer-friendly version of our 7-step plan, click here.

Step 4: Diversify With ETFs

Published Jun 15, 2009 at 12:00AM

Part of our **Profit With *Pro* in 7 Steps** series. Return to start page

Using CAPS to Dig Deeper

To find top ETFs on CAPS, just select the ETF tag and sort by rating. Or go to the CAPS screener and follow these steps:

1. For sector, select "Financial."
2. For industry, select "Financial Services."
3. For market cap, select "Mid Cap."
4. Under CAPS Rating, select "Rated Between 4 Stars and 5 Stars."

5. Click on "Search Now."

About 15% of *Pro*'s holdings will be exchange-traded funds, or ETFs — portfolios of stocks, bonds, commodities, or currencies united by a specific focus. Streamlined and cheap, ETFs are the ultimate investment tool when it comes to diversification, flexibility, and hedging.

Pro mainly focuses on long ETFs, but we'll short sectors we think are mispriced. Now it's your turn to take advantage of rising or falling global trends along with us by adding an ETF or two to your portfolio!

Here are *Pro*'s current ETF selections:

- **ProShares Short SmallCap600** (NYSE: SBB): In the course of just two months, the S&P SmallCap index has jumped 50% on what we consider to be weak or unsubstantiated economic data. Short the index with this ETF.
- **Vanguard Emerging Markets** (NYSE: VWO): We believe emerging markets are poised to grow much more robustly than developed markets, and this ETF allows us to profit from that trend.
- **Vanguard Energy** (NYSE: VDE): The sharp decline in oil and natural gas prices over the past six months has created a window of opportunity for long-term investors.

You'll also see **iShares Silver Trust** (NYSE: SLV) listed on our portfolio page; this is part of a covered call strategy (more on that later), so we don't recommend buying it outright.

What's Next?

Now that you're familiar with ETFs, it's time to dive in and diversify! Start with any of our ETFs labeled Buy First, then add our Buys. Questions or comments about ETFs? Visit our ETF Center board!

Step 3: Let Us Know How You're Doing

Published Jun 15, 2009 at 12:00AM

Part of our **Profit With *Pro* in 7 Steps** series. Return to start page

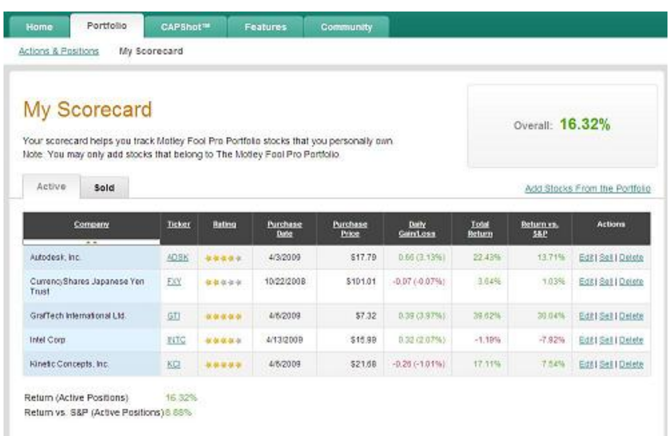
Congratulations, Fool! Now that you've invested with *Pro*, you've taken your first big step toward building a diverse, well-balanced portfolio.

Next, track the performance of your *Pro* holdings (options support coming soon!) with My Scorecard, a new Fool's tool that allows you to see your stock returns on a single page.

It's a snap to start tracking — just follow these steps:

1. From our portfolio page, find the stock or ETF you've purchased and select "Add" in the "I Own This Stock" column.
2. Enter your purchase date and purchase price, then select "Save."

That's it! You're all set to begin watching your *Pro* portfolio's progress.



What's Next?

Now you're ready to see how your *Pro* portfolio is performing — and you'll be letting us know how you're doing, too. Keep adding new stocks and ETFs as you make more purchases with us.

« Previous Next »

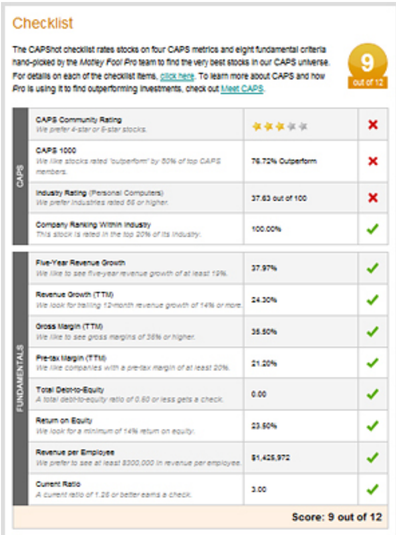
Step 5: Rate Your Portfolio

Published Jun 15, 2009 at 12:00AM

Part of our **Profit With *Pro* in 7 Steps** series. [Return to start page]

As a member of *Pro*, you have access to our proprietary CAPShot Report, designed to identify the strongest stocks in the CAPS universe — those with leading growth rates, strong margins, and healthy financials.

At *Pro*, we use the CAPShot as an additional screening tool to make sure only top-notch holdings make it into our — and your — portfolio.



The CAPShot checklist rates stocks on four CAPS criteria (CAPS community rating, CAPS 1000, industry rating, and company ranking within industry) and eight of our own hand-picked fundamental criteria (5-year revenue growth, trailing 12-month revenue growth, gross margin, pre-tax margin, total debt to equity, return on equity, revenue per employee, and current ratio). [Learn more here].

What's Next?

Now that you're familiar with the CAPShot, run your holdings through the tool and let us know how *you* score on the [Stocks That Interest You board]!

[« Previous] [Next »]

Monday Memo: Watching What's Driving the Market

Published Jun 15, 2009 at 12:00AM

While we're gearing up for a busy week at *Pro*, the S&P 500 isn't exactly sleeping, either. The index's 38% bounce since March has been impressive, but much of the gain has been driven by cyclical stocks — companies that are highly reliant on the ebb and flow of the economy, including commodity-based industries such as steel, oil, and basic materials, as well as machinery and construction.

On the one hand, it makes sense that these stocks have bounced first. They were punished most severely in the downturn, so they have the most ground to regain. Defensive stocks that are less reliant on a healthy economy — including food packagers, consumer staples, and health care — have less to gain from a recovery because these businesses slackened less to begin with.

On the other hand, these gains seem to have gotten, well, out of hand. According to AXA Investments (and quoted in [Bloomberg]), at current prices, basic resource and machinery stocks are trading at 1.3 times the average valuation of traditional defensive stocks — that's a 30% premium. Characterized by less-stable profits, cyclicals usually trade at a 10% *discount* to defensive stocks, so these valuations are rare.

At *Pro*, our decision to buy cyclical stocks before they regained popularity has given our portfolio a nice boost. We invested early and often in hard-hit companies like GrafTech (steel), **Cameco** ([NYSE: CCJ]) (uranium), and **Flowserve** ([NYSE: FLS]) (industrial fittings) — and as we expected, they bounced back first as recession fears eased. While Cameco is currently on Hold, GrafTech and Flowserve remain Buys at *Pro* despite their run-ups: These are attractive businesses, and they provide good hedges against inflation and a weakening dollar.

But as the market shifts, so do opportunities. We now see more value in defensive industries such as health care, software, insurance providers, and international consumer staples. Expect to see more of *Pro*'s attention focused on these areas. As slow starts in **AmTrust Financial Services** ([Nasdaq: AFSI]) and Jack Henry & Associates may attest, this isn't the hottest area of the market right now — but we're willing to be patient. Stay tuned as we keep working to find the best new ways to position ourselves for more gains.

The *Pro*[community boards] are consistently one of our favorite daily stops. Here are just a few examples of why we're hooked:

- Our new [Getting Started board] is for any question you have about starting any aspect of your investing with *Pro*. Even if you've been with us since the beginning, you may periodically have questions for this board.
- **johnnyvol** explores the common conundrum of [leaving money on the table].
- **Smorgasbord1** started an excellent discussion on [solar technology stocks].
- **intellivestor** has his [eye on IPOs] — and so does *Pro*.
- **dentilfooling** wonders which is best, [writing options that expire soon] or that expire in a several months?
- I posted about [possible put writing] on **Procter & Gamble** ([NYSE: PG]).
- Finally, **TMFEldrehad** (Russell) [explores a hot topic] of late: Is buy and hold investing dead? See what CAPS All-Stars are thinking.

We'll be making more trades soon. Meanwhile, stay Foolish, and ask any questions on the [Memo board]!

Jeff Fischer (**TMFFischer** on the boards)

Jeff owns shares of AmTrust Financial and Nasdaq OMX Group; Todd owns shares of Kinetic Concepts and Procter & Gamble.

Step 2: Invest With Pro

Published Jun 15, 2009 at 12:00AM

Part of our **Profit With *Pro* in 7 Steps** series. Return to start page

Finding Top Stocks

Jeff Fischer and his team diligently screen every stock that lands in the *Pro* portfolio. For the seven qualities Jeff looks for in a top-notch stock, see our Guide to Finding Great Stocks.

The best way to succeed with *Pro* is to invest alongside us. We do the heavy lifting for you, spending hours researching and vetting every investing recommendation and delivering it to you in easy-to-use buy reports.

What's more, since we're ultimately building a portfolio of long-term, core holdings, you don't have to make use of options in order to be a successful *Pro* investor. Fools solely following along with our long stock and ETF positions are building winning portfolios as well. Now let's start building yours!

Stocks the Pros Recommend

Make *Pro* Work for You

- Already fully invested or adding new cash?
- Using an IRA or have "only" 5 or 6 figures to invest?
- Don't want to use options?

No problem! Learn how to make *Pro* work for you and your needs.

Ready to dive in and begin investing with us? Great! (Hey options experts — you can fast forward to Step 7 now.)

To see all of our holdings, just pop on over to *Pro*'s portfolio page. The team's current favorites are labeled Buy First in our portfolio's "What To Do" column.

Start with any of our Buy First stocks or ETFs and then add our Buys.

Don't feel rushed, especially in this volatile market. Space your buys over a few weeks and slowly build positions incrementally.

Finally, pay special attention to our preferred buy prices, which you can get in each holding's detailed report — just click on a ticker, then select "What We Think."

Our Buy Firsts

Quick Stock Tip

You haven't missed the boat just because a stock has gone up since *Pro* bought shares. We believe all of our holdings are buys at current prices. If a stock is no longer a worthwhile opportunity, we'll put it on Hold and direct you to the best alternatives for new money.

As of June 15, 2009

- **AmTrust Financial Services** (Nasdaq: AFSI)
- **Jack Henry & Associates** (Nasdaq: JKHY)
- **Kinetic Concepts** (NYSE: KCI)
- **Vanguard Emerging Markets** (NYSE: VWO)

AmTrust, Jack Henry, and Kinetic Concepts all have strong, recurring revenue and are trading at a discount. Vanguard Emerging Markets is a great way for diversified investors to average into international stocks.

Fools looking to profit with *Pro* today need look no further than our Buy First stocks. Still, we understand that buying four stocks at once may not be for you, so don't feel like you need to match our positions in all of our Buy Firsts at once. Patience is a good thing! Build your portfolio slowly and deliberately and make each selection count.

What's Next?

Put it all together: As a stock holder, you're a part owner in a company — and that can be both rewarding and fun. Come share your progress toward building your portfolio with the *Pro* community on our Meet & Greet board.

Write Puts on Tupperware Brands

Published Jun 11, 2009 at 12:00AM

At a Glance

- **Target allocation:** 4%
- **Price when we released our original intent (6/11/09):** $26.40
- **Estimated fair value:** $50
- **Preferred buy price:** Up to $40
- **Type of holding:** Non-core; Discretionary consumer; Good for option income

The Big Picture

June 11, 2009

What's a piece of nostalgia worth to you? We're not talking your typical pet rock or hula hoop. This is an investment poised to benefit from shifting global trends, including how people shop for food, how they spend, and even how they eat. Toss in a reasonable valuation, decades-old competitive advantages, and fresh pasta salad for at least three days — and what do you have? Yes, we're talking about **Tupperware Brands** (NYSE: TUP). But this isn't your mother's Tupperware.

A seminal icon of '50s Americana, today the business earns most of its revenue overseas. Although its famous plastic containers are still the star of the show, Tupperware recently expanded into beauty and personal-care products, and overall the company is nicely profitable: In its fiscal 2009, gross margins topped 65% and net profit margin was a healthy 7% (the average profit margin across all businesses is 5%). A 5-star stock on CAPS, Tupperware trades at a cheaper-than-average price-to-earnings ratio of 11 and 13 times the year's free cash flow estimates, while paying an above-average dividend yield. At today's price, the shares appear to have good downside protection.

What's more, Tupperware is one of those well-positioned companies we love at *Motley Fool Pro*: It's weathering this downturn (even growing, when you strip out currency exchange rates) and is positioned to earn stronger results in better times, too. Although it's a consumer discretionary company, its storage containers aren't found in stores — rather, a direct sales force of a few million is on the front lines and growing as the unemployed look for nontraditional jobs. And while the share price is relatively volatile, with a beta of 1.65, that means the options pay well — making Tupperware a good candidate for writing puts and (if we get shares) covered calls.

Our Take

"No woman wakes up in the morning and says in her first hour, 'Geez, I've got to have some Tupperware.'" So says CEO and Chairman Rick Goings — and he's got a point. After all, burping bowls (so called because of the noise their lids make) are certainly not essential or repeat-purchase products. Yet even in this downturn, compelling big-picture arguments make Tupperware an appetizing opportunity:

- To save money, more people are cooking in batches and storing meals for later.
- Many people in emerging countries are starting to store food for the first time. Such economies account for about half of sales and are growing much faster than the U.S. economy.
- The Tupperware direct-sales army is now 2.3 million people strong and spans 100 countries — and it's still growing. It's also attracting superior talent as the rising ranks of the unemployed strike out on their own.
- The parties rage on: In 2008, there were 3 million more Tupperware parties than in 2007, and the average attendee spends less than $20 — a cost easily justified even in a recession.

Put it all together, and you've got a healthy business with positive catalysts that will help keep Tupperware fresh even if the economy stays sour.

Tupperware Everywhere

The company has five divisions (no points for creativity here): Tupperware Europe, Tupperware Asia Pacific, Tupperware North America, Beauty North America, and Beauty Other. Based on recent annual results, Tupperware products made up 65% of sales and 78% of profits, with beauty products making up the remaining 35% and 22%, respectively. Tupperware Europe, which includes the Middle East and Africa, is the company's biggest division, representing 35% of sales and 44% of profits. By contrast, Tupperware North America makes up just 14% of sales and 10% of profits. (We hereby urge North American readers to host a Tupperware party at their earliest convenience!) Meanwhile, emerging markets such as Russia, Indonesia, Brazil, and Venezuela are showing strong sales growth — 10% in Tupperware's fiscal first quarter.

Because 65% of Tupperware's business is generated outside of North America, foreign exchange rates have weakened the company's results due to the strong dollar earlier this year. In the first quarter of 2009, sales in local currencies grew 1%, yet when translated back into U.S. dollars, sales *decreased* 16%. This can cut both ways, of course. Since early March, the dollar has weakened against most major currencies, providing some relief. If this trend continues, Tupperware's reported sales figures are likely to increase sharply.

Meanwhile, CEO Goings — at the helm since October 1997 and with the company since 1992 — is an eccentric enthusiast for Tupperware. On conference calls, he comes across as part CEO, part motivational speaker for his sales teams and part globetrotter for the company — a plus in our book.

A Plastic Empire

Tupperware benefits from two primary competitive advantages: its brand and its sales model. The brand name is so strong that it's actually what's called a genericized trademark — that is, "Tupperware" is synonymous with the class of products it makes (think Kleenex, Q-Tip, Band-Aid — even Google). Tupperware is considered the benchmark of high-quality storage containers: It even backs its copious catalog of products with lifetime guarantees.

Out in the field, Tupperware's sales force is a highly trained, dedicated group mostly consisting of women. Many report feeling empowered and liberated by their self-determined career path — and these millions of saleswomen can earn impressive compensation, too.

The Community's Take

Tupperware earns a perfect 5 stars on CAPS. As of June 9, a hefty 85 of 87 (98%) All-Stars ranked the stock an outperform, and among all CAPS participants, 260 of 273 (95%) rate the stock an outperform. The stock's composite CAPS score is 89, nearly placing it among the top 10% of all stocks rated, while it rates in the top 4% of all stocks in its industry.

On our proprietary CAPShot Report, Tupperware is a soggy sandwich, only earning 6 out of 12 points. Why? Like many stocks at the moment, Tupperware comes up short on our aggressive five-year and annual revenue growth hurdles. It's also light on our very aggressive net-profit-margin hurdle. Ideally, we'd like Tupperware to rate higher on CAPShot, but we're comfortable with the reasons it rates a 6 — especially because we're approaching it with an options strategy.

Cupboard of Challenges

As iconic as the brand may be, Tupperware's core plastic-storage container business faces constant generic competition. With people trading down all over the world, consumers may eschew Tupperware parties for a visit to their local **Wal-Mart** (NYSE: WMT) and its many cheap offerings, including Ziploc, Glad, and **Newell Rubbermaid** (NYSE: NWL) brand containers. In its beauty and personal-care division — forged via acquisitions in 2000 and 2005 — the company houses seven brands, including Avroy Shlain, BeautiControl, Fuller, NaturCare, Nutrimetics, and Nuvo. Here, Tupperware faces significant competition from the much larger, similarly modeled **Avon Products** (NYSE: AVP). Avon is the world's largest direct seller, marketing to women in more than 100 countries with a sales force topping 5.8 million.

Meanwhile, Germany — one of Tupperware's biggest markets — has seen its economy shrink faster than a cheap plastic container in a dishwasher. The U.S. market is facing challenges, too. In fact, Tupperware's established markets as a group were down 7% in Q1 2009.

Despite these challenges, we believe Tupperware will continue to produce steady, sustainable results — and grow. Emerging markets still present a large and expanding opportunity, and the U.S. market should at least remain stable and ultimately grow again. Time and again, at least in our households, Tupperware products ultimately outdo the generic competition in terms of design and durability. (Plus, they can be safely put in the dishwasher, keeping the housework-allergic among us very happy.) Finally, Tupperware's containers may seem to last forever, but they're often lost (left at a picnic or friend's house) or need to be replaced after a few years (those spaghetti sauce stains are hard to get out!). Tongue only slight in cheek, you might be able to sum up modern day kitchen life in just one sentence: People always need more Tupperware.

Valuation and Financials

With shares around $26, Tupperware sports a market cap of $1.6 billion, making it a smallish mid cap. It has net debt of a reasonable $490 million, bringing its enterprise value (market cap plus debt, minus cash) to around $2.1 billion. In 2008, sales were $2.16 billion, so the company doesn't trade at a premium to sales. Gross margin was an impressive 65% and operating margin 11%. All of this translated to a net profit of $161 million, or $2.56 earnings per diluted share, last year. Tupperware is absolutely committed to its dividend, paying $0.88 per share in 2008. (However, it has not increased in more than a decade.)

Tupperware expects full-year 2009 sales to increase in local currency (measured in every country where sales occur) by 2% to 5% over 2008 levels. When translated into U.S. dollars, the forecast calls for reported sales falling by 8% to 11%. Diluted earnings per share is expected to be $2.16 to $2.26, down from $2.56 in 2008.

Wait, you're probably thinking — you said Tupperware is growing! Well, excluding one-time charges, 2009 would represent an earnings increase over the prior year of 3% to 8% in local currency. Tupperware therefore trades at a modest P/E of around 11 times this year's expectations, and 13 times this year's estimated free cash flow (it's currently at 16 times slightly depressed free cash flow for the past 12 months). Our potential buy price via puts is $22.85, or 11 times estimated free cash flow for 2009 and 10 times estimated 2009 earnings per share — conservative prices.

In a better market and a stabilizing economy, Tupperware would likely see margin expansion (investors willing to pay a higher valuation multiple); the historical market average P/E of 14 to 15 would price shares above $30. At the upper end, $35 per share would put the stock at 14.5 times the 2010 consensus earnings estimates — which appear reasonable — of $2.40 per share. Our discounted cash flow model, though, with a high discount hurdle of 12% factoring in inflation and currency risk, values shares up to $30. Given the competitive nature of Tupperware's low-tech business, we favor our conservative valuation. Therefore, we're beginning with an options strategy to potentially buy shares lower.

Put-Writing Specifics

We write ("sell to open") put options when we'd be happy to buy a stock cheaper, but will be happy to earn income if we don't get the shares. With options expiring in four months or longer, we want the puts to pay us at least 7% to 10% of our strike price (that's our effective yield). Bidding $2.15, the October $25 puts currently pay more than 8% and expire in just over four months. Netting us a potential buy price of $22.85, the stock is currently 14% above our break-even price. Both figures meet our guidelines in Options 301. Remember, each option contract represents 100 shares of the stock, and you must be ready buy the stock anytime it falls below your strike price. Other options you could consider selling to open include July $25 puts and October $22.50 puts.

What Would Make Us Change Our Strategy

Excluding the effect of currency exchange rates, Tupperware is forecasting steady year-over-year growth. However, most of Tupperware's products (including its beauty division) are discretionary, so consumers may cut back more than management expects if the recession drags on. If sales began to drop on an absolute basis, we'd seriously question our big-picture reasons to own this stock or use options on it. We'll also be the party police, keeping a close eye on Tupperware's sales force and how its party numbers are holding up. These are absolutely key metrics for the business — and therefore leading indicators of potential problems.

Pro Bottom Line

Tupperware Brands is an easy-to-understand business with macro trends — emerging market growth, more consumers eating at home and packing lunches for work — in place to support its usual steady long-term results and promote international growth. The company has competitive advantages, demonstrated by its long history and the enduring (endearing, even) qualities of the Tupperware party. The stock is modestly valued, and with any luck we can use options on it — and potentially own it — for a long time to come. Questions? The party is over on Tupperware's new discussion board. We'll bring the chips and dip.

Monday Memo: Most Stocks Are Losers

Published Jun 8, 2009 at 12:00AM

Awake the Sleeping Options Giant!

We'll likely have more option trades soon as our puts on **Nasdaq OMX Group** (Nasdaq: NDAQ), **GrafTech International** (NYSE: GTI), and **Intel** (Nasdaq: INTC) all look set to expire as 100% cash gains one week from Friday. If we see a new trade we like, we may close these early to take advantage.

Are stocks a loser's bet?

This was the question posed in a recent *Money* magazine article. The facts: A study from Dimensional Fund Advisors looked at the University of Chicago's total equity market database and came to the conclusion that a mere 25% of the stocks in the U.S. market were responsible for *all* the gains from 1980 to 2008. While the U.S. market as a whole generated a 10.4% annualized return, take out these "superstocks" (*Money*'s term), and the remaining 75% of stocks actually generated an annualized *loss* of 2.1% over the past 29 years.

That's right: Three-quarters of U.S. stocks lost value. This actually makes sense — just look at your local strip mall: As the likes of **Wal-Mart** (NYSE: WMT), **Best Buy** (NYSE: BBY), and **Home Depot** (NYSE: HD) eat up real estate and market share, smaller businesses struggle just to maintain a foothold. Many simply disappear. Across all industries, that's the nature of a free-market economy (unless you get bailed out by Uncle Sam — but I digress).

What Does This Mean for Investors?

The study goes a long way in explaining why most investors and mutual fund managers fail to beat the averages. With three out of four stocks losing money, even a skillful stock selector faces formidable odds.

So what should you do? First, you need to buy truly strong and lasting businesses at reasonable prices. Our *Pro*stock criteria are designed to help us do just that — and let's not forget that the young and growing CAPS community is also identifying outperformers.

Second, as The Motley Fool has always espoused, some of your money should be in passive indexes. Index funds cast a wide enough net to catch a number of winners — and grow in value overall, just like the market. We've taken this approach with the **Vanguard Emerging Markets** (NYSE: VWO) and **Vanguard Energy** (NYSE: VDE) ETFs. The small-cap universe, where the winners win big but the losers are many, is another sector where an index may be our best strategy.

Third, strategies that go beyond stocks increase your potential for overall success. Options are great tools for producing your own returns and income, rather than merely relying on a stock to go up. And fixed-income investments become more important the closer you get to retirement.

In a market where a majority of stocks lose value over time, you can't simply cherry pick your way to winning returns. The odds are against you. But by recognizing superior stocks and adding indexes, fixed income, and options, we position ourselves to profit steadily over time — and achieve life's many financial goals along the way.

Around Pro: On the Boards

Here are a few of our favorite discussions on the *Pro* boards over the past seven days:

- Todd Wenning (**TMFPhila**) posted about the patience required for research when looking for our investments.
- **Randy8118** blasted off a discussion about the possibility of hyperinflation.
- Mike (**SilverHawk27**) generously posted his spreadsheet that runs option calculations.
- Finally, Russell Carpenter's (**TMFEldrehad**) latest This Week in CAPS post discusses reading between the lines when you're looking at CAPS data.

Fool on!

Jeff Fischer

Write Puts on Autodesk

Published Jun 5, 2009 at 12:00AM

If you don't own shares of Autodesk yet, you can still make a trade on this stock today. See "Alternate trades" below.

- **Action:** Write ("sell to open") July 2010 $24 covered calls on Autodesk
- **Allocation:** Write one call for every 100 shares of Autodesk owned (for *Pro*, 24 contracts)
- **Option's recent bid/ask (Feb. 3):** $2.05/$2.15
- **Preferred limit price:** $1.85 or higher, day order; if needed, no lower than $1.70
- **Recent stock price:** $23.70
- **Special requirement:** You must own at least 100 shares of Autodesk to write a covered call.
- **Alternate trades:**
  - **Don't own 100 shares of Autodesk?** Continue to hold your position.
  - **Don't own any shares of Autodesk?** The stock is on Hold, but you can write ("sell to open") puts to potentially buy shares at a lower price. The July 2010 $22 puts recently bid $1.45.

What's New

Autodesk sells its 3-D design software by the "seat" — one subscription per user — so weakened employment in construction, engineering, architecture, and technology means weaker sales for the company. Yet the stock is trading at a premium — and not because investors are still gaga over the role of Autodesk's software in the *Lord of the Rings* trilogy. Shares are priced at an aggressive 35 times depressed free cash flow and 22 times estimated earnings for the year ahead because investors project that Autodesk's high margins and free cash flow will return once the economy gains some real ground.

But so far, companies aren't hiring. Despite increased government stimulus in fields related to Autodesk, we'll likely need to wait at least a few more quarters before customer numbers start to improve. That means the dire jobs situation may continue to push Autodesk's recovery farther down the road. Although *Pro* has done well with

Autodesk, enjoying a nearly 50% profit in less than a year (we've had the stock on Hold since the summer), given the stock's valuation and the weak jobs picture, we want to hedge our gains with covered calls.

What's a Covered Call?

- Check out *Pro*'s guide to covered calls.

We write covered calls when we're ready and willing to sell a stock we own at a higher price (the strike price) by our options' expiration date. Or, if the stock doesn't rise to our strike price by expiration, we keep our shares, and may write covered calls again, generating more income.

Why This Strategy?

Based on the current malaise, Autodesk's complete rebound could take many more years — but by writing covered calls, we're paid while we wait, or we obtain a favorable sell price in much less time. Our fair value estimate of the stock is in the mid $20s to low $30s, but that assumes Autodesk recovers about three-fourths of its former glory (measured by sales and free cash flow). Instead of waiting for that rebound, we'd be happy to sell the stock in the mid $20s and take our profits, earning most of our gains in much less time *and* with less risk, since the calls provide a hedge.

Meanwhile, if our shares aren't called away, we cushion our downside. The July 2010 $24 calls on Autodesk will yield us 8.6% (at a recent $2.05 per share) on the recent share price of $23.70, or 12.5% on our average purchase price on the stock. By choosing calls that expire in less than six months and have a strike price modestly above Autodesk's current share price, we are paid well on an absolute basis and better protected if the stock declines. We could write April 2010 calls instead, but if Autodesk declines in the coming months, we'll enjoy a much lower absolute payment compared with the July calls. The July calls also provide us with a higher potential sell price — and more than a year-long holding period on all of our shares.

How to Follow Along

If you need a refresher on covered call strategies, please see *Pro*'s guide to covered calls before placing the trade. Remember, you write one call for every 100 shares of stock you own; and you may cover all of your shares, or just some. We're covering all of ours. Here are the numbers behind the trade:

- **Trade:** Write ("sell to open") one July 2010 $24 call for every 100 shares owned
- **Option yield (at recent $2.05 bid):** 8.6% of the $23.70 share price, in 5.5 months
- **Option yield on our $16.36 average cost basis:** 12.5%.
- **Upside from today if sold at a net $26.05 ($24 strike plus $2.05):** 9.9%
- **Total return on position if exercised:** 59.2%
- **Downside protection:** 8.6%; a decline to $21.65 is hedged

When you write ("sell") an option, the going price is paid into your account and the money is yours to keep. In this case, you're then obligated to sell shares of Autodesk if they're above the strike price by the expiration date.

Writing puts? If you place the alternate trade and write puts, you'll be obligated to buy shares of Autodesk around a net $20.55 if the stock declines.

We'll make this trade in the next one business to 30 calendar days. To discuss it or ask questions, please visit our Autodesk board.

Monday Memo: The Case of the Disappearing Analysts

Published Jun 1, 2009 at 12:00AM

See, analysts provide classes of investors with critical company information, stoke interest in a wide range of stocks, and consequently make the markets more *liquid*. That liquidity means increased trading, which tightens securities' bid-ask spreads, which in turn makes it easier to buy and sell stocks without drastically affecting the price. That's crucial — especially when it comes to small caps.

Smaller companies generally have less analyst coverage to begin with, but they're losing even more this year. According to the FactSet study, in the first five months of 2009, a whopping 25.7% of small-cap companies announced an instance of dropped analyst coverage. In 2007, that figure stood at just 6.4%. By contrast, larger companies have reported a 15.5% dropped coverage rate so far this year, but many still enjoy sufficient coverage from Wall Street.

What's more, the lack of information in the market makes it more costly for small caps to raise public money. This was the topic of a 2007 study demonstrating that companies without analyst coverage have substantially higher cost of equity (that's the minimum return that equity holders demand from their investment). The more capital costs a company, the greater the risks it will need to take to satisfy its investors — which can lead to more volatile results.

Still, there have always been some advantages to a lack of Wall Street coverage. Individual investors can beat the big boys to the punch on underfollowed stocks, digging up "hidden gems" — especially in the small-cap arena. This advantage still holds true, of course, but the further decline in analyst coverage means it could take even longer for the big money to recognize a small company's success story.

When it comes to *Pro*'s small-cap holdings, such as **AmTrust Financial Services** (Nasdaq: AFSI), we need to remain patient even if investors don't boost the shares on good news. As we explained in Thursday's intent to buy another 1.5%, although AmTrust reported a solid first quarter in early May, shares have lagged during the latest market rally. Perhaps that's because just three analysts — and all from smaller regional firms — cover the stock. But we still believe in the company, which continues to generate cash and has strong growth prospects in its niche insurance markets. It may take a little longer to reach our goals, but over the long term, lack of analyst coverage should only augment our profits.

Elsewhere, discussions with fellow *Pro* members ran the gamut on the boards last week. Some highlights:

- Jeff (**TMFFischer**) discusses the giant synthetic long order placed on **iShares Silver Trust** (NYSE: SLV) last week.
- Our Audio Extra with *Global Gains* co-advisor Tim Hanson stirred up a conversation about **The China Fund** (NYSE: CHN).
- **FlorisHJ** wonders if **Vanguard Emerging Markets** (NYSE: VWO) is still a Buy First recommendation after the rally in emerging market stocks.
- Inflation fears are growing, and the dollar is falling. How should a Pro hedge? Bruce Jackson (**TMFGoogly**) and Jeff offer some answers.
- Finally, Russell Carpenter (**TMFEldrehad**) shows how the CAPS community has been rightly bearish on**General Motors** (NYSE: GM) for more than three years — and how he learned about the impending housing and banking collapse from CAPS.

As always, to respond to the Memo, please visit our Memo Musings board.

If you have thoughts on Tim's international take or want to weigh in on the **China Fund** (NYSE: CHN) or **Market Vectors Africa** (NYSE: AFK), please post on our ETF board!

The unedited transcript follows.

Jeff Fischer: Welcome to a new edition of *Motley Fool Pro* Audio Extra. I am Jeff Fischer. With me here is Todd Wenning.

Todd Wenning: Hey, Jeff.

Jeff Fischer: And we are glad to have with us special guest, Tim Hanson. Tim is the advisor to *Motley Fool Global Gains*.

Tim Hanson: How's it going, guys?

Jeff Fischer: Thank you for being with us here today, Tim.

Tim Hanson: Pleasure to be here; I admire *Pro*.

Jeff Fischer: Did you just; you flew in from China or Peru or ...

Tim Hanson: Actually we are hopefully heading out to China in July, so people should be on the lookout for the dispatches that will be coming back.

Jeff Fischer: Excellent. Tim, can you tell us what you do for *Motley Fool Global Gains* and how you invest?

Tim Hanson: Sure. We are a global newsletter, so we are basically looking for the best stocks we can find anywhere in the world, besides the United States. We think that should be a big part of everybody's portfolio. We like to think people should have somewhere 50% to 60% international exposure and basically we try to take a global perspective, very much in the tradition of John Templeton, which is to say using countries all over the world, we want to find the cheapest stocks, the best companies and then hopefully some sort of tailwind, some sort of macroeconomic tailwind that you are getting in, let's say China, that you won't necessarily get in Mexico or the United States.

Jeff Fischer: Now when you say 50% to 60%, can you give a little color on that?

Tim Hanson: Sounds aggressive, it sounds aggressive.

Jeff Fischer: It does.

Tim Hanson: Well, it is not as aggressive as it sounds, because you take an American blue chip like Microsoft (Nasdaq: MSFT); about 50% of its revenue is derived from foreign countries. So we would consider Microsoft to be about a 50% international global position. You can look at your portfolio holistically and you want to have some stuff focused on China or focused on Brazil, individual countries, but you also want a **Procter & Gamble** (NYSE: PG), I know you guys have in the *Pro* portfolio. I would consider that part; you can add that in to achieve your 50% international exposure.

Jeff Fischer: Excellent.

Todd Wenning: And Tim, we totally agree. You mentioned Procter & Gamble, but our most direct foray into the emerging markets so far has been the **Vanguard Emerging Markets** (NYSE: VWO) ETF.

Tim Hanson: Yes.

Todd Wenning: We really like that. It is diversified, but it is focused primarily, I think 28% or so in China and Brazil, two countries that we like.

Tim Hanson: Well it is a little deceiving I think on the China side because a lot of that exposure is in Taiwan and a lot of it is on the very large end of the market cap spectrum, so you are not really playing the Chinese consumer as much, which maybe we will get to talk a little bit about, but you are playing more that export part of the economy, which is really the part of the economy that is suffering the worst right now in China and I think as you guys build out that position or try to complement it, move down the market cap spectrum and go after the consumer in China or in Brazil.

Jeff Fischer: It's true. We started with large caps purposely ...

Tim Hanson: It's a good place to start; it's a good place to start.

Jeff Fischer: And we plan to make Vanguard, the Emerging Markets ETF, about 5% of the portfolio, so a fraction of our overall global exposure and as we see it, we need to move into smaller companies, mid cap, small caps, internationally because that is where all the growth is going to be.

Tim Hanson: Yeah, and funny to think about, a lot of these economies are much smaller than ours, so if you look at a place like Mexico, a large cap in Mexico is probably a four or five billion dollar market cap company, whereas a large cap here in the States, probably you don't get there until at least ten and maybe even 40 or 50. We have some hundred million dollar Chinese companies in the *Global Gains* portfolio and they look, to an American investor, extraordinarily speculative, but I think they are bigger in China than they would appear.

Todd Wenning: Tim, are there any names of stocks or ETFs or closed-end funds that you think are good complements?

Tim Hanson: Well I think in terms of increasing China exposure, one of the things about the Vanguard Emerging Market Stock ETF that makes me a little wary is it has more than 20% of its assets in financial companies.

Jeff Fischer: Yeah, we wrote about that as well.

Tim Hanson: Yeah, China just had a very aggressive loan program in the Q1, first quarter, to spur their economy and all those banks in China are state run and so it is unclear at this point who they were giving loans to. Probably to state-owned enterprises, SOEs, and if history holds, they are giving them at way too low interest rates in an effort to spur the economy, which means you might see some defaults down the line and the financial sector around the world, especially in the emerging markets, could suffer, but in terms of complementing that, there is a great closed-in fund called the **China Fund** (NYSE: CHN). The ticker is CHN and that I think is pretty close to what you are looking for because it has a lot of mid- and small-cap exposure. About 70% of its portfolio is mid to small and then it also has a lot of consumer exposure and health care exposure, which are both sectors in China we are pretty excited about at *Global Gains*.

Jeff Fischer: Tim, can you say what regions or countries are you most interested in at *Global Gains* right now?

Tim Hanson: I think everybody knows we like China. Like I said, we are going back there in July. It is a huge and fascinating country with a lot of opportunities going forward. In terms of sort of lesser-traveled countries, one that we are looking at right now is actually Peru and the reason we are looking at Peru is because Peru has two really nice big picture catalysts that we think it has going for it. The first is that it is very much a metals economy and a commodities economy. If you think those are going to rebound, I think I have seen some of the moves you guys have been making in *Pro* you sort of agree with that. That is an economy that should come around pretty fast. They also are doing pretty well today because they saved a lot of that revenue they got from the windfall profits they were making not too long ago so they can spend on some stimulus.

The second really interesting part is that it is sort of becoming the trading crossroads between China and Brazil, which I think are going to be real major economic players in the future and because the Pacific coast ports in Peru are where the ships come across and then in 2010 to 2011, they are going to complete this transcontinental highway that is going to run from the Pacific coast of Peru to the Atlantic coast of Brazil and all those countries have free trade agreements with China, so it could be a region to look for.

Jeff Fischer: So China, Brazil, Peru, we have been looking a little bit at Africa. What are your thoughts on Africa in general?

Tim Hanson: Well gosh; Africa is horribly oversold right now. I don't know if you guessed, looking at the currencies and things like that, obviously people consider it probably one of the riskiest places in the world.

Jeff Fischer: It has been that way a long time too.

Tim Hanson: It has been that way a long time too, but it is very much a stuff place. They have a lot of stuff and if anything looks like it is going to govern the world over the next decade, it is probably that people want stuff. That is food, oil, metals and those sorts of things, so I think there is potential in Africa, especially if you get outside South Africa, which is predominantly where most of the index funds are playing.

There is a great little fund that we have written about at *Global Gains* called the **Market Vectors Africa** (NYSE: AFK) ETF. The ticker on that is AFK and it has a lot of plays in Nigeria, some consumer plays like beverage companies. It has got some banks in Nigeria and some resource companies around Africa, so you guys might want to take a look at that if you are interested.

Jeff Fischer: Well thank you, Tim, for joining us today; we appreciate it.

Tim Hanson: Pleasure to be here.

Jeff Fischer: You can find Tim Hanson at *Motley Fool Global Gains*. We enjoyed the conversation today. For *Motley Fool Pro* members, we will continue to average into Vanguard Emerging Markets. It is a buy-first stock. We think it is a great core position to gain international exposure and we are also looking in other countries as well and it was very helpful to have Tim here with us. we are looking at Brazil, as we mentioned, Africa, Peru is a new one; hadn't thought about that and China, of course, as well is high on our radar as we grow our international exposure in the portfolio. So thank you everyone for listening. We will see you on the *Pro* boards. Fool on!

Monday Memo: Weighing Our Options; Autodesk Surges

Published May 26, 2009 at 12:00AM

In other portfolio news, engineering and design software leader **Autodesk** (Nasdaq: ADSK) pleasantly surprised us on Friday, as shares jumped 10% following quarterly results. Similar to **GrafTech International** (NYSE: GTI) last month, Autodesk reported a small profit and modest free cash flow, but results were stronger than expected.

Management said deceleration in the economy is slowing and may have bottomed in North America, but it doesn't see signs of an imminent recovery. Even so, as we expected, federal stimulus packages are goosing software sales for Autodesk as companies gear up to build and upgrade roads, bridges, airports, railroads, and federal buildings, both in the U.S. and abroad.

The company expects to cut $250 million in expenses this year, yet remain ready for the eventual economic recovery. Autodesk is winning bidding wars and expects a surge in license sales once the business environment starts to improve. The stock remains a Buy. For much more, please see my conference call notes on the Autodesk board.

What's on our minds here at *Pro*? Hot topics include Standard & Poor's downgrade of the U.K.'s economy from stable to negative — and what a possible downgrade to the U.S. would mean for its debt-raising prowess. Other news items flirting for investor attention include commercial real estate woes, more residential prime mortgages falling into foreclosure, and the continued elusiveness of credit. Even though consumer confidence is up, as Autodesk's management suggested (see above), signs of an imminent recovery are still lacking. We still like every stock we own in *Pro*, however, and are glad to have a small hedge with **ProShares Short SmallCap600** (NYSE: SBB).

Elsewhere, discussions with fellow *Pro* members ran the gamut on the boards last week. Some highlights:

- **Cabbie66** thinks the market's ascent is a dead cat bounce (sorry, cat lovers!), so asks about shorting stocks.
- Answering **TrojanFan**, I provide a few ways to use options on **iShares Silver Trust** (NYSE: SLV) at recent prices.
- **RafesUserName** asks, given its size, "Why buy**Procter & Gamble** (NYSE: PG)?" Where's the upside? Todd Wenning (**TMFPhila**) and others share thoughts.
- In a thread called Economic Slump 101, members discuss why a recovery may be long and slow.
- **Stamleo** starts a discussion on using options to protect recent gains.
- Here's an easy way to keep current on all *Pro* boards.
- Finally, Russell Carpenter (**TMFEldrehad**) lauds the valuable CAPS screener tool in his weekly CAPS Corner post.

The *Pro* team wishes Todd a happy birthday today! As always, to respond to the Memo, please visit our Memo Musings board.

Video Extra: Options in 3 Steps

Published May 22, 2009 at 12:00AM

Greetings, Fools! We know many of you have yet to begin using *Motley Fool Pro*'s option strategies in your portfolio, and that's OK — our new Video Extra is here to help. Watch as *Pro*'s own Jeff Fischer explains the basics of options trading. Just click on the player below to begin!

5kZ2N5MTobb7AmyLDnk30DEACuY4k9IQ

It's never too late to start using options to earn income, hedge, and land better buy and sell prices on stocks. *Pro* is steadily announcing new intents to trade so you can follow along with us, and as always, we're on the boards if you have any questions!

Buy GrafTech International

Published May 20, 2009 at 12:00AM

At a Glance

By increasing our target allocation to **GrafTech International** (NYSE: GTI) last week from 4% to 5%, we have another $10,000 (1% of the *Pro* portfolio) to put to work in this stock. We're doing so with a direct purchase.

Management has done a superb job during the worst industry upheaval in the company's history. In the first quarter, despite order flow from steel producers nearing a standstill, GrafTech still found ways to be profitable. As steel producers work through inventory, and orders for GrafTech's steel-producing electrodes start to resume (most likely later this year), profits should grow soundly. Meanwhile, shares still present value; we merely need to wait for steel demand to tick upward for this near-monopoly business to benefit.

With today's announcement, we'll be purchasing more GrafTech stock outright to increase our exposure to a more meaningful 3%. Meanwhile, when our June $7.50 puts expire (as income, most likely), we'll revisit our put-writing strategy to potentially buy our last 2% a bit more cheaply. The $7.50 puts currently don't pay much unless you go to December, so — depending where shares trade — next month we may consider the July or September $10 puts, which currently net a buy price of $9 to $8.50. If you have questions on a put strategy you might consider today, please post on the GrafTech board.

Buy Procter & Gamble

Published May 19, 2009 at 12:00AM

At a Glance

It isn't hard to see why **Procter & Gamble** (NYSE: PG) remains a core holding in the *Pro* portfolio. In the third quarter, the consumer products behemoth was able to grow organic sales 1% despite worldwide contraction in GDP. What's more, as margins expanded, core earnings per share grew 8% compared to last year and would have increased by "strong double digits" if not for currency fluctuations. P&G increased its dividend 10%, the 53rd year in a row that it upped its payout to shareholders; free cash flow in the quarter was a healthy $3.5 billion; and so far this fiscal year, management has repurchased $6.3 billion in stock, lowering the share count significantly even for a company this large.

We're also pleased with the company's persistent focus on building long-term value. It continues to innovate, enter new markets, and educate consumers on the value of its products. And although management is keeping a lid on expenses, it doesn't want to be *too* defensive during a recession; instead, P&G is positioning itself to emerge from the downturn even stronger.

The shares, meanwhile, remain at multi-year lows, trading at about 12 times earnings and free cash flow and yielding 3.4%. Although we can't predict when the recession will truly relent or when the U.S. dollar will lose some value (a great thing for P&G when it happens), we're happy to buy our last 1% at current prices. As long as the business performs, Procter & Gamble has a long-term home — and ideally, a profitable one — in the *Pro* portfolio.

Questions? Comments? Visit our Procter & Gamble discussion board.

Monday Memo: A Fresh Look at Options and CAPS

Published May 18, 2009 at 12:00AM

Of course, there are more option strategies that can come into play when you're writing covered calls and puts, such as writing in-the-money options when you're ready to transact on the underlying stock soon. *In the money* means the stock is already trading at a price where the option would automatically be exercised upon expiration. Suppose a stock is trading at $14, and you really want to buy it. You could write $16 puts, for example, that would net you a buy price of about $13.50 — lower than the current price — and you'd have a better chance of getting the shares than you would using a lower strike price. At long as the $14 stock stays below $16 before your option expires, you'll get to buy shares. We would generally only do this when we're strongly bullish on a stock.

When you're trying to sell something quickly, you can write in-the-money covered calls to net a higher sell price. Suppose you're ready to sell a $22 stock. You might write $20 covered calls to help insure a sale for your shares, and those calls might pay you $3, netting you a nice sell price of $23. We used near-the-money calls to sell our shares of **CurrencyShares Japanese Yen Trust** (NYSE: FXY) early this year.

A future *Pro* option guide will explain in-the-money option strategies with much more detail. For now, Todd is going to talk about using CAPS. Take it away, Todd!

CAPS and Other Spicy Burritos

Another valuable resource for finding new investing ideas in CAPS is to read Russell Carpenter's (**TMFEldrehad**) recurring This Week in CAPS series on the *Pro* boards. Each week, our resident CAPS master analyzes top players' picks, pulls apart data, and explores new investment strategies.

And in the fun and Foolish department, *Pro* member **RockenD** posted — while vacationing in Cabo — about the options he's writing. Sounds like the salsa is good down in Mexico!

With more than 130,000 Fools making more than 3 million ratings on 5,277 stocks, CAPS offers a veritable cornucopia of stock research ideas. All you need to know is how to slice and dice all that data to find what you want. That's easier said than done, of course, so I'm here to help get you on the right track, whether you're a CAPS newbie or an old pro.

A great place to start your research odyssey is the CAPS stock screener, which has four preset screens — Value, High Growth, Small Cap, and Dividend — that were created by some of the Fool's top advisors and analysts based on key criteria they look for in their favorite stocks.

The Small Cap screen, for example, looks for 4- and 5-star stocks with significant insider ownership, strong balance sheets, and better-than-average growth opportunities. When I ran the screen this morning, there were 25 results, including at-home health-care provider **Almost Family** (Nasdaq: AFAM) and packaged baked-goods company **Flowers Foods** (NYSE: FLO). In fact, this is the screen that first led me to research recent *Pro* portfolio addition **Jack Henry & Associates** (Nasdaq: JKHY) last fall.

Have you found an interesting stock idea using CAPS? Share your story with other members on the CAPS Corner board.

Thank you for being a *Pro* member! We hope to see you on the boards.

Jeff Fischer and Todd Wenning

Special Update: CCJ on Hold; New Buy Firsts, Allocations, and More

Published May 13, 2009 at 12:00AM

How do we differentiate between Buy First and Buy? If you're thinking Buy First is a shorter-term judgment call, you're generally right. We don't have a crystal ball, of course, but our Buy First stocks should currently present lower risk with attractive potential reward. This may simply mean we believe they're more undervalued than other positions, or that they won't decline as much in a weak market.

Our Buy Firsts as of today:

- **AmTrust Financial Services** (Nasdaq: AFSI)
- **Jack Henry & Associates** (Nasdaq: JKHY)
- **Kinetic Concepts** (NYSE: KCI)
- **Vanguard Emerging Markets** (NYSE: VWO)

AmTrust, Jack Henry, and Kinetic Concepts all have strong, recurring revenue, adding stability to their businesses; plus, they still look inexpensive on past 12-month results, not just on iffy future estimates (unlike many stocks). Vanguard Emerging Markets remains a Buy First because we believe diversified investors should continue to average into international stocks.

Moving from Buy First to Buy:

- **Autodesk** (Nasdaq: ADSK)
- **GrafTech International** (NYSE: GTI)
- **Plum Creek Timber** (NYSE: PCL)
- **Vanguard Energy** (NYSE: VDE)

When we put Autodesk and GrafTech on our Buy First list, they appeared significantly undervalued; after nearly 50% gains in both these stocks, the risk-to-reward equation has become less favorable. However, we still see plenty of promise in these stocks over the long haul even if they're not as cheap as they were a few months ago. Elsewhere, Plum Creek remains a key inflation hedge, but our estimated fair value is only 20% higher than current prices after a steady increase since March — which is why we've written covered calls and moved it to Buy. Oil has rebounded significantly, from $40 to $58 a barrel, so a Buy is ample for the Vanguard Energy ETF. All other holdings in the *Pro* portfolio (except one — more on that below) are also Buys — we believe in them as strongly as before. If you haven't already, we recommend averaging into these after you've matched our Buy First positions.

On Hold:

- **Cameco** (NYSE: CCJ)

We're pleased to see Cameco gain more than 50% in three months as uranium prices have ticked higher, and the company remains a world leader with a strong competitive moat. However, price matters to us. This $26 stock now trades in our fair value range, at about 25 times likely earnings this year, so we're placing it on Hold; this means we don't recommend buying shares if you haven't already. We've written covered calls to potentially sell some of our shares while still planning to keep about 40%. If you're not writing covered calls and would like to sell some profitable shares directly, we believe a partial sale makes sense at current levels.

The longer we own some of our earliest core holdings, the more we like and believe in them. Accordingly, we're increasing our target allocation on four favorites to 5%. We won't rush to invest additional funds, but we'll gradually average in — as always, sending you an intent to trade before each new buy — assuming prices remain attractive. We aren't obligated to reach these target allocations should prices get away from us — but we will try.

Stock	Old Target Allocation	New Target Allocation
GrafTech	4%	5%
Kinetic Concepts	4%	5%
Procter & Gamble (NYSE: PG)	4%	5%
Vanguard Emerging Markets	4%	5%

This does *not* mean fewer new ideas will enter the *Pro* portfolio (probably the contrary). It does mean our portfolio will be more focused — and focused investors tend to outperform. Plus, you ultimately pay less in commissions, benefit more from your gains, and get to know your investments better. Additionally, focused investors are more likely to sell a holding when it nears fair value because a fairly valued stock is occupying a coveted spot in the portfolio that could be better served by a new, undervalued stock. Being focused also makes it easier to trade more options on core holdings and sell partial positions for profits should we wish, while maintaining a meaningful stake.

Meanwhile, we have a long way to go as we build the *Pro* portfolio. Even if we fill these four positions to 5% each, we'll still be less than 50% invested.

Now for our last guidance tweak of the day: We've been listing "preferred buy price" and "acceptable buy price" atop our reports, but this feels like splitting hairs. To simplify (and improve!), we're only going to use preferred buy price in the future. By offering you our preferred buy price and our estimate of fair value, you have a clear picture of a stock's potential and where you should aim to buy it. Meanwhile, you'll know when the *Pro* team no longer believes a buy is attractive because we'll officially announce a move to Hold status, as we've done with Cameco. This is the most visible and direct way for us to tell you we no longer believe you should buy a stock, at current prices, in the *Pro* portfolio. Our portfolio page, with its Buy First, Buy, and Hold ratings, is your touchstone.

If you have any questions about today's changes, please visit us on our Member Suggestions & Help board.

Invest Foolishly!

Jeff Fischer (**TMFFischer**)

Buy ProShares Short SmallCap60

Published May 11, 2009 at 12:00AM

At a Glance

- **Special instructions:** Remember, we are *buying* this ETF — not shorting it. It is designed to move inverse to the underlying index it tracks. Also, this ETF is very thinly traded most days, so *you must use a limit order* at or slightly above the current ask price. If you don't get shares on day one, continue to use a limit order at or near the ETF's net asset value (NAV). You can find the closing NAV price on the ETF's website daily after market close.
- **Allocation:** Buying 2% of a target 3%
- **Price when we released our latest intent:** $50.39
- **Fair value:** N/A
- **NAV price (5/8/09 market close):** $50.26
- **Why buy:**
    - While concerns of an economic free fall have diminished, the underlying fundamentals of the market and the economy remain on shaky ground.
    - A two-month rally has sent the S&P SmallCap600 index up nearly 50% since early March and has consequently made the index look pricey on reasonable earnings estimates.
    - Short ETFs are an effective, low-cost option for hedging against down markets.
    - As with most shorts, this is anticipated to be a short-term holding, measured in months.

What's New

It's time to say hello to an old friend. Last December, we believed that following a post-election market rally, the fourth-quarter earnings season would be a bad one, likely sending stocks lower. We thought small caps were particularly vulnerable in that environment because they generally have less access to credit than their large-cap counterparts and would feel more pain from order cancellations and tough business conditions.

In the **ProShares Short SmallCap600** (NYSEMKT: SBB) exchange-traded fund, we found an investment vehicle to help us capitalize on our thesis. To review, this fund seeks daily investment results that correspond to the inverse of the daily performance of the S&P SmallCap600 index. In other words, if the S&P SmallCap600 is down 2% in a given day, this ETF will seek to be up 2%.

Over the three months following our December buy, the market indeed traded downward and reached a point of extreme pessimism in the first week of March. By the time we closed our Short SmallCap600 position on March 2, the S&P 500 had plunged 29% while our short ETF *gained* 22%, producing 51 percentage points of market outperformance.

In our sell report, we noted that "we may invest in Short SmallCap600 again later if the market begins an unsustainable or unsubstantiated rise." That may have turned out to be the case in nearly no time at all. In the course of just two months, the S&P SmallCap index has jumped 50% on what we consider to be weak or unsubstantiated economic data. Moreover, comments expressed by a number of management teams in first-quarter earnings calls lead us to believe that businesses remain concerned about the macroeconomic picture for this year and even into 2010.

The recent rally has once again assigned lofty valuations to this small-cap index. As of April 28, the S&P SmallCap600 traded with a trailing price-to-earnings ratio of 26 and a forward ratio of 21 based on what we consider to be very rosy 15% earnings-growth estimates for 2009. Incredibly, a number of highly speculative and unprofitable members of the index have more than tripled since March 2, including **Ruby Tuesday** (NYSE: RT), up 660%, **Stein Mart** (NASDAQ: SMRT), up 346%, and **DineEquity** (NYSE: DIN), up 307%. These types of gains are almost always unsustainable.

New Risks

The main risk we face in taking a short position now is a continued resurgence in market confidence. Even though we believe in our analysis, if the market at large only wants to see the worldwide recession becoming *less severe*, then stocks could continue to ascend. And in bull markets, valuation takes a back seat to excitement and hope, and short-sellers who are short based on valuation get clobbered. So if investors continue to send stocks higher, or economic data strengthens more than we expect, we'll look to cap our losses on this short position in the 15% to 20% range at most, as always with a short.

Foolish Bottom Line

Once again, we have an opportunity to profit from a potential market decline as well as hedge our increasing long positions using ProShares Short SmallCap600. To learn more about this ETF, please read our original report below.

We will make this trade in the next two business to 30 calendar days. To discuss this buy, please visit the ProShares Short SmallCap600 board. To review our general reasons for shorting, check out *Pro*'s Guide to Shorting. Please remember to use a limit order to buy these shares.

Monday Memo: Mr. Market's Merry-Go-Round

Published May 11, 2009 at 12:00AM

With all the market volatility we've seen so far this year, you'd think the S&P 500 was actually going somewhere. But the S&P started the year at 903, dipped as low as 676 on March 9 (down 25%), and has since rebounded about 33%, all the way back to ... the very same level where it began. That's right: No real change on the year; just a big fat Funyun.

In light of five months of incredible volatility, all merely to break even, we were compelled to check where the *Motley Fool Pro* portfolio stood on Jan. 1. We began the year just a smidge above $1 million, so our current balance above $1,060,000 puts us up more than 6% this year — and up about 20% on the cash we've invested — against a flat S&P. These returns, as we all know, are short term and could change in an instant; but so far, in these choppy waters, we're making progress. Even more important, we hear from many *Pro* members that you are doing better than we are. And not just over the short term — but that you're succeeding thanks to repeatable, long-term investing strategies, like writing options, that land you profits again and again. That's our ultimate objective.

Emotions in Motion

This market right now is moving on nothing more than emotions. Guess what? It almost always moves on emotions. — David Bach, author of *The Automatic Millionaire*

The market's volatility has set a series of traps for anyone acting on emotions. The drumbeat to go short banged loudest near the recent bottom at the end of February and into early March. As Todd wrote last week, according to some in the media, that was the "time for hysteria." Yet, if you'd sold your stocks then — or even worse, sold and gone short — you've suffered. Your emotions betrayed you, as they often will if you let them direct investment decisions.

Now, on the heels of an eight-week ascent that is one of the swiftest and steepest in stock market history, more and more analysts are now saying this rally is for real. Others are saying the buying is fueled by those *afraid* to miss gains.

We have two responses. First, you shouldn't invest for rallies. Strike that very word from your vocabulary unless you're starting a revolution or leading a union. Investing is a long-term, analytical, and disciplined endeavor, so thinking of it in terms of rallies is the wrong context. Second, fear is a horrible reason to invest. If *fear* is making you buy a stock, what would make you sell it? Greater fear, when it's falling.

Make Investing a Good Thing

Why not invest your assets in the companies you really like? As Mae West said, 'Too much of a good thing can be wonderful.' — Warren Buffett

The two quotes I've cited, from Bach and Buffett, seem to work together. The first presents a problem; the second provides a solution wrapped in a lesson. As long as the market is driven by investor emotion, it's going to be irrational, especially during uncertain times. The lows will be too low, the highs too high — and they'll come swiftly. One way to avoid falling prey to the emotions of the day, as Buffett so simply suggests, is to invest your assets in companies you *really like to own*. And, as the lesson implies, don't over diversify.

Rather than trying to own too many kinds of holdings or outmaneuver a volatile stock market, stay focused on companies you like to own and use an investment discipline that keeps you calm and happy.

At *Pro*, we will continue to:

- Average into investments that show us strong potential over the coming years.
- Use valuation as our guide in writing puts and covered calls.
- Consider reasonable hedges based on risk versus potential reward.
- Keep our emotions in check and focus on a long-term plan.

Around Pro: On the Boards

Last week on the boards, many *Pro* Fools asked if it's smart to sell winners; others lamented that the "gains train" has already left the station (we don't believe it has). Here are some interesting threads we answered:

- **Evan1974** asks about selling **GrafTech** (NYSE: GTI) after a 100% gain.
- **SPinSA** asks, "Is GrafTech still a buy at $9.50?"
- **dlbrundage**, who sports big gains in *Pro* stocks, asks, "Sell or hold?"
- **casspow** fears having missed the market train; we remind Fools to try not to anchor on March lows.
- **mdelalay** questions, "After a 55% gain, what do I do now?"
- **boilerup** takes a break from stock talk to ask the community, "What do you do?" (boilerup, it turns out, is a pilot.) Come share your own answer on the thread.
- Finally, **TMFEldrehad** talks about the role of sector rotation in his weekly CAPS analysis.

Invest Foolishly,

Jeff Fischer

Write Puts on Flowserve

Published May 9, 2009 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") July $70 puts (ticker +FLSSN)
- **Allocation:** 2% (for *Pro*, three contracts)
- **Option's recent bid/ask:** $5.10/$5.50
- **Initial limit price:** $5.10
- **Acceptable limit price if necessary:** $3 (4% of the strike price)
- **Alternate trade:** If you're not writing puts, consider a stock limit order for more shares near $65.
- **Why write puts:**
  - These puts would buy us more Flowserve shares at about $65.
  - We estimate fair value in the $80s, so we'd rather attempt to buy in the $60s than the current share price of $74.

What's New

The late John Lennon once sang, "Life is what happens to you while you're busy making other plans." The stock market has plans of its own, too, soaring over the past two months and taking many stocks we've been averaging into much higher. Rather than chase the market, our calmest strategy at the moment is to continue building positions in our selections at more favorable prices if we're able. Writing puts is the most obvious way to do so.

We recently began to average into **Flowserve** (NYSE: FLS), and the story has not changed meaningfully. First-quarter results were record-strong, but backlog during the quarter weakened more than 20% from a year ago. Management said orders began to increase in March, but we remain somewhat cautious since we have no confirmation that a bounce in orders means a new trend. This lack of confirmation remains true for the economy as a whole.

Put-Writing Specifics

The July $70 puts on Flowserve recently bid $5.10 per share, representing a 7.2% yield on the cash we'll maintain for this potential buy for the next 70 days (until July 18). The puts net us a purchase price of around $65 if we get shares. This is 12% below the current share price, easily imaginable for a stock this volatile. Our $70 strike price is 5% below the recent $74 stock.

If you have questions on this new trade, please visit the Flowserve board.

Audio Extra: Jeff, Todd, and Bruce on AFSI, NDAQ, and the Market

Published May 8, 2009 at 12:00AM

For this week's Audio Extra, we're thrilled to be joined in the studio by *Motley Fool Pro*'s analyst down under: Bruce Jackson, known to you as **TMFGoogly** on the boards. Listen in as Bruce chats with Jeff Fischer and Todd Wenning about the latest market zigzags and what the economy looks like in Australia these days. Plus, earnings news from **AmTrust Financial Services** (Nasdaq: AFSI) and **Nasdaq OMX Group** (Nasdaq: NDAQ).

thZnFpOoA2Lomg0CNfmfmBK-UW_UaThs

Questions? Comments? Come chat on our discussion boards.

The unedited transcript appears below.

Jeff Fischer: Welcome to a new edition of *Motley Fool Pro* Audio Extra. I am Jeff Fischer; with me here is Todd Wenning.

Todd Wenning: Hey, Jeff.

Jeff Fischer: And all the way from Australia, Bruce Jackson.

Bruce Jackson: G'day, Jeff. Good to be here.

Jeff Fischer: Thank you, Bruce. Now you know, you could have just phoned in or Skyped in or ...

Bruce Jackson: Well with the time difference, Jeff, it is so hard to sync everything up and I thought I would jump on a plane and be over here in person, so great to be here.

Jeff Fischer: Well it is good to see you. Bruce, Australia. Let's talk about it just really briefly. How does the world look from your perspective down under? How does the U.S. look?

Bruce Jackson: Well the U.S. looks pretty; it looks like it is struggling. We can see, we read in the press how the economy is struggling and comparing that to Australia, our market is down 50% from its peak as well. We are a commodity-based market so we have been hit by the same sort of things that the U.S. has been hit by. Lack of demand in the U.S., especially in the consumer segment eventually goes back to China and so China has really cut back their production. They need less commodities and so our stocks have been really pummeled as well.

Jeff Fischer: So it is truly a global economy now, for maybe the first time in modern history and so it makes sense; a recession becomes a global recession.

Bruce Jackson: It makes absolute sense, yeah.

Jeff Fischer: Well Bruce, Todd and I are here to talk about AmTrust earnings, Nasdaq OMX earnings and then the market in general, so let's start with AmTrust. I am surprised; they reported strong results early this week and the shares did not react at all. Even though book value was up, gross premiums written, another term for revenue was up strongly, operating earnings were up strongly, so the shares are still below ten and we are going to look to buy more shares to round out our position. Everything looks good on operational.

Bruce Jackson: I am surprised that the shares didn't react strongly, especially with the market going wild in the last few weeks as well, so they left a little bit behind, but ...

Jeff Fischer: Yeah, they have been very quiet.

Bruce Jackson: Well, that could play into our hands as we look to increase our position.

Jeff Fischer: And we just saw earnings from Nasdaq OMX, which were decent, above expectations, but the shares were down. What Nasdaq is facing exactly what we thought it might face, which is increased competition and some trading volume concerns. It has seen strong competition in the U.S. from the New York Stock Exchange, the BATS Exchange, Direct Edge and this results in lower trading revenue for the company.

Bruce Jackson: Yeah, we are obviously cautious about the trading volumes because of the state of the market, but then the competition is the real thing that we want to keep an eye on because they have got a strong competitive position and if that starts to be eaten away, then they are going to be struggling to increase earnings in the years ahead. They have relied on acquisitions in the past and probably overpaid in hindsight, as a lot of people have, and so we will certainly be keeping an eye on them.

Jeff Fischer: And lately you are right; the competition has been chewing away Nasdaq's profits. Since October, they have lost market share bit by bit, so what we are doing there, we have written $15 puts because if we are going to buy shares, we only want to get them bargain-basement price. That strategy probably will not change. Our current puts expire in June; they look safe to be cash in common and we will go from there.

Bruce Jackson: Absolutely.

Jeff Fischer: So now let's talk about this soaring market, the S&P 500, Todd, is up 35% or so since the March low?

Todd Wenning: That's right, Jeff, and there has been some really crazy rallies in individual stocks. I think **Ruby Tuesday** is up 700% in two months. So is **DineEquity**. They are up, I think, 300 or 400% and there is like...

Jeff Fischer: Why didn't we buy these?

Todd Wenning: These companies are...

Jeff Fischer: It is interesting. They are dog companies with weak balance sheets and one-star ratings on CAPS.

Todd Wenning: These were companies that were heavily shorted to, with the expectation they would go under and basically what has happened over the past two months is that they have been able to reconfigure their debt structure, reorganize a little bit and if proven that they are going to be going concerns, at least for a little while longer, which is why the stocks have really rallied.

Jeff Fischer: Interesting. The businesses still don't look attractive.

Todd Wenning: No, they are unprofitable.

Bruce Jackson: There has been a big dash for trash; the trash stocks have been leading this recovery.

Jeff Fischer: Yeah, the financial; everything that brought us down has now bounced. And so they fell 80%, financials in general and now they have since doubled, which means that they are still well, well below where they once were.

Bruce Jackson: And there are still a lot of headwinds as well; that is the main thing we have been looking at in *Pro*. There are still a lot of economic headwinds. The market has bounced substantially, but the economy hasn't bounced substantially. We are seeing; people were talking not so long ago about looking for green shoots of recovery; now it seems to be finding oak trees. All of a sudden it is a big turnaround from just two months ago, March the ninth when we had those lows.

Jeff Fischer: Right, things have slowed down; the slow down has slowed down, but it hasn't even stopped yet. We haven't even touched bottom yet and then once we finally do, it is going to be stability for a while, we will need to see before we eventually see growth.

Bruce Jackson: Yeah, and I think some of the valuations on the companies that we are seeing at the moment. Intel, we were talking this morning about Intel. They are on a forward P/E of 30 for the current year, falling to 20 next year. Now next year is a long way away in this economy and the P/E of 20 is highly prized.

Jeff Fischer: Right and that is based on a wild guess for what 2010 earnings may be.

Bruce Jackson: Well Intel, along with many others, are just not giving guidance at the moment. They still don't know where the economy is going.

Jeff Fischer: So what are we doing at *Pro* here in this market?

Todd Wenning: We are really staying patient. I think we have found; we still find good ideas like we did with Jack Henry, but the valuations on some of the companies that we had our eye on, like Tractor Supply, got away from us. We are just going to stay patient and wait for the right times to buy. We don't want to chase into this rally.

Jeff Fischer: I read in the *Los Angeles Times* the other day and a columnist wrote that first everyone was afraid of losing money and now everyone is afraid of missing a gain. And that is, by far, not the way we want to invest, not out of fear. We will just stick to our strategy of buying strong companies at good prices and averaging in over time.

Bruce Jackson: Absolutely. Fear and greed drive this market a lot of the time and certainly greed is winning at the moment, but we are very patient and we will wait for the right companies at the right prices.

Jeff Fischer: Well thank you guys; it has been a pleasure. Bruce, thank you for flying all the way in for this five-minute chat.

Bruce Jackson: You are welcome.

Jeff Fischer: Have a good trip back.

Bruce Jackson: Thank you.

Jeff Fischer: And thank you for listening and we look forward to seeing you on the *Pro* discussion boards. Fool on!

Making Pro Fit Your Profile

Published May 7, 2009 at 12:00AM

Way back in October 2008, the *Pro* portfolio began with a blank slate and $1 million cash. That cash sits in a non-retirement account in the Motley Fool name, separate from all other Fool money, and receives no additional injections of cash (other than the income we generate from *Pro*'s investments). And while we aim to reduce tax obligations where possible, we do not deduct taxes from the portfolio, and we don't let taxes dictate our investment decisions.

From the start, many *Pro* members have mirrored our moves as closely as possible, matching our percentage allocations, while others pick and choose their favorite *Pro* holdings. And that's great: We're building a diversified portfolio with energy stocks, technology and software, commodities, health care, international, and more — so our offerings are flexible enough that you can follow along according to what suits your profile best. After all, most Fools don't start with a blank slate and a million bucks in cash.

No matter how you're following along with us, many of you have had questions about how to make *Pro* fit your investing situation. Below we've gathered our best advice on common portfolio management issues to help you make the most of our service.

If you're already fully invested as you arrive at *Pro*:

- Don't sell everything you own at once. You own your stocks for a reason!
- Begin by reviewing your current holdings. Then, consider selling your least-favorite stocks to free up cash as you need it for new *Pro* trades.
- Gradually move freed-up cash into our Buy First stocks and then our Buy stocks.

- Consider your sector allocations and stay diversified as you add *Pro* buys.

If you're adding new cash over time:

- Averaging new money into stocks over time helps you achieve better returns. Do this if you can.
- Determine how much you plan to contribute over the next year and base your target allocations on *that* figure rather than on your current portfolio value. If you have $50,000 and expect new cash will grow it to $60,000 by year-end, keep that in mind as you allocate.
- Be mindful of commissions as you build your positions — ideally, you want commissions to cost less than 2% of any trade. A $20 commission for a $500 investment, for instance, would be 4% — that's not cost-effective. (This is much less true when writing options, where you simply want the cash you're paid to be worthwhile; commissions will typically be a larger part of your overall trade.)

If you're using an IRA:

- IRAs are tax-deferred accounts, so they're ideal for income-generating trades like covered calls, high-yielding dividend stocks, and any ETFs with large, taxable distributions.
- IRAs are *not* so great for more speculative trades because any losses generally cannot be used to reduce your taxes.
- Keep in mind that IRAs do not allow short selling or buying on margin, and will not allow more aggressive option strategies, such as writing puts on even modest margin.
- Consider opening a separate non-IRA account to take advantage of these *Pro* strategies. Then, manage this second account and your IRA together as *one* portfolio.

If you have "only" a 5- or 6-figure portfolio:

- Match our allocation percentage with your overall stock portfolio. For example, if we recommend a 4% buy that means a $40,000 investment for our $1 million, but it would be $4,000 for a $100,000 portfolio and $2,000 for a $50,000 portfolio.
- If your portfolio isn't large enough to keep up with all of our trades, don't worry! Pick among your favorite *Pro* ideas while being mindful of commissions and diversification.
- Look to write options mostly on our lower-priced stocks (below, say, $25 or so). And you can *buy* options whenever we do, as that's relatively inexpensive.
- Use *Pro* to help you grow your portfolio now — while learning strategies to use down the road as you build toward your own million (and beyond!).

If you want to reinvest dividends:

- If a *Pro* stock is rated a Buy or Buy First, reinvesting any dividend it pays into more shares is a good strategy to consider. Go ahead if you like.
- *Pro* is *not* reinvesting dividends simply because it's difficult for us to track. It results in partial shares, which also complicates option strategies on the stock. We take all dividends as cash and will invest them ourselves.

If you don't want to use options:

- That's OK — we're building an equity-based portfolio. Focus on buying *Pro* stocks in our preferred buy price range (stated at the top of each What We Think report) to give you the largest margin of safety. Use limit orders if you're waiting for a stock to decline first.
- Diversification helps reduce portfolio volatility, so make sure your *Pro* stocks keep your portfolio well-balanced along the lines of our allocation advice.

If you can't sell puts because of brokerage restrictions:

- Focus on buying stocks in our preferred buy price range to give you the largest margin of safety.
- Read up on our covered call strategy. This is another way to generate income from options and is allowed by most brokers and even in IRAs.

We don't expect every *Pro* member to start with our same $1 million cash and match us dollar for dollar -- though if that's you, congratulations! For the majority of you, it won't be difficult to develop a strategy to fit *Pro* to your existing portfolio, whatever its size. Follow our advice above, and if you have any questions, our *Pro* message boards are just a click away.

Monday Memo: Battle of the Bull Run

Published May 4, 2009 at 12:00AM

Much of that unforgiving pessimism we witnessed in early March has been traded for seemingly blind optimism today. Last Wednesday, for instance, it was reported that GDP fell 6.1% in the first quarter — a marginal improvement over the 6.3% drop in the previous quarter, but still far worse than the 4.7% expected by economists. Despite this bad news and mounting fears over swine flu, the market shrugged it off and closed the day up 2%. A day earlier, it was announced that the closely watched Case-Shiller home price index fell 18.6% year over year but stopped its 16-month streak of setting record declines. Once again, the market shrugged off the bad news.

A number of economists and analysts took these "less bad" reports and spun them in a positive light, noting that "the worst of the recession is behind us" and that the data point to "an end to the recession by late 2009." An economics professor at Northwestern even proclaimed, "The end of the tunnel may only be weeks away."

Weeks away? Two months ago, we were stocking up on potatoes and ammunition — now all of the sudden, we're Pollyanna. My, how quickly sentiment has shifted.

Pollyannas aside, there's simply more to the story here. One of the major reasons economists got excited about the latest GDP numbers was shrinking inventories, which they predict means businesses will need to increase orders, which would ramp up production at manufacturers. But let's not put the cart before the horse here. Inventories *always* appear bloated after an economic bubble bursts (think of the post-dot-com bust warehouse full of Pets.com mascots) and naturally slim down to meet the new economic reality. But until there's an increase in *real demand* for those products again, who's to say inventories won't remain low?

Bottom line, credit remains tight, unemployment continues to rise, and housing prices — while "less bad" — are still on shaky ground. In other words, we're no longer falling off a cliff; you might say we're rolling down a rocky hill. The rebound will happen, but it's definitely not weeks away. As investors, we need to be patient.

At *Pro*, we're pleased to see more green in our portfolio from the recent rally, and we're still finding undervalued companies worth buying at current prices — but we remain cautious. We continue to research new ways to hedge against a possible (if not probable) market sell-off. After all, it's our mission to find ways to profit no matter what the market does. We hope you're investing patiently along with us.

We had a number of earnings reports last week from companies in the *Pro* portfolio:

- **Procter & Gamble** (NYSE: PG) was operationally strong but couldn't overcome the sting of a stronger U.S. dollar. You can read my take on the quarter on the P&G board.
- It was a long winter for our favorite Saskatoon-based uranium producer **Cameco** (NYSE: CCJ), which reported light results according to Jeff and Bruce. Read their thoughts on the Cameco board.

- The market rewarded **Flowserve**'s (NYSE: FLS) quarterly results with a higher share price, but Jeff had some minor concerns about a decline in the company's new orders.
- Despite a struggling lumber market, **Plum Creek Timber** (NYSE: PCL) prudently allocated its capital resources and made a number of moves that I believe will increase long-term shareholder value.
- Graphite electrode-maker **GrafTech** (NYSE: GTI) played the little engine that could in a very weak quarter for steel demand and used its low-cost business model to turn a modest profit despite a plunge in sales. Jeff was dazzled by management's intellectual footwork and operational efficiency — you can read his thoughts here.
- Finally, congratulations to *Pro* member **trurl9** for his winning post in our "5 Covered Call Candidates" challenge. He'll be receiving an authentic Fool hat for his efforts!

As always, if you have any comments, come visit our Memo Musings board.

Fool on!

Todd Wenning (**TMFPhila**)

Audio Extra: The Pros on Flowserve, P&G, and GrafTech Earnings

Published May 1, 2009 at 12:00AM

Greetings, Fools!

Your latest installment of *Pro*'s Audio Extra features our take on hot-off-the-press earnings news from valve maker **Flowserve** (NYSE: FLS), consumer goods behemoth **Procter & Gamble** (NYSE: PG), and graphite electrode supplier **GrafTech International** (NYSE: GTI). How did these *Pro* holdings do in the past quarter — and what's our latest guidance for your new money? Find out as *Pro* team member Jill Ralph chats with Jeff Fischer and Todd Wenning — just click the player below to listen in!

RoNThpOub6mYpuD5x7l8OVyahsTv8imi

What do you think about the earnings news — and are you picking up shares (or writing puts) on any of these stocks? Let us know over on the *Pro* discussion boards:

- Chat about Flowserve
- Chat about Procter & Gamble
- Chat about GrafTech

Todd owns shares of Procter & Gamble.

Below is the complete unedited transcript.

Jill Ralph: Hi, I am Jill Ralph, part of your *Motley Fool Pro* team, and I am seated next to Jeff Fischer and Todd Wenning.

Jeff Fischer: Hey, Jill.

Todd Wenning: Hello.

Jill Ralph: And we are here with the latest rendition of *Pro* Audio Extra. A couple of our *Pro* holdings have reported earnings this week and we wanted to come and give you the *Pro* take.

We are going to kick things off with Flowserve. Jeff, for those of us who may not be familiar, let's just talk through. What does Flowserve actually do?

Jeff Fischer: They are one of the world's leading sellers of valves, pumps and seals. So whether you are moving gasoline or oil or water, you may be using Flowserve.

Jill Ralph: So we can all agree it is one of the sexier companies out there.

Jeff Fischer: I'd say top two.

Jill Ralph: So how were the earnings? They just came out today, yesterday.

Jeff Fischer: Good, record-strong first quarter. The stock reacted as you would expect on these strong results. It gained 5 to 10%, but we are a little more concerned about bookings, which are just another word for orders. They were down 30% in this quarter from a year ago and actually they were down 20% when you include currency adjustments, so let's say 20%, 25% overall. We expected only a single-digit drop in bookings more or less, 7, 8%, so we need to keep an eye on this.

However, on the good side, management said bookings improved in March and as March went on, so the first two months of the year were very weak, but they seen an improvement now and I think that is partly why the shares reacted so favorably.

Jill Ralph: So it was a mixed bag; there was some good, there was some bad. Clearly the market reacted well. Now for someone out there who owns this company or is thinking about adding some shares, what is the guidance?

Jeff Fischer: Across the board for the most part, there were strong results. Record margins, record results. We are just watching for 2010 numbers to be high as well, which is what these bookings will tell us. So to get to your question, overall the company is strong, it remains strong. We are glad that we have bought a little bit. We think in the sixties it is fair to continue to average in and if you can buy 100 shares or more, you have the ability to sell $65 or $60 price puts, which will get you shares into the fifties. So two good ways to approach the stock.

Jill Ralph: Great. And let's move on to our second company here. Todd, tell us, Procter & Gamble also came out with its latest earnings, also a mixed bag, all things good, all things bad? We hope that is not the case.

Todd Wenning: Well it was really a mixed bag. The last thing was out of Procter & Gamble's control. For example, for the quarter, organic sales were up 1% and diluted earnings per share should have been up double digits. However, and it is a big "however", since Procter & Gamble does 60% of its revenue sales outside of the United States, it is really suffering from the for-ex markets, the foreign exchange markets. So the U.S. dollar has strengthened tremendously over the past six months.

Now how does that affect Procter & Gamble? There are two ways. One way is when they make money in the local currency and they convert it back to dollars, it buys fewer dollars. The other thing is that commodity prices are mostly priced in dollars, so when they have to buy the commodities with the local currency in U.S. dollars, they can buy fewer commodities, so they have to raise their prices which hurts them in an already weak economy, so the foreign sales were hurt more.

Jill Ralph: So Procter & Gamble makes an array of things that we consider staples and perhaps maybe surprised that there has been a big dip in that market. Is it something that you guys see continuing?

Todd Wenning: I don't think there was a big dip in the staples so much; it was more in the discretionary area with fragrances and grooming where people are stretching their hair salon visits longer or…

Jeff Fischer: Todd, we wanted to talk to you about that.

Jill Ralph: I know; it's not looking good, Todd. You might want to go back in.

Todd Wenning: My beard is getting a little long here.

Jeff Fischer: The other thing is the currency effect, the negative currency effect. We don't foresee that continuing either. This record strong dollar, or very strong dollar anyway, is not likely to continue, so when it finally subsides a bit, it should benefit Procter & Gamble, and Flowserve, by the way, and many of our companies, considerably.

Jill Ralph: So let's get to the bottom line for *Pro* members who either again are thinking about buying Procter & Gamble or already have a position. What is the take-away?

Todd Wenning: Well now is a great time to buy Procter & Gamble; $50 a share currently. Dividend yield at 3.5%. They recently raised the dividend. They have generated $3.5 billion of free cash flow this past quarter. The company is operationally strong. It just has some macroeconomic things going on that it can't control.

Jill Ralph: So you are not shaken by this latest earnings report.

Todd Wenning: No.

Jill Ralph: In fact, possibly encouraged about the future.

Todd Wenning: Yeah.

Jeff Fischer: I think you just need patience. It could be at least a few quarters before things begin to really improve.

Jill Ralph: Absolutely. It feels like a common thread throughout the market.

Jeff Fischer: Not with any of our other stocks. *(Laughter.)*

Jill Ralph: No, no, and great segue, Jeff. Here we go; we'll get to the third and final stock on the docket for today, GrafTech. Jeff, give us a quick idea of what GrafTech does.

Jeff Fischer: GrafTech is a leading supplier of graphite electrodes to steel mills which allow steel mills to then produce steel.

Jill Ralph: Naturally.

Jeff Fischer: So if steel demand is low, demand for GrafTech's electrodes is low as well.

Jill Ralph: So let's get to the good part. Why is steel demand low?

Jeff Fischer: Yes, very, very low in quarter one, which was expected. GrafTech, as a result, had $130 million in revenue compared to nearly $300 million a year ago this same quarter, so a gigantic drop off and yet they were still profitable during the quarter, which is a surprise and made investors happy and really speaks to how well management is managing expenses.

Jill Ralph: So is that how they were able to be profitable after seeing that big decline?

Jeff Fischer: Yes, they run a very low-cost business, so during downturns, which they experience fairly regularly, they can ride it out.

Jill Ralph: And so again, we will get to the bottom line for our *Pro* members here. Own it or considering it, what is the take from the *Pro* team?

Jeff Fischer: It was a really interesting reaction from the market. The shares jumped on the news, even though the results were so-so and the guidance was very lackluster. The guidance was…

Jill Ralph: Was it vague or…

Jeff Fischer: Quarter two is going to be more of the same they said, so maybe break-even, small loss or small gain. Quarter three is usually very weak because it is summer; orders are very slow. A lot of steel mills shut down for the summer months. And the fourth quarter, they have no idea at this point. They say they have no visibility. They don't see any up tick yet.

Jill Ralph: Should we as investors be worried about that, for a management team that we trust so much?

Jeff Fischer: No, that is a great question, Jill, but no. I don't think we should because we are getting a good price. We still have a good price. We are happy to own it. You can continue to sell $7.50 puts on the stock to possibly get more shares. It is just a waiting game until orders pick up. They do think orders will resume towards the end of the year, but earlier they said in the summer they expected orders to pick up, so it is a waiting game.

Jill Ralph: But you guys are still happy with having it in the portfolio?

Jeff Fischer: Yes, we own 2% of a 4% position; we wrote puts for the other half and we may; we are definitely continuing to pursue greater ownership in this company.

Jill Ralph: So there we have it. It was perhaps not surprisingly a mixed bag of earnings for some of the holdings in the *Pro* portfolio. It has been a tough operating environment out there. Jeff, Todd, thank you guys for taking the time.

Jeff Fischer: Thank you, Jill.

Todd Wenning: Thank you.

Jill Ralph: And for all of you *Motley Fool Pro* members out there, feel free to join us on the boards. If you have any questions or concerns, we are out there perhaps too often, almost 24/7, so hop on and we will be back with another take of *Pro* Audio Extra in the near future. Fool on!

Write Calls on Cameco

Published Apr 29, 2009 at 12:00AM

At a Glance

- **New action:** Writing ("sell to open") one September $25 covered call (ticker +CCJIE) for every 100 shares of Cameco owned, up to 1,000 shares (60% of the 1,700 shares we own)
- **Recent stock price:** $22.50
- **Option's recent bid/ask:** $1.75/$1.85
- **Preferred limit price:** $1.75 or higher, day order
- **Acceptable limit price, if needed:** $1.50 or higher
- **Special consideration:** We are only covering 1,000 of the 1,700 shares we own, leaving some shares uncovered for additional potential upside. If you only own 100 shares, we recommend covering all of them with one call option. If you own 200 or more shares, we'd cover just half or slightly more than half.
- **Why write covered calls:**
  - To earn income while waiting for Cameco to appreciate to our estimated fair value.
  - To lower our cost basis on our covered shares by about 10%.
  - If our shares are called away, we'll close the trade with a 62% gain.

What's New

Uranium producer **Cameco** (NYSE: CCJ) has appreciated more than 50% since February, when management sold more shares to the public and we bought our stake via $17.50 puts. The stock is now near our fair value estimate of the mid to high $20s. By writing $25 covered calls on Cameco that expire Sept. 19 (four and a half months from now), we set up a potential sell price of about $26.75 per share on more than half of our position. This would give us a 62% gain on these shares while selling them in our current fair value range considerably sooner than we ever expected. Meanwhile, we'd keep about 40% of our shares in case our fair value estimate proves too conservative — say, if uranium prices begin to spike.

Remember, writing covered calls is a hedge strategy that nets you an option payment and can effectively lower your cost basis, but it obligates you to sell your shares if they reach the option's strike price or higher by expiration. The math behind this trade meets our covered call criteria: With Cameco recently $22.50, the September $25 strike price calls are paying $1.75 per share. This nets us more than a 10% payment (or effective yield) over the next 21 weeks on our $16.50 cost basis in Cameco. This payment also gives us 7.5% downside protection on our covered shares from the current $22.50 share price.

On the upside, the stock needs to increase 11% to hit our $25 strike price — and gain 19% to reach our $26.75 net sell price including the call option premium we'll be paid. If these shares are sold from our account, we'll end with a 62% gain.

"Risks" to the Upside

There are a handful of reasons we might see Cameco's stock continue to climb above $25. So far, it's shown considerable strength on the hope that uranium prices have bottomed. What's more, with investor concerns over inflation shifting hither and thither, Cameco's uranium and gold exposure make it an enviable inflation hedge. And while we believe that quarterly earnings results (announced May 1) could keep the stock in check — earnings are due to be flat this year — any optimism in the report could send shares even higher.

If you're writing covered calls, you always must be prepared to leave some additional upside on the table. Covering just part of our position with covered calls, and leaving 42% uncovered, lowers our risk of missing extra gains in the coming few months.

Covered Call Reminders

- The order is "sell to open," "sell," or "write."
- You may write one covered call for every 100 shares of Cameco owned. Remember, you don't need to cover all of your shares (unless you only own 100) — we're only covering 58% of our shares.
- If Cameco increases above the option's strike price, you need to be ready to have your shares sold away.
- You can close the calls early ("buy to close") if you wish to exit the covered call trade. If we make 85% or more, we'll consider this. Also, if Cameco is above $25 but below $26.75 by expiration, we may close the calls to book some option profits and keep our shares. We'll see in good time!

Please post your questions on the Cameco board!

Options 601: Stock Repair

Published Apr 29, 2009 at 12:00AM

To set up a stock repair, for every 100 shares of a losing stock you (woefully) own:

1. Buy one call option at a strike price below the current share price.
2. Sell (write) two call options at a strike price above the current share price.
3. Use the same expiration date for the options you buy and sell.
4. Typically, use options that expire in 90 days or less.

These option trades result in minimal or no cash outlay for you because the call you buy is paid for by the two calls you sell. Plus, the strategy does not bring new risk to your stock — your options are neutral and covered: They largely cancel each other out, and the first call option you sell (or write) is covered by the 100 shares of stock you already own, while the second call you sell is covered by the new call you just bought. Got that? Let's turn to an example to show how it works.

Assume you purchased 100 shares of a stock at $40 per share, and it now trades at $30. You're down 25%, lack hope for the stock's recovery, and don't want to hold your shares any longer. At the same time, you don't believe there's high risk left in the stock — otherwise, you'd simply sell. It seems your best move to get to breakeven is to initiate a stock repair strategy.

To start, you purchase a $30 call option for $2.50 that expires in 60 days. You then sell two $35 call options for $1.25 each. Your option trades have paid for themselves. Your positions look like this:

- Original stock, bought at $40, is now $30
- Buy one $30 call option costing $2.50
- Sell two $35 call options for $2.50 total income

Here are your possible outcomes:

IF the $30 stock ...	THEN ...
Declines or holds steady at $30	All the options expire, nothing changes (you just lost on commissions). You can try again.
Ticks up a few dollars — say, to $32.50	You make $2.50 per share on your $30 call option (because you bought it for $0 net cost) and by selling the call for the gain, you've effectively lowered your stock's cost basis to $37.50. The calls you wrote expire. You can use the strategy again.
Recovers to $35 — bingo!	Your $30 call is now worth $5 per share, all profit, so your cost basis in the stock is now $35. You can sell or close all positions and break even (commissions aside).
Soars to $40	No problem. You are breakeven on the stock, and your options cancel each other out. You can close everything and move on.
Catapults beyond $40	All of your positions still cancel each other out, and you can still sell your stock at breakeven. You've foregone a profit in the stock, though.

As you can see, the stock repair strategy has three possible results: (1) no change at all if the stock doesn't move or declines; (2) a lower cost basis if the stock ticks up; or (3) a break-even sale if the stock cooperates even halfway.

But what if you set up a stock repair trade only to change your mind and turn bullish on your stock again? The situation is salvageable. Let's say your stock returns to $40 on good news, and you wish to keep owning it. In that case, you can close all of your option trades at or near breakeven (they'll largely cancel each other out) and continue to hold the stock.

In general, this strategy works best when you're down about 20% on a stock. You buy your lower-priced call options at a strike price that is about 20% below your stock's start price (or, at about the current share price), and you write your two other call options at the midway point between the current share price and your stock's start price, splitting the two. So, in another example, if you bought 100 shares of a stock at $50 that is now $40, to repair it, you'd buy one $40 call and write two $45 calls.

When you're down a reasonable amount on a lagging stock and simply want out at breakeven, setting up a stock repair strategy may help you meet your goal more quickly. The strategy does not increase or decrease your risk in owning the stock, but (unless you close the options early) it does limit your upside to your break-even price. You must be happy to just breakeven and confident the stock won't fall sharply while you wait. To discuss this strategy or see if it'll work on some of your current holdings, please visit the All About Options board!

Monday Memo: Keys to Cash Flow

Published Apr 27, 2009 at 12:00AM

When we study a company's free cash flow, the measure we run first is *true free cash flow*, or TFCF. It's calculated using three numbers from the cash flow statement:

Cash from operations - Capital expenditures - Tax benefits from options = True free cash flow

For example, if a company had $1 billion in cash from operations, spent $300 million on capital equipment (such as factories), and received $100 million in tax benefits due to options granted employees, its TFCF comes to $600 million. We would then compare $600 million to the company's market cap — its market value based on shares outstanding — to arrive at its TFCF value multiple. Our recent intent to buy, **Jack Henry & Associates** (Nasdaq: JKHY), trades at 10 times TFCF. This tells us the company is cheaper than its price-to-earnings ratio of 15 suggests.

A second measure we run is *structural free cash flow*, or SFCF. This is what Warren Buffett dubs "owner's earnings": the income actually left over for stakeholders to enjoy. SFCF is calculated as:

Net income - Capital expenditures + Depreciation and amortization = Structural free cash flow

Sometimes, SFCF and TFCF results will vary considerably — and we dig deeper to figure out why. Typically, the two results are quite similar. Our recent intent to buy, **Flowserve** (NYSE: FLS), is valued at 14 times TFCF and 9.3 times SFCF. Why the difference? One explanation is changes in working capital, or current liabilities and current assets, which aren't reflected in both measures. Still, we find both multiples attractive and reasonable.

There are a few rules to remember about cash flow. First, it's important to calculate free cash flow on a company's past 12 months of operations because cash flow results can be lumpy quarter by quarter. Although it's much easier and less time consuming to calculate one quarter and annualize it, your estimate may be inaccurate — so don't do it.

Second, use a company's SEC filings to get the numbers for your calculations rather than a third-party data feed or even company press releases. SEC filings are the only authoritative source immune to error.

Finally, companies can spend loads of capital during certain stages of development — for instance, a young retail chain adding hundreds of new locations to help it grow. In this case, we back out the one-time capital expenditures that won't recur in future years to arrive at a fair estimation of the company's long-term cash flow creation. This calculation is called *maintenance free cash flow*, or MFCF — we'll address it further if we buy a stock where it applies.

Without consistent free cash flow, a company is hamstrung: It won't grow, it won't create lasting shareholder value, and it can't get ahead of competitors. If you have questions about our free cash flow measures, please post them on our Philosophy & Strategy board. Meanwhile, you can rest easy knowing we do our free cash flow homework on all *Pro* companies every quarter.

We're in the thick of earnings season, so we're making sure each *Pro* company is performing up to snuff. We saw solid results from **Kinetic Concepts** (NYSE: KCI) a week ago, and as the sidebar shows, more companies go under our Foolish microscope soon. *Pro* also has the following on deck for you:

- Do you own stocks that are down 20% or so and you just want to get back to breakeven? A conservative option trade can repair those stocks for you, helping you get to even! Our "stock repair" option strategy guide lands in your inbox this week.
- We'll email a new CAPS screen to you showcasing promising companies in a timely industry.
- Are you writing options? A coming option guide will explain the liberating process of "rolling out" your existing options to future months.

- We'll be visiting a *Pro* company soon — we'll let you know which one and when.
- As expected, new investments are in the works as we continue to build our real money portfolio.

Thank you, as always, for being a key part of *Pro*. Have a Foolish week!

Jeff Fischer (**TMFFischer**)

Buy Jack Henry & Associates

Published Apr 23, 2009 at 12:00AM

At a Glance

- **Target allocation:** 2.5%
- **Price when we released our original intent:** $17.50
- **Estimated fair value:** $30
- **Preferred buy price:** $22
- **Special note:** *Use a limit order at your desired price.*
- **Type of holding:** Long-term, Software/Tech
- **Dividend yield:** 1.9%
- **Why buy:**
  - Jack Henry's software serves small- and mid-tier banks and credit unions that have held up well in the banking crisis.
  - The company has a stellar balance sheet, high recurring revenue, and consistent free cash flow.
  - Its strong existing customer relationships help it cross-sell new products and grow revenue.

The Big Picture

Just two years ago, banking giants including **Bank of America** (NYSE: BAC), Wachovia, and **Citigroup** (NYSE: C) were revered by Wall Street and heralded as the future of finance. A few decades of deregulation and interstate consolidation saw these supermarket banks spread from coast to coast, offering services from deposit banking to investment banking and wealth management to credit cards.

Along the way, lending decisions moved from small towns and communities to banking centers in New York and Charlotte, N.C., creating unfamiliarity between lenders and borrowers — not to mention confusion about what's really at the heart of banking. The big banks' aggressive approach to subprime loans and nontraditional banking practices is precisely what's gotten them in all this trouble. And customers have literally paid the price: Bank of America generates more than half its revenue via commissions, credit card fees, and advisory fees — this is the new "normal" in big banking.

This stands in stark contrast with more than 8,000 community banks that primarily serve Main Street clients and represent more than 98 percent of all federally insured institutions. This segment of the banking industry has survived the financial meltdown better than its big-dog counterparts because it stayed true to traditional local lending practices and largely avoided the subprime debacle. This plays right into the hands of financial software and data-processing company **Jack Henry & Associates** (NASDAQ: JKHY). Jack Henry's two key markets are recently chartered de novo banks (state banks in operation less than five years) and mid-tier banks with $750 million to $10 billion in assets. Add that to the fact that 92% of banks in the U.S. have less than $1 billion in assets, and we see a wide market opportunity for Jack Henry as the industry repositions itself following the meltdown.

Our Take

If you've ever used a debit card, paid bills online, or had your paycheck direct-deposited via an electronic funds transfer, then you've had experience with the kinds of software and processing services Jack Henry offers to more than 8,700 community banks and credit unions. As electronic banking becomes an industry standard, small banks need software applications and systems that process transactions quickly, securely, and at a lower cost to stay competitive.

Jack Henry has a suite of software products to fill these needs, generally signing five-year contracts with customers — 98% of which renew automatically at the end of the term. Moreover, because fees are based on the institutional client's asset size, Jack Henry's revenue will increase as customer asset bases grow.

The company's revenue breaks down into three categories:

Software licenses represented 8% of total revenue in the first half of fiscal 2009 (the company's fiscal year ends June 30). Jack Henry licenses its proprietary software on a per computer basis to banks that process all transactions in-house. This part of the business is getting weaker as more banks elect to outsource these services to cut costs; today just 56% of all financial institutions and 73% of credit unions still use in-house processing. Fortunately, Jack Henry also offers outsourcing services, and in fiscal 2008, 27 of its in-house bank customers migrated to its outsourcing offering. A major advantage Jack Henry has over competitors is that its software is compatible when a bank decides to outsource — so no technical retraining of bank employees is needed.

Support and service fees, the fastest-growing division, represented 82% of total revenue over the past six months. This part of the business provides in-house software support, electronic transfer support, and the outsourced data processing we just talked about.. Despite the slowdown in bank mergers during the past year, this division has been supported by electronic transfer support sales that have grown with increased use of ATM and debit cards and bill payment transactions. The more people move money about electronically, the more need there is for Jack Henry software.

Hardware sales make up about 10% of total revenue. This division supplies hardware system solutions including servers, workstations, and check scanners compatible with the Jack Henry software suite. In this area, Jack Henry has a 30-year history with **IBM** (NYSE: IBM) and sells its IBM Power System hardware along with **Dell** (NASDAQ: DELL) servers and Lenovo work stations.

The backlog for Jack Henry's services increased 16% to $277.9 million as of December 2008 (representing about 37% of last year's total sales), with $61 million for in-house products and $216 million for outsourcing services. Clearly, Jack Henry products have serious demand despite a weakness in the broader banking community.

You Don't Know Jack

Jack Henry & Associates is a quintessential American success story. In 1976, Jack Henry co-founders Jack Henry and Jerry Hall sketched out an integrated banking software system on the back of a coffee shop napkin. At the time, small banks couldn't afford the expensive processing programs that big banks used, and consequently they had to send their business information elsewhere to be processed. Using a borrowed computer in a rented engine repair shop, Henry wrote the code for the original software program based on "intuition" and "common sense." Just nine years later in 1985, Jack Henry's IPO hit the Nasdaq Stock Market, and from 1991 to 2001 the shares grew at an *annualized* 77% rate, turning a modest $1,000 into $307,000 over a decade.

Certainly we don't expect that type of success to be repeated with our investment, but we do believe the shares offer excellent value today. We're particularly attracted to Jack Henry's strong business model, with 74% recurring revenue and high customer retention rates. Its credit union processing unit, for example, has lost only five credit unions to competitors in the unit's 23-year history. Moreover, we're impressed with Jack Henry's commitment to customer service, which the company calls a primary competitive advantage. That's not just corporate speak, either: It provides 24/7/365 support from its Monett, Mo. (pop. 7,000) headquarters, while a number of its competitors' support is based overseas. That makes a real difference to customers in need.

The Community's Take

Jack Henry earns a perfect five stars on CAPS and has an impressive raw score of 97.61, putting it in the top 5% of the CAPS universe. As of April 21, 2009, 35 out of 37 All-Stars ranked the stock an outperform, and among all CAPS participants, 134 out of 140 rate the stock an outperform.

On our proprietary CAPShot Report, Jack Henry rates a respectable 7 out of 12, coming up short on our steep annual revenue growth hurdles, revenue per employee, and its current ratio. Its industry (software) is rated poorly right now, but Jack Henry ranks in the top 1% of all software companies on CAPS.

Valuation and Financials

There's a lot to love about Jack Henry's financial statements, including strong operating margins of 21%, no long-term debt, and plenty of free cash flow to reinvest in the business and pay a dividend that management has increased each year as a public company since 1985 — recently by 13%.

Using a three-stage discounted cash flow model (to help determine the present value of estimated future cash flow) and conservative growth estimates below average analyst estimates with 3% terminal growth, we see a fair value for Jack Henry between $26 and $30 — offering strong upside from the current $17-ish prices. Shares currently trade for just over 10 times trailing free cash flow and 15 times earnings.

The company's healthy balance sheet and large, loyal customer base also make it a potential takeover target for an old friend like IBM or an outsider such as **Oracle** (NYSE: ORCL), which could be looking to make a foray into the growing electronic payments business. Of course, we're happy to own Jack Henry shares even if a buyout doesn't happen.

Jack Henry's major competitors are the larger **Fiserv** (NASDAQ: FISV) and **Fidelity National Information Services** (NYSE: FIS); the latter recently acquired another competitor, **Metavante** (UNKNOWN: MV.DL) for $2.94 billion. While competition from Fiserv and Fidelity National is fierce, both companies are mired in debt and have deep links with the troubled larger banks. Fidelity National has relationships with 40 of the top 50 global banks, including nine of the top 10. To these firms, small banks are a lesser priority. Needless to say, we believe Jack Henry, with its focus on smaller banks and no long-term debt, is in the best position to serve its niche.

What Would Make Us Sell

Over the past five years, Jack Henry has completed 15 strategic acquisitions of companies in the businesses of check and document imaging, fraud detection, and payment processing solutions, among others. Adding complementary services like these to the Jack Henry software suite is an ideal way to cross-sell products and increase revenue — and so far, it's proved successful. However, if the company makes a large acquisition we believe does not fit its core business then we would need to reexamine the value of the shares. Similarly, if Jack Henry is unable to find suitable acquisitions to help fuel growth, we may need to reconsider its valuation.

While Jack Henry itself isn't regulated or chartered by federal and state banking regulators, its clients certainly are, and its software needs to be compliant with any existing and future legislation. A major regulatory overhaul that adversely affects small- and mid-tier banks and credit unions could hamper spending for Jack Henry's clients and would force Jack Henry to quickly retool its existing software to meet the new standards. If it failed to become compliant and its customers were fined, the company could ultimately face litigation and liability damages. Obviously, management is not likely to let this happen, but you should know about it.

Finally, if Jack Henry's target market of 8,400 commercial and savings banks and 8,200 credit unions begins to rapidly dwindle due to industry consolidation (particularly big banks who don't use Jack Henry products buying small banks that do) or financial failure, we would need to readjust our growth estimates downward and determine if holding the shares still presented a value.

Pro Bottom Line

As an undervalued business with strong recurring revenue, a good balance sheet, and a leadership position in the healthiest niche of the small banking sector, we're happy to welcome Jack Henry & Associates to the *Pro* portfolio. If you have questions about Jack Henry, please post on its new discussion board. And if you decide to buy shares, please consider using a limit order in your desired buy range.

For more information on Jack Henry's corporate values and insider ownership, please see our board post with the subject line "More on Jack Henry."

Write Puts on Intel

Published Apr 22, 2009 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") June $15 puts (ticker +NQRC)
- **Allocation:** 6%
- **Recent share price:** $15.60
- **Option's recent bid/ask:** $0.82/$0.84
- **Preferred price for put options:** $0.75 or higher (5% of the strike price)
- **Acceptable price for put options:** As low as $0.60 (4% of the strike price)
- **Alternative trade:** Write July $15 puts for $1.00 or better
- **Why write puts:**
  - Intel's management told the world that the PC market has bottomed, and order patterns are stabilizing.
  - The stock is reasonably priced but likely to remain in a range, so we can continue earning income writing options.
  - If the shares are put to us near a net price of $14.25, we'd be happy buyers and would then consider writing covered calls.

With any luck, **Intel** (NASDAQ: INTC) will remain a profitable friend of *Pro* for years to come. This stable, dominant business provides a lasting opportunity to write options on a stock that is currently range-bound with a valuation floor beneath it that's probably in the low teens. We've written covered calls on Intel twice since November 2008, and recently, our shares were called away from us at a net $16.32. Rather than buy the stock back, we're going to write puts to potentially buy shares lower.

When you write puts, you're ready and willing to buy the underlying stock at a lower price if it arrives. Writing the June $15 puts obligates us to buy shares of Intel if the stock trades below $15 by the June expiration. Our net buy price would be in the low $14 range. These options recently pay 5.3% of the strike price — that's also the yield on our trade — while expiring in 58 days. Our net buy price if we get the shares is 9% below the share's recent $15.60 price, so the trade meets our put-writing guidelines.

We've increased our allocation from 5% (for our initial trades) to 6% today. We have increased confidence on Intel's business following its first-quarter profits and management's belief that business is stabilizing. Even in a recession, computers must be replaced and purchased. Given the relative stability of Intel, the reasonable nature of the downside risk, and our ample cash resources, we're increasing our allocation to greater capitalize on the stock.

Other Foolish Option Positions on Intel

If you already own Intel and have written covered calls, we suggest you continue to let your trade play out; if the calls get exercised, you can next consider writing puts. If your calls just expire, you can write new covered calls. Writing a put is in many ways equivalent to writing a covered call, especially when your strategy is income.

If you're unable to write puts but wish to follow along with Intel in some way, we recommend trying to buy the stock in the low $15's and concurrently writing July $16 covered calls for about $1.00 in payment.

If you have questions about our new intent to write puts on Intel, please post on the Intel board!

Monday Memo: Getting Greener With Pro

Published Apr 20, 2009 at 12:00AM

You see, in this fast-moving market, with six straight weeks of gains at our backs, it's tempting to just pile in and buy stocks with the hope that they'll zoom higher on the back of rising market sentiment. But that strategy is flawed for at least two reasons:

1. There are no guarantees the market will keep appreciating. Although it's had a good run, and President Obama sees "glimmers of hope" while Federal Reserve Chairman Bernanke sees "tentative signs that the sharp decline in economic activity may be slowing," the economy is far from out of the woods.

2. There is no substitute for thorough research and patience.

We continue to steadily and patiently invest $1 million of the Fool's real money into the *Pro* portfolio knowing that in this volatile market, opportunities will always arise. Even now, the S&P 500 is only back to prices last seen in *early February*, and it is far below prices for all the months and many years (about 10!) before then.

Tech bellwether **Intel** (Nasdaq: INTC), whose shares were called away from the *Pro* portfolio this weekend, was our first holding to report earnings this season. Intel -- a stock we've been specifically using to generate income via covered calls -- beat earnings estimates but failed to give revenue guidance for the second quarter or full year, citing a still-uncertain economic environment. This was despite Intel calling the bottom of the PC market, saying it had returned to more "normal patterns."

I covered the conference call in more detail in this post, but my main takeaway is that "normal patterns" does not mean a reversion to the go-go days of 2007. More likely, it means Intel is close to a new base level, one it will hope to grow from in the quarters and years ahead. It will likely take quite some time for it to return to the sales and profits enjoyed in 2007. And I think we'll see a similar theme among many companies throughout this reporting season.

Pro has earned a profit writing covered calls on Intel since November, and we'll likely revisit the stock with a similar (if not the same) strategy soon. If you haven't bought Intel or traded options on it yet, you'll have an opportunity to follow along with *Pro* on this stock in the near future -- assuming we see a strategy we like.

One of the beauties of options is that investing opportunities arise virtually every day, particularly while the market remains volatile. *Pro* Fools are regularly swapping investing ideas on the boards, such as this thread on our recent intent to buy, **Flowserve** (NYSE: FLS).

While opportunities abound, we caution Fools about getting *too* carried away with their options investing. At *Pro*, we're aiming to generate up to 5% additional income per year from our option writing (buying options is more open-ended). That said, we are always seeking especially attractive option opportunities. In case you missed it, Todd came up with 5 Covered Call Candidates From CAPS last Wednesday. Chime in with your vote on which is best -- we're giving a Fool hat to our favorite entry!

The *Pro*discussion boards are a wealth of information on our stocks and investing in general. We encourage you to participate as actively as possible -- you won't be disappointed. This week's highlights:

- Jeff suggested amendments to *Pro*'s Buy Below guidance on the **AmTrust Financial** (Nasdaq: AFSI) board two weeks ago, with many Fools weighing in with their thoughts. Today, Jeff posted our official new policy.
- Todd posted a poll asking which *Pro* company you'd like us to visit next. If you haven't already done so, it's not too late to cast your vote. Jeff and Todd are itching to hit the road and report back to you.
- Russell (**TMFEldrehad**) offers up his latest weekly take on CAPS on our CAPS Corner board.

Coming up, we have earnings from **Kinetic Concepts** (NYSE: KCI) Tuesday and many others soon, listed in the sidebar. As usual, we'll be covering them on the discussion boards. As ever, please feel free to comment about today's Memo on the Memo Musings board!

Foolish Best,

Bruce Jackson (**TMFGoogly**)

Bruce owns shares of Autodesk, AmTrust Financial, GrafTech, Intel, Nasdaq OMX, Procter & Gamble. He is short Cameco puts, Intel calls, and Kinetic Concepts puts.

5 Covered Call Candidates From CAPS

Published Apr 15, 2009 at 12:00AM

Generating income is one of the major reasons to consider a covered call strategy — one we've already put to work in the *Motley Fool Pro* portfolio with **Intel** (Nasdaq: INTC), among other holdings. To set up a covered call, we want to identify a stable, healthy business with a reasonably priced stock that also pays a dividend. This way, we generate income in two ways: the quarterly dividend payments *and* the premium income we receive from writing the call. Ultimately, we should also enjoy some capital appreciation from the stock itself.

So how do you find a company that fits the bill? A great tool is the CAPS screener, which scours the CAPS community's 132,000 investors and 3 million stock picks (and counting ...) to find investment ideas. At *Pro*, we use CAPS to help us search for both long and short opportunities, and in conjunction, options. We can also use it to find strong candidates for a covered call strategy.

Screening for Green

Using the CAPS screener, I looked for stocks with a:

- 4- or 5-star CAPS rating
- Market cap over $7 billion
- Current price between $12 and $35 a share (making 100 share lots more affordable)
- Price-to-earnings ratio below 12
- Dividend yield between 2% and 7%
- Return on equity greater than 10%

Of the 39 results the screener generated, here are five of the more well-known companies (remember, none of these is a formal *Pro* recommendation):

Company	CAPS Rating	Dividend Yield
Emerson Electric (NYSE: EMR)	*****	4.2%
CSX (NYSE: CSX)	****	3.0%
Merck (NYSE: MRK)	****	5.8%
Kraft Foods (NYSE: KFT)	****	5.2%
Texas Instruments (NYSE: TXN)	****	2.3%

Data as of April 14, 2009.

Each of these companies shares some of the characteristics we looked for when we recommended Intel as a covered call strategy. They're all fairly large, steady businesses that have taken their licks along with the market during this recession, but have a number of built-in competitive advantages that should help them rebound when the economy recovers. Plus, they generate enough free cash flow to cover their current dividend payments. With a record 367 firms cutting dividends by $77 billion in the first quarter of this year alone, that's saying something about the strength of these underlying businesses.

Chat With Todd, Win a Hat!

With that in mind, I invite you to join me in discussing these covered call opportunities over on our All About Options board. Which of these stocks would you write a covered call on — and why? We'll be giving a bona fide Fool hat to our favorite board post on the topic over the next week. For *Pro* members who are unfamiliar with covered calls, this will be a good introduction to the strategy; for our more experienced options traders, it could also provide some new investment ideas. Finally, one of these stocks might even end up in the *Pro* portfolio as a covered call position. So join the discussion!

Fool on!

Todd Wenning (**TMFPhila**)

Our Guide to Hedging Like a Pro

Published Feb 12, 2018 at 3:40PM

Fellow Fools,

In pursuit of our North Star, the *Pro* portfolio explores every corner of the market: We go long, we go short, we use options. That flexibility and creativity helps us find upside, but it also means that if we're not careful, we can be exposed to risk from every corner of the market, too.

We mitigate this by carefully using hedges. A hedge is a position that reduces a portfolio's overall exposure to risk, and over the course of *Pro*'s history, we've hedged in several different ways. In every case, we begin by deciding what exactly we want to accomplish with our next hedge. As we drill down on how exactly to rein in our exposure to risk, we focus on:

1. **Target selection.** What kind of potential decline are we trying to guard against -- a black swan, or a more moderate, run-of-the-mill slump? What are the risk factors that make us want to hedge, and which vehicle should we choose? Would an index do the best job of isolating those risks and protecting us against them, or do we want to target individual stocks?
2. **Size.** How much of the portfolio do we want to hedge out? Will this be the only position we'll use to do it, or will we have other approaches to reducing our long exposure in place as well?
3. **Time frame.** How long do we want the hedge to last? Do we prefer a set-and-forget type strategy, or one that requires maintenance?

Developing answers for each of these criteria has traditionally been a good way of narrowing down our possible hedging strategies to a select few. From there, if there are still two or more hedges we like equally, we'll consider pricing to try to break the tie. Here, we're considering the potential trade-off between the costs -- both direct (option premiums or losses on shorts) and indirect (missed upside from holding cash) -- and the potential benefits, given the current market environment and our portfolio positioning.

We'd love if there were a simple checklist to apply to every hedge, one that would both simplify the process and ensure we achieve our desired results every time. Sadly, it doesn't work that way. Hedging, like all of investing, is both an art and a science, one that requires constant learning and evolution for long-term success. That said, there are some hedging maxims we always keep in mind when picking a strategy:

- **Be miserly.** It's possible that at a given point in time, paying up for a hedge might be the right thing to do -- but the odds are heavily stacked against you in the long run if you do so repeatedly. (Just look at all the failing hedge funds.)
- **The goal of hedging is twofold.** In order for *Pro* to continue to achieve its lofty goals over a full market cycle, our hedges must do more than just reduce volatility; they will also need to provide us with enough capital that we can be aggressive during significant market declines.
- **Do no harm (or at least as little as possible).** Since 1896, the market has risen 78 years out of 119, or 66% of the time. This means you need to pay just as much attention to the risks of your hedge as you do to the potential benefits, since odds are you won't end up needing it. In most cases, a hedge will be a drag on your returns.

And now for the details behind our favorite approaches to hedging. Many of these strategies use options, so look for links to the relevant section of *Motley Fool Options*' Options U if you need a quick refresher.

Cash

- **How it works**
  - Arguably the most straightforward hedging strategy, cash works as a hedge by reducing a portfolio's long exposure. For example, a portfolio that has a 20% weighting in cash (and is thus only 80% long), all else equal, exhibits only 80% of the volatility of a similar portfolio that's fully invested.
  - Maximum gain: Interest earned on the cash
  - Maximum loss: You typically lose to inflation
- **Advantages**
  - Simplicity. Time spent constructing and monitoring more complex hedges is time *not* spent looking for the next long position that could double or triple in five to 10 years. Using cash to hedge your portfolio requires only a small initial investment in time and essentially zero maintenance.
  - Flexibility. Besides protecting a portfolio from untimely declines, one of the major reasons we hedge is as a source of funds: money you can use to take advantage of said declines by purchasing shares of your favorite companies at a discount. Some hedging strategies can be difficult to unwind at a moment's notice, meaning you could miss a buying opportunity, but that's not the issue with cash, which can be immediately deployed.
- **Drawbacks**
  - Missed upside. During bull markets, holding cash comes with a meaningful opportunity cost. Although you're not explicitly paying for a hedge out of pocket, you *are* missing additional upside on the cash you don't have invested. Compounded over multiple years, those missed gains add up. Consider two $100 portfolios: one that is fully invested and one that is only 80% invested, with the remaining 20% in cash. Assuming an average market return of 9% over various investment horizons (as well as a 1.5% annualized return on your cash), you can see how the cost of holding excess cash really adds up the further out in time you go.

	Portfolio A	Portoflio B	
year	100% long	80% long & 20% cash	difference in portfolio returns
1	9%	8%	1%
2	19%	16%	3%
3	30%	25%	5%
4	41%	34%	7%
5	54%	45%	9%
10	137%	113%	24%
15	264%	216%	48%
20	460%	375%	85%

- **When to use**
  - For investors seeking a straightforward approach to reducing volatility who are less concerned with missing out on upside, cash works as a standalone hedging strategy.
  - It also works as a great compliment to other hedges, especially those that are options-based and cannot be closed until close to expiration.

- **What to target**
  - Your primary considerations here are: By how much do you want to reduce the volatility of your portfolio? and What role will cash take in your overall hedging approach? *Pro* typically targets a net long exposure (long-shorts and hedges) of 70% to 80%, with cash being only part of our overall strategy for volatility reduction. Historically, we've targeted about 15% in cash (resulting in a reduction in volatility of 15%, *ceteris paribus*), though we've taken this number as low as 6.4% and as high as 22.8%. In an ideal world, our cash position will act as a counterbalance for the portfolio. As markets fall, our cash balance will fall, too, as we take advantage of depressed stock prices. But as markets climb higher, our cash holdings will likely rise as we sell out of overvalued securities (or investments where the thesis has run its course) and wait for better opportunities.

Shorting an ETF

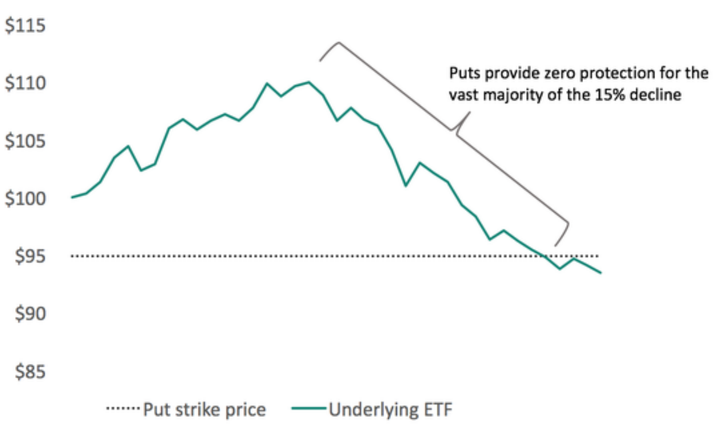
- **How it works**
  - Another straightforward approach, this is when you to sell short the ETF of a relevant index (e.g., the **SPDR S&P 500 ETF Trust** (NYSEMKT: SPY) or the **PowerShares QQQ Trust** (NASDAQ: QQQ)). For example, if you had a $1,000,000 portfolio and wanted to hedge out 20% in order to reduce your net long exposure to 80%, you would short $200,000 in your desired index ETF.
  - Maximum gain: Achieved if the ETF falls to zero
  - Maximum loss: Technically unlimited, but realistically confined to the amount the ETF can rise during the period you hold your short position open
- **Advantages**
  - Simplicity. Pick your ETF and your desired short weighting, then sell borrowed shares into the market at the current price.
  - Reactive. With a direct index short like this, if the underlying ETF falls by 2% the day after you set up the short, you can close your hedge and capture that gain immediately if you so desire. Many hedges, especially those that combine multiple options, are not nearly as immediately reactive.
  - Potential for outperformance over cash. An investor who targeted a net long position of 80% in a long-plus-cash portfolio would need to hold 80% of that portfolio in stocks. But in a long/short portfolio, this goal can be achieved with a greater weighting in stocks, as long as the short position results in a net of 80% long (e.g., 90% long and 10% short, 100% long and 20% short, 120% long and 40% short). If the "extra" long holdings (say, 20% in the case of a portfolio that's 100% long, 20% short) over the long-plus-cash portfolio outperform the ETF underlying the short, the long/short portfolio will outperform the long-plus-cash portfolio.
  - Liquid. In relation to being reactive (covered above), these positions can be put on and taken off at a moment's notice, which means you can take advantage of declines by reinvesting hedging profits as soon as you want.
- **Drawbacks**
  - Losses if the market rises. Unlike cash, shorting an ETF has a direct cost associated with a rising market. (Remember, when you short something, your payoff diagram is reversed: You make money when the underlying instrument declines in value and *lose* money when it rises.) The higher the market climbs, the greater your loss on the short, and potentially the larger a percentage of your portfolio the short becomes.
  - Shorting fees. Although they tend to be modest on larger ETFs, these fees do add up and weigh on returns if the short is held for long enough.

- **When to use**
  - When you're looking for a straightforward, highly reactive hedge, you're OK with paying a fee to borrow shares, and you don't mind that the hedge will act as an anchor on the portfolio if the market rises.
- **What to target**
  - As with cash, your primary consideration here is your desired target net long weighting for your portfolio as a whole, and what role you want this particular strategy to play.
  - Given how common this approach is, prices don't fluctuate much, so pricing discipline and discovery aren't much of a concern. The issue is more whether you're willing to pay up to use the hedge.

Buying Puts

[Options U link]

- **How it works**
  - For an up-front payment, puts protect the portfolio (or a position in it) from all downside below the strike price.
  - Maximum gain: Achieved if the underlying falls to zero
  - Maximum loss: The premium paid to purchase the puts
- **Advantages**
  - Simplicity. This is arguably the most straightforward options-based approach to hedging.
  - Upside exposure. You don't risk missing out on upside should the market move higher while your hedge is active. You only risk losing what you paid for the puts.
  - Accessible. This is a strategy that most investors will be able to set up in their accounts even if they have limited options-trading permission.
  - Reactive. This single-legged strategy will show profits if the underlying instrument falls by a large enough degree prior to expiration, in which case you don't need to wait until close to expiration to close.
- **Drawbacks**
  - Cost. Cost-wise, buying puts is essentially the opposite of using cash to hedge: You're not at risk of missing upside should the market rise, but you *are* required to make a payment in order to set up the hedge. Depending on the market environment, you could end up spending a significant percentage of your assets (say 3%-5%) per year for strike prices that are only reasonably out of the money -- meaning the strategy really starts to drag on portfolio performance if used for long enough. It's not impossible to imagine a situation in which the gains you receive when your hedge finally pays off — which will probably require multiple rounds of buying puts, unless you get really lucky with your timing — fail to even offset the cost you've incurred to buy those puts time and again, meaning you're actually worse off for hedging despite witnessing a decline in the market. At *Pro*, we guard against this by trying to find various ways to finance our put purchases, such as writing puts on longs we like to pay for the protective puts we buy.
  - Timing matters a lot. For the most part, puts only start paying off once they are in-the-money, so you run the risk that your hedge might be largely irrelevant by the time the market finally declines. For example, if you buy puts that are 5% out-of-the-money, but the market rises 10% before falling 15%, your hedge would only be reactive for the final 1.4% of the decline.



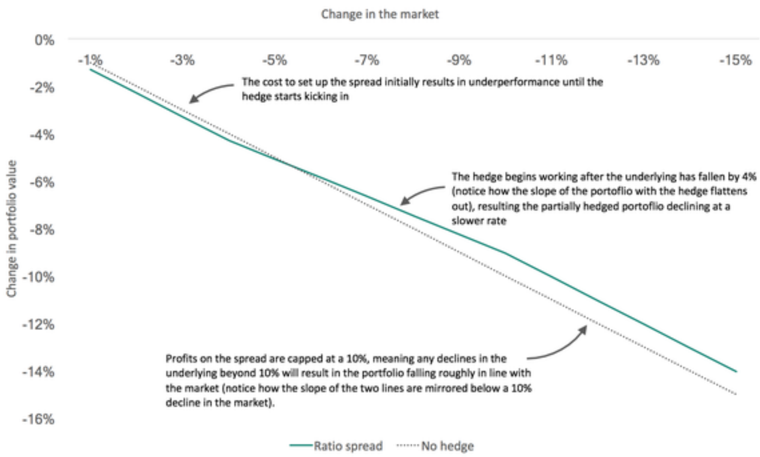
- **When to use**
  - When option prices are cheap (i.e., they favor the buyer) and your concerns about missing upside outweigh your dislike of paying to set up a hedge.
- **What to target**
  - There are two approaches you can take when looking to hedge by buying puts. The first is to target an intermediate length of time (typically 11 months or less) you'd like the hedge to be in place, then look to purchase puts, knowing it's likely you'll lose the entire premium you've paid if you hold them until expiration. When *Pro* takes this approach on an individual stock, we typically target puts that are somewhere around 10% out-of-the-money and pay no more than 5%-6% of the holding's value per year, with hopes that we'll sell the puts and get at least some of that back. The second approach is to purchase long-dated puts (typically expiring in a year or longer) and plan to roll them to a higher strike price if necessary to keep them closer to the underlying ETF's current price (and therefore more reactive as a hedge). In this case we target put strikes typically 10% to 15% out-of-the-money, and still aim to pay no more than about 6% per year of the position's value, initially, with hopes of recouping some of that when we sell, whether we roll up or not.

Bear Put Spread

[Options U link]

- **How it works**
  - With this options-based hedge, you purchase a put on an index or stock while financing some of the cost by simultaneously writing (selling) a lower-strike put with the same expiration date.
  - Maximum gain: Achieved if the underlying falls at least to the lower strike price of the written put
  - Maximum loss: The net premium paid to set up the spread
- **Advantages**

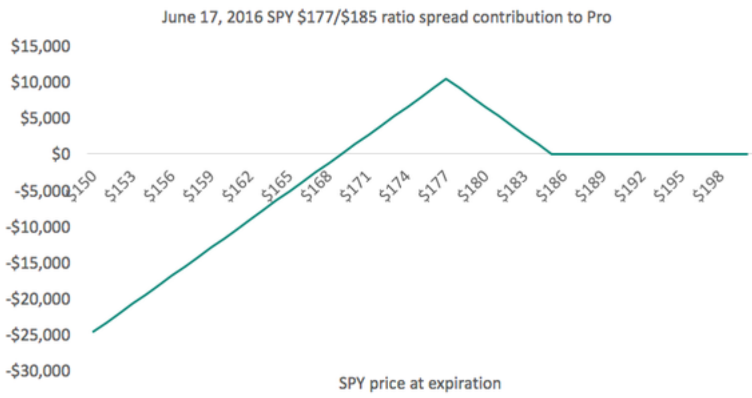
    - Cost, relative to just purchasing puts. Because you're selling puts with a lower strike price, you're able to meaningfully reduce the cost of setting up the hedge. This serves to minimize the drag on the portfolio if the market does not decline, while also raising your breakeven price and increasing the odds that your hedge makes money if the underlying instrument *does* go down.
    - Upside exposure. You don't risk missing out on upside should the market move higher while your hedge is active.
- **Drawbacks**
    - Cost. Although a bear put spread is cheaper than buying puts outright, you're still making an up-front payment for something that may never actually benefit you.
    - The amount of downside you can capture is limited. Selling puts helps reduce the cost, but it also caps the maximum profit you can make from a given spread.
        - To see these two drawbacks in action, let's say you set up a 20% hedge using a spread that starts making money when the underlying ETF falls by 4% and has a maximum gain at a 10% decline. Such a spread would leave you worse off in any market situation that's *better* than a 4% decline, because you had to pay to set up the strategy -- but once the hedge did kick in, your portfolio's value would decline at a slower pace than without it. However, that's only true until the decline reaches 10%. After that, you won't receive any additional protection.



- **When to use**
    - As with buying puts, you can set up a bear put spread if you desire a hedge that doesn't result in any missed upside (just the cost of your spread). But because your maximum gain on the hedge is capped, you should generally limit its use to situations where you're not overly bearish.
- **What to target**
    - Although you can set up a spread of any size and duration, typically we target a spread that is roughly 3% to 5% out-of-the-money, with about a $10 difference between strike prices. The cost for this type of hedge will largely depend on its duration, but a four-month position should cost about $2-$5 in most market environments. Your maximum profit in this example is $10 per spread, or at least a double, which is what we target since we risk a 100% loss of capital along the way. We generally target large ETFs including SPY, IWM, and QQQ, though you can also hedge individual stocks.

Ratio Spread

- **How it works**
    - A two-part, options-based hedge, a ratio spread requires the investor to sell twice as many puts as they purchase for a given expiration date. The written put's strike price must be lower than the purchased put's strike price. (For example, you might write 20 January 2018 $175 puts while simultaneously purchasing 10 January 2018 $190 puts.) At worst, the spread is set up for a very small debit; breakeven, or even a slight credit, can at times be achieved. It provides protection starting at the strike price of the purchased put, but if the underlying instrument falls far enough below the strike of the written put, the spread becomes a liability that also shows a loss.
    - Maximum gain: Achieved if the underlying falls to the strike price of the written put, but not below
    - Maximum loss: Achieved if the underlying falls to zero
- **Advantages**
    - Cost. Because you can set it up for little to nothing out of pocket, a ratio spread overcomes one of the most common drawbacks to hedging, which is that the long-term costs might outweigh any gains achieved when the market finally does fall.
    - Upside exposure. You don't risk missing out on upside should the market move higher while your hedge is active.
- **Drawbacks**
    - Cash necessity. Since written puts are a potential obligation, you need buying power or free cash to keep this position open, and that's cash that isn't invested elsewhere in most cases.
    - Downside protection is limited. That's the tradeoff for not spending any money out of pocket: A ratio spread's maximum gain is captured if the underlying falls exactly to the written put's strike price, but if it continues to fall beyond that, the protection the hedge provides starts to lessen. If it declines enough, you eventually arrive at breakeven, which can be calculated thusly: Written put strike price — (purchase put strike price — written put strike price). Below this price, the hedge is actually a liability.



- **When to use**
  - Ideal for situations when you are bullish but looking to hedge for small to moderate corrections.
  - When pricing is favorable (see below).
- **What to target**
  - There are a lot of moving parts here, but generally speaking, here's what to aim for:
    - Set up the position for a slight net credit or breakeven (a small debit is the worst-case scenario for this type of hedge, and that's not bad) while also achieving all of the criteria listed below. If pricing is unfavorable, consider an alternative hedge.
    - Your purchased put's price should be about 3% to 5% less than the current price of the underlying ETF.
    - Your written put's price should provide an acceptable gap between the purchased put's price and your maximum profit. (The smaller the gap, the greater the risk your ratio spread becomes a liability.) For shorter ratio spreads of three months or so, this can be as small as 5%, if that makes the spread between the maximum profit and the current price of the underlying instrument at about 10% (so, you earn your max profit if the index falls 10%). For ratio spreads of nine months or more, the gap between maximum profit and the current price of the underlying ETF should be 15% or more.
    - Expiration dates can be tailored as needed. We have previously targeted spreads from as short as three months to as long as one year.

Synthetic Short

Options U link

- **How it works**
  - This is an options-based approach that mirrors the performance of directly shorting an ETF by selling an at-the-money call in order to finance the purchase of an at-the-money put.
  - Maximum gain: Achieved if the underlying falls to zero
  - Maximum loss: Technically unlimited, but realistically confined to the amount the ETF can rise during the period you are short it. (This is calculated as the current price of the underlying less the short call's strike price.)
- **Advantages**
  - Reactive. As with purchased puts, this strategy should show a profit even if the underlying immediately falls after the strategy is set up (because the puts will start gaining value while the calls lose it).
  - Fewer fee events. By using options to short an index ETF, you avoid paying shorting fees on the ETF, and you don't need to pay out any dividend payments the index pays, either.
- **Drawbacks**
  - Losses if the market rises. You will not only miss out on upside above the written call's strike price, you'll also begin to see losses on the hedge in a rising market.
  - Costs. Setting up two options may cost more commissions than would just shorting the ETF directly for short periods of time.
- **When to use**
  - When looking for an alternative approach to directly shorting an ETF.
- **What to target**
  - Depending on the position of your strike price in relation to the underlying instrument, you should be able to set this position up for little to no cost. Generally speaking, you should use the single strike price on both the calls and puts that is closest to the current ETF share price, while adjusting both options up or down a strike or two (while still using the same strike on both option) if you want to avoid paying to set this up.
  - As with cash and directly shorting an ETF, the primary consideration here is your desired target net long weighting for the entire portfolio. Consider the role you want this particular strategy to play within that context.

Split-Strike Synthetic Short

- **How it works**
  - Essentially a more conservative, options-based alternative to shorting an ETF. With this strategy, you purchase an out-of-the-money put while simultaneously selling an out-of-the-money call. Both have the same expiration date, and the call typically offsets the cost of the put.
  - Maximum gain: Achieved if the underlying falls to zero
  - Maximum loss: Technically unlimited, but realistically confined to how much the ETF can rise during the period you are short it. (That's calculated as the current price of the underlying instrument less the short call's strike price.)
- **Advantages**
  - This strategy is more conservative than directly shorting an ETF. Because you're shorting an out-of-the-money call, your hedge has some headroom before it starts to guarantee you a loss on the short calls at expiration. Essentially, you're trading the ability to profit from small declines for more wiggle room on your short should the market rise.
  - Reactive. This strategy will, however, show a profit if the underlying instrument immediately falls after setting up the strategy, because the puts will start gaining value while the calls lose it.
  - Cost. By selling calls, you're typically able to offset a large portion of the cost (and sometimes all) of the purchased puts.
- **Drawbacks**

    - Losses if the market rises enough. You see a loss on this hedge if the ETF ends above the written call's strike price.
- **When to use**
    - If you're looking for an approach that's similar to directly shorting an ETF, but more conservative.
- **What to target**
    - As with most of the options-based approaches, there is a lot of flexibility here depending on how aggressive -- or defensive -- you want to be. More aggressive approaches start capturing declines sooner but risk showing losses with smaller increases in the underlying instrument, while more conservative strategies don't show losses as quickly but require the underlying instrument to fall further before showing gains. We generally like to target a small net debit in order to purchase puts closer to the current price of the underlying instrument (for example, we might purchase puts that are 5% out-of-the-money and sell calls that are 7% out-of-the-money).
    - There's a lot of flexibility possible with expiration dates, too. You can go short-term (three to four months) with the goal of just holding the position until expiration, or longer-term (nine months to a year) with the intention of being more active and periodically rolling the position higher or lower if need be.

Buying a short ETF

- **How it works**
    - A friendly trade for those with restrictions on their accounts, this establishes a short position by buying shares in an inverse ETF (e.g., the ProShares Short S&P 500 (NYSEMKT: SH).)
    - Maximum gain: Achieved if the underlying falls to zero (so, for example, the ProShares Short S&P 500 achieves its maximum gain if the S&P 500 falls to zero).
    - Maximum loss: Limited to your initial investment.
- **Advantages**
    - Ease of use. Since you're buying shares, you don't need permission to short or trade high-level options, although some short ETFs have extra requirements for ownership.
    - Reactive. This strategy should show a profit if the underlying instrument falls immediately after you set it up.
    - Imperfect tracking. We'll discuss this in greater detail in the "drawbacks" section, but these instruments deliver their inverse performance on a daily basis -- an imperfect measure and one that can at times work in your favor.
- **Drawbacks**
    - Losses if the market rises. If this happens, the ETF will decline in value.
    - Imperfect tracking. These ETFs seek to replicate the inverse of the daily performance of an index, but their long-term results will almost always differ from the true inverse of that performance. For example, over the past five years (as of Feb. 12, 2018), the S&P 500 has risen by 72.40%. Over that time, arguably the most well-known S&P 500 index, the Spider S&P 500 (SPY), has risen by 72.02%. But the corresponding short ETF, the ProShares Short S&P 500, has only declined by 51.71%. This discrepancy is most pronounced over long stretches of time, but it can occur over shorter stretches, as well. (In those cases, it's usually less extreme and can even work in your favor.)
    - Cash outlay. Since you're buying shares, this form of hedging reduces your cash balance on day one.
- **When to use it**
    - When restrictions on your account prevent you from participating in other strategies.
- **What to target**
    - As with cash, the primary consideration here is what you want the target net long weighting for your portfolio to be, and what role you want this particular strategy to play within it.

Hedging an Individual Stock in Your Portfolio

- **How it works**
    - When you have a large position in a single stock that you'd like to hedge (instead of hedging the entire portfolio), you can reduce volatility by hedging out that single stock using any one of the strategies listed above.
    - Maximum gain: Depends on the strategy
    - Maximum loss: Depends on the strategy
- **Advantages**
    - Pinpoint accuracy. Foolish investors tend to have stocks that aren't perfectly correlated with a single ETF, meaning an ETF-based hedge doesn't completely remove company-specific risk from the portfolio. By targeting a specific stock, you're able to exercise greater control over the business risk you hedge against.
- **Drawbacks**
    - Market risk. The odds are higher that a single stock won't correlate with the market than that an entire portfolio will go rogue, meaning you run the risk of hedging out a stock that continues to crush its performance while the market (and your overall portfolio) tanks.
- **When to use**
    - When you're primarily concerned about a single stock, but aren't ready to sell your shares just yet (perhaps you just want to hedge through earnings).
- **What to target**
    - Depends on the strategy selected.

Pro FAQ

Published Oct 26, 2016 at 12:08PM

Welcome to our Frequently Asked Questions about *Motley Fool Pro* and how you can get the most out of the service. Have a question that's not addressed here? Ask us on the Member Suggestions & Help discussion board!

About Pro

What is Motley Fool Pro?

Motley Fool Pro is a $1 million real-money portfolio being managed for accurate, recurring, and absolute profits (rather than relative returns). The portfolio buys all types of equities, uses several different options strategies, and employs ETFs, hedges, shorts, and other advanced strategies to make money in flat, down, and up markets. Over the years, however, the main bent of the portfolio should be that of long-term stock ownership. All trades are announced to *Pro* members well before we make them, and all returns are tracked publicly for you.

How can I see a list of the team's holdings?

You can see the *Pro* team's holdings here: Tom Gardner | David Gardner | Jeff Fischer | JP Bennett | Billy Kipersztok | Ellen Bowman

Recommendations Help

If I'm a new member, where do I begin?

Begin by establishing a position in our Buy First stocks, then follow our moves in that portfolio. We'll preannounce trades just for you — always sending you a "Trade Alert" email before we make a move — to help you build your portfolio with us.

What do Best Buy Now, Buy, Hold, and Sell mean?

- **Best Buy Now:** If your portfolio doesn't yet mirror ours, start by matching our percentages in these stocks. They represent the most attractive risk-to-reward opportunities today.
- **Buy:** We suggest you buy these strong stocks next as you build your portfolio.
- **Hold:** This means to keep your shares if you own them, but don't add more cash or open a new position in the stock.
- **Sell:** We're selling all or a partial stake in this position, and we recommend you do, too. You'll get a full sell report with any position we decide to jettison.
- **Short:** We recommend you sell short these positions. If you haven't shorted before, get a lesson from our Guide to Shorting.

What do the three portfolio tabs contain?

- Open Positions includes all active positions in the portfolio.
- Closed Positions offers details on positions that are no longer active (this does not include positions that have been *partially* sold).
- Transactions is a complete list of every transaction we've made from the start: buys, sells, dividend payments, interest on cash and more.

Building Your Portfolio

What is a good broker to use?

From Scottrade to TD Ameritrade, ThinkorSwim to OptionsXpress, Schwab, Interactive Brokers, and others, *Pro* members use 'em all. If you're looking to trade options, just about any discount broker will work, but some have stricter options permission policies than others, and IRA policies differ. Do your homework! The Motley Fool's Broker Center is also a great resource.

Should I buy every stock at once right now?

In a volatile market, it pays to move steadily. In building out your *Pro* portfolio, consider our **Buy First** holdings first; those are the companies we think are the best opportunities for your money right now.

How much of each Pro stock do I buy?

If you want to mirror *Pro*'s portfolio, see our buy reports and buy our committed (or actual) allocation so far.

How should I use Pro if I'm already fully invested?

Don't sell everything you own at once. You own your stocks for a reason! Begin by reviewing your current holdings, then consider selling your least-favorite stocks to free up cash as you need it for new *Pro* trades. Gradually move freed-up cash into our Buy First stocks and then our Buy stocks. Consider your sector allocations and stay diversified as you add *Pro* buys.

How should I use Pro if I'm adding new cash over time?

Averaging new money into stocks over time helps you achieve better returns. Do this if you can. Determine how much you plan to contribute over the next year and base your target allocations on *that* figure rather than on your current portfolio value. If you have $50,000 and expect new cash will grow it to $60,000 by year-end, keep that in mind as you allocate. Be mindful of commissions as you build your positions — ideally, you want commissions to cost less than 2% of any trade. A $20 commission for a $500 investment, for instance, would be 4% — that's not cost-effective. (This is much less true when writing options, where you simply want the cash you're paid to be worthwhile; commissions will typically be a larger part of your overall trade.)

I'm using an IRA for Pro. How should I proceed?

IRAs are tax-deferred accounts, so they're ideal for income-generating trades like covered calls, high-yielding dividend stocks, and any ETFs with large, taxable distributions. IRAs are *not* so great for more speculative trades because any losses generally cannot be used to reduce your taxes. Keep in mind that IRAs do not allow short selling or buying on margin, and will not allow more aggressive option strategies, such as writing puts on even modest margin. Consider opening a separate non-IRA account to take advantage of these *Pro* strategies. Then, manage this second account and your IRA together as *one* portfolio.

Should I reinvest dividends?

You can go ahead and reinvest any dividends, if you'd like, on any *Pro* stock that is rated a Buy or Buy First. *Pro* is *not* reinvesting dividends simply because it's difficult for us to track. It results in partial shares, which also complicates option strategies on the stock. We take all dividends as cash and will invest them ourselves.

Where can I learn more about ETFs?

Please read our guide, The ABCs of ETFs, for more on exchange-traded funds.

What broker does Pro use? Does Pro reinvest dividends? Pay commissions? Rebalance the portfolio?

- *Pro* currently trades via Interactive Brokers.
- We do not reinvest dividends so that we can deploy our cash to the best opportunities at any given time (that could be the company the dividends came from, but it may not be).
- Commissions vary per trade, but all costs are shown on our transactions page, and commissions are included in our prices and returns.
- Finally, though we won't rebalance in order to meet certain arbitrary allocation guidelines, we will manage the portfolio to avoid excessive risk in any one position.

How do you track your performance?

The Motley Fool measures the *Pro* portfolio's performance from its launch date in October 2008. The portfolio's cash balance is included (lowering returns when we have cash). We track relative returns for members' benefit, focusing on annualized rolling-three-year periods (which is consistent with our mission), even though *Pro* is managed for absolute returns (profits, period). *Pro*'s total returns and the S&P 500 Total Return Index include dividends. Our North Star is measured using the CPI-U (the Consumer Price Index for All Urban Consumers, as calculated by the Bureau of Labor Statistics) as its measure of inflation. For more on our North Star, click here.

Options Help

What should I know before investing in options?

Read our Options 101 guide and our Options Glossary to become familiar with the terms, strategies, and purposes behind using options before you consider placing any option trades. If options are new to you, we recommend that you watch a few of our trades play out before you start to follow them in your own portfolio.

What is a good broker to use?

From TD Ameritrade to ThinkorSwim to OptionsXpress to Schwab to Interactive Brokers — and others! — *Pro* members use them all. Just about any discount broker will work, but some have stricter options permission policies than others, and IRA policies differ. Do your homework! The Motley Fool's Broker Center is also a great resource.

How do I apply for option trading?

Ask your broker for full options approval, typically level 2 or 3 (it can vary by broker). Fill out, sign, and mail in a simple one-page document. After a week or two, you'll be approved! Slide on over to our All About Options board if you have any questions, and watch our Options in 3 Steps video for a visual walk-through of the process.

How much money do I need to trade options?

To buy an option, you need very little money: just enough so that your commission is, ideally, less than 2% or 3% of your total transaction cost. To write options, you need to have a margin account. Also remember that different brokerages have different requirements. You'll need anywhere from $10,000 to $50,000 to gain brokerage approval for option writing, depending on your broker. We recommend that you have at least $25,000 in your portfolio if you want to trade options with Pro, and $100,000 if you want the flexibility to follow along with most options trades we make. The smaller your portfolio, the more likely you'll need to pick and choose which of our options trades you follow.

What level of options permission do I need?

It varies by broker, but level 2 to 3 (the ability to buy and write calls and puts) is typically sufficient for now.

Can I make option trades in an IRA?

Yes, you can buy options and write covered calls in an IRA, tax-free. Some IRAs will also let you write cash-secured puts. Ask your broker.

I can't sell puts because of brokerage restrictions. What should I do?

Focus on buying stocks in our preferred buy price range to give you the largest margin of safety. Also, read up on our covered-call strategy. This is another way to generate income from options and is allowed by most brokers and even in IRAs.

CAPS and the CAPShot

What is CAPS?

CAPS is The Motley Fool's vibrant investing community filled with stock pitches, blogs, screens, and a host of proprietary data based on members' ratings of every stock's ability to outperform over time. For much more about CAPS and how to get involved, check out Meet CAPS and Using CAPS to Find Great Stocks. Here at *Motley Fool Pro*, we use proprietary CAPS data as another screen to find great stocks, sectors, and ETFs.

What is a CAPShot report?

Coming soon!

We created a special checklist to help *Pro* members find the strongest growth stocks in the CAPS universe -- those with leading growth rates, strong margins, and healthy financials. The CAPShot Report checklist rates stocks on four CAPS criteria and eight of our own hand-picked fundamental criteria. It then applies a score from 1 to 12, with 12 being highest. Few stocks will score 11 or 12, but when they do, you can bet that we'll be taking a closer look. We're currently working on getting the CAPShot report up and running and will notify you when you can begin generating your own reports.

My Scorecard

What is My Scorecard?

My Scorecard is your personalized one-stop shop for information about the stocks that matter most to *you*. It's part scorekeeper and part coverage collector:

- Add your holdings, and we'll track your performance for each position, as well as your overall returns versus the market.
- Add stocks you're interested in but don't own (enter the ticker, but don't add purchase data), and we'll track those companies' prices, too.
- Below your list of stocks, you'll see an activity feed of all your premium Motley Fool services' coverage of your companies — updates, articles, discussion board posts, and more. You can filter this list to zero in on just the type of content you're looking for.
- Finally, at the top of the page, you'll see quick bites of personalized information and Foolish fun facts. Every time you visit, you'll see a different set, so refresh the page and come back often!

Can I have a watchlist in My Scorecard?

Any stock you add without entering purchase information is treated as a watchlist pick. You will see the current price and commentary will start to appear in the feed. However, it will not affect your overall returns.

Can I enter the number of shares I own?

Now you can! When you add a stock, enter the number of shares you bought, along with the date and price of each position. We'll show you how much of your portfolio each stock makes up.

How are my returns calculated?

- **The overall return of your scorecard**, shown at the top of the page, is calculated using the annualized effective compounded return rate, commonly known as the internal rate of return (IRR). The best way to think about this return is as an interest rate — it represents the interest rate you would need to earn over the period you have been investing to end up with your current position. This takes into account all of your active and sold positions, as well as the dates you bought and sold each holding. IRR is an annualized figure, so if you've returned 40% over two years, your IRR will be 18.3%. Dividends are not automatically included for the individual stock positions, so you'll need to manually adjust your purchase price to account for dividends.
- **S&P Return** is calculated the same way, by mirroring each of your investments with similarly sized investments in the dividend-adjusted SPDR S&P 500 ETF (SPY).
- **The weighted average returns**, at the bottom of the Active and Sold tabs, are calculated using a the cost-weighted average of all your active or sold positions. Unlike IRR, the weighted average doesn't include the total of all of your positions (just the active or sold), and it is not annualized.

How do I add multiple tickers?

Just type them into the box below your scorecard (separated by commas or spaces) and they will appear in your scorecard. Click on Edit for each stock to add the purchase information.

How do I add a closed position?

Click sell and then enter all the information in at once. Your position will then be moved to the Sold tab of My Scorecard.

What happens when I delete a stock?

Poof! It's gone. When you delete a stock, it's gone from My Scorecard, and so is all the content associated with it. (We've put in a pop-up that checks to make sure you meant to delete it.) If you deleted a stock by accident, you can always readd the stock, and the appropriate information will reappear.

Does My Scorecard support splits and other corporate actions?

No. You will have to make these adjustments manually, by changing the purchase price.

A stock is newly listed on the NYSE or Nasdaq. Can I add it to My Scorecard?

Your Fool tech team will manually add these to our database. If you find a ticker that needs to be added, just give us a holler on the boards.

Getting the Most Out of My Scorecard

My Scorecard isn't a comprehensive portfolio tracker. It doesn't track options, warrants, mutual funds, and stocks on foreign exchanges. It also doesn't track cash; however, there is a workaround for tracking cash explained here. For corporate actions such as dividends and splits, you'll have to change a holding's Buy Price to adjust your cost basis.

The tool is a work in progress, though, so if you have suggestions or ideas for My Scorecard, bring them to our feedback discussion board, and we'll let you know what we can do!

Where can I get the latest information about the Foolish plans for My Scorecard?

You can find the latest and greatest information about what's next on the Foolsaurus page for My Scorecard, and if you have any questions, post them on the My Scorecard Feedback discussion board.

Emails, Memos, Audio Extras, and Guides

What are "Trade Alert" emails?

"Trade Alert" emails come to you at least 24 hours and no more than 30 calendar days before we make our trade. This gives you the chance to beat our price. You can manage the email you get from *Pro* and any other Fool services here.

When is the Monday Memo made available? Can I print it?

You can find our weekly news update both in your email box and here on the *Pro* site every Monday (imagine that!) at 4 p.m. ET. If Monday is a holiday, we'll publish it on Tuesday.

To print the Monday Memo, just look for the "Print This Page" link at the bottom of the page.

I'm feeling overwhelmed by all the guides and lessons on Pro. Where should I start?

Follow our simple three-step plan to help pace yourself. Reading a few of our recent (and brief!) Monday Memos is another great way to catch up. Just take your time. By reading just one of our feature articles or guides each week, within a few months you'll have read all of them, and you'll be completely in-the-know with *Pro*.

I want to learn all I can from Pro. What are the essentials?

Visit our resources page for the *Pro* team's favorite guides and investing lessons.

How can I view a list of all published articles?

Just go to our Alerts & Coverage tab and make your choice of content (Alerts, Memos, or Extras) on the sub-navigation bar. You'll see an archive of all *Pro* content in that category; click "Next" at the bottom of the Articles page to continue further back through our archives.

Will you post transcripts of your Audio Extras?

Yes! Transcripts of all Audio and Video Extras will be posted soon after publication.

Community and Discussion Boards

How do I use the discussion boards?

The basics: Only *Pro* subscribers can access the *Pro* community, whereas the at-large Fool Community, with more than 4,000 active boards, is accessible to anyone. For more general information on Fool discussion boards, visit the Fool's Help Centerfor a tutorial.

How can I keep up with the discussion boards when I only have 15 minutes a week?

Just check the "Most Recommended Discussions" section of *Pro*'s Community tab for members' favorite posts of the week.

Click the **heart** on each *Pro*discussion board that interests you. Now you can access it in the My Boards section of your My Fool page.

If you just want to find responses to your own questions, follow the Favorites & Replies link in the navigation bar at the top of the board page, and then click "Replies to Your Posts." Your replies will be automatically filed for you.

When using the discussion boards, what do "unthreaded" and "threaded" mean?

Unthreaded means the posts are listed in chronological order. This is our default setting. *Threaded* discussions are grouped according to a specific subject. For example, you might start a thread by posting on the subject of "Intel's Earnings." If I respond to your message, my post will be "Re: Intel's Earnings," and so forth. All of the replies to your subject will be kept together. This makes it easy to follow each small discussion on a board. The difference between threaded and unthreaded is that threaded takes the subject into consideration first and the chronological order second. If you have questions about this or are still confused, email customer support at FoolBoards@fool.com.

How do I write a post?

On every message, there's a link called "Post Reply." Just click there. A new page will come up, with the original post and a box to type your message in. Once you finish the message, click "Preview Reply" to make sure it looks like what you thought it would look like (if it doesn't, no worries; just click "Edit Reply" to make any fixes). Then click "Submit Reply," and it's on the way! Your message will show up as the last message on the board in chronological order.

Once you've posted a message, you can't go back and delete or edit it.

Technical Support

How do I change my username and password?

To change your username or password, click here. Please note: You can only change your username three times per year. Your password must have at least six characters (no spaces or special characters, please). You can change your password as often as you like.

My email address changed. How do I update it?

Note: When you change your email address, your account will be suspended temporarily. We'll send an email to your new address, with a link to a page that will unlock your account. Click that link and follow the instructions on the page. Please be sure to let us know when you change your email address. Failure to do so may result in the delay or non-delivery of online products or messages regarding any paid subscriptions.

What is your refund policy?

We sincerely believe in everything we sell. Yeah, it sounds hokey, but it's true. If you're not completely satisfied for any reason, just let us know within the first 30 days, and you'll get a complete refund. If you joined or renewed as part of our special three-year promotion in August 2011 or January 2012, you can cancel for a full refund anytime during your three-year subscription. Otherwise, after the first 30 days, you'll receive a pro-rated refund for the remaining portion of your subscription term. Our complete refund policy can be found here.

How do I renew my subscription?

You don't have to lift a finger. Your subscription will be automatically renewed each year on the same day that you originally purchased. Thirty days before your subscription renewal, we'll send you an email renewal reminder. If you don't want your subscription automatically renewed, or if you want to change your billing preferences, just contact us at membersupport@fool.com.

How do I change my billing or shipping address?

To update your mailing address, click here. Or click on the "Edit Your Account" link on your My Fool page or the newsletter's website.

What if I need more help?

If your question has gone unanswered or you are experiencing difficulties accessing the site or downloading an issue, please contact us at membersupport@fool.com. In your email, answer as many of the following questions as you can:

Are you using a Mac or a PC?

What operating system and version are you using? (Windows 98, Windows NT, Mac OS 9, Mac OS X, etc.)

What version of Adobe Acrobat are you using?

Did you see any error messages? What did they say?

***Pro* in 300 Words or Less**

Motley Fool Pro's mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star.

We expect most of our gains to occur in our long-term stocks, since we target owning companies that are "compounding machines" -- those special few earning outsized profits that are protected by long-term competitive advantages, and that invest those earnings in still more profitable growth. Alongside stock ownership, we sell short weaker companies to profit on downside and market declines; we use options to generate income, leverage our results, or protect ourselves. And we hedge market indexes as an extra form of insurance.

Many *Pro* members only buy our stocks. Because we are a portfolio service, we recommend that you buy as many of our long stocks as possible, and try to match or come close to our allocations. You don't need to short or use options unless you want to. We run a concentrated portfolio (typically fewer than 30 long positions); we aim to have very low turnover (we want to own long-term winners and let them compound); and we construct our portfolio to be diversified, but still invested where we see the most opportunity and best business models.

We're glad you're here at *Pro*! We hope that our streamlined yet powerful approach -- whether you use our shorts and options or not -- will help guide your investment portfolio to new highs over time. -- *Jeff Fischer, advisor*

Using Scorecard in Motley Fool Pro

Published Oct 17, 2016 at 11:01AM

Welcome, *Pro* Fool! This TMF scorecard app does not track options positions at this time, but we do have options tracking spreadsheets for download here, here, and here. You can, of course, still track your *Pro* long and short positions here, and you can also:

- Personalize the coverage you get from us. Follow (for example) FB in Scorecard, and you'll get a daily or weekly email (your choice) whenever there's any coverage of FB in any of your TMF services. For *Pro*, that means earnings coverage, updates on strategies, and info from all of our Monday Memos.
- Keep a watch list of stocks you are interested in and track their hypothetical returns.

For questions, please come to the Member Suggestions board. Fool on!

-- The *Motley Fool Pro* team

Portfolio Positioning Report

Published Sep 21, 2016 at 11:22AM

November 2018 Note: This report needs a refresh! Please stay tuned -- we'll let you know when it's up-to-date again.

Dear *Pro* Member,

Our first three Portfolio Building Reports provided you guidance on all of *Pro*'s Buy First and Buy stocks. This final report will do the same for our active short and timely option positions, some of which we use as hedges. For reasons we'll explain, we don't expect that many of you will initiate all of the positions in this report right away, or perhaps at all. And that's perfectly fine!

Hedging is about lowering your exposure to the risks of the market; to a lesser extent, shorting is as well. These additional investment tools tweak or adjust the risk profile of your *invested* portfolio, so if you're still building your collection of long-term stocks, concentrate on that first. Stock investments are the core of the *Pro* portfolio, and by owning *Pro* stocks, you are positioned to compound your value over time. We know there's a learning curve for strategies that are new to you, so it's important that you know there's no rush with shorts, options, and hedges; you can incorporate the positions in this report, or our future updated ones, when you're ready. We're here for you in the meantime.

Before outlining the current positions you can take, let's review how each strategy works. We'll begin with shorts — a sort of "anti-investment" that we believe will decline in value, adding profits to our portfolio in the process.

Shorting in Short

When you sell a stock short, you borrow shares of a company or an ETF from your broker and immediately sell them, collecting the proceeds. At various brokers, this trade action is called "sell short," "sell to open," or just "sell." In the future, you'll need to buy the same number of shares back to replace the ones you borrowed and sold. This second step is called "cover," "buy to cover," or "buy to close." You hope to profit from buying the shares back at a *lower price* than when you opened, or sold, the position originally.

The difference between your original sell — or short — price and the price you later pay to buy back (and return) the borrowed shares is your profit or loss. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock rises to $30, you've lost $10 per share when you buy it back. We use shorts in *Pro* because they're one way to profit when the market or a targeted company falls, but they come with their own risks — shares can be hard to borrow, shorting fees are often involved, and a short can get closed on you (you're forced to buy it back) if the broker wants the shares back early. So, we need to size each of our short positions appropriately small.

Hedging ... in Short

A hedge is similar to a short because it gains value when prices fall, but it's different in intent; these positions are taken only to *offset* the risk we have in another position or in our market exposure as a whole. So, when we sell short (or use bearish options on) a market-index proxy like the **SPDR S&P 500** (NYSEMKT: SPY) ETF or **PowerShares QQQ** (NASDAQ: QQQ), we are hedging our exposure to the stock market or to a particular index as a whole. A hedge is a form of insurance; it only pays you when you need it, and it usually won't make any money. But we *know* a market-index hedge will increase in value whenever the market goes down — making it an effective hedge during bad times. We just always remember that if the market doesn't fall (or doesn't fall enough), our hedge will go unused.

For this reason, we try to spend very little to hedge, but sometimes costs can't be avoided. We have to reconcile this with the fact that hedging lets us stay *more* invested in stocks than we might otherwise be. In other words, one key way we profit from our hedges is by using them to help us keep our long stock exposure higher! We own more great companies because we soften our total risk by hedging. As with shorting, you should only hedge if you have stock market exposure you want to "hedge out." You don't need to hedge or short to succeed.

Your Exposure

To know whether hedging is for you, it's helpful to think about your stock market exposure. This is simply how much of your total portfolio is invested in long stocks. Excluding options and shorts, *Pro* is about 73% invested in long stocks as of this writing. That's high for a typical absolute-return portfolio like ours, which is part of why we want to short and hedge! Many hedge funds are market-neutral (net 0% long) or only 10% to 20% net long. Pro is much more invested, and has benefited. Like many members, you may own other stocks beyond *Pro*'s, so if you've also bought all of our stocks, you might be even more exposed to market risk than we are. Lately, we typically hedge the *Pro* portfolio down to about 60% market exposure with our index hedges and other shorts, and you could (but do not need to) follow along today. In other market situations, we'll likely hedge much more.

The bottom line is: As you consider adding hedges and shorts to your portfolio, first know how much of your assets are invested in stocks. That helps dictate how much shorting or hedging you want to initiate to reach the *net* market exposure you desire. *Pro* has averaged about 73% net long exposure since January 2012, but that number will move up and down as our opportunities change. Our exposure is always shown at the bottom right of the Recommendations page. For many years, I've found that about 72% market exposure, along with the use of options, can be enough to earn strong (market-topping) returns with less risk. This pleasing result rests on investing in superior long-term stocks, and the past is no promise of future returns, but we're aiming to continue that success.

This Stuff Is Optional

Not every *Pro* member is comfortable with shorting or hedging, and there are practical considerations to take into account as well. First, you need a margin account to sell short, so (unless you use options to go bearish) you can't sell short in an IRA. Second, you have to accept that shorts can run strongly against you, so you need cash to cover that risk. Third, you'll usually pay an annualized fee of anywhere from 1% to 7% of a particular short's daily value to short it. Fourth, in many cases it's hard to borrow shares to short, period. That is the situation with some of our shorts today. Finally, short shares can be bought away from you at the worst time, when they're up in price (called a "forced buy-in"). If brokers can no longer find shares to borrow, you can be forced to "buy in" at market prices to return your borrowed shares.

So what to do given all this? You can use options to short in some cases -- we do, and we explain how to do so wherever appropriate. You can also consider opening a brokerage account that is particularly friendly to shorting. Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does, and does not charge a fee for shorting. You could also wait and see whether shares become available in your existing, traditional brokerage account, though note that at many brokers, certain shares are basically never available for shorting. Or, if you're not drawn to it, you don't need to short.

Options Are Optional, Too — but Advised!

Our options positions are also ... optional, but we strongly advocate learning to use options and following along with ours over time. Options are powerful tools for income, hedging, greater upside, and more. We know from experience they're well worth the time it takes to learn them, and we're here to help. Options can make you a much more confident and versatile investor, and they can generate a whole new stream of income for you and your family. So, if you're new to using options, you're certainly in the best place! Use *Motley Fool Pro* and our sister service, *Motley Fool Options* (free for the life of your *Pro* membership), to learn how to use these great tools. On a personal note, if you're going to learn just one simple strategy, I suggest learning how to write puts (link goes to *Motley Fool Options*) for steady income or to buy a stock lower.

About This Report

The *Pro* service will (when you're ready!) help you short vehicles we believe could decline; teach you how to hedge your portfolio; and set you up to generate returns from options. To that end, keep in mind that today's report is just a start; we'll have many *brand-new* investment recommendations arriving to your inbox as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way!

On the other hand, if this looks overwhelming right now — or if you're still catching up with our core stock positions — that's perfectly fine. You don't need to start these positions now. As mentioned, long positions are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and often rewarding — aren't necessary to succeed with *Pro*. As you learn these strategies and progress with us, just keep your exposure to the stock market in mind.

In closing, I'll stress again that you shouldn't feel pressured to act right away. We will continue to make updated recommendations on our holdings for newcomers on an ongoing basis in our Monday Catch-Up Trades — and as brand-new opportunities emerge. That's part of the fun! Building over time is the most rewarding process. So take your time, and make an investment only when you're ready. Finally, please bring any questions to our live event on Friday, Dec. 16, or to our Making *Pro* Fit You discussion board.

Foolishly,

— Jeff Fischer, *Pro* advisor

The Positions Themselves

Shorts

- **CurrencyShares Euro Trust** (NYSEMKT: FXE): Sell short 1.7%, on our thesis that the U.S. dollar will appreciate against the euro as U.S. interest rates increase. If you can't borrow shares, skip this position rather than using options, because we may close this short soon (we've had it for years in anticipation of today's current situation), and the options have significant friction costs if you only use them a short while. So, short shares directly, or don't start a position.
- **Domino's Pizza** (NASDAQ: PZZA): Sell short 2.1% only if you own about 3.9% in **Papa John's** (NASDAQ: PZZA). The Domino's short is a partial hedge of our Papa John's investment.
- **Direxion Daily Financial Bear 3x Short** (NYSEMKT: FAZ): Sell short 0.2% as a long-term leveraged investment in financial stocks going higher. If you can't borrow shares, but you have options approval in a margin account, you can set up a January 2018 synthetic short instead by selling to open January 2018 $20 calls and buying to open an equal number of January 2018 $20 puts. Set up one synthetic short for every $2,000 in value you can short, but only up to a very small portion of your portfolio. If you can't set this up, simply invest 0.2% more in one of our financial stocks, such as **Visa** (NYSE: V).
- **Gogo** (NASDAQ: GOGO): Sell short 0.5% directly. If you can't sell short directly, the options are not attractive enough to use.
- **Shake Shack** (NYSE: SHAK): Sell short 0.6% directly. Again, the options are expensive to use. Be aware we're down 18% on this short ourselves, so we will reconsider it, per our policy, at about a 20% loss. We may close it, protect it, or add to at that point. We shall see.

Hedges

- A live, new alert for a sizable market index hedge is scheduled to hit everyone's inbox (and the *Pro* site) soon. So watch for our new hedge soon, and all who wish can get on board.

Options

- **American Tower** (NYSE: AMT): Assuming you first have established your 3.5% American Tower stock allocation (the stock is a Buy First), set up diagonal calls per our recent alert; however, instead of selling to open April 2017 $115 calls, sell to open $110 calls. Follow allocation guidance in the alert, and ask any questions on the AMT board linked at the end of the alert.
- **Parexel** (NASDAQ: PRXL): If you already own at least 100 shares of Parexel, "sell to open" one March 2017 $65 call for every 100 shares of the stock you own. We are selling these covered calls for income and to potentially exit our position at a higher price. If you don't yet own Parexel, **do not** buy the stock or write these covered calls; the stock is rated Hold.
- **Skyworks Solutions** (NASDAQ: SWKS): Assuming you own shares of Skyworks (a Buy on our scorecard), "sell to open" Jan. 20, 2017, $75 calls, selling one call for every 100 shares of stock you own. We are selling these covered calls as income, and will manage the position for members at each expiration. The recent price you'll get paid for the calls is adequate.
- **Verisign** (NASDAQ: VRSN): Buy 1.5% in shares and set up a covered strangle for income and another potential 1.5% in stock, per our recent alert.

The Rest: On Hold

Any position not shown as Buy First, Buy, or Short is on Hold. And any option not listed here but still on the Recommendations page is either ending soon, no longer timely, or no longer recommended. So if you have started positions in all of our Buy First, Buy, and Short stocks, and then followed along with the shorts and options in this report that you're able to, you will be caught up to *Pro!* Sit back, bask in your success, and simply follow our new trade alerts to keep up (as well as our Monday Catch-Up Trades for any positions you might still lack). If you are not yet caught up, continue to take your time, follow our Monday updates, and ask questions on the boards. There's no rush. Good things come to those who move gradually, including investors.

Welcome again to the esteemed *Pro* community! We'll talk with you again soon.

Pro Portfolio Building Report No. 3: Our Buy Stocks, Continued

Published Sep 6, 2016 at 12:26PM

Welcome, Fools! As new members continue to learn more about *Pro*, we get a lot of questions about fair value. The most common one is this:

> **Q:** If a stock is rated Buy or Buy First, but its current price is higher than *Pro*'s stated fair value, is that stock still a Buy or Buy First right now? Should I really buy it today? At this price?
>
> **A:** Yes. Yes, at least *start* to buy your allocation. Dip your toes in if you're not buying the whole stake yet (which is also fine!). Today's price should still provide the long-term annualized return we seek.

This may seem counterintuitive at first, but with some context, we think you'll see how this approach makes sense for our portfolio. Make sure you read Jeff's important Memo, "The Flaws of Fair Value," to understand how a great company has multiple extra ways to increase value that we can't bake into our long-term projections, partly because we don't know everything management is planning. (And to read more on fair value, click here.)

Moving on to today's report: Presented below are the rest of *Pro*'s Buy stocks; with these and our previous two reports, plus judicious application of the advice above, you should be ready to keep adding to your *Pro* portfolio as you're comfortable! Stay tuned for our next live chat, which we'll tell you about on the site and via email, and bring us your questions on the Getting Started & Help discussion board. We're glad to have you.

Best,

-- The *Motley Fool Pro* team

Table of Contents

Buy: Johnson & Johnson (NYSE: JNJ)

At eight out of eight of our Pro Quality Checklist criteria, Johnson & Johnson is a quintessential Pro-quality stock.

Suggested Allocation: About 3.1% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (2/22/17)
- Talk about Johnson & Johnson

The eighth largest company in the U.S. by market cap, J&J is one of the world's leading health-care companies, conducting business in virtually every nation of the globe.

The business is organized as a holding company, with more than 250 operating companies that are separated into three business segments: consumer (19% of 2016 sales), pharmaceutical (46%), and medical devices (35%). The consumer segment sells dozens of familiar brands (think Band-Aid and Listerine). The pharmaceutical business is the company's largest; in fact, J&J is the world's sixth largest pharmaceutical company by annual sales. And the medical devices segment includes a broad range of products used in the orthopedic, surgery, cardiovascular, diabetes-care, and vision-care fields.

For such a large company, J&J has an outstanding financial profile (which provides evidence for the company's competitive advantages). As a top-notch business, this is one we expect to hold for a long time. While its large size means we don't expect runaway growth and upside from J&J, we do expect to earn North Star-challenging returns with low downside risk from one of the safest stocks you are likely to find in the entire investment universe.

Buy: OpenText (NASDAQ: OTEX)

This company's information management software keeps the digital lives of businesses in order, and its exchange software platform drives business transactions and earns recurring revenue.

Suggested Allocation: About 3.2% (see Recommendations page for real-time allocation)

For More

- Most recent earnings coverage (5/15/17)
- *Pro*'s original recommendation (8/31/11)
- Talk about OpenText

Based in Canada, **OpenText** (NASDAQ: OTEX) provides Enterprise Information Management (EIM) software to governments, legal firms, financial institutions, and other corporations that need to manage growing reams of digital data. Its overall goal is to provide customers with a singular software platform for managing, analyzing, and exchanging enterprise information; it also wants those customers to conduct business transactions over OpenText's business commerce exchange.

To these ends, OpenText steadily acquires smaller companies to add their services to its wares. Management made four acquisitions in mid-2016 that should fuel about $300 million in new revenue over the coming year (adding to its current $1.9 billion in annual sales), along with strong earnings-per-share (EPS) growth. As these acquisitions are assimilated, margins should continue to improve and the company's market share should rise. About 85% of OpenText's revenue is of a naturally recurring nature, being subscription-based.

This cloud and license software seller is under the radar of many investors, but it's the largest independent EIM software provider after IBM. Recently $63, the stock has been a strong long-term performer, up about 1,200% since its 1996 market listing, compared with 255% for the S&P 500. Today, the stock trades at 15.3 times estimated earnings for the coming year, while non-GAAP earnings per share are expected to increase by 15.5%.

Buy: Paycom Software (NYSE: PAYC)

Pro is looking to add more high-growth positions to the portfolio, and this company can sign that check -- so to speak.

Suggested Allocation: About 3% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (11/30/16)
- Talk about Paycom

Paycom Software is a profitable, young, cloud-based provider of payroll and human capital management (HCM) software, which manages the employment life cycle for employers and employees. It's differentiated by its comprehensive, integrated Software-as-a-Service (SaaS) solution that saves customers money and makes HR systems more efficient.

Revenue has compounded at 46% annualized over the past three years, and profitability and free cash flow much more rapidly than that. The company sports more than 15,000 clients and stores data on 2.1 million employees, and its average three-year retention rate (recurring revenue) was 91% as of Dec. 31, 2015. In the most recent quarter, 98% of revenue was recurring. It notches $300 million in annual sales, meaning the company can grow for years before it takes significant market share in the immense payroll and HCM industries. And its comprehensive and growing HR solution is ahead of competitors', promising market-share gains for years. Finally, at the time of our rec, the stock traded at 31.8 times expected non-GAAP earnings for 2018, in line with the company's estimated growth rate.

Be sure you've got a long-term outlook of at least three to five years, some comfort with high price volatility, and comfort with the potential for at least a partial loss of capital, then welcome Paycom as a high-growth, North Star-friendly addition to your portfolio.

Buy: ProShares Short VIX Short-Term Futures ETF (NYSEMKT: SVXY)

Profit from the long-term nature of stock market volatility to revert to an average level after each spike.

Suggested Allocation: About 2% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (11/25/14)
- Talk about SVXY

Buying shares in — let's make it easy and use the ticker, shall we? — SVXY is a recommendation for *Pro* members who are comfortable owning a small stake in a volatile position that we *may* add to during market downturns. *Pro* is a portfolio service, so all positions are meant for everyone, to the extent you can invest in them and wish to. But this position is not core to what we do, and will be especially volatile, so only follow it if you're comfortable with high volatility in a holding.

This unusual vehicle should increase in value when stock market volatility — as measured by the CBOE Volatility Index (or the VIX) — goes down or is range-bound. This ETF *sells short* futures contracts on the VIX that have one month and two months to expiration. Unless expected volatility from the S&P 500, as measured by the VIX, increases above and beyond the premium already baked into the futures contracts being shorted, the positions turn a profit in the ETF and the ETF goes up in value. Helping further, VIX futures contracts are historically in a state of "contango" as much as 90% of the time. Contango means that future-month contracts are increasingly more expensive than earlier months' and than the current VIX itself (much like a call option has a premium above the current stock price). This is a tailwind for SVXY. As long as volatility is ultimately rangebound overall (as it is historically), then just holding this small stake over the years should reward us.

We recommend starting at 1.1% (or round to 1% if you want), and we may add more when the VIX soars — meaning when volatility in the market is high and SVXY is low. But even if we don't, we believe this small position should create compounded value for us over the long term thanks to the regressive nature of volatility in the market: It spikes, and then grinds back down, and is usually range-bound.

Buy: Skyworks Solutions (NASDAQ: SWKS)

This leading designer of analog modules for smartphones and connected Internet of Things devices is growing sharply.

Suggested Allocation: About 4.4% (see Recommendations page for real-time allocation)

For More

- Latest earnings coverage (5/15/17)
- *Pro*'s original recommendation (8/5/14)
- Talk about Skyworks

The loftily named **Skyworks Solutions** (NASDAQ: SWKS) supplies customized analog semiconductor modules and related products to major smartphone makers around the world. As Wi-Fi connectivity grows, Skyworks' complementary Internet of Things business is growing, too, recently representing about one-fourth of total revenue. Company profit margins continue to expand as Skyworks increases its market share as well as the amount of its components it sells into many devices.

We're now seeing a move to higher-speed LTE wireless coverage in China and in most emerging markets; this is a long-term opportunity unfolding for Skyworks, even as smartphone sales level off in mature markets and at the company's largest customer, **Apple** (NASDAQ: AAPL). On July 21, Skyworks guided for 10% to 11% sequential revenue growth next quarter -- a bump higher than the 8% guidance given for the same quarter a year ago, suggesting healthy if not mind-blowing expectations for the iPhone 7. Management expects sequential growth to continue for the quarter after that, too, clearing current inventory concerns. As a technology leader growing faster than its market and with improving margins (a rarity in the chip industry), Skyworks, at about $74, is trading at 12.6 times earnings expected for the next year. The stock looks to us like a reasonably priced way to invest in the long-term ascent of mobile connectivity and the Internet of Things through a strong niche leader.

Buy: Starbucks (NASDAQ: SBUX)

You only think you're there for the coffee — the ubiquitous java purveyor has big plans.

Suggested Allocation: About 3.5% (see Recommendations page for real-time allocation)

For More

- Most recent earnings update (3/27/17)
- *Pro*'s original recommendation (8/22/2012)
- Talk about Starbucks

In the global coffee giant's fiscal third quarter, **Starbucks** (NASDAQ: SBUX) achieved 4% same-store sales (SSS) growth in the United States. Before that quarter, the company had generated at least 5% U.S. SSS growth for 25 consecutive quarters, so the "miss" grabbed some headlines.

But following a small dip in growth, there's no reason to see this green-and-white cup as half-empty. Revenue was up 7% year-over-year, and Starbucks now has more than 12 million active Rewards loyalty members, representing 18% growth from the prior year. A net 474 new Starbucks locations opened across the globe over the quarter, and we still believe that Starbucks is one of the highest-quality growth companies in the world. Revenue has increased for 23 of the past 24 years (1991 through 2015), and the company's 5- and 10-year average returns on invested capital are higher than 20%. Management is guiding for revenue growth of 10% for the full year (down from 10%-plus), and we expect Starbucks to provide at least a 10% forward rate of return.

Also this past quarter, management announced an investment in "Italian artisan bakery" Princi; the press release notes that Princi is "known for its artisan breads created from traditional family recipes" and that its "five locations have become beloved experiences for customers across Milan and London." Princi will also provide the food at Starbucks Reserve stores, showing that management is focusing on expanding and improving the food business as one way to give its growth a jolt. (Yes, that pun was intended. We might be working too mocha.)

Buy: Verisk Analytics (NASDAQ: VRSK)

This prototypical Pro *holding provides us with exposure to powerful tailwinds within the financial, energy, and health-care industries, among others.*

Suggested Allocation: About 2% (see Recommendations page for real-time allocation)

For More

- Most recent earnings coverage (2/27/17)
- *Pro*'s original recommendation (6/23/15)
- Talk about Verisk

Founded in 1971 by insurance-industry giants, **Verisk Analytics** (NASDAQ: VRSK) provides decades-old proprietary data and contemporary analytics to risk managers, property and casualty insurers, and financial institutions -- and after an acquisition to expand its data offerings, to the global oil and gas, chemicals, energy, and mining industries, as well. Company-wide, more than 80% of annual revenue comes from subscriptions to its services, and customers renew at an outstanding 98% rate as of 2015.

Verisk has pricing power, allowing it to increase prices regularly, including during the mayhem of 2009. How so? The company offers data that its customers need and others don't have; it has deep domain expertise, allowing it to work closely in each industry it sells to; it invents new analytic methods and better algorithms; and it's deeply embedded in customer workflow, becoming part of a user's process. Without Verisk's analysis, an insurance giant might have a hard time pricing policies.

Public since 2009, Verisk counts every major insurance company as a customer, and became part of the S&P 500 index in 2015. Historically fetching a premium valuation, the $83 stock recently trades at 26 times expected earnings for the year ahead, and 22 times free cash flow. We like the thought of new members starting a position here.

Pro Portfolio Building Report No. 2: Our Buy Stocks

Published Aug 30, 2016 at 11:56AM

Welcome, *Pro* Fool! This report details our current thinking on nine of the Buy positions in our portfolio; the Buy stocks not listed here are included in our third report. Once you've read theses and the previous report detailing our Buy First positions, you're ready to start (or continue) building your *Pro* portfolio as swiftly or as slowly as you like.

We want our advice to be uncomplicated: Purchase our Buy Firsts first (again, taking your time according to your situation — there's no rush); purchase our Buys after that; match our allocations as closely as you can (but don't worry about needing to buy in 100-share lots — fewer is fine); and stay tuned for our next monthly live chat, during which we answer member questions in real time. Also, please read this note on fair value as you move toward matching your portfolio to *Pro*'s.

We're glad you're here, learning to become an investor who will come out on top in all markets. Bring any questions to the Getting Started & Help discussion board, and Fool on!

Best,

The *Motley Fool Pro* team

Table of Contents

FactSet Research Systems (NYSE: FDS) | **Gentex** (NASDAQ: GNTX)

Buy: Amazon (NASDAQ: AMZN)

You will be assimilated.

Suggested Allocation: About 3.4% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (1/26/17)
- Talk about Amazon

When *Pro* first bought Apple in 2012, it was already the most valuable company in the world, sporting a massive $127 billion in annual revenue. Less than five years later, revenue is up 69%, and our investment (to which we later added) is up 72% excluding dividends. Apple has outperformed a majority of our positions, despite its giant size. Enormous **Amazon.com** could follow the same path, and may even have superior avenues for sustained growth:

- According to the U.S. Census Bureau, only 8% of U.S. retail sales occur online, but the shift to the Internet continues -- Amazon's revenue rose by 29% last quarter.
- Gartner estimated in 2015 that Amazon Web Services (AWS) for the cloud had 10 times the utilized capacity of its next 14 competitors *combined*, and this lucrative business increased revenue by 70% in 2015.
- Alexa is a leading artificial-intelligence operating system in the home.
- Amazon Prime may have as many as 80 million global subscribers, each paying $99 a year for free shipping and streaming video.
- And more ...

Amazon has so many business arms that a more fitting name could have been Octopus. Consumer retail sales drive massive cash flow to the company daily, but today it's cloud services that generate most of the profits. Amazon's cloud is heavy in machine learning and AI; relatedly, Alexa's early success is driving Amazon Echo and Dot product sales, and manufacturers around the world are now building Alexa into new devices and cars. Amazon has hundreds of fulfillment centers, and investment bank Piper Jaffray says 44% of U.S. citizens now live within 20 miles of one -- that's a strong competitive advantage. Drone delivery is in the works, and Amazon is investing in more of its own delivery to save on costs. U.S. sales account for about two-thirds of retail revenue, but international is growing and largely untapped. In an unconventional surprise, the company is launching a physical bookstore in Manhattan, and Amazon Go grocery stores around the country. And then there's Amazon's award-winning original content.

Sometimes lost in the breathless coverage of all these initiatives is what helps drive the success of each: data. Founder and CEO Jeff Bezos, 53, is driven by the intelligent use of information and cutting-edge technology to do business better than others. As the world's largest online retailer, Amazon has a better understanding of consumer retail behavior than any internet competitor, allowing it to anticipate customer desires. Couple that with the relentless pursuit of improving the customer experience, and Amazon always seems two steps ahead. In its own words, Amazon is "guided by four principles: customer obsession rather than competitor focus, passion for invention, commitment to operational excellence, and long-term thinking." Management has a history of reinvesting cash flow for more growth, learning from mistakes, and pushing new boundaries. This bodes well for long-term growth, and for us as shareholders.

Buy: Apple (NASDAQ: AAPL)

The leader in mobile computing products should see more long-term growth than anyone expects.

Suggested Allocation: About 4.8% (see Recommendations page for real-time allocation)

For More

- Most recent earnings update (2/27/17)
- *Pro*'s original recommendation (2/14/12)
- Talk about Apple

Led by its iPhone, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the smooth Apple operating system, iOS, which centers on the iTunes and App Store marketplaces, as well as the new Apple Pay. iTunes alone earns more revenue each year than two-thirds of the companies in the Fortune 500, while Apple itself is the most valuable company in the world, with more than $220 billion in annual sales. The company's integrated hardware and software make for a sticky consumer experience that provides disincentives to switch to a competitor, and as more people use multiple computing devices, Apple makes it easy to transition seamlessly from one of its products to another.

The company regained some shine with third-quarter earnings on July 26; while sales and earnings declined as expected, revenue of $42.4 billion and gross margin of 38% were at the high end of expectations. The new, cheaper, 4-inch iPhone SE is seeing strong demand in emerging markets (India and China included), becoming the first smartphone many consumers buy. Meanwhile, the number of customers switching to Apple products from other phone models hit its highest level ever. Apple sold 40.4 million phones this quarter, and the active installed base of iPhone users rose by more than 10% year-over-year. This helped drive services revenue in the Apple ecosystem (iTunes, Apps) up 19%, to $6 billion, for a $24 billion annual run rate.

Though Mac sales were down following new product releases a year ago, iPad revenue was up 7%, for the best result in 10 quarters, on the roll-out of the 9.7-inch iPad Pro. Overall, product sales have been strong (especially for phones) and inventories are at good levels as Apple reportedly readies a new phone model for release this fall. At $106, the stock trades at 12 times earnings, while EPS is expected to grow again in 2017. We're not counting on a revolutionary product anytime soon, but we are counting on record numbers of phones being sold to both existing and new customers over the coming years.

Buy: Broadridge Financial Solutions (NYSE: BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: About 5.4% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (4/27/10)
- Most recent earnings update (2/15/17)
- Talk about Broadridge

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in its fiscal 2015, its platforms processed approximately 85% of all shares in the United States. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider for managing investor communications.

The company's smaller division, Global Technology and Operations (GTO), accounts for 26% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance this Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy: FactSet Research Systems (NYSE: FDS)

Stable, predictable, and meeting every one of Pro*'s quality criteria, this data and analysis provider is no myth.*

Suggested Allocation: About 2% (see Recommendations page for real-time allocation)

For More

- Buy More recommendation (4/28/17)
- *Pro*'s original recommendation (5/18/16)
- Talk about FactSet Research Systems

The ideal *Pro* company has predictable recurring revenue, pricing power, a dependent customer base, expanding opportunities, and smart management. FactSet Research scores eight out of eight on our company quality checklist, and while most companies are struggling to grow these days, FactSet increased its revenue 9% in 2015 to more than $1 billion, with earnings per share growing 16%. That made for 35 consecutive years of revenue growth, and 19 consecutive years of earnings growth -- every year since FactSet went public in 1996. Over the past 21 quarters, earnings per share have grown by more than 10% year-over-year each quarter. The business has the traits we look for most: stable, predictable results with the ability to reinvest healthy free cash flow for more growth.

Founded in 1978, FactSet's data and analysis platform has become integral to the daily operations of thousands of financial professionals, including investment bankers, institutional investors, hedge funds, and asset and risk managers. Serving more than 3,000 customers with a total of 63,500 users, FactSet prides itself on personalized attention, making its customized data a core part of its customers' daily workflow and decision-making. FactSet's consultants paid 46,000 visits to its 3,000-plus customers in 2015, making sure to meet individual needs. Clients in turn reported 97% satisfaction with FactSet's customer service.

Meanwhile, FactSet doesn't carry any of the risks inherent with most "financial"-related companies; it's a subscription business model, selling data. It doesn't have balance-sheet risk. Should competitors start to cut prices to win market share (not likely, but possible), we'll need to reassess. But as long as FactSet retains pricing power and can steadily add new clients, it should create North Star-challenging long-term returns. We're happy with our position of about 2.2% today, and may potentially build it higher (with new trade alerts) as opportunities dictate.

Buy First: Gentex (NASDAQ: GNTX)

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: About 2.9% (see Recommendations page for real-time allocation)

For More

- Most recent earnings update (3/8/17)
- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex

In 1982, a small company in Zeeland, Mich., called **Gentex** made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands more than 90% of that market.

Currently, about 26% of cars made worldwide have an auto-dimming rearview mirror, and only 8.5% have auto-dimming exterior mirrors. For context, prior to 1987, those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher usage; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror (including the newly launched full-display mirror), both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy First: Mastercard (NYSE: MA)

With approximately 85% of the world's commerce still happening in paper money, electronic payment leaders have a lot of room to grow.

Suggested Allocation: 5% (see Recommendations page for real-time allocation)

Mastercard (NYSE: MA) is among the most attractive businesses in the world. The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns running a largely fixed-cost transaction network that becomes more profitable the more people use it.

For More

- Latest earnings update (2/9/17)
- *Pro*'s original recommendation (9/8/11)
- Talk about MasterCard

The company "charged forward" again in 2015 despite slow international commerce and a strong U.S. dollar. For the year, net revenue in local currency advanced 8%, and EPS gained 18% before special items. But right now, an investment in MasterCard -- as with **Visa** (NYSE: V) -- is an investment in growth *beyond* this year, because 2016 looks tepid as emerging markets struggle and the dollar remains strong. Much of the company's growth potential is being coiled up like a spring. That spring should pop when more economies begin to expand again and the dollar weakens. The market knows this, so the stock maintains a premium valuation.

Buy: Medtronic (NYSE: MDT)

The medical-device industry is complex and regulated, and it provides entrenched leaders with a competitive moat; our leading company is growing in international markets.

Suggested Allocation: About 2.9% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (7/1/2009) ...
- ... and our second buy recommendation (11/9/10)
- Talk about Medtronic

In March of 2016, the CEO of Medtronic put it like this: "Our formula for long-term success is to deliver consistent mid-single-digit revenue growth, with 200 to 400 basis points of EPS leverage, [and to] return a minimum of 50% of our adjusted free cash flow to shareholders through dividend growth and share repurchases. The expected net result is creating enormous value, with sustainable double-digit [at least 10%] total shareholder returns."

As shareholders of Medtronic, this is exactly what we've seen over the years: Our annualized return on the position is above 11%, and we think something close to this can continue going forward. Medtronic is a market leader in vital medical devices, be they for the heart, spine, knee, or one of four other key categories. The stock yields nearly 2%, and the dividend has increased annually for the past 39 years, resulting in an 18% compounded annual growth rate (CAGR). Expect continued dividend increases, sales growth of about 4% to 6%, and earnings-per-share growth considerably higher than that. Medtronic has a sound strategy to deal with the more regulated and costlier health-care environment. We're confident the business remains competitively advantaged, operates in an attractive industry, and is well-positioned to grow, especially in emerging markets. With reasonably priced shares, we target North Star-type returns.

Buy: Oracle (NYSE: ORCL)

This old-guard tech giant at a low price has more room to grow.

Suggested Allocation: About 3.7% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (9/17/09)
- Talk about Oracle

Oracle (NYSE: ORCL) is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems** (NASDAQ: CSCO), **Dell**, and **Microsoft** (NASDAQ: MSFT) — Oracle's value has steadily risen as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe, and its own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

We've been waiting patiently for the company to turn the corner in its transition to a cloud-based software-as-a-service (SaaS) business model, and it looks like that corner is now safely behind us. New software license sales declined 10% in the fiscal fourth quarter as demand for cloud-based applications increased, but a 4% increase in software updates and product support mostly closed the gap, resulting in a 2% overall decline. Fortunately, the cloud business has finally reached the size where its sales growth will more than make up for the slow decay of the on-premise business.

In the quarter, the company blew past the high end of management's estimates for SaaS/platform-as-a-service (PaaS) sales growth, posting a 68% increase over the previous year and 17% sequential growth over the previous quarter. Cloud sales now account for 8% of Oracle's revenue, compared with 5% a year ago. Though the top line will likely continue to grow at a modest low-single-digit pace for the next several quarters, the company is increasing the lifetime value of its customer base and becoming more profitable. Oracle is currently trading at a free-cash-flow yield of about 7.5%, which is attractive considering the likelihood of improved profitability as the cloud business scales. The company is a full-service solution, one that's poised to enjoy long-term growth in free cash flow.

Buy: O'Reilly Automotive (NASDAQ: ORLY)

Auto-parts retailers are boring, right? Right! But an investment here is up 670% over the past 10 years, and we expect additional returns around the corner.

Suggested Allocation: About 4.4% (see Recommendations page for real-time allocation)

For More

- Latest earnings update (3/6/17)
- *Pro*'s original recommendation (4/15/14)
- Talk about oh, oh, O'Reilly

America's second-largest auto parts retailer, **O'Reilly Automotive** (NASDAQ: ORLY) operates more than 4,500 stores, about one-quarter of them in California and Texas. Auto parts are a big business, estimated at $231 billion, and O'Reilly is an exceptional competitor, with an addressable market size of about $131 billion. Running 24 regional distribution centers and 240 hub stores as part of a two-tiered distribution strategy, the company provides same-day or overnight availability on more than 142,000 items, including many its competitors don't usually stock. Basic auto parts, tools, and services complement those hard-to-find treasures. As a result, O'Reilly's sales are historically split between "do-it-yourself" retail customers and lucrative, repeat-sales professional-services customers (such as auto repair shops), a luxury many smaller competitors don't enjoy.

On July 28, the company reported its 30th consecutive quarter of 15% or greater earnings-per-share growth. The results also featured a 7% increase in revenue and same-store sales (SSS) growth of 4.3%, on top of 7.2% SSS gains a year earlier. Operating margins continue to trend higher, now at 19.5%.

O'Reilly has opened 89 new auto-parts stores so far in 2016, pushing it toward 4,700 locations in 44 states, with a goal of 200 new stores total before the year is out. Besides the advantages listed above, O'Reilly's tailwinds include cheaper gas prices, more people working, and cars staying on the road longer (which means more repairs). For the year, the company increased earnings-per-share guidance to $10.30 to $10.70, implying a P/E of 27.5 on the $288 stock. Given the consistent track record of strong value creation at O'Reilly, a P/E in the lower 20s seems justifiable; shares trade at about 25 times expected earnings one year from now. This stock has always appeared a bit expensive, yet has rewarded handsomely.

As one of our largest positions, O'Reilly remains a stock we own for the long haul. Shares remain rated a Buy even though they currently (and historically) trade a bit above our fair-value estimate. After earnings per share rose 25% in 2015, we expect at least 16% growth in 2016, with the chance for acquisitions to move that number higher.

Buy: WisdomTree Emerging Markets Small Cap Dividend Fund (NYSEMKT: DGS)

Diversification in emerging markets with some of the best small, high-yield companies you've never heard of.

Suggested Allocation: About xxx% (see Recommendations page for real-time allocation)

For More

- *Pro*'s most recent Buy recommendation (4/28/17)
- Talk about DGS

At *Pro*, we like the idea of investing in emerging-market small caps to diversify and target higher growth. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) (the longest ETF name in the world!*). This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index, and yields between 3% to 4% per year.

For *Pro*, owning shares of this well-managed ETF offers exposure to up to 600 of the most promising international business that we couldn't easily buy in any other way. Serving as direct exposure to emerging markets, this is an excellent way to invest in small companies in locations where we don't have a discernible edge but where growth exists — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The benefits of diversifying outside our home market are equally important over long periods. Emerging markets have badly lagged developed markets for the last several years, but eventually they should take the performance baton again, and we'll be in good stead with this position.

Pro Portfolio Building Report No. 1: Our Buy First Stocks

Published Aug 15, 2016 at 8:29PM

Welcome, Fool! We're glad you're here. This first report is meant to get you up to speed on our Buy First stocks — the companies in your *Pro* portfolio that we believe you should start purchasing first. But before we get to that, a few words about how best to use *Pro* ...

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that aims to generate winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, hedges, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* fit you.** We know not all investors are in the same situation! We can help you figure out how to buy *Pro* investments given your personal situation, including investing in an IRA or coming to *Pro* already fully invested. Check out our advice for every approach to *Pro*: Invested Elsewhere | "Free-Range" | Whoever You Are
3. **Catch up with our portfolio at your own pace.** Start with the stocks in this report, and follow along with our subsequent reports. You can always see our Buy First, Buy, and Hold guidance (which is the most important -- more important than valuation estimates) on the Recommendations page, and you can get a succinct, up-to-date take on all of our stock positions on our What We Think Now page.
4. **Don't freak out about fair value.** Instead, read Jeff's explanation of how it's calculated and what it means.

Bring any questions to the Getting Started & Help discussion board, and Fool onward!

Table of Contents

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: About 4.1% (see Recommendations page for real-time allocation)

For More

- *Pro* 's original recommendation (5/6/13)
- Most recent earnings update (4/28/17, from our sister service, *Motley Fool Options*)
- Talk about AMT

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Global mobile data traffic is expected to increase at a compounded annual growth rate (CAGR) of 53% between 2015 and 2020, and global mobile 4G connections are expected to grow from 1.1 billion in 2015 to 4.7 billion by 2020 (a 34% CAGR). Communications site operator **American Tower** is well-positioned to benefit from this trend.

AMT leases antenna space on more than 100,000 cell sites (towers, rooftops, and more) to wireless service providers across the globe. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, can't be canceled, and feature contractual annual price escalations. More than half of AMT's properties are located in 12 (soon to be 13) different countries outside the U.S., including India, Brazil, Colombia, Mexico, Nigeria, and South Africa, and management is intent on expanding the company's international portfolio as it continues to build and acquire more towers.

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE, or to increase coverage density. When they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; about 98% of AMT's customers up for renewal each year do so, and more than 60% of its current leases don't renew until 2021 or later.

The stock may experience volatility in the short term because of its tendency to trade alongside the interest-rate-sensitive REIT sector, but over the long term, the underlying strength in business fundamentals should shine through. We expect to earn modest income from a growing dividend and strong appreciation as AMT continues to build out its international tower portfolio.

Buy First: Coherent (NASDAQ: COHR)

Specific devices may come and go quickly, but we have our eyes on the lasers that help put them together.

Suggested Allocation: 2.5%

For More

- *Pro*'s original recommendation (5/17/17)
- Talk about Coherent

Microelectronics. Miniaturization. Mobile computing. Wearables. Artificial intelligence. The Internet of Things. Moore's Law. All of these help to fuel the business of **Coherent**, a leading producer of commercial and industrial lasers and laser services. Coherent was founded near the dawn of the laser, in 1966, and its recent acquisition of peer Rofin-Sinar for $942 million gives today's business a leading breadth of products and worldwide reach -- even as the utility of lasers continues to grow.

The company sells dozens of laser models to dozens of industries, and 26% of last quarter's revenue was recurring (parts, consumables, repairs, and related services). That's nice to have, but the real story here is an ever-greater need for lasers in the manufacturing of ever more electronic devices and other items. This is a volume story -- and a story of rapid change. As the components that companies use in technology products rapidly evolve, the lasers used to build the products and test them must evolve, too, resulting in new sales for Coherent. We see how quickly tech is evolving, so rather than investing in one particular technology, we're investing in a means for putting most any technology together.

Buy First: Facebook (NASDAQ: FB)

Although it's lately riding a wave of popularity, we believe the strong stock is justified, and the business should grow handsomely in coming years.

Suggested Allocation: About 7.3% (see Recommendations page for real-time allocation).
You can buy in thirds, or halves, over a few quarters. Experienced investors can write put options to target buying some of their shares cheaper; to do this, "sell to open" one put option for every 100 shares you could buy. Because you want to be assigned shares, sell "near-the-money" puts, with a strike price near the current share price, that expire in just a month or two.

For More

- Latest earnings update (5/15/17)
- *Pro's* original recommendation (9/18/12 – dated by now! But this shows how we thought about it back then when it was $20 and most were bearish)
- Talk about Facebook

Facebook remains a young story about monetizing the largest, most engaged online audience ever hosted by one company. The company's future is in strong hands; management is showing patience and care as it starts to monetize more of its properties, putting visitor experience first. So far, this approach has paid off, with user engagement up even as more ads appear. The billions of connections maintained on Facebook's properties are making the sites extremely sticky, offering the potential for increased value to advertisers (and thus Facebook shareholders) -- especially as the advertising gets smarter and more targeted.

It's our largest position at a recent 6.5%, and the size of our investment in Facebook feels appropriate given how much growth potential lies ahead and how well-managed the company is. Even from today's price, we estimate Facebook could return about 15% annualized for shareholders over the next five to seven years. Though shares are currently a bit above our fair-value estimate, the stock is rated Buy First on its long-term potential. Key risks include users moving away from Facebook, but so far the company has shown great skill in *increasing* user engagement and stickiness, rather than stunting it. It's also possible that management could spend more than Wall Street expects, though that should mainly be a short-term concern.

Buy First: Visa (NYSE: V)

With its mission to "accelerate the electrification of commerce," industry leader Visa has most of the world left to conquer.

Suggested Allocation: About 3.1% (see Recommendations page for real-time allocation)

For More

- Buy More recommendation (3/30/17)
- *Pro*'s original recommendation (4/28/15)
- Talk about Visa

The ubiquitous nature of credit and debit cards in America means that many of us can go through life rarely touching cash. Yet even in the U.S., cash still accounts for approximately 40% of transactions, followed by debit cards at 25% and credit cards at 17%. And globally, cash is truly king: MasterCard estimates that 85% of all consumer transactions still take place with old-school paper and coins. But all of that is slowly changing as economies modernize and middle-income families proliferate, bringing more converts to the benefits of electronic payment. With its mission to "accelerate the electrification of commerce," industry leader **Visa** (NYSE: V) has most of the world left to conquer.

We like Visa for many of the same reasons we like MasterCard. And with the recent acquisition of Visa Europe, the company will be adding 523 million card accounts that resulted in 38 billion transactions and $1.67 trillion in point-of-sale spending last year. For the fiscal third quarter, revenue was up 3% year-over-year, primarily because of foreign-exchange headwinds and slow global growth. Management is guiding for 7% to 8% revenue growth for the full year.

Having closed on its acquisition of Visa Europe, the company can start taking advantage of some of the deal's long-term benefits, such as greater scale, increased market share, and growth in free cash flow (FCF). Visa has also formed a key partnership with PayPal, under the terms of which PayPal will no longer steer users toward paying with a bank account (and not Visa), and in return Visa will allow users to pay with PayPal in any stores that have Visa contactless payment technology. We like this deal, which both shows Visa's entrenched position and negotiating leverage and also effectively turns a major competitor into a financial partner; with the bank-account obstacle removed, we think more customers will likely pay with a credit card in order to build up points. Management has repurchased $5.5 billion of stock so far this year, with an authorization to buy back an additional $7.3 billion. After taking on $16 billion of debt to fund the Visa Europe acquisition, the company has net debt of about $7.1 billion, which is equal to about one year of FCF.

Visa is valued at about $195 billion, and given its tiny market share, its ceiling should be much higher than that. It fits into *Pro* as a recurring-revenue business that invests its free cash flow in more growth at still higher rates of return, making it a compounding vehicle.

Get to Know the Pro Universe

Published Jun 16, 2016 at 2:55PM

The *Pro* Universe is a screening tool powered by *Motley Fool One*'s Fool IQ and the Fool's central research database to show you Foolish analysts' conviction level on each company. In the following video, TMF head of product Tim Hanson explains the tool from a *Million Dollar Portfolio* perspective.

{% video %}

Fool IQ is a powerful research tool that we have inside of *Motley Fool One* that makes sense of all the stocks that our 50-some-odd analysts around the world are following.

My name is Tim Hanson, and I'm the head of product here at The Motley Fool. You know, one thing about Fool IQ that I think — or that I hope — is fun is that it's appealing to investors who are novices or experts. So if you're a novice investor, we've made some buttons that you can literally just click once and they will make the universe drill down to retirement-type stocks, or small-cap stocks, and so on and so forth. If, on the other hand, you're an expert investor who really likes diving in, you can build your own filters ... your own complicated screens ... to find what you're looking for.

It's a database of all the ideas that our analysts are working on, or of all the ideas inside the service in which you are a member. The way it's like a screener is it allows you to find our favorite ideas tagged by asset class (like small cap or large cap), or industry (such as energy or consumer discretionary). Or by criteria you might be looking for in a stock (if you were looking for a dividend yield, or lower-than-average volatility). Or you'd like to combine several of those elements to find the stock that's really a good fit for your portfolio and what you're looking for.

So the reason it's a little bit unique is that while it does include financial information that you'd find in most screeners, what it also includes is our conviction, or our covering analyst's conviction in the ideas. So we keep track of everything our analysts are following and how they feel about one stock relative to another, and then we aggregate them all into what we call a leaderboard so we can identify someone's favorite idea over an idea that they don't feel quite as strongly about. It's a way for you to personalize our picks, rather than based on what our advisors decide is the best at any given month without knowing your circumstances.

The Fool IQ universe within *MDP* includes all the stocks that you have access to. Those are *MDP* recommendations as well as *Stock Advisor*, *Hidden Gems*, *Rule Breakers*, *Income Investor*, and *Inside Value*. For the first time ever, you're able to access all of those stock picks, all of that investing IP, without having to leave the *MDP* site. We also want to give members the opportunity to engage with the universe of front-end recommendations that they have access to in the same way that the *MDP* advisors do. They're looking for certain strategies. You can look for ideas in those same strategies using the Fool IQ experience inside of *MDP*.

You could use it to suggest potential ideas on the discussion boards, if you wanted to. You could use it to find stocks that would be complementary to what you own. Or if you think, for example, that you want to have more exposure or less exposure than the portfolio managers, you can do that. Or if you come into cash at a time when *MDP* doesn't have cash, or vice versa, you can still get actionable advice from the service without waiting for them to transact.

You know, no one's obligated to use it. We're not taking away the recommendations that come out every month in features such as Best Buys Now and Starter Stocks and Core Stocks and all the things that we've tried to do to help people better navigate the universe. We just want to give people another tool that they can use to really make sense of the stock recommendations that they have access to, find the ones that are right for them, and really help you and our company, The Motley Fool, achieve our mission of helping the world invest better. And that's building a portfolio of stocks that you feel great about, on your terms, that can last you a lifetime.

Portfolio Positioning Report: April 27, 2016

Published Apr 27, 2016 at 12:06PM

Join our live event at 2 p.m. May 4

Dear *Pro* Member,

Our first three Portfolio Building Reports provided you guidance on all of *Pro*'s Buy First and Buy stocks. This final report will do the same for our active short and option positions, many of which we use as hedges. For reasons we'll explain, we don't expect that many of you will initiate all of the positions in this report right away, or perhaps at all. And that's perfectly fine!

Hedging is about lowering your exposure to the risks of the market; to a lesser extent, shorting is as well. These additional investment tools tweak or adjust the risk profile of your *existing* portfolio, so if you're still building your collection of long-term stocks, concentrate on that for now. Stock investments are the core of the *Pro* portfolio, and by owning *Pro* stocks, you are positioned to compound your value over time. We know there's a learning curve for strategies that are new to you, so it's important you know there's no rush; you can incorporate the positions in this report when you're ready. We're here for you in the meantime.

Before explaining these positions, let's review how each strategy works. We'll begin with shorts — a sort of "anti-investment" that we believe will decline in value, adding profits to our portfolio in the process.

Shorting in Short

When you sell something short, you borrow shares of a company or an ETF from your broker and immediately sell them, collecting the proceeds. At various brokers, this trade action is called "sell short," "sell to open," or just "sell." In the future, you'll need to buy the same number of shares back to replace the ones you borrowed and sold. This second step is called "cover," "buy to cover," or "buy to close." You hope to buy the shares back at a *lower price* than when you opened the position. You profit directly on the position if you are able to close it at a price that's advantageous to you.

The difference between your original sell — or short — price and the price you later pay to buy back (and return) the borrowed shares is your profit. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock rises to $30, you've lost $10 per share when you buy it back. We use shorts in *Pro* because they're one way to profit when the market or a company falls, but they come with their own risks — shares can be hard to borrow, fees are often involved, and a short can get closed on you (you're forced to buy it back) if the broker wants the shares back early. So, we need to size our short positions appropriately small.

Hedging ... in Short

A hedge is similar to a short because it gains value when prices fall, but it's different in intent; these positions are taken to *offset* the risk we have in another position or in our market exposure as a whole. So, when we sell short (or use bearish options on) a market-index proxy like the **SPDR S&P 500** (NYSEMKT: SPY) ETF, we are hedging our exposure to the stock market as a whole. A hedge is a form of insurance; it only pays out when you need it, and usually it won't make money. We *know* a market-index hedge will go up in value whenever the market goes down — and that's nice to know. But most times, the market won't fall (or won't fall enough), and our hedge will go unused.

For this reason, we try to spend very little to hedge, but there are sometimes still costs. We have to reconcile this with the fact that hedging lets us stay *more* invested than we otherwise would, given our goal of absolute positive returns. In other words, one key way we profit from our hedges is by using them to help us keep our long stock exposure higher! As with shorting, you should only hedge if you have specific stock market exposure you want to "hedge out." Recently, *Pro* issued a new market hedge using options on the SPDR S&P 500. Tweaked a bit for today (see below!), that is our current market-hedge recommendation for anyone who wants to hedge out 10% of their long exposure, as we are doing (bringing *Pro* right now to about 65% net long).

Your Exposure

To know whether hedging is for you, it's helpful to think about your stock market exposure. This is simply how much of your total portfolio is invested in long stocks. Excluding options and shorts, *Pro* is about 80% invested in long stocks as we work through quarter one earnings. That's high for an absolute-return portfolio (which is part of why we want to short and hedge!). And like many members, you may own other stocks beyond *Pro*'s, so if you've bought all of our stocks, you might be even more exposed to market risk than we are. We're hedging the *Pro* portfolio down to about 70% market exposure with our SPY hedge (other shorts make up the other 5%, bringing us to the aforementioned 65%), and you could (but do not need to) do the same.

The bottom line is: As you consider adding hedges and shorts to your portfolio, first know how much of your portfolio's assets are invested in stocks. That helps dictate how much shorting or hedging you want to initiate to reach the *net* market exposure you desire. *Pro* has averaged about 73% net long exposure since January 2012, but that number will move up and down as our opportunities change. Our exposure is always shown at the bottom right of the Recommendations page. For many years, I've found that about 72% market exposure, along with the use of options, can be enough to earn strong returns with less risk. The past is no promise of future returns, but we're aiming to continue that success.

This Stuff Is Optional

Not every *Pro* member is comfortable with shorting or hedging, and there are practical considerations to take into account as well. First, you need a margin account to sell short, so (unless you use options to go bearish) you can't do it in an IRA. Second, you have to accept that shorts can run strongly against you, so you need cash to cover that risk. Third, you'll usually pay an annualized fee of anywhere from 1% to 5% of the short's daily value to short something. Fourth, in many cases it's hard to borrow shares to short, period. That is the situation with some of our shorts today. Finally, short shares can be bought away from you at the worst time, when they're up in price (a "forced buy-in"). If brokers can no longer find shares to borrow, you're forced to "buy in" at market prices to return your borrowed shares.

So what to do? You can use options to short in some cases -- we do, and we explain how to do so wherever appropriate. You can also consider opening a brokerage account that is particularly friendly to shorting. Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does, and does not charge a fee for shorting. You could also wait and see whether shares become available in your existing, traditional brokerage account, though note that at many brokers, certain shares are basically never available for shorting. Or, if you're not drawn to it, you don't need to short at all.

Options Are Optional, Too — but Advised!

Our options positions are also ... optional, but we strongly advocate learning to use options and following along with ours over time. Options are powerful tools for income, hedging, greater upside, and more. We know from experience they're well worth the time it takes to learn them, and we're here to help you. Options can make you a much more confident and versatile investor, and they can generate a whole new stream of income for you and your family. So, if you're new to using options, you're in a great place! Use *Motley Fool Pro* and our sister service, *Motley Fool Options* (free for the life of your *Pro* membership!), to learn how to use these great tools. On a personal note, if you're going to learn just one simple strategy, I suggest learning how to write puts (link goes to *Motley Fool Options*) for income or to buy a stock lower.

About This Report

Let's return to the main show. This Portfolio Positioning Report and the special live event and Q&A following it on May 4, will (when you're ready!) help you short vehicles we believe will decline; teach you how to hedge your portfolio; and start to generate returns from options. But keep in mind that this is just a start; we'll have many *brand-new* investment recommendations arriving to your inbox as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way!

On the other hand, if this looks overwhelming right now — or if you're still catching up with our core stock positions — that's perfectly fine. You don't need to start these positions now. As mentioned, long positions are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and often rewarding — aren't necessary to succeed with *Pro* in the long term, let alone immediately. As you learn these strategies and progress with us, just keep your exposure to the stock market in mind.

In closing, I'll stress again that you shouldn't feel pressured to act immediately. We will continue to make recommendations on an ongoing basis, including in our Monday Catch-Up Trades — and as brand-new opportunities emerge. That's part of the fun! So take your time, and make an investment only when you're ready. Finally, please bring any questions to our Making *Pro* Fit You discussion board.

Foolishly,

— Jeff Fischer, *Pro* advisor

Shorts

Deere & Company (NYSE: DE): Sell Short

The farm equipment giant just ended a cycle of tremendous sales growth, and now we believe air is coming out of the tires.

Suggested Short Allocation: 2% to match us
(and this assumes you own about 2% in *Pro* stock **Valmont Industries** (NYSE: VMI)

How It Fits Into *Pro*

For More

- *Pro*'s recommendation history
- Talk about DE on our discussion board

We recently sold short shares of Deere & Company because we believe investors are currently overestimating the true normalized earnings power for this farm equipment manufacturer. As JP writes in our recent report, the latest agricultural "super cycle" gave rise to what we believe was an unsustainable increase in farm equipment sales. If we're right, this has positioned John Deere, the world's leading manufacturer of agricultural and forestry equipment, to report disappointing results going forward as the industry works its way back toward equilibrium.

But this short also serves another purpose – it's a low-cost macro hedge that reduces the impact on our portfolio of potential adverse developments in commodities, the U.S. economy, the global economy (both developed and emerging markets), and currency exchange rates. And given Deere's large book of financing receivables (debt owed to it), the stock also serves as a small counterbalance to our sizable exposure to the financial industry. Finally, it directly hedges our 2% long position in Valmont Industries, which also sells farm equipment, namely irrigation machines.

Availability

Interactive Brokers has 6.4 million shares available for shorting as of April 26 – so that should be enough for anyone here, wink wink. The annual fee to short is about 0.5%. Most all brokers should have Deere shares readily available for shorting. Just be ready to lose money on this short/hedge hybrid if Deere runs against us. It's far from a fly-by-night operation. As long as Valmont goes up more than Deere (and so far it has), then this "paired trade" is making us money.

Direxion Daily Financial Bear 3X Shares ETF (NYSEMKT: FAZ): Sell Short

Daily leverage keeps steady downward pressure on this bearish ETF that we're short.

Suggested Short Allocation: 0.3% to 0.6% (we are currently short only 0.3%, as the position has shrunk nicely, but we may add to it opportunistically)

How It Fits Into *Pro*

For More

- *Pro*'s recommendation history
- Talk about FAZ on our discussion board

This bearish ETF is meant to provide 3 times (300%) the daily *inverse* results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. By shorting this ETF, we're effectively 3 times long, on a daily basis, the U.S. large-cap financial sector, which includes the likes of *Pro* holdings **Wells Fargo** (NYSE: WFC) and **Visa** (NYSE: V).

Leveraged, inverse ETFs like this one are flawed because they rebalance their derivative positions daily in order to maintain a constant exposure. Over long holding periods, the costs involved with rebalancing eat away at returns, keeping downward pressure on the vehicle as a whole. Also, returns are compounded daily, which adds to tracking errors. As our original buy report details, we continue to believe that large-cap U.S. financials are inexpensively priced — and we own several of them as a result. That belief makes shorting this flawed bearish financial ETF all the more attractive.

That said, shorting FAZ has become difficult over the years, and our position size has dwindled severely. We lately have a 78% profit on our short! But similar profits should keep coming over the long haul -- like us, any newcomer to a short can make up to 100% on the short, and no more. So, new short sellers like you are in a fine position as this inverse, short, leveraged ETF can keep going down. That said, new members can skip this position if shorting it proves difficult, or use options instead (see the Alternative Trade below) if you have a six-figure account. We own plenty of strong financial companies serving a similar purpose in the portfolio. You have plenty of exposure to the upside we see in financial leaders if you own our stocks.

Availability

This ETF is hard to borrow. Lately, only 80,000 shares of FAZ were available for shorting at Interactive Brokers at a 6.1% annual fee. Periodically, TD Ameritrade has shares available with no fee. Members have sometimes been "bought in" on their shares at Interactive Brokers, for a forced closing of the short.

Alternative Trade

If you can't short shares directly, then you can set up a synthetic short in a margin account. "Sell to open" January 2018 $40 calls on FAZ, and "buy to open" an equal number of January 2018 $40 puts. Lately you will collect a net credit of about $2 to set this up. This makes you short FAZ with a start price of about $38, and sets you up to profit if FAZ declines in price. Only sell one call for every $3,800 in FAZ you are able to comfortably short. On a $380,000 account, one contract of each option would be a 1% allocation. That's about as much as we recommend.

Eagle-eyed members will notice that *Pro*'s short position on FAZ is 0.3% of our portfolio. We're recommending 0.6% to newcomers because we know you'll be unable to short at least one other position in the *Pro* portfolio, namely SRS (more on that later). There are no IRA-friendly alternatives for this short. If you can't short it at all, you could add between 0.3% and 0.6% to one of our three financial companies — Wells Fargo, MasterCard, or Visa — instead.

Hedge

SPDR S&P 500 (NYSEMKT: SPY): Set Up a Put Ratio Spread

Set up for no cost, this market hedge lowers our exposure to stocks and will pay us if the S&P falls about 4% to 10%.

Suggested Allocation: 10% or so; you would set up one spread for every $200,000 you manage

For More

- *Pro*'s original recommendation (please note, we recommend a higher strike price on the lower of the two put options now -- $192 instead of $190. You'd set up a trade as described, but using $192/$200 strike prices.
- Talk about the SPY hedge on our discussion board

Requiring a margin account, this June put ratio spread we set up last month can still be set up for no cost if you move your lower strike price up a bit. So, "sell to open" two June 17, 2016, $192 puts for every one June 17, 2016, $200 put you "buy to open." Again, this can be set up lately for no cost. Each $200 put represents a $20,000 short of SPY, so you would buy one for every $200,000 you manage, to set up a 10% position. Use the trade alert for more allocation guidance (again, simply adjusting your lower strike to $192, and still paying nothing to set up each spread).

Be aware that we plan to issue a second hedge to all members in future, one that profits if the S&P 500 falls further than this June hedge allows for. The two hedges will work together if the market falls more, the new one picking up where this one leaves off.

Alternative Trade

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:** For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, "buy to open" June 17, 2016, $200 puts and "sell to open" *an equal number* of June 17, 2016, $190 puts. Recently, this will cost you about $1.15 ($115) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $10 ($1,000) per spread on a decline to $190 or any lower price, but you should be prepared to lose your whole $115 per spread if SPY doesn't decline below $200 by expiration.

Options

American Tower (NYSE: AMT): Buy to Open January 2018 $80 Calls

Suggested Allocation: 0.6%

These calls target long-term upside on American Tower, adding to our existing stock holding.

For More

- [*Pro*'s original recommendation]
- [Talk about American Tower on our discussion board]

We're recommending 2018 calls on American Tower today, but you may notice that *Pro* owns January 2017 $80 calls instead. We bought them before the 2018 calls were listed, and newcomers should consider buying January *2018* $80 calls, to give the investment thesis more time to play out. *Pro* will likely roll its calls out to 2018 (or potentially 2019 later this year) before they expire in 2017, as long as the investment thesis doesn't change. We're seeking leveraged returns if American Tower stock appreciates by 2017 (or 2018 or 2019).

Because we recently established a diagonal call position (our owned long-dated call, plus an overlaid short-dated written call for income) that expires this week, **our guidance for this position is conditional.** We recommend that you **do not** establish this full position immediately, instead waiting until Friday, April 26, when American Tower reports first-quarter 2016 earnings before the market opens.

- **Condition 1:** On Friday after earnings, American Tower's stock price is above $105 and it looks like *Pro* will need to take action to either close the diagonal call position or roll our written call up and/or out.
  - **Action:** New *Pro* members should wait until *Pro* sends out our official rolling or closing alert on Friday and heed the guidance for new *Pro* members in the "Alternative Trades" section of the alert.
- **Condition 2:** On Friday after earnings, American Tower's stock price is below $105 and it looks like our $105 written calls will expire worthless.
  - **Action:** New *Pro* members can go ahead and buy a 0.6% allocation to American Tower January 2018 $80 calls, using a limit order and aiming for a price near the midpoint of the bid/ask spread.

A 0.6% allocation at current prices most closely equates to buying one call for every $450,000 or so you manage. This is a small position by design, so be careful not to over-allocate to the calls; you already own the stock, after all! We may seek to add more to our position later, though, if volatility provides us with lower prices. Members for whom one contract would over-allocate their portfolios can consider buying 0.6% more in stock, bringing your stake to approximately 4.3%. Realize you won't benefit from the leverage the calls will provide, although you will have a better breakeven price and no expiration.

All the Rest of *Pro*'s Positions

As a *Pro* member with an especially keen eye (and great memory!), you will note that we haven't updated you on *every* position in the portfolio yet. Pricing opportunities being what they are and with expirations right around the corner, not all of our positions are primed for new action right now, and not all options positions are timely. Worry not. We will publish Catch-Up Trades when we see new *Pro* opportunities on existing positions, and many of our positions will require upkeep in the form of a whole new alert emailed to everyone, so you can get on board then! One by one, it won't take us long to get there. Here's the status on our remaining positions that are currently "on pause for newcomers" — either on hold or not timely.

American Airlines (NASDAQ: AAL)

Long January $35 2017 calls on hold

Last year, we bought call options to profit on a rising, very inexpensive airline stock. Instead, our first foray into an industry fraught with a legacy of failure is, so far, failing. Our calls are down about 74%, and we're not sure how much longer we'll give them. American Airlines just reported earnings this week that came with lackluster guidance on key metrics, and with our expiration about eight months away, we may soon take our remaining money and go home, tail between our legs. Airlines are not a typical *Pro* investment, which is why we used low-cost call options to dip our toe in the water. So far, color us burned. If the winds change and we believe new members should get on board, we'll alert you. But for now, steer clear.

Caesars Entertainment (NASDAQ: CZR)

Short on hold

Pro is short shares of America's largest casino operator, **Caesars Entertaiment** (NASDAQ: CZR), which has put one of its units into bankruptcy proceedings. The stock is volatile -- we booked a 35% profit on half of our short last year, and our remaining short shares show a 40% profit of late. The outcome of this short position is partly dependent on the courts; lawsuits from large investors are being weighed, but operationally the business (shed temporarily of some debt on the books, and split into new units) is looking better. The court is dragging its heels on proceedings, so we're deciding whether we want to stay short or take our gains and move on. This makes us comfortable telling new members to hold off – wait and see what we decide. If we stay short, we'll tell you, and you can short shares then.

CurrencyShares Euro Trust (NYSEMKT: FXE)

Short on hold

We've been short the euro against the dollar since late 2011. We view this position as a quiet anti-investment; the risk to us is relatively known (and reasonable), and the profit potential remains worth pursuing. As the euro has declined from about $1.30 to a recent $1.10 to the dollar, we currently have a 15% profit on the position. But we pay fees to keep this short, and with interest rates now unlikely to rise quickly in the U.S., the dollar may not strengthen much more against the euro anytime soon. So we are considering closing this short position. Earnings results (taking place right now) may help us to consider how the Fed may act next regarding interest rates, which may help us decide what to do with this currency short. We should have a decision in May and will let you know! If we move from Hold back to Short, you can get on board.

Expeditors International (NASDAQ: EXPD)

Synthetic covered strangle on hold

Shares of shipper Expeditors International have run up sharply the past few months. Our synthetic long expires next January, but we'll have to address our May covered strangle before then. These options were written for income and will need to be rolled to higher strike prices. When we do that by the May expiration, we'll guide newcomers on exactly how to set this income position up.

Gentex

Puts on track to expire

Pro has written May 2016 $15 puts that, if exercised, would have us add about 1.5% in stock to our **Gentex** (NASDAQ: GNTX) position. The goal with these puts is to earn income and potentially add to our existing stock position at lower prices. Since this position is just a few weeks from expiration, we don't recommend that new members join us now. We'll aim to write puts again whenever we see good pricing after these expire -- and at that point all members can join in.

ProShares UltraShort Real Estate

Short on hold

We have a small (0.3%) short remaining in the **ProShares UltraShort Real Estate ETF** (NYSEMKT: SRS). We enjoy watching its slow descent in price, but the ETF only has $36 million in assets now, making it too small to recommend to new members. Plus, outside of our broker (Interactive Brokers), it appears impossible to borrow shares to sell short now — and if you do find them, the annual percentage fee to short is high (recently 5% at IB). Instead, as shared above, we recommend that you sell short 0.6% in FAZ as a long-term alternate. Or just sit this small position out.

Wells Fargo

Puts on track to be assigned

Our $52.50 written puts on **Wells Fargo** (NYSE: WFC) expire in May, and with the stock currently trading slightly below $51 per share, our puts are in-the-money. If current pricing stands and we do not take action, *Pro* will be assigned on its written puts, adding about 1.5% to our Wells Fargo stock allocation. New members are advised not to set up this position yet and to wait for an official follow-up alert from *Pro*.

Within the next few weeks (and dependent upon the price action of Wells Fargo stock), *Pro* will either roll our puts out to a later month -- targeting further income -- or we will let the puts expire and accept shares to increase our stock allocation. If we roll our puts out to a later month, new *Pro* members can write the new puts alongside us (there will be specific guidance for new members in the "Alternative Trades" section of the alert). If we accept new shares of Wells Fargo, new *Pro* members can add 1.5% to their stock allocation **if and when *Pro* does so via assignment of its written puts.**

In Conclusion

We'll likely recommend some of these positions (except the SRS short) to new members once we reaffirm that there's sufficient opportunity still afoot, when pricing improves, or after our options expire. Just watch your inbox for official trade alerts! Also, Monday's Catch-Up Trades could pertain to a few of these.

At the same time, we're not standing still. In this and our three previous Portfolio Building Reports, you have many great *Pro* investments -- all rated Buy First or Buy -- to move into. And of course, we'll continue to send brand-new investment recommendations to all members.

It's not vital that your portfolio be 100% identical to ours (many members deviate considerably), but by becoming familiar with how we invest, learning the strategies we use that you can also employ, and owning many of our core stocks, you should be positioned to succeed well with *Pro* over the time frame that matters. Meanwhile, if you're new to shorts, hedges, and options, start to dip your toes in as your comfort allows. We're here to help, and we believe you'll see many, many great benefits as the years unfold.

Fool on!

The *Pro* team:

Pro Portfolio Building Report No. 2: April 20, 2016

Published Apr 19, 2016 at 7:49PM

Welcome, *Pro* Fool! This report details our current thinking on eight of the Buy stocks in our portfolio. The rest of our Buys will be featured in our third report, coming Friday. Once you've read these and the previous report detailing our Buy First positions, you're ready to start (or continue) building your *Pro* portfolio as swiftly or as slowly as you like.

We want our advice to be uncomplicated: Purchase our Buy Firsts first (again, taking your time according to your situation — there's no rush); purchase our Buys after that; match our allocations as closely as you can (but don't worry about needing to buy in 100-share lots — fewer is fine); and stay tuned for our Portfolio Positioning Event on May 4, when the team will be answering your questions in real time.

We're glad you're here, learning to become an investor who will come out on top in all markets. Bring any questions to the Getting Started & Help discussion board, and Fool on!

Best,

The *Motley Fool Pro* team

Table of Contents

A Note on Fair Value >>

Buy: AmTrust Financial Services (NASDAQ: AFSI)

This shrewd insurer looks to enter markets optimistically, when pricing is favorable because others are struggling.

Suggested Allocation: 5.1%, perhaps bought in two to three blocks over the next two or three months

For More

- *Pro*'s original recommendation (4/3/2009)
- Most recent earnings update (3/7/2016)
- Talk about AFSI

AmTrust Financial Services (NASDAQ: AFSI) was founded in 1998, making it one of the new kids on the block in an industry where many of its competitors have been around for 100 years or more . But this newbie insurer has some serious street smarts. AmTrust likes to compete in niche markets (for example, small, low-hazard workers' compensation policies), waiting until a rough patch demonstrates that the incumbents in a space have loosened their underwriting standards. It's then able to grab market share in an environment favorable to itself, as rivals attempt to cope with prior losses by raising prices.

Over the past 12 months, AmTrust has written $2.8 billion of workers' comp premiums, making it highly likely to finish the year as one of the top five workers' comp underwriters in the United States. But we don't think that means it's doomed to the glacial pace of growth common to many of the larger insurers. The company is moving into the commercial package insurance business (which includes workers' comp); SNL Financial estimated this as a $241.3 billion market in net written premiums as of 2014. AmTrust management believes its commercial package business can become its next billion-dollar platform, and we believe management will continue to find markets ripe for disruption.

Buy: Apple (NASDAQ: AAPL)

The leader in mobile computing products should see more long-term growth than anyone expects.

Suggested Allocation: 3.8%

For More

- Pro's original recommendation (2/14/12)
- Most recent earnings update (2/4/16)
- Talk about Apple

Led by its iPhone, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the smooth Apple ecosystem, which centers on the iTunes and App Store marketplaces, as well as the new Apple Pay. Apple services (iTunes, App Store, Apple Music, etc.) generated more revenue last year than more than 70% of the companies in the Fortune 500, while Apple itself is the most valuable company in the world, with more than $230 billion in annual sales. Despite this massive size, the company continues to grow and generate increasing profits for shareholders -- earnings per share were up 27% this past year. The company's integrated hardware and software make for a sticky consumer experience that provides disincentives to switch to a competitor, and as more people use multiple computing devices, Apple makes it easy to transition seamlessly from one of its products to another.

We expect the recently launched Apple Watch and Apple TV to help further entrench the Apple ecosystem into people's daily lives, all while Apple continues to work on developing its next major product and returning massive amounts of capital to shareholders through dividends and buybacks (almost $50 billion in fiscal 2015!). We're not counting on a revolutionary product anytime soon, but we are counting on record numbers of phones being sold to both new and existing customers over the coming years. We want to be in on that conference call.

Buy: Medtronic (NYSE: MDT)

The medical-device industry is complex and regulated, and it provides entrenched leaders with a competitive moat; our leading company is growing in international markets.

Suggested Allocation: 3.1%

For More

- *Pro*'s original recommendation (7/1/2009) ...
- ... and our second buy recommendation (11/9/10)
- The next earnings update is coming in May.
- Talk about Medtronic

In March, the CEO of Medtronic put it like this: "Our formula for long-term success is to deliver consistent mid-single-digit revenue growth, with 200 to 400 basis points of EPS leverage, [and to] return a minimum of 50% of our adjusted free cash flow to shareholders through dividend growth and share repurchases. The expected net result is creating enormous value, with sustainable double-digit [at least 10%] total shareholder returns."

As shareholders of Medtronic, this is exactly what we've seen over the years: Our annualized return on the position is 11.25%, and we think something close to this can continue going forward. Medtronic is a market leader in vital medical devices, be they for the heart, spine, knee, or one of four other key categories. The stock yields 2%, and the dividend has increased annually for the past 38 years, resulting in an 18% compounded annual growth rate (CAGR). Expect continued dividend increases, sales growth of about 4% to 6%, and earnings-per-share growth considerably higher than that — all of which should combine for North Star-challenging returns. While Medtronic has touted itself as a play on international markets, growth in the U.S. has lately regained traction, too. International markets still account for a small minority of revenue, and are growing smartly.

Buy: OpenText (NASDAQ: OTEX)

This company's information management software keeps the digital lives of businesses in order, and its exchange software platform drives business transactions and earns recurring revenue.

Suggested Allocation: 3%

For More

- *Pro* 's original recommendation (8/31/11)
- Most recent earnings coverage (3/10/16)
- Talk about OpenText

A leader in Enterprise Information Management (EIM), OpenText offers customers (governments, universities, corporations) a full suite of software solutions to manage growing reams of digital data. Its three areas of focus are data and information management; information exchange platforms within and across organizations; and analytics, where "big data" is used to gain insights and better run a business. Said differently, OpenText helps customers go digital with their data, or manage what is already digital, including transactions.

The leading independent provider of EIM software, Canada-based OpenText is enjoying strong cloud sales as well as steady license contracts. Its EIM market should increase sales by least 10% annualized (our estimate) over the next four years. In turn, we're looking for at least 10% annualized returns from our ownership of OpenText shares. The year 2016 is an important and exciting one for the company; its new software, called Release 16, is rolling out after its fall 2015 debut. It's designed to integrate nearly everything OpenText software can do, and success should bring many more cross-selling opportunities, as well as new clients. At the same time, deep data analytics is embedded throughout the software for the first time, adding upsell opportunities. OpenText enjoys strong recurring revenue (which represented 84% of its sales in fiscal 2015). We may sometimes recommend options on the stock, as we've done several times in our sister service, *Motley Fool Options*.

Buy: Skyworks Solutions (NASDAQ: SWKS)

This leading designer of analog modules for smartphones and connected Internet of Things devices is growing sharply.

Suggested Allocation: 3.4%

For More

- *Pro* 's original recommendation (8/5/14)
- Latest earnings coverage (3/2/16)
- Talk about Skyworks

Beyond having one of the coolest names in our portfolio, Skyworks Solutions makes technology that powers wireless connectivity in a wide variety of products: Apple and Samsung smartphones, **Medtronic** (NYSE: MDT) medical devices, **Alphabet** (NASDAQ: GOOGL) and **General Electric** (NYSE: GE) products. In the "Internet of Things," millions of physical objects are going online, and Skyworks is uniquely positioned to benefit. Not only does it serve *all* smartphone makers, but the company is diversified across industries to total more than 2,000 customers. How so?

Skyworks sells more than 2,500 high-performance analog semiconductors and related products, supported by more than 2,200 patents. The product list includes amplifiers, attenuators, receivers, switches, diodes, modulators, GPS power and voltage regulators, and more, often sold together as a module for a phone or connected device. Skyworks earns industry-beating operating margins of more than 30% (and they're headed higher) by selling specialized solutions to giant customers with growing connectivity needs. Plus, as wireless complexity increases, fewer companies can deliver the integrated modules customers need, putting Skyworks in an even stronger position. The China opportunity is large as well.

This can be a volatile "chip" stock, but its long-term outlook (which is the time frame we care about!) remains compelling. The company expects its long-term total addressable market to increase by about 15% a year, and Skyworks is increasing its profits more quickly than that.

Buy: Starbucks (NASDAQ: SBUX)

You only think you're there for the coffee — the ubiquitous java purveyor has big plans.

Suggested Allocation: 3.8%

For More

- *Pro*'s original recommendation (8/22/2012)
- Most recent earnings update (2/5/2016)
- Talk about Starbucks

You may not realize it, but "**Starbucks**" (NASDAQ: SBUX) is no longer just a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense, it's just a front. We *think* we go to Starbucks for the coffee, but those green-and-white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

Starbucks began opening America's eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 24,000 stores in 70-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences in more than 80 million transactions each week This company is continually finding new ways to reach customers; we're grabbing a latte and a cake pop and coming along for the ride.

Buy: Verisk Analytics (NASDAQ: VRSK)

This prototypical Pro *holding provides us with exposure to powerful tailwinds within the financial, energy, and health-care industries, among others.*

Suggested Allocation: 2.2%

For More

- *Pro*'s original recommendation (6/23/15)
- Most recent earnings coverage (3/1/2016)
- Talk about Verisk

Verisk Analytics (NASDAQ: VRSK) may not be a familiar name, but with a strong competitive advantage, high customer retention, robust and contract-based cash flows, a scalable business model, and large (and growing) markets, the company is in many ways a prototypical *Pro* holding. Verisk started as an information utility for the insurance industry, but nowadays it's is a data and analytics powerhouse that provides customers with solutions in all sorts of arenas: raw data, tailored analytics, enterprise reporting systems, policy fraud detection solutions, competitive benchmarking, and legally tested policy language, just to name a few.

One way to invest successfully is to buy out-of-favor industries, and three to five years from now, we may look back and realize that Verisk did exactly that by entering into the energy industry (via its May 2015 acquisition of Wood Mackenzie) in the midst of the current energy slide. We tend to shun commodity-based businesses here at *Pro*, but we believe Verisk's purchase of WoodMac was a good one: The latter is pretty much a copy of the former, but with a different end market. WoodMac is a leading provider of data analytics to the global energy, chemicals, metals, and mining markets, and it actually has higher margins and a greater percentage of subscription-based revenue than Verisk's other business units. We don't profess to have the ultimate insight into what the next six months have in store for WoodMac and Verisk, but we believe shareholders will be very happy with the results over the next three years.

Buy: Visa (NYSE: V)

With its mission to "accelerate the electrification of commerce," industry leader Visa has most of the world left to conquer.

Suggested Allocation: 2.5%

For More

- *Pro*'s original recommendation (4/28/15)
- Most recent earnings coverage (11/25/2015 — this quarter's update is on the way)
- Talk about Visa

The ubiquitous nature of credit and debit cards in America means that many of us can go through life rarely touching cash. Yet even in the U.S., cash still accounts for approximately 40% of transactions, followed by debit cards at 25% and credit cards at 17%. And globally, cash is truly king: MasterCard estimates that 85% of all consumer transactions still take place with old-school paper and coins. But all of that is slowly changing as economies modernize and middle-income families proliferate, bringing more converts to the benefits of electronic payment. With its mission to "accelerate the electrification of commerce," industry leader **Visa** (NYSE: V) has most of the world left to conquer.

We like Visa for many of the same reasons we like MasterCard. And with the recent acquisition of Visa Europe, the company will be adding 523 million card accounts that resulted in 38 billion transactions and $1.67 trillion in point-of-sale spending last year

. Visa is valued at $195 billion, and given its tiny market share, its ceiling should be much higher than that. It fits into *Pro* as a recurring-revenue business that invests its free cash flow in more growth at still higher rates of return, making it a compounding vehicle.

Pro Portfolio Building Report No. 1: April 13, 2016

Published Apr 12, 2016 at 8:51PM

Welcome, Fool! We're glad you're here. This first report is meant to get you up to speed on our Buy First stocks — the companies in your *Pro* portfolio that we believe you should start purchasing first. But before we get to that, a few words about how best to use *Pro* ...

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that aims to generate winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, hedges, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* fit you.** We know not all investors are in the same situation! We can help you figure out how to buy *Pro* investments given your personal situation, including investing in an IRA or coming to *Pro* already fully invested. Check out our advice for every approach to *Pro*: Invested Elsewhere | "Free-Range" | Whoever You Are
3. **Catch up with our portfolio at your own pace.** Start with the stocks in this report, and follow along with our subsequent reports between now and our live event on May 4. You can always see our Buy First, Buy, and Hold guidance (which is the most important -- more important than valuation estimates) on the Recommendations page, and you can get a succinct, up-to-date take on all of our stock positions on our What We Think Now page.

Bring any questions to the Getting Started & Help discussion board, and Fool onward!

-- The *Motley Fool Pro* team

A Note on Fair Value >>

Table of Contents

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 3.8%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Global mobile data traffic is expected to increase at a compounded annual growth rate (CAGR) of 53% between last year and 2020, and global mobile 4G connections are expected to grow from 1.1 billion in 2015 to 4.7 billion by 2020 (a 34% CAGR). Communications site operator **American Tower** is well-positioned to benefit from this trend.

For More

- *Pro*'s original recommendation (5/6/13)
- *Pro*'s "Buy More" recommendation (3/17/14)
- *Pro's* "Buy Calls" recommendation (12/17/14)
- Most recent earnings update (2/27/16)
- Talk about AMT

AMT leases antenna space on more than 100,000 cell sites (towers, rooftops, and more) to wireless service providers across the globe. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, non-cancellable, and feature contractual annual price escalations. More than half of AMT's properties are located in 12 (soon to be 13) different countries outside the U.S., including India, Brazil, Colombia, Mexico, Nigeria, and South Africa, and management is intent on expanding the company's international portfolio as it continues to build and acquire more towers.

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE, or to increase coverage density. When they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; about 98% of AMT's customers up for renewal each year do so, and more than 60% of its current leases don't renew until 2021 or later.

The stock may experience volatility in the short term because of its tendency to trade alongside the interest rate-sensitive REIT sector, but over the long term, the underlying strength in business fundamentals should shine through. We expect to earn modest income from a growing dividend and strong appreciation as AMT continues to build out its international tower portfolio.

Buy First: Broadridge Financial Solutions (NYSE: BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 4.9%

For More

- *Pro*'s original recommendation (4/27/10)
- Most recent earnings update (2/5/16)
- Talk about Broadridge

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in its fiscal 2015, its platforms processed approximately 85% of all shares in the United States. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider for managing investor communications.

The company's smaller segment, Global Technology and Operations (GTO), accounts for 26% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance this Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy First: Facebook (NASDAQ: FB)

Although it's lately riding a wave of popularity, we believe the strong stock is justified, and the business should grow handsomely in coming years.

Suggested Allocation: 6.2% (buy in thirds, or halves, over a few quarters; or, experienced investors can write put options to target buying some of their shares cheaper; "sell to open" one put option for every 100 shares you could buy; since you want shares, sell "near-the-money" puts, with a strike price near the current share price, and that expire in just a month or two)

For More

- Latest earnings update (3/2/16)
- *Pro's* original recommendation (9/18/12 – dated by now! But this shows how we thought about it back then when it was $20 and most were bearish)
- Talk about Facebook

Facebook remains a young story about monetizing the largest, most engaged online audience ever hosted by one company. The company's future is in strong hands; management is showing patience and care as it starts to monetize more of its properties, putting visitor experience first. So far, this approach has paid off, with user engagement up even as more ads appear. The billions of connections maintained on Facebook's properties are making the sites extremely sticky, offering the potential for increased value to advertisers (and thus Facebook shareholders) -- especially as the advertising gets smarter and more targeted.

It's our largest position at a recent 6.2%, and the size of our investment in Facebook feels appropriate given how much growth potential lies ahead and how well-managed the company is. Even from today's price, we estimate Facebook could return about 15% annualized for shareholders over the next five to seven years. Though shares are currently a bit above our fair-value estimate, the stock is rated Buy First on its long-term potential. Key risks include users moving away from Facebook, but so far the company has shown great skill in *increasing* user engagement and stickiness, rather than stunting it. It's also possible that management could spend more than Wall Street expects, though that should mainly be a short-term concern.

Buy First: Gentex (NASDAQ: GNTX)

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 2.6%

For More

- Most recent earnings update (3/3/16)
- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex

In 1982, a small company in Zeeland, Mich., called **Gentex** made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands more than 90% of that market.

Currently, about 26% of cars made worldwide have an auto-dimming rearview mirror, and only 8.5% have auto-dimming exterior mirrors. For context, prior to 1987, those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher usage; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror (including the newly launched full display mirror), both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy First: MasterCard (NYSE: MA)

With approximately 85% of the world's commerce still happening in paper money, electronic payment leaders have a lot of room to grow.

Suggested Allocation: 4.5%

MasterCard (NYSE: MA) is among the most attractive businesses in the world. The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns running a largely fixed-cost transaction network that becomes more profitable the more people use it.

For More

- *Pro*'s original recommendation (9/8/11)
- Latest earnings update (3/14/16)
- Talk about MasterCard

The company "charged forward" again in 2015 despite slow international commerce and a strong U.S. dollar. For the year, net revenue in local currency advanced 8%, and EPS gained 18% before special items. But right now, an investment in MasterCard -- as with **Visa** (NYSE: V) -- is an investment in growth *beyond* this year, because 2016 looks tepid as emerging markets struggle and the dollar remains strong. Much of the company's growth potential is being coiled up like a spring. That spring should pop when more economies begin to expand again and the dollar weakens. The market knows this, so the stock maintains a premium valuation.

Even so, we recently moved MasterCard back to Buy First and increased its fair-value estimate. The stock trades a bit above that price, but that's been the case for as long as we've been following it. From this price, we target about 11% annualized returns over the long haul.

Buy First: Oracle (NYSE: ORCL)

This old-guard tech giant has reinvented itself into a cloud software leader, with expanding margins and fast-growing cloud revenue.

Suggested Allocation: 3.9%

Oracle is the largest business software provider in the world, with more than 420,000 customers and $37 billion in annual revenue. The giant built its legacy by selling database management software licenses and related hardware, but in recent years it's begun transitioning customers to its new cloud software offerings, in the process hosting customer data on its own premises.

For More

- Latest earnings update (4/1/16)
- *Pro*'s original recommendation (9/17/09)
- Talk about Oracle

This transition has cost it money in recent years. First, Oracle had to invest in hardware, software development, and sales staff. Second, cloud customers bring in less up-front revenue compared with traditional software license sales, creating a strong revenue headwind in the short term. Over the long term, however, cloud customers are more lucrative than old-timey license customers, with the benefits generally starting about three years after making the switch. Oracle is in early stages of this transition, but enough customers are moving to its cloud that Oracle's revenue has not been growing lately.

The good news: Now that investments and other transition costs are slowing, gross margins for the cloud business are going higher, and Oracle expects profit growth to result, especially as cloud revenue increases. We believe Oracle's comprehensive software solutions will help it keep most of its giant installed base and continue to win it new customers, ultimately leading to a larger, more profitable business. After several years of patience, we should start to see this healthy scenario unfold soon and for the coming many years. This Buy First stock looks undervalued today, and we model for at least 10% annualized total returns with relatively low risk.

Buy First: Wells Fargo (NYSE: WFC)

At heart, banks are simple businesses, and Wells Fargo is one of the best of the breed.

Suggested Allocation: 3.2%

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** (NYSE: WFC) is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 8,600 branches and 12,900 ATMs. It's the third-largest bank in America by total deposits, it has a reputation for high customer loyalty and satisfaction, and it's the U.S. leader in residential mortgage and small-business lending.

For More

- *Pro*'s original recommendation (12/10/10)
- *Pro*'s "Buy More" recommendation (7/29/14)
- Most recent earnings update (1/20/16)
- Talk about Wells Fargo on our discussion board

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up roughly half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During low-interest lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

Wells Fargo's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. In a world of continued low interest rates, we should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But if and when long-term interest rates rise and loan demand accelerates, Wells Fargo's earnings power — bolstered by growth in fee-based revenue — will hit its full stride.

Shares are trading at less than our estimate of fair value, and at recent prices they yield a growing 3.2% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. With its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

Invest Like a Pro: If You're Invested Elsewhere

Published Nov 12, 2015 at 10:00AM

How to build a *Pro* portfolio — investing gradually as you sell other holdings or accumulate funds.

If you're already fully invested, you may need to sell existing positions to add *Pro* picks. We recommend that you do this gradually and deliberately, and we've offered advice on how to approach this task.

Freeing Up Cash

List your existing positions in order from your highest-conviction holding to your lowest-conviction holding. If you own stocks from another Motley Fool service, you can use that service's guidance on those stocks in building your list. If you don't know why you own a stock, that's a good reason to sell it. When you're ready, incrementally sell your lowest-conviction stocks and use the proceeds to build your *Pro* portfolio.

Be mindful of your sector and geographic allocations. You don't want to unintentionally end up owning nothing but oil or European stocks just because they were your favorites. If you're struggling with what to sell, post to our discussion boards — the *Pro* team can't give you individual advice, but our community members can and frequently do weigh in with helpful guidance.

Building Your *Pro* Portfolio

Start Here: Portfolio Building Reports

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new *Pro* portfolio.

Part 1: Our Buy First Stocks
Part 2: Our Buy Stocks
Part 3: Our Buy Stocks, Continued
Portfolio Positioning Report
Important: A note on fair value

What's Next?

As you're building your *Pro* portfolio, participate alongside us with new trades if possible. If you don't have cash available, make the new trades the first ones you buy when the time is right. Each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want.

You may decide to modify the strategy we choose for a trade; for example, writing puts instead of buying a stock outright. If you choose to deviate from our recommendation, though, make sure you:

Uniquely *Pro*

If you're joining us from another Motley Fool service, it is critical that you understand what makes *Pro* so powerful. At *Pro*, we are building a portfolio, not simply offering investment recommendations. *Stock Advisor* and *Rule Breakers*, for example, offer stock recommendations from which members can pick and choose.

In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the *Pro* portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

1. Understand why we chose the strategy we did
2. Have a reason that the modified strategy better fits your portfolio
3. Exercise caution by sizing the position a bit smaller than you would otherwise

If you have any questions about our trades or making a strategy fit your investing goals, drop by our Making Pro Fit You discussion board, where the *Pro* team and community are happy to help.

You'll also receive the team's Monday Memo email every Monday afternoon, with commentary, news, and any updates to our guidance.

If You're Investing in an IRA

IRAs are tax-deferred accounts that usually don't allow shorting and allow only simple options strategies. If you're building your *Pro* portfolio in an IRA, you can follow our stock-buying trade alerts directly. Most IRAs allow you to write covered calls, so you can also follow those trade alerts (check with your broker to see if you have permission). For trades that go further afield, here are several points to consider:

Writing Puts: Some IRAs don't allow put writing (although many do, if they are cash-secured), so you should simply buy shares in these positions over time. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Other Options Trades: If you can't make a trade in your IRA, check our trade alert for a list of alternative trades. For example, when we write puts to try to buy shares of Stock X more cheaply, you might be able to simply buy shares of Stock X. (If there are no alternate trades, we'll say so.)

Shorting: Some inverse ETFs can be purchased in IRAs (purchasing an inverse of something is similar to shorting that thing). As with options, we'll mention suitable alternatives in the trade alerts.

As tax-deferred accounts, IRAs are well suited for income-generating strategies like covered calls, high-yield dividend stocks, and ETFs with large taxable distributions. If being unable to follow all our recommendations leaves a hole in your portfolio, you may be able to fill the gap with additional income-generating strategies — for example, by writing covered calls on *Pro* stocks you'd be willing to sell at your strike price.

Because IRAs do not allow the use of margin or shorting, you will likely find it difficult to follow along with most of our hedging strategies. If that's the case, we recommend keeping an eye on both your cash balance and *Pro*'s hedging strategies. When the *Pro* portfolio adds hedges, increase your cash balance; when we pull hedges off, reduce your cash balance by investing more in our Buy and Buy First stocks.

Finally, you may want to consider opening a separate, non-IRA account if possible. You can then manage both your IRA and non-IRA accounts as a single portfolio, with income-focused and shorter-term strategies in the IRA and more complex, speculative, and short trades in the second account.

If You Can't Trade Complex Options

You can still follow most of our trade alerts directly — except, obviously, those involving complex options strategies. In those cases, we offer simpler alternatives whenever possible, such as writing puts, writing covered calls, or buying or shorting a stock or ETF directly. If we issue a trade alert using an income-generating strategy you're unable to employ and there are no workable alternatives, consider using the strategies you do have at your disposal to generate income elsewhere in your portfolio.

If you want to expand your repertoire, you should continue to request higher options permissions from your broker every couple of months until they are granted. Account size is one factor brokers consider when making this decision, so to up your odds of success, consider consolidating accounts or moving funds to the account in which you wish to trade options.

In the meantime, don't lose sight of the big picture; remember that we're building a portfolio. If you can't make a particular options trade, you may be able to make an alternate trade or you may need to sit that trade out — either way, it's no big deal. That said, you'll want to pay particular attention to any trade alert in which we use options for hedging purposes (for example, a synthetic short or a ratio put spread on an ETF or an index). Trades like these are important to our integrated portfolio, so don't ignore them. If alternatives are available, we'll outline them. If not, you may want to take action elsewhere in your portfolio to meet similar goals. For example, one way to accomplish this would be to raise your cash position by trimming a few holdings. As always, we're available on the Making Pro Fit You discussion board to field your questions.

The Pro Portfolio

Published Dec 5, 2014 at 10:07AM

What Is Exposure?

The "Exposure" table at the bottom of our Recommendations page shows how exposed we are to the market's upside and downside. We're simply measuring the amount of the *Pro* portfolio that's invested long versus short as a percentage of total portfolio value.

- "Long" includes all the stocks, bullish ETFs, and options we own – and positions expected to increase in price as the market increases, and decline when the market declines, including our shorts of bearish ETFs.
- "Short" includes all the short stocks, owned shares in bearish ETFs, and options we've written in the portfolio. This excludes our shorts of inverse or bearish ETFs, because those behave like longs.
- Our long exposure *plus* our short exposure equals our gross exposure (or total exposure to the market, long and short).
- Our long exposure minus our short exposure equals our net exposure (or total long exposure to the market). A net number higher than 50% means we're more than 50% long. A number of 70% means we're net 70% long. And so forth.
- "Hedged Out": The percentage of our long portfolio that is currently hedged by in-the-money options (typically covered calls). Once in-the-money, these positions do not offer us more upside, so they're tracked as "hedged out" unless and until they decline below the hedging strike price.
- "True Long": The amount of our assets that is invested long and unencumbered by shorts or hedges. This provides us a clear view of the amount of capital that currently has uncapped upside potential.
- "Cash Ex-Shorts" is the cash we have left *after* the current cost to close all of our short stock, ETF, and option positions, so it's our true cash balance.
- "Short Put Exposure" shows how much cash we would need to spend if all our written (or short) puts were exercised. Keep in mind, we can roll or close our written puts, so we don't often plan to turn all our written puts into cash-based positions. This means this number can be larger than our cash balance for long periods, even though we're not borrowing any funds.

Portfolio Building Report No. 4

Published Dec 1, 2014 at 4:19PM

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new Pro *portfolio.*

Part 1 **Part 2** **Part 3** **Part 4** **Portfolio Positioning Event**

Dear *Pro* member,

The stocks in your fourth Portfolio Building Report range from one of the strongest and fastest-growing biotech companies in the world, to the company earning by far the most profit on the young mobile computing revolution. Once you've read this report, you'll have our updated thinking on the rest of the *Pro* stocks that are rated Buy or Buy First, and our recommendation that you buy them. As always, though, take your time, ask questions on the discussion boards, and only invest as you're comfortable doing so. Average in over time if you prefer, or as you have cash available. We are investing to win over the long haul — that's the only time frame that ultimately matters. Nobody knows what the stock market will do over the coming months (so take your time), but we feel strongly that our companies will create great value over the coming years.

Next up is our Portfolio Positioning Report and live event with you on Dec. 3. We can't wait to see you there! During that event, we'll talk about shorting, hedging, and options, and the accompanying report will provide recommendations on those positions. As you gradually build your *Pro* portfolio of stocks, it becomes time to consider hedges, shorts, and options if you're following along with us in these versatile and promising investment tools. We look forward to the event and then to helping you every step of the way to long-term investing success.

Have a great Thanksgiving! Be Foolish!

— Jeff and the *Pro* Team

Table of Contents

[Download this report as a PDF]

Buy: Apple (NASDAQ: AAPL)

The leader in mobile computing products could see more growth than anyone expects.

Suggested Allocation: 4.6%

What It Does

Led by its iPhone and iPad, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the smooth Apple operating system, iOS, which centers on the iTunes and App Store marketplaces. iTunes alone earns more revenue each year ($18 billion) than two-thirds of the companies in the Fortune 500, while Apple itself is the most valuable company in the world, approaching $200 billion in annual sales — and still growing strongly, with 20% earnings-per-share growth last quarter. The company's uniquely integrated hardware and software have made for a sticky consumer experience that provides disincentives to switch to a competitor, and as more people use multiple computing devices, only Apple makes it easy to transition from one to the other seamlessly.

For More

- *Pro*'s original recommendation (2/14/12)
- Talk about Apple
- Most recent earnings update (11/22/14)

How It's Working

Over the past year, Apple refreshed all of its product lines and announced Apple Pay and Apple Watch. The Watch rolls out in early 2015, while the new iPhone 6 is already achieving record sales with demand far outstripping ready supply. Tim Cook teases that Apple has more product ideas in the works. Meanwhile, Apple has maintained its magic touch and is not chasing the lower-priced phone market, instead protecting profit margins. We like this choice. Apple earns by far the highest profits in the mobile computing industry, making it the most cash-rich company on earth, with $50 billion in free cash flow last year.

What We Expect

In the longer term, we expect more great innovations from Apple, including other new product categories. We believe customer loyalty will drive healthy recurring sales of phones, tablets and Macs, and new customers and market expansion will add more growth. The stock is priced to produce North-Star type returns as long as Apple maintains its healthy glow, as we believe it will.

Buy: The Buckle (NYSE: BKE)

This well-managed retailer has fit into its jeans admirably over the past decade.

Suggested Allocation: 2.5%

What It Does

Your *Pro* team doesn't know much about fashion, but we can read financial statements. And if the next decade of business performance by **The Buckle** (NYSE: BKE) looks anything like the last one, we'd be willing to wear whatever getup the company suggests. The Buckle sells jeans, other apparel, and accessories at 463 retail locations across the United States, and we think the fantastic management team has figured out a formula that works: measured growth, middle-of-the-road merchandising, and great service. The store concept is in the middle of its life cycle, and the company's financial prudence and operational acumen should lead to a growing stream of free cash flow, dividends, and extra payouts — all of which can help the *Pro* portfolio in our pursuit of our North Star.

How It's Working

The Buckle is a surprisingly steady operator in the notoriously fickle specialty retail space. The company's same-store sales are down 0.5% year to date, while online sales are up 2.8%. We accept a degree of lumpiness here and don't get too bent out of shape when these numbers bop around — The Buckle's target demographic is fickle teens and twentysomethings, after all. We simply monitor these figures for clues about the overall shopping experience and brand relevance. Management's stellar performance has earned the benefit of the doubt:

Metric	2003	2013	Annual Growth
Stores	316	450	3.6%
Sales per Store	$1,354	$2,335	5.6%
FCF per Store	$121	$326	10.4%
Sales per Square Foot	$274	$461	5.3%
Inventory Turnover	4.1 times	4.9 times	1.8%

Dollars in thousands. Per-store calculations based on average stores open during the period. Sources: SEC filings, S&P Capital IQ, analyst estimates.

What We Expect

For More

- *Pro*'s original recommendation (6/20/12)
- Most recent earnings coverage (11/25/14)
- Talk about The Buckle

With 463 stores located in 43 states as of the end of the most recent quarter, we believe The Buckle has plenty of room to grow as it expands from the middle of the country to both coasts; it should be able to achieve wonderful store economics with the 650 to 850 locations we ultimately expect. Recent expansion into footwear, accessories, and children's offerings should provide enough fuel to keep same-store sales healthy, while a commitment to customer service entices repeat visits.

The Buckle also has a history of paying special dividends with its excess cash; since 2008, it's paid out almost $15 worth. This past January, *Pro* members holding the stock received a $1.42-per-share payout from the company (after a 1:16 stock split) in addition to the regular $0.22 dividend. While we can't count on special dividends, the average yield over the past six years, including special dividend payouts, has approached North Star-level returns. We're typically leery of the risks of investing in retail, especially fashion, but the proof is in the numbers for The Buckle.

Buy First: Gilead Sciences (NASDAQ: GILD)

One of the strongest biotech companies on earth, Gilead is positioned to keep rewarding owners.

Suggested Allocation: 4%

What It Does

Gilead Sciences (NASDAQ: GILD) helps millions of people fight life-threatening diseases. Its HIV drugs are prescribed to 9 out of 10 new HIV patients, and are already helping millions enjoy much better lives. The company's HIV products represented the majority of Gilead's revenue until its Hepatitis C cure, Sovaldi, was approved this year. The most successful drug launch in history, Sovaldi topped $8.5 billion in sales in three quarters, though it has only been prescribed to about 117,000 patients so far (as of Sept. 30).

An estimated 2.7 million to 3.2 million hepatitis C patients reside in the United States, and a whole 2.8% of the world (almost 200 million people) is thought to have this common blood-borne infection. That means tens of millions could conceivably benefit from Sovaldi or its newer single-pill version, Harvoni, and this would still leave plenty of room for upcoming competing drugs to do well, too.

How It's Working

Gilead's revenue rose 117% in the quarter just reported, sending earnings per share up 255%. The company's products have a healthy lead over competitors' Hepatitis C drugs still awaiting approval, first in the U.S. and then in other countries where it will take even longer. And because Gilead's Hep C drugs look as or more effective than competing products, doctors have few reasons to wait or switch. Gilead's new Harvoni drug, approved in October, is the first single-pill regimen for curing Hepatitis C, and competitors aren't likely to match it anytime soon. Meanwhile, the company's HIV franchise remains unparalleled, and Gilead has more than 200 compounds in clinical trials.

For More

- *Pro*'s original recommendation(4/30/14)
- Talk about Gilead
- Most recent earnings update (11/22/14)

What We Expect

Going into 2015, we expect more growth as Harvoni is prescribed to tens of thousands of new patients around the world. And that won't stop next year; countries will slowly approve the drug and its reimbursement over many years, and we expect Gilead to be the leader in the cure of Hepatitis C. Even if new competitors bring about a slip in pricing, the profits should remain substantial. And by signing generic drug agreements, Gilead is poised to lead the industry in providing a Hep C cure to 90 emerging-market countries. Meanwhile, we expect Gilead's refreshed HIV franchise and growing oncology franchise to keep increasing shareholder value even beyond the Hepatitis C market.

Buy: MasterCard (NYSE: MA)

Plastic — and digital — is overtaking paper as the world's way to pay, and MasterCard leads the charge.

Suggested Allocation: 4.5%

What It Does

MasterCard (NYSE: MA) is among the most attractive businesses in the world. Here's why: The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders, who are actually exposed to the card users' finances; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

Though MasterCard competes with a large number of well-heeled and (in some cases) innovative businesses, the company's profitability is growing quickly even though the global economy isn't. And that makes perfect sense, because when it comes to paying for stuff, the global market leader isn't **Visa** (NYSE: V), or PayPal, or banks ... it's still cash. Cash has a still-astounding 85% market share of transactions, but it's slow and inefficient, and with no one managing its brand, it's quickly losing out to better alternatives -- like MasterCard.

How It's Working

For More

- *Pro*'s original recommendation (9/8/11)
- Talk about MasterCard
- Most recent earnings update (11/22/14)

This trend has already taken hold in the U.S., where we use cards for a third of our personal expenditures, so Americans often underestimate the opportunities — especially in developing nations. In the first nine months of 2014, MasterCard processed $3 trillion in purchase volume, $2 trillion of which came from outside the United States. Growth in its U.S. business was 8.3%, strongly outpacing our economy (as measured by GDP). And worldwide growth, excluding the U.S., clocked in at a tremendous 14.8% in local currencies. Cash is losing, and fast, but there's a long way to go — and a lot of opportunity for MasterCard. In its October conference call, MasterCard called out India, Japan, Europe, Australia and China as being some of its largest opportunities. Cash is by far the leading means of transaction in each place.

What We Expect

Management recently confirmed guidance for continued 11% to 14% compounded annual revenue growth and 20% earnings-per-share growth through 2015. We think this is possible under current (difficult) conditions, and we expect even better if economies around the world can turn the corner in 2015 and beyond. CEO Ajay Banga and team are doing a tremendous job moving the company forward, and keeping it at the vanguard in new ways to pay, too. Digital payments are another avenue for growth as

MasterCard's invaluable connections to banks and millions of merchants make it a leading choice, along with Visa, for digital payment platforms such as **Apple**'s (NASDAQ: AAPL) Apple Pay. Though we value it conservatively, we expect MasterCard will continue to surprise the world with strong growth for years to come.

Buy: Medtronic (NYSE: MDT)

For once, maybe we can all profit from growing older.

Suggested Allocation: 3.2%

What It Does

No matter how good Grandma and Grandpa look at Thanksgiving, the honest truth is that ever more people in developed nations are advanced in age — and getting more advanced (that's the nicest way we can say it!). Global health care is a growth market we'd be silly to miss. Since 2009, *Pro* has stood by **Medtronic** (NYSE: MDT) because of its global reach, unrivaled commitment to research and development, and attractive financial profile. In that time, shares have risen 90%, but only now does the business finally looked poised to consistently grow, offering more upside to long-term owners like us.

Medtronic is in business to "alleviate pain, restore health, and extend life" for the chronically ill. The company has grown from a garage operation into one of the world's largest medical technology companies by keeping its patient-centric mission front and center. Today, Medtronic has a vast suite of high-tech products; it boasts market-leading share in key technologies; and it has successfully defended that position over time by keeping the pedal to the metal regarding research and development. And with approximately 9% of sales directed back into R&D, there are research dollars left over to keep the company's new product pipeline humming. Finally, Medtronic has made selective acquisitions to target higher-growth areas and fill product holes, and it now racks up nearly half of its annual sales in international markets. That trend will only grow stronger: Revenue was up 12% in emerging markets last quarter and only 5% in the U.S. Meanwhile, Medtronic prepares to acquire European-based Covidien, which should drive more growth.

How It's Working

Over the past few years, some of Medtronic's core markets have come under duress; in some cases, competition has picked up, while in others, product efficacy and sales practices have been questioned. As of late, though, all that has been stabilizing — and the company's other businesses, and its growth in emerging markets, were busy picking up the slack. Product diversification has been a big help in maintaining sales levels, and management's deft execution of its goals and impressive expense management have turned modest sales performance into admirable bottom-line results and cash generation.

Although sales have only advanced 3% annually over the past five years, earnings, dividends, and free cash flow have grown faster as management has cut costs, consistently rewarded shareholders, and maintained discipline with its reinvestments.

For More

- *Pro*'s original recommendation (7/1/09)
- Talk about Medtronic on our discussion board
- Most recent earnings update (11/22/14)

What We Expect

Under CEO Omar Ishrak (who came aboard in 2011), we expect Medtronic to continue its clinical excellence and focus on chronic diseases. We are also witnessing disciplined execution, a strong focus on building the infrastructure for ongoing emerging-market growth, and a healthy balance between the clinical benefits of the company's products and their economic value. Management expects the company to generate $25 billion worth of free cash flow over the next five years, and half of that is likely to be returned to shareholders in the form of dividends and share buybacks. The diagnosis is healthy for Medtronic to continue its North-Star topping returns.

Buy: Parexel International (NASDAQ: PRXL)

Outsourced drug development benefits this respected contract research organization.

Suggested Allocation: 3.3%

What It Does

Parexel (NASDAQ: PRXL) is one of the world's largest and most respected contract research organizations (CROs). Over more than 30 years, it has built a stellar reputation on helping drug makers navigate complex clinical trial processes quickly, which has enabled it to cement important relationships and have a role in developing more than 90% of the top 200 selling drugs.

For More

- *Pro*'s original recommendation (12/23/13)
- Most recent earnings update (11/10/14)
- Talk about Parexel

How It's Working

From 2004 to 2013, outsourcing penetration -- the number of development dollars outsourced to CROs -- has increased by almost 50%. Outsourcing is a cheaper alternative to the traditional high-fixed-cost model of staffing lots of white coats across various therapeutic specialties all around the globe. For large drug developers, letting CROs handle the development work (and those massive staffing needs) can boost profits and time to market, and for smaller drug developers who can't afford a huge staff, there is no other choice. As regulators require more efficacy data, larger patient participation, and increasingly global results, navigating the challenges of the 110,000-plus trials being conducted globally has become frustratingly complex. That makes a large, proven CRO with expertise and global capabilities more of a value-adding partner than a transactional customer.

Although Parexel's revenue and backlog growth have been lumpy recently as it competes for new partnerships, margins have already expanded as the company uses its assets more often and more efficiently. Since the first quarter of 2014, which ended Sept. 30, 2013, the company has increased gross margins from 32.5% to 35.2% and operating margins from 9.3% to 10.9%, leading to 34% earnings-per-share growth on a trailing-12-month basis.

What We Expect

From today's price, we believe the company's business performance will drive its stock to out-earn our North Star over the next decade. A continued industry shift from transactional, project-based relationships to integrated partnerships should ultimately make revenue more reliable. The company's operating leverage should lead to margin expansion over time as the company uses its assets ever more efficiently and revenue growth outpaces expense growth. And if our forecasts of the company's core business and industry tailwinds prove too optimistic, we could still see a nice return from its rapidly growing technology division, PAREXEL Informatics (PI) -- whether that's in the form of a possible spinoff, or just the market's acknowledgement of PI's hidden value.

Portfolio Building Report No. 3

Published Oct 29, 2014 at 2:43PM

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new Pro *portfolio.*

Part 1 **Part 2** **Part 3** **Part 4** **Portfolio Positioning Event**

Dear *Pro* member,

From the most popular social website in the world to a small-but-great software company you've probably never heard of, from the top manufacturer of "smart" car mirrors to the leading producer of irrigation systems — the six *Pro* stocks we cover in today's report span various industries across the globe. That's especially true when you include the emerging-market ETF that tops off our list today. We believe each of these investments will offer healthy returns over the coming years, with reasonable risk. Along with the other holdings delineated in our first and second reports, adding these is another step toward building your *Pro* portfolio. If you have questions about any of these positions, please visit the company-specific discussion board linked in the report. If you have questions about your portfolio as a whole, visit the Making *Pro* Fit You board.

Enjoy! And Fool on!

— Jeff and the *Pro* team

Download this report as a PDF

Buy: Facebook (NASDAQ: FB)

The world's leading social network — and most-trafficked website, period — is being well managed for long-term growth.

Suggested Allocation: 4.6%

What It Does

More than 1.3 billion people use **Facebook** (NASDAQ: FB) to connect to friends, families, companies, organizations, marketers and celebrities each month. Incredibly, more than 850 million people visit daily. Most traffic arrives through mobile devices, and the company has had great early success monetizing that traffic with ads in its popular mobile news feed. Over the longer term, management wants to make the ads on the site as targeted and relevant to users as are the updates from their friends and family. Meanwhile, Facebook keeps working to stay on the edge of social technology. The company has the equity to acquire competing platforms and then build traffic before monetizing them once it hits critical mass — which in Facebook's opinion is 1 billion users.

How It's Working

For More

- *Pro*'s original recommendation (9/18/12)
- Our most recent earnings coverage (10/31/14)
- Talk about Facebook

Facebook reported strong third-quarter results in October, with revenue up 59%, ad revenue up 64%, and operating costs only up 41%. The company's three-year plan is to increase additional value for users and businesses, so it's investing heavily in the site and in new ad platforms to do so. The five-year plan includes monetizing platforms like Messenger, WhatsApp and Instagram, which intentionally aren't running any ads yet. The 10-year plan includes Internet.org initiatives to connect the world, the majority of which is still not online.

What We Expect

Facebook will greatly increase spending in 2015 as it hires for future growth. Demand for advertising is outpacing Facebook's ability to serve widespread customers adequately, and — like **Google** (NASDAQ: GOOGL) in its early days — it wants to stay ahead of its technological needs with ample hiring and spending. Lately, the stock trades at 40 times expected earnings for the next 12 months, making it reasonable for its growth rate, and attractive for the coming years. We're reminded of when Google went public, and we expect Facebook's increased spending will pay off in higher revenue and earnings, ultimately pleasing investors like us.

Buy: Gentex (NASDAQ: GNTX)

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 3.4%

What It Does

In 1982, a small company in Zeeland, Mich., called **Gentex** (NASDAQ: GNTX) made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands almost 90% of that market, and it sells eight times more units than its closest competitor.

How It's Working

In 2000, the company sold 6.8 million units; in 2013, it sold 26.2 million. That growth has been driven by an increased focus on safety, higher car sales, and greater market penetration (more car makers offering Gentex mirrors as a trim option). Gentex has turned these market dynamics into wonderful financial performance. Revenue has risen by nearly 20% annually since 1990, and over the past decade, the company's net margins have bounced around the mid-to-high teens. Those numbers are shockingly good for an auto-parts supplier, showing that its fancy mirrors are showing up in more and more new cars.

What We Expect

For More

- *Pro*'s most recent update (11/10/14)
- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex

Currently, fewer than one in every four cars made worldwide has an auto-dimming rearview mirror, and only 6% have auto-dimming exterior mirrors. For context, prior to 1987 those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher penetration; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror, both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy: OpenText (NASDAQ: OTEX)

This company's information management software keeps the digital lives of businesses in order, and its exchange platform drives business transactions.

Suggested Allocation: 3.7%

What It Does

OpenText (NASDAQ: OTEX) is a leading provider of solutions in enterprise information management (EIM). It sells software (both in the cloud and on premises) that lets companies organize their electronic content, and it offers a leading business exchange platform for enterprise commerce. OpenText's products help companies, governments, and universities operate more efficiently and effectively, meet compliance requirements, communicate with colleagues, customers, and partners, and make transactions. Its software helps its customers manage digital information, and its Information Exchange platform lets customers manage their business-to-business communications and transactions. Both units generate strong recurring revenue.

How It's Working

For More

- *Pro*'s original recommendation (8/31/11)
- Most recent earnings coverage (11/16/14)
- Talk about OpenText

OpenText has increased sales and cash from operations by more than 14% annualized over the past three years, and the goal is to continue to grow by at least 10% annualized as its industries expand. Sales were up 40% last quarter, and operating cash flow jumped 73%. Margins have trended higher as growth continues, and OpenText expects recent upgrades to its software to continue to drive demand.

What We Expect

Electronic content management industries served by OpenText should increase top-line demand by at least 10% annualized over the next several years, and OpenText should take market share, too. The company has a long history of steady growth through acquisition, and it enjoys diversified software sales to multiple industries. With new products rolling out in cloud services (off-site servers), renewed sales execution through more distribution channels, exciting acquisitions in the works, and an intense focus on its financial performance, this medium-sized company looks to have a big future.

Buy: Papa John's Pizza (NASDAQ: PZZA)

Deliver a slice of the profit pie right to your doorstep.

Suggested Allocation: 3.9%

What It Does

Papa John's International (NASDAQ: PZZA) operates and franchises more than 4,500 pick-up and carry-out pizza joints in more than 36 countries. For the past 30-plus years, Papa John's has been making pizza and building its brand around the "Better ingredients, better pizza" tagline. Bringing that unwavering focus to each pie has resulted in the company's perceived quality advantage over its big-chain pizza competitors, which allows it to consistently price a dollar or two higher and attract the best franchisees. Now that its brand advantage is sufficiently established in North America, Papa John's is turning its sights abroad, believing that delicious American pizza is a language every taste bud speaks.

How It's Working

For More

- *Pro*'s most recent update (11/10/14)
- PZZA position review (5/23/14)
- Talk about Papa John's

As sure as a fresh pizza will be gobbled up by hungry kids, Papa John's delivers results. For 11 consecutive years, the company has recorded positive or even North American comparable-store sales growth. Recently, international comps have been in the 5% to 8% range, offering lip-smacking evidence that Papa John's flavors travel well. It has opened between 200 and 300 restaurants in the past two years, a pace that should continue — expectations are for about 230 new units this year. And because Papa John's is primarily a franchisor, it doesn't have to bear the cost of that expansion (it is taken on by the franchisees). Competing for a share of the global appetite is tough business, but Papa John's has been able to increase sales and profits at commendable rates over the past decade, which has resulted in plenty of cash generation. Management initiated a dividend in 2013 and has consistently bought back stock over the years.

What We Expect

We believe the company will maintain its brand positioning, modestly improve underperforming franchise locations, and continue to be an attractive entrepreneurial outlet for new franchisees abroad. We think the brand can easily support 6,600 worldwide locations by 2023. The company should also be able to take modest market share from mom-and-pop pizza shops in established markets as digital ordering continues to gain adoption; it's a tough hurdle for smaller players to overcome. With a little bit of menu innovation and the maturation of new markets, we believe 3% same-store growth is sustainable over this period. We rate shares a Buy and encourage members to do plenty of field research on this one.

Buy: Valmont Industries (NYSE: VMI)

Providing irrigation systems and support structures, this company benefits as agriculture needs increase and countries build infrastructure.

Suggested Allocation: 2.4%

What It Does

Valmont Industries (NYSE: VMI) offers investors a consistent suite of four business divisions, each serving a growing need around the world. Founded in 1946, Valmont's engineered products division supplies steel and aluminum poles to infrastructure projects worldwide, including road and traffic lights; stadium and parking lights; and wireless communications poles and support towers. This division also sells highway safety products including barriers and road grating. In addition, because it sells steel and concrete support structures for the global utilities industry, Valmont profits as electrical grids are renovated or built out.

Then there's water, essential to the world's farmers. Under the name "Valley," Valmont's center-pivot and mechanized irrigation systems are the world's leading brand. More than 80% of the planet's irrigated acres still use inefficient "flood" watering methods, rather than efficient mechanized irrigation, so there's lots of room to run.

To top it all off, the company provides hot-dip galvanizing (just like Mom used to make), anodizing, and other coatings to protect aluminum and steel from corrosion. One of the largest custom galvanizers in the world, Valmont expects continued growth because it still captures only a small percentage of the total market. Overall, the company operates in more than 80 countries and has more than 10,000 employees.

For More

- *Pro*'s original recommendation (11/5/13)
- Our most recent earnings coverage (11/2/2014)
- Talk about Valmont

How It's Working

Valmont's stock has returned 14% annualized since 1993, outperforming the vast majority of stocks on the market, even the likes of **Starbucks** (NASDAQ: SBUX) and **Whole Foods** (NASDAQ: WFM) over the past 10 years. By focusing on strong returns on invested capital, smart acquisitions, new markets, and product-line expansion, Valmont has been able to increase profits as the world economy expands. Yet it's still a relatively small company (at $3.4 billion) with plenty of potential in all business lines, and it trades at valuation multiples below market averages.

What We Expect

With outstanding management and four business divisions that continue to expand around the world, we expect Valmont to grow at more than 11% overall — riding through cyclical bumps — and the stock to ultimately perform admirably in our pursuit of our North Star. As mentioned, we will have to ride through cyclical downturns along the way. But as management says, each low is higher than the previous one, and each high is a record high. We hope to have a long, rewarding relationship with this recent *Pro* stock. It's going to require patience, but that patience should be rewarded.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund (NYSEMKT: DGS)

Diversification in emerging markets with some of the best small, high-yield companies you've never heard of.

Suggested Allocation: 2.3%

What It Does

At *Pro*, we like to invest in emerging-market small caps to diversify and target higher growth. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) (the longest ETF name in the world!*). This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields more than 3%). For *Pro*, owning shares of this well-managed ETF offers exposure to up to 600 of the most promising international business we couldn't easily buy in another way.

Serving as direct exposure to emerging markets, this ETF gives us an excellent way to invest in unfamiliar companies in locations where we don't have a discernible edge but where growth exists — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The diversifying benefits of investing outside our home market are equally important over long periods.

How It's Working

It's no surprise that small-cap companies (even dividend-paying ones) in emerging markets are volatile. We expect DGS to continue to experience higher-than-average volatility. So far, emerging markets have badly lagged U.S. markets. But eventually that will change.

For More

- *Pro*'s original recommendation (11/22/10)
- Talk about DGS

We'd always prefer to own great businesses over great ETFs, so this holding has a permanent spot on our short list of positions we'll sell if we need cash or find a higher-conviction alternative. In the meantime, though, for a low expense ratio, we get a basket of businesses with a history of exceptional performance, weighted by the size of their annual cash dividend. The fund's heavy weighting toward financials, industrials, and the consumer discretionary sector leaves it well positioned to benefit from an economic recovery if and when one comes along.

What We Expect

This is a top-notch fund, and you don't have to take our word for it; Morningstar has bestowed its coveted five-star rating on DGS. It's also made Morningstar's list of the top eight funds in its category in each of the past three years, and it's ranked No. 2 when considering five-year performance. We expect these impressive long-term results to accrue to us eventually. In the meantime, the watchword with small caps, emerging markets, and this ETF is: patience.

**Statement may or may not be accurate.*

Portfolio Building Report No. 2

Published Oct 29, 2014 at 2:35PM

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new Pro *portfolio.*

Part 1 Part 2 Part 3 Part 4 Portfolio Positioning Event

Dear *Pro* Member,

This report marks Part 2 of your *Pro* portfolio-building experience. We recommend that you add capital to these stocks next, as you continue to build your *Pro* portfolio. Once we build your foundation in strong *Pro* stocks, we'll address hedging, shorting, and options for those members who want to use these versatile extra tools — which, as we know, is many of you. For now, we're starting easy as a Sunday morning by introducing you to our stars — our core holdings, which should compound our core capital over the years. Each Portfolio Building Report introduces you to a selection of them one by one and explains why we like owning them, the upside we see, and how much we believe you should allocate to each right now. When you have questions on any company, please visit its discussion board; all of them are linked in the report.

Welcome again to *Pro*! Enjoy the process and ask questions. We're here to help. Fool on!

— Jeff and the *Pro* team

Download this report as a PDF

Buy: American International Group (NYSE: AIG)

Time and even average performance should lead to solid returns from this undervalued insurer.

Suggested Allocation: 3.6% stock, 0.7% warrants

Today's **American International Group** (NYSE: AIG) is not the same company that disgraced itself so profoundly in 2008. AIG has divested itself of whole business units since the financial crisis, managing to eliminate almost all of its previous exposure to the nasty derivatives that nearly brought down the economy. Left behind are three steadfast and improving insurance businesses.

What It Does

Insurance is a business of collecting premiums, investing the float, and paying out claims — and AIG is getting ever better at it. Improved underwriting is showing up in a lower loss ratio, which in turn is driving a lower adjusted accident-year combined ratio. All that is a fancy way of saying that the company's insurance operations are stronger than they've been in years and are poised for continued improvement.

For More

- *Pro*'s original recommendation (8/24/12)
- Most recent earnings update (11/5/14)
- Talk about AIG

At Your Broker: AIG Warrants

- eTrade: AIG.WS
- Fidelity: AIG/WS (paste CUSPID 026874156 into the quote page)
- Interactive Brokers: Find AIG; select "warrants" from the drop-down menu
- optionsXpress: AIGwS
- Schwab: AIG/WS
- TD Ameritrade: AIG+
- Vanguard: AIG_t
- OptionsHouse: AIG.WS

Helpful Links

- AIG's explanation of the warrants
- AIG's warrant registration statement filed with the SEC

AIG's insurance offerings consist of three divisions: AIG Property Casualty, AIG Life and Retirement, and Mortgage Guaranty. The first provides casualty, property, financial, and specialty insurance to commercial clients and consumers, typically through brokers. The life and retirement division offers domestic life insurance and retirement products (annuities, mutual funds, financial planning) through a diverse network of financial-services companies, brokers, agents, and advisors. The mortgage guaranty division insures lenders against losses from defaulted mortgage loans. Overall, AIG is writing fewer premiums at better prices than it was in past years, which is a great indication of improved underwriting discipline.

How It's Working

When we recommended buying AIG stock and warrants in August 2012, we were confident in the momentum of the company's turnaround, but we underestimated the rapid rate at which our thesis would unfold. In late 2012 (after our recommendation), the U.S. Treasury sold another $26.5 billion worth of its AIG shares. Management wisely used the opportunity to purchase billions of dollars' worth of stock at about half book value; that, of course, further increased book value in a virtuous cycle. Management continues to repurchase shares and, reflecting the company's remarkable improvement in balance-sheet strength, has paid a dividend (lately $0.125 per share) for the last five quarters.

What We Expect

Underwriting discipline will continue to drive increased earnings and a higher valuation. That plus a renewed focus on capital management will improve AIG's credit rating, reducing its cost of debt and providing another lever for higher profitability. We expect newly installed CEO Peter Hancock to stay laser-focused on improved underwriting and capital allocation, repurchasing shares so long as AIG continues to trade meaningfully below book value and maintaining or increasing the quarterly dividend if business performance supports it.

The *Pro* Bottom Line

We recommend buying 3.6% of AIG stock and 0.7% of AIG warrants (see below for more on those). AIG has cleaned up its business, so by purchasing now, you get in after all the hard work has been done. Book value — the best measure of an insurance company's worth — is steadily growing. And AIG's current share price is right around 0.7 times book value. That's cheap, especially given the company's momentum. Investors who buy AIG now are positioning themselves for outsized future returns with less risk. That's contrarian investing at its best.

A Note on Warrants

Warrants are similar to call options, except that they are issued by the underlying company. They offer the purchaser the right (but not the obligation) to buy the stock in question at the specified price. The warrants we're recommending on AIG are valid for 10 years from the date of issue (Jan. 19, 2011), and they can be exercised at any point before they expire on Jan. 19, 2021. When exercised, they allow the holder of the warrant to buy shares of AIG at $45 per share, regardless of the market price.

That $45 strike price adjusts favorably in the event of dilution or annual cash dividends greater than $0.675 per share (which would also lower the share price). Warrants are illiquid, and Goldman Sachs is the designated market maker for them; when you buy them, be sure to use a limit order so Goldman doesn't get more than a fair price.

Be aware that if our investment in AIG works out, those who own warrants will earn leveraged returns on them. But it's possible that the warrants could end up as a total loss if AIG's stock price is below the $45 strike price at expiration (even though they're currently in-the-money by a few bucks).

Buy: AmTrust Financial Services (NASDAQ: AFSI)

Its talent at capitalizing on human laziness is just part of what we love about this insurer.

Suggested Allocation: 7.4%

What It Does

At *Pro*, we speak a lot about the importance and power of recurring revenue — mostly because we know that humans are inherently lazy. Insurance purveyor **AmTrust Financial Services** (NASDAQ: AFSI) handily proves this point for us; many of the policies it writes (more than 80% in most lines!) renew at the end of their term without their owners even shopping for a better rate. Most of us, it seems, are guilty of preferring inertia to bargain-hunting, and AmTrust and its fellow insurers are the beneficiaries.

AmTrust focuses on insurance niches (workers' compensation, product warranties, and Italian medical malpractices, just to name a few) that are low-hazard and generally too small for large insurance companies to care about. But though AmTrust writes small policies, it's no small fry. Its high renewal rates and predictable cash flow allow it to focus on writing new policies, acquiring new books of business at prices that range from fair to an outright steal, and hunting for obscure investment opportunities.

How It's Working

AmTrust's focus on specific niches, its use of technology to keep its expenses low, and its opportunistic acquisition of policies other insurers struggle to find profitable have all resulted in impressive growth. Gross written premiums have risen from about $1.1 billion in 2008 to more than $4 billion this past year. But AmTrust is no one-trick pony; income from its high-margin and equally sticky service and fee business grew from $29 million to more than $331 million during the same time span. This growth, combined with a laser-like focus on low expenses, has resulted in consistent increases in earnings, dividends, and book value.

What We Expect

For More

- *Pro*'s original recommendation (4/3/09)
- Talk about AmTrust

The insurance market works in cycles, and AmTrust's strategy is built around taking advantage of this. The company targets markets in which pricing has risen as other companies struggle to deal with losses from policies written in prior years. Pricing has remained favorable in AmTrust's largest markets as of late, which means it can do one of two things: either charge as much as its competitors and make more in profit thanks to its lower expense structure, or undercut the competition on price in a bid to take market share, since it isn't dealing with legacy losses. If the economy continues to improve, the small businesses AmTrust insures should hire more workers and consumers should purchase more insurable goods, so there seems to be plenty of growth ahead.

AmTrust stock has consistently traded higher than our estimate of fair value, but we believe the company's premium valuation is warranted given the consistency of its growth, quality, and profitability. AmTrust is *Pro*'s largest holding and we're happy to let this winner run, expecting to increase our fair-value estimate over time.

Buy: Broadridge Financial Solutions (NYSE: BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 4.2%

What It Does

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in its fiscal 2014, which ended June 30, its platforms processed more than 80% of all shares in the United States. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider to manage investor communications.

The company's smaller division, securities processing solutions, accounts for 27% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

How It's Working

Both earnings and free cash flow are modestly depressed because mutual funds have been scrimping on investor communications recently and investor skepticism around the global economic recovery has led to low trading volume. Still, in fiscal 2014 Broadridge's sales were up 5%, earnings per share rose 25%, and the company hiked its dividend by 17%. The business is positioned for strong sales and margin performance for years to come. And Broadridge continues to serve its customers masterfully; its 98% retention rate sets the stage for recurring revenue (and deepening relationships) in future years.

What We Expect

For More

- *Pro*'s original recommendation (4/27/10)
- Talk about Broadridge

We think Broadridge will continue to write the e-book on electronic investor communications. Its dominance of this market should strengthen its competitive advantages, making it indispensable as transparency in the financial system increases. We also expect banks and brokerages to continue outsourcing their non-core operations to save money and increase flexibility; this should bring increased business and greater efficiency to Broadridge. We expect modest sales growth to translate to earnings growth of around 10%. Much of Broadridge's revenue is recurring, making its sales and earnings growth highly reliable, and its impressive free cash flow will likely bring an ever-higher dividend and increased share buybacks.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy First: Skyworks Solutions (NASDAQ: SWKS)

This leading designer of analog semiconductors for smartphones and connected devices is growing sharply.

Suggested Allocation: 3.2%

Skyworks Solutions (NASDAQ: SWKS) makes technology that powers wireless connectivity in a wide variety of products: **Apple** (NASDAQ: AAPL) and Samsung smartphones and tablets, **Medtronic** (NYSE: MDT) medical devices, **Google** (NASDAQ: GOOG) and **General Electric** (NYSE: GE) products, and the list goes on. In what's being called the "Internet of Things," billions of physical objects are being connected to the Internet for the first time -- and Skyworks is uniquely positioned to benefit. Not only does it serve all of the top-tier mobile device makers, the company is also diversified across industries to serve more than 2,000 customers.

What It Does

Skyworks sells more than 2,500 high-performance analog semiconductors and related products, supported by nearly 1,000 patents. The list includes amplifiers, attenuators, receivers, switches, diodes, modulators, GPS power and voltage regulators, and more, often sold together as components of a phone or other connected device. Skyworks earns industry-beating operating margins of 30.5% selling specialized solutions to giant customers with growing connectivity needs. Here are just a few examples:

- GE plans to connect all of its industrial products to the Internet -- from jet engines to dishwashers.
- Medtronic will connect many of its medical devices to the Web for monitoring.
- A majority of new automobiles will be connected to the Internet by 2017.
- Smartphone sales are expected to surpass 1 billion by 2016

All told, **Cisco Systems** (NASDAQ: CSCO) expects 50 billion devices will connect to the Internet by 2020.

How It's Working

Skyworks is already reaping some benefits, and it's ready for much more. As CFO Donald Palette said this summer, "We've spent the last decade investing significant resources and leveraging our technology to expand our presence in traditional analog markets like automotive, medical, and industrial. We have established significant traction in these higher-margin growth avenues, and we see tremendous opportunity ahead."

Whatever the device being connected to the Internet, the smaller, more complex, and more efficient the technology needs to be, the more Skyworks benefits. Also, as more data flows through networks and more connection nodes are required, the company's products become even more indispensable. As Palette said in the July conference call, "Complexity for us drives profitability. And there are fewer and fewer people in the space that can do it" -- even as complexity accelerates. Given this, Skyworks expects profit margins to continue to move higher.

What We Expect

We expect continued strong growth, and we think the reasonably-priced stock will ultimately appreciate at rates higher than the market average. CEO David Aldrich recently said, "Skyworks is entering a new and exciting growth phase driven by global wireless proliferation and the Internet of Things. Quite simply, we are capitalizing on the macro trend to connect virtually everyone and everything, all the time." Most significantly, he continued: "Skyworks is setting the pace for analog semiconductor industry growth in terms of both revenue and value creation." In the quarter just ended, revenue jumped 51% year over year, while operating income soared 81%. And for the fiscal 2015 that just began, Skyworks increased first-quarter guidance.

For More

- *Pro*'s original recommendation (8/5/14)
- Talk about Skyworks

CEO Aldrich summed things up on Nov. 6: "Our advanced solutions are at the heart of mobile connectivity and the Internet of Things, and are empowering exciting new applications spanning mobile payments, to streaming music services, to on-demand media. Given our accelerating design win momentum and deep product pipeline, we have never been better positioned to grow demonstrably faster than our addressable markets and in turn, to deliver best-in-class financial returns." Here at *Pro*, we hope to be owners for many fruitful years — as long as is merited.

Buy: Starbucks (NASDAQ: SBUX)

A global powerhouse devoted to creating experiences stands poised to brew up great returns going forward.

Suggested Allocation: 2.8%

What It Does

You may not realize it, but "**Starbucks**" (NASDAQ: SBUX) is no longer a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense it's just a front. We *think* we go to Starbucks for the coffee, but those little white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

Starbucks began opening America's eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 21,300 stores in 65-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences to fill more than 70 million mouths and hearts each week.

How It's Working

By placing the customer experience first, Starbucks has cemented its role in the daily lives of consumers worldwide. People demand their Starbucks products at home, too, which has allowed the company to build out a consumer packaged-goods division that sells more than $1.5 billion worth of products in more than 100,000 locations worldwide. And the company is cultivating a portfolio of other brands (Evolution Fresh juices, Teavana tea bars, La Boulange bakeries, Starbucks Reserve) whose products can be sold in Starbucks stores and grocery stores alike. Between coffee, health foods, and tea, Starbucks believes its end markets are a massive $140 billion and growing.

Recent results have been robust. Starbucks continues to add stores at a rapid clip, and its same-store sales have been rising by an average of 7% per year over the past five years. Earnings and cash-flow performance have increased even faster, and all of this growth has been achieved by doubling down on the in-store experience and refocusing on quality. Starbucks constantly seems to be setting new records for sales, operating profits, and earnings.

What We Expect

For More

- Most recent earnings update (10/30/2014)
- *Pro*'s original recommendation (8/22/2012)
- Talk about Starbucks

Given its very recognizable brand, artfully crafted business, and fanatically loyal customers, we expect Starbucks' diversified growth to continue. We believe the world's coffee and tea drinkers will happily support 30,000 or so stores across the company's various brands, and that products bearing the aspirational Starbucks brand will expand the company's real estate on grocery-store shelves.

The company's scale and its ability to raise prices should help profits, as will its unique advantages in low-cost marketing. Starbucks is also the leader when it comes to incorporating technology into a physical store experience – 90% of mobile payments in the U.S. took place in a Starbucks store in 2013.

At around 29 times trailing earnings, Starbucks might look expensive to some, but the company has been knocking it out of the park since CEO Howard Schultz's return to power in 2008; it now has so many levers to pull that capturing its potential value in a spreadsheet is very difficult. Starbucks offers a truly unique blend of growth and cost-reduction opportunities that leave it poised to deliver North Star-beating returns going forward. We want to tag along for the caffeinated ride.

Portfolio Building Report No. 1

Published Oct 29, 2014 at 2:31PM

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new Pro *portfolio.*

Part 1 **Part 2** **Part 3** **Part 4** **Portfolio Positioning Event**

Dear *Pro* Member,

Pro is a premier service at The Motley Fool not only because it's a portfolio service that incorporates options, shorts, and hedges alongside core stock investments — but because it is a full portfolio solution, period.

Thought goes into each part of the portfolio, the allocation we give to every position, and how the positions all work together. This means that every addition to the portfolio serves a specific purpose. The following report (as well as those to come on Nov. 13 and Nov. 20) outlines our current thinking on all of *Pro*'s positions, as well as suggested allocations and the thesis behind each one.

Welcome to *Pro*. We're glad to have you!

— Jeff Fischer, advisor

Getting Started With *Motley Fool Pro*

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that aims to generate winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* fit you.** We know not all investors are in the same situation! We can help you figure out how to buy the *Pro* investments given your personal situation, including investing in an IRA or coming to *Pro* already fully invested. Check out our advice for every approach to *Pro*: Invested Elsewhere | "Free-Range" | Whoever You Are
3. **Catch up with our portfolio at your own pace.** Start with the stocks in this report, and wait for our next two reports coming Nov. 13 and Nov. 20. You can always see our latest take on all of our positions on our What We Think Now page. As you explore our recommendations, it's important to remember that a stock's "scorecard status" (Buy First, Buy, or Hold) is the best indicator of how we feel about it. If a stock is listed as a Buy or Buy First on the What We Think Now page, that means we think you can buy it today.

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 3.9%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Total U.S. mobile data traffic is expected to increase by more than 2,000% between 2012 and 2018, and the number of U.S. mobile lines in service (including smartphones, computing devices, and machine-to-machine applications) is expected to jump from 360 million in 2012 to 648 million in 2018. Communications site operator **American Tower** (NYSE: AMT) is well positioned to benefit from this trend.

What It Does

AMT leases antenna space on more than 69,000 cell sites (towers, rooftops, and more) to wireless service providers across the globe. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, non-cancellable, and feature contractual annual price escalations. About 60% of AMT's properties are located in 11 different countries outside the U.S., including India, Brazil, Germany, and South Africa, and AMT is intent on expanding its international portfolio as it continues to build and acquire more towers.

How It's Working

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE (or, in Africa, from voice to data), or to increase coverage density. Every time they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; 98% to 99% of AMT's customers up for renewal each year do so, and more than 85% of its current leases don't renew until 2019 or later.

What We Expect

Revenue is up 25.3% year-over-year in the most recent trailing-12-month (TTM) period, with the international division up 27.2%, outpacing the domestic side. We expect revenue to roughly double over the next five years through a combination of price escalations, new towers, and upgrades; year-to-date 2014 results suggest that the company is well on its way.

After its 2011 conversion into a real estate investment trust (REIT), AMT is required to pay out 90% of taxable income to shareholders. It currently distributes $1.44 annually, a 1.5% yield, and management expects to increase the dividend 20% annually over the next five years. (Importantly, only the U.S. business and a small portion of the international business is organized as an REIT. For more, see our original write-up, linked here and in the sidebar.)

For More

- *Pro*'s original recommendation (5/6/13)
- *Pro*'s "Buy More" recommendation (3/17/14)
- Talk about AMT

Management reduces taxable income though the use of net operating losses. And because the useful life of its tower properties exceeds the depreciation schedule, AMT also uses a depreciation shield, which further reduces taxable income and understates the value of some assets on the balance sheet. Thus, typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

The *Pro* Bottom Line

We value AMT at about $110 a share. Today's price provides an acceptable margin of safety for a business of this caliber. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network.

Buy First: Oracle (NYSE: ORCL)

This old-guard tech giant has more room to grow.

Suggested Allocation: 4.2%

What It Does

Oracle (NYSE: ORCL) is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems** (NASDAQ: CSCO), **Dell**, and **Microsoft** (NASDAQ: MSFT) — Oracle's value has steadily risen as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe. And when it comes to hardware, Oracle's own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

Combining hardware with boxed software and cloud services, Oracle is a full-service solution, one that's poised to enjoy long-term growth in free cash flow. The business is incredibly sticky — companies don't trust their data to just anyone, and it's tricky and even risky to make a switch. To add to its massive recurring revenue base, Oracle cross-sells new products to existing clients and continues to rope in new customers with its comprehensive software and hardware solutions, whether on site or in the cloud. The company has also been known to make some (read: *many*) acquisitions to propel growth.

How It's Working

Leading software sellers can write a program once and sell millions of copies, then provide small but critical updates on a regular basis. These updates drive a subscription business model, which leads to recurring revenue. Most of Oracle's customers renew annual software contracts that represent more than 40% of its revenue. This is stability upon which Oracle grows. Even better, as more customers move to a cloud-based relationship (rather than licensing on-premise software), Oracle enjoys growing, monthly, recurring cloud revenue, even as customers save money because they no longer need to host their own software. For Oracle, economies of scale make hosting inexpensive.

In the quarter that just ended, Oracle's core cloud revenue was up 33%, while total software-plus-cloud sales gained a respectable 6% to $6.6 billion. Following some quarters of slow license sales growth (the increasingly popular cloud contracts bring in revenue more gradually), the stock has dipped, providing a good buying opportunity.

More Resources

- *Pro*'s original recommendation (9/17/09)
- Latest earnings coverage (10/3/14)
- Talk about Oracle

What We Expect

At about $39, Oracle trades at about 13 times free cash flow, well below the S&P 500's average, and management expects more operating leverage ahead and greater overall profits as cloud revenue steadily increases.

The *Pro* Bottom Line

This is a good buying opportunity for a proven business that still has plenty of room to grow. From this valuation, we think the stock should produce a North Star-topping, 10%-plus annualized return over the coming three years.

Buy First: TD Ameritrade (NYSE: AMTD)

Assets and investment fees are rising; earnings should surge when interest rates head higher.

Suggested Allocation: 3.1%

Entrusted with more than $650 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NYSE: AMTD) hosts around 400,000 stock, options, and futures trades on an average day, collects investment fees, and earns interest on billions in cash.

What It Does

Aside from being a leading discount broker, TD Ameritrade has a partnership with **TD Bank** (NYSE: TD) (which owns 41% of the company), giving it a unique position in its industry. The partnership allows TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank, and with cross-selling opportunities and below- average risk to boot. So, when the current record-low federal funds interest rate (targeted between 0% and 0.25%) increases, TD Ameritrade will earn much higher interest income, all of it pure profit. Meanwhile, it continues to focus on increasing client assets and launching more investment products.

But about that federal funds rate: In 2007, it was 4.75%, up from 1% in 2003 during the last recession. Today, it's hovering between zero and 0.25%. The first year that it increases by 100 basis points (to 1.1% from today's 0.1%), management estimates TD Ameritrade's earnings per share will rise by an extra 26% compared with the prior year, on top of any other growth. And as history shows, interest rates could rise by much more than 100 basis points over the next three, five, and seven years.

How It's Working

TD Ameritrade has increased client assets by at least 10% annualized for the last six years and counting. Management says this rate of growth has been about double that of its nearest competitor. For context, the S&P 500 (including dividends) has delivered about a 43% total return since 2007, but client assets held at TD Ameritrade are up by 235% over the same period. Operating margins are strong, too, lately in the low-40% range.

Diligent capital management led Standard & Poor's to upgrade the business to an "A" credit rating in 2012 (and reaffirmed that rating in July 2014), which has helped fuel recent dividend increases (the quarterly dividend has grown 44% annualized since Q1 2011). With steady gains in customer accounts, decreasing shares outstanding, and a commitment to paying out roughly two-thirds of earnings to shareholders, the business should continue to reward owners — with the added benefit of much higher profits when interest rates increase. Meanwhile, the stock is trading right around its 10-year average price-to-book value of 4, although the company is more diverse and stronger now than over the past decade.

For More

- *Pro*'s original recommendation (7/11/13)
- Monday Memo on TD Ameritrade's business model (9/15/14)
- Talk about TD Ameritrade

What We Expect

Management will continue to be excellent stewards of capital, returning profits to shareholders and increasing additional investor value. All the while, we know higher interest rates will someday lead to much higher net income. But even as we look forward to that, we can admire the company's current results and should enjoy healthy returns.

The *Pro* Bottom Line

Our current fair-value estimate on TD Ameritrade is $34. The company's earnings are likely at a cyclical low. Believing as we do that TD Ameritrade's profit potential is much greater than recent results suggest, we think the stock is a compelling buy in anticipation of higher interest rates. TD Ameritrade's business model is powerful when rates are headed upward. Most investors have probably forgotten that power since 2007, but will remember it when earnings start to jump.

Buy First: Tupperware (NYSE: TUP)

This is not your mother's Tupperware.

Suggested Allocation: 2.8%

What It Does

Tupperware Brands (NYSE: TUP) earns 70% of its revenue from giant emerging markets including China and India, where its sales reps are still only scratching the surface of the vast potential markets in dense urban population centers. As these countries, Brazil, Malaysia, and others begin to enjoy disposable income, shoppers able to store food for the first time can afford inexpensive kitchen products offered by Tupperware. In addition, Tupperware offers women in these regions steady employment, something that's still tragically hard to find for many women in emerging markets.

Elsewhere in the world, the company's sales through its iconic "Tupperware parties" still thrive in places as erudite as France and as prosperous as Germany, as well as in the good ole U.S.A. Cutting out retailers to focus on direct sales continues to set Tupperware apart from the rest of the pack, and with a sales force of 3 million and new products every year, the company still has plenty of potential ahead.

How It's Working

Tupperware has been increasing sales in key emerging markets by 20%, 30%, even 50% or more year over year, and overall in those regions by 10% or more. Including its legacy businesses in developed markets, the company targets long-term annual sales growth in the mid-single digits and earnings growth higher than that. Today, storage products only account for about 30% of sales, while region-specific kitchen tools have the lead. For example, in China water purification products are top sellers, while Tupperware vegetable steamers do well in France. The company's diverse product line, driven largely by the requests of local sales representatives, gives Tupperware relevance and success across different markets. A significant part of sales come from new products each year, a fact in which management takes pride. Tupperware creates innovative products and then outsources production to keep costs down.

A few quarters of soft sales, partly because of challenges in the Ukraine and South America, have led to a pricing opportunity for new buyers, making the stock a Buy First.

More Resources

- *Pro*'s latest buy recommendation (7/30/14)
- Talk about Tupperware on our discussion board
- Latest earnings coverage coming soon!

What We Expect

The $63.75 stock trades at 14.7 times earnings and yields 4.3% in annual dividends. After a soft year, the company is set up to have much easier year-over-year financial comparisons in 2015, and we expect the stock to handily return more than 11% annualized the next three years as headwinds dissipate. Feisty emerging markets should continue to drive sales, but we expect developed markets to hold steady (and even grow slowly) as well.

The *Pro* Bottom Line

You don't have to attend a party in someone's living room to enjoy the benefits Tupperware can bring to your portfolio (though you can if you want to). The company's innovative approach to products and sales continue to set it apart, and the future looks bright.

Buy First: Wells Fargo (NYSE: WFC)

At heart, banks are simple businesses, and Wells Fargo is one of the best of the breed.

Suggested Allocation: 4.1%

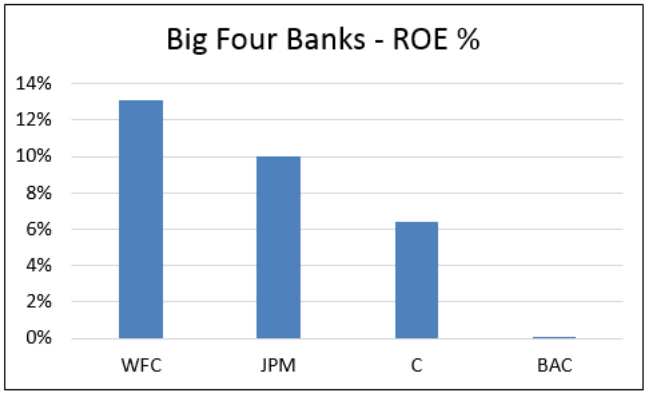
What It Does

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** (NYSE: WFC) is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 8,800 branches and 12,700 ATMs. It's the fourth-largest bank in America, it has a reputation for high customer loyalty and satisfaction, and it's the leader in mortgage and small-business lending.

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During tough lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

How It's Working

CEO John Stumpf and team are truly the best of the breed. Return on assets and equity for the most recent quarter (Q3 2014) were rock-solid, at 1.4% and 13.1% respectively — great results given the low interest-rate environment and new regulations that require higher liquidity levels (i.e., less leverage) than before the financial crisis. A look at ROE figures for the other three big banks shows how Wells Fargo is best in breed:



Source: Q3 2014 company filings (figures represent return on common equity)

Total revenue growth has been elusive, but expense reductions and improvements in credit quality have driven quarter after quarter of earnings growth, leading to higher earnings than before the financial crisis. Deposit growth has been tremendous (coming in at almost 10% in the third quarter of 2014), and as Wells Fargo grabs additional "wallet share," fee income increases as well. The credit quality of the loan portfolio is impressive and continues to improve. All of this has contributed to a very well-capitalized balance sheet, allowing Wells Fargo to comply with the aforementioned capital regulation requirements well ahead of schedule.

What We Expect

For More

- *Pro*'s original recommendation (12/10/10)
- *Pro*'s recent "Buy More" recommendation (7/29/14)
- Talk about Wells Fargo

Wells Fargo's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. In the current low-interest-rate environment, we should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But when the U.S. economy picks up, interest rates rise, and loan demand resumes, Wells Fargo's real earnings power — bolstered by growth in fee-based revenue — will hit its full stride. And many customers who start a deposit account or mortgage with Wells Fargo will explore the company's offerings in other areas, too.

Shares are trading at less than fair value, and they yield a growing 2.6% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. *Pro* has also used options in the past to generate even more income from this position, so try to invest using round, 100-share lots if it keeps you within half a percent (plus or minus) of our 4.1% allocation. If that's not feasible for you, share ownership alone is fine, too; with its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

Better yet, Tom Gardner and his *Motley Fool ONE* team have offered to give loyal *Motley Fool Pro* members like you access to *an entire week's worth* of in-depth coverage on this stock (and two of Tom's other top holdings) — *at absolutely no cost to you*. All they ask in return is that you simply follow this link and answer a few quick questions.

Pro: What We Think Now

Published Jul 29, 2014 at 2:12PM

See all our active trades at a glance, including our strategies and high-level thinking. We've highlighted recent changes with icons, and you can click on any column header to sort the table, which is initially sorted by allocation.

Holding	Ticker	Rating	Summary
SPDR S&P 500 ETF	SPY	Option: Put Ratio Spread	We're using low-cost hedge strategies called put ratio spreads to protect against downside in the S&P 500 while not risking anything if the market goes higher.
Facebook	FB	Buy First	Facebook remains a young story about monetizing the largest, most engaged online audience ever hosted by one company, and Facebook's future is in strong hands because management is showing patience and care as it monetizes more of its properties, putting visitor experience first. The billions of connections maintained on Facebook's properties are making the sites extremely sticky, offering the potential for increased value to advertisers (and thus Facebook owners) for years to come.
Broadridge	BR	Buy First	Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.
O'Reilly Automotive	ORLY	Buy	With exceptional management in the driver's seat, O'Reilly Automotive will grow impressively by adding new auto parts stores, acquiring others, and growing same-store sales.
AmTrust	AFSI	Buy	Under the radar, AmTrust is a disciplined underwriter of workers' comp and warranty insurance policies that is expanding opportunistically into other low-hazard areas and new geographies. Book value should continue to grow.
MasterCard	MA	Buy First	MasterCard's global network is a financial toll road that takes a small slice of each transaction. Though there are many established and upstart competitors, the leader is cash with 85% market share, representing plenty of room for MasterCard to grow.
Wells Fargo	WFC	Hold Option: Write Partial Covered Calls	Given recent scandal being uncovered at Wells Fargo, the position is on hold while we assess whether we want to go on owning call options on Wells or not. We have to believe there is upside in a few years or we'll sell our calls to get back time value.
American Tower	AMT	1Buy	A U.S.-based global tower operator, this business with excellent returns on incremental capital benefits from exponential growth in worldwide demand for mobile bandwidth. We expect strong growth as international markets continue to invest in wireless technology. We are invested in some LEAPS call options to leverage upside.
Apple	AAPL	Buy	Apple is the leader in mobile computing products, and the number of people buying into its ecosystem continues to grow. Apple capitalizes on this by making its operating system work seamlessly across devices, increasing stickiness. The mobile computing revolution is still in early stages, and Apple still has no equal.
Oracle	ORCL	1Buy	Oracle is an "old guard" tech giant that continues to grow strongly thanks to its expanding database software and hardware sales. It also has room for more margin expansion.
Papa John's	PZZA	Buy	Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. Near-term headwinds (commodity prices and technology investments) have proved temporary and Papa John's should deliver improved financial performance.
OpenText	OTEX	Buy	Selling software that lets companies and governments manage growing reams of digital information, OpenText should grow steadily for years. Plus, we plan to write options on it for income along the way, as long as the options pay well.
Starbucks	SBUX	Buy	The world's specialty coffee leader will continue its global retail expansion and will leverage its brand to offer consumers more choices — including tea, carbonated beverages, and juice — at more times in more convenient locations. The company has dynamic growth opportunities, operational discipline, and deft management. Starbucks stores and its trusted brand are a powerful platform off of which to introduce locally relevant new products, build relationships with customers, and compound intrinsic value.

Holding	Ticker	Rating	Summary
Parexel International	PRXL	Buy	Helping pharmaceutical companies get drug candidates to market, Parexel is poised to benefit as those companies gradually outsource more of this process to select CRO partners who can perform the work better, faster, and cheaper. We also expect margin expansion as recent investments and restructuring costs pay off as well as continued growth of the Parexel Informatics technology segment.
Medtronic	MDT	Buy	Medtronic has a sound strategy to deal with the more regulated and costlier health-care environment. We're confident the business remains competitively advantaged, operates in an attractive industry, and is well-positioned to grow, especially in emerging markets. With reasonably-priced shares, we target North Star-type returns.
Skyworks Solutions	SWKS	Buy Option: Write Covered Calls	Skyworks Solutions is positioned to keep increasing profits at a healthy clip as more smartphones are sold and connected devices (the Internet of Things) proliferate. Long-term growth rates overall could remain above 10% for many years.
Expeditors International	EXPD	Option: Synthetic Covered Strangle	The shipping logistics leader offers a stable business on which to set up an income position. The *Pro* team is targeting leveraged income with upside.
Gentex	GNTX	Buy First Option: Write Puts	Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time. We're also writing puts for income or to potentially buy more shares lower.
Gilead Sciences	GILD	Buy Option: Write Covered Calls	Gilead Sciences has seen surging free cash flow thanks to its market-leading Hepatitis C treatments, which accounted for nearly 60% of 2015 revenue. As sales growth tapers, the stock is cheap, and we believe management can find future growth opportunities through acquisitions. Meanwhile, Gilead has a large pipeline of drug candidates targeting deadly diseases including cancer, but for the coming few years, it's our belief in a stable Hepatitis C market and good use of its growing capital that makes the stock worth owning in *Pro*.
Visa	V	Buy	Expected to grow earnings per share by at least 14% to 18% annualized for several years, Visa's giant payment network should keep driving results as electronic money replaces cash, affluence increases, and new markets are added.
TD Ameritrade	AMTD	Buy	TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and when interest rates increase, the company is positioned to grow earnings sharply.
FactSet Research Systems	FDS	Buy First	Selling subscription data and analysis tools to investment professionals, FactSet enjoys a 95% contract renewal rate and has 35 consecutive years of sales growth. With high returns on capital, it meets *Pro*'s criteria for a compounder.
Verisk Analytics	VRSK	Buy	Also owned by Buffett but still under the main Wall Street radar, this leading provider of rich data to insurers and other industries has a strong competitive position, recurring revenue, and pricing power. It's a long-term buy we want to own and add to over time.
Domino's Pizza	DPZ	Short	As a paired trade, we are shorting the leading pizza chain only as a way to hedge 2% of our long exposure in Papa John's, since the two stocks have historically moved together. These two positions should be taken together.
Valmont Industries	VMI	Buy Option: Write Covered Calls	Valmont's end markets remain weak and we considered selling to harvest the tax losses, but recent news that Congress is making progress on a new highway funding bill leads us to believe it's worth holding on to this solid business for a bit longer.
WisdomTree Emerging Markets SmallCap Dividend Fund	DGS	Buy	This emerging-markets ETF is a large fund of nearly 500 stocks; its fate is tied to emerging economies (mainly Taiwan, South Korea, Thailand, Malaysia, Brazil, China). The ETF is well-managed and yields more than 3% while owning small, consumer-centric companies. Moved back to Buy 3/28/16 after review.
CurrencyShares Euro Trust	FXE	Short: Hold	The euro is held together by rubber bands and scotch tape (and financial threats). We believe the currency should be worth much less to the dollar. We may manage this short by adding to it when it spikes.
Deere & Company	DE	Short	John Deere should serve *Pro* both as a short with favorable odds of generating a North Star-like return and as a macro hedge to reduce our portfolio's sensitivity to the strength of the global economy.
ProShares Short VIX Short-Term Futures	SVXY	Buy	Over the long term, the futures on the CBOE VIX index should persistently trade at a higher level than the spot VIX level, until they dissipate into expiration. This situation — known as contango — will ultimately make this ETF go up in price, because it sells short the futures, which are a wasting asset. We expect price volatility, though, and we will look to add to the position on large drops. So, keep your allocation small.
Pier 1	PIR	Short: Hold	Coming soon!
Caesars Entertainment	CZR	Short: Hold	With interest on debt consuming all operating profits and then some, Caesars' back is against the wall as competition increases and traffic slows. We believe a restructuring is fairly likely, and equity holders may not end up with snake eyes, but something close to it. So, we're short.
Direxion Daily Financial Bear 3X Shares ETF	FAZ	Short	We believe financial stocks are inexpensive, so we're shorting the bearish financial ETF, which also suffers from compounding flaws that work in the favor of shorts like us.
SRS	SRS	Short: Hold	We're bullish on a real estate recovery, so we're shorting this flawed, leveraged, bearish real estate ETF -- but it has become too small for new investors to short.

See the team's and David and Tom Gardner's holdings here.

Your Slow-Mover Advantage Over Wall Street

Published Mar 17, 2014 at 12:42PM

Wall Street's short attention span makes it seem like the odds are stacked against snail-paced Fools like us. But in reality, high-frequency traders, big-pressure hedge fund managers, and supercomputers that calculate moves by the millisecond make our investing strategy even more successful.

In this exclusive glimpse at *Motley Fool One*, Morgan Housel reveals evidence for your single greatest — possibly even your only — advantage over Wall Street, along with three easy steps for maximizing your edge. Plus, listen to the *Fool One* podcast to hear Morgan and analyst Bryan White talk about how you can invest against the market's shortsightedness.

Podcast Transcript

BRYAN WHITE:

Welcome to EP Weekly. I'm Bryan White joined in the studio today by Morgan Housel. Thanks for joining us today, Morgan.

MORGAN HOUSEL:

Thanks for having me.

BRYAN WHITE:

And today, folks, it's just me and Morgan. Jason and Robert Brokamp and Chris Hill couldn't make it today, so you're stuck with just both of us, but we should have a great discussion today as Morgan has put out another special free report. It's called "Your Slow-Mover Advantage over Wall Street." We'll dig into that and also earnings season is just beginning for our EP companies. Coach reported yesterday and Starbucks reports today after hours.

First let's dig into this report, Morgan. A very interesting report -- another one from you. What gave you the motivation? Why did you pick this topic?

MORGAN HOUSEL:

I think there have been a lot of investors over the past couple of years -- maybe not necessarily all of our members from *Motley Fool One* -- but I've seen a lot of investors really start to question why is it worth being an individual investor when the evidence seems overwhelming that Wall Street has an edge over you. That the game is rigged in their favor against the individual investor. Things like high-speed trading, insider trading. We hear all these stories about how Wall Street can succeed over you.

But I think there's one huge advantage that individual investors have over Wall Street and it's this concept of *time arbitrage* -- which very simply put is if Wall Street is focusing on the next five months and you, the individual investor, are focusing on the next five years, that is a tremendous advantage that you have over them.

And you have that advantage over them because the way that Wall Street is set up ... And when I say Wall Street, I'm really talking about hedge funds -- big institutional, professional investors. They're by and large graded on the short term. They have to focus on the next quarter or else their clients start firing them. It's really a very short-term focus game. So, they're kind of stuck in that short-term bubble. If individual investors can get away from that and focus on years, it's a huge advantage.

So, I had some statistics in the chart about if you go and look back the past 150 years of the S&P 500 ... If you're looking at the market based on a one-day basis or a one-month or three-month basis, the odds of you making money is pretty close to a coin toss. The market goes up, goes down. That's what it is. If you can invest for five or ten years, your odds of making money are very good. And that flows down to individual companies, as well. If you're talking about stocks that miss earnings by a penny per share and then fall 20% after hours ...

BRYAN WHITE:

Yes ...

MORGAN HOUSEL:

... well that's Wall Street's game. But if you're in this for the next five years -- not only does that not affect you, but that becomes your opportunity at that point. So, really I think when investors focus on this, it becomes that this is the advantage that you hold over Wall Street and this is why individual investors can, indeed, outperform the market over the long run.

BRYAN WHITE:

Well, I think as One members, you do have an advantage. I think as members of One, you have a huge collection of great companies to choose from ... from all of the different services here at the Fool. And then, taking some cues from this report, we're likely to continue to see dramatic moves based on headlines, based on earnings reports, and especially with the more-and-more high-frequency trading that's going on in the market.

So, there's two different perspectives. One, the game's rigged against me or the perspective that hey, prices are going to jump quite a bit, and if I can only get my hands on a nice list of great companies for the future, I can be patient and wait for the most part. Or at least set my portfolio and then my incremental investments going forward -- part of them can be some of these things that move huge based on headlines and the news.

Obviously, you want to look at the fundamentals because sometimes a stock deserves to get hit, but a lot of times we're seeing an earnings season that stocks are just getting crushed just based off the headlines. The headline barely comes out and the stock's moved double digits.

MORGAN HOUSEL:

And I think it's really tempting for some investors to look at those moves and think, "What does Wall Street know that I don't?"

BRYAN WHITE:

Yes.

MORGAN HOUSEL:

My stock is down 20% after hours. Do they know something that I don't and should I be worried about that? And maybe sometimes that is the case, but I think most of the time the answer is no. It's just that they're just focused on the next 90 days. So, this move after hours or in the short run really doesn't apply to your goals as a long-term investor.

BRYAN WHITE:

Let's flip the coin on the other side. The short-termism, let's say, and let's say the advantage of high-frequency trades. What would be one negative that you would point out for individual investors like us that take the long-term approach -- but one negative that we should be mindful of because it's a true negative. Not everything is a positive story. What is one thing that we should watch out for?

MORGAN HOUSEL:

Well, I think it's really interesting. About two years ago at Fool.com, there was a group of writers that did this long, in-depth report on the flash crash which happened in May, 2010. The Dow fell a thousand points in a matter of minutes. So, they did this report and they set out to do this big investigation. They wanted to find an individual investor who had been harmed by the flash crash ...

BRYAN WHITE:

Okay ...

MORGAN HOUSEL:

... and they looked for weeks and weeks and they could not find one.

BRYAN WHITE:

Yes ...

MORGAN HOUSEL:

The flash crash -- the Dow fell a thousand points and then about five minutes later, it regained most of that. It's called a flash crash because it was over before most people knew it ...

BRYAN WHITE:

Yes.

MORGAN HOUSEL:

So really, I think when we're talking about high-frequency trading, it might harm individual investors if for whatever reason you need to sell stocks right this minute. I don't know why you would need to do that -- because you've got to raise money to pay a bill or whatever. Then, you know, it makes the day-to-day action more volatile.

But in terms of the value as an investor, and that we look at it, is owning real businesses for the long term, just like you would as a private investor. You own a McDonald's franchise and that's your business. If you think of investing that way, I really, firmly believe that high-frequency trading does not pose any risk to you whatsoever.

BRYAN WHITE:

I think you bring up a good point in your perspective. For investors [00:05:59] your portfolio is one of your small businesses. You may own another small business, but one of your small businesses ... it's your portfolio.

MORGAN HOUSEL:

Right.

BRYAN WHITE:

And to make snap decisions ... I mean, why not view it as if it was a small business? Would you run around and make snap decisions every day?

MORGAN HOUSEL:

Right.

BRYAN WHITE:

Every week? Acquire a company. Sell it off. Hire someone. Fire them the next day.

MORGAN HOUSEL:

You know, I've made the analogy before. If you own your home, let's say, and you go to Zillow.com one morning and you look up the value of your home and Zillow's having problems with its servers and it says your home is worth zero dollars ... Your home isn't actually ... Like, nothing happened to your house. Like, it's still warm. You've still got a roof over your head. Just because you get a bad quote or you get a problem in your servers -- nothing happened to the value of that house. And it's really the same thing when we're looking at stocks and talking about volatility and high-frequency trading.

BRYAN WHITE:

Well, it's a great report, Morgan. I hope everyone reads it. It's out there on the One home page if you haven't seen it yet, and we'll be looking forward to the next report, Morgan.

MORGAN HOUSEL:

Thanks.

BRYAN WHITE:

Now moving onto Coach. Coach reported yesterday. Basically the quick summary for Coach is the same struggles are still there. Comparable store sales, comps, in the United States or in North America fell 13.5%, which is a pretty disappointing result. They're still in the middle of a turnaround. The financials are not looking great right now. There's sort of a debate internally and within the market that Coach is a great value right now, great buy ... and then there's also the argument from the bears that Coach is in some big trouble. There's legitimate arguments on both sides.

We're obviously going to hold pat. We bought it for at least the next five years when we did buy it, so we've got about four years to go with Coach. Where I stand ... See, we all think differently. Between Tom, Jason and myself ... Jason tends to be more bullish on the name. I came into Coach incredibly bullish, but there are some warning signs out there. Number one -- fashion. Fashion is fickle. You can invest in a genius, but when it comes to fashion, if it turns on you, it turns on you. Not one person can really turn that around.

MORGAN HOUSEL:

Do you remember B.U.M. Equipment from the 1990s?

BRYAN WHITE:

Yes. Yes, I do. Wow!

MORGAN HOUSEL:

Things go from huge to laughable really quickly.

BRYAN WHITE:

Well, yes, and I wouldn't compare that ...

MORGAN HOUSEL:

No, I'm not making that equation, but when you said fashion is fickle ...

BRYAN WHITE:

Well, I think Coach is a great example, because Coach is one of those iconic brands ... and if it can happen to Coach, it can definitely happen to anybody out there. And then at the same time, it's almost a perfect storm for Coach. Huge management turnover. Both their lead designer and their leader and CEO, Lew Frankfort, stepping down. A lot of turmoil.

And at the same time, you have a category that Coach dominated, which was the affordable luxury category. The price point for handbags -- they dominated it for years. And now, all of a sudden, out of the woodwork, while you have management turnover, you have companies like Michael Kors and others that come into your territory and start taking share and they're very successful ...so far taking shares. So, Coach is under some pressure. Come to the boards. Jason's going to have a recap of the quarter after going through the conference call. We'll have further discussion on Coach. Tom's been out on the boards talking about Coach in the past, so you'll find his board posts out there. And then after hours today, Starbucks reports, so that'll be a big report. We'll be covering that today after the market.

All right, folks. That's all we have today. We will see you next week.

Live Advisor Roundtable With Tom Gardner and Jeff Fischer

Published Mar 10, 2014 at 1:29PM

In preparation for the reopening of *Motley Fool One*, the Fool hosted a roundtable discussion with Fool co-founder Tom Gardner, *MDP* and *Deep Value* advisor Ron Gross, *Pro* and *Options* advisor Jeff Fischer, and *Supernova* Odyssey 1 mission lead Matthew Argersinger.

Miss the action? Click the player below or read the transcript to see what they said.

Transcript

TOM GARDNER:

Welcome to the *Motley Fool One* Live Chat. We're going to get right into it. We've got an hour together. I have the promise of my panelists that this will be the most interesting and entertaining one hour of investment programming …

RON GROSS:

We made no such promise.

TOM GARDNER:

And the reason we make the promise is because we've heard that Ron Gross, our advisor in *Million Dollar Portfolio* and *MDP Deep Value* … his parents are watching today, so …

RON GROSS:

Hi mom and dad. Thanks for joining us.

TOM GARDNER:

So, we've got Ron. We've got Jeff Fischer — *Motley Fool Options*, *Motley Fool Pro*. The original Fool portfolio, as well. And we've got Matt Argersinger — *Supernova*, *Rule Breakers*, in *Stock Advisor* probably pitching in some ideas there …

MATT ARGERSINGER:

I'm on there — sure …

TOM GARDNER:

They're all over the place. Someday — perhaps not that far away — Motley Fool Germany, as well.

MATT ARGERSINGER:

That's right.

TOM GARDNER:

Pre-announcement there. So, we're going to get right into it. We have a couple of conversations that we're going to start with. Then we're going to talk to a member of *Motley Fool One*, Mark Timmerman. Very excited about that. And then we're going to be taking your questions throughout, so please know that you can submit questions about our conversations or any questions you have about *Motley Fool One*. We have a number of analysts out in the chat ready to answer your questions directly there. And, of course, we'll take some of your questions and answer them here as a panel.

I just want to start, team, with a conversation about where the market is today and what it makes you think about investing. Are you thinking the same way about investing in stocks that you did three years ago, or has there been a change because of the remarkable performance? Or even one year ago, before the market had risen 30%-plus? So, where are you now …

RON GROSS:

Hm. Can I jump in?

TOM GARDNER:

Yes …

RON GROSS:

My preferred answer, when anyone ever says to me, "What do you think of the market," is to say, "I don't know. I honestly don't know." If you had asked me on January 1 of 2013 when unemployment was high and GDP was low … interest rates were also very low …would the market have been up 32%, the S&P 500 … I would have never guessed. I think it's very difficult to opine where the market, as a whole, is. What I prefer to do is each day, every day, look at stocks, look at stocks, look at stocks …

TOM GARDNER:

Blind to what's happening with the macro issue.

RON GROSS:

It's there. I'm educated on it, but I don't make predictions and I don't make investment decisions by it. But what I can see as I analyze stocks every day, all day, is some patterns that are emerging …

TOM GARDNER:

It's getting harder.

RON GROSS:

… is it's harder to find good stocks.

TOM GARDNER:

Is it harder to find good stocks?

RON GROSS:

I am definitely finding it harder to buy stocks, especially if you're looking at stocks in the *Deep Value* service. We're almost 50% cash in that service. Very hard to find deep value stocks. In *Million Dollar Portfolio*, a little bit easier because we can look at growth stocks, high-growth stocks, innovative rule breakers …

TOM GARDNER:

Which is more important to you, Ron, when you're looking for these stocks? Are you looking for stocks that are going to make you money over the next five years, or stocks that are going to beat the market over the next five years or the next three years? If you knew that you were going to buy a stock and the market would be down 8% and you'd be down 2%, is that satisfying to you, or is the baseline that it's profitable?

RON GROSS:

It's a really difficult question to answer — but my standard answer to that is that I'm looking to beat the market under the assumption that over periods of time, the market does very well. Let's call it 9 or 10%. And if I can consistently beat it, even in bad years, then not only will I outperform the market, but I will also make investors money.

TOM GARDNER:

Now just before we came on air, you were calling the person to your left and to the audience's right fanboy Jeff Fischer. There are so many fanboys for Jeff Fischer. So, great answers, but I guess the world wants to know what Jeff thinks.

JEFF FISCHER:

That must be true. It must be true. And I'll start by saying to Ron's parents that Ron is really a nice guy.

RON GROSS:

Thank you, Jeff.

JEFF FISCHER:

He's nice to work with and he's genuine.

RON GROSS:

I appreciate that.

JEFF FISCHER:

He's the real deal.

RON GROSS:

Very thoughtful.

JEFF FISCHER:

Well, it's true. Speaking the truth. On the market. When I look ahead, the next three to five years, I'm excited. I'm excited about what good companies, what good stocks could do over the next three to five years. When I think in the next one to two years, it's more of a random guess. I don't know.

TOM GARDNER:

Is that always true for you, or do you have a particular feeling that the market, having gone up quite a bit over the last couple of years, it's cloudier …

JEFF FISCHER:

Yes. I think it's cloudier. The higher the valuations go in general, the more uncertainty there is in the next couple of years. Because you could say a stock needs some time to catch up to the valuation as much as we may dislike that phrase. So, yes. When the market, as a whole, was 20% or 30% cheaper a year ago, it was much more easy to be excited about the next year or two. But now, where they're at …

TOM GARDNER:

Getting a little harder. But your view of three to five years forward not seriously impacted by valuations today.

JEFF FISCHER:

I agree with Ron. It's harder to find things you're clamoring to buy, but there are still good companies that we're very happy to own and to recommend today, especially given our rolling three-year outlook.

TOM GARDNER:

Matthew?

MATT ARGERSINGER:

I tend to pay attention to the headlines.

RON GROSS:

What about my parents?

MATT ARGERSINGER:

When I'm not paying attention to Ron's parents, I tend to pay attention to the headlines because I think understanding market sentiment is kind of important. And what I see is there is a lot more enthusiasm about the market today. At the same time, there's still definitely a genuine level of skepticism. And I think as long as that's out there, I feel pretty good about investing and like Jeff, I feel very good about the next three to five years. But there are pockets, I would say, of the market that I would say are probably a little beyond their expectations …

TOM GARDNER:

What's a pocket for a company?

MATT ARGERSINGER:

As much as I love the social media companies, I think they're pricing in a lot of future growth today. They might very well be worth what you're paying for them today several years from now. I just don't know if they've earned that yet. We all know Seth Klarman. I don't know if he's been mentioned in previous …

TOM GARDNER:

Baupost Capital …

MATT ARGERSINGER:

Sure. Tremendous track record. He was out the other day saying, "Listen. The market's pretty high in certain places." And I look at that as a little bit of a shot across the bow. I think he's early and I think there's still a lot of skepticism.

RON GROSS:

Value investors are typically …

TOM GARDNER:

He's closer in the deep value camp, so he's going to come out with those shots earlier, but there's an analogy that I can't come up with here, but it's basically … Well, you can say *canary in the coal mine* … But it's basically an early indicator that you should consider thinking a little bit differently about what's happening than what's been the environment that we've been in over the last couple of years …

JEFF FISCHER:

I agree with that Tom, and I think you could easily look at this video a year from now and talk about, "Oh my gosh, so many stocks were overpriced or declined quite a bit in the year since," but then look at the video two or three years from now and most good businesses will be worth more.

TOM GARDNER:

Absolutely.

MATT ARGERSINGER:

Absolutely.

RON GROSS:

One thing I love about Foolish investing is you'll rarely hear someone in the building say, "The S&P 500 is 16x forward earnings — therefore we're moving to cash." You're more likely to hear that on CNBC. We're more company-centric. One company at a time. Is Tesla overvalued? Has it run its course? Is Netflix overvalued? Does Intel represent a good value? Do I want to own that? Rather than making these big, big macro stock market calls.

TOM GARDNER:

Quick question from each of you about your personal portfolio and then we're going to go to Mark Timmerman. We're going to start with MattyA this time and go from the audience's right to left. What percentage of your personal portfolio is in cash? Or you don't have to share your personal details. You could say what percentage of a portfolio that you would buy someone to manage right now would be in cash?

MATT ARGERSINGER:

I'd say less than 10%.

TOM GARDNER:

Less than 10%. But more than 1%?

MATT ARGERSINGER:

More than 1%.

TOM GARDNER:

But some cash on the sidelines.

MATT ARGERSINGER:

There's something on the sidelines for sure.

JEFF FISCHER:

Mine is around 25-30%.

TOM GARDNER:

Twenty-five to thirty percent in cash.

RON GROSS:

Woo!

TOM GARDNER:

Okay.

JEFF FISCHER:

That's pretty standard.

TOM GARDNER:

That's standard.

JEFF FISCHER:

It's close to standard. It fluctuates. But when you're chugging along …

TOM GARDNER:

Why is that happening?

JEFF FISCHER:

I use options, so the cash secures a lot of those options. Pro members see this in Pro where we have about 20% cash and that's partly defensive given Pro has absolutely …

TOM GARDNER:

If you were not using options at all — you had an all-equities portfolio and it was all long — what percentage in cash would you feel comfortable having? Or what would your standard …

JEFF FISCHER:

Well, then at my age, I would think I'd be more 90% invested maybe …

TOM GARDNER:

Because you're what? You're 26?

JEFF FISCHER:

I'm 44.

TOM GARDNER:

You're 44. Very healthy.

JEFF FISCHER:

So, I think I'd have less cash.

TOM GARDNER:

You'd have less cash.

JEFF FISCHER:

I'd have less than 30%.

TOM GARDNER:

But let's modify the question. I apologize. You're a 58 to 64-year-old right now. How much would you have in cash?

JEFF FISCHER:

Whatever money you need in three years should be in cash.

TOM GARDNER:

Got it. Ron?

RON GROSS:

Personally, about 10-11% in cash, *Million Dollar Portfolio* is 5% in cash. I don't see a huge difference between that. There's a 5% swing.

TOM GARDNER:

And is 5% a statement that it's difficult to find stocks or 5% …

RON GROSS:

No, I think having 95% of your capital at work means you can still find stocks to purchase. At any given time, we may have sold something and not put the cash back to work yet because we are managing a finite amount of money. So, portfolio management is all about sometimes selling a good stock to buy a great stock. So, sometimes we'll have some cash on the sidelines as that's taking place.

But as I mentioned earlier, *Deep Value* is almost 50% in cash because it's very difficult to find deep value stocks right now, and that's exactly how that philosophy is supposed to work.

TOM GARDNER:

I mean, Seth Klarman … It will not be unusual for Seth Klarman to be 40%-plus in cash and yet he's delivered something like 18% per year results going back 20-plus years. He's obviously a brilliant investor. One of the things I love about investing …

Obviously some investors or some members of The Motley Fool are trying to have it done for them as much as possible and trying to minimize the amount of time you're spending on investing. Others want to dive deep and learn more about business, about your portfolio, about portfolio strategies.

As somebody in the latter group for all four of us — it's really fascinating and has been for 21 years to study how other people are investing. Because Seth Klarman could sit down with growth investors at our company that are in that camp and I think they would find, actually, a fair amount of common ground, but they've taken a different path to getting extraordinary long-term results.

JEFF FISCHER:

Well, Tom, Warren Buffett, too, has quite a bit of cash. I don't know, offhand, how much right now, but he almost always carries cash for opportunities.

TOM GARDNER:

And Wally Weitz, I know, who's in Buffett's circle of great investors … He's often 30-40% in cash, even though he's all equity, all long. Okay. We're going to put our headphones on and we're going to tune in with Mark Timmerman from Des Moines, Iowa. First of all, Mark. Is it Des Moines or Des Moynes?

MARK TIMMERMAN:

It's Des Moines. Des Moines, Iowa. Thanks for having me here.

TOM GARDNER:

I'm sure you're passionate about making sure that people know how to pronounce your hometown.

MARK TIMMERMAN:

Oh, absolutely. We get really touchy about it, especially after the kind of winter we've had.

TOM GARDNER:

Actually, yes. Before we talk investing with you, just give us a quick snapshot of the winter in Des Moines — this winter.

MARK TIMMERMAN:

Did anyone see the movie *Frozen?*

RON GROSS:

Yes.

MARK TIMMERMAN:

That's pretty much it. We had more school snow dates because of temps below 10, 15 below and wind chills up around 35 to 40 below. But that's the Midwest. Anyone can live in Florida, can't they?

TOM GARDNER:

I love that. Trash talking. So, Mark, before we talk a little bit about your experience as a Motley Fool member and a *Motley Fool One*, I just want to hear a little bit about your investment philosophy. How do you think about investing and how's your portfolio been doing the last couple of years?

MARK TIMMERMAN:

The investing philosophy has evolved a lot. One of the things … I was just getting ready to talk to you folks. It's just amazing to look back — since I joined the Fool back in 1997 — and really not knowing much about how to do any of this. I knew I needed to save. I knew I needed emergency reserves.

It's evolved so much over the years, but I do understand and have refined so much more of the long-term focus on owning not stocks, but great businesses and sticking with them through the long term. That's grown a lot, but I always had that seed and that's grown so much with all my learning that's taken place over the last 17 years or so.

TOM GARDNER:

What is an example of a great business that you have held and enjoyed the fruits of their success? And what is an example of a great business that you sold too soon?

MARK TIMMERMAN:

Whoa!

TOM GARDNER:

Sorry.

JEFF FISCHER:

Shudder …

MARK TIMMERMAN:

My largest position, actually, is one of my smallest investments … Netflix. I've talked a lot about it on the boards. That was something I invested in, in 2004. My cost basis in Netflix was between $10-12 a share …

TOM GARDNER:

They're $440 now …

MATT ARGERSINGER:

Bravo …

MARK TIMMERMAN:

Yes. That's the fun part. But to me, the much more important part of that story is that I rode it down 85% in what was it? 2011? 2012? I've tried to block it from my memory completely. But I rode it down maybe 5%. Didn't sell a single share and continued to believe in what the company was doing. They hit some road bumps, but that taught me so much about sticking with a company that I felt like I truly understood.

Some of the other ones — I've owned Starbucks since 1998. Obviously, that's been very rewarding. Buffalo Wild Wings I've owned since 2004. That's been rewarding. One of the things I wanted to mention is it's really rewarding when you, Tom, select companies like that for another five-year holding period in the Everlasting Portfolio and the conviction is there to add your own money to those positions after all that growth. So, I'm really excited about just holding onto companies for the long term and really watching them blossom.

TOM GARDNER:

I notice that you've avoided the second question.

MARK TIMMERMAN:

I picked up — I invested — my first position in Tesla. My cost basis was around $30 a share. It must have been probably two, two and a half years ago — whenever it was $30 a share. I held it for about a year and just before earnings were coming out at that particular time, the price was hovering around $63 a share.

I just didn't have the conviction of understanding that company. I completely am amazed by Elon Musk — I admire him greatly — but I just didn't understand the size of the market with electric cars and what he was trying to do. One of my faults is that I sold it at $63 just before earnings. Obviously they blew out earnings and it's been on a rocket ride since.

TOM GARDNER:

Out of curiosity Mark, do you view that as a mistake, or do you view that as just the natural course of having conviction and you're thankful that, that conviction caused you to hold Netflix and certain times that conviction will steer you wrong, but it's important to follow through your belief and thesis and then try and learn from it after.

MARK TIMMERMAN:

That's a really good point, and I firmly believe that the discipline of following a process where I feel like I understand what I'm doing, I know why I'm doing it and I can stand by it — I've built into the assumption that I'm going to make some mistakes like that. I certainly can't own all the stocks that are going to do wonderfully out there. I'm certainly not going to sell all the stocks that should have been sold — but I'm going to be right more than I'm wrong and the winners have more than made up for my mistakes. So, on balance, I'm very happy about it. Still, when you put a microscope on it, it's a little tough to look at, but that's just part of how this works.

TOM GARDNER:

Sorry to pull the microscope out. So, we have Ron Gross, Jeff Fischer and Matthew Argersinger here with us from *Million Dollar Portfolio*, Options Pro, *Supernova*, *Rule Breakers*. I just wanted to talk a little bit, Mark, about your experience in Pro and Options and how that has impacted your investment approach. I'm presuming that in 1997, you were not using options when you joined The Motley Fool.

MARK TIMMERMAN:

No. Back then, remember, options were evil back then.

TOM GARDNER:

Absolutely.

MARK TIMMERMAN:

We didn't talk about options then. I was listening in on your conversation as I was waiting to join and I heard you talking about cash. My personal position on cash or percentage is hovering around 22-23%. By contrast, in 2001 when we had the big recession and 2007 and 2008, I was fully invested both times. That stuck with me, because I was stuck in not being able to act or have any opportunity to take advantage of the situation. And that, to me, was really painful.

As far as having cash now, the ability to use options — to productively use that money — while I'm waiting for opportunities and the ability, now that my portfolio has grown to the extent it has … I have the ability to hedge in a way that I never had before. So, the tools I've learned through Pro and Options have been priceless. Jeff's guided a real neophyte through this process. I was very apprehensive and had a lot of anxiety about making a mistake or doing something that was really going to cost me a lot of money by doing something stupid.

TOM GARDNER:

Out of curiosity, because of the deployment of options in your portfolio, does that cause you to feel less anxious about where the market is or what's happening in the macro environment because you have some built-in protections and hedges with options?

MARK TIMMERMAN:

It really does. I have an even more holistic view of how things are playing out. I just have more tools in the toolbox to use. Obviously the meat and potatoes of my portfolio is long-term positions that I anticipate growing nicely over the years, but while I wait for that, while there is volatility in the market, there's a nice opportunity for part of your portfolio to generate returns that not only add to your returns, but also stabilize your portfolio a little bit more.

In 1997, I was starting a family. Now I have kids that are going into college and I'm within 10 years of retirement. My objectives have evolved over time, and now I'm thinking about how can I generate income at sufficient levels? How can I take advantage of a special opportunity? That's allowed me to do it.

JEFF FISCHER:

That's a great point, Mark. So many people nearing retirement or in retirement use these really conservative options strategies, as you know now, to generate income month after month … and meanwhile you can let your stocks be for the long term to appreciate. So, I love how you put that … that the meat and potatoes of your portfolio remains great businesses …

TOM GARDNER:

Are meat and potatoes really recommended, though, at this point?

RON GROSS:

In Iowa, I think.

TOM GARDNER:

In Iowa.

MARK TIMMERMAN:

If you come to Iowa, that's all we have.

TOM GARDNER:

Okay, got it.

RON GROSS:

Mark, it's Ron Gross. Thank you so much for joining us. I really appreciate it.

MARK TIMMERMAN:

Hi, Ron.

RON GROSS:

I was curious. Obviously, you really like your experience with Jeff at Pro and Options. So what made you join One and how do you use the service?

MARK TIMMERMAN:

One of the things that drew me to One is that with things changing in our family's life where my wife is almost six years younger than I am, so my objectives for some of the IRA portfolios I've been managing were starting … I could see retirement or at least I was going to start working for fun and stop having to work at a certain time within 10 years. Pro became a really big lever for that.

But my wife — I've moved more of the new money and she's adding more money on a regular basis, too. So, *Supernova*, Odyssey 1 …

MATT ARGERSINGER:

Right on …

MARK TIMMERMAN:

… and the Everlasting Portfolio have been home for that new money.

TOM GARDNER:

How is your wife connected into the investment decisions and what success have you had in getting your children investing? But really looking at the entire family and trying to get every family member of a *Motley Fool One* member investing has been an aim of ours, but it's going to become a much more intentional aim in the year and years to come. So, how's that going in the Timmerman household?

MARK TIMMERMAN:

I'm really excited about the future, but I can tell you right now. I have a 17-year-old that's getting ready to go into a pre-law program, and I've not been as successful at luring him in or interesting him in the way I want, but I'm giving that time. I'm also trying to make sure that I do the right things to meet him where he's at rather than try to bring him along where I'm at. My daughter is more focused on probably being a teacher some day and has not shown any interest at this point. That's a development area for me.

But my wife is an actuary by profession. She's hardwired for number crunching. She leaves the more organic side to investing to me, but we talk about it constantly and she's very interested and has a tremendous amount of confidence in watching my experience over the last 17 years with the Fool. So, very supportive. She's hands-off, but very interested in hearing about how things are working.

MATT ARGERSINGER:

Mark, Matt here from *Supernova*. Thanks for joining us. How are you doing?

MARK TIMMERMAN:

Hi, Matt.

MATT ARGERSINGER:

I love the story about Netflix, Starbucks and Buffalo Wild Wings. You've held those companies for so many years. That really is the game that we're trying to play in *Supernova* with Odyssey 1 and I know Tom's playing that game with the Everlasting Portfolio. Is there a company that you see in *Supernova* or in the Everlasting Portfolio that you say, "This is the one. I'm going to hold this one for many, many years. I see so much upside for it. This is going to be a driver, a meat and potato of my portfolio for a long time."

MARK TIMMERMAN:

Oh, gosh. I should have my portfolio in front of me.

MATT ARGERSINGER:

I'm putting you on the spot, I realize.

MARK TIMMERMAN:

I'm really excited by what I see in LinkedIn. I've been very fortunate to get in well under $100 on that one and the growth has been nice. One of the most valuable parts of any of the services — and with *Motley Fool One* — you get access to all them … are the discussion boards. And the education I've received is literally priceless. In my estimation, you could almost get a finance degree really, if you wanted to dig in deep enough with all the information that's available to you.

LinkedIn is one of those companies that I've learned a lot more about. I knew very little about it. I apologize …

TOM GARDNER:

Here's what we're going to do for you, though, Mark … or at least I've got a couple of ideas … and then if anyone wants to chime in any. I've got some stocks for your kids. I'm going to make a couple of recommendations for your children …

MARK TIMMERMAN:

Excellent.

TOM GARDNER:

They may not have taken to the subject yet, but maybe if we go into the center of their area of interest … So, for the lawyerly son, there's a company called RPX Corporation. I believe it's Rational Patent Exchange. It has to do with patents — essentially large technology companies helping this organization buy patents that they then rent to the larger businesses. It came public in the last year and a half.

And in general, when trying to get a child interested, it is more important to pick something that's interesting to them than to pick a winner … although both is the ideal. But for your daughter that's interested in becoming a teacher, I would say obviously Amazon. That's the place to go for all the reading materials that you can find. LeapFrog or K12. That's a *Rule Breakers* recommendation, I believe. Do you all have any legal or educational stocks to give to Mark before we let him go?

RON GROSS:

Hm.

MATT ARGERSINGER:

Hm. [00:24:39]

RON GROSS:

Coach. They're going to need briefcases.

TOM GARDNER:

I love that …

RON GROSS:

I vote for Coach.

TOM GARDNER:

And Coach is …

MATT ARGERSINGER:

He's got to play video games, too. Activision and Blizzard's out there.

TOM GARDNER:

Yes. Activision Blizzard. Okay, Jeff. You're on the spot now. Everyone's got one.

JEFF FISCHER:

I would say eBay. Let's do — when you're filling up your dorm room — that's eBay's price point.

MATT ARGERSINGER:

And probably going to be involved in some big legal dispute over the next few months.

TOM GARDNER:

Sounds like it. [crosstalk 00:25:02]

MARK TIMMERMAN:

MercadoLibre is one of the ones that I've been very pleased with lately. It's [00:25:10] nicely and that's the one I've followed which is kind of a Latin American sister to eBay.

MATT ARGERSINGER:

Absolutely.

TOM GARDNER:

Mark, let me say in closing, it's our honor to serve you as an investor and to provide tools and ideas to help you build your portfolio and a financial plan of that portfolio. But I also just want to say how much I've enjoyed talking to you at the last member events. Hanging at the Minor League baseball game in St. Paul, Minnesota. That was a really great summer two-day that we had there. So, thanks so much, and I look forward to seeing you again at a future event.

MARK TIMMERMAN:

You're very welcome, and it was a real pleasure. It was a real thrill to talk with all of you folks.

RON GROSS:

Thanks, Mark.

TOM GARDNER:

Fool on!

JEFF FISCHER:

Thanks, Mark. Fool on!

TOM GARDNER:

Now we turn, without headphones, to your questions. I'm just going to take them in order. So, we've got Hilltop Gray has written in. "Should options be a part of every investor's portfolio?"

JEFF FISCHER:

I'll take that, and I'll say no.

MATT ARGERSINGER:

Thank you.

JEFF FISCHER:

I'll say no. You should give it a try, like anything. If you have a goal to make income stay or to protect your portfolio or you're adverse to downside and you want to hedge — then options are a tool you can certainly use. And see if you're comfortable with it. I honestly believe there's no better place than The Motley Fool to learn to use options in a Foolish way as an investor — when you use them as investors, not as traders.

And so, if you have a goal such as income, protecting yourself, or leveraging for upside with less money at risk … Like you can buy calls on Coca-Cola instead of buying Coca-Cola stock and pay a fraction of the money and have the upside. But then, there's a place for it. So, give it a try and see.

RON GROSS:

Awesome. Jeff, would you agree that it takes a little bit more activity, you need to pay a little bit more attention … or maybe a lot more attention … to your portfolio if options are a part of it?

TOM GARDNER:

This is Ron competing with you.

RON GROSS:

No, no. It's literally a question …

TOM GARDNER:

… over the *Million Dollar Portfolio*.

RON GROSS:

It's literally a question … versus a [00:27:06] like *Million Dollar Portfolio*? Shameless plug. Would you agree that it does require some more attention?

JEFF FISCHER:

It depends on the strategy you use, but in general, it requires a bit more. But you can do — as we did recently in Pro — we set up a 2016 option position on Coca-Cola …

RON GROSS:

Mm-hmm …

JEFF FISCHER:

So, we can let that go for two years.

RON GROSS:

That's great.

JEFF FISCHER:

If you're making income every month, then as those ideally expire, you write a new one. So, that's some monthly activity.

TOM GARDNER:

For regulatory reasons, I'm not going to be able to say very much about this right now, but I know that you have heard about our new solution that's part of *Motley Fool One* and that's separately managed accounts. And separately managed accounts — there will be a separately managed account option for *Motley Fool Pro*, so you will be able to have your money essentially managed by Jeff's ideas, and that will bear no assets-under-management fee. That's a really incredible … Just one statement on that.

You're not going to find many places out there in the financial world that are going to manage or help you manage your money without an assets-under-management fee. But when you actually look at that fee play out over — not just a year or three years or five years … but over ten years, fifteen years, twenty years where you're paying 1-2% of your portfolio in fees — what I think is going to happen here is we're going to see subscription membership at The Motley Fool significantly undercut that and our move to offer separately managed accounts where you can have *Motley Fool Pro*-like performance without having to spend any time should you choose not to.

Now we go to Pinky who says something in here … Pinky, you're going to upset one member of our panel with this. "I'm a Pro member. I'm an ex-*Supernova* member …"

MATT ARGERSINGER:

Oh …

TOM GARDNER:

Oh, wow. There have been some great returns in *Supernova*, but you had your reasons, Pinky, I'm sure.

"Now my question is in *Motley Fool One*, how do you suggest a member divide their capital between all the services? Is it only for those who have enough to create a reasonable portfolio in each of the multiple services?" I'll take a shot at that first, and then if anybody wants to jump in …

No, it is not our belief that you should have a full-blown portfolio that matches up with each one of the services. In fact, one of the key features in *Motley Fool One* is our Top Recs ranking of … Gosh, there are more than 450 active recommendations across all of our services. And what the Top Recs list does — and our analysts and advisors work on that each month — is it ranks from 1 to 50 the recommendations across all of our services. What we're trying to do is to help you build the right portfolio for yourself.

Now, there are certainly *Motley Fool One* members that are managing multiple portfolios. There are people who are running family offices. There may be a reason to set up multiple portfolios. But our goal in *Motley Fool One* is to set up the right portfolio for you that meets your needs, your risk temperament, your interests, the businesses that you want to learn about and focus on and your style of investing. No, our goal isn't … We're not trying to push you to a huge, huge allotment across each service.

From Diane. "I'm very interested in joining. I currently have *Motley Fool Options*, *Stock Advisor*, *Rule Breakers*. I am really enjoying Options and what I'm learning. Is *Motley Fool Pro* — which I'm interested in joining — is *Motley Fool Pro* part of *Motley Fool One*, Jeff?"

JEFF FISCHER:

Yes. A beautiful, easy answer. *Motley Fool One* is all access to all full services and big extras, including Tom's Everlasting Portfolio that is only in *Motley Fool One* … financial planners financial planning tools and the separately managed accounts that Tom mentioned. So, yes, you get everything and that's the beauty of this service. And you get to apply your current membership as a credit towards your One membership, so it all rolls over into One.

TOM GARDNER:

I guess I'll put it this way. I think that what we're trying to set up is the easiest pathway for you to be as involved and to build as much of your portfolio around our concepts as possible — and one of the key principles in that is the one-year money-back guarantee.

So, if I were living in Missoula, Montana, as I once did, and I were tapping into The Motley Fool not working for the organization — I would take advantage of that one-year money-back guarantee because you can come in, look around. Any service — whether it's *Motley Fool One* or any other service you're interested in — enjoy it for a day, a week, a month, 362 days. And if you decide it's not right for you, you let us know and we refund you in full. Our desire is to set you up on the right path for the next 10 to 20 years, and if a particular service is or isn't right for you, we want you to check it out.

I love the screen name of this next Fool member. MFNorway, which is awesome because MF used to be our nomenclature for somebody working on our staff back in the days when were on AOL. We were all MF … MFJoe … and now we're TMF out there. But MFNorway harkens back to another era.

"Hi, Fools. Given that as you discussed initially, it's more difficult to find attractive investments after the five-year bull market … and that some shares that are attractive long term but which missed their market may feel have run ahead of themselves … the question that I have is should *Rule Breakers* and *Supernova* customers rotate away from the growth stocks which tend to struggle in volatile market times?"

MATT ARGERSINGER:

Ow. [crosstalk 00:32:13] My initial answer would be no, and that's because we are looking at all these companies with three to five-year time horizons in mind and I would say … One thing David will often say and that I repeat — because I like to repeat everything he says — is that we are always interested in buying high.

It might look like we're paying an expensive price for a stock, but that's because we love the fact that the market's recognized that we're paying a high multiple and generally that's a little bit contrarian. Most investors out there are looking to buy the bargains. They're looking to buy cheap stocks. Stocks have come down in value.

We're actually the opposite. We get actually more excited about stocks that have run up quite a bit because we actually think there's a lot more to go and we think that says something about the business behind the stock, as well. So, we're not afraid of high-priced stocks.

TOM GARDNER:

What happens in an environment where so many companies have seen their stocks rise? In other words, is there a period at which you or the *Supernova*/*Rule Breakers* philosophy says it's no longer a distinguishing feature to be considered overvalued because …

MATT ARGERSINGER:

Yes, because everything's overvalued …

TOM GARDNER:

… because the market has gone up. It's like at 2000 and everything looks overvalued. Is that a time where you change or modify your approach or literally it's, "Hey, rolling ten years. We're trying to optimize it. If we have a roller coaster ride that takes us down 30% in an 18-month period, that's not going to present us a problem."

MATT ARGERSINGER:

No, not at all. One thing I always harken back to is that you could look at an investor who came in, in October of 2007, which was the month prior to the peak of the last bull market before … Of course, we know what happened in 2008. And that person, even if they invested their entire net worth, at that point in time … as long as they were investing a proportionate amount every month beyond that into the index or into their favorite companies … a few years later, they were not only in positive territory, they were way ahead of the market.

TOM GARDNER:

So, if you have income and you're getting into the market on a monthly, quarterly, annual basis … you really should be much less concerned about what the overall market's telling you …

MATT ARGERSINGER:

Right …

TOM GARDNER:

If you are at a point where you have no new income and you need to draw off that portfolio, does your philosophy change at all if your time horizon or need for the capital changes or not?

MATT ARGERSINGER:

I'd probably say it does. I mean, I would have to say if you don't have new income coming in, and you know you're going to need money within a five-year time frame, then I think your decision making changes a little bit.

TOM GARDNER:

Got you. But so many people in semi-retirement or retirement — they've got 30 years. We've got more time in our lives in semi-retirement or full retirement. I think at The Motley Fool we're probably big advocates of semi-retirement. Staying active …

MATT ARGERSINGER:

Right …

TOM GARDNER:

… working as Mark said because you love it, not because you have to … so, finding something you love, continuing to generate some income and invest that. But regardless, we're going to live much longer and I think many people are not preparing their portfolio for that and are fearful of the equities market short-term blips when they really should be reminding themselves that "Hey, rolling 10 and 15 and 20-year periods are exactly the place to be."

MATT ARGERSINGER:

Right.

JEFF FISCHER:

And I think if you're concerned about a downturn, which will inevitably happen at some point … maybe this year …

TOM GARDNER:

I hope so. Are you aware …

JEFF FISCHER:

I know you are. I know you're rooting for lower prices …

TOM GARDNER:

Yes, yes. I have to explain that in a second.

JEFF FISCHER:

So, remember that. Mark that down. This is going to take ten minutes, but …

TOM GARDNER:

Good. Go for it. I love it. I'm going to see if I can find water.

JEFF FISCHER:

Uh, where is my train of thought? So, it's important to have a positive action that you can take when prices fall. The people who are saving money — of course, they have something to do with it — so their mind is in the right place. Like, "Great. I can invest this money." But if you're not saving any money — if you're 100% invested and the market falls, your reaction is to start to worry …

TOM GARDNER:

The only positive action would be departure from looking at my portfolio …

JEFF FISCHER:

That would be good.

TOM GARDNER:

So, my positive action … If I have no new income, the market's down 30%, I will not go look, because I can't make, really, any meaningful changes.

JEFF FISCHER:

But as every action calls out for a reaction, too many people, as we know, will sell, because that's all they can really do. They feel trapped, so they'll sell. So, that goes back to having some cash, especially if you need money or you're not adding money …

TOM GARDNER:

Mm-hmm …

JEFF FISCHER:

… or, like we do in Pro, hedging frequently and when the market declines, your hedge pays you and you can then reinvest that cash.

TOM GARDNER:

Jeff, I really love the concept of what's your positive action when the market declines. What have you created that's going to allow you to be somewhat excited by a 10-20% recline? Ron?

RON GROSS:

The question focused on Mr. Market and I would really prefer that investors don't think about Mr. Market. Think about companies.

TOM GARDNER:

Anti-Buffett. This is an anti-Buffett play from you.

RON GROSS:

I would prefer that the individual investor focus on companies. We talked once before about it. I wish it was called the "company market," and not the stock market, because you're truly an owner of each of these companies.

And, as Buffett says, you can buy the same steak on Friday that you bought on Monday at a discount, you should be a happy man, because you're getting a steak at a discount. And that's the way I think about stocks, as well. If I can buy a company that I love at a cheaper price than I bought it a month, a year earlier … then I'm a happy man. I am not sad in any way. Because I am a long-term investor and I have a long-term time horizon — I will let Mr. Market do whatever he wants to do and I will be an owner.

TOM GARDNER:

These are the days when saying you're a long-term investor looks really, really smart … and you know there are a lot of people out there … and there were a lot of headlines in the financial media … and I read a lot of people that I see giving investment advice out there that were saying, "Long-term investing is dead," four years ago or six years ago or ten years ago. And now, you see the benefits of sticking with businesses in the company market and thinking about the prospects and adding money in down periods.

What I want to do now is I want to start with Ron. Put you on the spot first with a slightly trick question. Whoever goes first should be allowed to defer — but here's what it is. I want to know what your most controversial belief is. What your most unorthodox, unusual or flat-out controversial belief is about investing.

It could be about a particular company. It could be about the market. It could be about a philosophy. It could be something you disagree with that you've heard others say at The Motley Fool.

RON GROSS:

I come from a relatively traditional Wall Street background. I used to be a hedge fund manager. I lived and worked in New York for years and I come from that realm. And when I get together with friends or former colleagues that are still of that mind-set — which I am no longer. I am a proud Fool — I get those same kind of conversations and those same kind of questions. What do you think of the markets? What do you think of this? What do you think of that? What are you doing? What deal are you doing?

And I just want to say to that person, "You've got to calm down. Turn off CNBC. Focus on companies one at a time for the long term. It's not about what are you going to do this month or this quarter and what kind of returns did you put up and what kind of fees can you generate? Relax. Invest in companies long term."

TOM GARDNER:

Love it. Jeff. Be radical.

JEFF FISCHER:

Be radical. Well, I don't know how radical this is, but I will say I think probably all of us here, and maybe everyone watching, would have more money in the end if they just never made any sell decisions ever. But how do you get there? That means you're trapped. Why are you investing, then, if everything you invest you can never touch?

TOM GARDNER:

Well, you touch it if you need the cash or have something you want to enjoy. You don't sell because of the valuation, the business, anything that's going on. You let all of your existing investments just run until the end of time and you say, "Recognize that you may need to take cash out at different points along the way." But you're saying, "Leave that factor aside. That portfolio will outperform what you're doing right now."

JEFF FISCHER:

I believe so. And now that may signal that we're at the end of a five-year bull market. But really looking back even further from … Say you started in 1987, as I did. Almost everything I've sold along the way has been a mistake — almost everything — and the few things that I sold that then went down … well, they've become minuscule over time …

TOM GARDNER:

Thanks for the feedback there …

JEFF FISCHER:

… next to the things that I held or would have held.

TOM GARDNER:

Your losers get smaller and less relevant every day.

JEFF FISCHER:

Yes. Now, we're not about to go there in Pro …

TOM GARDNER:

Why not? You just told me this is the best way.

JEFF FISCHER:

Because it's over a lifetime and it's in aggregate and Pro is a very focused portfolio. Twenty positions, twenty-five is all we have. And we don't have new money coming in. So, if we see something we like better, we need to sell to buy it. But for most of us who are fortunate to be working and have savings, we should take some [crosstalk 00:40:31] …

TOM GARDNER:

So, if you have someone in your family that's under the age of, let's say 30, your primary advice to them as an investor to get the maximal, optimal results, is to buy the things according to a variety of factors that we teach at The Motley Fool and never sell …[00:40:44]

JEFF FISCHER:

Find what we call in Pro — taking it from Chuck Akre — find compounding machines like a MasterCard or a Google. Buy those and keep adding to them. Don't think about selling, especially at this age.

TOM GARDNER:

Love it. Radical!

MATT ARGERSINGER:

Oh, God!

TOM GARDNER:

Okay. Matthew. Shake the world.

MATT ARGERSINGER:

Jumping off Jeff, here. I think the buy high, buy higher idea … It's just not practiced enough by most investors. I think what David says often — we're so willing to trim the flowers and water the weeds and you should almost be doing the opposite. You should be ignoring the weeds and forgetting the weeds and continuing to buy and invest in your flowers. And I think that's so hard to do.

If I look at some of our biggest winners in *Supernova* … Zillow, for example. We've bought Zillow three times, and each time it's been at a much, much higher price.

TOM GARDNER:

And it's been volatile. There have been times when it's down and you're like …

MATT ARGERSINGER:

It's very volatile …

TOM GARDNER:

… wow. Could be we made the wrong decision. But if that happens, that's going to happen. However, it's ended up being, obviously, an unbelievable business.

MATT ARGERSINGER:

Right. This might sound crazy because we're in a big bull market and we have nothing but rising stock prices — but back to Jeff's point — over time, if you look at long periods of time, if you just added to your winners … the winners are the ones that are usually being recognized, not only just because the stock market's excited and people are excited about the stock, but people are excited about the business. And the business is going places and it's being recognized by the market. And it's achieving a higher value for a reason and you should double down on those all the time as much as you can.

TOM GARDNER:

Love it. I'm going to go, contrary to Jeff, for the fun of it … even though I basically agree with Jeff …

RON GROSS:

Just to confuse everyone …

TOM GARDNER:

I really do. I think that for the most part, our discipline should be to never sell … not just because we don't lose a great winner … which is the greatest mathematical pain to your portfolio is to watch something rise 5-20x and you sold it. Because how many bankrupt investments are you going to have to make to catch up to the losses that you didn't get by holding that incredible winner?

But I'm also going to agree with Jeff before taking him out at the knees for a second for another reason, and that is that if you have the mentality of "I never sell," you look for very different types of businesses. You look at the culture of the company. You look at the leadership differently. You look at the product line. It's not like, "Wow. They have one incredible innovation right now." It's, "Do they have a system for innovation that's going to lead to greatness over 15 years from now when we can't even know what the consumer marketplace will look like?"

There may not even really be malls. There may just be warehouses where products are being dropped off in driverless cars and it's all incredibly convenient for us to just sit at home and order everything, and it's all the home-related things we should be focused on, as investors now.

We don't know what the world is going to look like, but what do I think is a company that can adapt through those multiple different environments? And so, those are two great reasons to never sell. Mathematically you'll do better and number two, you'll look at the companies that you invest in differently before you make the investment.

I do think that there are a couple of situations where I would sell and I want to share those now. I guess it's not radical, but I just wanted to go contrary to Jeff. As Ron was saying, everyone loves Jeff and Ron's parents are watching, so it's indirectly a way of saying, "Solidarity to the Gross family!"

Here are a couple of sell rules that I have and in the Everlasting Portfolio and *Motley Fool One*, we're mandated to hold at least five years every single investment. We're going to learn from them. We're going to get the best long-term results out of all of them. I know it's surprising to some to think that you would continue to hold something you don't believe in, but I can assure you that some things you don't believe in now end up delivering awesome results. They just had a downturn and a bad cycle in their industry or bad performance with this leadership and something changes. And of course, we'll have some losers that just remain losers … but your best results will come from what Jeff said.

But here are my four sell rules, if I can remember them all *after* holding a business for five years.

1. If there is a major shift competitively in the marketplace that makes me think the business is losing pricing power. Warren Buffett's number one factor is he looks back across all the investments he made through his life. The single factor that he sees matches up with the best performance in his portfolio is pricing power. They have the ability to raise prices.

That's why when I interviewed Jim Sinegal in *Motley Fool One*, I just loved what he said about Costco … that they feel they have always had pricing power, but they have never fully utilized it and they never will. That is true pricing power. It's not like, "Wow. We have pricing power and we're extracting every additional dollar we can from our buyers." No. "We have pricing power and will never do that because we want to maintain a great relationship with our buyers."

So, if I see loss of pricing power, that's a real concern.

2. Succession. Leadership change. Will Thorndike, the author of *The Outsiders*, which is a great part of our *Motley Fool One* experience right now in the member lobby … I highly recommend that you join us. *The Outsiders* is a wonderful book that shows eight CEOs that allocate capital in an unorthodox way and have run their businesses differently and have delivered in excess of 20% a year, in most of those 8 cases, for more than 20 years.

And I can tell you that if you run the numbers on your calculator to what happens when you invest in something and it rises 20% a year for 20 years, you have your family taken care of financially with small, regular investments in businesses like those.

And when I talked to Will and interviewed him about the book about three or four weeks ago, he told me that he spends, in evaluating the CEO — just the CEO of his investments — 30-50% of his investment time is just on the CEO.

First of all, I love seeing that. As we talked about, I love the opportunity to study how different people invest … Seth Klarman, different approaches and all the rest. And I believe that you could crush the market by spending 50% of your time on just the CEO, because you'd start to see things about leaders that are different and a distinguishing factor. And so when I see succession away from an awesome leader, I get concerned.

Talking to John Mackey, our board member … co-founder and co-CEO of Whole Foods … we were talking about the difficulty in succession at Coach, which is a wonderful business under Lew Frankfort. It's a tough industry, and we'll see whether the next CEO can manage things as well as Lew Frankfort did, but it's definitely a concern point. None of these are automatic sell. They're just, "Hey, I have to start thinking what I should make of this situation."

3. The third one I'll say is companies that are too big to succeed. I know this is going longer than we expected. There will be a quiz. So, companies that are too big to succeed worry me. The data going back to 1950 shows that the largest company by market capitalization in the world loses to the market by 40% over the next 10 years.

It still makes money. It just doesn't do as well as the market, so I look very closely when a company is just the largest in the world or the largest in its industry. Those, actually, tend to become points where they slightly underperform and the disrupters come along and take a lot of the market opportunity in that industry away from the frontrunner. So, that's a concern.

4. And then the fourth one is whenever a stock, for me, has become more than 20-25% of the overall value of the portfolio. That would be a time to sell and bring it back into line so that I don't have 60% of my portfolio in a single position. We all feel differently about that, but those are my four sell rules.

JEFF FISCHER:

Nice.

RON GROSS:

Your sell rule about the companies that get too large — is that your proxy for valuation in the sense where you think at a certain point the stock goes up so much that it's unlikely to get you market-beating [crosstalk 00:48:03] …

TOM GARDNER:

That's a really beautiful way of thinking about that, and I'm not just saying that because your parents are watching. I think that's really a great way to view it. I mean, you look at Apple, and Apple's trading at 9x earnings. And everybody's like, "This is shocking." And in a way, it *is* shocking because Apple's a much better company than trading at a multiple … almost a 35-40% discount to the market's average multiple.

But I think that if you look back at the last great performing market … Well, let's go back to the late nineties … Microsoft, Intel, Cisco — they were basically like sure things. They had Bill Gates, Andy Grove, John Chambers. They were like lock-ins. They had balance sheets that were bigger than Fort Knox. They had the future on their side. Software. Chips. Networking. I could imagine so many different ways that they could take their businesses, but their size made it difficult.

Google has been an awesome investment for us across The Motley Fool and in the Everlasting Portfolio. I didn't expect it to essentially double since we recommended it, and it's done better for others who recommended it earlier. Google, to me, is one of if not the greatest companies in the last 100 years. And given how more difficult it is to run a company today — more global, 50,000 people — it's more difficult to run a business today than it was 50 years ago, so I think Google's probably the greatest company in the last 50 years.

But it's of such a size and scope now that I definitely don't feel I'm getting a triple from Google over the next seven years or eight years. And so, it just becomes a little bit less interesting to me as an investment, although as a company I love reading and studying and learning about they're doing.

JEFF FISCHER:

Sounds good.

TOM GARDNER:

Wow.

JEFF FISCHER:

I was going to say. It will be interesting, when Google is twice as big, to see what you're thinking at that point. In the next seven to ten years, it may be twice as big …

TOM GARDNER:

I certainly think it could double in the next seven to ten years. You know, one think you learn from *The Outsiders* is that I wonder whether these companies should begin spinning off divisions and paying special dividends. Essentially, you could have had Microsoft … In fact, I said this on CNBC in 2003, I think, on … What's that? I forget the name of the show. I'm sorry. I'll remember it.

But I said basically Microsoft should voluntarily break themselves up right now. Create entrepreneurial units and essentially give all the shareholders stakes because it happened to Standard Oil, and what happened to those oil companies over the next 70 years? Their market performance was unbelievably outperforming. I mean Exxon — you had incredible performers, and when you broke them apart, you gave them a new entrepreneurial lease on life.

RON GROSS:

Especially with companies like Google or Amazon, where there are going to be so many business lines that are not core to search or online retailing, it may make very good sense …

TOM GARDNER:

To capitalize them and spin them off. Yes. I guess I'll say that maybe my most controversial belief is that I have a little anxiety about the large … [00:50:58] about social media companies … about the large technology companies and the almost can't miss feeling about them that develops because of their incredible performance. That would be an area of a little caution that I would be placing as an investor.

JEFF FISCHER:

Tom, that makes me think of Everlasting Portfolio and *Motley Fool One* and it makes me want to ask …

TOM GARDNER:

Bring it!

JEFF FISCHER:

… to share your vision for Everlasting Portfolio and then for One, as a whole for the investors out there.

TOM GARDNER:

Great. So, Everlasting Portfolio adds $100,000 every quarter. We buy five separate investments. We have the option to leave some of that money in cash or to make investments. We've made investments all the way through. We're about 29 percentage points ahead of the market, maybe 27 percentage points ahead of the market today. That's been awesome. It doesn't compare to Odyssey. So, *Supernova*, which is part of One … That's the great thing, is that anyone who beats me, is a part of *Motley Fool One*.

MATT ARGERSINGER:

It makes it tough to be an employee.

TOM GARDNER:

Just so you know. I created *Supernova*. No. So, the Everlasting Portfolio benefits from all of the research that's happening at The Motley Fool. I get kind of a bird's-eye view, as a *Motley Fool One* member does, on everything that's going on in *Income Investor, Inside Value, Million Dollar Portfolio*, *Supernova*, Pro, Options, *Hidden Gems*. So, I've got a great view.

And then we do all of our own original research, as well, alongside that. So, we're building with a team of about ten investors now, our approach. We'll make five rounds of investments. We mandate holding for five years.

And I guess my view is we've got about $1 million in the portfolio now and I'm excited about looking down and seeing that at $5 million, $10 million, $15 million, $25 million and higher. I think when you run the numbers and show what happens if you generate 13-14% a year — which I think is possible with great long-term business focus, tax-deferred investing — and you run that forward 20-40 years, it's unbelievable the snowball that grows.

JEFF FISCHER:

When does your next investment take place?

TOM GARDNER:

Our next scheduled investment takes place on April 1. And then overall, *Motley Fool One* … Guys, I'm speaking quite a bit right now. I apologize … *Motley Fool One*, by integrating all of the services, is designed to give you the dashboard for what we believe in most. It gives you the opportunity to learn from each of our advisors and to see their most highly beloved investments right now and to see those investments compared across services with a ranked list.

I think what you're going to find in The Motley Fool — now we are adding separately managed accounts as we mentioned. There are pretty much two pathways with *Motley Fool One*. One of them is … Let's put it in the "lite beer" commercials from fifteen years ago.

One of them is Tastes Great. I'm avid. I'm passionate about this. When John Mackey joined our board he had, a couple of months before, become a member of *Motley Fool One* and he called and told me, "Pretty much, I'm done almost nothing for the last two days. I am totally obsessed. I've read through all back issues of *Rule Your Retirement*. I've read *Inside Value, Income Investor*. I'm not just improving my investment portfolio. I am actually learning a lot about these companies and I'm learning a lot about business that's useful for me." So that's the Tastes Great group that wants to dive in and loves this subject.

Then there's the Less Filling group and I think we're going to build out a lot of Less Filling services, particularly because our Tastes Great member has family members … a spouse, children, grandchildren … that they want to pass this onto …

MATT ARGERSINGER:

Plus parents …

TOM GARDNER:

… connecting them in through the Less Filling. Like, "I don't have a lot of time or interest, or my temperament isn't right to be an investor." Separately managed accounts. The access to a financial planner. And I frankly believe that more and more of your investing and financial advice that you see out there is going to be initiated by human research and proven, long-term public performance records which you don't see across the financial services industry.

Please tell me when you meet with an advisor or broker if you can look at their record and if that record is published and compare it to everyone else. It's very difficult to do, but that's coming because of the Internet, and I think that you're going to find a lot of this will be automated. Off of the initial research that is done, you'll be able to put your personal factors, your needs, essentially in surveys, building a profile, and then you'll get the guidance that really works most effectively for you. And that will happen for your kids, your spouse, your parents, etc.

JEFF FISCHER:

And *Motley Fool One* is already going down that route with [crosstalk 00:55:33] …

TOM GARDNER:

That's a big focus of ours. I kind of feel like the best comparison for our company right now … It's very nice to say this with our stock at $250 a share having gone up almost 10x in value in the last two years … but I think of us, a lot, like Tesla because I think that what we're doing does run contrary to the industry, so I'm sure we'll get some complaints.

But that's not important. We want them to follow. Tesla wants as many electric cars out there in the market as possible and we want as much long-term business focus investing with transparency, performance records that you can follow and that have beaten the market over long periods of time — we want as much of that out there for the individual as possible and it's not readily available and hasn't been in my lifetime. So, that's one of the biggest motivators for us. Team!

JEFF FISCHER:

Thank you.

RON GROSS:

It's great.

TOM GARDNER:

Okay. One stock from each person. Here we are. It's 6:13. I guess we have two minutes left, although Steve, our producer. Steve, you have appeared to check out on this. I'm looking at you looking down at the monitor as if you're playing World of Warcraft or Ticket to Ride, which is integrated into *Motley Fool One*. But we probably have about two minutes? Would that be right? Yes, excellent. Two minutes. Each one of us will share one investment that we think is a market beater over the next five years.

RON GROSS:

This is a little staid. It's not too sexy, but it's just a wonderful company …

MATT ARGERSINGER:

It's Markel.

RON GROSS:

It's Markel. MKL is the ticker symbol. Specialty insurer run by wonderful people who are Foolish in their own right. Tom Gayner, the chief investment officer, has an incredible track record. Not only does Markel make money on insurance which many insurance companies don't, but they invest their capital and they're great stewards of investors' capital, as well. I would be happy to own that company forever.

RON GROSS:

MKL.

JEFF FISCHER:

MKL. Markel is sexy compared to the company I'm about to …

TOM GARDNER:

Okay, love it. I think I know where you're going. I know where we're going here.

JEFF FISCHER:

At the *Motley Fool One* member event here in Alexandria last month, I brought this up …

TOM GARDNER:

Telephone poles.

JEFF FISCHER:

Telephone poles and light poles and utility poles. Valmont Industries. Ticker is V as in victory, M - I. And it's beaten down right now because irrigation sales were … they also sell irrigation systems for farmers … were a record high in 2012 and softened up last year and they're going to be softer this year, too. But we like that. It's in a down cycle. The stock is inexpensive in a relatively more expensive market. It's a defensive investment and it should grow well over the next five years. And it's been an outrageously great stock for the past 20 or 30 years topping pretty much everything I can look at.

TOM GARDNER:

Out of curiosity, do you expect your stock to double over the next five years? Markel? Valmont? Are you thinking 15% a year? Is that your target when you make an investment?

RON GROSS:

The Rule of 7 would say 7 years at 10%. So, can we do five years? Yes, I think we can. I think Markel can.

JEFF FISCHER:

We're hoping for that, too.

TOM GARDNER:

Double in five years. Right on.

MATT ARGERSINGER:

I'm going with the outsider theme here. One stock that makes up a big part of my personal portfolio is Biglari Holdings. It's ticker BH run by Sardar Biglari who counts, among a lot of his heroes, Henry Singleton which is certainly one of the premier outsiders I think for the last 50 years in terms of investing. So, you've got Sardar Biglari, Biglari Holdings. They own Steak 'n Shake, which is a Midwest burger chain. Pretty well known. They own a big chunk of Cracker Barrel.

And they recently, a week and a half ago, bought *Maxim* magazine. Talk about sexy, right? But he's amalgamated all these businesses together and I think, more than any investment that I've known … and I've studied Biglari. I've met him several times. I've been to every annual meeting over the last five years. And I think this is a company that I'm confident he can deliver 15-20% annual returns per year.

TOM GARDNER:

Love it. Is that a *Supernova* or *Rule Breakers*? Is that a Live Rec?

MATT ARGERSINGER:

I have tried and I have tried … [crosstalk 00:59:19]

TOM GARDNER:

There's a team-based approach.

MATT ARGERSINGER:

[00:59:23]

RON GROSS:

He's an activist, and something …

MATT ARGERSINGER:

He's a bit of an activist …

RON GROSS:

… and he rubs some people the wrong way.

TOM GARDNER:

So, Biglari is not a Live Recommendation anywhere because of you at the Fool. Is it a Live Recommendation?

RON GROSS:

It used to be a *Million Dollar Portfolio* one when it was Steak 'n Shake.

MATT ARGERSINGER:

When it was Steak 'n Shake …

RON GROSS:

Then he took it over and we said bye.

TOM GARDNER:

Got it. Got it. So, there's a disagreement about Biglari as a leader of a public company.

RON GROSS:

Yes.

TOM GARDNER:

Awesome.

MATT ARGERSINGER:

I would say he's the meaner version of Selim Bassoul. Of course, as the CEO we love him and Middleby that you own in Everlasting Portfolio …

TOM GARDNER:

And why do you say that out of curiosity? What do you read in him? Obviously you favor him. What is the edge to him and how do you …

MATT ARGERSINGER:

So, Sardar. If you look at Buffett or Selim, to a certain extent … I mean, these guys are always trying to do friendly deals. Friendly investments. "We want to work with you." Sardar is a guy who comes in and says, "No. I think I can do it better than you."

TOM GARDNER:

Like icon, a little bit. There's a little icon flavor.

MATT ARGERSINGER:

A little bit of icon. Better than icon, but certainly more of an icon flavor.

TOM GARDNER:

But would we say an icon? He's been an unbelievable investor, right?

MATT ARGERSINGER:

Absolutely.

TOM GARDNER:

Interestingly, about these three companies, because I'm actually going to add four to them, but it's the four outsider companies that we're following right now in *Motley Fool One* in our showdown to our March Madness of finding the best one to invest in. But what's interesting to me is that each of you has essentially picked an outsider company. I don't know about Valmont's leadership, but with a 20-30 year return, I'm going to be interested to learn more with them having done so well.

But these are three companies that the average person has never heard of. I mean, please tell me if anyone in your family has ever heard of Markel, Valmont Industries or Biglari Holdings. I'm going to guess that the answer is no for 99% of the adult U.S. population. And we need to remind ourselves at certain points in time that the stock market is an auction market and where everyone is bidding, two things can be happening. One, there's something unbelievable there and the bidders are right. Rembrandt is Rembrandt — but remember there was also a time in Rembrandt's life where Rembrandt could barely sell his paintings to pay off his debts in the end of his life.

So, you guys have identified three unknown companies that there aren't a lot of conversations about — therefore there aren't casual buyers of the stock who don't really follow it, because they've never heard of it. And I'm going to add to those three Leucadia, which is an outsider business that we're following, Valeant Pharmaceutical, Amazon, which is known, and Berkshire, which is known.

So of the seven stocks we've given you, two of them you've heard of. You would never really have heard of Berkshire Hathaway if it weren't for the fact that Buffett became, essentially, a legend as an investor. The businesses that he is buying, for the most part, and the way he's run his company is much more Markel-like or Biglari-like and not necessarily would you ever follow and get to know what that holding company is all about.

So, there are seven stocks. I'm going to put these seven stocks in the CAPS portfolio. I believe these seven stocks are going to deliver excellent returns over the next five years and I am interested to see in this environment — maybe it was or wasn't in this environment — that we've all focused on companies that are unknown great performers. And that's how I tend to think. When the market starts to look a little bit stretched to me, I look for the underfollowed and the unknown star performer to find the better values out there.

The most important point I can close with is that we're super long-term investors. Morgan Housel has done so much great work for us in *Motley Fool One* over the last year — the special reports — one of them showing that the market falls 10% every 11 months going back more than 100 years and that those drops are pretty evenly distributed. It's not like they're all bunched into a six-year period and then you have fourteen years with no 10% drops …

RON GROSS:

And your earlier comment that you were rooting for …

TOM GARDNER:

You're right, Ron. Thank you for reminding me. I made a bet in our *Motley Fool One* membership on January 1 that given a variety of factors, I felt that this year we would have a 10% decline. And again, they come every 11 months, pretty evenly distributed. We haven't had one for about two years. And so, my bet is that if the market does not fall 10% at some point in this year …

So, in a sense I'm cheering for like, "Well, let's rip it up a little higher here before the summer doldrums start to slough off a little." If it doesn't decline 10% peak to trough at some point this year, I will be walking a marathon on my treadmill desk each day for five days in a row. You know, it was so easy to write that sentence … and now I'm had like an Ironman in our member community and a couple of people here at the Fool that are marathoners go, "You know what? Day four you're going to be in pain, because walking a marathon, you'll be fine." Plus, I can space it out. It's not like I have to do it continuously throughout the day. I can do six hours here and there. But it's going to be a long five days for me.

The reason I did that is I want to make sure that we set ourselves up, eloquently said by Jeff, to have positive actions should the market decline. That we're prepared and expect that a natural course of investing is to see a 10% decline. Because I can promise you one thing. The media's going to make it sound disastrous. They already made it sound disastrous in early January when the market fell 5.5%. So, you can only imagine what's going to happen when it's down 10% and that's going to happen multiple times along the way as our portfolio grows throughout the year.

So, Ron Gross, Jeff Fischer, Matthew Argersinger, thank you all.

RON GROSS:

Thank you.

JEFF FISCHER:

Thank you.

MATT ARGERSINGER:

Thank you.

TOM GARDNER:

Some of my happiest times at The Motley Fool is hanging with the three of you and with our advisors and talking investments and working with you and for you in The Motley Fool. So, I've got some comments that I need to make here in closing our conversation.

First of all, thank you for spending your time with us. I hope you found this valuable and useful in its own right for you as an investor. If you're interested in *Motley Fool One*, the *Motley Fool One* member lobby is a really great place for you to go. If you click the link below, you begin the application process and you join us in our member lobby and our member lobby is fully free.

You're going to find everything from the four outsider companies that I mentioned — but more importantly, the explanation behind those businesses and why we believe they're going to deliver excellent results. You also gain access to my CEO interviews with Jim Sinegal and John Mackey and Selim Bassoul and Monty Moran, the co-CEO at Chipotle, which has been such an incredible investment for us.

We love to sit down and talk on camera with our CEOs, with the companies that we're invested in, not just to learn about the company and its prospects, but we learn things about the industry and about other businesses they love. We've learned so much from those interviews.

Finally, you gain access to interviews at our most recent member event, which I know many of you attended — but for those of you who didn't — our Malcolm Gladwell interview and Pete Miller's great talk, the CEO of National Oilwell Varco who will be a part of a spinoff out of that business and run the spinoff which is a really interesting dynamic that we've talked about in *Motley Fool One*.

So, *Motley Fool One* gives you access to all of our services, to these advisors, to my brother David, to *Income Investor, Inside Value, Hidden Gems*. We're very excited that in the next year it's going to provide you access to all of our international services, as well. It also gives you access to a financial planner. It's going to help you build a financial game plan around your investment portfolio so you really are thinking through not just the equities that you have, but what about allocation with bonds? What about insurance? What about building out your estate and taxes and thinking through the tax efficiency in your portfolio. That's a really important part of *Motley Fool One*.

We have the separately managed accounts coming. For regulatory reasons, I'm not going to go into great detail about it here other than to say that we want you to be able to invest with us whether you want to spend a lot of time on it or not. We want to make sure that you and members of your family can invest the Motley Fool way and aim for great, long-term returns that are tax efficient.

Beginning April 1, our *Motley Fool One* members will see the winner of our Final Four showdown and March Madness of our four outsider companies. If you'd like to see that and be a part of *Motley Fool One*, click the link below to join and apply to join *Motley Fool One*.

Last point is that it bears a 100% money-back guarantee. I have talked to members who have been members of particular services of ours and have stuck with it for 190 days and then felt bad bailing and taking the refund — but that's the nature of what we're trying to do. That's our purpose at The Motley Fool — to help you invest better.

I'll begin inviting members into *Motley Fool One* on March 20. I look forward to working with you, with our entire team … that's what you get as a *Motley Fool One* member …and to helping you invest better for the rest of your life and to set your family up for generations to come. Thanks so much for spending time with us. Ron, Jeff, Matthews …

JEFF FISCHER:

Ron's parents …

RON GROSS:

Bye, mom. Bye, Dad.

TOM GARDNER:

Thank you all and Fool on!

Fool One Podcast: Can Whole Foods Pair Price With Purpose?

CHRIS HILL:

Welcome to EP Weekly. I'm Chris Hill joined in-studio this week by Bryan White, Alyce Lomax and chief investment officer here at The Motley Fool, Andy Cross. Thanks everyone for being here.

ANDY CROSS:

Chris.

ALYCE LOMAX:

Hi.

CHRIS HILL:

We've got Middleby's earnings to talk about, but I should kick things off by officially welcoming Alyce Lomax to the Fool One team. Alyce has been working for years at Fool.com. I'm sure a lot of our listeners know her writing from there. And Alyce, before we get to Middleby's earnings, I wanted to touch on one company that I know you follow very closely because a big part of the work you've been doing at Fool.com … a big part of your focus as an investor … is on conscious capitalism. I think it's fair to say there's no one at The Motley Fool we identify more closely with conscious capitalism than John Mackey from Whole Foods.

Where are we now with Whole Foods? When you look at this as a company, you and I are both shareholders … longtime shareholders of this company. But I am curious. What do you see when you look at Whole Foods right now? What stands out to you in terms of their business today?

ALYCE LOMAX:

Well, I'm not sure that everybody is aware of just that holistic sense of conscious capitalism that Whole Foods and John Mackey have tried to further. I think that, that is such a wonderful thing for business. It's such a wonderful example to make that you can have that sense of all stakeholders and do well. I think that it's actually an exciting time right now because of the value. They're trying to get away from "Whole Paycheck." I think that's great for actually spreading the word about their business …

Showing people that you can take care of your employees, you can take care of the environment, customers … And I think that a lot more people are going to start to understand that as opposed to a lot of the other grocers.

CHRIS HILL:

On the one hand, if they're lowering prices … if they're offering more value opportunities within their stores … that's potentially great for getting more people in the door. On the other hand, selfishly, as a shareholder, I'm wondering what this is going to do to margins. At least in the short term, it's got to hit them.

ALYCE LOMAX:

Absolutely. Unfortunately, that is going to hit them, but I believe that it's worth the risk right now, especially in the current environment, too. I mean, consumers aren't exactly feeling too flush right now. But I believe that they still have the sense of … I mean, they do still have a lot of … let's face it … high-margin products …

ANDY CROSS:

I had heard, I think, both John Mackey and Walter Robb, who is the …

CHRIS HILL:

Co-CEO …

ANDY CROSS:

Co-CEO and co-founder, talk about much more … When I heard him at the Conscious Capitalism Conference a couple of years ago, he talked about it's really about education. You really want to find consumers … We want to go into highly educated markets because that's as important as the demographics when it comes to how much money they make and how wealthy they are …

ALYCE LOMAX:

Absolutely …

ANDY CROSS:

… because they're a more educated consumer. So, this is the one thing Whole Foods had done very well and they continue to do, and that is try to educate the consumer around the benefits of living a healthy lifestyle. Eating healthier. Organics. Not everyone can afford organics, but when they go into Detroit … And they just went into another, I think, inner city market. They're not offering a ton of organic food because they can't get the supply and also they know a lot of the customers can't necessarily afford it. But these are from customers who have no access at all to any kind of fresh …

ALYCE LOMAX:

They're food deserts. Yes, absolutely.

ANDY CROSS:

Absolutely. So, Whole Foods is going in and they're trying to educate the market. They're doing this in just little test markets, but it really does align with what John wants to do from a conscious capitalism perspective.

ALYCE LOMAX:

Yes, and from a strategy perspective, absolutely. I mean, you're going in where there's a major need for better food, basically. Like you were saying, there's really no fresh food in a lot of these places. And also, the community aspect … Some of them are hooked up with nonprofit things that are actually educating …

ANDY CROSS:

Yes …

ALYCE LOMAX:

… helping people get job skills. Actually supplying the Whole Foods. So, this is exciting, holistic stuff for the long term.

ANDY CROSS:

And as we think about how they are actually expanding their store footprint and trying to increase sales per square foot with including things like the bar that they have in there …

CHRIS HILL:

Right …

ANDY CROSS:

Coffee, much more. It's actually a little bit … I'm kind of mixed on this. Sometimes it gets a little crowded because they're using the floor space to kind of peddle and introduce you to new goods. It gets a little bit crowded in there, but expanding into other lines and trying to make the experience of Whole Foods as not just going to a grocer, but you're actually going to almost a restaurant.

CHRIS HILL:

That's what you want to hear if you're a shareholder, right? The place is too crowded.

ANDY CROSS:

Yes.

ALYCE LOMAX:

Yes. And they're being entertained and having a nice drink …

ANDY CROSS:

Yes. And if only they can continue to push the throughput through the line, which is really important. That's a premium I'm willing to pay for.

CHRIS HILL:

I was just going to say. I'm still bitter about the fact … Right before we started taping, I felt really good about the Whole Foods closest to us here at The Motley Fool because they do have the bar where they have espresso drinks and all that sort of thing. Then I heard about the one near where Bryan lives where it's so big they have multiple restaurants. And a sports bar?

BRYAN WHITE:

A sports bar right at the front door. Yes.

CHRIS HILL:

Hoh! Now, I'm just bitter that there's not a sports bar in the one near me.

ANDY CROSS:

How long will it be until Whole Foods is actually in a sports arena? They may be. I don't even know.

ALYCE LOMAX:

Well, see, expanding the demographic like that … We do not know what is going to happen in 20 years, 10 years. Who knows? Maybe next year.

ANDY CROSS:

And that's a very important point. The stock really has pulled back pretty dramatically here over the last say …

BRYAN WHITE:

Yes …

ANDY CROSS:

… six months …

CHRIS HILL:

Yes …

ANDY CROSS:

… and some members who are listening, who own the stock, may be wondering what's going on. It's a $20 billion market cap and they do probably $1 billion in free cash flow. That's double where it was five years ago during the financial crisis. You have to understand that as they continue to expand that — whether it's internationally, domestically, new markets, test different store concepts, large, small — they are really trying to live up to their mission and do it in a way that is good for all stakeholders, which is a big principle of conscious capitalism. Over time, that's proven to win out and I think it still will. Twenty billion dollars — it's not a real large company.

CHRIS HILL:

Let's move over to Middleby and their latest earnings. Bryan, profit's up 36% …

BRYAN WHITE:

Yes …

CHRIS HILL:

… revenue up nearly 40%. Stock hitting an all-time high today. I mean …

ANDY CROSS:

It's making me hungry. Talking about Middleby now is making me hungry …

CHRIS HILL:

It's really …

ANDY CROSS:

For the stock and for …

BRYAN WHITE:

Well, they're executing against their strategy — which is essentially acquisitions fuel growth — so the top line near 30% growth is not a surprise. Organic growth was around 8.5%. It's that bottom line that long-term investors need to keep an eye on, because the strategy is to acquire smaller players that are inefficient, roll them into Middleby's system and improve the profitability. And then also the reach, too. When you flow them through Middleby's system, you expect some revenue growth, also. But the core reason to go out and acquire these businesses is to really improve their operations and their profitability. And quarter after quarter, they continue to show that they're having success.

ANDY CROSS:

Not just quarter after quarter. Selim's been …

BRYAN WHITE:

Yes, exactly.

ANDY CROSS:

… doing this for years. I mean, they shell out anywhere between … I don't know. Call it $50 million and $300 million in cash …

BRYAN WHITE:

Yes …

ANDY CROSS:

… acquisitions per year. They've gobbled up probably maybe more than 40 …

BRYAN WHITE:

More, yes …

ANDY CROSS:

… companies that are entering different markets with the Viking Range into the consumer market. So, Selim really has this and Bryan's exactly right. They have it down to a model and Selim's going to continue to operate it. He's a sales guy. I feel like he could … What's it? Sell me sand if I'm stuck in the desert. I just feel like he has that. And that's really what you want from a person who is an acquisitive CEO who's going to go in there and turn things for the better, absorb those companies and really drive sales higher. That's been good for shareholders. The stock's more than doubled here in 10 months, maybe. Something like that, right?

BRYAN WHITE:

Yes.

CHRIS HILL:

Well, and one of his strengths must be hiring. I'm assuming he has a smart team around him because …

BRYAN WHITE:

Oh, yes …

CHRIS HILL:

… it's one thing to make acquisitions. It's another thing to make them work well. A lot of companies, regardless of the industry, really struggle with acquisitions and it seems like Middleby is the exception to that.

BRYAN WHITE:

Well, that's an excellent point, Chris. A lot of times we'll focus on the capital allocator and give them all the credit. But absolutely, the managers underneath Selim are doing a lot of work … a ton of work. And look at what they've done with Viking. I mean, this was a business where their sales got cut in half during the downturn …

ANDY CROSS:

Yes …

BRYAN WHITE:

… and they're turning that around. EBITDA margins were up over 15% and that's way ahead of schedule, so they're doing really well.

ANDY CROSS:

And astute, outsider-esque CEOs, to borrow a phrase from Will Thorndike's book, they are very effective users of capital strategies … so, whether it's debt or equity … In Middleby's case, it's mostly debt equity benefitting from low interest rates. Going out there and finding companies they can acquire, bringing them into the family and improving operations. I mean, that's a recipe for success that you can do again and again.

CHRIS HILL:

Brian, last question on Middleby. The market cap's only about $5.5 billion …

BRYAN WHITE:

Yes …

CHRIS HILL:

Over the next five years, how much bigger can this company get?

BRYAN WHITE:

Oh, it can get quite a bit bigger, and I think over the next year or two … maybe three years … it's going to start to become more of an emerging-market story, and I think the investors will appreciate that a little bit more. We're a little ahead of the game because we look at the business and we focus on the business so much — but their food processing segment has a lot of opportunity out there in emerging markets. There's demand that's expected to pick up quite a bit in emerging markets for processed food — the food that we're used to shopping and filling our fridges with here in the U.S. Demand in emerging markets is expected to pick up.

And then we also have the big story in terms of food safety. Middleby will be rolling out its solutions in emerging markets, and we know that's a big story in China with Yum! brands. So, food safety's also going to drive sales from emerging markets for Middleby. It's got a ways to go. The story is far from over for Middleby.

CHRIS HILL:

All right. For Bryan White, Alyce Lomax and Andy Cross, I'm Chris Hill. Thanks for listening. We'll see you next week.

The Next Market Meltdown

Published Feb 24, 2014 at 1:18PM

In this exclusive glimpse at the *Motley Fool One* weekly podcast, listen as Robert Brokamp invites expert analyst Morgan Housel onto the show to discuss his new *Fool One* exclusive report, The Next Market Meltdown. Topics include:

- Why we should always expect a pullback (34 seconds in)
- Whether bigger drops lead to sharper rebounds (3:21)
- What caused the 10 biggest drops (5:17)
- What's a better predictor of the market: earnings growth or ... rainfall? (5:53)
- Is our optimism just survivorship bias? (7:35)
- How individual investors can increase their odds of landing gains (10:45)

Podcast Transcript

Robert Brokamp: Hello everyone and welcome to the EP Weekly. This is Robert Brokamp sitting in for Chris Hill, and of course we're joined by Bryan White as always. But today we have a special guest, Morgan Housel, down from all the way in Baltimore. How are you doing, Morgan?

Morgan Housel: Doing well, thanks for having me.

Robert Brokamp: Great to have you here and we have you here because you are writing a special report that One members will get this week. It's called *[The] Next Market Meltdown*. So Morgan, are you a market timer?

Morgan Housel: I am absolutely not a market timer, but when I talk to fellow investors, when I communicate with readers at The Motley Fool and talk to my friends about investing, one question that keeps coming up quite a bit recently is look, stocks have come so far. Stocks recently hit all-time highs. We've pretty much gone straight up for the past four years. Are we due for some sort of market pullback, maybe something more like a market crash? And many people I have talked to are looking at this and getting nervous about it in a sense of is this a bad time to invest with stocks at an all-time high?

So I just want to think of different ways that I can think about stock crashes and pullbacks with the market at an all-time high, and I think there are two things that I thought about with this report. One is that the stock market being at all-time highs right now is really a matter of perception when you think about the rally we've had over the past four years. So yes, stocks are up about 170% since March 2009, which is an incredible four-year period. It's actually one of the best four-year periods in the history of the stock market.

But that's just anchoring, really focusing to the March 2009 lows. If you think about the last five or six years, since 2007, stocks have barely kept up with inflation, so it really depends on what starting point you're looking at when you talk about how far stocks have come. Two rational investors could look at the stock market and be amazed at how far it's come, or shocked at how flat we've been for the past six years, right?

Robert Brokamp: And I think even since 2000 on an inflation-adjusted basis, it's still not reached its peak.

Morgan Housel: Right, exactly. And then so the other thing I think about with market crashes is in this report I went back and looked at the long history of the Dow and the S&P 500, and I just counted the individual times that stocks have pulled back 10%, 15%, 20%, 30%, 50%, from its recent highs. If you look at 10% market pullbacks, that's happened 89 times since the 1920s, which is about once every 11 months.

So when people ask the question, Should we expect a market pullback, the answer is always yes, no matter what the economy is doing, no matter what that stock market has done recently, the answer should always be yes. These are just intrinsic things that the stock market does. It's a natural phenomenon on the stock market. And when you look at even big drops like 20%, that usually happens about once every four years, so I think most investors at The Motley Fool are investing for more than four years. We're talking about hopefully 10, 20, 15, 20 years we'll be investing for. So when you think that 20% drops happen on average every four years, you are going to experience hopefully several of those during your lifetime as an investor, so when I put those two together, that it's really not that clear how far, how overbought the stock market is and that these drops are much more inevitable than we think.

Really the conclusions that I come up with is that these things are unpredictable and that rather than trying to think about and time around them, we should just accept that they are parts of the stock market and that's just life as an investor.

Robert Brokamp: Right, so you have the drop; those drops are going to happen. The question then is how long does it take to get back to where you were, and you include some of that in your research as well.

Morgan Housel: Right, so historically the bigger the drop, the sharper the rebound that occurs after it. One of my favorite examples is in 1929, which is the massive crash of the Great Depression. From peak to trough, the stocks fell almost 90% during that period, but when you factor in inflation and dividends, stocks were back at an all-time high within six or seven years after that. And that was true for the financial crisis in 2009 too. That was the worst financial crisis in 80 years. It took four or five years for stocks to get back to an all-time high, so there's little precedent in American history at least, for stocks when you include dividends to crash and then not return to their all-time highs in less than a decade, and usually much faster than that.

Robert Brokamp: Right, and then there's the question of all right, so you were saying it happens pretty regularly, so you could think, well, if it happens that regularly, maybe I can predict it, maybe I do know what happens. And also in your report you talk about, all right, so what causes these crashes?

Morgan Housel: Right.

Robert Brokamp: And the answer is really, they're pretty unpredictable.

Morgan Housel: Right, it's really we don't know. You know the biggest factor is it moves stocks around when we have crashes like this is just human psychology. It's people getting optimistic and then people getting fearful. People move in hordes and in droves, they all move together. There's a great quote that I like that says, "Nobody knows what the American people are going to do next, but we know that they're all going to do it at the same time. And that's really true for the stock market. We really don't know when people are going to get fearful or greedy next and there's really no way that you can forecast human emotions like that. We know that people are going to change their moods significantly from time to time, but it's really difficult to nail down the precise timing of that.

Robert Brokamp: Right, and you cite some research by Jeremy Siegel about the causes of the top ten biggest drops. There are things you couldn't predict, like the September 11 attacks, things like that.

Morgan Housel: Right, yeah, so Siegel went back and looked at I think the 20 biggest market drops in the last hundred years, and at least ten of them were tied to things that nobody could have seen coming before hand. President Eisenhower having a heart attack, the start of wars, September 11, things like that. No one could have predicted those things, even 24 hours before they occurred.

Robert Brokamp: Right.

Morgan Housel: So it's certainly not something that we can sit here and try to guess what the stock market's going to do over the next ten years.

Robert Brokamp: Right, so there are events, but then there are various metrics you might want to look at and say like, Oh, this tells me that what the stock market's going to do and some other research you cite is from Vanguard. So you tell us, what has the biggest correlation to future returns: P/E ratio, 10-year Treasury yield or the amount of rain?

Morgan Housel: Right, so there's this really interesting report. Vanguard, the fund giant, looked back at all these interesting metrics that analysts use to forecast where stocks might go next. They just looked at these metrics and said, Okay, in hindsight, how good are they at explaining what the stock market is going to do over the following ten years? So they looked at things like the P/E ratio, the trend growth that the economy is growing at, how fast earnings are growing, things like interest rates and profit margins. Virtually all of them explain next to nothing about where stocks are going to go next during the following ten years.

The biggest, the most important variable that tells us where stocks are going next is the P/E ratio. That's just the basic idea that you buy stocks when they're cheap and they'll do well over the following period; buy stocks when they're expensive, they'll do poorly after that. But even the P/E ratio explains only a minority of stock returns over the following ten years. And things like earnings growth and interest rates and profit margins tell us literally nothing at all about where stock might go in the next ten years, and that really all comes back to the point that what's really driving the stock market over time, in short periods of time especially, are human emotions, just how optimistic and fearful people are about the future.

Robert Brokamp: So I can get rid of that barrel in my backyard that measures the amount of rain? Because that's not going to help me.

Morgan Housel: That's not helping you at all.

Robert Brokamp: Darn, right. All right, so I'm going to play Devil's Advocate because this is all good news. This is all very encouraging. Sounds like you just have to buy and hold, that type of stuff. Some people might say this is actually a bit of survivorship bias and that we're looking at the U.S. market, twentieth century, the American century. We all know that the Japanese stock market is still down about 70% from where it was in 1990 and through most of that period it was the second biggest economy in the world. Great economy, bad stock market, only recently surpassed by China.

So are we focusing too narrow here or is there something so awesome about being American that we can believe in our stock market?

Morgan Housel: Well I think there are two things to think about. If you look at the long history of stock markets, there's one even that consistently throws all of this analysis out the window. There's one event that can really destroy long-term stock returns, and that's of course war. We really saw that a lot in the twentieth century with large developed countries that saw their stock markets go to zero and never recover. During World War II when your currency is destroyed, when you have a dictator in power that's going to really run roughshod over the economy, that's really the variable that can destroy stock returns. But that's not a way of living that I think is very intelligent and to sit here and to think that we're going to have another war and worry about that...

Robert Brokamp: Or zombies.

Morgan Housel: Or zombies. That might be something to worry about. I think when you talk about Japan, the key variable there is that the Japanese stock market has done nothing for the past 25, almost 30 years. The big factor there is that the bubble that they had when stocks peaked around 1990 was like nothing we have ever seen in the United States. It put our dot.com bubble to shame really.

And really when you look at the Japanese stock market over a longer period, when you're not starting at the top of the bubble, but you look at the Japanese stock market over the past 40 or 50 years, it's done quite well. so really that just goes back to valuations, like we were talking about earlier, and that yes, if you buy stocks when they are grossly expensive, just off the charts expensive, then you're not going to do very well.

That's true of the Nasdaq too. The Nasdaq peaked in 2000 at around 5,000; I think today it's somewhere in the three thousands. It could be another decade or more before we return to an all-time high, so that would be 20 years or more before the Nasdaq recovers.

Robert Brokamp: Right, and the other aspect with Japan was they had a huge real estate bubble as well, and that never happens in America. But I was going to bring up the Nasdaq as well as my other devil's advocate because you looked at the S&P 500, and that says a lot about someone who owns an S&P 500 index fund, but individual investors, especially stock pickers, those are how fans of The Motley Fool, have different portfolios. I would say some of them probably have a portfolio that's closer to the Nasdaq. Still 30% down from where it was in 2000. From here you've got to get a return of about 40 or 45% just to get back to break-even.

So even if you are a U.S. investor investing in a major U.S. index, it doesn't necessarily mean that you will recover as well as the S&P 500 has.

Morgan Housel: That's absolutely right, and I think what that really shows is the power of diversification. If you have a portfolio that is heavily weighted toward one industry or even one broad sector like technology, that certainly increases your chances that you're going to go through very long periods of disappointment. It's really imperative for all investors I think to have a well-diversified portfolio.

That's not only true for individual stocks and sectors, but across assets too between stock, bonds, cash and real estate.

Robert Brokamp: Right, right, which I personally am a big fan of. The readers of *Rule Your Retirement* will know that that's one of our major points.

So that's all good stuff. The report will be available soon, if not by the time you listen to this podcast. Morgan, thanks for stopping by, and everyone else thanks for listening in and we'll talk to you next week.

Morgan Housel's Cash Strategy for Beating the Market

Published Feb 18, 2014 at 10:42AM

Do you hold cash in your portfolio? Many Foolish investors dismiss cash strategies as market-timing, short-sighted, or worse. But Morgan Housel disagrees. Find out why he believes the "optionality" value of cash is one of the biggest hidden opportunities for investors looking to build lasting wealth. Your cash isn't sitting ... it's waiting.

Podcast Transcript

JASON MOSER:

Welcome to EP Weekly. I am your host this week, Jason Moser. Chris Hill is out of the office. I thought maybe it was just because of the snowstorm, but I think he's still up in Philly for whatever reason, so we'll go forward without him. It's going to be a slow week anyways, so not much to talk about today. We've got what? MasterCard news and really the news of the week for us we want to talk about — Morgan Housel's report that just dropped yesterday, if I'm correct...

MORGAN HOUSEL:

Yes...

JASON MOSER:

I'm joined in the studio today with Bryan White and Morgan Housel. Guys, thanks for being here.

MORGAN HOUSEL:

Good to be here.

JASON MOSER:

So, really quickly let's just cover this MasterCard news because, you know, share splits seem to always make a bit more news than they're worth. Stock splits to me are — we know they don't create a whole heck of a lot of value, but they do create a perception out there, at least, that shares maybe are cheaper than they were before, and with MasterCard you're getting ten new shares for one old one. You don't see many 10:1 splits like that — or much more you see reverse splits with big numbers — but not the other way around.

But I think the bigger news of this MasterCard release was the 83% boost in the quarterly dividend along with the new $3.5 billion share repurchase program. Bryan, you know, when I was looking at this news, the two things that stood out to me were the share repurchase program and the dividend because those are the way that MasterCard really returns their capital to shareholders first and foremost. The stock split, not so much. I mean, maybe they open that share base up to a new buyer. Who knows? What's your take on that?

BRYAN WHITE:

Well, I'd say the number one thing would be the buyback. That's probably going to add the most value for shareholders. The dividend — they still don't pay a very high dividend, so you're talking around the 1% range. The dividend's not a big deal. It's nice to see them up that and in the future maybe we can get to a 2% yield and then you can talk about a somewhat significant yield there at 2%.

The interesting thing about the stock split is obviously it's going to open up liquidity in the market. You're going to have a share price around $80. It's going to be more accessible for folks. And we don't care too much about that. We want management focused on the long term. But the good thing is the CEO and the leadership team has shown that they are focused on the long term. They let the stock run to $800 a share — so it's obvious that we're not talking about a company that splits every time they get to $100 a share and brings it back down to $50 or $25 a share.

So, this is a company that obviously there's been plenty of discussion ... and most likely from the institutional side ... asking for a split and things like that, so it's not such a big deal. They've shown that they're focused on the long term. They let the stock run to $800 a share, so it's not as if they're a company that always does stock splits and things like that.

JASON MOSER:

Yes, and again it's worth remembering too, with the share repurchases, that they do bring that share account down. I think that's really what you want to look for in the share repurchase authorizations is it's just an authorization. It gives them the ability to execute those buybacks — but really at the end of the day you want to see those buybacks resulting in the share count coming down ... which for MasterCard it has. Since 2009, it's down about 7%, so that's good. That means that they're not just offsetting a bunch of dilution and inflating earnings per share.

MORGAN HOUSEL:

So many share buybacks are just offsetting share issuances...

JASON MOSER:

Yes, absolutely...

MORGAN HOUSEL:

...and from options from the managers and whatnot...

JASON MOSER:

No question...

MORGAN HOUSEL:

...and it's really almost a trick that some companies can play on their shareholders by announcing, "Look. We're doing this major buyback," and it's really not doing anything to the share...

JASON MOSER:

It's always a headline, too. I think that's one of the first things I learned really quickly was to approach every share buyback headline with skepticism. I mean, the first thing I look at is to see what are they doing with those buybacks? Is that share count coming down...

MORGAN HOUSEL:

You know, really interesting. In 2007, it was the biggest year for share buybacks in history, and among the S&P 500, the actual number of shares outstanding went up that year...

BRYAN WHITE:

That is incredibly interesting...

MORGAN HOUSEL:

It was more buybacks than ever and shares went up — because that was the year, 2007, that companies were paying their CEOs $50 million a year in stock and options, so buybacks were just offsetting that...

JASON MOSER:

Yes, and with all these social media companies (Twitter, Facebook and the like) out here you know you're missing a lot of restricted stock awards ... options being granted to employees and stuff like that. So, tech companies you do see more of that dilution. But, yeah, it's one of those things to always keep an eye on.

MORGAN HOUSEL:

Yes.

JASON MOSER:

Well, we also want to talk this week ... Morgan, you had a report that just came out that really, when I read it last night, I was thrilled, because I share the same perspective. It's titled, "My Cash Strategy for Beating the Market..."

MORGAN HOUSEL:

Right...

JASON MOSER:

"See why Morgan Housel keeps up to 40% of his assets in cash." And I think this is a question that we deal with a lot in members asking, "I have this lump sum in cash. What do I do with it? I want to earn something on it. I don't want to just stick it in a savings account that's going to pay 0.1% or whatever." But you know, I've always felt that having that cash is an opportunity. It serves as what you called "optionality" in the report...

MORGAN HOUSEL:

Yes...

JASON MOSER:

...and so to me, when I read this report it makes a lot of sense. It's how I look at things, and I was really thrilled to read it. What prompted you to write this?

MORGAN HOUSEL:

Well, first I think it's important to point out that just because I keep this high level of cash in my portfolio, I'm not recommending that all of our members go out and do the same. It's really different for everyone. It's dependent on how much money you have, your risk tolerance, your age. So, it's really important to point out that this is not advice for people.

But how I think about cash ... You know, for the past five years, all investors have been looking at the yield that they earn on their cash. It's probably 0% or something close to that. And they say, "Well, look. I'm earning 0% on my cash. We've got 2% inflation. I'm losing money here and that's painful." And I think that's pushed a lot of investors maybe into bonds where maybe there's a lot more risk. Putting more money into stocks than they might be comfortable with.

But I think, as I explain in this report, there's another return you can earn on your cash. It's invisible. It's sort of this theoretical return. But I refer to it as "optionality," which is basically the idea that sometime in the future, stocks are going to crash again. If you have cash on hand to take advantage of those low prices, the value you get from having that cash around can be massive, and that extra value is basically a yield that you are earning on your cash by holding it today that you don't really know of yet. And it's really important.

There's one quote that I had in the report from Warren Buffett and his quote was, "Cash combined with courage in a crisis is priceless." And that's really true. Having cash around hurts when the market is going up. When the market crashes, it's just the most beneficial thing you can ever have around.

And the other point I made in the report, too, is that for your long-term wealth measured over decades, what's really going to hurt your wealth is not necessarily earning a low return on your cash. It's being forced to sell stocks when you don't want to because of unemployment or illness or divorce or whatever it may be. If you're forced to sell stocks when the market is down, that's going to crush your long-term net worth.

JASON MOSER:

Yes, I guess that brought out the economist in me and I'm sure in you, right there ... just the whole idea of being a desperate seller ... whether it's stocks or a house or whatever it may be. You don't want to get caught in a position of being a desperate seller because you really limit your options at that point. Bryan, what stood out to you in this report as far as maintaining cash balances? Is that something you agree with? Is it something you prefer to stay 100% invested or get your money elsewhere where it's even earning some small yield?

BRYAN WHITE:

First, I would say it is an excellent report, Morgan. I enjoyed it thoroughly...

MORGAN HOUSEL:

Thanks.

BRYAN WHITE:

And I agree with what Morgan said to start off. Everything is different, right? I'm young. I tend to skew toward I want, throughout my investing career, to be able to take advantage of the major opportunities. We saw one in '08, '09. I'm young enough where I think I can get one or two or maybe three of those. Those are massive wealth-building opportunities and you cannot really take advantage of them unless you have some cash. So, it's different. If I was in retirement, I'd think much differently. I hope that would not be my focus, because I may not see one of those. It depends where you are in your time frame.

And then Morgan, the quote that you brought up is fabulous. So, if you're at home and you're a member, and you're thinking about this report and it appeals to you ... here's the thing that you have to definitely think about also and prepare for. You have to prepare for the emotional ... the feeling that's going to happen. If stocks drop 20% — if the market drops 20% — are you truly going to be willing to pull into your cash file and go all in or go a significant portion in?

Because it's easy to say, but it's hard to do. The good thing is, for everyone at home, we have a good measuring stick ... '08, '09. How did you feel? What were your emotions like? Were you scared? Were you mad at everything in the world in terms of stocks and market? Did you think it was all rigged against you? Those kinds of things will tell you probably how you're going to feel next time. So, it's not really smart to go after a strategy of 20, 30, 40% cash if you know you're the type of person that is going to become very, very fearful when everybody else is.

MORGAN HOUSEL:

Right. It's much easier said than done...

BRYAN WHITE:

Yes. You need to know your personality if you're going to employ something similar.

JASON MOSER:

I think there's a technical term for having the ability to pull the trigger like that. It's called "intestinal fortitude."

MORGAN HOUSEL:

Right.

JASON MOSER:

Make sure you have the intestinal fortitude to pull the trigger. In one other part of this report, I will encourage members to go through and actually do this exercise. You know, Morgan, you provide a road map...

MORGAN HOUSEL:

Yes...

JASON MOSER:

...and I know this road map would be different for everyone depending on what stage you are in life. Are you protecting your wealth? Are you growing your wealth or whatnot? And maybe it's not even a road map that you adhere to strictly, but it's a first step. It gets it down on paper. It gets your thoughts out there of if the market falls by this much, I would invest this much. And how often may this happen? It really, I think, helps to provide a lot of perspective and I think that no matter what stage you are as an investor, it could be a helpful exercise to do and then to also go through and revisit maybe once a year. I think that having a road map like that is just a wonderful exercise.

MORGAN HOUSEL:

Yes. It's really important to think of these things before they happen — because when a crash comes, you're probably not going to be thinking straight — and if you're just trying to figure it out ... if you're trying to figure out what to do with your cash in October 2008, you're probably not going to be thinking ... It's good to figure this out beforehand. Have it written down on paper. Here's what I would like to do. Here's what I plan to do. You might not follow it to a T when it actually arrives.

BRYAN WHITE:

Well, here's the thing, Morgan. Actually in 2008, if you were heavy in cash, you'd feel like you were the smartest man alive.

MORGAN HOUSEL:

Sure. Absolutely...

BRYAN WHITE:

...and you're probably pretty hesitant to dip into that and go into the stock market because you're laughing at all the fools that are 100% invested and rah rah through 2006, 2007...

MORGAN HOUSEL:

And that cash just saved your rear end. You don't want to get rid of it. It's your best friend.

BRYAN WHITE:

Yes. So, it's tough. You definitely need to think it through.

JASON MOSER:

Cash will save your rear end. Let's leave it there, guys. For Bryan White, Morgan Housel ... guys, thanks for being here...

MORGAN HOUSEL:

Thanks a lot.

JASON MOSER:

...and we'll see you next week.

Portfolio Building Report

Published Nov 20, 2013 at 12:00PM

AmTrust Financial Services (NASDAQ: AFSI) | **Apple** (NASDAQ: AAPL) | **Broadridge Financial Solutions** (NYSE: BR)
The Buckle (NYSE: BKE) | **Gentex** (NASDAQ: GNTX) | **Intel** (NASDAQ: INTC) | **MasterCard** (NYSE: MA) | **OpenText** (NASDAQ: OTEX)
Oracle (NYSE: ORCL) | **Papa John's International** (NASDAQ: PZZA) | **Starbucks** (NASDAQ: SBUX) | **Wells Fargo** (NYSE: WFC)
WisdomTree Emerging Markets SmallCap Dividend Fund (NYSEMKT: DGS) | **The *Pro* Bottom Line**

Download this report as a PDF

Dear *Pro* Member,

The way we manage *Pro* is pretty simple: We own a portfolio of investments that we expect to earn healthy positive returns over every rolling three-year period, so we can double our real purchasing power (that's after inflation) every 10 years. We own strong stocks and promising ETFs; we hedge to protect gains; we "sell short" to profit on falling prices; and we use options strategically and for income. Whether you use all of our strategies or just own *Pro* stocks, our mission is to earn you strong returns over our time frame. That's likely the prime reason you're here. Not all of our investment decisions will be right, and we won't always come close to our constantly positive North Star goal, but with a firmly plotted course, a stellar crew of analysts, and our wonderful community, we expect to stay firmly on track and enjoy the journey together — and to come out far ahead.

In our Most Recent Buys report last week, we highlighted our latest portfolio additions. Although those holdings may be our newest, shiniest toys, their true value is only apparent as a part of our larger portfolio puzzle. To complete that puzzle and execute our mission, we present to you this Portfolio Building Report, which summarizes our remaining Buy First and Buy positions.

Here are a few things to consider along the way:

- **Don't anchor on fair value.** We expect every investment we rate Buy First or Buy to play a role in helping us achieve the return goal stated in our mission. Yes, that's true even if the current stock price is a touch higher than our estimate of fair value! For one thing, our fair-value estimate is an imprecise figure, and for another, a "fair value" is really a range of values, one that doesn't take into consideration the holding's part in the portfolio puzzle.
- **Where to look first.** The reason we distinguish between Buy First and Buy is simple: We want to draw attention to our most compelling return opportunities at the moment for those members with limited capital available, or for those who don't follow the Pro portfolio step-for-step. Our decisions, however, are made in the context of all of the pieces of the portfolio puzzle, working in concert toward our mission.
- **What about Tupperware?** In October, we recommended writing puts on **Tupperware Brands** (NYSE: TUP). Those puts expired in November; some members may own shares (around 3%) as a result of that position or of our Alternative Trade recommendation. Although Pro has no official position in Tupperware right now, we will likely have an official follow-up recommendation soon. New members should hang tight and wait for the Trade Alert.
- **Say hello.** If you haven't already, please introduce yourself on our Meet & Greet discussion board. More than anything else, it's Pro's community that differentiates us from every other investing service in the world. Stop by, say hi, and carpool with the other intrepid members on this journey with us.

Onward,
— Bryan Hinmon, CFA, senior analyst

Buy: AmTrust Financial Services

Its talent at capitalizing on human laziness is just part of what we love about this insurer.

Suggested Allocation: 6.9%

What It Does

At *Pro*, we speak a lot about the importance and power of recurring revenue — mostly because we know that humans are inherently lazy. Insurance purveyor **AmTrust Financial Services** (NASDAQ: AFSI) handily proves this point for us; many of the policies it writes (more than 80% in most lines!) renew at the end of their term without their owners even shopping for a better rate. Most of us, it seems, are guilty of preferring inertia to bargain-hunting, and AmTrust and its fellow insurers are the beneficiaries.

AmTrust focuses on insurance niches (primarily workers' compensation and product warranties) that are low-hazard and generally too small for large insurance companies to care about. But though AmTrust writes small policies, it's no small fry. Its high renewal rates and predictable cash flows allow it to focus on writing new policies, look for struggling insurers to acquire, and hunt for obscure investment opportunities.

How It's Working

AmTrust's strategy — being a disciplined underwriter of low-hazard, small policies in well-defined niches; using technology to keep its expenses low; and opportunistically acquiring policies other insurers struggle to find profitable — has resulted in impressive growth. Gross written premiums have risen from about $1.1 billion to about $3 billion over the past five years, and this increase, combined with a laser-like focus on low expenses, has resulted in consistent growth in earnings, dividends, and book value.

What We Expect

More Resources

- [*Pro*'s recommendation history]
- [Talk about AmTrust on our discussion board]

The insurance market works in cycles, and recent signs indicate an upswing on the horizon, which means pricing and profit should improve across the board. AmTrust should thrive in a strengthening market: It can charge as much as its competitors and make more in profits thanks to its lower expense structure, or it can undercut the competition on price in a bid to take market share. If the economy continues to improve, the small businesses AmTrust insures should hire more workers and consumers should purchase more insurable goods, so there seems to be plenty of growth ahead.

AmTrust has consistently traded higher than our estimate of fair value, but we believe the company's premium valuation is warranted given the consistency of its growth, quality, and profitability. AmTrust is *Pro*'s largest holding, and we're happy to let this winner run, expecting to increase our fair-value estimate over time.

Buy First: Apple

The leader in mobile computing products is cheaper than it's been in years.

Suggested Allocation: 3.5%

What It Does

Led by its iPhone and iPad, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the Apple operating system, which centers on its iTunes and App Store marketplaces. Apps turn a piece of hardware into a personalized, go-anywhere computer that becomes ingrained into the user's daily life.

The company's uniquely integrated hardware and software have made for a great consumer experience that provides disincentives to switch to a competitor. Apple will have to fight harder to win new customers as competitors close the quality gap, but we maintain that it remains one of the best companies in the world, with the best products in its class, and it has one of the least expensive stocks among large caps.

How It's Working

Apple refreshed all of its product lines over the past 12 months, with the iPhone 5S achieving record debut sales and brand-new iPad models reportedly selling like hotcakes (literally, they're so thin). The iPad may set new sales records, too, this holiday quarter. This year's product refreshes show that Apple has not lost its touch and is not chasing the lower-priced market, instead aiming to protect profit margins. We like this choice. We also like that Apple is taking time to debut a new product category, which it hints it may do in 2014. Whether it's a TV, watch, or something else, Apple needs to get the product right and should take its time. It remains the most cash-rich company on earth, and generates tens of billions of new free cash flow every year.

More Resources

- [*Pro*'s original recommendation] (2/14/12)
- [Talk about Apple on our discussion board]

What We Expect

In the longer term, we expect more great innovations from Apple, including whole new product categories. Meanwhile, we believe customer loyalty will drive healthy recurring sales, and new customers, new market expansion, and product refreshes will fertilize stability and growth. The stock is too inexpensive for such a high-quality company at the very heart of the mobile computing revolution.

Buy: Broadridge Financial Solutions

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 4.0%

What It Does

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in 2013, its platforms processed 85% of all shares in the U.S. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider to manage investor communications.

The company's smaller segment, securities processing solutions, accounts for 27% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

How It's Working

Both earnings and free cash flow are modestly depressed because mutual funds have been scrimping on investor communications recently and investor skepticism around the global economic recovery has led to low trading volume. Still, in fiscal 2013 Broadridge grew sales 6%, grew earnings 11%, raised its dividend by 17%, and continued to position its business for strong sales and margin performance for years to come. And Broadridge continues to serve its customers masterfully; its 99% retention rate sets the stage for recurring revenue (and deepening relationships) in future years.

What We Expect

More Resources

- *Pro*'s original recommendation (4/27/10)
- Talk about Broadridge on our discussion board

We think Broadridge will continue to write the e-book on electronic investor communications. Its dominance of this market should strengthen its competitive advantages, making it indispensable as transparency in the financial system increases. We also expect banks and brokerages to continue outsourcing their non-core operations to save money and increase flexibility; this should bring increased business and greater efficiency to Broadridge. We expect modest sales growth to translate to earnings growth around 10%. Much of Broadridge's revenue is recurring, making its sales and earnings growth highly reliable, and its impressive free cash flow will likely bring an ever-higher dividend and increased share buybacks.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy: The Buckle

This well-managed retailer has fit into its jeans admirably over the past decade.

Suggested Allocation: 3.0%

What It Does

The Buckle (NYSE: BKE) sells jeans, other apparel, and accessories at 452 retail locations across the United States, and we think the fantastic management team has figured out a formula that works: measured growth, middle-of-the-road merchandising, and great service.

Your *Pro* team doesn't know much about fashion, but we can read financial statements. And if the next decade of business performance by specialty retailer **The Buckle** (NYSE: BKE) looks anything like the last one, we'd be willing to wear whatever getup the company suggests. The store concept is in the middle of its life cycle, and the company's financial prudence and operational acumen should lead to a growing stream of free cash flow, dividends, and extra payouts — all of which can help the *Pro* portfolio in our pursuit of our North Star.

How It's Working

The Buckle is a surprisingly steady operator in the notoriously fickle specialty retail space. The company reported modest same-store sales growth of 2.1% last year and has notched another 2.2% gain through two quarters so far this year. We accept a degree of lumpiness here and don't get too bent out of shape when these numbers bop around — The Buckle's target demographic is fickle teens and twentysomethings, after all. We simply monitor these figures for clues about the overall shopping experience and brand relevance. Management's stellar performance has earned getting the benefit of the doubt:

Metric	2002	2012	Annual Growth
Stores	304	436	3.7%
Sales per Store	$1,339	$2,387	6.0%
FCF per Store	$57	$406	21.6%
Sales per Square Foot	$274	$475	6.0%
Inventory Turnover	4.7x	6.0x	3.0%

Dollars in thousands. Per-store calculations based on average stores open during the period. Sources: SEC filings, S&P Capital IQ, analyst estimates.

What We Expect

More Resources

- *Pro*'s original recommendation (6/20/12)
- Talk about The Buckle on our discussion board

With 452 stores at the end of fiscal second-quarter 2013, we believe The Buckle has plenty of room to grow as it expands from the middle of the country to both coasts; it should be able to achieve wonderful store economics with the 650 to 850 locations we ultimately expect. Recent expansion into footwear, accessories, and children's offerings should provide enough fuel to keep same-store sales healthy, while the company's commitment to customer service entices repeat visits.

The Buckle also has a history of paying special dividends with its excess cash; it's done so for six of the past seven years. Just last December, *Pro* members holding the stock received a $4.50-per-share payout from the company in addition to the regular $0.20 dividend. Naturally, we encouraged all members to celebrate by buying themselves and their loved ones a few new pairs of jeans. While we can't count on special dividends, the average yield over the past six years, including special dividend payouts, has been approaching North Star-level returns.

We're typically leery of the risks of investing in retail, especially fashion, but the proof is in the numbers for The Buckle.

Buy: Gentex

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 3.5%

What It Does

In 1982, a small company in Zeeland, Mich., called **Gentex** (NASDAQ: GNTX) made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands almost 90% of that market, and it sells eight times more units than its closest competitor.

How It's Working

In 2000, the company sold 6.8 million units; in 2012, it sold 23.8 million. That growth has been driven by an increased focus on safety, higher car sales, and greater market penetration (more car makers offering Gentex mirrors as a trim option). Gentex has turned these market dynamics into wonderful financial performance. Revenue has risen by nearly 20% per year since 1987, and over the past decade, the company's net margins have bounced around the mid-teens. Those numbers are shockingly good for an auto-parts supplier, showing that its fancy mirrors are showing up in more and more new cars.

What We Expect

More Resources

- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex on our discussion board

Currently, fewer than one in every four cars made worldwide has an auto-dimming rearview mirror, and only 6% have auto-dimming exterior mirrors. For context, prior to 1987 those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher penetration; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror, both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy: Intel

Rumors of the PC's death have been greatly exaggerated.

Suggested Allocation: 4.6%

What It Does

Intel's (NASDAQ: INTC) goal is to be "the preeminent computing solutions company that powers the worldwide digital economy." Whether it's a high-speed server for a data center, a new Ultrabook with a touchscreen and detachable tablet, a new smartphone, a tablet, a car, or just about anything else: Now more than ever, Intel has the computing technology to drive it.

Admittedly, the company was late to the smartphone and tablet markets, but there's a silver lining: As these devices eat into PC sales, investors' fear about Intel's tardiness brings us the value opportunity we see in the stock. And because smartphones and tablets have very short life cycles, Intel can catch up quickly by steadily inserting its technology into new product designs.

How It's Doing

Intel asserts that the tablet is broadening the PC market, not shrinking it, and we agree. Tablets are wonderful for what they are, but it seems likely that the PCs of tomorrow will have the best qualities of both a tablet and a PC. If not, people will continue to need tablets for some uses, and PCs for others (which is fine with us, too!). Intel's new Atom chips are making their way into an increasing number of new tablets and smartphones – and Intel's chips continue to power the vast majority of all PCs, in whatever form they take. High-powered servers are also selling in record numbers as the cloud is built.

More Resources

- *Pro*'s recommendation history
- Talk about Intel on our discussion board

Intel is investing for greater growth in computing devices, period, whatever shape they take. Wall Street is leery of the company's expensive capital investment plans, designed to maintain its leading-edge manufacturing abilities, but we view this spending as a strong indicator for the company's future. Intel's confidence in the future of microprocessors seems well-placed in our increasingly digital age; as the number of devices connecting to the Web grows exponentially, so does the need for more computing power.

What We Expect

Historically, buying true blue chips (Coca-Cola, Johnson & Johnson, IBM …) when they're out of favor has been an excellent investment strategy. We believe Intel will fit that bill, too. Eventually, we believe Wall Street will realize Intel is here to stay -- and is indeed at the heart of a worldwide computing revolution. When that happens, investors will start to price the stock at a valuation that at least matches,if not exceeds, the market average. In the meantime, we can buy it at a good discount and enjoy a 3.7% yield, too.

Buy: MasterCard

Plastic is overtaking paper as the world's way to pay, and MasterCard leads the charge.

Suggested Allocation: 4.8%

What It Does

MasterCard (NYSE: MA) is among the most attractive businesses in the world. Here's why: The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders, who are actually exposed to the card users' finances; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

Though MasterCard competes with a very large number of well-heeled and (in some cases) innovative businesses, the company's profitability is growing quickly even though the global economy isn't. And that makes perfect sense, because when it comes to paying for stuff, the global market leader isn't **Visa** (NYSE: V), or PayPal, or banks ... it's cash. While MasterCard's stock price has risen since we recommended buying in September 2011, our thesis remains intact: Cash has a still-astounding 85% market share of transactions, but it's slow and inefficient, and with no one managing its brand, it's quickly losing out to better alternatives.

How It's Doing

More Resources

- *Pro*'s original recommendation (9/8/11)
- Talk about MasterCard on our discussion board

This trend has already taken hold in the U.S., where we use cards for a third of our personal expenditures, so Americans often underestimate the opportunities — domestically and especially in developing nations. In the first nine months of 2013, MasterCard processed $2.1 trillion in purchase volume, $1.4 trillion of which came from outside the United States. Growth in its U.S. business was 7%, strongly outpacing our economy (as measured by GDP). And worldwide growth, excluding the U.S., clocked in at a tremendous 15.4% in local currencies. Cash is losing, and fast, but there's a long way to go — and a lot of opportunity for MasterCard.

What We Expect

Management recently confirmed guidance for continued 11% to 14% compounded annual revenue growth and 20% earnings-per-share growth through 2015. We think this is possible under current (difficult) conditions, and we expect even better if economies around the world can turn the corner. CEO Ajay Banga and team are doing a tremendous job moving the company forward, so much so that results have outpaced our expectations every quarter since we bought shares. We expect MasterCard will continue to surprise the world with its strong growth for years to come.

Buy: OpenText

This company's information management software keeps the digital lives of businesses in order.

Suggested Allocation: 3.1%

What It Does

OpenText (NASDAQ: OTEX) sells software that lets companies organize and manage their growing reams of electronic content. Its products help companies, governments, universities, and others operate more efficiently and effectively, meet compliance requirements, and communicate with colleagues, customers, and partners.

OpenText is the leading independent provider of solutions in the enterprise content management (ECM) market and a leader in the broader enterprise information management (EIM) industry. Its top competitor, **IBM** (NYSE: IBM), may be larger, but OpenText enjoys longstanding sales relationships with **Microsoft** (NASDAQ: MSFT), **Oracle** (NYSE: ORCL), and **SAP** (NYSE: SAP).

With its newly planned acquisition of privately held GXS Group for $1.1 billion, OpenText is also positioned to become the largest provider of business-to-business transactions in the world, ahead of IBM. This should lead to strong recurring, high margin, transactional revenue, and more customers to whom to cross-sell.

How It's Doing

More Resources

- *Pro*'s original recommendation (8/31/11)
- Talk about OpenText on our discussion board

OpenText has increased sales and cash from operations by more than 14% annualized over the past three years, and seeks to continue to grow by at least 10% annualized as its industry expands. Trading at 14.5 times free cash flow, the business is attractively priced to increase shareholder value by at least its annualized cash-flow growth rate.

What We Expect

Electronic content management industries served by OpenText should increase top-line demand by at least 10% annualized over the next several years, and OpenText should take market share, too. OpenText has a long history of steady growth through acquisition, and enjoys diversified software sales to multiple industries. With new products rolling out in cloud services (off-site servers), renewed sales execution through more distribution channels, exciting acquisitions in the works, and an intense focus on its financial performance, this medium-sized company looks to have a big future.

Buy First: Oracle

This old-guard tech giant has more room to grow.

Suggested Allocation: 4.4%

What It Does

Oracle (NYSE: ORCL) is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems** (NASDAQ: CSCO), **Dell** (NASDAQ: DELL), and **Microsoft** (NASDAQ: MSFT) — Oracle's stock price has steadily risen as its business has grown.

Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe. And when it comes to hardware, Oracle's own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

By combining its software expertise (both in the traditional sense and in the cloud) with its young hardware business, Oracle is poised to experience another period of growth. The business is incredibly sticky — companies don't trust their data to just anyone, and it can be tricky and even risky to make a switch. So to add to its revenue base, Oracle mainly needs to cross-sell new products to existing clients, while continuing to rope in new clients with its great breadth of modular software solutions.

How It's Doing

Leading software sellers can write a program once and sell millions of copies, then provide small but critical updates on a regular basis. These updates drive a subscription business model, which leads to recurring revenue. Most of Oracle's customers renew annual software contracts that represent more than 40% of its revenue. This is stability on which Oracle can grow.

Where is it looking to grow? Oracle is targeting new cloud software sales, software as a service (SaaS), and groundbreaking data hardware sales — and we're pleased with its progress to date and the prospects of all three.

More Resources

- *Pro*'s original recommendation (9/17/09)
- Talk about Oracle on our discussion board

In the fiscal year 2013 that ended May 31, Oracle's new software sales topped a record $10 billion, up 6% in constant currency. Non-GAAP earnings per share rose 11% to $2.68, non-GAAP operating margin hit an all-time high of 47%, and free cash flow hit a record $13.6 billion.

What We Expect

Wall Street loves growth, but it especially loves growth that comes with higher margins. Oracle trades at 11.4 times free cash flow, well below the S&P 500's average in the mid-teens. With management expecting more operating leverage ahead and growth in hardware sales, the stock should produce a North Star-topping, 10%-plus annualized return over the coming three years. We expect the company's hardware and modular software combinations to continue to create a clear value proposition, driving new sales. We also expect Oracle's transition into more SaaS and cloud sales to go smoothly. With 390,000 customers, including all 100 of the Fortune 100, Oracle is the company we admire most and want to own in the enterprise software market.

Buy: Papa John's International

Deliver a slice of the profit pie right to your doorstep.

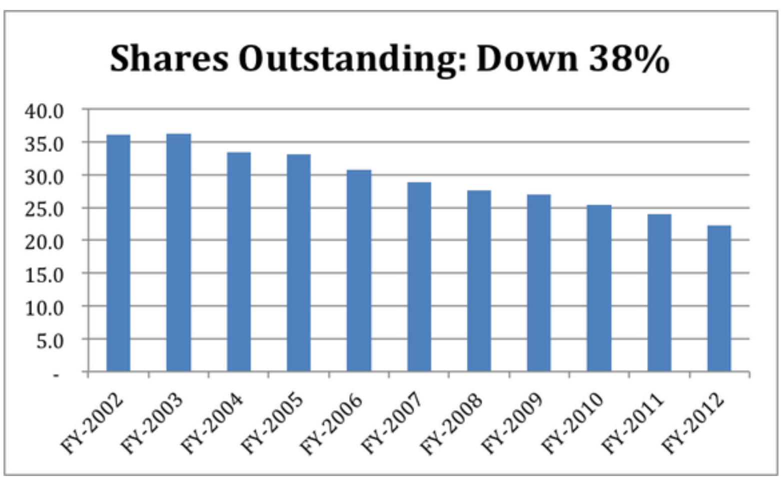
Suggested Allocation: 3.7%

What It Does

Papa John's International (NASDAQ: PZZA) operates and franchises more than 4,000 pick-up and carry-out pizza joints in more than 35 countries. For the past 30-plus years, Papa John's has been making pizza and building its brand around the "Better ingredients, better pizza" tagline. Bringing that unwavering focus to each pie has resulted in the company's perceived quality advantage over its big-chain pizza competitors, which allows it to consistently price a dollar or two higher and attract the best franchisees. Now that its brand advantage is sufficiently established in North America, Papa John's is turning its sights abroad, believing that delicious American pizza is a language every taste bud speaks.

How It's Working

As sure as a fresh pizza will be gobbled up by hungry kids, Papa John's delivers results. For nine consecutive years, the company has recorded positive or even North American comparable-store sales growth. Recently, international comps have been in the 7% range, offering lip-smacking evidence that Papa John's flavors travel well. It has opened more than 230 restaurants in both of the past two years, a pace which should continue. And because Papa John's is primarily a franchisor, it doesn't have to bear the cost of that expansion (it is taken on by the franchisees). Competing for a share of the global appetite is tough business, but Papa John's has been able to increase sales and profits at commendable rates over the past decade, which has resulted in plenty of cash generation. Management recently initiated a dividend and has consistently bought back stock over the years.



Source: S&P Capital IQ. Shares in millions.

What We Expect

More Resources

- Pro's most recent update (10/18/13)
- Talk about Papa John’s International on our discussion board

We believe the company will maintain its brand positioning, modestly improve underperforming franchise locations, and continue to be an attractive entrepreneurial outlet for new franchisees abroad. We think the brand can easily support 6,600 worldwide locations by 2023. The company should also be able to take modest market share from mom-and-pop pizza shops in established markets as digital ordering continues to gain adoption; it's a tough hurdle for smaller players to overcome. With a little bit of menu innovation and new markets maturing, we believe 2% same-store growth is sustainable over this period. We rate shares a Buy and encourage members to do plenty of field research on this one.

Buy: Starbucks

You only think you go for the coffee — Howard Schultz & Co. are serving up an experience.

Suggested Allocation: 3.4%

What It Does

You may not realize it, but “**Starbucks**” (NASDAQ: SBUX) is no longer a synonym for “coffee.” In January 2011, the company dropped the word “coffee” from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense it’s just a front. We think we go to Starbucks for the coffee, but those little white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

Starbucks began opening America’s eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 19,700 stores in 60-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences to fill more than 70 million mouths and hearts each week.

How It’s Working

By placing the customer experience first, Starbucks has cemented its role in the daily lives of consumers worldwide. People demand their Starbucks products at home, too, which has allowed the company to build out a consumer packaged-goods division that sells more than $1 billion worth of products in more than 100,000 locations worldwide. And the company is cultivating a portfolio of other brands (Evolution Fresh juices, Teavana tea bars, La Boulange bakeries) whose products can be sold in Starbucks stores and grocery stores alike. Between coffee, health foods, and tea, Starbucks believes its end markets are a massive $140 billion and growing.

Recent results have been robust. Starbucks continues to add stores at a rapid clip, and its same-store sales have been growing by an astounding 7% per year. Earnings and cash-flow performance have increased even faster, and all of this growth has been achieved by doubling down on the in-store experience and refocusing on quality. Starbucks constantly seems to be setting new records for sales, operating profits, and earnings.

What We Expect

More Resources

- *Pro*’s original recommendation (8/22/12)
- Talk about Starbucks on our discussion board

Given its very recognizable brand, artfully crafted business, and fanatically loyal customers, we expect Starbucks’ diversified growth to continue. We believe the world’s coffee and tea drinkers will happily support 30,000 or so stores across the company’s various brands, and that products bearing the aspirational Starbucks brand will expand the company’s real estate on grocery-store shelves.

The company’s scale and its ability to raise prices should help profits, as will its unique advantages in low-cost marketing. Starbucks is a pioneer in social marketing, and is perhaps better positioned than any other brand to reach out to its customers, nurture their relationship with the company, offer deals, and customize experiences.

Starbucks is riding high since CEO Howard Schultz’s return to power in 2008, and it now has so many levers to pull that capturing its potential value in a spreadsheet is very difficult. We’re not worried that shares trade higher than our fair-value estimate; we think Schultz & Co. have many tricks up their sleeves that will allow Starbucks to grow into and beyond its current valuation, and we want to be along for the caffeinated ride.

Buy: Wells Fargo (WFC)

At heart, banks are simple businesses, and Wells Fargo is the best of the breed.

Suggested Allocation: 2.7%

What It Does

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** (NYSE: WFC) is the type of company you’ll want to own before you take the plunge. It’s large, it’s strong, its operations are diversified, and its customers love it. Wells Fargo’s community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 9,000 branches and 12,000 ATMs. It’s the fourth-largest bank in America, it’s consistently No. 1 in customer satisfaction for American large banks, and it’s the leader in mortgage and small-business lending.

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up half of Wells Fargo’s business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During tough lending environments like this one, it’s easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

How It’s Doing

CEO John Stumpf and team are truly the best of the breed. Return on assets and equity for the most recent quarter (Q3 2013) were very attractive, at 1.5% and 14% respectively — great results given that the bank is using less leverage than before the financial crisis. Total revenue growth has been elusive, but expense reductions and improvements in credit quality have driven quarter after quarter of earnings growth, leading to record earnings. Deposit growth has been tremendous, and as Wells Fargo grabs additional "wallet share," fee income increases as well. The credit quality of the loan portfolio is impressive and is continuing to improve. All of this has contributed to a very well-capitalized balance sheet, allowing Wells Fargo to comply with upcoming capital regulation requirements well ahead of schedule.

What We Expect

More Resources

- *Pro*'s original recommendation (12/10/10)
- Talk about Wells Fargo on our discussion board

Wells Fargo's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. In the current low-interest-rate environment, we should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But when the U.S. economy firms up and loan demand resumes picks up, Wells Fargo's real earnings power — bolstered by growth in fee-based revenue — will hit its full stride. And many customers who start a deposit account or mortgage with Wells Fargo will explore the company's offerings in other areas, too.

Shares are trading at less than fair value, and they yield a growing 2.8% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. *Pro* has also used options in the past to generate even more income from this position, so try to invest using round, 100-share lots if it keeps you within half a percent (plus or minus) of our 2.7% allocation. If that's not feasible for you, share ownership alone is fine, too; with its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund

Diversification with some of the best small companies you've never heard of.

Suggested Allocation: 1.9%

What It Does

At *Pro*, we would love to invest in emerging-market small caps if it were easily accomplished and we could diversify. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS).

This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields about 3.5%). For *Pro*, it offers exposure to 521 of the most promising business we've never heard of.

This ETF gives us an excellent way to invest in unfamiliar companies in locations where we don't have a discernible edge — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The risk-reducing benefits of investing outside our home market are equally important.

How It's Doing

It's no surprise that small-cap companies (even dividend-paying ones) in emerging markets can be volatile. We expect DGS itself to continue to experience higher-than-average volatility, even though the diversification it brings to our holdings will likely lower the portfolio's volatility overall.

More Resources

- *Pro*'s original recommendation (11/22/10)
- Talk about DGS on our discussion board

We'd always prefer to own great businesses over great ETFs, so this holding has a permanent spot on our short list of positions we'd sell if we needed cash or found a higher-conviction alternative. In the meantime, for a reasonable 0.64% expense ratio, we get a basket of businesses with a history of exceptional performance, weighted by the size of their annual cash dividend. The fund's heavy weighting toward financials (23%), industrials (16%), and the consumer discretionary sector (14%) leaves it well positioned to benefit from an economic recovery if and when one comes along.

What We Expect

This is a top-notch fund, and you don't have to take our word for it; Morningstar has bestowed its coveted five-star rating on DGS. It's also made Morningstar's list of the top eight funds in its category in each of the past three years, and it's ranked No. 2 when considering five-year performance. We expect these impressive long-term results to continue. In the meantime, the watchword with small-caps, emerging markets, and this ETF is: patience.

The *Pro* Bottom Line

Once you've purchased our most recent buys, and the Buy First and Buy stocks in this report, you will be on your way to building your *Pro* portfolio with us! If you want to start slowly and average in, that is a Foolish approach, too. Some members buy positions in halves, or thirds, over several months. Just be sure, over time, to at least approximate our allocation guidance, since that's key to our portfolio approach. In the coming weeks and months, we will also lead you into *Pro* shorts and options (for members using those strategies with us) with real-time opportunities. Just watch your inbox for trade guidance.

Welcome again to *Pro*! We'll enjoy investing with you. Fool on!

— Jeff Fischer, advisor

Getting Started With *Motley Fool Pro*

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that generates winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* Fit You.** We know not all investors are in the same situation! Our "Make *Pro* Fit You" PDF will help you figure out how to buy the Pro investments given your personal situation, including investing in an IRA or coming to Pro already fully invested.
3. **Catch up with our portfolio at your own pace.** Start with our most recent buys, delineated in this report. Then move on to the rest of our Buy and Buy First stocks in our Portfolio Building Report (hitting your inbox Nov. 20). You can always see our latest take on all of our positions on our What We Think Now page. As you explore our recommendations, it's important to remember that a stock's "scorecard status" (Buy First, Buy, or Hold) is the best indicator of how we feel about it. If a stock is listed as a Buy or Buy First on the What We Think Now page, that means we think you can buy it today.

Buy First: American Int'l Group (NYSE: AIG)

Time and even average performance should heal the company's wounds.

Suggested Allocation: 3.8% stock, 0.6% warrants

Today's **American International Group** (NYSE: AIG) is not the same company that disgraced itself so profoundly in 2008. AIG has divested itself of whole business units since the financial crisis, managing to eliminate almost all of its previous exposure to the nasty derivatives that nearly brought down the economy. Left behind are two steadfast and improving insurance businesses and an aircraft leasing company, and AIG plans to rid itself of the leasing business, too.

What It Does

Insurance is a business of collecting premiums, investing the float, and paying out claims — and AIG is getting ever better at it. Improved underwriting is showing up in a lower loss ratio, which in turn is driving a lower adjusted accident-year combined ratio. All that is a fancy way of saying that we're seeing underwriting profits for the first time since Q3 2010.

AIG's insurance offerings consist of two divisions: property and casualty, and life and retirement. The former provides casualty, property, financial, and specialty insurance (think aerospace) to commercial clients and consumers, typically through brokers. The life and retirement division offers domestic life insurance and retirement products (annuities, mutual funds, financial planning) through a diverse network of financial-services companies, brokers, agents, and advisors. Overall, AIG is writing fewer premiums at better prices than it was in past years, which is a great indication of underwriting discipline and a hardening market.

How It's Working

When we recommended buying AIG stock and warrants in August 2012, we were confident in the momentum of the company's turnaround, but we underestimated the rapid rate at which our thesis would unfold. In late 2012 (after our recommendation), the U.S. Treasury sold another $26.5 billion worth of its AIG shares. Management wisely used the opportunity to purchase billions of dollars' worth of stock at about half book value; that, of course, further increased book value in a virtuous cycle. Management continues to repurchase shares and has even instituted a dividend for the past two quarters.

- TD Ameritrade: AIG+
- Vanguard: AIG_t

Helpful Links

- AIG's explanation of the warrants
- AIG's warrant registration statement filed with the SEC

What We Expect

Underwriting discipline will continue to drive increased earnings and a higher valuation. That plus a renewed focus on capital management will improve AIG's credit rating, reducing its cost of debt and providing another lever for higher profitability. Management is still ridding the company of non-core assets, including the aircraft leasing business mentioned above. We expect CEO Bob Benmosche to stay laser-focused on capital allocation, repurchasing shares so long as AIG continues to trade meaningfully below book value and maintaining or increasing the quarterly dividend if business performance supports it.

The *Pro* Bottom Line

We recommend buying 3.8% of AIG stock and 0.6% of AIG warrants (see below for more on those). Benmosche has cleaned out the business, so by purchasing now, you get in after all the hard work has been done. Book value — the best measure of an insurance company's worth — is steadily growing. And AIG's current share price is just over 0.7 times book value. That's cheap, especially given the company's momentum. Investors who buy AIG now are positioning themselves for outsized future returns with less risk: contrarian investing at its best.

A Note on Warrants

Warrants are similar to call options, except that they are issued by the underlying company. They offer the purchaser the right (but not the obligation) to buy the stock in question at the specified price. The warrants we're recommending on AIG are valid for 10 years from the date of issue (Jan. 19, 2011), and they can be exercised at any point before they expire on Jan. 19, 2021. When exercised, they allow the holder of the warrant to buy shares of AIG at $45 per share, regardless of the market price.

That $45 strike price adjusts favorably in the event of dilution or annual cash dividends greater than $0.675 per share (which would also lower the share price). Warrants are illiquid, and Goldman Sachs is the designated market maker for them; when you buy them, be sure to use a limit order so Goldman doesn't get more than a fair price.

Be aware that if our investment in AIG works out, those who own warrants will earn leveraged returns on them. But it's possible that the warrants could end up as a total loss if AIG's stock price is below the $45 strike price at expiration (even though they're currently in-the-money by a few bucks).

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 2.5%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Internet traffic from mobile devices in 2012 was nearly 12 times total Internet traffic in 2000, and the average connection speed of a mobile device doubled from 2011 to 2012. Communications site operator **American Tower** (NYSE: AMT) is well positioned to benefit from both trends.

What It Does

AMT leases antenna space on more than 57,000 cell sites (towers, rooftops, and more) to wireless service providers. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, non- cancellable, and feature contractual annual price escalations. About 60% of AMT's properties are located in 10 different countries outside the U.S., including India, Brazil, Germany, and Uganda, and AMT is intent on growing its international portfolio as it continues to build and acquire more towers.

How It's Working

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE (or, in Africa, from voice to data), or to increase coverage density. Every time they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; 98% to 99% of AMT's customers up for renewal each year do so, and more than 80% of its current leases don't renew until 2018 or later.

What We Expect

Revenue was up 17.7% year over year in 2012, with the international division up 34%, well outpacing the domestic side. We expect revenue to double from 2012 levels in the next five years through a combination of price escalations, new towers, and upgrades; year-to-date 2013 results suggest that the company is well on its way.

After its recent conversion into a real estate investment trust, AMT is required to pay out 90% of taxable income to shareholders. It currently distributes $1.12 annually, a 1.4% yield, and management expects to increase the dividend 20% annually for the next five years. (Importantly, only the U.S. side of this business is organized as an REIT. For more, see our original write-up, linked in the sidebar.)

For More

- *Pro*'s original recommendation (5/6/13)
- Talk about AMT

Management reduces taxable income though the use of net operating losses. And because the useful life of its tower properties exceeds the depreciation schedule, AMT also uses a depreciation shield, which reduces taxable income and understates the values of some assets on the balance sheet. Thus, typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

The *Pro* Bottom Line

We value AMT at about $100 a share. Today's price provides an acceptable margin of safety for a business of this caliber. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network.

Buy First: O'Reilly Automotive (NASDAQ: ORLY)

One of the best-managed companies in a growing space — with a great stock to match

Suggested Allocation: 3.3%

O'Reilly Automotive (NASDAQ: ORLY) is America's second-largest auto parts retailer, with more than 4,000 stores. Auto parts are a big business, estimated at $231 billion, and O'Reilly is an exceptional competitor, with an addressable market size of about $131 billion.

What It Does

Running 24 regional distribution centers and 240 hub stores as part of a two-tiered distribution strategy, O'Reilly provides same-day or overnight availability on more than 142,000 items, including many its competitors don't usually stock. Basic auto parts, tools, and services complement those hard-to-find treasures. As a result, O'Reilly's sales are historically split between "do-it-yourself " retail customers and more lucrative professional-services customers (such as auto repair shops), a luxury many competitors don't enjoy.

How It's Working

Since going public in 1993, O'Reilly has achieved 20 consecutive years of record revenue and operating earnings and has increased same-store sales every single year. Diluted net earnings per share have jumped more than 20% annually over the past decade, with 25% growth in 2012. All signs point to more growth ahead.

O'Reilly will open about 200 net new stores in 2013, increasing its 2012 year-end store count by 4.8%, and same- store sales are expected to rise by 3% to 5%. By clustering stores together, O'Reilly is able to rapidly achieve economies of scale, and by serving professionals and retail customers, it's able to enter smaller markets where competitors don't often tread. There's also no shortage of independent stores or chains to acquire in this highly fragmented industry. In 2012, O'Reilly acquired 56 locations on top of opening 180 net new stores. O'Reilly has steadily improved profitability, generated strong free cash flow, and maintained a healthy balance sheet while growing. As a result, shareholders have been greatly rewarded. But it's still young.

What We Expect

More Online

- *Pro*'s original recommendation (4/15/13)
- Talk about O'Reilly

By opening new distribution centers in key locations, and surrounding them with "spoke" stores, management sees more growth and operating leverage in its business model. Plus, cars last longer these days — meaning used cars are on the road longer, needing more costly repairs when something goes wrong.

The *Pro* Bottom Line

O'Reilly trades near our fair-value estimate today, but remember: Fair value is the price from which we can expect our desired rate of return, which is around 11% annualized on this stock. Plus, we think there's upside to that estimate as past success points to more to come. Last quarter, O'Reilly increased its earnings per share by a strong 28% year-over-year. This is a business we want to own for the long haul.

Buy First: TD Ameritrade (NYSE: AMTD)

Assets and investment fees are rising; earnings should surge when interest rates head higher.

Suggested Allocation: 3.1%

Entrusted with more than $500 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NYSE: AMTD) hosts about 378,000 stock, options, and futures trades on an average day, collects investment fees, and earns interest on billions in cash.

What It Does

Aside from being a leading discount broker, TD Ameritrade has a partnership with **TD Bank** (NYSE: TD) (which owns 45% of the company), giving it a unique position in its industry. The partnership allows TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank, and with cross-selling opportunities and below- average risk to boot. So, when the current record-low Federal Funds interest rate (targeted at 0%) increases, TD Ameritrade will earn much higher interest income, all of it pure profit. Meanwhile, it continues to focus on job No. 1: Increase client assets and launch more investment products.

But about that Fed Funds rate: In 2007, it was 4.75%, up from 1% in 2003 during the last recession. Today, it's hovering between zero and 0.25%. The first year that it increases by 100 basis points (to 1.1% from today's 0.1%), management estimates TD Ameritrade's earnings per share will rise by an extra 27% to 32% compared with the prior year, on top of any other growth. And as history shows, interest rates could rise by much more than 100 basis points over the next three, five, and seven years.

How It's Working

TD Ameritrade has increased client assets by at least 10% annualized for the last four years and counting. Management says this rate of growth has been about double that of its nearest competitor. For context, the S&P 500 is nearly flat since 2007, but client assets held at TD Ameritrade have more than doubled over the same period. Operating margins are strong, too, lately in the mid-30% range.

Diligent capital management led Standard & Poor's to upgrade the business to an "A" credit rating in 2012, which helped fuel a recent 50% increase in the dividend (likely the first of many). With steady gains in customer accounts, decreasing shares outstanding, and a commitment to paying out roughly two-thirds of earnings to shareholders, the business should continue to reward owners — with the added benefit of much higher profits when interest rates increase. Meanwhile, the stock trades about 20% below its 10-year average price-to-book value of 4, although the company is more diverse and stronger now than over the past decade.

What We Expect

For More

- *Pro*'s original recommendation (7/11/13)
- Talk about TD Ameritrade

Management will continue to be excellent stewards of capital, returning profits to shareholders and increasing additional investor value. All the while, we know higher interest rates will someday lead to much higher net income. But even as we look forward to that, we can admire the company's current results and should enjoy healthy returns.

The *Pro* Bottom Line

Our current fair-value estimate on TD Ameritrade is $34. The company's earnings are likely at a cyclical low. Believing as we do that TD Ameritrade's profit potential is much greater than recent results suggest, we think the stock is a compelling buy in anticipation of higher interest rates. TD Ameritrade's business model is powerful when rates are headed upward. Most investors have probably forgotten that power since 2007, but will remember it when earnings start to jump.

Buy First: Valmont Industries (NYSE: VMI)

The company's income is increasing as infrastructure expands around the world.

Suggested Allocation: 3%

Valmont Industries (NYSE: VMI) offers investors a proven, consistent suite of four business divisions, each serving a growing need around the world.

What It Does

Founded in 1946, Valmont's engineered infrastructure products division supplies steel and aluminum poles to infrastructure projects across the globe, including road and traffic lights; stadium and parking lights; and wireless communications poles and towers. This division also sells highway safety products such as barriers and road grating. In addition, by selling steel and concrete support structures for the global utilities industry, Valmont profits as electrical grids are renovated or built out.

Then there's water, essential to the world's farmers. Under the name "Valley," Valmont's center-pivot and mechanized irrigation systems are the world's leading brand. More than 80% of the planet's irrigated acres still use inefficient "flood" watering methods, rather than efficient mechanized irrigation, so there's lots of room to run.

To top it all off, the company provides hot-dip galvanizing (just like Mom used to make), anodizing, and other coatings to protect aluminum and steel from corrosion. One of the largest custom galvanizers in the world, Valmont expects continued growth because it still captures only a small percentage of the total market.Overall, the company operates in more than 80 countries and has more than 10,000 employees.

How It's Working

Valmont's stock has returned 17% annualized since 1993, outperforming the vast majority of stocks on the market, and the likes of **Starbucks** (NASDAQ: SBUX) and **Whole Foods** (NYSE: WFM) over the past 10 years. By focusing on strong returns on invested capital, smart acquisitions, new markets, and product-line expansion, Valmont has been able to steadily increase profits as the world economy expands. Yet it's still a relatively small company with plenty of potential in all business lines, and it currently trades at valuation multiples well below market averages.

What We Expect

For More

- *Pro*'s original recommendation (11/5/13)
- Talk about Valmont

With outstanding management and four business divisions that continue to expand around the world, we expect Valmont to continue to grow at a healthy rate (any cyclical bumps aside), and the stock to perform admirably in our pursuit of our North Star.

The *Pro* Bottom Line

Our fair-value estimate on Valmont is $170, providing plenty of upside. And remember, fair value is the price from which to expect your desired rate of return. A growing company's fair value will go higher annually. We hope to have a long, rewarding relationship with this new *Pro* stock.

Part 2, Step 1: Get Ready ...

Published Oct 30, 2013 at 12:00AM

Choose a Broker

You'll need a place for your money to reside and a platform to buy and sell. Any broker will do, but we prefer ones with low costs, transparent fee structures, a good options platform, and robust features. We don't endorse any broker in particular, but *Pro*'s account is housed at Interactive Brokers. You may find these resources helpful when deciding where to set up your account:

- ***Options* Brokerage Board:** Over at *Motley Fool Options*, which you receive free as part of your *Pro* membership, we've got a whole discussion board about brokerages. Visit the board »
- ***Options* Weekly:** If you think you're going to branch out into advanced options investing, be sure to read this can't-miss analysis from our sister service every Friday. See the *Options* Weekly archive »
- **TMF Broker Center:** This table compares features of six popular online brokerages. Visit TMF's Broker Center »

Request Options Permissions

Ask your broker (via the Options Permissions section in the account application, or just call them to request a form) for full options approval. Typically, this means level 2 or level 3 approval (it can vary by broker). The "levels" refer to what type of options strategies are allowable, so the higher your approval level, the more strategies you'll be able to participate in. Fill out, sign, and mail in the simple document, and after a few days you'll be approved. If you aren't granted a high level, be sure to submit another request after a few weeks with an account. You should be able to get promoted to higher levels over time and as your account size and experience grow.

Update Your Beneficiaries

Chances are, your account has a beneficiary designation. That is, when you set the account up, you answered the question: "Who should get my dough if space matter falls from the sky and makes me one with a crater?" That person, or entity, is your beneficiary, and now is a great time to make sure it is accurate. Life changes quickly and these things can be outdated. Your broker will have a beneficiary designation form that should be simple to fill out and submit.

Jeff Fischer

Advisor

Jeff Fischer (TMFFischer), advisor of *Motley Fool Pro* and *Motley Fool Options*, started working at the Fool in 1996, soon after he won the Fool's first year-long online portfolio contest. Jeff co-managed the original Fool Portfolio with co-founders David and Tom Gardner, and co-founded and managed the Fool's Drip Portfolio. Jeff also wrote *Investing Without a Silver Spoon* and served as editor on several other Motley Fool best-sellers. All four of the real-money portfolios Jeff has managed or co-managed publicly since 1996 have beaten the S&P 500, although that isn't his first objective, which is steady returns with reasonable risk. Jeff is married to an actress/professor and has a young son.

Billy Kipersztok

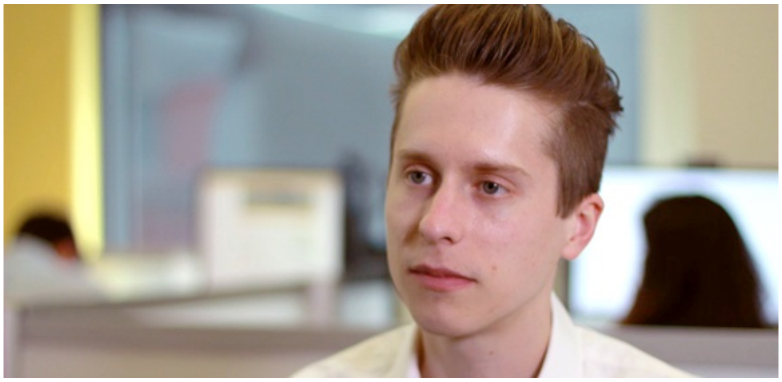
Research Analyst

Billy Kipersztok (TMFTailwind) was introduced to investing by his father, and began reading The Motley Fool as a teenager. He is a voracious reader of investment literature, and he enjoys scouring the market for investments with two characteristics: (1) favorable economics and (2) a fair price.

Prior to joining the Fool, he interned in the analytics department of the NBA's Atlanta Hawks, picked up an MBA and a master's degree in sport business management at the University of Central Florida, and earned a bachelor's degree in chemistry from the University of Florida. He enjoys learning, playing/watching sports, and cheering on his alma mater. (Go Gators!)

JP Bennett

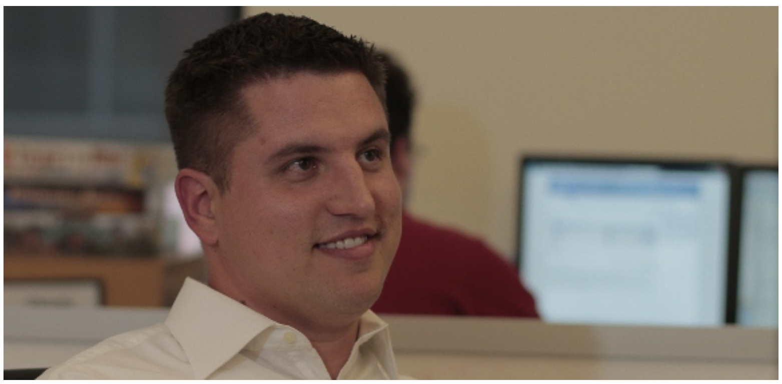
Research Analyst



JP Bennett (TMFYossarian) was once a doctoral student in psychology who thought that investing was destined to remain merely his favorite hobby. But following a career-changing epiphany, a very Foolish internship, and an MBA degree, he has returned to The Motley Fool to become a member of the *Pro* and *Options* teams. JP spends most of time researching companies and reading anything that might make him a better investor. He is also an avid runner and road cyclist, since these activities serve to counteract most of the negative consequences of his sedentary job and primary hobby (and also the fact that his favorite course of every meal is dessert). He is also a 2015 Level III CFA candidate.

Jeremy Myers

Analyst



Jeremy Myers, CFA (TMFTank) is a senior analyst for *Hidden Gems* and *Motley Fool Pro*. Jeremy joined The Motley Fool in 2009 after spending five years teaching ninth-grade biology and coaching football at a nearby public high school -- and, in his spare time, reading every investment book he could get his hands on. Jeremy attended the University of Virginia, where he majored in economics and spent two years as a member of the football team. After graduating, he started his career as an investment advisor for a large insurance company before returning to school to pursue a graduate degree in education.

As a devoted Fool since college, Jeremy developed a healthy skepticism for the financial establishment, which complements his deeply ingrained tendency to buy quality on the cheap. He also believes that the biggest advantage we have as individual investors is our ability to control our time frame and temperament. When he's not searching for the next 10-bagger, Jeremy can be found spending time with his young family, taking on home renovation projects that are over his head, or pursuing the elusive single-digit handicap on the golf course.

Ellen Bowman

Editor/publisher

Ellen Bowman (TMFKabellen) has been with The Motley Fool since 2006, first as a copy editor for Fool.com and then as an editor (and publisher, and chief bottle-washer) of various subscription services. She has worked on services from *Stock Advisor* to *One* and beyond, but considers *Pro* and *Options* "home." Ellen has a degree in creative writing from the University of Houston, and is amazed every day at how much a liberal-arts major can learn about investing when she has teachers like these!

Part 2, Step 4: Keep Track

Published Oct 30, 2013 at 12:00AM

Measure Us

We all have different investing goals, but the bond that holds together all *Motley Fool Pro* investors is the desire to better control our financial lives (present and future) so that we can fully embrace life outside of our brokerage accounts. When you're trying to assess *Pro*'s performance, your goals are the best place to start: Is *Pro* helping you progress toward your financial goals? Are you learning and having fun? Are you sleeping well at night and able to enjoy your life outside of investing?

You can always find our results at the bottom of our Recommendations page. For something a little more detailed, try this on for size:

- **The Truest Way**: We'd like to help you double your money, taking inflation into account, every 10 years. In a nutshell, that is our North Star, an omnipresent fixture that offers us direction and reminds us what we're striving toward. If we are able to meet or approach this goal, it will mean that many Fools are achieving financial success.
- **The Simplest Way**: While you're likely most focused on whether your investment portfolio is achieving your goals, the investing community demands relative return comparison to a stock index. The most common stock indexes don't have much in common with our strategy, and we don't care much how any given stock index performs — but we realize many investors appreciate the reference point, and we cite the performance of the S&P 500 Total Return Index and the MSCI World Index on our Recommendations page.
- **The Risk-Adjusted Way**: Looking at returns in isolation is a dangerous game. For instance, it could be silly to compare two investments with completely different risk profiles, or two investments with completely different goals. We realize that the absolute level of returns is only one component in assessing the returns we achieve. A few of our favorite performance measurements, popular with academics, institutional investors (like pension plans), and hedge funds, attempt to adjust returns for the level of risk taken. Even though these measures are far from perfect (some assume returns conform to a normal distribution and/or that price variability is a good measure of risk, among other deficiencies), they shed some light on the outcomes of our investing process. We'll do the math for you from time to time and show you our score.

Measure You

Track your stocks using My Scorecard. My Scorecard is your personalized, one-stop shop for information about the stocks that matter most to you. It's part scorekeeper and part coverage collector. Enter your holdings, and it'll keep track of your performance and whether you're beating the market; enter more stocks you're interested in, and it'll help you follow your watch list.

Plus, My Scorecard brings together all of the premium Foolish coverage for your companies — updates, articles, discussion board posts, and more. You can filter this feed, below your list of stocks, to zero in on just the type of content you're looking for.

Unfortunately, My Scorecard doesn't yet handle options, but it's a great tool to help follow the stocks that you are long and short. Check out My Scorecard here »

You can also see all our active positions, with Buy First, Buy, and Hold ratings, along with our latest opinions, in What We Think Now. Use this alongside our portfolio page's Recommended Allocation to help build your portfolio.

Remember, there's no need to rush into any trades, so take your time. We're here to help — if you have any questions, the *Pro* team and fellow members have the answers in our *Pro* Community.

In This Report

PDFDownload this report as a PDF file

Introduction

Dear Pro Fools,

The majority of the recommendations in this report are "shorts" of vehicles we consider to be flawed — they're investments that should slowly decline in value, adding profits to the short part of our portfolio. But let's take the pressure off right away: For reasons I explain below, we don't expect that many of you will initiate most of the positions in this report right away, or perhaps at all.

Shorting in Short

For those new to shorting, let's step back for a quick overview. When you sell something short, you borrow shares from a broker and immediately sell them, collecting the proceeds. In the future, you'll need to buy shares back (called "cover" or "buy to cover") to replace the shares you borrowed. You hope to buy those shares back at a lower price. The difference between your original sell — or short — price and the price you pay to buy back (and return) the borrowed shares is your profit. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock soars to $30, you've lost $10 per share when you buy it back.

Why do we short in *Pro*? It's one way we're able to profit when the market (or a weak company) falls. We also like to short flawed investments that, because of the way they're constructed, are destined to lose value in most environments. Most of these instruments use leverage and/or hold futures contracts that eat away at their daily value; when we sell short a vehicle like this (two of which are outlined below), we anticipate this steady decline in price.

Shorting Is Optional

As interesting as it is, not every *Pro* member is comfortable with shorting. Practical considerations can have an impact as well. First, you cannot sell short in an IRA — you need a margin account. Second, you have to accept that shorts can run strongly against you. Third, you'll usually pay an annual fee of anywhere from 1% to 5% (of the short value) to short something. Finally, in many cases it's hard to borrow shares to short, period. That is the unfortunate situation with our suggested shorts today. When we initiated the short positions in this report, they were a bit easier to borrow, but today, most brokers don't have shares of these vehicles available for shorting.

So, what do you do? You can use options to short in some cases; we explain how to do so below. You can also consider opening a new brokerage account (Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does); or you can wait and see if shares become available in your existing, traditional brokerage account. Or, not short at all, if you're not drawn to it.

This Positioning Report

Returning to the main show, this Portfolio Positioning Report (and the special live chat accompanying it at 1 p.m. July 18) will — when you're ready! — help you short vehicles we believe will decline, and generate options income. Keep in mind that this is just a start — we'll have many brand-new trade recommendations as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way! On the other hand, if all this looks overwhelming at first — or if you're still catching up with our long positions — that's OK, too. You don't need to make all of these trades now. Stock investments are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and rewarding — aren't necessary to succeed with *Pro* in the long term.

As you progress with us, just keep your exposure to the stock market in mind; hedging is about portfolio exposure. If you've bought all of our stock recommendations to date, your *Pro* portfolio is only about 63% invested, meaning you have enough cash that you don't need to hedge yet! We've kept that in mind in putting together this report (which does not carry any market hedges), and we'll do so with our future recommendations to you, too. That said, we do plan new market hedges for all members who are interested soon.

In closing, I'll stress again that you don't need to feel pressured to act. We will continue to make recommendations on an ongoing basis — there are always new opportunities. So, as always, take your time, and make an investment only when you're ready. Finally, please bring any questions to our Making*Pro*Fit You discussion board.

Foolishly,
Jeff Fischer, *Pro* advisor

Short: CurrencyShares Euro Trust (FXE)

Shorting the euro against the dollar is relatively low-risk disaster insurance

Suggested Short Allocation: 3.4%

We're shorting the euro against the dollar. We view this position as an asymmetrical investment where the downside is relatively known (and reasonable) and the upside, while less known, is much larger. For this position to work against us, the euro would strengthen against the dollar, but likely only by so much (assuming the U.S. doesn't go belly-up).

Even if the euro returns to its all-time high against the dollar ($1.60 — currently one euro is worth $1.31) our losses will be tolerable. Meanwhile, our possible upside — hard as it is to believe — may be as much as 100%. If the worst happens, the euro could fall apart completely. The trust we're shorting only holds physical euros, so it could end with negligible value. We don't hope for that calamity, but we can accordingly view this position as disaster insurance with relatively low downside risk.

More Resources

- *Pro*'s recommendation history
- Talk about FXE on our discussion board

Alternative Trade: Shares of FXE are available for shorting at various brokers, but if your broker does not have shares available, and you're trading in a margin account, you can instead "sell to open" January 2015 $100 call options on FXE. These calls currently pay you about $30 each (that price will fluctuate). This naked shorting of calls will provide you profits on any decline in FXE down to $100. Just realize that you are, just like us, short the vehicle at today's price, and you will have paper losses if FXE's price goes up. Only sell to open one call option for every $13,000 in FXE you can afford to be short, at a reasonable total allocation of around 3.4%, remembering that each option represents 100 shares. There are no IRA alternatives at this time that are attractive enough to merit your IRA dollars.

Short: Direxion Daily Financial Bear 3x (FAZ)

Rebalancing costs keep constant downward pressure on this bearish ETF

Suggested Short Allocation: 1.3%

This bearish ETF is meant to provide 3 times (300%) the daily inverse results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. By shorting this ETF, we'll effectively be 3 times long, on a daily basis, the U.S. large-cap financial sector. Leveraged ETFs like this one are flawed vehicles because they rebalance their derivative positions daily in order to maintain a constant leverage. Over longer holding periods, the costs involved with rebalancing eat away at returns, keeping constant downward pressure on the vehicle as a whole. As our full report linked below details, we continue to believe that large-cap U.S. financials are cheaply priced — and we own several of them as a result. That belief makes shorting this flawed bearish financial ETF all the more attractive.

More Resources

- *Pro*'s recommendation history
- Talk about FAZ on our discussion board

Alternative Trade: Shares of FAZ are available for shorting at only one broker we know of right now — Interactive Brokers — and sometimes at TD Ameritrade. If you can't short shares directly, then in a margin account you can "sell to open" January 2015 $20 naked calls on FAZ, lately paying you about $10 per contract. This effectively makes you short FAZ at $30 (just as we recently did, adding to our position), and sets you up to earn as much as $10 if FAZ falls to $20 or lower by expiration. Be sure to use the "standard" FAZ $20 call option, not the "NS" option. Again, it will pay you around $10 (or $1,000) for every call you write. Only sell one call for every $3,000 in FAZ you are able to comfortably short, up to a 1.4% allocation. Never over-allocate to a short, whether you're shorting with naked calls or shorting directly. Given the expense of FAZ put options, there are no IRA-friendly alternatives for this short.

Option Trade: Write a Covered Strangle on OpenText (OTEX)

Earn income while you wait to potentially buy more shares of this *Pro* holding on a decline

Suggested Allocation: Write one put option and one call option for every 100 shares you own

In our Catch-Up Report No. 2, we recommended that you invest about 3% of your funds in software leader OpenText. Now, to catch you up to our option position on this stock, we recommend you write a covered strangle on your shares. This means you'll write (or "sell to open") one put option and one call option for every 100 shares of the stock you already own. (If you don't own 100 or more shares, but already own 3% in the stock, simply keep holding the stock.)

A covered strangle pays you significant option income. It also sets you up to buy more shares (in this case, doubling your share count) if the stock falls enough, or sell your existing stock if it rises enough. Most likely, though, is we'll continue to manage our covered strangle together for income, rolling it to later months when expiration nears. So, to get started, you should:

- Use a strangle order if you can, and "sell to open" November 2013 $65 puts and November 2013 $70 calls on OTEX. Sell one of each option for every 100 shares of OTEX you already own (and we're assuming you only own a 3% allocation in the stock). Do not buy these options — sell them.
- Lately, look to get paid about $7.60 to $7.80 combined to sell this strangle. So, you'll collect about $760 to $780 per strangle that you write, or sell.

More Resources

- *Pro*'s recommendation history
- Talk about OpenText on our discussion board

This sets you up to potentially buy more shares around a net $57.40 (using the low end of recent prices), or sell your existing shares around a net $77.60. That's a nice wide range. If the stock stays between our $65 and $70 strike prices at expiration, we simply earn all $7.60 as income. We'll manage the position together with a real-time trade alert, if necessary, as expiration gets closer in November. But mostly, we'll just wait for these options to slowly lose value, paying us in the process.

If you have questions about this trade, please visit our OpenText board. And remember, you don't need to use options if you don't want to. We enjoy just owning the stock, too, and see good long-term things ahead for it.

Short: UltraShort Real Estate ProShares (SRS)

Another leveraged ETF with rebalancing flaws from which we benefit

Suggested Short Allocation: 1%

This ETF is meant to provide twice (200%) the daily inverse results of the Dow Jones U.S. Real Estate Index (from here out, "the index"). In other words, if the index goes up 1% in a day, the ETF will decline 2%, and vice versa. By setting up a short position on this inverse ETF, we are setting up a bullish position on the underlying index, and thus on U.S. commercial real estate. This is another leveraged ETF where we benefit from compound flaws as the ETF is rebalanced to maintain its 2:1 leverage.

More Resources

- *Pro*'s recommendation history
- Talk about SRS on our discussion board

Availability and Alternative Trades: Lately, shares of SRS are only available for shorting at Interactive Brokers and perhaps a few other brokers. This ETF does not have long-term options on it, so there are no alternative shorting trades available for anyone. However, if you want to follow the spirit of this trade, you can instead buy about 1% in shares of the bullish **iShares U.S. Real Estate ETF**, with its current 3.8% dividend yield. Our real estate investment thesis, and this alternative purchase, is outlined further in the full report link at right.

The Motley Fool owns shares of OpenText. The Motley Fool is short CurrencyShares Euro Trust, FINANCIAL BEAR 3X, and UltraShort Real Estate ProShares and has the following options: short January 2014 $25 calls on UltraShort Real Estate ProShares and long January 2014 $25 puts on UltraShort Real Estate ProShares.See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Catch-Up Report: Part 4

Buy: AmTrust Financial Services (AFSI)

Its talent at capitalizing on human laziness is just part of what we love about this insurer.

Suggested Allocation: 6.9%

At *Pro*, we speak a lot about the importance and power of recurring revenue — mostly because we know that humans are inherently lazy. Insurance purveyor **AmTrust Financial Services** handily proves this point for us; many of the policies it writes (more than 80% in most lines!) renew at the end of their term without their owners even shopping for a better rate. Most of us, it seems, are guilty of preferring inertia to bargain-hunting, and AmTrust and its fellow insurers are the beneficiaries. Even better, companies with such high renewal rates can actually grow their recurring revenue stream by raising prices a teensy bit at renewal time. This is just one of the characteristics of AmTrust's business we love, and it contributes to our confidence in making it *Pro*'s largest holding.

What It Does

AmTrust is an insurance underwriter. In general, insurance companies make money in two ways. First, they get paid to take on risks other people don't want (like the cost of repairing your car if you get in an accident); if a company takes in more in these policy premiums than it pays out in policy claims and handling, it makes an underwriting profit. Second, because policyholders pay for their coverage up front, insurance companies can invest that money — the industry calls it "float" — until they need it to pay claims.

AmTrust focuses on insurance niches (primarily workers' compensation and product warranties) that are low-hazard and generally too small for large insurance companies to care about. But though AmTrust writes small policies, it's no small fry. Its high renewal rates allow it to focus on writing new policies and looking for struggling insurers to acquire — and AmTrust has proven to be a very opportunistic acquirer.

How It's Working

AmTrust's strategy — being a disciplined underwriter of low-hazard, small policies in well-defined niches; using technology to keep its expenses low; and opportunistically acquiring policies other insurers struggle to find profitable — has resulted in impressive growth. Gross written premiums have risen from about $1.1 billion to $2.7 billion over the past five years, and this increase, combined with a laserlike focus on low expenses, has resulted in consistent growth in earnings, dividends, and book value.

What We Expect

The insurance market works in cycles, and recent signs indicate an upswing on the horizon, which means pricing and profits should improve across the board. AmTrust should thrive in a strengthening market: It can charge as much as its competitors and make more in profits thanks to its lower expense structure, or it can undercut the competition on price in a bid to take market share. If the economy improves at all, the small businesses AmTrust insures should hire more workers and consumers should purchase more insurable goods, so there seems to be plenty of growth ahead.

More Resources

- *Pro*'s recommendation history
- Talk about AmTrust on our discussion board

The *Pro* Bottom Line

Although AmTrust currently trades for more than our $33.50 estimate of fair value, we believe the company's premium valuation is warranted given the consistency of its growth, quality, and profitability. AmTrust is *Pro*'s largest holding and we're happy to let this winner run, expecting to increase our fair-value estimate over time. We have high confidence that owning a piece of this business will help *Pro* Fools achieve satisfactory returns.

Buy: The Buckle (BKE)

This well-managed retailer has fit into its jeans admirably over the past decade.

Suggested Allocation: 3.6%

Your *Pro* team doesn't know much about fashion, but we can read financial statements. And if the next decade of business performance by specialty retailer **The Buckle** looks anything like the last one, we'd be willing to wear whatever getup the company suggests.

What It Does

The Buckle sells jeans, other apparel, and accessories at 443 retail locations across the United States, and we think the fantastic management team has figured out a formula that works: measured growth, middle-of-the-road merchandising, and great service. We're typically leery of the risks of investing in retail, especially fashion, but the proof is in the numbers for The Buckle. Shares are modestly undervalued, the store concept is in the middle of its life cycle, and the company's financial prudence and operational acumen should lead to a growing stream of free cash flow, dividends, and extra payouts — all of which can help the *Pro* portfolio in our pursuit of our North Star.

How It's Working

The Buckle is a surprisingly steady operator in the notoriously fickle specialty retail space. The company reported a modest same-store sales increase of 2.2% so far this year, but that's an improvement from the 1.2% increase through April. We accept a degree of lumpiness here and don't get too bent out of shape when these numbers bop around — The Buckle's target demographic is fickle teens and twentysomethings, after all. We simply monitor these figures for clues about the overall shopping experience and brand relevance. With this performance, we feel confident that the 13 stores management expects to open this year should be solid contributors. As the company expands cautiously, we marvel at its ability to boost margins, improve inventory management, and boost profitability per store.

What We Expect

With 443 stores at the end of fiscal third-quarter 2012, we believe The Buckle has plenty of room to grow as it expands from the middle of the country to both coasts; it should be able to achieve wonderful store economics with the 650 to 850 locations we ultimately expect. The table below outlines the key metrics we monitor for a retailer, and as you can see, The Buckle has fit into its jeans pretty well over the past decade.

Metric	2002	2012	TTM Q1 2013	Annual Growth
Stores	304	436	441	3.7%
Sales per Store	$1,339	$2,387	$2,398	6.0%
FCF per Store	$57	$406	$484	21.6%
Sales per Square Foot	$274	$475	n/a	6.0%
Inventory Turnover	4.7x	6.0x	n/a	3.0%

Dollars in thousands. Per-store calculations based on average stores open during the period. Sources: SEC filings, S&P Capital IQ, analyst estimates.

Not only has the company's footprint grown wider than a pair of bell-bottoms, it has sold more — and earned more — at each location thanks to its tight control over operations. The Buckle also has a history of paying special dividends with its excess cash; it's done so for six of the past seven years. Just last December, *Pro* members holding the stock received a $4.50-per-share payout from the company in addition to the regular $0.20 dividend. Naturally, we encouraged all members to celebrate by buying themselves and their loved ones a few new pairs of jeans.

More Resources

- *Pro*'s original recommendation (6/20/12)
- Talk about The Buckle on our discussion board

The *Pro* Bottom Line

To us, The Buckle has two sides: a very healthy operating business and a not unimpressive bank account. We trust management to allocate the cash in that bank account appropriately, and we appreciate their propensity to return any extra to shareholders. While we can't count on special dividends, the average yield over the past six years, including special dividend payouts, has been approaching North Star-level returns. Meanwhile, the company's operating business has grown bigger, more profitable, and more valuable. An investment in The Buckle suits *Pro*'s penchant for superior businesses, steady income, and a favorable risk/reward profile.

Buy: Starbucks (SBUX)

You only think you go for the coffee — Howard Schultz & Co. are serving up an experience.

Suggested Allocation: 3.3%

You may not realize it, but "**Starbucks**" is no longer a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense it's just a front. We think we go to Starbucks for the coffee, but those little white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

What It Does

Starbucks began opening America's eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 18,000 stores in 60-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences to fill more than 70 million mouths and hearts each week.

By placing the customer experience first, Starbucks has cemented its role in the daily lives of consumers worldwide. People demand their Starbucks products at home, too, which has allowed the company to build out a consumer packaged-goods division that sells more than $1.2 billion worth of products in more than 100,000 locations worldwide. And the company is cultivating a portfolio of other brands (Evolution Fresh juices, La Boulange bakeries) whose products can be sold in Starbucks stores and grocery stores alike. Between coffee, health foods, and tea, Starbucks believes its end markets are a massive $140 billion and growing.

How It's Working

Recent results have been robust. Over the past three years, Starbucks has added almost 1,500 stores, its same-store sales have grown by more than 7% per year, and it has more than doubled earnings. All of this growth has been achieved by doubling down on the in-store experience and refocusing on quality. Starbucks constantly seems to be setting new records for sales, operating profits, and earnings. And if the lines at the two locations nearest to Fool HQ (where we perform our daily channel checks, purely for science) are at all indicative of larger business trends, Starbucks' mojo remains strong.

What We Expect

Given its very recognizable brand, artfully crafted business and fanatically loyal customers, we expect Starbucks' diversified growth to continue. We believe the world's coffee and tea drinkers will happily support 30,000 or so stores across the company's various brands, and that products bearing the aspirational Starbucks brand will expand the company's real estate on grocery-store shelves.

The company's scale and its ability to raise prices should help profits, as will its unique advantages in low-cost marketing. Starbucks is a pioneer in social marketing, and is perhaps better positioned than any other brand to reach out to its customers, nurture their relationship with the company, offer deals, and customize experiences.

More Resources

- *Pro*'s original recommendation (8/22/12)
- Talk about Starbucks on our discussion board

The *Pro* Bottom Line

Starbucks is riding high since CEO Howard Schultz's return to power in 2008, and it now has so many levers to pull that capturing its potential value in a spreadsheet is very difficult. We're not worried that shares trade higher than our fair-value estimate; we think Schultz & Co. have many tricks up their sleeves that will allow Starbucks to grow into and beyond its current valuation, and we want to be along for the caffeinated ride.

Buy: Wells Fargo (WFC)

At heart, banks are simple businesses, and Wells Fargo is the best of the breed.

Suggested Allocation: 3%

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 9,000 branches and 12,000 ATMs. It's the fourth-largest bank in America, it's consistently No. 1 in customer satisfaction for American large banks, and it's the leader in mortgage and small-business lending.

What It Does

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During tough lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

How It's Working

CEO John Stumpf and team are truly the best of the breed. Return on assets and equity for 2012 were very attractive, at 1.4% and 13% respectively — great results given that the bank was using less leverage than before the financial crisis. Total revenue growth, while modest, has combined with expense reductions to drive quarter after quarter of earnings growth, leading to record earnings. Deposit growth has been tremendous, and as Wells Fargo grabs additional "wallet share," fee income grows as well. The credit quality of the loan portfolio is impressive and is still improving. All of this has contributed to a very well-capitalized balance sheet, allowing Wells Fargo to comply with upcoming capital regulation requirements well ahead of schedule.

What We Expect

Revenue growth will be slow until U.S. loan demand resumes, but management's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. We should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But when the U.S. housing market emerges from its general malaise, Wells Fargo's real earnings power — bolstered by growth in fee-based revenue — will hit its full stride. And many customers who start a deposit account or mortgage with Wells Fargo will explore the company's offerings in other areas, too.

More Resources

- *Pro*'s original recommendation (12/10/10)
- Talk about Wells Fargo on our discussion board

The *Pro* Bottom Line

Shares are trading at less than fair value, and they yield a growing 2.8% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. Pro has also used options in the past to generate even more income from this position, so try to invest using round, 100-share lots if it keeps you within half a percent (plus or minus) of our 3% allocation. If that's not feasible for you, share ownership alone is fine, too; with its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

The Motley Fool owns shares of AmTrust Financial Services, Starbucks, The Buckle, and Wells Fargo. See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Catch-Up Report: Part 3

PDF Download this report as a PDF file

Buy: Broadridge Financial Solutions (BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 3.5%

Broadridge Financial Solutions helps the global financial system work. It operates the technology and logistical plumbing behind the scenes of global securities trading and the communication between banks, brokers, funds, and shareholders, and it made about $2.3 billion last year doing so. It's not sexy, but Broadridge dominates its niches, has remarkably steady recurring revenue and cash flow, and has recently broadened its suite of products and services with some small acquisitions. We expect the company to be a slow grower, but its consistent earnings growth and a healthy 2.7% dividend should help achieve North Star-like returns over time.

What It Does

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. Broadridge's investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in 2012, more than 85% of shares voted electronically used the company's platform. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider to manage investor communications.

The company's smaller segment, securities processing solutions, accounts for 28% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance Broadridge technology kicks into action — the company processes more than $4.5 trillion worth of global stock and bond trades each day.

How It's Working

Mutual funds have been scrimping on investor communications recently, and low trading volume has dinged sales and profit growth. Still, it's a testament to the company's resilient business model that sales growth, profit margins, and free cash flow remain attractive — revenue grew 6% last year and earnings advanced 13%. And Broadridge continues to serve its customers masterfully; its 99% retention rate sets the stage for recurring revenue (and deepening relationships) in future years.

What We Expect

We think Broadridge will continue to write the e-book on electronic investor communications. Its dominance of this market should strengthen its competitive advantages, making it indispensable as transparency in the financial system increases. We also expect banks and brokerages to continue outsourcing their non-core operations to save money and increase flexibility; this should bring increased business and greater efficiency to Broadridge. Management expects 3% to 4% revenue growth this year, which should translate to more than 9% earnings growth. Much of Broadridge's revenue is recurring, making its sales and earnings growth highly reliable, and its impressive free cash flow will likely bring an ever-higher dividend and increased share buybacks.

More Resources

- *Pro* 's original recommendation (4/27/10)
- Talk about Broadridge on our discussion board

The *Pro* Bottom Line

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns. While we wait for the market to come around to the Broadridge story, we believe management is buying back shares at an attractive price. We think shares are worth $27.50 today.

Buy: Gentex

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 3.1%

In 1982, a small company in Zeeland, Mich., called **Gentex** made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors. Today, the company commands almost 90% of that market, and it sells eight times more units than its closest competitor.

What It Does

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. In 2000, the company sold 6.8 million units; in 2012, it sold 23.8 million. That growth has been driven by an increased focus on safety, higher car sales, and greater market penetration (more car makers offering Gentex mirrors as a trim option).

How It's Working

Gentex has turned these market dynamics into wonderful financial performance. Revenue is up by nearly 20% per year since 1987, and over the past decade, the company's net margins have bounced around the mid-teens. Those numbers are shockingly good for an auto parts supplier, showing that its fancy mirrors are showing up in more and more new cars. Gentex has reinvested in its business to sustain its advantages; it pioneers its own manufacturing technologies; it owns all of the manufacturing plants it builds (the land, too); and it sets aside 7% of sales for research and development. It's also got almost $5 per share in cash and investments, sending a strong signal to automakers that Gentex should easily avoid any potholes in auto demand.

What We Expect

Currently, less than one in every four cars made worldwide has an auto-dimming rearview mirror, and only 6% have auto-dimming exterior mirrors. For context, prior to 1987 those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher penetration; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More Resources

- *Pro* 's original recommendation (5/29/12)
- Talk about Gentex on our discussion board

The *Pro* Bottom Line

More and more technology is finding its way to the auto mirror, both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. With shares trading around our estimate of fair value, we think Gentex reflects a great opportunity.

Buy: Intel

Rumors of the PC's death have been greatly exaggerated.

Suggested Allocation: 5.2%

The world's leading producer of microprocessors and chipsets for computing devices, **Intel** trades at less than 12 times earnings, or more than a 35% discount to the average S&P 500 stock. It also pays nearly twice the average dividend yield, at 3.8%. That's cheap enough to indicate that all is clearly not right in Intel's corner of Silicon Valley.

While the media loves to talk about the demise of the personal computer, it's our job at *Pro* to sift through that constant chatter to see the truth and invest accordingly. And to our minds, the death of the PC has been erroneously predicted. Mobile computing is indeed changing our online behavior, and PCs are evolving as a result. But the outcome is more computing devices, not fewer, and Intel is positioning itself to be the brains behind ever more of them.

What It Does

Intel's goal is to be "the preeminent computing solutions company that powers the worldwide digital economy." Whether it's a high-speed server for a data center, a new Ultrabook with a touchscreen and detachable tablet, a smartphone, a tablet, a car, or just about anything else, Intel has the computing technology to drive it.

Admittedly, the company was late to the smartphone and tablet markets, but there's a silver lining: As these devices eat into PC sales, investors' fear about Intel's tardiness brings us the value opportunity we see in the stock. And because smartphones and tablets have very short life cycles, Intel can catch up quickly by steadily inserting its technology into new product designs.

How It's Working

Intel asserts that the tablet is broadening the PC market, not shrinking it, and we agree. Tablets are wonderful for what they are, and the hype surrounding them is admittedly intense. But it seems likely that the PCs of tomorrow will have the best qualities of both a tablet and a PC.

In emerging economies, PC unit volume has steadily risen for years; in North America, it slipped in 2012 for the first time in 11 years, but we believe that was because consumers are excited about the novelty of tablets, not done with PCs forever. Even as the market is expected to shrink, data company IDC expects 2017 shipments to be less than 5% lower than in 2012. We view this as a mature market where Intel will continue to dominate — and generate cash for reinvestment elsewhere.

What We Expect

More Resources

- *Pro* 's recommendation history
- Talk about Intel on our discussion board

Intel is investing for greater growth ahead. Wall Street is leery of the company's expensive capital investment plans, designed to maintain its leading-edge manufacturing abilities, but we view this spending as a strong indicator for the company's future. Intel's confidence in the future of microprocessors seems well-placed in our increasingly digital age; as the number of devices connecting to the Web grows exponentially, so does the need for more computing power.

The *Pro* Bottom Line

Historically, buying true blue chips (Coca-Cola, Johnson & Johnson, IBM …) when they're down has been an excellent investment strategy. We believe Intel will fit that bill, too. Our fair value on the stock is about $27; on a price-to-earnings basis, that would still leave the stock trading at a healthy discount to the S&P 500. We don't expect this value gap to be bridged immediately — first, Wall Street needs to believe in the company's future again. But this year or next, we expect Intel to show skeptics that it's here to stay.

Buy: Medtronic

For once, maybe we can all profit from growing older.

Suggested Allocation: 3.2%

Bryan likes to tell people that the mounting gray strands in his hair represent rapidly increasing wisdom. Nick claims his sore back is the result of lifting cars over his head. Jeff … well, Jeff just thinks cruising around on a Hoveround makes him look hip (it doesn't). The honest truth is that your *Pro* team is aging, and global demographics are shifting in that direction, too. Cost issues aside, global health care is a growth market we'd be silly to miss. Since 2009, *Pro* has stood by **Medtronic** because of its global reach, unrivaled commitment to research and development, and attractive financial profile.

What It Does

Medtronic is in business to “alleviate pain, restore health, and extend life” for the chronically ill. Sure, it also makes money for its shareholders and provides a good life for its employees, but the company has grown from a garage operation into the world’s largest medical technology company by keeping its patient-centric mission front and center.

Today, Medtronic has a vast suite of high-tech products; it boasts market-leading share in key technologies; and it has successfully defended that position over time by keeping the pedal to the metal regarding research and development. And with more than 9% of sales directed back into R&D, there are research dollars left over to keep the company’s new product pipeline humming. Finally, Medtronic has made selective acquisitions to target higher-growth areas and fill product holes, and it now racks up $7.5 billion a year in international sales (45% of the company’s $16.6 billion total).

How It’s Working

Over the past few years, some of Medtronic’s core markets have come under duress; in some cases, competition has picked up, while in others, product efficacy and sales practices have been questioned. As of late, though, all that has been stabilizing — and the company’s other businesses, and its 20% annual growth in emerging markets, were busy picking up the slack. Product diversification has been a big help in maintaining sales levels, and management’s deft execution of its goals and impressive expense management have turned modest sales performance into admirable bottom-line results and cash generation.

Although sales have only advanced 4% annually over the past five years, earnings, dividends, and free cash flow have grown faster as management has cut costs, consistently rewarded shareholders, and maintained discipline with its reinvestments.

What We Expect

Under new CEO Omar Ishrak (who came aboard in 2011), we expect Medtronic to continue its clinical excellence and focus on chronic diseases. However, we expect more disciplined execution, a stronger focus on building the infrastructure for ongoing emerging-market growth, and an evolving balance between the clinical benefits of the company’s products and their economic value. Management expects the company to generate $25 billion worth of free cash flow over the next five years, and half of that is likely to be returned to shareholders in the form of dividends and share buybacks.

More Resources

- *Pro* ’s original recommendation (7/1/09)
- Talk about Medtronic on our discussion board

The *Pro* Bottom Line

We recommend you match our 3% allocation in this leading medical technology company. If it’s as good an investment as we believe, we can all buy Hoverounds to chase Jeff — and truly profit from getting older.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund

Diversification with some of the best small companies you've never heard of.

Suggested Allocation: 2.1%

At *Pro*, we think we could develop an edge when it comes to investing in emerging-market small caps — but the investment in time and energy would be tremendous. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund**.

What It Does

This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields about 3.5%). For *Pro*, it offers exposure to 521 of the most promising business we’ve never heard of.

This ETF gives us an excellent way to invest in unfamiliar companies in locations where we don’t have a discernible edge — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The risk-reducing benefits of investing outside our home market are equally important.

How It’s Working

It’s no surprise that small-cap companies (even dividend-paying ones) in emerging markets can be volatile. We expect DGS itself to continue to experience higher-than-average volatility, even though the diversification it brings to our holdings will likely lower the portfolio’s volatility overall.

We’d always prefer to own great businesses over great ETFs, so this holding has a permanent spot on our short list of positions we’d sell if we needed cash or found a higher-conviction alternative. In the meantime, for a reasonable 0.64% expense ratio, we get a basket of businesses with a history of exceptional performance, weighted by the size of their annual cash dividend. The fund’s heavy weighting toward financials (23%), industrials (16%), and the consumer discretionary sector (14%) leaves it well positioned to benefit from an economic recovery if and when one comes along.

What We Expect

Let’s be frank: We’ve lost a bit of money on DGS since recommending it in November 2010. But you shouldn’t fault DGS for our timing — it had great returns in 2010, before we bought it, and great returns in 2012, too. It’s the middling 2011 results that have us just now breaking even.

This is a top-notch fund, and you don’t have to take our word for it; Morningstar has bestowed its coveted five-star rating on DGS. It’s also made Morningstar’s list of the top eight funds in its category in each of the past three years, and it’s ranked No. 2 when considering five-year performance. We expect these impressive long-term results to continue.

More Resources

- *Pro* ’s original recommendation (11/22/10)
- Talk about DGS on our discussion board

The *Pro* Bottom Line

Overall, DGS provides cheap diversification and income for us, and it remains a well-run fund that has earned its place in the *Pro* portfolio. All that said, it needs to do its part in helping us achieve North Star-like returns over the coming years if it wants to stick around. We still believe that income and value within growing economies are worth investing in, and we suggest you match our 2.1% allocation now.

The Motley Fool owns shares of Broadridge Financial Solutions, Gentex, Intel, Medtronic, and WisdomTree Emerging Mkts Small Cap Div. See Pro*'s holdings here. See the team's and David and Tom Gardner's holdings here.*

Buy: American Tower (AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 2.7%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Internet traffic from mobile devices in 2012 was nearly 12 times *total* Internet traffic in 2000, and the average connection speed of a mobile device doubled from 2011 to 2012. Communications site operator **American Tower** is well positioned to benefit from both trends.

What It Does

AMT leases antenna space on nearly 55,000 cell sites (towers, rooftops, and more) to wireless service providers. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, noncancellable, and feature contractual annual price escalations.

About 60% of AMT's properties are located in 10 different countries outside the U.S., including India, Brazil, Germany, and Uganda, and that percentage is growing quickly as AMT erects more towers.

How It's Working

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE (or, in Africa, from voice to data), or to increase coverage density. Every time they do, AMT increases the lease rate — on top of the scheduled price escalations.

Switching costs in this space are high; 98% to 99% of AMT's customers up for renewal each year do so, and nearly 80% of its current leases don't renew until 2022 or later.

What We Expect

Revenue was up 17.7% year over year in 2012, with the international division up 34%, well outpacing the domestic side. We expect revenue to double in the next five years through a combination of price escalations, new towers, and upgrades. After its recent conversion into a real estate investment trust, AMT is required to pay out 90% of taxable income to shareholders. It currently distributes $1.04 annually, a 1.3% yield, and management expects to grow the dividend 20% annually for the next five years. (Importantly, only the U.S. side of this business is organized as an REIT. For more, see our original writeup.)

Management reduces taxable income though the use of net operating losses. And because the useful life of its tower properties exceeds the depreciation schedule, AMT also uses a depreciation shield, which reduces taxable income and understates the values of some assets on the balance sheet. Thus, typical valuation multiples (price-to-earnings, price-to-book) are misleading in AMT's case, making the company look like less of a value than it really is. Investors large and small likely gloss over how impressively AMT towers over its competitors, and how it benefits from meaningful advantages in an ever-growing industry.

More Resources

- *Pro* 's original recommendation (5/6/13)
- Talk about American Tower on our discussion board

The *Pro* Bottom Line

We value AMT at about $100 a share. Today's price provides an acceptable margin of safety for a business of this caliber. We expect to earn modest income from a growing dividend and strong appreciation as AMT builds out its international tower network.

Buy: GrafTech International

Steelmaking is evolving, and graphite electrodes will help build the emerging world.

Suggested Allocation: 2%

The International Monetary Fund reduced global GDP estimates three times during 2012, an admission that its rosy outlook for the world economy had been too sanguine. Currently, it expects global growth of 3.25% this year and 4% next year. The share price of **GrafTech International**, a leading supplier of graphite electrodes that are used in the production of steel, dances pretty closely with GDP, so 2012 was an electric slide downward for this economically sensitive *Pro* holding. The first quarter of 2013 wasn't much better, but there are plenty of reasons we think this bumpy ride in the short term will pay off for *Pro* investors in years to come.

What It Does

With a diverse customer base and six facilities on four continents, GrafTech creates products used in the electronics, defense, oil and gas exploration, and aerospace industries. Its customers span 70 countries, and it's well positioned to grow as governments increase their spending on infrastructure, technology, and energy. Its worldwide factory network puts the company near its customers and renders more than 70% of GrafTech's annual sales outside the United States.

How It's Working

Unfortunately, demand for graphite electrodes is driven by economic activity, and prices are set (for the most part) by that demand relative to the industry's supply. This suggests that GrafTech is largely a price-taker, and it leads to lumpy results that can look ugly for long periods. Accordingly, when we analyze GrafTech, we pay particular attention to the long-term trends for steel demand (and our outlook on same), GrafTech's strategic positioning, and how the company manages the costs it can control.

On each of these points, things look bright. Steel use should grow modestly as the emerging world builds out infrastructure, and environmentally friendlier electric arc furnaces should take share from dirty, costly blast furnaces in the production of steel. Strategically, GrafTech recently took control of its primary input (needle coke) so it could better control costs and quality. It also retains a reputation for being the highest-quality producer of electrodes. Finally, the company continues to wring costs out of its structure under the guidance of experienced management.

What We Expect

While supply expansion from other industry players will keep downward pressure on electrode prices, this sort of behavior is not uncommon in the steel supply chain that GrafTech inhabits, and the company has successfully navigated such turbulence in the past. If Chinese suppliers persist in exporting their product at a loss, we think the most likely outcome is that GrafTech's low-quality, high-cost competitors will suffer the most — maybe even go belly-up. Meanwhile, as a large, high-quality, low-cost producer, GrafTech is the best positioned in the industry to weather this storm. The company has the financial wherewithal to withstand a downturn; all we have to do is wait.

More Resources

- *Pro* 's original recommendation (12/16/08)
- Talk about GrafTech International on our discussion board

The *Pro* Bottom Line

At about $7 per share, GrafTech is selling for just about the book value of its assets, but it's the electrode kingpin with a history of strong profitability and a portfolio of graphite science patents. In any given period, we're along for the economic ride — but over entire cycles, GrafTech is proving it is a business worth owning.

Buy: MasterCard

Plastic is overtaking paper as the world's way to pay, and MasterCard leads the charge.

Suggested Allocation: 4.2%

Simply put, **MasterCard** is among the most attractive businesses in the world. Here's why.

What It Does

The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders, who are actually exposed to the card users' finances; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

Though MasterCard competes with a very large number of well-heeled and (in some cases) innovative businesses, the company's profitability is growing quickly even though the global economy isn't. And that makes perfect sense, because when it comes to paying for stuff, the global market leader isn't **Visa**, or PayPal, or banks ... it's cash. While MasterCard's stock price has risen since we recommended buying in September 2011, our thesis remains intact: Cash has a still-astounding 85% market share of transactions, but it's slow and inefficient, and with no one managing its brand, it's quickly losing out to better alternatives.

How It's Working

This trend has already taken hold in the U.S., where we use cards for a third of our personal expenditures, so Americans often underestimate the opportunities — domestically and especially in developing nations. Last quarter, MasterCard processed $947 billion in gross dollar volume, $653 billion (69%) of which came from outside the United States. Growth in its U.S. business was 4%, outpacing our economy (as measured by GDP) like America was standing still. And worldwide growth, excluding the U.S., clocked in at a tremendous 16% in local currencies (15% in USD). Cash is losing, and fast, but there's a long way to go — and a lot of opportunity for MasterCard.

What We Expect

More Resources

- [*Pro* 's original recommendation (9/8/11)]
- [Talk about MasterCard on our discussion board]

Management recently confirmed guidance for continued 11% to 14% compounded annual revenue growth and 20% earnings-per-share growth through 2015. We think this is possible under current (difficult) conditions, and we expect even better if economies around the world can turn the corner. CEO Ajay Banga and team are doing a tremendous job moving the company forward, so much so that results have outpaced our expectations not once but twice in the short time we've owned shares. We wouldn't bet against a three-peat.

The *Pro* Bottom Line

MasterCard's current share price is near our $550 estimate of fair value, a fair price for a great business that's strengthening every year. Buy now, then sit back and enjoy your take every time millions of people around the world present their MasterCards.

Buy: OpenText

This company's information management software keeps our digital lives in order.

Suggested Allocation: 3%

As you may have noticed, the world is going paperless. Most of us have fewer files and binders lying around our homes and offices these days. But there's a flip side: Right now, your computer is storing ever-growing piles of email, not to mention digital documents so numerous that, if you're like me, you're getting ready to unfurl the white flag of surrender. This is where **OpenText** comes in.

What It Does

Put very simply, OpenText provides information management software. Specifically, it sells software that lets companies organize and manage their growing reams of electronic content. Its products help companies, governments, universities, and others operate more efficiently and effectively, meet compliance requirements, and communicate with colleagues, customers, and partners. OpenText is the leading independent provider of solutions in the enterprise content management market and a leader in the broader enterprise information management industry. Its top competitor, **IBM**, may be larger, but OpenText enjoys longstanding sales relationships with **Microsoft**, **Oracle**, and **SAP**.

How It's Working

In quarterly results announced in May, OpenText's revenue rose 15.5% year-over-year, and adjusted earnings per share were up 25%, reaching record levels. New license revenue jumped a strong 13.3% last quarter. The company's profit margins grew substantially over the past year, as did cash flow.

The stock trades at around 13 times free cash flow (below the market average by a significant degree). Most customers only have one to three of the company's software product modules, leaving OpenText strong opportunities to sell many more product suites to existing customers, not to mention new ones, as its sales force expands (see below).

What We Expect

We estimate that the electronic content management industries OpenText serves will grow top-line demand by at least 10% annualized over the next several years, and OpenText will continue to take market share — perhaps even surpassing IBM in its niches. OpenText has a long history of steady growth through acquisition, and its young CEO (who's only been at the helm for about a year) is also intent on growing the sales team, both to reach out to new markets and to upsell more products to current clients. OpenText already enjoys diversified software sales to numerous industries, most notably financial services, general services, technology, basic materials industries, consumer goods, and the public sector.

More Resources

- [*Pro* 's original recommendation (8/31/11)]
- [Talk about OpenText on our discussion board]

The *Pro* Bottom Line

No one-trick pony, OpenText has multiple growth avenues ahead across all industries as the world's piles of electronic data grow ever larger and in need of management. With new products rolling out in cloud services (off-site servers), renewed sales execution through more distribution channels, and an intense focus on its financial performance, this medium-sized company looks to have a big future.

Note: Although you don't need to use them, we also recommend options alongside owning OpenText stock. For those who want them, we'll recommend a complementary OpenText options strategy on July 18 in our *Pro* Positioning Report.

Inside the Portfolio

Published Jun 17, 2013 at 1:00AM

Once you've decided what to buy, the next crucial question is how much. Here's how we approach allocation for our portfolio — and yours.

Pro Strategy Guide

Get up to speed in no time with this series of articles that will show you how to invest like a Pro:

As your portfolio managers, the *Pro* team is here to help you with allocation, diversification, and reassessing your holdings (many people call that last one rebalancing — a name we don't love, for reasons we'll explain shortly). Luckily, because we're managing a diverse portfolio and we want all of the pieces working in unison, the answer to "How much?" is quite clear.

Allocation: How We Decide How Much

When it comes to a long-term portfolio, the goal is to preserve what you have while boosting it with sensible growth. There's no reason to swing for the fences by throwing half of your savings into just a few equities or by crossing your fingers and taking enormous bets on just a few options.

At *Pro*, when we're right about a position, we want to be amply rewarded — and we want you to be rewarded along with us. When we're wrong, we want us all to easily live to see another day. We can never know everything about the investments we make, so we must remain humble, and we must allocate accordingly. That said, the more we know, the more we may allocate into the strongest opportunities.

Here's how we generally divide our portfolio into strategies, along with the typical starting size for new positions:

Strategy	Portfolio Allocation	Starting Position Size
Core Stocks	70%	3% to 5%
ETFs and Indexes	15%	1% to 4%
Options	15%	0.5% to 3%

That works out to 33 to 38 total positions, with an average allocation of 2.5% to 3%.

As you can see, our average starting size will be about 3%. This suggests we could own about 33 positions, along with typically holding 3% to 5% in cash.

Stocks: 70%

The majority of our portfolio will be in stocks that we believe will deliver steady returns over the long run. The size of each position will generally stay in the 3% to 5% range.

When it comes to *Pro*'s core stock holdings — those with truly exceptional potential and an outstanding margin of safety — we may invest up to 5% of the portfolio, most likely over the course of a few purchases. We're confident in any position we buy, but if we decide to make a position larger than 3%, that means we're extremely confident. We often buy a stock across two transactions to spread our timing and volatility risk. You'll know quickly where we stand on a stock buy: if we like it, 3%; if we're ga-ga over it, 4%; if we can't even sleep because we like it so much, 5%. As of October 2015, only seven stocks make up 4% or more of the *Pro* portfolio.

ETFs: 15%

We're going to use 15% of the portfolio to make sector-based decisions via exchange-traded funds. There are hundreds of specialized ETFs, and they offer tremendous opportunities to take advantage of macro and micro trends in the global economy. As you follow along, you'll find that most of the ETF investments will take a long position, but you'll also be able to go short in sectors we believe are mispriced.

These calls could be a bit riskier in nature than the stock portion of the portfolio, particularly if we buy an ETF that uses leverage, but we will be sure to fully explain any added risks in our trade alerts.

Our allocation to exchange-traded funds will average 2% to 3% in size. With ETFs, we're betting on a whole sector — or area of the globe — to move in a certain direction. Where there's more uncertainty involved, we may only invest 2% or less, and when we're very confident in an ETF and its core holdings, we may invest up to 4%. More often, we'll invest 3% or less.

Options: 15%

The final 15% of the portfolio will be reserved for options. This includes the premiums paid as option buyers, the credits we receive as option sellers, and the money we set aside to purchase the underlying stock when we sell puts.

Options are by nature smaller investments, and most of ours will average around 1.75% of the portfolio at the start — sometimes much less, rarely much more. If we do put 2% or more into, say, a call option, we'll do so very carefully.

Long vs. Short

Even though we'll go short with ETFs and options, *Pro* is primarily focused on the long term. Most often, the short positions we take will be used to hedge downside risk. Overall, we don't expect shorts to represent more than 30% of the portfolio.

And Then There Was Cash

We'll also keep about 5% of the portfolio in cash most of the time so we can catch extraordinary opportunities that pop up and write options.

We know what you're thinking: Wait, all this adds up to 105%! It does, but what we're saying is that while we'll keep an overall mix of 70/15/15 in stocks/ETFs/options, we'll save room for a modest but worthwhile cash balance.

Diversification

As we build the portfolio, we're mindful not to have too much exposure to any one industry, sector, or region, and we'll hedge if our exposure to one area is too great. Meanwhile, if we're missing a piece of our portfolio puzzle, we have the luxury of CAPS data to help us find the most compelling opportunities we're lacking. With a maximum of less than 40 positions, we're striving for diversification with focus.

Reassessment

What's the harm in rebalancing? Whenever part of a portfolio gets out of line with the rest, many investors trim it back; if it shrinks, they add to it. Makes sense, but if you're not smart about it, rebalancing can translate to selling your best winners — and buying more of your worst losers. Now *that* doesn't make sense.

At *Pro*, we prefer to call our portfolio upkeep process *reassessment* — flows off the tongue, doesn't it? — and we'll reassess on a regular basis, most ardently after quarterly earnings or any other significant events. But rather than letting a stock's size in our portfolio dictate our investing decisions, we let a stock's valuation and fundamentals guide us.

Our reassessments start with a vigorous study of every filing our companies make, every quarterly report, and every quarterly conference call as well as all the data at our fingertips. We want to know our companies so well that we could recite their business models in our sleep — so when there's volatility (and there will be!), we'll know how it affects our companies and whether it requires action. To us, reassessment is constant — but that doesn't mean trading is.

Letting Winners Run

In the original Motley Fool and Rule Breaker Portfolios, we outperformed the market by buying high-growth companies and letting them grow — while we held on for years. We didn't trim our biggest winners just because they had come to represent more of the portfolio than other positions — though we would trim back our position in a stock if the business started to merit doing so.

We won't be afraid if a 4% position doubles to become an 8% position, and then a 12% position. We want that! But we'll be mindful of our largest positions and do everything to ensure we don't let our biggest gains evaporate. We have the power to hedge or protect our positions, too, which provides us with more breathing room to let them grow.

Slowly, Slowly, Slowly

In "*Slowly, Slowly, Slowly*" *Said the Sloth*, Eric Carle's sloth hangs from a tree in the rain forest while animals scamper by — toucans, peccaries, a jaguar, and a howler monkey — and ask him why he is so slow, so boring, so calm ... and so lazy. The sloth says, "I am not lazy." He just likes to take his time, think about things, and not rush.

It's the same with a portfolio: Build it slowly. Enjoy each step, and make each selection count. Know every selection before you make it. You're embarking on what should be a long-term relationship with a company — even with options, as you can employ the same options, on the same stocks, again and again.

We manage the *Pro* portfolio thoughtfully (with our own money on the line, we're managing our own portfolio right alongside you). Sometimes we'll be rather active, but sometimes we'll be quite quiet. That's how investing works. Regardless of how often we're trading, you can always find us talking stocks on our members-only discussion boards.

Allocating Your Own Dollars

So how do you mirror our real-money portfolio, assuming that is your goal — even if you have $100,000 or less? In most cases, you can simply follow our percentage allocations rather than our dollar-based actions.

If you have a $100,000 portfolio, and we invest 2% of our funds into a certain position, it's easy for you to do the same thing. However, if you have $50,000 or less, you'll want to watch your commissions and try to keep them well below 2% of any trade you make.

If you're using a smaller account, you also may not want to write many options until you have more assets. For put writing, we recommend an account value of at least $75,000. You may write covered calls with considerably less, and you may buy puts or calls with very little money if you wish. That's one of the advantages of options. But put writing typically requires greater funds.

To discuss your situation and how you can best benefit from our investment decisions, please post your questions on our discussion boards. We'll be there to help.

Invest Like a Pro: If You're Free-Range

Published Jun 17, 2013 at 1:00AM

How to build a *Pro* portfolio — if you have money to invest now and are ready to own what we own.

We manage the *Pro* portfolio using a wide range of tools — including long and short stocks, options, and ETFs — to earn absolute returns with reduced volatility. But we know no two members have identical investment situations, and that means not all members will use all of our strategies. That's where we can help you find the best way to use *Pro* for *your* individual situation.

The most important thing to remember is that *Pro* is a portfolio, not merely a collection of investment ideas. All of our positions exist in the context of our portfolio; if you elect to pick and choose *Pro* investments, it is critical that you understand how they fit into *your* portfolio. Our trades are intended to integrate with existing positions and to form a portfolio of assets that keeps our North Star firmly in mind.

Building Your *Pro* Portfolio

Start Here: Portfolio Building Reports

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new *Pro* portfolio.

Part 1: Our Buy First Stocks
Part 2: Our Buy Stocks
Part 3: Our Buy Stocks, Continued
Portfolio Positioning Report
Important: A note on fair value

What's Next?

Once you've matched the guidance in the Building Your *Pro* Portfolio reports, all you need to do is wait for further trade alert emails from the *Pro* team. However, our alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want.

You may decide to modify the strategy we choose for a trade; for example, writing puts instead of buying a stock outright. If you choose to deviate from our recommendation, though, make sure you:

Uniquely *Pro*

If you're joining us from another Motley Fool service, it is critical that you understand what makes *Pro* so powerful. At *Pro*, we are building a portfolio, not simply offering investment recommendations. *Stock Advisor* and *Rule Breakers*, for example, offer stock recommendations from which members can pick and choose.

In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the Pro portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

1. Understand why we chose the strategy we did
2. Have a reason that the modified strategy better fits your portfolio
3. Exercise caution by sizing the position a bit smaller than you would otherwise

If you have any questions about our trades or making a strategy fit your investing goals, drop by our Making Pro Fit You discussion board, where the *Pro* team and community are happy to help.

You'll also receive the team's Monday Memo email every Monday afternoon, with commentary, news, and any updates to our guidance.

If You're Investing in an IRA

IRAs are tax-deferred accounts that usually don't allow shorting and allow only simply options strategies. If you're building your *Pro* portfolio in an IRA, you can follow our stock-buying trade alerts directly. Most IRAs allow you to write covered calls, so you can also follow those trade alerts (check with your broker to see if you have permission). For trades that go further afield, here are several points to consider:

Writing Puts: Some IRAs don't allow put writing (although many do, if they are cash-secured), so you should simply buy shares in these positions over time. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Other Options Trades: If you can't make a trade in your IRA, check our trade alert for a list of alternative trades. For example, when we write puts to try to buy shares of Stock X more cheaply, you might be able to simply buy shares of Stock X. (If there are no alternate trades, we'll say so.)

Shorting: Some inverse ETFs can be purchased in IRAs (purchasing an inverse of something is similar to shorting that thing). As with options, we'll mention suitable alternatives in the trade alerts.

As tax-deferred accounts, IRAs are well suited for income-generating strategies like covered calls, high-yield dividend stocks, and ETFs with large taxable distributions. If being unable to follow all our recommendations leaves a hole in your portfolio, you may be able to fill the gap with additional income-generating strategies — for example, by writing covered calls on *Pro* stocks you'd be willing to sell at your strike price.

Because IRAs do not allow the use of margin or shorting, you will likely find it difficult to follow along with most of our hedging strategies. If that's the case, we recommend keeping an eye on both your cash balance and *Pro*'s hedging strategies. When the *Pro* portfolio adds hedges, increase your cash balance; when we pull hedges off, reduce your cash balance by investing more in our Buy and Buy First stocks.

Finally, you may want to consider opening a separate, non-IRA account if possible. You can then manage both your IRA and non-IRA accounts as a single portfolio, with income-focused and shorter-term strategies in the IRA and more complex, speculative, and short trades in the second account.

If You Can't Trade Complex Options

You can still follow most of our trade alerts directly — except, obviously, those involving complex options strategies. In those cases, we offer simpler alternatives whenever possible, such as writing puts, writing covered calls, or buying or shorting a stock or ETF directly. If we issue a trade alert using an income-generating strategy you're unable to employ and there are no workable alternatives, consider using the strategies you do have at your disposal to generate income elsewhere in your portfolio.

If you want to expand your repertoire, you should continue to request higher options permissions from your broker every couple of months until they are granted. Account size is one factor brokers consider when making this decision, so to up your odds of success, consider consolidating accounts or moving funds to the account in which you wish to trade options.

In the meantime, don't lose sight of the big picture; remember that we're building a portfolio. If you can't make a particular options trade, you may be able to make an alternate trade or you may need to sit that trade out — either way, it's no big deal. That said, you'll want to pay particular attention to any trade alert in which we use options for hedging purposes (for example, a synthetic short or a ratio put spread on an ETF or an index). Trades like these are important to our integrated portfolio, so don't ignore them. If alternatives are available, we'll outline them. If not, you may want to take action elsewhere in your portfolio to meet similar goals. For example, one way to accomplish this would be to raise your cash position by trimming a few holdings. As always, we're available on the Making Pro Fit You discussion board to field your questions.

Invest Like a Pro: Whoever You Are

Published Jun 17, 2013 at 1:00AM

How to build a *Pro* portfolio — whether you have cash to deploy or you want to go slowly.

We manage the *Pro* portfolio using a wide range of tools — including long and short stocks, options, and ETFs — to earn absolute returns with reduced volatility. But we know no two members have identical investment situations, and that means not all members will use all of our strategies. That's where we can help you find the best way to use *Pro* for *your* individual situation.

The most important thing to remember is that *Pro* is a portfolio, not merely a collection of investment ideas. All of our positions exist in the context of our portfolio; if you elect to pick and choose *Pro* investments, it is critical that you understand how they fit into *your* portfolio. Our trades are intended to integrate with existing positions and to form a portfolio of assets that keeps our North Star firmly in mind.

Building Your *Pro* Portfolio

Start Here: Portfolio Building Reports

To get started with the funds you have available to invest, we've created a series of Portfolio Building Reports to explain our holdings and give our guidance on how to incorporate them into your new *Pro* portfolio.

Part 1: Our Buy First Stocks
Part 2: Our Buy Stocks
Part 3: Our Buy Stocks, Continued
Portfolio Positioning Report
Important: A note on fair value

You can also see all our active positions, with Buy First, Buy, and Hold ratings, along with our latest opinions, in What We Think Now. Use this alongside our portfolio page's Recommended Allocation to help build your portfolio.

We recommend that you invest along with the reports in the order in which they are released, as they will contain our latest guidance and thinking on every stock in the *Pro* portfolio, and will make it a snap to match your portfolio to *Pro*'s.

What's Next?

Once you've matched the guidance in the Portfolio Building Reports, all you need to do is wait for further trade alert emails from the *Pro* team. However, our alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want.

You may decide to modify the strategy we choose for a trade; for example, writing puts instead of buying a stock outright. If you choose to deviate from our recommendation, though, make sure you:

1. Understand why we chose the strategy we did
2. Have a reason that the modified strategy better fits your portfolio
3. Exercise caution by sizing the position a bit smaller than you would otherwise

Uniquely *Pro*

If you're joining us from another Motley Fool service, it is critical that you understand what makes *Pro* so powerful. At *Pro*, we are building a portfolio, not simply offering investment recommendations. *Stock Advisor* and *Rule Breakers*, for example, offer stock recommendations from which members can pick and choose.

In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the *Pro* portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

If you have any questions about our trades or making a strategy fit your investing goals, drop by our Making *Pro* Fit You discussion board, where the *Pro* team and community are happy to help.

You'll also receive the team's Monday Memo email every Monday afternoon, with commentary, news, any updates to our guidance, and a roundup of *Pro* coverage from the past week.

If You're Investing in an IRA

IRAs are tax-deferred accounts that usually don't allow shorting and allow only simple options strategies. If you're building your *Pro* portfolio in an IRA, you can follow our stock-buying trade alerts directly. Most IRAs allow you to write covered calls, so you can also follow those trade alerts (check with your broker to see if you have permission). For trades that go further afield, here are several points to consider:

Writing Puts: Some IRAs don't allow put writing (although many do, if they are cash-secured), so you should simply buy shares in these positions over time. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Other Options Trades: If you can't make a trade in your IRA, check our trade alert for a list of alternative trades. For example, when we write puts to try to buy shares of Stock X more cheaply, you might be able to simply buy shares of Stock X. (If there are no alternate trades, we'll say so.)

Shorting: Some inverse ETFs can be purchased in IRAs (purchasing an inverse of something is similar to shorting that thing). As with options, we'll mention suitable alternatives in the trade alerts.

As tax-deferred accounts, IRAs are well suited for income-generating strategies like covered calls, high-yield dividend stocks, and ETFs with large taxable distributions. If being unable to follow all our recommendations leaves a hole in your portfolio, you may be able to fill the gap with additional income-generating strategies — for example, by writing covered calls on *Pro* stocks you'd be willing to sell at your strike price.

Because IRAs do not allow the use of margin or shorting, you will likely find it difficult to follow along with most of our hedging strategies. If that's the case, we recommend keeping an eye on both your cash balance and *Pro*'s hedging strategies. When the *Pro* portfolio adds hedges, increase your cash balance; when we pull hedges off, reduce your cash balance by investing more in our Buy and Buy First Stocks.

Finally, you may want to consider opening a separate, non-IRA account if possible. You can then manage both your IRA and non-IRA accounts as a single portfolio, with income-focused and shorter-term strategies in the IRA and more complex, speculative, and short trades in the second account.

If You Can't Trade Complex Options

You can still follow most of our trade alerts directly — except, obviously, those involving complex options strategies. In those cases, we offer simpler alternatives whenever possible, such as writing puts, writing covered calls, or buying or shorting a stock or ETF directly. If we issue a trade alert using an income-generating strategy you're unable to employ and there are no workable alternatives, consider using the strategies you do have at your disposal to generate income elsewhere in your portfolio.

If you want to expand your repertoire, you should continue to request higher options permissions from your broker every couple of months until they are granted. Account size is one factor brokers consider when making this decision, so to up your odds of success, consider consolidating accounts or moving funds to the account in which you wish to trade options.

In the meantime, don't lose sight of the big picture; remember that we're building a portfolio. If you can't make a particular options trade, you may be able to make an alternate trade or you may need to sit that trade out — either way, it's no big deal. That said, you'll want to pay particular attention to any trade alert in which we use options for hedging purposes (for example, a synthetic short or a ratio put spread on an ETF or an index). Trades like these are important to our integrated portfolio, so don't ignore them. If alternatives are available, we'll outline them. If not, you may want to take action elsewhere in your portfolio to meet similar goals. For example, one way to accomplish this would be to raise your cash position by trimming a few holdings. As always, we're available on the Making *Pro* Fit You discussion board to field your questions.

If You're Already Fully Invested

If you're already fully invested, you may need to sell existing positions to add *Pro* picks. We recommend that you do this gradually and deliberately, and we've offered advice on how to approach this task.

List your existing positions in order from your highest-conviction holding to your lowest-conviction holding. If you own stocks from another Motley Fool service, you can use that service's guidance on those stocks in building your list. If you don't know why you own a stock, that's a good reason to sell it.

Be mindful of your sector and geographic allocations. You don't want to unintentionally end up owning nothing but oil or European stocks just because they were your favorites. If you're struggling with what to sell, post to our discussion boards — the *Pro* team can't give you individual advice, but our community members can and frequently do weigh in with helpful guidance.

When you're ready, incrementally sell your lowest-conviction stocks and use the proceeds to move into our Buy First and Buy stocks. Review your positions and portfolio after studying *Pro*'s mission and reviewing our North Star. Use that analysis to craft your portfolio going forward.

Finding Great Companies

Published Jun 17, 2013 at 1:00AM

Nearly three decades of investing have helped us home in on the qualities we seek in each company we consider for *Motley Fool Pro*.

Pro Strategy Guide

Get up to speed in no time with this series of articles that will show you how to invest like a Pro:

- 1. Sustainable Competitive Advantage
- 2. Pricing Power
- 3. Dependent Customer Base
- 4. Predictable Revenue
- 5. Growing Free Cash Flow With Compounding Returns
- 6. Financial Resilience
- 7. Expanding Possibilities
- 8. The Three C's of Management

Not every business we buy or use options on will possess all eight of these qualities — but for core stock positions, we prefer to see as many of the following strengths as possible. These qualities aren't in order of importance, but you'll often find that one quality builds to the next. They typically all combine to produce a company that could compound our returns.

Quality 1: Sustainable Competitive Advantage

Healthy profits in a business attract competition; everyone wants a piece of the profit pie. The only way a company can maintain its profit margin and grow is to have a sustainable competitive advantage that serves as a protective moat around the business.

You often hear this quality talked about, from Warren Buffett on down, but many investors typically fail to find companies that sustainably meet the bill. That's because it's the rare company that truly has lasting advantages — but they're out there.

They are usually mid-sized or larger and enjoy assets or market share that provide enduring advantages over all others. Think **Gentex**, which commands the market in auto-dimming rearview mirrors; **Broadridge Financial Solutions**, which has provided annual proxy services for 90% of the public companies and mutual funds in the United States since 1999; and **Facebook**, whose network effects have enabled the company to continually occupy the top spot in the social media space -- and buy would-be competitors. Each of these businesses has traits that keep competitors at bay, helping it maintain healthy profit margins.

Quality 2: Pricing Power

We're always on the lookout for companies that enjoy a degree of pricing power, those that can pass on rising costs to customers. The strongest companies may also implement modest price increases every few years without losing or alienating customers. A leading example of this is **Verisk Analytics**, a leading risk-assessment and decision-analytics firm. The company was able to push through annual price increases for many of its offerings to the insurance industry between 2007 and 2010 (some of the worst years for insurers in recent memory) without seeing any negative effects on customer retention. **Netflix** and **Chipotle** have also demonstrated pricing power. Pricing power gives a company one more important arrow in its quiver as it hunts for strong long-term annualized growth.

Quality 3: Dependent Customer Base

A competitive advantage may *not* be worth much if the business depends on only a few customers, or if its customers can get the service provided just as conveniently elsewhere. We're excited to find a captive or at least loyal customer base. In some cases, this might take the form of a product being integrated into customers' daily lives, a la **Starbucks**. It could also be evident in customers' desire to work with that company, as is the case with **Parexel,** a leading biopharmaceutical and medical device contract research organization. Such customer dependence often supports quality no. 2, pricing power.

Quality 4: Predictable Revenue

If a business exhibits the first three qualities and also has significant predictable or recurring revenue, we become even more interested. This means we're looking for sales that repeat all but automatically, often with the same customers again and again, and usually without the company needing to spend more on marketing or reinventing itself or its products.

Some examples from our *Pro* portfolio: **Oracle** and **OpenText** get a majority of their revenue in the form of long-term contracts with high renewal rates. Insurance companies enjoy recurring revenue every time a policy is renewed, which happens more than 80% of the time at the best providers, including our own **AmTrust**. Transaction-based revenue driven by network effects, like with **MasterCard** and **Visa**, also qualifies as predictably recurring; so does "platform access" that is heavily relied upon and not easy to replicate, which is exactly what we have with **American Tower**.

Predictable revenue helps management plan its future better, and it helps maintain a business even during recessions. For a contrast, consider apparel manufacturers, which are constantly battling with one another to win your business and capture fashion that's inherently fickle. This can result in feast-or-famine financial results – which we try to avoid here in *Pro*.

Quality 5: Growing Free Cash Flow With Compounding Returns

The qualities we've mentioned so far will usually lead to strong free cash flow, which is the lifeblood of a company. By definition, free cash flow is cash from operations minus capital expenditures and any other nonoperational cash income, such as tax benefits from stock options.

We're looking for free cash flow that's likely to increase by at least 10% annualized over the long term. No company grows in a straight line, but over time we want expanding free cash flow to drive the value of the businesses we own -- and that cash flow should be investable in more growth for compounding business returns. Free cash flow is a much more important proxy for value at *Pro* than are earnings per share, which are easily manipulated.

Quality 6: Financial Resilience

These first five qualities go far toward building strong financial statements — if not right away, then with time. On the balance sheet, the appropriate amount of leverage and cash on hand will depend on the industry and a particular company's business model; however, we seek to invest in companies that can do more than just weather the storm when times are tough. We want to find companies that can take advantage of turmoil to gain additional market share and maneuver for an even brighter future – and that's difficult to achieve if the financials aren't resilient enough to let management strive to grow even during hard times.

Quality 7: Expanding Possibilities

A company can increase its bottom line either by cutting costs to expand margins or by growing its top line. But there is a limit as to how much fat can be cut out of any business, and being too aggressive in slashing costs can actually be detrimental in the long run. So, in order to find companies poised to deliver North Star-like returns over the next rolling three years, we seek businesses that can both control costs *and* profitably expand operations. Often, that means companies that are riding long-term (rather than cyclical) tailwinds; this can lead to years of above-average growth. And this growth can take the form of increasing market share at home as well as developing new products or entering new markets. **Apple**, **Skyworks Solutions**, **O'Reilly Automotive, Gilead Sciences** -- most of the companies in our portfolio exhibit this characteristic.

Quality 8: The Three C's of Management

Warren Buffett once recommended investing in businesses that even a fool (with a lower-case “f”) can run, because someday a fool will be in charge. This may be true, but here at *Pro* we believe you can have the best of both worlds: great businesses that are also run by top-notch management teams. Every situation is unique, but as a starting point, we generally look for the following in company management:

- **Clarity:** Do they have a vision for the company and can they succinctly articulate how they’re going to get there?
- **Consistency:** It isn't enough to talk the talk; we want management teams that have also proven they can walk the walk. We avoid revisionist historians and look for managers that achieve what they said they would.
- **Capability:** Are they the right people for the job? Sometimes this means going with a founder-led company early on (the Fool invested in **Amazon** shortly after it went public); other times we’re looking for a track record of smart capital allocation decisions (**Verisk Analytics** has generated an average annualized return of about 20% on all of its deals from 2002 to 2012).

Combine our eight qualities, and the company is likely to be a long-term performer on par with -- or stronger than -- our relentless North Star.

We’re not making it easy on ourselves by using our North Star as our investing guidepost; however, we wouldn’t have chosen to do so if we didn’t believe it was possible. One of the keys to this approach is to have a high rate of accuracy when it comes to selecting stocks, and this quality checklist is just one of the many tools we use in our attempt to do exactly that.

To talk about the business qualities we seek — and to share your own — join us on the Philosophy & Strategy discussion board. Invest Foolishly!

Our North Star: Inflation + 7%

To stay on course toward a winning portfolio, we take our direction from this guidepost.

Inside the Portfolio: Stocks, ETFs, and Options

For each type of investment, we have a plan for how we decide how much.

Finding Great Companies: 8 Qualities We Seek

Two decades of investing experience help us home in on the best positions for the *Pro* portfolio.

Our Guide to Hedging Like a Pro

A hedge is a position that reduces a portfolio's overall exposure to risk. We hedge in several different ways.

How We Invest

Published Jun 17, 2013 at 1:00AM

6 *Pro* Principles: We always want you to know how we're thinking as we invest — and why — so see how we tie together our broad tools into a comprehensive strategy with focus and direction.

Pro Strategy Guide

Get up to speed in no time with this series of articles that will show you how to invest like a Pro:

Motley Fool Pro is here to help you build a diverse portfolio that generates winning returns no matter what the stock market throws our way. You can trust that our team relies on years of investing experience and on our array of tools and collective insight to produce outstanding long-term results — and we're thrilled that you're here investing along with us.

Our *Pro* portfolio has incredible flexibility — we can go long or short and use options and ETFs. We'll invest wherever we see the best opportunities — any sector, stock, country, or option. This makes our overall strategy wide and deep, but we'll do our best to clearly explain the specifics behind our actions.

Pro Principle 1: Accuracy Is Our Top Priority

Some portfolio managers are happy to speculate — and often be wrong — so long as their few big winners more than compensate for the losers. That is not our approach at *Pro*.

Our aim is to be correct the vast majority of the time. We will only put our cash to work when we feel extremely confident about an investment — and on that note, our ambitious goal is to have at least three out of four positions profitable by the time we close them. Yes, that's a sterling 75% success rate — and it includes all of our stocks, options, ETFs, and hedges.

In fact, it's more important to us to achieve absolute gains on each position than beat the S&P 500. Why is that? Because gains are our first goal. Period. But heck, if most of our positions are profitable, we should beat the S&P 500, too, over the years.

Pro Principle 2: When It Comes to Stocks, We Are Focused on Superior Businesses We Can Hold for 3 to 5 Years

Our portfolio primarily consists of long positions. The goal is to hold these stocks for three to five years — or as long as the investment merits. Each stock will have a catalyst (or several) that should kick our returns into gear through our target time frame.

The *Pro* team has found that the stocks that perform the best over the years have a lot in common. These companies have superior business models that we believe will remain strong in any market, strong and lasting competitive advantages, margins ripe for expansion, and growing market opportunities. We like dynamic companies with light business models — they don't need hefty, constant infusions of capital — and plenty of naturally recurring revenue. After we've found a company that makes the grade, we then aim to buy at a price that gives us both ample upside and a solid margin of safety.

Pro Principle 3: When It Comes to ETFs, It's the Big Picture That Counts

For exchange-traded funds, broad is the way to go. Say you want to invest in Brazil, which is growing rapidly. But which companies will lead the way? If you can't devote months to learning Brazil's competitive landscape, you can buy into the entire economy with a Brazilian ETF.

ETFs are an excellent way to invest in the rise or fall of just about any broad category — financials, biotech, China, Brazil — especially when you wouldn't otherwise know where to invest in a sector. These investments, long or short, are more macro-focused than business-focused. We study any ETF we buy to make certain that we agree with its largest holdings, but we'll still be betting on a macro trend — up or down — when we pick up an ETF.

With our ETFs and options, our outlook is usually a bit shorter than with stocks. We may take advantage of a 12-month option opportunity; we may buy an ETF in gold, only to sell it nine months later if the price of gold jumps. ETFs can be long-term macro investments, too; we bought into **Vanguard Emerging Markets** in 2008 to profit on a rebound, selling nearly three years later. Many of our short sales also have a shorter-term outlook, usually measured in months or a year.

Pro Principle 4: We Are Not Options Traders

When we invest with puts and calls, we're not twirling our pretend mustaches, making slick statistical bets, or using formulas and complicated computations. Our options investments are based on extensive knowledge of the underlying stock and its valuation.

So if we believe a stock is priced exuberantly, we can short it by buying a put option. If a stock looks deeply undervalued, we can use long-term call options to capture greater upside. In the end, all of our option trades are based on a full analysis of the underlying equity.

Pro Principle 5: We Won't Over-Diversify

We expect to hold no more than 40 positions. For a carefully constructed portfolio, that's plenty of diversification, especially because we'll use ETFs to gain broad exposure to various categories.

An investor diversifies for safety but still needs to stay focused when hoping to perform much better than the market average. Along these lines, it's likely that we'll usually only carry about 24 to 28 core positions, with open options positions representing other possible buys down the road, and always with stocks coming and going from the portfolio as necessary. With focus, we have an especially good chance of being rewarded strongly whenever we're right with a position.

We prefer to let our winners run as long as merited, so we won't rebalance just for the sake of doing so. But we will continually reassess. As of October 2015, we recommend buying 24 core stock positions — right in our sweet spot.

Pro Principle 6: We Never Want to Lose Money

As we strive for accuracy, we will always try to avoid permanent loss of capital. It's not about avoiding mere paper losses — these are common, as stock prices fluctuate. We're talking about losses you never earn back because you invested in a failing business or paid too much for a stock.

While we're more than comfortable with temporary losses that come about with the market's ups and downs, we'll do everything in our power to avoid permanently losing money — although keep in mind that this doesn't apply to options or shorts, in which permanent losses are part of the risk. So far, as of October 2015, we have only closed a few positions at a loss without recourse.

Putting It All Together — the *Pro* Way

Catch-Up Report: Part 1

Published Jun 17, 2013 at 12:00AM

These Catch-Up reports provide in-depth guidance on our active recommendations — a plan for starting to build your *Pro* portfolio:

Part 1• Part 2 • Part 3 • Part 4 • Shorts & Options

You can also see all our active positions, with Buy First, Buy, and Hold ratings, along with our latest opinions, in What We Think Now. Use this alongside our porfolio page's Recommended Allocation to help build your portfolio.

Remember, there's no need to rush into any trades, so take your time. We're here to help — if you have any questions, the *Pro* team and fellow members have the answers in our *Pro* Community.

In This Report

Buy First: AIG | Time and even average performance should heal the company's wounds.

Buy First: Apple | The leader in mobile computing products is cheaper than it's been in years.

Buy First: Oracle | This old-guard tech giant has more room to grow.

Buy First: O'Reilly Automotive | Exceptional management should deliver impressive growth.

PDF Download this report as a PDF file

A Note on Pricing

We've classified the four stocks in this initial report as "Buy First" positions for *Pro* members, because they are attractively priced and will remain so even if the price moves around a few dollars. As long as these stocks remain listed as Buy First on our scorecard, then we recommend that you buy them first for your *Pro* portfolio. If that status changes, we'll let you know in our Monday Memo and note the change on our scorecard.

Buy First: American International Group

Time and even average performance should heal the company's wounds.

Suggested Allocation: 2.8% stock, 0.7% warrants

Today's **American International Group** is not the same company that disgraced itself so profoundly in 2008. AIG has divested itself of whole business units since the financial crisis, managing to eliminate 95% of its previous exposure to the nasty derivatives that nearly brought down the economy. Left behind are just two steadfast insurance businesses and an aircraft leasing company, and AIG plans to rid itself of the leasing business, too.

What It Does

Insurance is a business of collecting premiums, investing the float, and paying out claims — and AIG is getting ever better at it. Improved underwriting is showing up in a lower loss ratio, which in turn is driving a lower adjusted accident-year combined ratio. All that is a fancy way of saying that we're starting to see underwriting profits for the first time since Q3 2010.

AIG's insurance offerings consist of two divisions: property and casualty, and life and retirement. The former provides casualty, property, financial, and specialty insurance (think aerospace) to commercial clients and consumers, typically through brokers. The life and retirement division offers domestic life insurance and retirement products (annuities, mutual funds, financial planning) through a diverse network of financial-services companies, brokers, agents, and advisors. Overall, AIG is writing fewer premiums at better prices than it was in past years, which is a great indication of underwriting discipline and a hardening market.

How It's Working

When we recommended buying AIG stock and warrants in August 2012, we were confident in the momentum of the company's turnaround, but we underestimated the rapid rate at which our investment thesis would unfold. In late 2012 (after our recommendation), the U.S. Treasury sold another $26.5 billion worth of its AIG shares. Management wisely used the opportunity to purchase billions of dollars' worth of stock at about half book value; that, of course, further increased book value in a virtuous cycle.

What We Expect

Underwriting discipline will continue to drive increased earnings and a higher valuation. That plus a renewed focus on capital management will improve AIG's credit rating, reducing its cost of debt and providing another lever for higher profitability. Management is still ridding the company of non-core assets, including the aircraft leasing business mentioned above; once that's complete and coverage ratios are in check, CEO Bob Benmosche will likely reinstate a dividend (provided the Federal Reserve gives the go-ahead).

At Your Broker

- **E-Trade:** AIG.WS
- **Fidelity:** AIG/WS (paste CUSPID 026874156 into the quote page)
- **Interactive Brokers:** Find AIG; select "warrants" from the drop-down menu
- **optionsXpress:** AIGwS
- **Schwab:** AIG/WS
- **TD Ameritrade:** AIG+
- **Vanguard:** AIG_t

Helpful Links

- AIG's explanation of the warrants
- AIG's warrant registration statement filed with the SEC

The *Pro* Bottom Line

We recommend buying 2.8% of AIG stock and 0.7% of AIG warrants (see below for more on those).

Benmosche has cleaned out the business, so by purchasing now, you get in after all the hard work has been done. Book value — the best measure of an insurance company's worth — is growing quickly. And AIG's current share price is two-thirds of book value. That's cheap, especially given the company's momentum. Investors who buy AIG now are positioning themselves for outsized future returns with less risk. That's contrarian investing at its best.

A Note on Warrants

Warrants are similar to call options, except that they are issued by the underlying company. They offer the purchaser the right (but not the obligation) to buy the stock in question at the specified price. The warrants we're recommending on AIG are valid for 10 years from the date of issue (Jan. 19, 2011), and they can be exercised at any point before they expire on Jan. 19, 2021. When exercised, they allow the holder of the warrant to buy shares of AIG at $45 per share, regardless of the market price.

That $45 strike price adjusts favorably in the event of dilution or annual cash dividends greater than $0.675 per share (which would also lower the share price). Warrants are illiquid, and Goldman Sachs is the designated market maker for them; when you buy them, be sure to use a limit order so Goldman doesn't get more than a fair price.

Be aware that if our investment in AIG works out, those who own warrants will earn leveraged returns on them. If we're wrong, though, the warrants will be a total loss, because they're out-of-the-money.

Buy First: Apple

The leader in mobile computing products is cheaper than it's been in years.

Suggested Allocation: 3.3%

There's only one type of apple we like to buy when it's bruised, and it's not a Red Delicious. Once the largest corporation in the world, the **Apple** we want to own has fallen from the market's good graces on investors' worry about declining profit margins, slowing growth, and a lack of innovation.

Is this commonly chirped refrain right? Has Apple lost its edge in the marketplace? We don't believe so, because the company's uniquely integrated hardware and software have made for a great consumer experience that provides little incentive to switch to a competitor. We do realize the company will have to fight a harder and more expensive battle to win new customers as competitors close the quality and experience gap, but we maintain that Apple shares are one of the greatest deals in the Pro portfolio.

What It Does

Led by its iPhone and iPad, Apple designs computing devices people love to use. Its products tie into the Apple operating system, which centers on its App Store marketplace. Apps turn a piece of hardware into a personalized, go-anywhere computer that gets ingrained into the user's daily life.

The gadget that kicked off the company's renaissance, the iPod, is joined not just by the iPhone and iPad but also by Mac computers, iCloud, software, and the small Apple TV to round out the surprisingly compact product line. By selling relatively few products, Apple can generate production efficiencies to earn higher margins and more effectively guide consumer behavior.

How It's Working

Apple's recent second-quarter results disappointed many investors, even though the numbers were just fine. Total sales were up 11% to $43.6 billion; gross margin, a measure of profitability, decreased to 37.5% from 47.4%; and operating cash flow climbed to $35.9 billion. The quick read is that Apple continues to sell a huge number of devices, but as product cycles ebb and flow, the company's profitability will do the same (because of differing pricing and cost structures for each product). One thing remains consistent: Apple's free cash flow is absurd — more than $45 billion over the past 12 months. That's enough to give $5 and a free iTunes song to every person on earth!

What We Expect

Apple refreshed nearly all of its product lines in 2012, driving sales but dinging margins. The company was unable to meet consumer demand for its two newest iPhone models, its new MacBooks, and its iPad Minis, so it wasn't running as efficiently or profitably as it could have. But it is ramping up production to keep that situation from happening again, which should also soften production costs per unit and set Apple up for a respectable 2013.

More Resources

- *Pro*'s original recommendation (2/14/12)
- Talk about Apple on our discussion board

In the longer term, we (like everyone else) expect more great innovations from Apple. While we wait, we think customer loyalty will drive healthy recurring sales, while new customers, emerging markets, and brand-new products fertilize growth. The resulting earnings should reassure investors that Apple isn't going bad.

The *Pro* Bottom Line

As much as we miss the late Steve Jobs at the helm, we believe he built a company that will continue to delight the world with its products. With investors running scared from one of the most groundbreaking businesses in recent history, we believe now is a good time to put our jester caps on and buy when others are selling.

Buy First: Oracle

This old-guard tech giant has more room to grow.

Suggested Allocation: 4.5%

Leading software sellers can write a program once and sell millions of copies, then provide small but critical updates on a regular basis. These updates drive a subscription business model, which leads to recurring revenue. **Oracle** is no exception, with most of its customers renewing annual software contracts that represent more than 40% of its annual revenue. This is stability on which Oracle can grow.

Where is it looking to grow? To name three areas, Oracle is targeting new cloud software sales, software as a service (SAAS) in general, and groundbreaking data hardware sales — and we're pleased with its progress to date and the prospects of all three.

What It Does

Oracle is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems**, **Dell**, and **Microsoft** — Oracle's stock price has steadily risen as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe. And when it comes to hardware, Oracle's own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

By combining its software expertise (both in the traditional sense and in the cloud) with its young hardware business, Oracle is poised to experience another period of growth. The business is incredibly sticky — companies don't trust their data to just anyone, and it can be tricky and even risky to make a switch. So to add to its revenue base, Oracle mainly needs to cross-sell new products to existing clients, while continuing to rope in new clients with its great breadth of modular software solutions.

How It's Working

In the fiscal year 2013 that just ended May 31, Oracle's new software sales topped a record $10 billion, growing 6% in constant currency. Non-GAAP earnings per share grew 11% to $2.68, non-GAAP operating margin hit an all-time high of 47%, and free cash flow hit a record $13.6 billion. Total revenue was up a modest 2% to $37 billion after very strong growth in fiscal 2010. Such a pause is not unusual, especially given that Oracle has sliced low-margin hardware products from its product line and hired thousands of salespeople to sell cloud software. On June 20, management doubled the dividend and announced a new $12 billion share buyback.

What We Expect

More Resources

- *Pro*'s original recommendation (9/17/09)
- Talk about Oracle on our discussion board

Wall Street loves growth, but it especially loves growth that comes with higher margins. Oracle trades at 10.8 times free cash flow, well below the S&P 500's average in the mid- teens. With management expecting more operating leverage ahead and growth in hardware sales, the stock should produce a North Star-topping, 10%-plus annualized return over the coming three years. We expect the company's hardware and modular software combinations to continue to create a clear value proposition, driving sales and resulting in pleasing growth — even for this large company.

The *Pro* Bottom Line

With 390,000 customers, including all 100 of the Fortune 100, Oracle has few equals in the enterprise software market. Now it's making headway in the related hardware market, and we believe this hard-driving company will continue to reward shareholders.

Buy First: O'Reilly Automotive

Exceptional management should deliver impressive growth.

Suggested Allocation: 3.4%

What It Does

O'Reilly Automotive is America's second-largest auto parts retailer, with more than 4,000 stores. Auto parts are a big business, estimated at $231 billion, and O'Reilly is an exceptional competitor, with an addressable market size of about $131 billion.

Running 24 regional distribution centers and 240 hub stores as part of a two-tiered distribution strategy, the company provides same-day or overnight availability on more than 142,000 items, including many that its competitors don't usually stock. Basic auto parts, tools, and services complement those hard-to- find treasures. As a result, O'Reilly's sales are historically split between "do-it-yourself " retail customers and more lucrative professional-services customers (such as auto repair shops).

Personalized customer service by long- tenured store managers paves the way for continued success. More than 800 managers have worked an average of 13 to 18 years with the company.

How It's Working

Tenured employees share a common history and learn to improve a business in a consistent fashion. Since going public in 1993, O'Reilly has achieved 20 consecutive years of record revenue and operating earnings and has grown same-store sales every single year. Diluted net earnings per share have jumped more than 20% annually over the past decade, with 25% growth in 2012. All signs point to more growth ahead.

O'Reilly plans to open 190 net new stores in 2013, upping its 2012 year-end store count by 4.8%, and same-store sales are expected to increase 3% to 5%. By clustering stores together (one-quarter of its locations are in California and Texas), O'Reilly is able to rapidly achieve economies of scale, and by serving professionals and retail customers, it's able to enter smaller markets where competitors don't often tread. There's also no shortage of independent stores or chains to acquire in this highly fragmented industry. In 2012, O'Reilly acquired 56 locations on top of opening 180 net new stores.

O'Reilly has steadily improved profitability, generated strong free cash flow, and maintained a healthy balance sheet while expanding. Rewarding this consistent showing, the stock has been a steady, top performer over the past five and 10 years.

What We Expect

Management should continue to build value as the auto store retail industry consolidates (O'Reilly may lead the way in acquisitions), and customers will continue to walk through the doors in record numbers as used cars last longer than ever. For every neighbor buying a brand-new car, somebody is buying the used one they're trading in, keeping it on the road. We expect and will demand steady, reliable business performance from O'Reilly over any reasonable time period, or we'll show it a stop sign.

More Resources

- *Pro*'s original recommendation (4/15/13)
- Talk about O'Reilly on our discussion board

The *Pro* Bottom Line

Older cars require more maintenance. The average car in America was 10.8 years old in 2011, near a record high. The number of registered cars in the United States increased 15% in the past decade. Even as more new cars drive off the lots, older cars are rarely being destroyed. O'Reilly is well positioned to be profitably supplying car parts and accessories to your grandchildren, who may very well be driving souped-up versions of today's Lexuses and Acuras decades down the road.

The Motley Fool owns shares of American International Group, Apple, Microsoft, Oracle, and O'Reilly Automotive and has the following options: Long Jan 2014 $25 calls on American International Group. See Pro's holdings here. See the team's and David and Tom Gardner's holdings here.

Our North Star

Published Jun 17, 2013 at 12:00AM

Our North Star is a guide for our investing behavior, and like the real North Star, we can use it to navigate on our course to a winning portfolio.

Pro Strategy Guide

Get up to speed in no time with this series of articles that will show you how to invest like a Pro:

- How We Invest
- ▼ **Our North Star**
  - Inflation + 7%
  - Historical Performance
  - *Pro*'s Performance
  - FAQ
- Inside the Portfolio
- Finding Great Companies

Motley Fool Pro's mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star.

Pro's North Star: Inflation + 7% annually

This isn't a specific destination; rather, it's an omnipresent fixture that offers us direction and reminds us of what we're striving toward.

Why inflation + 7%? our mission is to grow the real purchasing power of our capital. Therefore, the first competitor we need to beat is inflation, as measured by the Consumer Price Index.

We want to grow our dollars by more than the rate of inflation — that's a given. Exactly how much more is a difficult figure to pinpoint, but history tells us that if we can double the real purchasing power of your dollars every 10 years, we'll be doing what few manage to accomplish.

To double your dollars in a decade, we need to book a compound annual return of about 7%. To double your real dollars, we need to return 7% plus inflation. Thus, this figure is born directly out of our mission of absolute returns — returns that improve your financial standing in the real world.

Our North Star has several important characteristics that make it appropriate, challenging, and aspirational for all of us. It:

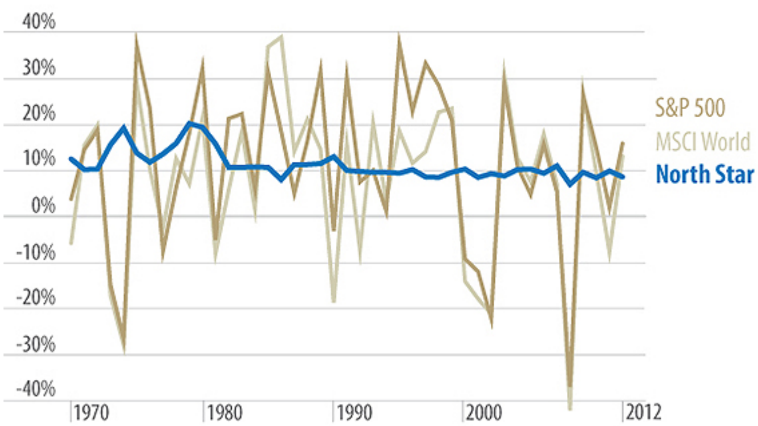
- **Never goes negative.** This lines up with our goal of positive returns over all three-year periods.
- **Is not investable.** It's impossible to lock in a return of inflation plus 7% with some other vehicle.
- **Is not a benchmark.** By definition, benchmarks are investable; they are used for evaluating the performance of a relative-returns strategy. Absolute returns are our goal.
- **Is not a hurdle.** A hurdle is something you must leap over to avoid tripping. Our North Star guides us to make appropriate investment decisions. We're more likely to reach our goals if we let it guide us. If we come close to our North Star, let alone jump over it, we'll be over the moon (sorry!).
- **Is not a gimmick.** We are working to better explain our philosophy and strategy to you, and our North Star will be an ever-present factor in our investment decision-making.
- **Is a challenging reference point.** Historically, our North Star has outperformed the U.S. and world stock markets. Over rolling three-year periods since 1970, our North Star has put up a compound annual return of 11.3%, versus 9.9% for the S&P 500 Total Return Index and 6.4% for the MSCI World index. Our North Star also delivered that return much more steadily than the market indexes, without a single down year.
- **Guides our behavior** as we invest with the tools available to us. It is a framework to explain and reinforce consistent portfolio decisions. Approached consistently over long periods, it should help us and our members achieve strong financial rewards.

Historical Performance

Here's a summary of the past 43 years:

Annualized Return, 1970–2012

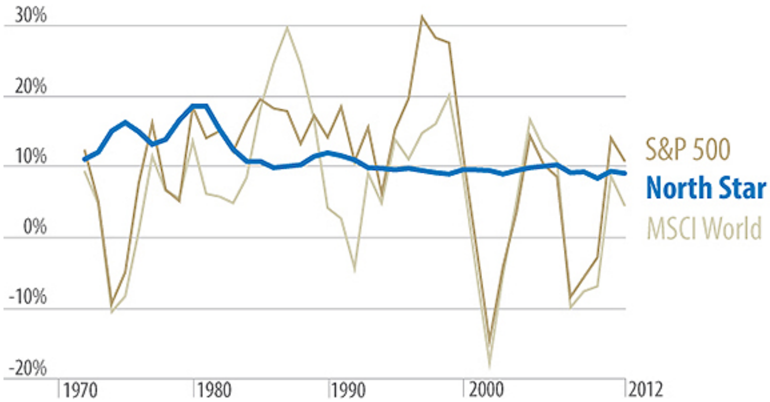
Target	Average	Compound Annual Growth Rate	Best Year	Worst Year
North Star	11.3%	11.3%	20.3%	7.1%
S&P Total Return	11.4%	9.9%	37.6%	-37%
MSCI World	7.8%	6.1%	39.1%	-42.1%



Here are the same data, showing rolling three-year annualized returns. Again, note the lack of volatility for our North Star:

Annualized Rolling 3-Year Return, 1972–2012

Target	Average	Compound Annual Growth Rate	Best 3 Years	Worst 3 Years
North Star	11.4%	11.3%	18.6%	8.4%
S&P Total Return	10.4%	9.9%	31.2%	-14.6%
MSCI World	6.9%	6.4%	29.7%	-17.7%



Note that we look at both average and compound annual historical growth rates. To investors, the one that matters is the CAGR. We include both to show the power of compounding: Even though our North Star has averaged an almost identical annual return to that of the S&P Total Return index over the past 43 years, the North Star — inflation plus 7% — has outperformed the index by about 1.4 percentage points annually. That's because when the index has those deeply negative years, much higher positive years are needed to claw its way back to positive territory. Since it never goes negative, our North Star doesn't have that problem. That is the power of steady, positive returns.

Pro's Performance

Here are *Pro*'s annualized returns lined up against our North Star. (Again purely for education, we've also included the returns for the S&P Total Return and MSCI World indexes.) The chart shows the annualized return as of the end of each month. The data begin one year after *Pro*'s start, because annualized returns based on less than a year of data aren't very useful.

These returns are annualized, not cumulative. Annualized returns are more useful to investors because they allow easy comparisons. Also, a note on the recency of data: The Consumer Price Index (inflation) data is reported with a several-week lag, while Pro's performance is in real time. Inflation is quite stable from month to month, so we use the previous month's inflation figure as an estimate for the current month's until the actual data are released. Any adjustment required is usually negligible, especially given the rolling three-year viewpoint we favor. This approach allows us to keep our performance tables updated all the time. (Updated October 2018; click for larger version.)

FAQ About Our North Star

How are you measuring inflation?

We're using the change in the Consumer Price Index. The Consumer Price Index is a measure of the average change over time in prices paid for a "market basket" of consumer goods and services. In plain language, it measures how many more dollars it takes to buy things over time.

Specifically, we're using the CPI-U, or the Consumer Price Index for All Urban Consumers, which covers about 87% of the U.S. population. We're using the "all items" version of the CPI-U, which means that we aren't excluding anything. This is worth pointing out because media-reported CPI figures often exclude food and energy prices.

Wait a second. I'm pretty good at math, and you need to return 7.177346% annually to double your money in 10 years. What gives with your 7% figure?

Yes, to be precise, we'd need to return $2^{(1/10)}$-1, or about 7.177346%, per year to double a portfolio in 10 years. Spelling out our North Star as inflation + 7.177346% doesn't in any way make it more useful as a guide, though.

Is the North Star a hurdle or benchmark?

Our North Star is neither a hurdle nor a benchmark. Hurdles are things you intend to leap over, and benchmarks represent an alternative for your investment dollars. Our North Star is neither of these things. Its purpose is to offer us direction, guide our behavior, and keep our mission front and center.

What is a rolling three-year period?

Rolling three-year returns measure performance over the most recent three years. So the rolling three-year return as of Oct. 31, 2011, measures the return since Oct. 31, 2008. A month later, the rolling three-year return as of Nov. 30, 2011, measures the return since Nov. 30, 2008.

How will the North Star change how *Pro* is managed?

Our strategy will not change, but our implementation of it should improve with the North Star as a guide. Our North Star should remind us to lower our risk when we have large, abnormal returns, or increase our exposure to stocks and income if we're not close to our North Star. Thankfully, this should work well in the marketplace. If stocks are up sharply, we *should* be looking to lower our exposure, as our North Star would suggest. If returns are lackluster, we *should* be looking for more stock values or income strategies. Following a steady North Star should help us make better decisions.

Why is the North Star better than the S&P 500?

Pro has never been an alternative for the S&P 500 index. We use options for income, we short, and we hedge. The index is a long, stock-only vehicle. *Pro* is also not about returns relative to an index; we're about positive gains over any reasonable period. The North Star never goes negative, so it's a much better measure against our goal than is the volatile S&P 500, which can be negative for years.

Inflation is relatively tame lately. What happens when it soars?

Then our North Star's annual return is going to soar, too. Thankfully, stocks typically compete well with inflation, so to follow our North Star, we know we'll need to be largely invested in stocks during periods of high inflation, and we'll likely use fewer income strategies, because fixed income may not keep up with inflation.

What if you don't top your North Star?

We'll be happy if we just stay on track with it — or stay relatively close. If we *can* top it over many years, that would be excellent. But we need to realize the lofty challenge of topping a measure that *never* has a negative year while we're investing in stocks. Our North Star is our aspiration, not a hurdle or benchmark.

Can I measure the North Star against my portfolio at home?

Absolutely. Using the Bureau of Labor Statistics CPI stats, you can obtain historical CPI measures along with a monthly update to compare the CPI+7% to your portfolio. We've already done the 41-year history for you above, and we'll be updating the North Star results monthly for you.

Where can I talk about the North Star with the *Pro* team and other members?

Our North Star discussion board is always shining (sorry!).

"Invest Like a Pro" Live Event

Published Feb 12, 2013 at 12:00AM

Don't miss our upcoming LIVE event for new *Pro* members (current members welcome too, of course)! On Thursday, Feb. 28 at 1 p.m. ET, Jeff and the *Pro* team will release our second catch-up report for new members — and then answer your questions on video and via a live chat. If you can't participate live, don't fret; the Catch-Up Report and archives of the video and chat will all be available on the *Pro* site immediately following the event.

The live event is a great chance for new and veteran members alike to get to know the *Pro* team and ask your burning questions about the service, how to align your portfolio with *Pro*'s ... anything at all. We look forward to "seeing" you on this page on Thursday, Feb. 28!

Use Options Like a Pro

Getting Started With *Pro*

1. Catch-Up Report No. 1
2. *Pro* 's Investment Strategy Guide
3. What *Pro* Believes
4. **Use Options Like a Pro**

Back to Guidebook | Site Directory

How Options Fit the *Pro* Portfolio

While we generally seek long-term capital gains from stocks, most of our options are used for *short-term* income or gains. By combining these strategies, along with ETFs and shorts, *Pro* investors can make profits in the coming weeks *and* the coming years, accomplishing our goal of earning steady, recurring profits with high accuracy in both the short and long term.

We use options strategically, as part of portfolio management. Options work hand in hand with stocks, and your *Pro* portfolio should come to reflect that. Finally, although most options do make money in the short term, we're not *traders* of options. We use them tactically and appreciate the fact that they expire in a matter of weeks or months.

The Strategies We Love

Pro will use more than a dozen options strategies, depending on what's most appealing at the time. But we rely on just a handful, and knowing how to use even one or two strategies is enough to change and improve how you invest. In addition to writing puts and writing covered calls — two of our favorite strategies — we will be buying calls to leverage gains; buying puts to protect positions or to short a stock; writing covered strangles (selling both puts *and* covered calls on a stock to double our income); using option spreads to earn large returns on investment with low risk; buying straddles to profit on big price moves in either direction; and more.

How to Learn More

If you are new to options investing, or just need a refresher, we recommend that you take advantage of the great educational resources at *Motley Fool Options* (to which you have unlimited access, as part of your *Pro* membership). Start at the Guidebook, take our quick survey, and then follow the steps to (re)learn the basics.

Catch-Up Reports

Published Feb 8, 2013 at 12:00AM

Ready to Become a *Pro* Investor? These Catch-Up Reports give you everything you need to match your portfolio with ours — quickly, painlessly, and (we hope) enjoyably. Start with Report No. 1, and watch this space for new reports through March 19. (Veteran *Pro* Fool? The guidance in these reports is not new, but if you need some help catching up with us, feel free to peruse them!)

Catch-Up Report 1: Feb. 14, 2013

- Download (PDF) (All in Cash Version)
- Download (PDF) (Currently Invested Elsewhere Version)

Catch-Up Report 2: Feb. 28, 2013

- Download (PDF)

Catch-Up Report 3: March 7, 2013

- Download (PDF)

Catch-Up Report 4: March 14, 2013

- Download (PDF)

Portfolio Positioning Report: March 19, 2013

- This report will tell you how to short, hedge, and use options to match our exposure and general portfolio position, even if you can't or don't want to engage in every strategy we employ. We'll also have a live chat at 1 p.m. ET on March 19 to address any questions you may have about this report.

Building Your Pro Portfolio

Published Feb 8, 2013 at 12:00AM

Pro is designed to make it easy for you to invest alongside our portfolio and stay up-to-date with the latest news that affects your stocks.

- **Trade Alerts:** When we see an opportunity, you're the first to know. Anytime during normal market hours, we will issue a real-time Trade Alert email with a link to our full recommendation — including details on why and how to make the trade — on the *Pro* site. See the archive here »
- **Monday Memos:** Every Monday at 4 p.m. ET, we'll send you our latest thoughts on the *Pro* portfolio, plus market insights, community highlights, and a list of active *Pro* positions we think still represent good opportunities for new money. See the archive here »
- **What to Do:** The *Pro* portfolio shows at-a-glance — and in real time — which positions the team thinks are ripe for new money now, and which are best to hold for the moment. See the portfolio here »
  - **Buy First:** Just what it says. If you're starting to build your *Pro* portfolio and plan to mirror us, we recommend allocating your capital here first.
  - **Buy:** We believe in these as much as our Buy First stocks and suggest you buy them next as you build your portfolio. (We like to buy these in chunks over time.)
  - **Hold:** This means to keep holding the position if you own it already, but don't add more cash to it. If you don't own this position yet, don't buy unless you can get shares near our preferred Buy Around price.
  - **Sell:** 'Nuff said. We're selling this position and recommend you do, too.
- **What We Think Now:** See the team's current thinking in brief on every position in the *Pro* portfolio. You'll know where we stand on each of our investments right now, all on one page. See What We Think Now »
- **Guides, Audio/Video Extras, Special Updates**: *Pro* helps you navigate the market by delivering market-beating recommendations right to your inbox. But we also aim to teach you how to find those gems yourself. Learn about *Pro*'s strategies, listen to the team talk stocks, and get the latest on happenings in your portfolio. See the archive of extras »

Your Guide to Our North Star

Published Feb 5, 2013 at 12:00AM

Like the real North Star, our North Star offers direction and guides our investing behavior. Learn more below.

Pro's Mission

Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years.

***Pro*'s North Star: Inflation + 7% annually**

Our North Star is a guide for our investing behavior. Like the real North Star, we can use it to navigate. It is not a destination; rather, it's an omnipresent fixture that offers us direction and reminds us of what we're striving toward.

Why inflation + 7%?

Our mission is to grow the real purchasing power of our capital. Therefore, the first competitor we need to beat is inflation, as measured by the Consumer Price Index.

We want to grow our dollars by more than the rate of inflation — that's a given. Exactly how much more is a difficult figure to pinpoint, but history tells us that if we can double the *real* purchasing power of your dollars every 10 years, we'll be doing what few manage to accomplish.

To double your dollars in a decade, we need to book a compound annual return of about 7%. To double your *real* dollars, we need to return 7% *plus* inflation. Thus, this figure is born directly out of our mission of absolute returns — returns that improve your financial standing in the real world.

Our North Star has several important characteristics that make it appropriate, challenging, and aspirational for all of us. It:

- **Never goes negative.** This lines up with our goal of positive returns over all three-year periods.
- **Is not investable**. It's impossible to lock in a return of inflation plus 7% with some other vehicle.
- **Is not a benchmark**. By definition, benchmarks must be investable; they are used for evaluating the performance of a relative-returns strategy. Absolute returns are our goal.
- **Is not a hurdle**. A hurdle is something you must leap over to avoid tripping. Our North Star guides us to make appropriate investment decisions. We're more likely to reach our goals if we let it guide us. If we come close to our North Star, let alone jump over it, we'll be over the moon (sorry!).
- **Is not a gimmick**. We are working to better explain our philosophy and strategy to you, and our North Star will be an ever-present factor in our investment decision-making.
- **Is a challenging reference point**. Historically, our North Star has outperformed the U.S. and world stock markets. Over rolling three-year periods since 1970, our North Star has put up a compound annual return of 11.3%, versus 9.9% for the S&P 500 Total Return Index and 6.4% for the MSCI World index. Our North Star also delivered that return *much* more steadily than the market indexes, without a single down year.
- **Guides our behavior** as we invest with the tools available to us. It is a framework to explain and reinforce consistent portfolio decisions. Approached consistently over long periods, it should help us and our members achieve strong financial rewards.

More Guidance

It's a bird, it's a plane, it's our [North Star discussion board]!

[Relive our live chat] with members about the debut of the North Star

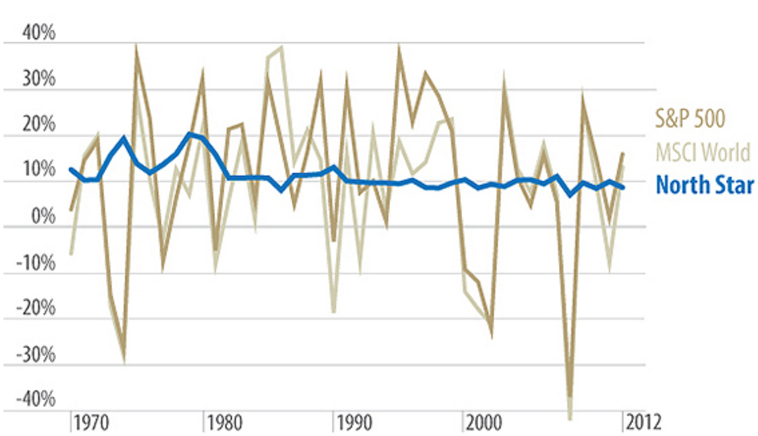
Historical Performance

How has our North Star performed historically? We're glad you asked, and we hope you like data! Here's a summary of the past 41 years. Below that are charts of the full history.

Annualized Return, 1970–2012

	Average	CAGR	Highest	Lowest
North Star	**11.3%**	**11.3%**	**20.3%**	**7.1%**
S&P Total Return	11.4%	9.9%	37.6%	-37.0%
MSCI World	7.8%	6.1%	39.1%	-42.1%

Annualized Return, 1970–2012

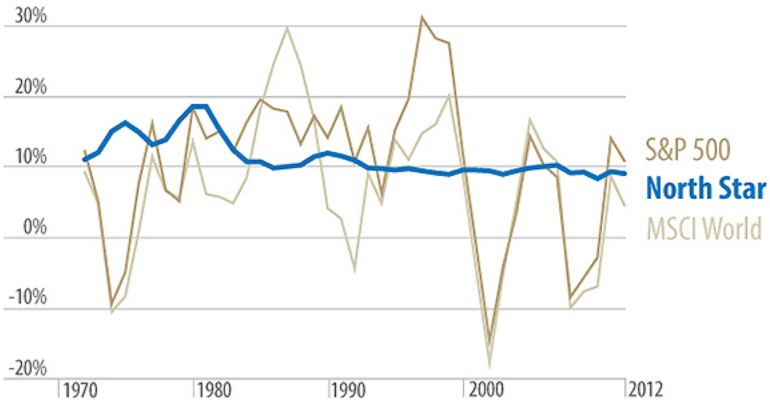


Here are the same data, showing rolling three-year annualized returns. Again, note the lack of volatility for our North Star.

Annualized Rolling 3-Year Return, 1972–2012

	Average	CAGR	Highest	Lowest
North Star	**11.4%**	**11.3%**	**18.6%**	**8.4%**
S&P Total Return	10.4%	9.9%	31.2%	-14.6%
MSCI World	6.9%	6.4%	29.7%	-17.7%

Annualized Rolling 3-Year Return, 1972–2012



Note that we included both average and compound annual (CAGR) historical growth rates. To investors, the one that matters is the CAGR. We included both to show the power of compounding: Even though our North Star has averaged an almost identical annual return to that of the S&P Total Return index over the past 43 years, the North Star (again, inflation plus 7%) has outperformed the index by about 1.4 percentage points annually. That's because when the index has those deeply negative years, much higher positive years are needed to claw its way back to positive territory. Since it never goes negative, our North Star doesn't have that problem. That is the power of steady, positive returns — see below for visual representation.

(We're including the S&P Total Return and MSCI World returns purely for the sake of education. Our investment strategies are not focused on either.)

Performance Since Inception

How has *Pro* performed against its North Star since our start in 2008? We hope you *really* like data: Here are *Pro*'s annualized returns lined up against those of our North Star. (Again purely for education, we've also included the returns for the S&P Total Return index and the MSCI World index.)

These returns are annualized, not cumulative. Annualized returns are more useful to investors because they allow easy comparisons.

A note on the recency of data: The Consumer Price Index (inflation) data is reported with a several-week lag, while *Pro*'s performance is in real time. Inflation is quite stable from month to month, so we use the previous month's inflation figure as an estimate for the current month's until the actual data are released. Any adjustment required is usually negligible, especially given the rolling three-year viewpoint we favor. This approach allows us to keep our performance tables updated all the time.

Annualized Return

To read this chart, remember that the return data are annualized, not cumulative: The chart shows the annualized return since inception *as of the end of each subsequent month*. The data begin one year after *Pro*'s start, because annualized returns based on less than a year of data aren't very useful.

And here are our rolling three-year annualized returns — again, our preferred measurement.

Annualized Rolling 3-Year Return

Date	*Pro* Portfolio Balance	*Pro*	North Star	S&P Total Return	MSCI World
10/6/08	**$1,000,000**				

Date	*Pro* Portfolio Balance	*Pro*	North Star	S&P Total Return	MSCI World
10/31/08	**$1,001,292**				
...					
11/30/12	**$1,451,264**	**6.90%**	9.23%	11.25%	4.61%
12/31/12	**$1,461,698**	**6.14%**	9.20%	10.87%	4.63%

Questions We Anticipate May Be Frequently Asked

How are you measuring inflation?

We're using the change in the Consumer Price Index. The Consumer Price Index is a measure of the average change over time in prices paid for a "market basket" of consumer goods and services. In plain language, it measures how many more dollars it takes to buy things over time.

Specifically, we're using the CPI-U, or the Consumer Price Index for All Urban Consumers, which covers about 87% of the U.S. population. We're using the "all items" version of the CPI-U, which means that we aren't excluding anything. This is worth pointing out because media-reported CPI figures often exclude food and energy prices.

Wait a second. I'm pretty good at math, and you need to return 7.177346% annually to double your money in 10 years. What gives with your 7% figure?

Yes, to be precise, we'd need to return $2^{(1/10)}$-1, or about 7.177346%, per year to double a portfolio in 10 years. Spelling out our North Star as inflation + 7.177346% doesn't in any way make it more useful as a guide, though.

Is the North Star a hurdle or benchmark?

Our North Star is neither a hurdle nor a benchmark. Hurdles are things you intend to leap over, and benchmarks represent an alternative for your investment dollars. Our North Star is neither of these things. Its purpose is to offer us direction, guide our behavior, and keep our mission front and center.

What is a rolling three-year period?

Rolling three-year returns measure performance over the most recent three years. So the rolling three-year return as of Oct. 31, 2011, measures the return since Oct. 31, 2008. A month later, the rolling three-year return as of Nov. 30, 2011, measures the return since Nov. 30, 2008.

How will the North Star change how *Pro* is managed?

Our strategy will not change, but our implementation of it should improve with the North Star as a guide. Our North Star should remind us to lower our risk when we have large, abnormal returns, or increase our exposure to stocks and income if we're not close to our North Star. Thankfully, this should work well in the marketplace. If stocks are up sharply, we *should* be looking to lower our exposure, as our North Star would suggest. If returns are lackluster, we *should* be looking for more stock values or income strategies. Following a steady North Star should help us make better decisions.

Why is the North Star better than the S&P 500?

Pro has never been an alternative for the S&P 500 index. We use options for income, we short, and we hedge. The index is a long, stock-only vehicle. *Pro* is also not about returns relative to an index; we're about positive gains over any reasonable period. The North Star never goes negative, so it's a much better measure against our goal than is the volatile S&P 500, which can be negative for years.

Inflation is relatively tame lately. What happens when it soars?

Then our North Star's annual return is going to soar, too. Thankfully, stocks typically compete well with inflation, so to follow our North Star, we know we'll need to be largely invested in stocks during periods of high inflation, and we'll likely use fewer income strategies, because fixed income may not keep up with inflation.

What if you don't top your North Star?

We'll be happy if we just stay on track with it — or stay relatively close. If we *can* top it over many years, that would be excellent. But we need to realize the lofty challenge of topping a measure that *never* has a negative year while we're investing in stocks. Our North Star is our aspiration, not a hurdle or benchmark.

Can I measure the North Star against my portfolio at home?

Absolutely. Using the Bureau of Labor Statistics CPI stats, you can obtain historical CPI measures along with a monthly update to compare the CPI+7% to your portfolio. We've already done the 41-year history for you above, and we'll be updating the North Star results monthly for you.

Where can I talk about the North Star with the *Pro* team and other members?

Our North Star discussion board is always shining (sorry!).

Worldwide Fool Meetups on Sept. 25

Published Sep 11, 2012 at 12:00AM

As you know, The Motley Fool is dedicated to helping the world invest better. We think one of the best ways to do that is to have the support and help of a community around you — so this Sept. 25 (Invest Better Day), we encourage you, our members, to meet fellow Fools in your local community and make some Foolish connections offline.

In fact, we are sending our investing team to 12 different cities on Invest Better Day. They'll be sharing their thoughts on how to invest better and discussing some companies on their radar. Join them and your fellow Fools in these locations:

Washington, D.C.	New York	Chicago
Los Angeles	San Francisco	Miami
Seattle	Boston	Denver
Philadelphia	Minneapolis	Portland, Ore.

Meetups in these locations are filling up fast, but if your local meetup is at capacity — or if you're not near one of those cities — you can still participate. There are enthusiastic members starting meetups in cities all across the globe. Check here to find your local Fool meetup, then scroll down for tips on how to host it!

Host Your Own Motley Fool Meetup

As a Fool, you're already part of our awesome online community — but we want to help empower Fools to get to know each other offline, too. Here are some tips for putting together your own Motley Fool Meetup for Invest Better Day on Sept. 25:

Time and Place
The date should remain Sept. 25 to be connected to Invest Better Day. Set the time and place for your meetup as early as possible, as scheduling is a big determining factor for attendees. If someone already has a meetup in the same general location you're considering, contact that organizer and see if you can collaborate.

Promotion
By **solidifying the time and place early**, you leave ample opportunity for grassroots promotion. You can simply by sharing the event details with your local friends and colleagues who invest (non-Fools are welcome, too!). Creating a Facebook event can help you reach an audience; you can also send interested investors to your local Motley Fool Meetup page, where they can RSVP.

Format
An Invest Better Day meetup can be **just about any shape and size**. It could be a packed house listening to prominent local keynote speakers. Or (perhaps more likely) it could be an informal get-together of investors at a coffee shop, bookstore, or bar, discussing how they invest now and how to get even better.

Steps to Take

Here's exactly what to do to create your own Motley Fool Invest Better Day event:

1. Visit The Motley Fool's Meetup Everywhere page.
2. Your location will display directly below the map. If this is where you want to host your meetup, click the "Start a new community in…" link. (If you want to use a different location, type it into the search box at the top; that location will then display atop the list of nearby locations.)
3. Enter a name for your new community in the input field. Just use the name of your city (for a meetup in Des Moines, simply enter "Des Moines"), and hit the "Create" button.
4. Click on the "Needs a location, Got one?" link just below the event title. Add the event's location and time. You also can share details and comments about the event.
5. Consider getting the word out by sharing your Motley Fool Meetup on Twitter, Facebook, and the Fool's message boards. Let us know about it, too! Send a note with the details to meetup@fool.com.
6. Check your location's Motley Fool Meetup page frequently to answer questions and start the conversation with attendees before the event begins.

David Gardner on Pro

Ketchup Reports: Terms to Know

Published Jul 20, 2012 at 12:00AM

As you use our Ketchup Reports to get, well, caught up with the *Pro* portfolio, make sure you're familiar with the terms on this page. As always, if you have any questions, ask us on the discussion boards — we are available from 3 to 4 p.m. ET every weekday through the end of August on our Office Hours board!

Terms to Know

- **Buy First:** These are the investments you should make first, setting a foundation for your *Pro* portfolio. In our opinion, these stocks usually have the best risk-to-reward profile, offering healthy upside and low downside.
- **Buy:** We like these as much as our Buy First stocks over the long haul, but they may be more volatile, and they may offer more downside risk while we wait for our thesis to play out.
- **Hold:** We currently have 10 stocks on hold, and we won't cover them in this report. They're always listed on the Recommendations page. We don't suggest buying our stocks on hold today, but if you already own them, hold them. In every Monday Memo, we'll share "catch-up" trades to help you get into stocks on hold at lower prices.

The Recommendations page is your "King of Guidance." That page is always kept current, so if something is listed there as a Buy First or Buy, we believe it can be bought today, period. The moment we no longer believe that, we'll move it to Hold on that page and announce that change on the *Pro* home page, as well as in the following Monday Memo.

You'll also need to know these terms:

- **Buy Around:** This is the ideal price around (or below) which you'll buy our recommendations, give or take 5% or even 10%. Investing is not a precise science; if we like a company enough to buy it, a 5% price difference is not going to change the outcome meaningfully. We provide this guidance to give you an initial guidepost, but if a stock is listed as a Buy or Buy First on the Recommendations page, that guidance applies regardless of the Buy Around price.
- **Fair Value:** This is the fair price for the stock — what we believe it's worth today. It is not the automatic sell price. In fact, a stock that's reached its fair value should proceed to achieve our desired rate of return (typically 10% or higher annualized). We only sell at fair value if we want a margin of safety (occasionally, there are stocks we only want to own below fair value) or we see something at a discount we like better.
- **Allocation:** We recommend each position as a percentage of the total amount you're investing in *Pro* stocks (exclude your fixed-income investments). If we say to buy 4.5% in something, then invest $4,500 in that stock for every $100,000 in your *Pro* stock portfolio. There is wiggle room here, and you should allocate in a way that makes you comfortable. Keep in mind, though, that our future guidance will assume you're matching our current allocation.

Walkthrough, Part 2: Invest With Us

What Pro Believes

Published Jul 12, 2012 at 12:00AM

Getting Started With *Pro*

1. Catch-Up Report No. 1
2. *Pro* 's Investment Strategy Guide
3. **What *Pro* Believes**
4. Use Options Like a Pro

Back to Guidebook | Site Directory

Our investment mission and our North Star guide our portfolio decisions. But our portfolio itself is a reflection of the key beliefs we have about the world and investing. We attempt to make those beliefs come to life in the *Pro* portfolio, though some beliefs don't yet have a voice.

Below are many of Jeff's strongest big-picture beliefs in 2013.

Jeff Believes ...	So We Own ...
Technology is essential to our world; the sector will grow and become even more important. But tech will remain cutthroat, with players rapidly coming and going, allowing both long and short opportunities.	**3D Systems** , **BMC Software**, **Intel**, **OpenText**, **Oracle**
Well-managed financial companies are still inexpensive and will reward long-term owners.	**AIG** , **Amtrust Financial Services**, **Broadridge Financial Solutions**, **Wells Fargo**
U.S. home construction will continue to recover.	**GrafTech International** , **Rockwood Holdings**
Cash and checks will continue to lose market share to electronic payments.	**MasterCard**

The euro is overvalued compared to the dollar.	Short **CurrencyShares Euro Trust**

The 14 positions listed above represent nearly 60% of the assets in the *Pro* portfolio (as of Jan. 22, 2013). We carry the other positions because we believe they'll help us keep pace with our always-positive North Star, or because we believe in management or the notion that (for example) the world could almost never have too many coffee bars. Below are some of Jeff's other beliefs that we'll also seek to capitalize on in 2013:

- Energy prices will be relatively stable and will potentially decline as the U.S. taps new reserves.
- Flawed ETFs will continue to offer profit opportunities, especially for shorting.
- Auto sales will recover and reach new records, and autos will offer many more technological bells and whistles.
- Our interaction with technology will evolve to commonly include voice commands.
- Most all products will eventually contain a computer chip of some sort.
- Big data will drive ever more pinpointed marketing, and social websites will become still more popular (and profitable).
- Paper media of all forms in the U.S. will come close to disappearing within 10 years.
- Younger generations will want to be memorialized online more than with a tombstone.
- I will live to at least 100 years of age, as will all *Pro* members.
- Healthy eating will remain a growing theme in the U.S.
- Many dominant U.S. companies will thrive, if not lead, in emerging markets.
- Some big retailers will revive and prosper by offering a specialized experience unavailable online.
- Cloud computing — storing files on remote servers — will be an even larger business than expected.
- A sustainable competitive moat will be more important than ever to strong stock performance.
- Interest rates will start to tick up in the next 24 months, but not by much initially.
- Alongside owning great businesses, *Pro* will do well by generating increased income and doing more targeted shorting.

What about the rest of the *Pro* team? Well, Bryan Hinmon's (TMF42) beliefs are listed below. Nick Crow's (TMFCrow), on the other hand, are not; he said his job is to talk us *out* of our beliefs. He'd rather not think in terms of beliefs as he looks for investments — a diverse viewpoint we welcome. Here are Bryan's:

- The number of flawed ETFs will grow.
- Outsourcing will slow, but jobs won't necessarily return to the U.S.; plant and factory automation (robots) will play a big role in productivity.
- Governments at all levels will begin to peel away conservatism by trying new ways to save money.
- People will try to be healthier, but they will fail and look for quick fixes.
- Web security is a big deal, for companies and for individuals.
- People will see their houses as homes, not investments. (Sub-belief: Kitchens will get bigger and more high-tech.)
- Electronic payments will continue to take share from cash.
- Brands viewed as soulless or "corporate" will suffer as consumers embrace individualism and companies with a heart.
- Chocolate is awesome (the new coffee).
- The impact of "big data" is likely to prove overhyped except in specialized instances, such as targeted advertising or health care (for example, the self-tracking movement exemplified by sites like NutritionData.com). In both cases, the data is relevant not for its size but for what can be culled from it.

What Do You Believe?

There you have it, Fools — many of our beliefs updated and laid bare. What are your key investing beliefs? Share them on *Pro*'s Philosophy discussion board so we can discuss whether and how to put them into play in 2013.

Catch-Up Trades

Published Jul 12, 2012 at 12:00AM

First introduced in our Jan. 23, 2012 Monday Memo, Catch-Up Trades are our weekly suggestions for members who aren't yet entirely aligned with the *Pro* portfolio. As Jeff wrote then:

> Every week, when we see attractive trades, we'll share them in the Memo so members who are not already fully allocated to the position in question can follow along. (Assume that we, too, would be making these trades if we weren't fully allocated!) We hope the Catch-Up Trades will help you catch up with the *Pro* portfolio, or at least make money trying. We'll also single out stocks that have been freshly moved back to a Buy rating.

As well as in the Monday Memo, you'll always find the most recent Catch-Up Trades on our discussion board for the topic. Fool on!

What Pro Believes

Published Jul 12, 2012 at 12:00AM

Getting Started With *Pro*

1. Catch-Up Report No. 1
2. *Pro* 's Investment Strategy Guide
3. **What *Pro* Believes**

Back to Guidebook | Site Directory

Our investment mission and our North Star guide our portfolio decisions. But our portfolio itself is a reflection of the key beliefs we have about the world and investing. We attempt to make those beliefs come to life in the *Pro* portfolio, though some beliefs don't yet have a voice.

Below are many of Jeff's strongest big-picture beliefs in 2013.

Jeff Believes …	So We Own …
Technology is essential to our world; the sector will grow and become even more important. But tech will remain cutthroat, with players rapidly coming and going, allowing both long and short opportunities.	**3D Systems** , **BMC Software**, **Intel**, **OpenText**, **Oracle**
Well-managed financial companies are still inexpensive and will reward long-term owners.	**AIG** , **Amtrust Financial Services**, **Broadridge Financial Solutions**, **Wells Fargo**
U.S. home construction will continue to recover.	**GrafTech International** , **Rockwood Holdings**
Cash and checks will continue to lose market share to electronic payments.	**MasterCard**
The euro is overvalued compared to the dollar.	Short **CurrencyShares Euro Trust**

The 14 positions listed above represent nearly 60% of the assets in the *Pro* portfolio (as of Jan. 22, 2013). We carry the other positions because we believe they'll help us keep pace with our always-positive North Star, or because we believe in management or the notion that (for example) the world could almost never have too many coffee bars. Below are some of Jeff's other beliefs that we'll also seek to capitalize on in 2013:

- Energy prices will be relatively stable and will potentially decline as the U.S. taps new reserves.
- Flawed ETFs will continue to offer profit opportunities, especially for shorting.
- Auto sales will recover and reach new records, and autos will offer many more technological bells and whistles.
- Our interaction with technology will evolve to commonly include voice commands.
- Most all products will eventually contain a computer chip of some sort.
- Big data will drive ever more pinpointed marketing, and social websites will become still more popular (and profitable).
- Paper media of all forms in the U.S. will come close to disappearing within 10 years.
- Younger generations will want to be memorialized online more than with a tombstone.
- I will live to at least 100 years of age, as will all *Pro* members.
- Healthy eating will remain a growing theme in the U.S.
- Many dominant U.S. companies will thrive, if not lead, in emerging markets.
- Some big retailers will revive and prosper by offering a specialized experience unavailable online.
- Cloud computing — storing files on remote servers — will be an even larger business than expected.
- A sustainable competitive moat will be more important than ever to strong stock performance.
- Interest rates will start to tick up in the next 24 months, but not by much initially.
- Alongside owning great businesses, *Pro* will do well by generating increased income and doing more targeted shorting.

What about the rest of the *Pro* team? Well, Bryan Hinmon's (TMF42) beliefs are listed below. Nick Crow's (TMFCrow), on the other hand, are not; he said his job is to talk us *out* of our beliefs. He'd rather not think in terms of beliefs as he looks for investments — a diverse viewpoint we welcome. Here are Bryan's:

- The number of flawed ETFs will grow.
- Outsourcing will slow, but jobs won't necessarily return to the U.S.; plant and factory automation (robots) will play a big role in productivity.
- Governments at all levels will begin to peel away conservatism by trying new ways to save money.
- People will try to be healthier, but they will fail and look for quick fixes.
- Web security is a big deal, for companies and for individuals.
- People will see their houses as homes, not investments. (Sub-belief: Kitchens will get bigger and more high-tech.)
- Electronic payments will continue to take share from cash.
- Brands viewed as soulless or "corporate" will suffer as consumers embrace individualism and companies with a heart.
- Chocolate is awesome (the new coffee).
- The impact of "big data" is likely to prove overhyped except in specialized instances, such as targeted advertising or health care (for example, the self-tracking movement exemplified by sites like NutritionData.com). In both cases, the data is relevant not for its size but for what can be culled from it.

Making Pro Fit You: If You're Fully Invested Elsewhere

Published Jul 2, 2012 at 12:00AM

Members joining Pro *from another Fool service and those who are already fully invested will need to consider changes to both their portfolios and their mindsets. Here's how to begin.*

As You Get Up to Speed

If you're already fully invested, you'll need to sell existing positions to add *Pro* picks. We recommend that you do this gradually and deliberately.

- List your existing positions in order from your highest-conviction holding to your lowest-conviction holding.
- If you own stocks from another Fool service, you can use that service's guidance on those stocks in building your list.
- If you don't know why you own a stock, that's a good reason to sell it.
- Be mindful of your sector and geographic allocations. You don't want to unintentionally end up owning nothing but oil or European stocks just because they were your favorites.
- If you're struggling with what to sell, post to the discussion boards — the *Pro* team can't give you individual advice, but our community members can and frequently do.
- When you're ready, incrementally sell your lowest-conviction stocks and use the proceeds to move into our Buy First and Buy stocks. Keep an eye on the Catch-Up Trades section of each Monday Memo for timely ways to enter our positions on Hold.
- Review your positions and portfolio after studying *Pro*'s mission and reviewing our North Star. Use that analysis to craft your portfolio going forward.

Once You've Settled In

Once you've built your Buy First and Buy positions, all you need to do is wait for further trade alerts from the team. Remember, though, that trade alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — one gradual step toward shaping the portfolio we want. You may decide to modify the strategy we choose for a trade; for example, you may wish to write puts instead of buying a stock outright. If you choose to deviate from our recommendation, make sure you (a) understand why we chose the strategy we did, (b) have a reason that the modified strategy better fits your portfolio, and (c) exercise caution by sizing the position a bit smaller than you would otherwise.

Your *Pro* Perspective

If you're joining us from another Fool service, it is critical that you understand the differences between *Pro* and some other Fool services. At *Pro*, we are building a portfolio, not offering investment ideas. *Stock Advisor* and *Rule Breakers*, for example, offer stock ideas from which members can pick and choose. In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the *Pro* portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

Next Steps

- **Got questions?** Bring them to our Making *Pro* Fit You discussion board.
- **Second opinion?** To see how we recommend you approach *Pro* under other circumstances (say, if you're building your portfolio in an IRA), download the entire "Making *Pro* Fit You" PDF by clicking here.

Making Pro Fit You: If You're Free-Range

Published Jul 2, 2012 at 12:00AM

So you're new to Pro *and able to follow every* Pro *portfolio move to a T? Here's what to do.*

As You Get Up to Speed

Match our portfolio positions and allocations, starting with the Buy First and Buy positions — and do so at your own pace. We'll be sending you four Catch-Up Reports designed to help you do just that, one per week through March 14. You'll find them in your inbox and on the Pro website, and they will include everything you need to know to make the trades. If you're comfortable with options, you can also consider writing puts to try to buy some of our stocks cheaper. Post on the discussion boards to get the community's feedback about any trades before you make them, if you like. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions. You can find a review of our most timely entry strategies for positions on hold in the "Catch-Up Trades" section in every Monday Memo.

Once You've Settled In

Once you've built your Buy First and Buy positions, all you need to do is wait for further trade alerts from the team. Remember, though, that trade alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want. You may decide to modify the strategy we choose for a trade; for example, you may wish to write puts instead of buying a stock outright. If you choose to deviate from our recommendation, make sure you (a) understand why we chose the strategy we did, (b) have a reason that the modified strategy better fits your portfolio, and (c) exercise caution by sizing the position a bit smaller than you would otherwise.

Your *Pro* Perspective

The most important thing to remember is that *Pro* is a portfolio service, not a collection of investment ideas. All of our positions exist in the context of our portfolio; if you elect to pick and choose *Pro* investments, it is critical that you understand how they fit into your portfolio. Our trades are intended to integrate with existing positions and to form a portfolio of assets that keeps our North Star firmly in mind.

Next Steps

- **Got questions?** Bring them to our Making *Pro* Fit You discussion board.
- **Second opinion?** To see how we recommend you approach *Pro* under other circumstances (say, if you're building your portfolio in an IRA), download the entire "Making *Pro* Fit You" PDF by clicking here.

Pro Philosophy

Published Jul 2, 2012 at 12:00AM

This is a collection of articles illustrating the *Pro* team's philosophy on how to invest and why. Want to talk philosophy? We have a discussion board for that!

Resources

Strategy Guide (PDF): How we invest, breaking down our portfolio, our guide to finding great stocks, valuation, and more.

Our North Star: Like the real North Star, our North Star — inflation plus 7% annually — offers direction and guides our investing behavior.

What We Believe: Our portfolio itself is a reflection of the key beliefs we have about the world and investing.

Philosophy & Strategy discussion: Talk it out with the *Pro* team and your fellow Fools.

Jeff Fischer: Hello and welcome to Motley Fool *Pro*. I am Jeff Fischer, Motley Fool *Pro*'s lead advisor, and I am very pleased that you have joined us. Our mission at *Pro* is to make you money in up, down, and sideways markets by teaching you how to implement a variety of smart investment strategies. I'd like to take a few minutes to familiarize you with the service and help you get started.

The first thing you'll want to do is get to know *Pro*. Visit our Getting Started Guide to learn more about our investing philosophy and what to expect as a new member, including how to set up your brokerage account and when to expect updates and trades. We'll also show you how to jump right into investing with Motley Fool *Pro*, as well as our take on investing with options. If you are new to options, we highly recommend our Options for Beginners handbook to get your crash course on this profitable strategy.

When you are ready to invest, check out our portfolio and read more about our Buy Firsts and our Buys. For each recommendation, you will get our full analysis, buy-around pricing, target allocation and much more. Every company we recommend has its own detailed snapshot, which includes our full recommendation, history, performance data and an archive of everything we have written about that company. You can also add the company to My Scorecard with just one click.

With My Scorecard, you can track stocks in which you have open positions or that you simply want to keep an eye on. And that's whether they are *Pro* recommendations or not. Not only will My Scorecard track the movements of the stock, it will also pull in all relevant articles and community discussions on that company.

Finally, as you get acquainted with *Pro*, we highly recommend that you drop by our friendly community of investors just like you. Learn what our analysts and fellow *Pro* members are saying about our stocks, ask questions about our strategies and dig deeper into *Pro* investing. The team and I are on the boards frequently, so if you have any questions, this is a great place to get answers.

We encourage you to take your time getting familiar with *Pro* and to work at your own pace. We are here to help you every step of the way. And coming soon is New Member Orientation Week, where we'll go into detail about our service, our philosophy, how to trade like a pro and everything else you'll need to make the most of your new service. In the meantime, if you have any questions about our service, our investments or our strategies, feel free to post on the discussion boards. The entire *Pro* team, as well as a robust community of smart investors, is ready to answer your questions.

Thank you again for joining *Pro*. We look forward to profiting alongside you for many years to come. Fool on!

- Buy-Around Price
- Gambling or Speculating ?

{double-click to post your FAQ and answer here - or just ask a Q }

Target List

In the interest of keeping things moving, let's post a list of questions that we feel keep getting asked because members haven't been able to find the answer easily. Then anyone can come back and paste or contribute good answers later.

What do I do with my SA/RB/other positions when I join Pro?

This thread contains a wealth of information about how members work with recs from many different MF services.

And Alex Pape published this definitive guide on how to start to implement Pro recs.

I tried to follow the rec, but my broker said I don't have enough permissions.

What happens when/if my short calls are assigned?

How close to options expiry should I be expecting an update rec?

How do I navigate around these message boards?

What is time value / intrinsic value and how do I calculate it?

- **"Buy-Around" price**
  Q: Greenpeace11 asks:

I am relatively new to Pro and was wondering about "Buy Around" suggested prices. Some of the technicals based newsletters and analysts suggest not to buy a stock until it has made a move up to a certain price point. Several of the Pro recommendations are currently trading at significantly lower prices than the "buy around" recommended prices. Do we wait to buy until they have moved up to the "buy around" prices or get in as low as possible? Thank you.

A: TMFMoosie answers:
Short answer: **buy as low as possible.**

The technical services may see moving above a price point as a *catalyst* that will move the stock even higher.

Pro primarily uses fundamental company analysis as the basis for the company's worth, and then setting a "buy around" comfortably *below* that point.

Pro catalysts will vary, but will rarely, if ever, be divined by looking at a historical price chart. So, as long as the original thesis has not changed (and Pro will alert us if it does), lower prices are better.

A: Addition by TMFMoosie: **Always use a limit order**. Set the limit at the most you're willing to pay,and then forget about it. The company recommendations at Pro are designed to be longer-term holdings. There's no rush.

- **Gambling V. Speculation**
  TMFFischer > *Far too many people treat the market like a casino even though the largest example of market success (Buffett) has always done anything but.*

  Q: *At what point are we assessing risks and probability and taking appropriate positions ? At what point are we just "Gambling" ? Is it like this:*

  - Odd 1 in 20 = Gambling
  - Odds 1 in 5 = Hedging
  - Odds 5 to 4 in favour = Investing ?

  A: spinningwood >

  - Gambling = What you call what you did, when it didn't work out and you lost big.
  - Speculating = What you call what you did when you suddenly have a whole LOT more money than you used to have, at least until the speculating inevitably turns into gambling.
  - Hedging = What you do until greed and boredom convince you to abandon the hedges so you can time the market. Many hedgers suffer from PHD (Post Hedge Depression) when their timing trade turns out to have been a gamble.
  - Investing = You have more money than you used to have.... or will some day...or at least you hope that will be the case....

  A: TMFCrowe > Knowing the probability of success is only one part of the equation. Rather than try to explain a concept you already know, I'd like to share one of my very favorite articles on investing. It's written by a professional handicapper. Here is an excerpt:

  What you really want to do is determine which most-likely winners are good prices and which most-likely winners are bad prices. It is a very simple equation:

  Price X Probability = Value

  The entire world of investing is that simple too. Here is what I mean. If a horse has a 33 percent change of winning a race, and if you can get odds of 2-to-1 on him (which means tripling your money), there is no value - the horse is priced correctly. If a horse is 6-to-5 (which means you will only get back 120 percent of your bet) and he is only 33 percent to win, then he is a terrible bet. If you're going to get 4-to-1 (quintupling your money) on a 33 percent chance winner, then it's a great bet.

  The majority of people who play horses refuse to think that way. They sometimes say that no horse is worth taking a short price on. That's just not true. If a horse is 90 percent to win a race and you're going to get a 50 percent ROI, then he is one of the greatest bets in history. They sometimes say that all long shots are over-bet and that you should never bet on a long shot. That's not true either. If a horse has a 10 percent chance of winning a race and he's 20-to-1, then you're getting double the value than you should.

  You owe it to yourself to read the rest here: http://www.leggmason.com/thoughtleaderforum/2007/conference/...

Wiki: Options

- Options 502: Synthetic Shorts
- Options 601: Stock Repair
- Options 701: Buying Straddles
- Options 702: Writing Straddles
- Options 703: Strangles
- Options 801: Spreads
- Options 802: Bearish Spreads
- Options 803: Neutral Calendar Spreads

A - Z of Options

American style: Options contracts that can be exercised at any time after purchase and before the expiration date.
See also: European style.

Assignment: When the options writer (also called the seller) is forced to buy (for a put writer) or sell (for a call writer) the underlying stock. Essentially, your counterparty has exercised its option contract, which you wrote, to buy or sell the underlying stock.
See also: counterparty, exercise.

At-the-money (ATM): An option whose underlying stock is trading at its strike price.
See also: deep in-the-money, far out-of-the-money, in-the-money, out-of-the money, strike.

Bearish: An options strategy (and outlook) that achieves its maximum payoff when the underlying stock drops in price. For example, if you are bearish on a stock you know well, you could buy a put or a bear put spread.
See also: Bullish, long, neutral, short.

Beta: A measure of the sensitivity of the price movements of a stock in relation to the movement of the broader market. A stock with a beta of 1.00 will theoretically move 1% for every 1% move in the market. A stock with 20% more or less price volatility than the broader market will have a beta of 1.20 or 0.80, respectively. Beta can be calculated by regressing the historical returns of the stock against the historical returns of the broader market index

The concept of beta does not translate directly into option pricing. It should not be confused with implied volatility, which only measures the volatility of the stock itself and ignores the broader market. A low-beta stock could theoretically have very high implied volatility.
See also: Greeks.

Bid: The price buyers currently are offering to pay.
See also: ask, bid/ask spread, mid.

Bid/ask spread: The difference between the bid and ask prices. For very liquid markets, it might be as narrow as a few pennies, but for thinly traded markets, the spread can be very wide. Options markets are less liquid than stock markets, so it is important to use a limit order to set your price.
See also: ask, bid, limit order, mid.

Binomial Model: An options pricing model that's useful for American-style options because it can help predict when early exercise is possible. It uses an iterative process that allows for pricing options at different points prior to expiration.*See also: Black-Scholes Model.*

Black-Scholes Model: One of the most well-known options pricing models. It incorporates time until expiration, strike price, stock price, dividends, implied volatility, and interest rate. It is based on several simplifying assumptions, but put simply, it calculates the value of a call option as the stock price multiplied by the probability of ending up in-the-money, less the present value of the strike price paid on the expiration date. The model is named after Fischer Black and Myron Scholes.

See also: Binomial Model.

Break-even price: The price the underlying stock needs to reach at expiration for an option investor to neither make nor lose any money. In strategies involving more than one option, there can be more than one break-even point.

Bullish: An options strategy (and outlook) that achieves its maximum payoff when the underlying stock appreciates in price. For example, if you are bullish on a stock you know well, you could buy a call or a bull call spread.
See also: bearish, long, neutral, short.

Buying Calls

> Buying a call isn't necessarily the best way to benefit from a stock's growth. It depends on the Time Value. When you buy a call you are buying Time Value and it will erode as the expiry date approaches.
>
> On the other hand buying the right call on the right growth stock can give you great leveraged returns with not much money at risk.

Make Sense? No ? There's a good starting point here:
http://newsletters.fool.com/50/optionsu/intermediate/buying-calls.aspx

Buying Puts

Buying puts. This is a very bearish thing to do. It can be hedgey too.

Buy to close: The brokerage command to exit an option contract in which you originally wrote ("sold to open") the put or call.
See also: buy to open, close, cover, sell to open, sell to close.

Buy to open: The command some brokerages use to enter an option contract in which you intend to buy a put or call.
See also: buy to close, close, cover, sell to open, sell to close.

Call option: The right, but not the obligation, to buy the underlying stock at a set price (the strike price) at or before the option's expiration date. A call rises in value as the stock price rises and declines in value when the stock price falls.

Chicago Board Options Exchange: The largest options exchange and creator of listed options in the U.S. It is owned by the **CBOEGroup** (Nasdaq: CBOE) and also specializes in futures trading. (If you want to sound savvy at cocktail parties, refer to the Chicago Board Options Exchange by its acronym and pronounce it *see-bo*, as in, "See Bo Derrick in the film*10*.")

Contract: Each standard option contract represents 100 shares of the underlying stock, provided no splits or other adjustments (i.e., corporate mergers) take place. (We'll be very specific about what to buy or sell if any non-standard options ever make it to *Motley Fool Options*.) A contract is quoted at the price for one share, so multiply by 100 to get the full contract value. For example, buying two option contracts for $1.50 actually represents 200 (2 x 100) shares of stock and would therefore cost $300 ($1.50 x 200).

Covered Call ("Writing" or "Selling" a covered call)

Popular stategy! Basically, you sell someone the option to buy your shares at a certain strike price. You receive a premium as soon as you have sold the call. It's called "Covered" because you own the shares.

Covered Calls are a classic way to generate investment income on shares you like and believe will go up, but they won't go up too quickly.

Covered Calls are a fine way to sell shares at a price you are happy to sell at - a covered call protects your profit.

Excellent Guide! - Covered Calls At a Glance

There's more detail on Page 3 of the Options U Intermediate Handbook
http://newsletters.fool.com/50/optionsu/2011/11/11/options-u...

Aleax: Never write a covered call on a stock you own, unless you know you'd be *delighted* to let said stock go at the strike price (plus the premium). You may or may not get a decent chance to roll the call as expiration nears, but it's absolutely crucial that you be quite happy letting the stock go if it soars to the sky.

Covered Strangle

A covered strangle is where we write a **Put** at a lower price, and write a **Covered Call** at a higher price. We have strangled the stock price between lower and higher. This strategy is useful for stocks which we are expecting to stay at more or less the same price by Expiry date. Here's an example: Covered Strangle on Plum Creek Timber

And here is a guide to Strangling: Options 703 - Strangles

Note: "*you write a strangle to profit when a stock stays within a predetermined price range or is relatively stable..... Writing a strangle offers more flexibility than writing a straddle because you "split the strikes" — set it up with a different strike price on your calls than on your puts — and you use strike prices that are "out-of-the-money," or well above or below the stock's current price, giving you more room to profit.* "

Close: Exit an option contract.
See also: buy to close, cover, sell to close.

Cover: Another term for closing out a short position.

See also: buy to close, close, sell to close.

Deep in-the-money: The condition of an option that has a large amount of intrinsic value. A call option is deep-in-the-money when the underlying stock is trading at a price much higher than the strike, and vice versa for a put option. A deep-in-the-money option will typically have little time value.
See also: at-the-money, far out-of-the-money, in-the-money, out-of-the-money, intrinsic value, strike.

Delta: Delta, loosely, can be three things:

1. Delta is roughly the amount the option changes in value as the stock changes in value. If you're the sort of person who likes to spend a quiet evening alone with math, you'll recognize that delta is the first derivative of the value of the option with respect to the value of the underlying. If a call option has delta of 1.00, then it rises in value $1 for every $1 increase in the stock. A delta of 0.60 means it would rise $0.60 for every $1 increase in the stock, and so on. Since the call is less expensive than the stock, the $0.60 increase represents a greater percentage change for the option than the $1 change in the stock. Put options carry *negative* deltas, but this, if you think about it,

makes sense. Since a put option profits when then underlying stock declines, and vice versa, we should expect an inverse relationship. A put with a delta of -0.60 would mean that its price rises $0.60 every $1 *decrease* in the underlying stock price.

2. Delta is roughly the probability that an option will expire in the money (though not necessarily at a profit). A deep in-the-money call is, statistically speaking, almost certain to expire in-the-money. Thus, it has a delta very close to 1.00. The negative sign on a put option's delta is unimportant in this context — the absolute value is the important thing. A put with a delta of -0.50 has a rough statistical probability of expiring in-the-money of 50%.

3. Delta is roughly the number of shares the position represents. A deep-in-the-money option trades almost the same as 100 shares of stock, so it has a delta of very close to 1.00. Here, negative delta does carry meaning. A purchased put option will have negative delta, reflecting that it is equivalent to some number of shares being sold short.

See also: gamma, Greeks.

European style: Option contracts that can only be exercised at expiration.
See also: American style, Black-Scholes model.

Exercise: Invoking the right (as granted by the option contract) to buy (if a call) or sell (if a put) shares of stock at the strike price.
See also: assignment, counterparty, strike.

Exercise price:*See: strike.*

Expiration date: The date on which the option contract becomes void, and the option holder no longer has the right to buy or sell stock granted by the option. This is typically after hours on the Friday before the third Saturday of the month.

Extrinsic value:*See: time value.*

Far out-of-the-money: The condition of an option when the underlying stock is trading at a price much lower than the strike for a call, or much higher for a put. Far out-of-the-money options have little intrinsic value but retain some time value depending on the time left until expiration.
See also: at-the-money, deep in-the-money, in-the-money, out-of-the-money, strike, time value.

Free cash flow (to the company): Money leftover for creditors and shareholders when all of a company's operational and investment expenses (think equipment upgrades, acquisitions, taxes) have been paid. This figure arguably provides a more accurate picture of the company's profits and financial strength than net income or earnings per share.

Gamma: One of the five "options Greeks" (delta, gamma, rho, theta, and vega), this shows how fast delta changes with respect to the underlying stock price. The larger the gamma, the faster delta changes; gamma is maximized when the stock price equals the option's strike price.
See also: delta, Greeks.

Greeks: The four primary Greeks are delta, rho, theta, and vega, and are risk measurements used to monitor the sensitivity of an option's price with respect to a change in one of the underlying contributors to option valuation — stock price, interest rates, time to expiration, and volatility. A fifth common Greek, gamma, measures the sensitivity of an option's delta with respect to changes in the price of the underlying.
See also: delta, gamma, rho, theta, vega.

Hedge: An offsetting position meant to reduce the price, volatility, or risk of an investment.

Historical volatility: The annualized standard deviation of the stock's price changes. Typically, daily price changes are used.
See also: implied volatility.

Horizontal spread

See: time spread.

Implied volatility: A prediction of the volatility of an underlying stock; it's calculated using the current market trading price of the option. Implied volatility may or may not bear any resemblance to actual historical volatility.
See also: historical volatility.

In-the-money (ITM): Indicates that an option has intrinsic value. Calls are in-the-money when the underlying stock is above the option's strike price (a stock is at $22 and the call has a strike price of $14, allowing the holder to buy the stock at $14). Puts are in-the-money when the underlying stock is below the option's strike price (a stock is at $22 and the put has a strike price of $30, allowing the holder to sell the stock at $30).
See also: at-the-money, deep in-the-money, far out-of-the-money, out-of-the-money, strike.

Intrinsic value: An option's value if it were to expire immediately; i.e., the value in direct proportion to the underlying stock's current price. For calls, intrinsic value is the current stock price minus the strike price. For puts, intrinsic value is the strike price minus the current stock price.
See also: premium, time value.

Last trading day: The final day on which trading takes place on an option contract prior to the settling of the contract, usually the third Friday of the expiration month.
See also: expiration date.

LEAPS (Long-Term Equity Appreciation Securities): Options that, when first offered, expire at least two years in the future. Most new LEAPS become available between September and November, depending on which option cycle the underlying company is on. They will almost always be for a January expiration, but are sometimes offered for a February or March expiration. We like LEAPS because they provide longer-term choices for an investment thesis to play out.

Leg: One piece of multi-option strategy. It also refers to entering or exiting a multi-option and/or stock strategy ("leg in" or "leg out") at disparate times and prices chosen to benefit the intended strategy, but with the potential risk that better prices will never be available.

Limit order: A modification to a brokerage command to buy or sell that allows you to buy or sell at a set price or better. These are particularly useful for illiquid stocks, as well as the option markets, for which there is often limited liquidity.
See also: market order.

Liquidity: Refers to how heavily traded a stock or option is, and usually corresponds to how wide the bid/ask spread will be. A heavily traded stock or option will have lots of liquidity and thus usually a narrow bid/ask spread.

Long: Having ownership of a security. If you own 100 shares of a stock, you're long the position. If you have purchased a whole mess of puts on something, you're long a whole mess of puts. It can also be a slang term meaning you feel positively about something. For example, TMFTheDoctor is long corgis, caffeine, and David Tennant.
See also: bearish, bullish, neutral, short.

Market-maker: Typically, a floor trader on an exchange whose job is to accept bids and offers from other traders — be they big institutional traders or Joe and Jane Optionsmember. The main job for a market-maker is to maintain liquidity and ensure that prices are more or less fair.

Market order: Typically the default order type for an options trade. It tells the broker to place your trade at whatever price is currently available on the market. Since options are often thinly traded, market orders can be very dangerous, as the bid/ask spread can be wide and a market order will simply buy at the ask or sell at the bid.
See also: bid/ask spread, limit order.

Mid: The midpoint between the bid and ask. When using a limit order, it's often advantageous to set it to the mid — sometimes called "splitting the bid/ask" — and move outward from there if the order doesn't get filled.
See also: ask, bid, bid/ask spread.

Naked: Taking a short position in an option without having a position in the underlying security as collateral. The concern of a naked position is that it carries theoretically unlimited risk. A naked call will begin showing a loss as the underlying stock rises, and the stock could possibly go to infinity (and beyond!) causing extreme loss on the naked call. A naked put does not carry quite as much risk: A stock can only fall to zero (Oh Joy!), so the position's potential loss is limited to the value of the stock.
See fully-clothed, semi-clothed

Neutral: An options strategy (and outlook) that achieves its maximum payoff when the underlying stock doesn't change in price.
See also: bearish, bullish, long, short.

Net operating profit after taxes (NOPAT): NOPAT (aka NOPLAT) is a taxed version of a company's operating income, or EBIT.
*(**NOPAT**: Net Operating Profit After Tax; **NOPLAT**: Net Operating Profit Less Adjusted Tax.)*
NOPAT is a useful metric for comparing the operating profitability of companies with different debt loads because it excludes the interest burden that comes with debt. A simple way to calculate NOPAT is EBIT x (1 - Tax Rate). A more accurate method adjusts the reported tax to exclude the *tax shield* provided by the tax exemption on interest payments: Adjusted Tax = Reported Tax + (Interest x Tax Rate); NOPAT = EBIT - Adjusted Tax.

Open: As a verb, open refers to entering an option contract; as an adjective it refers to whether you are still holding the position.
See also: buy to open and sell to open.

Open interest: The total outstanding open contracts on any particular option. If you buy or sell to open, pat yourself on the back! You've just upped the open interest. If you buy or sell to close, you've just decreased it. (Fine, you can give yourself another pat.)

Option cycle: Expiration dates available for various classes of options (not everyone gets to go at once). There are three cycles, offset monthly: January/April/July/October; February/May/August/November; and March/June/September/December. Regardless of cycle, there is always an option for the current month and the next month. Beyond that, the expirations correspond to whatever cycle the stock is assigned to. There will always be at least four expiration months trading.

Options Clearing Corp.: A middleman, operating under the Securities Exchange Commission, whose role is to police option buyers and sellers to ensure the obligations of an options contract are fulfilled. The OCC clears and settles trades for options exchanges (like CBOE) and takes on counterparty risk. It is also a useful resource for options questions.

Out-of-the-money (OTM): The opposite condition to being in-the-money. Here, an option has no intrinsic value, only time value. For example, if a stock is trading at $8, its call options with a $10 strike price would be out-of-the-money.
See also: at-the-money, deep in-the-money, far out-of-the-money, in-the-money, strike.

Premium: The total price of an option contract; the sum of an option's intrinsic value and its time value.
See also: intrinsic value, time value.

Put Broken Wing Butterfly

Poor butterfly!

But an example of this Strategy is [Set up a Put Broken Wing Butterfly on Expeditors International]

An iron butterfly is the combination of two spreads: a bear call spread and a bull put spread. If you're unable to set up a four-legged butterfly trade in one order with your broker, then handle the Bear Call Spread and the Bull Put Spread elements as 2 trades.

Put option: The right, but not the obligation, to sell a stock at a set price at or before the expiration date. A put's value increases as a stock's price falls.

Put ("Selling" or "Writing Naked Puts")

Writing Puts is a classic way of buying shares that you wish to buy anyway - but at a lower price. You sell the option. You receive a premium. That premium can be deducted from the strike price to give you a lower buy price!

Make sense ? No ? Read the great introduction here: http://newsletters.fool.com/50/optionsu/2009/08/10/writing-p...

More detail: Page 15 of this doc http://newsletters.fool.com/50/optionsu/2011/11/11/options-u...

Note: When you sell a Put option you are selling someone the right to sell **you** shares at a certain strike price. Now, whoever bought the Put from you can just ***make*** you buy those shares at the agreed strike price at any time up to Expiry Date!! Inconvenient if the share price is temporarily much lower than that strike price. Mind you, worry not, this "assignment of shares" doesn't happen too often.

Normally you'll reach the Expiry Date and the actual price will be lower - in which case you'll have to buy the shares at the higher strike price. Or the actual price will be higher and your put will expire for nothing. You keep the premium in either case.

It's best to keep **Cash** set aside to cover your Written Puts (i.e. buy the 100 shares at the strike price). It's best not to use margin for this. Read more in the introductions about this.

Return on equity (ROE): Return on equity is the profit earned on capital that stockholders have contributed to the company. Let's say a company has issued $100 million worth of stock, $100 million worth of bonds, and $50 million in preferred stock. This imaginary company brings in $25 million in profit, and pays out $5 million in interest payments on its debt and $5 million in dividend payments to the preferred shareholders. It is left with an adjusted net income of $15 million and total equity of $100 million, so it has an ROE of 15%.

Return on investment (ROI): Return on investment is the profit earned on funds put at risk. If you buy 100 shares of a stock trading at $10, and it rises to $12, you have an ROI of 20%.

Return on invested capital (ROIC): Return on invested capital is the profit earned on all sources of capital contributed to the company. Going back to the ROE example, the company has a total capitalization (equity + debt + preferred stock) of $250m. There are various ways to measure return on invested capital, but one of the simplest ways is to take net income and divide it by total capitalization. So if this imaginary firm brings in $25m in net income, it has an ROIC of 10%. Although slightly more complicated, we prefer to calculate ROIC using net operating profit after taxes (NOPAT) in the numerator.
See also: NOPAT, return on equity.

Rho: One of the five "options Greeks" (delta, gamma, rho, theta, and vega), this indicates an option's sensitivity to changes in short-term interest rates. Option premiums get more expensive when interest rates go up.
See also: Greeks.

Rolling forward, out,up, or down: A follow-up action in which you cover (or sell) an option you originally sold (or bought) and reinitiate that position at a different strike and/or expiration. "Rolling forward" (also called "rolling out") involves closing options that expire in the near term and opening options with longer-term expirations. "Rolling up" involves closing options with a lower strike price and simultaneously opening new options at a higher strike price (while maintaining the same expiration). "Rolling down" involves closing options at a higher strike price and simultaneously opening new options at a lower strike price.
See also: cover.

Sell to close: The brokerage command to exit an option contract in which you originally bought ("buy to open") the put or call.
See also: buy to close, close, cover.

Sell to open: The brokerage command to enter an option contract in which you intend to write (a.k.a. sell) a put or call.
See also: buy to open, open.

Spread: Any option strategy in which you buy and write ("sell to open") options of the same type (call or put) on the same underlying stock.

Straddle: A direction-neutral options strategy consisting of a call and a put with the same strike prices and expiration date. It profits from a large move, up or down, in the underlying stock.

Strangle: Similar to a straddle (a strategy consisting of a call and a put with the same expiration) but with different strike prices. It profits from large moves, up or down, in the underlying stock. A strangle is cheaper to set up than a straddle but requires a larger move in the underlying stock to become profitable.

Short: Having an obligation position in a stock or option. When you go short a stock, you're borrowing the asset, selling it, and hoping to profit by buying it back at a lower price. Shorting a stock reflects a bearish outlook. In an options context, it reflects the writing of options. In *Motley Fool Options*, we often pair our short options with our long options. For example, in a bull call spread, you are long one call at one strike and short another call at a higher strike. Despite having one short leg, it's still overall a bullish position.
See also: bullish, bearish, long, neutral.

Strike: Also known as the "exercise price," this is the price at which the option holder can buy (in the case of a call) or sell (in the case of a put) the underlying stock.

Synthetic: A way of using options, sometimes in conjunction with long or short positions in the underlying stock, to mirror the profit and loss potential of a different position. For example, a synthetic long can be created by buying a call and selling a put with the same expiration dates and strike prices. The profit payoff on such a strategy is identical to that of simply buying the underlying stock at the strike price; however, in a margin account the cost to establish the position is considerably less.

Synthetic Covered Strangle

A synthetic covered strangle is a variety of Diagonal Call. It's a 3 legged trade. We buy a long-term ITM call, and a short-term OTM Call AND finance it with a long-term ITM Put. Essentially it's a Synthetic-Long we have covered with a profitable call. It's useful when the stock is reckoned to rise over the next long time period (we're very bullish) as Synthetic Covered Call leverages capital at risk.

Here is a a live trade example using Microsoft from the Options team:
[Set up a synthetic covered call on microsoft]

Synthetic-Short

Some prefer a real single malt.

A Syn-Short is just like directly shorting the stock. But here you sell naked calls and buy puts at exactly the same strike price. Hopefully for a small net debit or even a net credit.

There's a great introduction here : http://newsletters.fool.com/50/optionsu/advanced/synthetic-shorts.aspx

And here's a Syn-Short in action: [PRO: Set up a Synthetic Short on CurrencyShares Euro Trust]

Syn-Short

Here's an insight from [Aleax] on the boards:

Q > I'd like to set up a syn-short but I am worried about the 'naked' unlmited loss. Should I short directly instead?

A> The upside and downside of a syn-short are exactly the same as for an outright short (net of "trading friction" aspects: a syn-short owes no payments in lieu of dividends nor shorting-fees, but options commissions are higher and bid-ask spreads wider; many of the hoped-for gains from a syn short [those due to the purchased put leg] can be taxed as long term capital gains if the position is held for > 1 year, while the outright short is always subject to short term rates [as is the short-call leg of the syn-short]; I think that's about it for trading friction aspects).

So you should be worried about the syn-short if, and only if, you would be exactly as worried about the outright short.

Tax-wise you prefer larger gains on the put leg and smaller ones on the call leg; so from this POV you want the syn short strike to be high (if you do close for gains in > 1 year, you'll have more money in your pocket, after taxes). This costs more money up front to establish than a syn short with a strike ATM or lower than ATM; but less ongoing purchasing power for maintenance margin. Also, the way-OTM short call stands hardly any risk of premature assignment.

Of course, if you set your strike so high that writing the call gives you, in your opinion, too little money to bother, you might omit writing the call (and thus avoid the theoretically unlimited risks) and turn it into a simple deep-ITM put purchase;-). (If the call would have too little TV to bother writing, the put will have too little TV to worry about buying it, either;-). Aleax

Also see Aleax's longer response to question Are there disadvantages to Syn-Long v. owning the stock ?

Theta: One of the five "options Greeks" (delta, gamma, rho, theta, and vega), this measures an option's sensitivity to time, or how much the option price decays per day.
See also: Greeks.

Time decay: The reduction in an option's value through the passage of time.
See also: theta.

Time spread

A strategy (also called a horizontal spread) with two or more legs from different expirations. Calendars and diagonals are prime examples of time spreads. A calendar involves buying an option in one expiration and, at the same time, selling that same strike in a different expiration. Strictly speaking, a diagonal is a time spread but *not* a horizontal spread.

Time value: The premium that the market is willing to pay for the potential upside of the option until expiration. Its value accounts for beneficial unknowns and volatility until expiration. For a tradable option, deduct intrinsic value from the trading price to arrive at time value. Options are wasting assets, meaning time value declines as expiration draws closer.

"Time Value" is vital in understanding options. Jeff Gilles gives a graphical introduction in "Video: The Value of Time"

See also: intrinsic value, time decay.

Uncovered:*See: naked*.

Underlying: The stock being bought or sold at the expiration of the option contract. Since stocks are pieces of businesses, it makes sense to understand that business, its valuation, and its prospects before overlaying options strategies on them.

Vega: One of the five "options Greeks" (delta, gamma, rho, theta, and vega), this indicates an option's price sensitivity to a change in volatility. Higher volatility makes options premiums more expensive.
See also: Greeks.

Vertical spread:

A strategy using two puts, or two calls, with the same expiration but different strikes. A bull call spread is a type of vertical spread.

See also: bull call spread.

Volatility: An estimate of the amount that the underlying stock's price is expected to fluctuate in a given period of time. Generally, volatility is measured by the standard deviation of the continuously compounded returns of the underlying stock.

Write: To sell an option contract. We prefer to use "write" when referring to selling an option contract in general, but specifically this refers to selling a *new* option contract. The option seller is referred to as the option writer.

Wing spread:

A strategy constructed from the combination of a pair of spreads that profits most when the stock does nothing. A trader could also construct a so-called "broken wing" spread, where one side has a slight bias. Butterflies and iron condors are good examples of wing spreads. They're referred to as such because, if you were to make a profit/loss diagram, the center has a kind of body shape (where the profit is if the spread is sold, or where the loss is if the spread is purchased), and the sides have a vague wing shape to them.

Questions about Options

FAQ from Pro Members answered by Pro staff and members

Question on Option Strategy with helpful reply:

I am still trying to figure out how to play leading company in high growth emerging market segment (enticing premium in exchange for high volatility)...

I see Jeff has provided an official answer and of course that's much more meaningful than my opinion (as I'm an amateur) but I think I'll offer that opinion anyway.

I've been well served over the years by a mixed strategy on such names -- build up (ideally buying on dips, of course, but in a very buy-and-hold mood anyway) a maybe-slightly-underweight position to never be touched again until it's a multi-bagger or the investment thesis sours; *on the side*of this core position, accumulate a somewhat smaller "trading position" meant for short- to mid-term profitable trading -- buy low, sell high.

Options help for the latter objectives (write puts on slight dips when trying to beef up the trading position rather than wait for deep dips; write covered calls on slight rallies when trying to whittle down the trading position rather than wait for steep rallies) though one could also just buy and sell shares (writing options can be more profitable when the market's implied volatility for the name is exaggerated compared to your assessment of what realized volatility is going to be).

Optimal duration to expiration for the written calls on the trading position varies, but they won't be all that long term (you want time value to erode, and it really doesn't erode fast at all for too many months if you write, say, 6-months-out or longer) and usually not too short-term to avoid excessively enriching your broker via commissions and the market makers via bid-ask spreads (the exception, where really short-term trades are warranted, is when you judge the market is badly mis-evaluating an impending event such as an earnings call or forthcoming relevant legal or regulatory decision).

As I said, this mixed approach is what overall tends to work out for me -- not every time, of course!, but often enough to keep me in the game.

For example, that's why I wrote calls on only half of my DDD shares -- I mentally re-tagged half the shares as a "trading position" and the other half as a "buy-and-hold position", so as to have my cake and eat it too.

Warning: whether this approach is psychologically tolerable to you depends on your character -- I have a sunny disposition so I tend to see the outcome of mixed strategies mostly in a "could have been worse!" [if I had picked the wrong pure strategy] mood, but if you know that your own reaction would mostly be a sour "could have been better!" [if you had picked the right pure strategy], then they're better avoided.

BTW, I'm kind of glad that my 5000th post comes on a subject where I have definite (though amateurish) experiential-based preferences that are pretty far from the mainstream -- at least this way the post should be interesting (perhaps controversial), compared to one where I just reaffirmed a broadly held opinion I agreed with, no?
-) Aleax

What are the disadvantages of a Syn-Long v. owning Stock ?

Question:

You give pros and cons for alternatives with the exception of synthetic longs. What is the "con" of this approach?

If there is no con, only pros, why does anyone buy stock?

Reply:

The disadvantages of a syn-long compared to outright stock purchase are as follows. TL;DR: there are plenty -- beware!-)

(1) You're constrained to multiples of 100 shares (except on the few stocks that now offer mini-options, in which case, multiples of 10 shares can be held) -- with stock purchase you can size your position more precisely and adjust it as you go.

(2) Fees, commissions, and, crucially, bid-ask spreads (i.e, all components of "trading friction"), are much higher for options than for shares. No big deal if you want to buy today and hold for almost two years, but anathema for more frequent trading.

(3) Taxes can work for or against you, but for a typical syn-long (established ATM) it will be against, if the stock price does rise.

If you buy 100 shares and sell them in Jan 2015, you will have (assuming the stock price did rise) long-term capital gains, taxed somewhere between 15% and 23.8% depending on your tax bracket. (Any qualified dividends you get in the meantime are also taxed at this same rate).

If you buy an ATM Jan 15 call and write an ATM Jan 15 put, and by Jan 15 expiration the stock has risen, you'll have long term capital gains on the call -- but your gains on the puts you write are always treated as short-term, no matter your holding period.

Those gains will be the whole premium you receive today for writing the put, and they'll be taxed at your ordinary marginal rate (up to 43.4% -- don't forget the 3.8% ACA surtax on "non-earned income").

To minimize this tax effect of a syn-long, pick a strike such that the call is deep-ITM (so the put will be deep-OTM and the premium you receive for writing it will be much lower -- since that's the part of your gain that will be taxed more dearly, you want it as low as possible from a tax viewpoint). This does increase the net debit you'll need to pay to initiate the position (i.e, reduce your leverage).

(4) your written put could be exercised at any time (if the stock dips below its strike, and low enough to reduce its time-value to near 0), forcing you (esp. assuming you want to stay in the position) to incur extra commissions and fees. Picking a strike well below the money reduces this risk, as well as reducing your taxes (see [3]).

(5) in a cash account, syn-longs make no sense, since you'll need to keep aside the whole exposure the written put gives you -- i.e, for a typical ATM syn-long, the same amount you'd have to fork over to just purchase shares.

(6) in a margin account, syn-longs are a mixed blessing.

If you buy shares, your purchasing power while you hold them is only reduced by your shares' maintenance margin -- typically 25%; most of your equity in those shares is available to margin other positions, if you wish (i.e, it's part of your account's purchasing power).

Options don't work that way. Your equity in the purchased long call does not help your purchasing power at all. Your liability in the written put does require maintenance margin, typically expressed as "Proceeds of the sale plus 20% of the underlying value less out of the money amount OR proceeds of sale plus 10% of underlying value, whichever is greater" but, beware, "proceeds of sale" actually means current, mark-to-market value of the put.

Suppose for simplicity that the syn long strike is 100 and the share price dips to 70 -- low enough to leave the put with no time value.

If you own 100 shares, this makes your maintenance margin 100 * 70 * 0.25 -> $1,750, so you still have 7000 - 1750 -> $5,250 of your equity in the shares available as purchasing power (e.g to help ensure the maintenance margin for other positions).

If you're long a 100-strike call (which does not matter to margin) and short a 100-strike put, the put's current value will be [at least] 30 (all IV, no TV), the "underlying value" is 100 (what you need to be ready to pay if assigned), and there is no "out of the money amount" (since the put is way IN the money after the dip). So the maintenance margin is 100 * (30 + 0.2 * 100) -> $5,000 -- this *reduces* your account's purchasing power... so, you'd better have cash or outright-owned shares in the account, to keep your overall purchasing power positive -- otherwise, best case, you'll get a margin call (and need to urgently inject more cash into the account and/or liquidate positions), worst case, your broker will just liquidate some or all of your positions without even bothering to tell you (I believe only IB, Interactive Brokers, routinely does the latter -- most brokers do pay you the courtesy of a margin call, at least -- but it's still NOT a nice position to be in).

Of course you did have to pay about $10,000 to initiate the outright all-cash share purchase, but still, under a bad dip like the above, the net effects on margin and purchasing power are even slightly worse for the syn-long than for the share purchase. People new to syn-long may not think in term of margin because they incur no margin *debt*, but, beware, you DO risk a margin call (at best!) if you have a syn-long and fail to keep ample cash in the account (or plenty of outright-bought shares to provide purchasing power to cover your maintenance margin).

(7) it's a highly leveraged play -- don't let the fact that you're not incurring margin debt and paying interest on it fool you into ignoring the sheer fact that you ARE leveraging (a lot, if you use an ATM strike -- or worse, an OTM one -- for your syn-long; less if you choose lower strikes, committing more cash up front). When all is said and done this will amplify your gains, if gains you have, but it will also amplify your losses, if losses occur. So, be wary about position sizes in syn-longs, especially on more volatile stocks! If you would normally buy a position size of 500 shares, with a syn-long it might be more prudent to go for 4 contracts, or maybe even just 3 if the stock is very volatile. Yes, this does reduce your potential gains if all is shiny -- but it reduces your potential losses just as much.

I'm sure I've forgotten some issues, but I hope I've highlighted enough to cause readers to do careful due diligence before embarking on syn longs. Remember the key idea with options trading (and most everything else in life): TANSTAAFL -- "there ain't no such thing as a free lunch". You're wise to dig for down-sides BTW, and I hope I helped.

Me, I don't do syn-longs -- if and when looking for a stock ownership substitute, I buy deep-ITM LEAPS calls instead, if I can find a strike that's liquid enough to not kill me with wide bid/ask spreads yet have very little time value (today's very low implied volatilities help;-).

I only get a few of the above down-sides (e.g, higher commissions, fees and spread-related trading friction -- but I did mention that usually matters little [unless the spread's ridiculously wide] when intending to hold for a reasonably long time; no buying-power help -- but then I use margin only very lightly and prudently anyway). And I do get one key extra advantage: limited worst-case losses compared to either outright share purchase or syn-longs.

After all, to reduce tax hits and risks of premature assignment, as I mentioned above, one should aim for a strike way below the money even when establishing a syn-long. But -- at such a strike, the written puts pay very little. So why even bother writing them, thus incurring (albeit to a limited degree) all of the above down-sides, and NOT getting the "limited loss" effect should the company go bankrupt overnight? Just buy the deep-ITM call and be done with it... at least, that's what I do, myself!-)

Similar reasoning can be applied to syn-shorts when you're bearish on a stock -- except that the plainer alternative of outright short sale comes with plenty of baggage of its own (which the outright purchase of shares, and the option positions, don't); so I do use plenty of syn-shorts (though sometimes I just buy a deep-ITM put instead, if and when I can find a narrow-spread, very-low-TV one;-).

Which reminds me of one special case where a syn-long would be very attractive (in theory -- haven't actually done that): when you're bullish on a stock that's so heavily shorted put/call parity breaks down, so premiums on puts are stellar compared with ones on calls. In such a case, "buy low, sell high" sure looks attractive, and that translates to a syn-long (typically a split-strike one). But, this post is already too long, so I'm not going to harp on that special case!-) Aleax

Which Account Do I Use for Options?

(a very helpful post from VelobiciOptions)

> Well, there is more than one opinion regarding which type of account is best for writing covered calls and puts.
>
> One reason options have a bit of a reputation for danger, is that it is easy to lose track of how much money one is committing when writing puts. In a taxable account, one can write a put and the "buying power" decrease by a fraction, often 30%, of the amount of money required should the put be assigned. In an IRA, that is not an issue, all puts are fully cash secured and the reported "buying power" decreases by the amount of money required by assignment. In that way using an IRA account is much safer....its just not possible to get over-extended when writing puts. So, you might want to start with paper-trading, then use an IRA account, and lastly a taxable account.
>
> That said, there are certain types of positions that dont work well in IRA accounts:
>
> | Position Type | IRA Account? | Taxable Account |
> |---|---|---|
> | **Sell Naked Calls** | No | No (1) |
> | **Sell Covered Calls** | Yes | Yes (2) |
> | **Sell Puts** | Yes (100% cash) | Yes (margined) (3) |
> | **Sell Strangles** | No (see note) | Yes (4) |
> | **Sell Straddles** | No (see note) | Yes (4) |
> | **Buy Bull Call Spreads** | Yes | Yes (2) |
> | **Buy Diagonals** | Yes | Yes (2) |
> | **Buy Synthetic Longs** | No (see note) | Yes (5) |
>
> (1) Motley Fool Options, and as far as I know Motley Fool Pro has never written naked calls
>
> (2) In both cases the stock, or purchased call, secures the call and the profitability is the same
>
> (3) IRA's are not marginable, so 100% of the cash needed to secure the put is set aside within the account for the life of the put. Taxable accounts allow the use of margin and do NOT set aside 100% of the money required, but rather only a portion
>
> (4) Straddles and Strangles combine a sold covered call with a sold put. In an IRA this would require us to purchase the stock and 100% cash secure the put....too expensive. Often the profitability of stangles and straddles is based upon receiving both the call and put premium without having to set aside 100% of the cash required should the puts be assigned.
>
> (5) Synthetic Longs require the purchase of call options which are funded by the sale of put options. In a taxable account, the put is partially funded via margin. In an IRA the put is fully funded, which costs just as much as buying the stock at the strike price. Might as well buy the stock and receive the dividends, if any.
>
> Whew! Well, that's how I understand these at this time.
>
> Please don't be bashful with any corrections or questions.

Moosie's Option Spreadsheets

Spreadsheet page

The spreadsheets are just some tools I built, mostly to analyze various option strategies. No rocket science here. They have an embedded Black-Scholes calculator. Feel free to change these and make them your own, or use them as a guide to build your own from scratch. Or use them as is.

The charting sheet is a handy way to make profit-loss graphs similar to those Pro includes in the recommendations.

You'll be able to use these in Windows, and Mac, except not Mac Office 2008. v2004 and v2011 work fine. Microsoft left VBA out of the 2008 Mac version.

Strategy Cheat Sheet

This is some documentation included in the optiontradingtips.com spreadsheet. Nice and concise.

MARKET DIRECTION	IMPLIED VOLATILITY: Low	Neutral	High
Bearish	Buy Naked Puts Bear Vertical Spreads: Buy ATM Call/Sell ITM Call Buy ATM Put/Sell OTM Put Sell OTM (ITM) Call (Put) Butterflies Buy ITM (OTM) Call (Put) Time Spreads	Sell the Underlying	Sell Naked Calls Bear Vertical Spreads: Buy OTM Call/Sell ATM Call Buy OTM (ITM) Call (Put) Time Spreads Buy ITM (OTM) Call (Put) Butterflies Sell OTM (ITM) Call (Put) Time Spreads
Neutral	Backspreads Buy Straddles/Strangles Sell ATM Call Or Put Butterflies Buy ATM Call Or Put Time Spreads	Do Nothing	Ratio Vertical Spreads Sell Straddles/Strangles Buy ATM Call Or Put Butterflies Sell ATM Call Or Put Time Spreads
Bullish	Buy Naked Calls Bull Vertical Spreads Buy ATM Call/Sell OTM Call Buy ATM Put/Sell ITM Put Sell ITM (OTM) Call (Put) Butterflies Buy OTM (ITM) Call (Put) Time Spreads	Buy the Underlying	Sell Naked Puts Bull Vertical Spreads Buy ITM Call/Sell ATM Call Buy OTM Put/Sell ATM Put Buy OTM (ITM) Call (Put) Butterflies Sell ITM (OTM) Call (Put) Time Spreads
