- **Verisign** (NASDAQ: VRSN): Fair-value estimate increases to $85. Our covered strangle is set to expire next month and we plan on continuing the strategy, prices willing.
- **Verisk** (NASDAQ: VRSK): Fair-value estimate increases to $83. It remains a buy at a 2.1% allocation.
- **Visa** (NYSE: V): Moves to Buy First (from Buy) at a 2.6% allocation.

Sell TD Ameritrade

Published Mar 10, 2017 at 2:52PM

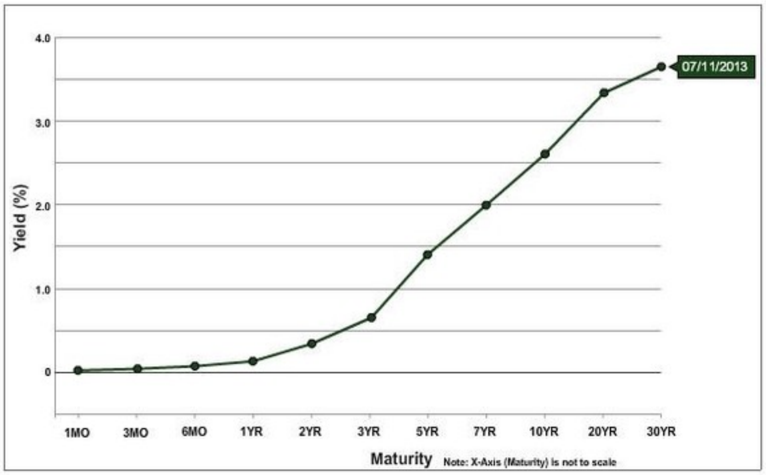
Is this for you? For all *Pro* members who own **TD Ameritrade** (NASDAQ: AMTD), we are moving the stock from Hold to Sell. If you own TD Ameritrade shares and agree with our thinking, follow this alert and sell the stock with us. Read on to find out why we're selling, including portfolio reasons. If, after reading, you want to keep the shares on your own, of course you may do so.

How You Participate

- **Trade:** Sell TD Ameritrade.
- **Allocation:** Sell all shares. *Pro* is selling our 2,000 shares (representing 2.8% of the portfolio).
- **Price Guidance:** It is **critical that you use a limit order** (please!) to aim to sell as close to the going market prices as possible, currently about $39.62.
- **Recent Price:** $39.62
- **Scorecard Status:** Sell

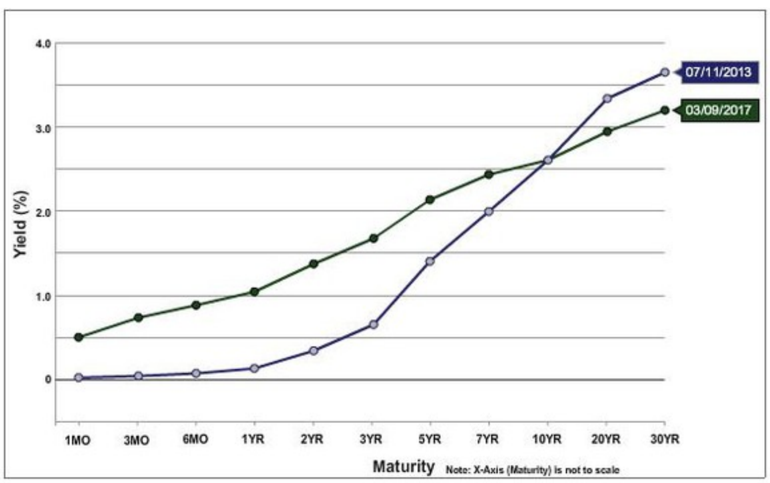
What We're Thinking

In July 2013, we bought TD Ameritrade in anticipation of the potential for higher interest rates. At that time, the treasury yield curve looked like this:



Source: U.S. Department of the Treasury.

A lot has changed since July 2013. TD Ameritrade has done an excellent job of expanding its core business while continuing to position itself to benefit from a higher-interest rate environment. Client assets have grown from $517 billion to $797 billion as of the end of the most recent quarter (a 13% compound annual growth rate, or CAGR). Trailing-12-month (TTM) revenue has grown from $2.6 billion to $3.4 billion (6.6% CAGR), and TTM earnings per share have grown from $1.07 to $1.59 (11.1% CAGR). Additionally, we have finally entered a period of rising rates. Now, the Treasury yield curve looks like this (with July 2013 still shown for reference):



Short-term rates (which affect TD Ameritrade the most because of the short-term composition of its interest rate-sensitive assets) are much higher than they were in 2013, which benefits earnings.

Owing to the company's strong core business performance, the benefits of higher rates, and the market's anticipation that they'll go even higher in future, our position in TD Ameritrade has performed very well since we initiated it in 2013. At current levels of about $39.60 per share, TD Ameritrade's stock price is up more than 54% (excluding dividends) in a little more than three and a half years, or about 13% annualized. Additionally, we've earned more than $5,000 in regular and special dividends since initiating the position, adding to our returns.

Now, with expectations for rising interest rates baked into the current stock price, and with the stock trading more than 10% above our newly lowered fair-value estimate, we're content to sell our stake in TD Ameritrade and chalk up our original investment thesis as a success.

As we explained in our sale of a similar *Pro* investment idea (AIG), *Pro* aims to buy outstanding businesses that will ideally compound our capital for many years to come. Although TD Ameritrade is a good business, we don't think it is a *great*, *Pro*-like business any longer. The company has limited opportunities to reinvest its cash flow, and it lacks pricing power (as evidenced by the recent reduction in its commission rate). Although the commission cut is certainly not the only reason we are selling our shares, the recent price war with competitors provides us with additional impetus to sell today. Even with the recent cut from $9.99 to $6.95, TD Ameritrade still has the highest commission rate among its competitors (with Fidelity and Schwab now at $4.95 per trade). Given current industry trends, we think it likely that commissions can continue to go lower still. Since commissions make up 41% of TD Ameritrade's revenue, price cuts provide a meaningful headwind to the company's results.

The *Pro* Bottom Line

While we know it's certainly possible that TD Ameritrade's stock will continue to do well from the current price (especially if interest rates continue to rise more than expected), we believe that our initial investment thesis has been satisfied, and we're happy to reallocate our investment dollars to companies we think are more likely to compound strongly over the long run, starting with trades as soon as next week.

Short (More) Direxion Daily Financial Bear 3X Shares ETF

Published Mar 10, 2017 at 2:52PM

Is this for you? This is for all *Pro* members interested; the short itself or one of the alternative trades (buying stock or using options) at the end of the report should be possible for all.

How to Follow Along

- **Action:** Sell short (more) **Direxion Daily Financial Bear 3X Shares** (NYSEMKT: FAZ) ETF.
- **Allocation:** Short enough to get to a 1.5% position (short $1,500 worth for every $100,000 you manage). *Pro* is currently short 0.1%, so we'll short another 1.4% sometime over the next 30 days.
- **Recent Price:** $18.33
- **Price Guidance:** Use a limit order near the current market price when you go to place your order.
- **Short Availability:** At Interactive Brokers, 150,000 shares are available or a 6.2% annualized fee. Most other brokers do not have shares; if yours doesn't, follow one of the alternative trades below. If *Pro* is unable to short shares when we go to make our trade at least 24 hours from now, we'll follow an alternative trade.
- **Scorecard Status:** Short 0.1% (now increasing that to 1.5%)

What We're Thinking

Here in *Pro,* we shorted more than $33,000 worth of FAZ in 2013, and it's worth about $3,500 now, providing us an 89% return on the initial capital at risk. Of course, because this was a short, we never invested our own capital, so this is actually about a $30,000 paper gain achieved without having to touch our cash. The short position is only 0.1% of the portfolio now, and we still believe in the long-term thesis here, so we're bringing it back to 1.5%, where it started. (In fact, this is the second time we'll be returning it to that level.)

As a refresher, this bearish ETF is betting against the likes of **Goldman Sachs** (NYSE: GS), **Wells Fargo** (NYSE: WFC), and **MasterCard** (NYSE: MA). It's managed to provide 3 times (300%) the daily *inverse* results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. The companies mentioned above are three of the index's largest shorts. By *shorting* this ETF, we're effectively *three times long*, on a daily basis, these stocks *and* the entire U.S. large-cap financial sector shorted by this ETF. We expect financial leaders to prosper as interest rates increase and regulations lessen, so this position reflects that belief.

The Vehicle

The FAZ ETF holds nothing but "financial swaps" and cash equivalents that give it short exposure to the underlying index, and it charges a 1.05% management fee, which helps our short. The underlying Russell 1000 Financial Services Index is deceptively comprised of only a few hundred stocks; it's a subset index of the Russell 1000 itself. As of March 9, 2017, the index was concentrated in banks (31.6%), real estate investment trusts (16.5%), insurance (14.4%), and capital markets (14.2%). Top positions as of March 9 were:

Business	Percentage of Index
JP Morgan Chase (NYSE: JPM)	7%
Berkshire Hathaway (NYSE: BRK.B)	6.9%
Wells Fargo	5.6%
Bank of America (NYSE: BAC)	5.5%
Citigroup (NYSE: C)	3.6%
Visa (NYSE: V)	3.5%
MasterCard (NYSE: MA)	2.2%
Goldman Sachs	2%

As these financial giants rise in price, the ETF we're short declines by a greater magnitude. The effects of leverage times three, plus daily compounding, can help our short further on the way down, especially during periods of high volatility. For example, the ETF would be expected to lose about 31% if the underlying index went nowhere in a year, but did experience 25% annualized volatility. So, our short would benefit in a volatile period even if the underlying index ultimately is flat. But with these giants trading at an average of roughly 1.5 times book value, we expect the stocks to slowly gain ground over the coming years, helping our position.

We all know that the financial sector can experience sudden, large shocks, and because this ETF uses leverage and shares are hard to borrow, one of our risks is getting called out of the short on a spike in price. For example, should financial stocks fall 20%, this ETF could rise at least 60%, and our shares could be called away at a costly time. That's why we're keeping the position to a **small allocation, no more than 1.5%** -- and we advise that you do, too. If the short continues to work for us, we'll look to top it off again down the road. If we lose our short and want to maintain exposure, we'll move to one of the alternative trades below. If you can't short FAZ at all -- and that's perhaps a majority of you -- then consider the alternatives below.

Alternative Trades

Options:

- **Non-IRA (preferred):** If your broker doesn't have shares available to short, consider setting up a January 2019 synthetic short on FAZ. Sell to open January 2019 $20 calls, and buy to open an equal number of January 2019 $20 puts. (One downside to a synthetic short is that it moves the tax event to 2019 at the latest, while you can leave short shares in place longer -- though you do keep paying annual fees.)
  - **Price guidance:** Lately, this syn short can be set up for an estimated net debit of about $3 to $3.50 per share (estimated; it's hard to know for certain given large bid/ask spreads), resulting in a short start price of $16.50 to $17. At the midpoint, that's 7.8% below the ETF price, which nearly equals the fee you

would be charged for shorting for just one year. Set up one syn short for every 100 shares you want to short at a start value of around $1,675 – at 1.5%, that's approximately one syn short (one call and one put) for every $100,000 you manage. (See our guide to synthetic shorts for more on the strategy.)

- **IRA (less preferred):** You could simply "buy to open" January 2019 puts at a strike price and for a total cost that you're willing to risk. With strikes near-the-money, we expect you can earn a reasonable profit before expiration, although the puts are very expensive, so this is a "last resort" trade for a very small sum. In other words: **Do not** allocate 1.5% of your funds to this alternative -- just what you're willing to lose. Lately, you can buy to open January 2019 $15 puts for about $3 and change.

Stocks:

- **Bullish on Financials (preferred):** If you can't short this financial index, you could instead buy an additional 1.5% in *Pro* financial stocks, namely **FactSet Research Systems** (NYSE: FDS) or **Visa** (NYSE: V).
- ***Really* Bullish on Financials (less preferred):** We're changing our stance a bit here compared with the past, suggesting you can buy the **Direxion Daily Financial Bull 3x** (NYSEMKT: FAS) ETF in a 1.5% allocation, no more. In periods of lower volatility and generally rising prices, this ETF has provided excellent, sustained (to date) returns. In periods of extreme volatility and falling prices, it can drop severely, but you only risk your initial investment (unlike our short).

Pro Video Chat, March 2017

Published Mar 10, 2017 at 11:32AM

The *Pro* team will be holding a live video chat on this page at 1 p.m. Eastern on Thursday, March 30! We'll be using sli.do to communicate with members during the chat; click here for an overview of how that works. The specific chat code today is ProChatMarch -- that's ProChatMarch to get into the sli.do chat and ask questions. We recommend leaving sli.do open in another tab (or on a mobile device) so you can follow along with the video and the sli.do chat simultaneously. See you soon!

Transcript

Jeff Fischer: Greetings Motley Fool pro members, and welcome to the March 2017 Motley Fool pro chat. I am Jeff Fischer, joined at the table by JP Bennet.

JP Bennet: Thanks for having me.

Jeff Fischer: And we have Billy Kipperstock on Skype. Hey, Billy.

Kipperstock, B.: Hey, Jeff.

Jeff Fischer: Good to see both of you and good to see all of you here at our monthly chat. The video that you see streaming before you is one part of the chat. It's the part that you stick with if you want to watch us. Then click over to slido.com, S-L-I-D-O.com, and enter pro chat March to get you into the question portion of this chat. Pro chat March. Then you can ask any question that you like and we will answer the questions generally in order of popularity.

This month, we have a bit of a twist. Ellen is away. She has strep throat, unfortunately. We wish her well. With Ellen away, we reconfigured the chat so that you can thumb up a question or if you really want to, you can thumb a question down. Just be kind about it. JP is going through and thumbing down questions already, trolling our members.

Kipperstock, B.: Come on JP.

JP Bennet: Just trying to have a little fun, liven up the chat a little bit.

Jeff Fischer: If you see a question you really don't like, you can politely thumb it down if you want. We'll see how kind you all are.

That's pro chat March, and the questions are starting to build right now. That's what we're going to spend most of the hour doing, answering your questions. Before we get to that, I'll just run through a little bit of where the pro portfolio is at. Now, just about one quarter through the year already. The portfolio is up 5.3% gear to date, as of this morning, as of about an hour ago. That improves a bit upon our 13% annualized return since its inception so far. We're right in line with the market, generally speaking the SMP. We're above our Norstar. We're about 72% net long, so we're happy with these results. Especially, we've had some drags.

Amtrust has been the largest drag on the portfolio down 33% this year as it's restating results, and we'll have more on that soon. It was one of our top five positions. Now Amtrust is number 12 at 3.4%, still a sizeable position. Winners though, offsetting that and putting us well into the green this year have been Facebook, American Tower, Oracle, Apple. A lot of buy first stocks in there have propelled us higher.

Facebook and Apple, JP, how much do you think they're up this year, here to date?

JP Bennet: Putting me on the spot. I have no clue.

Jeff Fischer: I knew you had no clue, so that's why, just take a wild guess.

JP Bennet: Gosh.

Jeff Fischer: Two giant companies. It's only been three months.

JP Bennet: Yeah, I know. Apple is up pretty good, what was it around 110 not too long ago, right?

Jeff Fischer: Yeah, and now it's 142.

JP Bennet: Something like that. Facebook, that's your stock. I don't follow Facebook. I have no clue.

Kipperstock, B.: I would guess 20%.

Jeff Fischer: That's right, Billy. They're both up 24% year-to-date. Now Billy said-

JP Bennet: Efficient markets.

Jeff Fischer: That's right. Whatever Billy says, that's what they do. So we just have to-

JP Bennet: All right, Billy how are we going to finish the year?

Kipperstock, B.: Don't ask me. I don't know. I have no idea.

Jeff Fischer: Even these giants are up 24%. Oracle is up 16%. We have mostly winners in the portfolio so far this year, as you would hope with the market rising as it has. Our buys from last six months are namely Paycom, Verisign, Amazon, Johnson & Johnson. They're all in the green. Paycom is up 33%.

Kipperstock, B.: Take a bow.

Jeff Fischer: Take a bow. It's too early to say it. Especially with a stock like that, but good start. Our shorts in the last few months: GoPro, Shake Shack, and Gogo are collectively about even. Perhaps, we even have a small gain. That's great. That's despite small caps being up more than 20% since the election. Our shorts have not really heard us to any degree and maybe even helped us a bit. I didn't do all the exact math. We can be happy with that too, so far. That's why we're looking for more shorts. As always, looking for more longs and will probably have some trades very soon for you. In fact, I'm sure we will. You guys have anything to say as we kickoff the question part of the chat before we do so?

JP Bennet: I'm ready to jump straight into the question-

Jeff Fischer: You guys feeling good.

Kipperstock, B.: Let's jump in.

Jeff Fischer: The questions are piling up, so here we go. Initially we'll just go through the top questions and then later we'll just each choose a question and go around the table as before. [Lon 00:04:33] is asking, "Pro fools, could you please elaborate," on our feelings about J&J, Medtronic, Gilead Sciences in the wake of last week's, not even a week ago, failed healthcare legislation. Thank you, Lon. Thank you, Lon. Good question. Who wants jump in first.

Kipperstock, B.: I'll take that one, I guess, or I'll start it off and then maybe you could finish up a little bit, Jeff.

Jeff Fischer: Sure.

Kipperstock, B.: We talked about this one right before we started the chat. We mentioned how it really doesn't change our feelings about our healthcare stocks all too much. We own these companies. We have exposure to these companies and all of our long stocks, really, with a long-term perspective in mind. The political environment is going to change all the time. Sometimes it can change really drastically. Donald Trump has mentioned and his administration has mentioned some ideas for legislation that could really significantly affect the value of stock. It's not to say that the political environment doesn't matter, it doesn't make a difference at all. It certainly can depending upon the legislation that's passed. In this case, I mean, we we didn't really put too much stock in the healthcare legislation that was going on. There were talks about some tariffs being introduced. Jeff can speak a little bit more to that. For me, specifically with Johnson & Johnson which is the company of those three that you mentioned that I cover. It hardly changes my perspective at all. It's a big, stable, gigantic company with lots of different revenue streams. We're looking to hold and own that company for 10, 15 years maybe more. Healthcare legislation doesn't play much of a role in how we feel about it moving forward.

Jeff Fischer: I agree, Billy. It's funny, the news last Friday actually made me think of some of our other companies even more than our healthcare stocks such as Valmont. What does this mean for an infrastructure, Bill, getting passed in a timely fashion? Are small caps like our short Shake Shack which would benefit from lower tax rates, but how [single 00:06:45] taxes actually go lower if they do. The failure to pass this bill, as we've all seen or read, calls the question how quickly and how efficiently this government will be able to pass bills period. I agree with Billy about this bill in particular not really changing ... Since nothing changed, nothing has changed.

The administration has talked about trying to get drug prices lower. They haven't laid out how they might do that other than having a competitive bidding process. Tariffs, Medtronic makes a lot of us devices overseas and brings them back in. If tariffs were to to be instilled on that sort of transaction, Medtronic may pay a price for it. It's hard to imagine that going through as well. I think enough people on capitol hill know that I would just hurt their constituents, because it just raises prices for everybody. Anyway, I think Billy summed it up well, and I'm just wasting time right now. It's a watch and see situation. It currently looks like, even today, there is more parson fighting with the president calling out the Freedom Caucus party. Insane, we have to fight them. They're of course 32 republicans. It may be a rough road to get things passed in a timely fashion, which amusingly the markets up on that. Generally the market likes when government stays out of business, generally speaking. Good question though.

Next question is from anonymous and no thumbs down, so we'll answer it. FactSet data systems, please comment. FactSet announced earnings two days ago. Their earnings per share were above estimates, not that we care about that so much. It is good sign. They're growing about 14% on the bottom line. Revenue was a bit light though, because they are seeing some smaller clients reduce their spending, namely by letting staff go. FactSet gets paid both by the client and then the number of seats at the client. Some of these companies pressured by the move to passive investing are letting more their analysts go. So that's fewer seats, means a lower payment to FactSet.

That said, they did pass through their normal price increase, their revenue, and their average subscription value are all growing mid-single digits. They foresee that continuing. They see a lot of opportunity ahead, looking very long-term. They believe their market size opportunity is about 10X what it is right now just based on their current business. Overseas, they have a lot of growth. They see more online coming to them. Overall the picture is positive, but they're not happy with the rate of growth that they have and neither was Wall Street so they sold the stock down a bit. The shares trade right around long-term average value multiple, actually a little bit below it, of about 21 times expected earnings, 23 times free cash flow. For a business of this quality with such strong recurring revenue, which is still 95% recurring revenue, the shares look reasonable. It's still a buy first, as of right now. We may add to our small position which is only around 2%.

Said differently, we're not discouraged by this. It is a headwind. It's a headwind that may last for a bit, well an indefinite time and maybe several more quarters. FactSet is working on ways to get around it and grow nicely, anyway including acquisitions, including more cross-selling. Their hundred largest clients create a vast majority of their profits. They're focused on increasing sales to them, as well while still opening up new markets and new clients, as well. Yes, there are some headwinds and FactSet's shares declined as a result, but we're not concerned about the long-term thesis.

Let's move to something one of you can answer, JP. How about John's ... John just made a comment that you could comment on. He liked your writeup on Starbucks which was very good. How many weeks in the making was your Starbucks deep dive?

JP Bennet: Oh gosh. I don't know how many weeks I ended up spending on that one, but quite a few. My personal process is you build up a reservoir of knowledge for a company and then you periodically update it. Every once in a while you need to go back in and try and do another deep dive on the company just to make sure you don't miss anything, because you get into a process with your periodic updates. You're looking for certain things. You're glossing over other issues. So you just have to go back and make sure you're not missing anything and just refresh your knowledge base.

Kipperstock, B.: Question you're assumptions, basically.

JP Bennet: Yeah, pretty much, right? That's essentially what I was doing with Starbucks. There was a a lot of things to adjust or to look into and memos we trying keep them somewhat pithy, so I really couldn't even adjust of a small fraction of the things I ended up looking into. We're sticking with Starbucks for the time being.

Jeff Fischer: If you head to the Starbucks board on Pro, you'll see JP's answers to some of your questions.

JP Bennet: Slow and steady. I'm working through them.

Jeff Fischer: John has pointed out that Apple's Numbers, which is the equivalent to Microsoft Excel, so Apple's Numbers program supports option and stock prices now. Thanks John for that tip. It's good to know for members who are tracking their results themselves.

Billy, do want to talk about Gentex and the rest of 2017 or as far forward as you care to look?

Kipperstock, B.: Sure. It looks like Gentex should have a decent, solid continued steady year in 2017. In fact 2017 might even be better than 2016. I'm looking at the company's quarter four report. They have some guidance here. For context, in 2017, vehicle production, auto production which is one of the primary determinants of demand for Gentex in the United States was down 1%. In 2018, auto production is expected to rise by 2%. Gentex management and my experience from monitoring the company is that what they say is that their growth rate in unit shipments for their mirrors is generally at a rate of maybe 4% to 10% above market growth, above growth of auto production. In 2016, auto production declined in North America by 1%. In 2018, it's expected to rise by 2%. That's a 3% difference. If auto production forecasts are accurate, then Gentex should have a nice boost to expected growth. If they are able to penetrate their market further and capture further market share, they may be able to increase even more about that.

Not only in 2017, they mention they get their contracts far in advance from the automotive companies that they sell to. They are able to give even 2018 revenue guidance, two years into the future. They're expecting 2018 revenue to be approximately 6 to 10% above the 2017 revenue estimates. The company looks set to continue to grow. They have new products that they're continuing to introduce and gain adoption with such as the full display mirror which is a mirror. Its completely electronic and has a wider field of view. It's really actually pretty cool if you look it up. The videos for it are interesting. They also have another product, an integrated toll module for your driving through tolls. They have some technology built into a toll module that it may integrate across all of the different toll systems in the United States.

They continue to do what they do which is try to introduce new features and bring technology into the mirror and the car in an area that allows for increased functionality. As cars and as technology become more important in cars, Gentex looks like they should be doing pretty well. I feel good about owning that company right now.

Jeff Fischer: Thanks, Billy. Gentex is a buy at 3.3% allocation. In the time we've owned the shares, we're up 112%, so far. The stock yields about 1.7%, add that to the returns as well and then we've written options on Gentex quite a few times. I know Billy continues to watch that for future opportunities. Thank you for the question.

For those of us just joining us and watching this video you can go to slido.com, S-L-I-D-O.com and then enter Pro Chat March, if you want to ask any questions. We recommend you set that up in a separate tab, separate window that you can, if you want to keep the video open as well.

Another question. We have Pablo, hello Pablo, asking about Paycom. For those of us who wrote puts, should we go ahead and buy some shares at 57 or just keep writing 52 puts to get closer to the 52 strike price value? In catch-up trades, we have said, "You can write puts on Paycom." The past several weeks now, they pay pretty well. They were down in the low 50's. I believe it was 52, 50. You can do both. The stock is still a buy. You could buy some shares. We have a two point, let me make sure I get it right, 2.6% position. I realize it's pretty small still.

You can buy some shares and write puts for the rest or you just keep writing puts as long as they pay well. I's a fairly volatile stock. I expect next time the market turns south, Paycom will decline with it for a while at least. There should be other opportunities given the way the stock is priced. It's bound to see some volatility when the market does, but at least you're making money writing puts. If you want to buy some shares again, it's still a buy. It's really your choice. It depends on where your portfolio is and what you feel best doing. Good question. I think either way in the long run it will hopefully work out. We do hope you'll own shares for the long haul at some point.

Dave T is asking, "Are there any plans for wholesale rebalancing or are we pretty much stable with some upcoming modest changes in recommendations?" I'm happy to briefly comment that we generally don't wholesale rebalance. Our mission is more to find companies that will compound value over the long term, generally whatever the short-term brings our way. We're not a part bond, part stock portfolio that rebalances to make everything equal. We're just trying to find outstanding businesses that should grow in value over the years regardless. We like to let our winners run within reason. We are not leery of letting winners get too big. Facebook is now 7-some percent. We do have several recommendations in the works though. Actually, many that will come out to soon. April will be a busy month for us, I'm assuming. You'll see the changes that were making there. We're always thinking with the portfolio as a whole. One change often leads to another. That's how we're thinking as we are actually working right now. We have several positions that may be tweaked or changed in the near term, but it's always with the whole portfolio in mind and with our long-term strategy in mind not just to rebalance, so to say.

Kipperstock, B.: I think you pretty much hit the nail on the head. I mean there's not really much there, right? We like to let our letter winners run within reason. If something gets to big, I know in the past, we wrote cover calls on AmTrust to pair it down some. If an ideas isn't working out, we don't want to leg out of it, we want to get out of it. We don't really rebalance. It's checking individual positions, how our thesis is playing out and is the portfolio as a whole properly diversified by industry, sector, risk exposure. We let that determine the decisions that we ultimately make.

Jeff Fischer: JP, we can go to O'Reilly's now. Then we'll do AmTrust. An update, we've talked about O'Reilly's a lot as a team the past month. Do we want to keep owning it? It's done really well for us. It's one of our largest positions. Amazon has been in the market for quite a while, but is moving in much more seriously now and that's making headlines. We really look at it in that light. Our latest thoughts JP?

JP Bennet: I think that is the big thing to keep in mind here is you don't want to let your prior success jade you and lead you to ultimately just take a pass when this is a position that needs management, that needs to be sold if the threat is real enough. For the time being, we're sticking with this one as well. We need to watch a situation develop, though to be a little bit difficult the first couple of quarters because there are tax refunds, there are some weather issues that will make it hard to tease out the

Amazon impact. What we've seen so far as there is a couple different trends going on here. The first is, obviously, the increased complexity with cars makes it are more desirable for people who aren't very knowledgeable to speak with someone in person to get that face-to-face reassurance that this is the part you need, here's how you do it, we can help you if you if you need that help. That's something to.

What you see actually in the younger generations, as you get to the younger generations, those people actually becoming increasingly uncomfortable with their ability to make minor repairs on their own, right? They want that face-to-face interaction. You actually see, this is the opposite to most industries, is that younger generations actually prefer to go to shops to get their parts, right? Normally, we like to buy our clothes online. We want to buy or video games online. We want to buy everything online and have zero face-to-face interaction, right? In the case of auto parts, we actually want to go into the store and speak with someone. There are factors that are are benefiting O'Reilly. At the end the day, you have people who are going to be, "Price is a number one factor." Right now, surveys across the country basically show the number one deciding factor is, "I need that part right away and I need someone who is knowledgeable, who can help me."

There are people for who price is a more deciding factor, but by and large, they've already moved to online parts. If you look at something like RockAuto, they crush O'Reilly's pricing. They actually beat Amazon's pricing more often than not. If you wanted cheap parts, there are many places online where you can get really cheap parts. To date, that really hasn't had as much of an impact on O'Reilly's, you might think because the delta there. You can be looking at your 20, 30% for certain parts. There's a lot of savings that you can go and grab if you move online.

There is also the issue of RockAuto is not Amazon. There's a big difference, the name, the selection, all of the things that go into Amazon. We haven't really seen that compete with O'Reilly. We have to watch it, right? We don't want to jump the gun, because management has done an amazing job. If you look at O'Reilly versus the other players, I believe O'Reilly is by far and away the best situated to deal with this threat. Again, what is a more deciding factor, I need the part right away. O'Reilly's in stock rates are by far and away the best in the industry. Their distribution center is really, really, it's just amazing for the industry. There is room for these guys to keep going, to keep making the appropriate moves, and to live in an Amazon world, so to speak. We just need to watch that situation closely, I believe. The further through the year we go, I think we'll get a better read on that.

Again, we we don't want to be someone that as soon as Amazon even looks in an industry, we just kind of throw hands up in defeat and just sell any type of exposure we had. I think that will be a mistake to make, because if you look at there are plenty of companies ... You go back to Best Buy. Best Buy did, the stock did languish for a while but it's recovered. It's recovered quite a bit. You look at when Best Buy first started competing with Amazon, it's just a show room. There's no reason for Best Buy to exist. Here we are couple years later. Best Buy's kind of retooled and refocused. We can see that there is most certainly a place for them in the industry.

Jeff Fischer: Good answer, JP. The stock remains a buy. It's our third, really our fourth-largest when you count America Tower including our call options, at 4.8%. As JP just very clearly said we're watching it really closely, but we still believe in it right now. Let's see, a thing we talked about in our meetings, just so you guys know, is trying to preemptively get out. If we see issues on the horizon, our hope is to sell early. If it's a retailer we don't want to give it too much room to get into trouble rather than wait until the numbers are starting to be affected and then sell because by then probably be down a fair amount. None of that may even come to light. They may just keep growing. They're adding 200 stores this year, same-store sales up so far as usual.

JP Bennet: Just to go back on what I said to, just everybody is aware that there are going to be a number of factors at play for the upcoming one or two quarters. There is a risk and I know I've talked about in the past where the market overreacts to maybe some weakness because of those other factors, and just assumes, "This is Amazon. O'Reilly's is dead." It takes to take the stock out behind the woodshed. There is that risk. If you look at great stocks over the long run, maybe a stock moves down 10% on one day but it's up over 300% over a couple of years. You just have to be willing to stomach that. The upcoming quarters are going to be important, but it's going to be very hard to tease out the Amazon effect. That is essentially what we're watching for.

Jeff Fischer: Thank you, JP. Anonymous is asking, "AmTrust, should we buy more stock? I also have a September $20 put option open." I assume written puts. The answer is no on buying stock. We have the stock on hold. We own 3.4% right now which is plenty. We took away our fair value guidance because the last three years are being restated, financials are being restated. It's really hard to know, although we don't expect book value or the loss ratio or return on equity to be affected that much, given what management has said, we can't know for certain. We're not advising a buy of more shares. The stock is on hold. You'll probably hear more about AmTrust from us very soon. Mean while, we wait for the numbers to be restated, to be released which we don't have a timeline for that. We're thing about our current position and what to do while we are waiting. You'll probably hear from us soon about that. No, don't buy more shares. If you have puts open, you can keep those open for now and wait for our next guidance for you on that.

"Given JP's write-up on Starbucks, can we discuss some options that could be advantageous with Starbucks?" Okay, that's a good point. JP you were like, "We're sticking with Starbucks, great company, great execution so far but, you know, looks a little pricey." You're maybe not as certain that the growth management projecting is in the bag. It's a high hurdle. What could someone do possibly with options?

JP Bennet: I would say in full disclosure. In addition to owning shares, I have a running synthetic cover call on it. The issue that I've had with that over the months is just the call options don't always pay very well. It is very hard to even come close to that kind of 1% a month target that we want. You just assume that we start throwing pro member volume at those contracts. You're not even going to come close. I would be perfectly willing if the yield was good enough to close or wind down my position, do it for members. We pretty much all have the same stance that members interest before our own. If there is an option, idea we like that meets the criteria in terms of the ability for the options to hold up and members get good pricing with the volume we're going to throw at it then that comes first.

Maybe later, we can look to do a book though. For me, my personal process is normally I try to run any options position that somewhat or loosely mirrors a pro'er options position in expiration months the kind of off the options or pro cycle. There really is never any competing interest. That's kind of the biggest issue. It is a little bit frustrating in that, I think, for the time being that could be a a lucrative idea. Part of the reason I set up the synthetic cover call though was just because the leaps were very advantageous. It was during one of the, "Oh man, Starbucks, restaurants, everybody they're dead, you know. [Sell 00:28:44] the baby with the bathwater." You're able to set up the synthetic long for extremely, extremely cheap.

It is a little bit frustrating but at the same time you go and you step back and you look at it. It's like, "This is a stock that," and I've personally have to been ready for it for as long as I've been running my options position ... If they prove the doubters wrong, in one quarter this thing could just be off to the races again. We've seen it on multiple occasions with Starbucks. There there are times when the market doubts the company. If they execute, again this is a big if and it's like I said in the write-up, if they execute right, the stock is going to do tremendous over the next five years. Unless we end up in a situation where at the end of those five years, we're in a bear market and it's getting crushed with everything else.

There's definitely a cost benefit analysis. With pro, I don't think I would be comfortable even if the option's paid. I don't think I'd be comfortable with covering our entire position, because you run that risk and then you had a options position in Starbucks. You have that seller's remorse were you're just like, "Oh man, I made some income and now the stock is 25% higher than were my strick price is, really wish I didn't do that." I would hate for us to end up in that position with our long position and have to chase that. Because of the concerns I listed, we already have a pretty full allocation. What is it for Starbucks?

Kipperstock, B.: 3.3%.

JP Bennet: I don't know if I would be comfortable bumping it up to make our second highest position in order to add on another sleeve to enable us to use options, right?

Jeff Fischer: Mm-hmm (affirmative).

JP Bennet: You would really only want to do that if you're really confident underlying business. Although, I think they can achieve it. It's not a gimme and so because of that I am not too inclined to add extra exposure to Starbucks just a we can try and generate some income. I think there are more attractive ways to do it elsewhere while remaining more diversified.

Jeff Fischer: All right. The shares are 58. The fair value estimate we have is 52. If you lack shares, if you lack a 3.3% allocation, you can keep watching for put options that would get you by price closer to 52. As JP said that options don't pay that well but sometimes they pay close enough to 1% a month to make it worth doing. We've recommended them a few times in Motley Fool 1.

JP Bennet: The puts have held up a lot better than the call. It all depends on how the market is skewing the bet for Starbucks. When it's a little bit skeptical those puts tend to pay a little bit well like they did when I set up the synthetic long.

Jeff Fischer: Sounds good. We are 36 minutes in. We have 24 minutes to go. We're doing pretty well on questions here. Facebook is more than 7% of the portfolio. That's because of price appreciation. It's also because we let it be. Do you really recommend new members or those without Facebook invest 7% of the current price. The answer is yes. We make sure every week that we are comfortable with allocations that we have. We're in the fortunate position and have been for a couple years now, I believe it's been that long, of Facebook being our largest position or one of the largest and being one of our favorite companies, favorite opportunities I should say as well for quite a while now. The stock is grown. It's free cash flow. Its earning at such a rapid rate that the shares become less expensive on a multiple basis than it's ever been before even as the stock has gone up and up.

Yeah, I'm comfortable saying invest 7% of the current price in Facebook. If it were a smaller business or something that had not as strong and robust a financial growth as it's seen and such a high ceiling for opportunity ahead, as well and such solid management with such a well laid out three, five, and ten year roadmap drawing traffic, growing engagement among that traffic, still only commanding a small fraction of worldwide advertising dollars. All these things in Facebook's favor make us comfortable with this allocation that we have. That said, with brand-new members, we do say if you want to buy in halves or even thirds, do that. If you want to write some puts, if you can at 140, it's pretty expensive to try to target some shares lower, you can do that. Yes, we are comfortable with the 7% allocation. It's been one of my favorite ideas for at least a few years, JP.

JP Bennet: Mm-hmm (affirmative).

Jeff Fischer: That still remains true. I actually think some ... Well anyway, I won't say anything. Facebook, yes we're okay with it.

JP Bennet: Make of that what you want.

Jeff Fischer: Exactly. You have to be comfortable with it, ultimately. If 5% is your limit then just do 5%. In any case, if one of our positions is larger than what you want just, go up to your maximum comfort level. Really, it's about what you want. Thoughts on how long Gilead's way back will be or AmTrust's? Should we be thinking one year, three year, five years? I'm going to do a little curve ball on that really and and say that our portfolio is up despite these two stocks performance. That's what we're looking at. The portfolio as a whole we want to appreciate. We know we're always going to have some losers. In a lot of ways, we are glad to have some losers because history shows that laggards later become leaders and leaders later become laggards. If you have some of each in your portfolio, it can help smooth your volatility. We don't want everything soaring at once because that likely means everything will crash at once too. The portfolio is still up nicely despite these two losing positions. That's a win. That's success.

That said, we of course evaluate each stock and want to believe that it can recover and grow at a Norstar type of rate. How soon? That comes in the play too. Right now we need at least 10, 11% annualized returns to make the position a Norstar contestant. Gilead, how can it do that? It leans on acquisitions. It needs the Hepatitis C market to stabilize. Both of those are question marks. Gilead's on hold. It's a very cheap stock but the business may not grow for quite a long time. It may indeed lose to our Norstar. The good news is a position as become small enough that it's less meaningful now. We still are about it critically. We wrote covered calls on it just this week to make some we're targeting at least 10% income on it per year, plus it pays more than 3% now in dividends. We're looking to make our Norstar no matter what. If we don't believe that the stock can appreciate and we can't make returns other ways, we'll clear that money out for something we like better.

AmTrust, that could recover as soon as next week if they restate results that are positive and the stock jumps on that news. It could also be a few years, at least. That stock now yields more than 3% as well. The key there, before we give any answer though, is really seeing what they say in their restatement and then we'll have a better idea of how quickly the stock may recover, if we believe it's going to. If we don't believe that, then course we'll sell and make the money elsewhere is the hope.

Good questions. My most general answer, I want to say my best answer I hope, is to think of your portfolio as a whole and not just focus on these positions and when they'll get back. Hopefully your whole portfolio is up no matter what. These positions we still believe in because we still have them. When we no longer believe that they can make a return for us, we'll get rid of them.

Let's see, question. Top question right now is "For those who increase allocations by writing puts, what's the best route from there? No one can predict what'll happen but what's the best road to take now." They're just talking generally. Billy, you want to share thoughts on that?

Kipperstock, B.: Sure. The answer, what is the best route from here. The answer is nobody knows. It depends on what happens with the market. You can never predict in advance whether the market as a whole or whether the specific companies that you're targeting with these puts are going to appreciate in value or depreciate in value. If you knew that in advance, if you knew that the stock over the next five months is going to rise or over the next two years can arise by 10, 15, 20%, then you would want to just buy shares and not write puts. If you know that the stock is going to decrease, you would if you had a choice between writing puts and just buying shares, you would choose the write puts. If you knew that, you might even just wait and then buy shares once it hits. The point is you don't know. It's a trade off. Whenever you write a put, you're just trading off. If the stock continues to rise, then you're not going to get the upside aside from whatever income you receive from writing that put. On the flip side, if the stock retreats, then you're going to end up getting a better buy price on the shares then you would have if you had just bought shares to begin with.

You know this. You mentioned no one can predict what happens, but what is the best road to take now. There is no best road. You just have to understand the risks and the trade-offs of doing one versus the other and don't get too discouraged if the outcome that happens is not the one that you want. The market is ... It can go either way and in a lot of ways it's weighted in a way such that the outcomes go in a 50-50 chance. Hard to know. If you really want to get upside, just buy shares. If you prefer to be more conservative and you're worried that the stock market will decline then maybe write puts. Just be aware that the only way to know the right answer is to be in the future looking backwards. What you can't do.

Jeff Fischer: Well said Billy. If you're in between those two scenarios that Billy laid out, you might want to buy shares, you might want to write puts, if you can, buy some shares and write puts for the rest. That way you are happy either way.

What's the best way to guard against dividend poaching? Is there a way to automate tracking? I'll just say anytime you are writing calls against a stock or a diagonal call, look up and put into your calendar when that stock goes ex-dividend and put in an alert about a week ahead of that ex-dividend date. Men check to see if it's in the money and what the time value is versus the dividend payment. It really comes down to just being on top of the situation. That only happens if you know when the ex-dividend date is coming. Have a spreadsheet or somewhere to your calendar to remind you of these things. We also in the pro and option services, we track in our scrolling calendar ex-dividend dates are in there for all of our positions. You can look there as well.

Kipperstock, B.: I'm going to add something here. In my personal portfolio, I have tracking of the options that I use. There is a guy, just some some guy who did this on the internet himself, he has a up plug-in to Excel that you can look up option pricing. I run formulas for whatever options positions I have. I run this add-in and it's called SMF add-in. You can look it up and download it and put it into Excel. Any options positions I put it into a spreadsheet. I run the SMF add-in and get the current pricing. Then I run a formula to calculate the time value. Whenever you want to check it, you can run the SMF add-in and see how much time value do I have left. Then you can see, "Okay if we're getting below $.50 of time value, now I need to start thinking about it." Check that out. SMF add-in. You can look up option pricing with a formula in Excel.

Jeff Fischer: Great. Thanks Billy. We're at 15 minutes to go so we're going to go into the speed round and answer the rest of these as quickly as we can. I'll start with Pablo's. "Any benefit in doing a QQQ hedge at current prices if we already have the original one." This is really an allocation question. The reason we haven't issued a second one is that you would then have some 30% downside risk to the index itself if you'd enclose the first one. More likely as we're going to advise that it wasn't quite time it on the prices that I looked at, advise rolling up that QQQ hedge in the near future. We're also considering starting some other other hedges as well. I would sit tight for now and perhaps we'll have a rolling trade before too long for that one. I wouldn't set up a whole other put ratio spread unless you close the original one first, because you have to watch your exposure on the downside on those positions.

This I guess is for me as well. Sal, hey Sal, was asking, "If you lack a short of the euro, should you set up a direct short or synthetic short?" If you can short it directly, do that because it's easier. The fee is annualized so it's a very small fee to start. If you set up a synthetic short, you pay the whole fee upfront through your transaction costs, through your friction costs really. Then we might close a position. Indeed, we're waiting to see what happens in Europe, frankly on that one. It looks like U.S. interest rates are not going to go up rapidly enough to cause the dollar to rise that much more quickly against the euro. Now the last kind of pillar in that short thesis is if trouble escalates in Europe with the EU, with the Euro zone. If that happens, the euro could get much weaker. We're waiting to see how elections go there this spring for a start in France. If you wanted set up a direct short, if you can that's the way to do it because it's cheaper than the synthetic short right now in the short term.

Spy, we just talked about that. Let's see anymore ... We're talking about downside exposure there. We have 15% downside exposure to the index right now. We're carefully considering shorts and/or other hedges. You'll be the first to hear about it. I wouldn't just off the cuff add another big block of index downside exposure right now.

A Lulu we can skip because that's a Motley Fool options position. I'm sorry. Seven of you want to hear about it. Four of you don't. That's in Motley Fool options. Please go to Motley Fool options to the Lulu board. It's a Jim Gillies positions. The three of us are not even up to speed on it, but you can get help at Motley Fool options on that one. Sorry about that.

Valmont, I actually have a report written up on Valmont. It'll go out when the time seems right. We're happy to have it on hold. Most of us do own shares now so holding it is as good as owning it. It is owning it. Don't assume that just because it's on hold it'll go back to sell. You're right, it may go to back to buy or we could move to sell it. I'm happy to keep it on hold for now until we know better. As you can imagine we're watching a lot of things in Washington along with in the industries that Valmont operates in. If the company is at a cyclical low which is very hard to estimate, but if it is, we don't want to sell too early. If it isn't, if this last quarter was kind of a head-fake and if this administration is not likely to push through progressive, maybe the wrong word, bills for infrastructure, I know republicans don't want to use the word progressive, then maybe we'll have to sell because there may not be an infrastructure bill coming. Anyway we're watching to see and meanwhile the stock is reasonably priced and we're okay holding it. There too, we might have answered soon. Things seem to be changing every day.

A question about in pro options prices. Someone have thoughts on that?

JP Bennet: I would just say the general guidelines that we use is just patience. It's pretty much what we always preach, because it really is the only way you can go about making sure that you're getting appropriate compensated for the risk that you're taking on. We have the issue in options. We have the issue in pro where we put our prices. We try and set limit guidance for everybody but there are always going to be people who aren't willing to potentially miss out on getting into a position right away by sticking to that guidance. They try and undercut by a little bit and then you end up in a situation where, "Well this guy isn't, you know, following the guidelines so I'm not gonna either." Then someone sees those and they're like, "Well, if they're not, I'm not going to either." You just get a race to the bottom. That doesn't benefit the pro member base at large. We really want to discourage that because again when you're writing options, you're taking on a risk and you want to make sure you're properly compensated for that risk. It's like insurance companies. They need to make sure that when they're underwriting policies, they're getting appropriately compensated, otherwise they go bankrupt. It really isn't a good idea to just kind of try and just throw our guidance to the wayside to make sure that you get into a position right away.

Now we try and update pricing when possible. Sometimes trades just do run away from us. It's not always just because of the volume. It could be we write puts and then the next two days, the stock pops 5% outside of an earnings release or something like that. So the puts just aren't attractive anymore. You're going to miss out on some, but that shouldn't because you know that end of the day, your core portfolio is your long position. That missing a couple options positions shouldn't really you know prevent you from achieving your financial objectives. Remember, with pro we have to wait 24 hours before we make a trade. There are times where we get a fraction of the guidance that we issue and so we are hurt by that too. That hasn't prevented us from achieving the results that we've achieved over the past couple of years. That is something to keep in mind.

I think FactSet, that's a perfect example. There have been two occasions where we issued the buy, the stock did really good and then he got hit really hard, and it basically fell back to where we issued the buy. Then it did really good and here we are back to were up only 2 or 3%. You really never can tell. Investing is a process. It is a discipline were if you don't have a long-term outlook and you're not willing to stay disciplined, if you get you a little bit itchy finger to pull the trigger and to make trades all the time, you're not going to win out. There are countless studies that demonstrate that. As individual investors, I firmly believe time horizon being able to look out those years instead of those weeks or days is the number one advantage that we have. That's essentially my long-winded answer of just saying patience.

Jeff Fischer: With that long horizon, look to catch up trades every Monday in pro. You might be talking about options too and strategies you can start and options every Friday. Then in their alerts themselves, we try to offer flexible pricing guidance so that you can approach it even later and still target the yield that were seeking with our buys. If you're buying an option or a stock, typically that has a pretty long shelf life. He did say buying options. I'm pretty sure, like you thought JP, he's talking about selling to open options.

All right, we have about 10 minutes to go, actually seven. "How many pro members are there and what do we think about the market impact to pro recommendations?" There are as many members as are in this chat, plus many more. We can't tell you, it's private. I would tell you in a second but the fool doesn't want us to.

JP Bennet: The screen would go black as you start to say the number.

Jeff Fischer: I'd get pulled off stage and that's the last you'd see of me. How do we ... The market impact is very real as JP just said. We sold GlaxoSmithKline several years ago and moved that stock lower when we sold it. That's a giant companies. There is a market impact. We're aware of it. That's why we really emphasize to use limit orders and be patient. We will still go after smaller companies like Paycom or even smaller than that if we believe the opportunity is too good to pass up. We're just going to pay a penalty to get in and get out. We will and members often will too. Hopefully as a group, we all do very well anyway. That's the bottom line. Yeah, we do have a market impact.

JP Bennet: I would just also add it probably does hurt us a lot more in terms of options. There are ideas that we would love to have in the pro port in terms of like an options idea and we just can't do it, because we know we would throw too much volume of the strike prices and the pricing would just collapse. We essentially had to stop writing puts on Live Nation, because basically, we are able to get two or three rounds in were the pricing was really favorable for us. Then market makers were like, "Yeah, no more of that." We basically had the walkway from the name in terms of writing puts.

Jeff Fischer: I will say the pro membership number and options as well is study the past many years, because that's the level that it can be at. We execute most things pretty well. We're not growing that number. That stays steady.

Let's see, in the five minutes we left, let's answer as many of these as we can, especially because there some funny ones down there. So really quick answers.

Sources that we use and recommend. We all use S&P Capital IQ which is a pay for service that's really great. Historical data and charts and screens and analytics that you can set up. That's the main thing we use for information. SCC filings are the second thing I use the most which are public to everybody. If you guys want to chip in on sources you use, otherwise we'll keep moving on forward.

Kipperstock, B.: Morningstar. I like Morningstar. Also U.S Bureau of Economic Analysis and just really primary data sources rather than opinion articles from media.

JP Bennet: I'm a big industry guy so I like to go to where I can get industry data. If I'm looking at tech company, I want to get tech data on the industry in general. There are places where you can put that out or where you can find that because there are people who are incentivized to promote their industry and to put that data out. That is another one that I think not everybody ... It's out there, but not everybody thinks about it.

Jeff Fischer: All right. "The Wall Street Journal is saying we could be in for a long losing streak due to loss of confidence in Trump being able to deliver. What is your take?" The market's definitely gone up a lot since November and some of those gains, at least, could be given back if lower taxes, big infrastructure spending do not occur or do not occur in a timely fashion even. The underlying dynamics of the economy are improving still. Earnings were strong for the most part in quarter one and are growing. That's really what will drive the market foremost that and any surprise shock to the downside even more than the administration. It's something definitely that were watching closely. We're also watching macroeconomics. You see China possibly getting stronger, emerging markets looking at a bit better. You have all sorts of things to keep an eye on and to try to project where bottom line, where earnings are going because that's what will ultimately drive stocks.

"Can we anticipate a spy hedge?" Can't make any promises. We have a large QQQ hedge that we'll want you to roll up before we consider any other hedges is my belief, rather than open another one and double your exposure. Watch for that. Billy, do you have a quick answer on Gentex here?

Kipperstock, B.: I do. I'm not sure that there is a typical crash in auto production. We have seen crashes in auto production that occurred around the 2007, 2008 financial crisis. I wouldn't say that's typical. That seemed to be a little bit unusual. I will also say that Gentex is not just the U.S. market. They sell all over the world. I think the U.S. only accounts for about a third of their sales. We're more concerned about what happens all over the world and not just the U.S. No, I do not think it's the aftermarket. I think Gentex's entire business and selling to automotive companies will be generating most of the company's business.

Jeff Fischer: Great. Bank of Internet is the top question right now. We can't speak to that. We don't follow it any longer. I closed it from Motley Fool options a few years ago. You can get opinions on it thefool.com or in other fool services if you're a member there. We just don't have one.

Broadridge, it's still a buy at pro. You could buy some shares or write some puts that are fairly near the money to target a buy at a lower price.

Kipperstock, B.: It may even be a buy first.

Jeff Fischer: Yeah, I was just about to check that and see if I got that right.

Kipperstock, B.: I think it is.

Jeff Fischer: You're right. It's a buy first. It's been a buy first for a long time as well. With that endorsement, consider buying some shares or writing puts right near the money. Let's see. Let's see. Let's see.

Provide more specific for, this is a suggestion that we'll listen to and talk about off camera from [Moores 00:54:44] Time Sensitive Timing Pricing Guidance. Polaris is not in the pro portfolio. It's not in this universe so I think we'll pass on that one. We talked about the president a little bit.

Factset, we talked about at the top of the hour. The long-term thesis there is the same. The company's just seeing some headwinds even as it is growing.

GameStop is a Motley Fool options, Jim Gillies position. Please go to Motley Fool options and the GameStop board there, GME at Motley Fool options and post your question there. Sorry, but that's where it is.

Let's see. We talk about QQQ quite a bit. We'll cross that bridge with our hedges when we get there. If the market correction does happen, we'll have to see where the options prices are respectively on our long and short puts on that index. Anything else that you guys see that you want to answer in our last minutes?

JP Bennet: You could jump down to the GoGo question. I think that would probably be a pretty descent one to-

Jeff Fischer: And fully offer FactSet? Yeah, you can write put options around 160 right now on on FactSet.

GoGo, that's a ... A hold incurs short fees, that's true. But a hold is as good as being short, of course. Rather than view it as a "We don't know." It's a don't initiate the position if you're new to it. As long as were still holding it, we're happy to do so. GoGo has fallen from about 12 to below 11 lately on laptops being disallowed on certain flights from certain countries is, I think, what drove that lower. There's a possibility that that ruling could spread. Right now, we're happy to hold it. We're also looking for other shorts before we close some of our shorts as long as we still like the shorts that we have.

It's a hedge against the market falling as well. Meanwhile it hasn't treated us badly in a rising market all that much. I'm trying to read all these questions and that's about all the time we have for. "What happened to JP's hair?"

Kipperstock, B.: "What happened to JP's hair."

JP Bennet: I though we were going to skip that one?

Jeff Fischer: That's one we have to get to in last minute. We're actually overtime now. JP, you're hair looks great. Did you cut it?

JP Bennet: No, nothing different has happened. I actually need to go get it cut again.

Jeff Fischer: You have to take off the earphones and show us. Can you ruffle it up?

JP Bennet: I think we're okay. Let's keep it professional Jeff.

Jeff Fischer: All right. Billy, the desk. Do you rent that desk for your chats?

Kipperstock, B.: Yeah, this room is normally just completely empty and I rent these just for the chats and that tree behind me is fake.

Jeff Fischer: Excellent. All right. What's the ring? You just put that there to pretend that you exercise?

Kipperstock, B.: Yeah, that ring thing, it is for dips and for push-ups but I never use it.

Jeff Fischer: All right. Someone's asking about Verizon, a recent Motley Fool options covered call position that Billy wrote up. Buy a hundred shares and then write covered calls as quickly as possible. Ideally you would do a buy write order were you buy the stock and at the same time sell the covered calls. With Ellen out sick, we just keep this chat going to see.

JP Bennet: Nobody could tell us to stop.

Jeff Fischer: Anne is behind the glass like, "Hey, stop." Thank you and Henry for hosting the electronic portion of this chat, making it happen. Thank you Motley Fool pro members for being here and asking your questions. I hope we provided satisfactory answers to as many as we could. Thank you Billy, down in Florida.

Kipperstock, B.: You're welcome. Thank you. A pleasure to be here.

Jeff Fischer: Good to see you. Thank you. JP as always, great to see you.

JP Bennet: See you next time.

Jeff Fischer: Thank you fools. Fool on and we'll see you soon.

JP Bennet: Fool on.

Gentex Reflects on a Strong 2016

Published Mar 8, 2017 at 1:20PM

***Pro*'s Take: GNTX Q4- and FY-2016 Earnings**

Gentex (NASDAQ: GNTX)

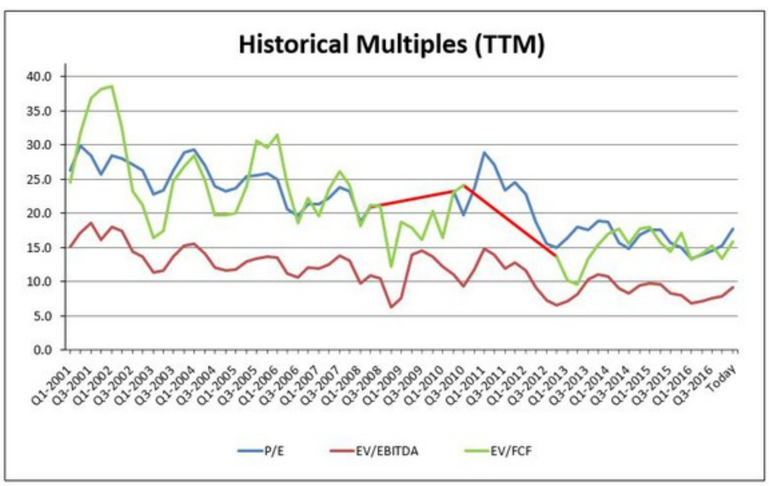
What Happened?

- Q4-2016 press release
- 2016 10-K

Guidance Update

After incorporating this quarter's results into my valuation model, **our Fair Value increases to $20 per share.** Since November 9th, the day after the U.S. presidential election, the stock is up more than 27%, as investor sentiment in the manufacturing sector has improved. Although Gentex is now trading near all-time high stock price levels (and above our FV estimate by about 7%), business performance is certainly strong enough to justify the newly higher stock price. **The stock remains a Buy on our scorecard**, and in the absence of a major global economic slowdown, the stock should be able to earn North Star-like returns from the current price.

At about 17.7 times trailing-12-month earnings and 9.2 times EV/EBITDA, given the recent stock price increase, the stock is now trading above the valuation levels we saw in late 2015 and throughout 2016. The stock is not as much of a bargain as it was during those periods, but the stock is still well within its historical valuation range and the business is as strong as ever. If you've yet to start a position or fill out your allocation in Gentex, you can feel comfortable doing so at current prices.



Note: Red lines represent omitted outlier multiples that correspond to recession-depressed earnings and free cash flow levels.

Additionally, since the last earnings update on Gentex, our December 2016 $17.50 written puts expired fully as income. We will patiently consider reinitiating our written put strategy, depending on whether we are able to achieve favorable pricing.

Updated Guidance: Buy (no change)

Recommended Allocation: 3.4%

Fair-Value Estimate: $20 (up from $19)

Current Price: $21.38

Our Thesis

Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1) Penetration: Unit growth vs. auto production. Over time, we want to see Gentex's auto-dimming mirrors to continue to gain market share. If the company is increasing units sold faster than auto production, it is moving in the right direction. In 2016, global interior mirror unit volumes grew at +10.6% year-over-year (vs. +10.8% in 2015). This compares to ~1% year-over-year growth in auto production in the company's primary markets, showing that Gentex continues to significantly outpace vehicle production growth and capture market share. Interior units sold in North America in 2016 decelerated slightly to +4.8% growth (from +5.4% in 2015) and international interior units sold in 2016 accelerated to +17% growth (up from +14% in 2015).

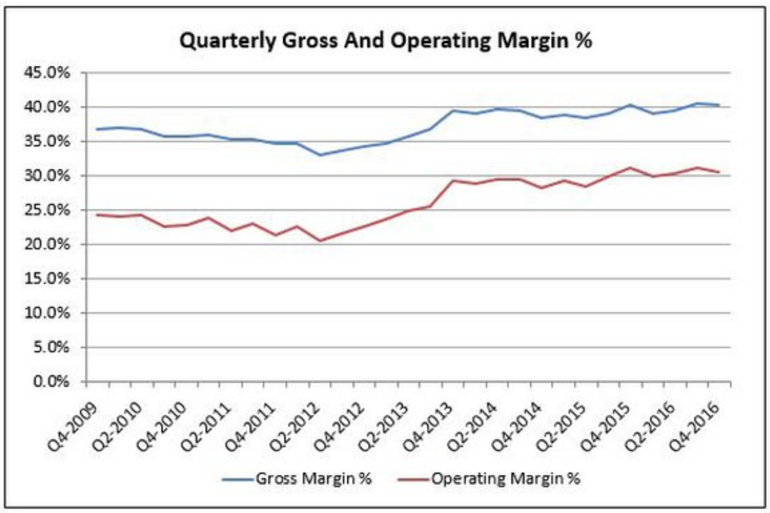
Exterior mirror unit shipments took a breather after a scorching 2015, with 2016 exterior unit volumes up +10% in North America (vs. +37% in 2015) and +6% internationally (vs. +14% in 2015). Due to lower exterior unit growth relative to interior unit growth, the exterior mirror attach rate declined to 38.7% (i.e. 38.7% of cars equipped with interior units also were equipped with exterior units), compared with 40.3% a year ago. Exterior unit growth going forward should be more moderate than 2015 levels, and we expect mid to high single-digit growth for exterior mirrors over the next few years.

2) Pricing and value: Unit growth vs. automotive segment sales. Powerful auto makers force annual price concessions on their suppliers, and Gentex isn't immune. Price reductions have recently been in the range of 2.5% to 3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices (ASPs) and gross margins.

In 2016, total units (interior + exterior mirrors) increased +9.4% and automotive segment sales were up +8.8%. This dynamic suggests lower ARPU (average revenue per unit) and is consistent with the expectation of annual price concessions.

3) Margin performance. In 2016, gross margin was 39.8%, up from 38.1% in 2015 as annual price reductions were more than offset by purchasing cost reductions and the positive impact of strong advanced feature product shipments. Management's gross margin guidance for 2017 is 39%-40%, which implies a slight decline in gross margin in 2017. I suspect that management is being conservative with their guidance and that margins may even expand in 2017 if unit shipments continue at current levels.

2016 operating margin performance was 30.5% (vs. 29.7% in 2015). Selling, general, and administrative (SG&A) and research and development (R&D) expenses came in within normal ranges and are consistent with recent trends. Given current trends in auto product and unit shipments, Gentex should be able to expand operating margins over time as revenue growth continues to outpace SG&A and R&D expense growth:



What We Think Now

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

If you have questions, drive on over to the Gentex discussion board.

Touching Base on 9 Pro Names

Published Mar 6, 2017 at 3:59PM

Dear *Pro* Fools,

Over these past many weeks, my desk at home has been covered in printouts of a few dozen conference calls, SEC filings, and press releases -- and no computer. I find the best way to read calls and filings is offline, in print, taking notes along the way. The annual report is the biggest and most time-consuming of the documents, both for our companies and for us.

Last month, I reviewed five companies in one Memo; last week, JP went through four more. Today, I'll share our thinking on some positions that are challenging us (some of which are on hold). There's one caveat: The *Pro* team is meeting often right now to discuss positions and consider moves in the portfolio, so this is a work in progress. And of course, in a portfolio, one decision can affect others. With that out of the way, here's where we are.

AmTrust Financial Services (NASDAQ: AFSI) moves from Hold back to Buy today, with an allocation of 4.1%. If you don't own shares yet, you could start with half that position and plan to add the rest later this year. Or you could write put options at a $22.50 strike or lower. Don't over-allocate. I wrote about AmTrust last week in a productive exchange with members on its discussion board. The business is seeing higher costs via acquisitions, and in 2016 it hired a new auditor, KPMG, that found internal weaknesses in AmTrust's controls and reporting that its former auditor had missed. The weaknesses will be remediated this year. The market rightly fears such revelations, but I appreciate AmTrust's transparency and its steps to improve. The company's underwriting isn't in question, and its results won't change materially.

Now larger than ever, AmTrust needs to continue to hire more staff to get its controls and reporting to KPMG's standards. Predictably, class action lawsuits are surfacing to capitalize on the fallen stock, and AmTrust is vulnerable to these claims, but that doesn't derail our investment thesis. We'll need patience (and a dollop of extra trust), but I believe AmTrust is striving for excellence as it grows bigger, and long-term rewards should follow given a long history of value creation and growth. The stock yields 3% now.

Gilead Sciences (NASDAQ: GILD) remains on hold a bit longer, with our 2.3% position now yielding 2.9%. We've talked about Gilead in all of our live events over the past quarter. It's an interesting situation: Outstanding business and management, strong free cash flow, a core "legacy" business focused on HIV, and a giant new Hepatitis C cure that ballooned revenue but is now tapering down. Barring a large acquisition, Gilead's earnings may not increase again for several years. The stock trades at about 8.5 times the average earnings estimate for this year. So, you have a top name in biotech at a depressed price. This sort of situation usually resolves itself when the share price resolves to a more reasonable valuation. But when will that happen here? It's possible Gilead's earnings will come close to bottoming out this year. If so, the stock could, too, after which we'd see those better returns. It's impossible to predict the Hep C market with confidence in the coming years, so we're working on making a decision based on probability and optionality (do we like other ideas better?).

We put our 0.5% short position on **GoGo** (NASDAQ: GOGO) on hold last week after the company's quarterly loss came paired with the announcement that management expects to be cash-flow positive in 2019 rather than 2020. The company's new 2Ku satellite Internet for airplanes is seeing rising demand. Gogo expects to add 2Ku to 450 to 550 aircraft in 2017, up from the 350 to 450 earlier projected. And it has agreements (which can be broken, but ...) to add 650 to 750 planes in 2018, also up by 100. Costs should come down in 2018, too, as investments in new technology slow. We went into the Gogo short with a short initial time frame (one to two quarters) knowing the company had a lot riding on 2Ku. It was going to be make or break, basically, given Gogo's expensive debt, growing competition, and lack of a plan B. That airlines are agreeing to adopt 2Ku is the first blow to our short thesis, and it may be enough to make us move on. The position is on hold as we consider our next step. The company still has $800 million in expensive debt and paid $82 million in interest expense last year, en route to losing $124 million.

O'Reilly Automotive (NASDAQ: ORLY) moved to Hold at our 4.8% allocation as we work to assess the long-term risk from the likes of **Amazon.com** (NASDAQ: AMZN). Management itself is surprised by investor concern on the matter, seeing little to no effect so far and arguing extensively in the conference call that their business is about relationships and real-time expertise. When something is wrong with your car, you often don't even know the part you need. You need someone to talk to, someone to test your car (which O'Reilly does), and someone to tell you the parts you need. And then you want the part at that moment. Currently, management doesn't believe their business model is at risk, but we want more comfort. We're seeking more research on how -- and whether -- shoppers are evolving when it comes to buying auto parts. Meanwhile, the business continues to grow, with about 190 more stores planned this year, and margins are ticking higher. The stock is priced at about 21 times 2017 earnings estimates, as low as it has been in years. We're content to hold while we assess.

Powershares QQQ Trust (NASDAQ: QQQ): This is just an update that we hope to correct our put ratio spread to January 2018 (from a mistakenly enacted 2019) soon -- the mechanics of the switch are taking time with the Fool -- and we'll tell you when we do and what strike prices we chose. Those already in the position can sit tight.

Shake Shack (NYSE: SHAK), which we're short 0.5%, is down 13% over the past week after results failed to inspire. Same-store sales growth of 1.6% (thanks to a 3% price increase offsetting a 1.4% traffic decline), with guidance for 2% to 3% this year, wasn't enough for a stock trading above 60 times earnings. With fewer than 100 company-owned domestic locations, the Shack has plenty of room to grow, and management does plan to add 22 or 23 owned stores this year, but shares still look dear. Plus, keeping traffic flowing in a highly competitive environment isn't easy. Add higher labor costs this year and next, and any other headwind to arise could make future results look stale. The biggest risk to our short right now -- as I see it -- is the chance for lower taxes. Shake Shack expects to pay a 40% to 41% effective tax rate this year. The company is well-managed, so if laws bring that down substantially, the stock could enjoy a run. As ever, the hope with our short is that the market reprices the stock to a more reasonable level, about $24. That would still represent 25.2 times expected earnings ... in 2020. If not that, we'd want to see same-store sales turn red, which would likely hit the stock hard. But with shorts, timing is important. We'll see if either happens for us. The stock is still a short, and we're in the green on it even though the market as a whole has soared since November.

SPDR S&P 500 (NYSEMKT: SPY): Many members have been asking if we'll set up more put ratio spreads on SPY. We may before long, and if we do, they'll be shorter-term in nature, expiring in just months as a hedge against downdrafts. Fewer people are seeking to travel to the U.S. so far this year, which could be the first step toward less money velocity and slower growth. Are fewer citizens looking to travel around the U.S., too? These are among several other uncertainties.

TD Ameritrade (NASDAQ: AMTD): We've moved the stock to Hold as we consider last week's news of lower commissions. TDA lowered the cost of a standard stock trade to $6.95 last week, down from $9.95, after competitors Schwab and Fidelity went even lower. TD Ameritrade makes about 40% of its revenue from commissions, so this is a serious change to analyze and get back to you about.

Valmont Industries (NYSE: VMI) is on hold while we consider results that were an improvement on last year's, but still leave the stock looking a bit expensive at 20 times earnings. The market is betting on a cyclical low, but we don't yet have confidence that irrigation and infrastructure spending is about to resume healthy growth for the long term. We're weighing the 2.2% we have in stock against other opportunities (including holding more cash). You'll hear from us once we decide.

A final reminder: We have two overarching goals. We don't want to lose money over any rolling three-year period, and we want to at least double our real purchasing power every 10 years. Those goals are captured in our North Star measure (inflation plus 7% a year), which guides our long-term decisions. Most hedges and shorts aside, we like to think in terms of rolling three-year terms. Ask any questions on the Memo Musings board. We aim to have some portfolio decisions for you soon. Fool on!

— Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: March 6, 2017

Published Mar 6, 2017 at 3:16PM

Pro Guidance Changes (from the past two weeks)

- **AmTrust Financial** (NASDAQ: AFSI): Moves back to Buy at a 4.1% position. See today's Memo for more!
- **Apple** (NASDAQ: AAPL): Fair-value estimate increases to $128. It remains a buy at a 4.4% allocation.
- **Domino's Pizza** (NYSE: DPZ): Our short moves to Hold as we assess results and our paired trade with Papa John's.
- **Gogo** (NASDAQ: GOGO): The short moves to Hold as we reconsider the position after stronger guidance. See today's Memo for more.
- **TD Ameritrade** (NASDAQ: AMTD): Moves to Hold as we consider the new, lower commission schedule it offers. Fair-value estimate decreases to $36.
- **Valmont** (NYSE: VMI): On hold as we assess results and valuation.
- **Verisign** (NASDAQ: VRSN): Fair-value estimate increases to $85. Our covered strangle is set to expire next month and we plan on continuing the strategy, prices willing.
- **Verisk** (NASDAQ: VRSK): Fair-value estimate increases to $83. It remains a buy at a 2.1% allocation.
- **Visa** (NYSE: V): Moves to Buy First (from Buy) at a 2.5% allocation.

Pro Completed Trades (from the past two weeks)

- **Johnson & Johnson** (NYSE: JNJ): As per our recent alert, we bought shares of the company at an average price of $121.75.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: March 6, 2017

Published Mar 6, 2017 at 3:02PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.6%.
- **Visa** (NYSE: V): Buy 2.5%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% (see our recommendation).
- **AmTrust Financial** (NASDAQ: AFSI): Buy up to 4.1% (or buy in halves over time, given today's volatility).
- **Johnson & Johnson** (NYSE: JNJ): Buy 3.1%.
- **Verisign** (NASDAQ: VRSN): Buy 1.5% (to strangle later).

Shorts:

- N/A

Pro options:

- **AmTrust Financial**: If you lack a 4.1% stake and want to build toward it but target a lower buy price, sell to open April 2017 $22.50 puts, lately for $0.95, or a 4.2% yield in 46 days. Be ready to buy shares, which trade near $22.50 today. Sell one put for every 100 shares you would buy.
- **FactSet Research Systems** (NYSE: FDS): April 2017 $170 puts lately pay $3, or 1.7%, in 46 days. Write one put for every $17,000 in stock you could buy. We have a 2.1% allocation.
- **Paycom Software** (NYSE: PAYC): Missed it so far? Consider selling to open May 2017 $52.50 puts, lately $2.25, for a 4.2% yield in 74 days. Write one put for every 100 shares you could buy at $5,250. We have a 2.6% allocation.

Hedges:

- N/A

Upcoming expirations (March 17):

- **Verisign**: Our $80/$85 covered strangle expires this month, currently with both legs on track to expire as full income. We'll look to continue the strategy with a new alert as this happens.

Papa John's Closes a Solid 2016; Domino's Short Moves to Hold

Published Mar 3, 2017 at 10:52AM

Pro's Take: PZZA Q4 and FY-2016 Earnings

Papa John's International (NASDAQ: PZZA)

....

Q4-2016

Total revenue growth: +5.5% (vs. -2% in Q4-2015)

Operating profit margin: 9.4% (vs. 9.7% in Q4-2015)

Adjusted EPS growth: +11.3% (vs. +19.2% in Q4-2015)

Domestic comparable store sales: +3.8% (vs. +1.9% in Q4-2015)

International comparable store sales: +5.6% (vs. +5.3% in Q4-2015)

FY-2016

Total revenue growth: +4.7% (vs. +2.5% in FY-2015)

Operating profit margin: 9% (vs. 8.3% in FY-2015)

Adjusted EPS growth: +22% (vs. +19.4% in FY-2015)

Net new restaurant unit growth: +204 (+4.2%, vs. +230 and 4.9% in FY-2015)

Domestic comparable store sales: +3.5% (vs. +4.2% in FY-2015)

International comparable store sales: +6% (vs. +6.9% in FY-2015)

....

Quarter Quick Take

Papa John's turned in a solid fiscal year in 2016. Papa John's delivered growth of 22% in non-GAAP earnings-per-share due to higher global restaurant sales growth (+5.2%), expanding operating margins (9% in FY-2016 vs. 8.3% in FY-2015) and continued share buybacks (the company reduced its diluted share count by 5.2% in 2016).

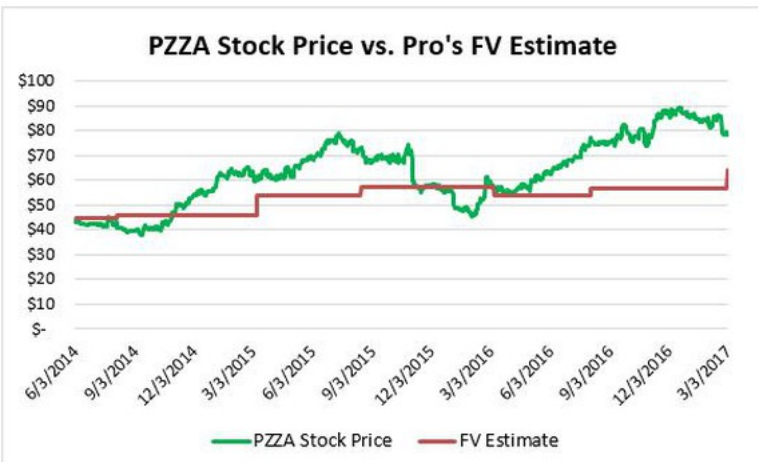
2016 was another example of the formula that Papa John's has successfully used to grow its earnings-per-share at a 5-year compound annual growth rate (CAGR) of +20% since the end of 2011:

	FY-2011	FY-2012	FY-2013	FY-2014	FY-2015	FY-2016
Net Revenue Growth	8.1%	10.2%	7.2%	11.1%	2.5%	4.7%
Global Restaurant Sales Growth*	7.7%	10.6%	6.2%	9.8%	5.3%	5.2%
Operating Margin %	7.1%	7.4%	7.4%	7.4%	8.3%	9.0%
Yearly Reduction in Share Count	4.3%	5.2%	7.1%	5.8%	6.2%	5.2%
EPS Growth**	12.2%	17.9%	18.8%	13.4%	19.4%	22.0%

*This metric includes both comparable store sales growth and net restaurant unit growth

**FY-2015 EPS growth is adjusted for legal settlement expenses and FY-2016 is adjusted for refranchising gains, impairment losses on assets held for sale, and legal settlement expenses.

After accounting for 2016 results and updating our valuation model, **we're raising our fair-value estimate to $64 per share (up from $57).** As I write this, the stock is trading around $78 per share, nearly 22% above our newly updated fair value estimate. However, Papa John's has often traded well above our fair value estimate over the life of the position, as business performance has consistently outperformed our (conservative) business assumptions. Since mid-2014, the average premium of Papa John's stock price to our fair value estimate has been 18%:



The current 22% premium to our newly updated fair value estimate is the narrowest gap since June 2016, suggesting the stock is now more reasonably priced than it has been over the past 9 months or so. **The stock remains a Buy**, but keep in mind that Papa John's is one of the more volatile stocks on the Pro scorecard. If you're comfortable with volatility, you can establish a full allocation to Papa John's today. The stock may continue to do well from current levels, but high expectations mean that the stock price can deflate quickly if performance disappoints. If you prefer to be more conservative, you can consider buying a half-position or writing puts to target a lower buy price.

Pro's current position is a 3.4% long stock allocation to Papa John's, combined with a 2.4% short position in competitor Domino's (NYSE: DPZ). We have also written June 2017 $140 covered puts on our Domino's short position for income and to potentially close our short at lower prices. **We are moving the Domino's short position (and the covered puts) to Hold today to reassess whether we want to maintain our paired long/short position.** You can expect a follow-up article (and/or alert, depending on our course of action) on Domino's sometime in the near future.

To be clear, those who have not established a Papa John's position can buy shares at a 3.4% allocation, and those who have not established a Domino's short position should **not** short shares of Domino's today, as the position is moving to Hold. If you are currently short shares of Domino's, leave that position alone until we have decided whether we want to keep the short/covered put position going or close it altogether.

Guidance: Buy (no change)

Recommended Allocation: 3.4%

Fair Value estimate: $64 (up from $57)

Current Price: $78

Our Thesis

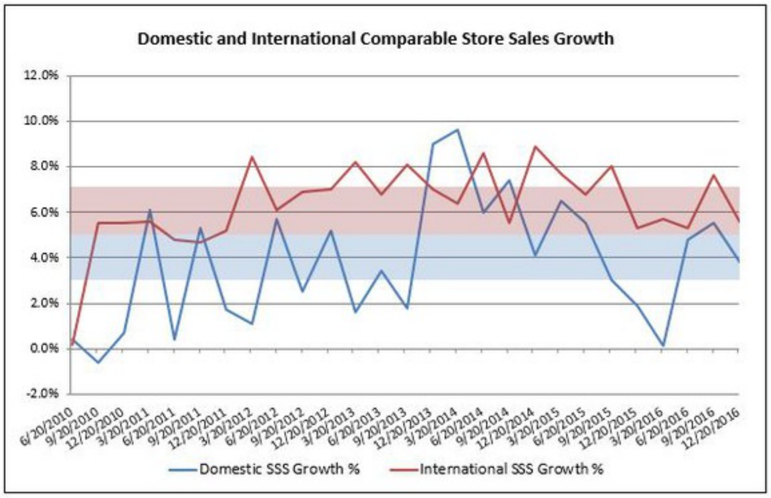
Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main quick service restaurant (QSR) pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only about 1,600 international restaurants the company has a long runway for growth (compare to Domino's which has over 8,400 international stores and Pizza Hut which has over 8,400 international stores). Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

1) Store Performance*:* During Q4-2016, systemwide restaurant sales increased +5.3% (+7% when excluding the impact of foreign currency). Domestic comps increased +3.8% while international comps increased +5.6%.

Domestic comps growth decelerated a bit this quarter as an "extremely aggressive" pricing environment has continued to challenged Papa John's "quality first" brand positioning. For a company that relies on a higher-quality brand message, aggressive pricing from competitors puts the company in a difficult position in terms of increasing comps. Nonetheless, for full year 2016, the company achieved +3.5% domestic comps growth, at the high end of the company's initial guidance of 2%-4% that was set out in Q4-2015. Management's guidance for 2017 is again for 2%-4% domestic comps growth, in line with last year's guidance.

As for international comps, the company continues to churn out mid-to-high single digit comps performance. At +5.6% for the quarter, this marks the 21st consecutive quarter of international comps above +5%:



**Shaded areas represent management's guidance ranges for full year 2016*

The company's measured expansion continued, adding 126 new restaurants (net) in the quarter and 204 for the full year -- of which 151 were international and 53 were in North America. The company now has over 1,600 international stores (up from 822 at the end of 2011, a 15% CAGR in units).

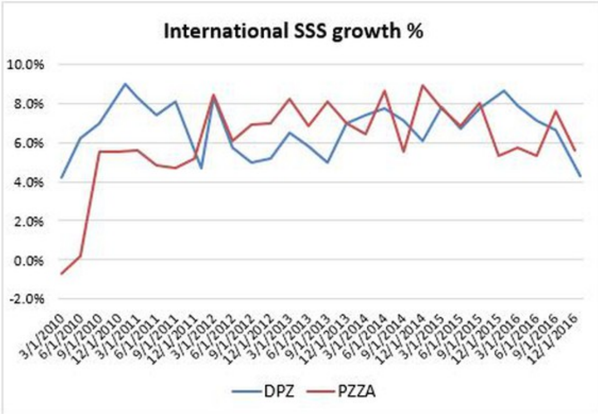
Management expects full year 2017 openings to come in at about 200-250 restaurants, with 75-80% of the net unit growth in international markets. 225 restaurant openings for 2017 would represent +4.4% growth versus the existing store count as of the end of 2016. The company's pipeline remains healthy, with 220 domestic restaurants and 1080 international restaurants, the majority of which are scheduled to be opened over the next six years.

2) Brand: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantages and higher price per pie. Based on recent data, the domestic pizza market grew about 3-4%. So Papa John's 2016 domestic comps of +3.8% suggest that the company maintained market share. On the other hand, Domino's posted 2016 domestic comps of +10.5%, suggesting that Domino's captured market share in 2016 relative to Papa John's.

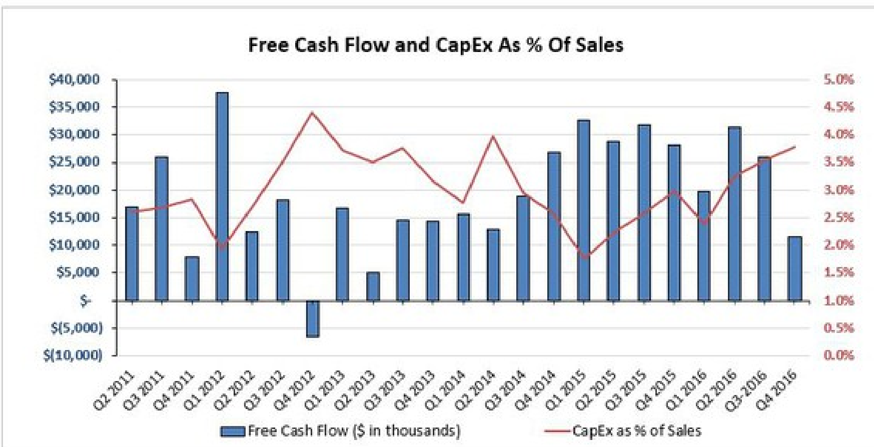
Over the past two years, Domino's has demonstrated excellent operational momentum. Domino's is much more willing to compete on price than Papa John's, which likely helped it earn share during the past two years of lower commodity prices and aggressive pricing. Comps have some cyclicality to them, and Domino's itself doesn't expect the double-digit comps to continue, mentioning that their long-term guidance is 3%-6% domestically, similar to Papa John's guidance range of 2%-4% (an example of how Papa John's tends to err on the conservative side).

But there's no denying that Domino's is on a roll domestically. Domino's is more aggressive strategically than Papa John's, which can lead to higher growth when the company executes well. But it also exposes the company to more potential operational missteps and volatility, which is something that Papa John's has largely avoided over the last several years:

The competition is much closer internationally, where most of future growth will occur. Both Papa John's and Domino's international comps performance suggest that the pizza concept and the two companies' technology advantages and expansion strategies are translating in the higher-growth overseas markets:



3) Margins: We expect Papa John's capital light business model to result in growing operating margins that propels free cash flow generation. In Fiscal 2013-2014, Papa John's dealt with depressed margins and free cash flow due to the roll-out of the company's proprietary POS system (FOCUS). In Fiscal 2015, the company enjoyed higher margins and free cash flow generation, as favorable changes in working capital (related to lower FOCUS inventory levels) and lower capital expenditures lifted free cash flow much higher. In 2016, capital expenditures increased by $16.6 million over 2015 levels due to construction costs for a new domestic commissary in Georgia (which will open in 2017), and investments in the company's online and mobile ordering business. In the graph below, note the inverse relationship between capital expenditures and free cash flow. When capital expenditures are elevated, free cash flow is depressed, and vice versa:



Free cash flow for Fiscal 2016 came in at $88.5 million, down -27% compared to Fiscal 2015 ($121.3 million). Last year, I noted that "free cash flow will likely decrease a bit in 2016 as the company paid the legal settlement in January (in Q1-2016), and the company expects a year of somewhat elevated capital spending (guidance is for $55-$60 million in capital expenditures, up from $39 million in 2015)".

That's exactly what we got this year with the legal settlement reducing free cash flow by $11.6 million, and capital expenditures coming in at $55.5 million for the year. Additionally, changes in working capital items added about $7.7 million to cash flow last year, and unfavorable changes in working capital detracted about $21.3 million from cash flow this year. If we adjust this year's free cash flow figure for the legal settlement payment, and normalize capital expenditures and working capital across 2015 and 2016, free cash flow would have increased this year by about 21%.

In Fiscal 2017, free cash flow should increase as margin expansion continues, capital expenditures slow a bit (2017 guidance is for $45-$55 million), and the ~$11.6 million legal settlement payment is lapped.

What We Think Now

Franchising is a good, capital-light business and we think the Papa John's brand is translating well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. As the Papa John's franchise system continues to add new units (mostly internationally, where about 75-80% of unit growth occurs), the high-margin franchise royalty revenue stream will grow, and Papa John's should continue to deliver improved financial performance.

Earnings From 4 Pro Holdings

Published Feb 27, 2017 at 3:56PM

Fellow Fools,

Pro's earning season is rapidly coming to a close, so today I'm going to piggyback on Jeff's recent Memo and provide you with updated thoughts on four additional *Pro* companies.

Apple (NASDAQ: AAPL)

It never ceases to amaze me how far sentiment can swing for the largest publicly traded U.S. company. "Apple is finally finished" talk was all the rage less than a year ago, but the company's solid first-quarter results and upcoming 10th anniversary iPhone "super-cycle" have it in Mr. Market's good graces once again.

iPhone unit sales returned to growth after a few consecutive quarters of decline, and by my estimate, Services revenue growth came in at more than 20% after adjusting for one-time items and an extra week in this quarter. I view services to be more of an extension of the iPhone than a separate business unit, and I still believe that combined, the two can grow in the high single digits for the foreseeable future. Management's goal of doubling revenue from services by 2020 seems very likely, and I believe this will boost Apple's already enviable margins even higher. And let's not forget that the company will likely be one of the biggest beneficiaries of any tax reform, given that 94% of its $246 billion in cash is currently located outside the United States. We're increasing our fair-value estimate up to $128.

Starbucks (NASDAQ: SBUX)

Of the four, the only stock not receiving a fair-value increase today is Starbucks. The company occupies what I would consider a precarious position at the intersection of the restaurant industry and brick-and-mortar retail. Multiple analysts have questioned whether we're currently in bubble territory with the former, while the latter is pretty widely acknowledged as an absolute mess. Starbucks may be the best of its breed (and it may not fit neatly into either category), but that doesn't mean it's immune to macro and industry headwinds. And it's having trouble meeting demand with the rapid adoption of Mobile Order and Pay, which is admittedly somewhat ironic given that management initially predicted an immediate *increase* in store productivity. That said, my concern here doesn't stem from these short-term bumps, although I do think they provide insight into some questions around our thesis as a whole. Instead, my ongoing deep dive into Starbucks has so far left me more cautious about the long term than in the past.

To derive a fair-value estimate for a restaurant chain, you need an educated opinion on the number of stores the company will ultimately be able to open, as well as the unit economics. With respect to the former, I don't believe Starbucks is close to market saturation. Starbucks caters to habitual purchases born out of convenience and consistency, which is why its drive-thru locations continue to see massive success (and why management touts the number of those drive-thru locations even though this contradicts the claim that Starbucks' success is based on its role as a "third place"). In fact, first-year unit economics for stores with a drive-thru dwarf typical results from those without.

However, I'm not entirely convinced that the company will be able to achieve its aggressive 2021 U.S. store-count target, something I believe the market is currently pricing into shares given their premium valuation. I also believe the market is extrapolating forward the improvement in store economics that we've seen over the past few years, and I'm actually quite skeptical about that. I'll be back before too long to report the final conclusions from my venti deep dive in another Memo.

Verisign (NASDAQ: VRSN)

Verisign is in the business of handling .com and .net domains on the Internet. Heading into the fourth quarter, the big question on most of its investors' minds was, what would happen to the large number of pending first-time renewals for those domains registered to Chinese speculators? Although the renewal rate for this cohort continues to lag the company's overall portfolio as well as first-year clients in general, the size of the decline (1.9 million) was around what most were expecting given management's prior commentary.

Although a sizable number of these domains remain up for renewal in the first quarter, so far .com has made meaningful strides in recouping last quarter's losses (I estimate that its base has grown by about 80 basis points), though the much smaller .net is still struggling somewhat. The company repurchased another 2 million shares in the fourth quarter to go along with the 5.7 million it had already retired in 2016. For those keeping track, the 7.8 million shares repurchased represent a 6% decrease in the share count in 2016. These are exactly the type of results we were looking for when we set up our covered strangle, and with our options expiring next month, we'll definitely be looking to keep the strategy going. We're slightly increasing our fair-value estimate, to $85.

Verisk (NASDAQ: VRSK)

Fourth-quarter results were a bit of a mixed bag for our data-analytics darling, Verisk. Its 2015 acquisition of WoodMac, which provides data services in the energy space, continues to hold up better than many have anticipated given the extended weakness in that market. And Verisk's financial-services offerings continue to deliver strong revenue growth. But the organic growth rate for Verisk's insurance products, its largest end market, continues to trend in the mid-single digits, thanks in large part to macro headwinds.

Over the past year, we've also seen the cadence of insurance-related acquisitions pick up, and although I think this is largely Verisk being opportunistic, I do believe it's driven in part by increased competition in the space. Although most of Verisk's big catalysts (e.g., WoodMac returning to 10%-plus revenue growth, meaningful contributions from new insurance products) won't materialize in the immediate future, we believe that investors who mirror management's long-term mindset will ultimately be pleased with the performance of the stock. Verisk also gets a slight valuation bump, this time to $83.

Enjoy your week, Fools!

-- JP (TMFYossarian)

Pro Guidance Changes and Completed Trades: Feb. 27, 2017

Published Feb 27, 2017 at 3:54PM

Pro Guidance Changes (from the past two weeks)

- **AmTrust** (NASDAQ: AFSI): Moves to Hold as we assess the company's recent earnings release.
- **Apple** (NASDAQ: AAPL): Fair-value estimate increases to $128. It remains a buy at a 4.4% allocation.
- **Valmont** (NYSE: VMI): Moves to Hold (from Buy) as Jeremy (TMFTank) leaves *Pro* and we reassess the company.
- **Verisign** (NASDAQ: VRSN): Fair-value estimate increases to $85. Our covered strangle is set to expire next month and we plan on continuing the strategy, prices willing.
- **Verisk** (NASDAQ: VRSK): Fair-value estimate increases to $83. It remains a buy at a 2.1% allocation.
- **Visa** (NYSE: V): Moves to Buy First (from Buy) at a 2.5% allocation.

Pro Completed Trades (from the past two weeks)

- **Johnson & Johnson** (NYSE: JNJ): As per our recent alert, we bought shares of the company at an average price of $121.75.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Feb. 27, 2017

Published Feb 27, 2017 at 3:31PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.5%.
- **Visa** (NYSE: V): Buy 2.5%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% (see our recommendation).
- **Apple** (NASDAQ: AAPL): Buy 4.3%.
- **Broadridge** (NYSE: BR): Buy 5.1%.
- **MasterCard** (NYSE: MA): Buy 4.7%
- **TD Ameritrade** (NASDAQ: AMTD): Buy 3.1%.

Shorts:

- **CurrencyShares Euro Trust** (NYSEMKT: FXE): Sell short 1.6%.

Pro options:

- If you want to attempt to buy any of our stocks lower, you can write (sell to open) near-the-money put options on shares of **Paycom** (NYSE: PAYC), among others. Choose puts that pay you enough to be happy. Realize all these stocks are rated Buy.
- Our **Verisign** (NASDAQ: VRSN) covered strangle is quickly headed toward expiration March 17, with both legs currently out of the money. We have every intention of continuing this strategy as long as pricing is favorable.

Hedges:

- No update this week.

Upcoming expirations:

- As noted above, our covered strangle on Verisign is set to expire March 17; we'll update you before that date.

Buy Johnson & Johnson

Published Feb 22, 2017 at 2:46PM

Is this for you? This recommendation is for all *Pro* members who don't already own shares in this company.

How You Participate

- **Action:** Invest 3% of your portfolio in **Johnson & Johnson** (NYSE: JNJ).
- **Price Guidance:** Use a limit order to buy at going prices, lately about $120 per share.
- **Recent Price:** $119.54
- **Guidance:** Buy
- **Fair-Value Estimate:** $118

The Business

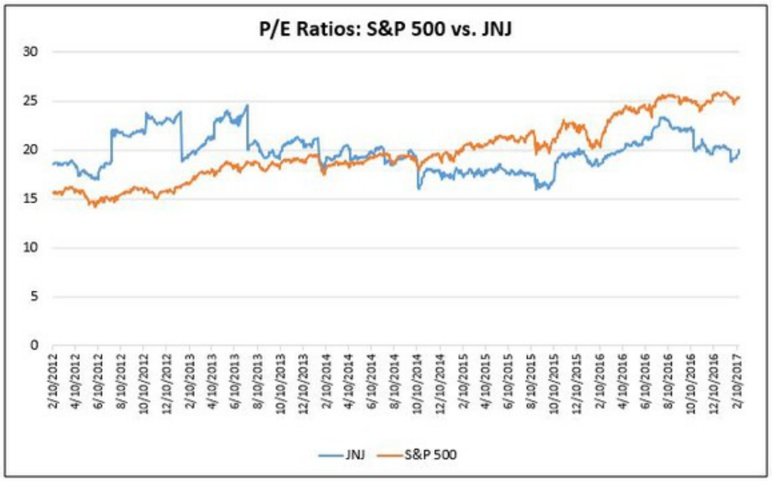
Incorporated in 1887, **Johnson & Johnson** (NYSE: JNJ) is an elder statesman on Wall Street -- especially compared with our other recent buy, **Amazon.com** (NASDAQ: AMZN). The eighth largest company in the U.S. by market cap, J&J is one of the world's leading health-care companies, conducting business in virtually every nation of the globe.

The business is organized as a holding company, with more than 250 operating companies that are separated into three business segments: consumer (19% of 2016 sales), pharmaceutical (46%), and medical devices (35%). The consumer segment sells dozens of familiar brands (think Band-Aid and Listerine). The pharmaceutical business is the company's largest; in fact, J&J is the world's sixth largest pharmaceutical company by annual sales. And the medical devices segment includes a broad range of products used in the orthopedic, surgery, cardiovascular, diabetes-care, and vision-care fields.

Financials and Valuation

For such a large company, J&J has an outstanding financial profile (which provides evidence for the company's competitive advantages). Free cash flow margins historically bounce around 20%, resulting in billions of dollars of free cash flow that management can then return to shareholders. The company paid $8.6 billion in dividends in 2016, and has repurchased about $7.5 billion worth of shares since initiating a $10 billion program for that purpose in the third quarter of 2015.

Over the past five years, J&J's earnings multiple has been roughly equivalent to that of the S&P 500, with five-year average P/E ratios of 19.82 vs. 19.80 respectively. However, recent appreciation of the S&P 500 has combined with heightened drug-price scrutiny on pharma companies to produce one of the largest P/E discrepancies between J&J and the S&P 500 we've seen over this time:



Source: S&P 500 Chart Builder, author's calculations

Our simplistic valuation of $118 per share assumes a 20% free cash flow margin and sales growth of about 5.5% annually over the next 10 years, which should be achievable thanks to the company's pricing power and heavy investment in R&D, plus demographic tailwinds that should fuel growing global health-care expenditures. Using another valuation methodology, our $118 fair value implies about 6.7% annual dividend growth in perpetuity.

Pro Quality Checklist

Here's how J&J scores against our *Pro* Quality Checklist criteria:

1. Sustainable Competitive Advantage

Yes. Johnson & Johnson has several sources of competitive advantage. First, the company has strong brand power (especially within the consumer segment), as evidenced by its ranking within the top 100 best global brands in 2016 (as rated by brand consultant Interbrand). Its large size and strong cash flows allow for heavy investment in marketing and research and development (R&D), continually reinforcing that brand power. Within the pharmaceutical segment, J&J has an intangible competitive advantage with respect to intellectual property, and its global sales and distribution network make it an excellent collaborative partner for smaller biotechnology firms looking to expand markets for drugs in development. And within the medical-device division, many of the company's tools and devices require specific training, meaning switching costs are high.

2. Pricing Power

Yes. Johnson & Johnson's brand power, leadership position across multiple product categories, and continuous product innovation (reinforced by the company's R&D efforts) support strong pricing power. Although that power varies across the company's diverse product portfolio, J&J has been able to use it to maintain strong (near 70%, and recently increasing) company-wide gross margins.

3. Dependent Customer Base

Yes. Johnson & Johnson has a dependent customer base across all three of its business divisions. Within the consumer division, it owns enduring brands that are Nos. 1 and 2 globally across 11 different product categories (including Tylenol, Neutrogena, Listerine, Motrin, Johnson's baby products, Band-Aid, Benadryl, and Aveeno). It produces several industry-leading drugs and, as mentioned, is the sixth largest pharmaceutical company in the world by annual sales. And as for medical devices, J&J owns the world leader in contact lenses (Acuvue) and is the global leader in surgery- and orthopedic-related hospital medical devices.

4. Predictable Revenue

Yes. Although sales of the company's individual products often fluctuate, J&J's revenue diversity and positioning in the growing health-care industry lead to consistent and predictable revenue growth. Since the end of 1993, JNJ has expanded its revenue at a compound annual growth rate of 7.3%. Additionally, because of the non-discretionary nature of its health-care products, the company's revenue is very stable during economic recessions. At the low point of the 2008-2009 economic recession, its worst currency-adjusted sales performance was -2.8% in the third quarter of 2009:

Source: http://www.investor.jnj.com/sales-earnings.cfm

5. Growing Free Cash Flow With Compounding Returns

Yes. Johnson & Johnson is a cash-generating machine, converting about 20% of every sales dollar into free cash flow (FCF). Over the past five years, the company has increased its FCF from $11.4 billion to $15.5 billion, which amounts to about 6.3% annual growth. The company uses this FCF to reinvest back into the business via R&D and marketing expenditures, and management has also spent about 30% of FCF over the past 20 years on acquisitions, which augment internal innovation and help the company maintain its steady revenue growth. The remainder is returned to shareholders via dividends and share repurchases.

6. Financial Resilience

Yes. Johnson & Johnson's large size, diverse revenue streams, strong free cash flow, and recession-proof nature lead to a rock-solid balance sheet. JNJ is one of only two companies (the other being Microsoft) to hold a coveted AAA credit rating from Standard & Poor's, a rating that is higher than even the U.S. government's. As evidence of its financial resilience, J&J is one of only 13 companies to have increased its dividend every year for the past 54 years.

7. Expanding Possibilities

Yes. Johnson & Johnson's R&D engine positions the company for expanding possibilities across all three of its businesses. Consumer-wise, management aims to expand by focusing on its iconic megabrands and by increasing its footprint in international markets; regarding pharmaceuticals, it has a robust pipeline, with 10 potential $1 billion products set for filing through 2019 and two of the top 20 most valuable R&D projects in the pharmaceutical industry as ranked by net present value. And as for medical devices, plans are to grow via internal innovation and by investing in areas where significant needs remain unmet.

8. The Three C's of Management (Clarity, Consistency, Capability)

Yes. Johnson & Johnson has an outstanding record of sound capital allocation and generating excess returns. Management does an excellent job communicating and executing on its strategies across its three business divisions, and CEO Alex Gorsky is very highly regarded, with a 97% approval rating on Glassdoor that places him as the 16th highest-rated CEO among large companies in the U.S. in 2016. J&J was also rated No. 26 among large companies in the Glassdoor "Best Places to Work" list for 2017, and the company's focus on sustainable business practices is reflected in its No. 8 ranking in the 2017 World's Most Sustainable Corporations list compiled by media company Corporate Knights, Inc.

The *Pro* Bottom Line

At eight out of eight of our *Pro* quality criteria, Johnson & Johnson is a quintessential *Pro*-quality stock, and we are excited to introduce the company into our portfolio -- especially as our exposure to health care has declined after we closed our entire position on Parexel. Johnson & Johnson qualifies as a top-notch business, and it is one we expect to hold for a long time. While its large size means we don't expect runaway growth and upside from J&J, we do expect to earn North Star-challenging returns with low downside risk from one of the safest stocks you are likely to find in the entire investment universe.

Alternative Trades

If you already own shares, keep your allocation right where you want it. If you don't own shares yet, we're starting with a 3% stake. We may use options on this stock in the future.

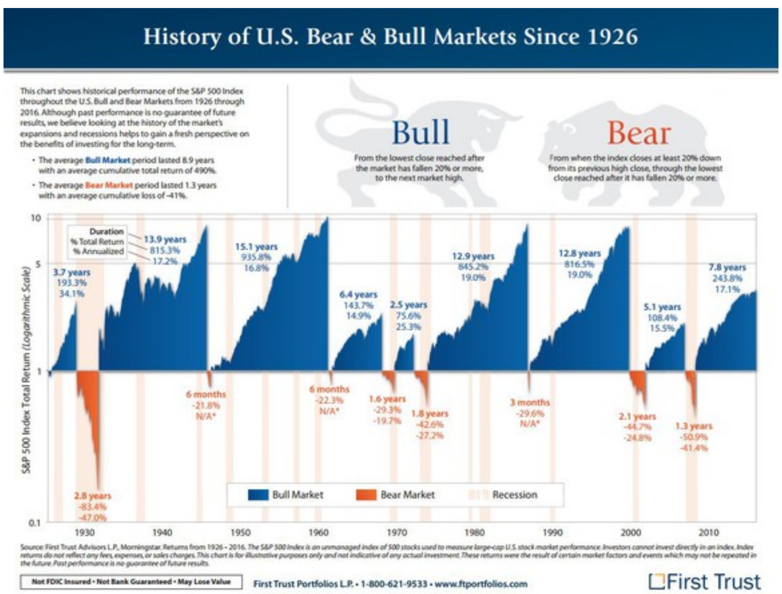
Charts of the Week: U.S. Bear and Bull Markets, Shifting Income Distributions, and More

Published Feb 21, 2017 at 3:20PM

Dear *Pro* Fools,

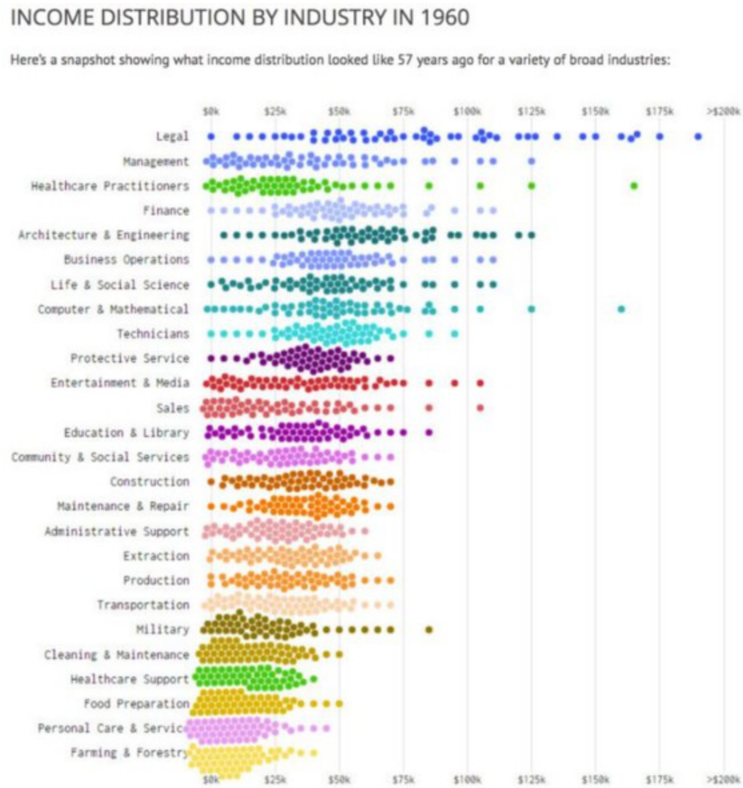
For today's Tuesday Memo (thanks to the President's Day holiday on Monday), I'll kick off our shortened week with another edition of my "Charts of the Week" series. Here are the five most interesting and/or market-relevant charts I found this week while perusing the financial/data blogs and websites I frequent:

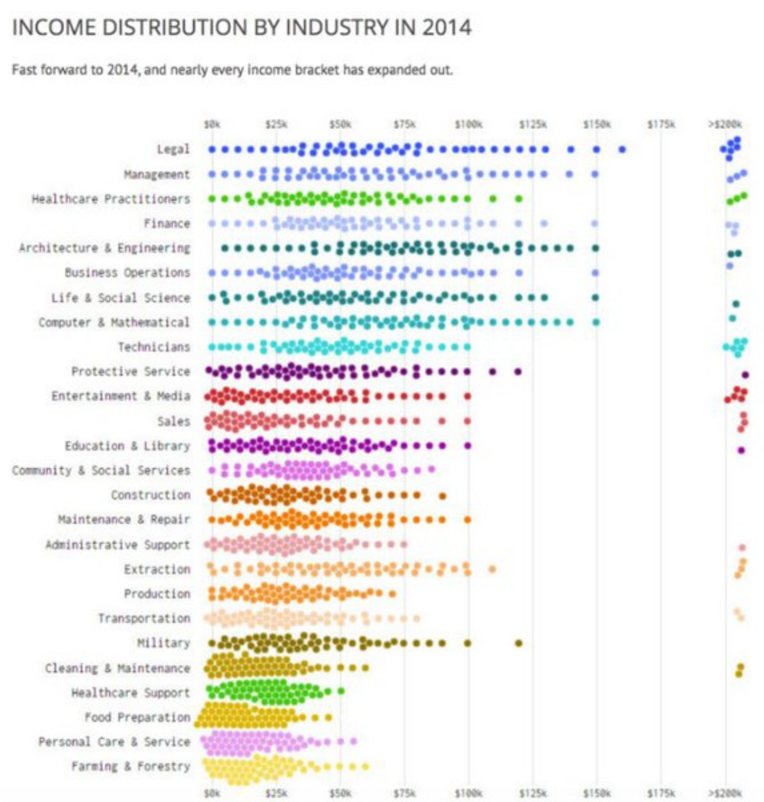
1. The History of U.S. Bear and Bull Markets Since 1926



This graphic from First Trust displays the historical performance of the S&P 500 Index, showing the length and return profiles for all of the different bull and bear markets since 1926.

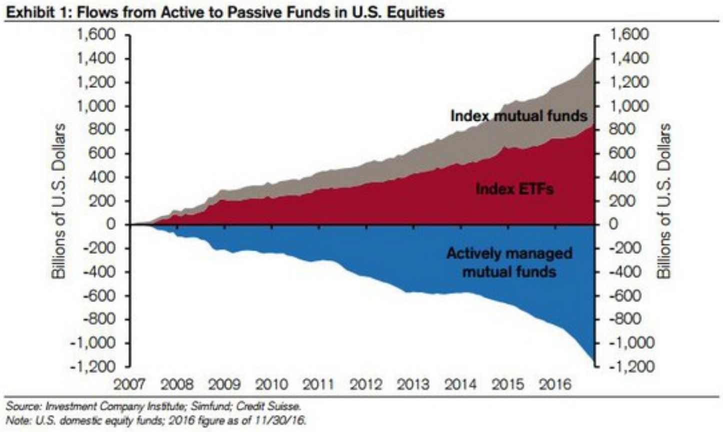
2. The Shifting Income Distribution of American Jobs





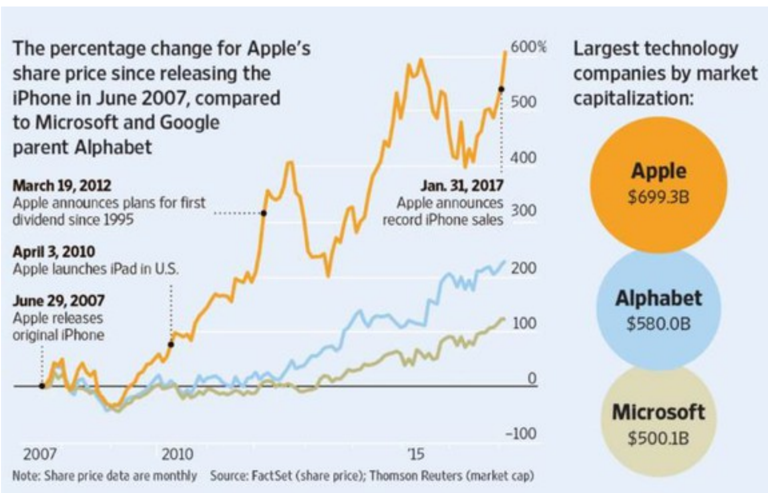
These two snapshot-in-time visualizations from Nathan Yau of FlowingData show the changing distribution of income for American jobs between 1960 and 2014, across various industries. We can see that income distributions have become more widely dispersed over time, and there are now more "super-earner" outliers on the far right end of the distributions. Click here for the full, interactive graphic showing four different time snapshots (1960, 1980, 2000, and 2014).

3. Flows from Active to Passive Funds in U.S. Equities



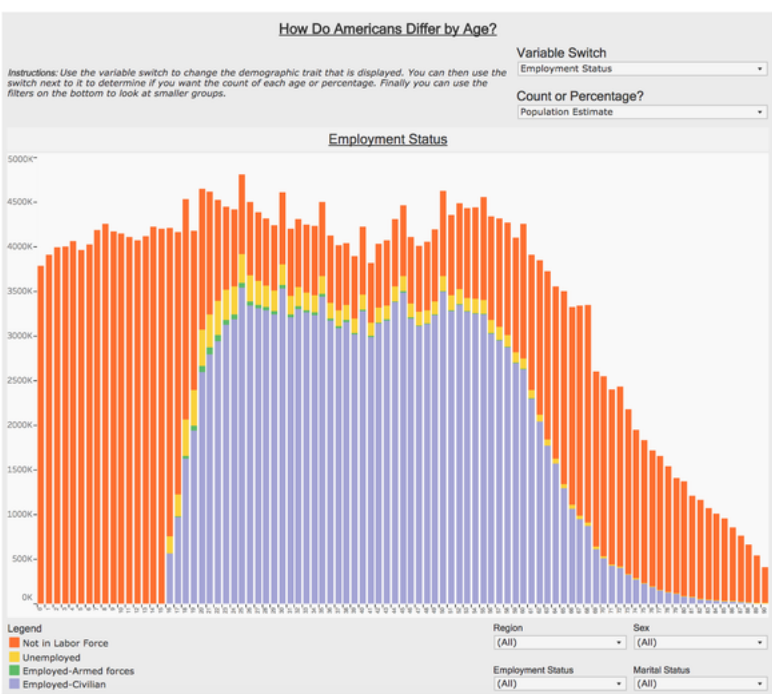
This chart from a January 2017 Michael Mauboussin research paper illustrates the ongoing (and seemingly accelerating) shift from active management to passive management. Since the end of 2006, investors have withdrawn nearly $1.2 trillion from actively managed U.S. equity mutual funds and have allocated roughly $1.4 trillion to U.S. equity index funds and exchange-traded funds (ETFs). Read the entire report [here](#).

4. Apple's New All-Time Highs



With Apple's share price now reaching all-time highs, this graphic from *The Wall Street Journal* (click [here](#) to access the full article if you have a *WSJ* subscription) shows the percentage change for Apple's share price since releasing the iPhone in June 2007, compared with Microsoft and Google parent Alphabet.

5. How Do Americans Differ By Age?



Click the image above for a customizable, interactive version. This graphic from Overflow Data shows age distributions for Americans across multiple demographic traits (such as sex, race, educational attainment, and more). By changing the variable in the "Variable Switch" drop-down menu in the upper right, you can see how that variable is applied to the population pyramid of the U.S. You can also adjust the pyramid in the bottom right to show only certain populations.

The *Pro* Bottom Line

There you have it, Fools -- this week's edition of my top five charts of the week. Hope you enjoyed it, and bring any questions or comments to the Memo Musings board!

Best,

-- Billy (TMFBillyTheKid)

Pro Video Chat, February 2017

Published Feb 21, 2017 at 3:01PM

The *Pro* team held a live video chat on this page at 2 p.m. Eastern on Monday, Feb. 27. A replay is available below this text, and a transcript is coming soon. Fool on!

Transcript

Jeff: Greetings fools and welcome to the Motley Fool February Chat. We are delighted that you have joined us. I am Jeff Fisher, advisor and I'm joined at the table by J.P. Bennett.

J.P: Thanks for having me, Jeff.

Jeff: Great to see you J.P., as always and we're joined through Skype by Billy Kipersztok. Hey Billy.

Billy: Hey, happy to be here.

Jeff: Happy to have you. The three of us, we would like to take a moment and thank Jeremy Myers, Team F Tank for his services. I was about to say services not her, his services to Motley Fool Pro for the last couple of years and to Hidden Gems for about eight years. Jeremy, if you hadn't heard from his memo, has left the Fool for another role. We are off to a rough start here. Had some dry air from the desert from Arizona, it made my skin all crackly.

We're here to take your questions. Remember to keep this window open so you can see the video portion of this live event if you want to. You may not want to see it. You can at least hear it, be sure to hear it and then go to, click to Slide O to get to the question portion of this chat. How am I looking J.P? Am I being murdered? Live TV, you have to love it. I'm about to give up the award to the wrong movie, just wait for that at the end of the show. Go to SlideO.com and login there. Hopefully, you have an account by now, but if you are new it just takes a minute to register and get in there. The keyword for this event is, J.P?

J.P: What is it?

Jeff: I think it's …

J.P: Pro Chat February.

Jeff: That's right. I couldn't remember either. That's why I do it threw it over to you, throw you under the bus.

Billy: Didn't you just tell me that J.P?

J.P: Maybe?

Jeff: Yeah, right before we started the camera we did all say it's Pro Chat February. Pro Chat February gets you in there. We're going to answer your questions. We're going to have a good time, a Foolish time. We recognize there's some red in the portfolio today. I actually wore a red sweater to account for that and I'm bleeding from the face to add to the drama. Hey, you have days like this in investing.

The bigger picture, the portfolios were up well on the year still so far and even today we're not getting hit much at all because Gogo our short, which is up some 16% today is a 0.5% holding. There's a reason for that and it's a small cap. It's going to be volatile.

Amtrust Financial is a small financial company, an insurance company mainly and it's going to be volatile and it always has been as well. It's been public about 10 years now and it's been volatile most of the time. That said, they did have some news in their earnings day that we'll talk about, naturally, and we'll give you our latest thoughts on both situations.

Before we jump into answer questions though, in case you are sitting there with your finger eagerly over your computer wondering if you are about to make a trade, we are not about to say whether you should make a trade. Amtrust moved to hold today, so we can review the news and give you our educated analysis and opinion. We are never knee-jerk here. We are never too quick to act. We want to act with confidence and full knowledge of the situation and then we will guide you, always with our long-term perspective.

That said, as long-term members know, if we don't believe in something anymore we will not hesitate to sell it, but we really have to reach that point honestly with research. Billy, J.P., anything to add before we start to the questions? How's the year looking so far?

J.P: So far so good, it's all about diversification, right? Like you said, when stocks move against us they hurt, but they don't really hurt us to the extent that they would if we made them 10%, 15%, 20% positions.

Jeff: Yeah, just wait until our biggest position does have a rough day like Facebook and then we'll talk about that. But as a whole, the portfolio as a whole is meant to work over the long term and our allocations mean something to that pursuit, so follow them to the full extent that you can. Amtrust today is the top question, notably so as it should be. Shares are down 16% last I looked.

J.P: Something like that.

Jeff: And for a lot of members who bought much later than us, they are down on their position so far. J.P., of the news that we know today, I know you and I have both looked over what we could in our short time that we had this morning, why don't we both just share our thoughts?

J.P: Yeah, my quick take on it is I didn't get a chance to go over the earnings call. I just skimmed the press release, right? Whenever you see a company having to go back and redo their financials from prior years, especially when you are dealing with an insurer where losses from past years can come up and really bite you in the butt so to speak and in certain cases it can make companies insolvent, it gets the market really spooked, right?

Basically, this will just get down to we don't know the size of the restatement. They said for most of it, it will be immaterial, right? It doesn't really change the thesis. There's always obviously the risk of that. It is like where there's smoke there's fire situation. This happens, then you have even more things start to show up. Also, coincides with when they are transitioning auditors, right? There's potentially a good way you can look at it or the bad way.

The first way is okay, these guys just came on board. They want to make sure they have everything perfect, so they are going to take the extra time. They are going to go back and look at the prior stuff and that's a good sign because we want companies in our portfolio that are honest and make sure that they have all of their filings in order.

You can look at it that way or you can look at it the super skeptical, cynic way and say, "Okay, this is, like I said, where there's smoke there's fire. This is just the tip of the iceberg. This is finally the whole thing is going to come unraveled." We want to be able to have time to look at everything and assess the situation like you said and not just have a knee-jerk reaction.

The stock has been volatile in the past. If you go back in the end of 2013, it went from around 20 to 15 in a couple of days and then what did it do? It went from 15, split adjusted to 35 before going back to where we are here. The stock has always been volatile because there is definitely that question surrounding the company because they do, do things a little bit different from your traditional insurer because they are a little bit smaller, a little bit more nimble and people don't necessarily like companies that do things differently and so it's been volatile.

They are also facing just some bigger picture, some industry headwinds right now where things aren't as favorable as they were say two, three years ago and so we just got to take the time to look back, make an honest assessment and not have emotions play a role in what we decide to do moving forward because it is in every position that we hold in the portfolio, it's not what it did in the past. It's what's it's going to do going forward? This happened. It really is unfortunate. It doesn't feel good, but the only thing we could do is to say from here forward what do we think the company can do and make our decision on whether to buy, hold or sell it based on that.

Jeff: Well said. I don't know that I can add much to what J.P. said, but I'll fill in a few of my thoughts as well. As J.P. mentioned, Amtrust decided to move to KPMG as their auditor last year after years with BDO. It was a choice they made in 2016 and KPMG is not yet done with the auditing process for the last year and that's why they have delayed there 10K filing, which will … They do expect to file it on or before March 16, so they expect to meet the extension deadline without a problem. That's just over two weeks away. I imagine if and when it gets filed on time and shows more data that may help the situation, add some clarity at least.

The other thing is in switching auditors and going through all their financials, they found they have some material weaknesses in their internal control structure over their financial reporting. Long-term members might recall we believe in Amtrust. We have owned it. We have recommended it, but all along we have also said it's a small company. In the world of insurance it's a little scrappy. We'd like to see greater controls on their finances. We'd like to see more clarity in some instances.

We have gone up and visited Amtrust in New York two or three times because it was one of our larger positions and it was one of the less transparent ones, hence we wanted to learn all we could by visiting. I'm glad to see that they are shoring up their internal controls on their financials on how they report it and how they reserve for losses and everything that an insurance company has to do. They have always been kind of shoestring in a way, just enough that we were obviously happy to own it and recommend it, but we always did want more and that we are getting that now can be read as a good sign. It is a good sign.

But the devil is in the details, so they are changing auditors to a more reputable firm, which is good. They are adding more staff in their finance department, more executives. They are adding more oversight. That's all good. They are restating some results from the past year or two actually, back to 2015, about $50 million in results. Because of the way they reported it, this is in relation to the warranty business, some of the revenue they took in they recognized right away and now under the new way that they are recognizing it, they recognized it over time as you should, as the warranty runs out … Or not as you should. There were two different ways to recognize it and they chose one way and now they are switching to this way, which is more conservative.

They are making these changes of their own accord and with their new auditor and that's a good thing. They are being transparent about it. That's a good thing. They are willing to take a hit on quarterly results, rather than try to snow us with some numbers. That's a very good thing. That's all the positive side.

The negative is the yes they are restating some results. Two, there are headwinds as J.P. said. In the business, their commercial auto business is facing big headwinds, but that's industry-wide and they are working to reprice and change to account for that. As a result their combined ratio wasn't as strong this time. Their loss ratio was a bit higher and so all these things combined, I'm surprised the stock isn't down more, frankly.

J.P: Don't jinx it, Jeff.

Jeff: We'll see. We will keep going through results and we did put it on hold just today, just now after the results because not because we are suddenly overly-concerned, but because we want to have a full view of the picture before we tell members what to do next. But right now that's where it stands, still happy to own it and until that changes or if that changes, you will know first.

J.P: Just to piggyback off that, there's a question further down the line where they asked whether the situation developed today, is it going to reduce our fair value estimate? To just double back on what we just said, we don't know yet. We have to take the time to go through their earnings call to go through the numbers and to use that to derive our fair value, so not going to sit here and say I know exactly what's going to happen and we have our fair value updated by the second. We're not. We're not sell side, so we don't basically try to have stuff out like ASAP. We want to make sure we take the time.

Jeff: That's true J.P. and thank you for that. J.P., by the way, I'm glad this is recorded so I look forward to going back to it and watching the first few minutes where you are laughing uncontrollably and my mouth is bleeding. I realize what happened. I sat down and then once we started I smiled and … I was just in Arizona over the weekend for a Motley Fool event, my face is dried out like a reptile, and it's maybe age, too, but keep quiet over there young man, and so my lip starts bleeding and I don't want to say that on film. I hope you can see it all right? I put my hand open and went wow. We're being hit all kinds of ways, Amtrust, Gogo, which we'll talk about.

J.P: It's a bit of a train wreck as we start and not the best way to start, but we recovered. I hope we recovered.

Jeff: Yeah, I think so. I think we are fine.

J.P: Made good progress.

Jeff: And I think the portfolios in the green this year nicely and we're going to keep working to manage it to maintain profits and set us on a good trajectory for the next three years. As always, we're looking three years ahead. Greg 145 is asking stocks and bonds are now moving in tandem. Should we add a new put ratio spread or maybe even some [shorts on spy 00:13:18] or the cubes?

Short answer is we are looking at new put ratios spreads on spy that may be short-term as we normally do once it expires in two to three months, while watching our downside exposure, because we obviously always have to watch that. We're looking at various ways to hedge in addition to just that 2018 hedge we're setting up. You should expect new things this quarter, especially once we get through earnings.

As long times members know, earnings, there's always about a five to six week period where we go through all our holdings. Once they all wrap up we can get a full picture, change any positions we might want to and also set up the portfolio exposure how we want to with hedges. Hopefully, the market will keep giving us a little more time for that. There's always that risk that no one knows when things will suddenly change. But good question, we are looking at more hedges.

Here we finally get to go to Billy. I was going to say J&J and Billy, but then I read it and it's not really a question for Billy, but members are asking with J&J now in the Pro Port, is it time to kiss Gilead goodbye? I don't know? Billy, if you have shots and I can share my thoughts, too.

Billy: Well, I think adding some healthcare exposure, it gives us a little bit more leeway to if we want to, reduce our exposure to a name that hasn't been performing up to our expectations. That's something we can now more strongly consider. We like Johnson & Johnson. I think it's a completely different type of company than Gilead. It's really diverse. It's not reliant upon one particular revenue stream, so just because they are in the healthcare industry, it doesn't necessarily mean they are exactly proportionate to each other in terms of the investment characteristics.

I think that depends. I think it's up really to Jeff to analyze Gilead, think about the characteristics of the investment moving forward. But I will say it may make a decision on Gilead perhaps a bit easier now that we have added a company in the healthcare sector.

Jeff: Yeah, I do feel that way Billy. It does help. It takes some of the pressure off of Gilead, but we still want it to perform. As I posted on that board last week I believe, I'm looking at possible options on it to try to get to at least our North Star and the stock now yields about 2.8%.

In a portfolio that's seeking more yield as we are, it may make sense to keep it as long as we believe that the damage is all but done and especially, if we can then possibly write options on it, strangles or covered calls or spreads maybe or an iron condor, who knows to try to target that minimum 10% annualized return, then we would keep it. As Jeff said a moment ago, we'll seek to answer that question very soon as we get through the earnings reports we have and take a full 100 foot view of the portfolio. We're not going to fly to high but 100 feet up. We'll look down at it.

Another one for me. It looks like Gogo earnings for today, does it change our rec? Should we stay short? Great question. As with Amtrust we almost always need more time. It's unusual that we have an answer right away, but the short story so far with Gogo today is the loss was less than expected and they updated and increased their guidance for this year as far as plane insulation. They are looking to install their services on I believe it's about 100 additional planes, 500-some verses 400-some previously estimated this year. That's good news for the company as well as long as each plane doesn't add to losses.

But so far I haven't been able to dig in and see why the loss is smaller and that's really probably what's going to drive our decision. As shared, it's a small position. That doesn't mean we don't take it seriously and we are down about 10% on it now, which in this market is outperforming, believe it or not, the small cap index, which is up with some 23% since November since we put the short on.

All of our shorts, Shake-Shack, Gogo, Go Pro that we started last fall right before the election, I'm actually very pleased with. The market, and these are all smaller companies, has as you have seen catapulted higher and our shorts have really not hurt us in that environment. But on a case-by-case basis we have to judge each one of them as I'm doing with Caesar's, too and Gogo.

We'll hopefully have some news within a week or so on where we stand, a week at the most on where we stand, whether we are going to keep it, close it, possibly add to it. Hopefully, I'll have enough information within a week to make that decision by next Monday's memo. So for now, we are sitting tight on that small short. Let's go to Billy and the second question here and then we'll answer at the top one later. How should we view the current Domino's Pizza short situation, even if we have written the covered puts?

Billy: The Domino's situation, what we are looking at right now is Papa John's just reported their Q4 and fiscal 2016 earnings I think it was yesterday if not the day before. We are going to go through those earnings. We are going to see what's going on with Papa John's. We haven't updated our fair value estimate for Papa John's since I believe August of last year, so it's been about six months. The company is due for a fair value update.

Now the stock after earnings did drop about 7% - 8%. It wasn't a bad report based on a cursory look the company did really well. They outperformed their guidance from the beginning of the year. Growth is steady. It's just not perhaps as much as the market was expecting. Part of the reason we put on the short is because the stock we felt was maybe a little bit overheated in terms of its valuation and we can see that with an earnings report where the company did pretty well, but the stock declined 7% - 8%, you can see the market's expectations are quite high.

Domino's also now reports tomorrow their earnings, so we are going to take a look at Domino's. We are going to see how the market reacts to their earnings. Expectations, again, for Domino's are quite high and reasonably so because the company has been firing on all cylinders.

The Domino's short is, it's a wash for us I think right now. It's risky for us to short a company that's executing so well in Domino's, so we are going to see if the company is able to keep up their momentum. Recently when they report earnings tomorrow, we are going to compare to Papa John's. We'll update our fair value estimate on Papa John's. We'll consider what's going on with our covered puts, which expire in June and we'll adjust our position as necessary. But right now it's not really harming us that Domino's short, I think you are pretty close to even on that trade overall, but we'll see what happens with Domino's tomorrow.

Jeff: All right, thank you Billy. I just put a poll out there for everybody because right before we started Billy said he really needs a haircut and we want to leave that up to you, answer this latest poll and Billy will do whatever you say, right Billy?

Billy: [Crosstalk 00:20:42].

Jeff: Dominoes Pizza earnings tomorrow, always excitement here. SVXY, is there no limit to the upside or should we take profits? Is there a future friction that buys is this to rise some in a steady market? The short answer is in a steady market there is impetus for that position to keep rising slowly and surely. The vix futures are in a state of contango typically and that eats away at the value of the index or the vix's index that this vehicle is short and so that increases the value of SVXY.

That said, when volatility spikes or even goes up, SVXY can lose value, can fall quite quickly. We could see quite a bit of our recent gain, I think we're up 90% or so, in a sudden shift in volatility, we could see half of our again, a good half of it get wiped away the quickly.

I'm comfortable with that view and this is a long-term position that I don't necessarily want to try to time the market and trade in and out of it. We are looking to set up, I think it is a long-term position now, so we have a long-term tax rate on it. I think if we were to look ahead at a typical three-years or so, the value of this vehicle is going to keep going up as it has since it came out, but there will be periods of volatility where we have to be ready to lose a lot of our recent gains. We have talked about in the past J.P. possibly adding when SVXY falls sharply, adding a small trading position on top of this position that we are holding pretty. Any other thoughts from you guys?

J.P: Yeah, mine is that if you can get short something like the VXX and just ride that slow and steady, that instrument to its slow and steady ultimate demise that's great, but because this … You go back a couple years. It really wasn't as much of a known commodity, just the way the futures contracts work and how the instruments that want to track the vix, so to speak. Just because of the nature of having these futures contracts instead of the vix itself, losing value over time as long as the market just muddles along and doesn't do too much. That's a very much a known story now. It's not always feasible or very attractive to short something that just can't directly mirror the decline.

The SVXY, like you said, is extremely volatile and because of that there is the opportunity. So if you go back to I think it was August 2015 where it was in the 90s and then a couple weeks later it was in the 50s or the 40s, right? So you can lose it really quickly, but because of how it is structured those are buying opportunities. It's essentially just like the market in large. Where the market gets hammered that's when it's normally a really good time to buy shares.

If you hold it, like you said, you have to have an extremely long-term mindset. I think to have the best outcomes you have to understand and be willing to use those big declines as opportunities to build your position and so you wouldn't want to just go all in right now and buy your full position. I think it would be best to buy this in thirds or something like that.

Jeff: Well said, I agree with that. Let's get to our … And one other thought I had is the way it's structured, my other hope is that it will over time each time hit higher highs and higher lows when it does rise and then contract. If we just ride that each time with this core position, until it gets so big that we want to trim it. It's less than 2% right now, then hopefully we'll keep seeing higher highs and higher lows until we decide to take some profits. But right now we are not thinking of that, at least not at the immediate moment. We have some other things we are thinking about. Are you looking at any additional REITs to add it to the Pro Portfolio? At the moment I'm not.

J.P: Interestingly enough, Jeremy was the REIT guy for the Motley Fool, him and one other analyst and now that he is gone there's definitely a lack of coverage in that space. I would say that I don't have a ton of familiarity. I'm looking into some of the commercial stuff, just helping out a fellow analyst and digging into that and getting a better lay of the land because I think a lot that you can tease from that industry has direct implications into other ones. Just because I don't have an intimate familiarity with it doesn't mean I'll never want to learn more about it. I am doing some work on it right now, but it is not something where it's like "Oh man, I feel like we need REIT exposure right now, so I need to find something in that space."

Jeff: Yeah and we have been looking at the housing sector in general. The demographics are improving there for house formation, household formation, but looking at a few non-REIT investments. REITs can be decent but also have different tax implications.

Billy: REITs are also very exposed to interest rates and the stock prices can change, pretty volatile depending upon how interest rates change. As interest rates are going up now, it's a period where REITs may be less desirable.

Jeff: The next question, what are pros and cons to setting up the, I assume it's the put ratio spread on the NASDAQ at 130, buying 123 puts, selling 109 puts for probably a breakeven or a small credit versus waiting for a decline and what strikes would currently apply?

I can't look up the strikes right now, if anybody wants to they could, but let me summarize where we stand. We asked the Motley Fool's finance department to answer our 2018 QQQ-Trade, accidentally 2019 was entered. The market kept rising. The way the 2019 options are priced, we are now on a $5000 or $6000 loss in the Pro Port, which is currently showing in our returns on this position alone.

To close it and get to 2018, the options that we want to, we are looking to get that money put back into the Pro Port from the Motley Fool itself because it's not a mistake we made. Our returns shouldn't be penalized by $6000. Once that is agreed to, and it shouldn't be a problem, but then we'll close the 2019 position presumably and open the 2018.

We would use strike prices that are relevant to today, which this looks pretty close, just eyeballing at the $123, $109 because remember when we set up the position in January, it was about 3% - 5% out of the money. The put that we were buying was about 3% - 5% below the current Q price, so this looks comparable to that. But that's what you want to try to mirror, look at the original trade alert and try to mirror those same percentage differences in the current price versus where we set up the spread. I realize that a lot of people are waiting for updated guidance on that and we will do that as soon as we can, as soon as we know what we can do.

Meantime, the good news is these are spreads that do not help you until expiration, in this case 2018, so it's not as if we are missing anything in the short term by not having it. I make regular, monthly contributions to my portfolio. That's excellent, Michael, great job. How best can I add these to my portfolio without disrupting Pro's recommended percentages for each stock? If you're following the Pro Port and you are adding money to your portfolio, how do you best do that each month?

J.P: I guess I can start. Overall, the goal is if you want to mirror Pro to the extent that you want to mirror it in your portfolio, you want to keep your allocations similar to what we have. Buy first obviously are the first ones and then you move down in buys and make sure you keep building them all.

It depends on obviously the transaction costs you have to incur. If you have a really low-cost platform where you can just buy a couple of shares and it doesn't really ding you all that much, then you have a greater luxury to spread it out with each iteration of you buying shares. But just basically over time to make sure you keep them in proportion to one another because there's obviously a rationale to why we have Facebook as 6.8% and why MasterCard's smaller at 4.7%. Apple is at 4.4%. There is a method to the madness so to speak when it comes to diversification. Just keep adding to them over time and keeping them in proportion to one another.

Jeff: Sounds good and keep in mind we add maybe six new names a year more or less on average, whether it's a direct stock or an option position. Having some cash on side for those could also be valuable. Now Bonds is asking with the rally in the stock market, at what point do diagonal calls become untenable to continue? Do you keep rolling the short call if it's very far in the money? Is there any max profit to target? Billy, do you want to share any thoughts on that?

Billy: Yeah, I think is dependent upon the individual situation. It depends how far the short call is in the money and it depends on the implied volatility of the underlying stock. Sometimes you have a stock that's got good volatility so that you can roll up and out and not pay too much of a credit to do so.

The main idea for rolling diagonal calls I think would be the return on the incremental capital invested. Ideally, if you can roll it up and not pay a debit at all and get paid a credit then that's great. But if you have to pay to roll it up, then what you want to do is you want to make sure you are getting an incremental return on that investment to roll the option up that's sufficient.

If you check in Options, over on our Options service, Jim Gillies has written a column about the incremental return on investment that he likes to target for rolling in the money options and I think specifically related to diagonal calls so that would be a good resource for you to use.

J.P: Yep and for those that are curious, I believe it's called "Don't Fall in Love" or something along those lines. Give me one second, I can actually … Yep, it is called "Don't Fall in Love." I have that one bookmarked in my note.

Jeff: Okay, from JSP Colorado. We appreciate your very kind words there that everybody can read and thank you. We take very seriously, of course, every day we know people are invested with us. In many cases it's your life savings that's invested in a Pro Portfolio, just like ours. So we look at our positions every week and make sure that's where we want our money and then a majority of my own funds are only in Pro stocks as well in much the same form as the Pro Portfolio itself.

Thank you, we appreciate it. We are here because of you and we are working for you and we'll keep doing our best to produce satisfying, if not really great hopefully returns over any meaningful time period. We will keep working to minimize mistakes, although of course, we'll always have some, thank you very much, we appreciate that a lot.

Bruce is down about 30% on Gilead. What is our current assessment and thought strategies for the near term? We talked about it a little bit with J&J that we should have a summary of where we stand on it within a short period of time and what we plan to do with it we'll share with you first, of course. Current thought though is it still a really strong business, great free cash flow. It's in no danger financially by any means as a going concern or a viable business that can merit its market cap today. It has nearly a 3% yield now. It trades at eight times expected earnings.

The problem is as you probably all know is that revenue isn't growing. It's actually declining because the Hepatitis C market took off really much faster than anyone thought and now it's cooling down faster than people thought and prices came down sharply.

How soon can the company grow revenue again is the big question and without a big acquisition, it may not happen until at least 2020, maybe later and that's going to keep the stock depressed. We're aware of that. We don't want to bank just on an acquisition prospect. Unless we think we can make the North Star return with it from this point forward, we'll try to find something better. But right now the hope is we can find a way using strategies to make at least 10% annualized and we also still have faith in management and in the business itself, even though we are not blind to the lack of growth right now and that unfortunate situation.

We'll keep sharing our thoughts as soon as we have done and just be aware that our whole portfolio, which thankfully is pretty focused, we're thinking of each position and we will update you as soon as any situation changes. Anonymous is asking, they purchased a shutter stock on the drop today. What recommendations do I have to use options? Please head to the Motley Fool Option Service and the Shutter Stock Board there. That's not a Pro position. It's a Motley Fool Options position put out by Jim Gillies and Billy as well. Head to that board in Motley Fool Options and you can get your question answered, just post your question.

All right, we have a question. It sounds we can all refund. Bill is asking with a less stable political environment, what is our strategy for the percentage of cash as a hedge? We, of course, all talk about that as a team. Every one of our team meetings starts with how's the portfolio look to you? How's our exposure look to you? What would you change?

Right now we are around 20% cash. That may be a bit lower with J&J, which I have to factor in. But right at high teens cash and that's about as low as I would feasibly want it in most cases. That said, we are looking at new investments so we may have to do some maneuvering, but do you guys have thoughts on the environment and the cash?

J.P: Do you want to start Billy or …?

Billy: Sure, I don't think that the political environment makes too much of a difference in terms of our strategy with our cash. We just want to maintain enough cash to be able to be flexible in downturns and initiate positions when market prices are depressed. We have seen, and this is data, this is not a political commentary, but just we have seen consumer confidence and business confidence has increased since the start of the Trump administration and that may have effects on the economy and some of the data and results that our companies report. I just got sent to the "does Billy need a haircut poll?" Let's see? I'm going to say yes.

Jeff: It looks like it took a while for that to go live. It looks like maybe …

Billy: Right, here we go. I'm voting yes. I do need a haircut. What do you guys think? Anyway, yeah, I think the political environment, it's definitely having an impact on the way businesses are operating and then there's going to be, I'm sure, legislation or at least talk of legislation that will impact the stock market, but we are just going to keep doing what we have been doing, which is maintain enough cash to be flexible and opportunistic when good market opportunities present themselves.

Jeff: Perfect and piggying on to that Billy, we're all looking to get better at using that cash during a market decline. We have had a few chances where when the market hasn't fallen for a long time you are thinking, "Well, this is the big drop. It's going to keep falling." Last January 2016, the market fell quite a bit and we were getting ready to buy things and then it snapped back really quickly. We're hoping with the next downturn to be ready, more prepared to be at least buy some calls, start to put some money to work gradually, so having that cash is key to that approach obviously. Thank you, Billy for your perfect summary of that.

Pablo, Pablo lives in Spain and he came out to the Motley Fool One event in Arizona this weekend and it was great to see you Pablo. We actually went bike riding Saturday morning before we all took off and that was fun. It was a little chilly in Scottsdale at 7:30 in the morning but not too bad. Why is QQQ not showing up in the Pro Port?

We addressed that about 10 minutes ago, so hopefully it's clear now. We have a mistaken position. We need to correct it and we will notify you all when we are ready to do that. Meanwhile, members who have set up the 2018 put ratio spread are fine and those who haven't can once we set it hope, which I'm hoping it will be as soon as this week and we will have that all done at that point. Billy, thoughts on writing puts on J&J?

Billy: Yeah, so just like any position, writing a put rather than purchasing shares, you have your trade-offs. With your puts, you can capture some income and potentially buy shares at a lower price if the stock price declines below your strike price.

But on the flip side, you are sacrificing the potential upside of just holding shares, so it depends. Unless you have a working crystal ball, as Fool On likes to say, it's impossible to know which one is better for you now more writing puts or just simply buying shares. If you want to participate in the upside, then buying shares is better and if you have more of a preference to target a lower buy price and you are not so concerned about missing some potential upside, then writing puts should be fine. It really just depends upon what you would like to target and your risk tolerance and how you feel about risk-reward of both strategies.

Jeff: Billy, since you are on a roll, or any take on have you had time to look at American Towers results yet today, any early takeaway?

Billy: Yeah, I took a quick look this morning. The results look pretty good. The market's reaction is neutral, but the stock had been rising in about the week or two prior to the report. It seems like the company met investor expectations for this report. The company is doing really well. There was … Let's see, I have some notes here.

There was 5.8% organic growth in the United States for the full year of 2016, which is a good result. Internationally, organic growth is even stronger. We have seen 13.4% organic growth in Asia, 14.1% organic growth in Europe-Middle East and 13.2% organic growth in Latin America. The company is doing really well. They are expanding across international markets and those international markets are growing at much higher rates, more than double the rates of the United States, which isn't growing so slowly itself at 6%. I continue to expect the company to see strong organic growth.

Now at this point the question becomes is the company going to be able to increase its margins? Because due to significant acquisitions, Viom in India, which increased the international portfolio by almost 100%, margins have come down because when you make an acquisition those assets tend to be lower tendency and lower margin.

Now American Tower is going to have to start leasing up those assets and increasing margins. If organic growth continues and the company is able to sign more tenants and increase the amount of equipment on those towers, then we see should margins increase, assuming that the company does not make any more huge acquisitions that again bring back down those margins. But it looks like everything is on track. The company is doing really well, firing on all cylinders, international growing very strongly, United States growing strongly as well. I don't see any reason why that shouldn't continue.

Jeff: Thank you, Billy and then Bruce is asking about Skyworks and the current option strategy with Skyworks around $95 and we have short calls at a $87.50 and short puts at $85. Overall it looks okay right now that the short calls still have a lot of time and value, $5 or so worth and we'll just keep watching that. If the short calls run low on time value, we'll look to roll. We will keep managing the position to make up that upside that we missed when the stock soared.

I think over time with the size of these premiums and a strangle, we can get back to where we want to be and more importantly, pretty safely so given the performance of the business, Apple's new product rolling out this year, the company's guidance. The fact that they have long-term relationships/contracts with companies, with the companies they work with and given the valuation. I feel comfortable managing a strangle on that position I asked we reel in the upside that has occurred.

Amtrust we have talked about quite a bit. We'll have more thoughts on that soon. We summarized our thoughts on Amtrust top of the hour. J.P. and I started right at 2:00 talking about that. The archive of this video will be available soon after this live event and you can go back to the start of the chat and listen to that five or 10 minute discussion on Amtrust, but know that we are going through it and we will all have our thoughts soon to everybody.

Valmont, so Jeremy covered Valmont for us and before Jeremy, I covered it, so I took coverage back over and I have just went through their earnings last week. Their cost cutting is doing well. Their guidance was better than expected and so we saw the stock jumped quite a bit and that's the depth of my summary right now. Since it's been maybe a year or so since I covered it I need more time to go through it.

But right now I was comfortable enough with everything I saw to keep the stock right at a buy and we are pleased to be in the green, pretty nicely in the green, including dividends I think on that stock right now and it remains a buy. It's around a 2% holding for us. We'll have more once we are all done summarizing it. Len is saying with the market run up, many of our shorts aren't doing well. Can you offer some reassurance of the thesis? Does anyone want to share thoughts on that?

J.P: I can start. I would say I believe the most important thing to do when you are shorting is to always make sure the starting point when you are judging how good you are doing is to judge how good you are doing in terms of the total portfolio. If you are shorting stuff to enable you to take advantage of more things on the long side and still remain at a net exposure that you are comfortable with and your portfolio is moving up at a very nice or steady clip, then even if your individual positions don't work out like you want, it's still a worthwhile endeavor.

Shorting is a very tricky and hard to master beast and you are not always going to get all of them right all of the time because timing is so crucial. Your long-term thesis can be perfect. I think it was a memo or maybe it was a chat in the past we talked about Abercrombie and Fitch, where way back when they probably was just getting started you came out with a bear thesis for those stock. You set up I think it was a bear spread or it was some type of bear spread and the stock goes and doubles or triples and so you lose all your money on that.

Fast-forward three, four years and then the stock just plummets and your thesis was ultimately proven correct, but the timing just didn't work out. That's why the timing aspect makes it really important to ensure you have a properly diversified short basket. You don't have all your eggs in one basket and they're not oversized so that a single short position can move against you and basically ruin your year, ruin your three years, ruin your investing career and make it so you don't want to invest ever again.

Yes, you need to go back and look at every individual position because you can't use that as a scapegoat to say that I don't ever have to be held accountable for an individual position not working out, but that's the starting point. In terms of the individual positions we currently have, I know you already summarized Gogo. Do you want to talk about the other few?

Jeff: Sure, I'm happy to. Gogo, I'll go through earnings again. That just came out this morning and see what's going on there. GoPro has done even worse than we hoped as far as the business. They had a dismal fourth-quarter, which was a key quarter to them with their new camera and their drone delayed and that drone looks quite weak now given all the competition.

Caesar's short is a tricky one, but the shareholders are in the end getting so little equity, 6% of the new company that I think the stock should be worth much less, but the market is not agreeing with me. As J.P. well demonstrated, well explained, do we sit and wait and hope that it comes around in time and meanwhile risk seeing the stock double or do we just get out with our profit and move on? That's the question that's been debated here at the last really couple months since we learned of the equity agreement that finally happened. That's three of them.

Shake Shack hasn't done anything extraordinary either and the stock is about the same. I'm encouraged because it's the same or actually a bit lower than where we initially wanted to short it, the $37, $38 level, really higher than that we wanted to short it but couldn't get shares. That's during the market soaring, so the market has soared and the short, which timing put us into the short in the lower 30s, which is unfortunate but we could live with it and hopefully profit, but since the market has short Shake Shack has really not gone anywhere. Again, to me it just looks like a really expensive stock in a crowded restaurant space. Right now we're comfortable with the shorts, including FXE and the other tiny shorts we have and as soon as that changes you will be at the first to know.

J.P: With respect to timing, at the end of the day we always hope that the timing aspect is way more variable and it's not really in our control. We can only analyze the business and what we think it's truly worth, but we hope those timing aspects where we get unlucky are offset by the pay coms, where we get very fortunate in terms of the timing and we get in it at the perfect time.

Jeff: Yep, that was just brilliance.

J.P: Yeah who wrecked? That was a perfect …

Jeff: I don't know. It came from nowhere.

J.P: Timing the market perfectly.

Jeff: That's what I do … Not. Someone, see I can't even get this right, someone, Anonymous just said that Valmont is marked as a hold on the portfolio page and of course, that reminds me yes, we moved it to hold as Jeremy left and as I took it over, so that I would have some time to get back reacquainted with it and then see earnings and then we will guide you on it again. I may have an updated valuation as well. Yes, it's on hold, but it was a buy right up until last week when Jeremy bid adieu. Billy does not need a haircut Allen says, but the poll is saying otherwise. The poll …

J.P: I was just going to say that.

Jeff: The poll is 53% to 47% to get a haircut, Billy.

Billy: I think the no's are more vocal.

Jeff: Jason and let's see? We have 10 minutes to go and I think for the first time if people don't ask many more questions, we might get through all of them, which would be an accomplishment, assuming the answers have some value. Jason, which stock already in Pro or not, would you most like to see make a 15% drop to buy? That's a great question. Why don't we go around the table and we can each quickly name a couple.

Billy: How about we go one in Pro, one not in Pro, how about that?

Jeff: I'll just do in Pro.

J.P: Yeah, I'm going to keep the one that's outside of Pro a secret because if that happens then it probably will make its way into the Pro portfolio.

Jeff: You can do that Billy if you want.

Billy: Okay.

Jeff: Do you want to start?

Billy: Sure, for the one in Pro, the easy answer I guess for me would be Johnson & Johnson, the one we just added. We are willing to buy the stock now, buying it at a 15% discount would be great. It's a very safe, stable stock. It very rarely has that kind of volatility, so if Johnson & Johnson dropped 15%, we would be very happy about that and would buy that. I'll give a bonus as well. Broadridge would be the other one that I would say 15% drop I would be eager to buy.

Now, outside of Pro would be McCormick, the spices maker. I followed that company for quite some time. It's always seemed very expensive to me, but it seems like a very Pro-like stock. That one would really interest me if it dropped 15% and good question Jason.

Jeff: Yes, J.P.?

J.P: I would say Verisign with the caveat that it isn't falling because the regulation has changed and they are not going to have exclusive control over the dot com registry. If it's something over like the fear of the China investor base and they are going to lose a ton of domains in the first quarter, I think that would be an amazing opportunity for us, but if it is because they are losing the business, then probably not so much.

Jeff: I'll say Verisk and Visa. They are both great businesses. We started them around 2%. We would like to grow them to 3% or larger, so on the drop, which we have been waiting for from the start. We would like to add to both of those businesses. Thanks for the question.

J.P: Yeah, I think just to piggyback off that real quick. If you go and you look at recommended allocation, a lot of those stocks that are of the smaller percentages, those are the ones we want to get hit because if we started it out at a 2%, we don't want to keep it at 2%, but given the market environment, given valuations, we wanted to take a measured approach. But we want those to get hit because we want to make them bigger positions because we wouldn't have bought them if we didn't believe in the companies.

Jeff: Certainly true and well said. Are we planning on additional hedging strategies? We talked about that near the top of the hour and yes, we are looking at hedging strategies of various kinds. I have most of my stocks in Motley Fool Pro and we thank you for your trust very much. We will work to keep earning it.

I get many emails from other Motley Fool services such as Total Income. Is there any reason to use another one? I would ask on the boards what fellow members think of that question? I know many members have multiple services and put together their own portfolio that way. The answer is really about what your objectives are and your goals and Total Income is a new service that focuses on high yield stocks is the primary focus. If you are looking for more yield, having that may make sense for you, but it's really an individual question. Many People Pro is all I have. Many People, they have a few other services, too. Thank you for the question.

Setting up the spread, I'm seeing a $12 spread for breakeven or a small credit instead of your recommended $13 to $14. $12 is close enough to $13 or $14. I do realize with the market rising each time I look at this position again while I'm waiting to update it that now you have to make the spread a little smaller because the market has been on quite a tear. Thanks for the question.

Shorts, we talked about shorts already. Len, I hope you enjoyed the answer as much as you could. Thoughts on Caesar, we talked about that. We talked about Amtrust already at the start of the hour as well, so all these Amtrust questions, the video will be on the site archived soon after we are done wrapping up here at 3:00. Please revisit the site and you can listen to our Amtrust talk right at the start of the chat.

Let's see? Any others that we have here? Shut or Shack, go to Motley Fool Options to ask that question. That's a holding only in Motley Fool Options. Go to the Shut or Shack, Shut or Stock Board there. Shut or Shack, it's what I want to shutter, shake, shack. Any questions you got see here that you want to answer?

J.P: Yeah, I can tackle one. Anonymous asked whether the political environment is going to have a negative impact on Starbucks? It says they took a hit and what do we think the future is looking like for that company? I will say in the memo that will be put out today, I'm covering four of Pro Stocks and Starbucks is one of them. It is actually the only one of the four that isn't receiving a fair value update and that is because I believe there are definitely some legitimate concerns to the long-term thesis for the company.

This isn't just a knee-jerk reaction to the mobile order and pay issues or the lackluster comps, though I think those are actually signs that can give you insight into the long-term issues. But for me it squares away towards what are the potential unit economics that the company can ultimately derive and what is the total adjustable market for Starbucks?

I believe it is a company that is basically in existence to cater to habitual purchases that are born from convenience and consistency and because of that I think they have a very large adjustable market. But I think management's 2021 goals are very ambitious and I think the market is based on the premium that it is currently commanding over the SAP 500, the market is basically taking that and saying 100% it's in the bank.

I think it's anything but 100% in the bank and so I'm still doing some more work on it, but you are correct in noting the future isn't as clear. I think management likes to downplay the macroeconomic environment, the struggles in retail, the struggles in the restaurant business, but I think those are things that … Starbucks is a great company, but they are like a best house in a bad neighborhood in terms of they are not immune to those. When those things have a negative impact on the industry at large or any type of tailwind or headwind, they are going to benefit or be hurt from that.

You are seeing that I think it was around 5 quarters ago, pretty much everybody's comparable store sales here in the US basically started to roll over and Starbucks basically followed suit with everyone else. I'm still doing a little bit more digging. We are not having a knee-jerk reaction to it. I'm not "Oh my gosh, they had a bad result in this quarter so we need to trim the position," but I think there's definitely some things that need to be looked at and reassessed for the company.

Jeff: Sounds good, if our guidance changes you will know first. I see a few questions that I can answer really quickly that seem important. J.P., which is not you J.P. unless you are asking questions through … You know you can always just come to me and asked directly, but J.P. is asking I bought Skyworks naked puts May and August, $85 strikes. Do we still stand behind these trades?

I really hope you mean to say that you sold those puts because we recommended selling the puts, sell to open the puts and not buy them. I think that's what you mean because you said naked. Yeah, you should have a profit on those trades and we still are advising a similar position in Pro and something similar in Options. We are still long Skyworks, the stock is rated a buy and then those who are using Options may have short puts on it as well.

I saw another question here. Someone was asking about Berkshire B shares in an IRA. Go to Motley Fool Options to the Berk Board there to ask your question please. That's a Motley Fool Options position. Finally, I'll do one more. G.B. is asking have we ever thought of hedging the entire portfolio by buying puts? Yeah, that's a fun thought that we throw around sometimes. It would be fun to just go market neutral and take some time to really think without any worry about what the portfolio may do, any real worry.

Yeah, but going market neutral is something we could do at any moment if we really thought we should. There is not great harm in it other than potentially missed upside, although that would have been great harm the past eight years if we were market neutral at any point. Yeah, it's a capability that we have and we consider all capabilities. I think that's it, guys. I think that's all we can answer because it's 3:00 and we need to free up at the studio. We appreciate your being here and joining us for this chat.

J.P: J.P. did sell to open those puts.

Jeff: Oh good.

J.P: I saw his question.

Billy: Good job J.P.

Jeff: Excellent, good, good, good, thank you J.P. for typing that in. Good job of getting the right trade in. That was great, good to hear and so you should be in good shape with that position. Billy and J.P., do you want to close each with your own 30 second thought, your most heartfelt thought at the moment, piece of advice, personal story? I'm throwing this at you. I didn't give them any warning of what you would say to members.

J.P: I'll take the easy way out because I saw a question there you didn't address and that is for me in terms of what do we think with regards to DE, Deer specifically. Anonymous wants to see it in the short basket again and we will have updated thoughts on that soon.

I still think the industry at large, 75% to 80% of those stocks are overpriced. Some of them buy a very large percentage, but the market just continues to shrug off those results and say the turn is coming and when it comes it's going to be huge. That is extremely frustrating for shorts and it makes it a lackluster endeavor and one that doesn't really pay off. We probably with regards to Deer, Caterpillar, anything like that, we will stay at the sidelines and then when we think the opportunity is right we will move back in probably at a smaller percentage to align with the basket.

Jeff: Thank you, J.P. ... J.P. closes with thoughts on Deer. I like it. Billy, what have you got?

Billy: Well, I'm going to go back to something we discussed before we started this chat, you, me and J.P., which is people have a tendency to get a little jittery based upon it may be a single quarter of results or something that happens on a given day. I think some overarching advice I can give people is to always remember we're in it for the long haul. It's about patience, making decisions carefully, analytically and not rushing or making any knee-jerk reactions.

Whenever you get a thought in your head like, "Oh, the stock is down 20% today. Should we do something?" maybe just keep in mind that doesn't necessarily mean we have to do anything at all. Just take your time, analyze and slowly figure out what it is you want to do based upon your analysis and decision-making. That would be my overarching guidance. I also want to say thank you to Heck Creek. I got your message that I do not need a haircut, but I should dye my beard gray to add some gravitas to my persona. I agree. I agree. That would work for me.

Jeff: I disagree, just give it time. Although Heck Creek, I rarely disagree with him and I see his point, but come on. You are only young for a while. You have to enjoy it. I'll close with I'll take J.P.'s route and answer two things I see here. Thoughts on special guidance for newcomers when selling a position, he's thinking of Wells Fargo, he or she. Bought and sold within 30 days at a loss. Not crying over spilled milk but could we have done better?

I'll just say, yeah, we need to do better. We can't foresee the future and we don't know when our thoughts on a position may suddenly change, but it's rare that it suddenly changes. If I were thoughts were evolving and we know we have new members coming in, we do our best to put anything on a hold that we don't think that we'll keep owning for years. Sometimes, and Wells Fargo was a rare example, we tell you to buy something and then soon afterward, telling you to sell. It is unfortunate. We will try to avoid that as much as we can and yeah, we will keep trying to avoid that.

That said, we have some new members come through at almost at any point and in those cases well, we'll just do our best. We try to put things on hold at least a month before we sell if that's reasonable to do. The other question was send out an alert please when you change guidance, buy, sell, hold or fair value estimate.

We do every Monday. Every Monday has the guidance update and typically our guidance updates are made right around Friday or Monday to account for that and not clutter your email with even more emails. On that note, thank you everybody for being here. We appreciate it. Thank you, J.P. Do you want to end laughing like you started?

J.P: No, I think I laughed enough for this chat.

Billy: As he laughs.

Jeff: Thank you Billy, we'll see you next month for the Options and Pro Chat and we'll see at that point whether you have had a haircut or not.

Billy: Thank you, Fool On.

Jeff: Thank you Pro members, Fool On.

Broadridge's Acquisitions Bolster Growth

Published Feb 15, 2017 at 12:22PM

Pro's Take: BR Q2-2017 Earnings

Broadridge Financial Solutions (NYSE: BR)

Q2-2017

Quarterly recurring fee revenue growth (Y-o-Y): +34.4% to $536 million (+6% organic growth, ex-NACC acquisition)

TTM Operating profit margin*: -277 bps Y-o-Y to 21.3%

Closed Sales growth (Y-o-Y): +15.5% to $56 million

Quarterly EPS growth (Y-o-Y): -25% to $0.25

**Operating profit / Fee revenue. This removes the impact of distribution revenue, which is a pass-through cost and distorts the true economics of the business.*

Quarter Quick Take

Broadridge has produced a typically steady start to Fiscal 2017, and it looks like management's revenue and closed sales guidance for the full year is going to be achievable: recurring fee revenue growth of +29%-+31% (YTD +34.4%), and Closed Sales of $140-$180 million (YTD $78 million). Although companywide margins are lower due to the impact of the company's recent acquisition of DST System's North American Customer Communications (NACC) business, Broadridge reported organic growth in recurring revenue of +6%, and margins should expand over time as the acquisition is integrated and operational synergies are achieved.

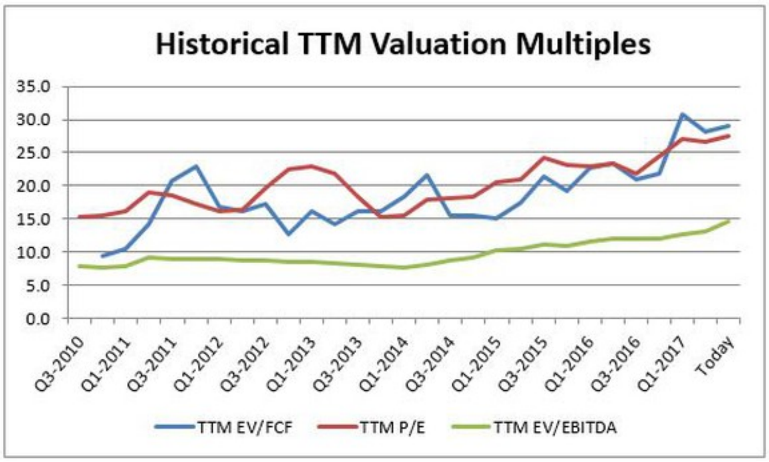
Updated guidance: Buy First (no change)

Recommended Allocation: 5.1%

Fair Value estimate: $65 (no change)

Current Price: $67.78

Based on management's guidance, at $67.78 per share, the stock is priced at about 25x projected 2017 cash flow and 26x projected 2017 GAAP EPS. Both of these valuation metrics are elevated relative to the company's history:



However, Broadridge still features stable cash flows, a steady growth profile, excellent management, an increasingly strong competitive positioning, and margin expansion opportunities. **Our Fair Value estimate remains unchanged at $65 per share, and Broadridge remains a Buy First on our scorecard.** Members who have yet to start or fill out their position can feel comfortable doing so at current prices, or you can write puts if you prefer to target a lower entry price (at current pricing, the $65 puts are a reasonable choice).

Our Thesis

Broadridge has a near monopoly in proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record and sound capital allocation policies make Broadridge a sturdy rock to build the Pro portfolio upon. We expect modest growth in fee revenue, slight operating leverage, plenty of free cash flow and a growing stream of dividends to help achieve North Star-like returns.

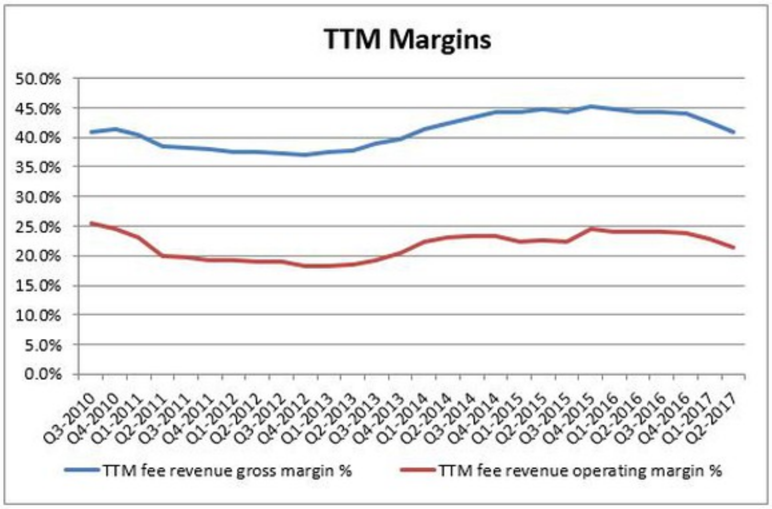
The Most Important Things

1) ***Closed Sales:*** This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%+). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

Broadridge has had a strong start to Fiscal 2017 with respect to closed sales. Year-to-date Fiscal 2017 (Q1 and Q2) closed sales came in at $78 million, which is up +18% compared to the first half of Fiscal 2016 ($66 million). The company reported record Q2 closed sales of $56 million, the highest magnitude for a second quarter in the company's history, and up +16% year-over-year. The company's success in closed sales is a reflection of continued investment in and expansion of the company's products and services.

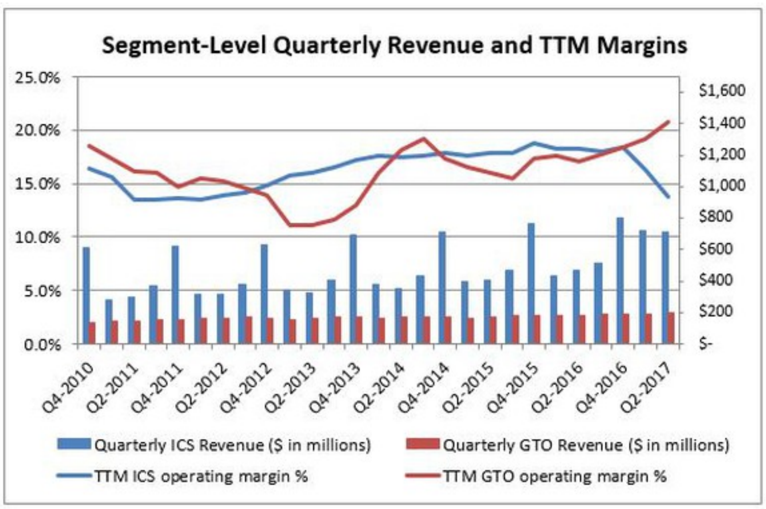
The run-rate for closed sales for Fiscal 2017 implies full-year closed sales of $156 million, which is within the company's guidance range of $140-$180 million. Additionally, Fiscal Q4 is historically the strongest sales quarter of the year, so the company may have room to reach the high end of its guidance for closed sales by the end of the fiscal year.

2) ***Fee Revenue Margin Performance:*** In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers) we prefer to look at trailing twelve months (TTM) margins to smooth out quarterly fluctuations. TTM fee revenue gross margins came in at 40.9% (down significantly from 44.4% a year ago), and TTM fee revenue operating margins came in at 21.3% (down from from 24.1% a year ago):



The reason for the decline in companywide margins is the company's [2016 $410 million acquisition of DST's North American Customer Communications] (NACC) business. The NACC business has a lower margin profile that Broadridge's legacy businesses, so that drags down the company's overall margin profile, given that the NACC business represents about 30% of total companywide revenues. In DST System's 2015 10-K filing, the NACC business generated operating margins of 8.2% (vs. Broadridge's ~17% reported operating margins pre-NACC). However, Broadridge should be able to expand NACC's operating margins over time via scale, cost synergies, and improved operational efficiency.

When looking at each individual segment, we can see that Broadridge's ex-NACC business is doing quite well. While the Investor Communications Solutions (ICS) segment shows significantly lower margins (due to the NACC acquisition), the company's Global Technology Operations (GTO) business has shown strong margin expansion, generating a record TTM operating margin of 20.8%:



We'll want to monitor the ICS segment's margins (expecting longer-term margin expansion once the acquisition period is lapped) to make sure the integration of the NACC business is on track, and we also want to watch the GTO segment to see if recent margin expansion trends continue.

3) ***Capital Allocation:*** Although Broadridge is a slow grower, it generates a lot of cash and has low reinvestment needs. Management has a very clear plan to put that cash to work: it targets a 45% payout ratio, and it plans on using incremental debt capacity to make acquisitions (having targeted $400-$600 million between FY2015-FY2017) and continue share repurchases.

On the dividend front, the company has paid out $1.26 per share on a TTM basis, good for a 51% payout ratio and about a 2% yield on the current price. On the acquisition front, the company has already significantly outpaced its FY2015-FY2017 target, having spent nearly $800 million on a variety of acquisitions and intellectual property that expand the company's breadth and depth of offerings. The company has an excellent acquisition track record (a 20%-plus IRR since Fiscal 2007), and I expect that the company's recent acquisitions and investments will continue to add to shareholder value. As for share repurchases, the company has bought back $101 million in shares in the first two quarters of Fiscal 2017.

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Pro Can Help

- **Questions?** Bring them over to the [Broadridge discussion board].

Let Winning Happen, and a Short Farewell

Published Feb 13, 2017 at 3:37PM

Dear *Pro* Fools,

When I was growing up, I often heard that if you want to achieve success in life, it is best to be a person of action. My parents, teachers, and coaches encouraged me to "take the bull by the horns" and "make things happen" rather than expecting that my goals would somehow come to fruition on their own. That was sage advice that's served me well through many aspects of my life, and I'd imagine that a similar mindset has helped many Fools in the *Pro* community.

Unfortunately, that bias toward action isn't as correlated with success in investing as it is with other endeavors in life. In fact, there's good reason to believe that with investing, more activity actually leads to poorer results over time. Sometimes playing not to lose really is a superior strategy to playing to win.

This idea crystallized in my mind recently as I reread an old Michael Mauboussin white paper about improving the decision-making process. It reminded me of the interesting research done by Simon Ramo for his book, *Extraordinary Tennis for the Ordinary Player*. Ramo's main conclusion was that there's a huge difference between how the pros win at tennis and how the amateurs do. In pro tennis, 80% of points are won by superior shots, but in amateur tennis, 80% of points are actually *lost* to unforced errors. In other words, amateurs can be more successful by simply keeping the ball in play and giving their opponent the opportunity to make the error. Mauboussin's key takeaway for investors: "It's often easier to succeed by making fewer mistakes than it is by being more brilliant."

That lesson immediately made me start thinking about the mistakes I see among my fellow investors (and myself). Which of them might be relatively easy to eliminate? Here are a few examples of missteps I think *Pro* members can easily avoid to improve their odds of long-term investing success.

1. **Don't forget that the devil is in the details.** Because of the various investing strategies we employ, *Pro* is one of the more complex managed portfolios at The Motley Fool. To successfully match the results of said portfolio, it's important to get the blocking and tackling correct. When a new trade is published, read it thoroughly to make sure you understand the strategy and the details of the transaction(s). Triple-check your options trades to make sure you are either buying or selling the correct type of contract. If you realize you made a mistake, close the trade immediately – even if doing so results in a loss – and make the correct trade. Use limit orders, be patient, and don't chase the trade if the price spikes immediately following the trade alert. Prices often drift back down in subsequent days, giving you a better opportunity to make the trade without paying a premium.
2. **Mind the forest *and* the trees.** Managing a portfolio presents a different set of problems than just picking individual stocks. When you're considering adding a new position, it's important to think about how it will interact with the rest of your holdings. Beware of over-weighting toward any sector and potentially exposing your portfolio to too much industry risk. Also, don't fixate on individual positions. Ideally, we want companies that move to their own beat, which means that some positions should be losing at any given time in a properly diversified portfolio.
3. **Anchors away!** Generating a fair-value estimate for a stock is as much an art as it is a science, because there are so many variables we simply cannot know. Too often, these estimates are used with a high degree of false precision, which causes us to anchor to what may be an arbitrary number. That's part of the reason Jeff has openly debated whether we should maintain fair-value estimates at *Pro*. I've personally missed many opportunities over the years by not buying a great company that was a couple of dollars above my conservative price target. Further, many investors only like buying stocks after they've declined in price, but adding to your winners at a higher price can be one of the best ways to compound capital over time. Use our fair-value estimate to inform your buying and selling decisions, but not to direct them.
4. **Avoid the seemingly irresistible urge to act.** When a trade goes against us, our first inclination is usually to try to fix it. But often, the best decision is to just sit on your hands and do nothing. That's a hard pill to swallow for the aforementioned "people of action" I think many of us at *Pro* work to be, but it's important. Before taking action, review whether your original investment thesis remains intact -- and remember that daily volatility is *required* to generate higher returns over the long term. If you've done your homework and invested in a high-quality business, you'll find such big moves often reverse over time, so it's often better just to walk away for a week or two and return to the decision when you're less impaired by an emotional response.
5. **Know that politics can be perilous.** The more rational you can be as an investor, the better -- and few things can impair rational thought like allowing your political beliefs to creep into your decision-making process. That precept has been on full display over the past year, with people across the political spectrum asking if they should sell everything for fear the world is coming to an end. Those who acted on that fear are likely kicking themselves following the recent market rally. Even if we could somehow know the results of elections ahead of time, it's doubtful we could predict how markets would respond to them. To be clear, I'm not telling anyone to ignore their principles -- but I am suggesting it's important to find ways to express them without recklessly endangering your financial future.

The *Pro* Bottom Line

There are enough challenges to succeeding as an investor without placing blockers in our own path. I think it's worthwhile for all of us to look at our processes and identify the unforced errors that may be costing us the win -- in fact, it's the only way we can advance from amateurs to pros in the game of investing. (It also helps to learn from other Fools' mistakes to avoid having to pay all of the "tuition" ourselves. The Lessons I've Learned board is a great place to do this, and to share the lessons you've picked up along the way.)

And finally, it is with mixed emotions that I announce this as the final Memo I'll be penning for *Pro*. I will be leaving the Fool and the *Pro* team at the end of the month to pursue a new, exciting chapter in my career. I have thoroughly enjoyed my time at *Pro* and have cherished the opportunity to learn alongside such a wonderful group of like-minded investors. Since joining the Fool in 2009, I've always admired the unique culture the *Pro* community has nurtured, and I have been honored to spend the past two years working on a team with some of the smartest and hardest-working investors in Fooldom. You should rest easy knowing that the *Pro* portfolio is great hands, and I expect many years of North Star-besting returns to come.

Foolish best,

-- Jeremy (TMFTank)

Pro Guidance Changes and Completed Trades: Feb. 13, 2017

Published Feb 13, 2017 at 3:33PM

Pro Guidance Changes (from the past two weeks)

- **Amazon.com** (NASDAQ: AMZN): Introduced to *Pro* as a Buy, at a 3% allocation.
- **Gilead Sciences** (NASDAQ: GILD): Moved to Hold as we assess 2017 guidance from management.
- **O'Reilly Automotive** (NASDAQ: ORLY): Moved to Hold while we consider the risk Amazon might pose to the auto-parts industry.
- **MasterCard** (NYSE: MA): Fair-value estimate increases to $99. It remains a Buy First at a 4.6% allocation.
- **Parexel** (NASDAQ: PRXL): Moved to Sell (the stock) and close all option positions.
- **TD Ameritrade** (NASDAQ: AMTD): Fair-value estimate increases to $41 from $35. The stock remains a Buy, at a 3.1% allocation.

Pro Completed Trades (from the past two weeks)

- **Amazon.com**: We bought a 3% stake (which turned out to be 100 shares) at $820.48.

- **Parexel**: As per our recent alert, we sold our shares at $64.42 and bought to close our covered calls at $1.69, closing the position.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Feb. 13, 2017

Published Feb 13, 2017 at 3:24PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.4%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% (see our recommendation).
- **Apple** (NASDAQ: AAPL): Buy 4.3%.
- **OpenText** (NASDAQ: OTEX): Buy 3.4%.
- **TD Ameritrade** (NASDAQ: AMTD): Buy 3.1%.
- **Visa** (NYSE: V): Buy 2.5%.

Shorts:

- **CurrencyShares Euro Trust** (NYSEMKT: FXE): Sell short 1.7%.
- **Direxion Daily Financial Bear 3x** (NYSEMKT: FAZ): Sell short 0.1%, or set up a January 2019 $20 synthetic short for close to zero net cost. Set up one synthetic short for every $2,000 in shares you want to short.

Pro options:

- If you want to attempt to buy any of our stocks lower, you can write (sell to open) near-the-money put options on shares such as **Paycom** (NYSE: PAYC) and **Starbucks** (NASDAQ: SBUX), among others. Choose puts that pay you enough to be happy. Realize all these stocks are rated Buy.

Hedges:

- No update this week.

Upcoming Expirations:

- In March, our covered strangle on Verisign and our covered calls on **Parexel** (NASDAQ: PRXL) all set to expire. We'll update you before that expiration March 17.

MasterCard's Ho-Hum Quarter Was Still Awfully Good

Published Feb 9, 2017 at 3:33PM

Following three straight quarters of easily besting market expectations, **MasterCard's (NYSE: MA)** fourth quarter seemed rather pedestrian. Though the company matched estimates on most counts -- despite stronger than anticipated currency headwinds -- the stock has pulled back about 5% from its recent highs. Even so, MasterCard has been on a great run over the past year and we expect that momentum to continue into 2017. For the full year of 2016, net revenue increased 13% and operating income grew by 14%, showing the continued health of the business.

During the fourth quarter, MasterCard was helped by improving economic activity across most of the globe. European growth is continuing to slowly improve, with Germany at the forefront of those gains. The drop in the British pound caused by the country's Brexit vote has led to a surge in travel to the country. Despite the slower economic growth in Europe than other regions in 2016, MasterCard was still able to grow its gross dollar volume by nearly 20% for the year. This was achieved through a combination of an accelerating conversion to digital payments in the region as well as market share gains.

Turning to Asia, in India MasterCard experienced a 75% jump in processing volume thanks to the government's decision to discontinue the 500 and 1,000 rupee notes in an attempt to reduce corruption and money laundering. With 86% of the country's currency now removed from circulation, there should be rapid growth in the number of digital transactions. Currently, there are only about 1.4 million point of sales (POS) machines in a country that could ultimately support more than 60 million, which provides a long growth runway in the country. Because of the lack of processing infrastructure, MasterCard is encouraging the use of QR codes that allow merchants to accept digital payments without a point of sale device. Also, in China MasterCard continues to wait for the government to finalize its regulations and open its door to outside payment processors. While it waits, the company continues to add to its list of card issuing banks so that it will be able to hit the ground running when the government finally gives the go-ahead.

MasterCard also continues to invest heavily in technology, with a focus on growing the company's MasterPass market share. As the first digital payment service that works across all devices and channels, MasterPass has a solid first-mover advantage which is attracting new merchants to the service. The company is also using the MasterPass technology to power a QR code solution that enables person-to-business transactions. In addition to the India example mentioned above, this solution has been rolled out in 33 African countries.

Altogether, MasterCard's services business, which includes safety, security, data analytics, loyalty and processing, now accounts for 25% of sales and is growing at a faster clip than the overall transaction business. It also provides a diversified stream of higher-margin, recurring revenue and the products should make MasterCard's customer relationships stickier over time.

***Pro* Bottom Line**

We continue to be pleased with how MasterCard's business has been performing and with management's commitment to staying at the forefront of the digital payment technology evolution. After just one year, MasterCard is well ahead on its three-year plan to grow net revenue in the low double-digits and EPS in mid-teens. Along with Visa, the two credit card companies now combine for a 7.1% allocation in the Pro portfolio. We expect both companies will continue to compound value as consumers the world over shift their spending toward digital payments. Shares now trade at about 27 – times trailing free cash flow, which is a bit on the high side, but still consistent with the company's historical trading range. Thanks to MasterCard's leadership and growth potential in international markets we still consider the company a *Buy First*. **We're also bumping up the company's fair value to $99,** which represents a more conservative, though still generous, 25-times free cash flow multiple.

Sell Parexel International (and Close All Outstanding Covered Calls)

Published Feb 8, 2017 at 12:28PM

Is this for you? For all *Pro* members who own **Parexel International** (NASDAQ: PRXL) and/or have followed our recent covered call recommendation, we are moving the stock from Hold to Sell. If you own Parexel shares (and/or have outstanding covered calls on the stock) and agree with our thinking, follow this alert and sell the stock (and close your covered calls) with us. Read on to find out why we're selling, including portfolio reasons. If after reading you want to keep the shares on your own, of course you may do so.

How You Follow Along

- **Trade:** Sell Parexel International and simultaneously close your covered calls, ideally in one single transaction.
- **Allocation:** Sell all shares and close all outstanding covered calls. *Pro* is selling our 1,300 shares (representing 3% of the portfolio) and closing our 13 covered calls, bringing our cash (excluding shorts) up to 18.1%.
- **Actions:** Close your entire Parexel position by simultaneously:
  - Selling ("sell to close") all of your shares of Parexel International.
  - Closing ("buy to close") all of your covered calls on Parexel International.
- **Price Guidance:** It is **critical that you use a limit order** (please!) to aim to close your entire covered call position ("selling to close" your shares and simultaneously "buying to close" your covered calls) at the midpoint of the going bid/ask spread, lately $62.09 or higher (math below).
- **Prices** (as of 10:15 a.m. 2/8/17):
  - Stock price: $63.07
  - Buy to close March 2017 $65 covered calls (bid/ask split): $0.98
  - Net credit: $62.09 ($63.07-$0.98)

What We're Thinking

In November of last year, we moved Parexel to Hold after the company reported its fiscal first-quarter 2017 earnings. Our rationale was based on recurring managerial missteps (two straight non-timely SEC filings, questionable corporate controls, and a tendency to miss its own guidance), and we mentioned in that report that we might choose to close our position outright in future, depending on price. Then, in December, we decided to write covered calls on Parexel to earn income and potentially sell our shares at a higher price. We decided to target opportunistic income as we waited for another quarter of business results to see whether the company could turn around its recent negative trajectory.

After analyzing the second-quarter results released last week, we have decided that we no longer have enough confidence in management to maintain our position (just look at slides 5-7 in the company's most recent earnings presentation for evidence of mismanagement). The company has demonstrated a history of missing and lowering its own guidance, providing excuses for poor results, and underperforming our estimates, and its competitive position may be weakening. We are taking this opportunity to close our entire position in Parexel, banking a North Star-beating return since the position's inception in December 2013.

We bought shares at a net $46.15, wrote puts in 2014 for $0.65 per share, and sold our covered calls in December of last year for $4.05 per share. Now we are buying back our covered calls for $0.98 each, which means our effective buy price on our shares is $42.43 per share ($46.15-$0.65-$4.05 + $0.98). In closing our position at the current price of $63.07, our cumulative return on the position since inception is 49%, which equates to a 13.7% compound annual growth rate since inception, well above our North Star.

While the business has largely performed in line with our initial thesis thanks to beneficial industrywide trends, our confidence in Parexel's management has steadily declined over time. Especially given our portfolio's increased long exposure after adding **Paycom** (NYSE: PAYC), **Verisign** (NASDAQ: VRSN), and **Amazon** (NASDAQ: AMZN) over the past three months, we think now is a good time to sell our Parexel shares in order to earmark that capital for ideas we have more confidence in. Keep in mind that the stock may continue to do well from the current price if management can turn around recent negative trends. But our lack of faith in management is enough for us to sell our shares, bank this three-year-old position as a success, and move on to better ideas.

Pro Can Help

- Questions? Please bring them to the Parexel discussion board.

Pro Catch-Up Trades and Upcoming Expirations: Feb. 6, 2017

Published Feb 6, 2017 at 3:31PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.4%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% (see our recommendation).
- **Apple** (NASDAQ: AAPL): Buy 4.3%.
- **Gentex** (NASDAQ: GNTX): Buy 3.2%.
- **OpenText** (NASDAQ: OTEX): Buy 3.4%.
- **Paycom** (NYSE: PAYC): Buy 2.4% (see our recommendation).
- **TD Ameritrade** (NASDAQ: AMTD): Buy 3.1%.
- **Verisign** (NASDAQ: VRSN): Buy 1.5% and then sell to open a March 2017 $80 put/$85 call strangle, selling one strangle for every 100 shares you buy.
- **Visa** (NYSE: V): Buy 2.5%.

Shorts:

- **CurrencyShares Euro Trust** (NYSEMKT: FXE): Sell short 1.7%.
- **Direxion Daily Financial Bear 3x** (NYSEMKT: FAZ): Sell short 0.1%, or set up a January 2019 $20 synthetic short for about no net cost. Set up one syn short for every $2,000 in shares you want to short.

Pro options:

- See Verisign above.
- If you want to attempt to buy any of our stocks lower, you can write (sell to open) near-the-money put options on shares such as Paycom, **Gentex** (NASDAQ: GNTX) and **Starbucks** (NASDAQ: SBUX), among others. Choose puts that pay you enough to be happy. Realize all these stocks are rated Buy.

Hedges:

- **PowerShares QQQ** (NYSEMKT: QQQ): We are working with The Fool to correct our mistakenly inputted 2019 put ratio spread to the suggested 2018 spread. For those not yet in the original position, today you would follow the allocation guidance given in the report, but you would sell to open January 2018 $102 puts, and buy to open January 2018 $114 puts, for no net cost or a small credit, selling two $102 puts for every one $114 put you buy.

Upcoming Expirations:

- In March, our covered strangle on Verisign and our covered calls on **Parexel** (NASDAQ: PRXL) all set to expire. We'll update you before that expiration March 17.

Pro's Earnings Are Looking Snazzy

Published Feb 6, 2017 at 3:25PM

Dear *Pro* Fools,

Business is tough. Acquiring customers and turning them into revenue -- let alone increasing that revenue every year -- is not easy for most companies. We hear about the big winners in the headlines, but we forget that most businesses struggle to reach real stature, failing or languishing instead. This kind of survivorship bias exists in investment funds, too: When we read about the best investors, we should remember that they're even better than we think given the thousands of funds that fail. Here at *Pro,* we're trying to own companies that will lead the parade of winners for a decade or longer, growing our investments in the process.

We have two overarching goals: We don't want to lose money over any rolling three-year period, and we want to at least double our real purchasing power every 10 years. Those goals are captured in our North Star measure (inflation plus 7% a year), which guides our long-term decisions. We won't take unreasonable risks to chase the North Star during any given year, because one year is a random amount of time; but we do want to stay close to the North Star over many years. Some years will inevitably encompass a falling market, and short positions are part of the path to better returns when that happens. With the market soaring since November, our shorts are behaving, not harming us much at all. In a down market, hopefully they'll help.

Most of our companies -- both short and long -- use the start of the year to give us a broad view of how the upcoming 12 months or so look to them. Over the past week, I've gone through results from several. While **Apple** (NASDAQ: AAPL) isn't one of them (JP will do that), we're pleased to see the stock hitting new all-time highs; **AmTrust** (NASDAQ: AFSI) is barely $1 from a new 52-week high, too. We'll get to those! But for now, here are the first companies I've reviewed.

Amazon (NASDAQ: AMZN) reported a record $9.7 billion in free cash flow last year, putting the stock's price at about 42 times that amount. The Amazon Web Services business now has a revenue run rate of $14 billion. Last quarter, Amazon increased total sales 22% to $43.7 billion, and earnings per share increased 54% to $1.54. Operating cash flow was up 38% to $16.4 billion over the past 12 months. The company continues to take market share, and is spending aggressively to expand its lead. It added 26 warehouses last year, increased its investments in digital content, Prime Now, AmazonFresh, and fulfillment, and continues to invest in AWS, Alexa, Echo and international growth. And this just scratches the surface of its activities (link opens a PDF -- maybe wait and come back to it!).

As for AWS, management expects to continue to lower prices and work on operating efficiencies -- that has always been the business model. It's adding clients, large and small, in droves. For the first quarter, Amazon expects *total* revenue to grow 14% to 22%. The net income line still hides a tremendous amount of leverage that it could one day unleash. The stock is a Buy with a 3% allocation, and serves as our most recent example of long-term thinking. Why expect a big gain in Amazon in a year? We don't. But we do over five years.

Facebook (NASDAQ: FB) continues to represent our favorite opportunity over the coming years, as indicated by its leading size in the portfolio, at 6.7%. Revenue was up 51% last quarter to $8.8 billion, with advertising revenue up 53% and mobile ad revenue up 63%. Facebook's daily users now number 1.2 *billion*, with monthly users at 1.9 billion. Instagram, Messenger, and WhatsApp also continue to grow. Four million businesses advertise on Facebook, and more than 500,000 are running ads on Instagram.

Meanwhile, Facebook continues progress on its long-term plans, investing in making its community more valuable to its members and advertisers, expanding its reach, and driving new initiatives including video content and virtual reality. Investments will accelerate this year and advertising growth rates will slow, but the stock already seems to have priced that in: Shares trade at 42 times free cash flow and 25.5 times expected earnings for the year ahead. The stock remains a Buy First.

GoPro (NASDAQ: GPRO) shares are down (a plus for our 0.4% synthetic short) following disappointing first-quarter 2017 guidance. Fourth-quarter 2016 revenue was up 24% from last year, to $540.6 million, on the refreshed Hero 5 camera, but despite this -- and the new Hero 5 Black, *and* the relaunch of the delayed Karma drone last week -- GoPro only forecasts first-quarter revenue of $190 million to $210 million. That's disappointing for a company that's selling its first slew of new products in about two years, especially given that GoPro's business has become much more international in that time. Later this year, we can expect a Hero 6 and new accessories, but nothing that suggests a sudden tailwind.

Last year, GoPro sold about 5.3 million units, down 12% from 6 million in 2015. This year could bring another decline. Management said it's focusing on margins and average selling prices rather than units. That's fine, but not when it sounds like an excuse for not reaching more customers. After multiple production issues on new products, the focus is on cost-cutting in a bid to return to profitability this year. The stock looks vulnerable to any market downturn, and unlikely to soar in the meantime. Keep watching our Catch-Up Trades each Monday for ways for newcomers to get on board; right now, this stock is prohibitively expensive to short or use options on.

Visa (NYSE: V) reported strong results that drove the stock to a new all-time high on Friday, pushing it above $200 billion in market value. Driven by the inclusion of Visa Europe *and* strong transaction growth around the world, revenue was up 25% last quarter to $4.5 billion, while earnings per share jumped 23%. Global processed transactions rose 13%, their U.S. counterparts were 11% higher, and cross-border volume was up a strong 13%. All areas of the business benefited, with services revenue up 17% and data processing revenue up 28%.

European and U.K. results were especially strong, with an influx of commerce thanks to the lower euro and the weak pound; Visa's purchase of Visa Europe may have been well timed. Management still expects Visa Europe to add 2% to 3% earnings-per-share growth per year. Meanwhile, they're watching the White House and Capitol Hill for any laws that could change trade or taxes (Visa would like to repatriate billions of dollars sitting overseas), but it's too early to predict anything. The stock trades at about 25 times both trailing free cash flow and expected earnings for the year ahead. Visa remains a Buy at our 2.5% allocation, and that allocation would be larger if we didn't also own 4.6% in **MasterCard** (NYSE: MA). Visa is up about 30% (including dividends) in the less than two years we've owned it.

I covered **Skyworks Solutions** (NASDAQ: SWKS) a bit in our recent rolling report. The company's results and outlook appear strong, with revenue up 9.4% last quarter, record margins, and guidance for sales growth of about 10% this year, with particular strength in the second half. Apple accounted for about 40% of revenue at Skyworks last year, which is a plus and a risk; but the companies' long-term relationship remains intact. And Skyworks is scoring other key customer wins around the world, in phones, Internet of Things ... things, and cars. The need for its complex connectivity solutions is growing, and management itself says 5G cell networks are "going to be a game-changer" as data speeds increase as much as tenfold.

The company's order backlog is "fully booked," and management believes this sort of demand is sustainable, projecting still-higher margins. At about $91, the stock trades at 18.4 times free cash flow and 14.1 times expected earnings for the year ahead (19.4 times trailing earnings), looking fairly priced. It remains a Buy at a 4% allocation. Only those who wrote covered calls on it with us last year (and rolled them in January) should have options on it at this point. If you just own shares, just keep owning shares.

So, that's five *Pro* positions right there. We'll have more reviews soon! Meanwhile, members continue to discuss *Pro*'s performance after Billy's column last week. Bring your thoughts about that, or about our positions in general, to the Memo Musings board. Thank you, and Fool on!

Pro Guidance Changes and Completed Trades: Feb. 6, 2017

Published Feb 6, 2017 at 3:12PM

Pro Guidance Changes (from the past two weeks)

- **Amazon.com** (NASDAQ: AMZN): Introduced to *Pro* as a Buy, at a 3% allocation.
- **O'Reilly Automotive** (NASDAQ: ORLY): Moves to Hold while we consider the risk Amazon might pose to the auto parts industry.
- **Parexel** (NASDAQ: PRXL): Moved to Hold while we consider management execution issues.
- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $87.50 from $85. The stock remains a Buy, at a 4% allocation.
- **TD Ameritrade** (NASDAQ: AMTD): Fair-value estimate increases to $41 from $35. The stock remains a Buy, at a 3.1% allocation.

Pro Completed Trades (from the past two weeks)

- **Amazon.com** (NASDAQ: AMZN): We bought a 3% stake (which turned out to be 100 shares) at $820.48.
- **Skyworks Solutions** (NASDAQ: SWKS): We rolled our January 2017 $75 calls to February 2017 $75 calls for a $1 credit. Soon after, we rolled those February 2017 $75 calls to August 2017 $87.50 calls for a $1 debit, and sold to open the same number of August 2017 $85 puts for a $1 credit (meaning no cost to roll overall, but 4% more stock exposure through the new puts). We now have an August $85/$87.50 covered strangle on the stock.

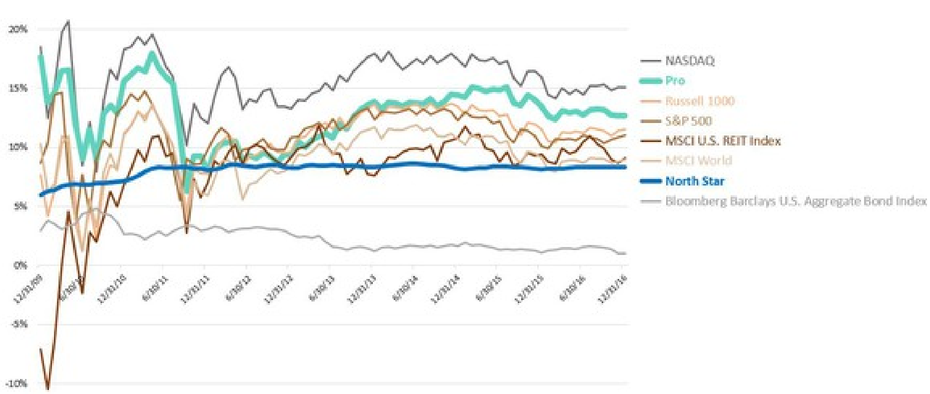
You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro's Performance Graph, Updated

Published Jan 30, 2017 at 3:48PM

Dear *Pro* Fools,

Last week, while I was checking out the North Star section of *Pro*'s Guidebook (which is a very important section if you haven't read it!), I noticed that the charts included there were a bit stale. The graphs included in that section were last updated as of 2012 -- five years ago. So I took it upon myself to recreate the performance graph using our most recent data (from *Pro's* historical monthly account balances):



(Click image for larger version)

To properly interpret this graph, keep in mind that the returns shown here are annualized, not cumulative. While annualized returns allow for easier comparison of data over time, they have some flaws. Over short time periods, annualized returns can appear volatile, while over long periods the data becomes more smooth (which is why the left side of the graph is highly variable and the right side looks more stable). Additionally, annualized returns over periods of less than one year are not very useful, so I started the data series a little more than a year after *Pro's* inception. I've also included a few more market indices for comparison than did the original graph, which I hope will provide more context for our performance relative to other asset categories.

Additionally, here is a tabular form of the same data, showing return comparisons over different time periods:

	1 year	2 years	3 years	5 years	Since Inception
Annualized Total Return					
Pro Portfolio	7.3%	7.4%	10.7%	15.9%	12.7%
North Star	9.3%	8.5%	8.3%	8.5%	8.3%
NASDAQ	8.9%	7.9%	10.1%	17.1%	15.0%
Russell 1000	11.4%	5.7%	7.9%	14.0%	11.5%
S&P 500	18.3%	7.2%	8.8%	11.8%	11.0%
MSCI U.S. REIT Index	7.1%	4.2%	11.8%	10.5%	9.1%
MSCI World	8.2%	3.8%	4.4%	11.0%	9.0%
Bloomberg Barclays U.S. Aggregate Bond Index	0.1%	-0.9%	0.6%	-0.4%	1.0%

Finally, for further context, here is the annualized volatility (i.e., the standard deviation) of the monthly returns for the same data categories:

	1 year	2 years	3 years	5 years	Since Inception
Volatility (Standard Deviation)					
Pro Portfolio	9.4%	10.5%	9.5%	9.7%	11.6%
North Star	0.9%	1.1%	1.1%	1.1%	1.4%
NASDAQ	14.0%	14.4%	13.2%	12.8%	16.5%
Russell 1000	10.6%	11.7%	10.7%	10.4%	14.7%
S&P 500	9.9%	11.7%	10.6%	10.3%	14.2%
MSCI World	10.8%	12.2%	11.0%	11.1%	15.7%
MSCI U.S. REIT Index	16.0%	15.7%	14.9%	14.3%	25.4%
Bloomberg Barclays U.S. Aggregate Bond Index	3.8%	3.5%	3.3%	3.2%	3.7%

This data was originally presented as monthly volatility. The table has been updated to annualize the figures.

What Does This Say About Our Portfolio?

We can see from the graph above that since 2012, Pro has significantly widened the gap between our portfolio's return and our North Star (although that gap has been narrowing since mid-2015). We can likely attribute some of our outperformance to our relatively high allocation to technology, as we can see that the NASDAQ index has been the strongest-performing asset category included in this analysis since *Pro's* inception.

Additionally, we can see that *Pro's* returns correlate much more closely with market indices than with our North Star. This is an important consideration: While we aim to achieve North Star-like returns over long periods of time, we do *not* expect to follow the return trajectory of our North Star over short periods. Our North Star is an abstract concept, not an real, investable asset. In fact, it's much more stable than any asset that will allow for the magnitude of returns we are looking for, and that's because it includes a constant 7% annual appreciation factor. As *Pro* investors, we must understand that to achieve the type of returns we seek (7%-plus), we must be willing to accept short-term volatility.

To illustrate that point, you can see from the volatility table above that the only included asset category that comes anywhere close to matching the stability of the North Star is bonds. However, in exchange for that stability, the annualized returns are far lower than what is achievable from the more volatile equity category. And while we accept that volatility is inevitable, we still work very hard to reduce the *Pro* portfolio's volatility using shorts, hedges, and our sizable cash balance. The table shows that the *Pro* portfolio scores the lowest among all the included categories (except for bonds) in terms of the volatility of our monthly returns.

The *Pro* Bottom Line

All in all, *Pro* has done well to outperform our North Star and most other stock categories, while still achieving a lower volatility of returns. We aim to continue to achieve our goals as we move forward, keeping our volatility, expected returns, and allocations in mind. I hope this update and analysis helps provide a more complete picture of how our portfolio has performed over time.

Pro Catch-Up Trades and Upcoming Expirations: Jan. 30, 2017

Published Jan 30, 2017 at 2:42PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.4%.

Continue building your portfolio with our Buys, including:

- **Amazon.com** (NASDAQ: AMZN): Buy 3% (see our recommendation).
- **Paycom** (NYSE: PAYC): Buy 2.4% (see our recommendation).
- **Visa** (NYSE: V): Buy 2.4%.

Shorts:

- No update this week.

Pro options:

- **Skyworks Solutions** (NASDAQ: SWKS): If you only own stock, keep it uncovered. Shares remain a Buy. If you are trying to roll your pre-existing covered calls that expire in February, roll to the August expiration, $87.50 strike. If you're also writing puts as part of the roll (not for any other reason), sell to open August $85 puts.

Hedges:

- No update for member portfolios. The Fool mistakenly set up a 2019 put ratio spread on QQQ for our account instead of 2018, so we need to close it and open the recommended 2018 position. We'll provide an update on which strike prices we're using once we're able to make that change. But those already in the 2018 position as recommended are fine.

Upcoming Expirations:

- Right now, nothing is set to expire until March, so we'll have updates on those in February.

Pro Guidance Changes and Completed Trades: Jan. 30, 2017

Published Jan 30, 2017 at 2:36PM

Pro Guidance Changes (from the past two weeks)

- **Amazon.com** (NASDAQ: AMZN): Introduced to *Pro* as a Buy, at a 3% allocation.
- **O'Reilly Automotive** (NASDAQ: ORLY): Moves to Hold while we consider anew the risk Amazon might pose to the auto parts industry.
- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $87.50 from $85. The stock remains a Buy, at a 3.9% allocation.
- **TD Ameritrade** (NASDAQ: AMTD): Fair-value estimate increases to $41 from $35. The stock remains a Buy, at a 3.3% allocation.

Pro Completed Trades (from the past two weeks)

- **Domino's Pizza** (NYSE: DPZ): We sold to open June 2017 $140 covered puts, receiving $2.96 each for selling three contracts.
- **Expeditors International** (NASDAQ: EXPD): We closed our January 2017 synthetic long and short $50 calls. We're currently out of the position.
- **ProShares QQQ Trust** (NASDAQ: QQQ): The Fool mistakenly set up a January 2019 $103/$116 put ratio spread for a credit, instead of the recommended 2018 put ratio spread. We need to adjust the position to 2018 and will alert you as we do.
- **Skyworks Solutions** (NASDAQ: SWKS): We rolled our January 2017 $75 calls to February 2017 $75 calls for a $1 credit. Soon after, we rolled those February 2017 $75 calls to August 2017 $87.50 calls for a $1 debit, and sold to open the same number of August 2017 $85 calls for a $1 credit (meaning no cost to roll overall, but 4% more stock exposure through the new puts). We now have an August $85/$87.50 covered strangle on the stock.

You can see all of our guidance, positions, and transactions from the Recommendations page.

How Our Eight-Year Bull Market Stacks Up Historically

Published Jan 30, 2017 at 11:42AM

Fellow Fools, this article was first published Saturday in our Motley Fool One *service, and the team thought* Pro *members might be interested, too. Let us know what you think on our Philosophy & Strategy discussion board!*

No investor is an island.

The Dow passed 20,000 for the first time this week.

The milestone doesn't mean much — the market is 0.02% from where it was two weeks ago, a level no one cared much about.

But what is impressive and deserves attention is the ongoing appreciation for how far the market has risen over the last eight years, and how long this bull market has lasted.

I started writing for The Motley Fool on October 1, 2007. The market peaked two weeks later before embarking on one of the biggest bear markets in history. It bottomed in March 2009. If you told someone at the time that stocks would basically go straight up for the following eight years, I'm telling you, not one person in a thousand would have believed you. Including me.

Why? Because there just aren't many periods in history where stocks do really well for eight years. It's only happened a handful of times in the last 100 years.

To put the last eight years of market gains in perspective, let's compare it to other historic bull markets.

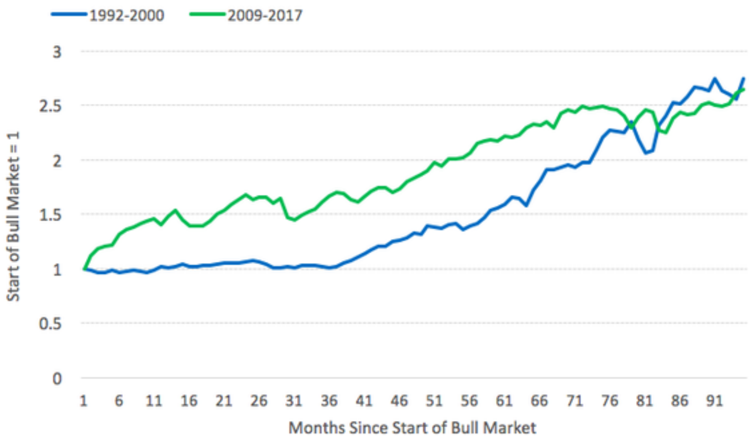
One caveat, and it's an important one: Comparing today's market to the past is not an attempt to argue that today's market will follow the same subsequent path as one in the past, especially in the short run. It's merely context on how far we've come.

The 1990s Bull Market

The dot-come era was born and the economy roared, making the 1990s one of the most famous periods in market history. For the first time ever, small retail investors (like you!) could participate in the market without the guidance of a broker.

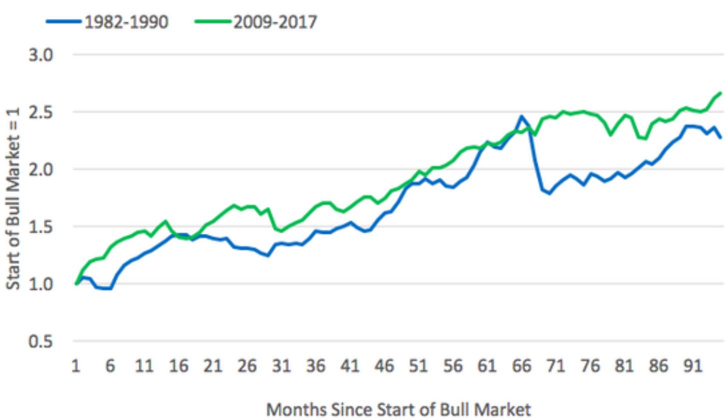
A recession in the early 1990s dragged the market down. Stocks began rallying in 1992, and didn't look back until peaking in 2000.

How do the 1990s compare to the last eight years? Pretty similarly, in both magnitude and duration:



The 1980s Bull Market

The market peaked in the mid-1960s and then went nowhere for the next 20 years, adjusted for inflation. The 1970s and early 1980s were a miserable time to be an investor. But high future returns are born in miserable periods, and by 1982 stock valuations were so low that a new rally was born. Morning In America was here, and stocks surged from 1982 to 1990 — even with the crash of 1987 in the middle:



Here again — both the magnitude and duration of the 1980s bull market is about on par with what we've experienced in the last eight years.

The 1920s Bull Market

Next to the 1990s, the 1920s are the most famous period of market excess and insanity — a period that both soothed the pain of an economy torn by World War I and set the seeds for the pain of the Great Depression. In his diary of the Great Depression, author Benjamin Roth wrote:

> As I look back now to the 1921-29 period it seems to me unreal and almost unbelievable. After the war pressure people wanted to have a good time and to spend money.

Here's how the 1920s stack up to today:

The 1920s is one of the only eight-year periods when the market performed better than it has in the last eight years. And it did far better: Equivalent eight-year returns would put the Dow at more than 34,000 today.

The 1950s and 1960s Bull Market

We remember the 1950s and '60s as a glorious time for American economic growth — and it was. Global dynamics that came out of World War II combined with an incredible amount of factory productivity learned during the war combined with pent-up consumer demand caused by rations during the war set the stage for 15 years of amazing growth.

Here's how it compared to today's bull market:

The eight-year rally from 1950 to 1958 is about on par with what we've experienced since 2009.

Then came a series of declines — moderate, but not severe. The 1950 to 1965 bull market, if taken as one, was an incredible period of wealth creation.

I left in the whole 15-year period in this chart not to predict what might come next for us today, but to show what's possible over long stretches of time even after big run-ups like we've had over the last eight years.

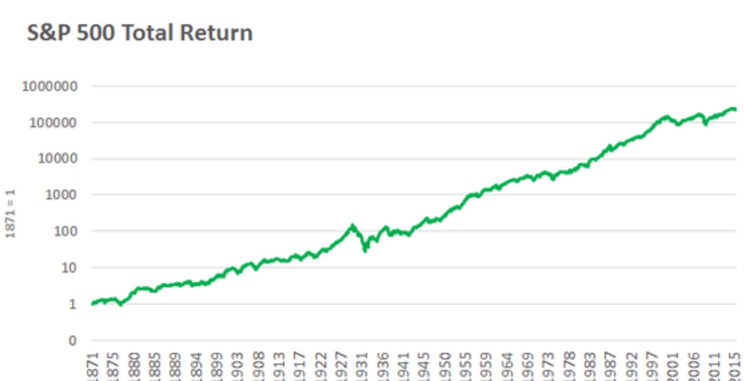
All of which is to say: We've been here before.

The last eight years is not unprecedented.

What gets dangerous is when you assume we've come too far, too fast, and think that the rally of the last eight years means we're due for crash.

We will have more bear markets. Maybe starting next month, maybe next year, maybe five years from now. The fact that we're surprised at how far we've come since 2009 should be a reminder that outcomes are surprising, not that your prediction of a new bear market is due to come true.

The most important thing any of us can do is contextualize big rallies and big drops against two things: our own personal needs and goals, and the long-term record markets have produced over time:



Buy Amazon.com

Published Jan 26, 2017 at 3:25PM

Is this for you? This recommendation is for all *Pro* members who don't already own shares in this company.

How You Participate

- **Action:** Invest 3% of your portfolio in **Amazon.com** (NASDAQ: AMZN)
- **Price Guidance:** Aim to buy below $850
- **Recent Price:** $837
- **Guidance:** Buy
- **Fair-Value Estimate:** $850, or 30 times projected one-year free cash flow
- **Note:** The company announces earnings Feb. 2. We have no idea how the stock will respond that day, but we aim to buy before then, with a long-term outlook.

What We're Thinking

When *Pro* first bought **Apple** (NASDAQ: AAPL) in 2012, it was already the most valuable company in the world, sporting a massive $127 billion in annual revenue. Less than five years later, revenue is up 69%, and our investment (to which we later added) is up 72% excluding dividends. Apple has outperformed a majority of our positions, despite its giant size. Enormous **Amazon.com** (NASDAQ: AMZN) could follow the same path, and may even have superior avenues for sustained growth:

- According to the U.S. Census Bureau, only 8% of U.S. retail sales occur online, but the shift to the Internet continues -- Amazon's revenue rose by 29% last quarter.
- Gartner estimated in 2015 that Amazon Web Services (AWS) for the cloud had 10 times the utilized capacity of its next 14 competitors *combined*, and this lucrative business increased revenue by 70% in 2015.
- Alexa is a leading artificial-intelligence operating system in the home.
- Amazon Prime may have as many as 80 million global subscribers, each paying $99 a year for free shipping and streaming video.
- And more ...

Amazon has so many business arms that a more fitting name could have been Octopus. Consumer retail sales drive massive cash flow to the company daily, but today it's cloud services that generate most of the profits. Amazon's cloud is heavy in machine learning and AI; relatedly, Alexa's early success is driving Amazon Echo and Dot product sales, and manufacturers around the world are now building Alexa into new devices and cars. Amazon has hundreds of fulfillment centers, and investment bank Piper Jaffray says 44% of U.S. citizens now live within 20 miles of one -- that's a strong competitive advantage. Drone delivery is in the works, and Amazon is investing in more of its own delivery to save on costs. U.S. sales account for about two-thirds of retail revenue, but international is growing and largely untapped. In an unconventional surprise, the company is launching a physical bookstore in Manhattan, and Amazon Go grocery stores around the country. And then there's Amazon's award-winning original content.

Sometimes lost in the breathless coverage of all these initiatives is what helps drive the success of each: data. Founder and CEO Jeff Bezos, 53, is driven by the intelligent use of information and cutting-edge technology to do business better than others. As the world's largest online retailer, Amazon has a better understanding of consumer retail behavior than any internet competitor, allowing it to anticipate customer desires. Couple that with the relentless pursuit of improving the customer experience, and Amazon always seems two steps ahead. In its own words, Amazon is "guided by four principles: customer obsession rather than competitor focus, passion for invention, commitment to operational excellence, and long-term thinking." Management has a history of reinvesting cash flow for more growth, learning from mistakes, and pushing new boundaries. This bodes well for long-term growth.

Financials

The longstanding critique of Amazon has been its lack of consistent let alone steadily-growing earnings. The company turns 23 soon, so it needs to start pulling its own weight. But this argument ignores Bezos's extremely long-term outlook. You've surely heard it before: Amazon brings in cash from customers before it pays suppliers, resulting in a "float" that keeps it perpetually cash-rich, like a rainforest rich with oxygen. Successfully investing some of that cash in new growth and succeeding some of the time (you'll have your failures) can turn the business into a regenerating compounding machine, one where the winners will outweigh the losers, and the core keeps growing. But until recently, it wasn't clear just how profitable Amazon could be.

In 2015, Amazon made a modest $596 million in net income, or $1.28 per share. The 2016 S&P Capital IQ estimate calls for about $2.3 billion in income, or $4.79 per share. We'll see on Feb. 2. After years of waiting, income finally appears ready to balloon, and that's despite management continuing to invest giant sums in the business. On average (from S&P Capital IQ), Wall Street expects earnings per share to jump another 85% in 2017, to more than $8, and then expand to nearly $15 per share in 2018, and then more than $22 per share in 2019. Amazon doesn't provide guidance, and we know Bezos doesn't mind sudden losses, but we believe these estimates accurately reflect the leverage becoming available to the business when Bezos *wants* to tap into it. In fact, this phenomenon is already unfolding on the top line as various business lines improve: Since 2012, gross profit is up nearly 300%, while revenue has only about doubled. And trailing free cash flow is more than $8 billion, up from just $395 million in 2012, putting the company at about 45 times free cash flow.

That's a lot of numbers in one paragraph, all meant to illustrate one belief: Amazon can be a richly profitable business, once it wants to be. Wall Street believes that will start to happen this year, and if so, the stock should celebrate. If not, we'll likely just need to wait longer before it does. But the past two years of free cash flow growth suggest it's happening.

Amazon.com Metric	2011	2012	2013	2014	2015	TTM (to 9/30/2016)
Cash from Operations	$3,903	$4,180	$5,475	$6,842	$11,920	$14,603
Capital Expenditures	$1,811	$3,785	$3,444	$4,893	$4,589	$6,040
Free Cash Flow	**$2,092**	**$395**	**$2,031**	**$1,949**	**$7,331**	**$8,563**

Source: S&P Capital IQ. Dollars in millions.

What We're Watching

Amazon continues to invest in worldwide distribution, artificial intelligence, the cloud, drones, original content, shipping, and now brick-and-mortar retail stores. The idea of retail might elicit a cringe, but think of retail stores done right: **Starbucks** (NASDAQ: SBUX), **Panera** (NASDAQ: PNRA). Done well, retail can be an excellent long-term investment, but we'll be watching Amazon's results.

Our largest near-term risk is that Wall Street's expectations prove premature, deflating the stock. Our largest long-term risk is that Amazon makes bad moves, putting a profit trajectory at risk. We want to see steadily growing profits and free cash flow as Amazon finally starts to mature (though it'll still be a young company for a few decades more). We're willing to wait for stable growth if it appears imminent, because then the stock should keep performing, but not if a positive outcome starts to appears less and less likely. Then we may have to exit. On the plus side, Bezos has more than $60 billion invested in the stock, so he's on our side. Finally, we view the highly profitable AWS business as a risk: Competition will likely lower margins, so we want to see the sales growth rate remain strong enough to compensate for that on the bottom line. And Amazon has a volatile stock. We have to accept that.

Why Now?

For most of our investments in *Pro*, we want to see a clear path toward increasing profits and free cash flow, and Amazon has always bounced along a dusty road between profits and losses. We knew that was by design, but we didn't know when it could finally turn the corner. It appears to be doing so now, and the profits that could result between now and 2020, and then beyond, could impress everyone. At the same time, online retail will become much more than 8% of U.S. retail sales and will keep expanding internationally. AI is also changing shopping behavior, and Amazon is leading that charge. Combine all these factors, and Amazon may soon have the stellar, smooth financials of a company that you simply "must" buy. We'd rather buy it a bit before the rush. (Amusingly, though, this isn't the first time I've been involved in an Amazon buy: The first was ... 1997.)

Alternative Trades

We assume that many of you already own shares. Keep your allocation right where you want it. If you don't own shares yet, we're starting with a 3% stake. Given the share price, we don't expect to use options on it.

Pro Can Help

- Finally, a *Pro* discussion board for the company where most of us likely do the majority of our online shopping: Amazon.com.

Pro's Biggest Stocks in a New Era

Published Jan 23, 2017 at 3:40PM

Dear *Pro* Fools,

There's change on the horizon. Scratch that. Change is already here.

For one, the United States has a new, hard-driven president intent on keeping and expanding manufacturing in the U.S., with penalties planned for U.S. companies that choose to make products elsewhere and import them for sale stateside. Earlier today, the White House suggested a 35% tax on outsourced items brought back to the country to sell. If even some form of this stance comes to fruition, it's bound to lead to epic changes. One of our largest overseas manufacturers is **Medtronic** (NYSE: MDT), which produces devices around the world that are brought home to sell. Much larger, of course, is **Apple** (NASDAQ: AAPL). We're digging into how these companies may be affected and how they may react.

While changes in import tax laws are probably on the way, major trade deals including NAFTA are simultaneously on the docket for renegotiation. Both situations suggest uncertainty for now, which likely will lead to volatile stock prices. Offsetting this potential "uncertainty headwind," today the White House suggested that up to 75% of current U.S. regulations governing business could be removed, potentially freeing businesses to do more, faster. That promise is difficult to fathom, since most regulations were put together over many years and for specific reasons. The 75% number will likely prove high, but suffice to say that regulations are likely to decrease. Taxes are expected to descend sharply for corporations, too. These two concrete changes could serve as a tailwind to stocks but may already be behind much of the market's gains since November.

Tailwinds plus headwinds generally equals volatility, and that may be especially true in this case because any change is a process: It takes time, it evolves as it happens (adding to uncertainty), and it can't help but upset the status quo. As we look ahead to that sort of environment, we should be asking ourselves, "How does my portfolio look?" Start with your largest positions.

Pro's largest positions, in order, are:

- **Facebook** (NASDAQ: FB)
- **Broadridge Financial Services** (NYSE: BR)
- **AmTrust Financial Services** (NASDAQ: AFSI)
- **O'Reilly Automotive** (NASDAQ: ORLY)
- **MasterCard** (NYSE: MA)

As of this afternoon, those five positions combined accounted for 26.2% of the portfolio's value. At first glance, we're not likely to face any import tariff concerns here. None of these businesses produce tangible items. They're all services, except O' Reilly's, which runs retail stores in the U.S. selling parts made by others.

But this is a simplistic look at the situation. Facebook relies on advertising. If manufacturers are suddenly hit by import tariffs, will they advertise less as they adjust? Will MasterCard be affected by fewer transactions if trade uncertainty slows commerce?

And then what of **Skyworks Solutions** (NASDAQ: SWKS)? With today's put-writing recommendation -- only for certain members, note -- Skyworks Solutions becomes a top potential position for us. It manufactures its tiny chips around the world, and those products are used overseas in phones and devices that Skyworks itself doesn't make or sell. As a result, most of its business starts and ends overseas. It should be clear of import tariffs, but what if its end customers are not, and business slows as a result?

Everything is interconnected, which is ultimately why changes from D.C. should ideally arrive slowly, methodically, after thinking through the ramifications as much as possible. This means we may live with uncertainty for a long time, as potential changes are debated. But that's better than the alternative -- better than changes that are rushed through, leading to cascading effects.

The bottom line is that we're assessing the news as we see it, and thinking about how it may affect our businesses. In most cases, there will not be an easy or early answer, so we need to expect volatility while we wait. We should see volatility as opportunity. Meanwhile, we have a portfolio that has little to do with manufacturing aside from a few positions, so we're fortunate in that sense. But we must still take stock of large potential changes in trade law, and invest how we believe is best. We've been looking at new companies in this light since November.

Overall, our biggest task will be to remain long-term owners in superior businesses, owning the ones that should win despite changes, because the environment is changing for everyone. We should *not* mess with our approach, which has always -- ultimately -- worked in the past and should continue to work over time. But we can tweak, adjust, and aim to get better, so we're tuned into our changing world as it happens.

Bring your thoughts to the Memo Musings board. Fool on!

— Jeff (TMFFischer)

Pro Guidance Changes and Completed Trades: Jan. 23, 2017

Published Jan 23, 2017 at 3:15PM

Pro Guidance Changes (from the past two weeks)

- **Skyworks Solutions** (NASDAQ: SWKS): Fair-value estimate increases to $87.50 from $85. The stock remains a Buy, at a 3.9% allocation.
- **TD Ameritrade** (NASDAQ: AMTD): Fair value estimate increases to $41 from $35. The stock remains a Buy, at a 3.3% allocation.

Pro Completed Trades (from the past two weeks)

- **Domino's Pizza** (NYSE: DPZ): We sold to open June 2017 $140 covered puts, getting $2.96 each, selling three contracts.
- **Expeditors International** (NASDAQ: EXPD): We closed our January 2017 synthetic long and short $50 calls. We're currently out of the position.
- **ProShares QQQ Trust** (NASDAQ: QQQ): The Fool mistakenly set up a January 2019 $103/$116 put ratio spread for a credit, instead of the recommended 2018. We need to adjust the position to 2018 and will alert you as we do.
- **Skyworks Solutions** (NASDAQ: SWKS): We rolled our January 2017 $75 calls to February 2017 for a $1 credit.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Jan. 23, 2017

Published Jan 23, 2017 at 2:19PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.4%.

Continue building your portfolio with our Buys, including:

- **Paycom** (NYSE: PAYC): Buy 2.4% (see our recommendation).
- **Visa** (NYSE: V): Buy 2.4%.

Shorts:

- Holding pat right now.

Pro options:

- **Domino's Pizza** (NYSE: DPZ): Use a limit order to write (sell to open) June 2017 $140 covered puts following our new recommendation. Write one put for every 100 shares of Domino's you are short. The puts lately pay around $3.10 or so. If the stock price declines, the puts should pay better.

Hedges:

> No update at the moment. The Fool mistakenly set up a 2019 put ratio spread on QQQ for our account instead of 2018, so we need to close it and open the recommended 2018 position. We'll provide an update on which strike prices we're using once we're able to make that change. But those already in the 2018 position are fine.

Upcoming Expirations:

> Right now, nothing is set to expire until March, so we'll have updates on those a bit later in February.

Roll Your Covered Calls on Skyworks Into a Covered Strangle

Published Jan 23, 2017 at 1:50PM

Is this for you? This recommendation is only for *Pro* members who have written $75 covered calls on **Skyworks Solutions** (NASDAQ: SWKS) expiring Feb. 17. The stock remains a buy at a 3.9% allocation. Those who have not yet written covered calls should leave it uncovered, and just go on owning it; we're playing catch-up here by rolling our calls into a covered strangle, so newcomers don't need to follow along.

How You Participate

- **Trade:** Use a rolling order on Skyworks' options to:
  - "Buy to close" all Feb. 17, 2017, $75 calls.
  - "Sell to open" the same number of August 2017 $87.50 calls.
  - In addition, "sell to open" the same number of August 2017 $80 **puts**.
    After this, participants should have the stock you already owned, plus an August 2017 $80 put/$87.50 call covered strangle written on all of your shares.
- **Allocation:** Write ("sell to open") one new call for every call you are closing. *Pro* is continuing to cover all 1,200 shares owned. We're now writing one new put for every short call, as well, potentially doubling our exposure, though we plan to roll the strangle rather than take shares.
- **Recent Prices:**
  - Stock: $89.90

- Buy to close Feb. 17, 2017, $75 call (splitting bid/ask): $15
  - Sell to open August 2017 $87.50 calls: $10.30
  - Sell to open August 2017 $80 puts: $5.40
  - Net credits collected: Approximately $0.70 (this price will change)
  - Upside gained: $12.50 per share
- **Option Price Guidance:** Prices will change, but lately use limit orders to complete all transactions for a credit of about $0.70 (at recent prices) or more. The price you pay to roll your calls from $75 to $87.50 (about net $4.70), you should aim to get back by writing puts for the same amount or more (lately $5.40). If the stock moves meaningfully in either direction before you make your trade, adjust your strike prices accordingly to end up rolling for no cost or, if not possible, a small debit, such as $0.50 or less. We'll do the same if need be.
- **Stock Guidance:** Buy 3.9%. As mentioned above, don't use options on it today if you haven't yet.
- **Fair-Value Estimate:** Increases to $87.50 from a long-standing $85.

What We're Thinking

Everything that stood out at Skyworks Solutions more than two years ago when we first bought shares came through in spades in last week's earnings report: Skyworks is signing more large customers for its complex connectivity solutions; it is expanding content in the products it serves, taking more market share; and it is increasing its margins and free cash flow. The company sees a healthy 2017 ahead and strength lasting into 2018, for a start. Along with serving all of the major smartphone makers, Skyworks is finding a home in home connectivity products, including those from **Amazon.com** (NASDAQ: AMZN), **Alphabet** (NASDAQ: GOOG), and **Microsoft** (NASDAQ: MSFT); its semiconductor products are also connecting cars to the Internet, with **Tesla** (NASDAQ: TSLA) among its newest customers. Skyworks sees tremendous long-term opportunity in cars because each automobile must process an incredible amount of data every time it's used, so fast, efficient, complex connectivity is key -- that's right in Skyworks' sweet spot.

The company expects revenue growth of greater than 10% this year, and Internet of Things growth above that, at 10% to 15%. Mobile phones account for about 60% of revenue, the broad Internet of Things category 25%, and power amplifiers about 15%. China contributes about 25% of revenue and growing, and overall production is fully booked going into the new quarter.

Management anticipates an especially strong second half and early 2018 on the heels of the new 10-year anniversary iPhone. **Apple** (NASDAQ: AAPL) recently accounted for 40% of company revenue; while that number definitely gives us pause, it also reflects the recent hit suffered by Samsung, due to its exploding phones; Samsung should start to claw back this year. Meanwhile, Skyworks' relationship with Apple is on strong footing, with a partnership that looks years ahead. Even beyond that, Skyworks sees 5G technology as a large opportunity, with data speeds up to 10 times faster than today's 4G and LTE, requiring more complex solutions that it's well positioned to offer.

Why This Strategy?

All of this is great, except that we covered our shares last summer for income, and we've been playing catch-up almost ever since. I knew it was a risk to cover a volatile stock, and we'll discuss lessons learned later; for now our priority is addressing it. Our latest covered call was closed last week for about a 35% gain (we made $3,324 in profit by closing our January $75 calls last week). But to get more upside in the stock now, we need to roll our February $75 calls, and we should do so soon because they now lack time value. With shares at about $90, we can roll up to $87.50, buying to close almost all intrinsic value in our $75 calls, and writing mostly time value in the new calls. Then we're also writing $80 puts (all time value) to capture more credit (note: the put writing is optional!). This allows us to roll our covered calls up $12.50 in strike price without putting in substantial or any additional capital.

But we are accepting more exposure to Skyworks in the process, making the stock our largest position on the surface. Given the $15 per share in credits we'll have on the books after this roll, we'll have a net $65 start price on any potential new shares, and a potential sell price of $102.50 on existing shares. It's a wide range to work in, and our intention is to roll our strangle as we earn credits on it, continuing to manage the position to earn back premium and recapture upside in the shares. We're comfortable with the extra exposure to the stock given the strength of Skyworks' business, reasonable valuation, and our plan for managing this lucrative strangle. But even the best of plans can sometimes get sidetracked, so be comfortable with extra exposure to Skyworks before writing the puts.

Alternative Trades

- **Can't write puts?** Then simply roll your covered calls, the same way we are. You still capture $12.50 in upside for a cost of only about $4.70 or so. It's worth it given the healthy prospects here.
- Other than that, this is a specific roll, with a strategy change, to regain recent missed upside. So again, those just owning shares going into today should continue to do so, and not use options today. The stock remains a Buy.

More That Matters

- **Maximum gain:** The stock's upside is capped at our written call's strike price; plus, we can profit by earning the premiums received for writing the strangle.
- **Maximum risk:** The full stock value, plus the full written put exposure, which is more stock exposure starting at our put strike.
- **Follow-up**: We'll continue to manage our covered strangle, rolling for upside or for more credits as needed, at least until we're satisfied with the returns we've recaptured. We plan to keep the stock long-term as long as the business and valuation seem to merit it.

Options Can Help

TD Ameritrade Benefits From Higher Interest Rates

Published Jan 20, 2017 at 1:20PM

Pro's Take: AMTD Fiscal Q1-2017 Earnings

TD Ameritrade (NASDAQ: AMTD)

What Happened?

- Fiscal Q1-2017 press release
- Fiscal Q1-2017 earnings presentation

- [Fiscal Q1-2017 earnings call transcript]

Guidance Update

After incorporating this quarter's results into our model, **our Fair Value estimate increases to $41**, up from $35. Cash flow generation since the last FV update, higher growth in the company's spread-based balance, and increased expectations surrounding interest rates are the factors leading to the increased FV estimate. Nonetheless, at more than $46 per share as of this writing, the stock is still more than 10% above our Fair Value estimate, so we'd advocate some caution (perhaps buying a half position or writing puts to buy shares lower) if you haven't yet established exposure to TD Ameritrade. The stock can be quite volatile as it often trades based upon market sentiment for financial stocks.

Updated guidance: Buy (no change)

Recommended Allocation: 3.3%

Fair-value estimate: $41 (up from $35)

Current price: $46.13

The Numbers

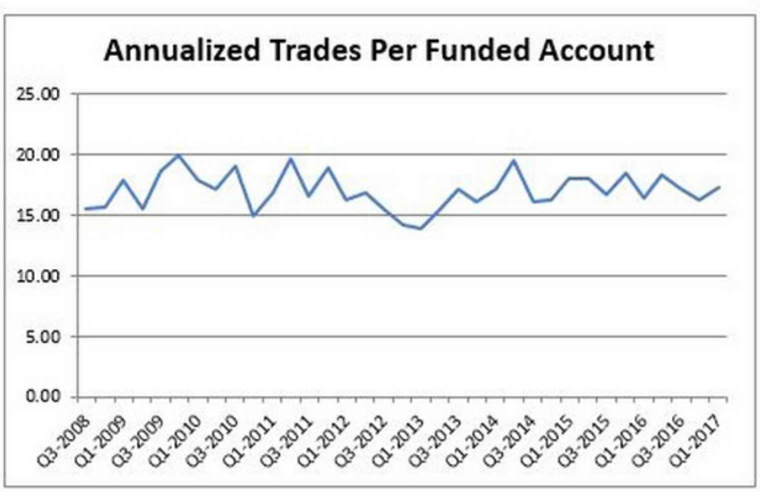
- Net revenue of $859 million (+5.8% year-over-year)
  - **Transaction-based**:
    - Funded accounts grew to 7.05 million (+5.4% year-over-year)
    - Trades per funded account of 4.32 (vs. 4.09 last quarter vs. 4.13 a year ago)
    - Average commissions and fees per trade of $11.65 (vs. $11.82 last quarter vs. $11.90 a year ago)
    - Totals up to:
      - 7,046,000 x 4.32 x $11.65 = **$355 million** in transaction-based revenue (+8.2% year-over-year)
  - **Spread-based**:
    - Total spread-based revenue of **$396 million** (+3.9% year-over-year)
    - Average spread-based balance of $117.7 billion (+14.8% year-over-year)
    - Thus, Net Interest Margin (NIM) =
      - $396 million / $117.7 billion = 0.336% (quarterly)
      - NIM (annualized) = 0.336% x 4 = 1.35% (vs. 1.37% last quarter vs. 1.49% a year ago)
  - **Fee-based**:
    - Fee-based revenue of $94 million (+2.2% year-over-year)
    - Average fee-based balance of $170.4 billion (+7.4% year-over-year)
    - Thus, Investment Product Fee Yield =
      - $94 million / $170.4 billion = 0.055% (quarterly)
      - Investment Product Fee Yield (annualized) = 0.055% x 4 = 0.221% (vs. 0.232% last quarter vs. 0.232% a year ago)
- Record client assets of $797 billion (+14.6% year-over-year)
- Record interest rate sensitive assets of $125 billion (+14% year-over-year)
- Net new client assets* of $18.7 billion (9.7% annualized growth rate)
- Diluted EPS of $0.41 per share (+3.8% year-over-year)
- Trailing-12-month (TTM) average return on equity (ROE) of 16.6% (down from 16.7% a year ago)
- Capital management:
  - Paid $0.18 per share in cash dividends in the quarter (a 1.6% yield on the current share price)

*excludes changes in client assets due to market fluctuations

Analysis

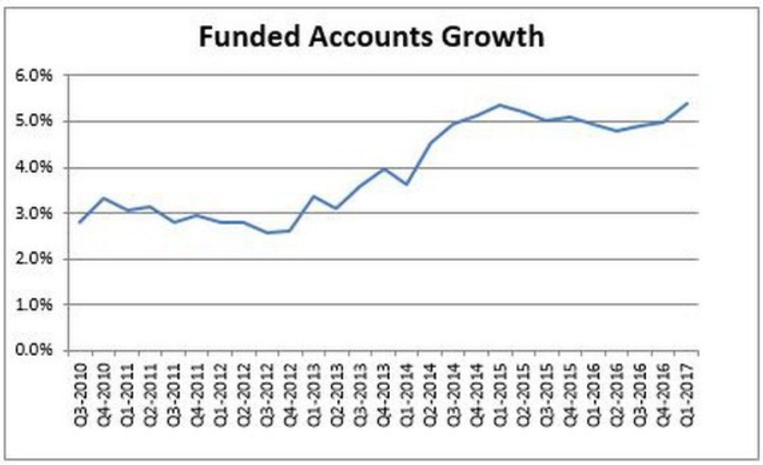
TD Ameritrade continues to gather client assets at a steady pace. In Fiscal Q1-2017, the company reported net new assets (NNAs) of $18.7 billion, a 9.7% annualized growth rate relative to total client assets at the beginning of the quarter. The company's long-term goal is to grow net new assets at a rate between 7-11%, and this quarter is at the upper end of that range.

Trading activity increased this quarter compared to last quarter, averaging 487,000 trades per day this quarter, up 11% year-over-year:

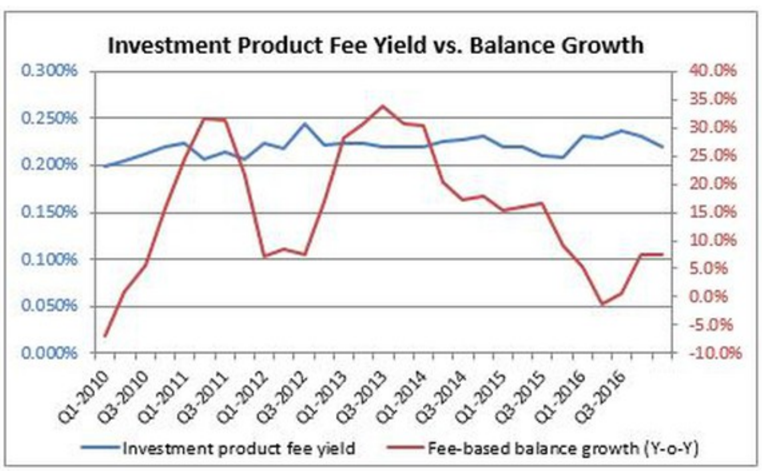


Average commissions and fees per trade came in at $11.65, which is down -1.4% sequentially and down -2.1% year-over-year:

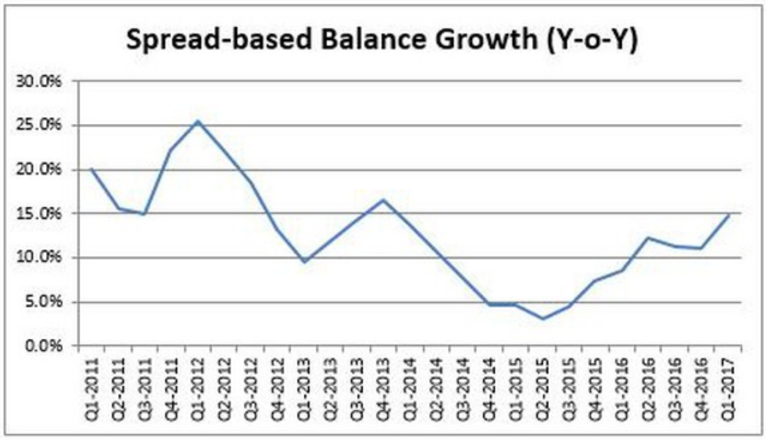
We expect a steady decline (around 3% per year) in commissions and fees per trade over the next ten years due to price competition in the industry. In the short-term, the transaction-based revenue stream will likely continue to bounce around, varying based upon product mix, market volatility, and fluctuations in the commission rate. But over the long run, steady account growth (a 4.4% CAGR over the last 8+ years) has led to persistent upward pressure on transaction-based revenue, and that trend seems likely to continue, as account growth accelerated in this quarter:



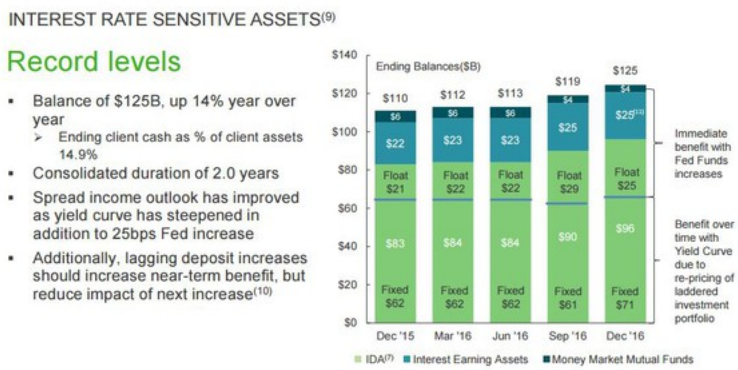
The performance of the fee-based segment of the business moderated a bit this quarter, with fee-based revenue up +2.2% year-over-year. The company's average fee-based investment balance during the quarter was $170 billion, up +7.4% year-over-year. A decline in the investment product fee yield led to the lower growth seen in this segment. We expect modest growth in fee-based revenue (about 4% annually) over the next ten years:



As for the company's spread-based revenue stream, TD Ameritrade reported accelerating growth the in the spread-based balance, which is important given that this segment is highly sensitive to interest rates:



As the interest rate yield curve continues to steepen (as it has post-election with the 10-year treasury up 54 basis points), the larger TD Ameritrade's spread-based balance is, the more the company stands to benefit from higher rates:



Management mentioned that the benefit from the market increase in interest rates is likely to exceed their earlier guidance for a $0.08-$0.10 impact to EPS, due to a steeper yield curve and lower pay rates than anticipated.

What We Think Now

TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and as interest rates increase, the company is positioned to grow earnings sharply.

If you have questions, post them on our TD Ameritrade discussion board.

Upcoming Split: OpenText

Published Jan 18, 2017 at 4:00PM

OpenText (NASDAQ: OTEX) is conducting a 2-for-1 stock split* next week. Here's what you need to know.

- **What's happening?** Sometime after market close on Jan. 24, OpenText shareholders will notice that they have twice as many shares as they used to, each priced at half that day's closing price.
- **What does this mean for me?** Not much! You will still own exactly as much of a stake in the company as you did before. Shares will be a little easier for investors to buy and sell since their price will be lower, but the short-term effect of moves like this is usually trivial. And to long-term investors, it's basically inconsequential.
- **Does this change what The Motley Fool thinks of this stock?** Nope! Fool on!

*This move is technically a stock dividend, but don't sweat the details. As far as your ownership stake is concerned, it's the same as a split.

Close All of Your Calls on Expeditors International

Published Jan 18, 2017 at 11:47AM

Is this for you? This is for *Pro* members who have any call exposure to **Expeditors International** (NASDAQ: EXPD) -- we are exiting our long calls and our short calls. Members with shares can sell those. For other situations, see our Alternative Trades at the end of this report.

How You Participate

- **Trade:**
  - Buy to close all January 2017 $50 (or other) calls.
  - Sell to close all January 2017 $42 (or other) calls.
  - Leave your written January 2017 $42 puts alone to expire Friday, unless you want to close for pennies.
- **Recent Prices:**
  - **Stock:** $53.67

- **Options:**
    - **Buy to close** January 2017 $50 calls: $3.50/$3.90 -- aim for $3.80 or lower (until prices change)
    - **Sell to close** January 2017 $42 calls: $11.50/$11.80 -- aim for $11.70 or higher (until prices change)
    - **Net credit:** That's about $7.90 in credit if you close both with one trade.
    - **Follow-up prices:** As prices change, aim to close both for a reasonable amount of time value of only $0.15 or so each.
    - **Timing:** As as long as Expeditors remains above $50, close your short $50 calls by Friday at the latest (earlier is better) to avoid being exercised. Pay only $0.15 or so in time value. Sell to close the calls you own by Friday, or else they'll turn to stock on Monday; you can of course hold that stock on your own if you want, but *Pro* will have no position in Expeditors after this trade.

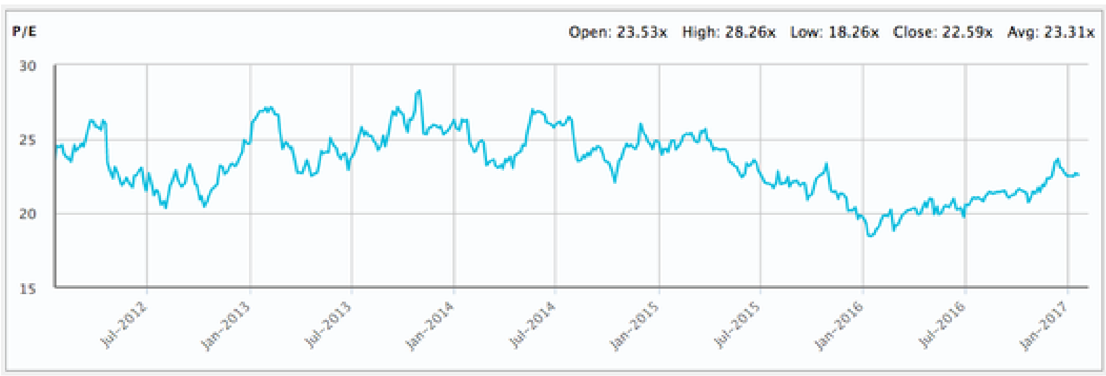
What We're Thinking

We're looking at a greater than $12,000 capital gain on our Expeditors synthetic long in one year. That's a 29% return on the $42,000 in look-through exposure the position gave us.

We also made a net $3,534 in option income on the syn long in 2016, despite having to roll short calls higher several times. That income brings our total return to $15,534, a 37% one-year return on the aforementioned $42,000. On a cash basis, we put no cash in this position and brought in $15,534. As shared in yesterday's Memo, this is a good example of using sensible leverage to enhance our results and keep cash in our coffers for opportunities or as a cushion.

After two years of writing synthetic covered strangles on Expeditors, why stop now? One word: trade. Expeditors leases and rents space on planes and ships to transport customer cargo back and forth between (primarily) Asia and the United States. With tough trade talk commencing under the incoming Trump administration, it's at least possible that trade will slow, and Expeditors is already not expected to grow much in 2017. In fact, revenue has flattened since 2011, but cost-cutting helped move earnings upward the last two years. That led to stock appreciation, which makes the shares more vulnerable to any slowdown.

The $53 stock now trades at 22.6 times earnings, 21.8 times expected earnings for the year ahead. These value multiples remain slightly below average for the stock in recent years, so in most situations this would not concern us. But given the specifics here -- future trade policies are a question mark, and the value multiple is up considerably since 2016 started -- the valuation is not low enough that we want to continue an income strategy.



Source: S&P Global Market Intelligence.

Given our desire to be defensive in this situation, we'll close our position and watch from the sidelines for now, rather than take shares or roll our synthetic long to 2018. Presidents have considerable, independent executive power when it comes to trade, so we'll watch for new opportunities after we start to get more clarity on how trade deals may trend with the new White House.

Alternative Trades

- **If you own stock and/or have covered calls:** You can let your shares get called away to match our exit of this position, or sell the shares outright if you don't have in-the-money calls on it. With our closing trade, it effectively becomes a Sell on our scorecard.
- **If you wrote puts last time:** Those are expiring as income. We're not suggesting new ones today.
- **If you have a 2018 synthetic long:** It's always possible we'll reinitiate the position later, but we can't be sure. If you want to match us, close your 2018 syn long -- and exit any positions related to it.

Pro Can Help

- **Questions?** Just ask! Ship yourself on over to our Expeditors board.

Roll Your Covered Calls on Skyworks Solutions

Published Jan 18, 2017 at 11:47AM

Is this for you? This recommendation is only for *Pro* members who have written Jan. 20, 2017, $75 calls with us. Those new to this position should just own stock at this point; do not write covered calls at least until after earnings Jan. 19. *Pro* members who aren't writing calls at all can continue to own this Buy-rated stock in a 3.4% allocation. (And finally, *Options* members who wrote $72.50 *puts* expiring Friday are on track to earn full income without needing to take any action. If the stock falls below $72.50 before then, *Options* will issue an alert to roll or close.)

How You Participate

- **Trade:** Use a rolling order on **Skyworks Solutions** (NASDAQ: SWKS) options to:
    - "Buy to close" all Jan. 20, 2017, $75 calls.
    - "Sell to open" the same number of Feb. 17, 2017, $75 calls.
- **Allocation:** Write ("sell to open") one new call for every 100 shares you are covering. *Pro* is continuing to cover all 1,200 shares owned, representing 3.4% of the portfolio.
- **Recent prices**:
    - Skyworks Solutions stock: $78.08

    - Jan. 20, 2017, $75 call (splitting bid/ask): $3.95
    - Feb. 17, 2017, $75 call: $5.10
    - Net credit to roll: Approximately $1.15
- **Option price guidance:** Prices will change, but use a limit order to roll for ideally about **$1.05 in net credit** or higher. If the stock remains above $75 by Friday, you *must* roll for the credit you can get then to avoid losing your shares.
- **Stock Guidance:** Buy 3.4% (you don't need to use options on it if you haven't yet).

What We're Thinking

With Skyworks Solutions' volatile stock a few dollars higher than the strike price of our $75 covered calls expiring Friday, we're going to roll the calls in order to keep our shares. With earnings being released on Thursday evening, we're going to roll before then to get another dollar or so in credit; that will make it easier if we need to roll still higher *after* earnings, and rewards us a bit more if the stock falls and stays lower after earnings. In other words, given that we're keeping the stock covered for now, there's little reason not to roll. An administrative note: We need to send this alert now so we can make the trade ourselves on Thursday, after our 24-hour waiting period -- and so you have some time to make it, too. Adventurous members who want to see where the stock trades *after* Thursday's earnings report could wait and roll Friday if need still be, though the advantages of that are likely slim.

Looking ahead into 2017, *Pro*'s current plan is to continue an income strategy on Skyworks. At about $77, shares trade at 15 times trailing earnings per share and 12.7 times expected earnings for the year ahead, according to S&P Global Market Intelligence. But the business trades at 24.5 times free cash flow, and shares are likely to remain volatile. We believe we can ultimately make more returns writing calls than we would by solely waiting for upside in the stock (though we see potential there, too). We'll manage these calls as need be.

Investors may view Skyworks favorably this year, given the big expectations for the 10th anniversary iPhone from **Apple** (NASDAQ: AAPL) due this fall. Apple remains Skyworks' largest customer. The promise of a big finish to 2017 could benefit both stocks both now and later. Of course, it remains to be seen whether the iPhone will deliver enough "wow" to drive record unit volume. We believe so, but we're biased. While we wait, we'll manage our covered calls on Skyworks for upside and for income. Over the longer term, the company's semiconductor products continue to drive connectivity in nearly all of the major smartphone models and in Internet of Things devices, cars, and more. The long-term outlook remains healthy as long as Skyworks' margins continue to appear safe from erosion, as they do right now.

Enough talk. We need to roll and then see how earnings come out Thursday night. Exciting -- even with our calm, long-term outlook and approach.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up**: We'll continue to manage our covered calls, rolling for upside or more credits as needed.

Options Can Help

- **Want to know more about this strategy?** Our guides to writing covered calls and rolling covered calls can help.
- **Questions about this trade?** To ask particular questions, please visit the SWKS board.

Navigating Toward Our North Star

Published Jan 17, 2017 at 4:02PM

Dear *Pro* Fools,

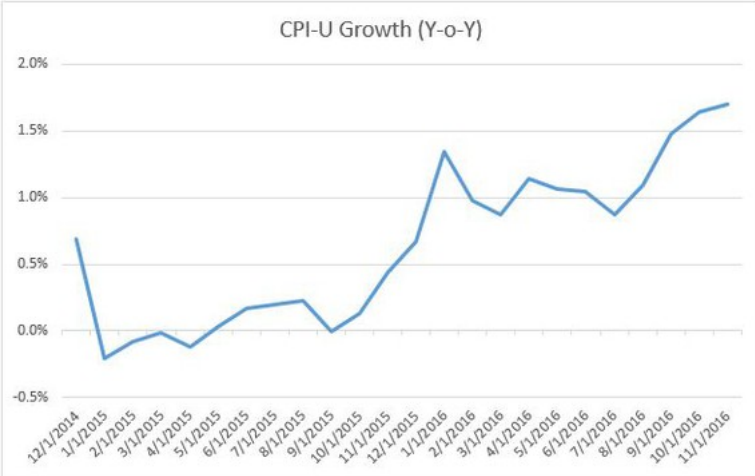
Jeff looked back on *Pro's* 2016 results in last week's Memo, detailing our portfolio appreciation by category, reviewing our activity, and sharing lessons learned. As he mentioned, last year was the second time in five years that we trailed our North Star (inflation + 7%), although our prior performance has been enough to ensure we are still ahead of it since inception and over the most recent rolling three-year period.

For some context on our North Star, *Pro* has two primary goals:

1. To achieve positive returns over every rolling three-year period.
2. To double our real purchasing power every 10 years.

Last year's results put us on track to achieve goal No. 1, but trailing our North Star means a little more pressure as we pursue goal No. 2. To double our real purchasing power in 10 years, we first need to beat inflation (as measured by the Consumer Price Index), and then we need to compound our capital at about 7% annually -- that's why the North Star is structured as it is.

Inflation + 7% is a very challenging target, especially as inflation continues to rise as it's been doing since the beginning of 2015, increasing our target for portfolio appreciation:



Source: Federal Reserve Bank of St. Louis.

During one of our regular investing meetings last week, the *Pro* team discussed four specific ways in which we plan to position our portfolio moving forward to continue to achieve our North Star goal. In this Memo, I'll share the ideas we discussed and provide some examples to help illustrate them.

1. New Long Stocks With Potential for Strong Growth

Although we are a portfolio that utilizes longs, shorts, options, and ETFs, the vast majority of our portfolio appreciation has come from our long stocks. We are firm believers in long-term buy-and-hold investing, aiming to own great businesses that will compound our capital over time. We have developed our *Pro* Quality Checklist to help us find and prioritize these long investments.

Because we tend not to be fully invested (we've averaged about 70%-75% net long over *Pro*'s history), it's all the more important to find long stocks that fit our criteria and can appreciate at rates above our North Star, helping drive our returns upward. Examples of stocks that have helped drive our returns include **Broadridge** (NYSE: BR), which has appreciated by 20% annually (including dividends) since we initiated the position in 2010; **AmTrust** (NASDAQ: AFSI), up 29% per year since our original 2009 recommendation; and **O'Reilly** (NASDAQ: ORLY), up 31% per year since we started our position in 2013.

We aim to find more long stock ideas that will appreciate strongly over time, helping drive our returns upward toward our North Star goal.

2. Intelligent Leverage Strategies

Thoughtful leverage can help generate strong returns while risking relatively little capital. A leveraged strategy that works favorably for us can go a long way toward helping us achieve our North Star goal. Our bought calls on **Facebook** (NASDAQ: FB) are a great example of an intelligent leverage strategy: In September 2012, near a low point for sentiment on Facebook stock, we purchased long-term calls. We risked just 1.2% of our funds, eventually exercising half of those options into owned stock at expiration in January 2014. The Facebook shares we now own started off as long calls that cost us less than $10,000 to initiate; those same shares are now worth nearly $180,000.

3. Protect Against Downside

It almost goes without saying, but we will have a very difficult time generating North Star-like returns if we allow our portfolio to suffer enduring losses. We must protect against downside where we can, utilizing shorts and hedges to make sure we have some positions that will generate positive returns in a market downturn.

It's important to note that we are OK with regular volatility in our long stocks. As equity investors, we must accept volatility as one of the risks necessary to generate long-term returns. Short-term price volatility is OK as long as we continue to expect the businesses we own to grow and compound our capital over time. But in the meanwhile, we can use shorts (such as our paired short on **Domino's** (NYSE: DPZ), half of a position that includes our Papa John's shares) and hedges (such as our **QQQ** (NASDAQ: QQQ) put spread ratio) to buffer some of our downside exposure.

4. Target Monthly Income Whenever We Can

As shared in Jeff's review column from last week, *Pro* generated $21,492 in option income in 2016 as we aimed to have some options expiring every month. Option income in 2016 accounted for 12% of our total portfolio appreciation for the year, and added nearly 1% to our overall returns for the year, a significant outcome. Income from options will not be the sole determinant of North Star-like returns, but it helps augment our long-term stock appreciation and dividend income. If we can earn a 1% or so return from options each year, that goes a long way toward achieving our long-term North Star (inflation + 7%) goal.

Examples of options for income include our series of written puts on **Gentex** (NASDAQ: GNTX), our written put on **Celgene** (NASDAQ: CELG), and our long-running strangle on **Expeditors International** (NASDAQ: EXPD). We intend to continue to target income with options in 2017 and beyond to help supplement our returns.

The *Pro* Bottom Line

In sum, because of the challenging nature of our North Star goal, we know we can't afford to rest on our laurels and trust our prior portfolio decisions to be enough to propel us to our goals moving forward. We know we have work to do to find strategies that will help us in our ongoing quest to achieve long-term North Star returns. We think that if we can can execute on these four specific strategies in 2017, we'll be happy about how we've positioned our portfolio for the future.

Fool on!

-- Billy (TMFBillyTheKid)

Pro Catch-Up Trades and Upcoming Expirations: Jan. 17, 2017

Published Jan 17, 2017 at 3:32PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.4%.

Continue building your portfolio with our Buys, including:

- **Medtronic** (NYSE: MDT): Buy 2.8%.
- **Paycom** (NYSE: PAYC): Buy 2.2% (see our recent recommendation).
- **Starbucks** (NASDAQ: SBUX): Buy 3.4%.
- **Verisign** (NASDAQ: VRSN): Buy 1.5% and write a covered strangle for another 1.5%, as per our recommendation. Lately you can be paid $4.10 to $4.40 for selling to open the strangle.
- **Verisk** (NASDAQ: VRSK): Buy 2.1%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5% if you haven't.

Pro options:

- **American Tower** (NYSE: AMT): Set up a diagonal call if you haven't yet, following our recommendation but altering it so that you sell April $110 calls instead of the $115 calls originally mentioned. Lately, this can be set up at a net debit of about $26.80 per diagonal. Set up a 0.5% allocation, but only risk what you can afford to lose.
- **Domino's Pizza** (NYSE: DPZ): Use a limit order to write (sell to open) covered puts following our new recommendation. Write one put for every 100 shares of Domino's you are short. The puts lately pay around $3.50 or so. If the stock price declines, the puts should pay better.
- **Verisign:** Please see above under Buys.

Hedges:

- **ProShares QQQ Trust** (NASDAQ: QQQ): If you haven't set this up yet, today you would sell to open January 2018 $103 puts, and buy to open half as many January 2018 $116 puts, for a small net credit. Set up a 15% allocation using the guidance in our alert.

Upcoming Expirations (this Friday, Jan. 20):

- **Expeditors International** (NASDAQ: EXPD): Our synthetic covered call (which started as a synthetic covered strangle) has done well as the stock has risen the past year. Watch your inbox for guidance this week before the position expires Friday.
- **Skyworks Solutions** (NASDAQ: SWKS): Our $75 calls expiring Friday have earned some premium, but remain in the money. Skyworks will announce earnings after the market closes Jan. 19, one day before our options expire, but given our one-day delay on trades, we need to issue a decision before then. Watch your inbox!

Pro Guidance Changes and Completed Trades: Jan. 17, 2017

Published Jan 17, 2017 at 3:27PM

Pro Guidance Changes (from the past two weeks)

- None

Pro Completed Trades (from the past two weeks)

- **QQQ** (NASDAQ: QQQ): Tweaking our recent recommendation, we are looking (at today's prices) to set up a January 2018 $103/$116 put ratio spread for no cost or a small credit. These strike prices will change, up or down, as prices change. We want a $13 to $14 spread for no cost, with the top strike price about 5% below the current QQQ price.

You can see all of our guidance, positions, and transactions from the Recommendations page.

CES 2017: Interview With Skyworks Solutions CEO Liam Griffin

Published Jan 10, 2017 at 4:28PM

While at the Consumer Electronics Show this January, *Supernova*'s Odyssey 2 mission lead David Kretzmann spoke with Liam Griffin, the relatively new CEO of **Skyworks Solutions** (NASDAQ: SWKS). Listen in (or read the transcript) to hear David and Liam discuss the future of technology, how Skyworks plans to capitalize on 5G connectivity, and a few key points for investors to watch with the business in the next few years.

About 6 minutes.

DAVID KRETZMANN:

David Kretzmann here with *Motley Fool Supernova* and I'm thrilled to be joined by Liam Griffin, the relatively new CEO of Skyworks Solutions, a multiple recommendation in several of our Motley Fool services. Liam, thank you so much for taking time out of your busy schedule to talk with us.

LIAM GRIFFIN:

It sounds good, Dave. I really appreciate it.

DAVID KRETZMANN:

Let's just start off with a little bit about your background, how you came to Skyworks, and the highlights of the past year since you became CEO last May.

LIAM GRIFFIN:

Sure, thank you. I joined Skyworks back in 2002 when we started our company. We rang the bell in the Nasdaq. I think we were a $4 stock and in the middle of the "can you hear me now" era. Fifteen years later, I was fortunate, under the guidance of Dave Aldrich, our exec chair, to be given the opportunity to be the CEO. I'm thrilled by the opportunities that the market presents to us today [and] our ability to capture share and drive mobile connectivity. A phenomenal opportunity. I'm really excited about it.

DAVID KRETZMANN:

And something that comes up in Skyworks' press releases and other presentations is the wireless networking revolution. Can you say a few words about what that is and why it's important?

LIAM GRIFFIN:

That's religion to us. That is religion. If you think about this market today... If you think about **Facebook** (NASDAQ: FB)... If you think about **Amazon** (NASDAQ: AMZN)... In fact, the leading five S&P companies today (**Apple** (NASDAQ: AAPL), **Alphabet** (NASDAQ: GOOG) (NASDAQ: GOOGL), Amazon, Facebook, **Microsoft** (NASDAQ: MSFT)) are all driven by mobile connectivity, mobile platforms, whether it's client, or client to cloud.

If you think about all this, and translate that to how it works from bits and bytes, all of that technology runs through mobile solutions invariably produced by Skyworks. So we underpin that tremendous new economy that we see — a shift from bricks and mortar — to kind of the clicks and clacks that you see on your keyboard. But it's very powerful and it's still early innings.

DAVID KRETZMANN:

And what would you say Skyworks does that your competitors can't do, or can't do effectively?

LIAM GRIFFIN:

A great question. So having said all these great things about mobility and the revolution, it's very, very complex and challenging. Our customers are faced with increasing burdens to deliver these higher data rates with more efficient solutions. Less consuming of battery.

What we do well is craft individual solutions and configure these customer by customer. We integrate filtering technology, gallium arsenide semiconductors, [and] switches, and integrate these into unique systems that are perfect for each and every customer.

DAVID KRETZMANN:

And for investors who are new to this space, I think a common risk or question that comes up is how a semiconductor company, or a backend technology company, can do something so that they don't become commoditized? What does Skyworks do to ensure that your products don't become commoditized down the road?

LIAM GRIFFIN:

It is all about performance today. I don't think anyone that uses a smartphone today — even the latest and greatest technology — is being dwarfed by the burden for demand. The burden for data. So our job is to be best in class around performance. To provide the greatest connectivity experience available. It's a challenge for our engineers, but ultimately it's perfect for our customers.

DAVID KRETZMANN:

Over the past year, your broad market segment has made up about 25% of sales. Can you just explain a little bit about what goes into that segment, and what will be the main driver of that segment over the next three to five years?

LIAM GRIFFIN:

That's a great, great point. It's often misunderstood at Skyworks. We have made our money — and our bread and butter has been mobile phones — but ultimately that connectivity core spans into IoT. We have a Wi-Fi portfolio. A Bluetooth portfolio. A technology called ZigBee for short range. So you'll see these in consumer products. You'll see this in diversified audio. You'll see it in automotive. You'll see it in headsets. You'll see it in your Wi-Fi router. That broad market business has been growing phenomenally. It has a tremendous tail going forward.

DAVID KRETZMANN:

What do you think investors should be watching most closely, in general, with Skyworks over the next three to five years?

LIAM GRIFFIN:

The way I would look at it is if you're a believer in mobile... If you're a believer in the internet economy... If you're going home and browsing your smartphone and you're putting your kids on an iPad and enriching your experience through mobility, then you're a bull on Skyworks. That's what we do. We provide that. We build that wireless pipe. We make it faster and better every day.

DAVID KRETZMANN:

You're someone who's closely tied to the tech space, so a question I want to ask you. What's one piece of technology that Skyworks isn't involved in that really excites you? We're at CES. Is there any certain tech trend or product that really excites you as a consumer? An investor?

LIAM GRIFFIN:

I think one of the areas that we are entering is the autonomous car. I think that is a phenomenal market. We have a piece today, and our piece will continue to grow as connectivity becomes more and more vital. But I think some of these things that we didn't dream about are going to really come to fruition. We'll play a role. We want a bigger position in those markets and we look forward to the challenge.

DAVID KRETZMANN:

Great. And last question. There are some rumblings about 5G. What does that mean for consumers and when will 5G become something that's applicable to everyday consumers?

LIAM GRIFFIN:

5G is absolutely on the horizon. What that's going to do is vastly expand your data pipe, which is going to give you higher speeds and lower latency or refresh time. Applicable for autonomous driving. Important for some of these densified urban environments. We need a high data rate in a small space. 5G is going to be vital for Skyworks. We have the right technology cores. Our teams are working on solutions now. Three to five years it will probably be 20% of our business, if not more.

DAVID KRETZMANN:

And the last question. Looking forward, do you see any particular regions around the world, whether you're talking about domestically here in the U.S., or internationally like Asia, that investors should be watching most closely?

LIAM GRIFFIN:

We do a phenomenal job and have a phenomenal business in developed markets, and that's important; but if you think about the emerging economies, the smartphone is often the only tool that you have for connectivity. So if you think about the unique value and utility a smartphone brings to some of these emerging countries, it's tremendous. So we think the next 2 billion subscribers are going to come onboard in emerging markets, adopt this technology, and take it to the next level.

DAVID KRETZMANN:

Awesome. Well, we'll leave it at that. Liam Griffin, thank you so much for taking time to talk with us. We always appreciate it and we look forward to seeing you next year at CES if not sooner.

LIAM GRIFFIN:

Sounds good. Thank you, Dave.

DAVID KRETZMANN:

Thank you and Fool on!

Pro Video Chat, January 2017

Published Jan 9, 2017 at 3:52PM

The *Pro* team will be holding a live video chat on this page at 2 p.m. Eastern on Friday, Jan. 27. We'll be using sli.do to communicate with members during the chat; click here for details on how that works. The Q&A portion of the chat can be find by going to slido.com and entering #ProChatJanuary, or you can reach it directly by clicking here. We recommend leaving the video open in one tab and sli.do in another (or on a mobile phone), so you can follow along with both. Fool on!

Transcript

Speaker 1: Please stand by. Our stream will begin shortly.

Jeff Fischer: Greetings, Motley Fool Pro members, and welcome to our January Motley Fool Pro chat. I'm Jeff Fischer. I'm joined by, to my left, JP Bennett.

JP Bennett: How's it going, Jeff?

Jeff Fischer: JP, good to see you. To my right, Jeremy Meyers.

Jeremy Meyers: Happy Friday.

Jeff Fischer: Thank you, and we have on the phone Billy Kipersztok in Florida. Billy, how are you?

Billy K.: I'm doing well, Jeff. Thank you.

Jeff Fischer: We have the whole Pro analyst team here and we're here to answer your questions, once again, this month. As you have the video on your screen right now, we're going to ask you to also open a separate browser page and go to slido.com or you can just click the link here on the video page itself, above the video that's playing right now. Slido.com, and there enter the Pro chat January as your code name, #prochatjanuary. That will get you into this chat question, the question portion of this chat. Now we're asking you to, if you want to hear and see us as you ... You need to keep your video page open because Slido ... I'm still thinking of throwback, old chats we had. Slido is you only ask the questions and we answer them here on the video. No matter what, keep your audio on and we'll answer the questions in Slido here in the video as we go forward.

Now, any question in Slido that you like, click it to thumb it up. The ones that are most popular are the ones we'll answer first, or try to answer first I should say. We'll go through as many of them as we can. If you have questions about earnings, portfolio as a whole, strategy, any personal questions about one of the four of us, it's all on the table here this Friday. We look forward to helping you. With that, guys, I don't have much to say to kick off this first chat of the year, but I'll point out, as we all know, it's been a very strong January. The NASDAQ is up about 5%, about twice as much as the SMP 500. Pro has benefited from that because we're pretty heavy in technology and NASDAQ companies. We're doing well along with the NASDAQ this year. Our exposure is about 80% net long, so we're more long than we have been in the past. That doesn't include our put ratio spread, which is well under the money and expires a long time from now. It's not really in play right now.

We're, of course, looking at other hedges and shorts because it's been a pretty happy stock market lately and prices are, they still make it challenging, as they have for a few years, to find companies at a bargain price. For sure, those are hard to find. What we've been doing instead of just buying quality companies at a acceptable price, which as Warren Buffet had said, better to pay up for high quality than anything else. It's helped us over the years that we've been investing. Let's get to our questions. We have a lot of you asking about Starbucks. I know right off the bat JP and I can talk about Starbucks, and anyone else who has thoughts. A pro member is asking what are our thoughts. The quarter, the earnings call, the CEO transition. Are we adjusting our fair value estimate?

JP Bennett: Well, there's a lot to talk about there, right? First thing: CEO transition. For me, not really much of an issue. We knew that it would come eventually. He's tried it once in the past and didn't turn out so well, though it did take quite a few years for it to come to a head and for Schultz to need to come back to the company. I think it might be a case similar to Apple where, if you look at Apple, Jobs tried it once, though he was kicked out. He found a replacement, but then he was kicked out and then he came back in. Concerned about his legacy, so he didn't want to make the same mistake twice. He definitely put a lot more thought into what's going to happen after he goes. I think you see a similar type of situation happening with Starbucks in that Schultz, concerned about his legacy, concerned about the future of the company, realizes he did it once in the past, didn't work out good. Let's not make the same mistake twice.

I think he probably spent a lot more time considering what's going to happen after he steps down. It's also important to recognize that he's not leaving the company. He's still going to be very involved with their future prospects, with advancing and pushing the brand into a more upscale, premium type brand. I think the leash for him to step back in and do something about it, if he thinks he sees something off, will be much shorter. That's not an issue for me. What we say, [China comps 00:04:58] were good. The big issue here is the US. We're seeing a slow down, it's specifically in traffic. One of the issues there is obviously the rewards program adjustment where previously you had people separating orders into multiple transactions to essentially game the system and earn more rewards. You can't do that anymore, so those have consolidated into one order.

That has a downward effect on the number of transactions that takes place, but even if you strip that out and you just look at the transactions that are occurring naturally, that's actually fallen some. What's going on there? I think it is probably undeniable to think that they are 100% immune to what's going on in retail and people not going out as often. They are, I think, the best of breed in that space and they will continue to perform well above their peers, but they aren't immune to what's going on in that space. There's going to be some impact for that. The other thing to take into consideration is they're definitely having some throughput issues, as we discussed earlier today in terms of mobile and things like that.

The transition that's taking place, it's going to take some time to work out the kinks. They're doing it because they want to stay relevant in a society that's moving towards digital ordering, fast-paced get-my-stuff-go type of mentality, not spending a lot of time in stores. It's not a seamless transition. I think they'll be able to figure that out over time, but that's the one thing that I think we need to watch and keep our eye on. As far as our fair value adjustment, I've just begun putting the numbers in my spreadsheet so I don't have anything to say here. I don't want to overreact. We have said for, I believe a few years now, since I basically came on and started covering Starbucks, I said, "Hey, Starbucks is a great company, but this valuation is pretty pricey."

The great thing about it is that the stock really hasn't done much recently, so it's essentially grown into its valuation because the company has been firing on all cylinders. Earnings, revenue, free cash flow, they're all moving higher. If the stock does nothing, what does that mean? It means the multiple contracts. Even still, we're still priced well above the market, so it's not like I would say that this is a back-up-the-truck type of opportunity. We need to remain diligent, but you're not going to see me come out and move this thing to a sell, slash the valuation by 50% or something like that. I think it's something worth watching, but I'm not ready to just pull the ripcord right now.

Jeff Fischer: Sounds good, JP. The thoughts I have going through the call this morning are, I'll just try to complement some of what you said. They're opening one new store in China every 15 hours.

Jeremy Meyers: It's amazing.

Jeff Fischer: Yeah, it's amazing. Especially when Schultz says, and we foresee that going on many, many years into the future.

JP Bennett: I think it will become the biggest market sooner than a lot of people think.

Jeff Fischer: Schultz was in on the call. As you said, he's much more involved than he was before. They have so many initiatives already in place that are multi-year initiatives, so the company knows where it's going and presumably how to get there. I agree with you. They'll iron out the throughput kinks, I think, in the mobile app order and pay process. They're hoping to grow revenue seven to 9% this year now, and earnings per share around 10%, 11%. Long term, they still hope for that 10% annualized revenue growth. If that's the case, then the stock at 25 times earnings, more or less one year forward, is probably worth that price in the way that a paycheck's is or a solid company where the certainty of the results are very high. You're going to pay a premium price for that. I agree with you. I think our stake is good where it is. If Starbucks gets hit hard in a bad market, it's one that we'd look to, potentially add to.

JP Bennett: Yup. In here or maybe even another service. Hint, hint.

Jeff Fischer: Yes, maybe.

JP Bennett: I'd also just double back and say, because I'm not the overly optimistic rose-colored glasses person. That one thing I will be watching is their new initiatives and what happens there. We saw with alcohol it's not really working out. Their evening ideas haven't really panned out like they wanted to. One of the issues they ran into when Schultz left previously was they really went into go go growth mode, trying a bunch of new things. That really tends to force a company to spread themselves really thin and not stay true to what made them great. You saw that, the delusion of the brand, the email that was leaked that Schultz sent out to the company that was like, "Hey, guys. We knew what made us special and we're not doing that anymore. We need to get back to it."

These new initiatives I think are really important. They have great opportunities, but they can't get side tracked and step away from what made them great. I think that's actually one of the great things about them actually having already gone through that. They understand the need to continue to develop new ideas and new initiatives, but they've already seen what happens when they get too focused on those and lose the core of what makes Starbucks great. I don't envision that happening, but we need to watch that going forward.

Jeff Fischer: Starbucks is a 3.2% position right now. It's rated a buy. It's been a strong performer for us since we bought it. More than doubled, 127% up. The past year and a half or so it's been flat, as JP said, growing into its valuation. That's flat excluding the dividend, which is close to 2%. Right before that year and a half of range-bound performance, it was strong. Given time, should be again, given the nature of that business. Let's get to our other questions. Number one is from Gary. "In recommending Amazon while at its all time high, any thought regarding waiting on this [fall to stock 00:10:55] to enter?" Fall, rather than. It's up to you if you want to. My years of investing, I've had better experience just buying a stock when I'm ready to buy it. In a lot of cases, I look to a new highest confirmation that they're doing something right. I've bought many of my companies at new highs. Whether or not that's the best move six months down the road is a ...

Jeremy Meyers: I know I've missed a lot of opportunities just wanting a dollar less. You know, just slightly cheaper, whatever it may be. When you're dealing with great companies like this that compound over time, you can at least, I think JP talked about laying into a position. You can get a starter position. If you don't feel entirely comfortable now, wait for a pull back to happen and add to it. A lot of times, if you don't at least get that starter position nailed down, it jumps up 10% and then you're chasing and it just feels more and more expensive, so you're anchored to where you were before, so you have a different problem then.

Jeff Fischer: That's so true. I mean, the market falls sharply on average every couple years at most. During that time while you're waiting, the stock would rise up so much that when it does finally fall, you're still buying at a higher price.

Jeremy Meyers: That's true.

Jeff Fischer: I've had that happen many times. It's up to you and what you're comfortable with. We were comfortable with moving forward on it. Again, it's a very long-term position. It's another one where if we get a market downturn, we'd be looking to potentially add to it. Now, I keep saying that. That means we have to manage our cash accordingly and be prepared for future opportunities. Next question. "How serious are you about hedging the overall portfolio? I'm concerned about the new president, the policies, the effect on the market. I would like a timeframe." Well, great question. Does anyone want to voice their thoughts?

JP Bennett: I can go, or if you want to talk, Billy, you can take it first.

Billy K.: Yeah, sure. We've talked about this on some of our other chats before. We are aware that policies are going to change and the new administration is going to implement some new ideas that would change how companies operate and tax regulations and things of that nature. We're taking an approach where we're not expecting to change anything too drastically until something has changed in reality as well. Our hedging strategy is going to be largely consistent with what we've done in the past, which has been hedging for those larger declines, 10 to 20, 25%. Not really worrying too much about a five to 10% decline. We're aware of the new administration and the possibility of change, but we're not altering our strategy all that much.

Jeff Fischer: Yeah, and we are looking for new shorts as well as a way to attack a potentially lower market that we like even better, trying to find companies that we want to be short no matter what. With earnings rolling out, usually that shakes out new research for us. It doesn't obviously lead to a recommendation every quarter, but it may. Yeah, we would really like to keep growing the short portion of the portfolio and have some more timely hedges, not just the one that we have expiring. It's recommended to expire in 2018. We have to set that up ourselves yet. It's on QQQ. Our exposure is around 80%, maybe a bit higher. As Billy said, we were managing that exposure, probably bring it lower over the coming months. It doesn't mean we'll sell things, but by hedging and sorting, hopefully.

Jeremy Meyers: It's good to remind everyone, the hedging can be expensive over time and a decent drag on your performance if they market would continue to rise. Insurance is not free, and certain times there's more volatility. It becomes even more expensive.

Jeff Fischer: Definitely. You're paying a dear price if you're short the indexes right now. That's been true since November, obviously,

JP Bennett: Which is also why cash can be such a great hedge over time, right? It reduces your volatility. Although in prior years you would get paid a lot more for having that cash, at least it's not costing you and it really will reduce the volatility of your portfolio. Also just to add on one quick little thing, like Billy said, we're not concerned with 10% declines in terms of hedging and shorting and things like that, but those are also great opportunities for out performance. We won't be overly concerned with them on the downside, but we may be looking to be more proactive. Especially if we end up in a more volatile market that isn't constantly setting new highs, but kind of moving between where we currently are, down 10%. Maybe it rallies and moves up a couple percent, then we get another sell off. If that's the type of environment that we're in, which some intelligent people have been calling for because of valuations and where we are in the economic cycle, that's really where you're going to see out performance come from. We have to take advantage of those opportunities.

Jeff Fischer: Next question. Let's review our decision to hedge the NASDAQ QQQ as opposed to SPY. The reason we did do that is indeed largely due to the tech portion of the portfolio, which is a large part of the portfolio, more than 20%. Much more. The new administration is seen as not being so friendly to tech in a general sense. There's the prospect of net neutrality going away, which could cost companies like Amazon or Netflix or even Google a lot of money.

Jeremy Meyers: [crosstalk 00:16:31]

Jeff Fischer: It could change the whole landscape, so we want to hedge out some of that tech risk. We won't step away from SPY indefinitely by any means. It may be the next thing that we hedge. Yeah, SPY is still in our toolbox as a way to hedge, and also as a way to make income. We've been talking about diagonal calls on SPY forever, but hoping for a drop in SPY before we set them up, speaking of that, and that hasn't happen. Yeah, we hear you. QQQ is a specific hedge right now for specific reasons. Can we discuss the mechanics of exiting a diagonal call or rolling it, which is different from exiting? Rolling diagonal calls or closing them. I'll talk to closing them. If someone wants to get ready to talk about rolling, and a diagonal call is no different than owning a stock with a covered call on it, in one sense. You close it by selling the close, the call you own; buying the close, the call that you've written.

You do that typically when you're nearing expiration and don't want to continue the position any longer. Usually six months before your long call expires, we look to potentially close it so that you don't risk a sharp drop those last six months wiping out your gains that you've taken maybe a few years to make? We usually close a long portion of a diagonal call, but before expiration. What about rolling a call forward? Does anyone want to speak to when you roll a diagonal call forward and how you do that?

Billy K.: Sure. Yeah, so rolling a diagonal call, you're going to want to do that when your short call is in the money and approaching expiration. What you're going to do, basically, depending on how far in the money your short call is and what your valuation estimate for the underlying stock of the diagonal is. You're going to buy back that short call, and then you're going to sell another short call at a later date, typically three to five months later. Hopefully, you're going to be able to do that for a credit, ideally.

Jeff Fischer: All right. Next question. They're starting to pile up, so we'll move forward here. How do you integrate Supernova with Pro? Anyone have experience with that?

Jeremy Meyers: I think the best option there is probably to post that onto our boards and see which members are actually doing that and how the approach that they've taken because we look at Pro as a standalone portfolio and don't manage that portfolio thinking about Supernova or anything. You're probably best off finding other fools who are actually doing it actively and have some better advice than, I think, we could probably offer.

Jeff Fischer: That's great advice. We should probably open a board on Pro saying managing Pro with the other services. Some sort of, that topic. That very topic, so you could all talk about it. Maybe we'll do that. I know our list of boards keeps growing, but that's a really good topic.

Jeremy Meyers: We run the danger of also having to have opinions on all the companies and positions in every other service, also, which is impossible for us to do.

Jeff Fischer: We can just say, "We have no idea. [crosstalk 00:19:33] Members, just discuss how you do it because we have no ..."

Jeremy Meyers: We might disagree, or whatever it is.

Jeff Fischer: Yeah. Great advice, Jeremy. See what other members are doing on the boards. I know you'll get a lot of help there. Let's talk about the put portion of Skyworks, the rolls. Should we change the strike? We did. Our trade executed the end of yesterday with a limit order and we sold to open $85 August puts, which is a little aggressive, but that's where I am on that position right now. We got $6 per put that we sold, so our cost to roll from February to August, 87.50 calls and $85 puts. The cost to roll was zero, so we gained $12.5 on the upside. Of course, we took on more exposure to Skyworks. That's really the cost of rolling that we've taken on. Hopefully the stock will now consolidate around these levels and we'll earn a lot of that premium and we'll roll up again as the time value dissipates in this strangle or roll to whatever direction we need to.

Yes, you can adjust your put as Trade Alert shared. Adjust either call or put to get to a roll that doesn't cost you much or anything at all. We'll have updated guidance, timely guidance, Monday in catch-up trades as well. Question. The question is, "Jeff, you wrote about preferred sectors such as tech, financials, and services." True. How do we feel about healthcare, especially like United Health? We still do like our exposure to tech, financials, and services, and that business model in general when they're highly profitable. I don't think our overall exposure there is about to decrease anytime soon. Healthcare, we're looking more into healthcare as we speak. We have been for several months. We do have Medtronic. [Par-sell 00:21:32], which may be sold through covered calls. We have Gilead Sciences, which has been disappointing so far. We're looking at other possible positions. I can't speak to United Healthcare much. I looked at it around November. I don't know where the health insurance industry is going to go in the country.

JP Bennett: Nobody does.

Jeremy Meyers: Yeah.

Jeff Fischer: I'm not sure, but I'd love to hear your thoughts. If UNH is a stock you like, go to the Pro Stocks You Like board and please post any thoughts that you have on it. Anyone else have thoughts to share?

Jeremy Meyers: I think we all still believe that the same secular tail wins and demographics are in place that we've been thinking about for a long time. Opportunities where there's a little more uncertainty like this is when some of the better run companies go on sale, and we have the opportunity to bounce on it.

Jeff Fischer: Yeah, and speaking of that, healthcare is I think our third largest allocation after tech and financials. All right. What are our thoughts on O'Reilly with the recent news at Amazon? We issued the Amazon report.

JP Bennett: There's our hedge, right?

Jeff Fischer: We were working on Amazon long before that. A long time coming for that. I can't really speak to why. I probably need to lay down on a couch to figure out why it took so long to get that report out. I figured so many members own Amazon. Speaking to O'Reilly, we're still thinking about it, frankly. That news is new to us. We knew Amazon was selling auto parts, obviously, and has been for a long time, but that they're now going after it with one-on-one relationships with the part makers themselves and under cutting pricing.

Now, they've come a long way just the last few years to having same-day delivery, which is what people want when they're under a car working on it. Amazon is more of a threat now, both on pricing and on convenience. The one area they don't have covered yet, but I wouldn't put it past them to try, is on service, where if you have a question, you can't yet call Amazon and say, "Hey, I'm looking at this part of my car, and what do I need?" That's where O'Reilly really shines. Amazon's a serious competitor, so we're considering this risk seriously.

JP Bennett: Yep. For a little bit more context for those who didn't see the news, I think pretty much most of the investor community knew that this was happening. Big markets, fashion, auto parts. Things like that. They're all basically in Jeff [inaudible 00:24:03] cross hairs. Those are industries he thinks he can disrupt and beat by being a low-cost provider. We knew that, but the details on it were a little fuzzy. Some information was leaked going out into the markets that in some cases Amazon is paying manufacturers around 30% more for the same parts. Like you said, they've been establishing direct relations with some manufacturers. In doing so, because they have such skill, they can offer certain parts at a price that's over 20% cheaper than what you might get if you go to your local O'Reilly or AutoZone or things like that. That really spooked the market there.

A couple of things I think to consider in relation to this and why we don't want to overreact. Obviously, the first thing is, like you said. The area that's ripe for disruption is the do-it-yourself market. That's a lot more consolidated already. It's a lot slower growth. It's not as big of an opportunity for O'Reilly, I think, because they've already established themselves. In that instance, people probably will be looking for cheaper parts. You've seen the rise of, what's it? I think it's called RockAuto, the online, really cheap. Their website is extremely basic. It looks like it's from the 90s, unless they updated it since I checked last. That market is ripe for disruption, I think. There still will be those people who prefer to just go to the store and get it same day because, unfortunately, we don't yet live in a world where everybody is within reach of a distribution center of Amazon to get same-day delivery.

That will be right for disruption. The other part of the market, that do-it-for-me part of the market, it's going to be hard for Amazon to move in and quickly displace that because, again, it's "do it for me," right? I need this part. I don't know how to put it on my car, my vehicle. Can you do it for me? Amazon's model currently doesn't involve that. It's not like O'Reilly is going to be completely destroyed over night. I think something to just keep in the back of your mind. Rewind 10 years. What kind of world do we live in? We live in one where Amazon was moving hard against Best Buy and everyone was like, "That's the perfect case study. Best Buy is dead. There's no way they can compete on pricing. They're just a showroom for Amazon." Basically what we had in December was Best Buy stock, the company isn't dead. They were within striking distance of hitting a 10-year high on the stock price.

Yes, it got hit on the interim, but the business didn't go completely bust as quickly as some people were thinking. You don't want to have a knee-jerk overreaction and things not pan out like you expect. We're watching it, like you said, but we don't want to ... We want to give O'Reilly management team, let's just say they've been one of the best management teams of the past 25 years out of any public company. You want to give them a little bit of leeway and more than just one leaked news report be the reason that you sell the stock.

Jeremy Meyers: Amazon's been great a force [inaudible 00:27:09] in the market. If you're not a great operator, if you're not best of breed, if you don't have dynamic and flexible management, then they're going to push you out. If you can offer a unique customer experience in some way, like if you think of how well Costco's performed and grown at the same time, where Amazon has come in and they're competing on price and undercutting them in some way. They offer a unique experience that the people appreciate and they have loyalty to that brand. I'd imagine over time, O'Reilly has built up that credibility and they're not going to be displaced over night.

JP Bennett: I think the immediate consideration is multiple contraction. The stock has been a stock that has justifiably traded for a premium for a long period of time. I know in the past, Jeff, you put it on hold because you're like, "Oh man, this valuation." It's a great company, but this valuation doesn't make a lot of sense. Then what happens? The company crushes it. The stock keeps going higher. Then you're like, "Okay, it's growing into its valuation." The more uncertainty that comes out, the more likely the market decides, "Okay, I'm not willing to pay as much of a premium," and so you may see some downward pressure in the stock. Again, we don't want to overreact to something like that.

Jeff Fischer: I agree. On the flip side, if we see good quarters rack up again this year, the stock could celebrate by an even great degree as people think, "Well, they have ways to get around this no matter what." That said, the mild winter is probably the bigger, more near-term concern that we should have for O'Reilly because extreme weather really drives auto parts sales, extra sales, and we haven't seen that this winter. It might be a little light. Suffice to say, I'm looking at O'Reilly as we get into earnings and at our allocation and I want to learn more about the Amazon competition threat too. An answer I don't have is would Amazon sell parts to repair shops, to car dealers, to I don't know? Okay. Next question. Do we feel that Gilead Sciences is well positioned for 2017 growth and is it a good time to add shares if one is not up to the recommended allocation? Which is pretty small now. It's only a few percent.

I'm checking to see exactly what the percentage is. The stock is a buy. As far as growth for the business, I don't think it is well-positioned. It's a 2.3% position that we have and we're down 9%, excluding dividends. The company is expected to grow earnings this year or the next couple of years at least because of the drag of the hepatitis C market pricing going down there and volume leveling off, competition growing. The one thing Gilead has in its back pocket is a lot of money and a lot of equity to make acquisitions that could then, ideally, drive some growth again. I don't know that you want to bank on just that, but right now that's what we are doing. By default, we own the stock. We haven't seen the argument for selling it. We've looked at it. Every time we meet, we talk about it. It looks extremely inexpensive for a really top quality business and management, with a lot of optionality going forward, mainly though through acquisition or merger.

The pipeline is okay. The current drug portfolio is obviously strong. Billions in free cash flow every quarter. It's a deep value stock. The question is, will it be a value trap for the coming years? Where we land is we have a 2% allocation, so we don't have that much at stake, 2.3%, if it does continue to languish for now. Suffice to say, we've been disappointed and I wouldn't rush out to buy it, but I like having it in our portfolio right now. Until we have a better place for that money and need cash, the money will stay there as it stands right now. That said, we'll see how the results come in in a few weeks. The stock is a buy. It's a high quality business and management and valuation across the board. It's a unique situation. A good learning experience. The blowout product that levels off so quickly. It can lead to a much cheaper stock. The stock was 12 times earnings when we bought 11 or 12, and now it's six times.

If you're just joining the chat, we're about halfway through. As you watch the video, you can go to Slido.com and enter any question that you. You enter prochatjanuary and enter any question that you have and we'll try to answer your question. We have a lot of them here, though, so this last half hour, we'll try to move quickly. This may be right up your alley, JP. How do we take advantage of the lowest VIX, or volatility index, since 2006?

JP Bennett: Yeah, I was actually up late crunching some data on the VIX for the weekly, though I ended up not using much of it. Yeah, we are in a very interesting situation in that we are really close to breaking sub-10 for the first time in years. Closing before 10 is something that's only happened nine times since 1992, so that's out of 6,314 trading days, if my memory's correct. It really doesn't happen very often. What does that mean? Well, for starters, that means the sample size of really low VIX values is extremely small. What you can deduce from that is very limited and very questionable. What can we do? I think for one thing is it's just worth staying on guard because when the market becomes complacent, opportunities on both the long and the short side tend to crop up. On the long side, if the market's complacent and we get a sell-off, well, it might be time for us to buy more shares of the companies really alike.

If the market is complacent, some overvalued companies could become even more overvalued, so maybe we should short them. In terms of direct instruments, like buying calls or buying an ETF that benefits from a rise in the VIX, those over time tend to have fundamental flaws that work against them, so that's more of a near-term play. Personally, I wouldn't be too inclined to do that. As far as personally, or what we might end up doing for Pro is one of the more interesting things to look at is to kind of just sit back and wait for the VIX to spike, and wait for uncertainty to hit. A rise in VIX, what do we know? If it spikes, it doesn't stay elevated for forever. That may be a time for us to act. In terms of basically saying, "Okay, now it's time for us to bet for the VIX to spike," I wouldn't really do that.

What you saw in early 2007, we actually had a clustering of really low VIX closing values. Well, we actually had a period of the market actually continuing to move higher. The market didn't roll over as soon as we hit that period. Perhaps we are in an environment, let's put politics in and thoughts regarding the economy aside. We may be in an environment where the market continues to drift higher for the foreseeable future or for at least a small period in time. Buying short-dated options contracts, betting on a spike, or setting up just maybe buying an instrument, betting on a quick spike and so making a few bucks on a quick trade, it's not something I would suggest doing.

Jeff Fischer: Yeah, the VIX around 10 or 11 and averages 18 or 19 historically, so it's well below that average. That said, earnings look pretty good so far. You have a pro business administration. You have tax rates that are probably going lower, so maybe that all speaks to why the VIX is so low. The hope is that the year will be a win for business as a whole in the country. A little VIX, as you said, could lead very well to the next volatile market. We would hope so, as far as option writing goes.

JP Bennett: Yes, yes. We would.

Jeff Fischer: Premiums are lower right now.

JP Bennett: It's been years since we started praying for an increase in volatility, so those put premiums or those covered call premiums start returning more towards what we like in our guidelines.

Jeff Fischer: We've done some ratio spreads on the VIX in the past. Like JP said, though, the VIX options trade on the VIX futures, and those premiums are giant and are not responsive to real time VIX prices, so it's a tricky trade. With the VIX this low, we look at the premiums and think about it at least. What are our thoughts on American Tower? It has lately been down. Billy.

Billy K.: Sure. Yeah, I think we have to distinguish between when we talk about the fact that American Tower is growing steadily for a while, but lately has been down. We're talking about the stock price. The stock price is down, but actually the business is performing very well. They, in 2016, made a really big acquisition, increasing their towers in India by almost doubling them. American Tower continues to grow very quickly overseas. They are focused on expanding. In the last year, they have investments in new markets in Nigeria, in Tanzania, in France. They're focused very much on expanding internationally. They are the tower company that is doing international expansion the most.

International markets are growing faster than the United States markets, so that is attractive for American Tower. I'm curious to see, when they report earnings next month, how that continues to break out as far as the growth in the United States and the growth internationally. I think when we talk about the stock price being a bit weak lately, I think there's a couple of reasons for that. For one, American Tower is a [inaudible 00:37:01]. As the new administration has come in, interest rates have gone up. When interest rates go up, generally [reads 00:37:09] as a category kind of decline in value. That's what we're seeing with American Tower. Then also, more specifically with respect to regulations, some of the concerns in the wireless industry have been that in the United States we may see some consolidation of wireless carriers. Where right now we have four big carriers and if we see a merger between Sprint and T-Mobile, we'll end up with only three.

If we end up with only three carriers, then there's only potential for three tenants on American Tower's towers. That's a bit of a concern, but I think both of those two concerns together are a bit overblown at this point in time with the consolidation of the carrier industry and then also the rates. The reason I say that is because, right now, we can see that American Tower is trading at the lowest valuation level. When you look at the EV to EBITDA ratio, that it's been since 2013. Even as the company is growing at rates similar or higher than they have been in the past five years. Right now I think American Tower, the business is doing really well. I'm curious to see how the results come in when they report earnings. I think we should see strong growth. There is some political uncertainty and risk in the United States, but they are so diversified internationally that the United States is not a huge concern for us. We're more concerned with how the international operations grow over time.

Jeff Fischer: Thanks, Billy. Karen is asking about Broadridge. Hello, Karen. We hope you're well. Broadridge is a large chunk of the portfolio. It's true. It's one of our top three holdings, but it's a really quiet business. Mainly proxy statements and SEC filings for companies. Are there any updates on this position and the long-term view?

Billy K.: Yeah. I would say that there's not really any updates on the long-term view. I mean, Broadridge is such a boring, steady stable business and nothing really is looking like it's changing there. It's a company that's going to grow its revenue anywhere between five to 10%, and will grow its earnings a couple of percentage points above that. You've seen very strong stock price appreciation over time from that company. They dominate their market. There's not too much competition for them. Steady. Stable. Demand is very consistent. I personally don't have very many updates. We're going to get earnings beginning of February on February 8, so we'll get an update then as far as how the business is going. They did make an acquisition recently, I think earlier this year or last year acquiring some block chain technology, which is data security. That's a little bit of a business update. Other than that, slow and steady.

Jeff Fischer: I don't have enough shorted Dominoes shares to write the protective puts, or the covered puts. Would you recommend closing the short at this time?

Billy K.: I would say probably not. Actually, definitely not. You don't need to write those puts. The puts are just a way for us to earn some opportunistic income from this hedge that we have with our Dominoes and Papa John's combined position. If you don't have enough shares to write those puts, don't feel like you need to close the short. The short is there to hedge our Papa John's exposure, so we have a combined exposure that together equals a certain amount. Those puts are not completely necessary to that position. It's just an augmentation to add some income. If you can't write the puts, don't worry about it.

Jeff Fischer: All right. How much of a disadvantage are fools modeling the Pro portfolio in an IRA and not being able to use the options recommendations? You could use many of the options recommendations when we do covered calls or diagonal calls in many IRAs, or anytime we buy options, or cash secured options, if you just have the cash in your IRA. I'd say the disadvantages in a healthy market are slight to none. In a lot of cases, you're better off just owning stock in a good market. In a flat market, the options come in handy. Extra returns from them can be garnered. In a fallen market, depending on the hedges that we have, you may miss out on some of the profits there, including like last year our option hedge paid us nicely last January. That's the answer. It's a variable answer. It depends on how the market does.

Overall, though, I hate to say this. Overall it may be a wash whether you have options or not. Options will, at times, cause you losses. Just owning stock for the long term may ... If your only goal is to have the most money possible in your account 20 years from now, then just owning the best stocks you possibly can is probably the way to get there. If your goal is to manage volatility and have income and have some winners in a down market, then you add options in. That doesn't necessarily mean that you'll make more money overall than the all stock person. There's a complex answer to your question. Use options to the extent that you enjoy them and that they add some returns that you're seeking, whether that's income or hedging returns or things of that nature.

Jeremy Meyers: I was just going to add, if you're investing in an IRA, you probably have a longer term outlook also. You can afford to take or bear a little more volatility. Where hedging that isn't quite as important. It might also depend on how long it's going to be until you're going to actually need that cash.

Jeff Fischer: Well said. CP1 is asking, "Will the relationship between Shop and Amazon provide a life for Shop value, and how much?" Shop isn't in the Pro universe, or Pro portfolio, so we'll move on to another Pro stock instead. I've been looking at Shop because it's recommended at The Fool. I think it leads one or two services. The relationship with Amazon has been in place for a long time, but it got more news media in recent weeks. I don't have an answer to that question today, but so far Shop has risen on the news that it has this relationship with Amazon. The market seems to think it will provide more value for Shop. The QQQ hedge has been tough to execute for even a penny credit, even with adjusting the strikes. That's so true and we share your frustration. We don't have the position properly set up either. It was accidentally executed at 2019 options for us. I've written about this on the site, but in case you didn't see.

We have the 2019 options. We need to close those and open 2018 options. It's very hard to do so out of credit, even adjusting the strikes right now. We're hoping for the market to fall because that makes it easier to set this position up, but the market has just risen and risen. We'll have updated guidance as we see a position we like. Within, I think we have about 15 more days now, so soon we'll have updated guidance on what to do there. If you have the existing position set up already, you're good. Just let it ride. The VIX, we talked about the VIX earlier so we can move on from that. We are looking at the VIX down at 10, as JP said. It's tough to find positions there, but we're mindful of it and what it may mean for the market and what we may want to do about it.

Are we planning any shortage from hedges, like the ones previously done on SPY? The short answer is yes, and SPY would probably be the vehicle of choice when we start doing rolling hedges again. They may not be put ratio spreads because we may not want more downside exposure, but some sort of option hedge is possible as the market keeps rising. SPY is a top candidate to possibly do that. That said, what we recommended for 2018 will help us a lot if the market is lower, come January 2018. At least that's some good insurance to have. Next one. Amazon. If you can't afford the outlay for Amazon, would a synthetic long be advisable? The short answer is no because each option represents $83,000 worth of stock. A $830 stock, each option is one contract, and a synthetic long is the same exposure as shares. That'd be very expensive. Even if you just by one share. If one share of Amazon is 3% of your portfolio or less, then you're following the allocation guidance. Let's talk about Facebook. I'm talking a lot lately, so anyone want to talk about Facebook?

JP Bennett: It's your stock, Jeff.

Jeff Fischer: It is mine.

JP Bennett: It's in your coverage universe.

Jeff Fischer: You guys talk about it. I think Facebook is performing perhaps better than ever as a business. I think more and more communities joining, getting together through Facebook. Some of the largest demonstrations and process in the history of the world have now happened thanks to Facebook. It was interesting to see people are now posting things on Facebook as kind of a ... that they plan to go back to in four years. I'm posting this now so I can revisit it. I'll be reminded of it four years from now in my timeline. That shows you how committed people are to Facebook as a platform and as a sharing medium. I think as far as the stickiness of the site, I think that's largely growing for most people. I think the financials will be strong despite increased spending this year. What we have to watch are ad rates and advertiser participation and effectiveness of ads. We'll get an update on that in about a week here.

Overall Facebook is right now still a buy first. I'm glad it's been buy first for a long time despite the price, and it's not even that far above our fair value estimate. I think it's so far showing itself to be one of the best companies of the decade, but what we care about more is the next decade. Will that continue? Right now, we still own it and believe that it's worth owning. Any plans to sell covered calls? I would say after earnings, we're always looking at the possibility. What we like is what we did last year, selling covered calls that expire before the next earnings report so that we don't get caught. That said, even a simple income strategy like on Skyworks worked against us when Skyworks jumped and our shares got called away.

In a era of low volatility, you're drawn to volatile stocks like Skyworks to get option income and that can bite you. I got bit by that myself. I'm like, "Oh, these premiums are good. They're the only good ones. Let's do them and manage them." As I posted on the boards, I think we'll make up for it over time, but it's still a lot of time and energy spent. Short answer, though, uncovered calls is opportunistically ...

Jeremy Meyers: Yes. Always watching, but there's not a lot of good opportunities right now. There's a reason.

Jeff Fischer: Jeremy and I talk about Oracle every week. We write covered calls here and they just don't pay anything.

Jeremy Meyers: It would've been fantastic, but you just feel like you're just picking up pennies. You know, it's probably not worth the risk.

Billy K.: We talk about low volatility, historically low volatility, so that harms covered calls as well.

Jeff Fischer: Yup. Covered calls on GameStop? That's not in Motley Fool Pro, it's in Motley Fool Options. I ask you to please go to Motley Fool Options and the GameStop board there. Jim [Gillies 00:48:13] can help you out. Are any of us going to the Fool event in Scottsdale the end of February? I think I am. I've been told I am. I don't know the full roster though yet. All I heard is save the dates to go to Arizona. I will be there is the plan. Hopefully other Motley Fool Pro and Options analysts, they should be there, so let's hope so. We look forward to seeing you. Updates on Caesar's? I've been looking at Caesar's almost daily the past few weeks. Really it's a few months. Time flies. Because the end of December they were cleared for bankruptcy and we're getting a better picture into the amount of equity shareholders we'll be left with, which is about 6% of the new combined company, which is not much, obviously, 6%.

I think the stocks should be much lower than it is, but I'm trying to figure out why it isn't before I lose the position, assuming that's what we choose to do, or keep it, assuming the bottom's going to fall out eventually once people see the actual financials tied to this equity, what the equity is actually worth. Right now it's hard to see because the companies haven't merged yet. You don't see the earnings power. I pieced the two together and it looks slight to none. The stocks should be much lower, in my opinion. We're sitting on our small short. We've covered half of it at a nice gain. Yeah, that's a question, Mark. What the stock will do next, I think the business will continue to putter along though, frankly. More updates there likely this year because we can't wait forever.

Any of us can answer this, I would think. Why is there even a reason Pro missed the run-ups in Texas Instruments, Nvidia, AMD, Avago. Didn't they catch your eye? For myself, speaking for myself, I looked at the industry and liked Skyworks best. I think Skyworks has more than doubled since we bought it, so it's done well. The chip industry, as a whole, is competitive and there's usually pricing problems or competition. Nvidia, I've started to look at again. David's recommended it a few times and it's not just a chip business, per se, it's all kinds of interesting businesses. Not entirely in my wheelhouse would be my answer.

JP Bennett: I would say that and just diversification. I mean, hind sight bias? Yeah, we should've loaded up on all of those, but at the time, do you really want to put all your eggs in one basket and double down on an industry that you haven't covered for very long not in your wheelhouse that has historically been pretty volatile and been subject to pricing wars, like you said? For me, it was, "All right, we've got one that we think is best of breed. We don't really need another one."

Jeff Fischer: Yeah. I felt that way too. AMD was highly speculative. Texas Instruments kind of is too. Nvidia, I think, I keep looking at it. It looks expensive to me because it was up 200% last year. Yup, can't get them all. There are a lot more winners than that that we've missed, for certain. We bought some losers instead. Overall, we're hopefully meeting or exceeding our goals over time, and that's how we can sleep at night still and not have too many regrets. When will we see recommendations from Pro in the defense sector, thinking that defense spending will increase dramatically? People are looking at me.

JP Bennett: Take the lead.

Jeff Fischer: We've owned defense in the past and it's not something I love investing in. It's not in my wheelhouse. It's reliant on big government contracts that can come and go. Any administration may only be around four years, and then the whole policy changes over again before things even get rolling. I don't like to bank on the government for my investment decisions because it's changing all the time. I don't know that will go to defense. Yeah, I don't know. We'll see. I'd put the odds at low. I don't know if there are that many defense stocks across the Fool universe recommended.

JP Bennett: Probably not. I think there are some opportunities in there, but like you said, it seems like something that everybody kind of wants to get into because of the new administration, so it could become a crowded trade, like you see with some of the industrials and some of the people banking their hopes on making America great again through investing in infrastructure and things like that. You got to be careful with that one, right?

Jeff Fischer: I probably would by Boeing before I bought defense because at least it has enormous commercial demand, not just government demand.

Jeremy Meyers: It's really hard to analyze a lot of these businesses because you don't have a lot of clarity on the contracts. Their multi-year, sometimes multi-decade even. They can be cut pretty easily and a lot of things are classified that you can't get the information on it or you have to know people within the industry to have a really deep understanding of the drivers of the business.

Jeff Fischer: Yeah. As you know, in Pro, we try to focus on companies with strong recurring revenue and growing opportunities to take their cashflow and reinvest it in more growth. Most defense contractors that I know of don't fit those dynamics. We're into lightning round with five minutes to go. Why don't we each choose two or three questions and we'll go around the table and answer them?

JP Bennett: I can take the first couple because the seem to be relevant to stocks that I cover.

Jeff Fischer: All right, JP. Fly.

JP Bennett: The first one. Any plans to write covered calls on Apple? I would say at the current time, no. Apple seems to go through periods of extreme hopelessness where the stock is doomed, the company's going to be out of business in a couple years to extreme optimism. We don't want to get tied into a situation like Starbucks. Not Starbucks, excuse me, Skyworks. It's a much cheaper valuation, but if the new iPhone comes out, the 10-year anniversary iPhone, and blows everybody's expectations out of the water, feel pretty confident that demand is going to be extremely high and so you may see the return of, "Oh, boy. Apple is the king of tech again." It'd just shoot and we don't want to miss that out because we get greedy for a couple extra pennies, like Jeremy said.

Do we plan on shorting Deere again? Oh, boy. Industrials, right? They report in February and at this time I probably would want to see those results and see how the market reacts to that. You look at Caterpillar who just reported. Basically, we're one month away from 50 consecutive months of declining sales. The stock is within a couple dollars of getting back to 10-year highs or something along those lines. It wasn't that far long ago where management was basically promising that we're going to have earnings in EPS in the teens in 2017. Now what are we at? A couple of dollars at best. Despite that, we have the stock moving constantly higher. It's a very interesting environment. We may consider it.

Personally, I do think a lot of companies in this sector are very overvalued because they're being bid up because people think that we're going to return to growth. I don't think, if you look at macro factors, it's not going to happen. A irrational market can last for a lot longer than you can stay short a company. We may do it smaller size. Probably going to prefer to see earnings first. I'll just take one quick one since it tied into what I talked before.

Jeremy Meyers: I'll circle back [Valmont 00:56:03] part of it.

JP Bennett: Yup. SVXY, it's moved strongly to the upside. Do we anticipate continuing to hold, consider writing calls on a portion or position, et cetera? This is something like I said before. We're currently considering VIX all time lows may be a good opportunity for us to do something like that. We had a period of extended low volatility in the early 90s. What happened? The market went on to rally like crazy for the next five, six, seven years. We had very low volatility right before the housing bubble burst and we had the great financial crisis. Low volatility doesn't necessarily guarantee that the market is going to crater. We don't want to bet the house on that, but you are correct in noting that is actually a position we are currently discussing and there may be something to do there. Being a little bit more active in taking advantage of opportunities like that may be worthwhile in volatile securities like that.

Jeremy Meyers: I would say we are not, at this point, thinking about pairing down the Valmont position. Deere was not a direct short. It was a partial hedge against Valmont because only about 25% of Valmont's revenue comes from its irrigation equipment. The rest is tied to infrastructure spending. If we're potentially going to get a huge wave of stimulus spending from the new administration, Valmont should be a prime beneficiary. If that does happen, even if the agriculture market stays weak for an extended period of time, I think that the gains in the other areas will far outweigh how investors are perceiving Valmont's future.

Jeff Fischer: Sounds good. I can jump on a few. Lon, happy rooster to you as well. Soon, very soon. I think Saturday. What's a good limit to sell Expediters at if I haven't sold? It's around 53 now, which is a good limit as any. Expediters is one of the most shorted stocks on the market because people are afraid trade may be disrupted. We're out of our synthetic long and covered strangle, but we watched the company for a possible reentry. If you're still in it and don't want to be, Lon, then 53-ish is a good limit. Coca-Cola was in Motley Fool Options. I'll just say the premiums are so low on the options right now that that's why it was closed and we're not doing anything right now, but it's possible. Starbucks we talked about early on. It's just down a little bit because sales were a little light. Same store sales were a little light, but long-term they're working to fix that. Any others here that we should address before we sign off?

Billy K.: Sure. I've got a couple about my companies I can address very quickly. Talk about Papa John's. My shares were called away. Papa John's we have as a combined position with our Dominoes short. Ideally when you covered your position, you covered just the amount of our Dominoes short so that you still have some Papa John's remaining. If you didn't and you covered all of your shares and you no longer have any Papa John's, you could do one of two things. You could either now buy the difference between our Papa John's allocations and Dominoes short, which is about 1.4, 1.5%. You could buy that right now and be matched up with Pro's exposure. If you feel like the stock is a little bit too expensive because it's well above our fair value estimate, you could buy maybe a half position or you could write some puts to try to buy into Papa John's, again, lower.

Similar question. I had my [ParkCell 00:59:21] shares called away. Would you reenter it or stay on the sidelines? ParkCell is a little bit of a different story. We covered that because management has had some concerns there and we want to wait for another quarter of results. I would way until we get some results. We'll have some guidance affiliated with our analysis of the quarter. Based upon what we do, or if we change our strategy, roll our covered call, or just let the position go, you can see what we do and then act accordingly.

Jeff Fischer: All right. Thanks, Billy. With that, we do have to wrap it up. If we didn't get to your question, please consider posting it on The Motley Fool Pro discussion boards. Choose an appropriate board and we will hopefully see it. Write us an email if we don't because we'll answer there. A lot of these questions that are left, thankfully there aren't that many, a lot will be best answered on a discussion board anyway. Thank you for being here. We really appreciate it. We appreciate that you are a Pro member and a Motley Fool member with us, a fool like us. We hope you're enjoying the start of the year. Hope you're enjoying the long-term process of investing, of having an ownership stake in great businesses in our country and around the world, and enjoying the appreciation that comes with that. Thank you for being part of Pro. I would also like to thank Ellen Bowman for once again setting up this live chat.

Pro's 2016 Results, Reviewed!

Published Jan 9, 2017 at 3:25PM

Dear *Pro* Fools,

I hope 2017 finds you optimistic about your investments for the coming years (note: plural!), and I hope we're all feeling wiser given another year of experience behind us. Here in *Pro* (and in *Options*), we had a decent if somewhat forgettable 2016, and that's saying something given all the excitement: The year began with the worst January for stocks in history, Britain voted to leave the EU, the U.S. is moving forward with an unconventional president, and our interest rates are headed higher. And yet the stock market ascended in the end.

Before we begin 2017 in earnest, let's review how our discipline -- or breaches of discipline -- treated us in 2016, and what we might learn. First, how did 2016 turn out for us?

2016 Redux: $178,604 Appreciation

Pro had a decent-to-good 2016, helping maintain a strong three-year annualized return, which is our first goal. (Our second goal is doubling our purchasing power every 10 years.) The *Pro* portfolio started 2016 worth $2.49 million and ended at $2.67 million, up 7.3%. Our $178,000 in appreciation last year is exactly what we achieved in 2015, too (what are the odds?). On average, we were 67.6% net invested over the year, using cash, shorts, and hedges to lower our exposure (in 2015, we were 67.7% net invested). Our returns were especially good in the context of our cash holdings and a growing basket of shorts in a market that ultimately rallied. The rally in the S&P 500 favored industrial stocks and energy, both of which we lack by choice. As a result, our return for the year more closely mirrored that of the Nasdaq, which was up 7.5%. Other comparisons:

Vehicle	2016 Return	2015 Return	2014 Return	2013 Return	Current 3-Year Annualized Return
Pro	7.3%	7.5%	17.5%	35.1%	10.7%
North Star	9.3%	8.2%	8.5%	8.7%	8.3%
S&P 500	12%	1.4%	13.7%	32.4%	8.9%

MSCI World	5.3%	(2.7%)	2.9%	24.1%	1.8%

Last year was the second time in five years that we trailed our North Star, and the first in four in which we trailed the S&P 500. Measuring at our 67% exposure level, as other funds would do, we didn't trail the S&P by much, and we topped the Nasdaq and other indexes. Our largest position, **Facebook** (NASDAQ: FB), gained 9.9% on the year, as did **O'Reilly Automotive** (NASDAQ: ORLY); but our other large positions, including **AmTrust Financial Services** (NASDAQ: AFSI), **MasterCard** (NYSE: MA), and **Oracle** (NYSE: ORCL), were down or relatively flat. **Gilead Sciences** (NASDAQ: GILD) declined more than 30%, and **Medtronic** (NYSE: MDT) and **Parexel** (NASDAQ: PRXL) fell as health-care performance suffered. In fact, industry-wise, technology and health care badly trailed industrials and energy last year. I think this will turn positive for us this year and/or in the near future.

Our strong 2016 winners included **Broadridge Financial** (NYSE: BR), **Gentex** (NASDAQ: GNTX), and **OpenText** (NASDAQ: OTEX), all up 20% to 30%; **Valmont** (NYSE: VMI), up 33%; and **Papa John's International** (NASDAQ: PZZA), which gained 53%. **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY) jumped 80%. And our longstanding short of **Direxion Daily Financial Bear 3X** (NYSEMKT: FAZ) fell 47% for us, making the annual fee to short it more than worthwhile.

Other stalwarts, including **Visa** (NYSE: V), **Verisign** (NASDAQ: VRSN) and **Starbucks** (NASDAQ: SBUX), didn't go much of anywhere last year, but earnings were up, and the subsequently improved valuations may add to our future returns. MasterCard and Visa have jumped to life so far already this year.

Net Realized Capital Gains: $47,559

We booked more than $47,000 in net realized gains last year; about $20,000 of that was long-term, the rest short-term gains. This is much lower than the $94,751 in net realized gains we booked in 2015, and this decrease is good. For those following *Pro* in taxable accounts, we don't want to give you an unnecessarily large tax bill every year. Our $125,000 in *gross* realized gains in 2016 were offset by $78,000 in realized losses.

Much of our realized gain came from selling **Wells Fargo** (NYSE: WFC) and **Skyworks** (NASDAQ: SWKS) (with Skyworks unfortunately getting called away) and from closing the rest of our **World Acceptance** (NASDAQ: WRLD) short. Most of the remaining gains were written options that expired as income.

Our only true realized losses were $22,000 in **American Airlines** (NASDAQ: AAL) calls and a net $14,000 loss on a **Deere & Company** (NYSE: DE) short; almost all of our other "losses" were options that were part of a spread, expected to end as a loss.

Dividends: $27,192

We said last year that our dividends would likely decline in 2016, because late in 2015 we sold big payers **The Buckle** (NYSE: BKE) and **Tupperware** (NYSE: TUP). And our dividends did dip last year.

Year	Dividends Received
2016	$27,192
2015	$32,304
2014	$25,387

Our largest absolute payers in 2016 were AmTrust, Broadridge, and Wells Fargo, and we have since sold Wells Fargo. We'll now consider new positions that could bring in more dividends, because these payments play a large role in the market's total return -- and our own. We've collected nearly $85,000 in dividends over the past three years. That said, we continue to seek the "Facebooks" of the market, as well: those that don't pay dividends but offer large upside.

Option Income: $21,492

Our option income increased again last year as we aimed to have some options expiring every month, a goal we maintain this year.

Year	Option Income
2016	$21,492
2015	$16,774
2014	$7,491

Much of our option income was earned on our original **American Tower** (NYSE: AMT) diagonal call, which we recently restarted in a new position. A good chunk of income came from writing a large put contract on **Celgene** (NASDAQ: CELG), multiple puts on **Gentex** (NASDAQ: GNTX), a strangle on **Expeditors** (NASDAQ: EXPD), and some covered calls on Gilead and others. Options didn't pay that well last year except during spikes of volatility.

Combining this income with our dividend income, we earned a 2% yield on the whole portfolio, despite having about 20% cash. But this income excludes the fees we paid to short. (It also excludes the money we made writing ratio put spreads, which goes into our hedging return.)

Short Stocks: ($1,762) in realized losses and ($2,608) in fees

We had realized losses last year on our individual short position on Deere, which lost a net $14,200 -- though Deere also helped us to keep Valmont, which is up more than that so far. The loss on Deere offset a $9,900 realized gain in the remaining portion of our World Acceptance short, and a $2,500 gain from shorting **Pier 1** (NYSE: PIR). We paid a meaningful $2,608 in shorting fees (or interest) last year, adding to our realized shorting loss. With the stock market up strongly, our shorting loss was slight, and we saw unrealized gains elsewhere on our shorts. Still, we keep an eye on our fees and make sure we want to keep the shorts we have.

Hedges: $7,950

After closing one in January of last year for a $9,000 gain, we set up several ratio put spread hedges on the **SPDR S&P 500** (NYSEMKT: SPY) ETF in 2016. With a rising market, none of these paid off the rest of the year, but most did pay us a credit of a few hundred dollars. In November after the election, we gave back about $4,000 in gains on our synthetic short of SPY. We exited that open-ended short right after the election. Here's how the year panned out compared with recent years:

Year	Hedge Gain (Loss)
2016	$7,950
2015	$811
2014	($34,673)

In 2014, we had direct shorts of SPY, and naturally we lost on those as the market climbed. In 2015, we vowed to improve on that approach and stuck to ratio spreads, earning income despite a flat stock market. Last year's combination of ratio spreads and a brief synthetic short on SPY worked out overall, even though the November short cost us. I believe setting up that short was appropriate given the uncertainty surrounding the election: A surprising result was indeed possible, like Brexit. Our portfolio on the whole jumped anyway.

Recently, we suggested a 15% allocation ratio put spread hedge on **PowerShares QQQ** (NYSEMKT: QQQ) that goes until January 2018. We'll have more hedges in future, as well. Remember, you *expect* to lose on a hedge -- it's insurance against a shock to your portfolio, and it allows you to be more invested on the long side. So, net-net, hedges should lead to larger long-term gains for the portfolio, even though they don't usually pay you anything. But of course, if we can minimize our losses on the hedges themselves, we will.

Active, but With Low Turnover

We issued 45 trade alerts in *Pro* last year, or 3.75 per month. This is in line with recent years. (We also issued 84 alerts in *Options*, making *Pro* and *Options* the most active services at the Fool according to the math.)

Year	Pro Trade Alerts
2016	45
2015	43
2014	34
2013	42
2012	55

We seek to keep our core stock turnover low, so much of our activity is related to options and hedges. But we did close some longs and shorts last year, including American Airlines, Deere, Pier 1 (all three new to *Pro* last year), and Wells Fargo. Overall, we had low turnover last year with about half a dozen positions closing. As long as we believe our positions are capable of challenging the North Star over time with reasonable risk, we're unlikely to close, unless we need the capital for something we like better.

Some other new names to debut in *Pro* included **Celgene** (NASDAQ: CELG), **Paycom** (NYSE: PAYC), and **Verisign** (NASDAQ: VRSN), along with several new shorts. We ended the year with 23 core stock investments, up from 21 a year ago. Our top 10 positions currently make up 44.5% of the portfolio's value (up from 42% last year).

Biggest Lessons and Improving Further

So, that's a lot of numbers on another positive year for *Pro*, a portfolio that's able to be as long, or as short, as it wishes. What were some key lessons learned this year?

Easily the largest one for me was related to our American Airlines call options. We started the bullish position in January on the argument that airline profitability was here to stay. As the year progressed, competition continued to drive down revenue per passenger mile at American, and the stock slid as if the company was going out of business. After an 80% drop in our calls, I sold them to avoid a complete washout. This move was somewhat defensive, but in retrospect made little sense. We had little still invested in the calls -- little left to lose -- and had we waited, the position would be back near breakeven today (we couldn't have known that, but again -- we had little financial reason to sell at that point). Adding insult to injury, Warren Buffett started buying airline stocks after we sold, using some of the same arguments we cited in January. One lesson I take away from this: Buying into an industry that's new to you increases your risk of bailing at the wrong time, just as we did. Lacking a history of knowledge, I didn't have the confidence to stay in it. A second: When you have little left to lose, you can more easily let time be your ally. We didn't need to sell at that point. I think we learned some other good lessons as well, though, as shared in the sell report.

Another regret is not buying more aggressively during the January swoon in prices. Some of the stocks we're watching fell close to our desired price -- close enough -- but rebounded quickly. We also wanted to add to our positions. We need to be ready to buy during swoons, even if we start small and average in; next time, we may start sooner. In the same vein, I took a very long time to make some of my shorting decisions, including on **Gogo** (NASDAQ: GOGO), **GoPro** (NASDAQ: GPRO), and **Shake Shack** (NYSE: SHAK). I wanted to short all three up to a year before we did so, and when they were at (sometimes much) higher prices. I still believe in the shorts at the prices we ended shorting at, and caution is merited before any short position is started, but I want to become more efficient when I "know" I want to short something. I tested the theory for months -- I can shorten that process.

Overall, we stayed disciplined more often than not, and avoided many large mistakes, allowing us to return more than 7% while being 67% net long and carrying cash. We topped most long/short funds out there (the average long/short fund returned 4.9%). But I still, and always, feel humbled by the market and a need to improve. Finally, did we enjoy ourselves? That's key, too. For the most part, we did.

So, Fools, we start 2017 hoping to again enhance how we think and act when it comes to our investing, and thus improve our long-term results. Expecting the unexpected (which is an oxymoron!), this year we want to keep earning income, continue to add shorts and hedges, and buy more top-tier stocks (or long call options) when we see opportunities for our specific portfolio. We'll also be seeking smaller growth companies. Many of you customize your Foolish portfolios to your own situation; consider studying your results from 2016 to see where you did well and what can be improved. Post comments or questions on the Memo Musings board. Meanwhile, thank you for being a *Pro* Fool with us! We enjoyed spending last year with you, and we thank you! We look forward to sticking to our discipline in 2017, and using what we we've learned.

In closing, 10 years ago today, in Foolish fashion, Steve Jobs introduced one more thing ... the iPhone.

Fool on!

— Jeff (TMFFischer)

Pro Catch-Up Trades and Upcoming Expirations: Jan. 9, 2017

Published Jan 9, 2017 at 3:11PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.5%.

Continue building your portfolio with our Buys, including:

- **Paycom** (NYSE: PAYC): Buy 2.3% (see our recent recommendation).
- **Starbucks** (NASDAQ: SBUX): Buy 3.4%.
- **Verisign** (NASDAQ: VRSN): Buy 1.5% and write a covered strangle for another 1.5%, as per our recommendation. Lately you can be paid $3.40 to $3.45 for selling to open the strangle.
- **Verisk** (NASDAQ: VRSK): Buy 2.1%.

Shorts:

- **Shake Shack** (NYSE: SHAK): Sell short 0.5% if you haven't.

Pro options:

- **American Tower** (NYSE: AMT): Set up a diagonal call if you haven't yet, following our recommendation. Lately this can be set up at a net debit of about $29 per diagonal. Set up a 0.5% allocation, but only risk what you can afford to lose.
- **Domino's Pizza** (NYSE: DPZ): Use a limit order to write covered puts following our new recommendation. Write one put for every 100 shares of Domino's you are short. The puts lately pay around $4, but we're holding out a bit longer, hoping for $4.50 or so. If the stock declines, the puts should pay better.
- **Verisign:** Please see above under Buys.

Hedges:

- **ProShares QQQ Trust** (NASDAQ: QQQ): If you haven't set this up yet, today you would sell to open January 2018 $103 puts, and buy to open half as many January 2018 $116 puts, for a small net credit. Set up a 15% allocation using the guidance in our alert. We need to make our trade soon and will adjust accordingly.

Upcoming Expirations (Jan. 20, 2017):

- **Expeditors International** (NASDAQ: EXPD): Our synthetic covered call (which started as a synthetic covered strangle) has done well for us this year, bringing in income while our core long calls are also up 155%. We'll bring the position to a close before expiration, likely all at once; an alternative is to accept shares and write strangles on them, though one consideration there is how international trade may be affected in the coming years.
- **Skyworks Solutions** (NASDAQ: SWKS): We'll close early if we've earned much of the premium, or roll the calls near expiration. Skyworks will announce earnings after the market closes Jan. 19, one day before our options expire, so we'll have a decision before then.

CES 2017, Day Three: Under Armour Thrills Crowd With Star-Studded Keynote

Published Jan 9, 2017 at 2:48PM

About 3 minutes 30 seconds. Scroll down for transcript.

Friday was the third and final day of CES 2017 for us at The Motley Fool. We have been on the front lines talking to CEOs, engineers, and other industry experts to gain insights that investors can use to reap rewards over the long term. We continued those explorations today — featuring, among other things, a wrap-up keynote from Under Armour CEO Kevin Plank — and didn't leave disappointed.

The Internet of Things

As expected, the Internet of Things (IoT) was on everyone's minds here at CES. Businesses are looking for ways to connect more devices to the Internet in an effort to help people automate and enhance various daily tasks. **Gartner** (NYSE: IT) estimates that the number of connected "things" will grow from 6.4 billion in 2016 to nearly 21 billion by 2020. As investors, the exciting part is identifying which companies are likely to lead the pack in enabling the number of connected devices to more than triple over the next several years.

One of the businesses enabling this growing wave of mobile connectivity is **Skyworks Solutions** (NASDAQ: SWKS). Another company blurring the lines between hardware and software to create a back-end technology platform for IoT is **NXP Semiconductors** (NASDAQ: NXPI). NXP's platform powers the voice activation of a wide array of devices, including the **Amazon** (NASDAQ: AMZN) Echo. Like other semiconductor businesses, NXP is also making inroads into developing the computers and sensors necessary for autonomous vehicles.

In October, it was announced that **Qualcomm** (NASDAQ: QCOM) plans to acquire NXP for the cool sum of $39 billion. Qualcomm set the standards for mobile communication with 3G and 4G data speeds, and acquiring NXP would diversify Qualcomm into other areas like automotive, mobile payments (through NXP's near field communications (NFC) technology), security, and more. Qualcomm made waves of its own at CES, particularly by sharing its vision for the next stage of mobile communication with 5G — meaning far faster data speeds and much slower lag times (or latency) — and what it means for the IoT. As reported by CNET:

Think of it this way: If 3G ushered in the picture era and 4G was about video, 5G will be about tying our entire world together. What will we get? Live-streaming VR, autonomous cars that respond to real-time conditions, and connected cities where everything from the houses to the street lamps talk to each other.

"5G will have an impact similar to the introduction of electricity or the automobile, affecting entire economies and benefiting entire societies," says Qualcomm CEO Stephen Mollenkopf. This shift toward 5G won't happen overnight — the infrastructure still needs to be developed and put into place — but large players like Qualcomm and **Intel** (NASDAQ: INTC) are both testing the waters with 5G technology starting later this year. In our conversation yesterday with Liam Griffin, CEO of Skyworks Solutions, he says he expects 5G solutions to make up 20% or more of the company's total revenue within the next three to five years.

As more devices come online and cars increasingly become computers or robots with four wheels, the behind-the-scenes companies mentioned here are among the ones investors should watch closely to get a sense for how the IoT is taking shape.

Bringing Education Online

Innovation can happen in unexpected places, and when it does, we want to be ready as investors. The traditional model of higher education could be one of those spaces slated for some major changes in the coming years. I spoke with Chip Paucek, co-founder and CEO of **2U** (NASDAQ: TWOU), which partners with top universities to build quality online degree programs.

When you think of online college education, says Paucek, most people think of University of Phoenix, not Yale. 2U, however, is working with top universities like UC Berkeley, UNC Chapel Hill and, yes, Yale, to bring their curriculums online. This means that students can still get a quality online education from a reputable university without having to uproot their lives. It's an attractive proposition for universities: 2U provides funding to get the program going and the online platform itself, and universities can admit more students online than they would otherwise have in their classes.

Paucek says the sleeping giants of higher education are awake, with more and more nonprofit schools coming online. UNC Chapel Hill's MBA program alone has over 1,000 students going through its courses via the web. 2U's model is attractive because it aligns its success with both the universities and the students. The company signs a 10-year contract to share student tuition with the university, so 2U only succeeds if students successfully complete their online degrees. When students drop out, 2U takes a financial hit.

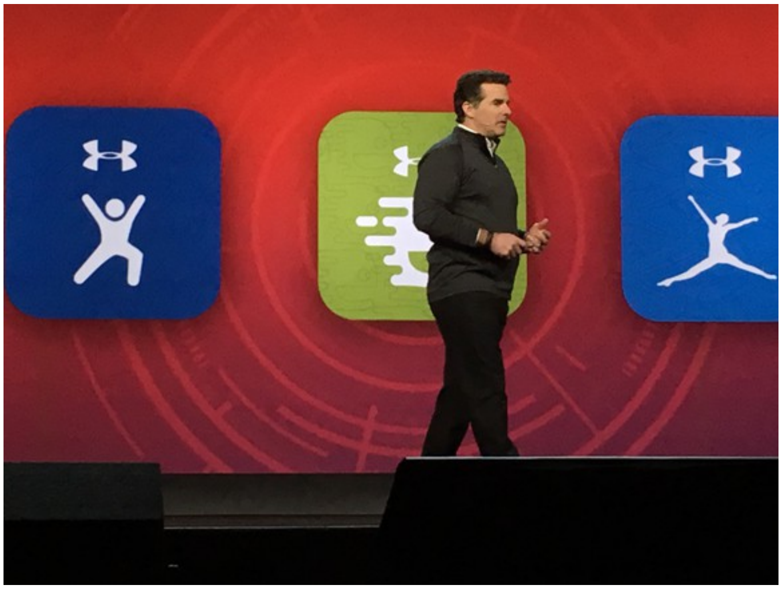
When 2U went public three years ago, it was adding new programs at a pace of about four per year. Today, the company is on pace to add 10 new programs this year. Paucek says 2U investors should pay close attention to the new universities it brings into its portfolio, since that is the main growth catalyst for the company in the coming years. Innovation can happen in hidden places, and 2U is a prime example of a young company bringing an innovative new approach to a long-established industry.

Under Armour

Kevin Plank, founder and CEO of **Under Armour** (NYSE: UA) (NYSE: UAA), was greeted on Friday with high expectations for his keynote presentation. It might seem strange for what is supposedly an apparel and shoes company to be giving a keynote at a tech conference, but Plank made the case that Under Armour is — and always has been — a technology company. "We are not just a logo slapped on a shirt or shoe," says Plank.

Plank is one of the most competitive business leaders in the world today, and has his eyes set on Under Armour surpassing **Nike** (NYSE: NKE) as the leading athletic brand in the world. That's no small order: Nike generated $33.5 billion in revenue over the past four quarters, compared to $4.7 billion for Under Armour. Plank used a colorful metaphor to distinguish his competitive spirit. To create fire, says Plank, some people rub sticks and others hit rocks to try to create sparks. Plank says he lights a match and dumps 100 gallons of kerosene on it.

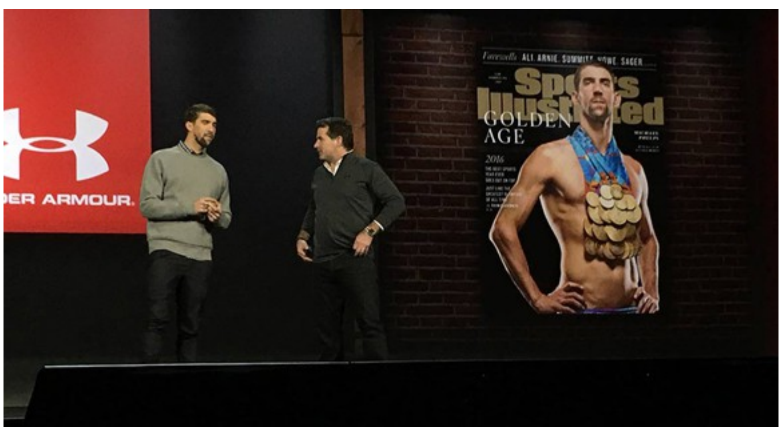
One way Under Armour is working to change how apparel is designed and manufactured is through its local-to-local manufacturing initiative, where the company aims to manufacture apparel in the respective countries in which it is sold (Brazil goods will be manufactured in Brazil, U.S. goods in the U.S., and so forth). Up until now, says Plank, apparel and shoes have been manufactured the same way for 80 or 100 years. Plank calls that "criminal." Under Armour's new 70,000 square foot Lighthouse — an innovation and design lab of sorts based out of its Baltimore HQ — is one of the company's early steps to shift to the local-to-local model.



Under Armour has taken big steps into the connected fitness space over the past several years. The company collectively spent $710 million acquiring three different fitness and nutrition apps (MyFitnessPal, Endomondo, and MapMyFitness). Plank made it clear that Under Armour's platform will remain hardware agnostic, meaning the apps can be used whether on an Apple Watch, a FitBit, or any other device. Except in certain instances where hardware can be integrated into its apparel and shoes, Plank says Under Armour plans to stay out of the hardware game.

What these three apps — which collectively have more than 194 million registered users, with nearly 100,000 new users joining each day — do very well is collect massive amounts of data. Whether users are logging the meals they eat, runs they take, or other fitness and wellness preferences and habits, Under Armour is gaining direct insights into the behavior and preferences of its customers. Plank showed the crowd an example of "user heat maps" in four major worldwide cities, where Under Armour can segment out different users based on whether they are walking, running, or using a bicycle. More than anything else, Under Armour's push into connected fitness is a way for the company to gather more data and better understand the needs and habits of its users — and hopefully sell more apparel and shoes as a result.

Plank says Under Armour strives to solve problems that people never knew they had. One of these oft-overlooked problems, according to Under Armour, is getting ample time for rest, sleep, and recovery. Plank announced a new line of Under Armour's connected fitness sneakers which are equipped with UA Record — an app that brings together all of Under Armour's connected fitness tools. Not only do these shoes automatically track data for athletes, but coming in February, Under Armour is launching a new feature where athletes can go through tests with the shoes to determine how hard (or not) they can/should push their body for that workout. Olympian swimmer Michael Phelps joined Plank on stage to showcase this new feature and explained how this data is vital for helping athletes both rest and perform better.



Plank then dug deeper into explaining the important role that sound sleep plays in maximizing performance, whether as an athlete or throughout life. Like exercise and sleep, explained Plank, sleep also needs a strategy. Arianna Huffington, founder of the Huffington Post and author of *The Sleep Revolution,* joined Plank to expand on an exciting new partnership with Under Armour. The company also connected with John Hopkins Medicine scientists to study and unlock the science of sleep, leading to a new product line of sleepwear (backed by Under Armour athlete Tom Brady) packed with technology that is supposed to lead to a better sleep.

It remains to be seen whether Under Armour's new PJs are indeed a product we didn't even know we needed, or if this is a case of the company pushing its luck with its brand power. This move into sleepwear makes sense to me, because Under Armour is now able to capture a wide array of data on people's sleeping patterns and habits and should be able to see whether certain products help improve the quality of sleep and subsequent performance.

In any case, this goes to show the power at Under Armour's fingertips as it looks to do to the connected fitness category what **Facebook** (NASDAQ: FB) did for social, Amazon did for online retail, and LinkedIn did for job search. Data is a powerful tool, and Under Armour just might be getting the data it needs to maintain its impressive growth trajectory in the years to come.

Foolish Bottom Line

And with that, our time at CES 2017 is a wrap. I hope you have found these reports useful, and come away from our reports with a better sense of what trends, companies, and technologies to watch in the months and years ahead. And now, we're going to follow Under Armour's advice and get some quality rest after a long, exciting week.

Thank you for following along with us!

Foolish best,

David Kretzmann

Transcript

DAVID KRETZMANN:

Greetings, and welcome to day three of CES 2017 here in Las Vegas, Nevada. I'm David Kretzmann of *Motley Fool Supernova* and I'll walk you through some of the highlights that we experienced today at CES.

First we had a chance to visit NXP Semiconductors, a company doing a lot of work bringing more devices and more items in our world online into the Internet of Things along with the connected home and other key trends like that that we've been hearing a lot about here at CES.

Among other things, NXP Semiconductors is really the company enabling that voice-activation technology in Amazon's devices like the Echo. The company is doing a lot of other work to bridge that gap between the hardware side and the software side of the Internet of Things, so we were able to explore more with NXP and what the company is doing there with the Internet of Things.

We also had a chance to talk with the founder and CEO of 2U. 2U is a company a lot of people probably haven't heard of. It's a company that's partnering with a lot of high-level colleges and universities (including the University of North Carolina at Chapel Hill, UC Berkeley, and many others), bringing their traditional curriculum online. Essentially enabling people around the U.S. and potentially around the world to take these courses from these great universities and colleges online [and] bringing the higher-education space online. So we had a chance to hear more about what 2U is doing and key trends to watch with higher education moving online in the 21st century.

Last but not least, and certainly the highlight of the day and potentially the highlight of the week, was the keynote presentation from Under Armour founder and CEO Kevin Plank. The bulk of the presentation really focused on the company's efforts in the connected fitness space.

Over the past three years the company has spent over $700 million acquiring three different apps that [have] nearly 200 million collective users today. The company, with those acquisitions, is really seeking to acquire data from its customers. So get a sense for what people are eating. When they're exercising. How long they're exercising. What type of exercise they're doing. Capturing that data and using that data to more effectively see the needs of those athletes and serve the needs of those athletes.

The bulk of the company's new platform has a lot to do with sleep, rest, and recovery. The company brought out Michael Phelps, the Olympian swimmer. Bought out Arianna Huffington, who's done a lot of research on the importance of sleep and recovery to maximize performance as an athlete and as a human being in terms of productivity.

This really seems to be a new area of focus for the company — bringing products to consumers that consumers didn't even know that they wanted. The goal is that once consumers are using these products, they'll wonder how they ever could go back to life without these Under Armour products. So a lot of high-level vision from Kevin Plank, as usual. He is a very competitive CEO. A driven entrepreneur. We learned more about what Under Armour is doing in that connected fitness space.

You can learn about all of this, and more, in my report today from CES, and be sure to check out the other two reports that we've put out this week from CES highlighting some of the key trends, businesses, and technologies that we think investors should be paying close attention to, to reap long-term rewards.

Thank you so much for tuning in, and we'll see you again soon. This is David Kretzmann live from CES signing off. Fool on!

Supercharge Your Portfolio With the Biggest Trends of 2017

CES 2017, Day Two: 3 Key Tech Trends for Investors

Published Jan 6, 2017 at 1:48PM

Thursday was our second day at CES 2017 in Las Vegas, NV, and our crew of Fools were back on the front lines to get a deeper understanding of the biggest trends and technologies we should be watching as investors.

About 3 minutes 30 seconds. Scroll down for transcript.

Let's dig right in!

Self-Driving Cars

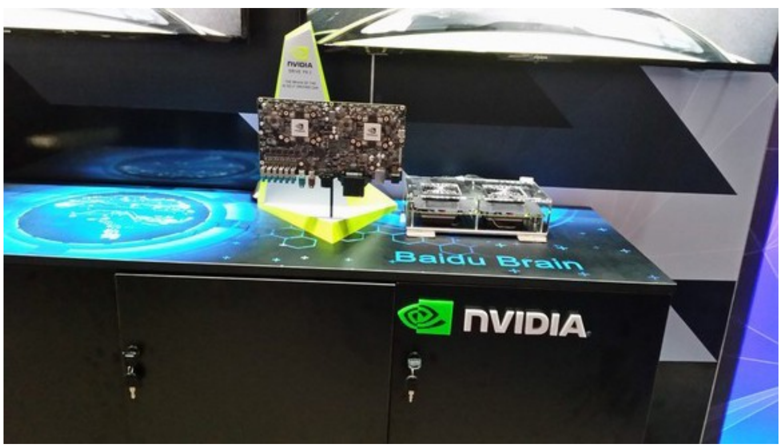
NVIDIA's (NASDAQ: NVDA) keynote on Wednesday evening set the tone for CES this year, and self-driving cars have been one of the event's biggest focuses. On Thursday, we had a chance to meet with AImotive, a European start-up that is developing software to make self-driving cars a reality. Interestingly enough, NVIDIA was a seed investor in AImotive, and the two companies continue to have a relationship today. NVIDIA's bread and butter is computer hardware — such as the supercomputers that power autonomous vehicles, big data analysis, PC gaming, and more — while players like AImotive are focusing on the software side of the equation.

Another company making a splash in this space is **Baidu** (NASDAQ: BIDU), which is commonly referred to as the Google of China. Baidu is well known as a popular search engine, but it's also making a serious push into providing software for autonomous vehicles. The company formed a new division — Baidu IV (Intelligent Vehicle) — in September 2016, which is already staffed with 150 employees, all working on Level 3 autonomous driving technology.

There are six "Levels" to autonomous driving, from Level 0 (absolutely no self-driving capability; a human must always be in control) up through Level 5, which requires no human control at any point in the driving process. Level 3 (the focus of Baidu's new IV division) still requires some control from a human driver, but enables a car to safely take over for a human in certain cases.

An interesting note: even before Baidu launched its Level 3 division in September, the company also had a Level 4 division in place. This is a clear sign that companies like Baidu are not only dreaming big, but are also making incremental progress on the path to fully autonomous vehicles. CES 2016 — which I attended last year — brought a lot of hype surrounding self-driving cars. There is still significant excitement this year, but the trend is focusing more on these smaller, decisive steps.

Baidu has already partnered with more than 60 auto manufacturers, with its "intelligent vehicle" software being integrated into over 150 car models so far — including both consumer and commercial models. Through its HD Map service, Baidu is the largest mapping provider for autonomous vehicles in China. This means that no company knows China's roads better than Baidu from the perspective of autonomous vehicles, which packs a powerful punch when Baidu is looking to form partnerships. Baidu partnered with NVIDIA in September to develop its software platform for autonomous vehicles. Its "Baidu Brain" software is powered by NVIDIA's hardware.



Media and eSports

Barry Diller — the media heavyweight who currently serves as chairman of IAC/InterActiveCorp and Expedia — had some words of caution about the movie and TV business. Due to the growing popularity of on-demand and streaming services like **Netflix** (NASDAQ: NFLX) and **Amazon** (NASDAQ: AMZN), Diller says a "profound dislocation" is coming in the industry over the next five to 10 years. For example, more people are increasingly opting for commercial-free television — paying a monthly fee to companies like Netflix, HBO, and Amazon — rather than suffering through commercials on linear TV. This is a troubling trend for TV advertisers, says Dillard, because eventually the people who are still watching linear TV in future years won't have money to buy the goods being advertised.

Diller was particularly critical of the business of making movies in this evolving media landscape, with the notable exception of one movie studio: **Disney** (NYSE: DIS). Put another way: In a world where movies serve as tentpoles for brands, characters, and franchises, Disney reigns supreme above all other movie studios.

eSports is another area where we are seeing media companies direct their resources. Yesterday, NVIDIA co-founder and CEO Jen-Hsun Huang said it is "very, very likely" eSports will one day become bigger than all other traditional sports *combined* — we're talking football, basketball, baseball, hockey, soccer... *everything*. Even established broadcasting companies like Turner Sports — the company behind sports broadcasts on TNT, TBS, and TruTV — are bringing eSports under their umbrella. I spoke with Christina Alejandre, Vice President of eSports at Turner Sports, who says Turner Sports is treating eSports in the same way it treats any other sport.

Alejandre says the biggest misconception people have about eSports is that it is still just a lot of kids playing video games for fun in their mom's basement. In reality, eSports is a full-time job for these players, who spend 40-to-60 hours each week practicing, reviewing replays of themselves and competitors, and perfecting their craft. The main difference between eSports and traditional sports is the technical issues that can arise with eSports — such as a computer server going down in the middle of a tournament — but otherwise they are both approached in a very similar manner by players, fans, and broadcasters alike.

Alejandre says the games that resonate most with audiences are the ones that are simple and straightforward. She used Counter-Strike as an example, a shooter game where the competition is made up of two teams of five. The first team to annihilate the other team wins. Simple, straightforward, and easy to follow.

As for what investors should be watching for over the next several years, Alejandre says we should pay attention to non-endemic sponsorships. If you are like me, you have no idea what that means at first mention. Let me explain non-endemic sponsorships are and why they're important. "Endemic" sponsors are the group of advertisers directly connected to a sport. In the case of basketball, for instance, endemic sponsors would include **Nike** (NYSE: NKE), **Under Armour** (NYSE: UA) (NYSE: UAA), Spalding, and so forth. "Non-endemic" sponsors would be outside advertisers that aren't at all connected to the sport, such as **Home Depot** (NYSE: HD) or **McDonald's** (NYSE: MCD).

Alejandre says these non-endemic sponsors are just starting to come on the eSports scene. As more non-endemic sponsors allocate their advertising dollars to eSports, Alejandre expects that to uplift the entire eSports ecosystem. This makes non-endemic sponsors a useful tool for investors to measure the rise of eSports.

Embracing the Connected World

In a world where more devices are getting connected to the internet, **Skyworks Solutions** (NASDAQ: SWKS) is a key provider of the technology that enables that connectivity. I spoke with Skyworks' CEO Liam Griffin, who explained that what Skyworks does best is craft individual solutions for each of its customers. In other words, Skyworks builds customized hardware solutions for its customers — something that can only be done if the company forms close and long-standing relationships. This gives the company a competitive advantage that can't be easily replicated by its peers, and helps explain its strong (and improving) margins and cash flow production despite operating in the competitive semiconductor industry.

The bulk of Skyworks' revenue has long come from smartphones, but its "broad markets" segment now accounts for about 25% of total sales. This includes everything from connectivity solutions in autonomous vehicles, the Internet of Things, headsets, WiFi routers, and more.

As consumer demand for faster and more reliable data continues to increase, don't be surprised if you hear more about 5G in the years ahead. Griffin explained that 5G connectivity will vastly expand the data pipe (meaning higher data speeds and less lag time), and expects 5G solutions to account for 20% or more of the company's overall revenue within the next three to five years.

Under Armour

We also stopped by Under Armour's booth on Thursday to find any clues for what might be coming in the company's keynote presentation on Friday. The company is plugging its ecosystem of connected fitness apps and apparel (especially its shoes with sensors built in), as well as a new line of sleepwear that is supposed to help people sleep better. This sleepwear line is backed by Under Armour athlete Tom Brady, and we saw another Under Armour athlete — Bryce Harper — swing by to talk about the importance of rest and sleep, among other things.

We're excited to see if Under Armour's keynote tomorrow can match — or top — NVIDIA's presentation and slew of announcements. Maybe Under Armour founder and CEO Kevin Plank will unveil new products, or perhaps offer more details on the company's vision with wearable technology and connected fitness. But if fancy PJs are the extent of the company's announcements, I'll be more than disappointed. Don't let us down, Under Armour!

Foolish Bottom Line

And thus wraps up another packed day for us at CES. We have more interviews and presentations lined up for Friday, and you can bet we'll be on the ground learning and reporting our findings back to you. Thank you for following along with us thus far — the Fool crew is just getting started!

Transcript

DAVID KRETZMANN:

Greetings and welcome to CES 2017. I'm David Kretzmann of *Motley Fool Supernova*. We're thrilled to be here at CES reporting from the front line.

Today there are really three highlights that stuck out to me. This morning we had a chance to really delve deeper into self-driving cars, which is a big theme, here, at CES this year, as it was last year. We initially were able to meet with AImotive, which is a European start-up based in Hungary with a recent office in Silicon Valley. This is a company providing software that's hardware-agnostic — so really to any automaker — to enable these cars to have that self-driving functionality. And Nvidia is actually a seed investor in this company, so it's interesting to get more of that backend perspective of what goes into artificial intelligence and enabling these cars to be self-driving or more autonomous.

We also had a chance to sit down with Baidu — which is commonly known as the Google of China — the biggest search engine in China with over 600 million monthly active users. But Baidu is actually the leading mapping company for self-driving vehicles in China and this was the first year that their self-driving auto unit came to CES.

This is a division of the company that just started in September, 2016, but they already have 150 employees dedicated to pushing this self-driving technology (software and hardware) into the Chinese market and potentially beyond. So a lot of companies that you might not expect on the surface are actually very much involved in pushing forward self-driving technology.

Next we had a chance to meet with the vice president of eSports at Turner Sports, which is commonly known for the traditional sports programming on TBS, TNT, and all those Turner Broadcasting networks. We were able to get a better feel for how that space has evolved for Turner Sports — bringing eSports under that umbrella of other sports programming at Turner.

ESports is a big, emerging category and has certainly been a big theme, here, at CES. Yesterday the founder and CEO of Nvidia said eSports at some point in the future will become bigger than all the other traditional sports like basketball, hockey, soccer (you name it), combined. So certainly a lot of growth opportunity left in eSports and we were able to hear a little bit more about how Turner Sports is approaching that emerging category.

Last but not least we had a chance to talk with the CEO of Skyworks Solutions, which is a recommendation in multiple Motley Fool services and a holding in several Motley Fool portfolios, as well. Skyworks is really on the front lines of the mobile connectivity revolution, as the company puts it.

This is a company that's powering the mobile connectivity of your smartphones [and] it's increasingly branching into the Internet of Things — a new category that makes up about 25% of the company's total sales over the past year — things in the Internet of Things whether it's autonomous vehicles, the connected home, Wi-Fi routers. You name it — Skyworks has an important role to play if there's any sort of mobile connectivity involved. So we were excited to get a chance to talk with the new CEO, Liam Griffin, at Skyworks Solutions.

Those were some of the highlights for me today. You can read more about it in my report and we'll be reporting back to you the rest of the week with our findings here on the front line at CES. Thanks for tuning in, and Fool on!

CES 2017, Day One: NVIDIA Sets a High Bar

Published Jan 5, 2017 at 3:10PM

Greetings from Las Vegas! We've made it to CES 2017. This four-day tech extravaganza, now celebrating its 50^{th} anniversary, isn't lacking for things to see — the show covers nearly 2.5 million square feet this year. Our Motley Fool team hit the ground running to get an initial glimpse of the tech and trends that will define the rest of the week.

I expect a lot of talk this week about virtual reality (VR) and augmented reality (AR) — relatively new computing platforms that carry the potential to transform how people interact with technology. At present, there is no clear winner yet with either of these emerging platforms. **Facebook** (NASDAQ: FB) has Oculus, and Google is doing its part with Daydream. Another key player in the virtual reality landscape is HTC Vive, which recently hosted an event showcasing the company's latest developments in VR.

It can be difficult to understand the potential of VR until you try one of the headsets on for yourself. Consider this: while at CES, I tested a VR experience that simulates a fireman putting out a fire in a home. I was outfitted with a special fireman's jacket which produced more heat as the size of the simulated fire grew. To put out the fire, I had to use a prop firehose controller which responds with jerking motions and increased pressure depending on the flow of the water in the simulation. For firemen in training, such a simulation — with the heat from the jacket and the pressure of the firehose — could be a component of their training routine that normally can't be safely simulated in the real world. I'm sure there are thousands of other potential use cases for VR well beyond the world of gaming.

About 4 minutes. Scroll down for transcript.

I also had the chance to check out a more typical shooter game, where I was outfitted with a heavy gun controller and put on a vest that provides haptic feedback — in other words, the vest would vibrate in different areas as I got shot by the aliens in the simulation.

David Kretzmann
@David_Kretzmann

Checking out the wonderful world of virtual reality with HTC Vive. That gun is heavy & the vest gives haptic feedback #CES2017 #FoolsAtCES

2 8:20 PM - Jan 4, 2017

See David Kretzmann's other Tweets

Both of these props made the simulation all the more immersive, and perhaps a little more realistic. My arm was tired from holding the gun by the end of the three-minute simulation (maybe I just need to lift weights more). Those aliens put up a good fight!

VR still hasn't broken out into the mainstream in the same way smartphones burst on the scene around 2007 with the launch of the iPhone. Some of the main limitations for VR include a limited selection games and content (at least today), still-pricey VR systems (Oculus costs $600 and HTC Vive costs $700, and that's without an even pricier PC to run the system through), and the fact that VR systems require a lot of space.

One way HTC Vive is combating these VR shortcomings is via arcades. This opens the door for people to experience VR without having to pay up for a console or headset. HTC Vive recently stated its goal was to turn "public virtual reality gaming" into a $100 million industry over the next two years. I see this as an attractive model to bring VR to a wider audience in a time when VR systems aren't personally accessible.

Look ma, no hands!

Another area that we're sure to see more of at this year's CES is self-driving cars, also known as autonomous vehicles. Yesterday, we made our way to an event put on by Hyundai, which gave us the opportunity to go for a ride in the company's autonomous Ioniq model.

Much of the technology used in the car (such as sensors and cameras) was developed in-house by Hyundai — with the exception of a Mobileye camera — and is still early stage. Once the human driver got us out of the parking lot, the car went into autonomous mode and proceeded to take us around the block without a human touching the steering wheel. The car stopped at a red light, turned when the light went green, and performed all the typical driving functions that you'd expect from a car.

NVIDIA

And this brings me to **NVIDIA** (NASDAQ: NVDA), which stole the show for the day — and possibly the week — with its keynote presentation on Tuesday evening. Shares of NVIDIA more than tripled in 2016, making it the top-performing stock of the S&P 500 for the year. Since the company's founding in 1993, NVIDIA has largely been tied to PC gaming graphics. The company has since branched out to use and develop its technology for other applications like autonomous vehicles, virtual reality, and machine learning (helping computers find patterns in complex sets of data, for instance).

NVIDIA's co-founder and CEO Jen-Hsun Huang made several big announcements during the presentation, starting with the gaming space. Huang called gaming the world's largest sporting event, stating that he believes it is "very, very likely" eSports will one day reach a bigger audience than all other sports combined. Of the two billion PCs around the world today, only half of them have the necessary technology (like NVIDIA's graphic processing units (GPUs)) to play games. Until now, that is.

NVIDIA announced that it has developed a "supercomputer" that stores its state-of-the-art graphics technology in the cloud, which tens of millions of gamers will be able to access. Think of it as on-demand video gaming on virtually any Mac or PC, meaning players will be able to stream a game wherever and whenever they want. This service — GeForce Now — will open in March, and could broaden the video game market to millions more players.

NVIDIA is also making strides with the connected home, announcing upgrades to its Shield TV streaming device. Shield TV will now include Google's AI (Google Assistant) — meaning the TV can be activated and controlled through voice commands — as well as a wider reach of 4K content from the likes of **Netflix** (NASDAQ: NFLX) and **Amazon** (NASDAQ: AMZN). NVIDIA also announced the Spot, a small WiFi speaker that plugs directly into an outlet and can pick up voice commands within 20 feet. Roll the Shield TV and Spot together, and NVIDIA is packing a powerful punch in the connected home.

Finally, NVIDIA had a slew of announcements related to its efforts with self-driving cars. Huang calls NVIDIA's efforts with self-driving cars "the most impactful work we're doing for society," given the potential to lessen the number of deaths, injuries, and financial costs that occur each year due to human error on the roads. NVIDIA is making strides developing an artificial intelligence (AI) supercomputer for vehicles, which enables a car to go on full autopilot (imagine getting into your car, saying "Take me to Starbucks," and never touching the steering wheel once) or "copilot" where the AI is still assisting the human driver (with heads-up warnings like, "A motorcycle is switching to the center lane behind you.").

NVIDIA has announced a host of new partnerships with multiple mapping companies around the world (including **Baidu** (NASDAQ: BIDU), the leading mapping company for autonomous vehicles in China), which will set the foundation for the next generation of self-driving cars to navigate roads worldwide. The company is partnering with two leading global auto suppliers to begin producing its AI computer for autonomous driving (which will start shipping later this year). And, finally, NVIDIA announced a partnership with Audi to produce the "next generation" of AI-powered autonomous vehicles by 2020. Jokingly, Huang said, "Let's make sure none of our kids ever have to drive."

With $3.7 billion in net cash, accelerating sales growth, and a leading position to power the computers behind key trends like autonomous driving, eSports and gaming, virtual and augmented reality, and the connected home, I can see why NVIDIA had a blowout year in 2016. Based on the company's presentation and announcements at CES this week, that business momentum seems poised to continue in 2017 and beyond.

Foolish Bottom Line

We're just at the beginning of CES 2017, and already NVIDIA has set the bar high for the week. The Motley Fool team will be back at it in the coming days, reporting from the front lines on the trends, technologies, and businesses that investors should be watching closest in the years ahead.

Stay tuned for more from us tomorrow. In the meantime, Fool on!

—David Kretzmann

Transcript

DAVID KRETZMANN:

Greetings from CES 2017 in Las Vegas, Nevada. I'm David Kretzmann, the Mission Lead for Odyssey 2 in *Motley Fool Supernova*.

Our Motley Fool team is here on the ground at CES and today was more of an introduction day for CES. There are a lot of vendors and businesses still setting up on the show floor, but we did get a chance to visit a few events today and get a taste for what we'll be experiencing the rest of the week here at CES and much more.

One of the highlights for the day was a visit to HTC Vive, an event that HTC put on to showcase the Vive virtual reality platform. It's a virtual reality headset and platform, and it was really interesting to get a chance to be up close and personal with a variety of virtual reality games. So whether you're a firefighter putting out a fire in a kitchen and feeling the heat on your chest and the pressure of the fire hose, or you're in a shooter game, where you're feeling the bullets hit your vest and you feel the weight of the gun, you can definitely see the potential for the virtual reality platform.

Obviously it's still a space with a lot of fragmentation. Whether you're talking about HTC with its Vive platform, Facebook with its Oculus platform, [or] Google with Daydream, there are a lot of players in this space. There's not one clear winner, but it will certainly be an interesting space for us to watch in CES and beyond.

Another highlight for CES this year will most certainly be self-driving cars. Today we had a chance to take a test drive in a self-driving car that Hyundai has been developing largely in-house. The technology is still early stage compared to some of the other solutions out there, but we were able to be in the car and get a sense for how that technology works [and] a sense for how the sensors and the cameras work to create or enable that autonomous driving experience.

And that really leads into what was certainly the highlight of the day and could prove to be the highlight of CES, which was the Nvidia keynote presentation. Nvidia covered a variety of topics, including self-driving cars. The founder and CEO described the company's efforts with self-driving cars as the most important thing the company is doing today — the most influential thing the company is doing for the good of the world — just in terms of being able to use self-driving technology to reduce the amount of accidents and deaths caused by human failure when it comes to driving cars.

Nvidia announced a whole lot of partnerships, including one with Audi, where the companies are essentially committing themselves to creating an artificial-intelligence-powered vehicle by 2020. Within the next three years they should have an AI-powered, self-driving capable car.

So Nvidia continues to be a powerhouse of a company. Obviously the company had an incredible 2016. It was the top-performing stock in the S&P 500. It more than tripled. The company has released a slate of new products and new partnerships.

And the company continues to power ahead in the video game space. The company today announced essentially an on-demand video game platform where players, even if you don't have a high-powered computer with an Nvidia processor or an Nvidia computing system [will] still be able to subscribe to this cloud gaming platform and play a variety of games from Electronic Arts, Activision Blizzard, and a whole lot of others. So that's certainly a first in the video game space, and that could have broad implications for PC gaming and video gaming in general, going forward.

So that was certainly an interesting announcement. There's a whole lot more from Nvidia that we'll cover in our daily dispatches, but for now that gives you a summary of what we experienced at our first day at CES. Stay tuned for more from the Motley Fool crew here at CES where we will share with you all of our findings on trends, products, businesses and where we think investors should be watching for long-term rewards.

Thanks for watching and Fool on!

Write Covered Puts on Domino's Pizza

Published Jan 5, 2017 at 11:54AM

Is this for you? This recommendation is for *Pro* members who are short at least 100 shares of Domino's Pizza as part of our paired trade, in which we also own Papa John's.

How You Participate

- **Trade:** Sell to open June 2017 $140 puts on **Domino's Pizza** (NYSE: DPZ).
- **Allocation:** Write ("sell to open") one put for every 100 shares of the stock you are short and want to cover. *Pro* will cover 300 of the 353 shares we are short (leaving 53 shares uncovered by necessity).
- **Price Guidance:** Prices will change as the underlying stock moves, but **use a limit order** to split the bid/ask price spread at going prices.
- **Prices** (11:00 a.m.):
  - **Stock:** $163
  - **June 2017 $140 put (bid/ask):** $4.20/$5.10
  - **The math:** $4.65 is a 2.9% yield on the current share price in about 163 days (five months or so).

Since we initiated our short position on Domino's in late August as a paired hedge with our long position in **Papa John's** (NASDAQ: PZZA), the two pizza stocks (which were both highly valued to begin with) have only continued to climb in price.

The downside volatility we were hedging for with our short hasn't yet come to fruition, but the paired position has largely performed as we might have expected. Between late August and Jan. 4, Domino's stock price is up 9.5% and Papa John's is up 16%; as a result, the EV/EBITDA "multiple discrepancy" we mentioned in our original alert has decreased from 4.5 to 3.3 (closer to the five-year average of 3.05), which benefits our paired position.

Stock Prices		
	DPZ	PZZA
8/30/2016	$148.85	$ 74.72
1/5/2017	$163.00	$ 86.66
Total Return	9.5%	16.0%

EV/EBITDA Multiple			
	DPZ	PZZA	Multiple Discrepancy
8/30/2016	21.1	16.6	4.5
1/5/2017	21.4	18.1	3.3

After all this, our 353 short Domino's shares have cost us $5,262 (including dividends, which we owe as short sellers), and the portion of our long Papa John's shares that offset the Domino's short have increased our portfolio's value by $8,637 (including dividends, which we're paid as stock owners). The total gain we've experienced with this paired short position is $3,374, or 0.12% of our total portfolio value as of today. This is a good outcome given the very strong historical price correlations between the two stocks. Lest we forget, the paired trade also helped to keep us from selling some of our Papa John's shares, which would have meant paying taxes on those gains.

However, despite the positive outcome so far, we have not yet been able to cash in on the primary objective of this paired short -- protection of downside risk. So far, both stocks have simply continued to rise in value, and Papa John's stock price is now more than 50% above our fair-value estimate.

We think the expectations built into both companies' stock prices are very rosy, and we think there's still significant downside risk to both pizza stocks if an industry-specific or market-wide downturn were to occur. As such, our plan for now is to maintain our short position in Domino's until the company's stock price declines to valuations that are closer to our estimates.

In the meantime, we've decided to target some additional income with our Domino's short by selling covered puts against it. We still like our paired position, and income is a secondary consideration (it's not why we originally opened the short). But we do have to ask anew, "At what price would we be inclined to consider closing this position?" If we know the price at which we'd be happy to close our short, we might as well write covered puts around that strike price for income as we wait for our hedge to benefit us in a downturn. And if Domino's tanks significantly and we want to close our short position, we can close it all with these puts.

In that scenario, we'll have simply guaranteed our strike price (plus any premiums collected) as a closing price. We may miss some additional downside (actually upside for our short), but we've chosen a strike price at which we're OK with that.

These June $140 covered puts yield 2.9% in a little more than five months -- not a screaming yield, but one we'll accept given the risk and reward of the overall position. We have to think differently about these puts than "typical" ones written for income, because with this particular strategy, income is a secondary objective. We're simply trying to offset some of the costs (and risks) of shorting while maintaining a "cover" price we like. Any yield is a plus.

Alternative Trades

If you are long Papa John's at a 3.8%-plus allocation (like us) and you haven't yet shorted Domino's, you could set up the entire strategy today. To do so, you'd sell short a 2.1% allocation of Domino's (to offset 2.1% of your Papa John's exposure), and simultaneously sell to open these covered puts on the shares of Domino's you sell short -- one put for every 100 shares. Make sure not to sell too many put contracts; you don't want to end up obligated to buy more shares than the amount you have shorted.

More That Matters

- **Maximum gain:** The stock's downside (i.e., our upside as short sellers) is capped at our put's strike price, and the potential gain on the covered put is the premium it pays us. The total combined gain is the put strike plus the premium received, leading to our net potential cover price of $135.35 (about 9% below our initial short price, and 17% lower than the current price).
- **Maximum risk:** Theoretically unlimited, although our Papa John's long ideally acts to offset upside risk on this short.
- **Follow-up**: We will monitor the stock prices of Papa John's and Domino's to help decide our ongoing course of action. Depending on stock-price movements, we may continue to leave our paired position alone, we may close the entire position, or we may pursue some alternative strategy. If the covered puts expire as income, we may look to write more puts. If the stock price is below the strike price at expiration, we may either let our puts get assigned (covering our short shares at a net $135.35), or look to roll out and/or down in order to capture further income or upside for our position.

Options Can Help

- **Questions about this trade or strategy?** Head over to our hot-from-the-oven Domino's discussion board.

Learning and Growing Together in 2017

Published Jan 3, 2017 at 3:32PM

Fellow Fools,

Happy New Year! It's a privilege to kick us off with the first Memo of 2017, following another year of solid performance by the *Pro* portfolio. Though I've always found it a bit arbitrary to measure successes and failures based on a calendar year, January does present as good an opportunity as any to take account of the year that's passed and look forward to the year ahead.

Don't worry, I won't be joining the herd of market strategists making predictions about what will happen in 2017. Following the string of largely unimaginable events that punctuated 2016, it's easy for me to avoid that temptation. And because studies show that the vast majority of New Year's resolutions fail, I'll spare you those as well. Instead, I'd like to take this opportunity to share something more tangible -- a few of my favorite tools and resources, the ones I use regularly and simply can't live without. You may already be familiar with many of these, but if I can add just one or two new resources to your repertoire, that might make for an even better 2017.

Pump Up Your Daily Reading

I spend much of my day reading voraciously, trying to distill some sort of signal from the market's noise. Many investors stick to the major news sources (*The Wall Street Journal*, Bloomberg, *The New York Times*, *The Washington Post*), but there's a lot of value to be found by stepping out of the mainstream.

- If you want to find quality blog posts, interesting research, and non-consensus thinking, curated daily "link-fest" websites like Abnormal Returns and Real Clear Markets are invaluable. These sites are an efficient way to see the top financial stories of the day and make sure nothing important falls through the cracks.
- Ever wonder why your favorite stock is up (or down) 10% in a day, but can't find any news that's causing the move? I've found that StockTwits is one of the fastest ways to search Twitter by ticker and see what investors are talking about. Maybe it's random noise, or maybe it's a little-known research report or financial filing that has the market in a tizzy. This is the fastest way to find out.

Learn From the Best

It used to be that attending a top-tier MBA program or working for an elite asset management shop were the only ways to gain access to the top minds in finance and investing. Thanks to the Internet, you can now learn from some of the best writers, educators, and practitioners in the financial industry, all from the comfort of your own couch.

- If you take nothing else from this Memo, please bookmark this archive of white papers from Michael Mauboussin, compiled and updated on the Hurricane Capital blog. Over his career at Legg Mason and Credit Suisse, Mauboussin has compiled one of the most exhaustive instruction manuals for equity analysis available to the public. He covers everything from business-model analysis to prediction techniques to behavioral finance and a whole lot in between. Just beware that once you start reading, it's easy to get sucked down the rabbit hole.
- When it comes to teaching and writing about equity valuation, nobody does it better than Aswath Damodaran. The esteemed professor maintains a blog where he discusses current business topics and the valuation of popular companies, and best of all, he records his lectures and gives free access to everyone. This is the best education you're going to find in stock valuation short of registering at NYU.
- Michael Kitces is one of the most highly respected financial planning experts in the country, and his Nerd's Eye View blog contains a wealth of knowledge. Though he mostly writes for other financial planners, his site is a wonderful resource for do-it-yourselfers as well.

Save Time and Money

Ben Franklin quipped nearly three centuries ago that, "a penny saved is a penny earned." Little has changed since, except the relative value of a penny. At *Pro,* we spend a lot of time discussing how to generate better investment returns, but when it comes to wealth generation, many people are just as well served finding ways to spend less and save more.

- You'd be shocked at how much money gets lost over time and goes unclaimed for various reasons. Run by the National Association of Unclaimed Property Administrators, Unclaimed.org lets you search multiple government databases for property that belongs to you or a loved one. It's free and reminds me of what it feels like finding a $20 bill in an old pair of jeans.
- As a dedicated research analyst, I often spend way too much time researching various household items before I buy. I've found that sister websites The Wirecutter and The Sweethome allow me to outsource that research and make those buying decisions in a fraction of the time. For example, The Sweethome spent 20 hours of

research just to decide on the best ironing board. Who has time for that?

If you are among the 83% of Americans who shopped at Amazon at least once in the past year, you probably already appreciate the value of an Amazon Prime membership. However, if you really want to up your Amazon game, here are a couple of sources to make sure you're getting the best deal available.

- CamelCamelCamel allows you to search for any item on Amazon and see how its price has changed over the past year. You can also set a target price for an item and the website will notify you when it drops below that threshold.
- Honey is a browser add-on that compares multiple merchants on Amazon and points you to the best deal on any given item. As a bonus, when you're shopping on other websites, the tool can search numerous deal sites and automatically apply coupon codes to make sure you're getting the best price available.

Make Life Easier

- I recently bit the bullet and spent the time to consolidate my passwords into a single password manager. It was well worth the effort. Not only do I have the peace of mind from more secure passwords on my financial accounts, I only need to remember one main password. Also, the program's auto-fill function saves a ton of time. I ended up going with Dashlane, but LastPass and 1Password are other highly rated options worth considering.
- My memory isn't what it used to be, which is why I've started saving all of my investment research on Evernote. I read several dozen news articles each day, and I find the ability to quickly save and search my archives invaluable. It's also useful in my personal life when researching a big purchase, or even doing something as simple as sharing a synchronized shopping list with my wife.
- I might hear groans from the serious audiophiles in the crowd, but Sonos has completely changed the way I listen to music. The app is incredibly intuitive, the speakers are high-quality, and the user experience keeps improving with periodic software updates.

The *Pro* Bottom Line

Like many of the Fools in the *Pro* community, I'm on a perpetual quest to improve my skills as an investor, a little bit of improvement each year compounds to make a big difference. Though we spend most of our time focused on maximizing our investing returns, it's important to remember that there are a lot of ways to create additional "household alpha." Whether that's achieved through the quest for more money, more time, better relationships, and/or improved health is all up to you, but the *Pro* community is here to help however we can. To that end, if you'd like to share a few of your favorite things with your fellow Fools, head on over to the Memo Musings board and fire away!

Here's to a prosperous 2017!

Foolish best,

-- Jeremy (TMFTank)

Pro Catch-Up Trades and Upcoming Expirations: Jan. 3, 2017

Published Jan 3, 2017 at 3:22PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.5%.
- **Facebook** (NASDAQ: FB): Buy 6.1%.

Continue building your portfolio with our Buys, including:

- **Apple** (NASDAQ: AAPL): Buy 3.8%.
- **Gilead** (NASDAQ: GILD): Buy up to 2.5%.
- **Medtronic** (NYSE: MDT): Buy 2.6%.
- **Paycom** (NYSE: PAYC): Buy 2.2% (read our recent recommendation).
- **Verisign** (NASDAQ: VRSN): Buy 1.4% and write a covered strangle for another 1.4%, as per our new recommendation.

Shorts:

- **Gogo** (NASDAQ: GOGO): Sell short 0.5% if you haven't.
- **Shake Shack** (NYSE: SHAK): Sell short 0.5% if you haven't.

Pro options:

- **Parexel International** (NASDAQ: PRXL): Write $65 covered calls for every 100 shares you own**,** if you haven't. At $3.65, the calls offer a 5.6% yield on the current $65.70 stock price in 73 days. See our recent recommendation.
- **Verisign:** Please see above under Buys.

Hedges:

- **ProShares QQQ Trust** (NASDAQ: QQQ): Over the coming days or weeks, look to set up a spread in the spirit of our recent trade alert, ideally for a credit or no cost.

Upcoming Expirations (Jan. 20, 2017):

- **Expeditors International** (NASDAQ: EXPD): Our synthetic covered call (which started as a synthetic covered strangle) has done well for us this year, bringing in income while our core long calls are also up 155%. We'll bring the position to a close this month, either by accepting shares for ownership to write options on them, or by closing the options to consider new ones.
- **Skyworks Solutions** (NASDAQ: SWKS): Our $75 covered calls are earning some premium back, capturing more upside from the stock position. We'll likely roll the calls near expiration and keep targeting income with upside on our shares.

Pro Guidance Changes and Completed Trades: Jan. 3, 2017

Published Jan 3, 2017 at 3:20PM

Pro Guidance Changes (from the past two weeks)

- **Gentex** (NASDAQ: GNTX): Shares moved from Buy First to Buy as the stock price approached our fair-value estimate.
- **PowerShares QQQ Trust** (NASDAQ: QQQ): We recommended setting up a put ratio spread on QQQ to hedge our portfolio for 2017.

Pro Completed Trades (from the past two weeks)

- **Deere & Company** (NYSE: DE): We closed our short shares at $101.46 and sold to close our protective calls at $8.94, ending the short.
- **Gentex** (NASDAQ: GNTX): Our December $17.50 puts expired as income.
- **SPDR S&P 500** (NYSEMKT: SPY): Our December put ratio spread expired for a little income.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Valuing Verisign

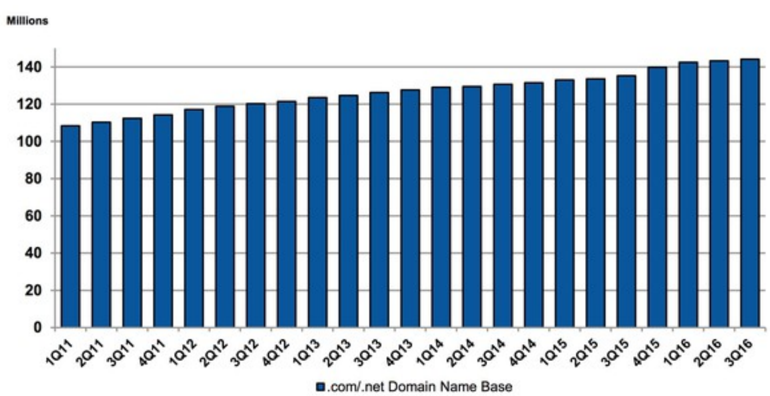
Published Dec 19, 2016 at 4:10PM

Fellow Fools,

You may know that when it comes to writing puts, we at *Pro* like to target a strike price 5% or so out of the money, regardless of whether the position stands alone or is part of a more complex income-generating strategy. You may also have noticed that when we issued our recent covered strangle on **Verisign** (NASDAQ: VRSN) , the puts we sold were only 2.5% out of the money. Why deviate from our own guidelines, exchanging downside protection for extra income?

Primarily thanks to our estimate of the stock's fair value. We examined the impressive economics of the business in our recent trade alert, so I thought today's Memo would be the perfect opportunity to go over the other primary determinant of a stock's valuation -- expectations for the future. Specifically, we're going to focus on the three key drivers for the ".com"/".net" business in which Verisign operates: new registrations, renewals, and pricing.

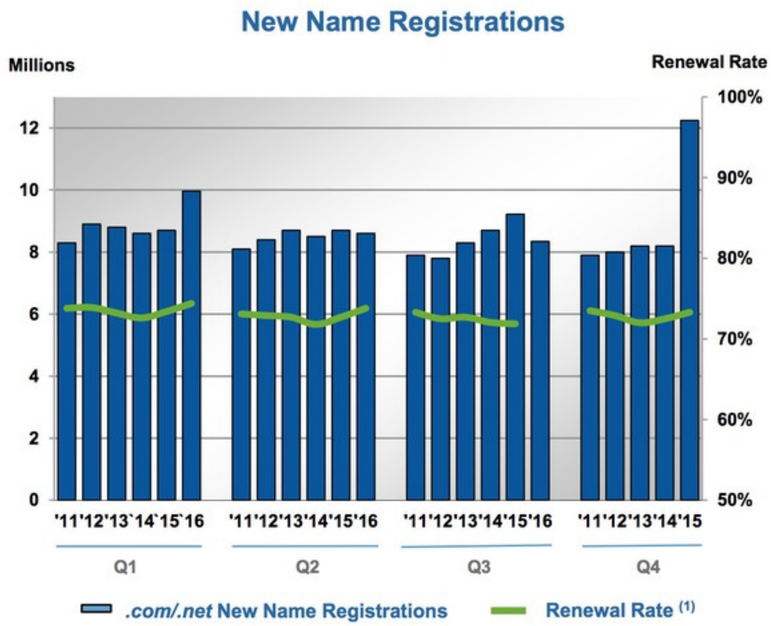
New Registrations



When it comes to steadily growing businesses, Verisign's registry business is hard to beat. People are still registering millions of new domains every year despite both top-level domains (TLDs -- ".com" and ".net") being 30-plus years old. And there's still plenty of room for growth, too, with 95% of possible five-character domain names and 99% of six-character combinations still available. Granted, the number of *desirable* domains is likely far less than the total available, so I don't believe the majority of these combinations will ever registered. But even if the number of new registrations does start to decline, we believe this will occur at a glacial pace. There are no current signs of a slowdown, but to be conservative, our valuation is based on an estimated growth rate of 8 million new registrations per quarter -- a figure not seen since 2012 and well below the five-year average of 8.5 million.

Renewals

A steady stream of new customers doesn't mean much if most of your existing customer base doesn't stick around. But in Verisign's case, although first-year renewals tend to hover at about 50%, the rate for previously renewed domains continues to improve, currently heading toward a very impressive 85%. The blended average for these two groups is in the low 70s at the moment, but we expect the overall rate to slowly trend higher; our expectations for new registrations imply that the existing base of domains older than one year will become a larger percentage of the yearly renewal cohort over time, pulling the overall ratio higher.



Source: Verisign Q3 2016 earnings release

However, it is worth pointing out once again that we expect to see some deviation from this trend in the upcoming quarter. Domain-name investing is big business, with the most coveted names in a given year selling for millions. Unsurprisingly, this has speculators buying up various domains in hopes of striking it rich, just like you see in the stock market. Although this activity can boost Verisign's new registrations in a given year, it's also one of the reasons the renewal rate for first-year domains is so low. The new-registration surge we saw in 2015 was likely the result of Chinese speculators, which is why we believe the renewal rate for the fourth quarter will likely fall well below average.

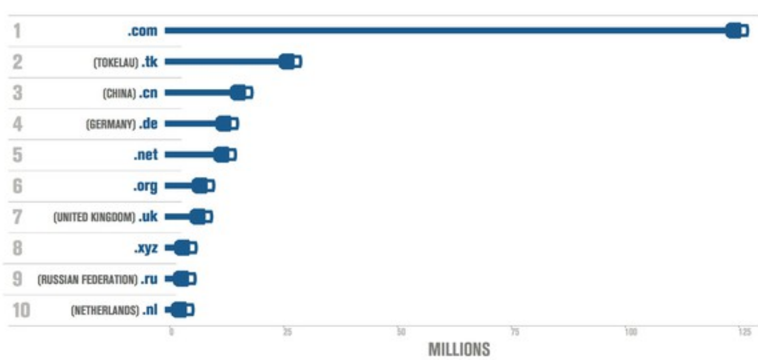
There were 143 million domains registered as of Dec. 18, down from 144 million at the end of last quarter. Assuming the net decrease for the upcoming quarter exceeds management's expectations (in a bad way!) to close in on 3 million, Verisign's steady-state revenue base (in which new registrations only offset non-renewals) is about $1.1 billion.

Pricing

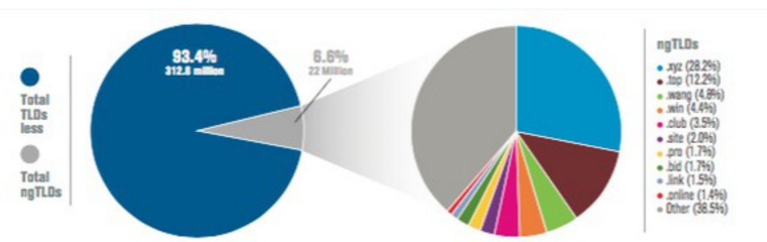
Given that Verisign has a monopoly on the registry business for the largest generic TLD (gTLD) in existence -- ".com" -- you'd think the company likely has tremendous pricing power. And you'd be right. However, the Department of Commerce also noticed this when it examined the TLD registry industry, and it decided to restrict Verisign from raising prices without prior approval.

Some investors were disappointed to see that the recently signed agreement to extend Verisign's ".com" registry contract until 2024 did not include permission for a price hike. However, based on the language of the contract, we believe Versign will request permission for such a hike in 2018; we expect that request to be granted, resulting in the first price hike for ".com" domains since the start of 2012.

Believe it or not, when these restrictions were initially set in place, ".com" was even more dominant as a TLD than it is now. But its slow decline in market share over the years -- from 42% in 2009 to 38% in the second quarter of 2016 -- hasn't come about because the number of ".com" domains is shrinking. Rather, it's because of an initiative started by Internet watchdog ICANN to increase competition, with new gTLDs capturing more than their fair share of new registrations.



Sources: Verisign Domain Industry Brief, Sep 2016; Zooknic, Q2 2016; Verisign, Q2 2016; Centralized Zone Data Service, Q2 2016.



Sources: Verisign Domain Industry Brief, Sep 2016; Centralized Zone Data Service, Q2 2016; Zooknic, Q2 2016.

While it may sound counterintuitive, this increased competition is actually a good thing for Verisign in terms of pricing power. The DOC's initial decision was based on Verisign's influence on the market as a whole, but this concern lessens as new gTLDs gain share. Moreover, with many new gTLDs charging upwards of $20 to register a domain, ".com" is actually becoming one of the most affordable gTLDs on the market, despite the disproportionate amount of value it delivers as the TLD most people associate with the internet.

From Forecasts to Fair Value

Assuming 8 million new registrations per quarter over the next few years and an overall renewal rate that slowly inches higher, we'll likely see revenue growth of 3% to 5% just from the increase in the domain base. And in 2019, we believe we'll see revenue growth reaccelerate into the low to mid-teens based on a .com price hike between 7% (the most recent ".com" increase) to 10% (the annual increase for ".net").

When combined, these conservative estimates show Verisign generating approximately $880 million in operating profits five years from now, up from $606 million in 2015. This means Verisign's stock should trade for about $115 in five years. However, when you factor in how much capital the company returns to shareholders through share repurchases -- almost $6 per share in just the past 12 months -- we believe the stock's intrinsic value will be closer to $130. Discount this back to today using a 10% rate and you get a fair-value estimate of about $83, which is 8% higher than the average net start price for our position (assuming our puts are exercised).

And don't forget that we didn't include any of Verisign's other businesses (security services and other TLD registries, for example) in our valuation. At the moment, we consider these divisions to be equivalent to call options on the business -- they're not currently worth much to shareholders, but they may create significant value down the road. In fact, Verisign recently bankrolled a bid to win the rights to ".web," the new gTLD that some have called the only possible threat to the originals' (".com," ".net," and ".org") market share.

So why not just buy the stock, you ask? It's currently undervalued, perhaps significantly so if our our forecast is in fact conservative. One reason is because of *Pro*'s goals as a portfolio: As we mentioned in the trade alert, we're looking to add positions that will generate healthy returns regardless of what happens in the market, and covered strangles do just that. Moreover, with the primarily catalyst for a change in the stock (a ".com" price hike) not set to arrive until 2018, we believe sentiment will remain muted in 2017, providing us with the perfect opportunity to generate income. Once 2018 rolls around, we'll likely leave our stock uncovered, hoping to generate significant capital gains to go along with our option income.

Enjoy your week, Fools!

-- JP (TMFYossarian)

Pro Catch-Up Trades and Upcoming Expirations: Dec. 19, 2016

Published Dec 19, 2016 at 3:54PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.6%.
- **MasterCard** (NYSE: MA): Buy 4.6%.

Continue building your portfolio with our Buys, including:

- **AmTrust Financial** (NASDAQ: AFSI): Buy up to 5.3%.
- **Apple** (NASDAQ: AAPL): Buy 3.9%.
- **Medtronic** (NYSE: MDT): Buy 2.7%.
- **O'Reilly Automotive** (NASDAQ: ORLY)**:** Buy up to 5.2%.
- **Paycom** (NYSE: PAYC): Buy 2.2% (read our recent recommendation).
- **Verisign** (NASDAQ: VRSN): Buy 1.5% and write a covered strangle for another 1.5%, as per our new recommendation. Today's net debit is nicely lower than in the original alert.

Shorts:

- **Gogo** (NASDAQ: GOGO): Sell short 0.5% if you haven't.
- **Shake Shack** (NYSE: SHAK): Sell short 0.6% if you haven't.

Pro options:

- **Verisign:** Please see above under Buys.

Hedges:

- **ProShares QQQ Trust** (NASDAQ: QQQ): Over the coming days or weeks, look to set up a spread in the spirit of our recent trade alert, ideally for a credit or no cost.

Upcoming Expirations (Jan. 20, 2017):

- **Expeditors International** (NASDAQ: EXPD): Our synthetic covered call (which started as a synthetic covered strangle) has done well for us this year, bringing in income while our core long calls are also up more than 200%. We'll bring the position to a close next month, either by accepting shares for ownership to write options on them, or by closing the options to consider new options. We'll decide in January based on the portfolio's exposure and the stock's valuation.
- **Skyworks Solutions** (NASDAQ: SWKS): Our $75 covered calls are earning some premium back, capturing more upside from the stock position. We'll likely roll the calls near expiration and keep targeting income with upside on our shares.

Pro Guidance Changes and Completed Trades: Dec. 19, 2016

Published Dec 19, 2016 at 3:50PM

Pro Guidance Changes (from the past two weeks)

- **Parexel** (NASDAQ: PRXL): We recommend writing covered calls on this whole position, which remains on Hold.
- **Verisign** (NASDAQ: VRSN): This new position is rated a Buy at a 1.5% stock allocation, plus 1.5% more in a written covered strangle.
- **PowerShares QQQ Trust** (NASDAQ: QQQ): We recommended setting up a put ratio spread on QQQ to hedge our portfolio for 2017.

Pro Completed Trades (from the past two weeks)

- **Verisign** (NASDAQ: VRSN): We set up a strangle by:
  - Purchasing 500 shares at $79.42.
  - Selling to open five March 2017 $85 call contracts at a price of $1.83.
  - Selling to open five March $80 put contracts at a price of $4.16.
- **Deere & Company** (NYSE: DE): We closed our short shares at $101.46 and sold to close our protective calls at $8.94, ending the short.
- **Gentex** (NASDAQ: GNTX): Our December $17.50 puts expired as income.
- **Parexel** (NASDAQ: PRXL): We sold to open thirteen March 2017 $65 calls, covering all our shares, for $4.04 each.
- **SPDR S&P 500** (NYSEMKT: SPY): Our December put ratio spread expired for a little income.

You can see all of our guidance, positions, and transactions from the Recommendations page.

10 Tips for Harvesting Investment Losses and Reaping Wealth

Published Dec 19, 2016 at 12:55PM

This article is brought to you by Robert Brokamp, the advisor of *Motley Fool Rule Your Retirement*.

Somewhere in your portfolio, you probably have a loser — an investment that is now worth less than what you paid for it. However, all is not lost. If that investment is in a non-retirement account — so, not in an IRA, 401(k), or annuity — you can sell it, take the loss, and use it to reduce your taxable income. Capital losses are first used to offset capital gains and then — if there's any loss left over — used to reduce taxable income up to $3,000 a year. Losses greater than $3,000 can be used in following years as long as you're a living, breathing taxpayer.

Even if you don't have losses in your taxable accounts, there are ways to be a tax-smarter seller — perhaps even intentionally realizing some gains this year, or passing them on to heirs (tax-free!).

Does a smaller tax bill sound good to you? Such a future could be yours, especially if you heed these 10 Foolish considerations.

1. Tax-Loss Selling Isn't Just for Stocks

Any stock, bond, mutual fund, ETF, or option contract that is below the price you paid can feel the wrath of your loss-harvesting hoe. So don't limit your search to just individual stocks. (Unfortunately, you cannot claim a taxable loss on property held for personal use, such as a house.)

2. Sell Now — but Wait Before Buying Back

If you decide to sell an investment to take the loss on your tax return, don't buy it back within 30 days of your sale date. Otherwise, the loss is considered a "wash sale" (which has nothing to do with discounts on a Maytag). A loss that violates the wash-sale rule will be disallowed — that is, you won't be able to enter it on your Schedule D to offset your gains or ordinary income. If you lose your calendar and accidentally buy the investment back within the 30 days, the disallowed loss is added to the cost basis.

The 30-day clock starts the day *after* the sale. Also, we're talking calendar days — not trading days.

Of course, if you have no intention of buying back the investment, then you don't have to worry about all this wash-sale hullabaloo.

3. No Cheating Allowed

Right now, you may be scheming ways to get around the wash-sale rule so you can still essentially own the investment *and* take the capital loss. Well, you might want to spend your mental energies on more fruitful pursuits ... because the IRS has been around this block. Here are some other ways to violate the wash-sale rule. Don't do these! And make sure your spouse doesn't, either.

- You buy the investment 30 days or less *before* you unload your original unprofitable stake. So the wash-sale rule actually covers 61 days: the day you sold the investment, the 30 days before that day, and the 30 days after. For example, if you sold a stock on July 31, the wash-sale period would include all of July and all of August.
- You buy an investment that is "substantially identical."
- You buy the investment in another account, including IRAs or other tax-advantaged retirement accounts.
- You buy a call option on the investment. As for other options strategies, it can get complicated. For example, you can sell a call at a loss, buy the stock, and not violate the wash-sale rule if circumstances meet certain criteria. The bottom line: Do your homework before mixing tax-loss harvesting and options.
- You buy an investment that could be converted into shares of the sold investment, such as a convertible bond or preferred.
- You get an award of company stock within 30 days before or after selling other shares of the stock.
- You sell an index fund or ETF based on one index and buy another ETF that follows the same index.

All that said, there are still ways to gain similar exposure to an investment while you wait for the 30 days to pass. For example, in the case of the last bullet point above, you could sell an ETF based on the S&P 500 and buy an ETF based another index. You could also sell shares of a particular stock and then buy a fund or ETF that invests in the same industry, even if it holds shares of the company you sold. For example, an investor could sell shares of **Intel** (NASDAQ: INTC) and invest the proceeds in the **SPDR S&P Semiconductor** (NYSE: XSD) ETF and not run afoul of the wash-sale rule.

4. It's Not All Roses and Lower Taxes

Like any transaction, buying and selling investments — even for tax-loss purposes — has its costs. You'll have to pay commissions and bid-ask spreads. Plus, the investment you sold could increase by an amount greater than the value of the deduction before you get a chance to buy it back. Of course, if the investment declines before then, that's a bonus.

Historically, the S&P 500 has risen in value in about 59% of the months from 1928 through October 2014, according to Yardeni Research. But the market tends to get festive in December — that's the month with highest percentage of positive months (74%), and it ties with July for the highest average monthly return (1.5%). So if you're going to engage in tax-loss selling in the next couple of weeks, historically you'll run a greater risk of missing out on some gains if you choose to keep the proceeds in cash.

Is that potentially forgone growth worth buying an investment for just 30 days, especially when you figure in the potential of short-term capital gains taxed at ordinary income rates? That's up to you, but factor your tax situation into your sales decisions to determine whether this year or the next might be the best time to recognize losses or gains (for example, if you expect to be in a higher tax bracket next year, consider putting off any tax-reducing decisions until 2017).

Historical Monthly Performance of the S&P 500

January 1928 to October 2014	Up	Down	% of Months With Positive Returns	Average % Change
January	55	32	63%	1.2%
February	46	41	53%	-0.1%
March	54	33	62%	0.6%
April	54	33	62%	1.3%
May	49	38	56%	-0.2%
June	48	39	55%	0.8%
July	49	38	56%	1.5%
August	51	36	59%	0.7%
September	39	47	45%	-1%
October	51	36	59%	0.4%
November	50	36	58%	0.6%
December	64	22	74%	1.5%

Source: Yardeni Research

5. You've Bought More Shares Than You Think

If you made multiple purchases of an investment — either deliberately or through dividend reinvestment — your holding has more than one cost basis. So it's possible that you have a mix of gains and losses.

Let's say you bought **General Electric** (NYSE: GE) 15 years ago in a taxable account and have been reinvesting dividends ever since. You originally bought the stock at a split-adjusted $47.06 in 1999, but it dropped as low as $21.30 in 2003. It eventually rebounded to $42.15 in 2007 but then plummeted to a close of $6.66 on March 5, 2009 (four days before the S&P 500 hit its low of 666). It closed at $28.88 on Nov. 1, 2016. You would have endured quite a ride with a stock previously considered among the bluest of the blue chips — and you'd have accumulated many shares with a wide range of gains and losses.

The lesson: When perusing your portfolio for profits — and lack thereof — don't just consider the purchase price of your first foray into the holding, or the average cost basis. You might have more losses than you remember. Even if you have nothing but gains, you can manage your tax bill by choosing the specific gains you'll realize when you want to sell a portion of a holding.

6. Specify Which Shares You're Selling

If you've determined which shares you'd like to sell, don't just click the "sell" button on your broker's website. Make sure you understand your account provider's options for assigning a cost basis and holding period to investments, and then choose the method that's best for you — before you sell. It can usually be done on the company's website or in writing but not over the phone.

The rules can differ from one type of investment to another. Here are the essentials:

- **Stocks and ETFs:** The default method is "first in, first out" (FIFO) — that is, you sell the shares you've held the longest. The other, more Foolish choice is choosing specific shares.
- **Mutual funds:** You have same two choices, but the default is usually a third option available only to funds: average cost, which as you might guess, is the total cost basis of all your shares divided by the number of shares. The default holding period will probably be FIFO. For example, if you bought 100 shares two years ago and 50 shares six months ago, the default cost basis would be the average of all 150 shares, but the first 100 shares you sell would be considered long-term because you held them for more than a year. Don't like that method? Then you should change it. Once you've sold shares of a mutual fund using one method, you have to stick with it for any shares you've bought up until then. You can choose a different method for newly acquired shares.
- **Bonds:** You can choose FIFO or identify specific bonds if you're not selling your entire holding in the same issue. The rules pertaining to bonds bought at a premium or discount — that is, a price different from par value — can get sticky, but the main thing to know is that the basis is adjusted each year so that it's very close to par when the bond matures. But there are exceptions — such as bonds from bankrupt companies — so do extra research or get professional help. Also, the interest from some types of bonds (such as Treasuries and municipals) might be exempt from state or federal taxes, or both. However, capital gains are still taxable, and capital losses can reduce your tax just like losses in other investments.

Up until 2011, financial-services firms were required to just report the gross proceeds of sales to the IRS. However, they now must also report the cost basis and holding period, so they're doing a better job of keeping records. If you own investments bought before 2011, you might find that your broker doesn't have the cost basis information for specific shares, so you'll have to unearth it yourself from your account statements. Plus, it's always possible that the info your broker has it wrong. Even FINRA, the self-regulatory organization run by the financial-services industry, recommends that investors regularly review their account statements for potential inaccuracies. So it's important to keep past account statements and trade confirmations, as well as documentation of your chosen disposition method.

7. When Tax-Loss Selling Doesn't Make Sense

Although it may be tempting to take a tax-reducing loss whenever possible, you may want to resist if you expect to buy back the investment and expect to be in a higher tax bracket in the future because of higher income or congressionally imposed higher tax rates. Why? Because when you sell a stock and then buy it back later at a lower price, you now have a lower cost basis — which could lead to more taxes later.

By way of illustration, consider the following two scenarios.

Scenario 1

- You bought shares of **Stinktronix** (Ticker: PU) at $100
- It drops to $80
- You sell it and take the $20 capital loss
- Thirty days after the day you sold the stock, you buy it back at $80 (for simplicity's sake, we'll assume the price didn't move)
- Years pass and the stock is worth $150
- You sell and now have a $70 taxable capital gain ($150 minus the $80 cost basis)

Scenario 2

- You bought shares of **Stinktronix** (Ticker: PU) at $100
- It drops to $80
- You resist the urge to harvest losses and just hold on
- Years pass and the stock is worth $150
- You sell and now have a $50 taxable capital gain ($150 minus $100 cost basis)

In the first scenario, you lowered your cost basis in the stock — from $100 to $80 — which resulted in a higher taxable capital gain down the road ($70 compared with $50). If you will be in a higher tax bracket in the future, harvesting the losses today may not be the right move because the benefit of taking the loss today may be outweighed by paying a higher tax rate on a bigger gain in the future.

On the other hand, if you'll be in lower tax bracket in the future, then taking the loss now might be smart given that you'll get more bang for your deductible buck. Plus, given the time value of money, taking the loss this year might still make sense, as a lower tax bill theoretically means you have more to invest.

8. Harvest Gains, Too!

Are you single and will have less than $37,650 in *taxable* income — that is, gross income minus exemptions and deductions — this year? Or married and will have less than $75,300? Then I have good news: You won't pay any taxes on long-term capital gains. Just sell the investment and take the profits. You can even immediately buy back the investment; the 30-day wash-sale rule applies only to capital losses, not to gains. This will give you a tax-free stepped-up cost basis, which you'll appreciate if you're in a higher tax bracket or if capital-gains tax rates are higher when you sell in the future.

You see, taxpayers below the aforementioned income thresholds are in 15% tax bracket or lower — and they don't pay taxes on long-term capital gains or qualified dividends. (Short-term gains are still taxed as ordinary income.) Remember, we're talking about *taxable* income — in other words, gross income minus all the exemptions ($4,050 per each member in the household for 2016), deductions (at least $6,300 for singles and $12,600 for married folks), 401(k) contributions, credits, etc. So you might be closer to the 15% tax bracket than you think.

Consider this very simplified example (taxes are rarely *this* simple!). A married couple has $100,000 in annual gross income. Their taxable income *could* be just $64,300 in 2016, which puts them squarely in the 15% tax bracket.

Gross income	$100,000
Minus two exemptions ($4,050 each)	- $8,100
Minus standard deduction ($12,600)	- $12,600
Minus 401(k) contribution	- $15,000
Taxable income	**$64,300**

Just know that the capital gains themselves will increase your taxable income, which could tip you into the next tax bracket. But that's not as bad as it may sound. The long-term gains up to that point still enjoy the 0% tax rate; only the long-term gains that crept into the next tax bracket will be taxed at 15%.

9. Know the Bracket Racket

One of the cornerstones of tax planning is so-called "bracket arbitrage": deliberately recognizing more income in years when you're in a lower tax bracket and deferring income as much as possible in years when you're in a higher bracket. But to do that, you need to know which bracket you fall into.

It all starts with your taxable income. Unless your financial situation is significantly different in 2016 than it was in 2015, the best way to estimate this year's taxable income is to start with last year's tax return — specifically, Line 43 on your 1040. Then adjust that number up or down to account for how this year's return will differ (for example, you received a raise or a bonus). With that figure in hand, check out the tax brackets for 2016 below. Remember that qualified dividends are taxed at the same rate as long-term capital gains.

2016 TAXABLE INCOME

Rate	Single filers	Married couples, filing jointly	Rate on long-term capital gains*
10%	$0-9,275	$0-18,550	0%
15	9,276-37,650	18,551-75,300	
25	37,651-91,150	75,301-151,900	15%
28	91,151-190,150	151,901-231,450	
33	190,151-413,350	231,451-413,350	
35	413,351-415,050	413,351-466,950	
39.6	415,051 and above	466,951 and above	20%

10. Avoid Gains by Helping Heirs and Others

Since we're discussing non-fun topics, permit us to bring up something besides taxes that is certain: death. You can carry capital losses forward to future tax years indefinitely — but not eternally. Your losses die with you. If the losses were incurred in a jointly owned account, only half the losses can be carried forward after one owner passes away.

Once you reach a point in life when you're earmarking specific investments as assets you'll be passing on to the next generation, remember that the cost basis of inherited assets is the value of the investment as of the date of death. That's good news if you pass on investments with large embedded gains, since neither your estate nor your heirs will ever pay taxes on those gains. However, if you pass along an investment that is worth less than what you paid for it, the ability to write off those losses is gone forever.

Because we're speaking of giving investments to others, we'll include a quick note about the power of donating long-term appreciated investments to qualified nonprofit organizations. You might be able to deduct the value of the donated investment (subject to certain conditions and restrictions). Plus, you avoid selling the investment and thus paying taxes on the gain. The lucky recipient organization of the investment will probably sell it, but qualifying nonprofits don't have to pay capital-gains taxes. Everyone wins! Make sure you do your research before making a donation, and you can start with IRS Publication 526: Charitable Contributions.

The Foolish Bottom Line: Don't Let the Tax Tail Wag Your Investment Dog

It's never fun to have an investment that doesn't pan out. But if it's in a taxable account, don't think of it as a mistake; it's now a "tax asset" to be deployed as befits your circumstances. If you are in a high tax bracket or will probably sell the investment anyhow, go ahead and take the loss. On the other hand, if you still believe in the longer-term prospects of the underwater asset and you expect to eventually be in a higher tax bracket, holding on for now might be your best move.

But whatever you do, don't let tax consequences be the sole reason you bid adieu to an asset. And if you sell an investment that you plan to buy back, don't forget to put in that order 31 days later. Some of the best investments in Motley Fool history have been stocks that were down 50%, 70%, or more. An investor who sold those stocks to harvest the losses but didn't repurchase any shares lost out on some of the biggest returns.

Hedge: Set Up a Put Ratio Spread on QQQ

Published Dec 16, 2016 at 12:29PM

Is this for you? At *Pro*, we use hedges to target returns during a market decline; this one applies if the market falls by the start of 2018. You don't need to hedge to succeed with *Pro*, but if you are at least 74% net invested in stocks (as we are) and *want* to hedge your market exposure, then consider following along. Those without a margin account can consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $76,000. Newcomers should note that this is a complex trade, but you have literally weeks (if not months) to learn how to set it up. This strategy initially becomes more lucrative to set up when the market is falling, and it can't reward us until close to expiration.

How You Participate

- **Action:** Use a spread order to set up a put ratio spread on the **PowerShares QQQ Trust** (NASDAQ: QQQ) ETF.
- **Allocation:** Set up one ratio spread for every $11,400-sized hedge you want. *Pro* is hedging about 15% of our total portfolio value. To follow that allocation, set up one 2:1 put ratio spread for every $76,000 you manage ($76,000 x 15% = $11,400; that $11,400 is because we're buying $114 puts, which represent $11,400 in value each). *Pro* will sell 70 puts and buy 35.
- **Trade:**
  - **Use a ratio spread order to simultaneously ...**
    - Write ("sell to open") **two** Jan. 19, 2018, $100 puts, and
    - Buy ("buy to open") **one** Jan. 19, 2018, $114 put.
    - Click "view all" at your broker to see all strikes.
- **Price Guidance (as of 11 a.m. 12/15):**
  - **Sell to open two $100 puts:** Lately $3.40 x 2 = $6.80 credit
  - **Buy to open one $114 put:** Lately $6.78 debit
  - **Net debit or credit:** Lately about **$0.02 credit** per spread -- but this price will change. As it does, simply aim for a credit or no cost; at worst, pay a tiny debit, always using a limit order.
  - **QQQ price:** $120.50

- **Potential adjustment:** If QQQ moves in price before you set up your trade, you'll likely want to move both of your strike prices up or down accordingly -- as much as QQQ has moved -- while still aiming for a net credit. We ourselves will make such an adjustment if need be, and tell you about it. We have 30 days to complete our trade; keep in mind that if the market falls sharply, this position initially pays you *more* to set it up, because the lower-strike puts will become more sensitive to volatility.

What We're Thinking

Any number of things could bring about a market downturn by 2018: higher interest rates slowing the economy; China trade fights; the fact that the market on average declines every three years; flying monkeys attacking Capitol Hill. Here at *Pro*, we aim to have winners in down, flat, and positive markets -- and that means we need to address all three possibilities at once in our portfolio. That said, we remain oriented toward the long term, and we are majority invested in strong businesses. A hedge on a market index is simply a hedge against a near-term lower market while the rest of our stocks remain free to appreciate. We generally don't try to manage for market declines of 5% or less (that's just standard volatility), but when *Pro* is functioning as desired, lasting declines of more than that should result in some of our positions, such as these spreads, becoming nicely profitable. At the same time, the put ratio spreads we use:

- Are harmless to us if the market goes higher (they don't ding our returns)
- Are typically cash-free to set up (they often pay us a small credit -- essentially income)
- Have a low probability of long-term loss

What's the trade-off? As with any written put, we need to be ready to buy the underlying investment; for today's position, that means we're prepared to buy into the Nasdaq 100 index if the price falls below $100, or about 17% lower. If this index tracker declines by more than about 29%, to below $86, this hedge becomes a liability for us, with QQQ falling below our break-even point. If that does happen, we would plan to buy *long-term call options* on QQQ instead of shares, saving most of our cash in the process. We don't believe there's much probability of long-term loss, because we believe that in a situation like the above, QQQ will recover. But to participate, you need the cash and capability to buy those calls in a market meltdown.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2,710,000
- Fifteen percent of that value: $406,500
- January 2018 spread:
    - Buy to open $114 puts -- 35 contracts representing 100 shares each = $399,000 in look-through exposure, or a 14.7% hedge on our current portfolio value, cash included.
    - Sell to open $100 puts -- 70 contracts, half of which are *not* covered by long puts and thus become a potential obligation at a net $86, for a current 11.1% possible stake in QQQ. Of course, as the market falls, our portfolio value will likely fall, too (unless we're really well positioned!), so this potential stake would be larger -- up to nearly 16% if our portfolio falls 29% with the market.
    - At home, you would buy one $114 put and sell two $100 puts for every $11,400 in portfolio value you want to hedge, or every $76,000 in value you have.

Return Details

QQQ Price at Jan. 19, 2018, Expiration	Value of 1 Purchased Jan. 19, 2018, $114 Put	Value of 2 Written Jan. 19, 2018, $100 Puts	Our Total Cash Return (or Loss) on 1 Ratio Spread	QQQ Price Change (%) From Recent $120.50
$114 or higher	$0	$0	$0.00 gain per spread -- or any credit or debit for setting up the trade	No result (just the initial credit earned) on any increase in SPY's price, or any decline of less than 5.4%
$112	$2 x 100 = $200	$0	$200	(7.1%)
$110	$4 x 100 = $400	$0	$400	(8.7%)
$108	$6 x 100 = $600	$0	$600	(10.4%)
$106	$8 x 100 = $800	$0	$800	(12%)
$104	$10 x 100 = $1,000	$0	$1,000	(13.7%)
$102	$12 x 100 = $1,200	$0	$1,200	(15.4%)
$100	**$14 x 100 = $1,400**	**$0**	**$1,400 (Max profit per spread)**	**(17%)**
$98	$16 x 100 = $1,600	($2) x 200 = ($400)	$1,200	(18.7%)
$96	$18 x 100 = $1,800	($4) x 200 = ($800)	$1,000	(20.3%)
$94	$20 x 100 = $2,000	($6) x 200 = ($1,200)	$800	(22%)
$90	$24 x 100 = $2,400	($10) x 200 = ($2,000)	$400	(25.3%)
$86	**$28 x 100 = $2,800**	**($14) x 200 = ($2,800)**	**$0 (break-even)**	**(28.6%)**
$80	$34 x 100 = $3,400	($20) x 200 = ($4,000)	($600)	(33.6%)
$70	$44 x 100 = $4,400	($30) x 200 = ($6,000)	($1,600)	(41.9%)

If QQQ declines more than 5.4% from recent levels, this hedge starts to come into play. Our maximum profit is earned on the spread if QQQ declines 17% from its recent level of $120.50, to $100, by our distant 2018 expiration. Beyond that, the spread will help us a little bit on an index decline of as much as about 28%; deeper than that, and our short puts turn into an obligation in the red.

Follow-Up

Assuming we set this spread up for a credit or no cost, it pays us something or costs us nothing even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $100 put obligation (starting with a net buy price of $86) if QQQ falls to a territory below either of these strikes at expiration.

If that does happen, our plan is to close our puts and buy long-term QQQ calls (or something we like better, whether calls or a stock) instead of buying the ETF directly. We should be able to do so at a reasonable strike price for about 25%-30% of the cost of buying QQQ shares. So, our potential 11.1% stake (potentially larger as our portfolio's value falls) in QQQ shares will only require about one-third of that put toward QQQ calls instead. We should be happy to buy calls on the index at depressed prices and still keep most of our cash available for other stock or call purchases.

How It Fits Into *Pro*

Pro hedges to lower market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and our goal is inflation plus 7% annualized (our North Star) over long periods. With these challenging goals, any small advantage we gain in a falling market can make a difference. We made about $10,700 when last year's put ratio spread on SPY closed in-the-money in February 2016. Even small gains add up over the years, especially after those gains are invested in good stocks. This hedge fits well with our goal of hedging in a cost-efficient way that doesn't work against us if the market rises. On the downside, these spreads are time-sensitive, usually only helping right near expiration.

With this particular position, we're not concerned about market declines followed by quick bounces back. We'll take advantage of those in other ways (closing profitable shorts, buying new longs). This particular hedge is in place in case the market falls in 2017 and can't get back up by 2018. Then this position should help us. We're hedging with QQQ because about 23% of our portfolio is invested in information technology. This 15% allocation hedges about two-thirds of that long tech exposure. Finally, keep in mind that the most this spread can pay us is $1,400 each, so *Pro*'s maximum profit on 35 owned puts is $49,000. That's 2.1% of our portfolio value should the portfolio fall by about 17% in a hypothetical market decline. Two percent of portfolio padding is nothing to sneeze at (especially in a market down 17%), but in a downturn, we'll also be relying on our basket of shorts, cash, and other hedges we'll set up. This hedge alone is just one piece.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $76,000:**
    - For a small cost, you can set up a **bear put spread** instead, a strategy with capped risk that most IRAs allow. Use a spread order to "buy to open" January 2018 $114 puts and "sell to open" *an equal number* of January 2018 $104 puts (or use a higher strike if you want to pay less for the spread). Recently, this will cost you about $2.60 ($260) per spread, and that is your maximum risk. Buy as many spreads as you care to risk $260 each on. This strategy would be worth up to $10 ($1,000) per spread on a decline to $104 or any lower price, but you should **be prepared to lose your whole $260 per spread** if QQQ doesn't decline enough by expiration. This is out-of-the-money, and only makes you money if QQQ is below $111.40 at expiration (it's $120.50 now), so you have to assume it will expire worthless. It's risk insurance.
- **To lower your market exposure while following our full official trade (and making the position possible in some IRAs):**
    - Set up the official put ratio spread as recommended, but also "buy to open" additional QQQ puts (with the same day of expiration) at a strike price *well below* $100. Buy *half as many* as the number of $100 puts you wrote. When you do so, all of your $100 puts will then be "covered" -- half by your long $114 puts, and half by the other long puts you choose to buy at a much lower strike. Choose how much you want to pay to protect your short put exposure. To us, the $80 strike or lower looks good, recently costing $1 or less. You will only need cash in your account to cover the difference between your two lowest strike prices (if you buy $80 puts, that's $20 per share), and your risk is capped at less than that, making this potentially IRA-friendly. This makes the total cost of your hedge about a $1 debit, with $6 per share in capped risk (an $86 break-even vs. $80, at which you have total protection), and it still has $14 in potential ending value if QQQ is at $100 at the end. Easy as pie?

$108	$6 x 100 = $600	$0	$600	(10.4%)
$106	$8 x 100 = $800	$0	$800	(12%)
$104	$10 x 100 = $1,000	$0	$1,000	(13.7%)
$102	$12 x 100 = $1,200	$0	$1,200	(15.4%)
$100	**$14 x 100 = $1,400**	**$0**	**$1,400 (Max profit per spread)**	**(17%)**
$98	$16 x 100 = $1,600	($2) x 200 = ($400)	$1,200	(18.7%)
$96	$18 x 100 = $1,800	($4) x 200 = ($800)	$1,000	(20.3%)
$94	$20 x 100 = $2,000	($6) x 200 = ($1,200)	$800	(22%)
$90	$24 x 100 = $2,400	($10) x 200 = ($2,000)	$400	(25.3%)
$86	**$28 x 100 = $2,800**	**($14) x 200 = ($2,800)**	**$0 (break-even)**	**(28.6%)**
$80	$34 x 100 = $3,400	($20) x 200 = ($4,000)	($600)	(33.6%)
$70	$44 x 100 = $4,400	($30) x 200 = ($6,000)	($1,600)	(41.9%)

If QQQ declines more than 5.4% from recent levels, this hedge starts to come into play. Our maximum profit is earned on the spread if QQQ declines 17% from its recent level of $120.50, to $100, by our distant 2018 expiration. Beyond that, the spread will help us a little bit on an index decline of as much as about 28%; deeper than that, and our short puts turn into an obligation in the red.

Follow-Up

Assuming we set this spread up for a credit or no cost, it pays us something or costs us nothing even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $100 put obligation (starting with a net buy price of $86) if QQQ falls to a territory below either of these strikes at expiration.

If that does happen, our plan is to close our puts and buy long-term QQQ calls (or something we like better, whether calls or a stock) instead of buying the ETF directly. We should be able to do so at a reasonable strike price for about 25%-30% of the cost of buying QQQ shares. So, our potential 11.1% stake (potentially larger as our portfolio's value falls) in QQQ shares will only require about one-third of that put toward QQQ calls instead. We should be happy to buy calls on the index at depressed prices and still keep most of our cash available for other stock or call purchases.

How It Fits Into *Pro*

Pro hedges to lower market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and our goal is inflation plus 7% annualized (our North Star) over long periods. With these challenging goals, any small advantage we gain in a falling market can make a difference. We made about $10,700 when last year's put ratio spread on SPY closed in-the-money in February 2016. Even small gains add up over the years, especially after those gains are invested in good stocks. This hedge fits well with our goal of hedging in a cost-efficient way that doesn't work against us if the market rises. On the downside, these spreads are time-sensitive, usually only helping right near expiration.

With this particular position, we're not concerned about market declines followed by quick bounces back. We'll take advantage of those in other ways (closing profitable shorts, buying new longs). This particular hedge is in place in case the market falls in 2017 and can't get back up by 2018. Then this position should help us. We're hedging with QQQ because about 23% of our portfolio is invested in information technology. This 15% allocation hedges about two-thirds of that long tech exposure. Finally, keep in mind that the most this spread can pay us is $1,400 each, so *Pro*'s maximum profit on 35 owned puts is $49,000. That's 2.1% of our portfolio value should the portfolio fall by about 17% in a hypothetical market decline. Two percent of portfolio padding is nothing to sneeze at (especially in a market down 17%), but in a downturn, we'll also be relying on our basket of shorts, cash, and other hedges we'll set up. This hedge alone is just one piece.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $76,000:**
    - For a small cost, you can set up a **bear put spread** instead, a strategy with capped risk that most IRAs allow. Use a spread order to "buy to open" January 2018 $114 puts and "sell to open" *an equal number* of January 2018 $104 puts (or use a higher strike if you want to pay less for the spread). Recently, this will cost you about $2.60 ($260) per spread, and that is your maximum risk. Buy as many spreads as you care to risk $260 each on. This strategy would be worth

up to $10 ($1,000) per spread on a decline to $104 or any lower price, but you should **be prepared to lose your whole $260 per spread** if QQQ doesn't decline enough by expiration. This is out-of-the-money, and only makes you money if QQQ is below $111.40 at expiration (it's $120.50 now), so you have to assume it will expire worthless. It's risk insurance.

- **To lower your market exposure while following our full official trade (and making the position possible in some IRAs):**
  - Set up the official put ratio spread as recommended, but also "buy to open" additional QQQ puts (with the same day of expiration) at a strike price *well below* $100. Buy *half as many* as the number of $100 puts you wrote. When you do so, all of your $100 puts will then be "covered" -- half by your long $114 puts, and half by the other long puts you choose to buy at a much lower strike. Choose how much you want to pay to protect your short put exposure. To us, the $80 strike or lower looks good, recently costing $1 or less. You will only need cash in your account to cover the difference between your two lowest strike prices (if you buy $80 puts, that's $20 per share), and your risk is capped at less than that, making this potentially IRA-friendly. This makes the total cost of your hedge about a $1 debit, with $6 per share in capped risk (an $86 break-even vs. $80, at which you have total protection), and it still has $14 in potential ending value if QQQ is at $100 at the end. Easy as pie?

Close Your Short Position on Deere & Company

Published Dec 14, 2016 at 1:56PM

Is this for you? This is only for *Pro* members who have positions -- including short shares and/or long protective calls -- on Deere & Company. All others should ignore this recommendation, or bring your questions to the Deere & Company board.

How You Follow Along

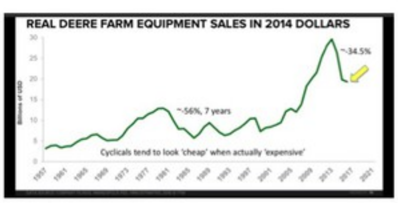
- **Trade:**
  - Buy to close (or simply close) all remaining shares of Deere that you are currently short.
  - Sell to close all Dec. 16 protective calls you have purchased.
- **Price Guidance** (as of 12:21 p.m. 12/14/16):
  - **Stock price:** $101.20
  - **Sell to close Dec. 16, 2016, $92.50 calls (bid/ask split):** $8.70 (these expire Friday, so you should sell to close them by then).
- **Related positions:** If you set up any alternative bearish strategy, we recommend you close that as well.

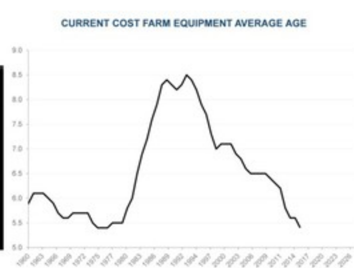
What We're Thinking

When we first recommended shorting **Deere & Company** (NYSE: DE) in January, we predicted that both the business and its industry would perform poorly in the coming months. Deere's 2016 results were actually even worse than we projected, but nonetheless, we're closing this short position today because the market continues to disagree with us about the stock's valuation. The share price is higher despite weaker recent earnings and initial 2017 guidance that once more calls for slightly lower revenue and income. With the market bidding shares higher in anticipation of a distant business recovery, we see little reason to hope this dynamic will change anytime soon, so we're taking our loss this month. One reason we're doing so now: to lock in the capital loss for this calendar year. If you have tax gains you want to offset, closing this losing short can help do that. After 30 days have passed for taxes, we'll reconsider this short, but in a smaller allocation (around 0.5%, if we go with it) as we continue to build our basket of shorts.

Now, what were we thinking, and what happened?

When a cyclical industry sees a rapid, extended increase in sales that takes away from future demand, the flipside -- a protracted decline in sales, followed by a muted recovery -- often follows. The U.S. housing market is a perfect example of this: Though the bubble peaked more than 10 years ago, housing starts and new home sales are still well off their highs. This basic precept was one of our cornerstones for shorting Deere. From our perspective, management's 2014 claim that 2015 would be the bottom of the heavy-machinery cycle for agriculture and other industries was overly optimistic, and the stock was overvalued because the market was giving management the benefit of the doubt and pricing in a speedy recovery. The last time we saw this type of over-investment in the industry, it took decades for Deere's sales to recover after adjusting for inflation (which is relevant here, given how much higher inflation was back then).





Source: Jay Van Sciver, Hedgeeye

We anticipated that four quarters of declining results at Deere, with no signs of a robust recovery on the horizon, would be more than enough to drive the stock lower in most market situations. But although we were largely correct about company and industry performance, we were wrong about the market's response. Despite management's attempts to stimulate sales with more attractive leasing terms, sales and net income have fallen every quarter, and manufacturing currently sits at less than 50% for most of the company's large facilities. But the market has downplayed these issues, focusing instead on management's promise to cut additional costs in the coming years. Deere's stock has also benefited from a broader sector rotation into cyclical stocks that has taken place this year, with many "industrials" soaring even more than Deere. We considered both of these possibilities at the outset; however, we underestimated the potential extent of such a market reaction.

Although we don't like making mistakes, we understand at the start of any position that they're at times unavoidable, so we size our positions, and hedge, accordingly. As importantly, we know that mistakes are wasted opportunities if you don't use them to learn and improve. So what can we take away from our experience shorting Deere?

- Pay attention to changes in the narrative

Stock valuation is about both the numbers (financial results) and the narrative (expectations for the future). For some stocks, such as Apple, the emphasis is on the hard numbers; for others, like Tesla, the narrative matters more. Deere's sales started to decline in 2014, and as the end of the year approached, management attempted to shift investor focus away from the numbers -- specifically, their preliminary estimate for 2015 results to be below what they called "trough levels." When it became obvious that 2015 would not be the nadir, management then shifted its emphasis away from industry weakness and toward cost-cutting initiatives. We thought investors would pay attention to the numbers, but management was able to shift attention to a different narrative instead.

- Timing does matter with shorts, which is why you need to diversify on the short side

Time may be your greatest ally in traditional investing, but it is often an enemy to your short positions -- you're fighting the natural tendency of the market to drift higher over time, you have to pay a fee to borrow shares, and you're responsible for any dividends the stock may pay out. For these reasons and more, timing matters in shorting. That said, we all know trying to time the market is a fool's errand with a lower-case "f." An example: In October 2009, *Pro* set up a bear put spread on **Abercrombie & Fitch** (NYSE: ANF) with the stock in the low $30s. While it currently trades for less than $15, it wasn't until the end of 2014 that the stock moved below $30 for good -- and in the interim, it came close to $80. *Pro*'s thesis was ultimately proven correct, but investors sure had to exercise a lot of patience to see it come to fruition.

This is where diversification comes into play. You already know how important it is for your long portfolio, and given the unique risks involved, it may be even more essential when you go short. This is why we place an emphasis on creating a basket of shorts. The positions in our basket are meant to pay off in aggregate; individual performance will be less predictable almost by definition (see above re: timing).

- Position sizing also matters

On the day we initially shorted Deere, the *Pro* portfolio was valued at $2,350,221. As I write, the monetary impact of closing this position on the *Pro* portfolio is as follows:

Dividends paid	- $1,080
Profits on purchased calls	+ $1,859
Capital losses on stock sold short	- $15,994
Total	**- $15,215**

Despite how much the stock has moved against us, the negative impact to the *Pro* portfolio is well less to than a full percentage point -- (0.647%). It's also important to remember that the reason we kept our position in **Valmont Industries** (NYSE: VMI) this January was because we were shorting Deere -- and Valmont's stock is up more than $20,380 in the same time, plus $1,607 in dividends and option premiums. In this context, the effects of Deere on our portfolio are reduced even further, all the way to a net gain.

Situations like this are why we focus so strongly on portfolio management. Don't get me wrong: We would love to be right and make money with 100% of our investments. But even the best investors in history have made mistakes, and so will we. Happily, success as an investor -- and the ability to meet one's financial objectives -- is judged based on the performance of a portfolio *as a whole*. This is why our top focus here in *Pro* is our North Star. We manage *Pro* with the intention that no single position should be able to make or break our year, let alone our ultimate success. In doing so, we shift the burden of performance from one or two "lucky bets" to a long-term process -- something we believe we can control and repeat, and learn from, over time. Chalk this short up as a good lesson on shorting cyclical stocks: The market may focus on the far future even as a business is weakening, leading the stock to rally without evidence of any real recovery.

To discuss this position, please visit the Deere board.

Pro Video Chat, December 2016

Published Dec 13, 2016 at 1:32PM

The *Pro* team held a live video chat on this page at 2 p.m. Eastern on Friday, Dec. 16. Here are Jeff's answers to the questions that we couldn't get to during the hour! Watch the replay below, and a transcript should be coming soon.

Pro and Options Prepare to Wrap Up 2016

Published Dec 12, 2016 at 3:33PM

Dear fellow Fool,

A tumultuous year is coming to a close on a strong note, with all the major U.S. indexes hitting new highs. Lest we forget, this year began with the worst January for the stock market in its history. Prices bottomed in mid-February, but by June and again in early November, the S&P 500 was all but flat on the year.

That choppiness invited more chances for second-guesses and errors (and we've had a few, which I look forward to reviewing), but investors in good companies who stayed the course are coming out ahead. As of Friday, the S&P 500 is suddenly up more than 10% this year, a good showing by any measure. It's also a *surprising* showing, given that earnings growth is muted, political uncertainty is high, and interest rates are heading higher. Nobody can call the market boring or predictable.

Pro and *Options* have had a busy year. I have to say that from a personal perspective, this year went by extremely fast. The Fool has been busy trying to offer our services to qualified individuals who will stay the course, and we've been working to welcome those new members while continuing to improve our investing results for everyone. Let's review some of the stats from the past year.

Between *Pro* and *Options* (remember, all *Pro* members receive *Options* free for the life of their *Pro* membership), we've issued 122 trade alerts so far this year -- 44 in *Pro* and 78 in *Options*. That comes to about 2.5 per week. We also publish a *Pro* Monday Memo every week, and the *Options* Weekly every Friday, making for another 100 or so (counting holidays!) pieces of content sent to you per year. This means a *Pro*/*Options* member receives about 4.5 emails from us in an average week -- plus, between the two services, we have at least two monthly live events. It's important to realize that once your *Pro* portfolio is set up, only our trade alert emails are truly *necessary*. We hope you enjoy our content in both services, but we don't want you to stress about the volume.

Members often ask us about the best way to use *Pro* and *Options* together. Our answer: *Pro* is a premium portfolio service. When you buy it, you're paying for a portfolio of long, short, hedged, and options positions, constructed and managed in a specific way. If you want to get the most from *Pro*, follow the portfolio as closely as you can -- even if you only buy our longs. Then, if you find you have room for more ideas beyond *Pro*, add *Options* ideas that suit you. *Options* is an *a la carte* service, offering individual ideas without allocation or portfolio guidance. Those ideas can complement your *Pro* portfolio.

We're having a good year in *Options,* as well. We started 16 new strategies in that service this year, 14 of which are profitable. Some highlights include lucrative bull call spreads set up on **Apple** (NASDAQ: AAPL), **Alphabet** (NASDAQ: GOOG) (NASDAQ: GOOGL), and **American Tower** (NYSE: AMT) during the market downturn; several profitable written puts on **Skyworks Solutions** (NASDAQ: SWKS); a new diagonal call on **Disney** (NYSE: DIS) that's up 34%; and a new **Home Depot** (NYSE: HD) diagonal call that's up 27%. The two new losers in *Options* this year are diagonal calls on **Nike** (NYSE: NKE) and **Anheuser-Busch** (NYSE: BUD), but we're confident that with time, both can turn around. In *Options* overall, more than 90% of our strategies continued to end profitably.

Here in *Pro*, the portfolio is up 8.1% year-to-date as of Friday, above our North Star, in line with the Nasdaq Composite, and a few points back from the S&P 500 and the Dow Jones 30. Industrials have come on strong to end the year, and we're on the wrong side of that particular trend -- we prefer owning the long-term consistency often found in less capital-intensive businesses with strong competitive advantages (such as pricing power). Given our 20% cash position and the fact that we remain 73% net long, our returns should please us, even as we always strive for better.

We're adding more growing companies to the portfolio, more income positions, more hedges, and more shorts. In other words, the living, breathing entity that is our portfolio continues to inhale fresh oxygen. We eschew high turnover or selling positions unnecessarily, but we always seek to improve our prospects with new holdings, balance our risk, and have some returns in any market. Early next year, once the ink has dried, we'll review the *Pro* portfolio and our wins and mistakes in 2016. Mistakes in particular are a useful topic, offering ways to improve, while studying your winners should lead to having more large gains down the road.

To discuss anything today, please visit the Memo Musings board. Thank you for being here, and Fool on!

Pro Guidance Changes and Completed Trades: Dec. 12, 2016

Published Dec 12, 2016 at 3:26PM

Pro Guidance Changes (from the past two weeks)

- **Parexel** (NASDAQ: PRXL): We recommend writing covered calls on this whole position, which remains on Hold.
- **Paycom** (NYSE: PAYC): This new position is rated a Buy at a 2% allocation.
- **Verisign** (NASDAQ: VRSN): This new position is rated a Buy at a 1.5% stock allocation, plus 1.5% more in a written covered strangle.

Pro Completed Trades (from the past two weeks)

- **Paycom** (NYSE: PAYC): We bought 1,300 shares at $42.57.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Dec. 12, 2016

Published Dec 12, 2016 at 3:25PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

New here? Make your way through the Portfolio Building Reports linked on our Guidebook page, starting (unsurprisingly) with No. 1, which focuses on our Buy First stocks. Speaking of which ...

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.5%.

- **FactSet Research Systems** (NYSE: FDS): Buy 2%.

Continue building your portfolio with our Buys, including:

- **Medtronic** (NYSE: MDT): Buy 2.7%.
- **OpenText** (NASDAQ: OTEX): Buy up to 3.2%.
- **Paycom** (NYSE: PAYC): Buy 2.2% (read our recent recommendation).
- **Verisign** (NASDAQ: VRSN): Buy 1.5% and write a covered strangle for another 1.5%, as per our new recommendation. Today's net debit is nicely lower than in the original alert.
- **Visa** (NYSE: V): Buy 2.3%.

Shorts:

- **Gogo** (NASDAQ: GOGO): Sell short 0.5% if you haven't yet.
- **Shake Shack** (NYSE: SHAK): Sell short 0.6% if you haven't.

Pro options:

- **American Tower** (NYSE: AMT): If you haven't yet, set up diagonal calls per our recent alert -- except, instead of selling to open April 2017 $115 calls, sell to open $110 calls. Follow allocation guidance in the alert, and ask any questions on the AMT board linked at the end of the alert.

Hedges:

- None right now.

Options expiring next (Dec. 16, 2016):

- **Deere** (NYSE: DE): Our $92.50 protective calls are in the money -- we'll have guidance on closing them this week.
- **Gentex** (NASDAQ: GNTX): Our $17.50 puts are on track to expire as income. No action needed as long as GNTX remains above the strike price.
- **SPDR S&P 500** (NYSEMKT: SPY): Our $180/$190 put ratio spread is on track to expire unused, paying us a little income. No action needed.

Write Covered Calls on Parexel International

Published Dec 12, 2016 at 12:39PM

Is this for you? This recommendation is for *Pro* members who own at least 100 shares of Parexel, and who wouldn't mind capping upside and potentially selling their shares at a net $69.15 if the stock price is above $65 at expiration. If you don't own shares yet, we don't recommend that you start a position today -- Parexel shares are trading above our fair-value estimate, and the position is on Hold.

How You Participate

- **Trade:** Sell to open March 2017 $65 calls on **Parexel International** (NASDAQ: PRXL).
- **Allocation:** Write ("sell to open") one call for every 100 shares of the stock you own and want to cover. *Pro* will cover all 1,300 shares we own, representing 3.1% of the portfolio.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a **limit order** to split the bid/ask price spread at going prices. Aim for as close to a 2% yield (that's option premium / current price of the stock) per month to expiration as possible, accepting a bit less if need be.
- **Prices** (12:20 p.m.):
  - **Stock:** $65.22
  - **March 2017 $65 call (bid/ask):** $3.90/$4.40
  - **The math:** $4.15 is a 6.4% yield on $65.22 in 96 days

We initiated our long stock position on Parexel International in late 2013, and including one round of written puts that expired as income in 2014, the stock has appreciated by more than 43% in just less than three years. That's equivalent to a nearly 13% compound annual growth rate (CAGR), besting our North Star by a significant margin; we have a 3.1% allocation to Parexel today. For reasons described below, we recently placed the stock on Hold, and today we're recommending covered calls as a way to earn income and potentially sell shares at a higher price.

While the business has largely performed in line with our initial thesis, the life of our Parexel position has been fraught with volatility. Significant customer concentration in its industry, contract research organizations (CROs), tends to make for lumpy results as a rule, and management has struggled to properly forecast and anticipate new business wins and customer project cancellation rates. And that's not to mention the multi-year restructuring program intended to improve margins, the surprise resignation of the company's CFO, and (in the past two quarters alone!) misappropriation of company funds *and* accounting errors leading to restatements of revenue and earnings.

All in all, despite Parexel's strong competitive position in a growing industry, it's safe to say we've lost some confidence in the management team. We recently placed the stock on Hold in order to wait for the next set of quarterly results, which will help to either confirm or reverse the recent negative trends. In that report, we mentioned that "we may decide to close our position if the stock drifts upward in the near-term, depending on price." With this covered-call alert, we are taking a more moderate, but still defensive and opportunistic, approach. Selling in-the-money covered calls allows us to earn income, buffer part of any potential share price decline, and target a potential sell price above our fair-value estimate.

These calls are only slightly in-the-money, yet they yield 6.4% in a little more than three months. If the stock ends higher than $65 in March (and if we don't decide to roll our calls), we will sell our shares at a net $69.15, 17% above our fair-value estimate, for a 52% total return on the position since inception (a 13.9% CAGR).

Parexel's next earnings report is due sometime around late January; the biggest risks to our position are continued signs of mismanagement and/or another set of poor results. However, we have no way of knowing the future in advance, and we've already indicated our willingness to wait for another quarter of results and assess ongoing business trends before making a call. While we wait, we believe it's a good idea to target some income at the same time -- especially because we are not averse to letting all of our shares get sold through our calls, should it come to that.

The *Pro* Bottom Line

In line with *Pro*'s goal of earning regular income by writing options while still running a portfolio that is mostly exposed to long-term upside, this position should result in additional income by March, whether we end up selling the stock or not. If you don't own shares yet, we don't recommend that you start a position today -- Parexel shares are trading above our fair-value estimate, and the position is on Hold.

There are no alternative trades today. If you own the stock and can't write covered calls on your shares, simply continue to hold and wait for future guidance. If our shares are called away, we will then advise you to sell.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call's strike price, and the potential gain on the covered call is the premium it pays us. The total combined gain is the call strike plus the premium received, leading to our net potential sell price above $69.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up**: After the next set of quarterly results from Parexel, we will decide our ongoing course of action. If the covered calls expire as income, we may look to write more calls, or we may sell our shares outright. If the stock price is above the strike price at expiration, we may either let our shares get called away at a net $69.15, or look to roll out and/or up in order to capture further income or upside.

Options Can Help

- **Want to know more about this strategy?** Our Options U guides to writing covered calls and rolling covered calls can help.
- **Questions about this trade?** Post your questions on our Parexel International discussion board.

Set Up a Covered Strangle on Verisign

Published Dec 9, 2016 at 2:59PM

Is this for you? This recommendation is directed to all *Pro* members managing at least $270,000. If you're managing much less than that, we suggest sitting out this income position, unfortunately. We'll have others!

How You Participate

- **Actions:** Set up a covered strangle by entering a multi-legged order to:
  - Buy shares of **Verisign** (NASDAQ: VRSN) in 100-share round lots.
  - Sell to open a number of March 2017 $85 calls (one for every 100 shares you buy) that is equal to the number of ...
  - ... March 2017 $80 puts you *also* sell to open (one for every 100 *more* shares you could buy).
- **Allocation:** Invest approximately 3% of your *Pro* funds in this total position on a look-through basis (assuming puts are exercised). At recent prices, this most closely equates to buying 100 shares and setting up a covered strangle for every $540,000 you manage. For *Pro*, this equates to buying 500 shares and selling five put and five call contracts. *Pro* members with portfolios between about $270,000 and $540,000 should see the Alternative Trades section below.
- **Price Guidance:** To start, look to split the bid/ask spread on the combined option prices and set up the entire position (including the stock buy) for a net debit of about $75.70 per share. Some reasonable deviation from this is fine!
- **Prices** (as of 1:31 p.m. 12/9/16):
  - **Stock price:** $81.98
  - **Sell to open March 2017 $85 calls (bid/ask split):** $3.00
  - **Sell to open March 2017 $80 puts (bid/ask split):** $3.28
  - **Net debit:** $75.70 ($81.98-$3.00-$3.28)

Temperament Needed

- Comfort with potentially significant option volatility.
- Comfort with the possible need to manage this position (with our official guidance) every quarter or so.
- Comfort with the potential requirement to buy additional shares, should the stock decline below the put strike price.
- Happy to generate income in exchange for potentially missing out on additional capital gains in the stock.

Why Set Up a Covered Strangle on Verisign?

- This cash cow of a company provides services that are mission-critical to the Internet.
- Verisign is able to convert close to 60% of its revenue and more than 100% of net income into free cash flow, which it primarily uses to repurchase shares and provide additional support to the stock price.
- In October, the company entered into an agreement to extend the contract that is the primary source of revenue for Verisign through November of 2024.
- The company's high-growth days may be behind it, but at 11.75 times EBITDA and 24.5 times earnings, we're essentially paying a market multiple for what we believe to be a far-above-average company while simultaneously generating a healthy option yield.
- So why not just buy stock alone? We want more positions in our portfolio that aren't solely dependent on a rising stock or rising stock market -- and we want more income. This covered strangle is poised to generate a healthy return even if the stock goes nowhere over the next few months.

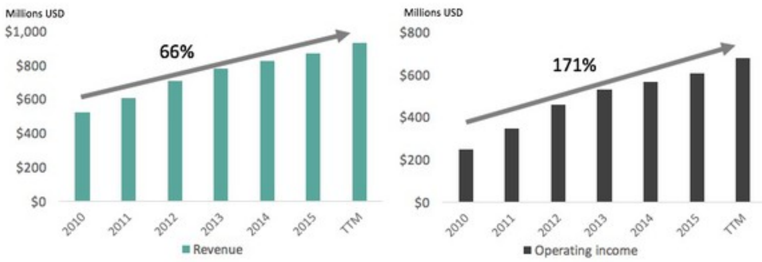
Want to Know More?

It may not be a household name like Starbucks or Facebook, but you might actually interact with Verisign more often than you do either of those staples. Whenever you type "fool.com" into your Web browser, Verisign is working behind the scenes to ensure that you actually end up at The Motley Fool's website. And the company doesn't just do this for fool.com, awesome though we are; Verisign handles more than 120 *billion* requests each day in providing this service for each and every 144 million ".com" and ".net" domain name currently in existence. To oversimplify, Verisign is kind of an old-school telephone operator for the Internet: Its servers convert the address you see in your browser (a person's name in the phone book) into a numeric IP address (a phone number) that the servers hosting the website (the phone) are able to understand.

Verisign also acts as the exclusive registry for ".com," ".net," and other top-level domains (TLDs). This means that Verisign receives a fee — currently $7.85 for the former domain and $7.46 for the latter — whenever someone registers or renews a domain name in a given year. This is actually how the company derives most of its revenue, and it's incredibly lucrative.

Every cost to a company can be put into one of two basic buckets: variable or fixed. Variable costs depend on the output a company produces; fixed costs do not. If a company's total costs are heavily skewed toward the latter, it becomes more profitable as it grows; this is referred to as operational leverage.

Verisign's registry business is a textbook example of this concept. The costs associated with maintaining its registry remain relatively unchanged as the number of domains registered grows over time. At 60%, Verisign's operating margin is already one of the highest among publicly traded companies (the S&P 500's operating margin tends to hover at about 14%), and incremental margin — the operating profit Verisign is able to generate on each new dollar of revenue it collects — is even more impressive at 85%. As Verisign grows, most of the revenue it collects flows straight down the income statement.



Source: Company filings.

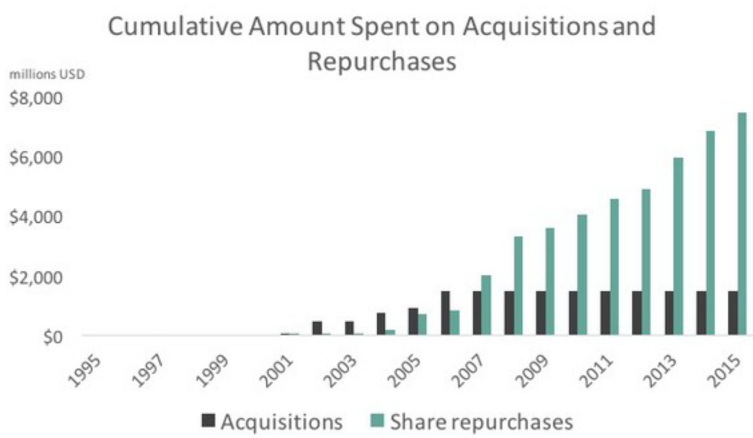
But the impressive economics don't stop there. Verisign might not be growing as fast as some of the other companies currently in the *Pro* portfolio, but it more than makes up for this with its efficiency in converting revenue into free cash flow. On a per-dollar-of-revenue basis, Verisign is able to generate more free cash flow than all of our other, already strong current holdings (examples below).

Free cash flow conversion for various Pro holdings

	FB	MA	AAPL	PAYC	FDS	VRSK	VRSN
FCF/Revenue	35%	41%	25%	15%	25%	18%	56%
FCF/Net income	116%	108%	116%	111%	84%	69%	144%

Source: S&P Global Market Intelligence.

So what's a company to do with all that cash? Fortunately for us, the current management team has a track record of being disciplined capital allocators. A former CEO in the previous decade had ambitions to turn Verisign into a diversified technology powerhouse by way of expensive acquisitions, but in the six years since the company decided to refocus on its core business, it has instead been busy returning capital to shareholders by way of share repurchases. Since the end of 2010, the number of shares outstanding has fallen from 160 million to 105 million.



Source: S&P Global

What We're Watching

Because Verisign's financial statements make it easy to see just how profitable the registry business is, there's always been a fear that someone or some entity, be it an attention-seeking politician or a competitor eager to steal profits, would try to put a stop to it. But to date these fears have been misplaced, and just two months ago, Verisign actually entered into a new agreement to extend its ".com" registry agreement until 2024. Moreover, the language for both the ".com" and ".net" registry agreements provides that they will be renewed unless Verisign is found in breach of certain provisions and is unable to cure said breach. Although it's hard to predict what the future might hold, it is worth noting that for more than 18 years Verisign has maintained 100% operational accuracy and stability for both ".com" and ".net."

The upcoming quarter is poised to be somewhat unique for Verisign. For most of 2015 and the start of 2016, the company saw an elevated number of new registrations coming from the Asia/Pacific region. Given that first-year renewal rates for domain names tend to be much lower than Verisign's overall average (50% vs. 70%-plus), this atypical activity will likely result in a net decline in the ".com"/".net" domain-name base in the fourth quarter. But we expect the business to return to its steady, if slow-growing, ways once this domain cohort passes its one-year anniversary, and we hope to continue using Verisign's stock for income for the foreseeable future.

Alternative Trades

Members who are unable to set up a 3% covered strangle because they manage less than $540,000 can instead consider setting up a covered call on Verisign -- necessitating just half that portfolio size. If you mange about $270,000, then buying $8,200 of stock is about a 3% holding. Do this and simultaneously aim to sell one March $85 call for every 100 shares you purchase, lately at a net purchase price of about $78.98 ($81.98-$3). Reasonable deviation is fine! And if you'd rather write a put, then sell to open one March $80 put (for $3.28) for every 100 shares you'd be willing to purchase.

Pro Catch-Up Trades and Upcoming Expirations: Dec. 5, 2016

Published Dec 5, 2016 at 3:31PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

New here? Make your way through the Portfolio Building Reports linked on our Guidebook page, starting (unsurprisingly) with No. 1, which focuses on our Buy First stocks. Speaking of which ...

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.5%
- **Facebook** (NASDAQ: FB): Buy up to 6.2%, in halves or thirds over time.
- **FactSet Research Systems** (NYSE: FDS): Buy 2%.

Continue building your portfolio with our Buys, including:

- **Paycom** (NYSE: PAYC): Buy 2.2%. Read our recent recommendation.
- **Oracle** (NYSE: ORCL): Buy 3.6%.
- **Visa** (NYSE: V): Buy 2.3%.

Shorts:

- **Gogo** (NASDAQ: GOGO): Sell short 0.5% if you haven't yet.
- **Shake Shack** (NYSE: SHAK): If you have not shorted 0.5% yet, you can do so now.

Pro options:

- None currently.

Hedges:

- None right now.

Options expiring next (Dec. 16, 2016):

- **Deere** (NYSE: DE): Our $92.50 protective calls are in the money -- we'll have guidance on closing them before expiration.
- **Gentex** (NASDAQ: GNTX): Our $17.50 puts are on track to expire as income.
- **SPDR S&P 500** (NYSEMKT: SPY): Our $180/$190 put ratio spread is on track to expire unused, paying us a little income.

Pro Guidance Changes and Completed Trades: Dec. 5, 2016

Published Dec 5, 2016 at 3:28PM

Pro Guidance Changes (from the past two weeks)

- **Paycom** (NYSE: PAYC): This new position is rated a Buy.

Pro Completed Trades (from the past two weeks)

- **Paycom** (NYSE: PAYC): We bought 1300 shares at $42.57
- **Deere & Co** (NYSE: DE): We bought to open three Dec. 16, 2016, $92.50 calls, capping risk on half of our short Deere stock.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Quality Checklist: Visa

Published Dec 5, 2016 at 1:38PM

Fellow Fools,

Since introducing our updated *Pro* Quality Checklist a little more than a year ago, we've used this eight-part analytical framework to turn our lens on nine of our current portfolio holdings, break down a previous short which has since been covered, and even circle back on a lingering watch-list idea. It's been awhile since we've run a new company through the checklist, though, so in today's Memo, I'll take a closer look at **Visa** (NYSE: V) and explain why we're still bullish on the company. Though management is working through the transition to a new CEO and the complex integration of the Visa Europe acquisition, those are just a couple of bumps in the road for a rock-solid business.

Take a look at how Visa stacks up against the characteristics of an ideal *Pro* company.

1. Sustainable Competitive Advantage

Yes. Visa has an enviable competitive position within its industry; as one of three dominant credit-card brands, it benefits from strong network effects. Consumers demand to use Visa's credit and debit cards because of the convenience, security, and rewards they provide, which forces merchants to accept Visa's cards to satisfy those customers and earn their business. This positive feedback loop makes the entire network more valuable over time and prevents newcomers from gaining traction.

Visa also possesses multiple intangible advantages. The company has spent decades building a trusted, globally recognized brand through massive advertising campaigns like the one we saw at this year's Summer Olympics in Rio. And the 83 billion-plus transactions Visa processed in 2016 add to a huge database of valuable proprietary information that can be used to offer ancillary services and make customer relationships even stickier.

Because of these advantages, Visa is insanely profitable. The company's operating margin is consistently higher than 60%, and its return on capital (in the mid- to high teens) is well above its cost. Those profits have attracted an ever-growing cadre of competitors trying to capture a tiny piece of the pie, but Visa's relative size allows it to invest heavily in research and development to maintain a technological edge and fend off the newbies.

2. Pricing Power

No. Though there are only a few credit-card companies in the market, they compete fiercely for the right to stamp their names on cards issued by banks and large retailers. Visa recently stole USAA from MasterCard and outbid both MasterCard and American Express to win Costco's business. Though every deal is structured differently, a recent upswing in costs related to incentives and rebates suggests that Visa is pulling out all the stops to win those big accounts. Also, the fees credit-card companies charge are regulated by law -- for example, the Durbin amendment of the Dodd-Frank Act, which limits fees paid by retailers on debit-card transactions.

3. Dependent Customer Base

Yes. Visa is deeply ingrained in the day-to-day business of its customers, both merchants and banks. Card-issuing banks sign on with Visa for the privilege of using its network to process payments. The banks then market the cards to consumers, who also receive any ancillary perks that come with the card. Merchants don't want to miss out on a sale, so they're generally willing to accept any form of payment. Over time, Visa has developed a portfolio of add-on data services related to things like security and marketing, which makes those relationships even tighter.

4. Predictable Revenue

Yes. Every time someone makes a purchase with their Visa credit or debit card, whether in a physical store or online, Visa's cash register also rings. If the global economy stays reasonably healthy and consumers continue to transition from cash to electronic payments, we can expect Visa's share to expand as the whole pie does. Further, Visa does not take on the risk of issuing credit to consumers, leaving that business to the card-issuing banks. Instead, in exchange for a small piece of each transaction, Visa ensures the digital money moves smoothly from customer to merchant.

5. Growing Free Cash Flow With Compounding Returns

Yes. Visa is a cash-generating machine, turning nearly half of each dollar of revenue into free cash flow. Over the past five years, the company has increased its free cash flow from $3.5 billion to $5 billion, which amounts to about 7.5% annual growth. That may not seem all that impressive, so it's worth noting that the $5 billion in fiscal 2016 is well below the $6.6 billion Visa banked in 2014. The company is currently digesting its recent, massive acquisition of Visa Europe, which is expensive and clouds the financial performance of the core business. But it's reasonable to believe that Visa will be able to blow through that high-water mark again within the next few years. One of the mixed blessings of generating a high return on capital is that it's hard to find opportunities to reinvest that cash at a similar level of return. For that reason, Visa returns the vast majority of its free cash flow to its investors through dividends and share buybacks.

6. Financial Resilience

Yes. Thanks to a strong balance sheet, fat profit margins, and the low capital intensity of the business, Visa is built to weather a storm. The payment industry is experiencing a massive secular change from cash to digital payments, and Visa is perfectly positioned to benefit. This trend was evident when Visa managed to continue growing during the Great Recession, only posting a loss in 2008 because of a $2.7 billion charge for a legal settlement. Unfortunately, these legal costs seem to have become a regular occurrence every few years; perhaps that's the cost of doing business as part of an oligopoly. Thanks to the copious cash generation mentioned above, Visa can easily digest these huge payouts and quickly get back to business. Management also issued about $16 billion in debt this year to help fund its purchase of Visa Europe. That number sounds huge in absolute terms, but Visa should have no problem servicing the interest, and the company's return on equity should benefit from the addition of a modest amount of leverage.

7. Expanding Possibilities

Yes. Eighty-five percent of the world's transactions still take place in cash, so capturing just a few percentage points of additional market share could make a huge difference in Visa's results. The company has invested heavily in new technology, such as mobile-wallet payments, ensuring it's available whenever and wherever the consumer is ready to make a purchase. In addition to payments, Visa offers a growing number of data services which will deepen the company's relationship with clients and help diversify its revenue stream over time. Meanwhile, all of the credit-card companies are also waiting patiently for China to open its doors to foreign payment processors. It will take years for Visa to develop the requisite relationships with Chinese card-issuing banks and then install the local infrastructure needed to process payment, but down the road, China stands to be another huge growth opportunity.

8. The Three C's of Management (Clarity, Consistency, Capability)

Sort of. This would have been a clear "Yes" a few months ago, but in October, longtime Visa CEO Charles Scharf announced his resignation for personal reasons (he'd been running a San Francisco-based company when his family lives in New York). He is being replaced by Alfred Kelly, a member of the Visa board of directors and 23-year veteran at **American Express** (NYSE: AXP). Thanks to his deep industry experience and knowledge of Visa's inner workings, Kelly likely checks the "capability" box, but it will take a while to establish "clarity" and "consistency" with investors. Even so, a CEO can only have so much influence on a massive global organization like Visa, where there already exists a deep bench of managerial talent. We'll be watching how Kelly leads the Visa Europe integration and whether he makes any meaningful changes to Visa's current capital-allocation strategy.

The *Pro* Bottom Line

As you've seen in previous installments of this checklist, a company doesn't have to score a perfect 8 out of 8 to make it into the *Pro* portfolio (or to become a winning investment!). Coming in at 6.5 out of 8, Visa qualifies as a top-notch business and one we're likely to hold for a long time. Though Visa is one of our smaller positions, accounting for only 2.3% of our portfolio, it combines with our position in **MasterCard** (NYSE: MA) to give us a solid 6.9% allocation in the two leading credit-card companies. We're big fans of this business and think both companies still have a lot of growth ahead of them, which should keep investors like us happy for years to come.

Here are links to additional *Pro* quality checklist articles on active *Pro* positions:

- **FactSet Research Systems** (NYSE: FDS) -- 8/8
- **Gentex** (NASDAQ: GNTX) -- 5/8
- **American Tower** (NYSE: AMT) -- 7.5/8
- **Broadridge** (NYSE: BR) – 8/8

- **Oracle** (NYSE: ORCL) -- 8/8
- **O'Reilly Automotive** (NASDAQ: ORLY) -- 6/8
- **TD Ameritrade** (NASDAQ: AMTD) -- 5.5/8
- **Valmont Industries** (NYSE: VMI) -- 5.5/8
- **MasterCard** (NYSE: MA) – 7/8

Have a great week, Fools!

Best,

-- Jeremy (TMFTank)

Buy Paycom Software

Published Nov 30, 2016 at 1:43PM

Is this for you? This recommendation is directed to all *Pro* members.

New here? This stock is rated Buy on our scorecard. If you haven't yet caught up with all of the Buy First stocks in our first Portfolio Building Report, consider doing that first before moving on to this and the rest of our Buys.

How You Participate

Paycom Software (NYSE: PAYC) is a profitable, young, cloud-based provider of payroll and human capital management (HCM) software, which manages the employment life cycle for employers and employees. It's differentiated by its comprehensive, integrated Software-as-a-Service (SaaS) solution that saves customers money and makes HR systems more efficient.

- **Action:** Invest 2% of your *Pro* portfolio in this new, Buy-rated stock.
- **Price Guidance:** You **must use a limit order; this is a thinly traded stock.** Right now, set a limit to pay less than $44.50. As time passes, the stock remains a Buy until we say otherwise.
- **Recent Price:** $43.70
- **Market Value:** $2.7 billion

Temperament Needed

- A long-term outlook of at least three to five years.
- Comfort with high price volatility.
- Comfort with the potential for at least a partial loss of capital.

Why Invest in Paycom?

- Revenue has compounded at 46% annualized over the past three years, and profitability and free cash flow much more rapidly than that.
- Sporting more than 15,000 clients and storing data on 2.1 million employees, Paycom's average three-year retention rate (recurring revenue) was 91% as of Dec. 31, 2015. In the most recent quarter, 98% of revenue was recurring.
- With $300 million in annual sales, Paycom can grow for years before it takes significant market share in the immense payroll and HCM industries. Its comprehensive and growing HR solution is ahead of competitors', promising market-share gains for years.
- The stock trades at 31.8 times expected non-GAAP earnings for 2018, in line with the company's estimated growth rate.

Want to Know More?

Founded in 1998 by payroll industry veteran Chad Richison, Paycom Software (which has only been public since 2014) is a rare combination of attributes:

- High and profitable growth with increasing returns on capital
- An invested founder (owning 13% of the shares) who has run the company for 18 years and counting
- A differentiated product that's taking market share from industry giants
- A long runway for growth, with market analysts IDC putting the payroll industry at $12 billion today and the HCM market at another $9 billion by 2020

You would expect Paycom to trade at a premium, and it does, but the price appears reasonable for the growth on hand and the long-term potential. With a relatively modest $2.7 billion in market value, Paycom has the runway to greatly exceed our North Star (inflation + 7%, lately about 10% annualized growth) over the long haul, especially given management's goal of maintaining current growth rates of north of 30% per year.

Payroll software is the company's bread and butter; clients must buy this to get access to the rest of Paycom's human capital management applications, or "modules," which currently number 26 and counting. Using a single, cloud-based database for everything it offers, Paycom propels HCM into the 21st century, improving on previous solutions in which multiple systems had to be pasted together. Paycom's single-login solution covers all the bases: applicant tracking and hiring, new-employee onboarding, time and labor management, paycheck reconciliation. It also offers performance management, learning and training, health-care and overtime compliance, and much more – with more modules on the way. Beyond the base payroll offering, companies only pay for what they use, so clients add more modules as they need them, and pay more to Paycom.

This ability to offer a complete solution in one place improves outcomes and removes errors for the small to medium-sized businesses (usually 5 to 2,000 employees) that use Paycom – and it helps clients save money. Paycom focuses on smaller companies which have historically not been served with comprehensive HRM software, but its solutions can also serve giants, and management expects more large companies to come knocking (its largest client to date has about 10,000 employees). Revenue is booked with each client through a fixed payment per month, plus a fee per employee or per transaction processed, with more fees as more modules are used. As new clients are added, revenue grows more quickly than Paycom's incremental costs, and larger clients aren't generally more expensive to add than are small ones.

Another longtime income driver hides in Paycom's payroll services -- specifically, the cash for clients' payroll checks that Paycom holds before releasing them, lately $660 million. Some cash is held for mere days, some for weeks. When interest rates are higher, Paycom can earn meaningful interest – all profit -- on this growing pile of cash.

On the road to growth, Paycom had 42 sales teams in 24 states as of Dec. 31, 2015, and continues to add new teams. Many major urban markets remain untapped. Each Paycom client is assigned a specialist and a dedicated welcome team, and ideally kept happy with personalized attention. Recurring revenue is highly profitable, so customer retention is integral to Paycom's approach.

The company has $74 million in cash, up from $7 million in 2011, and $29 million in long-term debt. The founder and CEO has been at the helm for 18 years, the CFO for 10. Lately, the CEO has bought more shares. Initially launched with a credit-card loan, the business has essentially been profitable from the start. Consistent leadership has led to financials that are now attractively ramping upward (dollars in thousands).

	2015	**2014**	**2013**	**2012**
Recurring Revenue	219,987	148,207	105,560	75,420
Total Revenue	224,653	150,929	107,601	76,810
Cost of Revenue	35,473	27,318	20,891	16,326
Operating Income	34,435	15,700	9,472	6,133
Net Income	20,945	5,663	607	(406)
Cash Flow Statement				
Cash from Operations	43,000	22,300	17,000	11,000
Capital Expenditures	16,500	14,300	17,200	6,000
Free Cash Flow	26,500	8,000	(200)	5,000

Source: 2015 10-K Filing and S&P Capital IQ

What We're Watching

Paycom checks most of the boxes for a strong *Pro* investment, but it lacks pricing power. The industry is competitive, with ADP, Paychex, Paylocity, Salesforce, Workday, Ultimate Software, SAP, *Pro* holding Oracle and others all offering products in the various niches that Paycom serves. Paycom's comprehensive HCM package provides advantages – almost all new Paycom clients are signed away from a competitor – but the company must still be price-conscious. There's execution risk in the plans to expand the sales staff. If Paycom's data is ever hacked, growth could halt. And 5% of revenue is related to the Affordable Care Act. If that law is rescinded or changed, this line of revenue could change or disappear. On the whole, new legislative risk exists as the White House turns to a new party that also holds Congress. Paycom could also be disproportionately affected by a recession or hiring slowdown. Finally, the stock is priced for high growth, and even small disappointments could send shares lower. And we do expect growth to slow at times.

Alternative Trades

We encourage you to use a limit order to buy shares directly, with a 2% allocation to start, for the long haul. It is rated Buy. If you would rather write puts, you can "sell to open" January, February or May 2017 $45 or $40 puts to target a lower potential buy price. Sell one put for every 100 shares you would buy.

5 Tips for Investing Success

Published Nov 28, 2016 at 3:23PM

Dear fellow Fool,

You joined The Motley Fool, and *Pro*, to help you succeed with your investments. You like to manage your own money, but you also know it takes a lot of time, research, and upkeep to remain current on companies you own, and to manage a sensible portfolio that should perform the way you hope. In addition, investing only works well over many years, so you know you need to commit to it for the long haul. *Pro* is more than eight years old (and represents a way of investing I've worked on for 16 years), but we're still very early in our lifespan. Imagine where our returns could be -- should be -- when we're 20 years old, or 25.

As we welcome new *Pro* members this week, it's worth revisiting some investing truths. After 20 years of helping investors to invest, two of the key underlying challenges I see again and again relate to temperament and patience.

Temperament problems pop up most when investors put too much capital into a position or two that fail to work out, instead of remembering from the start that a balanced portfolio will protect you from this common pitfall. If any single position is causing you to lose sleep, you likely put too much into that position and should correct it. At *Pro*, while we have low turnover and don't rebalance just to rebalance, we look at our allocations weekly to make sure we're comfortable with what we own and how much. That's key to succeeding during tough times, too.

Patience problems typically occur whenever we enter a downturn. That's when some investors display unhappiness, citing lower account values, even though *Pro* has never been a service that advocates selling in the short term. Under our philosophy, a downturn should represent a buying opportunity, or at worst just something to wait through; we have a minimum three-year outlook for any stock we buy. We will sell early if our investment case is proving suspect, but in most cases we can avoid that mistake from day one by buying "right" -- and then being patient.

Investing is not complicated, but it is difficult. It's difficult because emotions too often enter the equation. As noted, in my experience this typically happens when an investor concentrates too much risk in a few positions (or takes on too much risk overall), or when someone forgets that patience is the rule of investing. If you manage your allocations sensibly, you'll avoid many temperment problems. If you remain patient, you'll avoid most others -- and further benefit by having a clear head during downturns, helping you seize opportunities.

Members new to *Pro* are joining a community of investors that's truly exceptional; among other reasons, we know this because these concerns are addressed on our discussion boards. We see members helping fellow members on a daily basis, and often on these two very issues. If you have a question *or* an answer, we recommend the *Pro* community as an oustanding place to share it.

Five other tips to help you be a calm, ultimately successful investor:

- Focus on your portfolio as a whole. That's what needs to grow. Never expect gains in every position you hold -- instead, focus on increasing the total return of the portfolio.
- Here in *Pro*, we expect some positions to be losing at various times. It's not realistic to expect our shorts to all win for us when the market is rising, for example. They're mainly there for when the market is falling. And that's fine. That gives us more balance.

- Studies show that lagging stocks later become leaders, and vice versa, so you don't necessarily want your whole portfolio to rise all at once -- if it does, it may well fall in unison, too. We seek more diversity than that, and smoother returns, again looking to win overall in the long run.
- Let the past be the past. We all make mistakes. Learn from mishaps, but then don't dwell on them to the point that they harm your future. If you learn from mistakes, they can actually be turned into gains -- into future profits -- thanks to better choices made down the road.
- Forfeit a sense of short-term control over pricing; there's no such thing. Thinking you can control short-term results is folly. The longer the term over which we invest, the *more* "control" we have over the outcome. Short-term maket moves are completely unpredictable, but long-term cash flow at well-run companies is predictable, and that ultimately drives stock prices.

Finally, new and old members alike should always take their time. Invest gradually. You should be enjoying the process. If you're not, you may be moving too quickly, before you're ready. Ask questions and move at a pace that makes you happy. As we move toward 2017, vow to lower any stress in your investing, and increase your big-picture contentment. Keep in mind patience and the big picture as we issue new recommendations, too.

Earnings

I touched on earnings from several *Pro* stocks in last week's Memo. Additionally in *Pro* last week, we saw earnings from long-term holding **Medtronic** (NYSE: MDT) and our short position **Deere & Co.** (NYSE: DE).

I've posted initial thoughts on Medtronic -- the stock remains a Buy at our 2.8% allocation. Deere, meanwhile, remains on Hold. We're likely to decide to close half of our short on Deere via our purchased $92.50 calls (which capped our risk). We're still deciding about the other half; you will of course hear first once that decision is made.

In closing, we welcome new members to *Pro*, and we thank veteran members for making *Pro* what it is! For questions, please visit the Help board. And if you missed today's live chat at 2 p.m. ET, we'll have another one coming up in December, and we urge you to enjoy the replay in the meantime.

Pro Guidance Changes and Completed Trades: Nov. 28, 2016

Published Nov 28, 2016 at 3:22PM

Pro Guidance Changes (from the past two weeks)

- **American Tower** (NYSE: AMT): Shares moved from Buy to Buy First, and fair value increased to $125 from $120.
- **Deere & Co.** (NYSE: DE): This short position moved to Hold, and we bought protective calls on half of it.
- **Facebook** (NASDAQ: FB): Our fair-value estimate increases to $124. The stock remains a Buy First.
- **Gilead Sciences** (NASDAQ: GILD): Fair value decreases to $95. Shares remain a Buy.
- **MasterCard** (NYSE: MA): Our fair-value estimate increases to $90. The stock remains a Buy First.
- **Parexel** (NASDAQ: PRXL): Shares move to Hold as we consider recent news. We'll have an update, of course.

Pro Completed Trades (from the past two weeks)

- **American Tower** (NYSE: AMT): We bought to open a 0.5% stake (five contracts for us) via January 2019 $80 calls. We have not written the short calls yet to complete our diagonal, as pricing since fell far away from us.
- **Deere & Co** (NYSE: DE): We bought to open 3 Dec. 16, 2016, $92.50 calls, capping risk on half of our short Deere stock.
- **Expeditors International** (NASDAQ: EXPD): We rolled our November 2016 $50 calls to January 2017 $50 calls. Our short puts expired as income.
- **SPDR S&P 500** (NYSEMKT: SPY): We bought to close our short Nov. 18, 2016, calls, ending the synthetic short.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Nov. 28, 2016

Published Nov 28, 2016 at 3:16PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

New here? Start with our Portfolio Building Report No. 1, which focuses on our Buy First stocks. Speaking of which ...

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Facebook** (NASDAQ: FB): Buy up to 6.4%, in halves or thirds over time.
- **FactSet Research Systems** (NYSE: FDS): Buy 2%.

Continue building your portfolio with our Buys, including:

- **Medtronic** (NYSE: MDT): Buy 2.8%.
- **OpenText** (NASDAQ: OTEX): Buy 3.3%.
- **Visa** (NYSE: V): Buy 2.4%.
- **Verisk** (NASDAQ: VRSK): Buy 2.2%.

Shorts:

- **Gogo** (NASDAQ: GOGO): Sell short 0.5% if you haven't yet.
- **Shake Shack** (NYSE: SHAK): If you have not shorted 0.6% yet, you can do so now.

Pro options:

- None currently.

Hedges:

- None right now.

Options expiring next (Dec. 16, 2016):

- **Gentex** (NASDAQ: GNTX): Our $17.50 puts are on track to expire as income.
- **SPDR S&P 500** (NYSEMKT: SPY): Our $180/$190 put ratio spread is on track to expire unused, paying us a little income.

On Yearly Gains, and Earnings News

Published Nov 21, 2016 at 3:03PM

Dear fellow Fool,

Here at *Pro*, we pride ourselves on owning strong companies -- businesses with enough durability to *more than* make up for the losers (and mistakes) we know to be inevitable in investing. As an investor, the more action you take in a given time period, the more likely you are to make mistakes. But if most of your assets are invested in growing businesses, your portfolio as a whole should grow over time, allowing the errors to fade away.

Our *Pro* portfolio is up 6.6% this year (as of this afternoon), a healthy showing that's close to our North Star goal and in line with the major market indexes. We've achieved this while currently being 71% net long, with 22% of the portfolio in cash. One year's results don't usually mean much in the long run, but it's still much better to have a solid year than a losing one. *Pro's* returns over the past five years:

Year	Return
2012	14.3%
2013	35.1%
2014	17.5%
2015	7.5%
2016 YTD	6.6%

The S&P 500 was flat in 2015 (up 1.4% thanks to dividends); in fact, it's been pretty flat for nearly two years, only today breaking into new highs. But over the same time period at *Pro*, we've been able to add to our returns. Assuming the strong companies we own continue to grow and to improve the way they do business, then our best days are still ahead of us, and we will again see years with 10% returns (and higher). This may take a while due to today's valuations -- unless organic earnings growth revives after a few tepid years -- but it should happen. (You can see more of our returns on the bottom of the *Pro* Portfolio page.)

Like all of us, sometimes I focus too much on my mistakes. But our returns overall are what we have to show for our efforts when a year closes out. We keep moving forward, grateful for what we have, and seeking to improve -- and enjoy! -- our process. We believe our businesses are the same, always striving to improve. Today, let's review recent results from three *Pro* long positions and one new short.

Earnings Wrap-Up

Gilead Sciences (NASDAQ: GILD) is the cheapest stock we own, trading at 7 times expected earnings per share for the year ahead, even as earnings are falling from their record year-ago levels. This quarter, revenue declined 9% year-over-year, to $5.1 billion, on a 37% drop in Hepatitis C (HCV) sales; the decrease was mainly because of lower pricing. Sequentially, however, HCV sales were about flat compared with the second quarter (excluding unusual gains), suggesting the decline in the sector is slowing. Results were helped by Gilead's new Epclusa drug for genotype 2 and genotype 3 HCV patients; Epclusa sales hit $593 million in their first full quarter. Overall, an estimated 50,000 to 60,000 patients started HCV therapy each quarter over the past year, and Gilead maintains very strong market share.

Elsewhere, Gilead's HIV and anti-viral sales were up 32% year-over-year and 19% sequentially. Ten million people take a Gilead product everyday. The company continues to evaluate acquisition and partnership possibilities for growth. Meanwhile, Gilead has bought back many of its own shares at an average of $90 each, and management believes it's getting a great deal. We rate the stock (with its 2.5% yield) a Buy at our 2.5% allocation. That price is currently about 5% below our average cost. But as cash flow tapers, our fair-value estimate has to come down to $95.

OpenText (NASDAQ: OTEX) reported healthy growth and expects more on the way. Driven by acquisitions (as has been partially true for years), revenue was up 14% to $492 million, with $431 million of it (that's 87%) recurring. Software license revenue rose 18%; cloud and subscription revenue gained 15%. For the year that just started, management expects revenue growth of at least 10%, bolstered by its $1.6 billion acquisition of EMC's Enterprise Information Management business. By 2020, OpenText models 34% to 38% non-GAAP operating margins, with 50% of revenue from the cloud and 90% recurring revenue. Recently near $61, the stock trades at 14.4 times expected EPS this year, and 16.1 times trailing free cash flow. Shares remain a Buy at a 3.2% allocation. The stock yields 1.5%.

We have a short position on **Shake Shack** (NYSE: SHAK), where management is expanding the business as one would expect for a small restaurant chain adding new locations. Revenue was up 40% last quarter, and same-store sales gained 2.9%. Management is on track to open 19 new locations this year, for 43% store growth, with another 21 to 22 locations expected in 2017, representing 35% unit growth. But even this early in the game, some signs of age are creeping in. In the previous quarter, same-store sales growth was thanks to a 3.6% increase in price and menu choices, while traffic declined 0.7%. Next year, revenue is expected to increase by about 32%, which again is less than unit growth, and that includes price increases of up to 2% in January. Margins also face pressure as the company opens less profitable locations compared to its earlier iterations. At about $36, the stock trades at 81 times earnings and 68 times estimates for next year's earnings.

Shake Shack is well-run, but in a crowded "burger, fries, and shake" landscape, one where customers have a lot of choice, we don't believe the Shack deserves today's frothy valuation. At the very least, the stock is unlikely to gain a lot of ground, and in a weak market it should suffer, making our short's risk-to-reward ratio attractive. We remain short at a 0.6% allocation. We may consider adding to the short if that appears to fit the portfolio.

Finally, **Skyworks Solutions** (NASDAQ: SWKS) is defying skeptics. The stock is up 2.5% this year, and shares of its largest customer, **Apple** (NASDAQ: AAPL), are up 6% despite a year-over-year decline in iPhone unit sales. For its fiscal 2016 just ended, Skyworks hit record revenue of $3.3 billion, expanded its margins, and showed record operating cash flow of $1.1 billion. As an increasingly mobile-centric world takes shape, more devices connecting to the Internet mean more potential devices dependent on Skyworks' wireless technology. The company's revenue is expected to increase by 7% to 9% sequentially in the current quarter, and year-over-year growth should resume in the second quarter of 2017. Looking ahead, 5G technology will be another significant driver for the business. At the same time, Skyworks is diversifying beyond just phones, with the broad Internet of Things market now representing 25% of its sales and phones at about 60% (and 15% elsewhere). At $78, shares trade at 12.6 times one-year EPS estimates and 25 times trailing free cash flow. We own a 3.5% stake in this Buy-rated position, and we've written $75 covered calls for income. Today, you would write January $80 calls (as shared in our Catch-Up Trades).

Pro Catch-Up Trades and Upcoming Expirations: Nov. 21, 2016

Published Nov 21, 2016 at 2:26PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Facebook** (NASDAQ: FB): Buy up to 6.4%, in thirds over time.

Continue building your portfolio with our Buys, including:

- **Gilead Sciences** (NASDAQ: GILD): Buy 2.5%.
- **OpenText** (NASDAQ: OTEX): Buy 3.2%.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.5%.

Shorts:

- **Gogo** (NASDAQ: GOGO): Sell short 0.4% if you haven't yet.
- **Shake Shack** (NYSE: SHAK): If you have not shorted 0.6% yet, you can do so now.

Pro options:

- **Skyworks Solutions:** If you're just buying your shares now, you can "sell to open" Jan. 20, 2017, $80 calls on them, selling one call for every 100 shares you buy to cover.

Hedges:

- None right now.

Options expiring next (Dec. 16, 2016):

- **Gentex** (NASDAQ: GNTX): Our $17.50 puts are on track to expire as income.
- **SPDR S&P 500** (NYSEMKT: SPY): Our $180/$190 put ratio spread is on track to expire unused.

Pro Guidance Changes and Completed Trades: Nov. 21, 2016

Published Nov 21, 2016 at 2:23PM

Pro Guidance Changes (from the past two weeks)

- **American Tower** (NYSE: AMT): Shares move from Buy to Buy First, and fair value increases to $125 from $120.
- **Deere & Co.** (NYSE: DE): This short position moves to Hold, and we're buying protective calls on half of it.
- **Facebook** (NASDAQ: FB): Our fair-value estimate increases to $124. The stock remains a Buy First.
- **Gilead Sciences** (NASDAQ: GILD): Fair value decreases to $95. Shares remain a Buy.
- **MasterCard** (NYSE: MA): Our fair-value estimate increases to $90. The stock remains a Buy First.
- **Parexel** (NASDAQ: PRXL): Shares move to Hold as we consider recent news. We'll have an update, of course.

Pro Completed Trades (from the past two weeks)

- **American Tower** (NYSE: AMT): We bought to open a 0.5% stake (five contracts for us) via January 2019 $80 calls. We have not written the short calls yet to complete our diagonal, as pricing since fell far away from us.
- **Expeditors International** (NASDAQ: EXPD): We rolled our Nov. 2016 $50 calls to January 2017 $50 calls. Our short puts expired as income.
- **SPDR S&P 500** (NYSEMKT: SPY): We bought to close our short Nov. 18, 2016 calls, ending the synthetic short.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Buy Protective Calls on Half of Your Short Position in Deere & Company

Published Nov 18, 2016 at 11:25AM

Is this for you? This trade is only for members who have a direct short position on shares on **Deere & Company** (NYSE: DE). All others should ignore this recommendation, or bring your questions to the Deere & Company board.

One of the most important aspects of managing a portfolio -- the actual, hands-on management of that portfolio -- is also one of the most routinely unappreciated factors in investing success. That kind of management is exactly what we're doing today by covering half of our Deere position ahead of the company's earnings report. By spending a small amount (0.028% of the portfolio), we can take this defensive action while still retaining the potential in our short position should market sentiment toward this cyclical equipment manufacturer finally shift.

How You Participate

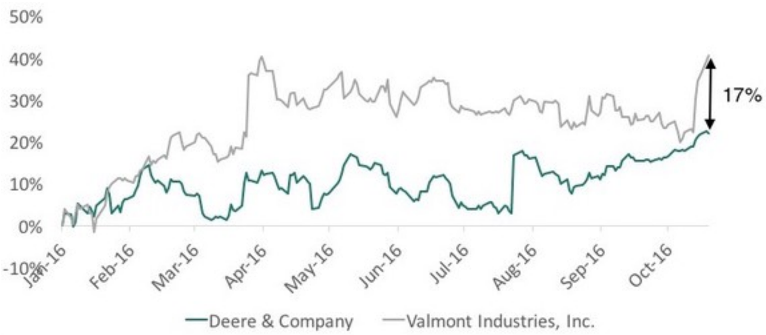
- **Trade:** Buy to open Dec. 16, 2016, $92.50 calls.
- **Allocation:** We're covering *half* of our position here, so buy one call for every 200 shares of Deere that you're short. *Pro* is short 600 shares and will be purchasing 3 contracts. If you're short between 100 and 200 shares, purchase one call; if you are not short at least 100 shares, close half of your position.
- **Price Guidance:** Initially, use a limit order of $2.47 or lower. If necessary, we'll pay more, because we want to set this up before the company reports earnings on Nov. 23.
- **Recent Prices** (10:30 a.m. ET)**:** Stock, $92; December $92.50 calls (bid/ask), $2.45/$2.49
- **Special Notice:** Deere will report earnings before the market opens next Wednesday, Nov. 23, so we want to buy this protection before then.

When we first established our short position on Deere & Company this Jan. 28, we noted two things we meant to accomplish. As with any short, our ultimate goal is to make absolute returns regardless of what happens in the market. But we also thought shorting Deere would serve to lower our exposure to the market by acting as an effective hedge for both the U.S. economy and our position in Valmont Industries. (We had considered closing our Valmont position because of industry struggles before deciding to short Deere.)

The market bottomed out shortly after we sent out our trade alert, and our goal of absolute returns hasn't come to pass so far. But hindsight is 20/20, and at the time, it seemed like anything but a sure bet that the market would snap back as quickly as it did. After years of a steady rise, the January pullback was the second sharp decline in six months, and the VIX -- the "volatility index" -- was sitting near five-year highs. But while our position has been in the red pretty much from the get-go, up until a month ago, Deere *was* serving as a worthwhile hedge on the market.

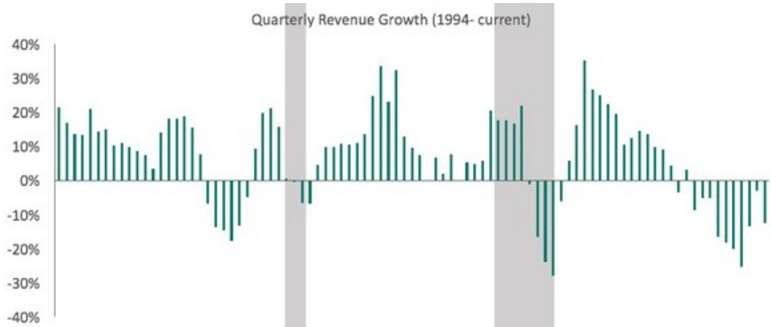
Source: S&P Global Market Intelligence

And it's served as a great hedge for Valmont, given how much sentiment has changed surrounding Valmont's stock so far this year.



Source: S&P Global Market Intelligence

A stock price is essentially a reflection of two things: how the underlying business is performing and investor sentiment, or how much investors are willing to pay for the current business based on expectations for the future. With respect to the former -- operational performance -- so far we've been spot-on. For the three quarters since we began our position, Deere's revenue has declined by 13%, 3%, and 12%, respectively, while net income has fallen by 34%, 28%, and 4%. To be fair, management has done well cutting costs during this downturn, but there's really only so much they can do to stem the operational deleveraging that takes place when you're a manufacturer stuck in the worst downturn you've seen as a public company.



Source: Company filings. Grey bars denote U.S. recessions.

Management, and those bullish on Deere, have been calling for a bottom in the cycle for more than a year now, but so far, signs point to weakness for the fourth quarter and continuing into 2017. The old adage for cyclical companies is that you should buy them when they're expensive, but that's only good advice when the cycle is about to turn and things are going to get better — something we currently don't believe to be the case with Deere.

U.S and Canada Ag. Business

	Industry	Deere
July 2016 Retail Sales		
2WD Tractors (100+ PTO hp)	-26%	less than the industry
4WD Tractors	-43%	more than the industry
Combines	-23%	more than the industry
August 2016 Retail Sales		
2WD Tractors (100+ PTO hp)	-26%	more than the industry
4WD Tractors	-39%	more than the industry
Combines	-17%	more than the industry
September 2016 Retail Sales		
2WD Tractors (100+ PTO hp)	-9%	in line with the industry
4WD Tractors	-18%	more than the industry
Combines	-27%	more than the industry

Source: John Deere monthly retail sales commentary. Industry results reported by the Association of Equipment Manufacturers.

But operational performance doesn't exist in a vacuum. The market at large is strong right now, and investor sentiment on cyclical stocks is improving -- **Caterpillar** (NYSE: CAT) is the best performer in the Dow so far this year by a wide margin, though its situation is similar to Deere's. This has put us in a tricky situation: We still believe in our thesis, but it's important that we don't let that belief get in the way of proper portfolio management.

To date, we've been wrong about how the market would respond to Deere's poor financial results. With earnings due next Wednesday, Nov. 23, we want to take preemptive action in case that continues. We're covering only a portion of our position, which enables us to pay less than we would have to cover our entire position at a higher strike price. By paying less, we stand to benefit more if the stock falls, and the lower strike price ensures we'll be better off as the stock rises until about $100. And a Dec. 16 expiration lets us hedge the uncertainty surrounding earnings but still expires before the year is out, enabling those who follow *Pro* in a taxable account to offset some of their capital gains this year should we ultimately need to exercise our calls and reduce our position.

With this hedge in place, the stock could rise to $100 by expiration and the negative impact to our portfolio would be just 0.13%. We may exercise our calls, bringing the position more in line with the others in our short basket, or we may decide to close the other half of our position as well. We'll analyze what we find in the earnings report and let you know.

More That Matters

- **Maximum Loss:** On this trade, we only risk what we pay to buy the calls, which end without value if Deere remains below $92.50.
- **Maximum Gain:** These calls will go up along with Deere shares, offsetting any losses in half of our position above $92.50.
- **Follow-Up:** After earnings, we'll decide whether to use our calls to cover half our short if Deere is above $92.50, or whether we want to keep our short (and perhaps hedge it again) if shares remain below $92.50.

Close Your Short Calls on SPY

Published Nov 17, 2016 at 12:48PM

Is this for you? This is for all *Pro* members who are short in-the-money calls on the market index expiring tomorrow, as a result of our synthetic short trade from Nov. 2. (This does *not* relate to *any* put ratio spreads we have on SPY, which are due to expire unused as income. So, only focus on short -- or written -- SPY *calls* in your account that are now in-the-money, with a strike price below SPY's current price, and that expire tomorrow.)

How You Follow Along

- **Trade:** Buy to close all short in-the-money calls on **SPDR S&P 500** (NYSEMKT: SPY) expiring Nov. 18.
- **Price Guidance:** Since this expires tomorrow, and SPY options are very liquid, just use a limit order at current prices to close your short calls.
- **Related position:** The November *puts* that we have on SPY are out-of-the money, have little to no value, and can be left alone to expire.

What We're Thinking

That was interesting.

On Nov. 2, we recommended a synthetic short on the **SPDR S&P 500** (NYSE: SPY) ETF as a simple hedge against an election surprise. Hillary Clinton went in with about 90% odds of winning the election, and ended up losing the electoral vote handily. Initially, U.S. stock markets dropped nearly 5% in overnight trading, before rebounding and *rising* the next day. Investors are apparently hopeful that a pro-business administration -- one where Trump favors more stimulus, more investment, tax cuts, and more U.S.-centric trade deals -- could ultimately drive more growth our way, and thus stocks have been bid higher. Or so one theory goes.

Our hedge was set up for an election shock, and meant to expire soon after (the soonest date feasible) so that we didn't mindlessly keep the hedge going. Although we were correct to think the election could surprise the world -- and Brexit was our biggest indicator -- we did not see the market react as we would have assumed. So now we are going to pivot, too. With the Dow hitting new highs, and the S&P 500 very close to doing the same, we're going to "buy to close" our short calls on SPY, take that loss for 2016, and reassess our next move. We still want to hedge the uncertainty that is ahead, but in the face of new market highs, we don't want a direct SPY short right now -- it could get too costly if the market trend continues. We are instead likely to revert back to put ratio spreads that can pay us credits, and add more direct shorts to our basket of shorts.

This hedge served us as wished. We didn't end up needing it, but it has not stopped our portfolio as a whole from rising sharply with the stock market. At a recent $218, SPY is up 2.8% from the original $212 short price in our recommendation, so even at a 10% allocation, it has influenced the typical member portfolio by only 0.28% -- a price we're fine paying for the insurance we had through the election, and the subsequent rise in the market and our portfolio that we kept long.

Alternative Trades

- **IRA-friendly:** The $210/$200 spread you set up as our alternative trade is on track to expire. There's no action to take.
- **Short SPY directly:** If you shorted SPY directly, you can close that as well -- unless you prefer to keep a direct short on SPY as a hedge. (Remember, a hedge is a personal choice; it's just a form of insurance against market declines, so you can keep them on or take them off at will, as you wish.)

Pro Can Help

- **Want to talk about our SPY hedge strategies?** [We have a discussion board for that].

Roll Your Short Calls on Expeditors International

Published Nov 16, 2016 at 2:42PM

Is this for you? This is for *Pro* members who have an existing income position on **Expeditors International** (NASDAQ: EXPD) with currently in-the-money call options expiring Nov. 18.

How You Participate

- **Trade:** Use a rolling order to simultaneously:
  - Buy to close all Nov. 18, 2016, $50 calls, and ...
  - Sell to open an equal number of January 2017 $50 calls.
  - Leave your written puts alone to expire Friday, unless you want to close for pennies.
- **Prices and Guidance (2 p.m.):**
  - **Stock:** $51.15
  - **Options:**
    - **Buy to close** November: $1.10/$1.60
    - **Sell to open** January: $1.90/$2.20
    - **Approximate net credit** (estimating $1.30 to close, $2 to open): $0.70 credit
    - **Timing:** As as long as Expeditors remains above $50, close your November $50 calls by Friday to avoid being exercised. Pay minimal time value -- $0.10 to $0.20 -- to close the November calls. If the stock falls below $50, you can wait to close if you want to watch it, as long as it stays below $50 through the end of Friday.

What We're Thinking

We've done well with our synthetic long on Expeditors, turning a net credit to start the position (and only about $8,400 in cash obligations) into more than $8,000 in unrealized profits so far since January, *not* including option income made along the way.

Our synthetic long expires in January, and before then we'll decide what to do: let it turn into shares, close and move on, or set up another synthetic long. Either way, we want that tax gain in 2017, not right now. Right now, we *do* need to close our Nov. 18 $50 calls because the stock is above that strike price. We can leave our puts alone to expire Friday, but will roll our calls to January for another credit and to cushion against a fall of about $2 in the stock.

We are not writing new puts right now because they don't pay enough. So, we'll only have our 2017 synthetic long and be short January $50 calls.

More That Matters

- **Maximum loss:** Our synthetic long has the same exposure as 1,000 shares of stock (or 2% of the portfolio).
- **Maximum gain:** Our upside will be capped at $50 plus the premium received.
- **Follow-up:** By early January, we'll decide our next move with our expiring synthetic long.

Alternative Trades

- **If you wrote covered calls last time and want to keep doing that:** Roll your November $50 calls to January 2017 $50, just as we're doing, for the same rough credit as above.
- **If you wrote puts last time:** Those are expiring as income. We're not suggesting new ones at current prices.
- **If you're new to the position:** We suggest waiting until January to see what we do next. You can get on board then if we keep it going.

Pro Can Help

- **Questions?** Please ask, Fools! Ship yourself on over to our Expeditors board. We can all help you, especially if you're new!

Pro Video Chat, November 2016

Published Nov 16, 2016 at 12:17PM

The *Pro* team will be holding a live video chat on this page at 2 p.m. Eastern on Monday, Nov. 28. We'll be using a service called slido to take members' questions during the chat; for a brief overview of how that works, click here. The Slido chat code is #ProChatNovember (direct link is here). We advise that you keep Slido open in a separate window so you can follow along with the chat and the questions at once. See you soon!

Transcript

Jeff F.: Greetings fools. Welcome to your November 2016 Motley Fool Pro live chat. Joining me today is Jeremy Meyers, Team [F-Tank 00:00:10] on the discussion boards. I'm Jeff Fischer, co-advisor of Motley Fool Pro. We're delighted to be with you here today after the, for US citizens, holiday weekend. Long holiday weekend. We hope you all had a great time with family, friends.

Jeremy M.: Everyone is out of their turkey comas.

Jeff F.: What was your favorite part of the holiday, Jeremy?

Jeremy M.: Well, for me it was I finally got out of my sling. I had shoulder surgery a month ago, and finally got to take that off and look somewhat normal again.

Jeff F.: The protein. We've been through the ringer a little bit.

Jeremy M.: That's right.

Jeff F.: Jeremy had surgery about a month ago, as you just said, just had your sling off just recently. J.P. had some surgery last week. He was okay with us sharing that. He's been out, but he'll be back this week and he's doing well. Ellen is okay, but a little under the weather today.

Jeremy M.: Cold. [crosstalk 00:01:01] after the holiday and all the hugs and handshaking.

Jeff F.: Exactly. Yeah, that's true. A lot of cold snow.

Jeremy M.: Don't want to get a cold.

Jeff F.: Billy, we don't know how he is, but he's in New Zealand travelling.

Jeremy M.: Yes. For two weeks.

Jeff F.: Hopefully he's doing great. The Pro teams kind of ... we're doing fine though, but we're kind of rocky couple of weeks in some ways. Everyone's healthy or getting there, so that's the key thing. For today's chat, Jeremy and I are hosting. Please go to see the video portion of the live chat on your page right now if you're on the Pro video chat page. You can go to slido.com. That's S-L-I-D-O.com. Then enter the hashtag "ProChatNovember", and that will take you to the question portion of this chat. If you want to ask your own question, and we highly encourage that you do, then we will see your question. All other members will too. You can vote on the questions that you want answered. Most, and we'll answer the questions one by one. Right now we only have three questions, so it may be a quiet or a short chat.

Jeremy M.: I see a few more coming in. It looks like you have about eight or more.

Jeff F.: Okay, so they're starting to come in. Thank you for joining the chat, and asking your questions. I don't think we have much of a preamble before we get to your questions today. It's end of November. We're looking forward to December and the end of the year, and making sure the portfolio is where we want it as the year ends. Kind of last, end of year house keeping, so to speak. Maybe taxes will play a role in some choices we make.

The portfolio, Jeremy, is up about 6% year to date last I looked, which is last I looked, about in line with the market. Close to the North star, and we're about 70% long right now. This year we've averaged about 75% long. We're pretty happy with that. A gain is never to be frowned upon.

Jeremy M.: It's been a tough year on the long and the short side for most investors. For how the year started, one of the worst starts ever. To the recovery and post-election rally. That there's a lot of Brexit and other unexpected news that the market's had to digest. I think overall we're probably in a pretty good place.

Jeff F.: Jeremy, I read the average hedge fund is up about 1 or 2%. 1 1/2% this year, so again they're doing badly compared to the market. So many of them, of the top 50 hedge funds performance-wise, the majority took positions prior to the election that have hurt them since they got out of financial as well. We sold one as well, but we kept the most of our financials. They shorted healthcare, thinking Hillary Clinton would win and that would hit healthcare. The opposite has happened, of course, and the healthcare has soared, financials have soared.

Jeremy M.: I'll tell you that's hit my watch list also. Of the companies that I was looking at on the long and the short side. Where some of the more regulated industries have just taken off. Up 25, 30% over the last couple weeks. A number of other longs just don't look quite as attractive now as they did. I feel like there's an entire ... all the sector rotation just happened so quickly, that it's hard to determine how much of it is warranted. How much is it an overreaction of everyone being on one side of the boat, and then just running as fast as they can to the other side. How realistic these expectations are as far as the fundamentals of some of these businesses.

Jeff F.: Exactly, how much will the bottom line move?

Jeremy M.: Our portfolio, you look at [Valmont 00:04:39], which is up probably 20% or more since the election, with only anticipation of infrastructure spending, without any actual funding, any actual projects launched. Looking out two three years, the markets a forward-looking instrument. There's some speculation there, right? When you start to digest whether or not those prices make sense, or if things are getting a little ahead of themselves.

Jeff F.: Definitely. When a price moves as much as 10 20% or more, it does require that kind of reassessment. In most cases, the companies we own are worth continuing to own, but would we want to buy more at this price? Or has it already priced in too much optimism? As you said, yeah, keeps you on your toes. You're right, its been a rocky year. I think the more you trade, the more chance you had to make mistakes this year. Many of the trades we made, luckily we don't make that many, turned out to be in the short-term, to not add to our returns. In some cases, take away from our returns. The more active you are, the more likely you are to be wrong in the short-term.

Jeremy M.: Sitting on your hands is the right decision, sometimes. Doing nothing is sometimes the smartest thing you can do.

Jeff F.: We're of course, hoping to be smart and right in the long-term, and so far, that's what we're doing. That's what we have to look back on. Eight years of Pro doing well, but we're just getting started as I wrote in today's memo. We're still just getting started. It's the next 10 years that we're most excited about. With that kind of overview of rocky volatile year, but we like the 23 positions in the Pro portfolio. For the most part. One or two are on hold right now, as we reassess. We like the shorts that we have. We're looking for new shorts. There's some new longs that will probably be in the portfolio before long. Some that take into account the new administration. Potentially the chance for lower tax rates on corporations, especially mid and small companies benefit from that.

Yes, we're moving as the world kind of leads us to move. Although, we like to chart our own course at the same time. We'll shine a light in every corner and see what we find.

Jeremy M.: As things settle down, we can start writing some options for income and return back to some of those strategies that we had been working on earlier in the year, where things were a little bit slower.

Jeff F.: That's true. That's true this year about volatility too. It has come and gone. It's jumped up, the VIX above 20 and then right back down to 13. Interesting year. Overall, we have a decent gain along with the market. We have plenty of cash, which we'll talk about in a second. Plenty of opportunity looking ahead. Jeremy, let's start in on the questions. Thank you again, Fools. We have quite a few. Jeremy and I, our goal is to answer all the questions today. We have 52 minutes still to do it. I think we can do it. Go to slido.com, if you haven't yet. Slido.com. Enter "ProChatNovember", and you can ask your question.

Now, Jeremy, let's get started. The first question is from Len. We'll go in order of most thumbed up, so if you see a question you really want answered, thumb it up and that will move it to the top of the list. Len, thank you for being here, and thank you to new Pro members as they start to join this weekend. This past weekend. Len is asking, "Will we be exercising our John Deer protective calls or what will be the direction I'm currently holding them? Thanks."

About a week ago, we bought call options to cap the risk on half of our short of John Deer. We bought 92 50 calls. Those have come in handy as the stock has risen after earnings. They capped our loss. We can now use them to offset half of our short position, and we probably will close half of the short at least. J.P. wanted me to share that he is looking at Deer right now, and should have a decision what he wants to do, in the near term. Then the team will discuss that, and we'll have a decision. Jeremy had some early thoughts looking at the results as well.

Jeremy M.: It's very similar to last quarter. The results, the guidance doesn't look great, but management is able to continue to paint a rosy picture. That they see the bottom of the cycle is coming anytime now, and they've been talking about that for over two years. They're able to just keep kicking the can down the road and investors are willing to give them the benefit of the doubt. It seems, more than anything, we've seen this shift in sentiment where despite results that leave a lot to be desired, despite use inventory piling up and farmers continuing to struggle and there is a very long article in Bloomberg this weekend about the family farmer, and how hard this has been with the record crops and falling commodity prices.

Even in that environment, people are looking out a year, two years. I think Deer's probably benefited a little bit from the shift into industrials. It is a brand that's sort of Americana. That people are rooting for. I think investors are willing to pay a little bit more, even though results right now have not been very good.

Jeff F.: It's been interest. Of course, the short hasn't worked out either, except in that we kept Valmont because of it. They're equally sized positions and Valmont has gained, I believe as much as Deer has. Maybe a bit more.

Jeremy M.: Yeah, it's more less since the election results, has matched Deer. They've offset each other. Previous through the year, is outperformed Deer overall. It was a net positive.

Jeff F.: A net positive. That said, we know some members may not own Valmont. May of just on the short, despite saying it's a paired trade. Overall, we want each position. Our goal is for each position to do well. That's the ideal goal. We know the short hasn't worked out, clearly, so far. Half of it is probably on track to being closed. The other half we'll decide what to do with soon. I think one of the big lessons, again, is allocation. It's been a small position, so it has nicked the portfolio by about 0.5%, even now. Even rounding 35% up. The short is up 35%, or so.

Jeremy M.: It's important to remind members that think about the portfolio as a whole. Think about those allocations and weightings and how a lot of these things offset each other. That's how a portfolio is supposed to work over time. You don't want perfect correlations, you want things to move in different directions. Emotionally, selling and shorting are two of the most difficult things that investors have to do. Through that lens, you sort of see red on your shorts and react a little more strongly than you do on a long position that might be losing by the same amount. At least, specially when you consider the allocation.

Jeff F.: That's true. Shorting is extremely difficult. It isn't for everybody, but we enjoy it. We'll help you do it if you want to, as many members do. Overall, shorting should be a net benefit to the portfolio, because it also allows us to be ... to have more long exposure. Our net long exposure is where we want it. Our gross exposure is higher than it looks like, and we benefit as those stocks go up.

Every single one of our long positions, except one I believe right now ... DGS. Emerging markets ... is up. We own those in part, because we've had shorts and hedges to offset that risk. Overall, we benefit. Jeremy's exactly right. That's the thing to keep in mind.

Deer is high on our radar, and we'll have an update for you as soon as we're ready to. Next question is from Gman1946. He's a new Pro member.

He or she. Thank you for being here. They're asking, "I notice that you have about 25% of the portfolio in cash. How is that varied over time, and how is it determined? Were you ever fully invested?"

I have the spreadsheet right here, that I keep, so I can speak roughly to this. We have been gross invested ... meaning what you're talking about is long invested. On the long side, we've been in the 89 to 90% invested range from 2014 ... we were even in the 90%s in 2011, 2012. 94%, 97%. The answer is, we've been close to fully invested at many times, but on average we've been 87% long over our lifetime, on average. 15% short, and net longs 72% on average. If you add that all up, we're 102% gross invested, on average. Yeah, we're using our whole portfolio, and we're using some cash strategically. We typically have averaged 12 ... No, I'm sorry. 15% cash has been our average over our lifetime. Right now, we're a bit higher than that.

That cash is used to hold options positions. That's cash free of the shorts that we have to cover. As a tool to hedge the portfolio, hedge against risk, and buy things when we see opportunity. That's where we are on cash right now, but it will change. That's been the average. Jeremy, if you have any other thoughts to add.

Jeremy M.: I think it just sort of represents our opportunities set, and what we're seeing out there over the last year or so. We haven't felt like there is a lot of screaming deals out there, even when there's a pullback of sort of post-Brexit, that the thinking was the opportunities might even get better. You notice that we didn't have to rush to ... it would have been nice to make a couple more purchases than we did, but we can afford to be patient. Over time, I think that's going to pay dividends when there is a meaningful pullback if they last longer, that you can really take advantage of.

I think we've been fortunate to perform as well as we have versus the market, and as the markets climb continuously since the recession. When eventually there is a pullback, we're going to be in a much better spot.

Jeff F.: Well said. Thank you Gman for the question. We have the next question from a Pro member asking, "Stocks are at all-time highs. Is there a plan to write more call options against Pro positions? Covered calls as defensive income small hedge."

Jeremy M.: I would say yes. We were talking about this morning, and if you look back to some of the stocks we've covered over the years, we're still looking at those same companies and looking for opportunities where we can harvest a little bit of volatility. If the yields are appropriate.

Jeff F.: Excellent. MacGregUSA. MacGregUSA asks, "What are your thoughts on writing put options to offset short positions? In other words, covered puts? For example, John Deer." We considered that with Deer, in fact. The main trade off, the main downside is once you write a covered put ... so say you're short 200 shares of Deer at 100, and you sell $95 put to bring in some income. Of course, then you're capping your potential gain at 95 plus your premium, so say 93. If the stock really falls, you don't benefit. Yet you still have all the risk of the stock rising. On a risk reward basis, writing covered puts, although it can eat away at the loss that you have in a short, it skews your risk reward in a way that's not favorable. That's why we typically shy away from doing that, but we do consider it.

Who knows, we might consider it for the rest of our Deer position. We'll see. It's a tool that you should know about, that we sometimes use, but do keep in mind how it immediately changes your risk reward. You now have this short that you're paying for, and that has unlimited upside risk ... not that theoretically ... and yet you have very little to gain by capping the short, because you have capped the short potential for yourself if you write a put on it. Be careful doing that.

JeffThinkingMan. Hello, Jeff, good to see you. Thank you for being here. "Is your plan to renew put writing on expediters?" Not anytime soon. Not right now, anyway. Our position is coming up to expiration in January. A synthetic long has done quite well. We're deciding whether we want to take shares, or close the position. Then we'll go from there. If we take share, we might continue to strangle them with writing covered strangles, but that remains to be seen. For now, we'll wait and see. The stock is up quite a bit this year. It still looks reasonably priced, but we just want to make sure that we want that double exposure that comes from writing more puts when we already have puts on it written, of course.

WarrenBetty is asking or commenting. They have a discussion board gripe. "Newcomers in Motley fool options can, at times, jump the gun on alerts and not use limit orders." We're happy to always talk about that. To use limit orders when we issue a trade, Jeremy.

Jeremy M.: It's easy to get excited when you see the trade come out and you just want to make sure you get it done. Definitely pay attention to our price guidance, and try to set the limits and be patient, because depending on the liquidity that's available in the stock, you can make that price move very quickly to the point that it doesn't make sense to make the trade anymore. Not only are you going to end up in a trade yourself, that won't be as profitable as we would like, you also limit the potential of other Pro members to be able to follow and make a similar trade. The market makers in the options market are very good at taking advantage of market orders. They come in, or if you set your limits, at the wrong price. You're putting profit in the market makers pocket, instead of your own.

Jeff F.: Well said. Let's all keep using limit orders. Anonymous is asking, "Any thoughts on small cap marijuana stocks with new legalization votes, particularly in California?" We've had the benefit of seeing legalization in many states for a handful of years now, and in the past the Fool has looked at some small cap stocks in that area, but the one's that I've seen wouldn't qualify as a Pro company. They don't have the amount of recurring revenue. They can't say ... they don't have the financials that would support a purchase in Pro. They're also typically too small for our service and audience.

Jeremy M.: There's probably not enough liquidity. Management generally doesn't have a track record that we're that knowledgeable about. I actually think, over time, if this is going to be a wave that sort of starts sweeping across the nation, that you're going to see larger companies start to come in and take advantage and compete some of that away. I just don't know from a competitive advantage standpoint. They might be the first movers, but I don't know from scale and from ... I don't know how capital intensive it is. If there's a lot of other sort of industry related dynamics that we haven't really cleared up.

Jeff F.: As with almost any new industry, it'll get a lot of press, and we'll be drawn into reading some of that, and out of curiosity looking at the companies that maybe float to the top. Jeremy, do you know if any Fool service has recommended any related stock? I can't think of any.

Jeremy M.: Not that I can think of, no.

Jeff F.: I think most are just too small. Among other possible issues. JeffThinkingMan, again is asking, "He still holds Wells Fargo shares and the call options. In Motley Fool options we own, we recommended call options on it. Your thoughts on it's future? Would you still look to sell?" I can speak to that, definitely. We've sold Wells Fargo shares in Pro, for very specific reasons. We already have a lot of exposure to financials in Pro. We don't want exposure to any financial company where we don't trust management and where we can't predictably, reasonably see what future cash flows are going to be.

The jury is still out on how much Wells Fargo business may be harmed. Especially in relation to new accounts being opened. We are content to sell it for now, and see where things start to play out. The call options in Motley Fool options, I presume is a much smaller position. I've kept that in options and we might write calls against it, or we may just sell. We're close to even on those now. That said, just before we started live, Jeremy and I were talking about the move the stock had made and was that merited.

Jeremy M.: Sure. Yes. It was one of those stocks that benefited from less regulation. Financials in general, banks in general and higher interest rates. We've seen bond prices increase basis points or so in just a few weeks, which is a huge move. There's almost a round trip from what the bonds have done from the beginning of the year falling to a low or almost an all-time low and then back up to where they were. With that balance, it should help the profitability of a lot of our financials. Once again, looking at the portfolio, looking at our other holdings, you know do we want that capital? Do we want to take that risk on Wells Fargo, or would we like to redeploy it in some of the other companies where we feel a lot more confident about the long-term prospects of the business?

Jeff F.: WiseGuy1971 is asking about a watch list in Pro. Stocks or options that Pro is considering. What are our thoughts on that. I'll start by saying occasionally we do share companies we're looking at and considering. Typically we share that in a Monday memo or on the discussion board called stocks that interest you. For now, I think that's how we'll continue to share idea that ... some of the idea that we're considering rather than make it formal. I feel like the formal watch list could potentially confine us too much.

In the past anyway, we've seen people act on idea that are not official yet. With sometimes good, and sometimes not great outcomes. What then happens, is people then ask for follow up on those companies, even though they're not in the universe yet. It can get a little messy, and that's why I'm not, right now, in favor of a formal watch list.

Jeremy M.: A lot of those stocks can sit on our watch list for several quarters, a year. We might never get to them. Other times we'll just bind something that's not even on the watch list. You also don't want to have the argument, "Hey, you didn't put this on the watch list, and then you bought it." That it's not formalized in the process, gives us a lot more flexibility I think.

Jeff F.: I agree. We appreciate the feedback. We will share ideas when sometimes it just seems right to share an idea. It seems like it's safe to do so. We'll do that in the memo or on the stocks that interest you board. Also, please post any stock that interests you on that board, because that's how it could get on our watch list. Share you watch list, if you would, because we are always looking for new ideas. It's one of the things that we enjoy doing most. Thank you for the question.

Anonymous is asking, "I'm new to options, and wondering about good resources that examine income tax considerations. Such as long-term holding on non-dividend stocks." Think I understand that, but generally what are the tax considerations with options? I can summarize that any option you write or sell to open, is a short-term gain or loss. Any option that you buy to open and hold for more than one year, qualifies for long-term tax gain or loss.

We have a tax guide in the Motley Fool options options you site. Little 1500 words on the basics of top taxes and options. Which is, I think a great place to start. It really gives you a good overview. Then post any questions on the boards as well.

Jeremy M.: It's worth the time to read, right? Because, if you can end up boosting your returns through managing in the most efficient way possible, that's almost a guaranteed return. Versus taking risk and getting every idea right. You can bet almost 100% just by reading the guide and making sure you're not making any of those mistakes and being as efficient as possible.

Jeff F.: To start, go to Options You in Motley Fool options, and see our tax guide there as a start. David In Alexandria, and I wonder if that's Virginia here. Could be, but there are a lot of Alexandria's in the country. In the world. David is asking, "As a new member, I'm looking at your three shorts. ShakeShack, GoGo, and GoPro. GoPro is now under 10. Should the strike price to open the synthetic short be 10 now?" Generally, the answer to that is yes. With a synthetic long or short, you use strike prices that are as close to the current share price as possible. Assuming the option pricing is attractive to you. No matter which strike prices you use on a synthetic long or short, as long as you use the same strike prices. 12 and 12 or 10 and 10. No matter what, you're setting up the position that will mirror the stocks movement from that point on.

From it's current price on. The only difference is whether you start with a net credit or a net debit. That shouldn't really matter to you, but one thing to keep in mind, taking into account taxes, is if you write or set up a synthetic short for a big net credit, that's going to be a short-term gain no matter what. It might be better to set up a synthetic short right near the money that you get. You pay a little for, or get little back on. Then if you own the puts for more than a year, you'll get a long-term hopefully gain on those put options that you own. Yes, David, GoPro the strikes would now be moved to 10. In a week or two, we'll have a Pro positioning report for new members that will guide you on how to get into our shorts and our current options. If you want to wait for that you could, but if you want to go forward now, then you would use 10 on that synthetic short.

ShakeShack meanwhile, and GoGo can be shorted directly at the current prices. In fact, they're in today's catch up trades that you'll be getting momentarily in your email box. Thank you David, and welcome to Pro. We're glad you're here. Jeremy, do you want to ... I'll read it. Member asking, "So we sold Wells Fargo, and we do not have a bank stock. Do you think we should add some banks?"

Jeremy M.: I think we need to have a good argument of why we need to own a bank stock, specifically. We have other financials. If we were to buy a bank stock, I think it would be because we think that it's trading at a huge discount. That it has the ability to grow or that it has some sort of key advantage in the market. I don't think we specifically need to own a bank, where we T Ameritrade, we own Visa and Mastercard. We own a bunch of financial services companies, and make their profits from the bank. In a lot of ways, they have business models that are easier to understand.

One of the issues we've always had with banks, is a lot of times they're black boxes. It's hard to really understand what's going on inside the bank. What we saw with Wells Fargo, where it's so big and so many divisions, and management is diluted to a degree, it's harder for, I think, the CFO to affect change on the business, other than helping set the culture. Which is what happened with Wells Fargo, but with a very complicated business, it could be years, like we've seen, before you finally realize how serious their problem was. I think that there's other businesses where the business model is easier to understand, easier to analyze, and longer term probably have better growth prospects. First, what we'd like to look at.

Jeff F.: That's true and we, as Jeremy said, we do own several companies that benefit from higher interest rates or that will. We're looking at some others. I think Jeremy answered perfectly with his very first statement, which is we need a good compelling reason to own a bank. If we see that, we'll definitely buy a bank again. We could even buy Wells Fargo again. We want to be flexible and stay flexible even while we, as you know, work to keep turnover low. We're not an active trading service, we're investors. We know that's how you compound your money. We are flexible. We'll admit mistakes. We'll return to something that we may have gotten wrong in the past, if we feel that we now have a line on a good investment there, so yes.

Jeremy M.: It usually comes down to opportunity cost, right? It's either that business versus our next best option, which might be something we own already. Might be a new idea. Or, it's cash and the optionality of holding cash in the event that there's a market downturn. We try to think about it in the context of all those different options.

Jeff F.: Excellent, so the next question is ... and if you're just joining us, we're halfway through the chat, but it will be archived on the site, along with a transcript in a few days. If you're just joining us, and watching the video portion, you can go to slido.com. S-L-I-D-O.com, and enter Pro Chat November to ask your own questions, and we will work to answer them. It looks like Jeremy we're in pretty good shape. I need to refresh my page. [crosstalk 00:31:38]

Jeremy M.: The list is growing.

Jeff F.: Is it?

Jeremy M.: Yes.

Jeff F.: The list is growing.

Jeremy M.: Which is great. It's fantastic.

Jeff F.: That is great. Look at all these questions. I was going on an old list. See, as an admin, it doesn't update automatically for some reason, so you have to refresh it. Here we are now. People were wondering, "What's going on? Where's the top question?" Bruce is in the lead right now. Nine thumbs up. "As a member who joined in November 2015, are there any trades that would help with Gilead's 30% decline? I'm wondering about stock repair."

I've looked at stock repair on Gilead, but the main concern we have with that is the stock is so cheap. A stock repair does max out your returns when the stock rebounds. When you set it up typically, it just gets you back to break even, but doesn't allow for gains beyond that. With shares trading at below 7 times earnings, management talking about how they're in the market for acquisitions that could make a difference. The HIV franchise doing very well. Their leadership in Hepatitis C holding strong. That market even looks like stabilizing at a very healthy rate for Gilead's cash flow.

I don't want to cover the stock or cap it. It's one of those top tier companies that it's unfortunate that some of us, including myself, have a loss on the shares, but with time I think that will be corrected. We'll be very careful. We have written covered calls on it a few times. We'll carefully do that again if we see an opportunity, but overall I want to be careful about capping that stock.

Jeremy M.: If you have a larger decline, it could be an opportunity for tax loss harvesting. Going into the end of the year with the idea that you can very easily buy it back 30 days out from now.

Jeff F.: I agree with that. With anything where you have a loss, now is the time to start to look at it. See if you want to sell it to offset a gain that you have, and then get back in. A fool is asking, "On writing put options, if we missed the price guidance, how do we determine what a next reasonable price is to jump in?" In Pro, we haven't had that issue much. You're probably speaking to Motley Fool options, and there we have every Friday strategies you can start. It used to be called Trades you can make. Every Friday, strategies you can start that give you updated pricing, especially on our most recent recommendations.

You'll see there how to get on board with a recent recommendation. Also, as Jeremy said earlier, read the alert itself carefully, because we frequently have flexible guidance in there. We say aim for 1% a month yield, so you can do that math yourself to expiration and see if you can write the put option at that time. We do try, and we're trying ever harder, to give very specific guidance that is flexible as well as time goes on. Hopefully that will help in the trade alert, but also follow strategies you can start in Motley Fool options every Friday, and pro catch up trades every Monday to see updated guidance on options.

JeffThinkingMan is asking, "Are we looking for another spy hedge?" The short answer is, yes. Our December 1 is well out of the money. We closed a spy direct short soon after the election results, because the market was surprising us with an upside move. We're looking at new ways to hedge since then, that will not be as affected as the market keeps rising. Yes, watch your inbox for that.

Bruce is asking, "Current thoughts on Papa Johns? I sold some shares earlier when Pro shorted the stock. It's an IRA. Would selling puts make sense right now?" Jeremy, I don't know if you have thoughts on that. I can ...

Jeremy M.: I don't follow Papa John's specifically that closely, but I just want to point out that we shorted Dominoes as a hedge, so that we wouldn't have to sell all of our Papa John's, or the half that we wanted to cover and have the tax implication, and have to pay taxes on the gain. Definitely think about those two together, and that the exposure that we have to Papa John's is only, I believe, half the shares were actually long. If you offset it with a dominoes hedge.

Jeff F.: Then on writing puts, I would wait for now. The stock is risen a lot lately, which we're happy about, but it's a volatile stock. Still a smaller cap company, and in a downturn, you should get a better chance to try at put options and we'll try to alert you to that as well with the catch up trades. I mean, Papa John's last year fell some 40%. This year I think it's nearly doubled. It's been volatile, but a giant winner over the long-term. I think the trends favor that [crosstalk 00:36:47] ultimately.

Jeremy M.: I don't like putting words in Billy's mouth, but based on the price target and some of our conversations, it sounds like he thinks that the stock's significantly overvalued and that we could have an opportunity to even buy back at a much more attractive price in the future.

Jeff F.: MikeB is asking about Wells Fargo again. We did speak to that, so we can maybe just share a few quick words. "For those who haven't sold yet, should we wait and see before selling?" It's a good question. Jeremy spoke to it earlier. I can add that it depends on your personal comfort level with Wells Fargo. Did you own it before you came to Pro? A lot of people have or did. Do you have as much financial exposure as we do, because it's still our largest sector industry by far. That's part of the reason we're comfortable letting Wells Fargo go. It has jumped a lot since the election, so this may be an opportunity to sell it. That said, the animal spirits in the market could continue for a long time if rates indeed start to head higher soon.

Maybe a good compromise is to sell part of it, and let the rest go. It's really, I would say, what you're comfortable with. It's hard for us to say, because we've made our decision, and you, for some reason, didn't. I don't want to force you to do something that you haven't yet, because you might have very good reasons for keeping it.

Jeremy M.: It's a stroke of good luck. Sometimes it's worth just saying, "hey this was a good win." Sometimes, luck goes the other way. You can take your gains. The other question is, whether or not you want continued coverage of the stock or whether you feel comfortable just owning it and covering it on your own, or keeping track of it on your own.

Jeff F.: Yep. We're out, and we'll still watch it and see how customer accounts grow or not in coming quarters. That could tell us a lot about how long it may take them to recover. We do, as we said earlier, have several companies that benefit from higher rates. We're looking at some other ones too. Higher interest rates. A fool member is asking, "I'm heavily invested in Bank of America. It's almost 95% of my portfolio. Aside from selling, how can I protect myself from the recent run up?" Jeremy, they must be an employee of Bank of America, perhaps.

Jeremy M.: I would assume so if ... that's a huge amount of the portfolio, and I think most financial planner would say that's way more risk concentrated in one industry and one company, than what's probably reasonable. That depends on your age. It depends on your overall assets. There's a huge amount of variables that go into that as well.

Jeff F.: Hopefully, none of us want to relive 2008 2009, but you never know. That typical bank stock fell 80 90% at that point. You have to ... most advisors would say we have to diversify beyond this, at least by a meaningful amount. If you just want to protect yourself, it will be expensive, but you could buy put options on the portion of the shares you want to protect. You would buy one put for every 100 shares you want to buy. In your case, if you plan to keep the stock a long time, you might as well buy the very long-term put option. 2019, now. That time value will hold up better than other options. In a year or two, you can whittle that position down, or get rid of it if your situation has changed. If you have less Bank of America at that time. Right now, you could pay a pretty penny in insurance and buy long-term put options to protect as many shares as you want, in Bank of America.

Jeremy M.: Sometimes I find that people don't want to sell a stock that's appreciated, because they don't want to assume any taxes. You really should not let the tax tail wag the dog in this investment decision. You know at this point that if the risk is a possible much larger decline, and loss of capital may be the smart decision to just pay a portion. Sell a part of it. It doesn't have to be an all or none type of deal. I'm also just curious of the reason of not wanting to sell at all. There's always complicating factors.

Jeff F.: All right, Jeremy, so we have about 20 minutes left and maybe 20 questions so far. I have to refresh, maybe there are more. We'll go into kind of a speed round, and try to answer each question. Yeah, many more questions. Okay, so Leon is asking, "Visa has come off it's highs recently. Any thoughts on writing the March 1777 50 puts to potentially get in line with Pro?" I would say right off the bat, you can get in line by buying 2.4% stake. We own 2.4% in stock directly. Shares are around 78 last time I looked.

Jeremy M.: 79.50 right now.

Jeff F.: We are about to talk about possibly buying a bit more. We'll see, who knows, but we like the company as much as ever, and results were healthy last quarter as Jeremy wrote about a few weeks ago in the memo. We recommend just buying 2.4%. If you would really rather target a lower price, you can write those put options definitely, but just realize you may not get shares. You may just get income. Good question.

Dave is asking about a Pro renewal request. "Is three years the best deal? Does everyone receive the same type of offer, or what is the best offer?" I don't know. We are not involved in the marketing of Pro. There should be a wall, and there pretty much is. The best that we can have a wall. I never know the prices they're asking, or the deals that they're offering. I do know that every price I've seen in the past, the longer term is by far the better deal. To the extent, that you can get the longest term you can because it makes your part of your costs, obviously much lower.

I did see on the boards this morning, that some people talking about the three year deal, and saying it was a good deal. For any Pro member who wants that, they can call in to customer service and get that. Those are the few things I do know. Can you comment on Medtronic? I wrote about Medtronic on Friday. Or was it Wednesday, on the discussion boards? Then it's in today's memo too. A link to that. The stock is remaining a buy. The shared price decline looks overdone. The affects that nicked Medtronics revenue a little bit, and their bottom line was still above expectations, because they're doing a great job on costs.

Their revenue was a bit light on things that are largely out of their control. For instance, their new insulin product pump was approved much sooner than they thought. Which is great news, but they won't have it to market until April or so, and now companies are waiting for that new, much better product instead of buying the existing pump. Things like that have hit revenue a little bit, but I think in the long-term it will be fine. The stock remains a buy. It's at 2.8% allocation, and it's a buy still.

We have a question about Amtrust. MackGregUSA owns some Amtrust, but not the whole Pro allocation, which is a little over 5%. Is this a good time to move some funds from Wells Fargo, which I haven't yet sold into Amtrust. Jeremy, do you have thoughts on that?

Jeremy M.: I would say you could move into Amtrust. You could move into any other positions fractionally, if you're trying to build out your portfolio, I would go with the buy first stocks first, and feel bad I don't know if Amtrust is a buy or a buy first.

Jeff F.: It is a buy right now.

Jeremy M.: It's a buy. I know that it's pulled back significantly over the past year. I would say sure. That could be a good opportunity right now, but I would also suggest you look across portfolio and see if there's any other chances to sort of add to a couple positions, rather than just move all your chips from one spot to another concentrated spot.

Jeff F.: Yeah, I agree with that. In the same vein, you don't have to put all 5.7% into Amtrust. Maybe you build Amtrust to 4%, and add a bit more Factset instead. We only have 2% in Factset. Maybe make it 2 1/2%. As Jeremy just said, kind of balance it out across other financial positions. I do in general like that Amtrust hasn't gone anywhere for more than a year. It's kind of just ... it's evaluation gets more and more attractive, because the business is still growing. Yeah, that gradual move can make a lot of sense.

"If Gilead is so cheap, why isn't it a buy first?" Rgregory is asking. The short answer is, buy first isn't just about valuation, it's about risk reward and potential for the stock as we see it in the next couple years. Gilead, the way we view it, could easily go no where in the next few years. I don't feel a great urgency to buy it. Thus, it's not buy first. That said, we think the downside is very modest. We hope so at this price and with this quality business. Yeah, it was a buy first not so long ago. Months ago. Now it's just a buy.

Also, since we are a whole portfolio service, our hope is that you own every company sooner or later, because the whole portfolio is meant to work together. The buy firsts are just a way to get you started into the ones that we think offer a good risk reward balance [crosstalk 00:46:49].

Jeremy M.: Buy still means we think it's a buy at this point in time. The buy firsters, like Jeff said, there can be a lot of reasons why we think that it's fractionally better. One is fractionally better than the other. Looking as Mastercard versus Visa, it's just business momentum right now. Visa's going through a transition. Mastercard is continuing to grow and will probably be able to take advantage of that while they're distracted with consolidating Visa Europe and a new CEO coming in. In the next few quarters, the next year or two, then we just feel like that's probably a better place to put your money first.

Jeff F.: All right, lets see. A Motley Fool options member is asking, "I am taking a beating with the Budweiser January call spread. Are you planning on getting out before expiration?" Definitely not. That's a Motley Fool options position, headed up by Jim Muler. He knows the company very well, including the new merged giant company. We set up, I believe, it's a 2018 spread diagonal call that we will also roll to 2019, 2020. It's something that we're in for the long-term.

Keep in mind that a call option is very responsive to a stock moving. The stock is down some 20%, which is a fair amount for a large cap. The option then will be down twice that. 50% say. It looks painful, but when the stock recovers, we'll earn that back, and we do believe it will recover. Meanwhile, we're earning pretty decent income by writing diagonal calls on that company. To wave the white flag on a company like Anheuser, when we're down, just wouldn't make sense to us. This stock remains a value. The business remains healthy. We're going to keep that position going. Again, that's a Motley Fools options and not in Pro. If you have questions, head over to Options and to the BUD board over there.

All right. Let me refresh my page, Jeremy, and see what we've got. Winston is asking, "Jeff, how long have you been with Pro, and how long do you plan on continuing to manage Pro?" If I could see into the future. I started full time at the Motley Fool in 1996, and from 2004 until now I've been managing a Pro-like portfolio. Pro itself from 2008 until now. For eight years in Pro, and I really look forward to us getting to the 10 year mark and having 10 year returns and the relationships that we built over the years continuing to get richer.

Jeremy M.: Jeff's still a young guy.

Jeff F.: Thanks, Jeremy.

Jeremy M.: He's got another 10, 15, 20 in front of him. I don't want to commit you to anything.

Jeff F.: I mean, sure. Yeah, I don't have plans to leave. I think as long as I enjoy it, and we enjoy working together on it, that we'll be here. As long as it's ... as long as we're succeeding, we'll hopefully be here a long time. Thank you for the question, in all seriousness. It's an important question because your basing our investments on the team, and you're making a long-term commitment when you buy a stock, so you want to know that the team will still be here. That I can definitely say, as we have a strong team and the team, as a whole, will be here no matter what. I also hope to be here, but we're all on the same page regarding the portfolio and how we invest. You have a good team here to rely on, and like any good company, we hope to set that up indefinitely so things can just continue on.

[inaudible 00:50:34] asking, "How does Motley Fool Pro relate to million dollar portfolio? Are they redundant? Am I doing a disservice to myself by monitoring both?" Jeremy, do you have thoughts?

Jeremy M.: I'd say the two services are not redundant. They have an entirely different mandate. The [inaudible 00:50:52] portfolio is only pulling investment stock ideas from other Motley Fool services. They do not employ options or shorting. I don't know what their cash balance is, at this point, but their investments are almost entirely long. Where at Pro, our strategy is entirely different. Our returns should also look very different over time, just because of our intention to not be as correlated with the market and using an options income and other things, to lower our volatility. Plus our mandate of thinking in absolute return perspective, versus a relative return perspective. Changes our behavior and how we think about investment.

Jeff F.: All right, next question is, "Does Pro look at options on things like FAZ, which we're short, or SVXY, which we're long? These are both ETFs." When they reach opposite ends of their trading range. I'll say FAZ hasn't really had a trading range. It's down some 85% for us, which is great as a short. We look at adding to it, and we're overdue to maybe add to it. Although, it's difficult to borrow. SVXY, we're now up 15 some percent in ... has it been a year or a year and a half? I don't know. It's getting close to our North star goals, which I think over the long run, it will exceed. We will look to add to it potentially, when it falls a lot. When the market gets very volatile. On SBXY, we may indeed trade around it a little bit on the downside, but FAZ is just a long-term short that we may want to add to next time it jumps, or at any point. Good questions, but they're both ... the key thing is they're both long-term minded positions.

InternationalWaters is asking, "I have a Polaris position from my time in Motley Fool 1. Are they staying the course or have they given up in disgust?" No, Motley Fool 1 own Polaris, believes in it, and is invested for the long haul. Especially with an equipment maker. Snow mobiles, ATVs, motorcycles, they need to be long-term minded, because it can be a cyclical business like automobiles. They still believe in it, because they really believe in management. They still-

Jeremy M.: Yeah, it's a well run company. I would probably argue it's best to breed with in that industry. It's a tough market right now for them.

Jeff F.: They're still believing in it. "What are your current thoughts on the Deer short?" We did talk about that, and will have an update soon as well. An official update on our thoughts. We're still going through the results. We're probably going to let half our short close via our calls. Okay, we have just five minutes left, Jeremy. I think we can do it.

Jeremy M.: Probably need to update, if you haven't.

Jeff F.: Do I need to update?

Jeremy M.: You might be.

Jeff F.: Oh no. All right, yeah I am behind. Man this is going fast. Okay, if the Fed finally raises rates in December, should I sell my bonds now or is the price already factored in and should I keep them?" That's a great one for you, Jeremy.

Jeremy M.: Immediately following the election, interest rates have increased dramatically pretty quickly. It seems like the market is already priced in that that increase is going to come, and probably subsequent increases are much more likely now. To make that sort of decision, I would think the Fed probably has the all-clear to make this next raise, and then going forward is what's going to determine how bonds respond from there. I think most market prognosticators that I've read ... that that for what you will ... believe they were probably in for measured increases over the next several months going into 2017.

Jeff F.: Casey is asking about four companies. Bud, Casey, Costco, DPLO. They're unhappy with them, are we staying long? None of those are on Pro. The only one I know, and follow, is Bud, which we talked about a moment ago. We own the calls. Diagonal call, we're definitely keeping that going. Follow Motley Fool options for updates on that. That's a long-term position we should be fine on. The other I don't know, Jeremy. I don't know where they come from.

Jeremy M.: It looks like some stock advisor, and maybe a hidden gems of some of the others.

Jeff F.: Please, enter the ticker on the Fool webpage itself. Enter the ticker and it should show you which service it comes from. Then you can go to that service, and get their update on that company on the discussion board or in the service content itself. "Skyworks was called away", a fool is saying, "Please advise what I should do." What we issued ... our recommendations to buy the shares back, and then write the January $75 call options to collect all that premium. You can do that right now, last I saw.

Few more here that we can get through. Jeremy, why don't you look ahead and see any that you want to answer and you can jump in. Meanwhile, when you're ready just say so. GoPro synthetic short. The orders still good. What to do at the NetDebit? Yeah, you won't get the same NetDebit anymore, because the shares are down quite a bit, but I'll have to look at the $10 synthetic short on GoPro and see what that costs. I'll update that on the basket of shorts board. I'll go there.

Jeremy M.: Question from Len, "You mentioned the rise in bonds recently. Does Pro or any Motley Fool service look at bonds or fixed income as part of a total portfolio?" I would say, that I don't believe there's any service other than [Roy 00:56:44] Retirement, that directly advises on bonds or bond holdings. They do have a asset allocation model portfolio that they include bonds, and write about it fairly frequently. We do look at what the bond market is doing, that a lot of times rapid increases are decreases could sort of predict some sort of volatility in the market. I would say, overall we don't spend a lot of our time thinking about bonds or interest rates. We're at a secular, almost all-time low. Odds are, they will probably increase going forward, but I don't know how much, how fast and exactly how the market is going to be reacting.

Jeff F.: Sounds good. Let's get to a few more we can answer in the last couple minutes. Let's see, I just saw one that's timely. Jim is asking expediters, which goes ex dividend tomorrow. Today, we may have our short $50 calls exercise on us. That would be fine. I posted on the board this morning. If that's the case, we'll be short expediter shares, but we own deep in the money calls, that offset that. We'll probably use that opportunity. All the time values gone from the calls at that point, because they were exercised. We may just close the position at that point. It remains to be seen if we get exercised. With the spread so wide on the option, we just have to wait and see if anyone gets exercised. If you do, just post it on the board, so we know on the expediter's board. We'll see where we are tomorrow, and issue an update to everyone if we need to.

Jeremy M.: There's a question on AMT. "What effect do you expect rising interest rates to have on AMT? Hire debt expense and possibly writing down of asset values?" That is true. With interests increase, discount rates increase. The cost of debt increases. At the same time, you have to ask why interest rates are increasing. If it's because economy activity is also increasing, then they're able to grow faster. The fundamentals of the business might be able to outrun any sort of that weight from increased debt cost. The thing that you're seeing in REITs in general right now, they just got broken out of financials at the end of August or the beginning of September. With the market having a lot of sector based ETFs, it's a lot easier for investors to trade in anticipation of what's going to happen with interest rates.

If interest rates go up, their decision rules say sell [REITs 00:59:12]. Sell high dividend stocks. You could have the entire sector moving in more correlated way, where the reality of the fundamentals of the business can be completely different. You're more likely to get some price dislocations, and that's what we're really looking at and why I think Billy likes AMT a lot right now; because the long-term secular trend of wireless has not changed.

Jeff F.: That's for sure. One, two more quick questions. Maybe three, but it is 3:00 so we have to wrap up. How to position now? The answer to that is we like the portfolio as it is now. We're about 72% net long. 22% cash. New member get our portfolio building reports to your inbox, which show you how to go step by step. Take your time. I read about that in today's memo too. Get to a exposure level that you like. We only have 23 companies that we own long, and we like all of them except for one, it's on hold right now. Move into those gradually with those portfolio building reports.

Basket of shorts. Is it still recommended? Yes, all three that we did a few weeks ago are still recommended. There was one more I thought we could get to, but that may be it, because we need to wrap it up we're told. Thank you everyone for being here, in the November Pro chat. Please post any question you still have, on the Pro getting started and help board, or whichever board is linked to from this chat page once the archive is up. We'll be there to answer the questions there. Jeremy, thank you for joining today.

Jeremy M.: Thanks for having me. Welcome to new members, and we look forward to seeing you on the discussion boards.

Parexel Moves to Hold

Published Nov 15, 2016 at 12:33PM

Pro's Take: PRXL Fiscal Q1-2017 Earnings

Parexel International (NASDAQ: PRXL)

What Happened?

- Q1-2017 press release
- Q1-2017 10-Q
- Q1-2017 presentation

....

Q1-2017

Sales growth: -3% Y-o-Y

Backlog growth: +6.8% Y-o-Y

Gross profit margin: +104 bps Y-o-Y to 34%

Operating profit margin: +380 bps Y-o-Y to 10.7% (+65 bps Y-o-Y when excluding one-time restructuring costs)

GAAP EPS growth: +58% Y-o-Y (-4.3% Y-o-Y when excluding one-time restructuring costs)

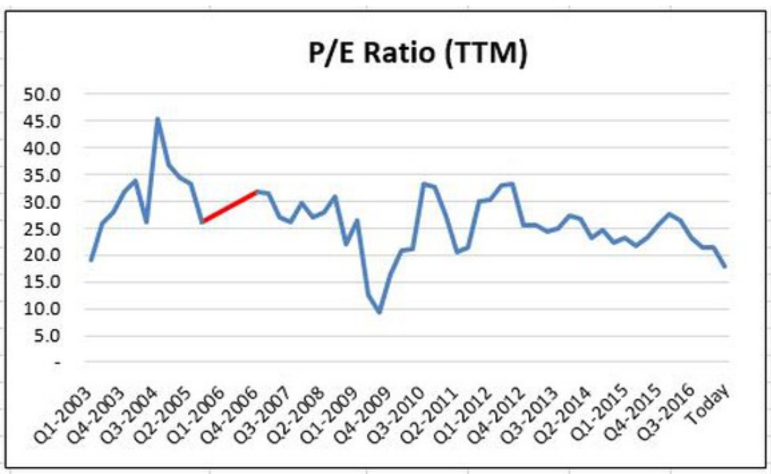
non-GAAP EPS growth: +1.4% Y-o-Y

....

Guidance Update

Parexel **moves to Hold** as we wait to see if management can improve the trajectory of the business and correct its recent slew of mistakes. The company has had two straight quarters of non-timely SEC filings, the first due to a misappropriation of corporate funds by a former employee and the second due to a mistake in revenue recognition in its largest business segment. This is in addition to the surprise resignation of CFO Ingo Bank in July (Bank is now the CFO at OSRAM in Germany). Management has often underperformed expectations during the life of Parexel's position in *Pro*, and our patience is wearing thin.

We may decide to close our position if the stock drifts upward in the near-term, depending on price. The business's financial metrics have generally tracked well against our thesis since the position's inception, but recent missteps and underwhelming financial performance relative to the rest of the industry have shaken our faith in the management team and suggest that Parexel is possibly losing share to competitors. The stock is now as inexpensive it has been since we initiated our position in late 2013, but the lower multiples may be justified by managerial mistakes and a potentially weakened competitive position:



Note: Red line represents outlier multiples that have been removed from the data series.

Updated guidance: Hold (changed from Buy)

Recommended Allocation: 2.8%

Fair Value estimate: $59 (down from $65)

Current Price: $57.13

We are reducing our fair value estimate from $65 to $59, reflecting an adjustment of the weighted probabilities of my bear/base/bull valuation cases, slightly offset by recent growth since the last valuation update. Our new $59 fair value estimate implies a TTM P/E ratio of 18.7x (GAAP) and 17.1x (non-GAAP) and a TTM EV/EBITDA ratio of 9.8x. It also implies a forward P/E ratio of 15.8x (GAAP) and 15.2x (non-GAAP) based on expected Fiscal 2017 earnings. If the company's recent performance is a short term concern (as management has suggested), these multiples are reasonable, if not relatively cheap.

However, if Parexel continues to lose share to competitors moving forward, the stock may have further room to fall. Members lacking a position should refrain from purchasing shares today, and those with current positions should wait until *Pro* changes its stance from Hold. If you are more risk-averse and prefer to sell your shares instead of waiting to see if the recent concerns are short-term in nature, that would be a reasonable choice, but *Pro* is content to either wait for a better selling price or for the potential of improved financial performance.

Our Thesis

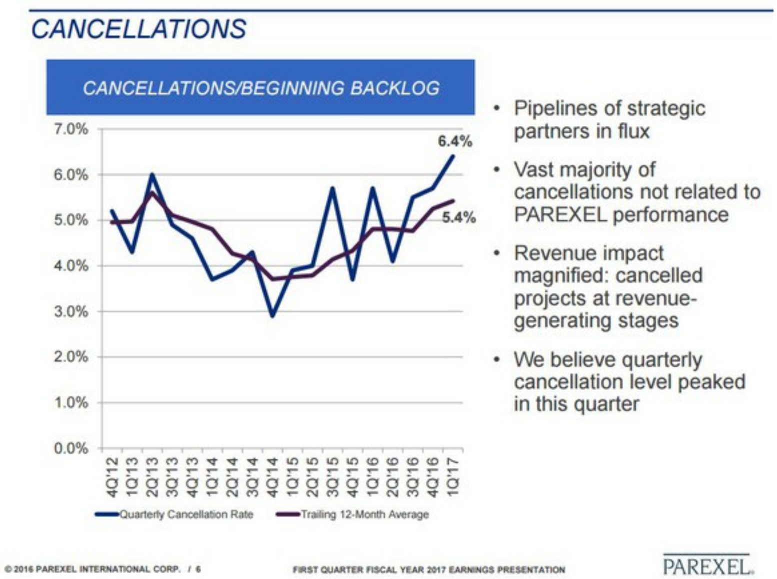
Because of its reputation, global reach, and technology prowess, Parexel International will win its fair share of the growing pharmaceutical development market. In addition, we expect the proportion of R&D dollars outsourced to contract research organizations to grow as large biopharma companies adopt the strategic partnership model and smaller biotechs become responsible for more drug discovery. Finally, as new business wins mature, the true earnings power and margin potential of the company's business will shine through.

The Most Important Things

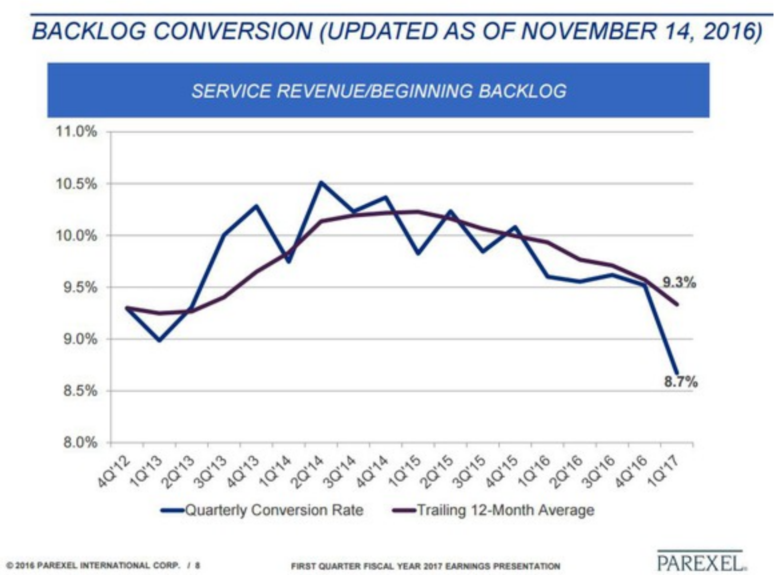
1) ***Penetration and Backlog*:** Penetration refers to the proportion of biopharma R&D dollars that go to CROs versus being used in-house for development and increased penetration provides evidence that the biopharma/CRO partnership model is proving out. We can compare the growth of the biopharma industry R&D spend to the growth in Parexel's backlog to determine whether the CRO industry is experiencing continued outsourcing penetration. We also monitor backlog trends to ensure Parexel is sufficiently adding future business – backlog that converts to sales usually represents ~80% of the sales in any given quarter, so strong backlog growth suggests strong future sales growth.

According to recently released industry data, biopharma R&D spend was up by 4.7% from 2014 to 2015, and it is expected to grow at a 2-3% CAGR from 2015 to 2022. For comparison, Parexel's year-over-year backlog growth in Fiscal Q1-2017 was 6.8%, so we can see that Parexel's backlog is growing at a rate higher than that of biopharma R&D spending. This indicates that the CRO industry -- and Parexel in particular -- is continuing to experience increased penetration of biopharma R&D spending.

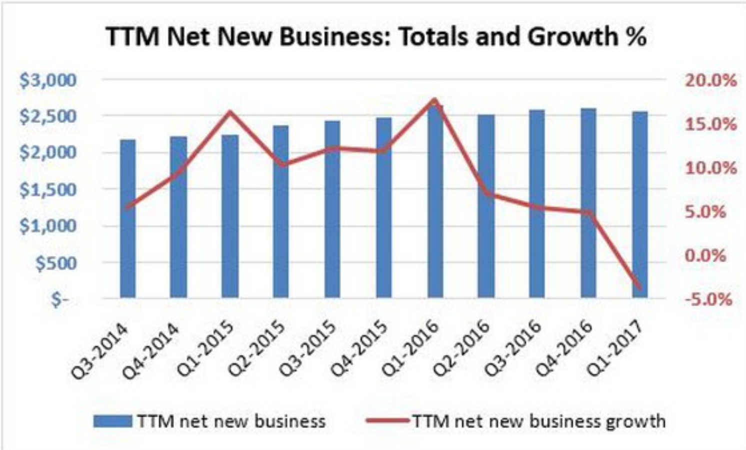
Despite the increased market penetration, recently, Parexel's net new business wins have been slowing, due to both higher cancellation rates...



...and lower conversion rates (pressure on both sides of the backlog equation):



Management continues to emphasize that the increased cancellations are not related to Parexel's performance, but the fact that the increased cancellations and lower conversion are not equivalent across the rest of the CRO industry suggests that there may be more to it than management suggests.



For example, as Parexel's latest Y-o-Y growth figure for TTM net new business is -3.8%, competitors Quintiles (NYSE: Q) and Icon (NASDAQ: ICLR) reported 10% and 2.1% growth in that same figure, respectively, over the same time span. These metrics potentially suggest that the changing dynamics of the biopharma R&D industry may be creating opportunities for some CROs at the expense of others.

However, given the significance of customer concentration in the CRO industry and the fickleness of clinical trials (which can be cancelled on a whim), it's also possible that Parexel is simply experiencing normal lumpiness. In Parexel's quarterly presentation, management stated that they "believe (the) quarterly cancellation level peaked in this quarter", so they're definitely placing a stake in the ground as far as their expectations for future performance. But given the continued managerial missteps, I'm not inclined to give them the benefit of the doubt.

We'll be carefully watching Parexel's backlog conversion and cancellation rates to determine whether or not we think Parexel's competitive position is weakening. Management has long stated that revenue conversion should reach a steady-state sometime in Fiscal 2017, so this year is an important one as far as the trajectory of financial metrics. We want to make sure that Parexel continues to win healthy amounts of new business and continues to grow its backlog at rates in excess of bipharma R&D spending. If the company can do that, the stock price returns from here should challenge our North Star.

2) ***Margin Performance***: Companywide gross margin was down sequentially and increased +104 bps year-over-year. The company's largest segment (representing 76% of total revenue), Parexel Clinical Research Services (CRS) increased gross margins to 30.3% from 29.9% a year ago, but the margin has declined since Q2 last year as revenue growth has slowed.

As for the other two business segments, Parexel Consulting (PC) gross margins declined to 44.7% (from 48.6% a year ago), most likely due to the company's acquisition of Health Advances (which was folded into this segment). I'd expect PC margins to improve over the next few quarters as the company improves upon the cost structure of the newly acquired business. The PC segment represents 11% of companywide revenue.

For the final business segment, Parexel Informatics (PI), gross margins increased to 46.2% (up from 43.3% a year ago). The PI segment represents 13% of companywide revenue.

Management continues to expect significant margin expansion over the rest of the fiscal year, although that expectation depends on satisfactory revenue growth, which at this point is a question mark.

3) ***PI Business Trends:***

Technology is a core competence for Parexel. The company's PI segment is the lifeblood of innovation for transforming the traditional clinical trials process into a more efficient, more effective, technology-driven one. We want to see this business perform well to ensure it remains a competitive differentiator for Parexel and helps it win business in its CRS and PC segments. Now reaching scale, we also expect PI to exhibit operating leverage and become a more meaningful portion of profits.

Revenue growth in this segment was solid at +4.5% year-over-year, coming in at $65 million in revenue for the quarter. The last three quarters have been OK for the PI segment, but I've ratcheted down my expectations slightly for this segment as performance has come in under my prior expectations. My valuation expects PI to grow revenue by 8% annually and achieve 53% gross margins by 2021 (I've lowered these expectations from 10% annual growth and 55% margins by 2020).

What We Think Now

Helping pharmaceutical companies get drug candidates to market, Parexel is poised to benefit as those companies gradually outsource more of this process to select CRO partners who can perform the work better, faster, and cheaper. We also expect margin expansion as recent investments and restructuring pay off and continued growth of the Parexel Informatics technology segment.

Pro Can Help

Missing the Forest for the Trees

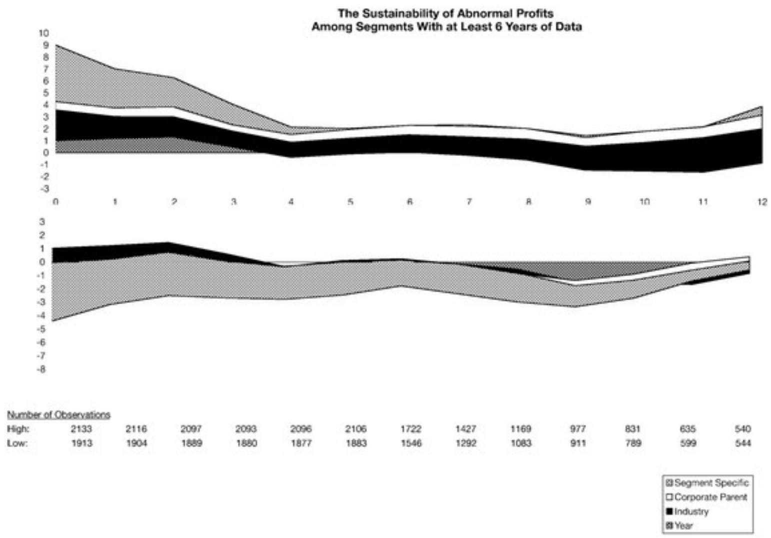
Published Nov 14, 2016 at 2:50PM

Fellow Fools,

What makes a company great? As long-term investors focused on finding great businesses for years to come, we know this question is at the core of what we do at *Pro*. So, if you would, take a moment to consider some of the traits you look for when considering whether to invest in a company. When you look over your list, do you see any common themes?

I've asked this question of myself and others many times over the years, and I've found that people tend to focus primarily on company-specific factors: a great management team, strong revenue and free-cash-flow growth, high returns on equity, and a strong balance sheet. These are important considerations, but they can distract investors from one key factor that plays a huge role in just how great a company can be: the industry within which it operates.

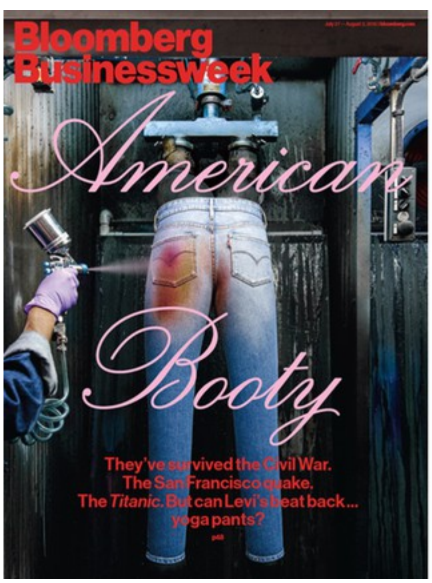
In a 2003 study, A. M. McGahan and M. E. Porter took a look at the data available from publicly traded corporations from 1981 through 1994, attempting to determine what differentiated the high performers from the low. Unsurprisingly, company-specific factors were the primary driver behind the emergence of high performers. But when it came to *sustaining* that outperformance, it was actually industry effects that had the largest influence. This can be seen by looking at the top graph of the subsequent chart. (The larger the bar, the higher the impact a factor had on performance in a given year.)

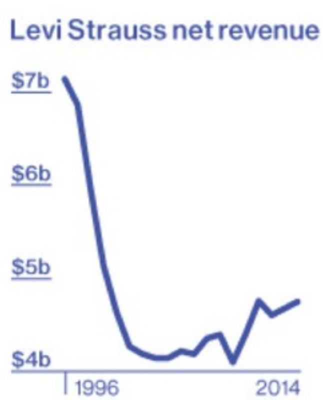


Source: McGahan & Porter (2003), The Emergence and Sustainability of Abnormal Profits

As bottom-up investors focused on finding individual companies, we tend to spend a great deal of time reading and analyzing company-specific information -- annual reports, proxy statements, earnings releases. However, as this study shows, investors who rely too heavily on company-related data in reaching an investment decision are at risk of missing the forest for the trees.

A little more than two decades ago, Levi Strauss & Co. was larger than Nike, adidas, The Gap, you name it. Its financials were very impressive, and although growth was somewhat lumpy, few doubted that the denim empire would continue to expand. After all, the company had been around since the 1850s, and jeans were never going to go out of style, right? Unfortunately for Levi's, the phrase "past performance is not necessarily indicative of future results" is just as applicable to businesses as it is to hedge funds, mutual funds, and ETFs. Sales peaked in the mid-1990s for Levi's, and to this day, the company that's synonymous with denim for many Americans remains a shadow of its former self.

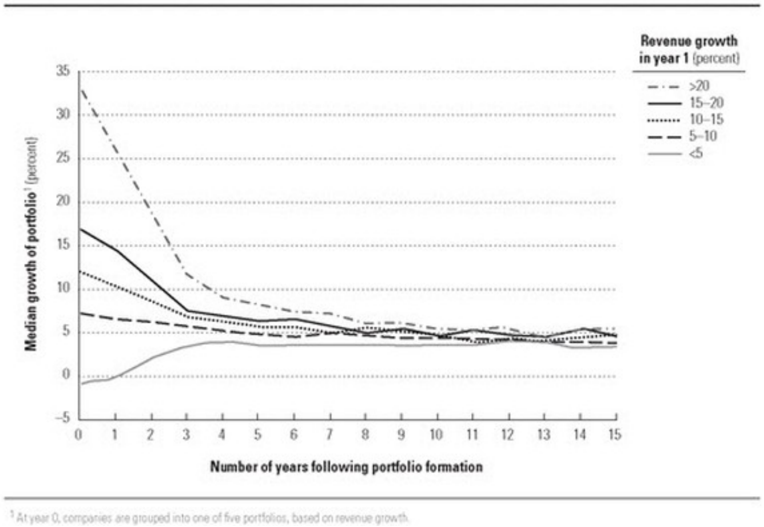




Source: Bloomberg, *Distressed Denim: Levi's Tries to Adapt to the Yoga Pants Era*

Although an evolving industry landscape wasn't the only reason for Levi's precipitous decline, it played a huge role. Most management teams don't want to acknowledge it, but things outside of a company's control (a large customer going belly-up, changing consumer tastes, the emergence of new competitors rejecting industry norms) play a large role in deciding just how great a company can be. You could put the best management team in the world in charge of an automobile manufacturer and it still wouldn't come close to being as profitable as **Verisk Analytics** (NASDAQ: VRSK) because of the differences between the two industries.

So what do we like to look for here in *Pro* when analyzing an industry? Essentially, we're looking for the one-two punch of attractive growth prospects *and* strong returns on invested capital (ROIC), because either one in isolation can actually lead a company to become a value trap. A secular growth industry or a large total addressable market makes for a great story, but growth actually *destroys* shareholder value if the company is investing in projects that generate returns below its cost of capital. Additionally, sustaining above-average growth for an extended period of time is actually extremely difficult, as can be seen in this chart from McKinsey & Company. The companies below were grouped based on how quickly they were growing, and even the portfolio of highfliers saw their growth rates revert to the mean after just a few years.



Source: Ensemble Capital, McKinsey & Company

Similarly, things may look great on the surface if a company is currently generating a high ROIC, but if management is running out of high-ROIC projects to invest in, then future results are likely to look very different. It can be tempting to pat yourself on the back for a job well done and just buy shares if a company appears to be checking off all the right boxes during your initial analysis. But in doing so, you run the risk of turning a blind eye to the full context. (And if you don't believe me, just ask Levi's management team.)

The purpose of today's Memo isn't to scare you away from investing in a company that operates within a subpar industry. Industry is not destiny, and companies can carve out a profitable niche in otherwise unattractive areas. However, absent a clear understanding of where this profit is coming from and whether it's likely to persist, investors are better off looking elsewhere.

One of the wonderful things about investing is that you don't have to take a stance on every stock. You can look for situations where the odds are stacked in your favor because of the confluence of both company- *and* industry-specific factors, which is exactly what we strive to do here in *Pro*. A company that exists within the most attractive industry in the world can make for a horrible investment if the business is run by a bunch of fools with a lower-case f, and the opposite is also true. Or, as Warren Buffett has often quipped: "When a management with a reputation for brilliance tackles a business with a reputation for bad economics, it is the reputation of the business that remains intact."

Enjoy your week, Fools!

Pro Catch-Up Trades and Upcoming Expirations: Nov. 14, 2016

Published Nov 14, 2016 at 2:40PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Facebook** (NASDAQ: FB): Buy up to 6.5%, in thirds over time given new uncertainty in the marketplace.

Continue building your portfolio with our Buys.

- That said, we're not highlighting any in particular this week. Instead, we're going through earnings and trying to assess how the incoming presidential administration may change some industry landscapes.

Shorts:

- **Shake Shack** (NYSE: SHAK): If you have not shorted 0.5% yet, you can do so now. (Note that we have not added more to our short yet.)

Pro options:

- None this week.

Hedges:

- We'll have more on hedges later this week.

Options expiring next (Nov. 18, 2016):

- **Expeditors International** (NASDAQ: EXPD): We'll address our November $48 put/$50 call synthetic covered strangle this week -- watch for a trade alert in your inbox.
- **SPDR S&P 500** (NYSEMKT: SPY): Our November $200/$210 put ratio spread is on track to expire unused (resulting in some income). We're not likely to do anything. Meanwhile, our November synthetic short will be either closed this week or allowed to turn into a direct short of SPY. That decision is in the making. Watch your inbox for an update.

Pro Guidance Changes and Completed Trades: Nov. 14, 2016

Published Nov 14, 2016 at 2:37PM

Pro Guidance Changes (from the past two weeks)

- **American Tower** (NYSE: AMT): Shares move from Buy to Buy First, and fair value increases to $125 from $120.
- **Deere & Co.** (NYSE: DE): Moves to Hold as we consider the situation with this short.
- **Facebook** (NASDAQ: FB): Fair value estimate increases to $124. The stock remains a Buy First.
- **MasterCard** (NYSE: MA): Fair value estimate increases to $90. The stock remains a Buy First.
- **Parexel** (NASDAQ: PRXL): Shares move to Hold as we consider recent news. We'll have an update, of course.

Pro Completed Trades (from the past two weeks)

- **American Tower** (NYSE: AMT): We bought to open a 0.5% stake (five contracts for us) via January 2019 $80 calls. We have not written the short calls yet to make it a diagonal, since pricing fell far away on us.
- **Gogo** (NASDAQ: GOGO): We sold short a 0.5% stake (1,300 shares) at $9.69 (click here for this and the next two shorts).
- **GoPro** (NASDAQ: GPRO): We set up 10 contracts, a 0.45% look-through value, of a January 2019 $12 synthetic short for a $1.08 net cost.
- **Shake Shack** (NYSE: SHAK): We sold short a 0.5% stake (400 shares) at $32.47.
- **SPDR S&P 500** (NYSEMKT: SPY): We set up a 10% synthetic short using options.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Set Up a Diagonal Call on American Tower

Published Nov 9, 2016 at 2:38PM

Is this for you? This recommendation is for all *Pro* members who have matched our 3.8% stock allocation to **American Tower** (NYSE: AMT) and would like to establish an additional diagonal call position to target leveraged upside and income. If you don't own stock in this Buy First position already, we think you should match *Pro*'s 3.8% allocation first, then consider establishing this diagonal call position.

How You Participate

- **Trades:** Use a "diagonal call" or "calendar call" or "spread" order on American Tower to simultaneously:
  - Buy to open January 2019 $80 calls (click "view all strikes" if you don't see them) and ...
  - Sell to open an equal number of April 2017 $115 calls.
- **Allocation:** Invest approximately 0.6% of your *Pro* funds in the net purchase of these diagonal calls (the aggregate cost of both buying the long calls and selling the short calls). At recent prices, this most closely equates to setting up one diagonal call position for about every $500,000 you manage; for *Pro,* that's about five contracts. This is a small position by design, so be careful not to over-allocate. We already own 3.8% in the stock. *Pro* members with smaller portfolios should see the Alternative Trades section below.
- **Price Guidance:** These options are very illiquid, so **it is extremely critical that you use a limit order,** aiming to split the bid/ask spreads. At current prices, ideally you'd pay about a $29.90 net debit on the aggregate diagonal call purchase (again, the cost of both buying the long calls and selling the short calls). Since the bid/ask spread is very wide, that price guidance may not be applicable once *Pro*'s collective volume enters the trade. **So please, make sure you use limit orders, aiming to split the bid/ask spreads, and don't rush to make this trade!**
- **Prices** (as of 2:20 p.m. 11/9/16):
  - **Stock price:** $109
  - **Buy to open January 2019 $80 calls (bid/ask split):** $33.25
  - **Sell to open April 2017 $115 calls (bid/ask split):** $3.35
  - **Net debit:** $29.90 ($33.25-$3.35)
- **Alternative Guidance:** If the volume of trading among *Pro* members results in a significant impact on the options in this alert, or if the stock price changes considerably from the prices in this alert, consider looking at various other strikes for your long and short calls. Also consider looking at various other expirations for your short call, depending on what you like best. If you choose this route, be aware that *Pro*'s course of action may diverge from yours, depending on what strikes and expirations you choose, and depending on the stock-price movements of American Tower.

What We're Thinking

In July, *Pro* closed our diagonal call position on American Tower after the stock had run up well above our $111 short call strike price. At the time, the stock was trading at about $117 per share, very close to our then-current $120 fair-value estimate on the stock. We were content to close our position with a nice 49.5% total return over the life of the entire position (which began in December 2014 with a simple call purchase).

Since then, American Tower has reported good third-quarter 2016 results, *Pro* has raised its fair-value estimate to $125 per share, and American Tower is down about 6% today on unexplained volatility, almost certainly related to macroeconomic (rather than company-specific) factors.

After analyzing the company's most recent results, we feel as confident as ever that American Tower's portfolio of nearly 150,000 sites worldwide (compared with just more than 100,000 sites to begin this year) positions the company to benefit from secular trends in mobile data demand on five continents, and acquisitions and incremental leasing activity should continue to drive revenue, cash flow, and ROIC higher over the long term.

Thanks to that conviction, and to the current volatility that once again provides us with a significant discrepancy between the stock's current price and our estimate of fair value, we think now is a particularly opportunistic time to reestablish our diagonal call position in the hopes of earning current income and leveraged upside.

We aim to keep our position small with a 0.6% allocation, knowing that American Tower may see some further volatility because it tends to trade alongside the volatile, interest rate-sensitive REIT sector. If the stock price continues to fall because of volatility, we may have an opportunity to add to our stake at lower prices. If not, we still benefit from leveraged upside.

This diagonal call purchase will increase our total look-through exposure (both owned shares and calls) to 5.8%, making American Tower in effect our second-largest position. Between this company's demonstrated operational execution, its excellent management, its strong industry tailwinds, and its attractive economics, we think today's diagonal call will prove a smart decision.

More That Matters

- **Maximum loss:** Our entire 0.6% investment if American Tower stock is less than $80 at January 2019 expiration, less premiums received from sold calls.
- **Maximum gain:** On this trade, we have upside to $115 for our owned call, but we plan to keep the strategy going, rolling our short calls if need be.
- **Follow-up**: By expiration, we'll look to write new calls or roll our $115 calls to a later month and different strike price if the stock is above $115. If there aren't attractive rolling opportunities, we will consider closing the entire position.

Alternative Trades

Members for whom one contract would over-allocate their portfolios can consider a few choices:

- Buy 0.6% more in stock, bringing your stake to 4.4%. Realize you won't benefit from the leverage calls provide, although you will have a better breakeven price and no expiration.
- Consider allocating 0.6% to a 2019 bull call spread at small strike increments. The in-the-money $90/$95, $95/$100, and $100/$105 spreads all offer attractive annualized returns if the stock price is above the higher strike price at expiration. Out-of-the-money spreads offer higher returns but an increased chance of total capital loss. The bid/ask spreads are very wide on these bull call spreads, so be very careful with limit orders and keep in mind that spreads with higher strike prices should offer a higher return. Don't be fooled by wide bid/ask spreads, and be demanding with your limit orders. (Our sister service, *Motley Fool Options*, offers what we think is an excellent overview of bull call spreads here.)

What a Trump Presidency Means for the Market

Published Nov 9, 2016 at 6:47AM

A special message to all Motley Fool members from Andy Cross, Chief Investment Officer of The Motley Fool

Dear Fools,

In one of the greatest upsets in U.S. politics, Donald Trump has won the 2016 presidential election.

What's that mean for investors? Well, ahead of the opening bell, U.S. market futures are down about 2% — but we don't pretend to know where stocks will go from there.

We all have questions about what a Trump presidency might bring and which laws Congress might pass in the coming years.

And we'll bet that many of you are also wondering what this election means for your stocks — not just tomorrow or next month, but for the next four years. Although we have no predictions that the market will snap back with the same velocity we saw after the U.K.'s surprising Brexit vote, we believe in American capitalism regardless of who goes to work in the Oval Office or the Capitol.

What We're Doing (The Same Thing We've Always Done)

Today and the days ahead, we'll probably see movements in stock prices. Don't let your emotions get the better of you. Don't overreact. Markets will always swing during times of uncertainty, but remember: You're a true investor in businesses that create value for customers, employees, partners, and shareholders, and you're looking out years, not days or months.

Here at Fool HQ, your advisor teams will be studying and analyzing our Foolish companies to understand how a Trump presidency might affect their long-term prospects. To say there are a lot of moving parts is an understatement. But we're analysts, and we'll be doing what any good analyst does: take in new information and revise opinions accordingly. If our opinions change on any of our companies, you'll be the first to know.

Our love of investing in stocks is as steady as ever, and your own faith in the market shouldn't waver now, Fool.

Finally, remember that today is just one day in the market. We Fools will keep investing for the future, with optimism, as we always have, in the way we always have. We're honored that you're doing the same.

Fool on,
Andy Cross
Chief Investment Officer

Verisk Stays the Course

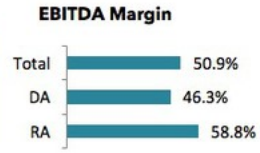
Published Nov 8, 2016 at 4:39PM

As usual at **Verisk Analytics** (NASDAQ: VRSK), the most recent quarter was likely another good baseline for what we'll see in the near term, until capital expenditures in the oil and gas industry start to rebound. Verisk's risk assessment division continues to deliver organic growth in the mid-single digits, although previously announced staff realignments put downward pressure on the EBITDA margin.

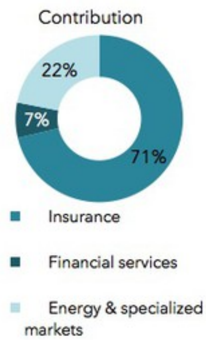
VRSK Q3 2016

Consolidated Results

		change
Total Revenue	$498 million	20.6%
EBITDA	$233 million	22.5%
GAAP EPS	$0.74	13.8%



Segment Results ($ in millions)	Revenue	change
Decision Analytics		
Insurance	$174	7%
Financial services	$34	25%
Energy & specialized markets	$109	0%
Total	$317	6%
Risk Assessment		
Industry-standard insurnace programs	$138	5%
Property-specific rating & underwriting	$43	5%
Total	$181	5%



Source: Company filings

Position Guidance

- **Updated Guidance:** Buy (unchanged)
- **Position Size:** 2.2%
- **Fair Value Estimate:** $80 (unchanged)

Pro's Take

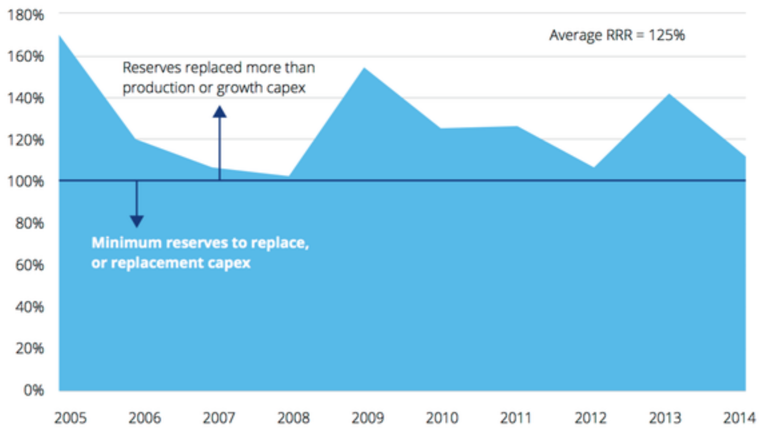
Earlier this year, management suggested that growth was likely to accelerate in Verisk's insurance offerings toward the end of 2016. But although this quarter's results were respectable, the acceleration hasn't materialized yet. Management stated on the call that they still expect it, noting that its absence this quarter was driven primarily by the soft reinsurance market and the fact that some of the company's newer customers are taking longer than initially planned to integrate its solutions into their workflow. Given that these events are largely outside of the company's control, I'm willing to give management a pass this quarter, but if this excuse becomes a common theme as we move forward, we'll need to readdress the situation.

All this might suggest that I'm disappointed by Verisk's insurance unit, but that isn't actually the case. Verisk's product pipeline for 2017 and beyond looks strong, and management continues to find new opportunities to cross-sell as it creates new solutions from existing ones. A great example of this is the recently launched unit providing insurance services to insurers in the commodity sector.

Verisk's energy business continues to be a focus for most investors, especially because it's the division that's currently struggling. I probably sound like a broken record, but it's worth repeating once again that given the current environment, slightly positive organic growth (ignoring the impact of foreign currency) is quite respectable. Customer retention continues to be strong, and additional tuck-in acquisitions have increased Verisk's customer base from 1,000 to 3,000 and created more cross-selling opportunities.

Management also noted the possibility of expanding WoodMac's consulting team next year. That's a really good sign if you think spending on discretionary consulting is a leading indicator of the health of the underlying market, as some sell-side analysts have suggested. I don't know when oil and gas capital expenditures will start accelerating again, but I do know the current run rate is not sustainable. The oil and gas industry needs to replenish drawdowns from current demand and meet demand growth of 1% to 2%, all while dealing with the productivity decline each well experiences over time. According to Deloitte, replacement capex (to maintain current reserves) accounted for about 80% of total spending compared with 20% for growth capex over the prior 10 years. As the authors of the report said, "It takes a lot for the industry to just stay flat." And as the charts below illustrate, current operations are well below the required breakeven.

Figure 1. Oil and gas reserve replacement rate (major oil and gas companies)

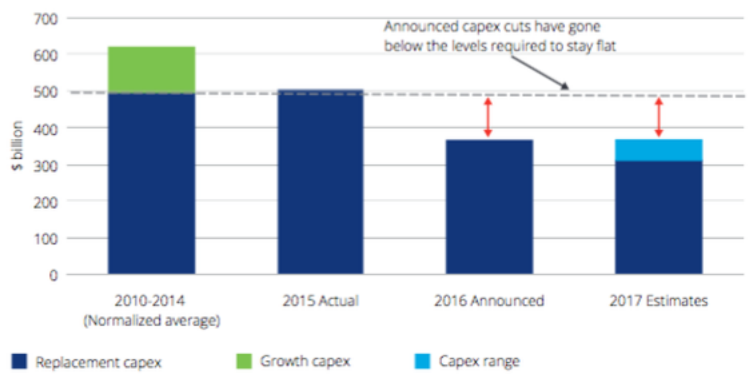


Note: Major oil and gas companies consist of top 50 resource-seeking oil and gas companies listed worldwide, which constitute 27 percent of global oil and gas production.

Sources: Deloitte Market Insights, Capital IQ, Bloomberg, SEC filings

Save PDF to Evernote

Figure 2. Global upstream spending (ex-MENA, $ billion)



Notes:
- Normalized annual capex during 2010-2014 is adjusted for upstream capital cost inflation until 2014.
- Analysts (as of early March 2016) expect a fall of 10 percent to no growth in the industry's 2017 capital spending.

Sources: Deloitte Market Insights, Barclays, J.P. Morgan

Source: Deloitte

Deloitte estimates that at a minimum, the industry will require investments of about $3 trillion from 2016 to 2020 to maintain its long-term health; on an annualized basis, that's 40% higher than 2016's expected level. Whether we'll get there remains to be seen, especially given that Deloitte's estimate greatly outstrips the expected operating cash flow over the same time period, but any growth in CapEx is a definite positive for Verisk.

We first purchased shares of Verisk back in July of last year. At the time, we thought the stock was likely to outpace our North Star target, but we were most excited about its prospects once the company's countercyclical investments in the energy sector started to bear fruit. The resiliency of the energy business during this low point in the cycle continues to increase our confidence that we made the correct decision, and we'll likely add to our position at some point before our expected result comes to pass.

Apple's Core Continues to Expand

Published Nov 8, 2016 at 4:28PM

Late last month, **Apple** (NASDAQ: AAPL) reported results that were essentially in line with expectations, with revenue falling 9% for the quarter even though demand for the latest iPhone outstripped supply. Given that these results did nothing to derail our investment thesis for Apple, we're staying put with our position, even though the stock is down close to 7% since the late-October report.

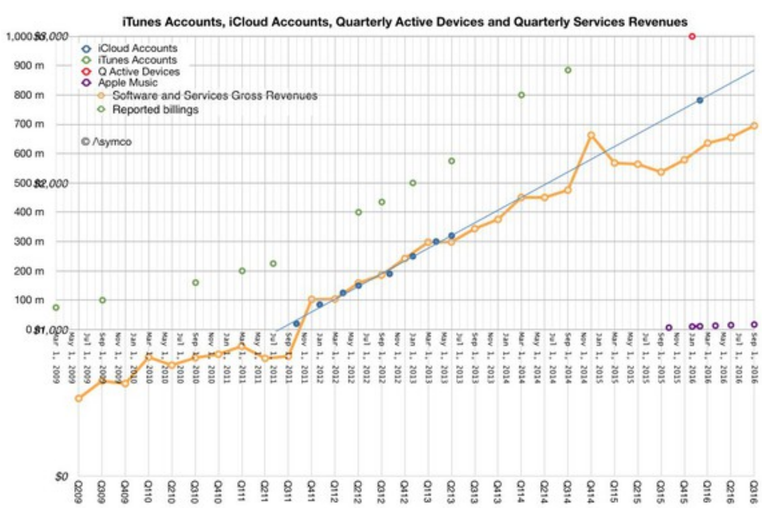
Source: Company filings

Position Guidance

- **Updated Guidance:** Buy (unchanged)
- **Position Size:** 3.8%
- **Fair-Value Estimate:** $122 (unchanged)

Pro's Take

Apple's customer base continues to expand, further increasing the value of its services business, which management expects to generate as much revenue as an entire Fortune 100 company next year. The services division continues to be one of the company's bright spots, with revenue growth up 6% for the quarter and 24% for the year. And while watching iPhone revenue fall 13% this fiscal year might have led some to think Apple's end is nigh, the fact is that Apple is still selling more devices than the number that go out of service, which means it's increasing its user base -- and the number of customers who could end up buying its services. Importantly, Apple is continuing to capture new customers *and* entice its existing customers to sign on for new services, as evidenced by the steadily growing number of accounts.

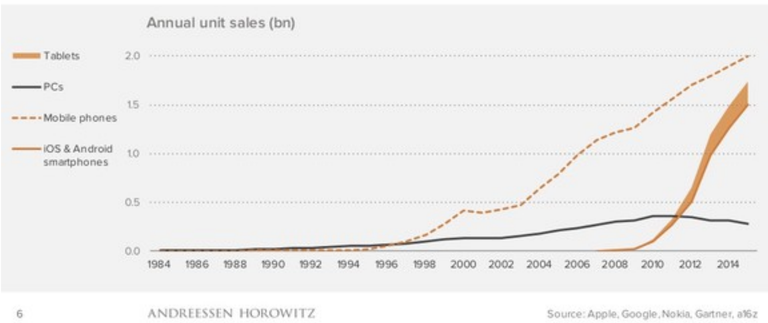


Source: Horace Dediu, Asymco

The importance of this should not be understated. Without these new customers, the only way Apple could expand its services business would be by selling more stuff to its existing customer base and/or raising prices. There are industries that do rely on this approach to a large extent (the mobile game industry, for example); the danger, of course, is that you might eventually alienate your core customers by charging them too much.

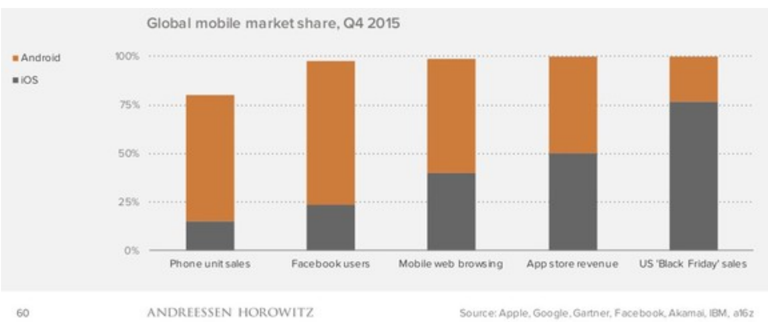
But as long as Apple continues to bring more users into its ecosystem, its business model and our investment thesis both still have legs, despite any yearly fluctuation in iPhone sales. The more users Apple has, the more attractive it is for developers to make apps, services, and content available to Apple users. This in turn attracts more users and encourages them to spend more money within Apple's ecosystem, which in turn attracts more developers and encourages *them* to develop products for Apple's ecosystem, and so on. This self-reinforcing loop is currently working in Apple's favor, but it's important to note that it could also work in reverse should customers start turning elsewhere.

Pricing the company at roughly 11 times free cash flow, the market really isn't expecting much from Apple in the future. From my estimate, embedded in today's price is the expectation that free cash flow will increase at a 2% to 3% rate over the next five years before tapering to 0% for year 10 and beyond. (You can actually model in negative terminal growth if you assume free cash flow will grow in the mid-single digits over the next five years.) We think Apple can do better than this and deliver North Star-beating returns, but for those returns to materialize, the company will likely have to continually demonstrate its staying power. Until then, the market will be tempted to conclude that Apple is just another fallen hardware giant. We believe that thinking is shortsighted, especially because mobile has displaced the PC as the new core ecosystem after a multi-decade reign.



Source: Benedict Evans, a16z

Some might believe that mobile is a winner-take-all market, but I believe both Android and iOS can coexist, given the different value propositions they offer for both developers and consumers. Android smartphone sales may dwarf iPhone sales, but as Apple CEO Time Cook noted on the earnings call, Apple's App Store generated 100% more global revenue than Google Play once again this quarter. And it's not just App Store revenue where iOS captures more than its fair share:



Source: Benedict Evans, a16z

It's not the most exciting company at the moment, but we're more than content to stay the course with Apple, given our belief that its value proposition offers a great risk/reward tradeoff today.

Pro Guidance Changes and Completed Trades: Nov. 7, 2016

Published Nov 7, 2016 at 3:21PM

Pro Guidance Changes (from the past two weeks)

- **American Tower** (NYSE: AMT): Shares move from Buy to Buy First, and fair value increases to $125 (from $120).
- **Wells Fargo** (NYSE: WFC): Shares moved to Sell last week, on Oct. 31.

Pro Completed Trades (from the past two weeks)

- **Gogo** (NASDAQ: GOGO): We sold short a 0.5% stake (1,300 shares) at $9.69 (click here for this and the next two shorts).
- **GoPro** (NASDAQ: GPRO): We set up 10 contracts, a 0.45% look-through value, with a January 2019 $12 synthetic short for a $1.08 net cost.
- **Shake Shack** (NYSE: SHAK): We sold short a 0.5% stake (400 shares) at $32.47.
- **Wells Fargo:** We sold all our shares at $45., ending with a positive but North-Star losing return.

You can see all of our guidance, positions, and transactions from the Recommendations page.

MasterCard and Visa Notch Another Solid Quarter

Published Nov 7, 2016 at 3:21PM

Fellow Fools,

On this Election Day Eve, I'll spare you another prognostication about what a win by candidate A or B might mean for the stock market. As the world waits on pins and needles to learn who will become leader of the free world tomorrow, we at *Pro* are still knee-deep in earnings reports from our favorite *Pro* portfolio holdings, so we'll stay focused. We can rest a little easier because *Pro* is prepared for market volatility thanks to our hedges on the S&P 500 and our growing basket of shorts. We also focus on businesses with resilient business models and durable competitive advantages, like **MasterCard** (NYSE: MA) and **Visa** (NYSE: V) -- companies that aren't likely to be rocked by any single event. Just know that when the dust clears on Wednesday, regardless of who wins, life, the economy, and the stock market will carry on, and *Saturday Night Live* will revert to being less funny.

As I did last quarter, I've chosen to review MasterCard and Visa together; doing so gives a good snapshot of both the global economy and trends in the payment industry. These two positions now account for a combined 7.3% of the *Pro* portfolio, up from 6.8% last quarter thanks to their strong performance over the past three months. Though the world remains volatile, MasterCard's and Visa's strong quarterly results provide further confirmation that the global economy is still humming along.

According to management at both companies, U.S. business remains on a path of slow but steady growth, a recovery is taking hold in the non-U.K. parts of Europe, growth in India is healthy, Brazil looks to be bottoming out, and business confidence is strong in Australia. On the negative side, exports and imports from China are both down sharply, and in the U.K., the long-term implications of the Brexit vote are unknown but the cheap pound sterling is attracting tourists to London. Both companies are seeing increases in cross-border transaction fees thanks to lower currency volatility (with the exception of the U.K.), and both are benefiting from the modest recovery in oil prices. Also, both companies are seeing rebate and incentive costs growing faster than revenue growth as the result of competition for a number of large, multi-year deals. We'll continue to watch this closely, because irrational bidding leading to a price war is the last thing we want to see.

Now, on to the individual results.

MasterCard

4.8% portfolio allocation

MasterCard reported a fantastic quarter in which net revenue increased 14% and diluted EPS was up 19%. Total operating expenses rose by just 12%, impressive considering the amount the company is investing in new technology. Management is focused on expanding its portfolio of services, employing the company's huge, proprietary database to create value for customers through data analytics, loyalty programs, and enhanced security. Revenue from these offerings was up 23% during the quarter. That said, as noted above, growth in rebate and incentive costs outpaced growth in revenue once more, increasing 21% for the quarter. I expect this trend to continue as the payment companies compete fiercely to win new long-term contracts and retain their largest customers.

Management put particular emphasis on the worldwide success of MasterPass, which enables a wide range of digital transactions through mobile payment apps, including Apple Pay and (soon) Android Pay, Microsoft Wallet, and Samsung Pay. Also, the MasterCard Send platform is being adopted by companies like Uber and Lyft to allow instant payment to drivers, and by insurance companies like Allstate to send claims payments directly to customers by debit card for instant access.

MasterCard's ability to spend heavily on research and development is an important competitive barrier to entry, and it should help build stickier relationships over time as the company's products become more ingrained in customers' day-to-day business. CEO Ajay Banga confirmed this strategy during the call, suggesting that analyst should not expect the company to experience significant margin expansion. Instead, they will continue to invest heavily in technology and new product development to maintain MasterCard's competitive edge and create a more diversified revenue stream than just payment processing.

In other news, MasterCard is moving forward with the acquisition of ACH payment company VocaLink as it waits for an antitrust review from U.K. regulators. And while progress in China has been slower than expected, MasterCard continues to sign deals with card-issuing Chinese banks as the government irons out the regulations.

MasterCard remains a Buy First at a 4.8% allocation. After topping expectations for a second straight quarter, it's clear the company has business momentum on its side. MasterCard is signing new clients at a rapid pace, and it remains on the forefront of technology innovation in the payment industry with its new service offerings.

Visa

2.5% portfolio allocation

Visa continues to perform well, just a bit less well than its peer MasterCard. That's understandable given the company's focus on integrating its massive Visa Europe acquisition, which is expected to take years. Management also recently announced a leadership change, with current CEO Charles Sharf to step down in December to be replaced by Alfred Kelly, a 23-year veteran at American Express and four-year member of the Visa board. Thanks to Kelly's extensive experience in the consumer credit market and his intimate knowledge of Visa's inner workings, I expect this transition to be relatively seamless. This news does highlight the challenge of running a global business that's increasingly focused on expanding in Europe and China.

In the U.S., payment volume was up 19% on increasing contributions from Visa's still relatively new partnership with Costco and a similar deal with USAA. Internationally (excluding Europe), the increase was 9%. Currently 19% of revenue, client incentive costs are expected to increase to about 21% in fiscal 2017 as the effects of Europe, Costco, and USAA are seen over the next few quarters. Also, interest expense is set to rise 40% as a result of the $16 billion in debt the company issued last December, as well as an additional $2 billion management plans to issue before the end of the year. Operating expenses were up 27% during the quarter, partly because of Europe and partly thanks to $110 million of severance costs as redundant positions were eliminated. However, again excluding Europe, management did an excellent job of controlling costs in fiscal 2016, with operating expenses only up 1% for the year. This is impressive considering management's continued heavy investments in developing its new service offerings, not to mention the fact that Visa was a major sponsor of the Rio Olympics.

Overall, management thinks the Europe integration is going extremely well, though it will take a few years to completely combine the relevant technology platforms. When an analyst asked whether that process could be accelerated, management noted that they need to maintain a measured pace so their merchant and bank customers can keep up with the changes. Management also expects European processing volume to become gradually more profitable over time, bringing yield more in line with what MasterCard is able to achieve in the region.

Like MasterCard, Visa is investing heavily in its mobile payment application (Visa Checkout). Management also announced that it is opening the Visa platform to card issuing banks and partners, like Google's Android Pay, to allow for better integration and faster authentication and checkout. They're also investing in expanding Visa's portfolio of service offerings, including recent advertising products that allow merchants to better measure the efficacy of their ads and optimize their spending. Visa Direct, which enables push payments from mobile phones, is seeing rapid adoption and should be popular in less developed markets, enabling customers and merchants can use their phones to make a transaction without any additional hardware. To accelerate the development of additional services, Visa has opened five innovation centers in San Francisco, New York, Miami, London, and Singapore, intended to improve collaboration with its customers and improve the time it takes to get a solution to market.

Looking forward to fiscal 2017, management expects net revenue growth between 16% and 18% and EPS growth in the mid-teens. Excluding Europe, expense growth is expected to return to the mid-single digits. Though management is still finalizing its spending requirements in Europe, we know they will be spending heavily to roll out Visa Checkout across the continent and begin the process of merging technologies; the tech investment alone for the merger is expected to cost between $450 million and $500 million over the next three years.

Visa remains a Buy at a 2.5% allocation. The company will have its hands full with Visa Europe over the next few years. In the short term, the business should benefit from a number of improving macro trends likely give growth a boost in the coming year. Even so, of the two businesses, MasterCard currently looks to have the most momentum and could possibly benefit from Visa's divided attention.

The Foolish Bottom Line

If you invest in global capital markets, you'll need to navigate through uncertainty caused by geopolitical events -- it's just part of the package. One group of people will end tomorrow upset, and they may well declare the U.S. doomed and exhort that the world as we know it is coming to an end. That's to be expected following one of the most divisive elections in modern history, but it won't take long for markets to digest the news and look forward to the next potential crisis. (Here's looking at you, upcoming Italian referendum and December Federal Reserve meeting.)

Looking at the big picture, 85% of the global population is still using cash for purchases, which means there's plenty of room for both MasterCard and Visa to grow alongside each other. We're happy to have our portfolio concentrated in high-quality businesses like these, companies that will benefit from a huge secular trend for years to come. For that reason, we remain confident in our current allocation to the payment industry and suggest that members try to match us if they haven't already.

Pro Catch-Up Trades and Upcoming Expirations: Nov. 7, 2016

Published Nov 7, 2016 at 3:20PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Facebook** (NASDAQ: FB): Buy up to 6.5%, perhaps in halves or thirds over time.
- **FactSet Research Systems** (NYSE: FDS): Buy 2%.
- **Gentex** (NASDAQ: GNTX): Buy up to 2.8%.

Continue building your portfolio with our Buys:

- **Oracle** (NYSE: ORCL): Buy up to 3.5%.
- **O'Reilly Automotive** (NASDAQ: ORLY): Buy up to 5.1%.

Shorts:

- **Direxion Daily Financial Bear 3X Shares ETF** (NYSEMKT: FAZ): Sell short 0.2% if your broker has shares. If they don't, then set up a January 2019 synthetic short, selling to open January 2019 $30 calls and buying to open an equal number of January 2019 $30 puts. With FAZ at about $31, see if a limit order for a $1.50 net debit gets taken.
- **Gogo** (NASDAQ: GOGO): If your broker has shares, sell short 0.5% per this alert. Earnings were out last week.
- **GoPro** (NASDAQ: GPRO): It's still expensive to short, post earnings. The January 2019 $12 synthetic short (sell to open $12 calls, buy to open $12 puts) will cost an estimated $3 debit to set up, for a $9 start price on a $10.70 stock. Still, the company is suffering and we're staying short right now.

Pro options:

- **Gentex** (NASDAQ: GNTX): Sell to open Dec. 16, 2016, $17.50 puts, aiming for at least $0.80. Sell one put for every 100 shares you could buy at a net $16.70. Selling 23 puts, *Pro* is looking to add 1.5% to our stake, for 4.3% total in stock.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY): Set up the **December $180/$190 put ratio spread** as shared in this alert. Lately, today, it can be set up for a small debit ($0.05); or you can wait for a market drop, which may improve pricing.
- **SPDR S&P 500** (NYSEMKT: SPY): If you want another hedge (this one a 10% stake) set up a synthetic short per last week's alert. Lately, with SPY again back at $212.50, you can sell to open Nov. 18, 2016, $214 calls and buy to open an equal number of Nov. 18, 2016 $210 puts for a net debit of about $0.10 per syn short. This expires in just 11 days, so it's just a hedge against surprises between now, Tuesday's election, and the 10 days after.

Options expiring next (Nov. 18, 2016):

- **Expeditors International** (NASDAQ: EXPD): We'll roll our $48 put/$50 call covered strangle soon, with expiration now 11 days away, as long as the stock stays outside our $48-$50 price range. Watch for a trade alert in your email.
- **SPDR S&P 500** (NYSEMKT: SPY): Our November $200/$210 put ratio spread is in play with SPY around $212. If SPY stays above $210, we'll do nothing and the position expires. If SPY falls below $210, we'll "sell to close" those puts near expiration. And we'll look to set up a new hedge either way.

American Tower Continues Its Global Growth

Published Nov 7, 2016 at 12:07PM

What Happened?

- Q3 2016 press release
- Q3 2016 supplemental materials
- Q3 2016 earnings presentation

CEO Jim Taiclet:

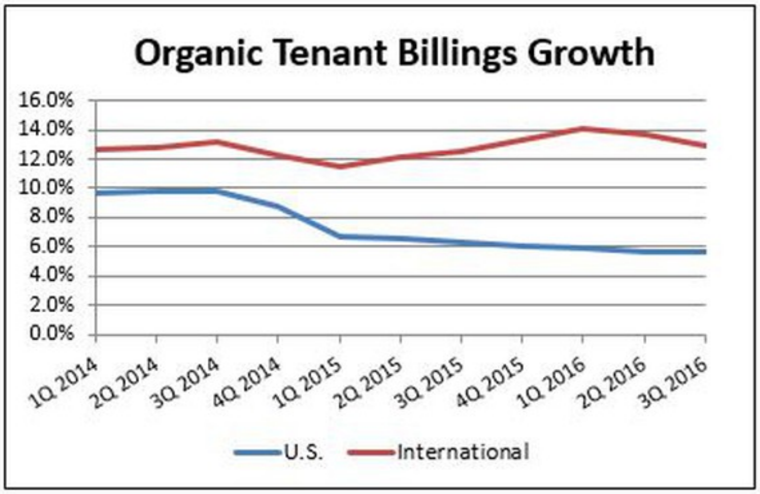
> "In response to rapid growth in mobile data usage, our tenants continue to utilize a combination of incremental spectrum assets, advancing technology and our diverse portfolio of real estate to expand their mobile networks and deliver top quality service to their subscribers. Our global asset base of nearly 144,000 towers and over 700 small cell systems is uniquely positioned to benefit from these continuing investments, and as a result, we were able to extend our long track record of generating double digit growth in property revenue, Adjusted EBITDA and Consolidated AFFO per Share in the third quarter."

So What?

American Tower (NYSE: AMT) reported yet another good quarter in Q3 2016, continuing the company's multi-year momentum with solid organic growth and expanding margins across the entire (growing) global asset base, achieving record levels of new business commencements in the quarter.

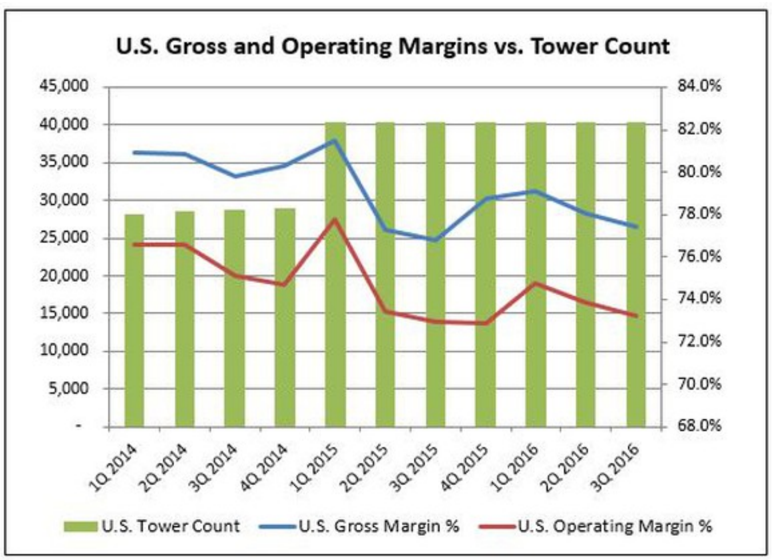
Organic tenant billings (growth attributable to tenant colocations, lease amendments, and price escalations, net of cancellations) came in at 5.7% in the U.S. and 13% internationally (vs. 6.3% and 12.5% in the same quarter a year ago).

International organic growth was broad-based across all regions, up 11.2% in Asia (i.e., India); 12% in Europe, the Middle East, and Africa (EMEA, which includes Germany, Ghana, Nigeria, South Africa, and Uganda); and 13.9% in Latin America (which includes Brazil, Chile, Colombia, Costa Rica, Mexico, and Peru).



Margins increased in the quarter thanks to the strong organic growth, cost controls, and the continued integration and lease-up of nearly 70,000 low-tenancy sites built, leased, or acquired since the end of 2014. These include newly acquired towers in the U.S. (acquired from Verizon), Nigeria (acquired from Airtel), Brazil (acquired from TIM), and India (acquired from Viom).

U.S. gross margins increased year-over-year to 77.4% (from 76.8% in Q3 2015) and U.S. operating margins increased year-over-year to 73.2% (from 72.9% last year), reflecting those trends:



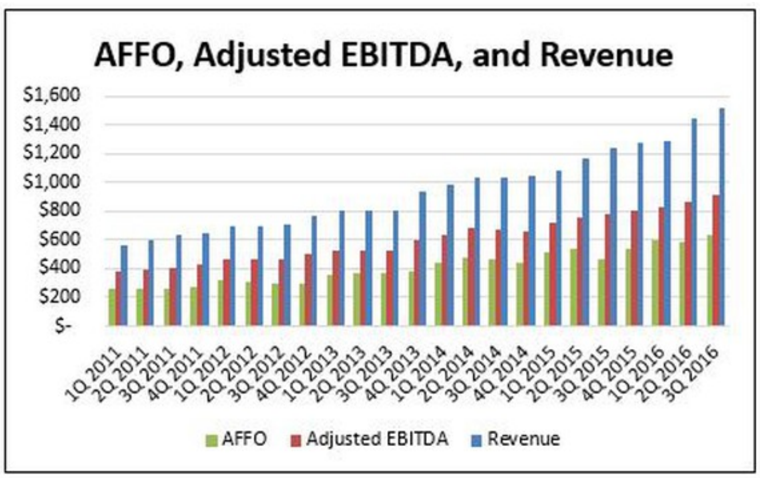
Internationally, margins increased sequentially as the company continues to integrate its newly acquired assets in Brazil, Nigeria, and India:

As for debt, the company's net leverage ratio came in at 5.0x, meeting management's expectation a full quarter early of ending 2016 at 5 times leverage or below. The company has plenty of liquidity (more than $3 billion), and no significant debt maturations until 2018.

Yearly distribution growth continues to track in line with management's 20% long-term growth target, coming in at 20% ($0.55 per share, a 1.9% forward yield on the current share price). Twenty-percent annual distribution growth continues to look like a more than reasonable target for 2016 and beyond.

Now What?

This quarter's report confirms that our investment thesis -- that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time -- is continuing to play out. The company's impressive operating history, excellent management, and strong competitive position in a growing industry give me confidence that American Tower will continue to increase revenue and cash flow at high rates for a long time, providing strong returns on capital (ROIC). The company's portfolio of nearly 150,000 sites worldwide (compared to just more than 100,000 sites to begin this year) positions the company to benefit from secular mobile data demand trends on five continents, and acquisitions and incremental leasing activity should continue to drive revenue, cash flow, and ROIC higher over the long term:



Data and Guidance

- Current Price: $115
- Fair-value estimate (**updated**): $125
- Allocation: 3.9%
- Market Cap: $48.9 billion
- EV/EBITDA (TTM): 19.8

AMT moves back to Buy First, with an updated fair-value estimate of $125 per share and an allocation of 3.9%. If you've yet to start a position, now is as good a time as any to match us. The stock may experience volatility in the short term because of its tendency to trade alongside the interest rate-sensitive REIT sector, but over the long term, the underlying strength in business fundamentals should shine through.

Fool on!

-- Billy (TMFBillyTheKid)

Set Up a Synthetic Short on SPY

Published Nov 2, 2016 at 2:06PM

Is this for you? As ever, be calm and cool and take your time. Assess. This is for any *Pro* member who wants another market hedge in place this month, and who uses a margin account. This split-strike synthetic short will closely mirror price movements in the index, once our strike prices are met, benefiting if the market falls more than a few percent. Those wanting to hedge in an IRA, or just short SPY directly, can consider the alternative trades at the end of this report. This hedge does not change our November or December put ratio spreads, which remain in place.

How You Follow Along

- **Trade:** Use a spread order to set up a synthetic short on the **SPDR S&P 500** (NYSEMKT: SPY):
  - Sell to open Nov. 18, 2016, $212 calls
  - Buy to open Nov. 18, 2016, $208 puts
- **Allocation:** Set up one of each option for every $20,700-equivalent hedge you want (that's based on the $208 put strike price times 100). With this position, *Pro* is hedging 10% of its total portfolio value (cash included), or approximately $261,000, so we're setting up 13 contracts of each option for exposure to 1,300 shares at $208.
- **Price (1 p.m. ET) and Guidance:** With the ETF at $210.20, a small debit of about $0.05 is necessary. That price will change, and you may need to change strikes, too, but generally aim to pay no more than $0.15 per spread to set up the synthetic short.
- **Later Guidance:** If SPY moves much in price before you act, you may want to move both of your strikes up or down accordingly, to continue to roughly straddle SPY's price and set up a split-strike synthetic short for a debit of less than $0.15.

What We're Thinking

Election results always have the potential to surprise, and the stock market rarely loves surprises. Going into Britain's European Union vote in June, polls showed a tightening race, but a lead for voters opting to stay in the EU. Bookies actually put the odds of the UK staying at 90%. But you know how that vote turned out, and in the next two days the S&P 500 declined more than 5%. Why were the polls wrong? Any number of reasons, but some believe it's because young voters didn't show up on voting day, and the assassination of UK lawmaker Jo Cox days before the vote apparently changed moods, and minds, in a way polls couldn't capture at the last minute.

This year's U.S. presidential race has been the most toxic in memory; everyone just wants Tuesday's election over with. Polls and odds-makers give the likely win to Hillary Clinton, but it's still possible the election could go to Donald Trump, which would surprise many. Right now, the Upshot election model gives Clinton 88% odds to win, but that means an upset would be an even bigger surprise, even as polls are tightening. Whichever candidate wins, the market could become volatile in response. Assuming more Democrats win on Capitol Hill, a Clinton victory would likely lead to higher tax rates in general. A Trump win would represent a wild card, because other than wanting to lower taxes, not many of his policies are spelled out, and he lacks a political background. Uncertainty could also result if the election is contested or drawn out for any reason.

In this environment, we're simply going to set up another hedge – *just in case*.

Why This Strategy

This particular position is a *split-strike* synthetic short, because the two strike prices differ modestly. Its effects on our portfolio are similar to those of direct exposure to the underlying investment, as a short in this case. This position will benefit if the S&P 500 declines on any surprise, but we may be looking to close it before the Nov. 18 expiration. Although history doesn't repeat, the S&P 500 recovered most of its losses after the Brexit vote within just four trading days, and all the losses (and more) within eight.

This synthetic short gives us losses if the S&P 500 rises above our short call strike, and provides gains if SPY declines below our long put strike. Between those two strikes ($208 and $212), the position will be on track to expire with basically no cost to us, and no harm.

This hedge complements our November $210/$200 put ratio spread, which we set up in August for a credit (and which can be set up for a *debit* of about $1.55 each today -- a bit rich for my taste, but if you wanted to match us, that's the price today). That hedge and our December put ratio spread remain unchanged in the portfolio. Unlike those put ratio spreads, this new synthetic short provides unlimited upside potential for us as the market falls and unlimited losses as the market rises. It's very similar to just shorting SPY itself. The reason a synthetic short is being used instead is that it gives us a little leeway for SPY to rise before we start to show losses by expiration. Plus, the expiration date helps keep us true to our purpose: We only want this for right now, mainly to cover election uncertainty, and then we'll reassess.

If SPY rises and we *do* end up accepting short shares of SPY through our short calls, for instance, we might write covered puts on them until we end the position. On the flip side, if SPY falls, we can sell our puts for a profit anytime, or turn them into short shares and stay short.

You of course don't need to set up this short if you don't want to. Only do so if it makes sense for your situation. Given *Pro's* goals, and our 6% return so far this year, we want to take steps to protect some of our gains should a steep downdraft occur. Our various hedges and shorts are one step in that direction. Our Nov. 18 $210/$200 put ratio spread, set up in August, *was* intended in part to protect against election risk. But today it seems there's greater chance for a "November surprise," or at least unrest, and thus ... today's alert, tacking on another hedge.

Alternative Trade

- **IRA-Friendly:** If you're using an IRA and can't set up a synthetic short, you can consider a bear put spread. Sell to open Nov. 18, 2016, $200 puts, and buy to open an equal number of Nov. 18, 2016, $210 puts. This will lately cost you about $2.43 per spread (again, not cheap right now, but that's all you risk, no more). Set up as many spreads as you care to risk $243 each on. The position has a maximum value of $10 ($1,000) if SPY ends below $200, and the spread ends worthless if SPY stays above $210. Keep in mind that you might already have a similar (or identical -- it was our alternative guidance in August) spread set up as per our earlier put ratio spread trade for November. In that case, only add more spreads if you want to pay more money into your insurance pool (that's what these hedges are: a form of insurance). If SPY moves much in price before you set it up, you may want to move your strikes accordingly, still aiming to pay not much more than $2 for a $10 spread.
- **Short SPY directly:** You could just sell short SPY directly if you prefer, in your preferred allocation. It's an immediately responsive position, up or down, without a price cushion above the current price, but also without a need to wait for results on a decline.

Pro Can Help

- **Want to talk about our SPY hedge strategies?** We have a discussion board for that.

Sell Short GoGo, GoPro, and Shake Shack

Published Nov 1, 2016 at 2:56PM

Is this for you? Take your time. Be calm. Assess. These recommendations are for *Pro* members who are comfortable continuing to build a basket of short stocks, who have margin accounts that have shorting availability on these stocks (there are no IRA-friendly alternatives; the puts are expensive), and who intend to remain with *Pro* for help managing the shorts (shorting is hands-on, and we can't give you further guidance if you're no longer here). Of course -- and as always in *Pro* -- you don't need to short if you don't want to. Because short shares are hard to find, many members may need to consider setting up synthetic shorts instead, which are alternative trades directly below. Whichever path you choose, even if it's none, you'll get the entertainment and education of watching us sell short!

How You Follow Along

- **Trade:** Sell short 0.5% in **GoGo** (NASDAQ: GOGO)
  - Timely note: Earnings are due Thursday, Nov. 3, before market open.
- **Shares Available** (Interactive Brokers): 600,000 at a 4.48% annual fee
- **Recent Price (and Guidance)**: $10 (use a limit order for $9.70 or higher; adjust lower if needed, but use a limit)
- **Alternative Trade**: January 2018 $10 synthetic short
  - Sell to open January 2018 $10 calls; buy to open an equal number of January 2018 $10 puts
  - Price: Aim for a net debit of $0.70 or lower

- **Trade:** Set up a 0.5% synthetic short in **GoPro** (NASDAQ: GPRO)
  - Timely note: Earnings are due Thursday, Nov. 3, after market closes.
- **Shares Available** (IB): None found
- **Recent Price:** $12.85
- **Official Trade**: January 2019 $12 synthetic short
  - Sell to open January 2019 $12 calls; buy to open an equal number of January 2019 $12 puts
  - Price: Aim for a net debit of $0.75 or lower

- **Trade:** Sell Short 0.5% in **Shake Shack** (NYSE: SHAK)
  - Timely note: Earnings are due Wednesday, Nov. 9, after market closes.
- **Shares Available** (IB): 500,000 at a 3.15% annual fee
- **Recent Price (and Guidance)**: $32.10 (use a limit order for $31.75 or higher; ditto the "adjust" advice above for Gogo)
- **Alternative Trade**: January 2018 $30 synthetic short
  - Sell to open Jan. 2018 $30 calls; buy to open an equal number of Jan. 2018 $30 puts
  - Price: Aim for a net **credit** of $1.70 or higher

All prices will change as the shares move, but the stocks will continue to be recommended as Short in *Pro* unless we say otherwise; we'll update guidance for newcomers as necessary in the weekly Catch-Up Trades we send on Mondays. You can short before the earnings dates above, or wait until after if you prefer. We hope to act before earnings, not because we have a crystal ball but because earnings will likely help some shorts in our basket and not others, and our time frame is generally a year or more.

What We're Thinking

The first point to make is that while this is a mini-basket of short positions, it's only a *small part* of the mega-basket we hope to continue to build. Having many small short positions should decrease the risk to our portfolio during a sharply lower stock market because historically a majority of stocks -- including the best companies -- decline in price when the market falls. And these three don't qualify as "the best," as each has their own shortcomings or challenges that we'll outline. We expect our current short basket -- these three positions, plus our other shorts -- to grow over time, but we want each position to start small. This approach means that any particular short that runs sharply against us (and some will!) shouldn't hurt the portfolio much. And if a position does rise, we should still have some room to short *more* of it if we decide that's the optimal next move.

So, we discourage you from setting up just one or two of these shorts; our advice is to set up all three or none at all. (Ultimately, of course, it's your call!) Keep in mind that the *Pro* portfolio is managed as a whole, with the goal of earning desirable *overall* returns. It's unrealistic to expect every position to make money, but we aim to make money overall, ideally while facing less risk than a long-only portfolio. One of the ways we mitigate risk is by employing shorts like these as a separate, intermediate-term, complementary strategy to our long-term investments. So with that out of the way, why these stocks?

GoGo

If you fly even a few times a year, you've probably run across Gogo's services in an airplane. The leading provider of in-flight Internet connectivity, Gogo offered WiFi on approximately 9,600 planes at the start of this year, or approximately 20% of the world's passenger and business fleet. As 2016 began, Gogo had contracts to install its equipment on approximately another 800 planes, off-set by about 220 *de*-installations as older planes fly off to a happy retirement. The company's initial ground-to-air WiFi was universally panned as slow and unreliable, but its new 2ku technology is getting much better reviews. That said, we're not here to argue about technology, or management, or future installations. The short argument here is much more broadly based: Connectivity is an expensive business to provide, and it's unlikely Gogo will ever make enormous profits providing it. The fees Gogo pays to satellite providers, its costs to install, monitor and maintain its equipment, and the increasing competition that will likely push prices it can charge lower: All of these points demonstrate that this is a tough industry, one where even the leader lacks strong financial advantages.

To date, Gogo has racked up negative $857 million in retained earnings, nearly equivalent to its current $791 million in long-term debt. Expected to lose more than $1.50 per share each in 2017 and 2018, the company isn't estimated to turn a profit until 2020, when the current guesses predict a $0.28-per-share gain. That assumes that many things go right (pricing holds up, airlines stick with GoGo as competition from **Viacom** (NASDAQ: VIA) and **Panasonic** (PCRFY) grows, technology doesn't leapfrog it). But perhaps most challenging, Gogo needs to manage its own costs and debt effectively even while trying to expand. The company's latest $525 million in six-year debt (issued this summer) carries a 12.5% interest rate, showing how risky its investors deem the business.

Even so, we're not banking that Gogo will take a steep dive and never recover, though that could happen. No matter where it's provided, Wi-Fi connectivity has proven a challenging business for all but the few giants that serve the home. What we're really banking on here are sustained economic losses at Gogo over the next few years, which should combine with growing competition to keep the stock in a holding pattern at best and send it lower when the stock market hits turbulence. We may take our profit if we get a 20% or 30% gain from recent prices, or we may add to our position if the stock rises at least 20% against us and we still feel the odds are stacked against sustained, large profits for Gogo down the road. We'll short 0.5% directly, assuming our broker still has shares. If not, we'll set up the synthetic short.

GoPro

The action camera retailer has issues. Its Hero 5 camera is rejuvenating its tepid sales, and may even bring profit back again for a few quarters, but that's about where the good news seems to end right now. Apparently because of supply constraints, the company stopped providing the Hero 5 through **Amazon.com** (NASDAQ: AMZN) after its early-October debut. Reports from analysts at Longbow suggest those issues are still present. New delays for the company's new drone, the Karma, only add to the difficulties GoPro seems to be facing. After earlier delays that stretched months, the company set an Oct. 23 ship date for Karma in September, but last week we saw that date bumped to Nov. 14 and then again to Nov. 28. At least some potential Karma buyers for the holidays are likely now shopping elsewhere, because competing drones are abundant -- and they're good (by some arguments, already superior to Karma and at lower cost). But even if Karma is a moderate hit, GoPro's financial challenges will likely persist for the long term.

Over the past 12 months, GoPro's revenue of $1.24 billion was below the $1.39 billion seen in 2014, and well below last year's $1.62 billion. Net losses ballooned, hitting $215 million in the last 12 months as margins fell through the floor. Unless it's selling cameras in volume and at lofty prices, GoPro's expenses outweigh its profits. (Welcome to the highly competitive, fast-changing world of consumer electronics.) The other challenge GoPro faces is the uncertain size of its end market. Adventure cameras are still a niche product; the company shipped 6.6 million cameras in 2015, up 27% from 2014, but still a tiny number relatively speaking. For most people, the camera on their phone is their go-to device. But more concerning than units shipped are the challenging financials; despite selling more cameras last year, GoPro's GAAP and non-GAAP profits fell sharply year-over-year (down 72% and 46%, respectively). Profit margins declined as the company sold cheaper cameras. Margins may improve this coming quarter with a move away from that strategy, but unit volume may not. GoPro is expected to lose more than $1 per share this year, then show a smaller loss in 2017 before turning modestly green again in 2018 -- but that's a distant guess based on hope. For that to happen, the market for action cameras and GoPro drones needs to sustainably grow, and given rampant competition, it may not.

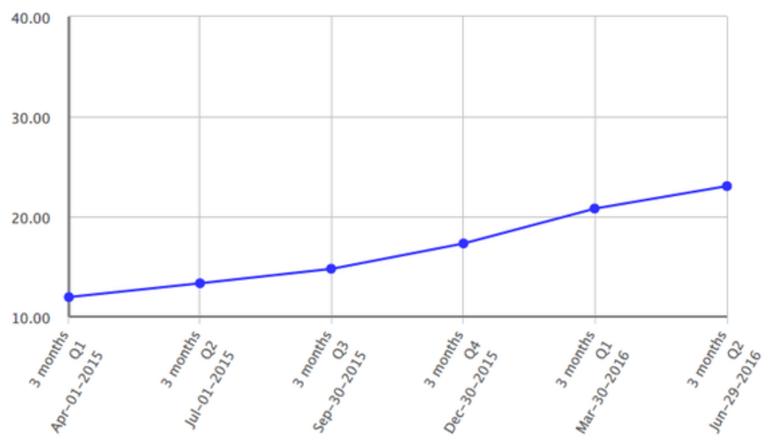
As with Gogo, the odds appear stacked against GoPro generating robust profits in a sustained fashion -- at least anytime soon. Although we expect the stock to be volatile during the holidays (for better or worse), the longer-term story should be one of challenge: The company must figure out how to keep selling more high-end action cameras and drones at premium prices, even after the holidays and the novelty have departed. It won't be easy, so what will matter more than holiday volume will be the outlook for the months after. With shares unavailable to borrow, we're setting up a small 0.5% synthetic short.

Shake Shack

Here's a profitable company selling popular burgers and shakes, seemingly well-run by management, and treating its employees well. The only beef we have with the business itself -- other than burgers and shakes being an incredibly *crowded* category -- is that Shake Shack's international franchise model doesn't lend itself to a good handle on food quality, which risks tarnishing the brand in far-flung locations around the world. But that aside, Shake Shack is doing well in the U.S. with its company-owned stores, with revenue-per-store metrics that are the envy of the industry. So why are we shorting Shake Shack at all? It's just that there aren't many locations yet, and won't be for years, making it hard to justify the company's valuation.

As of June 29, the company operated 51 domestically owned Shacks; six others are licensed in the U.S., and all 38 international locations are licensed. Because the revenue on licensed locations is small, we're going to focus on the owned Shacks. With Shack's recent $1.18 billion market value, owned locations are being valued at about $23 million each. Shake Shack reported $64.4 million in sales for the 13-week quarter ending June 29 (excluding $2 million in fees from its licensed locations). Spread across 51 company-operated restaurants, there's about $1.2 million in revenue attributable to each owned Shack for the quarter. Multiply that by four and you get $4.8 million in annual sales each. That's outstanding, but when valued at $23 million each, each location is priced at 4.8 times sales. Most chains command multiples of less than half that. Sure, Shake Shack is growing more quickly than most, but its growth rate is slowing, and each new location expands the whole pie by a smaller percentage, meaning it will take years for that value multiple to contract -- unless the stock declines.

So far, that appears to be the Shack's path; the stock is cooling off, down steadily since coming public, but it's still expensive for most any business, let alone a burger chain. The company is expected to top $1 in earnings per share ($1.12 to be exact) ... in 2020. So, at $32, shares trade at 28.5 times expected earnings looking ahead *four years*. Even if the business does well, that's a long time to wait for a near-30 P/E. And if the business hits a rough patch, or the market does, shares will likely sell lower because of valuation. Meanwhile, the number of average diluted shares outstanding has been growing sharply:



The Foolish Bottom Line

These three small 0.5% positions are meant to be part of a bigger whole -- a book of shorts we continue to build in the *Pro* portfolio. Remember that shorts are usually shorter-term positions, and we're likely to close any that aren't working out within mere months rather than waiting much longer. Maintaining a book of shorts is more time-intensive than long investing, but it's worth it if this helps the portfolio succeed in weak markets and doesn't drag our returns much lower in strong ones (ideally, it won't drag at all -- but that's a high bar). Each of these companies has strengths and weaknesses that makes it an interesting, but not risk-free, short. Gogo leads its market, albeit unprofitably. GoPro leads its niche, albeit unprofitably of late, and it's fighting an uphill battle to consistently expand at the price points it needs for high profits. Shake Shack is an admired young chain, but that's about as far as the novelty goes -- give it time, and it's likely another aging hamburger-and-shake store in a crowd of many. Maybe it will outdo the others operationally, but trading at nearly 30 times expected 2020 earnings, the stock appears likely to stay stalled or slip for the time being.

Bring any questions to the new *Pro* Basket of Shorts discussion board!

Pro Catch-Up Trades and Upcoming Expirations: Oct. 31, 2016

Published Oct 31, 2016 at 2:57PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **FactSet Research Systems** (NYSE: FDS): Buy 2%.
- **Gentex** (NASDAQ: GNTX): Buy up to 2.8%.

Continue building your portfolio with our Buys:

- **Oracle** (NYSE: ORCL): Buy up to 3.5%.
- **Valmont** (NYSE: VMI): Buy 1.9%.
- **WisdomTree Emerging Markets SmallCap** (NYSEMKT: DGS): Buy 1.8%.

Shorts:

- **Direxion Daily Financial Bear 3X Shares ETF** (NYSEMKT: FAZ): Sell short 0.2% if your broker has shares. If they don't, then set up a January 2019 synthetic short, selling to open January 2019 $30 calls and buying to open an equal number of January 2019 $30 puts. With FAZ at about $31, see if a limit order for a $2 debit or less will work.

Pro options:

- **Gentex** (NASDAQ: GNTX): Sell to open Dec. 16, 2016, $17.50 puts, aiming for at least $0.85. Sell one put for every 100 shares you could buy at a net $16.60. Selling 23 puts, *Pro* is looking to add 1.5% to our stake, for 4.3% total in stock.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY): Set up the **December put ratio spread** as shared in this recent alert. Lately, today, it can be set up for a small debit ($0.07); or you can wait for a market drop, which may improve pricing.

Options expiring next (Nov. 18, 2016):

- **Expeditors International** (NASDAQ: EXPD): We'll look to roll our $48 put/$50 call covered strangle closer to expiration, which is in 18 days, if the stock is outside the $48-$50 price range.
- **SPDR S&P 500** (NYSEMKT: SPY): Our November $200/$210 put ratio spread is still in play with SPY around $212. If SPY stays above $210, we'll do nothing. If it falls below that level, we'll close our put(s) near expiration. And we'll look to set up a new hedge either way.

Trick or Treat With Scary Stocks

Published Oct 31, 2016 at 2:57PM

Dear *Pro* Member:

Goblins and ghouls are out roaming the streets tonight, but that's not the only place to find them -- a few are haunting our portfolio, too. That said (to adroitly switch motifs), a baseball team can lose 67 games in a season (only winning 58% of its showings, like Cleveland), and still end up leading the World Series. Likewise, investors can never expect perfection; instead, we seek to win *overall*.

That doesn't mean we ignore problem positions. On the contrary, our problems get much of our attention here in *Pro*, because we have limited funds and we want our money (strategic cash ultimately included) positioned to perform. With that front-of-mind, let's run through the handful of gremlins in the portfolio today.

Ghoulish-Looking Positions

Deere & Co. (NYSE: DE) **Short:** Deere's sales and outlook have driven lower since we initiated our short early this year, but the stock price is up as investors bank on a bottom to the heavy farming, mining, and construction-equipment sales cycle. We believe the end of that cycle may yet be years away, but if our short (currently down 17%) moves 20% against us, we'll automatically reconsider it. We may take protective action or close altogether to limit our loss. We believe in our thesis, but only arrogance would have us convinced that the market needs to see it our way, too -- in fact, the market may differ from us eternally on this one. So we're waiting to see what the stock does next. You'll be first to know if we change our position.

Gilead Sciences (NASDAQ: GILD): The Hepatitis C and HIV drug giant has suffered a brutal year, judging by the 27% decline in its stock (we ourselves are down 6% for the year, not including dividends). Why so glum? Because revenue has topped out. Until Gilead produces a giant pipeline hit or acquires something big, total sales are not likely to grow. That's because revenue from the company's hepatitis drug, though healthy, is falling below peak debut levels, and current drug pricing suggests the biggest annual profits for the franchise have already been made. The hepatitis drug should nonetheless be a blockbuster cash cow for years, though, and with the stock trading at only about 6 times earnings, we can't bring ourselves to give up on it. Management is adept at increasing value and is spending much of each waking day working on that very thing. We can give them the benefit of the doubt and lend them our patience because the business remains so financially strong. We're comfortable with our 2.5% stake, and Gilead remains a Buy.

Oracle (NYSE: ORCL): We have a 67% gain on this position, but that was earned more than a few years ago; since then, the stock has disappointed. The company's cloud strategy is gaining traction (Oracle has some of the fastest growth rates and biggest customer adds of anyone in cloud), but there's no denying the decline in its legacy database software business. Software is changing all the time, and even the biggest leaders aren't immune to nimbler competitors. And Oracle was late to the cloud server business. But shares are inexpensive, and the business healthy enough, that we want to see how results continue to shake out. We're comfortable with our 3.5% stake, rated a Buy, and its risk/reward profile.

ProShares Short VIX Short-Term Futures (NYSEMKT: SVXY): This isn't much of a problem position; it's up a bit for us. But this small 1.1% position has mainly just bounced around for the nearly two years we've held it. That's largely because volatility has been choppy, and SVXY will only steadily gain ground when volatility is stable. We continue to plan to own shares for the long haul, expecting compounded gains eventually. However, we're also considering adding complementary positions to this one, and if SVXY falls sharply again (say, 30% or 40%) as it did in January, next time we may add some temporary shares in anticipation of a rebound.

Valmont Industries (NYSE: VMI): We bought our first shares of Valmont when the business was already in a down cycle, but that cycle deepened and, in unprecedented fashion, came to encompass every business line at Valmont. Given this, the stock has held up better than one might fear (we're down 11.6% as of Friday). For now, we're content to wait and see how this well-run company can manage its recovery. We're hopeful some light is showing through the darkness, and Valmont is aiming for 10% earnings-per-share growth this year. It's only a 1.9% stake, and we have ample cash in the port right now, so we don't need to sell anything we still believe in; thus, Valmont remains a Buy. But if we don't believe this company can ultimately meet our North Star, we'll need to move the funds elsewhere.

WisdomTree Emerging Markets SmallCap (NYSEMKT: DGS): Our second-largest loser among all our long and short stock positions (down 16% excluding dividends), DGS is nonetheless enjoying a good year, up 16.7% as of Friday. I don't view this 1.8% stake as a problem position, but as a macro diversification. This fund is well managed, and we believe funds of its breed in emerging markets will create long-term value. That said, this has been poor deployment of our capital so far, doing nothing for our portfolio (it's closer to even including dividends). But the problem is, that's how macro investments often work: They don't, until they do, and that's only if you stick with them. You're not timing the market by adding emerging markets to your portfolio – you're diversifying into different markets for the long haul. For now, we're happy to keep the diversification and it's rated Buy.

It's All Less Spooky in the Morning

For years now, we've avoided big blow-ups with our stocks; our biggest loser at the moment, our Deere short, is down 17%, and yet it's hedging recent gains in Valmont. I've always said that we should expect swings of up to 20% in short-term volatility from any stock -- that we can basically just call that "market noise," up or down. Over the years, a winning business will compound well beyond 20% based on its real merits. But a decline greater than 20% suggests we overpaid, or made a poor choice, or have bad luck -- or a combination of the three. We hope to minimize our losers and the size of our losses, but we know we'll never be perfect. That's not even a realistic goal when investing. The positions we just reviewed have disappointed us over the past few years, but we have reason to believe in them. And we have cash. So, we only need to sell these if our beliefs change or if we later need the cash for something we like better. Right now, we can wait. And that's largely what investing is all about.

Visit the Memo Musings board for questions! And Happy Halloween from the Fool!

Pro Guidance Changes and Completed Trades: Oct. 31, 2016

Published Oct 31, 2016 at 2:36PM

Pro Guidance Changes (from the past two weeks)

- **Wells Fargo** (NYSE: WFC): Shares move to Sell today. We're ending our entire stake.

Pro Completed Trades (from the past two weeks)

- **Celgene** (NASDAQ: CELG): Our $95 puts expired as full income.
- **Gilead Sciences** (NASDAQ: GILD): Our $85 covered calls expired as full income.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Sell Wells Fargo

Published Oct 31, 2016 at 1:49PM

Is this for you? All *Pro* members who want to follow the *Pro* portfolio should follow this alert and sell **Wells Fargo** (NYSE: WFC) with us. Read on to find out why we're selling, including portfolio reasons. If after reading you want to keep the shares on your own, of course you may do so. *Options* members should continue to follow our guidance in that service. We have not sold our 2018 calls on Wells Fargo yet, and we may not. That is still under consideration.

How You Follow Along

- **Trade:** Sell **Wells Fargo** (NYSE: WFC)
- **Allocation:** Sell all shares. *Pro* is selling our 2,400 shares, representing 4.2% of the portfolio, and bringing our cash (excluding shorts) up to 23%.
- **Price Guidance:** Use a **limit order**, please, to sell at the going price, lately $46.15 or higher.
- **Note:** Wells Fargo goes ex-dividend on Nov. 2. If you have dividend-related tax considerations, you may prefer to wait until after that date to sell in order to obtain the dividend. Otherwise, it shouldn't matter whether you sell before the ex-dividend date or after, as the stock price should fall by the amount of the dividend.

What We're Thinking

After significant deliberation about the highly publicized scandal regarding fraudulent accounts at Wells Fargo, we at *Pro* have decided that the best decision for our portfolio is to exit our position, hoping to reallocate those funds to other ideas in which we are more confident. Our rationale:

1. We are not confident in the company's ability to continue to generate North Star-beating returns.

Since we initiated our Wells Fargo position in December 2010, the stock has been an underwhelming performer. I went back and analyzed *Pro*'s position-level returns for Wells Fargo over the life of the holding, and including both dividends and option income, our annualized rate of return since inception is just 4.7%, well below our North Star. Over the same period, the S&P 500 has returned 15.6% annualized.

While a good portion of the underperformance can be attributed to the stock-price decline associated with the recent scandal, that's not the only reason the position's returns have been weak. A full percentage point of our annualized returns is thanks to our options activity; without options, the stock has returned just 3.8% annualized.

Additionally, a portion of our long-term thesis has involved waiting for the U.S. economy to pick up steam, leading to increased long-term interest rates and thus higher lending spreads (and higher profit) for Wells Fargo. That simply hasn't happened yet, and it appears that interest rates may remain low for the foreseeable future, leading to continued pressure on the company's interest-income profit stream.

2. Structural industry headwinds persist.

Wells Fargo's return on equity has been in a persistent slump since 2014; the company has reported year-over-year declines in ROE for the past 10 consecutive quarters. We expect ongoing pressure on ROE from long-term interest rates that remain low, increased regulatory scrutiny (especially in response to the scandal), higher capital requirements, and necessary investments in cybersecurity and risk management.

3. The scandal is having an impact on the company's business.

While the effects of the scandal were not immediately noticeable in the company's corporate-level earnings results, Wells Fargo has released some data showing that consumer behavior is certainly changing as a result of the negative publicity.

The malfeasance was reported in September. Just that month, consumer checking account openings declined 25% year-over-year and credit card applications were down 20% year-over-year. Other areas of the company's business were affected as well, with mortgage referrals from retail banking down 24% in September from August.

While the declines will likely moderate over time as the scandal fades, the company's reputation has certainly taken a big hit. Another of the core tenets of our Wells Fargo investment thesis was that the company's conservative culture and strong reputation should help it continue to attract new customers, and this scandal brings that assumption into question.

Additionally, millennials are now the largest demographic group in the U.S., and in a 2015 consumer research survey on banking performed by Accenture, millennials were the most likely age group to switch from their primary bank. Eighteen percent of millennials had switched their primary bank within the past 12 months, compared with 10% of customers 35 to 54 and 3% of those 55 and older. Given this information and given additional pressure from the scandal, we think that future retail customer growth for Wells Fargo is as questionable as it has ever been.

The *Pro* Bottom Line

We have decided to sell Wells Fargo because we are not confident in the company's ability to generate North Star-beating returns, and we think we can find other long investments that we prefer and are more comfortable owning.

It's important to note that although we are selling Wells Fargo, that doesn't mean we think the stock won't continue to earn positive returns for its shareholders. While the company's 3.8% annualized return since our position's inception in 2010 doesn't beat our North Star, it handily beats the 0% return on cash.

With an amply covered 3.3% dividend yield and a price-to-book multiple that's as low as it has been in several years, we don't think much further downside is all that likely. Additionally, if macro-economic conditions improve, it is possible that Wells Fargo could see strong appreciation as lending spreads rise and profits increase.

However, with *Pro*'s mandate to deliver North Star-beating returns over every rolling three-year period, we are making the decision to sell an underperforming stock in a company with a damaged reputation in the hopes of reallocating the cash to other ideas we like better. Because we run a portfolio that does not add funds, it's imperative that we only remain invested in positions we believe will perform up to our standards over time. Any morality issues aside, the odds look stacked against healthy growth in Wells Fargo's business anytime soon, and we believe we can reinvest this money someplace better.

For new members who recently bought shares: We're long-term investors, and we intended to keep Wells for years when we recommended it to you. But stories change, and in this case, we're moved to sell soon after you bought. At *Pro*, we always give time the benefit of the doubt, and we maintain a long-term view -- but we have to remain flexible. Often, sudden changes mean nothing for our positions. But when they are meaningful and have an impact on our investment thesis, it's our responsibility to respond.

Pro FAQ

Published Oct 26, 2016 at 12:08PM

Welcome to our Frequently Asked Questions about *Motley Fool Pro* and how you can get the most out of the service. Have a question that's not addressed here? Ask us on the Member Suggestions & Help discussion board!

About Pro

What is Motley Fool Pro?

Motley Fool Pro is a $1 million real-money portfolio being managed for accurate, recurring, and absolute profits (rather than relative returns). The portfolio buys all types of equities, uses several different options strategies, and employs ETFs, hedges, shorts, and other advanced strategies to make money in flat, down, and up markets. Over the years, however, the main bent of the portfolio should be that of long-term stock ownership. All trades are announced to *Pro* members well before we make them, and all returns are tracked publicly for you.

How can I see a list of the team's holdings?

You can see the *Pro* team's holdings here: Tom Gardner | David Gardner | Jeff Fischer | JP Bennett | Billy Kipersztok | Ellen Bowman

Recommendations Help

If I'm a new member, where do I begin?

Begin by establishing a position in our Buy First stocks, then follow our moves in that portfolio. We'll preannounce trades just for you — always sending you a "Trade Alert" email before we make a move — to help you build your portfolio with us.

What do Best Buy Now, Buy, Hold, and Sell mean?

- **Best Buy Now:** If your portfolio doesn't yet mirror ours, start by matching our percentages in these stocks. They represent the most attractive risk-to-reward opportunities today.
- **Buy:** We suggest you buy these strong stocks next as you build your portfolio.
- **Hold:** This means to keep your shares if you own them, but don't add more cash or open a new position in the stock.
- **Sell:** We're selling all or a partial stake in this position, and we recommend you do, too. You'll get a full sell report with any position we decide to jettison.
- **Short:** We recommend you sell short these positions. If you haven't shorted before, get a lesson from our Guide to Shorting.

What do the three portfolio tabs contain?

- Open Positions includes all active positions in the portfolio.
- Closed Positions offers details on positions that are no longer active (this does not include positions that have been *partially* sold).
- Transactions is a complete list of every transaction we've made from the start: buys, sells, dividend payments, interest on cash and more.

Building Your Portfolio

What is a good broker to use?

From Scottrade to TD Ameritrade, ThinkorSwim to OptionsXpress, Schwab, Interactive Brokers, and others, *Pro* members use 'em all. If you're looking to trade options, just about any discount broker will work, but some have stricter options permission policies than others, and IRA policies differ. Do your homework! The Motley Fool's Broker Center is also a great resource.

Should I buy every stock at once right now?

In a volatile market, it pays to move steadily. In building out your *Pro* portfolio, consider our **Buy First** holdings first; those are the companies we think are the best opportunities for your money right now.

How much of each Pro stock do I buy?

If you want to mirror *Pro*'s portfolio, see our buy reports and buy our committed (or actual) allocation so far.

How should I use Pro if I'm already fully invested?

Don't sell everything you own at once. You own your stocks for a reason! Begin by reviewing your current holdings, then consider selling your least-favorite stocks to free up cash as you need it for new *Pro* trades. Gradually move freed-up cash into our Buy First stocks and then our Buy stocks. Consider your sector allocations and stay diversified as you add *Pro* buys.

How should I use Pro if I'm adding new cash over time?

Averaging new money into stocks over time helps you achieve better returns. Do this if you can. Determine how much you plan to contribute over the next year and base your target allocations on *that* figure rather than on your current portfolio value. If you have $50,000 and expect new cash will grow it to $60,000 by year-end, keep that in mind as you allocate. Be mindful of commissions as you build your positions — ideally, you want commissions to cost less than 2% of any trade. A $20 commission for a $500 investment, for instance, would be 4% — that's not cost-effective. (This is much less true when writing options, where you simply want the cash you're paid to be worthwhile; commissions will typically be a larger part of your overall trade.)

I'm using an IRA for Pro. How should I proceed?

IRAs are tax-deferred accounts, so they're ideal for income-generating trades like covered calls, high-yielding dividend stocks, and any ETFs with large, taxable distributions. IRAs are *not* so great for more speculative trades because any losses generally cannot be used to reduce your taxes. Keep in mind that IRAs do not allow short selling or buying on margin, and will not allow more aggressive option strategies, such as writing puts on even modest margin. Consider opening a separate non-IRA account to take advantage of these *Pro* strategies. Then, manage this second account and your IRA together as *one* portfolio.

Should I reinvest dividends?

You can go ahead and reinvest any dividends, if you'd like, on any *Pro* stock that is rated a Buy or Buy First. *Pro* is *not* reinvesting dividends simply because it's difficult for us to track. It results in partial shares, which also complicates option strategies on the stock. We take all dividends as cash and will invest them ourselves.

Where can I learn more about ETFs?

Please read our guide, The ABCs of ETFs, for more on exchange-traded funds.

What broker does Pro use? Does Pro reinvest dividends? Pay commissions? Rebalance the portfolio?

- *Pro* currently trades via Interactive Brokers.
- We do not reinvest dividends so that we can deploy our cash to the best opportunities at any given time (that could be the company the dividends came from, but it may not be).
- Commissions vary per trade, but all costs are shown on our transactions page, and commissions are included in our prices and returns.
- Finally, though we won't rebalance in order to meet certain arbitrary allocation guidelines, we will manage the portfolio to avoid excessive risk in any one position.

How do you track your performance?

The Motley Fool measures the *Pro* portfolio's performance from its launch date in October 2008. The portfolio's cash balance is included (lowering returns when we have cash). We track relative returns for members' benefit, focusing on annualized rolling-three-year periods (which is consistent with our mission), even though *Pro* is managed for absolute returns (profits, period). *Pro*'s total returns and the S&P 500 Total Return Index include dividends. Our North Star is measured using the CPI-U (the Consumer Price Index for All Urban Consumers, as calculated by the Bureau of Labor Statistics) as its measure of inflation. For more on our North Star, click here.

Options Help

What should I know before investing in options?

Read our Options 101 guide and our Options Glossary to become familiar with the terms, strategies, and purposes behind using options before you consider placing any option trades. If options are new to you, we recommend that you watch a few of our trades play out before you start to follow them in your own portfolio.

What is a good broker to use?

From TD Ameritrade to ThinkorSwim to OptionsXpress to Schwab to Interactive Brokers — and others! — *Pro* members use them all. Just about any discount broker will work, but some have stricter options permission policies than others, and IRA policies differ. Do your homework! The Motley Fool's Broker Center is also a great resource.

How do I apply for option trading?

Ask your broker for full options approval, typically level 2 or 3 (it can vary by broker). Fill out, sign, and mail in a simple one-page document. After a week or two, you'll be approved! Slide on over to our All About Options board if you have any questions, and watch our Options in 3 Steps video for a visual walk-through of the process.

How much money do I need to trade options?

To buy an option, you need very little money: just enough so that your commission is, ideally, less than 2% or 3% of your total transaction cost. To write options, you need to have a margin account. Also remember that different brokerages have different requirements. You'll need anywhere from $10,000 to $50,000 to gain brokerage approval for option writing, depending on your broker. We recommend that you have at least $25,000 in your portfolio if you want to trade options with Pro, and $100,000 if you want the flexibility to follow along with most options trades we make. The smaller your portfolio, the more likely you'll need to pick and choose which of our options trades you follow.

What level of options permission do I need?

It varies by broker, but level 2 to 3 (the ability to buy and write calls and puts) is typically sufficient for now.

Can I make option trades in an IRA?

Yes, you can buy options and write covered calls in an IRA, tax-free. Some IRAs will also let you write cash-secured puts. Ask your broker.

I can't sell puts because of brokerage restrictions. What should I do?

Focus on buying stocks in our preferred buy price range to give you the largest margin of safety. Also, read up on our covered-call strategy. This is another way to generate income from options and is allowed by most brokers and even in IRAs.

CAPS and the CAPShot

What is CAPS?

CAPS is The Motley Fool's vibrant investing community filled with stock pitches, blogs, screens, and a host of proprietary data based on members' ratings of every stock's ability to outperform over time. For much more about CAPS and how to get involved, check out Meet CAPS and Using CAPS to Find Great Stocks. Here at *Motley Fool Pro*, we use proprietary CAPS data as another screen to find great stocks, sectors, and ETFs.

What is a CAPShot report?

Coming soon!

We created a special checklist to help *Pro* members find the strongest growth stocks in the CAPS universe -- those with leading growth rates, strong margins, and healthy financials. The CAPShot Report checklist rates stocks on four CAPS criteria and eight of our own hand-picked fundamental criteria. It then applies a score from 1 to 12, with 12 being highest. Few stocks will score 11 or 12, but when they do, you can bet that we'll be taking a closer look. We're currently working on getting the CAPShot report up and running and will notify you when you can begin generating your own reports.

My Scorecard

What is My Scorecard?

My Scorecard is your personalized one-stop shop for information about the stocks that matter most to *you*. It's part scorekeeper and part coverage collector:

- Add your holdings, and we'll track your performance for each position, as well as your overall returns versus the market.
- Add stocks you're interested in but don't own (enter the ticker, but don't add purchase data), and we'll track those companies' prices, too.
- Below your list of stocks, you'll see an activity feed of all your premium Motley Fool services' coverage of your companies — updates, articles, discussion board posts, and more. You can filter this list to zero in on just the type of content you're looking for.
- Finally, at the top of the page, you'll see quick bites of personalized information and Foolish fun facts. Every time you visit, you'll see a different set, so refresh the page and come back often!

Can I have a watchlist in My Scorecard?

Any stock you add without entering purchase information is treated as a watchlist pick. You will see the current price and commentary will start to appear in the feed. However, it will not affect your overall returns.

Can I enter the number of shares I own?

Now you can! When you add a stock, enter the number of shares you bought, along with the date and price of each position. We'll show you how much of your portfolio each stock makes up.

How are my returns calculated?

- **The overall return of your scorecard**, shown at the top of the page, is calculated using the annualized effective compounded return rate, commonly known as the internal rate of return (IRR). The best way to think about this return is as an interest rate — it represents the interest rate you would need to earn over the period you have been investing to end up with your current position. This takes into account all of your active and sold positions, as well as the dates you bought and sold each holding. IRR is an annualized figure, so if you've returned 40% over two years, your IRR will be 18.3%. Dividends are not automatically included for the individual stock positions, so you'll need to manually adjust your purchase price to account for dividends.
- **S&P Return** is calculated the same way, by mirroring each of your investments with similarly sized investments in the dividend-adjusted SPDR S&P 500 ETF (SPY).
- **The weighted average returns**, at the bottom of the Active and Sold tabs, are calculated using a the cost-weighted average of all your active or sold positions. Unlike IRR, the weighted average doesn't include the total of all of your positions (just the active or sold), and it is not annualized.

How do I add multiple tickers?

Just type them into the box below your scorecard (separated by commas or spaces) and they will appear in your scorecard. Click on Edit for each stock to add the purchase information.

How do I add a closed position?

Click sell and then enter all the information in at once. Your position will then be moved to the Sold tab of My Scorecard.

What happens when I delete a stock?

Poof! It's gone. When you delete a stock, it's gone from My Scorecard, and so is all the content associated with it. (We've put in a pop-up that checks to make sure you meant to delete it.) If you deleted a stock by accident, you can always readd the stock, and the appropriate information will reappear.

Does My Scorecard support splits and other corporate actions?

No. You will have to make these adjustments manually, by changing the purchase price.

A stock is newly listed on the NYSE or Nasdaq. Can I add it to My Scorecard?

Your Fool tech team will manually add these to our database. If you find a ticker that needs to be added, just give us a holler on the boards.

Getting the Most Out of My Scorecard

My Scorecard isn't a comprehensive portfolio tracker. It doesn't track options, warrants, mutual funds, and stocks on foreign exchanges. It also doesn't track cash; however, there is a workaround for tracking cash explained here. For corporate actions such as dividends and splits, you'll have to change a holding's Buy Price to adjust your cost basis.

The tool is a work in progress, though, so if you have suggestions or ideas for My Scorecard, bring them to our feedback discussion board, and we'll let you know what we can do!

Where can I get the latest information about the Foolish plans for My Scorecard?

You can find the latest and greatest information about what's next on the Foolsaurus page for My Scorecard, and if you have any questions, post them on the My Scorecard Feedback discussion board.

Emails, Memos, Audio Extras, and Guides

What are "Trade Alert" emails?

"Trade Alert" emails come to you at least 24 hours and no more than 30 calendar days before we make our trade. This gives you the chance to beat our price. You can manage the email you get from *Pro* and any other Fool services here.

When is the Monday Memo made available? Can I print it?

You can find our weekly news update both in your email box and here on the *Pro* site every Monday (imagine that!) at 4 p.m. ET. If Monday is a holiday, we'll publish it on Tuesday.

To print the Monday Memo, just look for the "Print This Page" link at the bottom of the page.

I'm feeling overwhelmed by all the guides and lessons on Pro. Where should I start?

Follow our simple three-step plan to help pace yourself. Reading a few of our recent (and brief!) Monday Memos is another great way to catch up. Just take your time. By reading just one of our feature articles or guides each week, within a few months you'll have read all of them, and you'll be completely in-the-know with *Pro*.

I want to learn all I can from Pro. What are the essentials?

Visit our resources page for the *Pro* team's favorite guides and investing lessons.

How can I view a list of all published articles?

Just go to our Alerts & Coverage tab and make your choice of content (Alerts, Memos, or Extras) on the sub-navigation bar. You'll see an archive of all *Pro* content in that category; click "Next" at the bottom of the Articles page to continue further back through our archives.

Will you post transcripts of your Audio Extras?

Yes! Transcripts of all Audio and Video Extras will be posted soon after publication.

Community and Discussion Boards

How do I use the discussion boards?

The basics: Only *Pro* subscribers can access the *Pro* community, whereas the at-large Fool Community, with more than 4,000 active boards, is accessible to anyone. For more general information on Fool discussion boards, visit the Fool's Help Centerfor a tutorial.

How can I keep up with the discussion boards when I only have 15 minutes a week?

Just check the "Most Recommended Discussions" section of *Pro*'s Community tab for members' favorite posts of the week.

Click the **heart** on each *Pro*discussion board that interests you. Now you can access it in the My Boards section of your My Fool page.

If you just want to find responses to your own questions, follow the Favorites & Replies link in the navigation bar at the top of the board page, and then click "Replies to Your Posts." Your replies will be automatically filed for you.

When using the discussion boards, what do "unthreaded" and "threaded" mean?

Unthreaded means the posts are listed in chronological order. This is our default setting. *Threaded* discussions are grouped according to a specific subject. For example, you might start a thread by posting on the subject of "Intel's Earnings." If I respond to your message, my post will be "Re: Intel's Earnings," and so forth. All of the replies to your subject will be kept together. This makes it easy to follow each small discussion on a board. The difference between threaded and unthreaded is that threaded takes the subject into consideration first and the chronological order second. If you have questions about this or are still confused, email customer support at FoolBoards@fool.com.

How do I write a post?

On every message, there's a link called "Post Reply." Just click there. A new page will come up, with the original post and a box to type your message in. Once you finish the message, click "Preview Reply" to make sure it looks like what you thought it would look like (if it doesn't, no worries; just click "Edit Reply" to make any fixes). Then click "Submit Reply," and it's on the way! Your message will show up as the last message on the board in chronological order.

Once you've posted a message, you can't go back and delete or edit it.

Technical Support

How do I change my username and password?

To change your username or password, click here. Please note: You can only change your username three times per year. Your password must have at least six characters (no spaces or special characters, please). You can change your password as often as you like.

My email address changed. How do I update it?

Note: When you change your email address, your account will be suspended temporarily. We'll send an email to your new address, with a link to a page that will unlock your account. Click that link and follow the instructions on the page. Please be sure to let us know when you change your email address. Failure to do so may result in the delay or non-delivery of online products or messages regarding any paid subscriptions.

What is your refund policy?

We sincerely believe in everything we sell. Yeah, it sounds hokey, but it's true. If you're not completely satisfied for any reason, just let us know within the first 30 days, and you'll get a complete refund. If you joined or renewed as part of our special three-year promotion in August 2011 or January 2012, you can cancel for a full refund anytime during your three-year subscription. Otherwise, after the first 30 days, you'll receive a pro-rated refund for the remaining portion of your subscription term. Our complete refund policy can be found here.

How do I renew my subscription?

You don't have to lift a finger. Your subscription will be automatically renewed each year on the same day that you originally purchased. Thirty days before your subscription renewal, we'll send you an email renewal reminder. If you don't want your subscription automatically renewed, or if you want to change your billing preferences, just contact us at membersupport@fool.com.

How do I change my billing or shipping address?

To update your mailing address, click here. Or click on the "Edit Your Account" link on your My Fool page or the newsletter's website.

What if I need more help?

If your question has gone unanswered or you are experiencing difficulties accessing the site or downloading an issue, please contact us at membersupport@fool.com. In your email, answer as many of the following questions as you can:

Are you using a Mac or a PC?

What operating system and version are you using? (Windows 98, Windows NT, Mac OS 9, Mac OS X, etc.)

What version of Adobe Acrobat are you using?

Did you see any error messages? What did they say?

Valmont Industries Sees a Distant Light in a Long, Dark Tunnel

Published Oct 25, 2016 at 12:16PM

Valmont Industries (NYSE: VMI) continues to fight through the dregs of a concurrent industrial/mining/agricultural downcycle as sales declined 3.5% for the quarter. The big contributors to the disappointing quarter was combination of falling steel prices, two unexpected kettle failures in the company's Coatings business, and continued weakness in European utility investment, As a result of Coatings segment challenges, management lowered their 2016 EPS guidance by about 2%, but they still expect the business to achieve 10% EPS growth for the year, which is in line with the long-term goals the company shared during the 2016 Investor Day held in February.

On a more positive note, management is starting to see signs of improving demand in two of the company's largest segments and the company continues to deliver on management's restructuring initiatives, achieving over two-and-a-half percentage points of operating margin improvement year to date. Those savings amount to an additional $17 million of additional operating profit and management is still targeting $30 million of annual savings. In the third quarter, management began the restructuring of the company's Australian manufacturing facilities which should result in an additional $5 million in annual savings in 2017.

Valmont's balance sheet remains strong, with a manageable $408 million in net debt, and the company continues to generate a ton of cash. Year to date operating cash flow has been $127 million with capital expenditure coming in at only $42 million. Valmont repurchased $18 million of its shares during the quarter at an average price of $129 and there is $139 million remaining in the current repurchase authorization

Segment Updates

- **Engineered Support Systems (~29% of Sales)**

ESS sales were slightly higher for the quarter thanks to improving commercial and infrastructure construction. The segment is also seeing an uptick in sales inquiries related to the Highway Bill that was signed at the end of last year. Lights and guardrails are installed toward the end of those projects, so management does expect a meaningful contribution from those sales until sometime in 2017. Also, U.S. telecoms have pulled back on some of their wireless infrastructure spending, but demand remains strong in the Asia Pacific region thanks to continued investment in 4G network upgrades in Australia.

- **Utility Support Systems ~(25% of Sales)**

Utility revenue was down for the quarter thanks to drop in steel prices -- which get passed on to customers -- but volumes are growing and market sentiment is improving. Also, a large European project expected to deliver this quarter was pushed into the fourth quarter. Order lead times are increasing which is a positive sign that capacity utilization at plants are tightening. Though management believes that there is still an oversupply of manufacturing in the market, lengthening lead times often result in pricing increases down the line.

- **Coatings (~11% of Sales)**

Demand for the coating business dropped unexpectedly during the quarter thanks to a combination of lower demand from for custom products for the solar energy industry and less internal demand from other segments. Also, the segment experienced temporary equipment failures at two plants which were quickly repaired, but hurt short term operating performance. Analysts on the call questioned whether these failures were the result of cost cuts and underspending on maintenance capex. Management explained that both incidents were unfortunate, but not the result of deferred maintenance. Also, management has taken measures to pre-emptively cut additional costs from the business in anticipation of lower demand for the remainder of the year.

- **Energy and Mining (~13% of Sales)**

Management reported that it seeing a marked improvement it the operating performance of the Energy and Mining segment, but weak end markets continue to be a drag on the business. The improvements were the result of better grinding media profitability and better operating performance for the Access Systems business, which is trying to diversify into adjacent industries.

- **Irrigation (~23% of Sales)**

Commodity crop prices remain depressed thanks to another record harvest in the U.S., so it's little surprise that the outlook for the Irrigation segment remains depressed. Further, a rainy growing season in the U.S. resulted in less run time for installed irrigation systems, resulting in less need for maintenance and replacement parts. Thankfully, pricing has held up in the U.S. as competitors have remained rational and internationally Brazil is holding up surprisingly well and should continue to rebound as the country's political issues are resolved.

Pro Bottom Line

Our thoughts regarding Valmont's prospects are little changed from the previous quarter – this is a well-run business slogging through a tough market. It seems that investors keep trying to anticipate the bottom of the cycle only, to be disappointed with each ensuing quarter. It would be nice to just sell and sit on the sidelines until the economy improves, but by the time there is a clear evidence that the fundamentals are improving, we're likely to miss the move in the stock. It will likely only require a meaningful improvement in one of Valmont's end markets to see the increased operating leverage from the cost restructuring start to kick in.

As we've noted previously, Valmont hasn't performed to our expectations and is lagging our North Star return expectations, but it does provide some industry diversification in a portfolio that is admittedly overweight financials and software/technology companies. It also has multiple high quality businesses that should benefit from long term global economic growth if we can remain patient. Now that the company has mostly completed its reorganization, it's likely that management will have the bandwidth to pursue acquisitions to grow the business. At about 20-times forward earnings Valmont doesn't look particularly cheap, but that's normal for a quality company that seems to be near the bottom of the cycle. **Valmont remains a Buy and I'm maintaining the current $140 fair value estimate.**

Pro Catch-Up Trades and Upcoming Expirations: Oct. 24, 2016

Published Oct 24, 2016 at 3:32PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Broadridge Financial Services** (NYSE: BR): Buy up to 5.1%.
- **FactSet Research Systems** (NYSE: FDS): Buy 2%.

Continue building your portfolio with our Buys:

- **Oracle** (NYSE: ORCL): Buy up to 3.5%.
- **Starbucks** (NASDAQ: SBUX): Buy 3.2%
- **Valmont** (NYSE: VMI): Buy 1.9%

Shorts:

- **Direxion Daily Financial Bear 3X Shares ETF** (NYSEMKT: FAZ): Sell short 0.2% if your broker has shares. If they don't, then set up a January 2019 synthetic short, selling to open Jan. 2019 $30 calls and buying to open an equal number of Jan. 2019 $30 puts. With FAZ around $31, see if a limit order for a $2 debit or less will work.

Pro options:

- **Gentex** (NASDAQ: GNTX): Sell to open Dec. 16, 2016, $17.50 puts, aiming for at least $0.90. Sell one put for every 100 shares you could buy at a net $16.60. Selling 23 puts, *Pro* is looking to add 1.5% to our stake, for 4.3% total in stock.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY): Set up the **December put ratio spread** as shared in this recent alert. Lately, today, it can be set up for a very small debit ($0.07); or you can wait for a market drop, which may improve pricing.

Options expiring next (Nov. 18, 2016):

- **Expeditors International** (NASDAQ: EXPD): We'll look to roll our $48 put/$50 call covered strangle closer to expiration, in 25 days, if the stock is outside that $48-$50 price range.
- **SPDR S&P 500** (NYSEMKT: SPY): Our November $200/$210 put ratio spread is still in play with SPY around $215. If SPY stays above $210 we'll do nothing. If it falls below $210, we'll close our put(s) near expiration. And we'll look to set up a new hedge either way.

Pro Quality Checklist: AMERCO

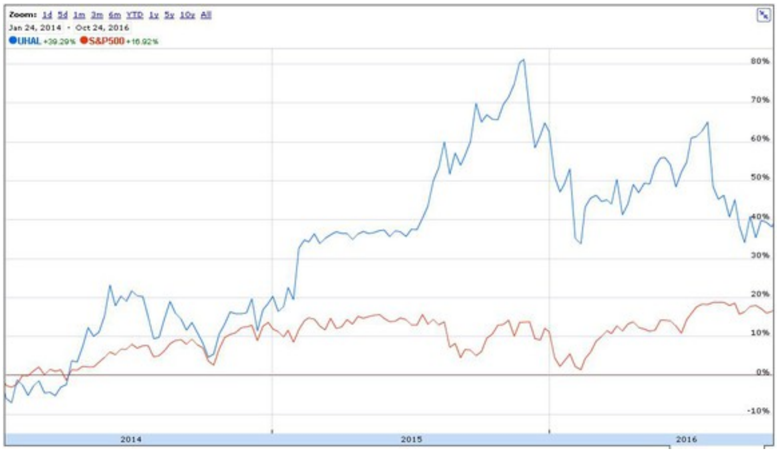
Published Oct 24, 2016 at 3:32PM

Dear *Pro* Fools,

Back in early 2014, I wrote a Memo about **AMERCO** (NASDAQ: UHAL), the holding company for do-it-yourself moving and storage business U-Haul.

In that Memo, I discussed how I was intrigued by the business and presented some info about the business in a "watch list" format, with the idea of keeping an eye on the company and its stock price in order to see if it might eventually be worthy of a spot in the *Pro* portfolio.

Since that column, here's how AMERCO's stock price has compared to the S&P 500:



Source: Google Finance

AMERCO has been a market-beating stock performer since that "watch list" Memo, up 39.3% vs 16.9% for the S&P 500 over the same period. However, lately AMERCO has been in a bit of a swoon, down 24% since achieving an all-time high of $436.89 per share in late 2015.

The falling share price, caused predominantly by weak earnings results, has drawn my attention to the business once more, and I thought it would be an interesting exercise to run the company through our Pro Quality Checklist to see how the company stacks up. Without further ado...

1. Sustainable Competitive Advantage

Yes. AMERCO's truck rental business is part of a 4-way oligopoly (including Enterprise, Penske, and Ryder) that dominates the truck rental business. Those four businesses control 50.9% of the truck rental industry in the U.S., with the remaining 49.1% largely composed of local and regional operators that each generate less than 5% of overall industry revenue. AMERCO's national scale is a source of competitive advantage relative to its smaller competitors.

Additionally, compared to its bigger peers, the company's large network of more than 21,000 rental locations (compared to 800 for Ryder, 2200 for Penske, and 229 for Enterprise), focuses on the do-it-yourself moving market (as opposed to commercial truck rentals). Its 70+ years of operating and optimizing a system tailored to one-way moves gives the company an additional source of competitive advantage.

2. Pricing Power

No. Pricing in the company's businesses can be highly competitive and dependent upon market rates. However, the company's large network gives it a source of relative pricing power for long-distance, one-way moves in regions where competitors don't have a market presence. But for the most part, AMERCO doesn't have significant pricing power across its entire business.

3. Dependent Customer Base

No. AMERCO's customers are not dependent upon AMERCO for truck rental, self-storage, or insurance, and there are many other sources for similar products and services.

4. Predictable Revenue

No. The do-it-yourself moving market generally ebbs and flows with the housing market, which is unpredictable. However, the company's growing self-storage business exhibits stable and recurring revenue, although it still comprises less than 10% of companywide revenue.

5. Growing Free Cash Flow With Compounding Returns

Yes. AMERCO continues to invest heavily in growing its truck rental and self-storage operations. As the company grows and continues to gain scale, the company should continue to earn rates of return on investment that exceed its cost of capital.

6. Financial Resilience

Sort of. The company has a significant debt load, with about $2.8 billion in debt, compared to $650 million in cash on the balance sheet. However, the company's debt load is easily manageable when compared to the company's cash flow, as debt maturities are reasonably paced and interest expense is well-covered by profits.

7. Expanding Possibilities

Yes. AMERCO continues to grow its truck-rental business, building on its strong position in the do-it-yourself moving business. Additionally, the company's self-storage business continues to grow nicely, with revenue up 16% in the most recent fiscal year. The company operates nearly 50 million square feet of rentable storage space, making it one of the largest self-storage companies in the industry. Self-storage companies trade at high valuations because the revenue streams are stable and recurring, the properties require very little maintenance expenditures, and margins are high. AMERCO continues to invest in and grow its self-storage business, which is complementary to the company's core truck-rental business.

8. The Three C's of Management: Clarity, Consistency, Capability

Yes. Current chairman/president/CEO Joe Shoen (son of founder Leonard Shoen) runs the business, and Shoen family members litter AMERCO's organizational chart, with most of them having worked with the company for the majority of their adult lives. The Shoen family owns more than 55% of the company's common stock, and executive pay is modest — perhaps even excessively so — for a company with more than $2 billion in annual revenue (total CEO compensation including incentives is consistently around $1 million or less). What this means is that the vast majority of the Shoen family's wealth is concentrated in AMERCO stock. We can rest assured that the leadership team is running the business with a long-term mindset that's well aligned with that of common shareholders.

The *Pro* Bottom Line

With just 4.5 out of the 8 *Pro* quality characteristics we look for, AMERCO doesn't exactly check off all of the qualities that we look for in an ideal *Pro* investment. However, the company has enough positive attributes to warrant taking a closer look. At just over 6.8 times EV/EBITDA, the company seems cheap for a growing, competitively advantaged business. If our valuation work suggests the company is undervalued, we might be interested in boxing up this stock to store in our portfolio.

Your October Chat Questions, Answered

Published Oct 21, 2016 at 2:41PM

We had a few questions left over at the end of our October live chat -- here are Jeff's answers!

Q: With the oil market stabilizing a bit any thoughts on stocks like NOV?

A: We've looked the energy sector but don't like the competitive dynamics and lack of pricing power at so many of the companies in it this crowded space. We lean toward companies with long-term competitive advantages, multiple growth avenues, and pricing power.

Q: The ETF structural (my term) shorts seem more successful than the outright stock shorts. Will you be looking for more of those?

A: We are seeking more (or to add more to our) shorts of flawed ETFs.

Q: Seems to me that the Fool universe has a tendency to hang onto positions just to get them into the positive. Why not just sell/move on w/ something else?

A: Pro differs as a focused portfolio that doesn't add cash. We do sell stocks to buy things we like better.

Q: Interested in the two hedges, Deere & Domino's. Why hedge just tractors & pizzas? Why not everything (or nothing)?

A: We're hedging the whole S&P 500 with our SPY put ratio spreads, and we'll add other hedges over time. These two hedges were specific: We weren't going to keep PZZA or VMI longs without these hedges.

Q; What would be the best route to rebalance allocation in defense of a market down turn.

A: We believe a portfolio should always have a balance of longs/shorts/cash and options that leads to market exposure you're comfortable with. If you can get to 70% market exposure(or less if you wish), as we are, you may find less need or no need to rebalance. We manage our exposure, rather than focus on balancing assets. We want some positions that will make some money in all market environments.

Q: When you sell a covered call on a dividend stock are you paid dividends during the option period?

A: Yes. As long as you own the shares, you get the dividend. That's true even if you write covered calls on the stock. Just make sure the calls are out-of-the-money (or have more time value than the dividend) on the ex-dividend date, so you don't lose your shares to a dividend poacher. Other than that, all fine.

Q: Should I hold FIT, WSM, TRIP UA? All are not doing well.

A: We haven't recommended any of those, and unfortunately don't know them well enough to offer advice. Please ask at the sponsoring Fool service that recommended them!

Q: Where do we stand with the spy November 18 puts

A: We're fine. They're due to expire unused right now, but they're there for us should the market fall before then.

Q: What about the DPZ short, after a great results

A: We expect strong results from PZZA, too, and meanwhile we're OK with this hedge — though assessing DPZ's results to make sure.

Q: this market getting long in tooth...........I have troulble committing $400k to your old, 6/8 years

A: Keep in mind we only own things we want to go on owning, and new recommendations are not always better than previous ones (often not). We believe in each stock we recommend (that isn't on Hold). If you're concerned about the market, move gradually, averaging into our Buy stocks over time.

Q: Did you comment on VMI?

A: We did at the outset. We're going over earnings and will provide an update! Thank you!

Q: You sold DDD a while ago. Comments today as I own shares?

A: I'm not up to date on DDD, but last I looked a few quarters ago, I wasn't compelled to invest in it again. But you really should ask a sponsoring service at the Fool that recommends the shares! Sorry!

Pro Catch-Up Trades and Upcoming Expirations: Oct. 17, 2016

Published Oct 17, 2016 at 2:50PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **FactSet Research Systems** (NYSE: FDS): Buy 2%.

Continue building your portfolio with our Buys, including these highlighted today:

- **American Tower (NYSE: AMT):** Buy 3.9%.
- **Starbucks** (NASDAQ: SBUX): Buy 3.2%
- **Valmont** (NYSE: VMI): Buy 1.9%

Shorts:

- **Domino's Pizza** (NYSE: DPZ): Sell short 2%, along with *owning* 3.6% in **Papa John's** (NASDAQ: PZZA). This is a paired trade.
- **John Deere** (NYSE: DE): Sell short 2%, along with *owning* 1.9% in **Valmont** (NYSE: VMI). This is a paired trade.

Pro options:

- **Gentex** (NASDAQ: GNTX): Sell to open Dec. 16, 2016, $17.50 puts, aiming for at least $0.70. Sell one put for every 100 shares you could buy at a net $16.80. Selling 23 puts, *Pro* is looking to add 1.5% to our stake, for 4.4% total in stock.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY):
  - Set up the **December put ratio spread** as shared in this recent alert. Lately, today, it can be set up for a small debit ($0.05); or you can wait for a market drop, which may improve pricing.

Options expiring next:

- **Celgene** (NASDAQ: CELG): Our Oct. 21 $95 puts are on track to expire as income. We'll consider writing new ones as that happens.
- **Gilead Sciences** (NASDAQ: GILD): Our Oct. 21 $85 covered calls are currently on track to expire as income.

An Underappreciated Four-Letter Word

Published Oct 17, 2016 at 2:50PM

Fellow Fools,

Members new to *Pro* often find it easy to get excited about learning how to use options and short positions to manage risk and improve returns. We love those approaches too, but it's critical not to overlook some of the less novel -- but just as important -- strategies we use to achieve our North Star goal over the long haul. During a recent *Pro* stock talk meeting, I heard my fellow analysts use the phrase "better than cash" several times when discussing positions in the portfolio that are currently treading water and under review. For that reason, I thought this might be a good time to circle back on one of the risk-management tools that often goes underappreciated in the *Pro* portfolio -- our cash.

But first, a disclaimer: Remember that the cash I'm referring to is meant to live within your dedicated *Pro* portfolio. You shouldn't be double-counting your rainy day fund or your savings for a large upcoming purchase, like a down payment on a house. We intend to put our portfolio cash to work in the future, so it shouldn't be earmarked for other competing purposes. If you'd like to match the performance of the *Pro* portfolio, don't get a stuck in a situation where you're forced to decide between buying shares of your favorite company at fire-sale prices or replacing the broken air conditioner in your house (those things only seem to conk out on the hottest day of the year). With that said, let's move on to why we maintain a cash position in the *Pro* portfolio.

The Joys of Cash

We've written before about the benefits of cash as a hedge on market volatility, but we believe it will also play an important role in boosting our returns over time. That may sound strange at first -- wouldn't cash drag have reduced our returns over the past few years as stocks rocketed upward? All else equal, investors who were fully invested in stocks over that period did perform better, but anyone who's been around for a couple of market cycles knows that won't always be the case.

We consciously manage the volatility in the *Pro* portfolio, intentionally forgoing some of the upside of the market today so we're better able to react optimally when a market decline suddenly occurs. It's during those periods of market turbulence that savvy investors with cash to spare are often able to dramatically improve their long-term returns. When thinking about the benefits of maintaining a cash position, few have articulated it as well as Alice Schroeder, Warren Buffett's hand-picked biographer, who explains how he thinks about cash. According to Schroeder, "He thinks of cash differently than conventional investors. He thinks of cash as a call option with no expiration date, an option on every asset class, with no strike price."

For investors like us who use options regularly, it should be obvious why that sort of flexibility holds value, but there's even more to like about cash in today's market. As investable assets become more expensive relative to their intrinsic value -- a situation I believe we're seeing now in multiple asset classes -- the opportunity cost of holding cash approaches zero. Add in limited depreciation risk thanks to historically low inflation rates, and the cost to hold cash has rarely been lower. That explains why even though our long-term target is to have about 5% of the portfolio in cash, our cash balance today (excluding shorts and cash-secured puts) has grown to nearly 19%.

Learning to Let Go

That said, it's not good enough just to have cash during a market decline -- you also need a plan for how to redeploy it when opportunities abound. Most people think they'll have no problem buying when stocks go on sale, but in reality, it's tempting to hold on to that cash like a life preserver when you're not sure how deep the decline is going to be. To combat that tendency, some investors suggest using a mechanical approach to buying into a market decline, which is similar to what happens with our **SPDR S&P 500** (NYSEMKT: SPY) put ratio spreads. During the initial drop, our long puts become a source of cash, but after a certain point the short puts become a liability that obligates us to buy into a declining market. Having exposure to that downside risk can be a bit scary, but it also solves for a number of psychological biases that might otherwise keep us from pulling the trigger.

Further, we maintain a growing watch list of companies that meet our *Pro* quality criteria and that we'd love to own at the right price. After following those businesses over many years, we expect to be excited to buy shares when they're eventually thrown into the bargain bin. By considering cash a viable option for our hard-earned capital, we're able to remain patient and wait for those opportunities rather than risk overpaying and earning mediocre returns or worse.

The Foolish Bottom Line

The funny thing about cash is that there never seems to be enough when you need it the most. I'm sure many of us experienced that frustration in the wake of the 2008 financial crisis and/or the bursting of the dot-com bubble; in both cases, high-quality businesses were beaten up as badly as the rest of the market. In those days, fortunes were made by investors who could provide the market with liquidity. To be clear, we're not trying to be market timers, jumping in and out of investments based on our opinion of where stocks are heading. Instead, our decision to carry a larger cash position than "normal" at this time is the consequence of a limited opportunity set and the understanding that even though the return on cash is 0%, the value of its optionality is substantially larger.

Thoughts? Bring them to our Memo Musings board. Have a great week, Fools!

Foolish best,

-- Jeremy (TMFTank)

***Pro* in 300 Words or Less**

Motley Fool Pro's mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star.

We expect most of our gains to occur in our long-term stocks, since we target owning companies that are "compounding machines" -- those special few earning outsized profits that are protected by long-term competitive advantages, and that invest those earnings in still more profitable growth. Alongside stock ownership, we sell short weaker companies to profit on downside and market declines; we use options to generate income, leverage our results, or protect ourselves. And we hedge market indexes as an extra form of insurance.

Many *Pro* members only buy our stocks. Because we are a portfolio service, we recommend that you buy as many of our long stocks as possible, and try to match or come close to our allocations. You don't need to short or use options unless you want to. We run a concentrated portfolio (typically fewer than 30 long positions); we aim to have very low turnover (we want to own long-term winners and let them compound); and we construct our portfolio to be diversified, but still invested where we see the most opportunity and best business models.

We're glad you're here at *Pro*! We hope that our streamlined yet powerful approach -- whether you use our shorts and options or not -- will help guide your investment portfolio to new highs over time. -- *Jeff Fischer, advisor*

Using Scorecard in Motley Fool Pro

Published Oct 17, 2016 at 11:01AM

Welcome, *Pro* Fool! This TMF scorecard app does not track options positions at this time, but we do have options tracking spreadsheets for download here, here, and here. You can, of course, still track your *Pro* long and short positions here, and you can also:

- Personalize the coverage you get from us. Follow (for example) FB in Scorecard, and you'll get a daily or weekly email (your choice) whenever there's any coverage of FB in any of your TMF services. For *Pro*, that means earnings coverage, updates on strategies, and info from all of our Monday Memos.
- Keep a watch list of stocks you are interested in and track their hypothetical returns.

For questions, please come to the Member Suggestions board. Fool on!

Pro Guidance Changes and Completed Trades: Oct. 10, 2016

Published Oct 10, 2016 at 3:00PM

Pro Guidance Changes (from the past two weeks)

- **Pier 1** (NYSE: PIR): *Pro* has decided to cover its short on Pier 1 after the acquisition of a significant stake by a "vulture" fund. If you're still short Pier 1, we recommend you close your short now.

Pro Completed Trades (from the past two weeks)

- **SPDR S&P 500** (NYSEMKT: SPY): We set up our December 2016 $180/$190 put ratio spread, as described in the alert, for a credit of $0.06.
- **Pier 1** (NYSE: PIR): We covered our entire short position at $4.52 per share.

You can see all of our guidance, positions, and transactions from the Recommendations page.

Pro Catch-Up Trades and Upcoming Expirations: Oct. 10, 2016

Published Oct 10, 2016 at 3:00PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **American Tower** (NYSE: AMT): Buy 3.7%.
- **Broadridge** (NYSE: BR): Buy 5.3%.
- **FactSet Research Systems** (NYSE: FDS): Buy 2%.

Continue building your portfolio with our Buys, including this highlighted today:

- **Oracle** (NYSE: ORCL): Buy 3.5%

Shorts:

- **John Deere** (NYSE: DE): Sell short 2%, along with *owning* 1.9% in **Valmont** (NYSE: VMI). This is a paired trade.

Pro options:

- **Gentex** (NASDAQ: GNTX): Sell to open Dec. 16, 2016, $17.50 puts, aiming for at least $0.55. Sell one put for every 100 shares you could buy at a net $16.95. Selling 23 puts, *Pro* is looking to add 1.5% to our stake, for 4.4% total in stock.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY):
  - Set up the **December put ratio spread** as shared in this recent alert. Lately, today, it can be set up for no net cost ($0.00).

Options expiring next:

- **Celgene** (NASDAQ: CELG): Our Oct. 21 $95 puts are on track to expire as income. We'll consider writing new ones as that happens.
- **Gilead Sciences** (NASDAQ: GILD): Our Oct. 21 $85 covered calls are currently on track to expire as income.
- **Wells Fargo** (NYSE: WFC): Our Oct. 14 $50.50 covered calls are on track to expire as income.

The Likelihood of a U.S. Recession, Revisited

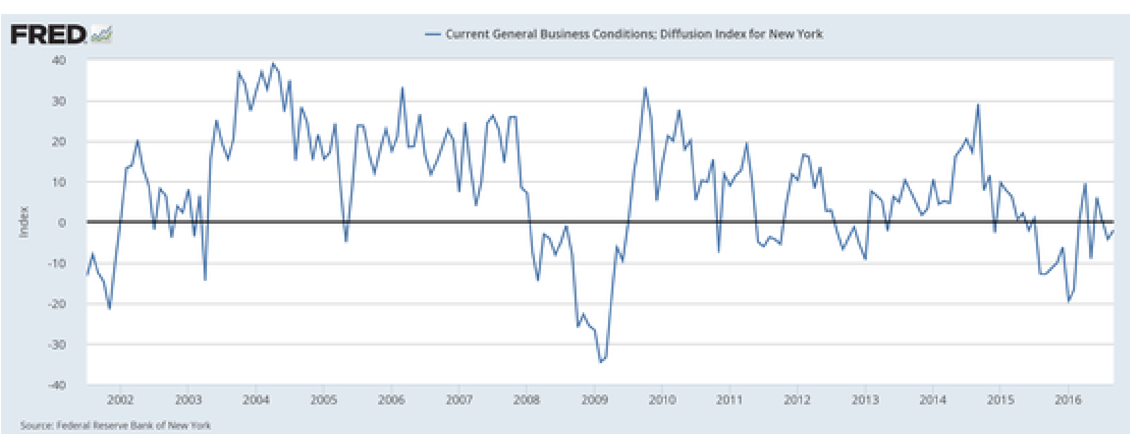
Published Oct 10, 2016 at 3:00PM

Dear *Pro* Fools,

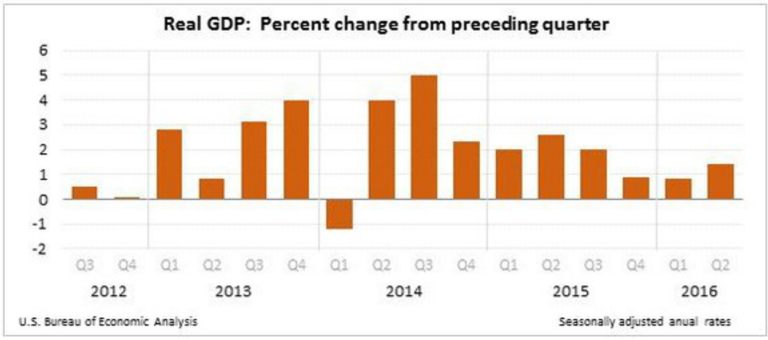
After the significant stock market volatility we experienced early this year, in late February I examined the likelihood of a near-term U.S. economic recession. Based upon an examination of three important data series, I concluded that the likelihood of a near-term U.S. economic recession was quite low. In retrospect, that conclusion has so far been correct. Crude oil prices have recovered from their lows, up 46% since the column in February:

Source: Bloomberg

The U.S. manufacturing sector is improving from its early in-the-year swoon, with the New York Fed's Empire State Manufacturing Survey up significantly from the low that was observed during the prior Memo (the index is at -1.99 for September, vs. -19.37 in January):



And according to the most recently released estimates from the Bureau of Economic Analysis, real GDP increased at an annual rate of 1.4% in the second quarter of 2016 (after being up 0.8% in the first quarter):



It's now clear that the U.S. hasn't been in a recession during the first half of 2016. But that doesn't mean one won't happen in the future, or that a recession isn't currently unfolding now. In this Memo, I'll revisit the three data series I examined last time, and see whether the data suggests that the likelihood of a recession has changed.

1. Job Growth

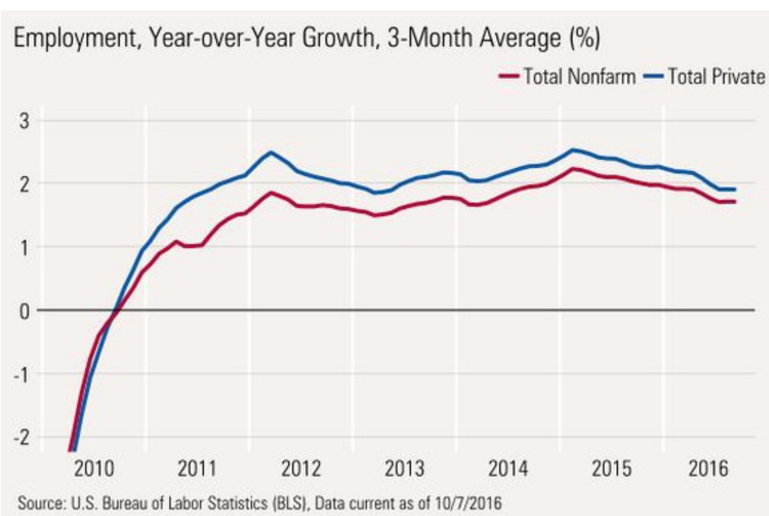
Higher unemployment rates are one of the most widely recognized indicators of a recession. For example, in December 2007, the national unemployment rate was 5%, and it had been at or below that rate for the previous 30 months. At the end of the recession, in June 2009, it was 9.5%.

As of the most recent reading, the U.S. unemployment rate is 5%, and it's been bouncing around that level since October of last year:

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2006	4.7	4.8	4.7	4.7	4.6	4.6	4.7	4.7	4.5	4.4	4.5	4.4
2007	4.6	4.5	4.4	4.5	4.4	4.6	4.7	4.6	4.7	4.7	4.7	5.0
2008	5.0	4.9	5.1	5.0	5.4	5.6	5.8	6.1	6.1	6.5	6.8	7.3
2009	7.8	8.3	8.7	9.0	9.4	9.5	9.5	9.6	9.8	10.0	9.9	9.9
2010	9.8	9.8	9.9	9.9	9.6	9.4	9.4	9.5	9.5	9.4	9.8	9.3
2011	9.1	9.0	9.0	9.1	9.0	9.1	9.0	9.0	9.0	8.8	8.6	8.5
2012	8.3	8.3	8.2	8.2	8.2	8.2	8.2	8.1	7.8	7.8	7.7	7.9
2013	8.0	7.7	7.5	7.6	7.5	7.5	7.3	7.3	7.3	7.2	6.9	6.7
2014	6.6	6.7	6.7	6.2	6.2	6.1	6.2	6.2	6.0	5.7	5.8	5.6
2015	5.7	5.5	5.5	5.4	5.5	5.3	5.3	5.1	5.1	5.0	5.0	5.0
2016	4.9	4.9	5.0	5.0	4.7	4.9	4.9	4.9	5.0			

Source: Bureau of Labor Statistics

The pace of job growth is slowly creeping downward, with a current reading of 1.7% vs about 2.1% in early 2015:



Recessions are strongly correlated with declining job growth. So the current decline in the pace of job growth indicates to me that all else equal, the likelihood of a recession has increased since the last time we examined this data series.

2. Wage Growth

Decelerating or falling wages are another strong indicator of a recession, as wage growth often declines in a recession.

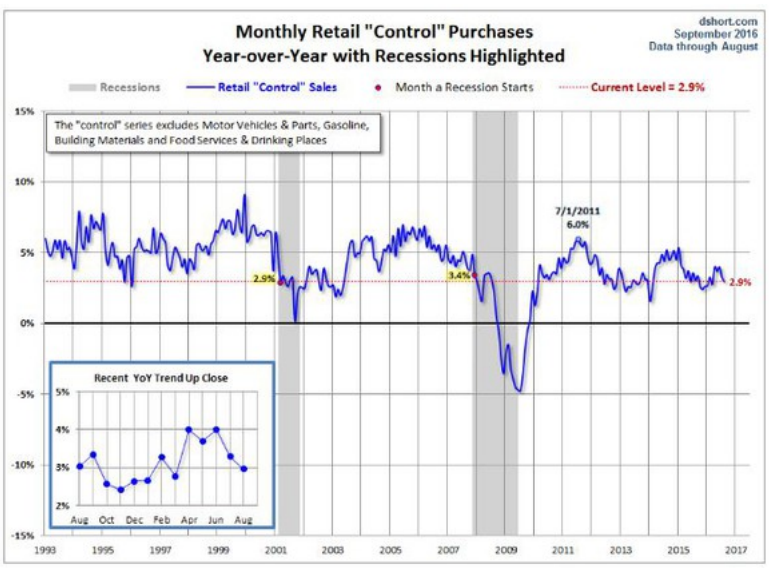
Private Sector Total Wage Growth and Components	Total Wage Year-over-Year % Change 3-Month Average	Inflation Year-over-Year % Change 3-Month Average	Real Total Wage Year-over-Year % Change 3-Month Average
September 2015	4.9%	0.1%	4.7%
October 2015	4.8%	0.1%	4.7%
November 2015	4.7%	0.2%	4.5%
December 2015	4.7%	0.4%	4.2%
January 2016	4.6%	0.8%	3.8%
February 2016	4.5%	1.0%	3.5%
March 2016	4.3%	1.1%	3.3%
April 2016	4.2%	1.0%	3.2%
May 2016	4.3%	1.0%	3.2%
June 2016	4.3%	1.1%	3.2%
July 2016	4.2%	1.0%	3.2%
August 2016	4.0%	1.0%	2.9%
September 2016	3.9%	1.0%	2.9%
Average (12 Months)	4.4%	0.8%	3.6%

Source: Bureau of Labor Statistics, Morningstar Calculations

Lately, real wage growth (i.e., adjusted for inflation) has been decelerating, at a three-month moving average of about 2.9% in September 2016 vs. 4%-plus late last year. As inflation rates have slowly crept higher, real wage growth has been pressured. This situation is likely to get worse in the coming months as energy inflation increases (see the recovery of crude oil prices above), pressuring real wage growth further. Again, this data series suggests to me that all else equal, the likelihood of a recession is higher now than it was in February.

3. Retail Sales

Slowing retail sales are yet another sign of a recession:



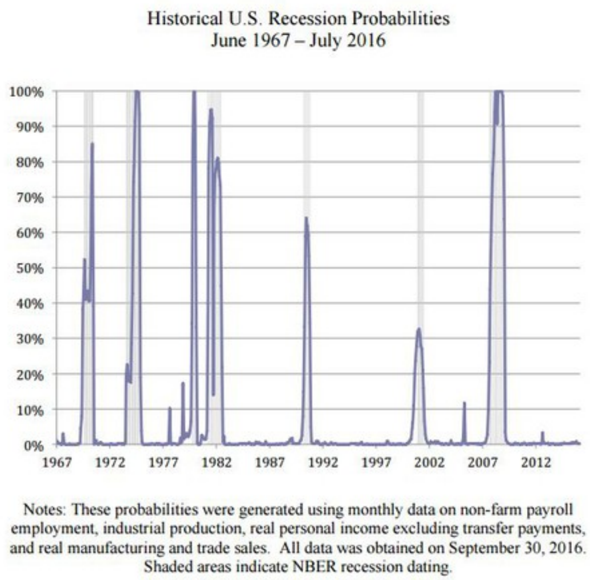
Source: advisorperspectives.com

The graph above examines "control" retail sales, which excludes motor vehicles and parts, gasoline, building materials, and food services and drinking places. This data series strips out certain volatile data series that can distort the true picture of the state of retail sales. As you can see in the graph above, the immediate trend is that "control" retail sales are experiencing decelerating growth.

The *Pro* Bottom Line

Despite strong stock market performance since my previous Memo on this topic in February, based on the data examined here, it appears to me that the likelihood of a near-term U.S. recession has increased since the beginning of this year. Given slowing job growth, deceleration in real wages, and slowing retail sales, there is reason to be somewhat more cautious about the state of the U.S. economy as we continue toward the end of 2016.

Of course, this data is a look back at what has recently happened, and although trends are worsening, what's happening now -- or about to happen -- could change that. And the less positive data doesn't necessarily mean a recession is right around the corner: According to the most recent data point (July 2016) from a [mathematical model that predicts the probability of a U.S. recession](), the likelihood is only 0.2%.



Fool on!

-- Billy (TMFBillyTheKid)

Pro Video Chat, October 2016

Published Oct 7, 2016 at 2:36PM

The *Pro* team held a live video chat on this page at 2 p.m. Eastern on Thursday, Oct. 20. Click below for a replay, or see below for a transcript!

Transcript

JEFF FISCHER :

Good afternoon, Motley Fool PRO members, and welcome to our October Chat. You'll see the live video on the screen that you're currently on and you can go to Slideo.com and enter the code, "PRO Chat October", that's "PRO Chat October", and ask your questions there and we will answer as many as we can.

Joining us on the chat today, as usual, is the PRO team with an extra, some added spice as well. Starting to the far left, we have Jeremy Myers, Team F-Tank. Jeremy?

JEREMY MYERS:

Hi Jeff.

JEFF FISCHER :

Good to see you again.

JEREMY MYERS:

Always excited to be here.

JEFF FISCHER :

Yeah, it's one of our favorite things of the month is to chat with you. And we're welcoming back to PRO, J.P. Bennett.

J.P. BENNETT:

An old face, but might be a new face to some people who just joined recently.

JEFF FISCHER :

That's right, new members may not recognize J.P. yet, but J.P. has been with PRO for quite a while. He took three or four months to work on The Motley Fool Asset Management Team and now he's back in PRO. So welcome back to PRO, J.P.

J.P. BENNETT:

Thank you.

JEFF FISCHER :

And we have on Skype, joining us from sunny Florida, Billy Kipersztok. Hey, Billy.

BILLY KIPERSZTOK:

Hello, great to be here.

JEFF FISCHER :

Good, we're all looking forward to seeing what you have in your surrounding environments today.

BILLY KIPERSZTOK:

I'm ready for it.

JEREMY MYERS:

We all reminded him to clean up before the video started.

JEFF FISCHER :

That's right, get the laundry done. And Billy told us he did get a bookcase.

BILLY KIPERSZTOK:

There is a bookcase, I can confirm.

JEFF FISCHER :

Excellent. So we only have, I should say at the outset, we have 45 minutes. We need to end at 2:45 today because of another event that's happening right on the heels of us . So we're going to get as much accomplished as we can in 45 minutes and we'll start by talking for a few minutes while you enter your questions into Slideo that we'll get to.

We'll start by talking about a few positions that are top of our minds, and we assume the top of your minds as well.   Let's jump right in with a stock that is on hold, Billy, and that's Wells Fargo, which just announced earnings last Friday as well, and our latest thoughts on that, Billy.

BILLY KIPERSZTOK:

Yeah, so I'm still parsing through their earnings report and I'm really trying to take my time with this one. I'm trying not to rush a decision as far as what we want to do with Wells Fargo. My initial thoughts on their quarter, immediately there's not much of a tangible impact from the scandal that you can see in their numbers. Their return metrics and account growth and certain other things, they seem to be pretty stable, although there were some other metrics that when you look just at September, which is when the scandal occurred, which was the last month of a quarter that was just reported, certain metrics including new account openings, when you look year-over-year from last year September to this year September. Mortgage referrals, certain other things took a significant decline, and that's most likely in response to the scandal that's been going on with Wells Fargo that you all know about.

So we're still kind of incorporating our thoughts about what happened this quarter and how the scandal is going to affect our long-term thesis. I will say that as far as our considerations for PRO are going, we want to consider; to make a decision about this, what we really want to think about is is our investment thesis significantly and materially changed? That's the first thing. Then the second thing is do we still trust management enough to maintain exposure to this position, because if we don't trust management, we shouldn't continue to hold Wells Fargo.

So those are the two questions that we really want to answer.   How is our investment thesis impacted moving forward and do we still trust management? We are still kind of processing and trying to determine the answer to those questions. As of right now, if I had to say which way we would be leaning towards, I would probably say that we may be leaning towards exiting the position, but again that determination has not yet been made and we are still processing the information. So that's our recap on our Wells Fargo position.

JEFF FISCHER :

Thank you, Billy. One good part about the time of year is it's the end of the year, or it's getting there, and we're reassessing the whole portfolio, as we shared toward the end of last month. We like to look at the end of the year, at all of our holdings, with extra scrutiny and potentially sell positions that are not living up to our expectations, that we think we can do better than.

Selling does a lot of things. It refocuses you. It makes you work harder in some ways to find something that you like much better than the sale, because you do feel that hole in the portfolio, that loss of exposure. But it really holds us to our standards. We really only want to own things that we believe in strongly, that we believe will match or exceed our North Star with reasonable risk, and if something is falling down on that account, we want to have the gumption to get rid of it, to move on and do better, to find something better.

So recently the PRO team met just a few days ago, and we talked about the handful of challenging positions in the portfolio, which included Wells Fargo and included Gilead right now and Valmont and Oracle as well. I'll talk about Gilead for a moment and then Jeremy can share some thoughts on Oracle and Valmont and where we stand at the moment.

But just so you know, we're always looking at each position, of course, and we're a concentrated portfolio so we're able to spend ample time on each position, and the ones that are not working out or that are lagging, we really want to make sure we still want you to own them , and that's what we're always working to make certain of.

So when it comes to Gilead, we decided as a team to keep the position for now. It's a high-quality business making incredible amounts of free cash flow. Revenue and earnings should hold fairly steady, at least the next couple of years, giving management time to perhaps make acquisitions to grow or buy at least part of a pipeline, or for it's own pipeline to offer more promise.

The stock is very inexpensive at around six times earnings, and even if free cash flow were to stay steady, we think the shares are worth more than this at this point. But that's only as of right now. We'll see earnings again in a few weeks and we'll again reassess and see if we want to keep it. Because we don't want to keep a value that is not going to grow, even if it's extremely cheap. If the business is not going to create value, we're not going to keep it, but for right now we're waiting to see how the next quarter comes out and what management has to say at that point.

Then Jeremy on Valmont reported today.

JEREMY MYERS:

Yes, let's start there because we have some actual news to cover. The stock was down about 5% earlier today, but it looks like it's bounced back. I've read through the earnings report; still working through the conference call. I would say it's more of the same, for the most part. There's not a big change quarter to quarter. We have them put in the bottom of the cycle and they're not bouncing back.

Their coding segment, they sell galvanized steel for infrastructure, structures, poles, things like that. Demand in the US was down a little bit, and especially from some of the solar power producers, less demand for custom projects, but there are some bright spots. I'll add in that the agriculture segment, the irrigation segment, is still down, which has some implications for the Deere short, which sort of confirms that they don't expect anything to improve anytime soon.

Very consistent with what Lindsay said, which is their biggest competitor there. But the one thing that Lindsay had said that you're seeing in Valmont's reports is that pricing has stayed consistent. They're at least being rational and they're not trying to just undercut each other. So the company continues to manage the business pretty well. They're cutting costs, they're starting to see improvements there, operating margins up about two-and-a-half percentage points year-to-date, so that's an additional $17 million in profits they've been able to achieve. They're starting to see improvements in the utility sector on Asian telecom and some of the overseas agriculture markets are actually improving a little bit.

So a few bright spots looking forward. The quarter was sort of a ho-hum quarter. I think that the initial reaction was probably the market just waiting and becoming frustrated, trying to time the bottom and it's still not here and there's no indication that it's going to be the next quarter too.

JEFF FISCHER:

Thank you, Jeremy. I see we have a lot of questions here. I'm the admin today on this as well, so Ellen can work on other projects right now. Please thumb-up the questions that you would like to see answered first and foremost. I think we can go right to questions because the other positions that we've talked about lately, as positions that we're focused on for what to do next, including Deere and Oracle, as we just talked about, they're showing up in your questions, so I think that's a way we can address them.

And let's go through quickly your questions and get to as many as we can. As shared, we only have until 2:45, so we have just over half an hour and let's see if we can get all of your questions answered.

We'll start with Kathryn, who is the most thumbed-up. Kathryn's new to PRO. Welcome, Kathryn. We're glad you' re here, and we hope you'll be here for many years, long enough to see what we're about and to prosper because of it, I hope.

Wells Fargo, will we have a stock repair for this? Billy just spoke to this, J.P., if you want to reiterate what Billy said or where we stand on Wells?

J.P. BENNETT:

I mean we're still considering, right to [inaudible] response. We're still considering it. There are challenges th ere, but if we don't like management, we really don't see a reason to own the stock. Well could in fact be a value trap, and that's what we try to avoid, right? We'll never hold a stock just because it's cheap. Sure, it's cheap on a historical basis, but it may be warranted, just with the changes, both company-specific and industry landscape, right? Maybe you think about regulations becoming more stringent, the capital they have to hold being higher. You've seen for a lot of banks, just the returns that they're able to generate on their investments have been less than what you've seen historically, not just because of where interest rates are.

So weighing all the factors, and we'll have a decision relatively soon I feel like.

BILLY KIPERSZTOK:

Also Kathryn, you mentioned that Wells Fargo is a Buy First, but it is no longer a Buy First; it has been placed on hold. So just kind of a semantics thing there, but it's important. It's not a Buy First; it is on hold.

JEFF FISCHER:

That hold was several weeks ago, I think, it was put on hold. We convey that every Monday in the Monday Memo, as well as on the discussion board.

Okay, great. So I can answer this one. Red44, thank you for posting, is asking, "What is the long-term plan for SVXY, which is an ETF vehicle that should grow in value over many years , as long as volatility is relatively stable or when it spikes, it regresses back down to the mean. And during periods of low volatility, ongoing low volatility, that's when SVXY should really shine and give us the kind of compounded 10% annualized we hope for at least, returns that we're seeking. So I view SVXY as a small, one-percent, very long-term holding that should compound, given the dynamics of the ETF, given that it shorts the futures of the VIX, of the Volatility Index.

Now for people who have more knowledge about those ETFs, such as VXX, which we've shorted in the past, we're considering adding a small short of VXX as well, because that short has, in the past year, two years really, outperformed along of SVXY, but shorting has other complications. You can get called out. You can't compound, so the position just shrinks over time, so we might do a combination approach. But my plan is to hold SVXY a long time.

Then we talked about this week, when SVXY falls sharply, since we now have more belief in its ability to come back and then reward us over time, we may add a small trading position to it when it falls very sharply, so why n ot use big spikes in volatility? This is something J.P. has argued for the past week. Use big spikes in volatility to add to SVXY, so I think we're all on board to potentially do that next time.

J.P. BENNETT:

Yeah, if you think in terms of tactical decisions, something like this that is go ing to move very sharply when the market is getting hit since the falls tend to be more volatile than the climbs up. It's a really easy way for us to kind of adjust our position in the portfolio with one decision, right? Given back earlier in the year when the market did get hit, it fell around 40% or so. Yes, it came back, but if there's something in the market that makes us want to adjust our exposure, it's an easy way to go about doing that.

JEFF FISCHER:

All right, so thank you for the question. I hope now you know, for now, we plan to keep SVXY for a long time and we may add little positions to it at times.

We have a question from Lon, hey Foolon, good to see you and thank you, as always, for all of your help on that discussion board. You are really incredible out there in helping so many members, and us too, in the work that you do, so thank you. Very Foolish. Lon is asking, "Any thoughts on Gentex as the shares fall a little today?" Billy, any thoughts on the Gentex puts or Gentex itself?

BILLY KIPERSZTOK:

Sure, since you prompted it, I'll start with the puts. Obviously it depends upon our assessment of the business what we want to do with those puts, but our puts expire, let's see, in December, so we still have two months until the expiration of those puts. They are currently right now in the money, so as it stands, if the stock price would stay the same until December, they would be assigned and turned into shares, which is something that we stated we were okay with in our initial put right alert. And anytime you write puts, you want to make sure that you're okay accepting the stock if it were to be assigned to you. But we may, as we have done with several other written put positions, roll that put out to a later month targeting further income, or we may decide to just accept more shares and buy more of Gentex.

And that kind of segues into the next part of the question which is, what did I think of the quarter? I thought that the quarter, at least based upon my cursory look at results, which I did this morning, it seemed to me to be an excellent earnings report. I wrote a little bit like my first-take thoughts on the Gentex board, so you can check that out . It was in response to CMF, who had posted about their earnings release and I wrote something there.

The company is doing well. They're increasing revenue. Revenue grew at greater than 10%. Earnings per share is growing near 20% year-over-year. Gross margins are as high as they've been in many years and seem to be continually increasing and the company just continues to execute really well and it's trading at a valuation that in my estimation is pretty cheap, and you can see that as a good deal below our fair value es timate.

So Gentex is a company; it's one of the companies that I cover that I have the most conviction in as far as at this price and at this valuation. The biggest risk to them being a migration of technology away from the mirror in cars, which is not something that we should discard, but I don't see that as a major risk anytime in the next three to five years, which is the period we are focused on with our long investments here at PRO.

So as for Lon's specific question as to why the shares fell a little bit today, I'm actually kind of surprised to see that because earlier today, after I looked at the release, Gentex was actually up about 2%, and that was earlier today, and now they're down about 2%. So I'm not sure if management said something in the conference call or an analyst asked a question that got a non-satisfactory response, but to my eyes, initially without having fully analyzed the quarter, seemed like it was a good quarter and Gentex continues to execute just as we expect, so things are looking good there.

JEFF FISCHER:

Sounds good, Billy. It could just be post-earnings volatility by selling and buying, who knows? But we'll look forward to your update on Gentex as you go through results.

J.P., I'll ask the next one from Kathryn again of you , and as we step to that question, first I'll say that Proport is up about 6.5% year-to-date, which is just a tad below the North Star at 7.2%. J.P. mentioned earlier, well we have the Santa Claus rally to look forward to, so maybe that'll help us.

J.P. BENNETT:

The North Star doesn't benefit from that, but we will.

JEFF FISCHER:

And I think we're a little above the indexes right now, so even though I personally feel that we've had kind of a challenging year with some challenging positions and some mistakes I've made, we're still doing pretty well on our returns, especially for veteran members. Then newer members, as always, as we always have said the past eight years , once you're with us a few years, your return should move in lock-step with us over time and hopefully you'll benefit every rolling three years with nicely positive returns , but so far this year, as with last year, a fairly up and down flat market, and we did well last year. I can't complain this year, although I'd like to be doing a bit better, but still not a bad year by any means so far. And hopefully we'll improve upon it going forward.

So J.P., I was going to ask you, and it just jumped down, but we'll still ask it anyway because you probably looked at it and are ready. Kathryn asks, "Percentages for stock buys resulted in fewer than a hundred shares for small accounts. How does that affect future options participation?"

J.P. BENNETT:

I think the way we've always talked about it is the core of your portfolio should be holding great stocks, right? And then you layer on top of that option strategies, if you can, and so even if you can't buy a hundred shares, you can't buy it in round lots, so maybe you'll have to miss out on future options strategies for a particular name. we would never recommend buying a stock if we didn't believe that it could beat the North Star on its own right, just with the stock going up in price. So I wouldn't be overly concerned with that. It's always a great benefit to kind of have that tool in your pocket for in the future if something doesn't work out like you want and you maybe want some extra income or something like that, but at the core, buy shares of great companies. That's what we strive to do and so do that, even if you can't buy in round lots.

JEFF FISCHER:

Sounds good. Which then leads into our next question. The one at the top now is from Anonymous. "Has PRO ever sold a stock? We've been riding Gilead downwards all year. Gilead has had a rough year . Starbucks; Starbucks, come on. Great stock over the years, but flat or down this year.

MALE:

It's only down around 13% or so since peaking last year. And I'll just quickly jump on that one; you can speak to the other ones. But that's a stock that I think since I took over coverage two or so years ago, I've always said, man, this valuation is pretty frothy or pretty full, right? Frothy, I don't think it's a bubble, but just speaking in terms of coffee-speak, right? But I actually like that it is kind of going nowhere because that gives it a chance to grown into its valuation, right? Because if you look at the business, it's still doing tremendously well and so the stock goes nowhere, but the fundamentals continue to improve, the stock just becomes cheaper over time and so it's down only 13%, like I said, since peaking last year. I'm not really all that worried, to be honest with you.

JEFF FISCHER:

And we have sold many stocks over the eight years. I don't know, more than a dozen easily, maybe 18, maybe 20. Because we're always trying to improve the portfolio and focus on companies that we believe in most strongly. Some stocks we've bought just opportunistically, like in energy and metals and things like that, and sold when our thesis played out.

BILLY KIPERSZTOK:

AIG as well.

JEFF FISCHER:

AIG as well. To speak to the other few that you mentioned here and then conclude with a point, I hope. Faxet we just started buying in May, we recommended first in May and a 2% position, and it's up from the day the alert went out; it's still up. It just ran up further than I would have expected and then gave those gains back, but that's all short-term stuff. We believe in the business and for the past 20 years it has grown earnings every single year, it's grown revenue for more than 30 years straight, 35 years. It's a good business with pricing power, strong recurring revenue, 95% retention rate on customers, so we believe in the long-term of that stock. We're actually looking at it to maybe add a little bit more, now that it's come back to our original purchase price.

Gilead Sciences , as we talked about earlier, even as it hits record free cash flow as a business, the stock is down I think 20, 25% this year. That said, biotech has had a rough year as well. Celgene is down quite a bit along with some other giants. But as shared earlier, we believe in the business. If that is not the case, if we don't believe in the business anymore or the stock price, then we will indeed sell.

We're always looking for things to put in the portfolio that are better than what we own, and since we're a limited cash portfolio, we don't add cash to the portfolio; we do need to sell to keep a cash balance and keep buying new things that we like more. So you will see sells the longer you're with PRO, definitely. But we're very particular and deliberate in our sells, in most cases, unless something really throws us for a surprise.

BILLY KIPERSZTOK:

And Jeff?

JEFF FISCHER:

Yes, Billy?

BILLY KIPERSZTOK:

I'm sorry if I didn't catch it or if you already went into this, but did we go over some of the stocks that we had recently sold?

JEFF FISCHER:

No, we just mentioned AIG and there's things like Cameco and L-3 and…

BILLY KIPERSZTOK:

Things that come to mind for me are Buckle and Tupperware as well. So we definitely do sell stocks, but it's not all that frequent.

MALE:

The Buckle is a great example of kind of a value shot that we got outright. It was really cheap. It remains cheap, but we just looked at it and we're like we don't really believe in management's direction, we don't believe in the fundamentals, so we're getting out even though it's cheap. It's had a pretty rough go of it since we sold it.

MALE:

We try really hard to differentiate between market volatility and shifts in sentiment towards the company is not unusual for stocks to move up and down 10, 15% for no reason versus shifts in fundamentals of the underlying business and the industry, which definitely needs work and we spend time trying to figure out if that changes the investment thesis.

JEFF FISCHER:

That's a great point, and over time so far, our turnover has been about 10%, so far below the average mutual fund, which I know is 40ish, 50% even, which means they're selling, they're churning half their holdings every year, which is not a way to generate good returns. We like our turnover to be low, 20% or lower, 10% is great, lower than that, fine, some years, because that's the way you compound. We're always looking to trade up into better companies that we can then keep for years and years. So my two cents.

GoodName is asking, "Most recent alerts have related to options. Do you see this as a favorable environment for using options? Why?" Ironically, you guys can add whatever you wish to this, but I would say no. Options aren't paying well right now. That said, the stock market is in some ways even trickier than options. Do you guys want to expound on that?

MALE:

I would say my stance right now is personally I place an even higher emphasis on making sure that the effective entry price is the price I'm willing to actually buy shares at, right? I'm willing to give up a little extra yield because let's be honest, most options don't pay very well, and so I'll give up a little bit extra if it means I get to write puts or do options on a company that I'm really comfortable with and effective entry price that I actually really want to buy shares at.

JEFF FISCHER:

I think as the year ends and we reassess the whole portfolio, it's fairly likely that we'll see some sells and some new buys, as well as new shorts. So it has been pretty option-centric in the past year. We've been targeting income, that's true, but it's also been challenging to find stocks that we're really excited to buy, that we like better than what we already own and so forth.

But as we manage the portfolio, we're likely to move ahead in baskets of sells of two or three and purchases of two or three and new things, and so we may not be quite so option-centric. I know we won't be all the time so options-centric, but it's a touch environment for both options because they don't pay well right now and stocks as well. There's a lot of risk out there.

MALE:

Valuations seeming a little stretched on a lot of companies and we have a number of holdings that seem to be moving sideways, at least in the short term, but no obvious catalysts for the next quarter or two. It's probably not surprising that you've seen a number of cover calls in income-type positions, and we'll probably continue to do that.

JEFF FISCHER:

That's a good point. We've done more covered calls this year than we have I think, perhaps since inception pretty much. So Heck Creek, hey Heck, hey Ben, is asking, "How much were we smiling after AXP announced earnings?" I'm glad the stock is up about 10%. It's just a good example of when you believe in a business, as Jeremy talked about a question prior, you give it time to play out. And as we've talked about here as well in the past, we don't want our whole portfolio to be doing well all at once, because that means it's likely all going to do poorly all at once. History and studies show that laggards in good companies, lagging stocks of good companies become leaders later on and vice versa. So to smooth out your returns a bit, it's good to have some good companies that have lagging stocks right now in your portfolio.

That said, AXP is only in Motley Fool Options, where we have the stock, but now that shares are up so much, maybe we'll look at covered calls there finally. But I still believe the brand and the business will prove itself out over the long run.

So now a question from Kathryn; we already answered that question from Kathryn. Stocks are the main show here; options when you can do them. Great. And a question from Mike, "Heads up on what we'll do with Nike, diagonal after tomorrow's expiration?" That's a Motley Fool Options position. I was writing something up on it today that may go out as soon as tomorrow as those calls expire, so watch your inbo x soon.

And Tim is asking, "What would be a good breakdown of our cash allocation, such as income and hedging and market correction purchases?" If any of you want to jump in on that, you certainly do. It's a tough question, so I'll thrown in that on average over time, we've averaged 72% long, about 20% short and 10 ish percent options/cash, very roughly speaking. And we'll go whichever way the market seems to tell us to go. We don't have a set allocation framework that we're always going to stick to. If we're bearish, we could be no more than 50% long or less, so we'll be flexible with the market opportunities.

I don't know if you guys have anything you'd like to add to that, to Tim's question?

BILLY KIPERSZTOK:

Yeah, I don't really think of our cash allocation as having different baskets of like using a portion of our cash for income or a portion for hedging or a portion for something else. I kind of just view the cash by itself. The amount of cash that we're holding relative to maybe the amount of short put exposure we have or the long exposure that we have, that kind of gives you a sense of how we feel about the market in general. If we're holding more cash than we normally do, maybe we're feeling a bit more defensive, and if we're holding a bit less cash than we normally do, maybe we're feeling like there are some opportunities in the market for us to pursue. So the way we treat our cash is a way for you guys also to gauge our sentiment.

JEFF FISCHER:

Jeremy just wrote about cash in this week's Monday Memo too.

JEREMY MYERS:

We get a lot of questions about that.

JEFF FISCHER:

But thanks, Billy. That was a better direct answer to Tim than I gave now, rereading his question.

Okay, we're going to go down to Leslie's question. Great to see you, Leslie. You can see she's welcoming J.P. back, questioning about Deere. Great to see the rest of us. Thank you, Leslie, for as always, your very kind comments. Billy does rock the tie. J.P., quick thoughts on Deere.

J.P. BENNETT:

Quick thoughts, or can I have the rest of this chat?

JEFF FISCHER:

We have 13 minutes and I'm hoping we can answer all these questions.

J.P. BENNETT:

Well don't count on it because I'm about to get started. Quick take, I posted some comments up on Deere's board. I know you guys hit on it while I was away and it continues to be the case in the months since they posted earnings. Results for the industry are pretty abysmal, right? If you look at it on a monthly basis, four-wheel drive tractors down 20, 30% month over month over month over month. And in many cases Deere is down more than the industry, so their fundamentals are not; it's just the industry is not doing very good.

You look at other people in the industry and they're saying you could see upwards of two, three planting cycles before you see any kind of changing sentiment for orders. If you just kind of look at that part of the thesis, it's playing out perfectly. The part where we kind of messed up a little bit on and it's really important if you're going to be good at shorting over the long run is being able to identify when sentiment is really going to break down.

So what we saw with say something like World Acceptance where that short worked out amazing because we identified A, when the fundamentals were really going to start to deteriorate even at a faster pace than they were previously and the second part is we also identified when sentiment was just going to get super bearish. We were able to turn that pretty good, and to be frank, we were wrong in terms of that part. If you look at kind of the industrial machinery index for the S&P since bottoming out when the market fell, it's upwards of over 30%, right?

So if you think in terms of just kind of sector rotation and kind of trends like that, there's just a lot of money that's flown into this industry because people are saying that the bottom is in and I fundamentally don't believe that is the case. When you look at heavy equipment, those cycles take years to play out, to kind of reverse course. And so we still think that eventually things are going to play out like we want, but at the same time, we need to kind of be humble and practice proper portfolio management and not just be like we're going to hang onto this thing until the very end, right? We need to be humble and recognize maybe people just are going to forever look two, three years down the road and kind of have that pie-in-the-sky analysis.

I think based on how the industry basically overextended itself due to the commodity super cycle, it's going to take years to play out, but right now the stock is not trading based on those expectations. People are saying that maybe the bottom is in this year and it's going to rebound sharply and so we're going to keep watching it, but it's not going to have a leash that extends for years and years. We're going to make what we believe is the best decision.

JEFF FISCHER:

Thank you, J.P. And now we have ten minutes left, and let's really see if….

J.P. BENNETT:

That wasn't too bad.

JEFF FISCHER:

That wasn't. that was good. It's a complicated question, and we're going, as J.P. said, we're reassessing it every week now.

Let's see if we can get through all these. It will be a miracle, but I'll start with Snide23 who says, "Why no call writing on DGS since the first one? What has changed in the thinking since then?" What's happened is emerging markets have been stronger. The ETF is now around 42 up from 38 where we wrote the first covered calls, so it's good those calls expired and we haven't covered it again. That's quite a move for an index since then. And the ETF is near a 52-week high , which would be a good thing if it can get to that. Just kind of confirmation that there's buying interest there and the valuation looks reasonable still. And the calls have not paid well, so that was part of the thinking too, so really it's good to seem some appreciation and we'll write calls again only if they pay well and we like the valuation pricing on it too.

Anonymous is asking, "The thinking on AmTrust? Keep holding for larger growth long term? We don't hear much from you on AmTrust from you lately it seems." It's true, AmTrust has had a quiet year. I'll just say, and J.P. if you want to add anything of course do, but it's a stock I've known 11, 12 years now and I still like how they're growing the business largely through acquisition over time and I think they've done something different in the industry and created value because of it and I think in the long run, as long as we believe in the thesis, we will be keeping it long term.

J.P. BENNETT:

I would say maybe just a little bit more pessimistic and we're a motley bunch, so we can always have different opinions, right? And just if you think about it in terms of where the insurance and reinsurance markets are, they're extremely competitive. There's a ton of money that has flown in from hedge funds and from other people and so you look at it, the returns these companies are able to generate going forward, are not as great as they once were and I do believe you are seeing people start to kind of move into segments where before AmTrust was one of the few players.

There's a lot more people playing. I think it's going to be a lot more competitive going forward, so I wouldn't expect the same type of growth going forward unless they are willing to kind of reduce how kind of strict they were with their acquisitions and kind of maybe play a little more fast and loose with the type of risks that they were accepting. And if you look at certain segments of the insurance market that they're playing in, the market looks like it's had some really great years and so it's probably going to start tightening up and conditions are going to start worsening and so I think that probably has some thing to do with why AmTrust stock has been a little bit troubled recently.

JEFF FISCHER:

It also ran up so far in prior years. But yeah, you're right. I would expect them to make acquisitions that are kind of complementary to what they do as well, to grow a bit more, grow their fee business some more potentially. As with any insurance provider, you have to believe in management, which we've talked about a lot because there's risk there too, but so far, we're with it. Good points though, J.P.

We have seven minutes to go; let's see how far we can get. We're in pretty good shape. Anonymous is asking, "We mentioned Oracle, but we haven't yet expanded. Jeremy, we just talked about it this week and Jeremy shared his thoughts with us, with the team on the thesis.

JEREMY MYERS:

Oracle is a stock we've owned for a long time now and I would say as a whole has probably underperformed our expectations and has been going through a transition over the last two years or so from an on-premise license business where they get all their cash upfront to a software-as-a-service subscription business and the economics of those two businesses are different, so there's been some distortion in the financials. What you're seeing is sales growth has slowed. The top line is about flat. They're not making a lot of new licensure sells and within that on premise business, they're making up for that by selling support and updates.

So my one concern there is a lot of open source software is becoming much better and much more competitive in the market and they need to be able to defend that part of their business while the cloud business is growing. At this point, the cloud business is only about 10% of sales. Now it's growing. Last quarter grew at 80% and is actually starting to grow faster as it gets bigger, which is pretty amazing for the size of the company. So this year it'll probably grow, [inaudible] just got in for 65+%, so that's impressive and there's a great reception for the product, but we need to look down the road three or four years and be convinced that Oracle's going to be able to also transition a lot of those legacy database customers into sort of a hybrid cloud model so that they'll continue to capture that cash and that profit is available in the industry.

I wouldn't say that I'm negative at this point; I'm just skeptical and just trying to think through what that's going to look like.

JEFF FISCHER:

We ended our last meeting with Jeremy saying some things are starting to go in the right direction, definitely, and they've maintained their core free cash flow well; they just haven't grown it for several years. So let's give them another quarter; we'll see results again in December and we're just going quarter by quarter, kind of…

MALE:

I want to see management deliver on the profitability expectations that they've promised for that cloud business, that they expect to get to 80% gross margins. They've grown from 40 to 60 over the last year, and they also claim that the business as a whole has hit a trough in profitability and it should improve from here on out. So if they're able to deliver and you start to see that trend reversing, I'd be much more positive.

JEFF FISCHER:

And we do believe that the risk should be reasonable while we wait to see it play out, at least quarter by quarter as we go.

MALE:

Sure, and I don't see a ton of downside at this point either. I wrote in my last update that I sort of look at it as ballast in the portfolio. If there's volatility, I don't expect it to get hit all that hard while we're waiting for some of those new initiatives and new investments to really start to pay off.

JEFF FISCHER:

Great, so Karen is asking, "Do we plan to write new puts on Celgene after ours expire tomorrow?" We did make good income, expiring tomorrow, and we'll see as we look at the portfolio as a whole, we'll make that decision fairly soon.

Any updates on Wells Fargo? We talked about that right at the outset at two o'clock, so this is a good reminder that this will be on the PRO website, archived indefinitely, so you can revisit and if you miss anything, you'll see it there.

I think this next question from Mitchell, I'll go through quickly too because I think it regards Motley Fool Options more than PRO. "A lot of trades cannot be filled at the strike prices indicated." We usually provide flexible guidance, even if it's a spy-put ratio spread that you may be talking about, you move your strikes up or down in accordance with how much the spy has moved in that case and/or no matter what you're talking about, PRO or Options, watch Strategies You Can Start on Friday for updates or with PRO Catch-up Trades on Monday.   So hopefully that will help you. Then really read the pricing guidance too, because we try to add flexibility and timely advice over the weeks, no matter when you show up to the trade, this yield per month, etc.

Current thinking on Deere short? J.P. just covered that. Anonymous, here's one for Billy, I think, "Covered pizza shares with calls expire tomorrow." So this is timely. "Shares are 80. What do you think you should do?" What should anonymous do, Billy?

BILLY KIPERSZOTK:

I think it depends on why you wrote those covered calls. If you did it as part of an alternative trade for when we shorted Domino's Pizza to hedge a portion of your portion, perhaps you could let those shares go because at this point for PRO, now that we've shorted 2% in Domino's Pizza, it basically effectively lowers our Papa John's exposure by 2%, so if you kind of did the covered calls to match us, when you sell, you're going to end up being at the same level of exposure in pizza that we are. Now if you sold those covered calls for income and you don't want to lose those shares, then you might want to roll them up and out. Really it depends on why you wrote those covered calls.

Now with respect to your specific question, is do we see pizza, Papa John's, making a move? I'm not sure whether you mean making a move down or up. If it does make a move down, we are hedged by our Domino's short, and if it makes a move up , it may or may not, I'm not sure. They report earnings in a couple of weeks, I think in early November, and if those earnings are strong, then the stock might rise, but whether you roll those calls is really up to you as far as why you wrote them in the fist place.

JEFF FISCHER:

All right, thank you, everybody. We do have to wrap up here, unfortunately.   Jayco, a final question on Skyworks? That's an Options position that expires next week. No need to take action as long as Skyworks stays above $72.50. Couldn't help myself there.

So the rest of the questions we'll just answer and put on the site along with this archive chat and video. So thank you, everyone. Jeremy, thank you.

JEREMY MYERS:

Good to be here.

J.P. BENNETT:

Glad to be back.

JEFF FISCHER:

J.P. good to have you back, and Billy, thank you for the snazzy tie and calling in.

BLLY KIPERSZTOK:

No problem, thank you. Pleasure to be here.

JEFF FISCHER:

Thank you, Motley Fool PRO members. We'll see you on the boards and we'll see you again in the Monday Memo as well and next month for a chat as well. Thank you. Fool On!

Close Your Short on Pier 1 Imports

Published Oct 5, 2016 at 1:52PM

How You Participate

- **Trade:** Buy to close your remaining short shares of **Pier 1** (NYSE: PIR).
- **Allocation:** We are currently short 3,700 shares, or 0.6% of the portfolio.
- **Price Guidance:** ***It is incredibly important that you use a limit order*** and aim to close at going prices. ***If we all set limit orders at no greater than the going price, we may be able to avoid causing the stock price to rise due to the collective action of our membership.***
- **Price (as of 1:38 p.m.):** $4.53

What We're Thinking

After placing the stock on Hold a few weeks ago (watch or read about that decision here, from our late-September Portfolio Positioning Event), today we're recommending that *Pro* members close their entire short positions on Pier 1.

Last week, the company reported second-quarter 2017 results. Those results had already been pre-announced, and they were not good. The company reported decelerating same-store sales or comps (-4.3%), declining net sales (-6.7% year-over-year), and negative operating and net margins. Management also guided to continued comps and sales contractions for the rest of the year. In a vacuum, our short thesis (that the company's brick-and-mortar business is in a serious long-term decline and that it doesn't have the resources to compete with big-pocketed competitors in the omni-channel market) is playing out just as we'd hoped.

However, we don't live in a vacuum. On Sept. 19, management disclosed that hedge fund Alden Global Capital had acquired a 9.5% stake in the company. Alden Global Capital is a secretive hedge fund that focuses on distressed equities. Recently, Alden Global has been known for buying up news media assets and making significant changes to the companies; Alden Global's principal investor, billionaire Randall Smith, has been described as a "pioneer of so-called vulture investing."

Following the Alden Global news, the company quietly disclosed on Sept. 27 that it was adopting a "Short-Term Shareholder Rights Protection Agreement." In Pier 1's words, the rights from the agreement "restrict any person or group from acquiring beneficial ownership of 10% or more of the Company's outstanding common stock (including, for these purposes, certain derivative securities) after the date of this announcement. The Rights will not prevent a takeover of the Company, but may cause substantial dilution to anyone acquiring 10% or more of the Company's common stock, which may block or render more difficult a merger, tender offer or other business combination involving the Company that is not supported by the Board of Directors."

Based on this agreement, our assessment is that management is likely expecting Alden Global to pursue a hostile takeover of Pier 1, either by buying up more shares in the public markets or by making a tender offer to current shareholders.

We have prior experience with an activist investor targeting one of our struggling shorts (see our position history with Boulder Brands). Combined with the above assessment, this makes us content to close our position now for an approximate 9% gain in the three months since we started it.

We still expect further decline in the company's business, and it would have been nice to be able to continue holding the short. But risk management dictates that the proper decision is to close our short now. Shorting is inherently much more tactical and timing-based than investing in core long positions, and we must be willing to act quickly and decisively when needed.

Once we've closed this position, we can then keep an eye on the company's situation and see whether an alternative strategy is possible later, which will depend on how our assessment of the investment thesis changes. And even if we don't reinitiate a strategy on Pier 1, we can be content with our 9% gain on this position in a short three months, while the market indexes increased to new highs.

Alternative Trades

- **If you set up a any other alternative position on Pier 1 (synthetic short, bearish spreads, etc.):** We recommend that members who followed us using an alternative trade close their position as well.

Pro Can Help

- Questions? Head over to the Short Pier 1 discussion board.

The Facts on FactSet Research

Published Oct 3, 2016 at 3:27PM

Dear *Pro* members,

October has begun, hearkening another month of earnings reports -- and the final quarter of the year. We like to use this quarter to reassess all of our positions with a *twice-as-critical* eye, making sure we don't want to close some by year-end (perhaps for a tax loss where we're losing faith, or to clear room for new positions we like better). Some of us, myself included, are slow to pull the selling trigger (I tell myself this is a much better fault to have than selling too quickly!), so I find the year-end gut-check helpful. Expect updates on this process in the *Pro* port from here through the end of December.

Meanwhile, data and analytics company **FactSet Research Systems** (NYSE: FDS) was ahead of the pack in announcing fourth-quarter 2016 results last week, but the stock has been kicked in response. Those results continued FactSet's long streak of steady growth, but were shy of average Wall Street estimates. That fact, plus fear of customer cancellations, plus analyst downgrades all combined to clock the stock. After going through results, we don't share Wall Street's concerns to nearly the same degree. FactSet remains a **Buy First** at our current 2% allocation. If you don't own shares yet, step up to the plate! (Or, at least, "sell to open" puts, considering any $155 or $160 puts today.)

The Facts on FactSet

In the quarter that just ended, FactSet's revenue increased by 9.7% to $287 million, while organic revenue was up 8.8% and diluted earnings per share (excluding one-time gains) rose 11.9%.

Client count was up 17 to nearly 3,100. User count grew by more than 2,100 (up 5.5%) to greater than 65,600. The company is paid on both metrics, and adding new clients is important because it leads to long-term cross-selling opportunities and typically a growing user count at those businesses. On this count, FactSet had record growth in new client acquisition last quarter and saw more competitive wins in the marketplace than it has before. In an industry that is largely about taking market share, FactSet is relatively small compared with competitors; it has an expanding product suite, and it's doing "exceptionally well" alongside larger peers. And revenue for all of FactSet's add-on products (those being sold to existing clients) was up at least 10% year-over-year. International revenue also advanced smartly, up 10% in Europe and nearly 17% in Asia-Pacific. Next quarter, management guides for 14.5% total EPS growth.

So why did the stock fall?

Funds Losing to the Market

In part, the answer relates to a problem you and I know very well in this industry: underperforming mutual funds and hedge funds. Yes, record highs in the stock market mean *tough* business for many active managers. If you can't keep up with the market, your business is at risk -- and that's what the industry is seeing, leading to employee firings or fund closures. As measured in *dollars*, FactSet's retention remained at 95%, so most of its revenue is renewing thanks to the staying power of large clients. But it is seeing more "market-related cancellations," when a smaller fund that's losing to the market goes out of business or lets employees go. Global director of sales Scott Miller said "it feels like the worst of [this] is over," but management admits it doesn't know what the market will do next.

Most of FactSet's largest customers are still in the game, but this was the second quarter in which management had to discuss higher-than-usual cancellation numbers. Investors were spooked and are selling the stock -- despite the fact that FactSet is adding healthy numbers of new clients and still growing. Management sees a healthy pipeline ahead, too, and is confident about its competitive position.

Moving With the Punches

Management's confidence is boosted by the belief that the company is among the best-positioned to help passive investing clients, the number of which is growing. Dollars that are moving out of active funds don't just vanish; these dollars move into passive investments, including ETFs. FactSet bought the data and analytics business run by ETF.com in 2015, and management believes it offers the highest-quality data and analytics solutions to passive fund managers. Keep in mind, most ETFs *are not* actually passive. Managers need to assess an ETF's holdings, potential, and risks before investing -- and the sheer number of ETFs (there are more funds than there are individual stocks) makes this a daunting task. CEO Frederick Snow said the company will "continue to capitalize on marketplace trends, including the movement from active to passive."

Overall, FactSet's offerings to every client are sticky -- whether that client is a global bank or a small hedge fund, and whether it's using portfolio analytics tools, risk assessment data, or multi-asset class analysis tools. A typical client might be using all of them, because FactSet's solutions are enterprisewide. As with *Pro* holding **Verisk Analytics** (NASDAQ: VRSK) in the insurance industry, FactSet is embedded into its clients' daily workflow, making the company essential to the process of doing business. When I've spoken with friends in money management who use FactSet, the universal response has been along these lines: "The data is indispensable. Once you use it, you can't work without it. And switching costs [in time and process disruption] are enormous." This speaks to FactSet's high retention rate.

I believe Wall Street fears a growth slowdown to a degree that won't likely materialize. If the stock market continues to hit new highs, putting lagging funds out of business, FactSet may lose some more small clients that can't compete -- but its large client list is growing, and its revenue dollars are, too. It's very well positioned to keep serving the growing horde of passive asset managers, and its young product suite promises healthy cross-selling to clients. On the flip side, if Wall Street declines, that's not an easy situation for fund managers either (the fund business is tough either way!). During downturns in the past, they've relied on FactSet's services even more. The company increased revenue and earnings handsomely right through 2008 and 2009.

Meanwhile, management bought back 258,000 shares last quarter at an average of $166 apiece, and they won't take on debt to buy back shares (a decision we're happy with!), keeping FactSet's powder dry to make major acquisitions. Trading at about $160 today, the stock fetches about 23 times expected earnings -- right in line with its 10-year average P/E, putting it near our fair-value estimate for North Star-type returns. It may take a while to see those returns (multiple compression is one risk today), but as with our other high-quality "compounding" businesses, we expect the stock to eventually deliver the long-term gains we seek.

Here's our original buy report (the stock is up 7% since then). Questions? Please ask on the FactSet board.

Fool on!

Pro Catch-Up Trades and Upcoming Expirations: Oct. 3, 2016

Published Oct 3, 2016 at 3:27PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

- Just getting started? Our Portfolio Building Report No. 1 features details on all our Buy First stocks; Portfolio Building Reports No. 2 and No. 3 get you up to speed on all of our Buy stocks; and our Portfolio Positioning Report tackles our shorts, options, and hedges.

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Gentex** (NASDAQ: GNTX): Buy 2.9%.
- **FactSet Research Systems** (NYSE: FDS): Buy 2%.
- **MasterCard** (NYSE: MA): Buy up to 4.6% (or buy in halves over time).

Continue building your portfolio with our Buys, including these highlighted today:

- **AmTrust Financial Services** (NASDAQ: AFSI): Buy up to 5.2%, in halves if preferred. Or, see options below.
- **ProShares Short VIX Short-term Futures** (NYSEMKT: SVXY): Buy 1.1%.

Shorts:

- **John Deere** (NYSE: DE): Sell short 1.9%, along with *owning* 2% in **Valmont** (NYSE: VMI). This is a paired trade.

Pro options:

- **AmTrust Financial Services**: This is not an official recommendation, since the stock is a Buy. But if you don't want to buy all of your 5.2% stake yet, consider selling to open January 2017 $25 puts, lately about $1.05, to target potentially buying some of your shares around $24, if they're below your strike by expiration.
- **Gentex**: Sell to open Dec. 16, 2016, $17.50 puts, aiming for at least $0.70. Sell one put for every 100 shares you could buy at a net $16.80. Selling 23 puts, *Pro* is looking to add 1.5% to our stake, for 4.4% total in stock.
- **Skyworks Solutions** (NASDAQ: SWKS): Sell to open January 2017 $75 calls on your shares if you want income, selling one call per every 100 shares you want to cover.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY):
  - Set up the **December put ratio spread** as shared in this recent alert. Lately, today, it can be set up for no net cost ($0.00).

- If you haven't yet, you can set up something similar to our November put ratio spread by buying to open one November 18, 2016 $210 put and selling to open two November 18, 2016 $202 puts ($2 higher than our official trade). This can be set up today for a net debit of about $0.09 or $0.10. So, it's not a credit, but it's only a small debit.

Options expiring next:

- **Celgene** (NASDAQ: CELG): Our Oct. 21 $95 puts are on track to expire as income. We'll consider writing new ones as that happens.
- **Gilead Sciences** (NASDAQ: GILD): Our Oct. 21 $85 covered calls are currently on track to expire as income.
- **Wells Fargo** (NYSE: WFC): Our Oct. 14 $50.50 covered calls are on track to expire as income.

Pro Guidance Changes and Completed Trades: Oct. 3, 2016

Published Oct 3, 2016 at 3:27PM

Pro Guidance Changes (from the past two weeks)

- **Deere & Co.** (NYSE: DE): Moves back to Short, at a 1.9% allocation. We also assume you own a 2% stake in **Valmont** (NYSE: VMI).
- **Pier 1** (NYSE: PIR): Moves to Hold as we review recent news events. Hold means that if you have a position, keep it, but don't start a new one for now.
- **Wells Fargo** (NYSE: WFC): Moves to Hold as we assimilate and contemplate the unfolding scandal. We're as disappointed as you are -- perhaps even more so, given that it's our recommendation.

Pro Completed Trades (from the past two weeks)

- **Gentex** (NASDAQ: GNTX): As recommended, we sold to open 23 contracts of Dec. 16, 2016, $17.50 puts for $0.73, potentially increasing our stake of Gentex shares by 1.5%, to 4.4% if we get shares.
- **SPDR S&P 500** (NYSEMKT: SPY): We set up our December 2016 $180/$190 put ratio spread, as described in the alert, for a credit of $0.06.

You can see all of our guidance, positions, and transactions from the Recommendations page.

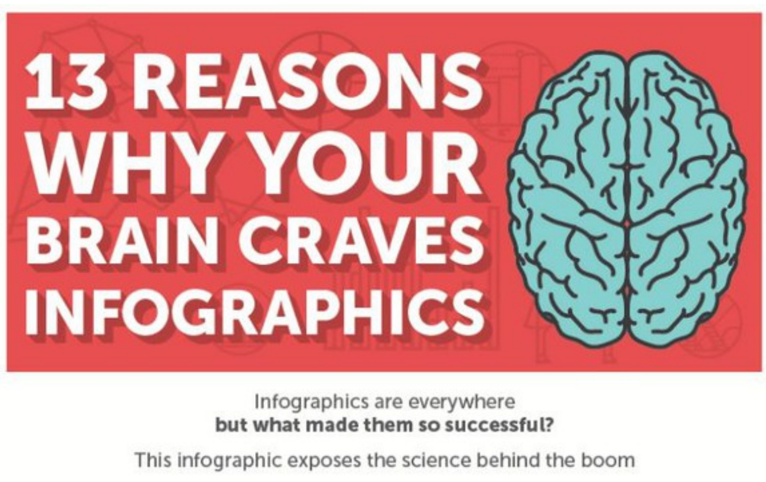
Charts of the Week: Infographics, Cognitive Biases, and the Gender Pay Gap

Published Sep 26, 2016 at 3:26PM

Dear *Pro* Fools,

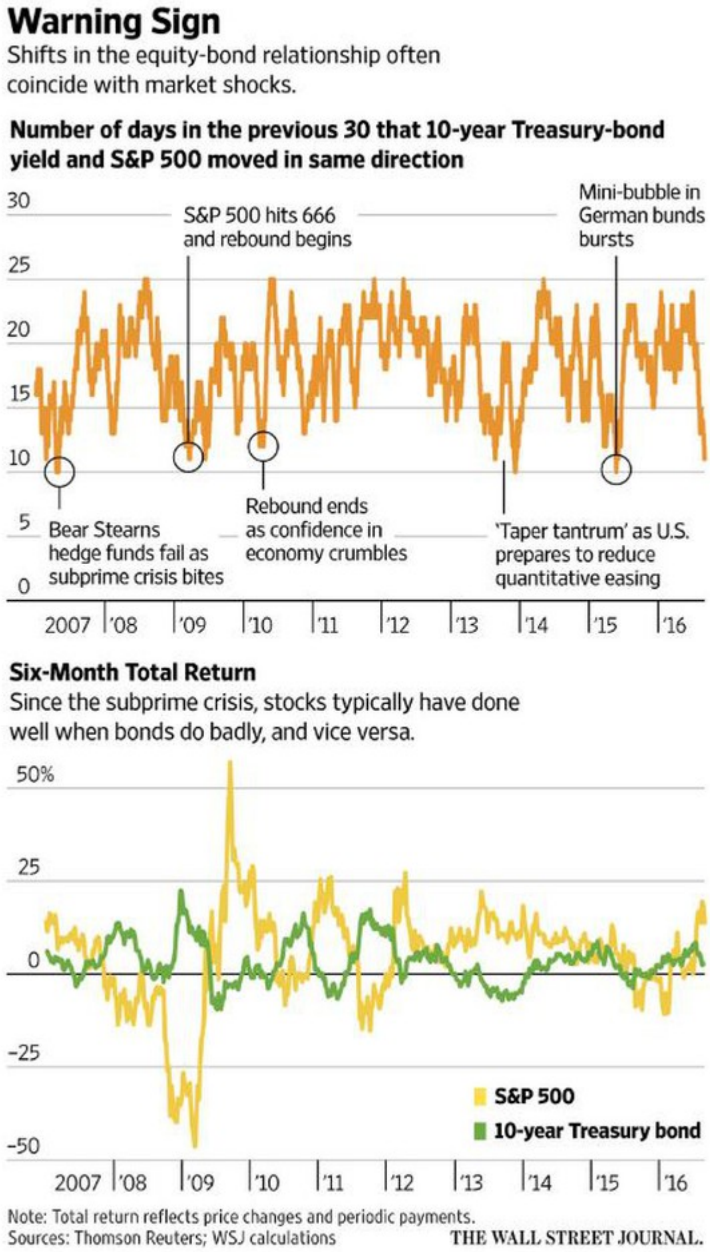
After a fantastic *Pro* Fool meetup in Chicago last weekend (thank you to all who organized and attended!), I'll kick off our Monday with the fourth edition of my "Charts of the Week" series. In this week's Memo, I'll share the five most interesting and/or market-relevant charts I came across this week while perusing the financial blogs and websites I frequent:

1. 13 Scientific Reasons Explaining Why You Crave Infographics



This meta-graphic from Visual Capitalist details 13 data-driven reasons behind the power of infographics (click on the photo for the full graphic), providing empirical evidence for my love of graphs, charts, and visual data!

2. Time to Worry? Stocks and Bonds Are Moving Together

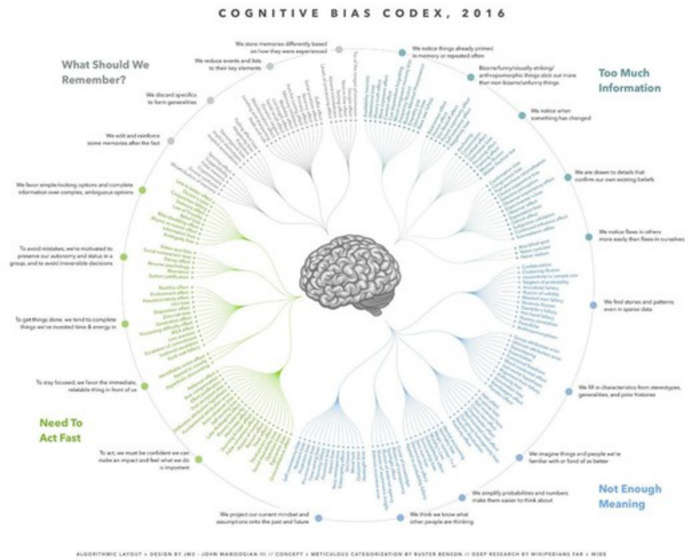


This graphic from *The Wall Street Journal* shows how shifts in the equity-bond relationship often coincide with market shocks. The top graph shows that as of Sept. 6, the date the graphic was published, the S&P 500 and the 10-year Treasury bond yield had moved in the same direction in just 11 of the prior 30 trading days, close to the lowest number since the start of 2007.

For context, the general relationship is that stock prices and bond yields tend to rise and fall together, as what is good for stocks is bad for bonds (pushing bond prices down and yields up), and vice versa. When bond yields and stock prices *don't* move together, it has often been a signal of marketwide volatility.

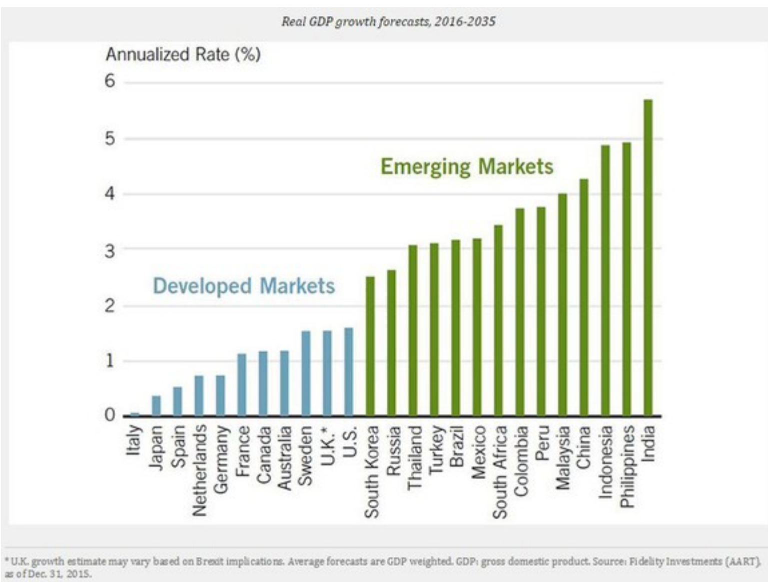
One possible explanation for this recent dynamic is the market's fixation on central bank policy and interest-rate expectations. Expectations of interest rates being lower for longer push the price of everything up and yields down, leading to a possible divergence between stock prices and bond yields, as seen in the graph above. For what it's worth, since this graphic was published Sept. 6, the S&P 500 and the 10-year bond yield have moved in the same direction on 7 of the 14 trading days.

3. Cognitive Bias Codex



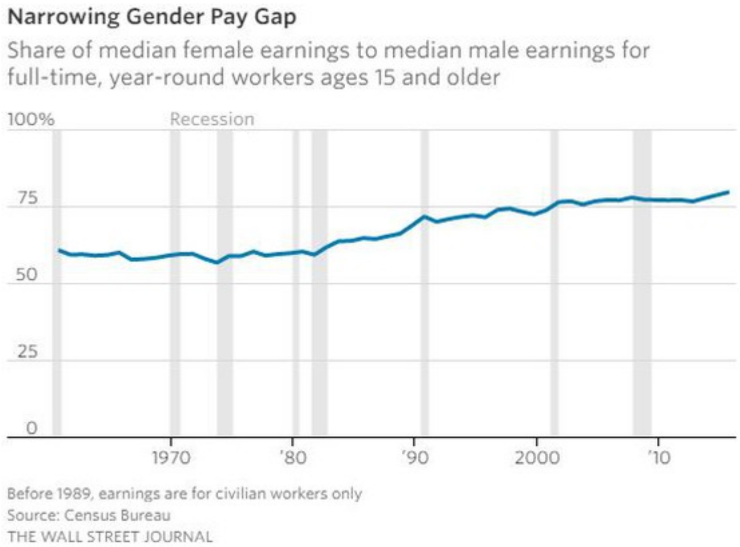
This fantastic graphic from [Better Humans](#) (click on the image for an enlarged graphic) breaks down cognitive biases (the bane of investors) into four main categories: too much information, not enough meaning, need to act fast, and what should we remember?

4. Emerging-Market Countries Are Likely to Grow Faster Than Developed Markets Over the Next 20 Years



This chart from [Fidelity](#) shows annualized real GDP growth forecasts for 2016-2035 for various countries. The graph clearly shows that emerging markets are expected to grow at a faster rate than developed economies over the next 20 years (at least according to Fidelity's research team). The expectation of faster growth is in large part because of faster labor-force growth, and several emerging markets with youthful demographics -- such as the Philippines, India, and Indonesia -- also have the potential to grow productivity rates off a relatively low base. According to Fidelity, the largest risk to this emerging-market outlook is the potential for financial instability, particularly in China.

5. Narrowing Gender Pay Gap (But Still a Ways to Go)



This graph from the U.S. Census Bureau and *The Wall Street Journal* shows how the gap in earnings between men and women was the narrowest on record in 2015. But women still earn just 80 cents for every dollar earned by a man working full time -- the ratio of female-to-male earnings last year came in at 79.6%, up one percentage point from 2014.

According to Cornell University economics researchers, about half of the gender wage gap stems from women being more heavily clustered in lower-paying jobs and industries -- not that they are paid less for identical work. Around one-sixth comes from men being on the job longer, and just over one-third of the gap comes from factors that can't easily be pinned down, including potential discrimination.

For more data and graphics on the gender pay gap, check out this graphic that shows the top 15 occupations with the largest gender wage gaps, and check out this interactive graphic that shows the pay gap across 446 different occupations. According to that interactive graphic, women earn more than men in just 7 of the 446 occupations (the seven are: wood sawing machine setters/operators, utility meter readers, highway maintenance workers, dietitians/nutritionists, telecommunications line installers/repairers, crane/tower operators, and transportation/storage/distribution managers).

The *Pro* Bottom Line

There you have it, Fools -- the fourth edition of my top five charts of the week. Hope you enjoyed it, and bring any questions or comments to the Memo Musings board!

Best,

-- Billy (TMFBillyTheKid)

Pro Guidance Changes

- **Deere & Co.** (NYSE: DE): Moves back to Short, at a 1.9% allocation. We also assume you own a 2% (currently) stake in **Valmont** (NYSE: VMI).
- **Pier 1** (NYSE: PIR): Moves to Hold as we review recent news events. Hold means that if you have a position, keep it, but don't start a new one for now.
- **Wells Fargo** (NYSE: WFC): Moves to Hold as we assimilate and contemplate the scandal unfolding. Boo to management!

Pro Completed Trades

- **Gentex** (Nasdaq: GNTX): We sold to open 23 contracts of Dec. 16, 2016, $17.50 puts for $0.73, potentially increasing our stake of Gentex shares by 1.5%, to 4.4% if we get shares.
- **Skyworks Solutions** (Nasdaq: SWKS): We bought back 1,000 shares to bring our allocation back to 3.4%, same as before, and we sold to open January 2017 $75 covered calls on all our shares, as earlier recommended. Those calls can still be sold today by those seeking income.

Pro Catch-Up Trades: Sept. 26, 2016

Published Sep 26, 2016 at 3:26PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

- Just getting started? Our Portfolio Building Report No. 1 features details on all our Buy First stocks; Portfolio Building Reports No. 2 and No. 3 get you up to speed on all of our Buy stocks; and our Portfolio Positioning Report tackles our shorts, options, and hedges.

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Broadridge Financial Services** (NYSE: BR): Buy up to 5.4%, in halves if preferred.
- **Gentex** (NASDAQ: GNTX): Buy 2.9%.

Continue building your portfolio with our Buys, including these highlighted today:

- **AmTrust Financial Services** (NASDAQ: AFSI): Buy up to 5%, in halves if preferred. Or, sell to open January 2017 $25 puts, lately about $1.10, to target potentially buying some of your shares at $24, if they're below your strike by expiration.
- **Oracle** (NYSE: ORCL): Buy 3.5%.

Shorts:

- **Domino's Pizza** (NYSE: DPZ): Sell short 2%, along with *owning* 3.6% in **Papa John's** (NASDAQ: PZZA). This is a paired trade.
- **John Deere** (NYSE: DE): Sell short 1.9%, along with *owning* 2% in **Valmont** (NYSE: VMI). This is a paired trade.

Pro options:

- **Gentex** (NASDAQ: GNTX): Sell to open Dec. 16, 2016, $17.50 puts, aiming for at least $0.70. Sell one put for every 100 shares you could buy. Selling 23 puts, *Pro* is looking to add 1.5% to our stake, for 4.4% total in stock.
- **Skyworks Solutions** (NASDAQ: SWKS): Sell to open January 2017 $75 calls on your shares if you want income, selling one call per every 100 shares you want to cover.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY): Set up a December put ratio spread as shared in this recent alert. It pays a lower credit today, of about $0.11, but it's still a credit.

Options expiring next (October):

- **Celgene** (NASDAQ: CELG): Our Oct. 21 $95 puts are on track to expire as income. We'll consider writing new ones if that happens.
- **Gilead Sciences** (NASDAQ: GILD): Our Oct. 21 $85 covered calls are currently on track to expire as income.
- **Wells Fargo** (NYSE: WFC): Our Oct. 14 $50.50 covered calls are on track to expire as income.

Oracle Is Gaining Momentum In The Cloud

Published Sep 22, 2016 at 3:07PM

Oracle's (NYSE: ORCL) fiscal first quarter earnings report disappointed the market, but the company's shift to the cloud continues to gain momentum. Overall sales increased 2% -- or 3% when adjusting for Brexit-related currency volatility. Similar to recent quarters, new license sales declined 10%, but thanks to a 3% increase in updates and product support, total on-premises revenue actually increased 1%. Though Oracle's legacy database system is in slow decline, the cloud-based software as a service (SaaS) and platform as a service business (PaaS) is gaining momentum.

SaaS and PaaS sales grew by 82%, which bested the 80% high end of management's guidance and management expects demand to continue growing through the end of the year. As a result, management raised cloud growth guidance from 65% to 67%. Further, cloud gross margins improved to 62% vs. 40% a year ago, making solid progress to management's eventual 80% gross margin target. As promised last quarter, the dollar growth in cloud revenue is finally exceeding the dollar decline in licensing revenue, which should help operating profitability gradually return to previous levels.

One of investors' biggest concerns is that the rapid growth in the cloud business is coming at the cost of the licensing businesses. To that effect, management confirmed that on-premises renewal remained at historical levels and 50% of new cloud customers are entirely new. Management attributes the accelerating growth in clouds sales to a more experience, and better trained sales force that finally has a full suite of products to sell and more geographies to sell into. They also have a large installed base to serve as referrals and promoters of the cloud products which makes adoption less risky for new clients. Down the road, Oracle intends to convert as many of its legacy database customers to the cloud as possible, but the company believes that most companies will use a hybrid combination of cloud-based and on-premises applications to meet the full range of their IT needs.

The company has cleared foreign antitrust reviews for the NetSuite acquisition, but it still awaits regulatory approval in the U.S. One of NetSuite's largest shareholders, T. Rowe Price, recently announced that it would vote against merger, citing a conflict of interest due to Ellison's ownership stake in both companies. That move makes it likely that Oracle will be required to raise its bid to close the deal. Though the interest on the debt that the company recently raised to fund the deal is a slight drag on earnings, management expect the NetSuite deal to become accretive quickly, strengthen Oracle's portfolio of cloud applications, and improve Oracle's exposure smaller companies.

Management has also begun to emphasize their strategy to grow the infrastructure as a service (IaaS) business, which puts them up against Amazon Web Services and Microsoft's Azure business. Ellison claims that Oracle's updated IaaS data centers have a technological advantage over AWS which makes them faster and more cost effective. Ellison also claims that Oracle's technology allows customers to shift their corporate infrastructure to the cloud in the most convenient way possible. This all sounds great, but the data center business is inherently a lower margin because of its capital intensity and the prospect of competing on cost against Amazon isn't encouraging. However, if this allows Oracle to sell a total end-to-end solution to a new cloud customer, it should make the relationship stickier over time.

Oracle continues to be reasonably priced at about 14.5x forward earnings and 8.5x enterprise value-to-EBITDA, both of which are just a hair above their five-year average. The balance sheet remains strong with $14.3 billion on net cash. Free cash flow over the past twelve months has grown 5% to $12.6 billion. Management spent about $2 billion during the quarter to repurchase an additional 49 million shares. There's little reason to expect Oracle to take off all of a sudden – in my mind this is more of a defensive position that serves as ballast in a volatile market – but over time the company should gradually get rerated at a higher multiple that is more in-line with it cloud-based peers. We're keeping our current "Buy" rating and $46 fair value estimate in place. We're also looking for an opportunity to write covered calls on the stock, but option premiums for Oracle are generally very small and usually not worth the effort.

Write Puts on Gentex

Published Sep 22, 2016 at 11:42AM

Is this for you? Since we're looking to add 1.5% to our stake in this company, this alert should be applicable (now or perhaps later) to all *Pro* members, whether you already own shares of **Gentex** (NASDAQ: GNTX) or not. If you don't yet own shares, check out the Alternative Trades section at the end of the report.

How You Participate

- **Trade:** Sell to open December 2016 $17.50 puts.
- **Allocation:** 1.5% — write one put for every $115,000 or so you manage; *Pro* will write 23 contracts. In addition to our current 2.9% stock holding, this would bring our total allocation to about 4.4%.
- **Price Guidance:**
  - **Now:** Use a **limit order** to target $0.75 or greater to start (for a 4.3% effective yield in 86 days). **If we all use limit orders** and the stock price cooperates, we may be able to achieve $0.75 today.
  - **Later:** As prices and time to expiration change, those approaching the position should aim to get paid a yield on time value of at least 1% or so ($0.175) per month to expiration.
- **Prices (10:45 a.m. 9/22):** Stock: $17.67; options: $0.70 bid / $0.85 ask. Guidance: $0.75.

- **Stock Rating:** Buy First, 2.9% allocation; we're now adding 1.5% in additional exposure through these new puts.

What We're Thinking

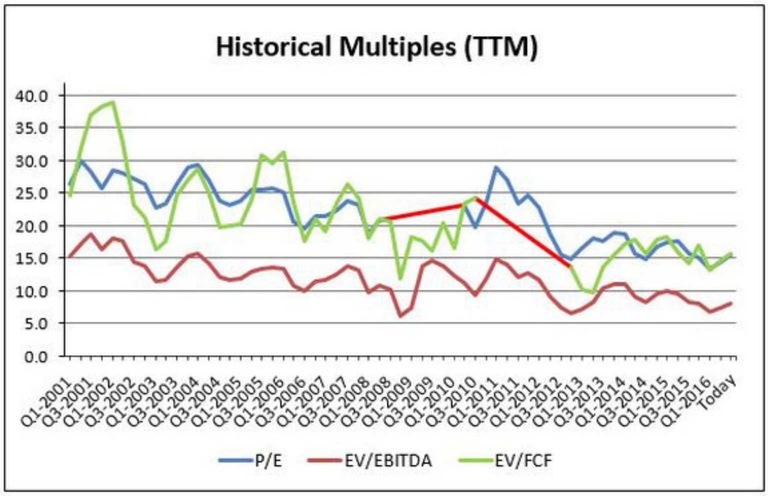
With the expiration of our September 2016 $15 puts last week, we've now run five successful rounds of put-writing for income on Gentex, with all five iterations expiring fully as income. This has taken place over about a year and 9 months, with our first round of written puts occurring in January 2015.

Since then, we've earned $6,370 in options income from our five rounds of written puts, and we've earned $2,596 from seven dividend payments in January, April, July, and October of 2015 and in January, April, and July of 2016. Based on our current ownership stake of 4,400 shares, that's income of $2.04 per share. That equates to an 11.5% yield on the current share price, which helps offset some of the stock-price weakness Gentex has experienced since the end of 2014 (as of today, the stock price is down about 2% compared with the closing price on Dec. 31, 2014).

Those who have followed this strategy from the beginning will notice that we've upped the strike price from $15 in the prior iteration of the strategy to $17.50 in this one. We're OK with increasing our strike price for a few reasons.

For one, when we initiated this strategy in January 2015, we started at the $17.50 strike. Since that first iteration of the strategy, Gentex has increased quarterly revenue by 21%, quarterly gross profit by 24%, operating profit by 30%, and earnings per share by 25%, and the company's EV/EBITDA ratio has decreased from 9.6 to 8.1.

With the income from this strategy at $0.75 per share, if assigned, we'd buy shares at $16.75 apiece. At that price, we'd be buying at 14.7 times trailing-12-month (TTM) earnings, 7.6 times TTM EBITDA, and 14.8 times TTM free cash flow.Given Gentex's recent business execution, we think those multiples are attractive.



Note: Red lines represent omitted outlier multiples that correspond to recession-depressed earnings and cash flow.

More That Matters

- **Maximum loss:** For this iteration of the put strategy alone, our risk is the same as share ownership starting at about $16.75, or 5.2% less than the recent price.
- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At a minimum of $0.75, that's a 4.3% effective yield in 86 days.
- **Follow-up:** For this iteration of the put strategy alone, we'll buy shares at a net $16.75 if the stock is below our $17.50 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 2.9% allocation first — Gentex's shares are a Buy First. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1.5% of your portfolio, then just buy 1.5% in stock directly *if and when Pro* does so through these puts (we'll alert you on the boards and in the subsequent Monday Memo if and when we do).
- **Want to write other puts?** Consider writing November 2016 $17.50 puts if the price on those options holds up better than the December puts after this alert is issued. Right now, the bid/ask on the November 2016 puts is $0.55/$0.70 (a 3.6% effective yield in about two months).

Pro Can Help

- See our Options U guide to writing puts if you want more on this strategy.
- Check your mirrors and switch lanes over to the Gentex discussion board.

Portfolio Positioning Report

Published Sep 21, 2016 at 11:22AM

Welcome | Shorting in Short | Hedging ... in Short | Your Exposure | This Stuff Is Optional
Options Are Optional, Too — but Advised! | About This Report
The Positions Themselves (Shorts, Hedges, Options, All the Rest)

November 2018 Note: This report needs a refresh! Please stay tuned -- we'll let you know when it's up-to-date again.

Dear *Pro* Member,

Our first three Portfolio Building Reports provided you guidance on all of *Pro*'s Buy First and Buy stocks. This final report will do the same for our active short and timely option positions, some of which we use as hedges. For reasons we'll explain, we don't expect that many of you will initiate all of the positions in this report right away, or perhaps at all. And that's perfectly fine!

Hedging is about lowering your exposure to the risks of the market; to a lesser extent, shorting is as well. These additional investment tools tweak or adjust the risk profile of your *invested* portfolio, so if you're still building your collection of long-term stocks, concentrate on that first. Stock investments are the core of the *Pro* portfolio, and by owning *Pro* stocks, you are positioned to compound your value over time. We know there's a learning curve for strategies that are new to you, so it's important that you know there's no rush with shorts, options, and hedges; you can incorporate the positions in this report, or our future updated ones, when you're ready. We're here for you in the meantime.

Before outlining the current positions you can take, let's review how each strategy works. We'll begin with shorts — a sort of "anti-investment" that we believe will decline in value, adding profits to our portfolio in the process.

Shorting in Short

When you sell a stock short, you borrow shares of a company or an ETF from your broker and immediately sell them, collecting the proceeds. At various brokers, this trade action is called "sell short," "sell to open," or just "sell." In the future, you'll need to buy the same number of shares back to replace the ones you borrowed and sold. This second step is called "cover," "buy to cover," or "buy to close." You hope to profit from buying the shares back at a *lower price* than when you opened, or sold, the position originally.

The difference between your original sell — or short — price and the price you later pay to buy back (and return) the borrowed shares is your profit or loss. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock rises to $30, you've lost $10 per share when you buy it back. We use shorts in *Pro* because they're one way to profit when the market or a targeted company falls, but they come with their own risks — shares can be hard to borrow, shorting fees are often involved, and a short can get closed on you (you're forced to buy it back) if the broker wants the shares back early. So, we need to size each of our short positions appropriately small.

Hedging ... in Short

A hedge is similar to a short because it gains value when prices fall, but it's different in intent; these positions are taken only to *offset* the risk we have in another position or in our market exposure as a whole. So, when we sell short (or use bearish options on) a market-index proxy like the **SPDR S&P 500** (NYSEMKT: SPY) ETF or **PowerShares QQQ** (NASDAQ: QQQ), we are hedging our exposure to the stock market or to a particular index as a whole. A hedge is a form of insurance; it only pays you when you need it, and it usually won't make any money. But we *know* a market-index hedge will increase in value whenever the market goes down — making it an effective hedge during bad times. We just always remember that if the market doesn't fall (or doesn't fall enough), our hedge will go unused.

For this reason, we try to spend very little to hedge, but sometimes costs can't be avoided. We have to reconcile this with the fact that hedging lets us stay *more* invested in stocks than we might otherwise be. In other words, one key way we profit from our hedges is by using them to help us keep our long stock exposure higher! We own more great companies because we soften our total risk by hedging. As with shorting, you should only hedge if you have stock market exposure you want to "hedge out." You don't need to hedge or short to succeed.

Your Exposure

To know whether hedging is for you, it's helpful to think about your stock market exposure. This is simply how much of your total portfolio is invested in long stocks. Excluding options and shorts, *Pro* is about 73% invested in long stocks as of this writing. That's high for a typical absolute-return portfolio like ours, which is part of why we want to short and hedge! Many hedge funds are market-neutral (net 0% long) or only 10% to 20% net long. Pro is much more invested, and has benefited. Like many members, you may own other stocks beyond *Pro*'s, so if you've also bought all of our stocks, you might be even more exposed to market risk than we are. Lately, we typically hedge the *Pro* portfolio down to about 60% market exposure with our index hedges and other shorts, and you could (but do not need to) follow along today. In other market situations, we'll likely hedge much more.

The bottom line is: As you consider adding hedges and shorts to your portfolio, first know how much of your assets are invested in stocks. That helps dictate how much shorting or hedging you want to initiate to reach the *net* market exposure you desire. *Pro* has averaged about 73% net long exposure since January 2012, but that number will move up and down as our opportunities change. Our exposure is always shown at the bottom right of the Recommendations page. For many years, I've found that about 72% market exposure, along with the use of options, can be enough to earn strong (market-topping) returns with less risk. This pleasing result rests on investing in superior long-term stocks, and the past is no promise of future returns, but we're aiming to continue that success.

This Stuff Is Optional

Not every *Pro* member is comfortable with shorting or hedging, and there are practical considerations to take into account as well. First, you need a margin account to sell short, so (unless you use options to go bearish) you can't sell short in an IRA. Second, you have to accept that shorts can run strongly against you, so you need cash to cover that risk. Third, you'll usually pay an annualized fee of anywhere from 1% to 7% of a particular short's daily value to short it. Fourth, in many cases it's hard to borrow shares to short, period. That is the situation with some of our shorts today. Finally, short shares can be bought away from you at the worst time, when they're up in price (called a "forced buy-in"). If brokers can no longer find shares to borrow, you can be forced to "buy in" at market prices to return your borrowed shares.

So what to do given all this? You can use options to short in some cases -- we do, and we explain how to do so wherever appropriate. You can also consider opening a brokerage account that is particularly friendly to shorting. Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does, and does not charge a fee for shorting. You could also wait and see whether shares become available in your existing, traditional brokerage account, though note that at many brokers, certain shares are basically never available for shorting. Or, if you're not drawn to it, you don't need to short.

Options Are Optional, Too — but Advised!

Our options positions are also ... optional, but we strongly advocate learning to use options and following along with ours over time. Options are powerful tools for income, hedging, greater upside, and more. We know from experience they're well worth the time it takes to learn them, and we're here to help. Options can make you a much more confident and versatile investor, and they can generate a whole new stream of income for you and your family. So, if you're new to using options, you're certainly in the best place! Use *Motley Fool Pro* and our sister service, *Motley Fool Options* (free for the life of your *Pro* membership), to learn how to use these great tools. On a personal note, if you're going to learn just one simple strategy, I suggest learning how to write puts (link goes to *Motley Fool Options*) for steady income or to buy a stock lower.

About This Report

The *Pro* service will (when you're ready!) help you short vehicles we believe could decline; teach you how to hedge your portfolio; and set you up to generate returns from options. To that end, keep in mind that today's report is just a start; we'll have many *brand-new* investment recommendations arriving to your inbox as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way!

On the other hand, if this looks overwhelming right now — or if you're still catching up with our core stock positions — that's perfectly fine. You don't need to start these positions now. As mentioned, long positions are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and often rewarding — aren't necessary to succeed with *Pro*. As you learn these strategies and progress with us, just keep your exposure to the stock market in mind.

In closing, I'll stress again that you shouldn't feel pressured to act right away. We will continue to make updated recommendations on our holdings for newcomers on an ongoing basis in our Monday Catch-Up Trades — and as brand-new opportunities emerge. That's part of the fun! Building over time is the most rewarding process. So take your time, and make an investment only when you're ready. Finally, please bring any questions to our live event on Friday, Dec. 16, or to our Making *Pro* Fit You discussion board.

Foolishly,

— Jeff Fischer, *Pro* advisor

The Positions Themselves

Shorts

- **CurrencyShares Euro Trust** (NYSEMKT: FXE): Sell short 1.7%, on our thesis that the U.S. dollar will appreciate against the euro as U.S. interest rates increase. If you can't borrow shares, skip this position rather than using options, because we may close this short soon (we've had it for years in anticipation of today's current situation), and the options have significant friction costs if you only use them a short while. So, short shares directly, or don't start a position.

- **Domino's Pizza** (NASDAQ: PZZA): Sell short 2.1% only if you own about 3.9% in **Papa John's** (NASDAQ: PZZA). The Domino's short is a partial hedge of our Papa John's investment.

- **Direxion Daily Financial Bear 3x Short** (NYSEMKT: FAZ): Sell short 0.2% as a long-term leveraged investment in financial stocks going higher. If you can't borrow shares, but you have options approval in a margin account, you can set up a January 2018 synthetic short instead by selling to open January 2018 $20 calls and buying to open an equal number of January 2018 $20 puts. Set up one synthetic short for every $2,000 in value you can short, but only up to a very small portion of your portfolio. If you can't set this up, simply invest 0.2% more in one of our financial stocks, such as **Visa** (NYSE: V).

- **Gogo** (NASDAQ: GOGO): Sell short 0.5% directly. If you can't sell short directly, the options are not attractive enough to use.

- **Shake Shack** (NYSE: SHAK): Sell short 0.6% directly. Again, the options are expensive to use. Be aware we're down 18% on this short ourselves, so we will reconsider it, per our policy, at about a 20% loss. We may close it, protect it, or add to at that point. We shall see.

Hedges

- A live, new alert for a sizable market index hedge is scheduled to hit everyone's inbox (and the *Pro* site) soon. So watch for our new hedge soon, and all who wish can get on board.

Options

- **American Tower** (NYSE: AMT): Assuming you first have established your 3.5% American Tower stock allocation (the stock is a Buy First), set up diagonal calls per our recent alert; however, instead of selling to open April 2017 $115 calls, sell to open $110 calls. Follow allocation guidance in the alert, and ask any questions on the AMT board linked at the end of the alert.

- **Parexel** (NASDAQ: PRXL): If you already own at least 100 shares of Parexel, "sell to open" one March 2017 $65 call for every 100 shares of the stock you own. We are selling these covered calls for income and to potentially exit our position at a higher price. If you don't yet own Parexel, **do not** buy the stock or write these covered calls; the stock is rated Hold.

- **Skyworks Solutions** (NASDAQ: SWKS): Assuming you own shares of Skyworks (a Buy on our scorecard), "sell to open" Jan. 20, 2017, $75 calls, selling one call for every 100 shares of stock you own. We are selling these covered calls as income, and will manage the position for members at each expiration. The recent price you'll get paid for the calls is adequate.

- **Verisign** (NASDAQ: VRSN): Buy 1.5% in shares and set up a covered strangle for income and another potential 1.5% in stock, per our recent alert.

The Rest: On Hold

Any position not shown as Buy First, Buy, or Short is on Hold. And any option not listed here but still on the Recommendations page is either ending soon, no longer timely, or no longer recommended. So if you have started positions in all of our Buy First, Buy, and Short stocks, and then followed along with the shorts and options in this report that you're able to, you will be caught up to *Pro!* Sit back, bask in your success, and simply follow our new trade alerts to keep up (as well as our Monday Catch-Up Trades for any positions you might still lack). If you are not yet caught up, continue to take your time, follow our Monday updates, and ask questions on the boards. There's no rush. Good things come to those who move gradually, including investors.

Welcome again to the esteemed *Pro* community! We'll talk with you again soon.

Hedge: Set Up Another Put Ratio Spread on the SPDR S&P 500

Published Sep 20, 2016 at 2:48PM

Is this for you? At *Pro*, we employ hedges to target returns during a market decline. You don't need to hedge to succeed with *Pro*, but if you are at least 80% invested in stocks and *want* to hedge some of your market exposure, then consider following along.

Our Other SPY Position: We currently have another 10% SPY hedge, which is due to expire in November and is near-the-money (we have a long $210 strike while SPY is $214). Today's new 10% hedge is designed to kick in if the market falls *below* the $190 break-even price of that November hedge. So this new hedge is a hedge on our previous hedge, since that previous hedge becomes an obligation if SPY falls below $190. Got it?

Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $190,000. We are leaving our current November 2016 SPY put ratio spread in place; you can set it up today if you haven't yet. (And if you're only setting up one SPY hedge, you should set up that November one, which will lately cost you a small $0.15 debit. Today's new one is supplementary to that one.)

This is a complex trade, so if it seems challenging at first read, don't fret. Simply tune in to our live **Portfolio Positioning Event** **at 1:30 p.m. Eastern tomorrow, Wednesday, Sept. 21.** During the event, we'll discuss this and our other options, hedges, and shorts. In the meantime, bring questions to the SPY discussion board -- but there's no need to hurry. A hedge like this is easier to set up once the market is declining, so it's not necessarily imperative to set it up now.

How You Participate

- **Action:** Use a spread order to set up a put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
- **Allocation:** About 10% of your total portfolio value, measured on the look-through value of the $190 puts you're buying (each $190 put represents $19,000 in hedge value). Set up one 2:1 put ratio spread for every $19,000-sized hedge you want. Hedging about 10% of our entire portfolio of $2.67 million, *Pro* will sell 28 $180 puts to finance this position and buy 14 higher-strike, $190 protective puts with the proceeds. (Fourteen puts representing 100 shares each at a $190 strike = $266,000 look-through put value = 10% of our $2.67 million portfolio value.)
- **Trade:**
  - **Use a combo or spread order to simultaneously ...**
    - Write ("sell to open") **two** Dec. 16, 2016, $180 puts, and
    - Buy ("buy to open") **one** Dec. 16, 2016, $190 put. Click "View All" on the option chain at your broker to see all strikes, and do not use the "NS" (or non-standard) option. Use the liquid option. Execute one set of the above options for every $19,000 hedge you want; or one for every $190,000 you manage (assuming you want another 10% hedge in addition to our November hedge).
- **Price Guidance (as of 2:40 ET):**
  - Sell to open **two** Dec. 16, 2016, $180 puts: Lately $0.92 x 2 = $1.84 credit.
  - Buy to open **one** Dec. 16 2016, $190 puts: Lately $1.66 debit.
  - **Net credit:** Lately about **$0.18** credit per spread -- but this price will change (it has fluctuated between **$0.18 and $0.20** today). As it does, simply aim for a credit, and later for close to no cost, using an appropriate limit order when you act.
  - **SPY price:** $214
  - **Potential adjustment:** If SPY moves much in price before you set up your trade, you may want to move one or both of your strike prices up or down accordingly -- as much as SPY has moved -- while still aiming for a net credit. After our mandatory 24-hour trade delay, we will make such an adjustment if need be, and tell you about it.

What We're Thinking

You've heard our philosophy and approach before. At *Pro*, we aim to have winning positions in down, flat, and positive markets. That means we need to address all three possibilities at once in our portfolio. At the same time, we remain oriented toward the long term and majority invested in healthy stocks. A hedge on a market index is a hedge against a lower stock market while the rest of our stocks remain free to appreciate. We generally don't try to manage for market declines of 5% or less (that's just volatility), but when *Pro* is functioning as desired, declines of about 7% or more should result in some of our positions, such as these spreads, becoming profitable. At the same time, the put ratio spreads we use:

- Are harmless if the market goes higher (they don't ding our returns)
- Are typically cash-free to set up (they often pay us a credit -- essentially income)
- Should have a low probability of long-term loss or even opportunity cost (since if we buy into SPY, odds are good it'll outperform many other stocks we could have bought instead)

What's the trade-off? As with any written put, we need to be ready to buy the underlying investment; for today's position, that means we're prepared to buy into the S&P 500 index (through SPY) if the price falls below $180, which is our breakeven point on this hedge. That's 15.8% lower than today's prices. If the S&P does fall that much, we would plan to buy *long-term call options* on SPY instead of the shares, saving most of our cash in the process; see below for details on that. We don't believe there's much probability of long-term loss, because we believe SPY will recover. And if the index does fall sharply, history suggests it's likely to do so in the range of 10% to 20%, so in most cases this hedge would help us.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2.67 million
- 10% of that value: $267,000
- Dec. 16, 2016, spread:
  - Buy to open $190 puts. Fourteen contracts representing 100 shares each = $266,000 in look-through exposure, or about a 10% hedge on our current portfolio value, cash included.
  - Sell to open $180 puts -- 28 contracts, half of which are *not* covered by long puts and thus become a potential obligation at a net $170, currently an 8.9% possible stake. (If the decline occurs, this would be a larger stake then, as our portfolio value would be lower).
  - At home, you would buy one $190 put and sell two $180 puts for every $190,000 in portfolio value you want to set up a 10% hedge against.

Return Details

SPY Price at Dec. 16, 2016, Expiration	Value of 1 Purchased Dec. 16, 2016, $190 Put	Value of 2 Written Dec. 16, 2016, $180 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Recent $214
$190 or higher	$0	$0	$0.18 or so gain per spread -- or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 11.2%
$185	$5 x 100 = $500	$0	$500	(13.5%)
$180	**$10 x 100 = $1000**	**$0**	**$1000 (max profit per spread)**	**(15.8%)**
$175	$15 x 100 = $1,500	($5) x 200 = ($1,000)	$500	(18.2%)
$170	**$20 x 100 = $2,000**	**($10) x 200 = ($2,000)**	**$0 (break-even)**	**(20.5%)**
$165	$25 x 100 = $2,500	($15) x 200 = ($3,000)	($500)	(22.9%)

If SPY declines more than 11.2% from recent levels, this hedge starts to come into play (and our November hedge, assuming we still have it, moves out of its maximum profit range). Our maximum profit on *this* hedge is earned if SPY declines 15.8% from its recent level of $214 by our December expiration date. The spread will help us a bit on an index decline of as much as about 20%, to $170; deeper than that, and our short (or "sold to open") $180 puts start to work against us. So this hedge is effective up to that point.

Follow-Up

Assuming we set this spread up for a credit, it will result in a small profit even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $180-strike-price put obligation (starting with a net buy price of $170) if SPY is below $180 by expiration. We should be happy to buy into the index at 15.8% lower. And up to that point, this hedge will have paid us as the market fell.

If the market *does* fall by more than 15.8%, our plan would be to close the short puts and buy long-term SPY calls (or something we like even better, whether calls or a stock) instead of buying the SPY ETF. We should be able to do so at a reasonable strike price for about 25% to 35% of the cost of buying SPY shares. So, our potential 9.2% stake in SPY shares will likely cost us only about 2% to 3% of our cash if we buy calls instead. We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases.

The bottom line is that any drop in SPY as far as 20% below recent prices will result in this hedge showing at least a small profit at expiration. And it costs us nothing to set up (it pays us) and will not hurt our returns if the market keeps rising.

How It Fits Into *Pro*

Pro hedges to lower our market exposure, or risk. We aim to achieve positive returns every rolling three years, and inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market can make a difference. We made $10,700 when our last put ratio spread closed in-the-money in February. Since then, we've also made more than $1,300 in income using put ratio spreads that expired unused this year. Even small gains add up over the years, and this hedge fits well with our goal of hedging in a cost-efficient way that doesn't drag on our returns in a rising market. These spreads do require regular upkeep, opening new positions as old ones expire, and they are time-sensitive, really only helping at or right near expiration.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $190,000:**
  - For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Assuming you already have our $210/$200 spread set up from a previous recommendation, and you want another spread, use a spread order to "Buy to open" Dec. 16, 2016, $190 puts and "sell to open" *an equal number* of Dec. 16, 2016, $180 puts. Recently, this will cost you about $0.73 ($73) per spread, and that is your maximum risk. Buy as many spreads as you care to risk $73 on. Paying a bit more is fine, too, if prices change. This strategy would be worth up to $10 ($1,000) per spread on an 15.8% market decline to $180 or any lower price, but you should be prepared to lose your whole $73 per spread if SPY doesn't decline at least below $190 by expiration, which is a large 11% drop. You have to assume a hedge like this will expire worthless. So, only risk what you are comfortable losing.
- **To lower your market exposure while following our full official trade (and making the position possible in some IRAs):**
  - Set up the official put ratio spread as recommended, but also "buy to open" puts (with the same day of expiration) at a strike price *well below* $180. Buy *half as many* as the number of $180 puts you wrote. When you do so, all of your $180 puts will be "covered" -- half by your $190 puts, and half by these other puts you choose to buy at a much lower strike. Choose how much you want to pay to select your lower strike price to purchase. To us, the $170 strikes or lower look good, recently costing $0.53 or less. You will only need cash in your account to cover the difference between your two lowest strike prices (if you buy $170 puts, that's $10 per share), and your risk is capped, making this potentially IRA-friendly. This makes the total cost of your hedge about a $0.33 debit, and it still has $10 in potential ending value.

Pro Can Help

- **Need a refresher on ratio spreads?** Our guide can help.
- **Want to talk about SPY?** We have a discussion board for that.

Pro Catch-Up Trades: Sept. 19, 2016

Published Sep 19, 2016 at 3:22PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy (or Buy First); the portfolio is meant to work together as a whole.*

- Just getting started? Our Portfolio Building Report No. 1 features details on all our Buy First stocks, and Portfolio Building Reports No. 2 and No. 3 get you up to speed on all of our Buy stocks!

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Facebook** (NASDAQ: FB): Buy up to 6.8% (in halves if you prefer).
- **FactSet Research** (NYSE: FDS): Buy 2.2%.
- **Wells Fargo** (NYSE: WFC): Buy 4.1% (intending to write covered calls on one-third of that).

Continue building your portfolio with our Buys, including these highlighted today:

- **AmTrust Financial Services** (NASDAQ: AFSI): Buy up to 5.1%, in halves over time if preferred. Or, sell to open January 2017 $25 puts, lately about $1, to target potentially buying some of your shares at $24, if they're below your strike by expiration.
- **Gilead Sciences** (NASDAQ: GILD): Buy 2.7%.

Our shorts (if you're new to shorting, you can wait for our Portfolio Positioning Event this Wednesday, Sept. 21):

- **Domino's Pizza** (NYSE: DPZ): Sell short 2.1%, along with owning 3.5% in **Papa John's** (NASDAQ: PZZA). This is a paired trade.
- **Pier 1 Imports** (NYSE: PIR): Sell short 0.6% to start (see our trade alert).

Pro options (again, to be addressed during our Portfolio Positioning Event):

- **Skyworks Solutions** (NASDAQ: SWKS): If you lost your shares, buy them back up to 3.1% of your portfolio and sell to open January 2017 $75 calls on them, one call per every 100 shares you want to cover.

Hedges:

- To be discussed at our Positioning Event this week.

Options expiring next (October):

- **Celgene** (NASDAQ: CELG): Our Oct. 21 $95 puts are on track to expire as income. We'll consider writing new ones if that happens.
- **Gilead Sciences** (NASDAQ: GILD): Our Oct. 21 $85 covered calls are currently on track to expire as income.

- **Wells Fargo** (NYSE: WFC): Our October 14 $50.50 covered calls are on track to expire as income.

Resist the Easy Explanation

Published Sep 19, 2016 at 3:22PM

Fellow Fools,

Following two sleepy summer months during which the stock market rarely moved more than 0.5% on a given day, the S&P 500 fell by nearly 2.5% two Fridays ago, and the increased volatility continued through last week. As usual, there's been no shortage of market pundits offering their take on why the market suddenly took a dive, with most settling on an increased likelihood of rising interest rates in the near future.

The specter of rising rates has loomed for the better part of two years, so why did the market suddenly start paying attention over the past two weeks? Maybe it was hawkish comments by various Federal Reserve regional presidents favoring higher interest rates. Or maybe it was comments from the newly anointed "Bond King," Jeffrey Gundlach, who suggested that the decades-long bond rally is finally over. Or maybe it's just the result of a bunch of trigger-happy investors looking for any reason to lock in gains following the recent post-Brexit rally. These explanations make for good headlines and punchy sound bites, but figuring out the true cause is never that easy.

The Opposite of Simple

"It's not supposed to be easy. Anyone who finds it easy is stupid." – Charlie Munger

In reality, the sudden spike in market volatility was probably caused by a combination of all of those things, as well as a multitude of other small events that led a diverse group of investors to act in tandem, driving stock prices lower. This behavior is what scientists and economists have come to expect from complex adaptive systems. These are systems in which individual agents pursue their own interests, and through numerous interactions and constant adaptation, they create a self-organizing system such as an ecosystem -- or in this case, the stock market. Because there isn't a linear relationship between the individuals and the system, it's difficult to make direct connections between cause and effect, In other words, you can't just add up the behavior of all of the individuals to explain the behavior of the entire system. Instead, a series of events combine in seemingly random succession until a trend emerges from the chaos.

Michael Mauboussin is well-known for his popular investing books and the insightful white papers he continues to publish as the head of global financial strategies at Credit Suisse. What many of his fans don't know is that he is also chairman of the board of trustees of the Santa Fe Institute, a leading center for multidisciplinary research in complex systems theory. Over the years, Mauboussin has written extensively about why market efficiency is better explained by complex adaptive systems than by traditional financial theory, which assumes linear relationships, normal distributions, and rational market participants. I highly recommend his white paper, "Revisiting Market Efficiency: The Stock Market as a Complex Adaptive System," for members who would like a more thorough explanation of this framework for describing market activity.

The key aspect of this framework for investors is being able to identify the circumstances under which market efficiency starts to break down. This is most common when the decision rules being used by market participants, which can start out very different, begin to converge -- usually the result of fear or greed -- and the buying and selling begins to aggregate in the same direction. This loss of diversity explains the booms and busts the market experiences on a macro scale from time to time, but it also contributes to the occasional inefficient pricing we as investors try to exploit on individual securities.

The Theory in Practice

The rapid growth of the ETF industry has made it easier for investors to pick and choose classes of stocks on which they can make directional bets based on the theme of the day. One example over the past two years has been REIT indexes, which have bounced up and down amid speculation over the next interest-rate move by the Federal Reserve. To many investors, the decision to buy and sell this group of stocks is easy math. Real estate companies tend to have highly leveraged balance sheets, and higher rates will cause borrowing rates to increase, so sell REITs.

What's missed by this type of decision-rule investing is the second-order thinking that provides nuance to the markets. In this example, higher interest rates are usually accompanied by a strengthening economy, higher employment, and increased inflation -- all forces that tend to be good for the real estate industry. The approach also doesn't account for the relative fundamentals of the individual companies in the index. For example, in the *Pro* portfolio we've seen **American Tower**'s (NYSE: AMT) stock fall with no news about the company to justify the sell-off. Further, remember that higher interest rates aren't bad for all stocks. Goldman Sachs recently pointed out in a note to clients that even though rising interest rates are good for mmany financial institutions, the price the market is charging to hedge them is currently the same as for the rest of the market, suggesting that investors are treating all stocks the same and selling indiscriminately. In the *Pro* portfolio, financial companies including **Wells Fargo** (NYSE: WFC) and **TD Ameritrade** (NASDAQ: AMTD) should both benefit in a rising rate environment.

The *Pro* Bottom Line

Humans feel an intense desire to link cause and effect in our daily lives. When there are big swings in the market, it's easy to latch on to the narratives of stock-market commentators and think we need to take action. It's important to remember that these expert explanations of what's driving the market are usually oversimplified at best. Remember that when everyone is telling the same story, odds are that nuance is being missed and inefficiencies created. If we can keep our heads during these times and stay patient -- which our hedges, shorts, and cash position allow us to do -- we'll have the ability to be opportunistic and generate considerable value for our portfolio over time.

Thoughts? Bring them to our Memo Musings board. Have a great week, Fools!

Foolish Best,

-- Jeremy (TMFTank)

Position Update: Skyworks Solutions

Published Sep 19, 2016 at 2:04PM

Is this for you? This advice is only for members who lost some or all of their shares of **Skyworks Solutions** (NASDAQ: SWKS) through covered calls last week. We're taking the following steps to buy the position back and write the previously recommended covered calls. That said, this overview might be of interest to any members who use covered calls.

Foolish Summary: Of our 1,200 shares of Skyworks Solutions, 1,000 were called away from the *Pro* port late last week via our $70 September covered calls before we could roll them. We still have 200 shares of the stock, and we rolled our $70 calls on those shares to a January expiration and a $75 strike price, as we advised members. This situation is not a real problem, but we want to get back into the position as intended, so today's update sets us all up for that!

Buying Back Our Called Away Shares: To make our position whole again and align with members, tomorrow we will *buy back* the 1,000 shares sold from us and write the January 2017 $75 calls on them as planned. The end result should match our intentions all along: We'll have 3.1% in stock with January 2017 $75 calls written against it. If you lost your shares, some or all, you can take this same action to match us. This position still provides ample upside via the time value we're collecting.

Actions:

- Own 3.1% in Skyworks. It is rated a Buy.
- "Sell to open" January 2017 $75 calls, one call for every 100 shares owned.
- Use a limit order at the going price (it can change rapidly).
- If you own fewer than 100 shares as a 3.1% stake, simply keep owning shares.

Service Clarification: In *Pro*, we recommend owning 3.1% in shares. You can write calls on them or not. In *Options*, we have been writing puts on the stock for income.

What Happened

We already knew that when you write covered calls, you must be prepared to lose your shares. Situations can change quickly, and you may not be able to act in time to keep a stock. That is true for you in your busy life, and it's true for us in this service. It was definitely true for us last week, not least because behind the scenes, your *Pro* team must wait 24 hours after we issue an alert to act. In this case, during those 24 hours, most of our shares were called away.

In seeking other lessons can we take from these events, we found few new ones, but a couple of old ones worth repeating.

In any situation, prices can rise and fall rapidly. In this one, the stock swung 17% in the space of three days. Even so, if you were able to act when the alert went out with the stock at $74 (and the report was written mere minutes earlier, with the stock at $72!), then you rolled your calls up $5 per share for a credit, to $75, and you kept your shares. You're golden. So, there was not a strategy error to learn from here. The stock simply kept rising that day, suddenly evaporating the time value in the calls, until most of our shares were called away in after-hours trading Thursday night, with the stock above $77. When we went to roll first thing the next morning, after our 24-hour Fool delay, we saw we'd been assigned.

Prior to this large stock-price move, everything with this position was standard for a covered call. The stock was above our $70 strike price for most of the past month, but the calls carried so much time value that it didn't make sense to close or roll them early.

For instructive purposes, let's look at the closing price of Skyworks over the past month (from Google Finance):

Date	Open	High	Low	Close
Sep 16, 2016	77.15	77.24	75.00	76.07
Sep 15, 2016	73.00	77.25	72.98	77.02
Sep 14, 2016	69.73	72.43	69.51	72.40
Sep 13, 2016	68.50	70.45	68.25	69.36
Sep 12, 2016	66.00	68.58	65.76	68.34
Sep 9, 2016	70.51	70.69	66.06	66.76
Sep 8, 2016	71.93	71.94	70.84	71.43
Sep 7, 2016	73.18	73.76	71.57	72.05
Sep 6, 2016	74.29	74.52	72.25	73.01
Sep 2, 2016	75.25	75.43	74.21	74.62
Sep 1, 2016	74.79	75.19	74.21	75.09
Aug 31, 2016	74.13	75.24	73.90	74.86
Aug 30, 2016	74.40	75.79	73.84	74.20
Aug 29, 2016	74.79	75.65	74.50	75.22
Aug 26, 2016	74.35	75.00	73.74	74.84
Aug 25, 2016	73.16	74.75	73.11	74.33
Aug 24, 2016	73.95	74.31	72.98	73.29
Aug 23, 2016	73.13	73.90	72.88	73.78
Aug 22, 2016	72.34	72.89	71.94	72.62
Aug 19, 2016	71.56	73.40	71.56	72.29
Aug 18, 2016	70.48	72.06	70.29	71.80
Aug 17, 2016	69.70	70.42	69.20	70.19
Aug 16, 2016	69.35	69.81	68.60	69.60

Almost from the time we started the position, the stock rose above our $70 strike price and stayed there, and yet our $70 calls carried high time value, as you would expect on a volatile stock.

The Friday before last, Sept. 9, shares suddenly fell below that, to $66, and our patience looked to have been vindicated, with us potentially collecting full income soon. If we had wanted to for some reason, we basically had one day to close early in response; if we issued an alert on Monday, Sept. 12, we could have closed Tuesday for just a little time value. But seeing shares as low as $65 Monday (before closing higher) meant reasons to act looked minimal to none. Then the quick ascent began Wednesday (from Fool Quotes):

Late Wednesday, the stock jumped to $72 from less than $70 earlier in the day. Now I knew we had to act, because we didn't want to risk losing shares with only two days left. We issued our rolling alert at 10 a.m. Thursday morning. As I entered current pricing into the alert, the stock was still $72; suddenly that morning, it ran to $74, and then before long all the way to $77, leading to many early exercises on the $70 calls.

All this is hopefully instructive in demonstrating that circumstances can leave you less than a day-long window in which to avoid losing your covered shares on a sudden move in the underlying stock. It's important to always keep that in mind when writing covered calls. The standard procedure with covered calls is:

- Watch time value and roll or close once it's nearly gone.
- But if the call looks on track to expire as income, you typically let it be, knowing you can usually roll it for a credit if it later moves against you (so why pay to close it?).
  - **An exception we can add now -- one new lesson we can take home:** On an exceptionally volatile stock, close the calls early if you get a good chance to a few days before expiration and you have any concern about the stock rebounding.
- No matter what, be ready to lose your stock, because it can go out of your control.

We followed these standard steps, and will consider the exception next time in such a situation. Was it wrong to write calls in the first place? Not in my opinion, because we chose to turn this stock into an income position for now and the foreseeable future, and we'll keep doing that until the valuation situation changes. Trading at 15 times earnings while being a "chip" stock now growing earnings around 10% annually, Skyworks looks reasonably priced.

Soon we will buy our sold shares back again,and write the January $75 calls on them. We'll need to do so at today's higher price. We'll make our trade once 24 hours have passed after this update.

As ever, do not cover any shares you want to keep for certain! To talk about this, please visit the Skyworks board.

Roll Your Covered Calls on Skyworks Solutions

Published Sep 15, 2016 at 10:05AM

Is this for you? This recommendation is for *Pro* members who wrote September $16 $70 *calls* on Skyworks with us. Newcomers who want to write covered calls can follow along with today's recommendation; see the How You Participate box for more. *Pro* members not writing calls can continue to own this Buy-rated stock in a 3.1% allocation. (*Options* members who wrote $70 puts expiring tomorrow are on track to earn full income without needing to take any action. If the stock falls below $70 tomorrow, *Options* will issue an alert to roll or close.)

How You Participate

- **Trade:** Use a rolling order to on **Skyworks Solutions** (NASDAQ: SWKS) options to:
  - "Buy to close" all Sept. 16, 2016, $70 calls (click to see "All Strikes")
  - "Sell to open" the same number of Jan. 20, 2017, $75 calls
- **Allocation:** Write ("sell to open") one new call for every lot of 100 shares you are covering. *Pro* is covering all 1,200 shares owned, representing 3.1% of the portfolio.
- **Prices** (9:35 a.m.):
  - Skyworks Solutions: $74.10
  - Sept. 16, 2016, $70 call (splitting bid/ask): $4.20
  - January 20, 2017, $75 call: $5.50
  - Net credit to roll: Approximately $1.30 (plus we gain $5 in upside per share, $4 of which is currently already earned)
- **Option Price Guidance:** Prices will change rapidly, but use a limit order to roll for ideally about **$1.30 in net credit** or higher. You *must* roll for the credit you can get by Friday to avoid losing your shares.
- **Stock Guidance:** Buy, at 3.1% (you don't need to use options on it unless wished)
- **Newcomers:** Simply "sell to open" the January $75 calls, lately for around $5.50 or so (that price will fluctuate), selling one call for every 100 shares you own and want to cover for income. Against the current share price, aim for a minimum 1.5% option yield per month to expiration -- lately about 6%, or $4.45.

What We're Thinking

iPhone 7 pre-orders are reportedly blistering, and **Skyworks Solutions** (NASDAQ: SWKS) – with **Apple** (NASDAQ: AAPL) as its largest customer – is enjoying a higher share price as a result. That's interesting because Skyworks' *second-largest* customer is Samsung. Samsung, meanwhile, is in the hot seat, suffering an expensive phone recall over potentially explosive batteries. The company faces massive refunds and perhaps customer defaults. However, Skyworks shouldn't need to refund any of its revenue to Samsung, and many customers may default to another of the phones that Skyworks serves with its analog modules, amplifiers, antennae and so forth.

Anyway: On word of strong iPhone orders, yesterday Skyworks jumped well above the $70 strike price of our calls that expire tomorrow (Friday), so we're rolling our covered calls to a later month and a higher strike price. Waiting until now to act gave us a couple of benefits: it allowed time value to dissipate from the calls, and it let us see whether the stock really did rise above $70. A few days ago this looked less likely, but here we are, so we'll take action.

But please note that this stock can be volatile. If Skyworks is back *below* $70 by Friday and you can afford to watch it periodically that day, you won't need to buy to close your $70 calls if the stock ends the day below $70 and stays there after hours. In that case, you could let your calls simply expire as full income (do nothing), avoiding paying any time value, and then write the new calls next week.

But as long as Skyworks is still above $70 on Friday, we're buying to close the $70 calls as soon as we can to avoid being exercised; we're then selling new calls expiring later, and rolling our strike price up in case the Apple-infused rally continues. From a higher strike price, it should be easier to attractively roll our calls again down the road if Skyworks goes even higher.

For now, the plan is to continue to write covered calls on the belief that the stock will remain volatile and we'll generate extra income on it over time. The stock remains a Buy in *Pro*, and we have a 3.1% allocation. We're covering all of our shares at the moment. If you're not writing covered calls, or own fewer than 100 shares, you can just continue owning the stock. Cool? Stay cool.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium paid us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up**: We hope to see this covered call expire for income, and then write new calls if wished. If we need to roll higher to capture more upside in the stock, we will if we like the pricing.

Options Can Help

- **Want to know more about this strategy?** Our guides to writing covered calls and rolling covered calls can help.

Pro Catch-Up Trades and Upcoming Expirations: Sept. 12, 2016

Published Sep 12, 2016 at 3:04PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

- Just getting started? Our Portfolio Building Report No. 1 features details on all our Buy First stocks, and Portfolio Building Reports No. 2 and No. 3 get you up to speed on all of our Buy stocks!

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights this week:

- **Facebook** (NASDAQ: FB): Buy up to 6.7% (in halves if you prefer).
- **FactSet Research** (NYSE: FDS): Buy 2.2%.
- **MasterCard** (NYSE: MA): Buy up to 4.4%.
- **Wells Fargo** (NYSE: WFC): Buy up to 4.4% (intending to write covered calls on one-third of that).

Continue building your portfolio with our Buys, including these highlighted today:

- **AmTrust Financial Services** (NASDAQ: AFSI): Buy up to 5.1%, in halves over time if preferred. Or, sell to open $25 puts expiring in later months.
- **Gilead Sciences** (NASDAQ: GILD): Buy 2.7%.
- **Medtronic** (NYSE: MDT): Buy 3.2%.
- **Oracle** (NYSE: ORCL): Buy 3.6%.

Our shorts (if you're new to shorting, you can wait for our Portfolio Positioning Event on Sept. 21, or move forward now and ask questions on the boards):

- **CurrencyShares EuroTrust** (NYSEMKT: FXE): Sell short 1.8%.
- **Domino's Pizza** (NYSE: DPZ): Sell short 2% along with owning 3.4% in **Papa John's** (NASDAQ: PZZA).
- **Pier 1 Imports** (NYSE: PIR): Sell short 0.5% to start (see our recent trade alert).

Pro options (again, to be addressed during our Portfolio Positioning Event):

- No catch-up options trades are currently recommended.

Hedges:

- **S&P 500 Depository Receipts** (NYSEMKT: SPY): Set up the November put ratio spread as per our latest alert. You can do so for a credit.

Options expiring next (on Sept. 16):

- **Gentex** (NASDAQ: GNTX): Our $15 puts are on track to expire as full income.
- **SPDR S&P 500** (NYSEMKT: SPY): Our September $200/$189 put ratio spread is on track to expire unused, earning us some income. No action should be needed unless the market falls 7% or more this week. We have the November hedge ongoing, and will look to set up a new complementary one after this one expires.
- **Skyworks Solutions** (NASDAQ: SWKS): Our $70 covered calls are on track to expire as full income. If the stock gets above $70 later this week, we'll issue an alert to close or roll the calls. If shares stay below $70, we'll do nothing and let the calls expire.
- **Valmont Industries** (NYSE: VMI): Our $135 covered calls are on track to expire as full income on Friday. We'll only take action if the stock price rises above $135 before then.

Short Stories on 4 Short Ideas

Published Sep 12, 2016 at 3:04PM

Dear *Pro* members,

I don't force decisions. I would rather have several months pass without a new idea in the *Pro* portfolio than rush, or force, a decision and end up seeing members lose money on it. Plus, after decades of investing, you come to recognize the difference between when you're compelled to act and when you're hesitant, and you learn to listen to your hesitancy. Many of the positions you *don't* take *could* have performed well for you, but if you force a decision at the start, you're teaching yourself the wrong lesson, and eventually you'll pay for that.

The stocks we'll outline next are just a few of the shorts I've been considering for a long time (months or even a year or more). They're all down over this time, but we don't anchor on that, because it's not relevant. We're still considering them as shorts, and our assessment of the business *today* is what's relevant. Often, we want to short companies that could potentially go bankrupt, but that's not likely with any of these anytime soon, so they make for interesting discussion.

4 Short Considerations

Cameco (NYSE: CCJ)

- Uranium miner
- Nuclear power industry struggling
- Considered shorting since $18, lately $9
- Risk of being acquired: Very low

Longtime *Pro* members may remember that we invested in the world's leading uranium miner back in 2009, and sold for a profit in 2010. Since the devastating 2011 tsunami in Japan, the nuclear power industry has been in a mini-meltdown. Japan shut down all of its reactors. Germany is doing the same. The U.S. is taking down plants more quickly than planned. Growth in nuclear energy has stalled, uranium supplies spiked, and spot prices are in the basement. Uranium providers have a tough time making money now, and there's no telling when the industry will turn.

Cameco was one of few uranium miners with the size and strength to stay in the green, at least until last quarter. To do so, management has had to close some mines, take charges, and reorganize, and now it spends about $40 million a year just to keep water pumping through inactive mines to keep them safe. Against such a challenging backdrop, we considered shorting Cameco in the high teens. A few things have stopped us so far: It is the industry leader with a fine balance sheet (only now are its shrinking cash and meaningful debt starting to look a bit threatening); until now, it still showed annual profits; and commodity prices are impossible to predict. We keep watching, because if the industry doesn't turn, even Cameco could end up largely washed out.

Gogo (NASDAQ: GOGO)

- Provider of in-flight Wi-Fi
- Competitive, expensive business
- Considered shorting since $18, lately $12
- Risk of being acquired: Very low

For several years, Gogo was the *de facto* in-flight Wi-Fi provider on planes progressive enough to offer that amenity. The connection was typically spotty, but many were willing to pay for it anyway. Now, competition has taken flight. Gogo needs to compete against heavyweights including **ViaSat** (NASDAQ: VSAT) and **Panasonic** (OTCMKT: PCRFY) as the skies get crowded with new satellite-powered Wi-Fi. Gogo recently lost some **American Airlines** (NASDAQ: AAL) business to ViaSat, and management will need to keep spending to maintain its customer relations, upgrade, and compete. In June, management sold $525 million in junk bonds at a steep 12.5% annual interest rate. The company isn't expected to make a profit for years, and its quarterly interest payment alone is now $17 million. Gogo has $509 million in cash and $791 million in long-term debt, along with negative $60 million in free cash flow over the past 12 months.

Why have we hesitated to short it in the past? A few times, we've been close to acting but then the stock price took a precipitous drop, causing us to cancel our attack. But we hesitated *initially* because Gogo was the first mover and industry leader, serving a few thousand planes and growing. As with Cameco, we'd usually rather bet against second-tier companies than leaders, even in a weak industry. But this year competition has heated up, and Gogo proved itself willing -- even eager -- to take on that 12.5% debt, so it appears the competitive risks are serious. Gogo may be a more *logical* short now than it was last year, before competitors arose and interest payments went up. Shares have always been difficult to borrow, but we could use options to set up a synthetic short if we decide to act. For more, check out this nice summary by fellow Fool Brian Stoffel.

GoPro (NASDAQ: GPRO)

- Maker of sport-action video cameras
- Electronics industry is notoriously cutthroat
- Considered shorting (*seriously*) since mid-teens, lately $13
- Risk of being acquired: Moderate

Occasionally, I've imagined issuing a combined "Short Gogo and Short GoPro" trade report here in *Pro*. It just *sounds* amusing -- and, to my ear, profitable. Maybe it'll happen.

You know GoPro for its Hero line of indestructible cameras, but its margins have not proven nearly so resilient. Profits plummeted this year, turning to losses, as demand cooled for cameras that are arguably a niche product. Your mom loves her iPhone, but she doesn't need a Hero camera to record her daily life (unless your mom is an uber-cool kite-surfing, sky-diving, shark-riding, cliff-jumping dynamo).

GoPro is banking on its new Hero 5 camera and Karma drone, both due this year, to restart its adrenaline. But even if these products make a splash, risks seem high that they won't have a long-term impact on revenue. The drone industry is already crowded with quality machines at low prices, and the high-end adventure camera market is still a niche. Plus, now that iPhones are waterproof and getting better cameras, many potential consumers may feel less need to try a GoPro.

We hesitated to short in the past because -- again -- GoPro is the leader in its space, has great brand recognition, and has been growing until recently. It's also recommended by smart Fools in other Motley Fool services. Today, I still believe risks favor GoPro's main business being "commoditized" toward minimal profits; the technology device industry is littered with innovative companies that became irrelevant. GoPro's recent acquisitions of video editing companies have been an attempt to avoid that. In addition, a disastrous attempt to sell low-end cameras may have taught management that maintaining premium prices is smarter. The company has no debt and ample cash, but it hasn't been profitable in a year. Its two new products will broadcast to the world whether that will change, and if so, for how long.

Shake Shack (NYSE: SHAK)

- Popular burger and shake joint
- Priced like a groundbreaking, high-moat company
- Considered shorting since $40s (wasn't really possible earlier), lately $34.50
- Risk of being acquired: Above average

Shake Shack's angus beef hamburgers are popular, but so is the stock, perhaps to a fault. It's trading at a $1 billion valuation despite only operating 51 owned stores as of June 29, which means each Shake Shack is valued at $19.6 million, compared with $6.1 million for each **Chipotle** (NYSE: CMG) location. The stock trades at 85 times earnings and 66 times forward estimates, while the bottom line is expected to grow about 24% in fiscal 2017. Any real disappointment in same-store sales could make the stock more soggy than a day-old cup of french fries.

Like GoPro, Shake Shack was a fairly recent IPO; the opportunity to take a reasonable short position only arrived six months after the IPO, at best, and as long-term options became listed. But we have some hesitancy about shorting shares of a brand leader with expanding profits. We usually won't short on valuation alone, preferring cracks in the foundation, which Shake Shack seemingly lacks (other than slowing growth). That said, we've been close to shorting it via a synthetic short because the price is so generous and we see few catalysts for it to go higher, other than years of earnings growth to lower the valuation multiple. Could the chain be acquired? That's possible ($1 billion is easy for, say, McDonald's), and is another reason why shorting a leader is more risky than a lower-quality business.

The Jury Is Still Out

Any of these positions could end up working or not; Cameco aside, these are young companies, and all have compelling factors alongside their risks. We've been watching them since prices were higher, but that doesn't tell the whole story; we were smart *not* to short two of them earlier this year, when Gogo and GoPro were both in the $8 range and left for dead. Both are up more than 50% since then. All of these stocks are difficult and expensive to borrow for shorting, so we might need to use options to short them. But they're all still possibilities, among the others we're considering (including more retailers). Share your thoughts on these! And do you have a short you like? Share it on the Shorting board, too!

Fool on!

Pro Catch-Up Trades: Sept. 6, 2016

Published Sep 6, 2016 at 3:19PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

- Keep in mind our Portfolio Building Report No. 1, which features details on all our Buy First stocks, and Portfolio Building Reports No. 2 and No. 3 -- the latter, just released today, gets you up to speed on all of our Buy stocks!

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Broadridge Financial Services** (NYSE: BR): Buy up to 5.5%.
- **Facebook** (NASDAQ: FB): Buy up to 6.7% (in halves if you prefer).
- **FactSet Research** (NYSE: FDS): Buy 2.2%.
- **MasterCard** (NYSE: MA): Buy 4.4%.

Continue building your portfolio with our Buys, including these highlighted today:

- **American Tower** (NYSE: AMT): Buy 3.8%.
- **Gilead Sciences** (Nasdaq: GILD: Buy 2.6%.
- **OpenText** (NASDAQ: OTEX): Buy 3.3%.
- **Papa John's** (NASDAQ: PZZA): Buy 3.4% in conjunction with shorting 2% in Domino's (see below).
- **Verisk** (NASDAQ: VRSK): Buy 2.2%.
- **Visa** (NYSE: V): Buy 2.4%. (See our earnings update.)

Shorts -- if you're new to shorting, feel free to wait for our Portfolio Positioning Event on Sept. 21:

- **CurrencyShares EuroTrust** (NYSEMKT: FXE): Sell short 1.8%.
- **Domino's Pizza** (NYSE: DPZ): Sell short 2% along with owning 3.4% in Papa John's (see above) (see what we did there? We set up an infinite loop).
- **Pier 1 Imports** (NYSE: PIR): Sell short 0.6% to start (see our recent trade alert).

Pro options (again, to be addressed during our Portfolio Positioning Event):

- None currently recommended for newbies.

Hedges:

- **S&P 500 Depository Receipts** (NYSEMKT: SPY): Set up a new put ratio spread per our latest alert. You'll have to set it up now for a small debit of $0.05 per spread, but that's still not bad.

Options expiring next (on Sept. 16):

- **Gentex** (NASDAQ: GNTX): September 2016 puts. Gentex shares are trading at about $18, well above our $15 strike. These puts are on track to expire as full income. The stock remains a buy.
- **Skyworks Solutions** (NASDAQ: SWKS) and **Valmont Industries** (NYSE: VMI): September 2016 covered calls. These contracts have 11 days to go, so we'll issue updated guidance as we approach expiration. If Skyworks is still above $70, as appears likely right now (it's $72.50), we plan to roll our options to a later month ahead of expiration, as time value dissipates. Valmont is the same story -- we'll likely roll if the stock is above $135, but right now our calls are due to expire as full income.

What Has Pro Taught Us?

Published Sep 6, 2016 at 3:19PM

Dear *Pro* member:

This past week, *Pro* member and Ticker Guide Karen (CMF_KBecks) posted a question on the *Pro* discussion boards, asking fellow members what they've learned during their time with *Pro* and how it's changed them as investors. She also asked for Foolish stories from anyone willing to share one. This conversation is off to a great start, and you can read your fellow members' thoughts here.

And when you're done, if you haven't already, please share your answers! What are the key lessons you've learned so far as an investor, either with *Pro* or before you joined us? Do you have a funny, difficult, or inspiring investing or life story to share? Please do!

We always like to walk the walk, so today members of the *Pro* team are sharing the key things *we've* learned.

Billy:

We start with our most senior analyst. You know him from his great analysis, writing, and recommendations: Billy Kipersztok (TMFBillyTheKid). Billy joined *Pro* and *Options* in the spring of 2013 as a newcomer to options. Now he's a star. Enough said. Billy's takeaways:

- I'm now much more cognizant of the behavioral aspects of investing.

- I have a much greater understanding of sophisticated investing strategies such as options, shorting, hedging, and ETF investing.

- I've developed a better process for identifying great businesses (the *Pro* Quality Checklist), improving the efficiency of the idea-generation process.

Ellen:

Pro launched in 2008, and Ellen Bowman (TMFKabellen) joined the team in 2011, making her the second most senior Fool here. *Pro* and *Options* wouldn't be half what they are without Ellen's tireless creative work, including building pages, organizing live events, managing content, and making sure we're coherent (and polite!) when we write. [*Editor's note*: *Thanks, Jeff. :)*] Like us, Ellen is, of course, also an investor. Here are some things she's learned:

- Fair value is neither objective nor immutable. Working on *Pro* over these five (!) years, I've seen so many members fret about fair value and when to hop on board with various positions -- and the advice from Jeff and team has always stayed the same: If it's listed as a Buy or Buy First on our Recommendations page, we think it's poised for North Star-beating returns today. I recently moved half of my 401(k) into a self-directed account to mirror *Pro*'s long positions (which allows me to amuse myself by telling Jeff to do a good job because my kid's gotta eat!), and I followed my own advice: I chose a day to buy, followed the *Pro* allocation calculator, and bought without looking back.
- It's gonna be fine. So far, even the most shocking events I've seen while working at TMF, from the housing crash to terrorist attacks to Brexit, have passed without destroying the stock market, the country, or the world as we know it. Jeff's and the team's steady advice and perspective have been key for me as I learn to let things pass.
- Community matters. One of the most wonderful things about *Pro* and *Options* in particular is the involvement and expertise of our community members. It feels great to be part of the *Pro* team, but it feels even better to watch new members come into *Pro* and turn from students to teachers. The amount of knowledge we can all share this way is exponential.

Jeremy:

Jeremy Myers (TMFTank) is our newest analyst, having joined *Pro* last year, but he's nonetheless a senior analyst after having spent nearly seven years on *Motley Fool Hidden Gems*. He's already providing outstanding coverage on several *Pro* stocks, and working on new recommendations, too, in a tough market to find value. Jeremy says:

- I've learned that you don't have to make it back the same way you lost it. Too often, we hang on to losing positions hoping to get back to even, when it makes more sense to cut our losses and invest in a better opportunity going forward.
- I've found that the key edges we Fools have over the market are time frame and temperament. Stretching our time frame further into the future provides a greater margin of error for an investment thesis to play out, but we also need the temperament to ride out the bumps along the way.
- Since joining the *Pro* team a year ago, I've become more cognizant that stock picking and portfolio management are separate, complementary investing skills. You need to be reasonably good at both to be a successful investor over time, but I've gained a greater appreciation for the role that intelligent portfolio and risk management play in compounding your wealth over time.

Sept. 23 Is Coming Soon! *Pro* Chicago Meetup

Pro and *Options* Fools are planning an unofficial meetup in Chicago in September. If you'd like to eat some pizza at Gino's East and chat with Jeff and Billy Kipersztok of *Pro*, Jim Gillies and Jim Mueller of *Options*, and many of the finest *Pro* members around, check out [this discussion-board thread] to get details -- and then RSVP!

Jeff:

When I think of what I've learned since *Pro* launched in 2008, many of my thoughts center on the challenges we face as a service, and working to excel despite those, as well as some investment lessons:

- We will recommend fewer than 2% of the companies we look at, which means that out of every 100 companies we consider, we'll be fortunate to recommend a few of them, long or short. Almost all of them have something that holds us back. I consider this a *good* thing, as long as our high success rate on both longs and shorts continues. This does mean that many months can go by before we recommend something entirely new, but often, a business you already know and own is better than something novel with its unknown risks.
- By far, the biggest mistake I've ever made personally is selling a good company because of valuation concerns. This has cost me many thousand times more (in lost opportunity) than any bad stock I ever held on to. I sold **Amazon.com** (NASDAQ: AMZN) years ago on valuation worries, before buying it back mountains higher. Here in *Pro*, we have fixed funds, so if we lack cash and want to buy something new, we need to sell something. But the lesson still stands: We should rarely, if ever, sell our strong companies. We've made some good sells, including **3D Systems** (NYSE: DDD) and **InvenSense** (NYSE: INVN), but only when the companies were struggling and not living up to our hopes, which is different from selling a good company on valuation concerns.
- I've learned from hearing countless member experiences -- and from my own life -- that there is always adversity to overcome in life, and some of it is monumental. Despite this, you need to keep calm and focused when it comes to your investing, and stay on course (even if that means stepping back for periods of time, leaving your stocks alone). Investing is a privilege, and you remember this the moment there's a family emergency that needs your attention. I've learned that we're surrounded by resilient people here at the Fool, because all of us go through tough times. I hope you are usually content, because adversity never really ends. It's part of life and part of investing. How you approach and address it is *more* than half the battle, especially with investing. The great community here can be a giant help.

Thank you again to Karen for posting these key questions to the community! This is an excellent way for members (new and old alike) to get to know each other, and *Pro*, better. Please [visit the discussion] if you haven't already, and we'll see you there!

Fool on!

-- Jeff (TMFFischer)

Pro Performance

Performance as of 8/31/2016

	Annualized		*Total Return*

Pro Portfolio Building Report No. 3: Our Buy Stocks, Continued

Published Sep 6, 2016 at 12:26PM

Welcome, Fools! As new members continue to learn more about *Pro*, we get a lot of questions about fair value. The most common one is this:

> **Q:** If a stock is rated Buy or Buy First, but its current price is higher than *Pro*'s stated fair value, is that stock still a Buy or Buy First right now? Should I really buy it today? At this price?

A: Yes. Yes, at least *start* to buy your allocation. Dip your toes in if you're not buying the whole stake yet (which is also fine!). Today's price should still provide the long-term annualized return we seek.

This may seem counterintuitive at first, but with some context, we think you'll see how this approach makes sense for our portfolio. Make sure you read Jeff's important Memo, "The Flaws of Fair Value," to understand how a great company has multiple extra ways to increase value that we can't bake into our long-term projections, partly because we don't know everything management is planning. (And to read more on fair value, click here.)

Moving on to today's report: Presented below are the rest of *Pro*'s Buy stocks; with these and our previous two reports, plus judicious application of the advice above, you should be ready to keep adding to your *Pro* portfolio as you're comfortable! Stay tuned for our next live chat, which we'll tell you about on the site and via email, and bring us your questions on the Getting Started & Help discussion board. We're glad to have you.

Best,

-- The *Motley Fool Pro* team

Table of Contents

Buy: Johnson & Johnson (NYSE: JNJ)

At eight out of eight of our Pro Quality Checklist criteria, Johnson & Johnson is a quintessential Pro-quality stock.

Suggested Allocation: About 3.1% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (2/22/17)
- Talk about Johnson & Johnson

The eighth largest company in the U.S. by market cap, J&J is one of the world's leading health-care companies, conducting business in virtually every nation of the globe.

The business is organized as a holding company, with more than 250 operating companies that are separated into three business segments: consumer (19% of 2016 sales), pharmaceutical (46%), and medical devices (35%). The consumer segment sells dozens of familiar brands (think Band-Aid and Listerine). The pharmaceutical business is the company's largest; in fact, J&J is the world's sixth largest pharmaceutical company by annual sales. And the medical devices segment includes a broad range of products used in the orthopedic, surgery, cardiovascular, diabetes-care, and vision-care fields.

For such a large company, J&J has an outstanding financial profile (which provides evidence for the company's competitive advantages). As a top-notch business, this is one we expect to hold for a long time. While its large size means we don't expect runaway growth and upside from J&J, we do expect to earn North Star-challenging returns with low downside risk from one of the safest stocks you are likely to find in the entire investment universe.

Buy: OpenText (NASDAQ: OTEX)

This company's information management software keeps the digital lives of businesses in order, and its exchange software platform drives business transactions and earns recurring revenue.

Suggested Allocation: About 3.2% (see Recommendations page for real-time allocation)

For More

- Most recent earnings coverage (5/15/17)
- *Pro*'s original recommendation (8/31/11)
- Talk about OpenText

Based in Canada, **OpenText** (NASDAQ: OTEX) provides Enterprise Information Management (EIM) software to governments, legal firms, financial institutions, and other corporations that need to manage growing reams of digital data. Its overall goal is to provide customers with a singular software platform for managing, analyzing, and exchanging enterprise information; it also wants those customers to conduct business transactions over OpenText's business commerce exchange.

To these ends, OpenText steadily acquires smaller companies to add their services to its wares. Management made four acquisitions in mid-2016 that should fuel about $300 million in new revenue over the coming year (adding to its current $1.9 billion in annual sales), along with strong earnings-per-share (EPS) growth. As these acquisitions are assimilated, margins should continue to improve and the company's market share should rise. About 85% of OpenText's revenue is of a naturally recurring nature, being subscription-based.

This cloud and license software seller is under the radar of many investors, but it's the largest independent EIM software provider after IBM. Recently $63, the stock has been a strong long-term performer, up about 1,200% since its 1996 market listing, compared with 255% for the S&P 500. Today, the stock trades at 15.3 times estimated earnings for the coming year, while non-GAAP earnings per share are expected to increase by 15.5%.

Buy: Paycom Software (NYSE: PAYC)

Pro is looking to add more high-growth positions to the portfolio, and this company can sign that check -- so to speak.

Suggested Allocation: About 3% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (11/30/16)
- Talk about Paycom

Paycom Software is a profitable, young, cloud-based provider of payroll and human capital management (HCM) software, which manages the employment life cycle for employers and employees. It's differentiated by its comprehensive, integrated Software-as-a-Service (SaaS) solution that saves customers money and makes HR systems more efficient.

Revenue has compounded at 46% annualized over the past three years, and profitability and free cash flow much more rapidly than that. The company sports more than 15,000 clients and stores data on 2.1 million employees, and its average three-year retention rate (recurring revenue) was 91% as of Dec. 31, 2015. In the most recent quarter, 98% of revenue was recurring. It notches $300 million in annual sales, meaning the company can grow for years before it takes significant market share in the immense payroll and HCM industries. And its comprehensive and growing HR solution is ahead of competitors', promising market-share gains for years. Finally, at the time of our rec, the stock traded at 31.8 times expected non-GAAP earnings for 2018, in line with the company's estimated growth rate.

Be sure you've got a long-term outlook of at least three to five years, some comfort with high price volatility, and comfort with the potential for at least a partial loss of capital, then welcome Paycom as a high-growth, North Star-friendly addition to your portfolio.

Buy: ProShares Short VIX Short-Term Futures ETF (NYSEMKT: SVXY)

Profit from the long-term nature of stock market volatility to revert to an average level after each spike.

Suggested Allocation: About 2% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (11/25/14)
- Talk about SVXY

Buying shares in — let's make it easy and use the ticker, shall we? — SVXY is a recommendation for *Pro* members who are comfortable owning a small stake in a volatile position that we *may* add to during market downturns. *Pro* is a portfolio service, so all positions are meant for everyone, to the extent you can invest in them and wish to. But this position is not core to what we do, and will be especially volatile, so only follow it if you're comfortable with high volatility in a holding.

This unusual vehicle should increase in value when stock market volatility — as measured by the CBOE Volatility Index (or the VIX) — goes down or is range-bound. This ETF *sells short* futures contracts on the VIX that have one month and two months to expiration. Unless expected volatility from the S&P 500, as measured by the VIX, increases above and beyond the premium already baked into the futures contracts being shorted, the positions turn a profit in the ETF and the ETF goes up in value. Helping further, VIX futures contracts are historically in a state of "contango" as much as 90% of the time. Contango means that future-month contracts are increasingly more expensive than earlier months' and than the current VIX itself (much like a call option has a premium above the current stock price). This is a tailwind for SVXY. As long as volatility is ultimately rangebound overall (as it is historically), then just holding this small stake over the years should reward us.

We recommend starting at 1.1% (or round to 1% if you want), and we may add more when the VIX soars — meaning when volatility in the market is high and SVXY is low. But even if we don't, we believe this small position should create compounded value for us over the long term thanks to the regressive nature of volatility in the market: It spikes, and then grinds back down, and is usually range-bound.

Buy: Skyworks Solutions (NASDAQ: SWKS)

This leading designer of analog modules for smartphones and connected Internet of Things devices is growing sharply.

Suggested Allocation: About 4.4% (see Recommendations page for real-time allocation)

For More

- Latest earnings coverage (5/15/17)
- *Pro*'s original recommendation (8/5/14)
- Talk about Skyworks

The loftily named **Skyworks Solutions** (NASDAQ: SWKS) supplies customized analog semiconductor modules and related products to major smartphone makers around the world. As Wi-Fi connectivity grows, Skyworks' complementary Internet of Things business is growing, too, recently representing about one-fourth of total revenue. Company profit margins continue to expand as Skyworks increases its market share as well as the amount of its components it sells into many devices.

We're now seeing a move to higher-speed LTE wireless coverage in China and in most emerging markets; this is a long-term opportunity unfolding for Skyworks, even as smartphone sales level off in mature markets and at the company's largest customer, **Apple** (NASDAQ: AAPL). On July 21, Skyworks guided for 10% to 11% sequential revenue growth next quarter -- a bump higher than the 8% guidance given for the same quarter a year ago, suggesting healthy if not mind-blowing expectations for the iPhone 7. Management expects sequential growth to continue for the quarter after that, too, clearing current inventory concerns. As a technology leader growing faster than its market and with improving margins (a rarity in the chip industry), Skyworks, at about $74, is trading at 12.6 times earnings expected for the next year. The stock looks to us like a reasonably priced way to invest in the long-term ascent of mobile connectivity and the Internet of Things through a strong niche leader.

Buy: Starbucks (NASDAQ: SBUX)

You only think you're there for the coffee — the ubiquitous java purveyor has big plans.

Suggested Allocation: About 3.5% (see Recommendations page for real-time allocation)

For More

- Most recent earnings update (3/27/17)
- *Pro*'s original recommendation (8/22/2012)
- Talk about Starbucks

In the global coffee giant's fiscal third quarter, **Starbucks** (NASDAQ: SBUX) achieved 4% same-store sales (SSS) growth in the United States. Before that quarter, the company had generated at least 5% U.S. SSS growth for 25 consecutive quarters, so the "miss" grabbed some headlines.

But following a small dip in growth, there's no reason to see this green-and-white cup as half-empty. Revenue was up 7% year-over-year, and Starbucks now has more than 12 million active Rewards loyalty members, representing 18% growth from the prior year. A net 474 new Starbucks locations opened across the globe over the quarter, and we still believe that Starbucks is one of the highest-quality growth companies in the world. Revenue has increased for 23 of the past 24 years (1991 through 2015), and the company's 5- and 10-year average returns on invested capital are higher than 20%. Management is guiding for revenue growth of 10% for the full year (down from 10%-plus), and we expect Starbucks to provide at least a 10% forward rate of return.

Also this past quarter, management announced an investment in "Italian artisan bakery" Princi; the press release notes that Princi is "known for its artisan breads created from traditional family recipes" and that its "five locations have become beloved experiences for customers across Milan and London." Princi will also provide the food at Starbucks Reserve stores, showing that management is focusing on expanding and improving the food business as one way to give its growth a jolt. (Yes, that pun was intended. We might be working too mocha.)

Buy: Verisk Analytics (NASDAQ: VRSK)

This prototypical Pro *holding provides us with exposure to powerful tailwinds within the financial, energy, and health-care industries, among others*.

Suggested Allocation: About 2% (see Recommendations page for real-time allocation)

For More

- Most recent earnings coverage (2/27/17)
- *Pro*'s original recommendation (6/23/15)
- Talk about Verisk

Founded in 1971 by insurance-industry giants, **Verisk Analytics** (NASDAQ: VRSK) provides decades-old proprietary data and contemporary analytics to risk managers, property and casualty insurers, and financial institutions -- and after an acquisition to expand its data offerings, to the global oil and gas, chemicals, energy, and mining industries, as well. Company-wide, more than 80% of annual revenue comes from subscriptions to its services, and customers renew at an outstanding 98% rate as of 2015.

Verisk has pricing power, allowing it to increase prices regularly, including during the mayhem of 2009. How so? The company offers data that its customers need and others don't have; it has deep domain expertise, allowing it to work closely in each industry it sells to; it invents new analytic methods and better algorithms; and it's deeply embedded in customer workflow, becoming part of a user's process. Without Verisk's analysis, an insurance giant might have a hard time pricing policies.

Public since 2009, Verisk counts every major insurance company as a customer, and became part of the S&P 500 index in 2015. Historically fetching a premium valuation, the $83 stock recently trades at 26 times expected earnings for the year ahead, and 22 times free cash flow. We like the thought of new members starting a position here.

Establish a Partial Allocation of Covered Calls on Wells Fargo

Published Sep 2, 2016 at 11:15AM

Is this for you? Yes, if you're a *Pro* member and have matched our 4.5% allocation to **Wells Fargo** (NYSE: WFC). If you're new to *Pro*, Wells Fargo is addressed in our Portfolio Building Report No. 1 from Aug. 16; it may be helpful to review that information as well. (If you own 2018 calls on Wells Fargo from *Motley Fool Options*, leave those alone. They have nothing to do with this alert.)

How You Participate

- **Action:**
  - Sell ("sell to open") Oct. 14, 2016, $50.50 calls on Wells Fargo. *Please note that these are **weekly** options*.
  - Stock Status: Buy First; own a 3.2% stake in WFC for the long term; and have an additional 1.3% WFC stake for today's option income generation.
- **Allocation:** Cover about 30% of the 4.5% portfolio stake in Wells Fargo that you own. *Pro* will be selling seven calls (we own 2,400 shares; 700/2,400 = 29.2% of our shares). Please note that if our 4.5% allocation is fewer than 200 shares for you, you can opt not to write covered calls and just keep your allocation as is for long-term upside -- unless you really want to cover 100 of the shares you own.
- **Prices (11:00 a.m. Sept. 2):**
  - **Stock:** $50.45
  - **Sell to open Oct. 14, 2016, $50.50 calls (bid/ask):** $1.14/$1.18
- **Price Guidance:** Using a **limit order**, split the bid/ask and aim to receive a net credit of at least $1.16. As prices change, realize that the price of the calls will change as well. Over time, aim to earn a premium of at least 1.5% (expressed as a percentage of the stock's market price) per month to expiration.
- **Important Earnings and Tax Note:** These calls expire at the end of the same day that Wells Fargo is scheduled to release third-quarter 2016 earnings before the market opens. We are choosing this date by design, taking advantage of the "earnings uncertainty premium" embedded into the option prices. Be aware that there may be volatility involved with this trade on the day of earnings/expiration, and we need to be -- and are -- ready to sell these income shares. With your broker, be sure to be set your account up for tax purposes as "Last In, First Out (LIFO)." We don't want to sell our long-term shares and have larger capital gains taxes to pay. We only want to sell the shares we acquired this year for income.

What We're Thinking

Wells Fargo has been an income workhorse for *Pro* for a few years now. Since 2014, *Pro* has written two covered strangles on the company and has written or rolled puts three times (not including this covered-call trade). The net result of all these income trades over the past two years has been a total of $3,259. When including the regular dividends we've received along the way, we've earned more than $9,000 in income from Wells Fargo in two years, a 7.5% return when expressed as a percentage of the current value of our Wells Fargo stake.

Since our last iteration of written puts ended with assignment of shares in early May, we've been patiently waiting for Wells Fargo's stock price to increase before reinitiating our long-running income strategy with covered calls.

Our intent with this strategy is to continue to monetize this small part of our Wells Fargo position for income. We are covering just the portion of our shares that was assigned to us via our written puts in May.

Considering the income we've earned on just the written-put portion of our Wells Fargo income strategy (i.e., ignoring the covered strangles), our net buy price on our shares that were assigned in May is $49.39. With these calls, assuming we earn $1.16 per call (the bid/ask midpoint), our net buy price on the portion of shares we are covering is reduced to $48.23. If Wells Fargo ends up above $50.50 at expiration, we intend to let our shares get called away for an effective 4.7% return earned in about five months (excluding dividends), and then immediately write puts again for more income. If those puts are assigned, we can follow up again with covered calls.

In this manner, we can run a continuing income strategy of near-the-money puts and/or calls as one portion of our Wells Fargo exposure, until we no longer feel that the income strategy is worthwhile. Meanwhile, we leave our long-term shares uncovered in order to capture full upside.

The fact that these covered calls will expire on the day of earnings means we can simplify our decision-making process. We won't have time to issue a rolling trade if the stock is above $50.50 on the day of expiration, so there are only two potential outcomes:

1. **Wells Fargo stock ends below $50.50 on Oct. 14:** Our calls will expire fully as income, and we will look to initiate another partial covered-call position so long as pricing is favorable.
2. **Wells Fargo stock ends above $50.50 on Oct. 14:** Our calls will be assigned and we will sell 700 shares (29.2% of our total WFC allocation) at $50.50 per share. We will look to write puts shortly thereafter to continue our income strategy, so long as pricing is favorable.

More That Matters

- **Maximum loss:** For the current iteration of the income strategy (which includes the January, March, and May recommendations), our risk is the same as share ownership starting at about $48.23, or about 4% below the current price.
- **Maximum gain:** On this covered-call trade alone, our maximum gain is the covered-call premium. At $1.16, that's a 2.3% yield on the current share price in 43 days.
- **Follow-up:** In October, we'll sell our shares at $50.50 if the stock is above our $50.50 strike price. We may then write new puts to continue our income strategy. If the calls expire as income, we will look to write new calls (or pursue a different strategy) for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 4.5% allocation first — Wells Fargo's shares are a Buy First. Then write these partial covered calls for income on about 29% of your shares, leaving a 3.2% allocation uncovered.
- **Don't like the idea of writing calls that expire on the day of earnings?** You can look at various other expirations and strike prices, depending on what you like best. If you choose this route, be aware that *Pro*'s course of action may diverge from yours, depending on what expiration and strike you choose, and depending on the stock-price movements of Wells Fargo.

Pro Can Help

- **Want more on this strategy?** See our guide to writing covered calls.
- **Questions?** Please ask, Fools! Drive your stagecoach over to the Wells Fargo discussion board.

Deere Cuts Costs to Kick the Can Down the Road

Published Sep 1, 2016 at 2:38PM

Deere (NYSE: DE) continues to struggle through a tough agricultural operating environment, but this quarter another large sales decline was overshadowed by management's cost cutting initiatives, delivering a surprise earnings beat. Rather than regurgitate the details of the quarter, I'd point members to the Press Release and the Conference Call Slide Deck for review of the nitty-gritty detail.

Overall, it was another rough quarter for Deere with net revenue and sales down 11% year over year. Agriculture & Turf sales declined 11% for the quarter though the segment's operating margin increased to 12.1%. Nearly two percentage points of that margin lift was the result of a one-time gain on a partial sale of Deere's equity stake in landscapes supply company SiteOne. Even worse, Construction & Forestry net sales decline 24% for the quarter and operating profit declined 58%. Financial Services net income declined by nearly 18% during the quarter as the result of "less favorable financing spreads, a higher provision for credit losses and higher losses on lease residual values".

The biggest news for the quarter came at the end of the conference call when the CFO shared that, on a mid-cycle volume basis, the company's operating margin should improve by three percentage points compared to where they were in 2010. As a result, management believes those savings should result in an additional $500 million in pre-tax income by the end of 2018, even if the ag downturn persists at current levels. Our short thesis is based on the expectation that the downturn will end up being worse than most investors expect -- but more on that in a minute.

With one quarter to go in the fiscal year, here is management's updated guidance for 2016:

- Worldwide Ag & Turf equipment are forecast to be down about 8%, including about 2 points of negative currency translation. This is unchanged from the previous forecast.
- U.S. and Canada expected to be down about 15% to 20%, with sales of large ag equipment down 25% to 30%.
- Europe remains flat to down 5%, due to lower crop prices and farm incomes as well as persistent pressure on the dairy sector.
- South America, expected to be down 15% to 20% in 2016.
- Construction & Forestry sales forecasedt to be down 18%.
- Field inventory to sales ratios for new large ag equipment are expected to end the year in line with 2015 year-end levels
- Full-year 2016 earnings forecast increased to $1.35 billion

Pro's Take

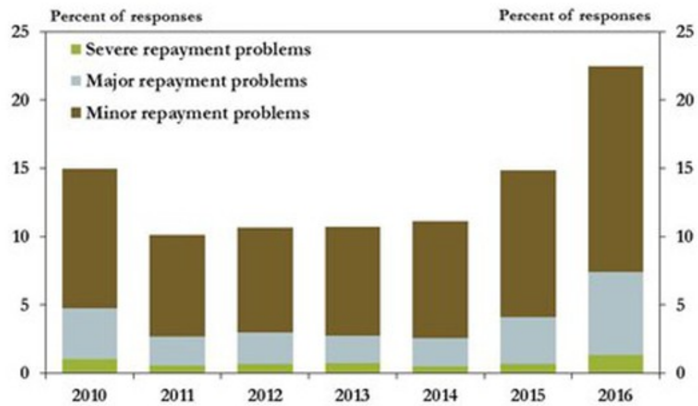
It would be fair to say that we were surprised by the market's reaction to Deere's third quarter earnings report. As we expected, industry fundamental remain weak as persistently low commodity food prices have resulted in falling farm profits, declining farmland values, and plummeting demand for new equipment. These developments were all in line with our original short thesis. We also knew that Deere was cutting costs and reducing its work force in response to industry conditions, but what caught us (and most other investors) off guard was the magnitude of the $500 million of cost savings that Deere guided for by fiscal 2018. Based on the current challenges of the business, it's obvious why management would like to point investors' eyes to the horizon, but we remain skeptical.

It also seems that investors are trying to call the bottom of the ag cycle, likely under the belief that 1) this is a normal cycle and 2) an improved cost structure will make it easier for the company to ride out the downturn, thus limiting the downside from here. It remains our view that the abnormally large volume of tractors sold near the top of the cycle will require an abnormally long (or deep) trough to clear out excess used equipment inventories.

Though some investors have become more optimistic, there are few reasons to believe that the fundamentals will improve in the next few quarters. For example, other agricultural-related businesses, like Pro's own **Valmont Industries** (NYSE: VMI), reported last quarter that it has yet to see a light at the end of the tunnel for its Valley irrigation segment. Also, the management team at **Titan International** (NYSE: TWI), which makes around 80% of Deere's tire and wheel sets under the Goodyear brand of farm tires, stated on its recent earning call there was little evidence of a turnaround in the U.S. for Deere through the end of the year. Titan only saw a modest improvement in the <100 horsepower tractor segment and one of the few bright spots for the company was the aftermarket business, which suggests that farmers are still directing their dollars to maintaining existing equipment.

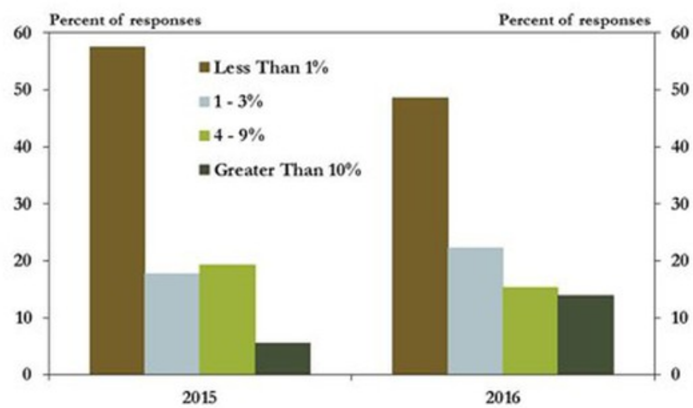
Additionally, earlier in the month the USDA announced that it expects a record harvest this fall which should keep commodity prices depressed through at least the end of the year and weigh further on farm profits. The Kansas City Fed reported that banks in its district are reporting more evidence of financial distress by farmers, noting an uptick in both the percentage of distressed loans and the number loans being denied. They're also reporting a continued slide in the value of farmland (see the charts below).

Chart 6: Loan Repayment Problems, Second Quarter



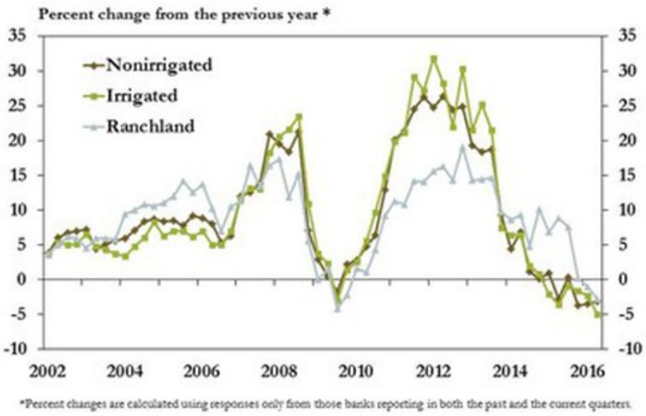
Source: Kansas City Federal Reserve

Chart 8: Percent of Farm Operating Loan Applications Denied, Second Quarter



Source: Kansas City Federal Reserve

Chart 9: Tenth District Farmland Values



Source: Kansas City Federal Reserve

These statistics suggests that farmers' financial distress is increasing which should reduce demand for new equipment in the coming quarters. The data also supports our suspicion that farmers are relying more on short-term leases to manage their balance sheets and lay off the risk of a decline in future residual value onto Deere. This should be a concern for Deere shareholders because even though management claims that they are trying to reduce the residual values for their new leases, in recent quarters the residual value of their leasing book sits at about 64% of initial cost compared to 40% to 42% of initial cost a decade ago. Considering that we're in a soft resale market for used equipment there's a high probability that Deere will have to take additional writedowns on the value of that equipment as those leases expire and also increase the depreciation charge being taken on the lease book as a whole. According to the last John Deere Capital Corp 10-K filing from nearly a year ago,

"*Estimates used in determining end of lease market values for equipment on operating leases significantly impact the amount and timing of depreciation expense.* ***Hypothetically, if future market values for this equipment were to decrease 10 percent from the Company's present estimates, the total impact would be to increase the Company's annual depreciation for equipment on operating leases by approximately $141 million.***"

$141 million isn't all that significant for a company that is projecting to earn $1.35 billion for the current fiscal year, but that lease portfolio has continued to grow rapidly over the past year and any significant impairments could certainly could put a dent in management's narrative. During the call management validated analysts concerns about the leases, stating,

"*As we look at future maturities, we continue to work hard to reduce the return rate on those maturities as well as finding more effective ways to dispose of those when they get returned so that the loss rates are not as significant. But as long as we stay at these lower levels, as long as used equipment prices continue to be at more depressed levels, I think that continues to bear watching and certainly has risks.*"

Further,

"*We'll hit some pretty strong maturities in the fourth quarter of this year and then certainly as you move into spring next year, I think another kind of wave of maturity.*"

This means that there will be a steady stream of used equipment hitting the market in the coming quarters, adding to the current glut. Deere has been very aggressive in growing its new and used equipment leasing business to make up for fewer retail sales. Over the past few quarters we've also seen a big jump in the size of the operating lease book while the proceeds from the sale of used equipment actually decreased. Part of the reason for the decline is arguably fewer trade-ins on new retail sales, but it's likely also the result of Deere releasing the used equipment and/or holding it on its balance sheet rather than selling it and further flooding a depressed market. Further evidence of this is that in the John Deere Credit Corp (JDCC) SEC filings you can find a line on the balance for "other assets" which has been growing steadily the past few quarters (the most recent quarter has yet to be filed). That's where Deere holds the leased equipment that it has yet to sell\. Combined with the fact that JDCC's profitability declined nearly 30% last quarter, it seems likely that the company is working hard to manage aftermarket prices for used inventory to delay additional impairments.

Foolish Bottom Line

No one ever said shorting is easy. In fact, a couple weeks ago I highlighted in the Monday Memo that it's among the toughest things we have to do, at least emotionally, as investors. Despite the challenge, we continue to think that finding strategic shorts is a worthwhile endeavor. In the case of Deere, shorting it kept us from selling Valmont, which generates about 25% of its sales from the Valley irrigation segment, over similar concerns about a prolonged downturn in the U.S. agriculture industry. We also expect that it will provide a hedge should the stock market, which has been marching steadily higher since the March post-Brexit low, ultimately reverse course in the coming months.

The key points of our original thesis appear to still be in place, but sentiment toward the stock has obviously shifted. Deere is aggressively cutting costs and doing a good job of managing through the down cycle. Even so, following the recent increase in the stock price shares are trading at 18-times The Street's estimate of **2018** earnings. If the company can continue to manage investor expectations long enough, eventually it will be rewarded by an upturn in the cycle. Thus far management has proven adept at that task, promising a 2016 recovery in 2015 that never materialized and now a huge cost savings over two year out. We think the next two quarters will be telling as the company deals with upcoming lease maturities and tries to continue rationalizing its cost structure in the face of tepid demand for new equipment. **Deere remains on Hold, while the team discusses whether the recent move in the stock price warrants an update to our guidance.** (For new members a "Hold" rating means that it's ok to keep the position open if you have already shorted the stock. Otherwise, we are not recommending that members start a new position at this time.)

Short Domino's Pizza

Published Aug 30, 2016 at 11:57AM

Is this for you? This trade is for all *Pro* members who are matching our allocation to **Papa John's** (Nasdaq: PZZA) and seek possible downside protection for that position.

How You Participate

- **Trade:** Sell short **Domino's Pizza** (NYSE: DPZ).

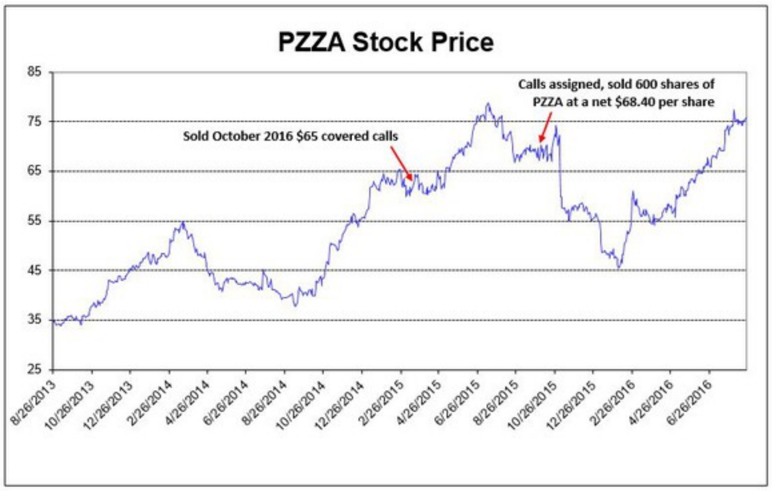
- **Allocation:** 2% (or short around 59% of your *long* allocation to **Papa John's** (NASDAQ: PZZA) in a new DPZ short -- read on).
- **Price guidance:** It is **critical that you *use a limit order*** to aim to short around current pricing.
- **Recent price:** $149.83
- **Availability at Interactive Brokers (Aug. 30):** 3.4 million shares
- **Current annualized shorting fee (Aug. 30):** 0.25%
- **Current dividend yield (Aug. 30):** 1%; we also need to pay this dividend while shorting shares.
- **Short interest (percentage of shares outstanding as of Aug. 30)**: 6% (per S&P Capital IQ)
- **Next earnings date**: Oct. 18

What We're Thinking

Why short Domino's? Doesn't *Pro* own competitor Papa John's? Exactly. In fact, as you'll read in this alert, this short is a *paired* position with Papa John's, meaning that we cannot consider this position without also considering the position it's paired with. The long position (Papa John's) and the short position (Domino's) combine to create one, single super-position that reflects our thesis. Further explanation of the paired thesis follows below, and reviewing the history of our Papa John's position will help provide further context.

In early 2015, *Pro* decided to establish a partial allocation of covered calls on our shares of Papa John's. The rationale for the covered calls was that the then-current price (about $61 per share) reflected rosy expectations, and we aimed to buffer a portion of potential downside volatility via the covered-call premiums. Our stake had also grown large enough that we were content to cut it.

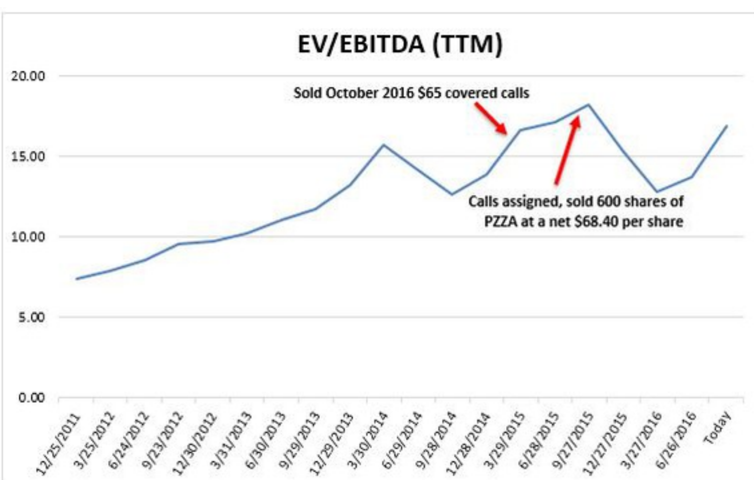
About seven months later, *Pro*'s calls were assigned, and we sold one-third of our Papa John's position at a net $68.40:



Source: S&P Global Market Intelligence

Over the following months, Papa John's stock experienced severe volatility, reaching as low as $44.47 in February of this year, a 44% decline from its peak of $79.40 in July 2015. Remember, small- and mid-cap stocks will tend to be more volatile than large companies. Since that roller-coaster ride, Papa John's stock has been on a tear, and it's back above the price levels at which our covered calls were exercised.

However, looking only at the stock price is somewhat misleading. An alternative way to look at our position management would be to examine Papa John's valuation multiples; doing so takes business performance into account as well as the stock-price changes. Here is the same graph, except instead of stock price, the metric in question is EV/EBITDA:



As you can see, the graphs generally follow the same trend, but a key difference is that in the EV/EBITDA chart, today's valuation multiple is roughly equivalent to the multiple that existed when we wrote our first set of covered calls. The stock price is higher, but the multiple is nearly the same; the only way for that to be the case is if the denominator of the equation (EBITDA) is higher. And as we see below, that is the case:

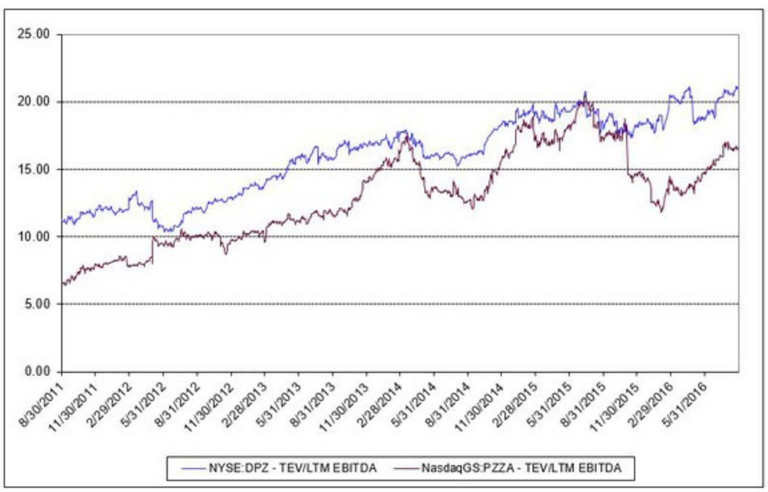
	Stock Price	TTM EBITDA (in thousands)	EV/EBITDA
3/10/2015	$60.90	$157,584	17.15
8/30/2016	$75.11	$187,300	16.69

Papa John's now sports an EV/EBITDA multiple similar to when we covered a portion of our shares last year -- and it's at an even higher premium (about 32%) to our admittedly conservative fair-value estimate. Since our assessment of the position hasn't meaningfully changed, we need to decide how we're going to manage our Papa John's exposure. We could write more covered calls, but instead, we believe that shorting Domino's is a superior way to buffer potential downside volatility for Papa John's. Consider the following:

- The correlation coefficient (the statistical variable *r*) of Domino's and Papa John's daily stock-price movements over the last five years is 0.977, an almost-perfect positive linear correlation. Put another way, 95.5% of the variation of Papa John's stock price can be explained by variation in Domino's stock price ($r^2 = 0.955$).
- Selling calls buffers only a very small portion of potential downside. Let's say we were to write the January 2017 $77.50 calls: We would earn a premium of about $3.65. That buffers against about a 4.9% decline in Papa John's stock before the covered-call position would enter negative-returns territory.
- For comparison, selling short a stock that historically moves in tandem with the stock we aim to protect would in theory buffer almost *all* of our downside. Assume Papa John's stock were to decline 44% from the current price, like it did during the last peak-to-trough decline mentioned above. In that instance, Papa John's stock would be at $42.06. At the same time, we could expect Domino's stock to decline almost exactly in the same proportion (at least as predicted by the stocks' historical correlations). The gain on our short position in Domino's could almost exactly offset the loss from a Papa John's price decline, providing much more complete downside protection than would a covered call.

The trade-off is that we won't receive any income from selling calls, and we also have to consider the costs of shorting (the modest 0.25% short fee, plus the cost of paying the 1% dividend). However, we think the prospect of much more complete downside protection is worth it.

Additionally, we may even stand to earn an absolute return from this position, thanks to the discrepancy in valuation multiples between the two companies. Domino's has consistently carried higher multiples than Papa John's over the past five years, with the average discrepancy between their EV/EBITDA multiples at about 3.07 over that time frame (the median is 3.33). Currently, the multiple discrepancy is 4.5, with Papa John's at 16.6 and Domino's at 21.1. Over the past five years, that figure has been lower than 4.5 nearly 84% of the time. With a higher multiple, Domino's has less room for error and is likely to experience more volatility after a poor quarter or if markets go south. If that happens, and the multiple discrepancy decreases, our paired position will benefit.



Source: S&P Global Market Intelligence

How This Fits Into *Pro*

All in all, this short of Domino's has almost nothing to do with Domino's business (which is performing well) and everything to do with managing our current Papa John's position. As a paired trade, it is a low-cost hedge that will ideally protect almost all of our downside for the portion of the long Papa John's allocation we are hedging.

By shorting Domino's at a 2% allocation, and with our current Papa John's exposure at 3.4%, we bring our effective allocation to Papa John's to about 1.4%. This short / hedge / paired position allows us to continue owning Papa John's indefinitely, preventing the potential tax consequences that would arise if we were to sell part or all of our stake through covered calls.

If Domino's and Papa John's stock prices decline to a valuation that is more in line with our estimates, we can cover our short; in doing so, we'll immediately increase our effective exposure to Papa John's back to its original allocation. And if the stocks keep rising in value, we still benefit from the 1.4% of our Papa John's position that we are choosing not to hedge.

Finally, we must discuss the worst-case scenario for this position: that Papa John's stock price falters while Domino's continues to rise. In that case, we lose out on both sides of the trade. If that scenario occurs, we'll assess the business performance of both companies and attempt to determine whether the stock-price action is warranted. If our assessment leads us to believe that we should adjust our paired position, we'll do so at that time. If not, we'll likely maintain it.

Alternative Trades

- **New to Pro and haven't established your Papa John's allocation yet?** We suggest that you simultaneously buy 3.4% in Papa John's and short 2% in Domino's, in the spirit of this alert. If you can't or don't want to short, then we suggest you buy only the *difference* between the Papa John's and Domino's allocations, purchasing 1.4% in Papa John's. If you take this course, if and/or when *Pro* closes its short to increase its allocation to Papa John's, you can buy more Papa John's stock to match our allocation.
- **In an IRA and can't short?** Consider:

- Reducing your stake in Papa John's by 2% (since tax consequences for those in IRAs are irrelevant), and increasing your allocation to Papa John's if and/or when *Pro* closes its Domino's short.
- Or you could sell covered calls (the January $77.50 or $80 calls look good to us, but feel free to explore other options if you like them better).

Pro Can Help

- **New to shorting?** Check out this Memo on the topic from Jeff for a look at how *Pro* approaches the strategy. If you're considering covered calls instead, this guide from *Motley Fool Options* should help answer your questions.

Pro Portfolio Building Report No. 2: Our Buy Stocks

Published Aug 30, 2016 at 11:56AM

Welcome, *Pro* Fool! This report details our current thinking on nine of the Buy positions in our portfolio; the Buy stocks not listed here are included in our third report. Once you've read theses and the previous report detailing our Buy First positions, you're ready to start (or continue) building your *Pro* portfolio as swiftly or as slowly as you like.

We want our advice to be uncomplicated: Purchase our Buy Firsts first (again, taking your time according to your situation — there's no rush); purchase our Buys after that; match our allocations as closely as you can (but don't worry about needing to buy in 100-share lots — fewer is fine); and stay tuned for our next monthly live chat, during which we answer member questions in real time. Also, please read this note on fair value as you move toward matching your portfolio to *Pro*'s.

We're glad you're here, learning to become an investor who will come out on top in all markets. Bring any questions to the Getting Started & Help discussion board, and Fool on!

Best,

The *Motley Fool Pro* team

Table of Contents

Buy: Amazon (NASDAQ: AMZN)

You will be assimilated.

Suggested Allocation: About 3.4% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (1/26/17)
- Talk about Amazon

When *Pro* first bought Apple in 2012, it was already the most valuable company in the world, sporting a massive $127 billion in annual revenue. Less than five years later, revenue is up 69%, and our investment (to which we later added) is up 72% excluding dividends. Apple has outperformed a majority of our positions, despite its giant size. Enormous **Amazon.com** could follow the same path, and may even have superior avenues for sustained growth:

- According to the U.S. Census Bureau, only 8% of U.S. retail sales occur online, but the shift to the Internet continues -- Amazon's revenue rose by 29% last quarter.
- Gartner estimated in 2015 that Amazon Web Services (AWS) for the cloud had 10 times the utilized capacity of its next 14 competitors *combined*, and this lucrative business increased revenue by 70% in 2015.
- Alexa is a leading artificial-intelligence operating system in the home.
- Amazon Prime may have as many as 80 million global subscribers, each paying $99 a year for free shipping and streaming video.
- And more ...

Amazon has so many business arms that a more fitting name could have been Octopus. Consumer retail sales drive massive cash flow to the company daily, but today it's cloud services that generate most of the profits. Amazon's cloud is heavy in machine learning and AI; relatedly, Alexa's early success is driving Amazon Echo and Dot product sales, and manufacturers around the world are now building Alexa into new devices and cars. Amazon has hundreds of fulfillment centers, and investment bank Piper Jaffray says 44% of U.S. citizens now live within 20 miles of one -- that's a strong competitive advantage. Drone delivery is in the works, and Amazon is investing in more of its own delivery to save on costs. U.S. sales account for about two-thirds of retail revenue, but international is growing and largely untapped. In an unconventional surprise, the company is launching a physical bookstore in Manhattan, and Amazon Go grocery stores around the country. And then there's Amazon's award-winning original content.

Sometimes lost in the breathless coverage of all these initiatives is what helps drive the success of each: data. Founder and CEO Jeff Bezos, 53, is driven by the intelligent use of information and cutting-edge technology to do business better than others. As the world's largest online retailer, Amazon has a better understanding of consumer retail behavior than any internet competitor, allowing it to anticipate customer desires. Couple that with the relentless pursuit of improving the customer experience, and Amazon always seems two steps ahead. In its own words, Amazon is "guided by four principles: customer obsession rather than competitor focus, passion for invention, commitment to operational excellence, and long-term thinking." Management has a history of reinvesting cash flow for more growth, learning from mistakes, and pushing new boundaries. This bodes well for long-term growth, and for us as shareholders.

Buy: Apple (NASDAQ: AAPL)

The leader in mobile computing products should see more long-term growth than anyone expects.

Suggested Allocation: About 4.8% (see Recommendations page for real-time allocation)

For More

- Most recent earnings update (2/27/17)
- *Pro*'s original recommendation (2/14/12)
- Talk about Apple

Led by its iPhone, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the smooth Apple operating system, iOS, which centers on the iTunes and App Store marketplaces, as well as the new Apple Pay. iTunes alone earns more revenue each year than two-thirds of the companies in the Fortune 500, while Apple itself is the most valuable company in the world, with more than $220 billion in annual sales. The company's integrated hardware and software make for a sticky consumer experience that provides disincentives to switch to a competitor, and as more people use multiple computing devices, Apple makes it easy to transition seamlessly from one of its products to another.

The company regained some shine with third-quarter earnings on July 26; while sales and earnings declined as expected, revenue of $42.4 billion and gross margin of 38% were at the high end of expectations. The new, cheaper, 4-inch iPhone SE is seeing strong demand in emerging markets (India and China included), becoming the first smartphone many consumers buy. Meanwhile, the number of customers switching to Apple products from other phone models hit its highest level ever. Apple sold 40.4 million phones this quarter, and the active installed base of iPhone users rose by more than 10% year-over-year. This helped drive services revenue in the Apple ecosystem (iTunes, Apps) up 19%, to $6 billion, for a $24 billion annual run rate.

Though Mac sales were down following new product releases a year ago, iPad revenue was up 7%, for the best result in 10 quarters, on the roll-out of the 9.7-inch iPad Pro. Overall, product sales have been strong (especially for phones) and inventories are at good levels as Apple reportedly readies a new phone model for release this fall. At $106, the stock trades at 12 times earnings, while EPS is expected to grow again in 2017. We're not counting on a revolutionary product anytime soon, but we are counting on record numbers of phones being sold to both existing and new customers over the coming years.

Buy: Broadridge Financial Solutions (NYSE: BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: About 5.4% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (4/27/10)
- Most recent earnings update (2/15/17)
- Talk about Broadridge

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in its fiscal 2015, its platforms processed approximately 85% of all shares in the United States. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider for managing investor communications.

The company's smaller division, Global Technology and Operations (GTO), accounts for 26% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance this Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy: FactSet Research Systems (NYSE: FDS)

Stable, predictable, and meeting every one of Pro'*s quality criteria, this data and analysis provider is no myth.*

Suggested Allocation: About 2% (see Recommendations page for real-time allocation)

For More

- Buy More recommendation (4/28/17)
- *Pro*'s original recommendation (5/18/16)
- Talk about FactSet Research Systems

The ideal *Pro* company has predictable recurring revenue, pricing power, a dependent customer base, expanding opportunities, and smart management. FactSet Research scores eight out of eight on our company quality checklist, and while most companies are struggling to grow these days, FactSet increased its revenue 9% in 2015 to more than $1 billion, with earnings per share growing 16%. That made for 35 consecutive years of revenue growth, and 19 consecutive years of earnings growth -- every year since FactSet went public in 1996. Over the past 21 quarters, earnings per share have grown by more than 10% year-over-year each quarter. The business has the traits we look for most: stable, predictable results with the ability to reinvest healthy free cash flow for more growth.

Founded in 1978, FactSet's data and analysis platform has become integral to the daily operations of thousands of financial professionals, including investment bankers, institutional investors, hedge funds, and asset and risk managers. Serving more than 3,000 customers with a total of 63,500 users, FactSet prides itself on personalized attention, making its customized data a core part of its customers' daily workflow and decision-making. FactSet's consultants paid 46,000 visits to its 3,000-plus customers in 2015, making sure to meet individual needs. Clients in turn reported 97% satisfaction with FactSet's customer service.

Meanwhile, FactSet doesn't carry any of the risks inherent with most "financial"-related companies; it's a subscription business model, selling data. It doesn't have balance-sheet risk. Should competitors start to cut prices to win market share (not likely, but possible), we'll need to reassess. But as long as FactSet retains pricing power and can steadily add new clients, it should create North Star-challenging long-term returns. We're happy with our position of about 2.2% today, and may potentially build it higher (with new trade alerts) as opportunities dictate.

Buy First: Gentex (NASDAQ: GNTX)

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: About 2.9% (see Recommendations page for real-time allocation)

For More

- Most recent earnings update (3/8/17)
- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex

In 1982, a small company in Zeeland, Mich., called **Gentex** made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands more than 90% of that market.

Currently, about 26% of cars made worldwide have an auto-dimming rearview mirror, and only 8.5% have auto-dimming exterior mirrors. For context, prior to 1987, those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher usage; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror (including the newly launched full-display mirror), both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy First: Mastercard (NYSE: MA)

With approximately 85% of the world's commerce still happening in paper money, electronic payment leaders have a lot of room to grow.

Suggested Allocation: 5% (see Recommendations page for real-time allocation)

Mastercard (NYSE: MA) is among the most attractive businesses in the world. The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns running a largely fixed-cost transaction network that becomes more profitable the more people use it.

For More

- Latest earnings update (2/9/17)
- *Pro*'s original recommendation (9/8/11)
- Talk about MasterCard

The company "charged forward" again in 2015 despite slow international commerce and a strong U.S. dollar. For the year, net revenue in local currency advanced 8%, and EPS gained 18% before special items. But right now, an investment in MasterCard -- as with **Visa** (NYSE: V) -- is an investment in growth *beyond* this year, because 2016 looks tepid as emerging markets struggle and the dollar remains strong. Much of the company's growth potential is being coiled up like a spring. That spring should pop when more economies begin to expand again and the dollar weakens. The market knows this, so the stock maintains a premium valuation.

Buy: Medtronic (NYSE: MDT)

The medical-device industry is complex and regulated, and it provides entrenched leaders with a competitive moat; our leading company is growing in international markets.

Suggested Allocation: About 2.9% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (7/1/2009) ...
- ... and our second buy recommendation (11/9/10)
- Talk about Medtronic

In March of 2016, the CEO of Medtronic put it like this: "Our formula for long-term success is to deliver consistent mid-single-digit revenue growth, with 200 to 400 basis points of EPS leverage, [and to] return a minimum of 50% of our adjusted free cash flow to shareholders through dividend growth and share repurchases. The expected net result is creating enormous value, with sustainable double-digit [at least 10%] total shareholder returns."

As shareholders of Medtronic, this is exactly what we've seen over the years: Our annualized return on the position is above 11%, and we think something close to this can continue going forward. Medtronic is a market leader in vital medical devices, be they for the heart, spine, knee, or one of four other key categories. The stock yields nearly 2%, and the dividend has increased annually for the past 39 years, resulting in an 18% compounded annual growth rate (CAGR). Expect continued dividend increases, sales growth of about 4% to 6%, and earnings-per-share growth considerably higher than that. Medtronic has a sound strategy to deal with the more regulated and costlier health-care environment. We're confident the business remains competitively advantaged, operates in an attractive industry, and is well-positioned to grow, especially in emerging markets. With reasonably priced shares, we target North Star-type returns.

Buy: Oracle (NYSE: ORCL)

This old-guard tech giant at a low price has more room to grow.

Suggested Allocation: About 3.7% (see Recommendations page for real-time allocation)

For More

- *Pro*'s original recommendation (9/17/09)
- Talk about Oracle

Oracle (NYSE: ORCL) is one of the world's largest providers of software for corporations, but unlike other old-school tech giants over the past 10 years — including **Cisco Systems** (NASDAQ: CSCO), **Dell**, and **Microsoft** (NASDAQ: MSFT) — Oracle's value has steadily risen as its business has grown. Oracle's software runs databases, middleware, applications, and hardware for thousands of clients around the globe, and its own groundbreaking Exadata and Exalogic machines provide extreme data processing with industry-leading speed.

We've been waiting patiently for the company to turn the corner in its transition to a cloud-based software-as-a-service (SaaS) business model, and it looks like that corner is now safely behind us. New software license sales declined 10% in the fiscal fourth quarter as demand for cloud-based applications increased, but a 4% increase in software updates and product support mostly closed the gap, resulting in a 2% overall decline. Fortunately, the cloud business has finally reached the size where its sales growth will more than make up for the slow decay of the on-premise business.

In the quarter, the company blew past the high end of management's estimates for SaaS/platform-as-a-service (PaaS) sales growth, posting a 68% increase over the previous year and 17% sequential growth over the previous quarter. Cloud sales now account for 8% of Oracle's revenue, compared with 5% a year ago. Though the top line will likely continue to grow at a modest low-single-digit pace for the next several quarters, the company is increasing the lifetime value of its customer base and becoming more profitable. Oracle is currently trading at a free-cash-flow yield of about 7.5%, which is attractive considering the likelihood of improved profitability as the cloud business scales. The company is a full-service solution, one that's poised to enjoy long-term growth in free cash flow.

Buy: O'Reilly Automotive (NASDAQ: ORLY)

Auto-parts retailers are boring, right? Right! But an investment here is up 670% over the past 10 years, and we expect additional returns around the corner.

Suggested Allocation: About 4.4% (see Recommendations page for real-time allocation)

For More

- Latest earnings update (3/6/17)
- *Pro*'s original recommendation (4/15/14)
- Talk about oh, oh, O'Reilly

America's second-largest auto parts retailer, **O'Reilly Automotive** (NASDAQ: ORLY) operates more than 4,500 stores, about one-quarter of them in California and Texas. Auto parts are a big business, estimated at $231 billion, and O'Reilly is an exceptional competitor, with an addressable market size of about $131 billion. Running 24 regional distribution centers and 240 hub stores as part of a two-tiered distribution strategy, the company provides same-day or overnight availability on more than 142,000 items, including many its competitors don't usually stock. Basic auto parts, tools, and services complement those hard-to-find treasures. As a result, O'Reilly's sales are historically split between "do-it-yourself" retail customers and lucrative, repeat-sales professional-services customers (such as auto repair shops), a luxury many smaller competitors don't enjoy.

On July 28, the company reported its 30th consecutive quarter of 15% or greater earnings-per-share growth. The results also featured a 7% increase in revenue and same-store sales (SSS) growth of 4.3%, on top of 7.2% SSS gains a year earlier. Operating margins continue to trend higher, now at 19.5%.

O'Reilly has opened 89 new auto-parts stores so far in 2016, pushing it toward 4,700 locations in 44 states, with a goal of 200 new stores total before the year is out. Besides the advantages listed above, O'Reilly's tailwinds include cheaper gas prices, more people working, and cars staying on the road longer (which means more repairs). For the year, the company increased earnings-per-share guidance to $10.30 to $10.70, implying a P/E of 27.5 on the $288 stock. Given the consistent track record of strong value creation at O'Reilly, a P/E in the lower 20s seems justifiable; shares trade at about 25 times expected earnings one year from now. This stock has always appeared a bit expensive, yet has rewarded handsomely.

As one of our largest positions, O'Reilly remains a stock we own for the long haul. Shares remain rated a Buy even though they currently (and historically) trade a bit above our fair-value estimate. After earnings per share rose 25% in 2015, we expect at least 16% growth in 2016, with the chance for acquisitions to move that number higher.

Buy: WisdomTree Emerging Markets Small Cap Dividend Fund (NYSEMKT: DGS)

Diversification in emerging markets with some of the best small, high-yield companies you've never heard of.

Suggested Allocation: About xxx% (see Recommendations page for real-time allocation)

For More

- *Pro*'s most recent Buy recommendation (4/28/17)
- Talk about DGS

At *Pro*, we like the idea of investing in emerging-market small caps to diversify and target higher growth. Enter **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) (the longest ETF name in the world!*). This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index, and yields between 3% to 4% per year.

For *Pro*, owning shares of this well-managed ETF offers exposure to up to 600 of the most promising international business that we couldn't easily buy in any other way. Serving as direct exposure to emerging markets, this is an excellent way to invest in small companies in locations where we don't have a discernible edge but where growth exists — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The benefits of diversifying outside our home market are equally important over long periods. Emerging markets have badly lagged developed markets for the last several years, but eventually they should take the performance baton again, and we'll be in good stead with this position.

Getting Into the Flow of Pro

Published Aug 29, 2016 at 3:43PM

Dear *Pro* member:

The *Pro* service just closed to new members, so we're excited to welcome new investors to the service! We're also grateful to our veteran members who are helping newcomers get started. Remember when you were getting on your feet here, and how much you had to consider to make *Pro* work best for you? That's where many newer Fools are right now, and with every question we see in the community, we're heartened by the help the asker is getting from fellow members. A special shout-out to phooLon, TMFEpsilon, RockyTopBob, marksrjm, BigOil1, CMF_KBecks, JSPColorado, HeckCreek, SilverHawk27, and so many others we've seen! I wish I could name you all. Thank you.

Of course, the team wants to help as much as we can, too, both on the boards and in larger communications like this. I remember when *Pro* itself started in 2008, and how overwhelming it felt at times. But I knew we just needed to take one step at a time, make some progress each day (in our learning, in our teaching, in our process), and follow our core beliefs. That's true for members, too. One step at a time. *That* will get you invested in the types of companies that have served us well for years, and should looking ahead. Companies including **FactSet Research Systems** (NYSE: FDS), with its strong recurring revenue, and **Facebook** (NASDAQ: FB), with its clearly laid-out 10-year plan.

The qualities that we seek in our core investments are usually lacking in the companies we sell short. *Pro* combines long-term investments in "compounding machines" with selling *short* poor performers, an approach that should continue to generate healthy returns for members. And even if you don't sell short, you should do perform strongly over time invested in our long stocks.

Sept. 23 Chicago Meetup

Pro and *Options* Fools are planning an unofficial meetup in Chicago in September. If you'd like to eat some pizza at Gino's East and chat with Jeff and Billy Kipersztok of *Pro*, Jim Gillies and Jim Mueller of *Options*, and many of the finest *Pro* members around, check out this discussion-board thread to get details -- and then RSVP!

Portfolio Politics and New Ideas

All members should give themselves ample time to get into the flow of *Pro*. Most members take *months* or longer to get fully on board with the portfolio, and that's fine. You want to feel confident and knowledgeable about each step you're taking, and the portfolio is a living entity (at least, we see it that way) that's full of symbiotic relationships. It takes time to get fully aligned. This week is a case in point.

We plan to issue a new short recommendation on Tuesday. This position will be a *hedge* on a position we currently own and rate a Buy. You would *not* set up this new short unless you also own the long position -- but you might not realize this if you just skimmed the alert. So, each time *Pro* sends you a recommendation, please take the time to enjoy reading it carefully. Our portfolio holds more than 30 total positions, and most are meant to work together in one way or another, with some holdings offsetting others. Expect to take some time to get into the flow of this way of "complete investing," to whatever extent you think is right for you.

We simplify the initial process for you by offering Portfolio Building Reports on our Buy First and Buy stocks. Following these is as simple as buying stakes in allocations similar to our own, as shared in the reports. We have a new Portfolio Building Report coming out tomorrow (Tuesday), followed by a third on Sept. 6. On Sept. 21, we'll have a Portfolio Positioning Event to get you started in hedges and options (and other shorts), too, if you wish. Meanwhile, brand new recommendations may arrive in your inbox at any time. We're considering new long, short, and option ideas.

As a *Pro* member, you also receive all the content from *Motley Fool Options*. The ideas from that service are meant as stand-alone recommendations -- they may complement your *Pro* portfolio very well, but aren't part of the *Pro* portfolio.

Pro Portfolio Housekeeping and Guidance

Along with new ideas, we're of course always keeping current on our whole portfolio. Although we sometimes take months to make decisions (a good thing, in my mind), we're always thinking about them. Lately, our positions on Hold are all shorts. Here's our latest on some ongoing positions.

- **Caesars Entertainment** (NASDAQ: CZR): We closed half of this short for a 35% gain in July 2015, and we have a 47% gain on the other half. Are we smart to keep sitting on it in hopes that lawsuits unravel against Caesars? One concern is that the longer these cases go, the more chances Caesars management has to convince their adversaries to work with them (or just exhaust the opposition). That said, the company's legal expenses are mounting, and we still believe Caesars has illegally swindled its secured debtors out of assets. We'd like to see the whole company unravel. For now, we ponder the odds of this, clouded by the opaque prism of the legal system; as we do, the short is on Hold for newcomers. Even so, Friday's late news that protection from outside bondholder lawsuits for the parent company will *not* be renewed as they expire today is a step in the right direction for our short. In this case, the parent company we're selling short may be held liable for up to $11 billion in bondholder debts, enough to bring the whole thing down. But it's still a judge's decision. A ruling on Caesar's potential liability could arrive as soon as Tuesday after the market closes in New York.
- **CurrencyShares Euro Trust** (NYSEMKT: FXE): We're short the euro via this ETF, a position that's up 16% for us. That's a healthy gain in a currency. With the U.S. poised to increase interest rates, the U.S. dollar should stand to rise a bit more against the euro, so for now this short remains in place. It moves back to Short today from Hold. Just be mindful that we might close this short at any time (it's interest rate dependent), and thus newcomers may end with a short-term loss if FXE doesn't decline further before we do. Newcomers could also wait for Sept. 21 for more guidance, if wished.
- **Deere & Company** (NYSE: DE): Cyclical stocks are strange beasts. They often rally long before a recovery occurs because investors *anticipate* a recovery. That seems to have happened lately with Deere and with **Valmont Industries** (NYSE: VMI). Both businesses continue to struggle, lacking revenue growth, but both are regaining investor favor on cost-cutting and *prospects* of a distant recovery. Our Deere short serves as a hedge to our Valmont long, and so far the combination has made money overall since we shorted Deere. Shorting Deere let us keep Valmont. But what's the best move now for newcomers? And for us veterans, too? Deere is on Hold while we asses this, with our expected update coming to you this week.
- **Skyworks Solutions** (NASDAQ: SWKS): Targeting income, we're short September $70 covered calls on this Buy-rated stock. Shares have risen lately, perhaps in anticipation of **Apple**'s (NASDAQ: AAPL) iPhone 7, but the expected volatility for the stock is high enough that we should be able to roll our covered calls next month to a later date and collect another credit. (We will of course send a trade recommendation to all members when we do.) Writing lucrative options on Skyworks, just as we've done in *Motley Fool Options*, should ultimately result in income. This chipmaker is likely to remain volatile in both directions, even though

we believe its long-term direction will be up. Newcomers right now will be advised in a forthcoming Portfolio Building Report to just buy shares, at a 3.4% allocation, and wait for the Sept. 21 event to consider writing covered calls. You can also take a look at the Catch-Up Trades we publish each Monday.

Once again, welcome to new *Pro* members! We're grateful you're here as a *Pro* Fool, and we're here to help you succeed, ideally exceeding your investing goals. To *Pro* veterans, thank you again!

Please visit the Memo Musings board if you have any questions.

-- Jeff (TMFFischer)

Pro Guidance Changes

- **CurrencyShares Euro Trust** (NYSEMKT: FXE): Shares move back to a Short, at a 1.8% allocation. Just be sure to read the paragraph on this position above. Newcomers can wait for the Sept. 21 Portfolio Positioning event to act, if preferred. If you can't get shares to short at your broker, and you have options experience and persmission, you can set up a 2018 synthetic short.

Pro Completed Trades

- **S&P 500 Depository Receipts** (NYSEMKT: SPY): We set up a put ratio spread, as decribed in our recent recommendation. We sold 26 November 2016 $200 puts and bought 13 November 2016 $210 puts, getting a net credit of $0.27 each. This position hedges out 10% of our long exposure when SPY is between $210 and $200, and a sliding scale less than that amount when SPY is between $200 and $190.

Pro Catch-Up Trades: August 29, 2016

Published Aug 29, 2016 at 3:42PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

- Also keep in mind our Portfolio Building Report No. 1, which features details on all our Buy First stocks, and stay tuned for tomorrow's Report No. 2, which will detail nine of our Buys!

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Broadridge Financial Services** (NYSE: BR): Buy up to 5.4%.
- **Facebook** (NASDAQ: FB): Buy up to 6.6% (in halves if you prefer).
- **FactSet Research** (NYSE: FDS): Buy 2.2%.

Continue building your portfolio with our Buys (or wait for our Portfolio Building Report on Tuesday if you wish), including these highlighted today:

- **American Tower** (NYSE: AMT): Buy 3.8%.
- **Apple** (NASDAQ: AAPL): Buy 3.6%.
- **OpenText** (NASDAQ: OTEX): Buy 3.3%.
- **Medtronic** (NYSE: MDT): Buy 3.3%.
- **Visa** (NYSE: V): Buy 2.4%. (See our earnings update.)

Shorts -- if you're new to shorting, feel free to wait for our Portfolio Positioning Event on Sept. 21:

- **CurrencyShares EuroTrust** (NYSEMKT: FXE): Sell short 1.8%.
- **Pier 1 Imports** (NYSE: PIR): Sell short 0.6% to start (see our recent trade alert).

Pro's options (again, to be addressed during our Portfolio Positioning Event):

- None currently.

Hedges:

- **S&P 500 Depository Receipts** (NYSEMKT: SPY): Set up a new put ratio spread per our latest alert. You can still do so for a credit.

Options expiring next:

- **Gentex** (NASDAQ: GNTX): September 2016 puts. Gentex shares are trading at $18, well above our $15 strike. With 25 days remaining, these puts are on track to expire as income.
- **Skyworks Solutions** (NASDAQ: SWKS) and **Valmont Industries** (NYSE: VMI): September 2016 covered calls. These contracts have 18 days to go, so we'll issue updated guidance as we approach expiration. If Skyworks is still above $70, as appears likely right now, we plan to roll our options to a later month (and possibly higher strike) ahead of expiration, as time value dissipates.

Portfolio Positioning Event: Sept. 21, 2016

Published Aug 22, 2016 at 4:18PM

As you gradually build your *Pro* portfolio of stocks, it will become time to consider hedges, shorts, and options if you're following along with us in these versatile investment tools. Join us on this page at 1:30 p.m. ET today, Sept. 21, for our live video chat on these topics and anything else you'd like to know about *Pro*! In the meantime, please enjoy our final report for new members, released today. We'll be answering questions about the positions in this report during today's chat.

The *Pro*-event-specific chat room can be found here or by visiting slido.com and entering the code #ProPortReport. Please open Slido in a new tab or window -- that way, you can follow along with the video here and the questions there. We'll be answering questions in order of which get the most votes, so please vote on other members' questions as you ask your own!

Transcript

Jeff: Greetings Motley Fool Pro members, we are delighted that you are here for our September 21st 2016 Pro Portfolio Positioning event. I am flanked on both sides and through technological wonders up in the air as well by your fellow Pro team, analysts and advisers and content manager extraordinaire. We have Jeremy Myers to my right, senior analyst on Pro, we have Billy Kipersztok on Skype and saving the most of all for last, we have Ellen Bowman right here on my left.

Ellen: Thank you Jeff.

Jeff: Ellen, really I should introduce you first every time, it's not very gentlemanly of me not to.

Ellen: Yeah, I actually forgive you, I forgive you this time.

Jeff: Thank you. We were talking right before we went live how very little sleep we got last night.

Ellen: This will be ...

Jeff: I only got a few hours sleep and so it's going to be an interesting hour together but we are thinking clearly and focused and ready for a great hour with you.

Jeremy: Absolutely.

Jeff: The purpose of this hour is to give a quick overview of the positioning report we just issued which covers our active shorts, options and hedges. Also even more than that I would say, because you can read that report at you leisure, is to answer your live questions. On this page where you see the video right now, be sure to go down to the paragraph underneath the video and click into the slido.com for the chat room. You'll need to do that in a separate window and then hopefully you can size the two windows to have them on your screen at the same time, the chat, the video and the slido.com where you will enter the code Proportreport, it's Proportreport.

Inside there you can see all the questions from your fellow Pro members and ask your own questions and vote up the questions that you want to see answered most and we'll get to those first. Before we get to your questions which are already starting to be collected here, and we thank you for that, a lot of great question here already. Let's talk a little bit, Ellen, about the positioning report that you put together with the writing of all of us analysts here.

Ellen: This is a big Project, this is Probably the biggest report that we issue. It's so long in part because the introduction is so important. If you are not familiar with shorting or hedging or options or how to gauge your exposure against what we are doing here, please, please read the introduction. There is also an important part that says this stuff is optional. We know that not every member is going to be comfortable with shorting or hedging. We know that not everybody is going to want to use options or be able to. That doesn't mean there's not important information here for you but please don't feel pressured to follow every single piece of advice immediately. As Jeff notes in the intro, if you are still building your long portfolio, these positions are meant to be a compliment to that, so you are going to want to continue with that before you leap in here.

A lot of the stuff is, especially at first glance, can be really complicated and so we hope to have a live event that would be able to clear up any questions that you have at the start. After the intro we go into our shorts and then our hedges, and then at the end there is a list of the positions that we have on our score card but we are not recommending for new members now and some reasons for that. We are going to take your questions as they come in here and as the highest voted. The first one is from Jeff Thinking Man, he says, "In an IRA, do the put spreads require some reserve?"

Jeff: Yes Jeff, good to see you again, we saw you in the Motley Fool Options chat yesterday as well.

Ellen: Shout out.

Jeff: The answer is a spread in an IRA, the amount of reserve that you will need is the difference between your two strike prices. If you set up a $10 dollar spread in an IRA for say at one dollar cost, well let's see if I'm thinking about this right. You are buying the put, you are selling a put, well it depends on what type of spread that you have. I told you not much sleep and now we are talking options. In IRA, the beauty of an IRA is that it will only let you risk the cash that you put on the line to begin with. It really doesn't use margins so there should not be in a typical spread any need for additional funds set aside in the IRA other than what you initially put aside with most spreads. That is certainly true with what we are recommending which is a bear put spread as a hedge. That's why you are buying a put option at a higher strike for Protection and you are selling a put option at a lower strike to help fund that purchase of your higher strike put.

The lower strike option that you are selling is completely covered by the higher strike that you are buying, so there is no additional funds needed for that position. The most you can lose is your near cost at the outset which is around a dollar per share in most of the spreads we recommend. Jeff, short answer is that with the spreads you can use in an IRA usually just the cash you put up is all you need to put up.

Ellen: Okay, Headcreek, hello Headcreek? Says, "Wells Fargo gets a public park walk to the senate woodshed. The stock is down at Buck today in reaction and the Feds statement this afternoon will add volatility, should we write puts for income?"

Jeff: Billy.

Billy: As the, yeah I'll step up and answer this one, as the analyst who covers Wells Fargo. To answer your question, today we actually put Wells Fargo on hold for the portfolio due to the latest scandal involving sales quotas and fraudulent accounts which is still ongoing. Wells Fargo testified, management testified before Senator Congress yesterday and news and information is still rolling in on that. We want to make sure that we read that information and we check on the commentary for management to make sure that this scandal hasn't changed our investment thesis. If you go back and you read our original recommendation for Wells Fargo, one of the biggest parts of our thesis was a best in class management team and a difficult to replicate sales culture. Both of those things were implicated in the scandal that occurred.

This may represent a significant change to our thesis, so we are putting the stock on hold so that we can review all of the information and come to a determination on how we want to Proceed. For anybody with the covered calls if you have questions about our recent covered calls at the $50 dollar and 50 cent strike which expire October 14th, those call are not really viable anymore because the stock prices declined in response to the scandal. The stock is on hold, the calls are not really viable so for now just wait until you hear something from us. If you want to go off on your own and write puts, certainly feel free but Pro is not recommending that right now and we have the stock on hold.

Jeff: Good summary Billy, thank you. I would say within Probably a week to 10 days we'll have a formed opinion on everything that's going on. We of course as always want to take our time and go through all the information that we can. There is more information coming out each day including the hearing of course. The good news is we have to believe that 98% some of Wells Fargo's business at least is on the up and up and strong and creating value for shareholders. Even though we believe that we want to make certain that that thesis is true and only continue to recommend it if we believe that to be the case. Wells Fargo is one of our top 10 positions, it's about our 4% holding but as Billy said, it's on hold. What that means is just don't buy it now if you haven't yet but if you own it of course keep it and the covered calls are nice. I'm glad you wrote those Billy because they are expiring as income in a couple of weeks it looks like.

Ellen: Okay, Jeff Thinking Man is back again, he is the voice of the people, he gets applauded a lot. How would you change or modify the Pro Portfolio for people who are retired or would you?

Jeff: That's a great question, do you have thoughts Jeremy?

Jeremy: I would say, well I always start any retirement question on it depends on your personal situation if you have a pension, if you are trying to ... If you have a lump sum of money that you are trying to live off of. The Pro Portfolio really is a standalone portfolio that represents an equity position. Even though it is absolute returns and even though we are trying to achieve Northstar returns, it's still somewhat or mostly delivered to the stock market, even though it should be less volatile over time. Odds are that you Probably have a bond allocation or some the other asset allocations that a financial planner would suggest have a truly diversified portfolio. Also the opportunity to diversify internationally and some other ways that we don't necessarily directly address within the Pro Portfolio. As I said before it's I believe that we are pretty well setup for a standalone portfolio and with a lower volatility investor in mind, like someone who is in retirement.

Jeff: That's true, I agree with all of that and the longer you are at Pro or investing generally you might learn from us or from your experiences ways to generate more income if that's what you want. You can use more of our option strategies or add in more of the Motley Fool option ideas to your Pro Portfolio. Maybe like Jeremy said it really depends of the rest of your holdings whether you have bonds or pension might tell you how much you want in stock. If you want more or less stock exposure than we have, you can make that adjustment just as an allocation adjustment but still own everything we own just in smaller amounts so you have the portfolio balanced how we are trying to set it up. Great question, great answer Jeremy and we do have our retirement board on the Pro site itself. Check out in the community section the boards and you will see that there. There's periodically really great long discussions going on there on that board.

Ellen: Yeah, it's a lot of our boards are really educational but that one in particular is I've seen it be very helpful to a lot of people.

Jeff: Well a lot of our members use Pro in so many different ways and have a ... Are very willing to share in exactly what their strategy is and how they use it in their own portfolio.

Ellen: I know some of them better than we do, how they can ... They are living it, we are giving you theoretical advice. We have a question from Paul that says, "The strategy guide states that the portfolio's cash will be around five percent most of the time but cash extort which you can find on our recommendation's page at the bottom is 18.8%, can you explain the higher cash position?"

Jeff: Sure, part of it is that we have short puts out in the market that are of essentially long exposure of about 16% so really our free cash is around two or three percent. The way we manage those short puts we view our free cash as being higher than that because we don't plan to turn those put options into positions. I'll also say that this strategy guide is Probably that one part of it could be updated and that falls on me. Because I remember writing that believe it or not in 2008 when we started. Like the Fool will want to know what was your cash normally going to be at? I said, well around five percent net after everything is a pretty good ... It's likely to be there over the long, long term but we'll have periods where we have 20% cash, periods where we have no cash and sometimes we might have even more cash than that.

We were looking for an average there and I think that's still pretty accurate that we'd like to keep some free cash always. Then through our use of strategy, of option strategies and what not, really have much more free cash than five percent but five percent is the net after everything is accounted for. Again as you said Ellen that's on the recommendations page, the boxes at the bottom of that page showing all our exposure.

Ellen: Excellent. Yeah, okay, here is Jeff again. He says, "I am slowly transitioning from a stock adviser and NFO Portfolio to a Pro Portfolio. How do people balance new options recommendations with their Pro Portfolio?" As almost everyone watching this already knows I'm sure you got Motley Fool Options as part of your Pro subscriptions but they are separate services. Motley Fool Options recommendations are not tied into the Pro Portfolio as a whole. That's my disclaimer you guys take it away.

Jeff: Billy, do you have thoughts on this?

Billy: Sure, what I would say to you Jeff would be the best way Probably to answer this question would be to pause it, the question to the boards on Pro. I'm sure you'll get tons of great answers from people who are actively doing that Like how we mentioned the boards are a great place to get answers rather than from us because we are the ones that are giving you the information and not really the ones implementing it. I think more qualified to answer this question than we are would be members who are actually doing it but I'll offer my input as well. How do people balance new options recommendations with their Pro Portfolio? I think it depends on your personal preference, you might look at an options recommendation and you may not like the company or the strategy on one hand or on the other hand you may really like it. Depending on whether you like the idea, whether it fits in with your current portfolio, many other factors you might consider whether you want to implement a certain option.

For example your overall exposure to the market, do you have the cash available to secure a put? Are you in IRA? Et cetera. There are lots of different considerations that you'll need to take to decide whether you want to do an options recommendation but just make sure that especially with options and Pro because Pro is a portfolio, like we always say it's integrated. You don't want to just act on every options recommendation like you would with Pro. Every recommendation in Pro we intend you to act upon because it's a whole portfolio. With options it's more like stock adviser, it's you pick and choose and you figure out which one fits in best with your portfolio at a given time and go from there.

Jeff: That's exactly right and that's how I view the services. Once you join Pro and so many of you are new here and this event is for and directed at new members as well as existing members. You've joined to get the full portfolio as Billy said and so that's what you should focus on first. Once you have that built and you are comfortable with it and how we invest, you can follow Motley Fool Options ideas and see which ones you like personally to complement your Pro Portfolio. You do you use Pro first as a whole then tack on some of the options ideas that you particularly like.

Ellen: Sounds good, excuse me, Paul asks this similarly, "How does a new Pro investor choose between matching your cash allocation versus buying long positions? Which comes first?"

Jeremy: I think in this case my personal opinion is that you should always have some cash in your portfolio, so depending on if you are new to Pro as you are building the portfolio, you should buy our or buy first stocks first and gradually start matching our other trades. If you are following any of our options trades or puts specifically where you have to have some cash to secure those, you should always leave that cash available in your portfolio but over time I would expect there always would be some amount of cash in your portfolio. You can't really beat the optionality of having that and if you don't have hedges setup where if the market drops they are going to create cash, that you are going to be able to reinvest, you are Probably going to be sorry that you don't have any what we call dry powder to redeploy at lower prices.

Ellen: I'm going to put that in the next head report. You are going to be sorry, Jeremy says you are gong to be sorry.

Jeremy: Yeah. I have been there before, I have been sorry before.

Ellen: All right, Eugene Wilson asks, "I am new to Pro and four of my bigger gainers are not in the Pro Portfolio. What do you recommend?" I think this speaks to I'm already invested, I'm joining your service, how do I prioritize?

Jeff: It's a great question and it dovetails nicely with the one Jeremy just answered. We typically don't want you to sell your winners from the past if you can at all avoid it. Because unless it in an IRA you are taking a tax liability, a tax hit. Even beyond that if you have a low cost basis and it pays a dividend you are generating a great yield on that company, you Probably know it really well, you own it for a reason, you like owning it. You have a great return that could only if you've really bought into a compounding business, it could have much farther to run. We are always hesitant to sell winners in our lives and in Pro as well as long as the business is still performing. If you can avoid selling your big gainers do so is our recommendation as long as you still believe in them. That may mean you buy 20 of Pro stocks instead of 24, or you buy less of each one and still put the whole portfolio together.

Whatever you can do at this point anyway, meld your current portfolio that you like and want to keep with Pro. Because I think what will make you happiest in the long run. As you learn our strategies like our hedging and shorting strategies, you'll see that those work on your portfolio as a whole even if you have some different positions than we do. Because really you are just trying to lower you exposure with the hedge and that works whichever 24 stocks you own. I hope that helps, what we are doing is discouraging you from selling winners that you still like. If there are stocks that you no longer believe in or are just not comfortable owning that's an easy sell. Then over time you'll get more and more to the Pro Portfolio, many members take a few years or longer to get there but you will get there.

Because events will happen, companies you own will be bought out or you'll find a reason to sell something and you'll meld bond more with Pro but it's a long term Process and I say that all the time and it's a funny part of our business. Investing is a long term endeavor and you should maneuver very gradually and yet we know members are paying a subscription that's typically three years long or so. They want to make Progress quickly on what they are doing but that goes against investing well so to the best of your ability be patient, move gradually and hopefully be committed to Pro for the long term because that's where you'll get the most reward.

Ellen: It is a little bit of a paradox that members love actionable advice and often especially in Pro our actionable advise is we are good right now or you know. You read a memo recently about how you are not going to buy something unless you are sure of it and if that means six months go by and then six months go by because that's how the portfolio works. Okay, anonymous asks, "I see you added ..."

Billy: Yes. Hey, guys I wanted to ...

Ellen: Oh yeah, go for it.

Billy: Sorry, sorry Ellen.

Ellen: Sorry.

Billy: I wanted to add something to that one as well. One thing that members do if they have positions from outside of Pro that they want to integrate into Pro is check and see which industry or sector or part of the economy that those companies represent. See if Pro also owns any companies in those same industries or sectors and if there's an overlap, then that may be an area where you can use your company that you own that's outside of Pro to represent that portion of exposure within Pro. For example some people instead of owning MTrust, own maybe like Berkshire Hathaway Uninsured or a Markell Alston Uninsured. That's one way also that people can meld their current holdings that are outside of Pro with Pro.

Ellen: Thank you, that was very important and I'm glad you said it. Anonymous says, "You added another put ratio spread on the SPY yesterday. I didn't make the first one that expires in November, how best to catch up today?"

Jeff: A great question there, I love that it's on a recommendation that's in the positioning report that went out today. The answer, the short answer is in the SPY report itself that went out yesterday. It says that if you don't have the November hedge yet, then set that one up first. You can still do so as of yesterday night for a small, only a small debit, it was a small cost of 30 cents or so. Then also setup the December one which you can do still for a credit. The reason we want two is these spreads really only become handy at expiration and you never know when the market is going to be down. Of course the November one was partly setup in a response to well we always run these typically almost always because you never know what will happen. We also want one of these hedges in November because it's the election month.

If we have a rustic response to the elections outcome, at least we'll have, at least we'll have some hedges and there are others we're thinking about setting up too for that month right now. At least we'll have some hedges expiring in November that could help us but so set that one up first and then December afterwards. The guidance is in the SPY report both SPY reports at this point. I just realized the pricing has changed a bit but not bad.

Ellen: Yeah, everything is linked in the SPY section of the report that came out today. You will be able to find the previous two reports in there. We have another anonymous question about the SPY hedges, "They represent a fairly large obligation to purchase this stock, what do most brokers require for reserve?"

Jeff: Most brokers do require anywhere from 10 to 30% of the potential stock purchase price be set aside in cash. These SPY puts that we are writing will be a smaller amount, closer to the 10% side because they are pretty far out of the money. The market has to fall quite a bit before these become an obligation. As the market does fall the obligation will grow so no matter what you need to have a sizable amount of buying power in your account to set these up. We've recognized that of course we have the cash to buy SPY if it came to that but we don't plan to. If things really went south our plan would be to close the puts and buy call options on SPY instead for about a quarter of the cost of SPY itself or buy some other stock that we like better. No matter what we want to use this position as a trigger to put on some long positions if the market falls really sharply. We want the discipline and this to be the reminder of that discipline to make some good investments at that time in a recovery. Anyway, so fairly large obligation, typically 10 to 20% of the cash value.

Ellen: Bruce says, "I think a review of Wells Fargo is in order. Management is a concern given the lax oversight that has become public, update please." Then he mentions the position that he has, January 28th calls from 11:15. Before this started I know, Billy, we were talking a little bit about Wells Fargo, what did you have to say?

Billy: Yeah, I think we touched on this also a little bit earlier, is we are definitely going to review Wells Fargo. I agree that the scandal represents some mismanagement and we want to determine whether that's systemic or whether that's something that really affects our conviction in investing in this company for the long term. We are going to dig into management commentary, we are going to listen to the hearings, we are going to make sure we've heard and really digested what management has to say and make sure we are satisfied holding the position.

Jeff: Yeah and we really want to hear what solutions they are putting in place to stop this from happening again. This crisis could become an opportunity that makes Wells Fargo stronger and the stock has already reacted negatively which of course makes it cheaper. This maybe a time we might come out of what Billy just said and be more positive on the company. We can't know though until they really lay out, what happened, why and what they have done or are doing to fix it. This is a good moment to touch on the guidance changes that we had today in the report and on the site for all members. Which was again Wells Fargo moved to hold while we review it the coming week or so, however long it takes. It's on hold right now, hold your shares but if you haven't bought yet you can wait until you get our opinion, our updated opinion.

We also moved Pier 1 Imports short on hold for new members and Billy can maybe speak to that in a second. We moved Deere, John Deere back to short for all members so it was on hold while we reviewed results and it's back on short now at ... I have to look up the exact allocations because I don't want to give it incorrectly. It's at 1.9% allocation, so Billy if you want to take a minute to say why Pier 1 moved to hold for now and then Jeremy could speak a moment on us moving Deere back to short especially in relation to our Valmont long that will be great.

Billy: Sure, so Pier 1, a couple of weeks ago the company preannounced its Quarter Two 2017 earnings, which repertoire and below it's own guidance and below expectations. Simultaneous with that preannouncement, the company also announced that the current CEO will be resigning, a mutual agreement to step down with the company and in response to that news the stock dropped significantly, 10-15%. Right now we're sitting on I think about a 20 percent gain on our short, meaning the stock has declined about 20% since we shorted it which is great. Before some news that we heard a couple days ago, we had not put the position on hold, we were continuing to recommend a short and waiting for the full Quarter Two 2017 results to be released. Because of a portion, only just a few snippets of financials were released with a preannouncement. The full results will be announced September 28th so a week from today. Two days ago on the 19th we learned that a hedge fund, Alden Global Capital LLC, has acquired a nine and a half percent stake in the company.

To us especially given our experience with another one of our prior shorts which was older brands where a hedge fund investing firm came in, established a significant stake and then advocated for a sale of the company. Then the company ended up being bought out which was a negative for our short position. Any time we see a hedge fund come in and take a significant stake in one of our shorts that triggers a well, we should check this out, review it and make sure that our short is still good and we want to remain short. That the risks haven't changed measurably. Being as it happened two days ago, that this nine and a half percent stake was announced and the company is going to report earnings in one week. Right now we are going to put the position on hold, we are going to wait and see what the full financial results look like a week from now. We are also going to do some research on this hedge fund that has established a significant stake in Pier 1.

We can check out their history of value creation, how they tend to go about being an activist investor, taking significant stakes and maybe changing management or changing business strategy. Those are things that we can look into. For now the short is on hold, we don't recommend that new members who haven't already shorted it, short now but for those that are short you can continue to hold it and you should expect to hear pretty soon from us. Like Wells Fargo I would say, within a week or two max on what we plan to do.

Jeff: Great, thanks Billy. Jeremy, John Deere we shorted earlier this year, it's partly to hedge our position in Valmont Industries. The two positions are the same size and in similar cyclical large equipment, farming related industries and so far Valmont has risen more than Deere has risen. We put Deere on hold as the analyst who brought it to the portfolio took a few months to work in a different division and they are now coming back. Jeremy took over Deere, went through all the results and has now led us to this point.

Jeremy: The thing that is obvious is that the agricultural industry is still struggling, the forward string construction and for the smaller part of Deere's business but really agriculture is still struggling. What Deere was able to do this past quarter that caused a stock rise was surprise the market with good earnings that they have been cutting cost, which we were expecting them to do. The numbers that they announced were in their long term targets and this is looking out two years or Probably a little bit higher than what the market was expecting. The other thing is that there is some one time gains of solving equity stake in a subsidiary and other things that it helped the earnings look a little better than what the market was expecting. It was really that cost cutting which is what I think got people excited. Now, I think they've known for a while that this ... What these targets were and they've been holding that for an opportune time to release those. Which is going into a harvest season which is pretty bad and farm Profits are falling and used equipment are starting to pile up on lots. Being able to ... The way that they actually release the information at the end of the conference call was after the analysts' questions were finished and they said, "By the way at the end this is what our target is going out to 2018 I believe." Which is like half a million or half a billion dollar in cost savings and three full percentages points of extra margin mid-cycle earnings. That's based on previous mid-cycle earnings and our short thesis is really that that is going to be a lower level going forward because there is so much access inventory that's starting to build.

Jeff: It's so funny, it's unusual that they said that at the very end when usually you share that information at the start and you are able to take questions on it but not to be like a conspiracy theorist guy but it's funny how they did that at the end. We still believe in the short and as the short as a hedge as well against Valmont. I'm glad it's moved back to short now. If you haven't shorted it yet, you can short 1.9% that assumes you also own 1.9% in Valmont Industries.

Jeremy: Well that is just a partial hedge because in Valmont, about 25% of sales is based on as from agriculture, from irrigation. You are also just hedging the global economy and commodity prices and a number of other things in addition to Valmont.

Jeff: Great.

Ellen: We had a question down the list from Lean about the thesis on the Deere shorts so Lean hopefully that answered that for you.

Jeff: Yeah, we have a lot of questions and we are half way through so we'll Probably start ... I'll do my best to be a speed responder.

Ellen: We'll try lighting around, we'll try it. Another question about coming new to the portfolio from Dwayne. I was an MDP, how do I determine which socks I have the lowest conviction in so that I can sell them to raise funds to purchase Pro stocks?

Jeff: You joined Pro from Million Dollar Portfolio, we appreciate that, thank you very much for being a full member period. We hope whichever full service you are in brings you long term value. That's a tough question because each team works on their own and we don't know which stock in Million Dollar Portfolio are low conviction or lowest but I assume they all believed in. Because they are running a portfolio as well so they only want to be own things they believe in. Which are the least appealing to you which don't match your style or your method of investing perhaps? Which are the smallest positions or the newest ones is where I would start. I also want to say that you can Probably ... Lack of sleep may be saying this but you could Probably call customer service here at the full, get back into MDP and try to stay for 30 days and try to assess out which ones you might what to sell.

Because they'll be helpful on the boards to that extent but I bet they are going to tell you that they believe in all of them because it's a portfolio so it's really up to you which ones to sell. Go to the making Profit you board here on Pro and ask you fellow members how they have done it because so many members have joined while being members of other services and then meld over to a Pro Portfolio so it can certainly be done.

Ellen: Okay, anonymous says, "Can I get someone to walk me through the put ratio spread you on the SPY or will I have to go all through options U first? This is my main goal?" Options U is a lot and I don't blame you for having this as your main goal. This answer may be disappointing but hopefully fruitful please take this to the boards and someone there will walk you through. Go to the SPY board on the Pro site and one of us will or Lon Probably will before we get a chance to. We've got a couple of members who are amazing at explaining this stuff and that is where you'll get the one to one beck and forth that we can't do right now on this video. Yes, we don't expect you to read all of Options U before you take action and hopefully, well definitely you will find some knowledgeable people on the SPY board who can help you piece it together.

Jeremy: The thing that's great about that is that there are other members out there that have the exact same question who will be able to benefit because that's going to stay on the board and you will be able to go back and review it.

Ellen: Yeah, absolutely.

Jeremy: It will be a little more convenient to be able to do that.

Ellen: Absolutely. A new member post, it says anonymous suggests that marketing played up Pro is hedging. For newbies and old-timers both, can you briefly discuss the place of hedges in the whole portfolio? You do in the intro a little bit.

Jeff: Sure, I think what's really happening is the market's making new highs, there's a lot of uncertainly up there so hedging, a lot of people are thinking about hedging after years of rising prices. For all of us how do we hedge in the Pro Portfolio? As Ellen said, it's the intro to today's positioning report. It's one place where you will learn a bit about it but we try to hedge in most cases in a way that doesn't drag in our returns, it doesn't cost us a lot of money and that will reward us with a sizable amount of cash that we can then invest in new longs when the market falls. That said, we are not all that hedged right now, with two 10% hedges and SPY with about seven percent or so exposure and shorts which are also a form of a hedge and we have some covered calls, little ones. We could be much more hedged in the future, it just depends on the risk that we see out there.

The key is that we have tools and ways to hedge very inexpensively and in ways that can really limit our risk. Like we will buy put options when we have cause to, when we think that that's money well spent. Hedging is an always evolving but organic part of Pro and sometimes will be minorly hedged and sometimes much more hedged. The point is to try to have winners even when the market falls and then reinvest those funds into cheaper stocks.

Jeremy: Well just buying puts can become pretty expensive over time. You essentially buy insurance and paying that premium so using the put ratio spreads is much more cost effective and less of a drag on your returns over time.

Ellen: I liked what you said about the hedge being a trigger to act to. I don't know if I quite thought of it that way before but it makes good sense. I think so

Jeff: Sure.

Ellen: Anonymous says, "I'm new to shorting, when does margin interest get charged against a short position?"

Jeff: Well I think generally we are interactive brokers and it's the end of each month, the 20th, the third week of each month, I think it hits our account but it's a monthly cycle and it may differ by broker. I assume it's the same day each month, so check with your broker and see. Realize that if a position is, a short position has a three percent fee, it's the average of the value of that position and then it's three percent per year divided by 12. You'll pay one 12th of that in a given month. Hopefully the fees are pretty small mostly.

Ellen: We have another anonymous or maybe the same one who says, "Follow up, are there any plans for income securities like bonds in Pro?

Jeff: Yeah, we've talked about bonds since we started long ago but stocks have been more attractive. They are bond ETFs that we can consider certainly. I think in the long run, assuming we do this for 20 or 30 years, there will come to be a bond sleeve of the portfolio, a bond ETF at least sleeve of the portfolio. Because bonds and stocks cycle as far as attractiveness can go and lately it's been stocks almost all the way and that's been a good thing.

Ellen: Stick around.

Jeff: 20 or 30 years it's ...

Ellen: Yeah, it's just patience, we preach patience. Jeff says, "He doesn't own I assume any of VMI and doesn't have a six percent allocation of Facebook. Which is the higher priority by some Valmont or by more Facebook to get to the allocations?"

Jeff: My quick answer is that depends on how much Facebook you own, if you only own a few percent of Facebook, I'd bring it to four percent before I would buy VMI. If you are at four percent Facebook already then I'd Probably add some VMI instead but we still believe in Facebook as much as ...

Jeremy: If you have neither, Facebook is rated by personnel and Valmont's the buy so we put those ratings up because that's our conviction as far as the valuation or the timeliness of each individual position.

Ellen: Norman says, "I find your quick reference guides on corporate calls, buying calls, writing puts quite instructive and any plans to have guides on diagonals, ratios, et cetera." First of all, thank you, Norman. Second of all, yes, Billy and I work on those and Billy I'm going to call you out right here, can we make a new one for Norman pretty soon?

Billy: Let's do it.

Ellen: All right cool, where do you want to start? Maybe diagonals, we do a lot of those.

Billy: Yeah, diagonals sound good.

Ellen: Okay, we are always, theoretically, we are always working on them but this is a good trigger to get us to mix. Well, because we can do one for everything and we haven't done that yet. Anyway, yes, Norman we will do that for you, thank you.

Billy: Also put into the slido, the ones that you want to see the most and that way that might help us.

Ellen: Yeah, please do submit and then we can see them voted on and that will help us decide maybe more logically than we just did. Anonymous, Billy, wants to be reassured that you will be able to get your ironing done?

Billy: I think I should be able to. I have what I need here so hopefully, hopefully yes.
Jeremy: He hasn't learnt his lesson from last time when we talked about his bookshelves first.
Billy: Yeah, I'm going to start clearing up this whole back area so that we don't get any comments anymore, just nothing.
Ellen: I'm going to send you like a $50 yes certificate IKEA and that can buy some lovely bookshelves for you.
Billy: What's interesting actually is IKEA has a book case, its actually a bookcase system, it's called The Billy and you know how IKEA has some crazy names for all their furniture. There's this bookcase called Billy and so that's literally screaming my name.
Ellen: Don't be freaked out but we have a Billy in our house. Moving on, anonymous says, "Pro has lots of financials and yet no financials specific hedge, FSC seems like a complex train, any thoughts?"
Jeff: FSC is a short of a short of financials so it's another long and yet it's a flawed ETF because it uses leverage, three times leverage. Even when the financials were down for much of this year, this FSC short worked for us and it still went down in value. That's just an aside, it's a flawed ETF short that is basically a long financial. You're right, we have a lot of financial exposure overall and no specific hedge right now. In the past, we have done a little bit of financial hedging, and we've considered it but for the most part we still like prices there, and we still see upside. If the interest rate cycle finally starts to change, that should really help a lot of our financials. We haven't talked about hedging them lately.
Jeremy: I think if anything we looked at short specific companies but I don't think we've found anything that's specific really compelling on an individual stock level at this point.
Ellen: All right. I'm sorry, I just moved one that I shouldn't have moved. Let's see.
Jeff: Ellen's controlling the behind the scenes of the slides.
Ellen: Yes, I decide whether your question makes it through. I missed that one. I'm going to go back and find it in a second.
Jeff: Okay, I can jump to another one.
Ellen: Yeah. Why don't you do that while I look?
Jeff: Then we can click all these off. Another Pro member asks, will there be a transcript and yes, I believe there will be a transcript.
Ellen: Yes, there will.
Jeff: As always.
Ellen: It usually takes a day or two but yes we're getting a thumbs up from the studio that there will be a transcript.
Jeremy: Yes. Excellent.
Jeff: Excellent. The transcript will be on the site along with a video replay as well, and I think any questions that we don't get to during this live chat will publish a written response to as well.
Ellen: Yes, I'll collect them, and we'll follow up with them in another couple days as well. Probably by the end of this week or beginning of next. I found it. David A. asks respecting Pro philosophy and Northstar goals, should you consider other investments like Gold or Miners in these times of negative interest rates and high stock values?
Jeff: I was just reading another question so I missed. Okay.
Ellen: I'm sorry.
Jeff: We're on the top one now. Should you consider other investments? Well, Jeremy, do you have thoughts?
Jeremy: We generally avoid stocks that are specifically tied to moves in commodity prices that we don't have a lot of control or knowledge or insight into such as gold. In this example the gold miners and the miners tend to be more leverage plays on gold. If you wanted to do something like that, you could Probably take a smaller position in a miner, but I would say that if you look at our portfolio, we don't have a lot of exposure to energy to oil. Also other things that we just don't have a core competency in judging where the value of that commodity is going to go or have a very strong opinion on that in order to build a position.
Jeff: True. What we do have are companies that generate reliable free cash flow and something that we believe we can model continuing. We're looking for businesses with really strong recurring and a lot of cases subscription type revenue. That's exactly why Jeremy would say we don't go after commodity type businesses very much.
Billy: Now, I could see being as gold is unique in that it trades inline with investor fear and sentiment, I could see Pro maybe getting into gold at a small allocation as a hedge against market volatility or some crazy event that would cause the price of gold to increase. Like Jeremy and Jeff were saying, I don't see Pro going into individual stocks and individual miners in that sense. Yeah, gold is something that I've been thinking about more lately. I used to write it off but I can see within Pro especially with our absolute return goal, during times of volatility where having a small allocation of it might be beneficial, and I've been giving some more thought to that for what it's worth.
Jeff: Billy, I just saw your video stream and nice tie. I liked the tie.
Billy: Thank you.
Jeff: It looks good.
Ellen: Is it ironed? Did you iron it?
Billy: I did, I did.
Ellen: Good. Yeah, I know, all of us look like slabs next to this guy.
Jeff: It's true, Pro actually owned a Gold ETF back in 2009/2010 and we sold it for a Profit which was fortunate given what happened to Gold later. Remember how everyone was so positive on Gold, and that has proven anything but true in the last six to seven years.
Ellen: Len asks this one has moved up quickly. I'm retiring at the end of the year, congratulations, is Pro a logical portfolio for retirement or would Supernova or Rule Your Retirement be more suited? I will say at the outset that Rule Your Retirement is not a managed portfolio, it is a collection of advice. They do have sample portfolios that you can follow along with but it might not be the same integrated portfolio experience that you would get at a Pro or a Supernova.
Jeremy: It is a great complement to any of the other investment services.
Ellen: It's amazing, Rule Your Retirement is ...
Jeremy: I would recommend it as far as Bang for your Buck.
Ellen: Yeah, no kidding.
Jeremy: It's well worth it.
Ellen: The archives we have 10 years of really good stuff there.
Jeff: Maybe everyone should join Rule Your Retirement no matter what.
Ellen: We collaborate, book and happy.
Jeff: The service is always open. I think it's, I don't want to say, but I think it's $49 or some low amount like that. Pretty good.
Ellen: Yeah, we don't charge enough for it, for what's it worth. It's really good.
Jeff: Ellen's right. There's no real portfolio there, I think to have bond focused model portfolios.
Ellen: They do.
Jeff: Then Supernova is higher volatility, higher risk than if volatility is a risk to you, then Pro. As we talked about at the start of this event, we think Pro is a good portfolio for those in retirement or nearing retirement. Especially if you can tweak it a little bit for your specific needs. Whether that means targeting more income or having more cash or what have you. Overall as Jeremy said in his first answer to a question like this, we have stability in mind and we're hoping to have positive returns every role in three years no matter what. We're investing fairly conservatively I would say for the most part.
Jeremy: Well I was just going to add that as we're living longer also retirements becoming longer. That equity position is important so you also don't want to get too conservative. You want to make sure that money's going to last as long as you are. An equity position over a full market cycle it is valuable.
Ellen: I would say to Supernova does have some missions that are designed for people in retirement, those are their phoenix missions. What you might want to do is give member services a call and have them walk you through each if you haven't done that already. We definitely we have a lot of members in Pro who are retired and use it that way, and our retirement board would be a great place to ask, but member services can give you some more context about the other services and how they're used as well.
Jeff: That's a good point. I wonder if any members are using the Supernova Retirement Portfolios and if they are, could they post on the Pro Retirement Board about it?
Ellen: Yeah, we would love to. If you are, please do share with us, we would love to have ...

Jeff: Put a new thing there.
Ellen: We touched on this a little earlier but anonymous says, "I'd like to take advantage of more option recommendations, but I'm nervous about the elections further turning anything into chaos. What are your feelings?"
Jeff: Well, higher volatility like we've seen lately leads to better options prices if you're an option writer. That's a good thing for writing options right now. As we've talked about, we do have a hedge setup for November. We were just talking yesterday with the team and I about possibly putting more hedges on that expire right around the election, like short-term hedges. Because yeah it could be rocky depending on what happens in the election and the markets response to that. We're aware of that, but it's also a short-term concern hopefully.
Ellen: If it's not, it will be the least of our concerns.
Jeff: We'll just we'll be as well prepared going into November as we reasonably can be without being too reactionary.
Ellen: Paul says, would you consider periodically posting most recent one, three and five annualized for comparison? I assume es talking about one, three and five-year rolling returns versus rolling and inception.
Jeff: I think we have that.
Ellen: I think we do too, but I thought maybe I misunderstood.
Jeff: Its on the recommendations page and were one of the few services that does this. Go to the bottom of the recommendations page, we have a returns table that shows annualized since reception the rolling three years and then the year to date return and then our total absolute return since inception as well. Take a look at that and if you have other ideas, other returns you'd like to see we can try to get them from the full every month as they do our statements. Post on the what the Pro suggestion board if you have other numbers you'd like to see.
Ellen: Yeah, member suggestions and we will listen. Penny says the Fed leaves the rate unchanged, what are our thoughts?
Jeff: Oh, so we're getting that breaking news in this event. That's cool.
Ellen: Thank you, members.
Jeff: Breaking news everybody, the Fed is not acting. Thoughts are well let's see the odds were laying a rate hike in this fall as the higher odds, higher than well it's September now, I think it was October when a rate hike Every hike was really expected, but I'll have to see what their comments were to really share thoughts.
Jeremy: Yeah, I think the Bond Market was pricing in their raise but this time. I think not having a surprise is going to reduce volatility a little bit versus if the decision was different. I would imagine most people suspect nothing is going to change until after the election. That they don't want to influence the market immediately leading into the election.
Jeff: Yeah that's a good point.
Jeremy: December is probably the best bet I've made from what I've read.
Billy: I think, yeah, the market is pricing in rate hike in December so far is what I've been reading.
Ellen: Bruce says he would vote cheat sheets on spreads and diagonals. Thank you, Bruce. NMNM says, "Where is the commentary on the hold on the Pier 1 short? Why was it moved to hold? I have an alternative position using options what to do?" We did touch on that earlier in this conversation. Hopefully you NMNM were able to see that part, if not, the video they will be up shortly after and you'll be able to touch on it there. Do you want to recap real quick, Jeremy?
Jeremy: Billy or I could quickly say I did hear she did post this before we talked about PIR so hopefully they heard that, but it's on hold while we review it pending results that are coming and recent news of a hedge fund buying a greater than nine percent stake. We want to see what that hedge fund is about and what they're hoping to do with Pier 1.
Ellen: Okay, Jason says if options are available only in my non-IRA account approximately 20% waiting versus 80% IRA, can I identify which recommended positions I should purchase in this account?
Jeremy: Okay, so I guess I see what you mean. Which stocks should you put in the IRA on the argument that you might be using options on them? We can't know the future for certain but we can know right now that if you go to the recommendations page for certain we can't know the future at all but if you can, we can know some things.
Ellen: Speak for yourself.
Jeremy: Time will go by. If you go to the recommendations page, each stock that has an option on it will have a little O icon next to it. I would start with the safe bet is to buy the stocks that we currently use options on in your IRA. Then you'll be able to partake in those. Other than that, I can say that all of our core holdings it's rare that we use options. Our stocks that we own for the long term are usually just left alone as stocks. You shouldn't have much, it shouldn't be a real problem for you.
Ellen: Headcreek again. Hello Heck. Jeff said no incremental security for bare puts spreads in IRAs but primary hedges put ratio spread. One sold put must be cash secured I believe.
Jeff: That's certainly true in an IRA. The IRA alternative is a bear put spread that requires no extra cash. I don't know that most IRAs will allow a put ratio spread and if they do it'll be cash secured as you said. The ones they'll put will have to have all the cash put aside. I think in an IRA the bear put spread usually makes more sense rather than hold all that cash on the side, all the time. That's why it's there is an alternative trade in the report.
Ellen: Anonymous wants to know if they can consider preferred stock I guess as a way to hedge the market as well as provide fairly good income?
Jeff: Jeremy or Billy, of thoughts on preferred?
Billy: Yeah, I've looked at preferred stocks before. I've made some commentary on them in prior chats and on the board sometimes. Preferred stocks can be a good way to provide lower volatility than regular stocks. They're like a mix between equity and bonds. You have some upside depending on the structure of the preferred, and you also have protection on the downside being as they have a regular yield. Again it's all dependent upon the preferred, each preferred is different, and the terms are different which you'll find in the prospective. They generally tend to be correlated very highly with interest rates, right? When interest rates are low, the demand for a preferred and their higher income than regular stocks is higher. Then when interest rates are rising which is the current environment that we're in right as I just said the market is pricing in a rate hike in December when rates go up, preferred, the value of a preferred goes down. It may be a good way to hedge the market but for us and Pro as far as how we consider using them, we think now is not necessarily the best time to own preferred because as rates rise, the demand for a preferred should decrease.
Ellen: Okay, let's do ... We've got five minutes left so let's try to get three, maybe two or three more and then we will say our goodbyes. Katherine says the covered calls for Wells Fargo are on hold. Is the recommendation to buy first also on hold? Yes, give us a week to 10 days while we work through what's going on there. Anonymous says I just recently joined Pro, and I'm starting to build the portfolio. Since November is close, should I just wait till after the election to buy the portfolio recommendations?
Jeff: I'd say no. Usually elections don't result in that much change but either way, why not average and start to average in to the buyer first and move gradually. A lot of members buy in into the portfolio over many, many months. At least start so that you're starting to get on board.
Ellen: Sprinkles says on the Pro Open Positions page, I can't seem to find where hold would be written for options. One moment, let me look. There is a what to do column.
Jeff: Yeah, for options there isn't because options are timely, and so they're either you either have them or you don't but Wells Fargo, the stock has been put on hold and that should imply that the option that we wrote is also on hold.
Ellen: You can check there what we think now page two as well under recommendations because that will say short hold et cetera. That will give you some guidance.
Jeff: Maybe we should put some words above the options part that just says these were timely these, I don't know but ...
Ellen: Yeah, that might be revisiting. We might need to.
Jeff: Yeah, well make a note of that.
Ellen: Sure. Jeff says we heard discussion about volatility, any pending or thoughts on a VIX Trade.
Jeff: We have done positions on the VIX in the past.
Ellen: Yes we have.
Jeff: Given the curve of the price of those options and how much the VIX futures have to move to make them profitable, it's a tough, it's a tough proposition as I'm sure Jeff knows. That said we setup some creative options trades on the VIX and I look at the pricing every once in a while. We'll probably do more with the VIX in the long term at various times maybe November, we'll see.
Ellen: Maybe 20 years from now, you don't know. You just don't know. Sprinkle has a question about options and Pro. I was following the Skyworks trade in options, and I had my $70 puts expire for full income. Is writing $75 puts the best way to move into the Pro position?

Jeff: Well, that's one way to but we have the stock rated buy in Pro and then to have everyone on the same page for writing as we recommended the $75 calls that we rolled up to. If you're not in the position yet at all, you have the freedom to either buy the stock directly or keep writing put options at a strike of your choice. 75 and below is fair game because that's where we have the stock now as a buy so you can do what you prefer. Options will probably have another trade on Skyworks as well.

Ellen: It will probably.

Jeff: Yes.

Ellen: Kenny says, Pro members are posting Pro positions and strategies questions on the options boards, please keep those to the Pro boards. That's good board hygiene. Listen to Kenny. Thank you. Penny says for new Motley Fool 1 members, is there a place we can see a matrix of Pro everlasting et cetera to see if a stock is recommended by multiple Motley Fool services? Yes but I am not the one to walk you through that. Please call member services, they will be able to walk you through the screen on the one site and the way that those recommendations are organized so that someone who really knows what they're doing there will be able to get you the tools that you need.

Jeff: I think if you enter a ticker in the one site, it gives you a summary of everywhere it is, but it's not a matrix per say. It's more, it's a long list.

Ellen: Yeah, they do the stuff all day. They'll really know how to help.

Jeff: Sweet.

Ellen: Anonymous says I'm getting overloaded by email about Fool 1 right now. Is there a good way to compare the different Motley Fool Programs? This is going to sound familiar, but please call member services. It's a big part of what they do is walking individuals through what we offer and helping them figure out where they might best fit. They're really, really good people and they are good at it. Yes, please do give them a call. We'll do one more. Linda says as I'm trying to figure out the SPY recommendations. Assuming I went with August recommendation, could you walkthrough what will happen to them in November?

Jeff: Yeah, certainly. If Spy is below the price of those options, we'll close the options for the current value. If it's between our two strikes, we'll have a profit on the hedge. If Spy is above the strike prices that we had in November, the options expire on use. We don't have to do anything, they just disappear, and we keep the initial income that they paid us. As with almost any option if it's in the money at expiration we'll then take action, if it's all the money, we don't need to do anything.

Ellen: Okay and that brings us to one minute left. I think we should probably say our goodbyes. If we did not get to your question, I am collecting them, and we will answer them and send them to you via e-mail within by Monday. Because the memo will be out on Monday and we'll definitely want to have it done by then.

Jeff: Great.

Ellen: Yes, apologies if we didn't get to you.

Jeff: That's great that we will.

Ellen: Exactly.

Jeff: Thank you on behalf of all of us, the Pro team here, thank you for being here with us today. Thank you to new Pro members. Again as we've all said four different ways, among the four of us, take your time, move gradually. We believe you're in a great place. Hopefully, fellow members believe that as well for investing success over the coming year and years to come, I had a nice poetic.#

Ellen: You did. Lack of sleep is good for your wisdom.

Jeremy: Inhibitions.

Ellen: That's right.

Jeff: If you have any questions as always go to the Pro community boards. Jeremy?

Jeremy: Well thanks for being here. Enjoyed it and looking forward to interacting with everyone on the boards.

Jeff: Thank you and Billy, do you want to say your goodbye?

Jeremy: Sure, thanks for joining us guys. I've really enjoyed it and looking forward to hearing from you guys on the boards.

Ellen: We have one of these chats every month. Not a portfolio positioning one but a live video chat so we'll have a date for the October 1 up pretty soon and you'll be informed about it. Take care Fools.

How did we do?

Pro Quality Checklist: Pier 1 Imports

Published Aug 22, 2016 at 4:00PM

Dear *Pro* Fools,

Our *Pro* quality checklist series looks at our stocks through the lens of the eight factors we identify in the "Finding Great Companies" section of our Strategy Guide. Today, we're continuing the series with our first look at one of the shorts on our scorecard: **Pier 1 Imports** (NYSE: PIR). We expect most of our long positions to check off a majority of our quality criteria, so it stands to reason that we should expect our short positions to *lack* most of those qualities. And as we'll see in this Memo, there are reasons why we chose Pier 1 as a direct short. Without further ado ...

1. Sustainable Competitive Advantage

No. The success of Pier 1's retail business depends on consumer retail traffic and on management's ability to identify trends and provide merchandise that satisfies consumer demands. Pier 1 has no structural characteristics (for example, scale, network effect, or switching costs) that allow it to draw customers and achieve success to a greater degree than competitors.

Pier 1's lack of competitive advantage (and deteriorating competitive positioning) is evidenced by its margin trends:

Quarter	TTM Gross Margin %	TTM Operating Margin %	TTM Net Margin %
Q1-2014	43.7%	11.8%	7.6%
Q2-2014	43.6%	11.4%	7.0%
Q3-2014	43.5%	11.4%	7.0%
Q4-2014	42.1%	9.9%	6.1%
Q1-2015	41.5%	9.4%	5.7%
Q2-2015	41.1%	8.6%	5.1%
Q3-2015	40.8%	7.8%	4.6%
Q4-2015	40.4%	6.8%	4.0%
Q1-2016	39.9%	6.1%	3.6%
Q2-2016	39.0%	5.6%	3.2%
Q3-2016	37.9%	5.0%	2.9%
Q4-2016	36.7%	4.0%	2.1%
Q1-2017	36.2%	2.9%	1.4%

2. Pricing Power

No. As a retailer that doesn't offer uniquely differentiated products, Pier 1 competes in a highly contested market. The emergence of online commerce over the past 15 years has spawned hundreds (if not thousands) of low-cost competitors that can offer similar products without the burden of Pier 1's legacy infrastructure, leading to intense price competition. Pier 1's margin trends also provide evidence of a lack of pricing power, which often goes hand in hand with a lack of competitive advantage.

3. Dependent Customer Base

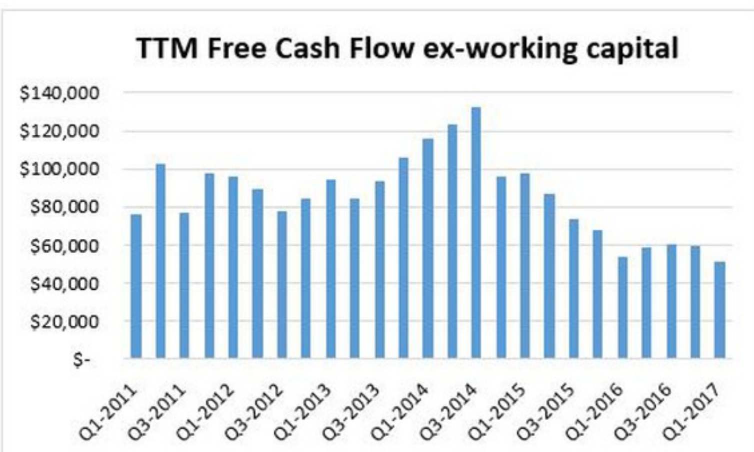
No. About 99% of Pier 1's business revolves around around individual retail consumers. These consumers are not dependent upon Pier 1 for home goods and furnishings, and there are myriad other sources for similar products.

4. Predictable Revenue

No. As a home goods and furnishings retailer based predominantly in the U.S., Pier 1's sales generally ebb and flow with the U.S. housing market. The housing market itself is unpredictable, which provides the first layer of unpredictability for the company's revenue. Additionally, Pier 1's weak competitive positioning is leading to loss of market share, and management has not been able to consistently predict the impact of slowing retail traffic and the pace of sales declines, often missing its own guidance.

5. Growing Free Cash Flow With Compounding Returns

No. As you might expect from the company's margins, Pier 1's free cash flows -- while still positive -- are declining. When excluding fluctuations in working capital such as inventory adjustments (which can significantly obscure underlying trends in reported cash flows), Pier 1's free cash flows look like this:



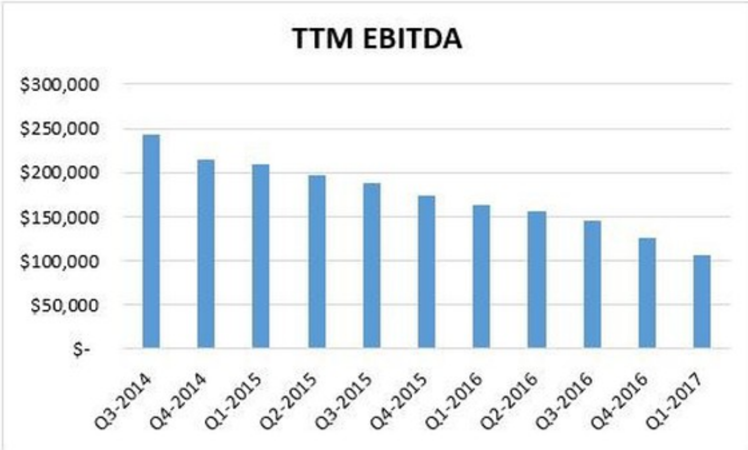
If the company's margins continue to deteriorate, further investment in the business (via capital expenditures or share repurchases) will have the effect of diminishing -- rather than compounding -- shareholder returns.

6. Financial Resilience

Sort of. The company has $128 million in cash on its balance sheet, compared with about $200 million in long-term debt. Despite falling margins, Pier 1 is cash flow-positive, and management is not in danger of defaulting on debt or being unable to pay for routine capital investment.

However, the company's financial resilience is certainly trending negative. Pier 1 is currently paying about $20 million to $25 million a year in cash dividends, and annual capital expenditures since 2011 have been in the range of $20 million to $80 million a year.

Meanwhile, trailing-12-month EBITDA was at $106 million as of the most recent quarter, and is falling quickly as margins decline.



Given this, management may eventually need to start making difficult decisions about whether to suppress capital spending or reduce the dividend if earnings continue their free-fall.

Additionally, Pier 1 took on most of its current debt in fiscal 2014 to use for continued share repurchases. Since December 2012, management has spent a total of $464 million on share repurchases at an average cost of $15.75 per share.

In retrospect, these repurchases have been a very poor capital allocation decision. With the stock currently trading at $4.62, those $464 million in repurchases are now worth just $136 million, good for a -71% return on investment. These repurchases have taken capital away from the business that could have been used for supply chain investments, investments in marketing and advertising, or to pay down debt.

7. Expanding Possibilities

No. Pier 1's possibilities are shrinking. The company's core business (in-store retail sales to consumers) is in decline as general U.S. retail traffic is fading, losing market share to online shopping.

Pier 1 did launch an e-commerce business in 2013, but that segment of the business is slowing rapidly; Pier 1 simply doesn't have the scale or the cash to compete with bigger players with deeper pockets.

Furthermore, with the reduced financial flexibility caused by falling margins and ill-timed share repurchases, the company doesn't have much excess cash to devote to exploring new growth opportunities.

8. The Three C's of Management (Clarity, Consistency, Capability)

No. Management has not shown the ability to properly forecast and anticipate business performance, and has consistently missed and/or revised its near-term and longer-term guidance and financial targets.

For example, here's how Pier 1 performed on certain metrics in fiscal 2015 and 2016, relative to its initial guidance announced in the fourth quarter of the prior year:

	Fiscal 2015 Initial Guidance	Fiscal 2015 Actual	Fiscal 2016 Initial Guidance	Fiscal 2016 Actual
Company comparable sales growth	"High single-digits"	4.7%	"Mid single-digits"	0.7%
EBITDA margin %	11%	9.3%	9.3%	6.7%
Earnings per share (EPS)	$1.16-$1.24	$0.82	$0.83-$0.87	$0.46
Operating margins by the end of Fiscal 2016	11%-11.5%			4.0%
eCommerce sales by the end of Fiscal 2016	"at least $400 million"			$305

Not only has Pier 1 missed its initial guidance, but management has continued to revise their estimates downward each quarter as the years have progressed, and they don't seem to have a good handle on the pace of the decline of the business.

In addition to the poor forecasting, the aforementioned strategy of taking on debt to increase share buybacks has so far been disastrous, increasing the company's debt load significantly while the stock's free-fall simultaneously incinerates shareholder capital.

Moreover, management has poured money into restructuring and new initiatives (such as the e-commerce platform) that so far just haven't paid off. In my opinion, the company would have been better off embracing the fact that its business is in terminal decline, slashing capital spending to the bone, suspending all share buybacks, and funneling as much cash flow as possible directly to investors in the form of dividends.

Finally, there is a lack of consistency in financial management (which provides context to the company's poor forecasting), as the current CFO joined in 2015 after the prior CEO "retired" under suspicious circumstances. Prior to joining Pier 1, the current CFO held the same role at **Tuesday Morning** (NASDAQ: TUES), a company that itself has recently been struggling to meet investor expectations.

The *Pro* Bottom Line

With just 0.5 out of the 8 *Pro* quality characteristics we look for, it's little surprise that we chose Pier 1 as a direct short. Although the stock price has declined more than 80% since its recent highs in 2013, we think the business is likely to suffer through further pain. Pier 1 is currently an active short on our scorecard at a 0.6% allocation, and if you've yet to establish a short position, hopefully this Memo helps provide some impetus to match our short allocation.

Here are links to additional *Pro* quality checklist articles:

- **FactSet Research Systems** (NYSE: FDS) -- 8/8
- **Gentex** (NASDAQ: GNTX) -- 5/8
- **American Tower** (NYSE: AMT) -- 7.5/8
- **Broadridge** (NYSE: BR) – 8/8

- **Oracle** (NYSE: ORCL) -- 8/8
- **O'Reilly Automotive** (NASDAQ: ORLY) -- 6/8
- **TD Ameritrade** (NASDAQ: AMTD) -- 5.5/8
- **Valmont Industries** (NYSE: VMI) -- 5.5/8
- **Mastercard** (NYSE: MA) – 7/8

Fool on!

-- Billy (TMFBillyTheKid)

Pro Guidance Updates

- **Broadridge Financial Services** (NYSE: BR): This quiet, typically non-volatile, strong-performing stock remains a **Buy First** for our long-term investors. With its high recurring revenue, strong retention rates, healthy business performance, and a few more quarters of growth under its belt, our fair value estimate increases to $65 from a previous $58.

Pro Catch-Up Trades: August 22, 2016

Published Aug 22, 2016 at 4:00PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Broadridge Financial Services** (NYSE: BR): Buy up to 5.4%.
- **Facebook** (NASDAQ: FB): Buy up to 6.5% (in halves if you prefer).
- **FactSet Research** (NYSE: FDS): Buy 2.2%.

Continue building your portfolio with our Buys (or, wait for our next Portfolio Building Report if you wish), including these highlighted today:

- **OpenText** (NASDAQ: OTEX): Buy 3.3%.
- **Oracle** (NYSE: ORCL): Buy 3.7%.
- **Visa** (NYSE: V): Buy 2.4%. (See our earnings update.)

Shorts:

- **Pier 1 Imports** (NYSE: PIR): Sell short 0.6% to start (see our recent trade alert).

Options (or, wait for our Portfolio Positioning Event):

- **Gilead Sciences** (NASDAQ: GILD): Sell to open October 2016 $85 calls, one for every 100 shares you would like to cover (as expiration gets closer, we accept what the market is willing to pay). See our recent trade alert.
- **Skyworks Solutions** (NASDAQ: SWKS): If you haven't covered your shares yet, and want to, sell to open September 2016 $75 calls, lately for $1.10 each, writing one call for every 100 shares you own and are OK covering. The stock is still rated Buy.

Hedges:

- **S&P 500 Depository Receipts** (NYSEMKT: SPY): Set up a new put ratio spread per our latest alert.

Options expiring next:

- **Gentex** (NASDAQ: GNTX): September 2016 puts. Gentex shares are trading at $18, well above our $15 strike. With 25 days remaining, these puts are on track to expire as income.
- **Skyworks Solutions** (NASDAQ: SWKS) and **Valmont Industries** (NYSE: VMI): September 2016 covered calls. These contracts still have 25 days to go, so we'll issue updated guidance as we approach expiration. If Skyworks is still above $70, we plan to roll our options to a later month (and possibly higher strike) ahead of expiration.

Hedge: Set Up Another Put Ratio Spread on the SPDR S&P 500

Published Aug 18, 2016 at 1:46PM

Is this for you? At *Pro*, we employ hedges to target returns during a market decline. You don't need to hedge to succeed with *Pro*, but if you are at least 80% invested in stocks and *want* to hedge some of your market exposure, then consider following along.

We currently have another 10% SPY hedge, which is due to expire in September (and is at prices where we wouldn't recommend it anew); today's additional 10% hedge will lower our market exposure -- if the market falls to our strike prices -- to a net 60% or so. Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $210,000. We are leaving our current September 2016 SPY put ratio spread in place for veteran members; today's new spread is at much higher strike prices, to account for the market's rise this summer, and it expires in November after the election.

This is a complex trade, so if it seems challenging at first glance, don't be alarmed. Simply wait until our live **Portfolio Positioning Event on Sept. 21**, when we'll discuss this and our other options, hedges, and shorts. In the meantime, bring questions to the Hedging discussion board -- but there's no need to hurry. A hedge like this is easier to set up once the market is declining, so it's not necessarily imperative to set it up now.

How You Participate

- **Action:** Use a spread order to set up a put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
- **Allocation:** About 10% of your total portfolio value, measured on the look-through value of the $210 puts you're buying (each $210 put represents $21,000 in hedge value). Set up one 2:1 put ratio spread for every $21,000-sized hedge you want. Hedging about 10.3% of our entire portfolio of $2.65 million, *Pro* will sell 26 $200

puts to finance this position and buy 13 higher-strike, $210 protective puts with the proceeds. (Thirteen puts representing 100 shares each at a $210 strike = $273,000 look-through put value = 10.3% of our $2.65 million portfolio value.)

- **Trade:**
  - **Use a combo or spread order to simultaneously ...**
    - Write ("sell to open") **two** November 2016 $200 puts, and
    - Buy ("buy to open") **one** November 2016 $210 put. Click "View All" on the option chain at your broker to see all strikes. Set up one set of the above options for every $21,000 hedge you want; or one for every $210,000 you manage, if you want a 10% hedge.
- **Price Guidance:**
  - Sell to open **two** November 2016, $200 puts: Lately $1.90 x 2 = $3.80 credit.
  - Buy to open **one** November 2016, $210 puts: Lately $3.45 debit.
  - **Net credit:** Lately about **$0.35** credit per spread -- but this price will change. As it does, simply aim for a credit, or close to no cost, using a limit order.
  - SPY price: $218
  - **Potential adjustment:** If SPY moves much in price before you set up your trade, you may want to move one or both of your strike prices up or down accordingly -- as much as SPY has moved -- while still aiming for a net credit. After our mandatory 24-hour trade delay, we will make such an adjustment if need be, and tell you about it.

What We're Thinking

At *Pro*, we aim to have winning positions in down, flat, and positive markets -- and that means we need to address all three possibilities at once in our portfolio. At the same time, we remain oriented toward the long term and majority invested in healthy stocks. A hedge on a market index is simply a hedge against a lower stock market while the rest of our stocks remain free to appreciate. We generally don't try to manage for market declines of 5% or less (that's standard volatility), but when *Pro* is functioning as desired, declines of about 7% or more should result in some of our positions, such as these spreads, becoming profitable. At the same time, the put ratio spreads we use:

- Are harmless to us if the market goes higher (they don't ding our returns)
- Are typically cash-free to set up (they often pay us a small credit -- essentially income)
- Have a low probability of long-term loss

What's the trade-off? As with any written put, we need to be ready to buy the underlying investment; for today's position, that means we're prepared to buy into the S&P 500 index (through SPY) if the price falls below $200 -- or really, below $190, which is our breakeven point on this hedge. That's 13% lower. If the S&P falls that much, we would plan to buy *long-term call options* on SPY instead of the shares, saving most of our cash in the process; see below for details on that. We don't believe there's much probability of long-term loss because we believe SPY will recover. And we think it's likely that if the index does fall by November, it's likely to be down in the range of 5% to 13%, in which case this hedge will help us.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2.65 million
- 10% of that value: $265,000
- Nov. 18, 2016, spread:
  - Buy to open $210 puts. Thirteen contracts representing 100 shares each = $273,000 in look-through exposure, or about a 10.3% hedge on our current portfolio value, cash included.
  - Sell to open $200 puts -- 26 contracts, half of which are *not* covered by long puts and thus become a potential obligation at a net $190, currently a 9.3% possible stake.
  - At home, you would buy one $210 put and sell two $200 puts for every $215,000 in portfolio value you want to set up a 10% hedge against.

Return Details

SPY Price at Nov. 18, 2016, Expiration	Value of 1 Purchased Nov. 18, 2016, $210 Put	Value of 2 Written Nov. 18, 2016, $200 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Recent $218.40
$210 or higher	$0	$0	$0.37 gain per spread -- or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 3.8%
$205	$5 x 100 = $500	$0	$500	(6.1%)
$200	**$10 x 100 = $1000**	**$0**	**$1000 (max profit per spread)**	**(8.4%)**
$195	$15 x 100 = $1,500	($5) x 200 = ($1,000)	$500	(10.7%)
$190	**$20 x 100 = $2,000**	**($10) x 200 = ($2,000)**	**$0 (break-even)**	**(13%)**
$185	$25 x 100 = $2,500	($15) x 200 = ($3,000)	($500)	(15.3%)

If SPY declines more than 3.8% from recent levels, this hedge starts to come into play. Our maximum profit on the hedge is earned if SPY declines 8.4% from its recent level of $218.40 by our November expiration date. The spread will help us a bit on an index decline of as much as about 13%; deeper than that, and our short (or "sold to open") $200 puts start to work against us, at least for now. Our breakeven on SPY is at $190 -- again, that's 13% below recent prices. So this hedge is effective up to that point.

Follow-Up

Assuming we set this spread up for a credit, it will result in a small profit even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $200-strike-price put obligation (starting with a net buy price of $190) if SPY is below $200 by expiration. We should be happy to buy into the index 13% lower. And up to that point, this hedge will have paid us as the market fell.

However, if the market *does* fall by more than 13%, our plan would be to close the short puts and buy long-term SPY calls (or something we like even better, whether calls or a stock) instead of buying the SPY ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY shares. So, our potential 10.3% stake in SPY shares will cost us only about 2.5% of our cash if we buy calls instead. We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases. We would likely ultimately diagonalize those new SPY calls for ongoing income.

The bottom line is that any drop in SPY as far as 13% below recent prices will result in this hedge showing a profit at expiration. And it costs us nothing to set up (it pays us) and will not hurt our returns even if the market keeps rising (in fact, we make a small profit on the hedge even then). If the market falls by more than 13%, we are obligated to buy into shares of SPY, but we'll be happy to do that -- and we'd likely buy call options instead of the ETF, committing only 2.5% of our portfolio value in this particular position as we look to leverage profits as the market recovers. After this hedge is set up, we rest easier knowing that it will start to help us if and when the market slides by between 4% and 13%.

How It Fits Into *Pro*

Pro hedges to lower our market exposure, or risk. We aim to achieve positive returns every rolling three years, and inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market can make a difference. We made $10,700 when our last put ratio spread closed in February. Even small gains add up over the years, especially after those gains on market declines are invested in good stocks. This hedge fits well with our goal of hedging in a cost-efficient way, one that doesn't work against us if the market rises. Plus, it offers us protection on a market drop greater than 3.8% or so. These spreads do require regular upkeep, opening new positions as old ones expire, and they are time-sensitive, really only helping at or right near expiration.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:**
  - For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Use a spread order to "Buy to open" Nov. 18, 2016, $210 puts and "sell to open" *an equal number* of Nov. 18, 2016, $200 puts. Recently, this will cost you about $1.55 ($155) per spread, and that is your maximum risk. Buy as many spreads as you care to risk $155 on. This strategy would be worth up to $10 ($1,000) per spread on an 8.4% market decline to $200 or any lower price, but you should be prepared to lose your whole $155 per spread if SPY doesn't decline to at least below $210 by expiration. You have to assume a hedge like this will expire worthless. So, only risk what you are comfortable losing.
- **To lower your market exposure while following our full official trade (and making the position possible in some IRAs):**
  - Set up the official put ratio spread as recommended, but also "buy to open" puts (with the same day of expiration) at a strike price *well below* $190. Buy *half as many* as the number of $200 puts you wrote. When you do so, all of your $200 puts will be "covered" -- half by your $210 puts, and half by the other puts you choose to buy at a much lower strike. Choose how much you want to pay to select your lower strike price to purchase. To us, the $189 strike or much lower looks good, recently costing $1 or much less. You will only need cash in your account to cover the difference between your two lowest strike prices (if you buy $189 puts, that's $11 per share), and your risk is capped, making this potentially IRA-friendly. This makes the total cost of your hedge about a $0.65 debit, and it still has $10 in potential ending value.

- **Want to talk about SPY?** We have a discussion board for that.

AmTrust Financial Keeps Doing What It Does Best

Published Aug 16, 2016 at 10:10PM

AmTrust Financial Service (NASDAQ: AFSI) posted another solid quarter, though the stock is still out of favor with investors and is still trading about 25% below its 2015 peak. Even so, the company continues to perform well and management remains focused on growing the company's book value through opportunistic acquisitions and disciplined underwriting. Annualized return on equity for the quarter was 21.1% and despite issuing shares to help fund recent acquisitions, book value per share increased 26% compared to a year ago. The company recently closed on its acquisitions of Republic Companies and Nationale Borg and both contributed to results for the quarter. The pending acquisition of ANV Holdings, which gives the company access to the Lloyd's of London marketplace, is slated to close in the fourth quarter and according to management the acquisition pipeline "remains robust".

Gross written premium for the quarter grew by 23.5%, or 14.5% not counting the Republic Companies acquisition, and net earned premium grew by 21.9% to $1.18 billion. AmTrust's combined ratio came in at 91.7% versus 90.5% a year ago. The loss ratio ticked up slightly to 66.4% compared to 65.9% in the second quarter of last year. Management attributes a 70 basis point increase in the cost ratio (from 24.6% to 25.3%) to acquisition costs based on premium distribution. The company's invested assets have grown to a record of more than $9 billion which delivered $50.7 million of investment income for the quarter and the average yield on the portfolio was 3.47%

In late July the company announced that the Tower Group was being placed into conservatorship and the California Insurance Department shared its conservation plan to help resolve Tower Groups's legacy liabilities. The plan requires the Karfunkel Family Trust and members of the Karfunkel family to contribute $200 million to the Tower Group receivership to speed up the resolution process. This is positive news for AmTrust because it relieves the company of the $125 million stop loss reinsurance agreement that it signed when it acquired the Tower Group's commercial lines business. AmTrust management is pleased to have this contingent credit liability removed from the business. The conservation plan also includes a maintenance guarantee by the Karfunkel Family Trust that allows AmTrust to refinance the loan the company used to acquire Tower Group's assets to fixed rate of 3.7% from 7%. (A more detailed explanation of the conservation plan can be found here)

Pro's Take

AmTrust may be unloved by the market, but it's still a Buy in the Pro portfolio. The company's stock also appears to be on management's "buy first" list, as they repurchased over 3.5 million shares during the quarter at an average price of $24.82. That brings the total shares repurchased for the year to nearly 6 million. Management stated on the call that as long as AmTrust shares were trading at a discount to their assessment of the company's value, it makes more sense to buy back shares than to buy another business. I agree with that sentiment and over time management has proven to be prudent capital allocators. **With shares trading just below our $26 fair value estimate and not far above management's recent buyback range, we continue to think that members should allocate up to 5% of their portfolio to AmTrust Financial Services**.

Pro Portfolio Building Report No. 1: Our Buy First Stocks

Published Aug 15, 2016 at 8:29PM

Welcome, Fool! We're glad you're here. This first report is meant to get you up to speed on our Buy First stocks — the companies in your *Pro* portfolio that we believe you should start purchasing first. But before we get to that, a few words about how best to use *Pro* ...

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that aims to generate winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, hedges, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* fit you.** We know not all investors are in the same situation! We can help you figure out how to buy *Pro* investments given your personal situation, including investing in an IRA or coming to *Pro* already fully invested. Check out our advice for every approach to *Pro*: Invested Elsewhere | "Free-Range" | Whoever You Are

3. **Catch up with our portfolio at your own pace.** Start with the stocks in this report, and follow along with our subsequent reports. You can always see our Buy First, Buy, and Hold guidance (which is the most important -- more important than valuation estimates) on the Recommendations page, and you can get a succinct, up-to-date take on all of our stock positions on our What We Think Now page.
4. **Don't freak out about fair value.** Instead, read Jeff's explanation of how it's calculated and what it means.

Bring any questions to the Getting Started & Help discussion board, and Fool onward!

-- The *Motley Fool Pro* team

Table of Contents

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: About 4.1% (see Recommendations page for real-time allocation)

For More

- *Pro* 's original recommendation (5/6/13)
- Most recent earnings update (4/28/17, from our sister service, *Motley Fool Options*)
- Talk about AMT

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Global mobile data traffic is expected to increase at a compounded annual growth rate (CAGR) of 53% between 2015 and 2020, and global mobile 4G connections are expected to grow from 1.1 billion in 2015 to 4.7 billion by 2020 (a 34% CAGR). Communications site operator **American Tower** is well-positioned to benefit from this trend.

AMT leases antenna space on more than 100,000 cell sites (towers, rooftops, and more) to wireless service providers across the globe. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, can't be canceled, and feature contractual annual price escalations. More than half of AMT's properties are located in 12 (soon to be 13) different countries outside the U.S., including India, Brazil, Colombia, Mexico, Nigeria, and South Africa, and management is intent on expanding the company's international portfolio as it continues to build and acquire more towers.

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE, or to increase coverage density. When they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; about 98% of AMT's customers up for renewal each year do so, and more than 60% of its current leases don't renew until 2021 or later.

The stock may experience volatility in the short term because of its tendency to trade alongside the interest-rate-sensitive REIT sector, but over the long term, the underlying strength in business fundamentals should shine through. We expect to earn modest income from a growing dividend and strong appreciation as AMT continues to build out its international tower portfolio.

Buy First: Coherent (NASDAQ: COHR)

Specific devices may come and go quickly, but we have our eyes on the lasers that help put them together.

Suggested Allocation: 2.5%

For More

- *Pro*'s original recommendation (5/17/17)
- Talk about Coherent

Microelectronics. Miniaturization. Mobile computing. Wearables. Artificial intelligence. The Internet of Things. Moore's Law. All of these help to fuel the business of **Coherent**, a leading producer of commercial and industrial lasers and laser services. Coherent was founded near the dawn of the laser, in 1966, and its recent acquisition of peer Rofin-Sinar for $942 million gives today's business a leading breadth of products and worldwide reach -- even as the utility of lasers continues to grow.

The company sells dozens of laser models to dozens of industries, and 26% of last quarter's revenue was recurring (parts, consumables, repairs, and related services). That's nice to have, but the real story here is an ever-greater need for lasers in the manufacturing of ever more electronic devices and other items. This is a volume story -- and a story of rapid change. As the components that companies use in technology products rapidly evolve, the lasers used to build the products and test them must evolve, too, resulting in new sales for Coherent. We see how quickly tech is evolving, so rather than investing in one particular technology, we're investing in a means for putting most any technology together.

Buy First: Facebook (NASDAQ: FB)

Although it's lately riding a wave of popularity, we believe the strong stock is justified, and the business should grow handsomely in coming years.

Suggested Allocation: About 7.3% (see Recommendations page for real-time allocation).
You can buy in thirds, or halves, over a few quarters. Experienced investors can write put options to target buying some of their shares cheaper; to do this, "sell to open" one put option for every 100 shares you could buy. Because you want to be assigned shares, sell "near-the-money" puts, with a strike price near the current share price, that expire in just a month or two.

For More

- Latest earnings update (5/15/17)

- *Pro's* original recommendation (9/18/12 – dated by now! But this shows how we thought about it back then when it was $20 and most were bearish)
- Talk about Facebook

Facebook remains a young story about monetizing the largest, most engaged online audience ever hosted by one company. The company's future is in strong hands; management is showing patience and care as it starts to monetize more of its properties, putting visitor experience first. So far, this approach has paid off, with user engagement up even as more ads appear. The billions of connections maintained on Facebook's properties are making the sites extremely sticky, offering the potential for increased value to advertisers (and thus Facebook shareholders) -- especially as the advertising gets smarter and more targeted.

It's our largest position at a recent 6.5%, and the size of our investment in Facebook feels appropriate given how much growth potential lies ahead and how well-managed the company is. Even from today's price, we estimate Facebook could return about 15% annualized for shareholders over the next five to seven years. Though shares are currently a bit above our fair-value estimate, the stock is rated Buy First on its long-term potential. Key risks include users moving away from Facebook, but so far the company has shown great skill in *increasing* user engagement and stickiness, rather than stunting it. It's also possible that management could spend more than Wall Street expects, though that should mainly be a short-term concern.

Buy First: Visa (NYSE: V)

With its mission to "accelerate the electrification of commerce," industry leader Visa has most of the world left to conquer.

Suggested Allocation: About 3.1% (see Recommendations page for real-time allocation)

For More

- Buy More recommendation (3/30/17)
- *Pro*'s original recommendation (4/28/15)
- Talk about Visa

The ubiquitous nature of credit and debit cards in America means that many of us can go through life rarely touching cash. Yet even in the U.S., cash still accounts for approximately 40% of transactions, followed by debit cards at 25% and credit cards at 17%. And globally, cash is truly king: MasterCard estimates that 85% of all consumer transactions still take place with old-school paper and coins. But all of that is slowly changing as economies modernize and middle-income families proliferate, bringing more converts to the benefits of electronic payment. With its mission to "accelerate the electrification of commerce," industry leader **Visa** (NYSE: V) has most of the world left to conquer.

We like Visa for many of the same reasons we like MasterCard. And with the recent acquisition of Visa Europe, the company will be adding 523 million card accounts that resulted in 38 billion transactions and $1.67 trillion in point-of-sale spending last year. For the fiscal third quarter, revenue was up 3% year-over-year, primarily because of foreign-exchange headwinds and slow global growth. Management is guiding for 7% to 8% revenue growth for the full year.

Having closed on its acquisition of Visa Europe, the company can start taking advantage of some of the deal's long-term benefits, such as greater scale, increased market share, and growth in free cash flow (FCF). Visa has also formed a key partnership with PayPal, under the terms of which PayPal will no longer steer users toward paying with a bank account (and not Visa), and in return Visa will allow users to pay with PayPal in any stores that have Visa contactless payment technology. We like this deal, which both shows Visa's entrenched position and negotiating leverage and also effectively turns a major competitor into a financial partner; with the bank-account obstacle removed, we think more customers will likely pay with a credit card in order to build up points. Management has repurchased $5.5 billion of stock so far this year, with an authorization to buy back an additional $7.3 billion. After taking on $16 billion of debt to fund the Visa Europe acquisition, the company has net debt of about $7.1 billion, which is equal to about one year of FCF.

Visa is valued at about $195 billion, and given its tiny market share, its ceiling should be much higher than that. It fits into *Pro* as a recurring-revenue business that invests its free cash flow in more growth at still higher rates of return, making it a compounding vehicle.

Pro Catch-Up Trades: August 15, 2016

Published Aug 15, 2016 at 3:48PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **MasterCard** (NYSE: MA): Buy 4.3%% if you haven't yet. (See our earnings update.)
- **Wells Fargo** (NYSE: WFC): Buy up to 4.3%.
- **FactSet Research** (NYSE: FDS): Buy 2.1%.

Continue building your portfolio with our Buys, including these highlighted today:

- **Visa** (NYSE: V): Buy 2.4%. (See our earnings update.)
- **Starbucks** (NASDAQ: SBUX): Buy up to 3.3%.

Shorts:

- **Pier 1 Imports** (NYSE: PIR): Sell short 0.7% to start (see our recent trade alert).

Options:

- **Gilead Sciences** (NASDAQ: GILD): Sell to open October 2016 $85 calls, one for every 100 shares you would like to cover (as expiration gets closer, we accept what the market is willing to pay). See our recent trade alert.
- **Skyworks Solutions** (NASDAQ: SWKS): Sell to open September 2016 $70 calls, one for every 100 shares you would like to cover. See our recent trade alert.

Hedges:

- No updates.

Options expiring next:

- **Gentex** (NASDAQ: GNTX): September 2016 puts. Gentex shares are trading at $18.28, well above our $15 strike. With 32 days remaining, these puts are on track to expire as income.
- **Skyworks Solutions** (NASDAQ: SWKS) and **Valmont Industries** (NYSE: VMI): September 2016 covered calls. These contracts still have 32 days to go, so we'll issue updated guidance as we approach expiration.

The Human Side of Investing

Published Aug 15, 2016 at 3:46PM

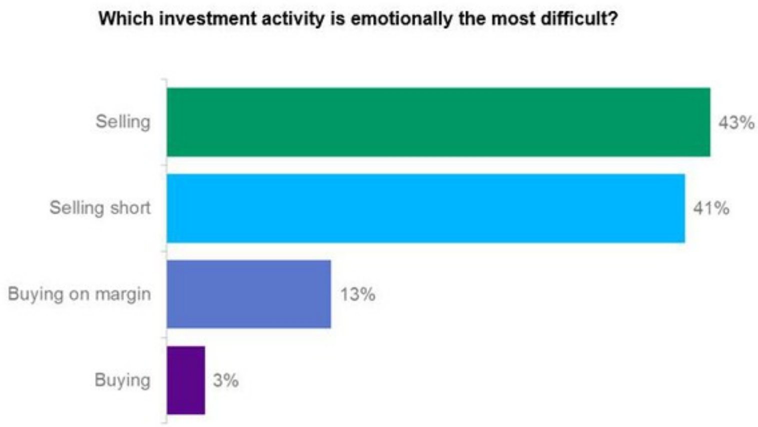
Fellow Fools,

We humans are complicated animals. That's becoming ever more apparent to me as the parent of two young children, for whom every emotion seems to be magnified to the *n*th degree. If you ask my five-year-old daughter about her day, a good day is often "the best day of her life" and a bad one quickly spirals into a tear-filled "worst day ever." It has taken me awhile to learn that it's much more effective to meet these emotional outbursts with validation rather than trying to insert my own rational perspective.

With the exception of their teenage years, I expect my kids' mood swings to moderate over time, but we adults know there's no escaping our emotional vicissitudes. Even for the most dispassionate among us, these whirlwinds of emotion remain into adulthood to some extent, adding color to our personal lives -- and heavily influencing our financial lives. In other words, our emotions are a feature, not a bug in the system. For that reason, I thought it might be worthwhile to provide some validation for those *Pro* Fools out there who find themselves caught on the occasional roller coaster of feelings when it comes to making investment decisions.

Don't Worry, It Isn't Just You

An article on the CFA Institute's blog, titled "Feeling Machines: The Emotional Cost of Buying and Selling," caught my attention recently. To be honest, the article itself isn't too exceptional, but what did turn my head were the following survey results from more than 700 readers of the CFA Institute's Financial NewsBrief who were asked to rank their investment activities based on the emotional difficulty they associate with them.



Source: CFA Institute blog, *Feeling Machines: The Emotional Cost of Buying and Selling*

These results shouldn't be surprising to anyone who's tried managing their own investments for any period of time. If anything, it should be reassuring that a large group of likely well-trained financial professionals (I doubt many others subscribe to the Financial NewsBrief) also fall victim to the same emotional biases as the rest of us.

At *Pro*, these less pleasurable investing activities are an everyday fact of life. With our mandate of managing a fixed amount of capital in pursuit of North Star-besting returns, selling existing positions or engaging in selective short-selling can be critical tools as we manage risk while trying to maximize returns. Most of us go out of our way to avoid negative emotions, so it's little surprise that the vast majority of the investing media spends a lot more time talking about which stocks to buy rather than which to sell or (gasp) sell short. At The Motley Fool's 2016 FoolFest, then-*Pro* analyst JP Bennett hosted a fantastic presentation highlighting the challenges investors face when deciding to sell a position.

Also, Jeff has written at length about the ins and outs of shorting, including this great Memo from a couple of years back. We currently only have a few short positions in the *Pro* portfolio, but those positions often cause a disproportionate amount of angst among our members -- whether or not they ultimately perform as expected. As you can see from the survey results above, that response to shorting is perfectly natural. Fortunately, there's also the *Pro* Community, which is a powerful tool in such circumstances, allowing you to share your feelings and get thoughtful responses from like-minded Foolish investors.

The *Pro* Bottom Line

First and foremost: Know thyself. We'd love for all of you to follow all of our trades if you'd like to match our returns over time, but every Fool should also draw a line in the sand if certain strategies keep them awake at night. After all, you can't win if you don't stay in the game. There are many ways to use your *Pro* service successfully. Many members pick and choose a combination of our long, short, and option trades that best suits their individual needs and investing temperament. Others follow every trade and match our allocations precisely.

And remember, it's good to be a little bit uncomfortable when investing. In the words of Warren Buffett, "you pay a very high price in the stock market for a cheery consensus." The fact that investing is difficult should be encouraging. If it were easy, then everyone would do it well, and any profits would be spread thin. Embrace those emotions. They are what create the cycles of fear and greed that drive the market and create pockets of opportunity for patient, rational investors to exploit over time.

Foolish best,

-- Jeremy (TMFTank)

Pro Guidance Changes

- None in the past week.

Pro Completed Trades

- **Gilead Sciences (Nasdaq: GILD):** We sold to open October 2016 $85 calls, collecting $1.15 each, writing nine contracts to cover all our shares.
- **Skyworks Solutions** (Nasdaq: SWKS): We sold to open September 2016 $70 calls, collecting $1.24 each, writing twelve contracts to cover all our shares.
- **Expeditors International** (Nasdaq: EXPD): We rolled our covered strangle, buying to close our August 2016 $46 put/$49 call strangle, and selling to open a November $48 put/$50 call strangle, for a net credit of $1.05.

Write Covered Calls on Skyworks Solutions

Published Aug 10, 2016 at 2:25PM

Is this for you? This recommendation is for *Pro* members who own at least 100 shares of Skyworks Solutions, and who wouldn't mind capping upside on the shares in return for near-term income.

How You Participate

- **Trade:**
  - Sell to open September 16, 2016 $70 calls on **Skyworks Solutions** (NASDAQ: SWKS)
- **Allocation:** Write ("sell to open") one call for every 100 shares of the stock you own and want to cover. *Pro* will cover all 1,200 shares we own, representing 3% of the portfolio.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a **limit order** to split the bid/ask price spread at going prices. Aim for as close to a 1% yield (that's option premium / current price of the stock) per month, accepting a bit less if need be.
- **Prices** (11 a.m.):
  - **Skyworks Solutions:** $66.30
  - September 16, 2016 $70 call (bid/ask): $1.05/$1.10.
  - So, $1.08 is a 1.6% yield on $66.35 in 37 days.

Skyworks Solutions (SWKS), 3% stock allocation, Buy rating

We have a 30% gain on Skyworks in about two years of ownership — more including the dividend — so it has been a strong performer for us. But it has also been volatile. It was above $100 for a while before falling back to the $60s. Most newer members are likely underwater on it so far. Now looking for another round of icome, it's still OK to write covered calls in that case, since you shouldn't anchor on your cost basis. These covered calls have a strike price that's lately 5.5% above the share price, and the option pays us another 1.6%.

We seek to make an optimal decision on the current condition, and writing short-term calls on this chipmaker (as we did this spring) may bring us some income and increase our return on it this year. Trading at 11.4 times one-year ahead estimates. Skyworks is priced like a typical chip company, even though its financials are far better than average. But until the uncertainty surrounding iPhone and smartphone sales subsides, the stock may be volatile and rangebound, a situation options can usually capitalize on. These options will expire well before the October earnings report.

The *Pro* Bottom Line

Given *Pro*'s goal of earning monthly income by writing options, our hope is that this position will result in additional income in September. If you don't own 100 shares, don't sweat it. The income is nice, but owning quality stocks, in any amount, is the first priority of a long-term investor.

There are no alternative trades today. If you can't write covered calls on your shares, simply continue to own the stock. Skyworks Solutions remains Buy rated.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium it pays us. The total combined gain is the call strike plus plus the premium received.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up**: We hope to see this covered call expire for income, and then decide our next course of action. If we need, we may roll it higher. We may also let the shares get sold (if it comes to that) and write puts if we want to maintain exposure to the company.

Options Can Help

Write Covered Calls on Gilead Sciences

Published Aug 10, 2016 at 11:03AM

Is this for you? This recommendation is for *Pro* members who own at least 100 shares of Gilead Sciences, and who wouldn't mind capping upside on the shares in return for near-term income.

How You Participate

- **Trade:**
  - Sell to open October 21, 2016 $85 calls on **Gilead Sciences** (NASDAQ: GILD)
- **Allocation:** Write ("sell to open") one call for every lot of 100 shares of each stock you own. *Pro* will cover all the 900 shares of Gilead that we own, representing 2.7% of the portfolio.
- **Price Guidance:** Prices will change as the underlying stocks move, but use a **limit order** to split the bid/ask price spread at going prices. Aim for as close to a 1% yield (that's option premium / current price of the stock) per month, accepting a bit less if need be.

- **Prices** (11 a.m.):
  - **Gilead Sciences:** $79; October 21, 2016 calls (bid/ask): $1.25/$1.27. So, $1.26 pays 1.6% in 72 days. This is a bit lower than wished, but OK with the strike price 7.6% above the share price.

What We're Thinking

Writing covered calls in this case on a strong but struggling business, we're working to generate (or at least improve) returns on the position while we await a recovery, in the aftermath of this earnings season. Though we're risking missed upside on the shares if the stock rises far beyond our call stock price, we think the potential payoff is worth the risk.

Gilead Sciences (GILD), 2.7% stock allocation

Gilead's giant Hepatitis C sales have likely peaked; year over year, revenue from the franchise declined sharply last quarter, and management said peak sales may have been realized. The drugs should remain a cash cow franchise for years to come, though, with (by far) most Hepatitis C patients still untreated. Shares are extremely cheap at less than 7 times earnings, but the market is skeptical that Gilead can grow any year soon — and, barring a major acquisition, that's probably true.

In the past, management has grown through acquisition, and it likely will again. They may even make a purchase by the end of this year. But for now, we're comfortable targeting income on the stock. Our calls have a strike price that's lately 7.6% higher than the share price, and pay us 1.6% in 72 days. Lacking real gains on the stock, if we lose shares, there isn't a tax issue to consider. But if Gilead does increase for good reason, we'd likely aim to roll our calls higher, or close them.

The *Pro* Bottom Line

Given *Pro*'s goal of earning monthly income by writing options, our hope is that this position will result in additional income in October. If you don't own 100 shares, don't sweat it. The income is nice, but owning quality stocks, in any amount, is the first priority of a long-term investor.

There are no alternative trades today. If you can't write covered calls on your shares, simply continue to own the stock. Gilead Sciences remains Buy rated.

More That Matters

- **Maximum gain:** The stock's upside is capped at our call strike price, and the potential gain on the covered call is the premium it pays us. The total combined gain is the call strike plus plus the premium received.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up**: We hope to see this covered call expire for income, and then decide our next course of action. If we need, we may roll it higher. We may also let the shares get sold (if it comes to that) and write puts if we want to maintain exposure to the company.

Facebook's Future Spelled Out

Published Aug 8, 2016 at 4:00PM

Dear *Pro* member:

The *Pro* portfolio struck a new all-time high on Friday, up 6.9% on the year, in line with our North Star, and keeping our returns "index-topping" the last one, two, three, five, and eight years (or since inception). Looking ahead, our three-, five-, and 10-year goals aim for continued strong returns with (ideally) fewer mistakes and as little turnover as feasible.

Some of us are at a stage in life where the biggest long-term goal we have is to simply enjoy each day. That's fortunate! Others have three-, five- and 10-year plans laid out. Strong companies make long-term plans, too, and out of all the companies I follow, **Facebook** (NASDAQ: FB) is the best at revisiting the topic every quarter.

Our largest holding at 6.6%, Facebook has three-, five- and 10-year plans that have been consistent for years, and are all in motion at once. They are:

- **Three years:** Continue to build the community and help people share more of what matters to them.

- **Five years:** Build its products into full ecosystems with developers and business.

- **10 years:** Build new technologies to help everyone connect in new ways (4 billion people, more than half the planet, are not yet online).

Within these plans are several initiatives. For examples: Facebook believes that within five years, most online content-sharing will be video, so it's building for that. Artificial Intelligence and virtual reality are in the early stages of consumer use. Facebook's new DeepText learning-based engine can understand the context of several thousand posts per second in 20 different languages. About 1 million people a month are using Oculus Rift on mobile phones, and demand for the new VR headset is growing.

Helping fulfill its plans, Facebook has several growing product platforms:

- **Facebook:** 1.7 billion people use it monthly, and 1.1 billion daily (daily user numbers are up 17% compared to last year). Facebook added more than 200 million users the last 12 months, its best absolute growth in more than three years. Average time spent on the site per user increased by more than 10% this quarter (largely thanks to video).

- **Instagram:** The photo- and video-sharing site now has more than 500 million monthly active users, and more than 300 million daily.

- **Messenger:** For the first time, more than 1 billion people use Messenger every month. It isn't monetized yet.

- **WhatsApp:** More than 1 billion people use WhatsApp each month. Not yet monetized.

- **Search (mostly on Facebook so far):** 2 billion searches a day, and this "product" is also not being monetized.

Across these properties, Facebook has three phases. They are:

- **Phase 1:** Grow the user base and engagement.
- **Phase 2:** Grow organic interactions between businesses and consumers.
- **Phase 3:** Build the commercial opportunities.

To give you an idea of the scale Zuckerberg wants on each product line, Messenger now achieves 1 billion organic interactions between businesses and consumers each month. Despite that milestone, the company is still in the "incredibly early" stages of thinking about monetizing it. Messenger is really still in phase 2, building the organic interactions. Only Facebook and recently Instagram are in phase 3.

As Facebook builds its giant consumer-driven platforms, businesses flock to them like birds to the largest bird feeder on the planet. About 60 million businesses now have a page on Facebook. Yet fewer than 4 million are advertising so far. More than 30% of small and medium-sized businesses in the U.S. don't have a website at all. For them, Facebook has made launching one on its site easy.

On the commercial front, Facebook has still another framework in place, with three priorities:

- Capitalize on the shift to mobile.
- Grow the number of marketers using its ad products — offering a simple, quick ad interface (which more than 80% of new advertisers use at first) to detailed, targeted ads.
- Continually make the ads more relevant and effective.

For savvy advertisers, Facebook is a potential goldmine. The size and engagement of the community means that even an ad targeting a specific demographic can reach 300,000 or more people.

This sort of advertising power is driving record financial results. Last quarter, advertising revenue jumped 63% to $6.2 billion, with the strongest growth rates in the lucrative North America and Asia-Pacific regions. Some 84% of advertising revenue was on mobile. Profitability levels at Facebook grew more than expected, and CFO David Wehner was able to lower guidance for expected *spending* this year on the top end of the range.

At its current price around $125, Facebook trades at 50 times free cash flow and 28 times estimated earnings for the year ahead. Some near-term risks include more challenging year-over-year growth comparisons the rest of this year, and the likelihood that ad loads (the number of ads shown per user experience) will flatten out after mid-2017, taking away one recent growth driver. Presumably, new drivers across the business will be unfolding.

We're in the process of updating our fair-value estimate, but the stock remains a **Buy First** here. Newcomers may wish to buy in thirds or halves, since Facebook is our largest holding; or, you can consider selling to open put options to target a lower buy price on some shares.

In its conference calls, different members of the management team fluidly access the same frameworks outlined above in their comments and answers, showing a team on the same page. Another strong quality of Facebook: It can largely control its own fate as long as it can maintain traffic engagement (which draws in still more users and advertisers). Unlike many investments, Facebook won't be derailed by falling commodity costs, sudden competition at scale is unlikely, and technology improvements will likely work in its favor, not against it.

Please visit the Facebook board if you have any questions or comments, and thank you for being a *Pro* Fool!

-- Jeff (TMFFischer)

Pro Guidance Changes

- None in the past week.

Pro Completed Trades

- **Valmont Industries** (NYSE: VMI): We sold to open September 2016 $135 calls, collecting $1.40 each, writing four contracts to cover all our shares.

Pro Catch-Up Trades: August 8, 2016

Published Aug 8, 2016 at 4:00PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio. Some highlights:

- **Facebook** (NASDAQ: FB): Featured in today's Memo. Buy up to 6.6% if you haven't yet. If starting out, consider buying in portions over time.

Keep building your portfolio with our Buys, including these highlighted today:

- **Oracle** (NYSE: ORCL): Buy 3.7%.
- **Visa** (NYSE: V): Buy 2.4%.

Shorts:

- **Pier 1 Imports** (NYSE: PIR): Sell short 0.75% to start (see our recent trade alert).

Options:

- **Valmont Industries** (NYSE: VMI): Sell to open September 2016 $135 calls, one for every 100 shares you would cover (as expiration gets closer, we accept what we get paid). See our recent trade alert.

Hedges:

- No updates.

Options expiring next:

- **Expeditors International** (NASDAQ: EXPD): Our August $46/$49 covered strangle expires in 11 days. Time value is nearly gone, so we'll be rolling the strangle. See today's trade alert.

Roll Your Covered Strangle on Expeditors International

Published Aug 8, 2016 at 3:30PM

Is this for you? This is only for *Pro* members who have an existing income position on **Expeditors International** (NASDAQ: EXPD) and currently in-the-money call options expiring August 19. Those not yet in this position can check out Alternative Trades at the end of this report to start a partial position (writing puts) or wait and watch our future *Pro Catch-Up Trades* each Monday, where we'll guide you into the entire position if pricing improves for newcomers.

How You Participate

- **Actions:**
  - **Closing old position:** Buy to close all existing August 2016 $49 calls. You may also buy to close all existing August 2016 $46 puts for mere pennies, or leave them be to expire August 19 (if you do wait, do not write new puts until these expire). Leave your 2017 synthetic long alone.
  - **Opening new position:** Write a new covered strangle. Sell to open November 2016 $48 puts and sell to open November 2016 $50 calls. Sell one of each for every synthetic long you have already set up (or every 100 shares of stock you own).
  - **Allocation:** Approximately 1.9% look-through exposure on the synthetic long plus an additional 1.8% exposure through your short puts in the strangle for 3.7% total exposure to Expeditors International. Each synthetic covered strangle at today's price represents about $10,000 in exposure to the stock. So, for 3.7% exposure, set up one synthetic covered strangle (one each of all four options involved) for approximately every $270,000 you're managing. *Pro* has 10 contracts of each option in the synthetic long, and then in the written strangle, too.
- **Prices and Guidance (12:45 p.m.):**
  - **Stock:** $50.90
  - **Options:**
    - **Close old strangle (or you can roll your entire strangle, combining these two orders):**
      - Buy to close August 2016 $49 calls, lately about $2.10 (splitting the bid/ask). Aim to pay as little time value as possible to close these calls.
      - Buy to close August 2016 $46 puts, lately $0.05 (or leave these alone to expire August 19, and write your new puts then).
      - Combined: **About a $2.15 debit**
    - **Write new covered strangle:**
      - Sell to open November 2016 $48 puts (bid/ask): $1/$1.10.
      - Sell to open November 2016 $50 calls (bid/ask): $2.70/$2.75.
      - Combined splitting the bid/ask: **About a $3.75 credit**
  - **Total price to roll:** About **a $1.60 credit**
  - Close your old positions using a limit order at current pricing, paying as little time value as possible. Write the new strangle using a limit order of about $3.75 in credit. As prices change, ideally accept no less than $3, or about 6% on the current share price in just more than three months to expiration. Later, aim for a 2% yield on the current share price per month to expiration.
    - **Timing:** As as long as Expeditors International remains above $50, aim to close your August $49 calls soon, to avoid being exercised a bit early. Time value is nearly gone.

What We're Thinking

Shares of our overseas shipping facilitator, Expeditors International of Washington, remain an income position here in *Pro*. We are comfortable having exposure to the shares (currently through a synthetic long, which mirrors share ownership without requiring us to pay out capital) and writing put and call options to target income. Since *Pro*'s inception in 2008, Expeditors has had a recurring presence in the portfolio, generating returns.

After a record 2015, earnings at the Seattle-based operation have been flat so far in 2016, as expected. The stock has drifted higher and still fetches a reasonable valuation. We believe this well-run business will continue to deliver respectable results, even if world trade volume slows marginally. Meanwhile, the stock is as reasonably priced as it has been in years, now trading at 21.3 times earnings and 15.5 times free cash flow.

Asia trade accounts for about half of the company's revenue. But, of course, many of China's exports are shipped to North America and Europe. This gives the business some breathing room even when China's domestic economy (including imports) slows, as it's currently doing. Although this year could remain choppy, that uncertainty adds to the option premiums we collect, aiding our income strategy.

Why This Strategy?

Although it's a highly profitable, expertly managed niche business in an attractive service space, Expeditors is not on the radar of the average investor. Its valuation is reasonable, and its options pay well. Not expecting a surge in earnings, we're content to keep covering the position with calls, in this case, with in-the-money calls (our only other option right now would be to write $55 calls rather than $50, and those don't pay well).

Given the premiums on the options, we're able to roll our calls up $1 in the strike price, from $49 to $50, and still do so at a credit, even though we're rolling forward only a modest three months. We'll have one more potential roll in November, and by January 2017, we may turn our synthetic long into stock — or set up another synthetic long if we want to keep the position going. Time will tell.

More That Matters

- **Maximum loss:** The same as owning at least 200 shares of stock (100 now, and 100 at $48), minus the option premiums received.
- **Maximum gain:** This new strangle caps our upside at $50, plus the combined option premiums received. The most we can make on this strangle alone is the $3.75 or so in premium paid to us (ignoring that it was a roll, which is a sunk cost); that's earned if the stock is between $48 and $50 by expiration.
- **Follow-up:** In November, we'll weigh our options heading into our January 2017 expiration, likely writing one more round of options expiring January.

Alternative Trades

- **If you simply wrote covered calls last time and want to keep doing that:** Roll your August $49 calls to November $50 calls. Lately, this pays about a $0.60 credit.

- **If you simply wrote puts last time and want to do so again, or if you're new and simply want to write puts:** Your old puts are expiring as income. As they do, sell to open November 2016 $48 or $49 puts (newcomers can do so anytime), selling one for every 100 shares you would buy, up to a 3.7% potential allocation. Note: These puts pay less than our desired 1% per month right now, but they're the best options available.
- **If you're new and simply want to write covered calls (the IRA-friendly alternative!):** With the stock above $50 and $50 calls being the most viable ones to write, we don't recommend setting up this particular position right now.
- **If you're new to *Pro* and want to participate in the full new position:** We recommend waiting and watching *Pro Catch-Up Trades* every Monday. We'll include Expeditors if pricing improves a bit for newcomers.

Pro Can Help

- **Want more on this strategy?** See our guides to covered strangles and synthetic longs. We're combining the two into a synthetic covered strangle.
- **Questions?** Please ask, Fools! Ship yourself on over to our Expeditors board. We can all help you, especially if you're new!

Gentex's Results Reflect Healthy Growth

Published Aug 7, 2016 at 3:23PM

***Pro*'s Take: GNTX Q2-2016 Earnings**

Gentex (NASDAQ: GNTX)

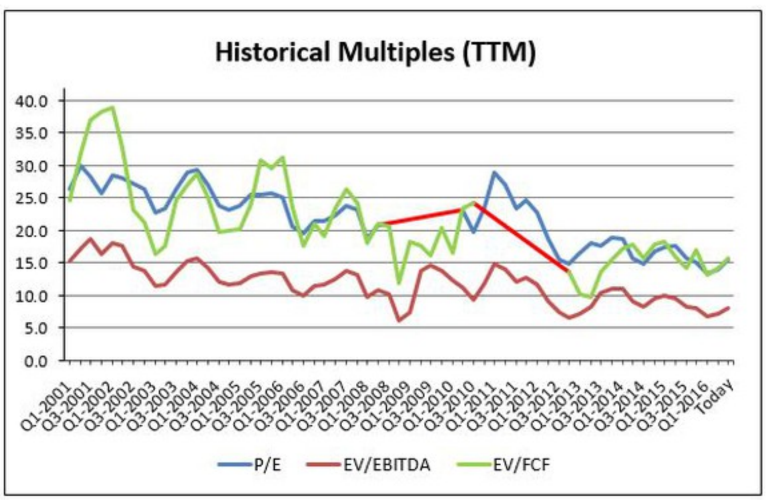
What Happened?

- Q2-2016 press release

Guidance Update

After incorporating this quarter's results into my model, **our Fair Value increases to $19 per share.** The market was pleased with this quarter's report, and the stock price is up almost 10% since the day before the report, nearing levels not seen since early 2015. The stock is about 7% below our newly updated fair-value estimate, and **Gentex remains a Buy First** on our scorecard.

At about 15.5 times trailing-12-month earnings and 8 times EV/EBITDA, despite the recent stock price increase, the stock is still trading near the low end of historical valuation multiple ranges despite a robust balance sheet, steady operating performance, and continued success in market penetration and organic growth. If you've yet to start a position or fill out your stock allocation in Gentex, now is a great time.



Note: Red lines represent omitted outlier multiples that correspond to recession-depressed earnings and free cash flow levels.

We also have a 1.4% look-through allocation in September 2016 $15 written puts. After the earnings bounce, those puts are on track to expire fully as income (as did our four prior iterations of Gentex puts), although we are still more than a month away from expiration. If you've yet to match our written put allocation, I would wait until the current round of puts expire in September to see if we reup our strategy. If we choose to write new puts, you can match us then.

Updated Guidance: Buy First (no change)

Recommended Allocation: 2.9% with a 1.4% look-through allocation in September 2016 $15 puts

Fair-Value Estimate: $19 (up from $18)

Current Price: $17.70

Our Thesis

Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1) Penetration: Unit growth vs. auto production. Over time, we want to see Gentex's auto-dimming mirrors to continue to gain market share. If the company is increasing units sold faster than auto production, it is moving in the right direction. Quarterly global interior mirror unit volumes grew strongly to +15.1% year-over-year growth (accelerating from +13.6% a quarter ago) vs. ~3% year-over-year growth in auto production in the company's primary markets, showing that Gentex continues to significantly outpace vehicle production growth and capture market share. Q2-2016 interior units sold in North America decelerated to +6% (from +11.6% last quarter) and Q2-2016 international interior units increased +20.6% (up from +14.7% last quarter).

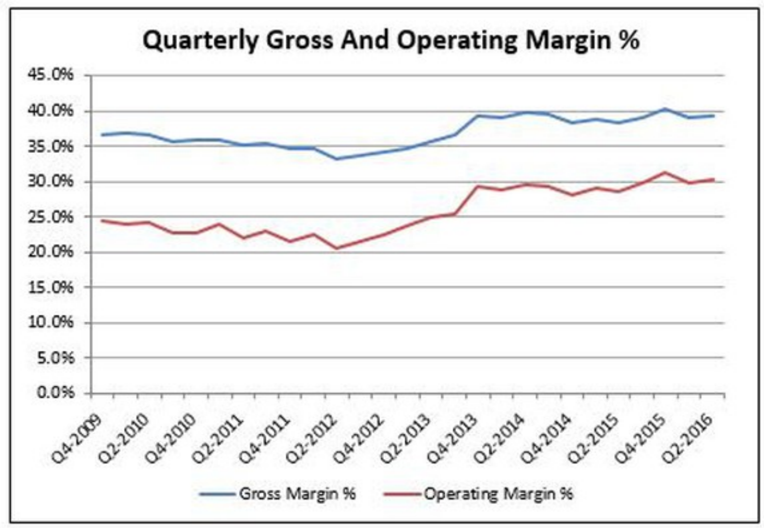
Exterior mirror unit shipments have taken a breather after a scorching 2015, with Q2-2016 exterior unit volumes up +9.2% in North America (vs. +16.8% last quarter) and +8.8% internationally (vs. +0.4% last quarter). Due to lower exterior unit growth relative to interior unit growth, the exterior mirror attach rate declined to 38.1% (i.e. 38.1% of cars equipped with interior units also were equipped with exterior units), compared with 40.3% a year ago. Exterior unit growth in 2016 will likely continue to lag 2015's growth rates as demand builds back up, but the overall trajectory of exterior unit growth is sound and market penetration continues.

2) Pricing and value: Unit growth vs. automotive segment sales. Powerful auto makers force annual price concessions on their suppliers, and Gentex isn't immune. Price reductions have recently been in the range of 2.5% to 3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices (ASPs) and gross margins.

In Q2-2016, total units (interior + exterior mirrors) increased +15.1% and automotive segment sales were up +11.9%. This dynamic suggests lower ARPU (average revenue per unit) and is consistent with the expectation of annual price concessions.

3) Margin performance. In Q2-2016, gross margin was 39.4%, up from 38.4% a year ago as annual price reductions were more than offset by purchasing cost reductions and favorable product mix. Management raised the low end of its gross margin guidance range for full year 2016 margins to 39%-39.5% (up from 38.5% at the low end previously), and the company has done a great job keeping margins up through the first half of 2016.

Q2-2016 operating margin performance was 30.4% (vs. 28.5% in Q2-2015). Selling, general, and administrative (SG&A) and research and development (R&D) expenses came in within normal ranges and are consistent with recent trends:



What We Think Now

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

If you have questions, drive on over to the Gentex discussion board.

TD Ameritrade's Steady Growth Continues

Published Aug 7, 2016 at 11:51AM

Pro's Take: AMTD Fiscal Q3-2016 Earnings

TD Ameritrade (NASDAQ: AMTD)

What Happened?

- Fiscal Q3-2016 press release
- Fiscal Q3-2016 earnings presentation
- Fiscal Q3-2016 earnings call transcript

Guidance Update

After incorporating this quarter's results into our model, **our Fair Value estimate remains unchanged at $35**. Positive operational momentum was offset by slightly lower expectations surrounding interest rates. The valuation does assume a slow increase in interest rates over the next several years, so in the absence of that occurrence, the company may be challenged to grow earnings and the stock price may stagnate. The stock has been quite volatile this year, swinging between extremes as market sentiment on financial stocks has fluctuated (exacerbated by Brexit).

Updated guidance: Buy (no change)

Recommended Allocation: 2.4%

Fair-value estimate: $35 (unchanged)

Current price: $31.36

The Numbers

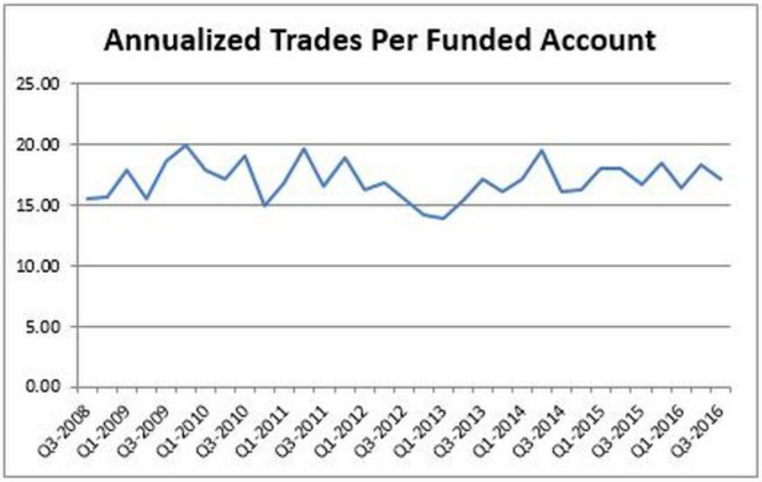
- Net revenue of $838 million (+5.5% year-over-year)
    - **Transaction-based**:
        - Funded accounts grew to 6.87 million (+4.9% year-over-year)
        - Trades per funded account of 4.31 (vs. 4.59 last quarter vs. 4.17 a year ago)
        - Average commissions and fees per trade of $11.72 (vs. $11.60 last quarter vs. $12.01 a year ago)
        - Totals up to:
            - 6,872,000 x 4.31 x $11.72 = **$347 million** in transaction-based revenue (+5.8% year-over-year)
    - **Spread-based**:
        - Total spread-based revenue of **$377 million** (+3.3% year-over-year)
        - Average spread-based balance of $106.1 billion (+11.3% year-over-year)
        - Thus, Net Interest Margin (NIM) =
            - $377 million / $106.1 billion = 0.355% (quarterly)
            - NIM (annualized) = 0.355% x 4 = 1.42% (vs. 1.44% last quarter vs. 1.53% a year ago)
    - **Fee-based**:
        - Fee-based revenue of $96 million (+12.9% year-over-year)
        - Average fee-based balance of $162.1 billion (+0.5% year-over-year)
        - Thus, Investment Product Fee Yield =
            - $96 million / $162.1 billion = 0.059% (quarterly)
            - Investment Product Fee Yield (annualized) = 0.059% x 4 = 0.237% (vs. 0.230% last quarter vs. 0.211% a year ago)
- Record client assets of $736 billion (+4.8% year-over-year)
- Record interest rate sensitive assets of $113 billion (+10% year-over-year)
- Net new client assets* of $13.6 billion (8% annualized growth rate)
- Record diluted EPS of $0.45 per share (+26% year-over-year)
- Trailing-12-month (TTM) average return on equity (ROE) of 17.5% (up from 16.7% a year ago)
- Capital management:
    - Paid $0.17 per share in cash dividends in the quarter (a 2.3% yield on the current share price)
    - Repurchased approximately 1.7 million shares of its common stock at an average share price of about $28.82 per share ($49 million)

*excludes changes in client assets due to market fluctuations

Analysis

TD Ameritrade continues to gather client assets at a steady pace despite a volatile market. In Fiscal Q3-2016, net new assets (NNAs) were up $13.6 billion, a 7.6% annualized growth rate relative to total client assets at the beginning of the quarter. The company's Fiscal 2016 and long-term goal is to grow net new assets at a rate between 7-11%, and this quarter is within that range.

Trading activity was more muted this quarter compared to last quarter, with just one day in the quarter where intraday volatility eclipsed 2%, compared to 16 such days last quarter. The company averaged 462,000 client trades per day this quarter, up 6% year-over-year:

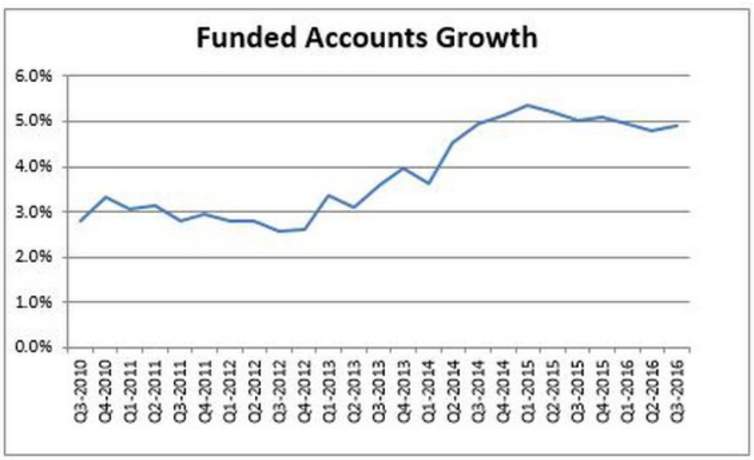


Average commissions and fees per trade came in at $11.73, which is up +1% sequentially and down -2.5% year-over-year:

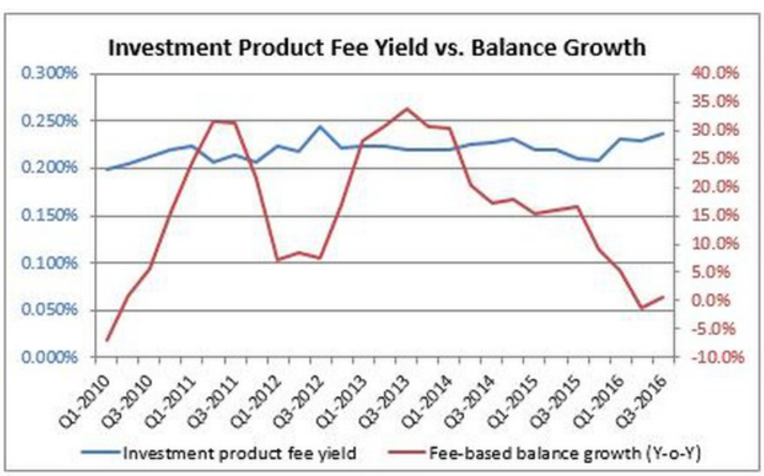
Notably, in the conference call, management finally conceded that "continued price competition" is playing a part in pressuring commission rates, as opposed to focusing on product mix to explain the trend. I wrote last quarter:

> *"I'm not convinced that mix is the predominant factor in reduced commission rates. The metric is probably also influenced by the emergence of very low-cost brokers (e.g. Robinhood, Interactive Brokers)."*

I am glad that management is now willing to admit that price competition is playing a part in the decline in commission rates. However, this is not too much of a concern in terms of our assessment of the business, as our valuation assumes a steady decline in commissions and fees per trade over the next ten years. In the short-term, the transaction-based revenue stream will likely continue to bounce around, varying based upon product mix, market volatility, and fluctuations in the commission rate. But over the long run, steady account growth (a 4.4% CAGR over the last 8+ years) has led to persistent upward pressure on transaction-based revenue, and that trend seems likely to continue:



The fee-based segment of the business had a good quarter, with fee-based revenue up +12.9% year-over-year. The company's average fee-based investment balance during the quarter was a record $162.1 billion. Higher investment balances and a higher investment product fee yield led to the strong growth seen in this segment:



What We Think Now

TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and as interest rates increase, the company is positioned to grow earnings sharply.

If you have questions, post them on our [TD Ameritrade discussion board].

Papa John's Continues to Deliver

Published Aug 4, 2016 at 11:26AM

Pro's Take: PZZA Q2 Earnings

Papa John's International (NASDAQ: PZZA)

....

Q2-2016

Total revenue growth: +6% (vs. +4.8% in Q2-2015)

Operating profit margin: 8.7% (vs. 7.8% in Q2-2015)

EPS growth*: +24.8% (vs. +22.5% in Q2-2015)

Domestic comparable store sales: +4.8% (vs. +5.5% in Q2-2015)

International comparable store sales: +5.3% (vs. +6.8% in Q2-2015)

....

*EPS growth is adjusted for a non-recurring legal settlement expense recorded in Q2-2015

Quarter Quick Take

Papa John's turned in a strong Q2-2016, continuing its successful formula of sales growth, expanding margins, and share buybacks. The company delivered growth of 24.8% in earnings-per-share (when adjusted for a non-recurring legal settlement expense) due to higher global restaurant sales growth (+5.9%), expanding operating margins (8.7% in Q2-2016 vs. 7.8% in 2Q-2015) and continued share buybacks (the company has reduced its diluted share count by 6.7% since the same quarter last year).

It's been almost a year since *Pro* trimmed its Papa John's position by one-third via covered calls (selling at a net $68.40 per share), and the past year has been a typically volatile one for the stock. Papa John's stock is often subjected to extreme movements in the share price. After this earnings report, the company is now trading at all-time highs, and up 75% from the year-to-date low of $44.47 just 6 months ago on February 4th. The stock trades at the mercy of market sentiment, and right now sentiment is quite high. Restaurant traffic and sales trends has been sluggish lately, and Papa John's strong comps in the second quarter again show the continued resiliency of the pizza category.

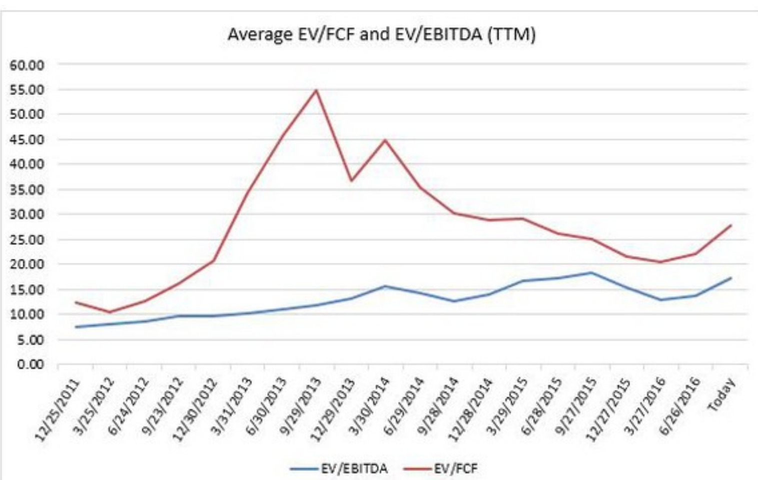
Guidance: Buy (no change)

Recommended Allocation: 3.5%

Fair Value estimate: $57 (up from $54)

Current Price: $77.80

The recent increase in the stock price has led to a corresponding increase in the stock's valuation multiples:



At $77.80 per share, Papa John's is trading at 17.2x EV/EBITDA, and 27.8x EV/FCF. For context, **Domino's** (NYSE: DPZ) trades at 20.7x EBITDA, **Dunkin' Brands** (NASDAQ: DNKN) trades at 14.5x, and **Starbucks** (NASDAQ: SBUX) trades at 16.9x:

After incorporating this quarter's results into our model and adjusting for the time value of money, **we're raising our fair-value estimate to $57 per share (from $54)**. At $77.80 per share, the stock is trading 36% above our fair value estimate. The stock remains a Buy, but those who have yet to establish a position can likely afford to be patient, as the market is building in quite rosy expectations for future growth. At this price, among all the companies I cover, Papa John's would be the one I'd be most careful about establishing a new position or increasing an under-allocation.

Our Thesis

Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main quick service restaurant (QSR) pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest market share gains in the mature QSR-pizza market.

We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only about 1,500 international restaurants the company has a long runway for growth (compare to Domino's which has over 7,300 international stores and Pizza Hut which has over 7,500 international stores). Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

1) Store Performance*:* During Q2-2015, systemwide restaurant sales increased +5.9% (+7.7% when excluding the impact of foreign currency). Domestic comps increased +4.8% while international comps increased +5.3%.

Domestic comps growth reversed course after five straight quarters of deceleration, a welcome sign. The prior deceleration was due to "extremely competitive pricing" within the category driven by a commodity environment that has been "very favorable" in terms of both cheese prices and beef prices. For a company that relies on a higher-quality brand message, lower commodity prices make it easier for competitors to undercut Papa John's on pricing.

However, this quarter, cheese pricing edged back up, easing some of the competitive pricing pressure that was seen in the first quarter. Additionally, Papa John's was much more active in Q2 with promotional offers, introducing another national sports partnership with Major League Baseball (in addition to the recently renewed partnership with the NFL and Super Bowl), new limited-time-offers, and a promotional bundle deal.

In part due to the strong performance in Q2, management raised its domestic comps guidance for full year 2016 from 2%-4% to 3%-5%. The midpoint of the new guidance range (4%) is roughly in line with what the company achieved in full year 2015.

As for international comps, the company continues to churn out mid-to-high single digit comps performance. At +5.3% for the quarter, this marks the 19th consecutive quarter of international comps above +5%:

**Shaded areas represent management's guidance ranges for full year 2016*

The company's measured expansion continued, adding 32 new restaurants (net) in the quarter and 42 so far this year -- of which 28 were international and 14 were in North America. The company now has over 1,530 international stores (up from 822 at the end of 2011, a 14.9% CAGR in units).

Management expects full year 2016 openings to come in at 180-210 restaurants, with 75% of the net unit growth in international markets. 195 restaurant openings for 2016 would represent +4% growth versus the existing store count as of the end of 2015. The company's pipeline remains healthy, with 200 domestic restaurants and 1100 international restaurants, the majority of which are scheduled to be opened over the next six years.

2) Brand: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantages and higher price per pie. Based on recent data, which includes store growth, the domestic pizza market was about flat and the international pizza market grew about 3%-4%. So Papa John's comps (which *exclude* store growth) suggest continued market share gains at the expense of competitors. This is likely due to the company's competitive advantages related to scale (efficient advertising/distribution) and an early lead in technology (digital ordering and loyalty programs).

One way to monitor brand strength is to look at customer satisfaction. I track the yearly scores from the ACSI customer satisfaction survey, and this year's recently released results showed that Papa John's is continuing its winning ways. The company has scored the highest (or tied for highest) among its pizza chain competitors for the 16th year in the past 18, extending its streak at the top of the category to 5 straight years:

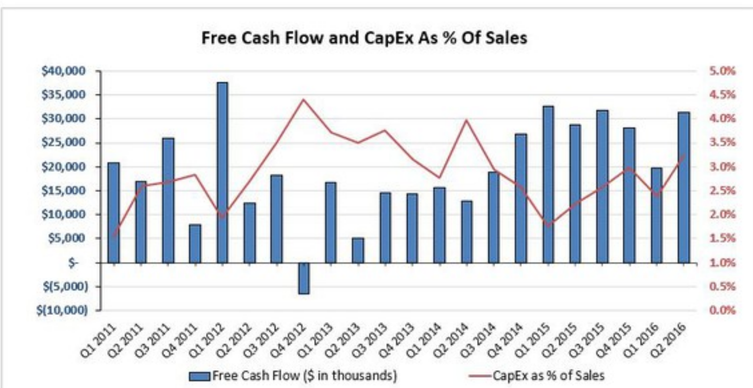
ACSI Customer Satisfaction Scores

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
Papa John's	76.0	77.0	78.0	76.0	76.0	77.0	78.0	79.0	77.0	76.0	75.0	80.0	79.0	83.0	82.0	82.0	78.0	82.0
Little Caesar	70.0	69.0	70.0	74.0	75.0	74.5	74.0	77.0	75.0	75.0	75.0	78.0	80.0	82.0	82.0	80.0	74.0	81.0
Domino's Pizza	67.0	69.0	73.0	75.0	75.0	73.0	71.0	75.0	75.0	75.0	77.0	77.0	77.0	77.0	81.0	80.0	75.0	78.0
Pizza Hut	68.0	70.0	71.0	70.0	75.0	73.0	71.0	76.0	72.0	76.0	74.0	78.0	81.0	78.0	80.0	82.0	78.0	77.0
Limited-Service Rest. Avg.	69.0	70.0	71.0	71.0	74.0	75.0	76.0	77.0	77.0	78.0	78.0	75.0	79.0	80.0	80.0	80.0	77.0	79.0
Papa John's	**76.0**	**77.0**	**78.0**	**76.0**	**76.0**	**77.0**	**78.0**	**79.0**	**77.0**	**76.0**	**75.0**	**80.0**	**79.0**	**83.0**	**82.0**	**82.0**	**78.0**	**82.0**
Competitor average	68.3	69.3	71.3	73.0	75.0	73.5	72.0	76.0	74.0	75.3	75.3	77.7	79.3	79.0	81.0	80.7	75.7	78.7
Gap	7.7	7.7	6.7	3.0	1.0	3.5	6.0	3.0	3.0	0.7	(0.3)	2.3	(0.3)	4.0	1.0	1.3	2.3	3.3

When the ACSI results were released, I mentioned on the boards that there have been studies that link ACSI scores with financial and stock market performance, so it is good to see Papa John's widening its customer satisfaction edge over its competitors this year. Continued high marks in customer satisfaction are a nice plus to our investment thesis.

3) Margins: We expect Papa John's capital light business model to eventually result in higher operating margins that propels free cash flow generation. From 2014-2015, the company dealt with depressed margins and free cash flow due to the roll-out of the company's new proprietary POS system (FOCUS), which as of the end of 2015 is totally complete.

Now that the investment phase has passed, the company is enjoying higher margins and free cash flow generation, as lower capital expenditures have lifted free cash flow higher. In this graph, note the inverse relationship between capital expenditures and free cash flow; when capital expenditures are elevated, free cash flow is depressed, and vice versa:



Note that free cash flow will likely decrease a bit in 2016 as the company paid a $12.3 million legal settlement in January (in Q1-2016), and the company expects a year of somewhat elevated capital spending (guidance is for $55-$65 million in capital expenditures, up from $39 million in 2015) due to a new domestic commissary in the U.S., company-owned unit development in the U.S., investments in technology, and routine capital replacement.

The company's operating margin continues to expand as the company's sales growth (+6%) outpaced its expense growth (+4.9%). Quarterly operating margin in Q2-2015 came in at 8.7%, versus 7.8% in the same period a year ago. When we look at TTM operating margins to smooth out seasonality, the picture looks very nice:

The operating margin expansion is due in part to strong cost control, but also to a favorable commodity cost environment. Cost control gains should continue if the company continues to achieve healthy sales growth in excess of expense growth. But if commodity prices rise sharply, the current pace of margin expansion will likely slow.

What We Think Now

Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. Prior headwinds (commodity prices and technology investments) have proven to be temporary and Papa John's should continue to deliver improved financial performance.

Checking In on Visa and MasterCard

Published Aug 1, 2016 at 2:59PM

Fellow Fools,

It's earnings season at *Pro*, which means it's time to take a brief respite from searching for new opportunities and check in on the performance of a couple of our existing holdings. When combined, **Visa** (NYSE: V) and **MasterCard** (NYSE: MA) now account for a 6.7% allocation in the *Pro* portfolio -- about the same size as our largest holding, **Facebook** (NASDAQ: FB). Though the companies compete against each other, their future will largely be determined by similar economic forces, so it makes sense to think about them in tandem. For example:

- Both companies have announced new deals (Visa's partnership with PayPal and MasterCard's acquisition of VocaLink) that allow them access to payments and data being routed through the bank-operated Automated Clearinghouse (ACH) system, which completely bypasses the card companies' networks. These deals also give both companies exposure to the growing person-to-person transaction business led by companies like Venmo, as well as to a large number of business-to-business and government-related payments that tend to use the ACH system exclusively. According to MasterCard's management, ACH payments represent 50% of the total payments across the world's top 50 countries.
- Both companies are also experiencing legal uncertainty after the Second Circuit Court of Appeals decided to throw out a $5.7 billion class action settlement against MasterCard, Visa, and a number of large card-issuing banks. At this point, we're waiting to hear next steps from the court. It'll certainly be expensive to litigate and settle these claims, but such legal fees seems to be a regular cost of doing business. These lawsuits are evidence of the strong competitive advantage that our companies possess in the payment industry. At this point, I view these legal expenses to be an ongoing cost of doing business rather than an existential threat. I expect both card companies to gradually cede a bit of their profit margin in order to be allowed to keep the lion's share.
- Finally, both companies are working to expand their geographic footprint, most notably in China. In June, the People's Bank of China released the final regulations for foreign card networks that would like to enter the Chinese market. According to both Visa and MasterCard, the biggest challenge is navigating the cybersecurity and national security standards. While they slowly sort through the details, management at both companies is working to add new card issuers, increase acceptance by merchants, and develop the required local technology. China still represents a massive opportunity for both MasterCard and Visa, but it'll obviously be awhile before either is able to generate significant volume there.

Those are just a few of the common developments that the companies reported on this quarter. Now, let's move on to a quick review of individual results.

MasterCard (4.3% Allocation)

MasterCard beat expectations handily this quarter, posting a 14% increase in both net revenue and earnings per share. The company recently announced the acquisition of UK-based VocaLink, which expands MasterCard's presence in the UK market and, as mentioned above, also provides more exposure to payments routed through the ACH system. Management believes they have picked up a market-leading asset thanks to VocaLink's popular Fast ACH solution, and they are excited about the new transaction data they can now access to develop additional value-added services.

In addition to increasing payment volume, services like MasterPass -- which allows merchants and mobile wallet providers to use MasterCard's network to process online and mobile payments -- continue to grow in popularity. The addition of near field communication (NFC) capabilities will allow contactless payments for Android devices at more than 5 million locations spread across 77 countries beginning later this month. MasterPass is powering mobile wallets like Apple Pay and Android Pay, and MasterCard will be partnering with Microsoft for its mobile wallet solution on Widows 10 devices. All together, "Other Revenue," which also includes consulting, fraud prevention, and security services, grew by 25% for the quarter.

Despite a faster-than-expected start to the year, management still expects 2016 results to come in at the low end of their "low-double-digit" three-year revenue growth estimates. Also, as we've noted in the past few quarters, rebates and incentives are expected to increase by 20% this year, outpacing revenue growth and indicating a difficult bidding environment for both new deals and the retention of existing clients.

MasterCard remains a Buy First at a 4.3% allocation. The company is experiencing improved momentum across its business lines, and the stock should continue to perform well in the coming quarters. MasterCard remains one of our favorite investment ideas in the *Pro* portfolio. Following the strong second quarter, we're reviewing MasterCard's fair-value estimate for a possible update.

Visa (2.4% Allocation)

Visa's business continues to grow at a steady rate as the company works to integrate its large Visa Europe acquisition, which closed at the end of the quarter. Management is focused on rolling out a number of its value-added services (including Visa Checkout, Visa Token Service, and Visa Direct) to its European customers who are excited to have the added functionality. One of the analysts on the earnings call asked whether management planned to begin raising fee levels in Europe to match its competition in the region, but management tactfully avoided the question.

There's little doubt that the company will try to increase fees over time, but Visa needs to sell its new customers on the value of its ancillary services before increasing costs. Visa is also beginning to see U.S. transaction volume increase as the recently signed Costco and USAA deals ramp up. Incentives as a percentage of gross revenue increased to 19%, which shows that the company needed to offer attractive term to steal customers from the other card companies. That number is expected to grow further as the Costco program kicks in next quarter, but should settle at 18.5% for the year, at the high end of the guided range.

Visa's newly announced partnership with PayPal begins a new era of cooperation for these former competitors, and it also allows Visa access to the ACH payment world. The key benefit for Visa is that PayPal will no longer discourage users from linking their Visa cards to their PayPal accounts during the registration process. PayPal is also going to improve the quality of the data it provides to Visa to make it easier to identify fraud, track disputes, and apply loyalty rewards. In exchange, PayPal will receive incentive payments based on transaction volume; it will also have use of Visa's Digital Enablement Program (VDEP), which employs token encryption technology. This should improve the security of PayPal's mobile payment platform and increase the company's point-of-sale acceptance. PayPal's willingness to deal with Visa shows that consumers still value the ancillary services the card companies provide and demand to be able to use their Visa cards to fund payments.

There wasn't much discussion of this on the call, but as one of the corporate sponsors of the Rio Summer Olympics, Visa is about to start a large advertising campaign. Expect to see a lot of new Visa commercials and branding throughout the games, which should help to preserve the company's spot as one of the most valuable global brands.

Visa remains a Buy at a 2.4% allocation. The company is working through a number of complicated transitions with the Visa Europe acquisition and now the PayPal partnership. It may take a couple of quarters for the dust to clear, but members should feel comfortable buying shares at today's price if they don't already own the stock.

The *Pro* Bottom Line

It looks like both of our payment companies are performing well despite a number of economic and legal headwinds. Weak economies in Europe and Asia have weighed on transaction volumes, but the shift toward digital payments is continuing to gain momentum around the globe. Visa and MasterCard have been facing various lawsuits for years, and I don't expect that to change anytime soon. Over the past year, the companies have combined to generate nearly $15 billion in operating profits, which is more than sufficient to fund their legal defense. Additionally, the move to secure better access to ACH payment flows shows that management at both companies is not just resting on their laurels and cashing checks. They both continue to invest in technology and keep a close eye on where the industry is heading.

We are pleased with the progress that both companies are making in growing their business and the steps they're taking to defend their competitive position. The transition from cash to digital payments is still in its early innings across the globe, and we think Visa and MasterCard are well-positioned to capitalize on that trend.

If you have any questions or comments, please visit the Memo Musings board and/or the Visa and MasterCard boards to share your thoughts.

Foolish best,

--Jeremy (TMFTank)

Write Covered Calls on Valmont Industries

Published Jul 28, 2016 at 11:15AM

Is this for you? This recommendation is for all *Pro* members who own at least 100 shares of Valmont Industries and who wouldn't mind potentially capping upside on the shares in return for near-term income.

How You Participate

- **Trade:** Sell to open Sept. 16, 2016, $135 calls on **Valmont Industries** (NYSE: VMI).
- **Allocation:** Write ("sell to open") one call for every round lot of 100 shares of stock you own. *Pro* will cover all of its 400 shares; that represents 2% of the portfolio being covered for income. If you own fewer than 100 shares, just hold on to them for now. They remain a Buy.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a limit order to split the bid/ask price spread at the going price. Aim for about a 1.7% yield (that's option premium / current price of the stock) with a little more than 1.5 months to expiration. As expiration gets closer, always aim for our usual 1% per month in income to expiration. These options are relatively thinly traded, so **it is critical that you use a limit order**.
- **Prices** (10 a.m.): As prices change, just divide the going option premium -- splitting the bid/ask pricing -- into the current share price to target a yield of about 1.7%.
  - **Valmont Industries:** $131
  - **September $135 calls (bid/ask):** $2.00/$2.50 (as of 10:30am today)

    So, $2.25 is equal to about 1.7% in 50 days. This yield is sightly better than we achieved in our last round of covered calls on Valmont, assuming that current pricing holds up. We'll accept this income or close to it.

What We're Thinking

Following the recent post-Brexit run-up in the stock market and a couple of yawn-worthy earnings reports from our *Pro* companies, we're writing covered calls on **Valmont Industries** (NYSE: VMI) to generate income while we wait for results to improve. Many industrial and agriculture businesses have continued to struggle through what has become an extended cyclical downturn, and Valmont has not escaped the malaise. We don't anticipate any near-term catalysts to change the market's sentiment toward the company before the next earnings report, so we're writing covered calls on all 400 shares in the *Pro* portfolio, hoping to generate a 1.7% yield on the position in the next 50 days. If Valmont's stock price ends up higher than the $135 strike price at expiration, we'll plan to roll our calls to a higher strike. Should we ultimately lose our shares, we'll end up walking away just shy of breakeven on the position, including the dividends and the written call premiums we've collected.

Another Less-Bad Quarter for Valmont

Valmont's second-quarter earnings report was essentially a replay of the previous one. The company once again blew past earnings estimates, thanks mostly to management's cost-cutting initiatives, but sales continue to disappoint and management doesn't expect a near-term rebound in its key markets. Sales were flat in the engineered support structures division, thanks to weak U.S. wireless telecom spending and lower infrastructure investment by European governments. Improvements in the coatings division were mostly the result of the recent acquisition of American Galvanizing, and the irrigation business continues to be hurt by falling farm income. Despite the headwinds, management remains focused on improving operating efficiency, announcing an additional $4.7 million restructuring charge to consolidate the company's Australian manufacturing facilities. This move is expected to generate an additional $5 million in savings in 2017.

As a result of these initiatives, operating income margin for the quarter came in more than 3 percentage points higher than a year ago, and management expects year-end earnings per share to improve by 12% to 15% over last year (excluding the one-time Australian restructuring charges). This is good news, and a good reason to continue holding the stock, but the company is currently priced at just less than 20 times forward earnings -- which still is not categorically cheap. For that reason, we don't expect to see meaningful stock appreciation until sales growth rebounds and the company begins to realize significant operating leverage from its improved cost structure. In the meantime, Valmont has a strong balance sheet and continues to generate significant free cash flow, so we also think the downside is limited, barring another major leg down in the industrial and/or agriculture markets.

The *Pro* Bottom Line

Management's recent restructuring initiatives should serve Valmont well in the long run, as it will emerge as a more efficient organization when demand returns, but we don't expect any meaningful changes in the market's sentiment toward the stock between now and the end of the next quarter. As we mentioned in our last report, as long as Valmont's end markets remain stuck in the mud, we'll continue to write covered calls between earnings reports and generate income while we wait for the cycle to turn.

More That Matters

- **Maximum gain: T**he stock's upside is capped at our call's strike price, and the maximum gain on the covered call is the premium it pays us.
- **Maximum loss:** The full stock value, minus the call premium received.
- **Follow-up**: We hope to see these covered calls expire for income, and then decide our next course of action. If necessary, we may roll them higher. But if we lose our shares, we are comfortable with that prospect.

Options Can Help

- **Want to know more about this strategy?** Our Options U guides to writing covered calls and rolling covered calls can help.
- **Questions about this trade?** To ask particular questions about any of these, please visit the VMI board.

Seeing the Big Picture

Published Jul 25, 2016 at 3:26PM

Dear *Pro* member:

As of Friday, the *Pro* portfolio was up 5% year-to-date -- right near our North Star, and closer to the S&P 500's 6% year-to-date gain than the Nasdaq's mere 1.7%. Looking farther back, the portfolio gained 7.5% in 2015, while the S&P 500's total return was 1.4%. So, for the past 18 months, we've been able to grind out a return in a fairly tepid -- yet choppy -- environment.

I don't believe any Americans have seen an investing environment quite like today's before. We have ...

- extremely low interest rates and little cause to increase them
- a strong dollar because interest rates are even lower, and the picture weaker, overseas
- very slow (to no) GDP growth here and abroad

Yet we've never seen so many U.S. companies succeeding around the world, growing through geographic diversification as (in many cases) decades-old investments in fostering international expertise slowly reap growing dividends.

Demographics suggest that this low-interest rate environment may not lose hold anytime soon. Low interest rates are offered when businesses need to drive demand; they go up when demand is overheating. Temperatures are rising this summer, but why would demand anytime soon? An estimated 32% of the U.S. population is 50 years old and older, with nearly half of those being 65-plus. In other words, much of the population is closer to an age where they're likely to *downsize* their spending. The average American woman is having fewer than two children (not enough to replace herself and her mate), so immigration is the fuel for the modest population growth seen in the United States. (In fact, immigrants are expected to drive 88% of our population growth through 2065.)

Along with slow growth and an aging populace, it's inevitable that negative surprises will hit the economy, slowing GDP periodically. And it's hard to imagine rocket boosters that will suddenly increase economic growth. For example, cheaper energy is a net positive, but it drags down earnings for the energy sector, and thus the S&P 500. Pokemon Go may be the hottest new fad, but it's not going to push the economy higher (sorry!). And when interest rates tick up, if they do, not much of anything is likely to change.

Despite potential productivity improvements and innovation, today's demographic headwinds, the combative political landscape, troubles internationally, and the surprise problems that always pop up suggest that the emphatically rocky road we've seen since 2000 is likely to continue. And yet great companies continue to create record-breaking value, because the foundation of our economy -- entrepreneurial thinking and ownership -- remains strong. Average Americans' needs are being met better than at any point in history, people are living longer and healthier lives, and consumer choice is everywhere.

Our job as investors is to see the big picture *and* the small one. We need to recognize the most likely outcome for the big picture -- the economy and the world as a whole -- by seeing the trends in place today and trying to estimate what will change them or keep them going. And we need to see the smaller (but no less complete) picture whenever we analyze an individual company. What makes it special? Why are its earnings likely to grow? Why would investors give it a valuation that will grant us our desired return? How does it fit into the big picture of the world and the smaller picture of our portfolio?

These questions are part of what make investing an ongoing delight and challenge. And they help make me want to be a focused investor. If I owned 100 companies or more, I might do just as well, but by only owning about 30 (long and short), I can have strong opinions about each. Each one fits into a puzzle that should, ideally, help the portfolio perform as wished. It's my hope that by being focused, I'll have fewer losers. This is one way to invest. Another way is to buy many dozens of stocks and let time work its magic. Your winning value should exceed your losers, but you're likely to have plenty of fallen stocks, and you'll have less ability to react to situations with in-depth knowledge. Maybe you don't want to react, though; maybe that's your strategy.

Whatever your approach, our environment is likely to only reward exceptional companies and leave many others behind. We hope our *Pro* approach will continue to capitalize on this, because the coming years promise to be just as interesting -- and perhaps more challenging -- than recent years.

Skyworks Lights Up Some Hope

Earnings season always make us think big-picture, even as we're looking at a small snapshot of results. We'll see earnings from many *Pro* stocks this week, and the results we've seen so far have largely been satisfactory. **Skyworks Solutions** (NASDAQ: SWKS) is a case in point. Although the stock fell after its report last week, the company projected healthy guidance, with 10% to 11% sequential revenue growth expected in the current quarter, and another sequential bump in the quarter after.

At the same time, operating margins continue to trend upward, the company's products are in an increasing array of smartphone models, and its Internet of Things business is growing. Wall Street is leery of growing inventory, but management said it's "product in process" for new phones to come. The projected sales growth rate may also be less than some hoped for, given the new iPhone model expected this fall, but Skyworks typically guides conservatively. Assuming the new iPhone does even moderately well, Skyworks should be set up to keep growing nicely. And over time, ideally **Apple** (NASDAQ: AAPL) will become a smaller customer (on a relative basis) as the Internet of Things grows. For more on our initial summary of Skyworks, *Pro* members can look up the stock anywhere on the Fool.

For now, please visit the Memo Musings board if you have any questions or comments, and thank you for being a *Pro* Fool!

Pro Catch-Up Trades: July 25, 2016

Published Jul 25, 2016 at 3:25PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **FactSet Research** (NYSE: FDS): Buy 2.1% if you haven't yet.

Continue building your portfolio with our Buys, including these highlighted today:

- **Visa** (NYSE: V): Buy 2.4%.

Shorts:

- **Pier 1 Imports** (NYSE: PIR): Sell short 0.75% to start (see our recent trade alert).

Options:

- None today.

Hedges:

- No updates.

Options expiring next:

- **Expeditors International** (NASDAQ: EXPD): Our August $46/$49 covered strangle expires in 25 days. We'll have updated guidance closer to the expiration. Lately, shares are $49.90, and the options in our strangle have a combined $1.60 in value, so that's $0.70 in time value that we want to see dissipate before we roll the in-the-money option (currently the calls).

Business as Usual for Wells Fargo

Published Jul 19, 2016 at 12:13PM

Wells Fargo (NYSE: WFC)

Updated Guidance: Buy First (no change)

Recommended Allocation: 4.5%

Fair-Value estimate: $55 (**reduced from $58**)

Current Price: $48.42

What Happened?

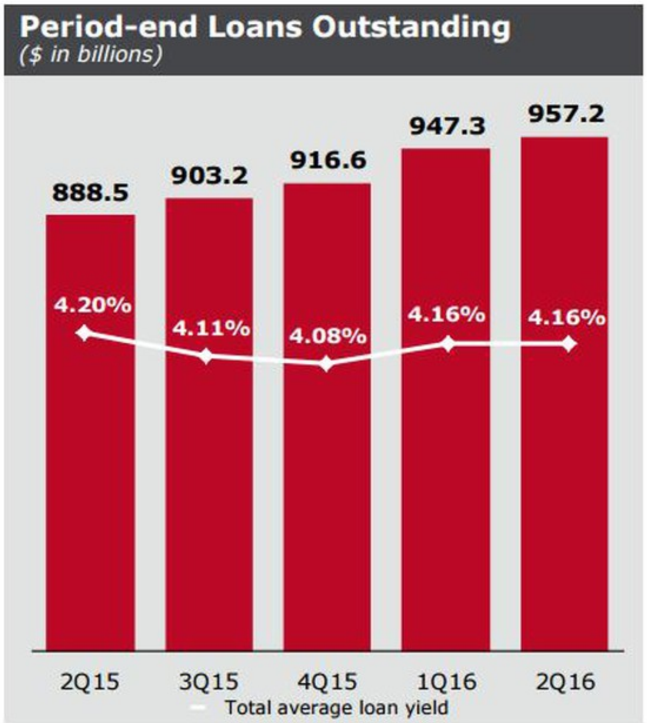
- Q2-2016 press release
- Q2-2016 financial supplement

So What?

The 3 key items that I watch for Wells Fargo:

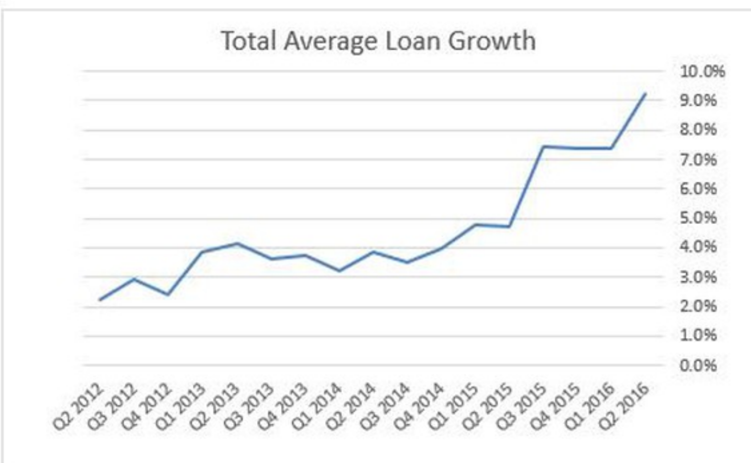
- Growth (or lack thereof) in loans and deposits
- Trends in credit quality (as monitored via net charge-offs and reserving policy)
- Trends in the efficiency ratio and expense reduction

1) Growth in loans and deposits



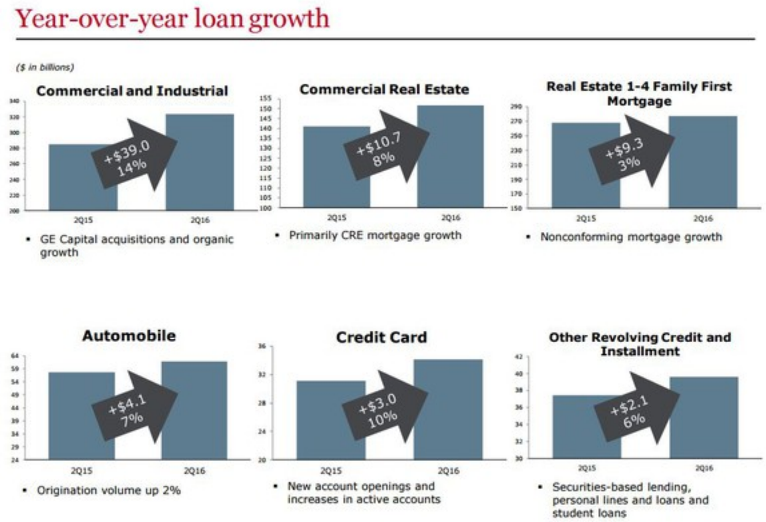
Source: WFC 2Q16 Quarterly Supplement

Total average loan growth for the quarter accelerated nicely compared to last quarter's +7.4% growth year-over-year, coming in at a strong +9.2%, though this figure was partially impacted by inorganic growth from recent GE Capital acquisitions:



Source: Company filings, analyst calculations.

There was particular strength in commercial & industrial loans, and credit card balances, and commercial real estate loans:

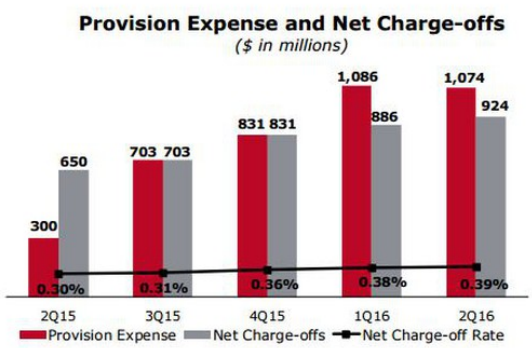


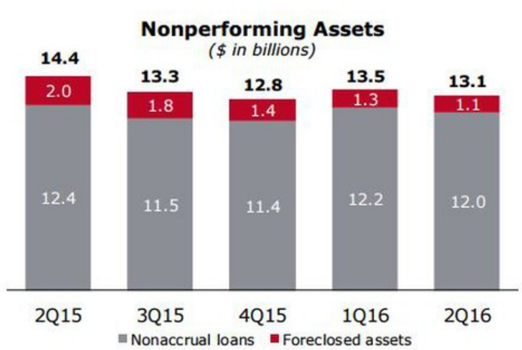
As for deposits, Wells continues to perform well. The company achieved 4.3% year-over-year growth in total average deposits, and 7.6% year-over-year growth in consumer and small business banking deposits. Consumer and small business banking deposits comprise about 59% of total deposits. Funding costs increased a bit to a still-low rate of 0.11%, up from 0.10% last quarter, driven by increased short-term interest rates and a corresponding increase in deposit pricing for certain wholesale banking customers.

The company's ability to grow deposits meaningfully at a very low cost is perhaps the company's biggest structural competitive advantage. Wells is able to do this by having a nationwide presence with significant geographic density in most markets, optimizing distribution via newer channels (mobile/technology), and strong customer relationship management and product cross-sell achieved via a consistent culture that has been a hallmark of the company for decades.

2) Trends in credit quality

Credit quality showed a fourth straight quarter of sequential decline, with net charge-offs as a percent of total average loans increasing slightly to 0.39% (from 0.38% last quarter, and 0.36% the quarter before). Lower is better. Despite the slight increase, this charge-off rate is still very low and below historical averages. High credit quality has been a consistent theme of the current credit cycle as banks have cut down on risk in response to the turmoil of the 2008-2009 financial crisis.





Source: WFC 2Q16 Quarterly Supplement

The reason for the continued declines in credit quality is the company's exposure to oil & gas loans. Credit quality in the oil & gas industry has decreased over the past year or so alongside the concurrent decline in the price of oil.

Wells charged off $263 million in its oil & gas loan portfolio in Q1 2016, up from $204 million last quarter and $118 million last quarter. Oil and gas nonaccrual loans (loans where the full and timely collection of interest or principal is uncertain) came in at $2.6 billion, up from $1.9 billion last quarter, working out to about 15% of the company's total outstanding energy loan portfolio.

The company has $1.6 billion of allowance for credit losses on oil & gas loans, which based on a $17.1 billion portfolio works out to a 9.3% reserve rate. The company's entire subset of outstanding oil & gas loans accounts for 1.8% of total loans outstanding. The company's declining credit quality in the oil & gas portfolio is not exactly welcome, but it is certainly not a dire threat to the company's business. Continued credit quality declines in the oil and gas portfolio are likely, but as the company continues to reduce its exposure to that industry and grow loans in other industries, the impact to the overall business becomes smaller and smaller.

3) Trends in the efficiency ratio

The efficiency ratio (a measure of the bank's overhead costs as a % of its revenue -- lower is better) came in at 58.1%, down from 58.7% last quarter and down from 58.5% a year ago. The efficiency ratio is at the high end of management's target range of 55-59% (blue shaded area in graph):

Source: Company filings.

Management has indicated that they expect the efficiency ratio in 2016 to come in at the high end of their target range, unless interest rates increase faster than expected. The company continues to invest in product development and compliance / risk management technology, including cyber-related spending.

Now What?

All in all, Wells Fargo continues to do what it does best -- steadily grow loans and deposits, and generate a lot of profit. The company's diverse operating model shields it from difficulties in any one particular segment, and this revenue and profit diversity (alongside the company's hallmark conservatism relative to peers) helps Wells Fargo produce consistent results even as the macroeconomic environment shifts and fluctuates.

From our long-term view, underlying business results remain strong, the core earnings power of the business remains intact and is poised for positive operating leverage if and when interest rates and lending spreads rise, and the company's capital return program continues to benefit shareholders. At $48.42 per share, the company yields 3.1% and trades at 1.37x a growing book value.

Guidance Update

Due to reduced return-on-equity targets shared at the company's 2016 Investor Day (management's ROE target range was reduced from 12-15% to 11-14%), **our Fair Value estimate is reduced to $55 per share** (representing a 1.55x P/B multiple), about 14% higher than the current price. Long-run ROE targets are a direct input into our WFC valuation model, and when ROE expectations decline, the fair value of the business declines as well. The fair value decrease is more a reflection of reduced expectations surrounding interest rates than it is a reflection of weakness in the business.

Wells Fargo remains a Buy First on our scorecard with a 4.5% allocation. Those who have yet to fill out their stock allocation in this long-term compounder should feel comfortable doing so at current price levels. At some point, we expect to run an income strategy (perhaps covered calls) on a portion of our allocation, but we are waiting for more advantageous prices before initiating an income strategy.

Fool on!

Billy

Pro's Third Annual Mid-Year Review

Published Jul 18, 2016 at 3:27PM

Dear *Pro* members,

It's time for our annual *Pro* portfolio mid-year review! In this installment of the series I started two years ago, we will discuss *Pro*'s performance halfway through the year. We will discuss market volatility, portfolio activity, and talk about major drivers of our performance. With the information from this review, we can determine how our results or approach have changed (if at all), and we can potentially use this new information to our benefit.

The Review

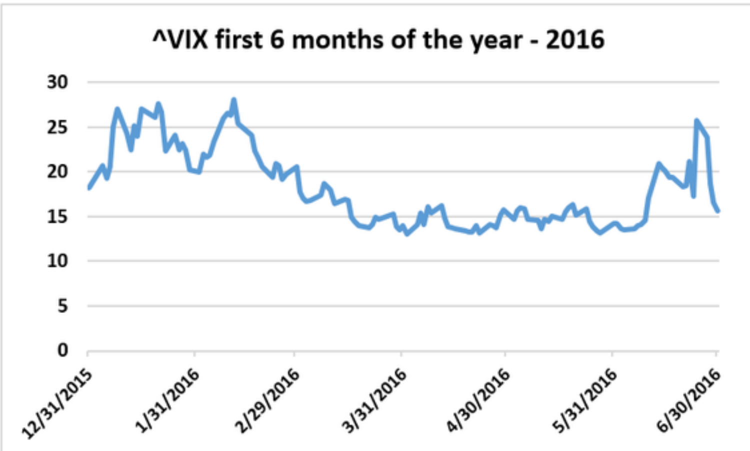
The *Pro* portfolio's performance has been below our goal over the first six months of 2016. Our year-to-date performance as of June 30, 2015, is about 1.4%, underperforming both the S&P 500 (up 3.8% during a very volatile six months, ranging between -11.4% and +3.7%) and our North Star (up about 5.1% in the same time frame). One thing to note is that the Nasdaq is lagging the S&P 500 considerably; it was actually in the red as of June 30, and has an influence on many of our positions. Adding returns since July 1, the portfolio is now up about 4% year-to-date, getting much closer to the North Star.

Our gross long exposure is about 83%, a bit less than our historical average of about 87%, indicating our slightly more cautious stance during this volatile market. Here's a comparison of the performances of *Pro*, the S&P 500, and our North Star over the first halves of 2013, 2014, and 2015:

Year	*Pro*	S&P 500	North Star*
2013	22.4%	12.6%	4.1%
2014	7.4%	7%	4.4%
2015	9.4%	1.2%	4.6%
2016	1.4%	3.8%	5.1%

Source: U.S. Bureau of Labor Statistics seasonally adjusted, indexed, monthly CPI-U data series.

Volatility (as measured by the ^VIX index) started the year at an elevated level, as fears of an economic slowdown in China led to a global sell-off in equities markets, including the worst 10-day start to a trading year in U.S. market history. From there, volatility declined as markets recovered, only to spike again after the UK voted to leave the European Union (i.e., "Brexit") in late June. Since then, markets have roared back strongly to new all-time highs, and volatility has declined to lower levels:



Source: S&P Capital IQ.

As far as our activity, the pace of our trades has been somewhat different when compared with the first halves of 2013, 2014, and 2015, mainly because of our increased emphasis on options for income:

	2013	2014	2015	2016
New Purchases	2	2	1	1
Allocation Increases	3	1	0	1
Options for Income	8	8	8	13
Options for Leverage	1	1	1	0
Shorting	1	0	2	2
Hedging	4	4	4	4
Sales (or short covering)	3	3	1	4

Note: 2016 activity includes trades made between June 30 and today.

Pro has been much more active in attempting to generate option income in 2016 so far; this has been an area of emphasis for us as we aim to buffer a volatile, seesaw market with consistent option income.

We have been similarly active in buying in 2016 compared with last year (though less active than in 2014 and 2013); we've established one new stock position (**FactSet Research Systems** (NYSE: FDS) -- up more than 10% since our buy recommendation) so far this year; and we have increased our allocation to just one of our core stocks (**Wells Fargo** (NYSE: WFC), thanks to the assignment of written puts.

We've been a bit more active in selling and/or closing positions this year compared with the past few, which -- alongside the muted buying activity and addition of two new shorts -- has led to the decrease in our gross long exposure as mentioned above. We closed leveraged options positions in **Coca-Cola** (NYSE: KO), **American Airlines** (NASDAQ: AAL), and **American Tower** (NYSE: AMT), and we covered our short on **World Acceptance** (NASDAQ: WRLD).

Our strongest-performing stocks so far this year have been **Valmont Industries** (NYSE: VMI) (31% return year-to-date), **OpenText** (NASDAQ: OTEX) (26%), **Broadridge** (NYSE: BR) (25%), **Papa John's** (NASDAQ: PZZA) (24%), and American Tower (22%).

Our worst (again, so far) have been **AmTrust** (NASDAQ: AFSI), down 16%; **TD Ameritrade** (NASDAQ: AMTD), down 15%; **Gilead Sciences** (NASDAQ: GILD), down 13%, **Skyworks** (NASDAQ: SWKS), down 12%, and Wells Fargo, down 11% -- as well as our American Airlines calls, which lost most of their value as the stock fell to a P/E of less than 4.

All in all, the first six months of 2016 have been volatile and perilous. We've used options for income to take advantage of a more volatile market, we've seen strong appreciation from a number of our core stocks, and we've added shorts and slowed down our purchase activity to take a slightly more defensive stance in this uneasy market environment.

Despite the weak performance of some of our larger positions (many of them financial stocks affected by a lack of interest-rate increases), the *Pro* portfolio as a whole is holding up well in a choppy market. Though we have trailed both the S&P 500 and our North Star over the first six months of the year, we think we're set up well to continue to achieve our goals over the long term, and we view the weakness in the Nasdaq and many of its stocks as future returns we're likely to enjoy. We are also glad for the many poor performers in the market we have avoided buying.

The *Pro* Bottom Line

Pro's low-turnover approach is patient, flexible, and focused on an absolute-return strategy. We try to keep our underlying philosophy in mind with every portfolio decision we make. Fittingly, the conclusion from the prior two mid-year review columns is still completely applicable today. Here it is, with edits in brackets only to change the reference to the year:

"While we aren't market prognosticators and we can't tell you what to expect from the market over the second half of [2016], we can tell you what our approach to portfolio management will be. We will continue to invest in core stock positions (i.e., compounding machines) when the balance of risk and reward looks favorable. We will continue to use options strategies either for income, to add to our positions at lower prices, or for leverage, depending on what opportunities present themselves. We will seek to short weak, disadvantaged companies that appear poised for a stock price decline, and we will manage our net long exposure via index hedges as market conditions dictate."

Fool on!

--Billy (TMFBillyTheKid)

Pro Guidance Changes

- **American Tower** (NYSE: AMT): Following sharp appreciation, shares move to Buy from Buy First. We have a 4% stock allocation.
- **Oracle** (NYSE: ORCL): Finally seeing some appreciation, shares move to Buy from Buy First. We have a 3.9% allocation.

Pro Completed Trades

- **American Tower:** We closed our long January 2017 $80, short July 2016 $111 diagonal call for about a $31 credit.

Pro Catch-Up Trades: July 18, 2016

Published Jul 18, 2016 at 3:20PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Gentex** (NASDAQ: GNTX): Buy 2.7% in stock if you lack it.
- **MasterCard** (NYSE: MA): Buy up to 4.2%.
- **Wells Fargo** (NYSE: WFC): Buy up to 4.4% in stock.

Continue building your portfolio with our Buys, including these highlighted today:

- **American Tower** (NYSE: AMT): Buy up to 4% in stock.
- **Oracle** (NYSE: ORCL): Buy up to 3.9% (see our earnings update).
- **Verisk** (NASDAQ: VRSK): Buy 2.4%.

Shorts:

- **Pier 1 Imports** (NYSE: PIR): Sell short 0.75% to start (see our recent trade alert).

Options:

- **American Tower**: Buy to close your July 22, 2016, $111 calls, and sell to close your January 2017 $80 calls, to end your diagonal call per our alert.

Hedges:

- Hedges? We don't need no stinkin' hedges! Just kidding. But no new "catch-ups" today.

Options expiring next:

- **Expeditors International** (NASDAQ: EXPD): Our August $46/$49 covered strangle expires in 32 days. We'll have updated guidance closer to the August expiration. Lately, shares are $49.95, and the options in our strangle have a combined $2.25 in value, so that's $1.30 in time value that we want to see dissipate before we roll.

Close Your Diagonal Calls on American Tower

Published Jul 14, 2016 at 2:00PM

Is this for you? This alert is for *Pro* members who, like us, own a diagonal call position on **American Tower** (NYSE: AMT). The diagonal call consists of both a long-dated owned call and a shorter-dated sold call. *Pro* owns the January 2017 $80 call and is short the July 22, 2016, $111 call. If your strike prices and expiration dates differ from ours, we still recommend that you close your position alongside us. **Please note: We are not touching our stock position, which remains a Buy First right now at a 4% allocation.**

How You Participate

- **Action:** Sell ("sell to close") your January 2017 $80 calls on American Tower (or whatever variant of these you have); simultaneously buy ("buy to close") your July 22, 2016, $111 calls (or other variant). *Please note that the short calls are **weekly** options.*
- **Allocation:** Sell all long calls you hold and buy back all short calls you have previously written. *Pro* will be selling its six long calls and buying back its six short calls.
- **Price Guidance:** Use a **limit order** to target a net credit of at least $31 per diagonal call spread (the difference between our $111 and $80 strike prices). With time value in our short calls at about $0.05, aim to close the position promptly to avoid being assigned. That said, you'll need to be very disciplined with your limit order, as our diagonal spread is worth at *at least* $31 so long as the stock price remains above our strike price. If you accept less than $31 to close your spread, you are

giving your counterparty free money. That's all to say: **Make sure you get this trade done promptly, but be cognizant of the value of what you're selling, and be disciplined with your limit orders.**
- **Prices** (as of 11:35 a.m. 7/14/16):
  - **Stock Price:** $116.60
  - **Sell to close January 2017 $80 calls (bid/ask split):** $36.65
  - **Buy to close July 22, 2016, $111 calls (bid/ask split):** $5.65
  - **Net credit:** $36.65-$5.65 = $31

What We're Thinking

Our long-running option position on American Tower, which began with a bought call in December 2014, has worked exactly as we might have hoped. In that initial alert, we mentioned that the goal of our call purchase was to benefit from leveraged upside. Having accomplished this, we now prefer to close the entire position. The alternative is to attempt to roll the calls out and/or up to target further returns, but this would expose us to leveraged losses if the stock price drops.

With the $31 or so per spread from closing our diagonal position, plus $1.39 from our first set of diagonal calls (at the $105 strike), plus $1.45 for the second set of diagonal calls (at the $108 strike), minus $1 for closing those calls, plus $1.16 for our most recent round of diagonal calls (the calls we are buying to close at the $111 strike), we will have received, or will be receiving as we close ...

$31 + $1.39 + $1.45 - $1.00 + $1.16 = $34

... over the life of the entire diagonal call position.

We established the bought calls in December 2014 for $23.35 per contract (with American Tower's stock price at about $96 per share). That means the total return on our diagonal call position is:

$34 / $23.35 = 46%

That's 46% in a little more than 18 months since initiating the position, compared with a 21% increase in the stock price (which we also captured with our unencumbered 4% stock position). That's the leveraged upside we're referring to.

This strategy has been a great example of how we can opportunistically use options to help enhance our returns. We've kept track of the position-level returns for American Tower since buying it in May 2013, and if we hadn't employed any options at all, our return on the stock alone (including dividends) would be 12.4% annualized. That's great on its own -- but including all the options we've done on American Tower (including written puts in late 2013 and early 2014, and then the call and diagonals), our position-level return increases to 14.5% annualized. Options have added 2 percentage points annually to this position's returns, an excellent result.

Now that American Tower is trading closer to our fair-value estimate than it ever has across the position's entire history, we are content to close our leveraged position, reducing our portfolio's risk profile slightly as we continue to capitalize on further upside with our simple 4% stock allocation. Again, we are keeping those shares.

This position has been a win-win on both sides, and we can chalk this strategy up as a success -- even with the stock now about 5% above our latest strike price. We aim to make good returns with smart risk, while knowing we can't be perfect. In the interest of risk management (and with expiration not that far away now, in January), we're happily closing our diagonal calls on American Tower.

Alternative Trades

- **Want to keep your diagonal call position going?** You can keep the position open if you really prefer, rolling out and/or up, and being careful to mind your allocation. If the stock continues to rise, rolling out and up over time will capture further upside in a leveraged manner. We're closing for the reasons explained in this report, but if you are comfortable with the risk of leveraged losses if the stock price drops, it's OK if you want to keep the strategy running on your own.
- **Other strikes and expirations?** As shared at the start, we would suggest simply closing those, too, as we're managing our total AMT exposure at this price.
- **Simply own the stock?** Do nothing. *Pro* will still own a 4% allocation in American Tower after closing our diagonal calls. We recommend that you match our allocation.

Pro Can Help

- **Questions about this trade?** Consume data and post your questions on our American Tower board.

Learning to Love Uncertainty

Published Jul 11, 2016 at 3:37PM

Fellow Fools,

Seemingly impossible events -- or, rather, low-probability happenings that have never happened before -- actually occur all the time. Sports provide some of the best instances of this phenomenon, because they feature a lot of historical statistical data as well as robust betting markets that collectively gauge the odds of future outcomes. For example, before the Cleveland Cavaliers recently claimed the NBA title, no team had come back from a 3-to-1 deficit to win the NBA championship -- and the feat occurred against a team with the best regular-season record in history, no less. A year ago, UK bookmakers placed 5,000-to-1 odds against Leicester City winning the English Premier League championship, only to watch the Foxes hoist the trophy this year for the first time in the club's 132 years.

Over the past few months, a lot of ink has been spilled about a few improbable geopolitical outcomes that have left experts scratching their heads and reexamining their prediction models. We'd be the first to tell you that no one can consistently guess the direction of the market (or politics), but like it or not, as investors, we're in the business of predicting. We are forced to become comfortable using incomplete information to make reasonable assessments regarding the likelihood of future outcomes, and a few of these events provide good examples of where we can go wrong.

Playing Favorites

A year ago, few people believed that Donald Trump had a realistic chance of becoming the Republican nominee for president. Even Nate Silver, the respected statistician who made his name by correctly predicting 99 of 100 states in the past two presidential elections, initially pegged Trump's chances of securing the nomination at about 2%. Since then, Silver has penned a *mea culpa* reflecting on how he got caught acting more like a pundit than an empirically minded analyst.

Similarly, when the stock market pundits were trying to divine the outcome of the Brexit vote, they overlooked the polls, instead relying on the bookmakers they believed had a better fix on the voters' sentiment thanks to the wisdom of crowds. Some of those bookmakers had odds of British citizens leaving the European Union as low as

10%; the 90% odds of a "Stay" vote were seductive to bettors and even seemed to lure the financial markets into a false sense of security.

My intention isn't to bash Silver, who is very good at what he does, or to dismiss the wisdom of the crowd. Rather, I think this gives us a few good examples of how groupthink can influence predictions, and how most humans are really bad at interpreting probabilities. On the whole, people tend to underestimate the odds of unlikely events -- unless they are particularly scary, like a plane crash or shark attack, in which case they severely overestimate the odds. Further, when we hear that something has a high probability of occurring, let's say an 80% to 99% chance, our brains often take a shortcut and label it a "sure thing." As a result, we don't spend enough time considering the possible ramifications of a highly unlikely, but still possible, negative outcome.

The longer you've been investing, the more likely it is that you've experienced the frustration that occurs when an improbable event rips a small hole in your portfolio. It's a humbling experience, and one that usually recalibrates your risk gauge to expect more randomness. It's important to remember that as investors, we are compensated for taking on risk and embracing uncertainty -- there's simply no way around it. If there were, investors would bid up the price of equity assets, accepting lower future returns and significantly reducing our ability to earn the North Star-matching returns we target at *Pro*.

The *Pro* Bottom Line

Though we have a number of high-conviction investments in the *Pro* portfolio with heavy combined weightings, like **Facebook** (NASDAQ: FB) and the credit card companies **MasterCard** (NYSE: MA) and **Visa** (NYSE: V), we are careful not to over-commit to any one idea. The fallout from the **Valeant Pharmaceuticals** (NYSE: VRX) saga has shown the pain that an overweighted, high-conviction pick can inflict on a portfolio. In that case, even investors with board seats and easy access to management learned too late they were also working with incomplete information. We know that we rarely have an information advantage, so we maintain a diversified portfolio to reduce idiosyncratic risk (that's the business risks associated with each company), and we use hedges and shorts strategically to limit market risk and hopefully reduce volatility over time. We also hedge against our own uncertainty -- it's our acknowledgement that there are simply things that we cannot know. It's critical that we don't allow any position to become so big that it would cause irreparable harm should it suddenly go to zero.

The *Pro* team is currently preparing for the next round of earnings, which will really start to pick up in the next two weeks. As much as we'd love to see every company perform exactly as planned, we fully expect a few surprises (positive and negative) along the way. In the meantime, please visit the Memo Musings board if you have any questions or comments.

Foolish best,

--Jeremy (TMFTank)

Pro Catch-Up Trades: July 11, 2016

Published Jul 11, 2016 at 3:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **American Tower** (NYSE: AMT): Buy up to 4% in stock.
- **Gentex** (NASDAQ: GNTX): Buy 2.6% in stock if you lack it.
- **MasterCard** (NYSE: MA): Buy up to 4.2%.
- **Oracle** (NYSE: ORCL): Buy up to 3.8% (see our earnings update).

Continue building your portfolio with our Buys, including this highlighted today:

- **Verisk** (NASDAQ: VRSK): Buy 2.4%.

Shorts:

- **Pier 1 Imports** (NYSE: PIR): Sell short 0.75% to start (see our recent trade alert).

Options:

- Not today.

Hedges:

- Not today.

Options expiring next:

- **Expeditors International** (NASDAQ: EXPD): Our August $46/$49 covered strangle expires in 39 days. We'll have updated guidance closer to the August expiration. Lately, shares are $49.95, and the options in our strangle have a combined $2.30 in value, so that's $1.35 in time value that we want to see dissipate before we roll.

Good Investing Hurts

Published Jul 11, 2016 at 1:16PM

Pro *Fools, we thought you might enjoy this Morgan Housel article from 2014, recently re-run in our* Motley Fool One *service.*

In his book on the Bin Laden raid, Navy SEAL Mark Owen writes that "one of the key lessons learned early on in a SEAL's career was the ability to be comfortable being uncomfortable."

Being cold, wet, hungry, and tired is a normal part of the process, Owen writes. Rather than trying to avoid it, they learn to deal with it.

That's probably a good lesson for most things in life, including investing.

Want to be a great investor over the long run? Get used to being uncomfortable.

Research Affiliates, one of the smartest market research firms around, just did a big study on 45 years of mutual fund returns.

The results were depressing. Of 350 mutual funds available to investors in 1970, only 100 survived through 2014. The other 250 closed, or were merged with other funds. Of the 100 that survived, 45 beat the market over the whole period; 42 of them beat it by less than two percentage points per year.

But that's old news. What's remarkable was a characteristic of the three "superstar" funds that beat the market by more than 2 percentage points a year for 45 years. They spent, on average, a third of the time underperforming the market on a rolling three-year basis:

	Excess return over S&P 500, 1970-2014	Percentage of quarters spent underperforming the market on a rolling 3-year basis	Longest consecutive number of quarters underperforming the market on a rolling 3-year basis
Franklin Temleton Mutual Share	3%	35%	18
Fidelity Magellan	2.9%	43%	23
Fidelity Contrafund	2.3%	31%	21

Source: Research Affiliates

You can imagine the ridicule these managers went through when, for years on end, they lagged the market. Clients surely pulled money out of their funds. Journalists stopped calling them. Their personal pay likely plunged. It was uncomfortable.

But they still beat 99% of their peers over the long run.

This is a good display of four of important rules.

History Doesn't Crawl; It Leaps

There are four types of investment returns:

- Consistently bad.
- Mostly bad and occasionally good.
- Mostly decent and occasionally good.
- Consistently good and fraudulent.

That's the complete list.

Look at the long-term history of great investors, and you'll find they occupy the third category. A disproportionate share of their overall gains come from a small number of investments. At last year's **Berkshire Hathaway** (NYSE:BRK-B) shareholders meeting, Warren Buffett noted that of the 400 to 500 stocks he's invested in during his life, he's made most of his money on 10 of them. Same with Ben Graham, whose entire career success as an investor is tied to one stock: GEICO. Incredible opportunities (or luck) don't happen frequently enough to show up in annual returns. It's often middling performance for years, and then ... wham. One event knocks it out of the park.

There's Nothing Special About a Year

Yale economist Robert Shiller once noted the absurdity of racing to meet one-year goals. "I don't know why people keep using one-year earnings," he said. "That is the time it takes the Earth to go around the sun. I don't see any other significance."

Say a manager underperforms the market for 12 months, but by month 19, they're beating it. Who cares? Why is 12 months the official limit on measuring success? What gets dangerous is when a manager feels he needs to perform on a 12-month -- or quarterly -- basis, and starts doing all kinds of insane trading maneuvers to window-dress year-end returns.

You Have to Act Differently if You Want Different Returns

This seems obvious, but there's safety in numbers, and for most managers, there is more job security being consistently mediocre than being occasionally bad and occasionally great. Too many fund managers effectively run a high-fee index fund and aren't really trying to outperform. As with SEALs, doing well over time means being comfortable being uncomfortable, straying from the crowd, and often lagging your benchmark.

Picking the Right Manager Is Insanely Hard

Out of 350 funds, three did well over the 45-year period. Three. 0.85%. And how many investors were brave enough to stick with them for a long period of time? Few, I bet. Sometimes a manager's poor performance is really a sign he's incompetent. Other times, a smart manager is just going through a bad stretch. How do you know which is which? If there was an easy way to answer that, we'd all be rich.

Pro Video Chat, July 2016

Published Jul 7, 2016 at 11:10AM

The *Pro* team held a video chat on this page at 3 p.m. Eastern on Monday, July 18, to answer your questions! Below are written answers to the questions we received via email ahead of time, and a transcript is pending.

Q: PRO has had a tough 18 months it looks like PRO has under performed both the S&P 500 and our North Star targets. Fortunately, I do measure success with a longer time frame(3-5 years) however it can be hard to make up for losses or lack of performance as we lose compounding power - if you know what I mean. I would rather have steady 7-8% yearly returns then 1% followed by 15%, right. How do does PRO avoid making mistakes or taking on more risk to make up for these lack luster returns. What do we need to do differently or are you happy with the current strategy?

A: Hi JPro: Pro has done well the past 18 months. From 12/31/14 to 6/30/16, the portfolio is up 9.1% vs. the S&P 500 total return at only 5.2%. The North Star was up 13.3% over that time, but add in our strong July so far, and we're closing in on the North Star, too -- which remember is our ultimate goal, but not a benchmark. We hope to be able to get close to the North Star over the years. If we do, it should be phenomenal compared to most anything else out there. Mainly we use the North Star to help guide our decisions and remind us of our absolute return goals. Anyway, our returns are tracking right along what you could hope for, if you want steady returns like that. -JF

Q: So svxy and shorting vxx are really not the same trade. Shorting vxx is a long term short, if you don't close your position any paper losses can be recovered with patience and time. Svxy is only shorting the next month or two, and then is rolling its short so svxy is not performing as i expected. In times of mild volatility it performed well, however in times of very high volatility it seems like svxy locks in some losses? Look at the volatility spike in august of last year. Vxx increased in price as expected but svxy dropped in price a lot more than i would expect. I am curious to see if pro is looking a svxy performance. Should we go back to shorting vxx. The way to start the short is to sell a naked call on the vxx. pro got burned by this in the past but the real lesson was not the short but Pro i think over allocated capital to the short and also thier broker at the time hurt them.Those who could hold on to it eventually did fine. Just because the horse bucks you off does not mean you give up on it, we learned a lesson and maybe its time to get back on?

A: There are multiple issues involved in shorting VXX in a service like ours, including: Not everyone will be able to short it, or will be able to stay short when VXX spikes. People are too often called out of VXX on very large spikes (someone always is, it seems) -- and if that happens to even one member, then we've failed that member. A synthetic short may work better for all of us, and that's being considered as a complement to our tiny SVXY position. We of course are keeping a close eye on SVXY. I posted recently that I believe it will still perform in the long run, and it offers benefits that include we can't get called out of it, and it can indeed compound over the years (unlike a short). I think utlimately it will again (again -- as it had its earliest years). It has just been a choppy 18 months or so. -JF

Q: Jeff has mentioned several times now how VXX seems to be performing better than SVXY as a volatility trade. VXX shorting via options seems to have less risk than direct shorts. What type of trade would PRO consider if they used options to short VXX? Regards, Bob

A: Hi Bob! Indeed, a synthetic short is being considered on VXX, especially the next time the VIX futures spike. It may be time to finally start a SMALL position again, since SVXY -- though I still believe in it -- may take a longer time to start to generate returns. VXX, meanwhile, has continued to work for those short it. -JF

Q: "That's a good impression" she said. "OK, can you do an impression of Mickey Mouse?" I asked. "No, I only do Dental Impressions and this upper mouth night-guard costs $650. Last week's emergency dental crown cost $900. Don't forget your regularly scheduled office cleaning is next Wed." the dental assistant said. I've heard from others that their crowns cost $1000 to $1300. Implants are more $. The machine that makes the crowns is akin to a reverse 3D printer. The machine takes a tiny block of porcelain and follows the computer generated pattern to produce the crown, using 2 diamond drill bit needles and 2 water jets. Took 15 mins. to make a perfectly fitted and color-correct crown. Assistant also stated that ALL Filings and Crowns wear out. What we BBBs (Beautiful Baby Boomers) have in common is expensive dental work. I'd like PRO to consider adding a dental stock. Can anyone there do some research into this please? I really would love to put a stock where my money is... Duwango

A: Thank you, Duwango! And thank you for the great postcard we just received! Very Foolish! I don't know this company, but we do know a bit about medical devices thanks to our MDT investment. We are also looking for other healthcare investments as GILD is a bit disappointing so far. We will consider many different aspects of health care, including dental now. Thank you! -Jeff

Q: How do I trade the recommended options when my account may have only 7, 8, or 10 shares of this stock? Jeff

A: Hi Jeff: In those cases, you can't write covered calls on the stock. You need 100 shares. But with more limited funds, you can buy options when we choose to, and leverage your capital. But writing options only works when 100 share exposure is a fair allocation for you. Best, Jeff

Q: The VIX is very low right now, and you have to believe that in time it will jump considerably higher. Isn't there a sumwhat conservative way to use this to generate cash?

A: Hi King2fish: The VIX has bounced around a lot this year, as Billy's Memo wrote about today. We have used options on the VIX before (you can't trade the VIX itself), but they're expensive and don't move as much as the index itself. It's tough to make money with them, to say the least. -Jeff

Q: I was writing weekly puts on ORCL about this time last year, partly for income and also to fill out my position. Then ORCL missed earnings and I was assigned on more puts than I had planned for. I continue to hold the excess shares but I am thinking about trimming my holdings now that ORCL is near a 52 week high. However ORCL has been a MF Pro buy first stock like forever. Should I trim now or wait for a while since ORCL just had a good earning report and I am potentially leaving profits on the table? I currently have 2000 shares and should sell about 800.

A: Hi there: If you are that over-allocated, trimming is typically a good idea at anytime. You don't want to own too many shares of any single stock such that the position makes you uncomfortable when it falls -- becuase then your discomfort will cause you to sell at the worst time. So, trimming -- or starting to trim now at least -- proably makes sense, since you have 2,000 shares and should only have about 800 to have a 4% allocation. Sounds like your allocation is around 10%. We believe in ORCL, and its price, but you'll probably want to trim that down for your own comfort level. -Jeff

Q: I think I know your answer to my question, but I am going to ask any way. I am a charter member, so I purchased initial partial positions in some stocks at a muck lower cost basis than I paid when I filled out the position. So when I calculate my position size, should I factor in the lower cost basis or just calculate on the current share price? For example, using BR at a 5.4% position size and assuming a portfolio size of 1 million, I should invest $54,000 to own about 800 shares using current pricing of about $67. I initially purchased 300 shares at $21.27 for $6381 in mid 2010 and filled out my position (correct total dollars invested) buying 700 additional shares at $52 for $36,405 in March 2015. I have $42,786 invested in BR and am overweight by 200 shares by today's pricing. AFSI is another example. With a price of $24.50 and 4.9% position size I should own about 2000 shares. My cost basis is $9.55 on my initial 1400 shares. I currently own 2800 shares and have slightly more invested than the $49,000. I guess I am asking if I should be looking at dollars invested on these older positions or number of shares I should own with current pricing? I am at or slightly over all positions, including shorts and hedges, except only half of ORLY, no short on PIR until after the dividend payment and for personal reasons I have chosen not to own PZZA. I also participate in many of the MF Options recommendations. Thanks for all you do. It's been an amazing education for me.

A: Hi again! The only value that matters today is the current value of the position, not what you invested in it. So, all of our allocations are based on the current value of the positoin -- **the money that is in that position today. I hope this helps! -Jeff**

Q: I have participated in this trade (AMT) and have a short call that is expiring next week. The current price is 116 and the short call strike is 111. Will you be recommending a buy to close or a roll up and out trade? When should we expect notification?

A: Hi Bruce: We did recommend closing the whole diagonal call on AMT. We've made our returns and we're happy to close at this price on AMT. So, close your diagonal call (both legs) if you're following us. Best, Jeff

Q: I wrote 2 covered call contracts on EXPD which was listed as an alternate trade for IRA purposes, instead of the strangle, if memory serves. The stock is trading at ~$50.50 at the time of this writing and the $49 strike is for the August 19 expiration. The stock is up 4.6% since I wrote the buy write order and I have a $1.32 in option premium. Would you recommend rolling up and out or simply let the shares be called next month and reestablish the trade? Thoughts? And thanks for your comments.

A: Hi again Bruce: We'll issue a recommendation when the $49 calls have very little time value remaining -- so probably in early August unless the stock falls back some (or sooner if the stock goes higher). We are watching it and plan to roll our options. You can follow along then, when we issue that trade. It'll be in your inbox! Best, Jeff

Q: I the recent Monday Memo of May 31 on "Targeting Annualized Returns", APPL and GILD were left unestimated. Is there any consideration to moving the capital currently allocated to these 2 investments to something where there is a higher conviction? Thanks for the great service, still new to the program but love the the multi faceted approach.

A: Thank you, Dan! We have plenty of capital to invest still, right now, so we're not planning on selling AAPL or GILD right now. We look forward to the next earnings reports. Both are listed as Buys, meanwhile. Both are really outstanding companies -- among the best, or the best, in their industries -- so we're glad to own them. Both are also very inexpensive. Our lack of an estimate on how much they may appreciate is more a reflection of not knowing where the market will want to value them over the long term. Will value multiples below 10 remain the case!? Maybe. Then appreciation will likely be around 6-7% a year, and unless we can get those returns higher with options, we may need to move that capital eventually. But will the market value them above 10x earnings again? Then the returns should be well above 10% annualized. So, that's where our uncertainty exists, but not in the quality of the businesses. Best, Jeff

Short Pier 1 Imports

Published Jul 6, 2016 at 3:17PM

Is this for you? This trade is for Fools with a margin account who can locate shares with their broker. Before this alert was sent, TD Ameritrade, Interactive Brokers, Fidelity, and OptionsHouse had shares available to short. Check with your broker to locate shares and inquire about any fees involved. Also, this trade is only for Fools who don't mind volatility — the stock will likely bounce around depending on quarterly results, so be prepared for a potentially bumpy ride.

How You Participate

- **Trade:** Sell short **Pier 1 Imports** (NYSE: PIR)
- **Allocation:** 0.75%
- **Price guidance:** Because Pier 1 is not highly liquid, **it is critical to use a limit order.** Initially, **use a limit order** to short around recent prices, about $5.30 or higher. As time goes on and prices change, newcomers may need to short below that.
- **Recent price (2:48 p.m. 7/6/16):** $5.34
- **Availability at Interactive Brokers (7/5):** 2.7 million shares
- **Current annualized shorting fee (7/5):** 0.65%, plus the dividend below
- **Current dividend yield (7/5):** 5.2%; we also need to pay this dividend while shorting shares
- **Ex-dividend date:** July 18th
- **Short interest (percentage of shares outstanding as of 7/5):** 16.3% (per S&P Capital IQ)

What We're Thinking

Founded in 1962, Pier 1 Imports is a home-goods retailer specializing in decorative accessories, furniture, candles, housewares, gifts, and seasonal products. As of May 28, 2016, the company operated 1,027 stores in the U.S. and Canada.

The bull case for Pier 1 goes like this: The stock has been beaten down lately, and it's now trading at relatively cheap multiples -- 4.8 times EV/EBITDA, 4.4 times free cash flow, a P/E ratio of 17, and a price-to-book of 1.6. The company has a fast-growing e-commerce presence, and management is closing stores and taking steps to increase profitability. Inventory and working capital management are improving, and as a consequence, gross margins may expand in the near term after their prior weakness.

The bear case for Pier 1 goes like this: The company's long-term viability is questionable. Its industry is in the midst of disruption, and Pier 1 cannot easily compete on price with online retailers that don't have large store bases and utilize just-in-time inventory management. Margins are likely to continue to erode, and the fast-growing (until now) e-commerce business is experiencing a sharp slowdown that's likely to persist, harming comparable-store sales metrics and bringing attention to falling margins. Management is also plowing organic cash flow -- and debt -- into fruitless share repurchases, which demonstrates poor decision-making around capital allocation and detracts from shareholder value.

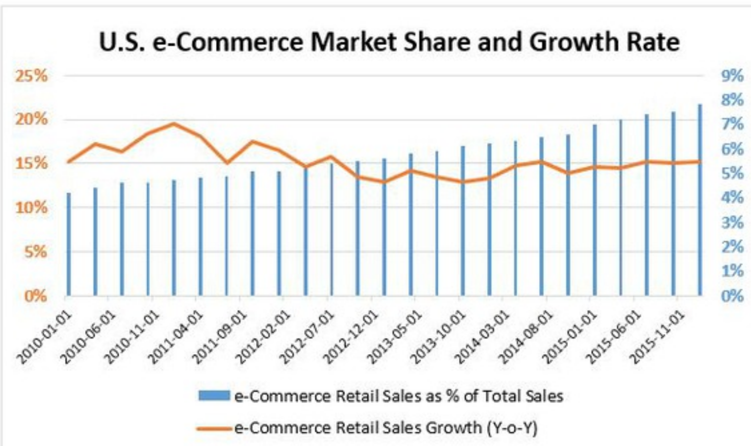
Given slowing growth and deteriorating margins, we think Pier 1's current price of $5.34 per share is higher the true intrinsic value of the business. We believe there is potential for outright downside from these price levels as Pier 1's e-commerce sales slow, total margins continue to deteriorate, and same-store sales decline. If these trends continue, the company will not be able to earn its cost of capital, leaving its worth equivalent to the book value of its assets -- if we're being generous. Book value per share (which has been declining) is currently $3.31, suggesting nearly 40% downside from current price levels.

Red Flags

- We don't believe the company has a sustainable competitive advantage. The success of Pier 1's retail business depends on consumer retail traffic and management's ability to identify trends and provide merchandise that satisfies consumer demands. Pier 1 doesn't have unique characteristics (that we see) to draw customers to stores to a greater degree than competitors. Additionally, overall U.S. physical retail traffic is in decline as e-commerce continues to grab a growing share of U.S. retail spending:

Month	U.S. Retail Traffic % Change (Y-o-Y)
May-16	-9.9%
Apr-16	-6.5%
Mar-16	-9.7%
Feb-16	-6.6%
Jan-16	-4.3%
Dec-15	-5.8%
Nov-15	-7.6%
Oct-15	-10.7%

Source: RetailNext

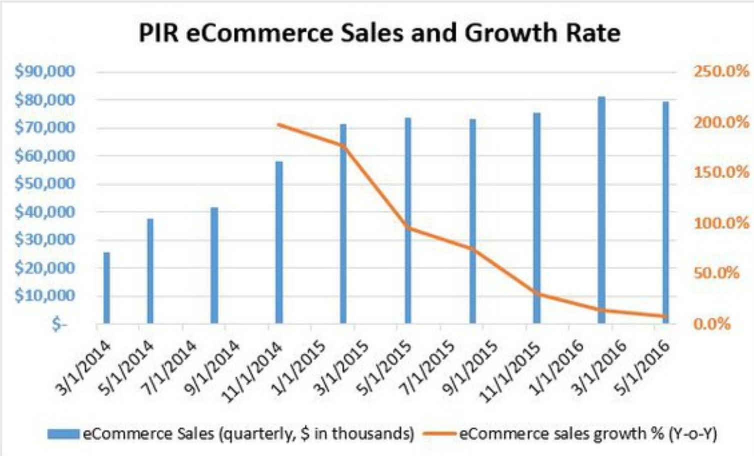


Source: FRED economic database

- We can see the effect of declining retail traffic and increased competition in Pier 1's financials, as same-store sales have been in a general decline over the last several years:

- Even in decline, same-store sales are artificially inflated because of the e-commerce business, which was launched in July 2013. The company includes orders placed online in its comparable-store sales calculations, which makes the metric look stronger than it really is, especially as the e-commerce business showed rapid growth during its first few years.

- However, after that initial burst, sales growth from the digital channel has sharply decelerated, and the trend looks likely to continue as organic growth starts to take the place of inorganic, start-up growth:



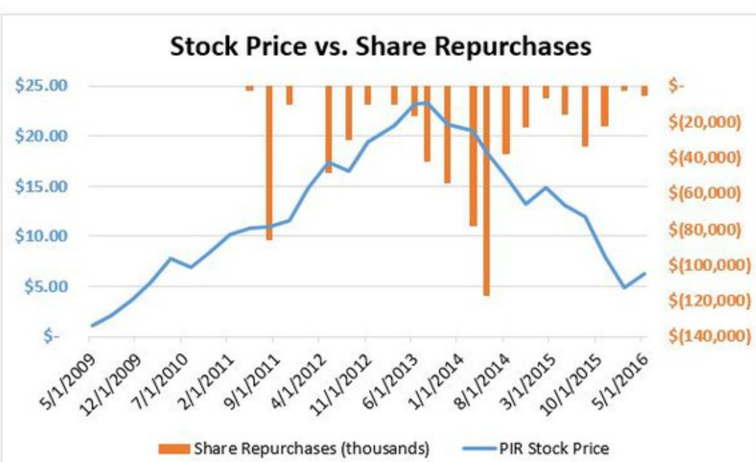
- Because of the confluence of declining traffic, increased promotional activity to drive sales, and increased competition from newer businesses with leaner cost structures, Pier 1's margins have been under significant pressure in the past few years. The company's trailing-12-month (TTM) gross, operating, and net margins have declined essentially every quarter since the beginning of fiscal 2014:

Quarter	TTM Gross Margin %	TTM Operating Margin %	TTM Net Margin %
Q1-2014	43.7%	11.8%	7.6%
Q2-2014	↓ 43.6%	↓ 11.4%	↓ 7.0%
Q3-2014	↓ 43.5%	→ 11.4%	→ 7.0%
Q4-2014	↓ 42.1%	↓ 9.9%	↓ 6.1%
Q1-2015	↓ 41.5%	↓ 9.4%	↓ 5.7%
Q2-2015	↓ 41.1%	↓ 8.6%	↓ 5.1%
Q3-2015	↓ 40.8%	↓ 7.8%	↓ 4.6%
Q4-2015	↓ 40.4%	↓ 6.8%	↓ 4.0%
Q1-2016	↓ 39.9%	↓ 6.1%	↓ 3.6%
Q2-2016	↓ 39.0%	↓ 5.6%	↓ 3.2%
Q3-2016	↓ 37.9%	↓ 5.0%	↓ 2.9%
Q4-2016	↓ 36.7%	↓ 4.0%	↓ 2.1%
Q1-2017	↓ 36.2%	↓ 2.9%	↓ 1.4%

- In fact, because of "internal and external pressures, including competitive pricing" and "the headwind of a challenging store traffic environment," Pier 1 reported a quarterly operating loss (-$7.8 million) in its most recent results on June 29. This was the first such loss since the summer of 2009, when the company was emerging from the U.S. housing crisis.

- We think Pier 1's e-commerce sales are likely to continue to slow, and category competition will continue to be fierce, pressuring the company's margins and bringing attention to the slow decline of its retail storefront operations. This decline has until now been partially obscured by the rapid growth of the nascent e-commerce business.

- Additionally, we are not fans of management's capital-allocation policies. Since fiscal 2014, Pier 1 has spent more than $450 million on share repurchases at much higher stock prices than today's. Management even took on about $200 million in debt in fiscal 2015 with the intent of ramping up share repurchases, yet as of Feb. 27, the company's average repurchase price since fiscal 2014 has been $16.39 per share -- 212% higher than today's price of $5.26. Based on the current stock price, these share repurchases have had the effect of incinerating more than $300 million in shareholder capital, quite notable for a company with a total enterprise value of about $500 million. If operations don't turn around, continued share repurchases will further erode shareholder value:



How It Fits Into *Pro*

Given Pier 1's weak competitive positioning, deteriorating financials, and questionable capital-allocation policies, we feel comfortable with a 0.75% short position. The intent is to start small with our allocation, retaining the flexibility to add to our short position over time. If the company's numbers exhibit further decline, we may look to increase our allocation to the short. On the other hand, if management manages to reignite growth and steady its margins, we'll re-examine our thesis.

This small position is an addition to our direct short basket, and it modestly lowers *Pro*'s net long exposure to the market. This short should fare well for us in a falling market, at which time U.S. consumer spending and retail sales will likely decline and the company's debt load should become a burden.

Be aware that we will need to pay the company's current 5.2% dividend yield as it is paid out on a quarterly basis. Despite that hurdle, we still believe that shorting this company offers us the ability to reduce our market exposure and potentially achieve an attractive position-level return going forward.

Alternative Trades

- **Prefer not to short or otherwise aren't able to locate shares?** If you're in a margin account, you can consider setting up a long-term synthetic short position, simultaneously buying January 2018 $5 puts and selling an equal number of January 2018 $5 calls. This strategy can currently be set up for almost no cost (at a start price of $5 per share). This differs from shorting in that you are not required to pay the dividend (although said dividend is factored into the start price), and you don't receive cash up front like you would if you were shorting outright. The value of the synthetic short will increase in a 1:1 ratio as the stock price declines and decrease in a 1:1 ratio as the stock price increases. Set up one synthetic short for every 100 shares (or $500 worth) you wish to short, up to a 0.75% allocation.

- **Investing in an IRA?** Consider setting up a shorter-term bear put spread, simultaneously buying January 2017 $6 puts and selling an equal number of January 2017 $4 puts. This trade can currently be set up for about $1 per spread (at a start price of $5 per share). This trade profits if the stock declines to less than $5, and its profit is capped once the stock price reaches $4, at which point the spread will be worth $2 -- a potential 100% return on your $1 cost to set it up. If Pier 1 stock ends at more than $6 by expiration, your spread will expire worthless, so be very mindful of position sizing. Only invest as much capital as you are willing to lose, and be aware of how the risk/reward payoff differs from that of shorting.

- **For advanced options investors:** If you're in a margin account, and you prefer to use options to target a cash inflow at the outset of your strategy, you can also consider selling short-term or long-term naked calls at various strike prices, whichever you like best. (Be wary of important dates like earnings reports.) If Pier 1's stock price ends up below the strike price of your calls at expiration, you keep the entire premium as income. On the flip side, naked calls (like shorting) have theoretically unlimited losses. If the stock price rises well above your strike price by expiration, you'll be obligated to buy shares at the market price in order to sell them at your strike price; the difference is your loss on the trade, minus the premiums received for selling the call in the first place. Selling naked calls is the bearish equivalent of writing puts: The most you can earn is the premium received, and you don't have upside below your strike price, but you receive a cash inflow up front that you are ideally less and less obligated to pay back over time, rather than paying up front to achieve future gains.

Pro Can Help

Pro Catch-Up Trades: July 5, 2016

Published Jul 5, 2016 at 3:02PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **FactSet Research Systems** (NYSE: FDS): Buy 2% in this new position.
- **Gentex** (NASDAQ: GNTX): Buy 2.6% in stock if you lack it.
- **MasterCard** (NYSE: MA): Buy up to 4.2%.
- **Oracle** (NYSE: ORCL): Buy up to 3.8% (see our earnings update).

Continue building your portfolio with our Buys, including these highlighted today:

- **Gilead Sciences** (NASDAQ: GILD): Buy up to 3%.
- **Verisk** (NASDAQ: VRSK): Buy 2.4%.

Shorts:

- None currently.

Options:

- **Celgene** (NASDAQ: CELG): Sell to open October 2016 $95 puts, for a potential 3% stock allocation, lately getting paid $4.50 or more with the stock just above $100. Sell one put for every 100 shares you could buy at $95 (or a net $90.50).
- **Gentex** (NASDAQ: GNTX): Sell to open September 2016 $15 puts for a potential 1.5% additional allocation to the stock; lately, shares are $14.95, putting the puts in-the-money, but we still like this option, which nets a buy price of about $14.30.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY): You can set up our latest Sept. 16, 2016, $200/$189 put ratio spread for a small debit of about $0.06 lately; right now, it may be better to wait for a market drop to set this up for a credit.

Options expiring next:

- **Expeditors International** (NASDAQ: EXPD): August $46/$49 covered strangle. We'll have updated guidance close to the August expiration. Lately, shares are near $49, which would have both options expiring as nearly 100% income.

Choppy Challenges Won't Stop Us

Published Jul 5, 2016 at 3:02PM

Dear *Pro* member:

We have entered a newly challenging period for investors, but that doesn't mean we need to change the foundation of how we invest. With social unrest in Europe, tepid earnings growth in the U.S., China trying to support an over-leveraged economy, and South America largely suffering, only a mole couldn't see that headwinds exist for stocks. Add to this the belief that most U.S. stocks appear generously priced (because few other attractive investments exist!), and it may mean that the choppy, sideways market we've seen over the past 18 months will persist.

This doesn't mean we can't make money here, though. **FactSet Research Systems** (NYSE: FDS) is up about 7% since our recommendation was issued in May, and **Verisk** (NASDAQ: VRSK) and **Visa** (NYSE: V) are both up more than 11% since our recommendations to buy last year. We are buying new stocks carefully. And we've repeatedly made money writing options on the likes of **Gentex** (NASDAQ: GNTX) and others, with more in the works. So, we don't mind the choppy challenges of today's market. Large returns are more difficult to realize in such a situation (and avoiding large losses must remain a priority), but we believe we can continue to work our way toward positive results while biding our time for the next market upswing that should lift our strong stocks.

As we work on that path, let's revisit six foundations of investing.

Six Investing Foundations to Remember

1. Time is the biggest factor for success. Whatever you wish to master, it's the *time* devoted to it that will most determine your success. But investing is generous. You *don't* need to devote all of your waking hours to it to succeed. To the contrary: As the popular saying goes, it's time *in* the market, not timing the market, that matters. The longer you let your funds stay invested in good companies, the higher your odds of success.

2. A 52-week high doesn't matter. Many stocks are currently trading far below their past year's highs, but don't let that convince you they're all good buys. Many might still be better *shorts* than buys. A stock's past high may have zero relevance -- it may simply represent a mistake made by previous investors. So, don't assume a beaten-down stock is a bargain by anchoring on something (an old high) that may lack meaning.

3. Make the best decision for today. In the same vein, many investors anchor on their cost basis. "I'll sell when I get back to even on this position" is rarely a good way to approach your decisions, because your past buy price is *not* relevant today. All that's relevant is how you believe the stock will perform next. If you don't believe in a company any longer, take your lumps and sell.

4. Time could make your portfolio stronger and stronger. Over the years, your winners will become a greater portion of your portfolio, and your losers will shrink in relevance. So, even those who don't make any new decisions can benefit from an increasingly strong portfolio -- assuming enough positions in it are winners. Keep this in mind if you're reluctant to sell, or if you're a poor seller. Inaction is a perfectly acceptable response much of the time.

5. Know yourself. Along with time in the market, your temperament is key. Know your limits. When you make a poor decision, realize why you did it, and avoid that situation in future. Some industries will simply make you nervous, for example, so learn to avoid them. Or, putting too much money in one stock may cause you to panic and sell when it's down. Observe yourself and then protect yourself from future mistakes of temperament.

6. Even simple decisions can take weeks. I typically like to take weeks, sometimes months, to make a new decision, even if it's a relatively simple one (such as deciding to write covered calls on a holding for the first time). Don't feel rushed. By pondering the decision for a few weeks, you'll come to have a more rounded view of it, and feel more comfortable when you do decide.

Earnings Ahead

We hope you all enjoyed some fireworks the past weekend! We're due for more starting next week, as earnings season ramps up. **Oracle** (NYSE: ORCL) and FactSet have already kicked off our earnings season in *Pro*, and so far we're pleased -- although it may be a challenging quarter overall. We'll see.

On that note, please visit the Memo Musings board if you have any questions or comments, and thank you for being a *Pro* Fool! Let's get 'em.

Pro Catch-Up Trades: June 27, 2016

Published Jun 27, 2016 at 3:24PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **FactSet Research Systems** (NYSE: FDS): Buy 2% in this new position.
- **Gentex** (NASDAQ: GNTX): Buy 2.7% in stock if you lack it.
- **Oracle** (NYSE: ORCL): Buy up to 3.8% (see Jeremy's new earnings update).

Continue building your portfolio with our Buys, including these highlighted today:

- **Skyworks Solutions** (NASDAQ: SWKS): Buy 2.9%.
- **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY): Buy 0.7%.
- **TD Ameritrade** (NASDAQ: AMTD): Buy 2.2%. With new expectations that interest rates won't go up perhaps until 2017 thanks to Britain, financial stocks have been hit, and patience will be required.

Shorts:

- None currently.

Options:

- **Celgene** (NASDAQ: CELG): Sell to open October 2016 $95 puts, for a potential 3% stock allocation. These puts lately pay more than $7 each, with the stock right near $95.
- **Gentex** (NASDAQ: GNTX): Sell to open September 2016 $15 puts for a potential 1.5% additional allocation to the stock; lately, shares are $14.70, putting the puts in-the-money, but we still like this option, which nets a buy price around $14.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY): You can set up our latest Sept. 16, 2016, $200/$189 put ratio spread for about a $0.90 credit lately (but any credit is good), as higher volatility increases the bid on the lower-strike puts. So, follow the original alert to set up this position for September.

Options expiring next:

- **Expeditors International** (NASDAQ: EXPD): August $46/$49 covered strangle. We'll have updated guidance close to the August expiration. Lately, shares are $47, which would have both options expiring as income.

Pro's Updated Correlation Matrix

Published Jun 27, 2016 at 3:24PM

Dear *Pro* Fools,

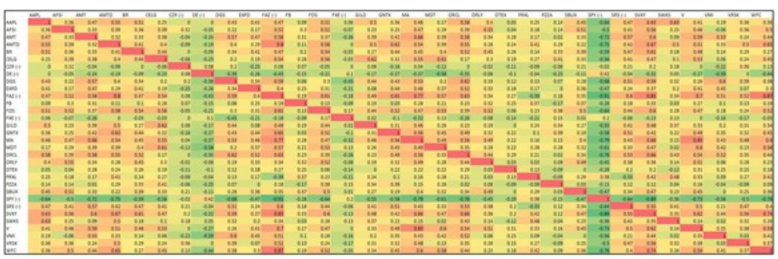
It's been a while since we've run a Memo that analyzes the stock-price correlations between our companies; this was the last one, from early last year. After the market shock of Brexit last week, it's all the more important to keep an eye on the *Pro* portfolio's exposure and other risk measures so we can accurately consider whether we're positioning ourselves properly to achieve our long-term North Star goal.

As such, in this Memo, I've run the correlation analysis we've run in the past on today's portfolio, re-creating our correlation matrix for *Pro*'s current holdings. I hope this Memo is useful not only to those members who have seen how our portfolio composition and correlations have changed over time, but also to those who've never considered our correlations before. Please be sure to reread former *Pro* analyst Nick Crow's original correlations Memo for background information on how to interpret the correlation matrix.

Step Into the Matrix

The graphic below shows all the possible correlations between each pair of stocks ("pairwise correlations") for our portfolio. The matrix includes our shorts and companies on which we only hold options positions. A (-) in the header indicates that we are short that security.

A note of consideration: Although I've included our SPY hedge, be careful in interpreting its output. Our SPY put ratio spread is a combination of several derivative positions, meaning that price correlations are difficult to analyze because the profit/loss curve is not linear (i.e., correlations change depending on which price we're talking about). The numbers in the matrix for SPY likely best represent only the prices in between our strike prices ($189 and $200); outside those strike prices, the correlations are likely to be very different. (Click the image for a larger version.)



Source; Portfolio Lab Pro and analyst calculations. Correlations are based on monthly price movements.

As we can see from their green shading, our direct shorts (CZR and DE) are negatively correlated with most of the rest of the portfolio, offering us diversification benefits. Our direct shorts zig when the rest of our portfolio zags, and it is partially for this reason that we are intent on continuing to build out a direct short "sleeve."

We refer to CZR and DE as "direct shorts" because they are short positions on individual company equities. Our other shorts (FAZ, FXE, and SRS, all three of which are ETFs) behave differently. FAZ and SRS are actually short vehicles themselves (short financials for FAZ and short real estate for SRS). When you short a short vehicle, the position behaves like a long. We can see that effect with the orange and red shading for FAZ and SRS, indicating their positive correlations with the rest of our portfolio. The FXE short, as a short of a currency, behaves somewhat independently from the rest of the portfolio, with neither a strong positive or a strong negative correlation with almost any position.

The matrix indicates that among our core long positions, the five with the lowest correlations to the rest of the portfolio are Papa John's (aggregate pairwise correlation score: 3.98), OpenText (4.49), Facebook (5.68), Parexel (6.00), and Valmont Industries (6.24). And the five positions with the highest correlations are MasterCard (12.27), Visa (12.22), TD Ameritrade (11.84), FactSet Research Systems (11.47), and Wells Fargo (11.27).

The *Pro* Bottom Line

Pro follows a flexible, absolute-return investing strategy that utilizes shorts, options, and ETFs alongside our core long stocks. Despite some areas of significant concentration (for example, our 25%-plus allocation to financials), we believe our portfolio is sufficiently diversified. Additionally, our current S&P 500 put ratio hedge offers significant negative correlation to our holdings once the index falls below a certain level, further reducing overall riskiness. And as options investors, we build strategies with non-normal return profiles — hedging and collecting premiums in exchange for the obligation to sell shares higher or buy shares cheaper. That means we can manage our risk *and* profit through a wide range of outcomes.

While some of the names of the companies have changed, and the correlation table looks a bit different than it did in its prior two iterations, our underlying philosophy and our goals are the same. We continue to aim for North-Star beating returns over every rolling three-year period, and correlation and diversification are important parts of achieving that goal.

Fool on!

Oracle's Cloud Business Is Firing on All Cylinders

Published Jun 24, 2016 at 5:31PM

We've been waiting patiently for **Oracle** (NYSE: ORCL) to turn the corner in its transition to a cloud-based software as a service (SaaS) business and it now looks like that corner is safely in the rearview mirror. In the recently announce fiscal Q4 the company blew past the high-end of management's estimates for SaaS and platform as a service (PaaS) sales growth, posting a 68% increase over the previous year and 17% sequential growth over Q3. As management noted in the conference call, what's most encouraging is that Saas/PaaS growth is actually accelerating as the business gets bigger. In the last quarter the company added 1,640 new customers, bringing the total SaaS count to about 12,000, and cloud sales now account for 8% of Oracle's revenue versus 5% a year ago. For reference, the cloud business posted 20% growth in 2014, 34% growth in 2015, 52% growth in 2016, and management is guiding for better than 65% growth next year.

Though most of the talk is about the breakaway success of the cloud business, Oracle's on-premises business is still the primary contributor to company sales at 72% of total revenue. As expected, new software license sales declined 10% as demand increases for cloud-based applications, but a 4% increase in software updates and product support mostly closed the gap, resulting in a 2% overall decline. At best, we expect this business to tread water while the cloud business continues to grow. Management pointed out that the cloud business has finally reached the size where its sales growth was more than making up for the slow decay of the on-premise business. As a result we should begin to see a marked improvement in most operating metrics (operating margin, EPS, etc.) in the coming year.

For the year, total software and cloud sales totaled $29 billion which is a 3% increase in constant currency. Of that total, cloud increased 52% for the year while on-premises was about flat. In total, the company generated about $12.4 billion in free cash flow over the year which the company returned to shareholders through $10.4 billion in buybacks and $2.5 billion in dividends. That amounts to 105% of cash flow, which Oracle funded debt, though the company maintains a net cash position of $12.3 billion.

What's Driving Cloud Demand?

The main drivers of the faster SaaS growth are an improving suite of products, a better trained salesforce, new sales tools that shorten the sales cycle, and increasing cross-selling opportunities. In the past quarter Oracle had 917 current customers expand their relationship and over 270 customers who bought SaaS also bought PaaS. This success, in addition to the reported two percentage point increase in cloud renewal rates, suggests that Oracle's cloud applications are being well-received by customers. Also, Oracle is quickly becoming a force in cloud enterprise resource planning (ERP) software. That development has expanded the company's addressable market to include many middle-market businesses which were previously considered too small. This quarter Oracle added 800 ERP customers and about half of those had no previous Oracle relationship.

As always, Larry Ellison made sure to call out Oracle's cloud competition on the call, noting that Oracle's cloud business is now growing faster than both **Salesforce.com** (NYSE: CRM) and **Workday** (NYSE: WDAY). He also shared the company's two ambitious goals for 2017: growing the cloud business twice as fast as the closest competitor and becoming the first SaaS company to reach $10 billion in annual cloud sales. Infrastructure as a surface (IaaS) sales growth have been growing at a slower, but still respectable at a 11% clip, because of stiff competition from **Amazon's** (NASDAQ: AMZN) AWS and **Microsoft's** (NASDAQ: MSFT) Azure units. The company has recently reengineered its IaaS offering to improve its performance and reduce costs significantly, but I expect this business to remain a distant third for the foreseeable future.

Legal Matters

It's also worth noting the whistleblower suit that popped up earlier in the month that alleged that Oracle was using misleading accounting to inflate its cloud sales. During the call Safra Catz only shared a brief mention of the case stating, "Now in regard to our cloud revenue accounting, we have reviewed it carefully and are completely confident that it is 100% accurate, and if anything, slightly conservative." At this point there's little detail regarding the exact charges and the only other response from Oracle was from a spokesperson who stated, "This former employee worked at Oracle for less than a year and did not work in the accounting group. She was terminated for poor performance, and we intend to sue her for malicious prosecution." We'll be paying close attention to this as additional details emerge, but in the interim, I'm willing to give Catz (Oracle's former CFO) the benefit of the doubt.

Looking Forward

As the cloud business continues to scale, profitability should improve toward management's stated goal of an 80% gross margin. Management didn't nail down the timeline for that improvement other than to state that the expected Q4 FY '17's gross margin to be much higher than FY '16's 52% year-end margin. Sales growth guidance for next quarter has been increased to 75% to 80% suggesting that the cloud growth momentum we saw in the fourth quarter isn't just the result of management pulling sales forward to hit year-end bonus targets. If that pace continues then the company could once again blow past management's 65% baseline estimate for the coming year.

The *Pro* Bottom Line

Overall, Oracle posted a solid quarter and our investment thesis appear to be on track. The transition to a SaaS sales model is proving successful and we should begin to see those wins show up on the income and cash flow statement as a steady stream of recurring cash flow. Even though the topline will likely continue to grow at a modest low-single-digit pace for next several quarters, the company is increasing the lifetime value of its customer base and becoming more profitable as the cloud business scales. Oracle is currently trading at a free cash flow yield of about 7.5%, which is attractive considering the likelihood of improved profitability as the cloud business scales. Oracle remains a *Buy First* recommendation and we suggest that you buy shares to match *Pro's* 3.8% allocation if you haven't already.

Brexit: And Then There Were 27

Published Jun 24, 2016 at 12:15PM

Dear *Pro* member:

Along with the rest of the world, we at *Pro* have been watching the polls in the United Kingdom for weeks. As recently as yesterday, Wall Street put the odds of Britain staying in the European Union almost as high as 90%. Those odds turned out to be 100% wrong, with 52% of UK voters electing to leave the EU. With roots going back as far as the 1950s, this union of 28 countries officially began to form in 1993 as a way for European countries to share trade agreements, environmental and immigration laws, and eventually a common currency (for many countries, not the UK) -- in short, to lend more stability and growth to much of the continent. The union was greatly tested by the financial crisis of 2008, and the strains have grown since then.

I don't want to sound too dramatic, but the UK's referendum to leave the EU may just be the first splinter off the mantle. More indebted countries -- the likes of Portugal, Greece, Italy, or Spain -- have more to gain from leaving the EU, on the surface at least, than does the UK (for one, they could devalue their expensive debt). Plus, rumblings for liberation from the EU in France and the Nordic countries has already begun. But let's not get ahead of ourselves. Nothing is certain right now, not even the UK's fate, and that's why Wall Street is bound to be volatile for a time.

Now-former UK Prime Minister Cameron resigned today -- having promised a referendum to help win his own election, he played a game of chicken with the country and lost. So the first step for Britain is to establish new leadership. Then, assuming the UK honors the referendum, it needs to begin a lengthy, multi-year process to extricate itself from the many binds of the EU. Britain will need to draft new trade laws and pacts; new environmental regulations; new immigration policies; new, new, new. It's going to be messy and it will take time. But this is one instance in which we might be glad that most investors have a short attention span.

The shock of this news will wear off, replaced by the tedium of bureaucracy. Investors will return their focus to earnings results, beginning in a few weeks in the United States. Yes, headlines from Europe may lead the news for weeks, especially if more countries set up their own referendum votes, but before too long, financial results and reassurances from companies could go far to bring investors back to what matters most. The UK is the fifth-largest economy in the world (although it may have just ceded that spot to France), and it's in no one's interest to lose trade with it. Countries, and businesses, will work to keep commerce moving throughout this transition.

In the *Pro* portfolio, stocks most affected this morning include financials. Economic uncertainty tightens up lending, and banks depend on overnight lending to fund some operations. **AmTrust Financial Services** (NASDAQ: AFSI) has business in England, and the stock is lower this morning, but **Wells Fargo** (NYSE: WFC) is down nearly as much. This isn't because anyone knows something we don't know. It's because they don't know what the future holds, and that worries them. But we will argue that's always the case. We never know the future. We invest in probability. Our ability to be right more often than we're wrong is the result of close study of businesses and probabilities. Bumps aside, as long as we keep our minds healthy, I don't expect that to change. Adding probability to a long-term frame of mind, we should continue to generate pleasing returns over long periods.

The UK voted to leave the EU because 52% of its voters desire more control over immigration; over trade and employment; over how the country spends its money. Whether this was the right choice for the UK, only time will tell. In the meantime, we know we're invested in companies with strong leaders that we believe will grow value even when adversity is put directly in their path.

Right now, we have no plans to sell any of our stocks as a result of the UK's vote. However, we may now stay short the **CurrencyShares Euro Trust** (NYSEMKT: FXE) for a longer period of time, waiting to see if another shoe drops in Europe. We'll decide whether to take the short off Hold for newcomers soon. But if the euro falls much more, we may use the price to exit the short.

Elsewhere in the portfolio, **O'Reilly Automotive** (NASDAQ: ORLY) only operates in the U.S., and yet the stock is initially down sharply this morning. There's a chance to add to the position if you lack our 5.2% allocation. **Visa** (NYSE: V) just closed on its acquisition of Visa Europe, and is initially down sharply this morning, too -- an opportunity to buy shares if you lack them. We are especially careful when we buy financial stocks, so with our due diligence in hand, we still believe in them today for the long haul, including Wells Fargo and our others.

If you're looking to catch up on more recent *Pro* positions, you can also:

- Buy 2% in **FactSet Research Systems** (NYSE: FDS), per our report.
- Sell to open puts on **Celgene** (NASDAQ: CELG), per our recent recommendation, if you haven't yet.
- If you haven't, sell to open puts on **Gentex** (NASDAQ: GNTX), per our recent recommendation.
- Set up the **SPDR S&P 500** (NYSEMKT: SPY) put ratio spread per our recent recommendation. This morning, as I write this, the same hedge trade we did can be set up for a credit of about $0.35 per spread. That may change, but the point is, you can still get a credit.

Or, you can decide to do absolutely nothing today, and enjoy your weekend, same as always.

Whatever you do, if you maintain flexibility in your portfolio -- including cash -- you should not sweat volatility; instead, we hope you, like us, can see the opportunity in it. We are here hoping that expectations for volatility remain high on Wall Street, because that will lead to more options opportunities (including writing more covered calls at better prices), and we hope that actual volatility will lead to more stock opportunities, both long and short.

Overall, it's possible the rest of this year will be dominated by news from Europe, just as the Arab Spring was the big news years before, or the currency crisis in Asia in the 1990s, or any other number of historical upheavals. Britain is charting a new course for itself; it won't be easy; it will come with costs. Any benefits may only be seen many years ahead. The reverberations are only now beginning. But business goes on, and we'll be watching our companies to navigate the new environment well.

Brexit: What We Are (and Aren't) Doing

Published Jun 24, 2016 at 8:57AM

Market commentators are lining up to calmly forecast the likely outcome of the U.K.'s decision to leave the European Union. These are the same commentators who calmly forecast that the U.K. would not leave the European Union, so take them for what they're worth.

Winston Churchill fittingly said, "Democracy is the worst form of government, except for all the others." Thursday's vote may have been precisely what he spoke of. While the people have spoken, they have voted for pushing the pound to the lowest level since 1985, the nation's bank stocks down nearly 30%, and — at the risk of being one of those forecasters — almost certainly a weaker economy. Based on currency fluctuations, the U.K. gave up its title as the world's fifth-largest economy last night, ceding to France. And we're only a few hours after polls closed.

What's this mean for you as an investor?

An investor friend of mine, Tren Griffin, jokes whenever market-moving news occurs that he "cannot wait to get to my computer in the morning and proceed to do absolutely nothing."

The most important thing you can do right now is heed his advice. We're not selling or fleeing the market. We're genuinely shaking our heads in surprise, but we're not worried. If anything, huge declines become opportunities.

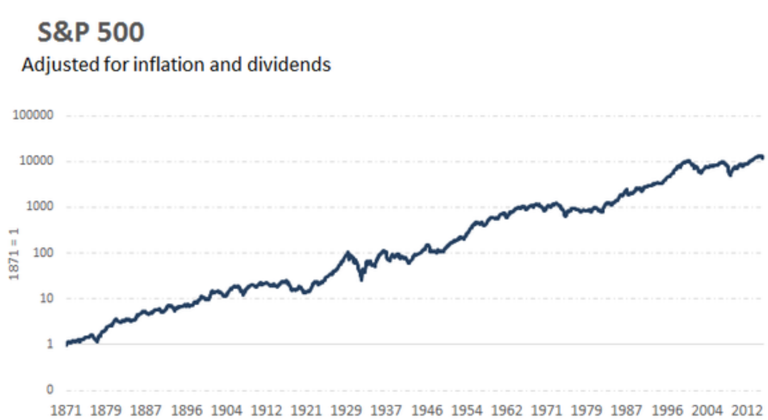
My litmus test for whether the world economy will create value over time is asking the question, "Did more people wake up this morning seeking to solve problems and make life better for others than do the opposite?" And the answer is still firmly "yes."

Whether it was after 9/11, or the 2008 financial crisis, or Greece's default, financial markets habitually have sharp, knee-jerk reactions to big news stories with lots of uncertainty. The attitude among investors becomes "sell now, ask questions later," as so many hedge funds and professional traders cannot afford the risk of *not knowing* what might happen to their investments over the next, say, 30 days.

We're not in that camp.

It's possible a big stock sell-off is justified. But it's probable that a downward dip is more indicative of people selling because they don't know what's going to happen, not because they know something you don't. That's why we stay the course.

Let me remind you of this chart. It's the U.S. stock market over the last 140 years, adjusted for inflation:



Do you know what happened during this period?

- 1.3 million Americans died while fighting nine major wars.
- Four U.S. presidents were assassinated.
- 675,000 Americans died in a single year from a flu pandemic.
- 30 separate natural disasters killed at least 400 Americans each
- 33 recessions lasted a cumulative 48 years.
- The stock market fell more than 10% from a recent high at least 97 times.
- Stocks lost a third of their value at least 12 times.
- Annual inflation exceeded 7% in 20 separate years.
- The words "economic pessimism" appeared in newspapers at least 29,000 times, according to Google.

And the market still increased 10,000-fold.

So, I suspect we'll be OK.

Patience will be constantly tested but ultimately rewarded — as it always has been.

Facebook: A Deeper Dive

Published Jun 22, 2016 at 3:29PM

Facebook, one of members' most widely held stocks, is worth a closer look. What will the company look like, a few years from now? Motley Fool analysts Simon Erickson and Aaron Bush go deep into Facebook, the stock, and the future.

{% video %}

Simon:

Welcome to the breakout session of a deep dive on **Facebook** (NASDAQ: FB), a small company you might have heard a thing or two about in the last couple of years. Quick show of hands, who is a Facebook shareholder in the room? Awesome. We know what we're getting into with this company. Hopefully, Aaron and I, over the next 30 minutes or so, will teach everybody something new about Facebook, especially from an investing perspective, that you didn't know already, and that we think is important to this company. This is a fantastic company in so many different ways.

Let's go ahead and look at what we're going to talk about today. We'll start with just an introduction of how Facebook got from where it was in Harvard in the year 2004, to what it looks like 12 years later today, and how this company has transitioned over the years. The second section's going to be really about the competitive advantages of Facebook. Social networking was not new when Facebook got into it. There were other companies that were also trying to do the same things, but we're going to look at why Facebook became Facebook, and then MySpace and Friendster became what they did as well.

We'll talk a little bit about [its] competitive advantages. What are the financials that have really become important for this company, and how does that transition into those? Then we'll step back and we'll look at the Mark Zuckerberg part of this equation. What [are] the culture and the people like in this space? How does that play a part for us as investors? We'll look forward from 2016 on.

Facebook's a $330 billion company today. What does it look like in the future, past 2016? What does that mean for us that raised our hands as investors in the room? We'll talk about some other opportunities and some of those risks that are associated as well. We'll even throw in what we think Facebook could potentially be worth going forward. On that note ... Oh also, I should say, if you do have questions, we should have index cards passed out on the table. Please fill out questions on that and pass them to the sides to Motley Fool staff, and we'll get to questions after we go through the presentation. All right, so [here] we are, deep dive into Facebook.

Aaron:

Great. Thanks, Simon. Before we go into talking about the current state of Facebook and what Facebook could be worth going forward and how it's going to get there, I think it's interesting to talk a little bit about how it came to where it is today. As Simon mentioned, the company was founded in 2004 by Mark Zuckerberg when he was 19. He was a sophomore at Harvard, and really right off the bat, Facebook took off. It became a phenomenon on the Harvard campus, and within two years, not only had it scaled to other college campuses, to high schools, but very rapidly opened up to anyone over the age of 13. Within six months of its initial founding, they already had moved their headquarters to Silicon Valley. Tremendous start from the very beginning.

Only two years later is when they made their first big change to the platform. Facebook in their early days, is really just a bunch of profile pages, where people had updates about themselves ever so often. In 2006, that's when Facebook rolled out its news feed, its timeline, which took all the changes that members on Facebook were making on the platform and put them into a stream for people to use. Two years after that, is when they launched chat, which now is Messenger as we know it today, and [it's] also when Sheryl Sandberg was brought onboard as Chief Operating Officer, and she has been incredibly instrumental in helping Facebook monetize its business.

The company IPO'd in 2012, which is about when us, as Foolish investors, started getting familiar with it. That same year it hit 1 billion active users, and after that it became a story of acquisitions. Acquiring first Instagram for a billion dollars, Oculus VR for $2 billion, and then later WhatsApp for about $19 billion, I believe. If we look now, where Facebook is today, this chart, our picture is a little bit outdated, so right now Facebook has 1.65 billion users. That's larger than any country's population around the world. It has actually now topped 1 billion WhatsApp users per month and 800 million Facebook Messenger users. Now, between WhatsApp and Facebook Messenger, they now send over three times as many messages per day as SMS or text messages did [at their] peak. It's a really tremendous growth. Instagram, now over 400 million active accounts, and Oculus is just getting started. That's where Facebook is today, and I'll hand it back over to Simon to talk a little bit about how all of this helps form the company's competitive advantages.

Simon:

Yeah, exactly. Like Aaron was saying, go back to 2004: Facebook was almost instantly a success, as soon as it was launched. On day four it had 650 users. On week three, it had over 6,000 users. We always talk about the power of the network effect, and that's just when more users join, more users want to join, and of course that attracts a lot of attention from advertisers. The basis of this business is, it's a very good business to be in. Mark Zuckerberg was able to very quickly scale this business in a quick way.

In addition to getting a lot of users early on, he really didn't have any costs required to do this business as well. He built the software off of freely open-sourced software, PHP for the programming language. He use MySQL for the database. It was freely available, it didn't cost him anything. Even at the point that Facebook had over a hundred thousand users, the only bills they were paying were for the servers to manage the traffic coming to the site. You put the combination of a company that's getting stronger and stronger with each new user that joins, with very, very few up-front costs, and you get a very powerful combination between the two of those.

I would argue the biggest competitive advantage that Facebook has, and the best thing they were getting for free, was information from their users. Because of the profiles, like Aaron talked about, all of Facebook's users were voluntarily giving them free information about their interests and what they liked out there. Advertising has always been a business of going where the traffic is. The billboards that are on the major highways cost more than the ones that are out in the middle of nowhere, so volume alone was not enough to justify competitive advantage. Facebook also had the ability to show a different billboard for every car that was driving along their highway. They knew what their users liked, they knew exactly what their interests were, and this was the gold mine was advertisers that they had.

In addition to that, Facebook took it the next step forward. Because it was an Internet company, there was back and forth, getting information in real time, all the time, from all of the traffic that was going to it. It could instantaneously tell an advertiser what the return on their investment was for any ads placed on Facebook. This was something that Friendster and Myspace did not have. They didn't have that wealth of information that Facebook did. As they got bigger, that information vault got stronger, and it really transformed the company into the strong competitive advantage it has. I'm going to pass it back over to Aaron to talk about what financial metrics flow from that competitive advantage.

Aaron:

Right. There are many different things to look at here, many different ways to look at the financials, but just to choose one thing to put on the slide, I decided to put this graph. The graph is of revenue growth. It's an important one, because the blue line represents just how far Facebook has come, scaling its revenue so quickly. The orange line represents the revenue growth rate. As you can see, if you can see the numbers, they still are growing above a 40% [annual rate]. It's been pretty steady and consistent for a good while now. That is incredibly powerful.

This growth really stems from two things. One, it stems from more users coming on board, onto the platform. That 1.6 billion users really adds up. Second, it shows the growth of average revenue per user. I think that is particularly interesting. In the fourth quarter of this past year, Facebook generated $13.50 per user in the US and Canada. That's a pretty good amount just for people scrolling through the Facebook feed. That number was up 50% year over year, so that really shows really strong, compelling growth. What is particularly interesting to me is the discrepancy between what's going on in North America and the rest of the world. $13.50 in US, but worldwide, where the vast majority of users are, the average revenue per user is only $3.70, which is [roughly] three and a half times lower than what it is domestically. That is a large opportunity that Facebook is able to chip away at every day until that gap closes.

Revenue growth is great, and seeing it [so] strong for so long is really impressive, but it only matters if it translates into earnings and cash flow. Unfortunately, as Simon partially discussed, they are a pretty low-cost business, so they have a tremendous margin profile. It's been a bit lumpy due to some certain expenses, like scaling employees and infrastructure ahead of the growth curve. All in all, it averages out. It really is a tremendous number.

Gross margins have been in the mid-80% range, which, if you don't sit around looking at financial statements all day, that's a very, very high number. More importantly than that, 30% of revenue turns into free cash flow, which is all of the cash that Facebook pulls in in a certain period of time, minus basically the cost of infrastructure. 30% of the revenue and growth turning into cash is a very high amount and that is what funds their acquisitions and future [purchases] and what have you that allows them to diversify and grow tremendously. Because of that, it's no surprise that the balance sheet is so strong, with over $20 billion of cash and absolutely no debt. It's a financial fortress on top of having great competitive advantages, stronger network effects, and people coming back every single day. Let's talk a little bit about the culture now.

Simon:

Right. If we step back ... By the way, this is the original thefacebook.com, in Harvard in 2004. You see at the bottom, "a Mark Zuckerberg production." I don't know if anyone remembers the old-school Facebook as it looks here, but in the original conversations that Mark Zuckerberg was able to have with his team, as this was just a concept in 2004, he used words like "connect" and "dominate." "Monetize" was never part of the conversation for him. He just wanted to build something that users really liked. He didn't have to worry about fundraising or the business of making any money. He didn't have any costs he had to worry about.

Because he had a team with Dustin Moskovitz doing a lot of the programming, [and] Sean Parker doing a lot of the business stuff, it allowed him to really just focus on what his vision for Facebook, "The Facebook" at the time, was going to be. I think it gave him a lot of flexibility, which is very powerful for a young leader like Mark Zuckerberg was. On top of that, he didn't have to spend any money to grow his business, either. Facebook selectively picked colleges that it wanted to launch at. Especially in the first year, they could basically control how they were expanding, based on much traffic they wanted to get and how many servers they had at the time. There really wasn't a whole lot of costs involved in marketing or advertising this business, either.

The combination of the two of those, of not having to raise any money because you don't have have very many costs, and selectively controlling your growth, means that he always had absolutely voting control. He had the vision of this company all the way. He didn't have to share his vision with anyone else, and he didn't have to rely on other financing, which so many other businesses have. It was a really great industry and a great time to be a part of.

Then this is the one that I really [like] the most of the culture of Facebook. They call it the hacker mentality. It's continually optimizing small things on the site, continually. It's very interesting to me because I came from a background in the energy industry. I'm from Texas, if there's any other Texans out there. In the industry that I worked in, the amount of time from the concept of a new idea to when you would actually have that in front of a customer was, if you were lucky, 18 to 24 months. A very long cycle time.

I got the chance to visit Facebook's headquarters a couple of years ago. I asked them the same question. I said, "What's the amount of time that goes, from when you guys come with a new idea in a discussion with management, to when it's actually in front of a customer or user on Facebook on the site?" I was kind of figuring maybe it was like a month, maybe it was six weeks, something like that. Their answer was, "It's 20 minutes." They immediately can launch something out there and get feedback about whether or not it's going to work, and they just pull the stuff off the site that doesn't. It's continually being optimized. It's that hacker mentality that's just so amazing to me, that culturally is still a part of this business. Aaron, what does the future of Facebook look like?

Aaron:

Yeah, this is the part that interests me the most. I think we can look at this in a few different steps. First of all, they're going to continue to grow in the same way that they have. They're going to continue to add new users across the entire platform. Between Facebook, Instagram, WhatsApp, they have now about 3 billion -- probably a little less than that because of some overlap -- but about 3 billion active users across all of that. They can still continue to grow. They're going to constantly improve the platform. They recently just launched live functionality. It's going to show live video. They just made a big partnership with eSports, with a big eSports company, to showcase just video games being played, which is a huge market now.

Then they're going to continue rolling things out, like recently, instant articles, which allows users to read articles on Facebook without using much bandwidth, so you don't have as high of Internet needs to use the service well. Just continuing what they've done is going to continue to help them. Also there's some other things out there that are more predictable that they're going to do, but that they're not necessarily doing in full force right now.

First of all, I think Facebook will absolutely continue to help people in developing countries go online. One, because Mark Zuckerberg thinks it's the right thing to do. Two, because doing so naturally just helps Facebook become a stronger business. Right now, they're doing it with these fancy Internet drones that fly in the air for a very long period of time. It's super impressive technology, but I have a feeling we'll continue to see more of that.

Second, I think we'll continue to see them scale products. Not just the Facebook core platform, but other ones, too -- Instagram being perhaps the most important one. A really interesting statistic about Instagram is that they have one-fourth the number of active users as Facebook, but they have one-fifteenth the number of active advertisers. That's a humongous discrepancy. I think even though the advertisers are less, even so, the average advertiser is probably spending less money on Instagram than they are on Facebook. Instagram has a tremendous runway.

Then WhatsApp and Messenger, they're two messaging apps will likely start integrating commerce capabilities at an accelerated pace over the next few years. We've seen them roll it out with Uber and make some minor tests here and there, but I have a feeling they're going to start pushing a lot harder, which opens up some really interesting opportunities.

Lastly, looking at what is more abstract. If you were to look at Facebook anytime in the past several years, trying to look for it and predict what was going to happen in the next five years, you always would have been blindsided by something. There just always would have been something big that would have happened that you wouldn't have been able to see before. I have a feeling that's going to happen again. I have a feeling they'll make some large acquisitions that we can't even predict now. Partially because those companies may not exist yet, partially because they might be getting started, or they could surprise us.

Virtual reality is also probably going to be a very huge deal, several years away. I think investors have learned to lower their expectations a little bit with virtual reality, looking more in the near term, but looking longer-term it still has tremendous opportunity. Then lastly, bots, which are basically little nuggets of artificial intelligence software that plug into Messenger or can even be plugged into the core of Facebook that help users solve tasks, get things done, or make the platform more addicting to use. Tons of room for them to think about how to move forward in a bunch of different ways. Of course, things could always go wrong. Simon, you want to talk a bit about the risks?

Simon:

Well, OK, Aaron, before we get too hooray about artificial intelligence and virtual reality and the bots taking over out there, let's take the other side of this coin, too, as objective investors and say, there's a lot of uncertainty in those future markets. A couple that we just talked about:

Virtual reality. We've seen forecasts of this being a $70 billion industry by the year 2020, but when you look at that today, it's still about a $7 billion market. That's a [tenfold] growth in the next four years. That sounds optimistic, and I can definitely see there being a case [for] that, but in reality today, most of it's still a hardware play. There's a lot of uncertainly in that forecast that we have to at least look at and objectively say, OK, is this really progressing as well as a lot of those forecasts would believe?

Artificial intelligence was another one that Mark Zuckerberg has recently talked about, about incorporating AI into Facebook's five- and 10-year plan. Still a very small industry today. Sub-$1 billion industry in the entire AI world. Big ambitions, big opportunities. We love this about Facebook, but we have to make sure that they're actually fulfilling their claims on these multibillion-dollar acquisitions.

The second thing that's a key risk that investors, I think, should be aware of, is that this is a great visionary leader. I mean, Mark Zuckerberg's got some noble things he's trying to accomplish over the next year. With his wife, [in] the Shannon Zuckerberg initiative, they're looking to cure diseases by the end of the century, they're looking to personalize education, they're looking to slow climate change. These are multibillion-dollar, noble but charitable goals, and to accomplish those, Mark Zuckerberg has committed 99% of his personal net wealth, which is mostly Facebook shares, to these charitable activities.

Now, because of that, he's recently created a third class of Facebook stock, that's non-voting, so he can actually offload shares without losing voting control of the company. It's going to be very interesting to see if there's any kind of disconnect in the next couple of years between Zuckerberg's noble initiatives, and then maybe a little bit of a clash with shareholders who still want to see profits on their investments as well. Two things I think we should keep an eye on as far as risks.

Aaron, the question I think as investors we're asking today is, like we said, Facebook is a $330 billion company today. You've seen a huge run-up in shares over the last several years.

Aaron:

Yeah.

Simon:

What is this company worth to an investor that's starting out at 2016?

Aaron:

That is a very good question. There are many ways to look at finding what that answer is. The answer itself is changing all the time, too. I decided to take a fairly simple approach and break down how we can see returns shape up in the next five years. Walking through my assumptions a little bit and thinking about this, I think it makes sense to expect 6%-8% annualized user growth on their core platforms. Historically, it's been double digits, but naturally, when they have to bring in people by the hundreds of millions, there's only so many more hundreds of millions of people out there, so that has to slow down a little bit, but 6%-8%.

Then I think we can expect 15%-20% growth in revenue per active user. That may sound very ambitious, but I really don't think it is, considering [that] a lot of advertisers are still moving money online, they're going to continue to up their ad spend. There's a tremendous amount of opportunity for Facebook to bridge the gap, lower the discrepancy between what they're making in advertisements domestically and the rest of the world. Then yeah, there's tons of room.

I was talking to Simon a little bit yesterday about this, but if you look at any Facebook news feed, about 3% of the content that you're looking at is paid for. If that were to go up to 5% or 6%, you probably wouldn't notice a huge change in your Facebook experience, but what that means for the advertising money that Facebook is pulling in would be enormous. Tons of room to grow with that.

I also think we should start to see messaging apps slowly monetize. Oculus might break even. Those are both a little bit iffy. Then 30% free cash flow margins, which is normal with what they've already been doing. Then if you put that together, look a little bit into the different growth that they could hit with those different ranges, you see these returns up here, which range from 9% to 96%. I've bolded the third one because I think that is probably closest to the most likely scenario, and that's a 62% return.

A couple of things about that. One, 62% is about 10% annualized. That's not fantastic. Part of that is because of just simply the massive run-up that Facebook has had. It's already up 50% over the past 12 months, just to give some perspective. When stocks go up that much, it does tend to take away a little bit from future returns. That said, I didn't really include any optionality in looking at how the valuation could play out in the future. What that means is that I really just looked at the core Facebook platform, how Instagram can plug into that, but if messaging really takes off monetizing with commerce, or if Oculus takes off, or if they acquire something else, it really could boost that up fairly significantly above that 60-ish percent growth and that would very likely be market-beating. Because they're such a great company, I would not count against that at all. All right.

Simon:

Aaron. Thanks very much. We're going to start the Q&A session. If you do have questions, please write them on that note card. If we can collect those. Do we have anyone from The Motley Fool here that can help us grab the questions? Thanks. Thanks, Matt. As we get started on the Q&A session, let me ask you, Aaron, to kick this off. As an investor, you've got a lot of metrics up here and a lot of assumptions, but what do you think the most important metric as an investor that I should be looking at when I'm looking at Facebook?

Aaron:

Sure. In the past I would have said, you would have to look at a combination of both user growth and average revenue per user, and those would give a very good idea of where the business is going and what it's capable of. As they're looking to lower out some expenses over time, I think it will start to make sense to look at free cash flow per user, so looking really at, "What is each user bringing down in terms of cash?" in whatever time period. I think we'll start to see that become more and more relevant in the years ahead. That could be very, very good indicator of the health of the business, but also how to value it.

Simon:

Great point. One other one I'd like to add to is, content is changing on Facebook. If you looked at Facebook during the last decade, early on it was mostly just text-based ads. Then it came picture-based ads, and now it's a lot of video-based ads. You kind of wonder, what is Oculus going to look like? Is it going to be a virtual reality-based ad in the future? A lot of the acquisitions Facebook's making right now [are] to get that price per advertising point up, which of course quickly falls to the bottom line. I would argue they've got the platform in place to handle all of that, and the capacity to handle the increased data associated with those. The price per ad of Facebook is now increasing concurrently with the volume of ads. I should say that again. The number of total advertisements is increasing [at] a positive rate, as is the price per advertisement, which is a very powerful one-two combination we've seen from Facebook. All right.

Aaron:

Questions.

Simon:

Here we go. Aaron, I'll spot you up with the first one. Question is, why does **Twitter** (NYSE: TWTR) not have the same competitive advantages as Facebook?

Aaron:

Sure. I think their history has been very different in terms of what they're used or. Facebook is more a biography of yourself over time. It's turned more and more into sharing videos and that kind of thing. Twitter has been more, "Oh, I'm thinking this in the moment. I'm going to say it," or something that is more sharing the news. Fundamentally two different purposes that don't butt heads too much. Second, and one thing that has really helped Facebook and has not helped Twitter at all, is that Facebook has been constantly iterating on its platform and its timeline -- basically, its news feed. Through being able to improve what people are seeing, that helps people stick around. Twitter has just kept it the same, chronological for a very long period of time. It's harder to get started with it as well, so that's part of what has made Twitter stagnant, and why Facebook has gotten so far ahead.

Now we're seeing Twitter start to try do some things to change their platform, and they're having a really hard time [doing] it. While Facebook does it all day, every day, with the hacker mentality that Simon was talking about. It's working very well for them. That's how I would look at Facebook versus Twitter a little bit. All right. Simon, do you think that the stock will reach a point where it will plunge dramatically?

Simon:

I don't think so. We get this question a lot. It's kind of a variation, I think, of, is Facebook at an all-time high, and have I missed the boat on this investment? Back to the comment you made, Aaron, about 3% ad load, only 3% of the news feed that we're currently seeing is sponsored and paid for by a company -- 3%. The other [part] of that, there's about 27% of that is trying to get you to come to another business's page. They're not paying for it, they're trying to redirect you to come see their Facebook page. The other 70% of that is cat videos, and videos of your baby doing whatever it's doing that you're sharing with your friends.

When you think about it, like the point Aaron made, when you've got a business that is making as much money as it is today, [still] only 3% of what you're seeing is being monetized. We're not even really monetizing Messenger. We're not even really monetizing Oculus. These are huge optionality plays that haven't made any money for Facebook yet. I don't see anything that, to me, says that this is the top of this business, and that we're going to decline after this. I think that Zuckerberg has done a great job of planning for the future, putting the right pieces in place for Facebook to be a lot larger than that.

Aaron:

Yeah, I would just say, I don't think there's any fundamental reason right now to think that something about the business would cause the stock to dramatically sell off. If I had to guess, it almost definitely will to a significant degree at some point, because of recessions, which cause ad spending to go down. There are many different reasons why it could happen, and I think with all great businesses, you do see that over time. It's nothing I would bet against.

Simon:

I like this question. How about the younger generation? Are they still as in to Facebook as far as competitive threats from things like Snapchat? What do you think Aaron?

Aaron:

That's a good question. I think to some degree, that they are missing out. I think that's only natural, but one important thing to realize is that people don't just use one social media platform. People can use multiple and juggle them very easily. I think with Facebook, we still are seeing a good amount of young people use it. What is turning into the Facebook of the youngest teenager generation right now, is Instagram, which is owned by Facebook. A lot of the user growth we're seeing there is that demographic jumping on board. That's part of why Facebook bought Instagram, [to] capture that younger demographic.

Snapchat, it definitely is a competitor, and it definitely is butting into market share, but in the growing market, there can be multiple winners. I'm not worried about that yet. All right. In the earlier session, Tim presented the case against M&A, mergers and acquisitions -- that they usually don't work out. With Facebook so active in M&A, should we be worried? Why or why not?

Simon:

Well, I mean, we definitely got that as a risk. That's one of the uncertainties of the bridge that leads into the clouds; you don't know what it's going to look like. Clayton Christensen -- any fans of disruption out there? -- would say that the innovators dilemma is [that] you can't know everything about a new market before you get into it.

You're not going to have perfect data for anything when you're jumping into something like virtual reality or artificial intelligence. It's just that Mark Zuckerberg has got a war chest of money that he can almost carve his own future into these new markets, in a more compelling way than a lot of competitors could. He's creating the future of Facebook because he's starting those markets. Oh yeah, there we go.

Aaron:

I can't believe we didn't show that picture earlier. It's epic.

Simon:

That was the best part of the presentation so far, I think. This guy is creating markets and he's jumping ahead of his competitors. Rather than saying, "Hey I'm going to wait for perfect data, he's saying, "Hey I'm going to put $19 billion down for WhatsApp. $2 billion down for Oculus, because I want to be a part of what those look like in the future." I think it's something we should be aware of, but I'm not sure it's a killer that they're spending a lot of money on acquisitions.

Aaron:

Yeah. I'd say a couple of things about that. One, there are two types of acquisitions that Facebook is probably going to do. One are the tools, and for a lot of start ups that make tools that help other companies grow or market better, that kind of thing, their goal is to be able to reach a scale of a billion users or so that they can assist. Naturally they can't do that without the help of someone like Facebook, or Google. Facebook is going to definitely be active in buying the smaller companies and bringing them to scale very quickly. I think that's pretty much a no-brainer for them to do, in terms of M&A. It's just [pennies] of change for them.

Then second, the type of acquisitions that they'll make are the kind that threaten their existence. I think we've seen this. They don't just go buy something because they think it'll be successful, or because they think it's cool. They really only buy big things if it potentially is a threat to taking them down. If you think about Instagram, capturing the younger generation. If you think about WhatsApp, it's a competitor to Messenger, and together they have almost 2 billion messaging users. Then Oculus, Zuckerberg has said, is the next-generation computing platform, and there are many ways for social to plug into that over time. Even if that's a very, long distance away, in terms of chess, it's making a move seeing 10 steps ahead. I think that's what they're thinking about there.

Even if something like Oculus doesn't pan out, it was a $2 billion dollar acquisition for now a company that's $330 billion. Even that, we talk about a lot, but that still, it's less than 1% of who they are.

Simon:

I read recently also that WhatsApp had the capacity to add 1 million users per day. Pretty phenomenal when you think about the terms of how big this platform is getting. Yes, it's not as defined today, but if you can get that kind of user base also plugged into Facebook ... They're buying these companies with stock. The new companies they acquire, they want to see Facebook succeed, too. This is an aligned interest of them as shareholders, too. I'm OK also with the acquisitions they're making.

Aaron:

Simon do you know what the average user does [in terms of] minutes per day?

Simon:

Do you have the number on that?

Aaron:

I don't, so this is a question we don't have the answer to, so I can find the answer and post it onto the one discussion board for Facebook, unless someone knows.

Speaker 3:

The last [reported figure] was fifty minutes.

Simon:

Fifty minutes. Five-Zero.

Aaron:

Fifty minutes. Okay.

Simon:

Fifty minutes per day.

Aaron:

Thank you. Fifty minutes per day. I think that is trending up. Then another question: Is there any risks or concerns with security and privacy?

Simon:

Oh sure, yeah. Any user community like this that has billions of users across the globe, you can't say that's not a risk.

Aaron:

Right.

Simon:

Two parts of that. One is the cybersecurity risk, which I think Facebook does its homework on making sure that's pretty much as secure as they can have it at all times. I think the privacy, the sharing of how much information that you're sharing is publicly available is a much bigger discussion maybe than we can even get into. People sometimes don't want to see Facebook get political. Maybe some users don't want to have all of their information immediately being mined by advertisers out there.

I expect we're going to see even more of a discussion, which Zuckerberg has done a good job of alerting anybody who is a Facebook user about, of [how to] control your privacy settings, and make sure you're comfortable with what you're putting on the site. That's not something the company should manage. I think that's an individual user's perspective on what you're comfortable with. I think that's a bigger discussion, don't you think, Aaron?

Aaron:

Yeah. I don't have too much to add. I would just say that hacking is probably just in its very beginning, so it's going to be a constant struggle between hackers getting smarter and businesses getting smarter to deal with them. Almost definitely there will be slip-ups over time, and privacy is just relative to people's opinions, basically.

Simon:

With regard to the gentleman that's on the screen to our right right now: What do you see happening if Zuckerberg follows the Bill Gates model and steps away from Facebook?

Aaron:

I wouldn't entirely count against it. I don't know if we're going to see that soon. He's still is in his younger thirties, but if that happens, I think that raises big questions. That is a potential risk that I don't know if we have perfect answers to. I would assume that someone like Sheryl Sandberg would become CEO. That's not something that terrifies me, just thinking about that for a moment, but I couldn't say whether anyone could perfectly replace the founder mentality and the visionary thinking that the Zuckerberg has put into Facebook. So, definitely a risk.

Simon:

Last time I checked, we look at Glassdoor a lot to judge employee satisfaction, and Facebook, amazingly, last I looked, has a 99% approval rating of Mark Zuckerberg from employees. Fantastic for a company that size. For Mark Zuckerberg, who's now the seventh-richest person in American at what? 30? 32? 31 years old?

Aaron:

Something like that.

Simon:

31 or 32 years old. Definitely a key part of our thesis for this. He also decentralizes a lot of control. Like the artificial intelligence stuff, he doesn't have to make all of the decisions on that department. He's able to hand off a lot of the stuff that's going on at Facebook right now, that you mentioned in the future-

Aaron:

That's an important. Instagram operates separately from the core of Facebook. Messenger operates in its own unit. WhatsApp operates on its own unit. All together, under the Facebook holding company so to speak. All right.

Simon:

Good? Two more questions. I'll give you one of these, and I'll take one too. Is there a correlation between the change in P/E, [the] price to earnings multiple, and the focus of Facebook on new areas, i.e Oculus, etc. Is there a correlation between the valuation metrics that the market's giving Facebook, and how much they're spending on new acquisitions?

Aaron:

I would say yes, a little bit in acquisitions as well as the core platform. I think the biggest boost in expenses has been just rapidly hiring employees over the past couple of years to get ahead of certain growth curves. That's nothing unnatural. Google went through that. Other companies in the past, like Cisco, went through that same thing. Yeah, definitely these more ambitious, newer projects, especially when they try to add tools to monetize them and scale them, that's definitely going to have a cost to it. I think we're starting to see those costs come into play. All right. Initially, all users were college students. How does the more diversified user base hurt the connections between users? Goals of the platform?

Simon:

Yeah so first of all, I don't think that it's hurting the connections of the platform. Having more people is actually, if anything, improving your connections. It's not just a subset of the population that goes to Harvard University this year. It's now [that] anybody can get on Facebook. Again, Zuckerberg, his intentions for this, is always to improve communication between people. He's adding tools like Oculus, where you can actually pretend that you're seeing your friend right in front of you at the same time, and talk to them. You haven't talked to them in maybe 10 years; you can use Facebook to better connect in doing stuff like that. Imagine how an advertiser can connect with a user if they can actually take them on a test drive of a car in virtual reality, or show them what they're trying to sell in what looks like real time. I think if anything, yes it's a larger pool, maybe it's not as exclusive as the original The Facebook was, but I'd argue that they're actually connecting better now than they were before.

Aaron:

I'd say there's a trade-off. I think they're getting more types of connections between different types of people, and that's definitely a plus for growing users and growing advertising dollars. I do think there has been an effect that has had on the users. If it's all college students, they're going to act like college students, but as soon as their mothers start coming onto the Facebook platform, they're probably going to start acting a little bit differently, so that's when they start heading over to a new platform. I think some of the popularity of Facebook, with everyone coming on board, has propelled competitors to rise and fill certain gaps that Facebook now has left behind.

Simon:

A niche that's opened up.

Aaron:

Yeah.

Simon:

Good point. All right, well, thanks again for attending our deep dive of Facebook. We'll stick around for a little while, if anyone has any other follow-up questions. Hope this was helpful for everyone, and Fool on!

Summer Solstice Solicits Sunshiny Sentiments

Published Jun 20, 2016 at 3:40PM

Dear *Pro* member:

I was once told by an editor [*editor's note: and I was once told by a managing editor*] that Rule No. 1 of writing a regular column is *not* to cite the weather or the season in your opening line. I'm not sure why that would be Rule No. 1 -- perhaps because it's so commonly done? -- but I must ignore it today as summer begins in the northern hemisphere. It feels downright disrespectful to ignore the importance of the seasons on this day, the longest day, the summer solstice. So, welcome, summer! We love you.

Here is the photo our excellent editor, Ellen, sent me to greet summer -- her daughter, Lola:

I can't get anywhere *near* topping that, so can we all sign off and go outside now?

Not yet? OK. But soon.

June 20, 2016: An Income Assessment (With Sunshine)

Another snapshot in time, today. A June Monday in 2016. With 172 days down, we have 194 days remaining in 2016, a leap year. *Pro* launched in October 2008, nearly eight years ago, or less than 2,900 days. We have healthy returns largely because we had been investing for years prior to 2008, so we know what we like; we know too much activity hurts returns; and we try to avoid big mistakes (although we still make them from time to time).

Most of our gains have been driven by capital appreciation in long-term stock holdings, and that should hold true for the next eight years, too. That said, it may be a bit *less true* between now and 2024, only because we are using (and plan to use) options more often for income now that most stocks don't look as attractively priced as they did in the recent past.

Even so, a few large stock winners the next eight years (and we certainly hope to have several!) will likely still produce the bulk of our future gains here in *Pro*, helped along by income and hedges. I also know that many members write many more options than we do, and produce considerable income doing so. Following our way of investing, you can amp up or down your income as you wish. We aim to amp it up for the rest of this year as long as it looks reasonable to do so.

We had several options expire last Friday for income, including covered calls on three stocks. We're looking to write more options on several positions soon. We're also due to set up new hedges, because our **SPDR S&P 500** (NYSEMKT: SPY) put ratio hedges expired Friday, too (for about $450 in gains, despite being unused).

So far this year, we've made $11,238 on our market index hedges, all of them on SPY. The bulk of that came from a February $200/$190 put ratio spread that ended in-the-money. SPY is at about $208 today, up about 3% this year. The Nasdaq is still down nearly 3% in 2016. Overall, it's generous to call 2016 a wash for most stocks so far. Many stocks have declined sharply.

The *Pro* portfolio is modestly in the green thus far this year, helped by our hedges and by $12,549 in realized option income year-to-date. A good part of the gain from options arrived with last Friday's expirations, but nearly half is still from **Coca-Cola** (NYSE: KO) puts that expired in January. All told, our closed hedges and options have added nearly 1% to the portfolio so far this year, which is notable in a pursuit where you sometimes battle to stay positive, and may need to fight for every point you make.

In 2015, we made about $800 on index hedges, and nearly $17,000 in option income; so we're well ahead of last year's pace, at our current $11,238 and $12,549, respectively.

Our stocks -- as is true for many investors -- have equally given and taken so far this year, resulting in not much change, excluding dividends. But most of our businesses are growing, so they're working their way toward future returns. Some results this year as of this morning:

- **AmTrust Financial** (NASDAQ: AFSI), down about 18%
- **Apple** (NASDAQ: AAPL), down 9%
- **Broadridge Financial Services** (NYSE: BR), up 19%
- **Facebook** (NASDAQ: FB), up 9%
- **Gilead Sciences** (NASDAQ: GILD), down 17%
- **O'Reilly Automotive** (NASDAQ: ORLY), up 4%
- **Papa John's International** (NASDAQ: PZZA), up 18%
- **Skyworks Solutions** (NASDAQ: SWKS), down 14%

Some stalwarts, including **Visa** (NYSE: V) and **MasterCard** (NYSE: MA), are about flat on the year so far, as their value multiples slowly contract; **Starbucks** (NASDAQ: SBUX) is down 7% since January.

It's during times like these that we're happy to own strong businesses that we greatly believe in; we're ready to potentially add to them on drops, while always scanning for more options opportunities. As long as our investing house is in order and we're up-to-date on all of our holdings, we'll also have time to work on other investing content. So it may be summer, but a Fool's work is never done. The key thing is that we enjoy it -- and keep in mind that no Fool should miss the summer for the screen.

On that note, get out and enjoy the longest North American evening of the year! Just visit the Memo Musings board if you have questions, and thank you for being a Fool with us!

-- Jeff (TMFFischer)

Pro Guidance Changes

- None this week.

***Pro* Completed Trades**

- **American Airlines** (NASDAQ: AAL): We sold to close all of our January 2017 $35 calls, getting $2.18 each.
- **Celgene** (NASDAQ: CELG): Per our recommendation, we sold to open eight October 2016 $95 puts, getting paid $5.30 each.
- **Gentex** (NASDAQ: GNTX): Per our alert, we sold to open 25 September 2016 $15 puts, getting paid $0.50 each.
- Our covered calls on **Valmont** (NYSE: VMI), **Skyworks Solutions**, and **WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS) all expired as income.
- **SPDR S&P 500** (NYSEMKT: SPY): Our two June hedges expired unused.

Pro Catch-Up Trades: June 20, 2016

Published Jun 20, 2016 at 3:38PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our Portfolio Building Reports will get you fully invested over the coming few weeks, as much as you want to be.

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **FactSet Research Systems** (NYSE: FDS): Buy 2% in this new position.

Continue building your portfolio with our Buys, including these highlighted today:

- **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY): Buy 1%.

Shorts:

- None currently.

Options:

- **American Airlines** (NASDAQ: AAL): Sell to close your January 2017 calls, per our alert.
- **American Tower** (NYSE: AMT): Sell to open July 22, 2016, $111 diagonal calls for income, per our recent alert. *Pro* is accepting a lower price in order to get this short-term trade done; today, we entered a $0.90 limit order. (Leave your long-term shares in AMT alone.)
- **Celgene** (NASDAQ: CELG): Sell to open October 2016 $95 puts, for a potential 3% stock allocation. With 123 days to expiration, that's 4.1 months. We're targeting at least 1.25% in yield on the strike price per month, so that equates to being paid at least $4.85 per put you write as of today.

Hedges:

- None currently.

Options expiring next:

- **Expeditors International** (NASDAQ: EXPD): August $46/$49 covered strangle. We'll have updated guidance close to the August expiration.

Get to Know the Pro Universe

Published Jun 16, 2016 at 2:55PM

The *Pro* Universe is a screening tool powered by *Motley Fool One*'s Fool IQ and the Fool's central research database to show you Foolish analysts' conviction level on each company. In the following video, TMF head of product Tim Hanson explains the tool from a *Million Dollar Portfolio* perspective.

{% video %}

Fool IQ is a powerful research tool that we have inside of *Motley Fool One* that makes sense of all the stocks that our 50-some-odd analysts around the world are following.

My name is Tim Hanson, and I'm the head of product here at The Motley Fool. You know, one thing about Fool IQ that I think — or that I hope — is fun is that it's appealing to investors who are novices or experts. So if you're a novice investor, we've made some buttons that you can literally just click once and they will make the universe drill down to retirement-type stocks, or small-cap stocks, and so on and so forth. If, on the other hand, you're an expert investor who really likes diving in, you can build your own filters ... your own complicated screens ... to find what you're looking for.

It's a database of all the ideas that our analysts are working on, or of all the ideas inside the service in which you are a member. The way it's like a screener is it allows you to find our favorite ideas tagged by asset class (like small cap or large cap), or industry (such as energy or consumer discretionary). Or by criteria you might be looking for in a stock (if you were looking for a dividend yield, or lower-than-average volatility). Or you'd like to combine several of those elements to find the stock that's really a good fit for your portfolio and what you're looking for.

So the reason it's a little bit unique is that while it does include financial information that you'd find in most screeners, what it also includes is our conviction, or our covering analyst's conviction in the ideas. So we keep track of everything our analysts are following and how they feel about one stock relative to another, and then we aggregate them all into what we call a leaderboard so we can identify someone's favorite idea over an idea that they don't feel quite as strongly about. It's a way for you to personalize our picks, rather than based on what our advisors decide is the best at any given month without knowing your circumstances.

The Fool IQ universe within *MDP* includes all the stocks that you have access to. Those are *MDP* recommendations as well as *Stock Advisor*, *Hidden Gems*, *Rule Breakers*, *Income Investor*, and *Inside Value*. For the first time ever, you're able to access all of those stock picks, all of that investing IP, without having to leave the *MDP* site. We also want to give members the opportunity to engage with the universe of front-end recommendations that they have access to in the same way that the *MDP* advisors do. They're looking for certain strategies. You can look for ideas in those same strategies using the Fool IQ experience inside of *MDP*.

You could use it to suggest potential ideas on the discussion boards, if you wanted to. You could use it to find stocks that would be complementary to what you own. Or if you think, for example, that you want to have more exposure or less exposure than the portfolio managers, you can do that. Or if you come into cash at a time when *MDP* doesn't have cash, or vice versa, you can still get actionable advice from the service without waiting for them to transact.

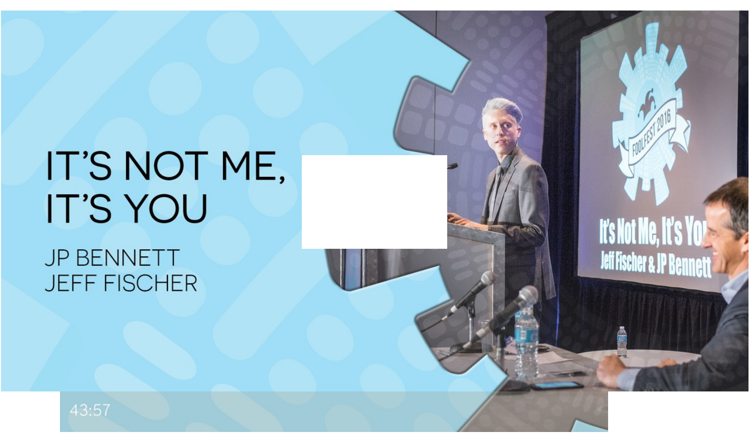
You know, no one's obligated to use it. We're not taking away the recommendations that come out every month in features such as Best Buys Now and Starter Stocks and Core Stocks and all the things that we've tried to do to help people better navigate the universe. We just want to give people another tool that they can use to really make sense of the stock recommendations that they have access to, find the ones that are right for them, and really help you and our company, The Motley Fool, achieve our mission of helping the world invest better. And that's building a portfolio of stocks that you feel great about, on your terms, that can last you a lifetime.

FoolFest 2016: It's Not Me, It's You

Published Jun 16, 2016 at 10:29AM

Our annual member event, FoolFest, took place last month in Alexandria, Va. This video shares some Pro*-related content from the event. Enjoy!*

We talk a lot at The Motley Fool about stocks we're buying, but we hear from members that when to sell is a much bigger challenge. Here, Jeff Fischer digs into how to make the difficult decision to part with a stock.



JP BENNETT:

For those of you who were here, yesterday, for Tom Gardner's opening remarks and Tim Hanson's presentation, you know that they both had some pretty strong things to say about selling, but for those of you who don't know me, I have a bit of a rebellious side to me, and so I'm going to stick my neck out, put my job on the line, and talk about selling.

Specifically, today we're going to talk about *Pro's* approach to identifying when it's not really working out between you and one of your stocks, and when it's time to break up; hence the title of the presentation.

If you think about it, at its core, investing is really all about buying low and selling high. Hopefully the selling takes place far down the road and at a much higher price; but we're really talking about two pieces of the puzzle here. Despite this, it seems like everywhere you look, 90%-95% of the attention is focused on the first half of that equation ... on buying ... and if you think about this from a psychology perspective, this does make a lot of sense.

There's a lot of appeal to finding a new idea — the thrill of the hunt — but there's actually a great quote from Terrance Odean, a professor at the University of California, where he says that buying tends to be more optimistic because it's about what a stock can do for you going forward; whereas selling tends to be more pessimistic, because it's about what a stock has done for you in the past, and this may or may not have been very pleasant, as we all can relate. Now, the side effect of this is that for many people, selling tends to be nothing more than an afterthought with really no deliberate process in place.

From our perspective here in *Pro*, this is really unfortunate, because although it would be great if we could always follow the Buffett maxim of "the best time to sell a stock is never," a lot of times that really isn't achievable for us. If you think about it, we're investing in order to meet financial objectives; whether it be retirement, a college education, or a fancy vacation. We need cash to pay for those things and oftentimes that comes in the form of closing positions. So we think it's really important to give selling its due.

Now, the first thing we want to impress upon you is that selling really isn't easy. It's just as hard as buying stocks, or finding great stocks to buy. One might be able to argue that from a psychological perspective, it's even more challenging. So let's say you bought a stock, here, at around $20 and over time it goes up to $30. That's great. You've got a really nice return, but what do you do now?

Perhaps you're the type of investor who's really concerned about giving back gains, so you sell prematurely, even though the company is essentially firing on all cylinders and odds are the stock's going to keep going up over time.

Or perhaps you're the type of investor who's overly optimistic, and you just think all of your stocks are going to keep going up and up and up and you're subject to what is referred to as the *endowment effect*, which refers to simply by owning something, you tend to think it's worth more.

Or perhaps you considered selling at $30, but you decided to hold off. Then the fundamentals turn and the stock starts to fall and it essentially becomes a dog. Yet you just can't bring yourself to sell because you're anchoring on that $30 price and you're just holding out saying, "That's when I wanted to sell originally. If it gets back there, I'll sell, but not until it gets there." You just leave this stock lingering in your portfolio and not really helping you achieve your financial objectives.

This, alone, would probably be more than enough to make selling quite difficult...

AUDIENCE:

[Laughter]

JP BENNETT:

...but it's just the tip of the iceberg, right? There are a lot of behavioral biases that are essentially working against you to prevent you from making a rational and optimal decision when it comes to closing your positions. And this is why we think it's so important to actually have a deliberate process in place for selling when you actually need to sell.

So moving on, the rest of this presentation is really going to be structured around the why and the when for why we sell in *Pro*. There are a lot of unique scenarios that you will probably encounter during your investment careers for why you need to sell. We really don't have time to cover all of those, so we're just going to focus on what we do here in *Pro*.

With respect to *why*, we're looking for three key things, and the first one is with respect to our thesis. We're looking to see whether it's played out like we had hoped, and so we no longer have our reason to invest in the stock. We're looking to see if our thesis has kind of drifted in an undesirable manner, or we're looking to see if our thesis is essentially straight up busted and the fundamentals have changed. Now this is a really big component of the *when*, so we're going to skip over that for the time being and talk about the latter two (risk management and opportunity cost).

With respect to risk management, there are a ton of things that we could talk about, but today we want to just touch on the whole notion of managing or trimming positions, and to a large extent, this really has to do with the debate between not wanting to punish your winners versus insuring that you don't have a single point of failure in your portfolio.

I'll be the first to admit that the notion of punishing your winners — that is, selling shares of a stock simply because it's done what you wanted it to do (and not only that, but it's done such a good job [that] it now represents an oversized percentage of your portfolio) — doesn't sound very smart. That's not what we want to happen.

But at the same time, I think it's important to realize that you can't let those positive possibilities cloud your judgment of potentially investing in the next **Amazon** (NASDAQ: AMZN) or **Apple** (NASDAQ: AAPL) in the early innings, and have that prevent you from making an appropriate portfolio-management decision and ensuring that your performance and your ability to achieve your financial objectives isn't overly reliant on the performance of one or two stocks.

A great example of this, from our perspective, is **Valeant Pharmaceuticals** (NYSE: VRX). For those of you who don't know, last year Valeant was essentially the epitome of a hedge-fund darling. In the second quarter of 2015, there was a ton of really large investors with really big stakes in the company and Bill Ackman of Pershing Square fame had, at one point, around 20% of his funds in this one stock. He referred to it as an "early stage **Berkshire Hathaway**." (NYSE: BRK-A) (NYSE: BRK-B)

Now, Valeant's fall from grace, as you can see by the stock, is really nothing short of amazing, but the point we want to focus on here, for the purposes of this discussion, is the notion that here you had a bunch of hedge funds, who had millions of millions of dollars to spend researching this one company [and] who had access that we couldn't even dream of here at the Fool. Who employed some of the brightest minds in the finance industry, and even they couldn't see what lay beneath the surface with Valeant.

So from our perspective, it forces us to realize that we need to have some humility, here, and understand that we Foolish investors, with far fewer resources at our disposal, can't understand a single stock well enough to the point where we can justify making it an oversized percentage of our portfolio and make our dependence overly reliant on that one stock.

As far as *Pro* is concerned, we tend to have 7% be the general point where we start to have those discussions, and 10% of our portfolio tends to [be] more of the hard line for us. But it's important to remember, first and foremost, we're Foolish investors, so we're not micromanaging our positions. We're not selling or adding every time a position changes by a couple of basis points. We really want to let our winners run as much as possible and then only seek to sell some shares — not all — just some if it gets to the point where diversification becomes an issue for us.

Moving on to opportunity cost, *Pro* was originally seeded with $1 million from The Motley Fool, and that's the only external funding we're ever going to receive. The only way our portfolio will grow over time is through performance, so basically, what we've got is what we've got. This means if we want to keep buying shares of new companies, at some point we're going to have to sell shares of other companies.

And if you drill this down even one step further, it's worth considering why you would want to keep just an average idea in your portfolio when you have something that you think is potentially a *great* idea. Once again, we're Foolish investors. We don't believe in high turnover. We want to find great companies that we can hold for extended periods of time, and reap the benefits of capital appreciation with minimal tax and trading consequences.

But at the same time, we don't necessarily think you should essentially just grandfather a position in your portfolio. That's to say that periodically, we think that your stock should essentially *earn* the right to be included in your portfolio. They should demonstrate it with their performance, and you shouldn't just keep them in there simply because they were in there the day previous.

A great example of that from *Pro's* past is **AIG** (NYSE: AIG), the insurer that got into just a tiny bit of trouble in the financial crisis.

AUDIENCE:

[Laughter]

JP BENNETT:

Now the team, back in 2012, took a look at it, and they found a reformed insurer that was much more simplified, trading at a really attractive valuation for what an average insurer should be trading for, so they bought shares. And basically over time, the company has stayed decidedly average, but that valuation discrepancy ran its course, and it was no longer trading for a deep discount to what an average insurer should be trading for.

We decided that, especially when you consider the alternatives we were thinking of investing in, it made sense to sell those shares, and we ultimately picked up **Visa** (NYSE: V) and **Verisk Analytics** (NASDAQ: VRSK). Now, both of these companies have outperformed the S&P since we bought shares, but really importantly, from an opportunity-cost perspective, both of those stocks have outperformed AIG by around 15% in the first year. We think that so far, it's playing out in terms of us making a smart move in terms of opportunity costs.

Now let's switch into the second part, the *when* part of the presentation. The first thing that we really want to impress upon you is the importance of having the proper mind-set. I'm a firm believer that you need to have the right mind-set straight from the get-go if you want to mitigate the impact of all those behavioral biases we referred to earlier.

And one of the keys to doing this is accepting the fact that reaching the point where you decide to buy shares means that in no way you're at the finish line. Now that you have capital on the table, you can't fall prey to the allure of just looking for confirming evidence to your thesis, and just root your stock sign higher. You need to maintain an objective mind-set, because now the risk of losing capital is real, and you need to be looking for *dis*confirming evidence for your thesis, even if it's uncomfortable. And in most cases, it is.

The reason for this is pretty straightforward. Last year, J.P. Morgan did a pretty good study where they looked at the Russell 3000 Index from 1980 to 2014. As to what they found, the first thing really isn't all that surprising, and I'm sure a lot of you know this ... that two-thirds of the stocks in this study underperformed the index.

But even more interesting, from my perspective, is they found that 40% of the stocks in the study, from their all-time high, had a permanent decline of 70%. A permanent decline. So there are a lot of duds out there in the public markets, and this means that like it or not, we try to avoid it, but some of these are going to make their way into our portfolio. So you need to maintain an objective mind-set and have some humility to be able to accept when you've made a mistake because as the famous saying goes, "It's OK to be wrong, but it's not OK to stay wrong."

Moving on to what we talked about earlier with respect to thesis tracking, we're looking for these three key things, and it's actually pretty straightforward in terms of tracking them and making sure that we can identify when one of these things are taking place. Specifically, what we're looking for is when you find a stock that you think you want to buy, what do you do?

You create a thesis for why you're doing it, and key to that is identifying the key drivers that will make your thesis play out, and [make] the stock a good investment. Once you've identified those key drivers, just track them over time to make sure things are progressing in an appropriate fashion.

Now, I'm not saying track them quarter to quarter, and if the company messes up in two quarters, pull the ripcord and get out. You want to give the company the ability to manage for the long run, but at the same time, just make sure that your thesis is working appropriately. Now let's move into some examples. We'll go in order here to flesh out this idea a little bit more.

The first one is when your thesis plays out like you had expected. Back in 2010, we had the [Deepwater] Horizon oil spill and in the aftermath of that, it seemed like every company that had even the slightest exposure to deepwater drilling really had their stocks take it on the chin, regardless of how much that would actually impact the business. The *Pro* team looked at Bristow Group.

For those of you who don't know, it's in the helicopter business, and essentially what they do is provide transportation for the crews, for supplies, for machines, and things like that. They felt like the haircut that the stock took really wasn't fair. The stock was now trading at a discount to the fair value of its helicopter fleet -- that they had recently upgraded -- that you really hadn't seen at all in the past five years.

Pro bought shares, and over time, the thesis proved itself as the market subsequently realized that the discount really wasn't warranted, and the business continued to perform pretty admirably. The stock recovered, and it was at this point the *Pro* team decided that basically the thesis had worked, and we don't have a reason to own shares anymore. Let's look for something else.

The next one is thesis drift, and David Einhorn from Greenlight Capital has a really good quote on this, where he basically says that he doesn't have a ton of rules, as far as investing is concerned; but one rule that has served his team really well is, whenever they find that they're wrong about why they did something, they get out of the position, period. End of story. They never invent new reasons to stay in a position when the original reason isn't there anymore.

So what you're really looking for is, say you invest in hypothetical Company X for a reason we call Thesis A. Over time, that thesis proves to not work out. It's a bust. But instead of recognizing that you were wrong, you dig in your heels, and you invent Thesis B and say, I'm going to stick with this one. Thesis B doesn't work out, but instead of recognizing that you were wrong and taking your capital and putting it in a more promising situation, you dig in your heels once again, and you come up with Thesis C. You continue to justify your actions instead of recognizing that you were wrong.

I'll be the first to admit that we're not perfect here in *Pro*, by any stretch of the imagination. We make a lot of mistakes, but one thing that I found by going back and reviewing *Pro's* history, even before I joined the team, was that the *Pro* team has a really good track record of acknowledging when they were wrong and not trying to come up with reasons to justify their reason for holding a particular stock. I actually don't have an example for this one, so we can move into the next one — the one that is probably the most prominent — and that's when your thesis is just busted.

Now, Scott Fearon is a money manager, and he's not really as well known as the other people I've quoted so far. He's got a really good book called *Dead Companies Walking*, where he talks about how he's been really successful at shorting over the years. This quote really struck a chord with me, because he acknowledges that he's not perfect, but he considers himself to be a really great quitter.

That's one of the things that has helped him succeed over the long run -- and actually do really well and vastly outperform the S&P 500. It's because he understands what the J.P. Morgan study found (that more companies are going to fail than are going to succeed), so if you can essentially identify when you are wrong early on in the process, you can actually put yourself at a huge advantage going forward.

The example we'll use, here, is **The Buckle** (NYSE: BKE), which is an apparel retailer who specializes in having a really good in-store experience, and they sell an awful lot of denim. Now, when we bought shares, there were three things that the *Pro* team really liked. They thought the management team really had a firm grasp on the industry and understood what it takes to create shareholder value. The store performance was really impressive, and it was actually getting more impressive over time. And then, of course, there was some type of valuation appeal to the thesis, as well.

But what we found as we tracked the stock over time — those first two points right there really started to come into question. Specifically with regard to the first point, what we found was there were two big things that the management team really whiffed on. The first one was the activewear trend — the trend that has been benefiting the likes of Nike and Under Armour for years now. I really hesitate in even calling it a trend, because it's not something that was hot in the spring and no longer fashionable in the summer.

This has been around for a couple of years now, and if you look at the chart on the left, you'll see that activewear, which is represented by the blue bars, has really accounted for the vast majority of growth in this industry. There have been many years where the bricks-and-mortar stores for ex-activewear has really done almost nothing. It's been flatline, and in some years even negative. The management team really was unable to deal with this shift that we saw within the industry.

The second point is the move to online retailing for apparel. We all know that online accounts for a really small percentage of total overall sales in the U.S., but within the apparel industry, it's a vastly different story. These are numbers from 2014, and I'm still waiting for 2015.

But at that point, online sales had already accounted for over 17% of total sales, here, in the U.S. and it's consistently growing in the high teens/low 20s. With bricks-and-mortar performance, in your good years you're getting low single digits, and in most years you're getting flat to potentially negative growth.

For the longest time, The Buckle really didn't prioritize having a good online presence, and that really started to eat into their store performance. A key metric that you should be looking at when you're considering buying bricks-and-mortar [retailers] is same-store sales or comparable-store sales, and this way, you can get a feel for how the stores are performing over time.

The thing that we saw with The Buckle was that there was a divergence that started to take place within The Buckle and the industry. Now, to be fair, the industry has definitely had some hard times over the past few years, and especially recently, it's been getting hit pretty hard, but the divergence was alarming for us because it seemed like The Buckle, more often than not, was doing worse.

We eventually got to the point where we essentially lost conviction in those first two parts of our thesis, and because of that, we decided that the thesis was busted and it was worth selling shares, even though we had given back a lot of the gains that we had. We still closed for a relatively modest gain, but we wanted to wait and make sure we saw that the performance really wasn't there and the thesis was truly busted, and so we decided to sell at this point.

It turns out it was a really good call because their performance since then...

AUDIENCE:

[Laughter]

JP BENNETT:

...has been really lackluster. They've had comparable-store sales growth of negative 10%-plus for the past few months, and they're just really struggling right now.

Now, if you want to talk a little bit about that valuation part of the thesis, as you can see, we actually sold the stock at a valuation that was quite attractive compared to historical norms. But one thing I'm sure every investor knows is that cheap stocks can get even cheaper...

AUDIENCE:

[Laughter]

JP BENNETT:

...and that's exactly what happened with The Buckle. We gave back a large chunk of our gains, like I said, but since we closed, it's down around 32%. I know it was down again, today, based on some pretty weak earnings. Overall, I would say we probably made a really good decision acknowledging that our thesis was no longer in play and it was time to move somewhere else.

Now one thing that a lot of people think about with selling and selling discipline is a valuation-based approach, and that's because a lot of people think about traditional value investing, where you've got a stock trading for, say, $30 and change. You think the intrinsic value is close to $40, and you want to benefit from that convergence, and once it hits $40, you're selling and you're out of the stock.

But once again, in *Pro* we're Foolish investors, so although we're looking for that difference, we consider that more the margin of safety, because we want great stocks that we can hold for long periods of time that can deliver those outsized returns. One of the things that really helps hit home here is the example of **Starbucks** (NASDAQ: SBUX).

We bought Starbucks in the second half of 2012 and it really took only a couple of months where we had a really strong earnings report and the stock moved above what we thought the fair value of the stock was. But for those of you who track Starbucks, you know that our decision to not sell just based on valuation was a great one, because the stock has been an absolute monster since then.

And if you want to take a step further to look at when we decide it's OK to sell based on valuation and when it isn't, it really gets to the point where there's different reasons for a stock to increase in value. So going back to that hypothetical example, let's say that that stock at the time, when it was trading for around $30 and change, was trading for around 18x earnings. Now here's two possibilities for when you fast forward and the stock has more than doubled.

In the top example, sure, the business has grown and earnings have increased, but the primary driver for that increase in stock price has been the market's willingness to pay a higher multiple. To pay more for those shares. And that's an example where we tend to be somewhat leery, because it's really hard to predict what the market's going to think about a given stock in the next couple of days, couple of months, couple of years. So that's an instance where we will more strongly consider valuation.

Starbucks, on the other hand, was a case of the lower example, where it was really strong store performance that was driving the increase in stock price. In this example, yes, the market's now paying slightly more for those earnings. It's primarily the company knocking it out of the park and firing on all cylinders, and that's what's forcing the stock price higher.

So in that case, because we recognize that valuation is more of an art than a science, and there's more of a fair value range of a stock than a specific point, that's a case where we'll be happy to sit back and say: "You know what? We may be wrong, here, on valuation. We may be undervaluing this company. We probably shouldn't sell just based on valuation alone."

Here's a great quote from Chuck Akre of Akre Capital Management on the situation, where he basically admits that selling for him is rarely about valuation, and just about valuation, because he understands that the great companies (the Starbucks, the Apples, the Amazons) are really hard to find, and once you find an attractive entry point to buy shares at, you really shouldn't part with them lightly.

He's had plenty of examples where you have a stock that you get out at $50 and tell yourself you'll get back in at $35. Well, it's going to fall down to $35 and a penny. You're not going to look at it again, and then the next time you do, it's going to turn into an Amazon and be trading for $300 or something like that, and that can really hurt. So if you've got a great stock, don't just be beholden to valuation-based principles for selling.

We'll leave you here with just a few more final thoughts, and the first one is, first and foremost, once again, we're not advocating for a trading mind-set. We're Foolish investors. We just think it's important to understand that this is a really important part of the process for a lot of people, in order to have the funds to pay for what they're investing for, and so it's important to develop a process and not just leave it to an afterthought and haphazardly decide when you're going to sell a given stock.

The second point is, just like with buying, you're never going to bat 1,000%. It's incredibly hard to call tops and bottoms. Some of the stocks you sell are going to go on and become the next Apple. Some of the stocks you don't are going to become duds. But what you need to focus on is your total portfolio performance, because ultimately, that's what's going to determine whether or not you're able to meet your financial objectives. You can't just focus in on one mistake and let that beat you up. You can learn from it, but don't let that mistake essentially defeat you.

And then the last one is just with respect to timing versus longs and shorts. In *Pro*, we actively short stocks, and there is definitely a different nuance with regards to timing. As our example with The Buckle showed, we really want, when we have a long position, to give the company its fair shake to prove us wrong. To turn the ship around. We don't want to, like I said, pull the ripcord after a bad quarter or two, because the company may turn around and recover, and it may just be a short blip in the radar.

With respect to shorting stocks, though, there are basically two things that you're essentially fighting against. The first is the cost to borrow shares. You essentially have to pay a fee to short stocks; and the second one is, the market tends to grind higher over time, so when you short something, you're essentially trying to fight that tide. You tend to want to have a shorter leash for our shorts.

An example of this, here, is **Five Below** (NASDAQ: FIVE), a retailer that sells five-dollar cheap-priced knickknacks. When we decided to short it, there were three things that we homed in on. As time progressed, the first and the latter point hadn't really run its course, yet. It can take quite a while for competitive dynamics to change within an industry, and the financial flags that we had identified — some were working out as we wanted them to. They were getting worse (like inventory management). Other things weren't really playing out like we had hoped. It was essentially a push, in my opinion.

But the one thing that really made us take a step back was the issue with respect to the management team. When we originally shorted it, it was run by their founders, who had a prior public company that they took into bankruptcy. There were some decisions that we saw them make that really made us question whether or not they could create shareholder value over the long run. So although we were short the company, we really liked the management team there, but we wanted them to stick around for a while.

AUDIENCE:

[Laughter]

JP BENNETT:

Shortly after we shorted the company, we started to see a bunch of management turnover. They got a new CEO from **Wal-Mart** (NYSE: WMT). They replaced a bunch of executives. That forced us to take a step back. We essentially decided that, "You know what? These guys aren't proven. We don't know whether or not they're going to be able to achieve their goal of opening 2,000 stores in the long run, but we've got a really nice thing, here." And especially given what the market has done (the market was up over that time frame), we decided that it was probably best for us to take those gains and go elsewhere.

The final point here for this presentation, before we get into the Q&A, is the ultimate litmus test, and that's reallyl whenever you're looking at your stocks, just ask yourself: "If I didn't already own it, would I want to buy it today?" If not, it might be worth at least having that discussion with someone else, or even with yourself, to think whether or not it's time to break up with this particular stock. And with that, let's go on the Q&A.

AUDIENCE:

[Applause]

JP BENNETT:

Thank you.

JEFF FISCHER:

Such a great, attentive audience. Do you have any questions for JP and myself?

JP BENNETT:

Or Jeff?

JEFF FISCHER:

Yes?

MALE:

[00:30:59]

JP BENNETT:

For that example, it's important to differentiate optionality from thesis drifts. In the case of an Apple or an Amazon, where you have one thesis, and originally they knock it out of the park, your thesis isn't drifting. They knock it out of the park, and then they have that optionality to develop another one. And then you see, "OK, now they're moving on to the iPod. Well, they killed it with the Mac. Maybe they're going to do well with the iPod. So it's worth sticking around for that." They kill it with the iPod, and then you see the iPhone coming down the line. "Well, maybe the third time's the charm and they're going to keep going on and on." So it's really important to differentiate between the two.

MALE:

[00:31:44]

JP BENNETT:

I don't follow **Chipotle** (NYSE: CMG) that closely, so Jeff, this is all you.

AUDIENCE:

[Laughter]

JEFF FISCHER:

I don't follow it, either, but I have an opinion. Or I'm about to have an opinion.

AUDIENCE:

[Laughter]

JEFF FISCHER:

But I'm happy to share. We know management has executed very well in the past, and what they sell has really connected with consumers on a broad basis. It's one of the most successful quick-serve restaurants ever, so far, in the short history of what they're doing.

I would give it more time to play out, still. Food-based illnesses have happened to probably a majority of restaurant chains at some point or another. They didn't deal with it as quickly or effectively, in my opinion, as I would have liked them to have, but I think they're learning very rapidly the cost of their actions, and I think they're going to make up for them in the long run.

So if I were an owner of Chipotle — and I'm not, but we've looked at the stock several times since this happened — I believe I would keep it. I don't think the thesis is broken. I think they've definitely hit one of those one or two-year speed bumps that JP mentioned. I don't think the thesis is broken yet, but they've hit a real challenge, and they dealt with it, in my opinion, maybe on a 6 out of a scale of 10. They scored a 6. Hopefully with the next challenge, they'll do better. Any other questions? Do you guys never sell stocks?

AUDIENCE:

[Laughter]

JEFF FISCHER:

That's OK.

MALE:

When things are busted and it's time to sell, is it also time to look at coming out of the short?

JP BENNETT:

We should have with The Buckle.

AUDIENCE:

[Laughter]

MALE:

Weren't you thinking about it?

JEFF FISCHER:

With The Buckle, no. With other positions, yes.

JP BENNETT:

Speak for yourself, Jeff.

JEFF FISCHER:

Oh, were you? So many sells we've looked at later and thought, "Why didn't we short it? We should think about shorting it." But in a lot of cases, hopefully the companies that we buy have enough qualities that it will keep us from shorting them even if we no longer want to own them. But it's always worth considering. If you're selling it, at least consider shorting it.

FEMALE:

[00:34:16]

JEFF FISCHER:

I bet we can each add some tips. Look at the 150 really sincerely, and any that don't really speak to you, that don't draw some sort of reaction from you, like "Oh, I like that." If it's just an "Eh, I don't know why I own that," then definitely put that on the list to potentially sell. If it's taxable accounts, of course, any that are "eh," and at losses, if you have gains to offset, that's a tax-friendly decision right there. That's two points. JP?

AUDIENCE:

[Laughter]

JP BENNETT:

But you stole my two points, Jeff.

AUDIENCE:

[Laughter]

JP BENNETT:

I would say...

JEFF FISCHER:

Got to go for it.

JP BENNETT:

The big thing is you're going to want to start to give yourself essentially hunting ground within your own portfolio. So like you said, do just a quick [review] of "like it, don't like it, like it, don't like it." And then once you compile a list of "I don't like" stocks, then it's time to maybe do a little bit more digging. And also, I would say one thing to pay attention to is essentially to make sure when you're selling stocks, you still remain properly diversified in terms of sectors and things like that.

I don't know your investing style, but maybe you have a penchant for biotechs and other things like that; and so all the stocks you don't like are just other stocks, and you just cut them out. Then what you're left with is an extremely volatile portfolio that may or may not achieve your objectives.

You have a very challenging task ahead of you. I commend you for undertaking it, because I think it's definitely important to take the first step, but I think the most important thing is to just develop a game plan and a point of attack.

JEFF FISCHER:

And if you don't have a thesis for any of the stocks as you go through them, you don't have to throw it out right away, necessarily, but take a look at it, as JP said, and then see if you can come up with a thesis. Well, that's kind of dangerous at this point.

AUDIENCE:

[Laughter]

JEFF FISCHER:

If you don't have a thesis, consider selling that one, too. You should know why you own it.

MALE:

[00:37:28]

JEFF FISCHER:

That's a great question. The question is, do we manage our own portfolios differently than the *Motley Fool Pro* service? Do we take a different approach? And over time, the answer is, "less and less." My portfolio and the *Pro* portfolio become more and more similar kind of naturally over time. And we try to manage the *Pro* portfolio as we would want our own portfolio managed. We don't want high turnover. We don't want to give you tax bills. We don't want to hang onto losers and just hope against hope that they'll work out.

It's one thing, I'm proud of, that we don't have much thesis drift. If a thesis isn't working out — like InvenSense was something *Pro* owned early, or 3D Systems — we'll hopefully sell. That's true of ourselves and it's what we'll do in the service, too. And some of those sells are hard, because they're recommended in other places.

But what we always think about in the end, and what the Fool is always thinking about, is the best choice for the member, and every service tries to do its best to make the best choice for the member. And that's typically the best choice for ourselves, too. We're invested right alongside you, and over time, I'd match the portfolio exactly, if I could, but my portfolio and *Pro* are becoming very similar over time.

JEFF FISCHER:

Did I make buys and not recommend them, or why is it different? The context is, *Pro* started in 2008, and I arrived with an existing portfolio myself. And a lot of *Pro's* early buys (Open Text, Amtrust, Oracle) were things I owned personally. So it started out where *Pro* was mirroring what I owned and then we started to get new things into *Pro* that I don't own and that I couldn't own first. If I know we're going to recommend it in *Pro* and I don't own it, I can't buy it.

So we'll recommend it in *Pro* and then eventually I hope to get a chance to buy it inside our trading restriction guidelines. So part of the reason I don't own everything is we have trading restrictions that keep us from easily owning everything. And anything I buy, I cannot sell before *Pro* does, no matter what. I have to keep that in mind, too.

JEFF FISCHER:

A sell watchlist? Should you have a sell watchlist? We talk about the positions that we would sell first if we wanted to raise cash, and I think anyone with a limited funds portfolio can benefit by doing that. So you have a short list of your favorites, I imagine. Why not have a short list of your least favorites?

And the way we work, especially, is very deliberate and very slow. It took us quarters and quarters to sell The Buckle. We were thinking about it for several quarters, but having that list initially helped. So right now, we have a list of things that we would sell first if we wanted to raise cash.

So yes, I think that's a good practice. It also makes you pinpoint and be aware of your so-called problem positions, or the ones that aren't working out as you hoped right now. Put them on the deck, so to speak, to be sold off if they don't get better. That's a good way to stay on top of your portfolio. We have time for one more question for JP.

AUDIENCE:

[Laughter]

MALE:

How do you separate emotion from this?

JP BENNETT:

That's definitely really tough, and one of the best things to do, obviously, is to try and not focus on the stock price, but in reality there are a lot of situations where you have to and it's almost essentially unavoidable. The key thing for me, as an investor, is I think it's important to know thyself. As an investor, you need to be able to identify what your triggers are and what gets you emotional.

The first thing is, whenever you get to a point where you think you want to make a decision, at least sleep on it. At least try and walk away for a little bit, because maybe the couple of percentage points that the stock moves in the interim isn't really worth worrying about in terms of making sure that you have a clear head.

And one thing that works a lot for me, and it might work for other people too, is whenever there's a position like that (a problem position) I always go back to the thesis. Go back to the key drivers that I've identified, and try to step away from what's going on in the market. Just bury my nose in the financial statements and try and step away from the activity.

It almost, to a large extent, helps me essentially calm my mind and refocus on what's really important, and there may be a case where it's like Chipotle, where the stock is getting hammered, but if you look at what the company's doing, you ultimately decide that this may be the first of three strikes, but it's not worth being all three strikes at once, and it's time to go elsewhere.

All right, thanks everyone.

FoolFest 2016: Advanced Options Strategies

Published Jun 16, 2016 at 10:24AM

Our annual member event, FoolFest, took place last month in Alexandria, Va. This video shares some Pro*-related content from the event. Enjoy!*

Motley Fool Options Co-Advisors Jeff Fischer and Jim Gillies led this in-depth seminar for experienced options investors interested in going deeper.

{% video %}

JIM GILLIES:

Thanks for coming. I am Jim Gillies, co-advisor of *Motley Fool Options* and lead advisor of *Pro Canada*. Jeff and I drew lots to see who was going to do the basic *Options* presentation and the advanced *Options*, and you can see who lost. Did anyone go to Jeff's session? Jeff had 40 slides for beginner options, and I have 10 slides for advanced options.

AUDIENCE:

[Laughter]

JIM GILLIES:

So there's a message in there somewhere. I'm also going to be squinting at my iPad, so if I'm not looking at you, it's because I'm trying to figure out what I'm going to say again.

Everyone's obviously spent a little bit of time in *Motley Fool Options*, I'm guessing, or at least you're interested through the [Everlasting Portfolio options] that we brought out. I think we started about a year ago on that. And Jeff would probably agree with this. We often feel that we're saying the same things over and over again, because we're generally saying the same things over and over again.

But it's true. It's like, we don't want you to overleverage. We don't want you to do things you're not comfortable with. So if you feel that you've heard a lot of this before, think how I feel.

AUDIENCE:

[Laughter]

JIM GILLIES:

But we'll try to get through this in hopefully about half the time allotted, and we'll have a bunch of time, there for Q&A.

Q&A this year is apparently a little different. You've all got index cards on the table. You'll be writing on those, and I believe Liz — wave at the back, Liz — will collect them, or if you have something you want to ask, Liz will collect them and bring them to me. I will weed out the bad questions and throw them away. Anything that's making fun of me, I will read, and then hopefully we'll get to a few and we'll go through the session.

Advanced options is a broad subject. I mean, the Bible on options for investing is McMillan's book [*Options as a Strategic Investment*, by Lawrence McMillan]. That thing is about 1,200 pages with appendices, and it's not light reading. So when you say, "Oh, you can do advanced options," I'm like, "OK. Let's try to narrow that down a little bit."

I was going to talk about three strategies — the diagonal call, the synthetic covered call, and the jade lizard. I know you're all disappointed, but I had to drop the jade lizard, so if you want to talk about jade lizards later, we can do that, but for the interest of expediency, we can come back to that.

Options, as a Foolish tool -- it's hard to believe they really didn't exist until about seven or eight years ago. In 2006, as a young eager Fool, I pitched an idea for a service that looked a lot like *Motley Fool Options* to Tom and Dave. They were very nice, and thanked me very pleasantly. "That's great, Jim. Thank you very much," and completely ignored the whole thing for the next couple of years. And it was probably right to do so. Tom has talked a lot about how he didn't think options were Foolish.

Jeff Fischer came back to the Fool after being gone for about four years. We launched *Pro* in late 2008. We launched *Options* together in 2009, and from that you can probably glean who the better salesperson is.

AUDIENCE:

[Laughter]

JIM GILLIES:

Today we've got options in multiple services. Obviously *Motley Fool Options*, *Pro*, *Pro Canada*, *Special Ops*. There's an *EP Options* and a couple of services that are no longer with us (*Alpha*, for example). There was options use there, and what we've done is encouraged options use, and we've gotten through the message that options are Foolish.

I think this is just personal speculation, but you're listening to me, so...

AUDIENCE:

[Laughter]

JIM GILLIES:

...I think what options do is they scratch an itch for the investor. Especially in the 21st century wire-connected world, we've got these two competing narratives coming out. On the one hand, long-term buy and hold, and "our favorite holding period is forever" with Warren Buffett. And Charlie Munger talked about, "buy good companies and sit on your ass while you're not doing anything." *Gee, I bought **MasterCard*** (NYSE: MA). OK, I'm done.

And on the other hand, you've got CNBC nattering at you 24/7. You've got Jim Cramer coming on every night. "Buy Apple. Sell Apple. Buy Apple. Don't trade Apple." Last night, did anyone see the headline on CNBC tied to Tesla? What did Tesla do yesterday? They're offering stock. Two billion dollars to bring you your Model 3 two years faster. Two billion dollars [in] stock. The worst kept secret. Everyone knew Tesla was going to have to do this. What was the headline on CNBC yesterday? Not "drop." *Plunged! Tesla plunges!* Did you happen to check what it did? It was up 3% during the day and it was down 0.5% after hours. That in a 24-hour, always-investing, do-something [television program], that qualifies as plunging. Sure.

And even Motley Fool, we've always got a stream of ideas coming at you, and there's always all kinds of things going on. You have these two competing narratives. You have the "do nothing" narrative and you have the "oh my goodness, I've got to do something," so call this the logical side of your brain and the emotional side. You guys are on the logical side. (Jim points to the left side of the audience).

AUDIENCE:

[Laughter]

JIM GILLIES:

Sorry! (Jim points to the right side of the audience). And I maintain that options and options use — Foolish options use — unless you scratch that itch, you can leave that side of the portfolio alone. It's just a theory. Worth what you paid for it. But we know long-term buy and hold works, so let's look at the stuff where we can scratch that itch. Get your trading fun in. Maybe make some income. Maybe make some capital gains, as well, and we move from there.

This is the 7 Rules. Does anyone not know what the 7 Rules are? Has anyone not seen the 7 Rules of Options Use? If you're a *Motley Fool Options* member or a *Motley Fool ONE* member, of course, in the service it's like the first thing you see over in the guidebook and Options U. This is how we run the service.

The most important is the first one — valuation first, options second. We spend 90% of our time with No. 1. That's the dirty little secret. That's where all the Foolish investing principles come in. That's where we're looking at the business's cash flow. That's where we're looking at the strategy and what's going on. And the options come — I'm going to let Rick take my picture — at a later date. Everything else is kind of a follow-on.

Second, we do think long term. Options, people tend to think, are short-term vehicles. The longest-dated, publicly traded option tends to be about 26 months if you happen to get it on day one in September, when the two-years-hence options come out. Yet we can run strategies for multiple years. We've been running a strategy on **Monsanto** (NYSE: MON) in the service for six-plus years now, and ideally we'll run it another six-plus years unless it gets bought. I'm still trying to wrap my head around if someone is going to buy Monsanto. Monsanto is hated so much! Who would buy them? Why do you want that headache?

We are more often writers than we are buyers, because we like to get paid. Options can have the somewhat negative effect of going to zero, which is less pleasant than you think it is (unless you've sold that option). So we do tend to like to write the options most of the time.

Diversification is not necessary. We can pick one strategy and run with it. Jeff is very famous for saying he likes to run one strategy. He likes to write puts, write puts, write puts, and for variety write puts.

AUDIENCE:

[Laughter]

JIM GILLIES:

Or you can pick a stock... This is payback. There he is! This is payback for 2010 in Miamim when he wrote a column wherein he said I was going to be standing in a disco bar wearing a glitter suit.

AUDIENCE:

[Laughter]

JIM GILLIES:

And that went out to how many umpteen *Options* members? So this is for Jeff, who I'm going to call up later.

So diversification. You can run multiple strategies on the same company. **GameStop** (NYSE: GME) has been in *Options* for years and we've been running variants of income strategies on it.

We stay focused. Again, we're focusing on the business. We're staying off CNBC is what we're doing most of the time.

We believe in making money most of the time. We're not looking for options strategies to individually beat markets at any given time. We prefer our portfolio to beat the market and we prefer accuracy. With most of them, at the end of the strategy you have more money than when you started. Pretty simple.

And then the last one. We like community, which should be glaringly apparent.

The next Jeff shot. Make sure he's not checking his phone. So this is Jeff's 40-slide presentation in one.

AUDIENCE:

[Laughter]

JIM GILLIES:

This is the two types of options. (He's going to shoot me later.) Two types of options — calls and puts. Four different positions for options. You can buy or sell each, so you can have long call, short call, long put, short put.

Options are Lego blocks. You put them together along with long stock or short stock and that is how you make the advanced option strategies we talk about. Everyone is familiar with the Lego block concept, I'm sure, with options. The simplest Lego block position would be... Anyone? Covered calls. A covered call is just you buy stock and then you write a call option against it. There's your Lego block concept. Two securities together that are working for a specific process outcome.

So our first diagonal call. Who does not know what a diagonal call is? Probably about 15%-20%. Who hates diagonal calls? It depends how they go. You can make a decent amount of money on diagonal calls. You're not going to shoot the lights out, but you're probably also not going to blow a big hole in your portfolio, so on balance, that's a good thing.

A diagonal call is like a covered call, except you are purchasing a deep-in-the-money call option instead of stock by as long-dated as you can. Right now in May 2016, the longest-dated options that are publicly traded and available are January 18, so that's where you look and you stop looking. You buy that. (If you are a member of Fidelity and your broker tells you to set up a diagonal buying of a six-month option, ignore them. That's true — Fidelity does that.)

And then you sell a short-term out-of-the-money call. So again, it's like a covered call, and it's going to let you scratch that trading itch I was talking about earlier, because you have to do something probably every three to six months. Maybe a little more frequently, maybe a little less frequently, but the general average is every three, four, or five months, you're going to being doing something. Some sort of a rolling trade or your written call will expire and so you'll do another one.

I believe these are IRA-friendly. Being a Canuck, we don't have IRAs and we're not allowed to do it in our registered accounts. But I believe it's IRA-friendly.

The reason you are buying deep in the money when you buy your call is go to the principle of option prices being the summation of intrinsic value and time value. Does anyone not know what intrinsic value and time value are? *This is the advanced class*.

AUDIENCE:

[Laughter]

JIM GILLIES:

So real difficult math, here. The intrinsic value of a call is simply the difference between the stock price and the strike price. If you have a $60 stock and you're looking at a $40 striking call, $60 minus $40 is $20. The intrinsic value of that call is $20. So that call better cost more than $20 when you see the price. If it doesn't, you should probably buy a lot of them and then sell them immediately to the next sucker. So that's intrinsic value.

Now intrinsic value is bounded at zero, so if you're looking at buying a $65 call and the stock is trading at $60, well $60 minus $65 is negative $5. It doesn't have an intrinsic value of negative $5. Intrinsic value is bounded by zero on the bottom, so it's either bounded by zero or the stock minus strike price.

Time value is just the market's trading price less the intrinsic value. So if, again, the stock is at $60, you're buying a $40 call, the intrinsic value should be $20. You see that option is trading for $25. The time value is? $5. Very simple.

So when you're doing a diagonal — the call you're buying — you want to buy as little time value as possible. Why? Because time value goes away. It is going to go to zero, and we don't want to buy something that goes to zero. We want to *sell* something that goes to zero. So we buy as deep in the money as possible. The farther down the strike price is away from the current stock price, the less time value you will have to pay.

My basic heuristic, here, when I'm setting up a diagonal is the short-term, out-of-the-money call has a zero intrinsic value. Why? Because the strike price is above the current stock price, so by definition it's going to have zero intrinsic value. It's going to all be time value. I want the short-term call that I sell — all that time value I sell — to fully cover the time value I'm going to pay for in the purchased option. I'm literally just walking away. I've got no money up for time value. I'm buying intrinsic value of the stock where it is less the strike price.

So the point of doing a diagonal is it leverages your return if things go your way, and your risk ... you can't lose more than you put into it. We'll get to an example in a minute, here, but anything you put into a diagonal, if the stock immediately and irrevocably goes to zero, you can't lose more than you put in. So there are some strategies where you can have a more negative outcome.

The good news is if you are trading this around — if you're satisfying your trading itch — what's going to happen over time, in most cases, if you pick a good diagonal candidate and it does what you think it's going to do, you're probably going to be bringing cash out over time, which lowers your investment capital. If it does go immediately and irrevocably to zero (which I've never seen happen, but I keep on saying it), your risk over times lessens in your diagonal.

You want to pick a good candidate. If you wanted to go out and willy nilly set these up on your favorite biotech company, or pre-revenue tech company... Thank you. Sorry. Finance jokes.

AUDIENCE:

[Laughter]

JIM GILLIES:

No, it's true. There's a company I follow in Canada that I was asked to look at by someone else, and I described it as the worst company I've ever seen, and it still refuses to go to zero. But they made an acquisition yesterday, and they announced their acquisition as they were buying a "pre-revenue" company.

AUDIENCE:

[Laughter]

JIM GILLIES:

The jokes write themselves, right? It's like, "Really? OK!" So you're not going to do this on those types of companies. You are going to do this on the big, bloated, and boring. You want a company that's in a big, profitable industry group. Biotechs — no. Consumer staples — sure. **Coca-Cola** (NYSE: KO). **Pepsi** (NYSE: PEP). Jeff has a Coca-Cola diagonal running right now. I had a Pepsi diagonal running in the past. I'm sure there's a joke in there somewhere.

You want big companies. $25 billion minimum is usually a pretty good rule of thumb. You want companies that don't have a lot of leverage. A diagonal strategy is leveraged in and of itself. Let's let the blowup happen in that leverage if it's going to happen, rather than having the company blow itself up ... **Valeant Pharmaceuticals** (NYSE: VRX).

Sorry. I'm a Canadian. You knew Valeant was doomed. You knew Valeant was doomed when the headlines started coming out. "Valeant Pharmaceutical surpasses Royal Bank as largest company in Canada by market cap." Because the other companies that have previously done that (**Potash Corporation** (NYSE: POT), Research In Motion [now BlackBerry], Nortel, Bre-X) most of those are bankrupt or close enough. Well, Research In Motion is still around. So I should have known Valeant, but that's another story.

So you want no leverage or fairly little leverage unless there's a good reason to break with that tradition. You want a strong history of returns on equity. 12% is a good hurdle. More if the company has been buying back a lot of stock, which depletes the equity account, which reduces your ROE. You want a good history of free cash flow. You want a company that's making lots of money and has been showing good earnings growth. And you want it trading at or slightly below fair value estimates.

What you see down there are some examples from our past and present in *Options*. **Microsoft** (NASDAQ: MSFT), **3M** (NYSE: MMM), **Costco** (NASDAQ: COST) (which screwed me), **Accenture** (NYSE: ACN), **Coca-Cola** (NYSE: KO), **Home Depot** (NYSE: HD). [These are] all good candidates for diagonalization. You heard this morning the companies that would be for the next 10 years (five or six companies).

None of them would be too good diagonal candidates — maybe **Marriott** (NASDAQ: MAR)— but the rest of them have LEAPs, so that fails because you can't directly set it up. **Illumina** (NASDAQ: ILMN) and **Amazon** (NASDAQ: AMZN), way too volatile. Might be great companies, but your diagonal would blow up within a couple of quarters. Markel has no LEAPs. Marriott — it's probably not bad.

But I'll let you in on a secret. A good diagonal candidate probably isn't the stock for the next 10 years, because it's already been the stock. Microsoft, over the next 10 years, will probably get roughly a market return, if you include the dividend. It's not going to be what Microsoft was in the '90s. That's OK. You don't need that for diagonals.

This is one we ran until earlier this year. It's **eBay** (NASDAQ: EBAY), everyone's favorite online auction house they don't go to anymore. We set up a diagonal on eBay in October, 2013. We set it up at about $15, so we can't lose any more than $15. If eBay went to zero, our loss is $15. The stock price was about $52 at the time, so it sucks to go to zero, and eBay wasn't going to zero, anyway. Lots of cash. No debt at the time. That sort of thing.

So you can see we set it up in October, 2013 and we started trading around it. And every one of those lines, there, is basically a trade when we would buy back a previously written call, or we would sell a new call, or we would see a previously written call expire worthless and we'd sit out, maybe a little bit, for an earnings report. And then you can see toward the end, in 2015, we rolled it a couple of times. Rolled it up and out.

But you can see the column here, we started putting $15 into it. We got basically half of our money back over time. So again, we started off that if eBay had gone to zero, we'd lose $15 a share. By July of 2015, if eBay had gone to zero, we would have lost $7.50. We'd already put a lot of cash out. eBay, of course, wasn't going to zero. eBay owned some little company called **PayPal** (NASDAQ: PYPL), which I'm still shocked wasn't listed as a stock for the next 10 years, and they were going to spin it out.

When they did spin it out, they adjusted the options, which isn't germane here, but what ended up happening is by the time we got to January of this year, the time to close, we closed the position for $18.40. Again, we only had about $7.65 left in the stock at that point. And so if you'd been an eBay buyer, you had stock that was up about 14%. A diagonal basically could triple that return. Actually, eBay is probably still a good diagonal candidate now that PayPal's out the door. PayPal is not a good candidate because there's some growth in there. You probably want to capture the growth for that.

And remember I said diagonals are like a covered call, so if we decided to run a covered call, here, just replacing the LEAP with purchased stock, eBay would have been a great covered call. It makes 31% in about two years, two and a third years. That's OK. Again, the diagonal call still looped it much better. So that's diagonals.

Now everyone who loves diagonals, do you love synthetic covered calls, as well? Good. What's your favorite synthetic covered call? **Gilead Sciences** (NASDAQ: GILD)?

AUDIENCE:

[Laughter]

JIM GILLIES:

IBM (NYSE: IBM). Ooh. Ix-nay on the IBM thing. Basically, a synthetic covered call is a three-legged strategy. You are selling to open a long-dated put. You are buying to open a long-dated call. Both at the money. If the stock is trading at $50, you're doing this at $50. Same expiration. Same strike price. And then like the diagonal, you're selling a short-term call.

This is not IRA-friendly, because IRAs require you to cash in to secure your written puts, which is just the same as buying the stock, so you don't do these in an IRA. Now, in many cases, the two options you sell (the long-dated put and the short-term out-of-the-money call) will more than cover the cost of the purchased call. So you are selling this for no money out the door.

You're basically taking a covered call and you're juicing with pure leverage, because who doesn't like pure leverage? Much like the diagonal, you're trading this every three to six months most likely, and again, you're scratching that itch, so you can leave your long-term holdings (not of IBM) alone.

You can earn with this a spectacular cash-on-cash return, because you're leveraging the value of your other assets. You're leveraging the value of your long-term buy-and-hold portfolio. I'm not sure why I always think you guys are the long-term buy and hold (points at left side of audience). You're the rogue traders over here (points at right side of audience). But you can get some absolutely spectacular cash-on-cash returns, and the neat thing about the first two (the at-the-money, long-dated written put and the at-the-money, long-dated purchase call) is that forms what's called a synthetic long.

Synthetic longs are a type of strategy that are almost infinitely rollable. I mentioned Monsanto, earlier, and how we've been running a strategy on Monsanto for six-plus years. We've been doing that even though their longest options are just barely over two years. You have the ability, as you approach expiration on one round, to buy back the written put you sold, sell the call as a purchase, write a new two-years-out put, purchase another long-dated call. You exit the exact same position.

You probably get paid to do it (the company is the dividend payer). With Monsanto, we've been paid every single time we've done it, and you keep going on your merry way. So synthetic covered calls can run basically as long as you want them to, unless Monsanto gets bought by the aspirin maker.

This is just a quick profit graph, here. This is a synthetic long. You can see the lower-dotted line that slopes up and to the right. That's what a profit-loss curve of a long call would be. The blue line is the profit-loss curve of a written put. You put those two lines together, and you get the big red line in the middle which looks a lot like the profit-loss curve if you own a stock. Forty-five degrees up and to the right. The stock goes up a dollar, you make a dollar. The stock goes down a dollar, you'll lose a dollar.

This is an $80 synthetic long that crosses the X-axis at about $2, ballpark, suggesting that you would have paid $2 to set up the synthetic long, but it's OK. You're going to write a call that's going to pay you $2 to take care of that. Probably the stock is about $80. I don't know what stock this was when I set this up. So it's to say that the first two options (the sold-to-open, long-dated, at-the-money put and the bought-to-open, long-dated at-the-money call) form this synthetic long. That's the underlying for your strategy, and then you write the written call on top of it, just like with the diagonal.

Again, in the spirit of always saying the same thing over and over again, the most important criteria, if you're going to do one of these, is the fair value of the stock. If you cannot estimate the fair value of the stock, you have no business doing probably any options strategy on it and certainly not one of these types.

And more importantly, saying that it's trading at a P/E of 20 and historically it's always traded between 22 and 23, so it must be undervalued ... that's not fair value, by the way. That's not a fair value assessment. It's part of a valuation analysis, but that's not a reason. You have to basically have an understanding of why Microsoft is trading at $50 today, but I think it's worth $172, and here's why.

And once you go through it, you should be checking your assumptions. I once graded a students thing at the local university on valuation. I sat down and there was this very nice, young group of kids. Very earnest. And **McDonald's** (NYSE: MCD) at the time was trading at about $90 a share and they said it was worth $240. The largest restaurant company in the world that everybody knows of, that has an army of analysts following every single thing it does, was undervalued by 70% because a group of young MBAs thought it was.

What are the assumptions in your model? How did you come to this? Do you really think the cost of capital for McDonald's is 3.5%, and so on and so forth? Once you realize maybe your model might be subject to some change, what I'm saying is, be skeptical of any value you come out with, and test why you think the company is worth what you think it's worth.

Also, don't forget certain expense items. There was once a company called Reddy Ice — it's still around, I guess — but it was the subject of a big activist/investor fight. These guys were buying their own stock back, and the activist investor (Roy Disney's hedge fund) was fighting with them. There was all kinds of stuff. Made mistakes. And they said, it's undervalued, and they said they were being taken out $25 a share. A big fight over it.

They finally got the merger kiboshed. Basically the stock went to zero, afterwards, because the guys who were fighting over it, who owned one-sixth of the stock, had forgotten to include basically three-quarters of the operating expenses in their model. I'm pretty sure the analyst that put that model together got fired, as he should have been.

Similar criteria, though, when you're doing a synthetic covered call. You want your big and profitable [companies]. You don't mind maybe going down a little bit in size, because you like [to see a little growth] in these types of strategies, so maybe a smaller company. You like, again, your debt-to-capital ratio a little bit lower. You want a strong history of cash generation and the ability to reinvest their cash in their own business at high rates, or at least reinvest in acquisitions at high rates if their business can be acquisitioned. Trading at or below fair value.

A couple of poster children for this type of thing are MasterCard and **Berkshire Hathaway** (NYSE: BRK-A) (NYSE: BRK-B). Anyone running a synthetic covered call on Berkshire Hathaway? Is it your first experience, or have you run the first two with this, as well? It's Berkshire Hathaway. I think that Warren Buffett kid is going to amount to something.

We've been doing this for a long time, but the added benefit for this being, an interesting strategy to run with Berkshire Hathaway is that Buffett has said they will be active buyers of their own stock below 1.2x book value. Well, Berkshire Hathaway, again, that whole strong history of cash generation and ability to reinvest itself at high rates ... I think Buffett's got that covered. Berkshire is currently trading at $140. What's that multiple-to-book? It's about 1.33x or 1.32x. Somewhere in there. And Buffett has said they were going to be a buyer in force with all that cash they make at 1.2x.

What are the chances of Berkshire Hathaway ever trading below 1.2x book value for any length of time ever again? Pretty close to zero. What is Berkshire Hathaway's book value doing over time? Going up. Its book value today is about $105, which would put the 1.2x — basically Buffett has given you an embedded put option. He will buy your stock from you at 1.2x book value. Today that's about $126. So Berkshire, unless there's a major dislocation, probably doesn't go below $126.

The book value is growing. By January of next year, book value, at say 7% growth by the next time the January 2017 LEAPs expire ... that floor, that strike place on the Buffett put, as I call it, will probably be $132 or $133. January 18, again, [7%] book value growth. By the way, Berkshire has compounded book value at about 19%, so I don't think 7% is a big hurdle over 50 years. It will be about $140, so it's a ratchet effect. You've got your synthetic long all set up, which you can push out ad infinitum, and you're constantly rolling and doing your maintenance trades on top of it.

Another chart you can't read. This is one of the examples. We've done this on Berkshire a number of times in this service, and we will probably continue doing it until they close the doors on either us or the coffins, whatever comes first. Basically this is a 2012 to 2014. We could do the 2014 to 2016 one. We could do the one prior to this one. Basically what you want to see on this one is, out of the gate, the stock was about $78.50. We set up our synthetic long at $80 going out as far as possible. We wrote the $85 call for about three months hence, so out of the gate, even though the stock was at $78 and change, we were paid $0.85.

Well, it's better than nothing. Better than a kick in the teeth. That gave us a capital-at-risk profile, which you can think of as what the effective price is. If we were assigned on our puts immediately, what is the effective price of Berkshire that we'd be paying? $79.15. So over time, again, much like with the eBay example, we trade around, we roll it up, roll around, and we start building cash.

Then what happens about midway through? We build about $3.00 a share in cash and the stock was slowly rising. Then Berkshire went *vroom*. The last half of this strategy shot to the roof. So we had to put cash back in a couple of times. By the time we got pretty much to the end of our trading activities on this — remember, we're scratching that itch we've all got — so we'll leave our long-term buying [alone]...

We've got our Berkshire Hathaway stock over here, and you guys are trading in Berkshire Hathaway options. By the time we got to where we were kind of done with the trading aspect of this service, we had invested a net $2 per share in Berkshire Hathaway. When we closed the position, we pulled out $17.50. We put in $2 net. That's a very hard thing to calculate return on investment for. Actually, not that hard. So the stock, alone, jumped 47% during this period. Now, that's OK. Berkshire did well. And the long-term buy and holders of Berkshire who owned it for years and are going to keep holding it for years were very happy with that return over that time.

The synthetic covered call folks beat it by about 20 percentage points. What ended up happening — remember, you're not doing this is in an IRA. You're not cash securing that because No. 1, you're an advanced optioneer, so that's fine. And No. 2, you're not doing this in an IRA so you're using the buying power. You're leveraging your other assets. You're leveraging, perhaps, the owned Berkshire Hathaway stock over here by generating option income and capital gains over here.

So you put $2 in and you pulled $17.50 out. That's nearly an 8x cash-on-cash return. In a year and a half to almost two years, that's pretty satisfactory. I think that's reasonable. And we can do that over and over. We are on our third iteration of this particular strategy on Berkshire. We will probably continue running it out again as long as we can. I think that's it for me.

AUDIENCE:

[Applause]

JIM GILLIES:

You had to give me this one on top? Really? From Jeff Fischer in the back.

AUDIENCE:

[Laughter]

JIM GILLIES:

Do you have a spare room if Trump wins?

AUDIENCE:

[Laughter]

JIM GILLIES:

Jeff, you are always welcome north of the border, where free healthcare flows like milk and honey and the top tax rate is 55%.

AUDIENCE:

[Laughter]

JIM GILLIES:

I'm looking to buying a bigger house, but it's my policy not to comment on the politics of others, but since you brought it up. Ellen is our wonder editor. Our cat herder. She's not here, today, I don't think. So whenever Ellen gets upset with me, which (a) is my fault most of the — all of the time...

AUDIENCE:

[Laughter]

JIM GILLIES:

...and (b) it happens an annoyingly number of times that I probably should learn better, so what I do is I soothe the savage beast. I did not call Ellen a savage beast. I love Ellen.

AUDIENCE:

[Laughter]

JIM GILLIES:

But what I'll do is I'll send her a reminder of how wonderful Canadians are because I'll send her a picture of Justin Trudeau, our prime minster, or as I like to call him, Prime Minster Centerfold.

AUDIENCE:

[Laughter]

JIM GILLIES:

He's a nice young man. "Would **Apple** (NASDAQ: AAPL) fit fair-value criteria today?" This gives me a great chance to invite my partner in crime up. Come here, Jeff. Let's turn this into an options Q&A if you don't mind. I know what I think about Apple. What do you think about Apple? We can sit down, too.

JEFF FISCHER:

That's funny. Sunny and I in the back were talking about Apple as a possible diagonal call candidate. As long as you believe that their smartphone units will hold up, the business should be fairly stable if their units hold up and their margins hold up. I happen to believe Apple has, believe it or not, more growth ahead. It may just be quite lumpy getting there, but the smartphone market is not actually saturated by any means. The question is, what sort of pricing will Apple be able to maintain when the market slowly lurches to a larger size in coming years.

I wouldn't make Apple my first diagonal call candidate today, because it is so dependent on smartphones. That said, all its early years, it was dependent on computers, so one product for another. But it's a possibility — not a terrible one, because the calls pay pretty well (the ones that you're writing). By the way, I didn't ask about Trump. I don't get into politics.

JIM GILLIES:

[Laughs]

JEFF FISCHER:

Who asked that question?

JIM GILLIES:

No one will admit it. John! I like Apple. In the interest of full disclosure, both *Motley Fool Options* (points at Jeff Fischer) and *Motley Fool Pro Canada* (points to himself) both have bull call spreads on Apple. A bull call spread is a starter drug for diagonals.

AUDIENCE:

[Laughter]

JIM GILLIES:

We kind of like it. Where is yours? I think yours is $85-$90 and mine is $90-$95?

JEFF FISCHER:

Yes. What we've done in *Options* when Apple declines quite a bit, which it does more frequently than you would think, is we've set up bullish positions ... mostly spreads. Bullish spreads. And we also own shares in *Pro*, of course. I think like most Fool services, for better or worse it's almost (not a mandatory stock to own) but it seems that way right now.

JIM GILLIES:

I'll be buying [an iPhone 7], because this thing is pretty much toast. (Holds up his cellphone). The next question. "Would you ever run strategies using futures and/or options on futures? Why or why not? On Forex, financials, commodities? Simple hedge S&P with futures instead of SPY options?" I'm going to say no, because I'm not that smart.

AUDIENCE:

[Laughter]

JEFF FISCHER:

I would say that the cost is greater, typically ...at least the platforms I'm aware of. The risk — the leverage is much higher...

JIM GILLIES:

The leverage is huge.

JEFF FISCHER:

...so I'm not sure that we would go down that route. It's so easy to blow yourself up. That said, I don't know if you guys have heard of the new binary options, which are all or nothing, and which make a lot of sense to me initially. You risk what you want. You either make all of that amount or you lose all of it.

But the advantage is you can't lose any more than that, so in a way, it's less risky than writing put options on a stock that can go to zero. In this case, you're either going to make the $1,000 or pay it out. Done. So if you're right 90% of the time, or even 60%, you'll make money in a binary way with much less capital at risk. Most brokers, including TD Ameritrade, don't trade binaries, yet, although they are out there. You can look it up and there's an app to look into them.

"Do you ever use tech analysis to help a timing RSI Bollinger bands?"

We don't, but we use fundamental analysis, which ties into valuation. Tech analysis sometimes matches valuation analysis. A stock reaches support at a certain price because its valuation is attractive to enough people at that price. So we don't use tech analysis, but our fundamental analysis, in a lot of regards, fills that role for us.

JIM GILLIES:

I'm all of a sudden having a Charlie Munger vibe, too, with Buffett over here.

JEFF FISCHER:

Shoot it down.

JIM GILLIES:

I don't use tech analysis at all, mainly because... What's the old Buffettism? I looked at the chart upside down and got the same answer.

AUDIENCE:

[Laughter]

JIM GILLIES:

I'll let you take the next one. "When do you roll in-the-money short calls, (a) early on before they get too far underwater, or (b) after all time value has expired?" The answer is (b)-ish. You do it when most of the time value has expired. There are rare circumstances when you might want to buy back time value.

One example would be the much-cited Monsanto. We currently have a written call, July, $97.50 against our synthetic long there. If Monsanto does get bought, or at least take an offer from Bayer, and we'll assume they can get through ... they'll never get through antitrust ... you might want to buy that one back, but the market knows that you're going to pay a pretty healthy time premium, there, so it's still probably worth holding your cards, and holding on, and hoping it doesn't happen yet. But why pay for something you don't need to pay for?

JEFF FISCHER:

The question is: "You begin with a thesis and set up a bullish position, a synthetic long. Now the underlying stock doubles or triples," which makes your synthetic long go up a great amount in value, "but your thesis has not been met. Discuss your thought process." I'm very happy.

AUDIENCE:

[Laughter]

JIM GILLIES:

I was going to say. I actually had that happen to me one time. I set up a synthetic long in a company (I put a couple of grand into it because I had to pay for the syn long) and the stock basically doubled in six weeks. I wish that would happen more often.

AUDIENCE:

[Laughter]

JIM GILLIES:

It was crazy. So me being a smart guy [pauses], I sold a higher-strike call for about $4,000 and bought back the written put and I netted myself $2,000 on that. Now I have no risk on the written put if the stock were to go back down. Now I have a big, fancy bull call spread. The stock proceeded to double again in the next six months, except now I've capped my upside.

JEFF FISCHER:

I think when this happens, try to assess why the stock moved so much. And then is there more to go if your thesis does play out? Is that going to be a rocket booster further, or has it already played out to such a degree that your thesis is now priced in? Also, has the price risk gone up enough that you should just close your position? Be happy with what you made and go? Those are a few things to think about.

JIM GILLIES:

I already mentioned Nortel, earlier. Nortel back in the day, for those who don't know, is a spinoff from the Canadian Telecom Company and it was, at one point, the largest company in Canada. But as all, it failed. It doubled, tripled, and quadrupled a number of times throughout the '90s, but it was pretty much always at the same valuation ratio. It was 2x earnings and so many times EBITDA.

And then in the last year, the tech bubble of '99 and into 2000, it went from something like 2x revenue where it had sat (between 1.5-2x revenue) forever, up and up and up. It went to, I believe, 8-10x revenue. If you were holding a syn long at that point, and that situation plays out, at that point you are running away screaming with your money. You're done. At least I would be.

JEFF FISCHER:

Here's a question. "Does it make sense to sell put options in an IRA? If you're in an IRA, is a buy-write covered call better? Why? What are the best options strategies for IRAs?"

Covered calls certainly work in IRAs. You can sell put options in many IRAs, as long as you have the cash. It has to be cash-secured, so you have the cash on the side to buy the stock should it fall. That's a requirement. You can't use your equity.

If you're making a strong enough yield on your cash, and you're happy to have it out of the market while you wait for a lower buy price, then sure, you can sell puts in an IRA. The great thing, obviously, is all the taxes are deferred on that income.

But probably some of the best strategies for IRAs, then, are income strategies, because those are always taxed very highly and they're taxed at your income level in a regular account. So if you can make income in an IRA — granted, you can't tap that income, yet — you'll save a lot on taxes doing it that way.

JIM GILLIES:

I have a question wanting me to put on a glitter suit. "Jim, how much of your personal portfolio is invested in options? Is this different than what you advise?"

That's a hard question to answer, because invested in options — I don't buy hardly any stand-alone calls or stand-alone puts where you're actually invested. If you do a diagonal, there's a certain amount there, but is a diagonal invested or is a covered call ... does that count as an options part of it? Plus options, there's no portfolio in options.

I'd probably say my exposure is probably about 35%-40% beyond my straight-up stock holdings, if that makes any sense.

JEFF FISCHER:

And how long are you invested in stocks?

JIM GILLIES:

Oh, forever.

JEFF FISCHER:

No, I mean exposure-wise. Is it 100%? Eighty percent?

JIM GILLIES:

I'm probably about 10%-15% cash [00:46:30].

JEFF FISCHER:

That math works out.

JIM GILLIES:

Yeah, ballpark. Do we have time for one or two more, Liz? One more.

JEFF FISCHER:

We have four more, so we have to choose.

JIM GILLIES:

How do we determine fair value? Oh, big question.

JEFF FISCHER:

It is. Visit the Option Philosophy Board and Jim will answer.

AUDIENCE:

[Laughter]

JIM GILLIES:

In excruciating detail.

JEFF FISCHER:

This is a good one. A sensitive one. "Why can't *Motley Fool Options* and *Motley Fool Pro* members use limit prices?"

JIM GILLIES:

I didn't know Rocky Top Bob was here.

AUDIENCE:

[Laughter]

JEFF FISCHER:

See the hat back there? There he is. It's a good question. We always say to use a limit price when trading an option. When investing in an option. I think part of what happens is some members do not. They want to get the position done, no matter what. They just put in a market order and that happens. But I think the market makers are also moving the price as soon as they see this flood of orders coming through. They see all these limit prices coming and they'll move the pricing to protect themselves. To take advantage.

JIM GILLIES:

To screw you.

JEFF FISCHER:

And then people lose patience and they start to change their orders to the market makers' prices. So if the market makers see a huge amount of volume coming in on a stock, they'll adjust the bid-ask accordingly. But that's really true in options where there's dedicated one or two market makers to each option and their job is to make that option liquid. They'll move prices when they see all of our orders coming in.

The good thing is we know that's going to happen. A lot of people don't believe me when I say it, but the price guidance is flexible and we spell that out. We say, "Here's the ideal price right now, but as prices change, accept no less than 'blank.'" And that usually gives you a wide range of pricing that you can accept that day or the coming days or weeks.

So we're always trying to improve on how we message pricing and limit orders, but because I don't think we can stop market makers from moving their pricing.

JIM GILLIES:

And I think the add-on I would give is you should ignore trade alerts. If you're sitting at your computer and it shows up, maybe you can get the recommended price thing. If you check your email two hours later and there's already been a lot of movement in the stock, and the options prices have moved, you should just ignore it and tune in on Friday to the trades you can make in the weekly where we'll give updated pricing, because on Friday at 2:00 ET when that comes out, you're not going to be fighting with however many other *Options* members who are chasing the price down.

JEFF FISCHER:

If we didn't get to your question, track us down. We'll be here. We can answer. Thank you, Jim. I'm glad that the U.S. let you in, again.

AUDIENCE:

[Laughter]

JIM GILLIES:

I'm shocked every time, actually.

JEFF FISCHER:

Thank you, all.

AUDIENCE:

[Applause]

JIM GILLIES:

Thank you, sir. [Jim and Jeff shake hands]

FoolFest 2016: Intro to Options

Published Jun 16, 2016 at 10:20AM

Our annual member event, FoolFest, took place last month in Alexandria, Va. This video shares some Pro*-related content from the event. Enjoy!*

Motley Fool Options co-advisor Jeff Fischer and senior analyst Jim Mueller led this in-depth seminar on the nuts-and-bolts of options investing, designed for the options novice.

JEFF FISHER:

[This is a] beginning options class, more than a presentation. We are assuming that you don't know options very well or at all. We are going to introduce you to options -- what they are, some of the terms that you would want to know over time. We are going to talk about two strategies: buying call options for upside, and selling put options for income. I'm joined by Jim Mueller.

JIM MUELLER:

Thank you.

JEFF:

Core analyst on *Motley Fool Options*. Also on *Supernova* -- portfolio lead on *Supernova,* and -- Jim?

JIM:

And *Stock Advisor*. We are going to be throwing a whole bunch of information at you. There's going to be some terms that are familiar in one way, and totally unfamiliar in a way. We are going to be using them. If you feel overwhelmed, that's entirely normal. Everything that we talk about is available in the Options U course section of the Options service website.

I encourage you to go through that and review what we are talking about. Then go to the boards, and then ask questions about anything you might not understand. There are plenty of resources beyond this that will help you understand how to use options.

JEFF:

I've been using options about 16 years, since the year 2000. I've found pretty early on, too, that they can really change your life financially. They can add a little bit of extra income that just helps your life financially become easier, or they can add enough income to make a real difference. We've met over the years now many Motley Fool members who have retired earlier thanks to options. Who have built dream vacation homes thanks to options.

Mainly, what they are doing is writing options for repeated income month after month on their stock portfolio. The way we use options in general is, we have less risk typically than owning a stock outright. Everyone generally thinks options are risky, and use certain ways that would be [risky]. The way we always use them at the Motley Fool is a way that generally decreases our risk.

That's why at Motley Fool Options, more than 90% of our closed positions have made money. That goes back to some eight years now. Personally, it goes back even further. I've publicly been recommending options since 2005, 11 years, to members. Jim, how long have you been using the options?

JIM:

About six years, I guess. I agree with Jeff, the income is a nice boost to your portfolio. Also when times are flat or even down, it helps cushion the down as far as cash flow goes. What I use the income for is to invest in more stock positions I want to be in. I don't have to contribute as much cash to my portfolio as maybe I should.

JEFF:

They are also a lot of fun if you obviously have a great interest in investing. The addition of options to your stock portfolio lets you leave your stocks alone for the long term, but have some fun -- sometimes excitement -- in the short term, [using options] in a way that reflects what you believe about a stock to create some different outcome. [If] the stock is flat, you can make money on it. If it's down, you can make money on it . ...

There are different sets of tools that you'll have. You don't just have to rely on stocks going up. You have other ways to make money.

Let's get started with what an option is. I think we will have time for questions at the end. Please write down any questions you have [for] when we are done.

An option gives its owner -- you can be a buyer initially or a seller of the option; we'll talk about that later -- it gives the owner the rights to either buy or sell the underlying stock.

It's an option to make a transaction on the stock at a set price, called the strike price, and by an expiration date. All U.S. equity options have an expiration date. We'll talk about all these things a bit more as we go forward. An option just gives you the right to make a transaction in the stock at a price that you chose initially, before your expiration date.

An option has value, of course. It trades on the exchange all day long just like a stock. Typically at a small fraction of the stock price. The stock price may be $20; an option for it may trade at a dollar or less. Of course, the price of the option itself moves with the stock price up and down, but to a much greater degree, typically. It's leverage; you are going to see larger gains or losses as the stock moves in the option itself.

Options are very liquid. They are traded all day long. There's a market-maker behind every option. They are out there making sure there's liquidity. You can buy or sell an option pretty easily at any moment in the market. Granted, we tend not to -- we think long-term even as we use options -- but they are liquid. Liquid enough that Warren Buffet uses them. He used options, a strategy we'll talk about, to build up his **Coca-Cola** (NYSE: KO) stake, to build up his Burlington Northern stake, at lower prices.

Just an aside: When Warren Buffet said, "derivatives are weapons of mass destruction," he was not talking about stock options. Stock options are listed. They are transparent. You know the underlying value of a company. It's all in the clear on stock options. Here, he was talking about mortgages that were bundled, that had no clear liquid market, that you couldn't get pricing on -- anything that was unclear. Equity options, he has used for a long time.

Finally, an option can be turned into the stock at the strike price any time the option owner likes -- but it doesn't need to be. You can just buy yourself the option instead, if you prefer.

Why would you want to use options? What got us started, why do we now espouse options to Motley Fool members? I really started to use them around 2000 to generate income. I knew if I could generate some of my own cash flow from my portfolio beyond dividends, and beyond just waiting for capital appreciation, I would have that more flexibility in my life and in my investments.

Think about the cash that you are bringing into your portfolio, in this case by selling options for income. You can then reinvest in stock and grow your returns even further, or you can keep the cash and use it as you wish. I had some good vacations thanks to option income. You also use options to of course gain greater upside on your position, with less capital at risk. It's leverage.

A leverage has bad connotations to it, typically if you are using margin, which we do not recommend -- if you are borrowing money to buy a stock. That's leverage we don't recommend. Leverage with an option is a way to leverage returns while putting less money at risk than you would with a stock.

JIM:

That leverage is built into the option itself. You are not doing anything extra.

JEFF:

The third reason, or many reasons more to use options are, as we said, the upside: You can make returns in a flat market, a down market. A stock that goes nowhere can be your dream, because you can just make income on it again and again. Jim really has made income on **Wal-Mart** (NYSE: WMT) for [the] 10 years that it was flat. He just kept writing options on it. You can also use it to protect your positions, given that options can be set up bearishly or bullishly or neutral.

Keeping in with our intro to options, I have to touch on briefly that there are two types – luckily, there are only two types. There's the option called a call option. The call option goes up in value when the stock goes up. The call option is the right to buy that stock. As the stock goes higher, that call option, the rights to buy the stock, goes up as well.

JIM:

The reason it gets more valuable as the stock goes up is because that strike price is the transaction price. If the strike price is say $50, it becomes more valuable when the stock is trading at $60 compared to $55, because the option gives you the right to buy those shares at $50 when they are on the market at $60 or $70 or whatever.

JEFF:

Inversely, a put option will go up in price as the stock falls, because the put option gives you the right to sell that stock at your strike price. The value of that right of course rises as the stock falls.

JIM:

That's just the opposite of the situation I just described. You can sell at $50 when the shares are at $35.

JEFF:

There are some key ways that options differ from stock. We don't expect you to remember all these, or the terms we are about to talk about. We just want to plant the seed, so that when you come across them again, you will remember you heard them. You'll start to internalize them. The biggest thing to know and remember is [that] each option contract represents 100 shares of the stock.

There's no way around that. Every single option is 100 shares. That's partly or largely how you get the leverage that you do get.

Every option has time value. We'll talk about that in greater detail with some examples. It's extra value that the option has beyond what you would expect it to have, to count for the potential volatility of the stock and the time until expiration.

As we said, options have strong strike prices, but it's important to know that they're staggered. They won't be at every single level. Some options have strike prices that are $20, $25, $30, $35. Others will have dollar increments. You get to choose your strike price. When you go to your brokerage account, you will enter a stock ticker. Somewhere there, you'll see the option chain link. You click to see that link. You'll see all the strike prices that that option has available.

As we said, an option expires. They always expire. US options can expire anywhere from a week from now to up to two and a half years from now. Let's talk a little bit about each of these factors. [With] 100-to-1 leverage, you get to control more shares for much less money at risk. Therefore, you have greater upside or downside on a percentage basis, even though you have less money involved.

The strike price is your choice. You set it up on day one, and that determines the price at which you would later buy or sell the stock if you choose to do so. It's an important consideration. We look at the stock, and what we believe [about] what the stock price would do, to help us set up the strike price that we choose. A couple of terms that you'll hear again and again are "in the money," "out of the money," and there is "at the money."

An in-the-money option is an option that has a strike price that is beneficial compared to the current share price. A call option, for instance -- if a call option gives you the right to buy a stock at $5 per share, and the stock is trading at $10 per share, that strike price is more advantageous than the current share price. It's lower. It's a better buying price. That's in the money.

Inversely, if the strike price was $12 and the stock was $10, that's an out-of-the-money option, because you can buy the stock cheaper in that case for a call option. The strike price you choose -- it influences pretty much everything. The outcome of your trade. It will determine how much capital you put in, the amount of risk or speculation you have or do not have, how defensive you are. Strike price is important.

For an example of strike prices, we'll take a look at Disney, which recently traded at $100 per share. Just to demonstrate how this can be lined up. We wouldn't buy a June call option on Disney -- that's too short-term -- but we might buy a 2018 call option on **Disney** (NYSE: DIS). Here's an option that expires in one month. The right to buy Disney at the $85 strike [price] -- you would pay $16 for that call right now. That would cost you about $1,600 as opposed to $8,500 to buy the stock. That's how you risk less.

JIM:

No, $10,000. The share price is $100.

JEFF:

Oh, right, right. At $100, not $85. $10,000 to buy the stock, $1,600 compared to $10,000 to buy 100 shares. Much less money at risk.

The $100 strike price is at the money. The strike is the same as the share price. You would pay $2.75 for that right now. Yesterday, somebody asked, why would you pay -- great question -- $2.75 today for a call option that lets you buy the stock at the current price? The answer is, only if you want to risk much less money.

If you believe Disney could rise 5% or so in a month to $105 or $105.50, this call option would about double in value. If you are looking for leveraged returns, and you only want to put a few dollars in at this time, you might buy that call option. A much more speculative call option to buy would be the $105 for just $0.85. You would only buy that if you thought Disney could rise considerably in the next month.

Another example of pricing: [There's a] $55 stock, and there's a $50 strike price call option on it. That has $5 in intrinsic value. Which is simply the difference between the stock price and the call option strike price. This call option gives you the right to buy shares at $50. The shares are right now at $55. That alone is worth $5 right three. If the stock fell to $54, the intrinsic value would fall in kind [by] $1, to $4.

JIM:

The intrinsic value is how much in the money -- using the earlier term -- how much in the money the option is. For a call with a share price above the strike price, it's in the money. It's just $5 or $4 as Jeff just said. Suppose the share price drops to $49. Then it's out of the money, and the intrinsic value is equal to zero. Any out-of-the-money option has no intrinsic value.

JEFF:

Then above intrinsic value, you add time value, which we mentioned. It's the magic extra value than an option has to account for its super powers, or really, to account for the unknowns of the time until expiration and how much the stock may move. The more volatility expected from a stock, the greater time value its option has. In this case, it's not a very volatile stock, let's say. There's only $1 in time value. You add that to the intrinsic value, the real value, and that's what comes to what is called the option premium, or the complete cost of the option.

Again, this is a lot to take in if you are new to options or just starting. We just want you to start to know these terms. Intrinsic value is what the option is truly worth right now -- how much is in the money. The time value is the extra amount to account for the time until expiration. In this case, the total option premium is $6.

This, we just talked about -- we'll move quickly. Jim explained this really well.

Time value is anything outside of intrinsic value. The more time till expiration, the more time value you have. Here's a great example: **MasterCard** (NYSE: MA), recently $95 a share. It's a fairly volatile stock, even though it's such a stable business. The options have some premiums to them. The July call option costs about $2. It has a few months until expiration. If you were to buy the January 2018 option, you would pay $11.

In both cases, since this is an out-of-the-money call, that's all time value. You are paying this for a few reasons. You don't want to pay so much for the stock, but you are willing to pay a little bit of time value for the upside of the stock. You of course believe MasterCard is going to rise by -- above your strike price, and greater than your time value as well. [The] main point here is, the more time until expiration, the more time value you'll pay as the option buyer -- or you'll collect as the option seller, as we'll talk about.

If MasterCard doesn't get above the strike price in time, that time value evaporates, and the option ends without any value. MasterCard is $95 right now. If it doesn't rise above that strike in time, that option is worthless. All options have expirations. This is just a visual to show you how many expirations there are. There are now weekly options. There are options that expire every week on many stocks. On many stocks, there are options that go all the way up two years, to 2018 in this case. The 2019 options will roll out this fall incrementally.

When we are buying options, we are buying the long-term options almost exclusively. As far out as we can go -- 2018 right now. When we are selling options, as we'll talk about, we are selling short-term options. That's where we generate that regular monthly income that we'll talk about.

The first strategy -- before we talk about selling options for income -- is buying calls, which you do when you believe a stock is going to go up, and you want to participate in that upside, but with less money at risk, or you are looking for a greater return than the stock might give you, or you want to conserve your cash.

You might be in a rocky market. Stocks are falling. You want to start to dip your toes in, but you don't want to burn up a lot of your cash to buy shares. You can invest typically much less -- only 10% of the stock's cost, maybe less -- to get 100-share exposure to that stock, and then participate if the market does recover soon, or if it does in the next few years, too.

You can buy call options to increase a stake in something you believe in. You may own shares of something, and you like it enough that you want a bit more exposure. Again, you may not want to put in [as] much money that it would take to buy shares, but you put in a little bit of money that it would take to buy calls, and let that sit alongside your stock exposure.

Of course, you buy call options to potentially turn them into stock at a later date. Any call option that you own that's in the money, you can turn it into stock at any time at your strike price. You pay the strike price at that point, and the cost that you paid for the option initially is a sunk cost as well of course.

[Here are] some examples of the success we've seen buying call options.

JIM:

Here, you can see where the leverage starts to play in. Jeff had a bought call in **Coca-Cola** (NYSE: KO). When the stock rose only 60%, the value of the option itself rose 75%. That's an example of the leverage that [comes from] owning, controlling, or getting the benefit from the 100 shares without putting as much money into it.

JEFF:

It can really help on a large company like Coca-Cola that you don't expect to go up much. It's stable to own. It's OK, but it's much more fun if you can make a large return on a small gain in the stock. [Here's] **Disney** (NYSE: DIS), another example in Motley Fool Options, another recommendation, and how it did. In Pro we recommended Facebook calls, which did well when the stock went up. We turned a lot of those calls into stock that we still own. It's Pro's largest position.

It's great -- buy options for upside -- but how? What parameters should you follow? We buy the most distant expiration, as I said, almost exclusively. We tend to only buy calls on stocks that have long-term options listed on them. Not all stocks do. Right now, we look at the 2018 call options. We typically most times buy at a strike price that's below the current share price.

We are doing that because we want to minimize the time value that we have to pay, that we need to pay. We want to maximize the potential that the call option ends with the value, let alone goes up in value [by] the amount that we want.

JIM:

If you are buying a call that's out of the money, with the strike price above the share price, you are paying 100% time value. You are increasing the risk that the option is not going to be worth anything at the end, because the share price has to move further up in order for you to make money at the end than if you were buying options in the money with strikes below the share price.

JEFF:

We'll have some examples of that in a second, I believe. Next, [the] time value that we want to pay is 3% to 5% a year. When we buy call options, we are looking at 100% gain or better. The risk of a call option is that the stock falls below your strike price before expiration, or at expiration. If that happens at expiration, not before -- at expiration is what matters.

If the stock is below your strike price at expiration, the call ends without value. To take that risk of 100% loss, we want to target at least 100% gain, but again, without being speculative about it. By buying a call on Coca-Cola that's logical, that could double if the stock goes up 20%, say in two years.

[Here are] some examples, some real-time examples of call purchases. **Visa** (NYSE: V), as you can see. The stock is $77. You might, if you are bullish on Visa, buy a 2018 $70 call option.

Right now, you would just pay $13 per call. For 100 shares, you would put in $1,300 instead of $7,700, keeping cash for other ideas if you want. When you do the math of the share price minus the strike price ... Said more easily, when we do the strike price plus the cost of the call option, you could see what our net buying price on the stock would be if we were to turn these calls into stock much later down the road: $83 per share.

We are paying $6 in time value, which is reasonable. It's within the 3% to 5% per year maximum that we want to pay. Now, we want again the potential for a double. Since we are paying $13 for these call options, the way to get 100% return on them, the calls need to get to $26. Which means Visa needs to get to $96 per share. That's just the difference between the share price and our $70 strike price.

Visa needs to gain 24% in about two years for these calls to double in value. It could happen if you get close to that. If it could go up 18%, we would still be quite happy with our return, which would be 70%, 80% or so.

Some examples of these strikes that are available to you. You can see a deeper in-the-money strike, like a $50, will cost you more in intrinsic value, but less in time value. Gives you a lower net buying price on the stock.

If you want to go up to $60, you'll pay a bit less in intrinsic value, and a little more in time value, and so on. Which one do you choose? In this case, our favorite one is this one. It's a reasonable amount of time value. As shown earlier, we are paying less than 3% to 5% per year on time value. We have decent odds that Visa could gain 20% or so or more to make these calls about double in price.

We have a reasonable net start price on the stock of $83 versus the current $77. I view that as -- a price to use options is [that] you have to accept a little time value cost. If it's reasonable, it's fine, because of the leverage that you are getting and the less money that you are putting at risk -- much less, in this case. Just to reiterate before we go to the next example, [when] buying calls we look at the distant expiration, 2018.

We buy strike prices that are in the money. We minimize the time value that we are paying. We look for 100% gain on that call. The price that we pay for the call, we are hoping that it can double. We look at how far the stock has to go to get there. Typically, we are looking at stocks that need to go up 18% to 25% in two years for our calls to double.

Another example: Alphabet trades around $700 lately. The calls are pretty expensive, but you pay $16,000 for a call option as opposed to $70,000 for 100 shares of the stock. You can see you're paying $60 in time value there. It's not too bad, though; it's 8.5% in nearly two years. It's just within the parameters of what we might accept to pay. Here's where it's a little bit of a reach maybe to gain 100%. In this case Alphabet would need to reach $920, which is a 31% share gain.

It's possible, but I wouldn't necessarily say it's highly probable. This is a call option that we may pass on for now, or wait for Alphabet to slip some, unless you are happy with less than a 100% gain. If you are bullish on Google (**Alphabet** (NASDAQ: GOOGL) (NASDAQ: GOOG)), [and you] are happy with the 50% gain in the call, then you could earn that if Alphabet just went up 15%. You are buying call options on companies you believe in, stocks you believe are going up in the next few years.

What's the follow-up, what happens next? You can turn it into stock any time you like as the owner. You call your broker and you say you want to exercise these call options -- turn them into the stock. Then you buy the stock at the strike price. Then you can own it as long as you like. Or, if you wait until expiration and the call is in the money -- the strike price is better than the current share price -- the call automatically turns into stock.

If you don't want the stock, you can just sell the call on the market at the going price, and you have your gain or loss that way based on the price of the call at the time. Finally, you can close the calls and open new ones at a later date. We've done that in options, the service Motley Fool Options, where we've had positions going on for years and years -- six, seven years -- because every two years we'll just roll it to a new option.

Finally, the worst case is, the call ends without any value. Again, if the stock is at a lower price than your call option strike price at the end, then that option is out of the money. You can buy the stock cheaper on the market. The call doesn't have any value. You are out that money. The only good news [is] that maybe that you invested a small amount, much smaller than you would have to buy 100 shares of stock, one. Two, you can, if you want, buy the stock on the market at a lower price. By owning the call option, it's kept your eye on the stock as well.

JIM:

The last issue is, you get the leverage gains by a relatively small move in the stock, and get a large movement in the value of your options. This last point is the risk that you are putting up with to get that, and there's the risk that you will end up with nothing at the end.

JEFF:

That's why we typically buy call options on strong businesses with solid earnings, just as we do when we use strategy No. 2, where we are selling put options on strong businesses. This is the strategy I use most -- and Jim as well. I would say a majority of option members use selling puts most of all. And why? It's the steady short-term income. It sets you up to buy the stock that you like at a lower price. That time value that we talked about, that you have to pay when you buy a call option? You are paid the time value -- you collect it when you use this strategy.

Why do it? Income every month you can target. You just have to be ready to buy the stock that you are writing or selling puts on at a lower price, the price that you choose. The strike price that you choose. Aside from income and buying the stock lower, you can sell puts to potentially add to positions that you own or [are] building, and that you like. If you want to build a 5% allocation in the stock, you might start with buying 2% or 3% outright.

If you think you have time and want to target a lower buy price on the stock, you can sell puts instead of buying the rest of the shares outright. You get to add to the position lower potentially, but you get paid income while you wait either way. How you sell puts mechanically is different than buying a call option. You buy a call option or buy to open, just like a stock.

When you sell a put option, your beginning transaction is a sale, and you are paid money in. It's like you're selling insurance to someone. If the stock is $25, you could sell a put option that says, "If that stock falls to $20 or lower, I'll buy it from you." You are paid the option premium, also known as, in this case, an insurance premium. That's paid into your account on day one, and you get to keep that.

It's [a sell] transaction at the start. It's like selling short. You collect the option premium, all of it, and you are taking on this potential obligation to buy the stock lower. It's really like setting a limit order at a lower price, and then waiting to see if the stock hits that price -- but you are getting paid while you wait.

JIM:

That's the best part.

JEFF:

How to sell puts, again, it's quite different than how we buy calls. When we buy calls, long-term is all we do. Selling puts, you are selling near-term expirations, because you are maximizing the time value that you are being paid. We look at puts typically that expire in three months or less. They can be weekly for some people. Some people prefer six months, but we generally do three months or so or less.

JIM:

The philosophy here, as Jeff said, is different. In buying a call, we are trying to pay as little time value as we can, but we want to use a long time period for our thesis to turn out right. Time value will decay very, very slowly over that long time period. As expiration nears, the decay rate starts to pick up speed. We want to take advantage of that. In selling puts, we want to take advantage of that decaying time value. We can sell more and more time value over and over and over again.

JEFF:

That's exactly right, and especially because we are only selling time value -- meaning we are selling put options that are out of the money, with a strike price that's below the current share price. Then we are paid the time value. We aim for at least the 1% yield per month, and we'll show you how to calculate that in a moment. (All these slides will be on the website.)

We are selling puts when we are ready to buy shares if they decline. We always have to be ready to take on that potential obligation if it happens. As with buying call options, here's one way where they are similar. We target strong, growing companies. The reason being, you don't want the stock to fall sharply on you. From your strike price, your risk is the same as owning the stock, ultimately.

From your strike price, that's the risk you have. You want ... a strong company that has reliable earnings, generally speaking -- that's what we favor -- and that has a valuation that you are at least very comfortable with. We say this because speculative stocks have very high premiums. You can get paid a lot to sell a put option on a company that has no earnings. That may or may not work out.

The reason that those put options pay so much is there's a lot of risk in them. The stock could fall very sharply. We prefer to collect income on a regular basis, avoid blowups, and therefore we apply the strategy to reliable companies with reliable earnings.

JIM:

Slow and steady wins the race.

JEFF:

That speaks to again being happy to own these shares. It's a company that we believe in for the long haul. We are not interested in gambling here. [Here's] an example of selling to open puts on a stock that right now is at $117.50. I've been selling puts on **Facebook** (NASDAQ: FB), I think about three years now. I own shares. I've also, alongside that, sold puts to potentially get more shares if they fall by my expiration date.

Really, I've been targeting income on a company I know really well and believe in. Over these three years or so, as well as the shares have done, I've made more selling put options on the stock than I've done by owning the shares. One way to think about that is if you can make a few dollars per share per month selling puts over three years, that's $24 a year times three, would be $72. [In order to exceed that,] I must have gained more than $72 per share in the stock. I've made more writing puts the last three years, even though I'm happy to own the stock as well.

Right now, if you are happy to potentially buy Facebook lower, you would sell to open. In this case, we are doing a short-term example. We typically do the options that expire in one month. In this case, you're paid more than $200 per put option that you sell. Your outcomes are, you're potentially on the hook to buy shares about 4% lower. That's if the stock price is below your strike price at expiration. (What happens before [that] doesn't matter; generally speaking, it's only at expiration.) Or you are just paid this nearly 2% yield in less than a month.

That's your option premium. Measured against your strike price, which is the money you should set aside to potentially buy the shares, [that] gives you your yield. Nearly 2% a month. Again, we target at least 1% a month, 12% annualized. You can usually get considerably more than that, as you can see here. As long as Facebook remains or is above $115 on June 17 when this expires, we just collect that nearly 2% yield. It's done. Option disappears. We could do it again.

If Facebook is below $115, the strike price at expiration, we could buy the shares. We still keep that income we are paid. Our net buy price on the stock is actually below $113, or more than 4% lower.

[Here's] another example going a bit longer, which shows you that you can write puts at a lower strike price and still get paid well. The August options at $110 pay about $400 each per put. You are committing to buying the shares around 10% lower if the stock is below $110 at this August expiration.

In return for that commitment, that potential obligation, you are paid a nearly 4% yield in about three months. If you are at all bullish on Facebook, or even neutral -- you think the stock is going to hold its ground -- this position may make sense for you. You can make 3.7% in three months. You have a 10% cushion until you are at your potential buy price on Facebook. As long as the stock falls less than that, or doesn't fall at all, you'll make some money here. If it stays above $110, you make the whole premium and have no obligation.

We have a few other examples of put selling. **Skyworks Solutions** (NASDAQ: SWKS) is a holding in Pro. They supply technology, digital analog chips to smartphones and Internet of Things devices. They have very reliable earnings historically -- strong margins. Their margins are going up, which is unheard-of, for the most part, for a semiconductor company. (It's grouped into semiconductor stocks.) It's quite volatile, and the put options pay well. In this example, options expiring in a month will pay you nearly a dollar per share, even though they net you a buying price that's nearly 9% lower, just one month from now.

The stock would have to fall a fair amount for this option to become in the money. You are getting a 1.6% yield in 30 days. That's great. If you are looking for income in the next month, this is something that you could set up. We have recommended selling put options on Skyworks in Motley Fool Options a few times now. We have an active position there.

Here's for someone who wants to maybe go a bit longer. Some members prefer to not have to look every month. They would rather live their lives. Maybe they are taking a long summer vacation. You could then sell a put option that expires in November on Skyworks, with a much more distant strike price. Remember, there's more time to expiration now, [so] you are going to be paid much more time value in this case than you would on a June option at this strike price. You are paid more than $300, even though you set up a potential buy price on the stock 20% lower.

Skyworks would need to fall quite far for you to get all the way to your breakeven price. That's a nice cushion. Meanwhile, you are earning a 6% yield in six months, which as you know these days is very tough to get -- a 12% annualized yield, with this added cushion that your breakeven price on this position is 20% lower.

That's an intermediate-term income that members target as well -- those who want to write options expiring in six months instead of one month. You get the added benefit of a lower strike price. You still get a strong yield. You just have to wait longer to collect that value, because the time value, as Jim mentioned, will take a longer time to decay.

JIM:

To realize that value, you are paid on day one. You get to realize it when the option is over. When it expires or you close it.

JEFF:

All right. We have ...

JIM:

How much time?

JEFF:

About five minutes. Here's one more. This is a company in the Everlasting Portfolio, [a] Tom Gardner recommendation. It's operating in commercial real estate. As a financial company, the premiums are pretty good as well. Stock is $23. You can sell to open August puts, and you are paid about $145. What I found surprising about this -- and I recommended it in early May in Motley Fool One because of this --

You are setting up a much lower buy price in three months, and you are getting paid very well in three months. A 6% yield in just that short time frame, on a stock that is already down quite a bit this year, 20% or 30% this year. It looks like a good valuation. We issued this recommendation to Motley Fool One members a few weeks ago, as a way to make income or set up a buy price on the stock more than 8% lower.

Here's an example like we saw with call options. The different strikes that are available to you -- and that's one beautiful thing about options: You can choose how much risk you want to take, how defensive you want to be. Intel is $30. The at-the-money put option with the $30 strike price will pay you the most, of course, because the odds are highest that Intel could end below $30 in this scenario.

It pays you a dollar, expires in two months. If you wanted to instead sell to open at a $29 strike price, you will be paid a bit less, but you are setting up a more defensive position. The odds are perhaps better that you'll just get that income and won't have any obligation to buy the stock. If the stock does fall below 29 by expiration, you have a lower net buy price -- in this case, 28.30.

Even further, you could sell a $28 put instead, and have a more defensive position. ... In this case the one that we like best would be one that is 5% lower or so and still offers a greater-than-2% yield in two months. That's this one. That's the type of position that we've recommended at Motley Fool Options before. It pays pretty well. Gives you a nicely lower potential buy price on Intel, and a good yield.

As alternatives, we tell members, they can write a lower strike if they want to be more defensive. If you are more eager to get shares, you can write the $30 strike and get paid more income while you wait, and have a better chance of getting to buy the shares at $30. The outcomes when you sell put options, just to go over that again: As long as the stock price is above your strike price at expiration, you don't get the stock; you keep all the income you were paid. The option disappears, and you can sell another put option.

That's how people do this week after week or month after month. The stock holds steady or goes up until the put expires. They sell another one for more income. If the stock is below your strike price at expiration, then you get to buy the stock at your strike price, but you still keep the income you are paid, and that lowers your net start price even further. If you don't want to buy the stock, you can buy to close at any time the put option that you sold to open.

You pay the going market price, either a gain or a loss at that time, depending where the stock is trading. We use this strategy most -- I think most members do, too -- because it's probably the best repeatable strategy out there. Again, it's like setting a limit order to buy a stock at a lower price that you want to buy anyway, and getting paid while you wait for that price to come along, whether it does or not.

Why is this good as well? Of course, good stocks were turned up. You are increasing your discipline. You are committing to buying on dips. Many of us step away when stocks fall; we think, "Oh, we will wait longer, maybe it will go down further," and then miss the dip. How many missed January-February? When you sell put options, that locks you in and commits you to buying the stock. Whenever that happens, nine times out of 10, I'm happy down the road that I got the stock at that price. Of course, you are paid while you are waiting.

In summary, when we buy call options, we are doing [it] for these reasons: We want the upside. We want a leveraged return. When we sell put options, we are targeting short-term income and a really good yield of about 12% annualized or more. That's how a lot of members have made a lot of income to make a difference in their portfolio. The risks, as Jim and I talked about: [A] call option can end worthless if the stock price is below your strike price at expiration.

You only risk what you are comfortable risking, or can just end worthless if the stock price doesn't go up. [If it] just stays on a range. You'll lose that time value that you paid. With the put option, [if] the stock falls far below your strike price and your net start price on the stock, you are starting at a large loss. That said, you are probably buying the stock at a lower price than you would have if you bought on day one, without selling put options.

JIM:

There are strategies to deal with that situation.

JEFF:

Or another risk: If you sell puts without owning shares, the stock might soar. Like if I didn't buy any Facebook shares, I would regret that. We recommend in a lot of cases selling puts on a stock that you already own some shares of that, you really believe in. That way, you are getting all the upside of the stock as well, and then collecting income and potentially getting to add to your shares at a lower price.

The best thing about options, as we started out with, is they let you be long-term with your stocks. They are a complement to your stock. You don't have to touch your stocks. You can let them be to appreciate as you should. [Options] add all these extra tools to your portfolio: the income, the leverage, the gains whether the stock market is flat. As you get more experienced with options gains by hedging and protecting, you can put on positions that will make money when the market falls.

They are just a way to be a much more flexible investor, making money in various scenarios, different ways, while still being a long-term stock investor with your stocks. You can learn much more about options in Motley Fool Options, of course, where we have a whole full Options U suite of tutorials and guides. Motley Fool Pro, where we use options alongside a stock portfolio, combined, as they are meant to be complementary to each other. We target monthly income in Motley Fool Pro as well. In Motley Fool One, we have quarterly options recommendations on Tom's Everlasting Portfolio stock.

Thank you, everybody. Thank you, Jim.

JIM:

We are just about out of time. We are are going to try to squeeze in -- we've got a lot of questions, thank you very much. We are not going to be able to answer all of them. We'll try to squeeze in just a few.

JEFF:

Before we start, I'll say, we have lunch next. Then after lunch at 1:10 you can go to "The Four Stocks You Don't Want To Miss." That session is starting right now, but then repeats after our lunch. You won't miss it. It will run again after lunch. We'll have lunch and then go to that session.

JIM:

One member asked, though, "When can you exercise the option?" The options we deal with, you can exercise it anytime until expiration. From the moment you buy it until the expiration. You must be the owner of the option. You must buy it in order to exercise it. If you sell the option, like if you sell a put, that choice is not yours.

"What would happen when selling a put with a flash crash?" Basically nothing, because it happened so quickly. More importantly, there's still a lot of time value left in the option that the owner would be giving up if they exercised to take advantage of that.

Finally ... Those are the ones that we are not going to answer, sorry. You can pigeonhole us after this session if we didn't get to your question.

"Can you explain how buying options [fits] with a Motley Fool long-term holding stock philosophy?" I'll let Jeff speak to that.

JEFF:

We'll buy an option that expires in 2018, and then at 2018, we'll either turn it into stock, let it exercise into shares as we did with Facebook, or we can roll those options, if we are bullish, another two years ahead – two-and-a-half years. You can keep positions going indefinitely. We'll stay as long-term as we think we should be in that company. It's a great question.

We think long-term even as we use short-term put options. We know we might end up with shares that we then want to own for the long term. We think long-term when we buy call options, too -- at least in increments of two years or more. Someone else asked about allocation: "What size is the position similar to a stock size?" If that's 2% or 3% before you do the same thing here.

JIM:

[The percentage yield is relative to] the price it would cost you to buy the shares.

JEFF:

Yes.

JIM:

With that, we thank you for your attention. If your name is Bob, see the gentleman in the red shirt. That guy in the back. Thank you very much.

JEFF:

Thank you all.

JIM:

Or Rob.

Write Puts on Gentex

Published Jun 15, 2016 at 1:16PM

Is this for you? Since we're looking to add 1.5% to our stake in this company, this alert should be applicable (now or perhaps later) to all *Pro* members, whether you already own shares of **Gentex** (NASDAQ: GNTX) or not. If you don't yet own shares, check out the Alternative Trades section at the end of the report.

How You Participate

- **Trade:** Sell to open September 2016 $15 puts.
- **Allocation:** 1.5% — write one put for every $100,000 you manage; *Pro* will write 25 contracts. In addition to our current 2.8% stock holding, this would bring our total allocation to about 4.3%.
- **Price Guidance:**
  - **Now:** Use a **limit order** to target $0.50 or greater to start (for a 3.3% effective yield in 94 days). **If we all use limit orders** and the stock price cooperates, we may be able to achieve $0.50 today.
  - **Later:** As prices and time to expiration change, those approaching the position should aim to get paid a yield on time value of at least 1% or so ($0.15) per month to expiration.

- **Prices (1:05 p.m. 6/15):** Stock: $16.05; options: $0.45 bid / $0.55 ask. Guidance: $0.50.
- **Stock Rating:** Buy First, 2.8% allocation; we're now adding 1.5% in additional exposure through these new puts.

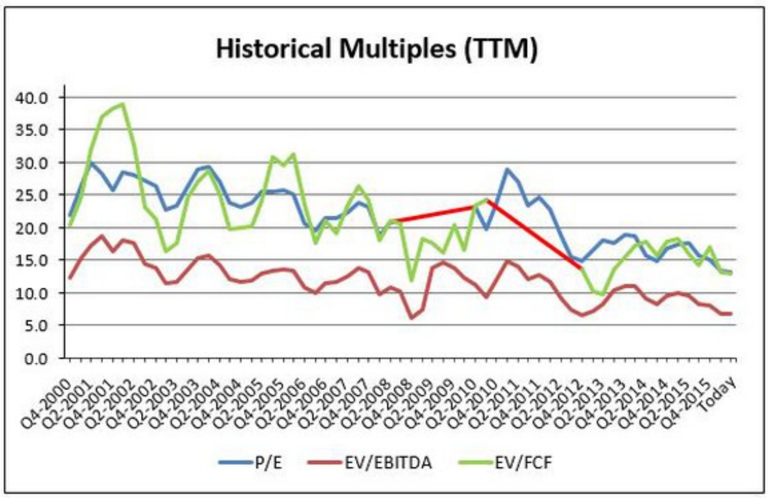
What We're Thinking

With the expiration of our May 2016 $15 puts last month, we've now run four successful rounds of written puts on Gentex, with all four iterations expiring fully as income. This has taken place over about a year and a half, with our first round of put-writing occurring in January 2015.

Since then, we've earned $5,139 in options income from our four rounds of written puts, and we've earned $2,200 from six dividend payments in January, April, July, and October of 2015 and in January and April of 2016. Based on our current ownership stake of 4,400 shares, that's income of $1.67 per share. That equates to an 10.4% yield on the current share price, which helps offset some of the stock-price weakness Gentex has experienced since the end of 2014 (as of today, the stock price is down about 11% compared with the closing price on Dec. 31, 2014).

Since our May puts expired, we've been waiting for a new opportunity to reinitiate our income strategy. Now that Gentex's stock price has declined a bit from its recent highs, we've decided to continue our approach by writing these new September 2016 $15 puts. While we like Gentex's long-term prospects, we prefer to target income on our position alongside the potential to add to our stake at a lower price. With the income for this iteration of the strategy at $0.50, we'll have collected a total of $2.56 per share with our series of five written puts on Gentex, giving us an effective start price on assigned shares of $12.44. (Your mileage may vary depending on how much you collected in the first several go-rounds and your tax situation.) This is about 22% lower than the current level, and 31% lower than our fair-value estimate; we'd happily buy shares for this price.

That said, we also need to evaluate the strategy on today's new decision alone — are we happy to potentially buy shares at $14.50? At that price, we'd be buying at 13.3 times trailing-12-month (TTM) earnings, 6.7 times TTM EBITDA, and 13 times TTM free cash flow, at the low end of historical ranges over the company's past 15 years. That includes the 2008-2009 period, when auto sales plunged and several automakers looked like they might go bankrupt. Given Gentex's recent business execution, we think those multiples are attractive.



Note: Red lines represent omitted outlier multiples that correspond to recession-depressed earnings and cash flow.

More That Matters

- **Maximum loss:** For this iteration of the put strategy alone, our risk is the same as share ownership starting at about $14.50, or 9.7% less than the recent price.
- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At a minimum of $0.50, that's a 3.3% effective yield in 94 days.
- **Follow-up:** For this iteration of the put strategy alone, we'll buy shares at a net $14.50 if the stock is below our $15 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 2.8% allocation first — Gentex's shares are a Buy First. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1.5% of your portfolio, then just buy 1.5% in stock directly *if and when Pro* does so through these puts (we'll alert you on the boards and in the subsequent Monday Memo if and when we do).
- **Want to write other puts?** Consider writing December 2016 $15 puts if the price on those options holds up better than the September puts after this alert is issued. Right now, the bid/ask on the December 2016 puts is $0.80/$1.00 (a 6% effective yield in about six months).

Pro Can Help

- See our Options U guide to writing puts if you want more on this strategy.
- Check your mirrors and switch lanes over to the Gentex discussion board.

Write Puts on Celgene

Published Jun 14, 2016 at 3:22PM

Is this for you? This is for all *Pro* members who can add another potential 3% position to their portfolio to match us. If you can't write puts or are managing less than $300,000, do nothing but wait and then buy 3% in shares directly if and when we do the same (we'll alert you if shares are put to us).

How You Participate

- **Trade:** Sell to open October 2016 $95 puts on **Celgene** (NASDAQ: CELG).

- **Allocation:** 3%. Write one put for every $300,000 you manage; *Pro* will write 8 contracts, potentially buying 800 shares worth $76,000 of our $2.5 million portfolio.
- **Price Guidance:**
  - **Now:** Use a **limit order to target $5.50** or greater to start, for a 5.8% effective yield in 129 days, or 4.3 months until expiration. Accept no less than $5.10.
  - **Later:** If the stock rises, you'll need to accept a lower yield. If it falls, the puts will pay more. As prices and time to expiration change, those approaching the position later should aim to get paid a yield of at least 1.25% per month to expiration, measured on the $95 strike price; that's $1.18 per month, or $5.10 in put proceeds, right now with 4.3 months to go.
- **Prices (2:55 p.m.):**
  - Stock: $100.50
  - Sell to open October 2016 $95 puts (bid/ask): $5.45/ $5.65
- **Stock Rating:** We don't yet own the stock, but we'd rank it a Buy at $95 or less, with a 3% allocation. If we get shares, we'll tell all members to buy.

What We're Thinking

A nearly $80 billion biotech behemoth, Celgene is a research and development success story, pioneering new drug discovery methods to become a leader in treating cancer and inflammatory diseases -- and it's growing strongly.

In the first quarter of 2016 reported in May, revenue was up 21% and earnings per share jumped 23%. And management expects to enjoy earnings growth at a clip of about 15% annualized through 2020; they project earnings per share of $13 that year, up from the estimated $6.75 to $7 per share they're calling for in 2017. That's on projected 2020 sales of $21 billion compared to 2016 estimates of $10.75 billion.

Celgene's success is being driven by a few blockbuster drugs, but one – REVLIMID – represents an estimated 62% of its sales, with $6.7 billion in revenue expected this year . REVLIMID sales were up 19% year-over-year last quarter, as more multiple myeloma patients were treated. Other sharply expanding drugs treat other versions of blood cancer; there's also ABRAXANE, a treatment for breast, lung, and pancreatic cancers with about $1 billion in sales expected this year despite a highly competitive landscape.

Not standing still, Celgene has one of the richest product pipelines in the industry. The company expects to see results from an whopping *18* phase III (or final-phase) clinical trials in the next two years, some of which could become blockbusters. The company can't rest. REVLIMID will start to lose U.S. patent protection in stages between 2022 and March 2025, and though management believes it can replace lost sales by then with new drugs (potentially including a new version of REVLIMID itself), Wall Street is likely to take a wait-and-see approach.

Patent cliffs on key drugs naturally make investors cautious (including Fools like us), so despite currently strong earnings growth at Celgene, odds seem low that Wall Street will sustainably reward the company with much higher value multiples right now -- until and unless Celgene appears able to keep growing in 2022 and beyond thanks to new drugs. That's how our strategy comes into play.

Why This Strategy?

At $101.61 as of Monday's close, the stock trades at 17.2 times expected earnings one year ahead. Assuming management can reach its $13-per-share earnings target for 2020 -- a target it deems conservative -- the stock trades at 7.8 times those distant estimates. That's obviously inexpensive, but we know that large biotech stocks -- such as **Gilead Sciences** (NASDAQ: GILD) lately -- can trade at that type of valuation if future growth is uncertain or lacking.

Rather than assume Celgene can maintain a P/E multiple in the teens and increase the share price nicely into 2020, we're taking a much more conservative stance and assuming the stock can just tread water around current prices, or not fall too much. That's all it needs to do for us to earn nearly 6% in yield over the next 4.3 months, and then presumably more after that assuming we can repeat the strategy. If we end up getting to buy shares, we'll consider using covered calls to improve returns.

The bottom line driving this investment is a belief that, at current prices, Celgene's downside risk should be reasonable, and we can earn a North-Star topping return writing options on it -- while remaining happy to buy this biotech if it comes to that. Longer-term, management's collaborative approach to drug discovery and its product pipeline suggest additional success for the business, but we don't need to bank on that yet.

More That Matters

- **Maximum loss:** The same as share ownership starting at about $90 per share.
- **Maximum gain:** The yield the puts pay us, or about 5.8% in 4.3 months. If we get shares, our upside is initially uncapped.
- **Break-even:** If the $95 puts pay us $5.50, our net start price per share is $89.50 if we get the stock.
- **Follow-up:** We may roll our puts if the stock is below $95 at expiration, or take shares and consider covered calls. If our puts expire as income, or are closed for partial income, we will consider writing new ones.

Alternative Trades

- **Can't write puts, or managing less than $300,000?** Simply wait and see whether we get "put" shares to our portfolio. If we do, at that time we'll alert you to buy 3% in stock directly to match us -- assuming we want to own the stock even without covered calls (because you won't be able to write covered calls, either, without 100-share exposure).
- **Want to write other puts?**
  - If you want a more defensive position, write ("sell to open") October 2016 $90 puts; lately they pay about $4 each.
  - If you want a more aggressive position, you can write October 2016 $100 puts. They lately pay about $7.50 each -- and our recommendation was nearly for writing $100 puts instead of $95, but we went a bit more defensive in the end.

Pro Can Help

- See our Options U guide to writing puts if you want more 411 on this strategy.
- Keep a healthy mind and healthy outlook on our new Celgene board.

Pro Catch-Up Trades: June 13, 2016

Published Jun 13, 2016 at 3:39PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our Portfolio Building Reports will get you fully invested over the coming few weeks, as much as you want to be.

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **FactSet Research Systems** (NYSE: FDS): Buy 2% in this new position.
- **MasterCard** (NYSE: MA): Buy up to 4.5%.

Continue building your portfolio with our Buys, including these highlighted today:

- **OpenText** (NASDAQ: OTEX): Buy up to 3.3%.
- **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY): Buy 1%.

Shorts:

- None currently.

Options:

- **American Airlines** (NASDAQ: AAL): Sell to close your January 2017 calls, per our recent alert.
- **American Tower** (NYSE: AMT): Sell to open new July 22, 2016 $111 diagonal calls, p today's alert.

Hedges:

- None currently.

Options expiring:

- Currently, all three of our June 2016 covered call positions -- on **Skyworks** (NASDAQ: SWKS), **Valmont** (NYSE: VMI), and **WisdomTree Emerging Markets SmallCap** (NYSEMKT: DGS) -- are on track to expire as full income this Friday, with no action needed. If that changes, we'll issue a trade alert.

Pro Quality Checklist: MasterCard

Published Jun 13, 2016 at 3:39PM

Fellow Fools,

With only a few quiet weeks remaining before earnings season picks back up, this seems like an opportune time to return to our *Pro* quality checklist series and review another portfolio holding. This week, we're taking a look at Buy First-rated **MasterCard** (NYSE: MA). The credit card behemoth is one of our largest holdings with a nearly 5% allocation, thanks to a gain of almost 200% since we added it to the portfolio. Based on those stats, it's safe to assume that MasterCard is one of our favorite long-term investing opportunities. It's always tempting to spend most of your time studying your losers to avoid future pain, but it's just as worthwhile to run a winner through the paces. To that end, and as a reminder of why the company earned a top spot in the *Pro* portfolio, here's MasterCard.

1. Sustainable Competitive Advantage

Yes. MasterCard has one of the widest competitive moats on the *Pro* scorecard. The company's global payment processing system provides massive network effects; the more merchants using the system, and the more consumers using MasterCard-branded cards, the more valuable the system is for everyone. The best part about companies with network effects is that they can sometimes offer a winner-take-all situation. In this case, there's a triumvirate of winners, which includes **American Express** (NYSE: AXP) and **Visa** (NYSE: V) as well as MasterCard, and it would be extremely difficult for a newcomer to capture meaningful market share. MasterCard also has a number of intangible assets, including a global brand that's taken decades to build and a treasure trove of data being collected -- and, increasingly, monetized -- every day. Finally, MasterCard's scale advantages allow it to operate efficiently across a global footprint spanning 210 countries with various currencies and ever-changing laws and regulations.

MasterCard's strong competitive advantage is evidenced by operating margins in excess of 50% and return on capital approaching 40%. These fat profit margins attract a constant stream of newcomers hoping to gain share, including PayPal and other new digital solutions. New innovations, like the blockchain distributed ledger technology that powers cryptocurrencies like bitcoin, are also threatening to disrupt the current payment ecosystem. For the most part, MasterCard has been quick to embrace these newcomers and find ways to form partnerships or develop similar capabilities rather than clinging to the status quo.

2. Pricing Power

No. This point is a close call because of MasterCard's dominant position in the industry. Growing regulatory scrutiny, which has reduced or capped some processing fees, and stiff competition from Visa, which has recently resulted in the loss of longtime accounts including USAA, have left MasterCard's pricing power limited at best. Also, recent increases in incentives and rebate costs suggest that the card brands feel the need to share a bigger portion of their take in order to sign new banks and merchants. It's unlikely this trend will reverse in the near term.

3. Dependent Customer Base

Yes. Merchants who want to offer customers the option to use a credit or debit card are almost certainly going to use the MasterCard and Visa payment platforms (and possibly American Express if they can stomach the higher fees). On occasion you'll find businesses that try to operate cash-only, like my local barbershop, but the reality is that consumers enjoy the convenience and benefits of using a credit card, and many merchants would forego sales if they failed to provide that service.

On the other side of the coin, if an issuing bank wants to get its card into consumers' wallets, there needs to be a MasterCard or Visa logo on the front. Consumers trust these global brands and value the cardholder benefits, including rewards and fraud protection, that they receive from MasterCard.

4. Predictable Revenue

Yes. MasterCard is essentially a toll-taker in the global consumer economy. The company pockets a tiny slice of every transaction that passes through its payment network. Unlike American Express, MasterCard does not issue credit itself; that means it doesn't have to worry about cardholder defaults, only their willingness to spend. Though economic turmoil can affect consumers' transaction volume, MasterCard's global footprint helps smooth some of the volatility, even with occasional currency fluctuations. Also, the company's growing suite of service offerings, including fraud prevention and loyalty programs, add a new revenue stream while making the company's relationship with card issuers stickier. Over the past two years, currency volatility and the rapid decline in gasoline prices have weighed on MasterCard's sales growth, but even so, that amounts to a small wiggle in a steady upward march.

5. Growing Free Cash Flow With Compounding Returns

Yes. Like many companies in the *Pro* portfolio, MasterCard sports an asset-light business model, meaning that management invests more in people and platform than plant, property and equipment (PP&E). With its processing platform built, MasterCard can leverage its existing network to service increasing purchase volume with little incremental spending required. That's why the company is able to generate operating margins in excess of 50% and copious free cash flow to reinvest in the business or return to shareholders. Over the past three years, management has returned $10.8 billion to shareholders through a combination of share repurchases and dividends, and we expect this to continue for the foreseeable future as the company's ability to reinvest at the same level of returns is limited.

6. Financial Resilience

Yes. MasterCard is a cash-printing machine with little need to invest in fixed assets, so the company boasts an ironclad balance sheet. Though management employs a bit of debt to boost the company's return on equity, the large cash reserve and steady free cash flow would allow them to pay down debt quickly if the need arose. MasterCard's business held up surprisingly well through the Great Recession, and it should do even better in your garden-variety business-cycle downturn. Also, because the company's fees are tied to total transaction volume, MasterCard is also well-positioned to deal with -- or even benefit from -- an inflationary environment, should one arise.

7. Expanding Possibilities

Yes. One of the linchpins of our investing thesis is MasterCard's ability to capitalize on the transition from cash to digital transactions -- a trend that should only accelerate over time with the addition of mobile payment technology. MasterCard has proven success expanding its network into international markets, and one of the largest developing economies, China, is just getting ready to open its doors to foreign payment processors. It will take a while for MasterCard to establish itself in the country, but growth in China and other emerging markets with a rising consumer class will certainly add to the company's processing volume over time. Also, MasterCard is developing a number of ancillary businesses that allow the company to profit from the huge amount of unique data it creates. These value-added services not only keep existing customers happy, they are additional channels for high-margin revenue growth.

8. The Three C's of Management (Clarity, Consistency, Capability)

Yes. With a company as large and globally diverse as MasterCard, it's impossible to pin its success on any one individual. Though there's no "visionary founder" -- MasterCard was previously controlled by an association of financial institutions -- CEO Ajay Banga and CFO Martina Hund-Mejean have a long track record of successfully running large, multinational businesses, and both have a significant portion of their wealth tied up in MasterCard shares. Management has done a good job of setting ambitious, though achievable, multi-year goals, executing on their plans and effectively communicating their progress to shareholders. The payment industry has experienced rapid innovation over the past decade, and MasterCard's management has been successful in recognizing important trends and responding, either by developing new technology in-house or by acquiring new capabilities as necessary to stay at the front of the pack. Overall, MasterCard has such a strong business model that management's biggest job is limiting the number of unforced errors and avoiding complacency.

The *Pro* Bottom Line

With 7 of the 8 *Pro* quality characteristics we look for, it's little surprise that MasterCard has been a top performer since we added it to the portfolio in 2011. Though competitive pressures have picked up recently, management has been investing heavily in defending MasterCard's competitive position and finding new opportunities for growth. We think MasterCard has a fantastic business model, and we're happy to have a 7% combined allocation to the industry through our 4.5% position here and our 2.5% position in Visa. MasterCard is currently rated as a Buy First, so we suggest members buy shares to match our allocation if they haven't already.

Here are links to additional *Pro* quality checklist articles:

- **FactSet Research Systems** (NYSE: FDS) -- 8/8
- **Gentex** (NYSE: GNTX) -- 5/8
- **American Tower** (NYSE: AMT) -- 7.5/8
- **Broadridge** (NYSE: BR) – 8/8
- **Oracle** (NYSE: ORCL) -- 8/8
- **O'Reilly Automotive** (NASDAQ: ORLY) -- 6/8
- **TD Ameritrade** (NASDAQ: AMTD) -- 5.5/8
- **Valmont Industries** (NYSE: VMI) -- 5.5/8

Have a great week, Fools!

Best,

-- Jeremy (TMFTank)

Pro Completed Trades

- **FactSet Research Systems** (NYSE: FDS): We bought 330 shares, for a 2% position, at $160.30. (edited)
- **American Tower** (NYSE: AMT): We bought to close our June 10, 2016, $108 diagonal calls for $1.

Re-Establish Your Diagonal Calls on American Tower

Published Jun 13, 2016 at 11:57AM

Is this for you? This recommendation is for all *Pro* members who have matched our 3.9% stock allocation in **American Tower** (NYSE: AMT) and **also** own January 2017 or 2018 calls, or are ready to buy them now. For new *Pro* members who do not yet own calls, please check out the guidance under "New *Pro* members" in the "How You Participate" section of this alert. Mind that we are only writing calls to cover our owned calls, **not** to cover our stock position. We recommend that you leave your stock allocation **uncovered** in order to capture further potential upside in American Tower.

How You Participate

- **Trade:** Sell to open July 22, 2016, $111 calls on American Tower. *Please note that these are **weekly** options*.
- **Allocation:** Sell one call for every January 2017 (or January 2018) $80 call you already own (or are buying now). *Pro* will cover its six long calls.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a limit order to split the bid/ask spread at going prices as long as you get at least a 3.5% yield on your long January 2017 or 2018 call value (see the math below). These weekly options are relatively thinly traded, so **it is critical that you use a limit order** to avoid collapsing the bid/ask spread.
- **Prices** (as of 11:35 a.m. 6/13/16):
    - **Stock price:** $109.50
    - **Sell to open July 22, 2016, $111 calls (bid/ask split):** $1.40
    - **January 2017 $80 calls we own (bid/ask split):** $29.85
    - **Diagonal call yield:** $1.40/$29.85 = 4.7% in 40 days.
- **New *Pro* members:** If you've yet to buy calls on American Tower, go ahead and set up the whole diagonal call trade today. Use a diagonal call order (sometimes referred to as a "calendar spread" order, depending on your broker), buying the **January 2018** $80 calls (rather than the 2017 calls *Pro* owns, in order to give your calls more time to expiration) and simultaneously selling the July 22, 2016, $111 calls to aim for a net debit of $30.05 or so. Invest about 0.7% of your funds in the long calls if you're matching our allocation.
- **Alternative Guidance:** If *Pro*'s volume results in a significant impact on the July 22, 2016, $111 call pricing, or if the stock price changes considerably from the price in this alert, consider looking at various other strikes or weekly expirations for your short call, depending on what you like best. Be sure to consider when American Tower is expected to report second-quarter 2016 earnings (last year, that date was July 29), as that may impact the option premiums and expected volatility of the stock around that date. If you choose this route, be aware that *Pro*'s course of action may diverge from yours, depending on what strike and expiration you choose, and depending on the stock-price movements of American Tower.

What We're Thinking

After closing our short calls last week to avoid assignment, we're content to keep our diagonal call position going, selling a new short-dated call to generate income and target further upside from our long-dated owned calls.

The rationale for this diagonal call is much the same as it was for the previous iteration. These new written calls could pay us 4.7% or so on our current long call's value in one month, and we have upside to the $111 strike price (about 1.4% higher than the current price), which if reached would increase the value of our owned calls by about 5%. This is an example of the leverage that owned calls provide! If the stock price shoots well above our written call's strike price prior to expiration, we can roll our calls for further income (if the rolling trade looks attractive) while still capturing the full upside of the stock with our uncovered 3.9% stock allocation, currently our seventh largest.

Even if we assume that we will have to sell our long calls in a little over a month when our written calls are assigned, the return on the long calls (including the income from the series of two diagonal calls) would be approximately 47%, well ahead of our North Star since our December 2014 purchase. And although we aren't explicitly planning to close or sell our diagonal call, preferring to roll if possible, our willingness to sell outright does increase as the stock price appreciates and grows closer to our fair value.

More That Matters

- **Maximum gain:** The 4.7% premium earned from writing the calls, plus upside in our owned calls to our short call strike price at $111, which is lately about 1.4% higher than the current price.
- **Maximum risk:** The full value of our long $80 calls, minus premiums received from short calls.
- **Follow-up**: We hope to see these short calls expire for income later this month, and then we will determine whether we want to write new calls. If we need to roll or close, we will.

Pro Can Help

- **Want to know more about this strategy?** Our Options U guide to writing diagonal calls can keep you on an even keel.

The Best 2 Days in Fooldom

Published Jun 9, 2016 at 12:00PM

The best part of The Motley Fool's online community is bringing together hundreds of thousands of investors from all over the world. The worst part is that we rarely meet any of those people face to face.

We bridge that gap a few times a year by inviting hundreds of our investors, advisors, analysts, and guest speakers to talk investing, business, the economy, and more. The events are truly one of the highlights of being part of our community.

We just wrapped up FoolFest 2016, our largest event of the year near our headquarters in Alexandria, Virginia.

Here's a video of the highlights. Check it out, then keep reading for my top takeaways -- and how you can watch the full two-day event.

{% video %}

1. Dan Pink on Motivation

Best-selling author Dan Pink gave a great talk about motivation, including how making people's jobs more meaningful increases productivity:

> Let me very quickly give you one study that I think makes this case really well. It's a study out of Harvard Business School. They went to a cafeteria. Imagine people going through the line in a cafeteria. What the researchers did is they set up an iPad, and the iPad allowed the people in the kitchen, the back of the house, to see the people in line, the cafeteria customers.
>
> There were four conditions. In one case they could see each other. In one case, the cooks could see the customers. In another case, the customers could see the cooks. In one case they couldn't see each other.
>
> When the cooks could see the customers through this iPad camera, the quality of the food improved. The dependent variable in this study, what they were measuring, was the quality of the food. It wasn't whether the cooks were satisfied. It was, what do people think of the food? When the cooks could see the customers, the quality of the food improved.

> Now those cooks were not like, "We're standing up against Big Food. We are empowering local farmers," or anything like that. It's like, "I'm just making an awesome omelet, and I want it to be great, because this guy looks like a nice guy and I want the omelet to be good."

2. Nell Minow on Curfews and Cutoffs

Nell Minow, a corporate governance expert, told an amazing story about having to scold her dad for not attending enough board meetings:

> I was at the then very new Institutional Shareholder Services, which was the first large company set up to advise institutional shareholders on proxy votes, and it bugged me that nobody was paying attention to boards of directors. And I said, "Well, they have to tell us two things: do they have any stock and did they go to meetings. Let's not vote for them if they don't have any stock and they don't go to meetings."
>
> So the second name that came up was my dad, who had missed more than 25%, which is the cutoff. So I had to call him and tell him. I said, "Hi..."
>
> And he said, "Hi, how are the kids?" So I said, "Oh, they're fine. Listen, I have something to tell you. You've missed too many meetings on the board of AON, and we're going to recommend a vote against you. Our clients include the California Public Employees' Retirement System, and TIAA-CREF, and they're going to vote against you."
>
> He said, "How many meetings did I miss?" I said, "Well, the cutoff is 25% and you missed 27%." He said, "That's really close." I said, "When I came home at 12:15 and my curfew was 12:00, you told me that close didn't count."

3. David Gardner on the Pressure for Predictability

Motley Fool co-founder David Gardner talked about the importance of predictability in corporate results:

> I had that taught well to me by Howard Schultz of Starbucks, who was invested in [The Motley Fool] early on, and we had some good opportunities to learn from Howard. One of the things Howard said is, "If and when you ever go public, you need to know ahead of time that you have your next four quarters nailed." Howard was probably a little too hardcore on this, but he basically said, "If you come out of the gate, and you miss your first, second, or third earnings, Wall Street will walk away from you and they'll never come back."
>
> And while I think, again, that might be a little bit over the top, he was just talking about the importance of predictability in a business.

4. Bryan Hinmon on Finding Time to Focus

Motley Fool analyst Bryan Hinmon, CFA, shared uncommon ways to improve your performance as an analyst:

> How many of you are familiar with the circadian rhythm? The circadian rhythm is the biological process whereby very naturally our bodies are synced up to a 24-hour cycle. A guy named Nathaniel Kleitman studied sleep for a long time. Apparently he felt like he understood everything there was to know about sleep. Or got bored with it, and decided to study being awake.
>
> And what he found, when he dove into his study of wakefulness, was there are cycles within that circadian cycle. This is the ultradian rhythm, a product of Nathaniel Kleitman. He basically posited that we have natural, biological cycles of alertness and they happen to take a form. The bad news is we've got about 90 minutes of high-functioning activity before we need a 20-minute break.

5. Morgan Housel on the Risk Inside Our Heads

I gave a talk about risk, and how the biggest risk we face as investors is our own behavior:

> We, as investors, are constantly bombarded with mental ammunition for the fact that markets are risky and that we should take actions to avoid that risk. And we tell ourselves after the market decline that we learned our lessons, and we won't make the same mistakes [as in] the past, so we sell after stocks have declined, only to get lured back into them after they've risen again. We come up with all kinds of different trading strategies to get in and out of the market at opportune times. And we do these with good intentions to make ourselves safer. To reduce risk. And rarely do we take a step back and realize that we're doing just the opposite.
>
> Because the biggest risk that you face as an investor is not that you're going to experience volatility in the stock market. Volatility is a pretty normal and common thing in the stock market, even when the stock market's doing really well.
>
> The biggest risk, by far, that you face as an investor, is fooling yourself into believing that the way that you deal with this risk is to take actions and try to outsmart and outmaneuver the volatility. That's when you really end up in trouble.

6. Jason Moser on the Optimism of Chipotle

Fool analyst Jason Moser talked about Chipotle's recent stumbles, and how the company has capitalized on a lower share price:

> We go back to November 1, 2015, they've spent almost $1 billion since then on share repurchases, representing a reduction of almost 2 million shares in the total share count there. This, all the while, they still have a very flush, healthy balance sheet with $250 million in cash and equivalents at their disposal.
>
> There are a couple of things we can take from this. No. 1, the model is very cash-flow productive, right? These stores don't cost a lot to open. They realize the return on their investment very quickly, which allows them to really bring in a lot of cash, reinvest in the business, and build up a very healthy balance sheet. No. 2, I think management here even recognized that the shares, while they probably deserve to get hit pretty hard, I think management also seeing the forest for the trees, knows that this is not the end of the business. This is Steve Ells' legacy, I don't think he wants to go out on a sour note like this.

And that's just a small slice of what we covered at FoolFest. There's actually 21 videos available -- just click below to get more:

Watch the Full Event

Video transcript

Chris Hill: We're just wrapping up FoolFest 2016, two incredible days where we were talking about top stocks for the next decade, Morgan Housel doing an amazing session on risk and what it means for us as investors. We had CEO interviews; we had breakout sessions on retirement planning, dividend stocks, growth stocks, options — so much great content — we hope you check it out on this year's Digital Pass.

Another Potential Trade on Your Diagonal Call on American Tower

Published Jun 9, 2016 at 10:34AM

Is this for you? This is for all *Pro* members who wrote June 10, 2016, $108 diagonal calls on **American Tower** (NYSE: AMT). If you're a new *Pro* member and you have yet to establish a diagonal call position on American Tower, please ignore this particular alert. If and/or when *Pro* decides to re-establish its diagonal call position, after we either buy to close our calls on Friday or let them expire, we'll issue a *new* trade alert instructing you how to do so. Remember that all members should already own an unencumbered 3.8% stock allocation to American Tower, so if you have yet to establish the diagonal call, you should still have exposure to the stock's upside.

How You Participate

- **Condition:** If American Tower's stock price is below $108 as Friday's market session nears its close, you need do nothing. If the stock price is above $108 at that time, buy to close your $108 calls. (Leave your owned 2017 or 2018 calls alone. We will keep owning those.)
  - **Trade:** Buy to close your June 10, 2016, $108 written calls.
- **Allocation:** Buy every June 10, 2016, $108 call you previously sold.
  - **Price Guidance:** Use a **limit order** and aim to pay as little time value as possible, but realize you need to close these calls on Friday if the stock is above $108, or you risk getting your owned *shares* (rather than calls, assuming both securities are owned in the same account) called away. **We want to avoid that scenario!** As of today, the calls still have $0.205-$0.30 in time value remaining, even though they are "out-of-the-money" and on track to expire if the stock price stays unchanged. As we approach expiration, time value will erode, so the longer you wait to make this conditional trade, the more advantageous it will be.
  - **Prices** (10:00 a.m. ET):
    - Stock: $107.67
    - June 10, 2016, $108 calls (bid/ask): $0.20/$0.30 (by tomorrow this value should be lower, unless of course the stock price rises above $108 by more than this amount).
- **Follow-Up:** We're not issuing a rolling trade alert today because rolling may not be possible (and we can't foresee future prices tomorrow -- sorry!). Instead, we're waiting until our existing calls are closed before we consider writing new calls on this stock. This will probably be next week or the following week.

What We're Thinking

We're back at it again -- another race to expiration with our American Tower diagonal calls. Since the stock price is flirting with our diagonal-call strike price, and we don't want our short calls to be assigned, we need to address what to do with our calls if the stock stays above our strike price on expiration day. Since *Pro* itself must wait a day before taking action on its recommendations, we have to issue this alert today if we want to act tomorrow. So here it is.

If luck shines on us, American Tower's stock will be modestly below $108 tomorrow, and our written diagonal calls will expire fully as income. If not, and the stock looks like it will end the day above $108, we'll need to take action as detailed above in order to maintain our desired position. We'll buy to close our $108 calls in that case tomorrow, then reassess the position for a few days, while keeping our 2017 long calls.

How This Trade Fits Into *Pro*

Unless American Tower's stock price declines significantly in the next week or so, we're likely to initiate another diagonal call before long, again targeting income in between earnings reports. We don't want to sell our long call just yet (the underlying stock is rated Buy First on our scorecard), because we see more long-term potential in the business.

Pro Can Help

Pro Catch-Up Trades: June 6, 2016

Published Jun 6, 2016 at 2:08PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our [Portfolio Building Reports](#) will get you fully invested over the coming few weeks, as much as you want to be.

Pro's [Buy First stocks](#) are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Facebook** (NASDAQ: FB): Have close to our 6.5% exposure yet? Work toward 5% if 6.5% seems too large to you.
- **FactSet Research Systems** (NYSE: FDS): Buy 2% in this [new position](#). (*Pro* has 30 days from the report date, May 18, to buy our shares. We won't likely wait that long, but so far our limit orders have missed a buy.)
- **Wells Fargo** (NYSE: WFC): Match our newly larger 4.8% stock position with new shares (or short-term, near-the-money written puts, if you prefer).

Continue building your portfolio with [our Buys](#), including these highlighted today:

- **Gilead Sciences** (NASDAQ: GILD): Buy 3.1%.
- **Starbucks** (NASDAQ: SBUX): Buy up to 3.4%.
- **TD Ameritrade** (NASDAQ: AMTD): Buy 2.6%.
- **Visa** (NYSE: V): Buy 2.5%.
- **ProShares Short VIX Short-Term Futures** (NYSEMKT: SVXY): Buy 1%.

Shorts:

- None currently.

Options:

- None currently.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY): The June 17, $177/$185 put ratio spread we announced on May 4 can be set up for a net cost of $0.01 (in a debit) at recent prices. Given the strong chance this spread won't get used in the next 10 market days, you can skip setting it up if you haven't yet and don't want to; or if you'd rather, you can set it up to match *Pro* and as "disaster" insurance.

Pro's June Options Race to a Finish

Published Jun 6, 2016 at 2:08PM

Dear *Pro* member:

We have eight options positions on track to expire this month, one this Friday, seven next Friday. As this year rolls on, we plan to continue to write more monthly options, often targeting income. To prepare you for our current pending expirations, let's run through our plans.

American Tower (NYSE: AMT) June 10 $108 diagonal calls: We closed our April 29 $105 diagonal calls for a 93% gain, then wrote these June 10 $108 diagonal calls for more income. With the stock lately at $107.50, we may need to close these calls by the time they expire this Friday, ideally for a partial gain. Watch for a conditional trade alert to hit your inbox by the middle of this week if American Tower's stock price is still flirting with $108 or higher. A conditional alert informs you what to do in case of either option: If the stock ends Friday *below* $108, we can do nothing and simply let our calls expire for the full gain, but if shares are bouncing around $108, we'll close them for a partial gain to be safe and avoid seeing them exercised. We'll then look to write new diagonal calls with a new alert in the near future. Right now, the $108 calls expiring this Friday still have $0.40 in value remaining (all time value), so we can wait for that to dissipate. Again, if shares stay below the $108 strike, we can just let them expire as full income. But we'll be ready to close on Friday if the stock price continues to dance around $108.

Skyworks Solutions (NASDAQ: SWKS) June 17 $70 covered calls: With shares lately at $66.50, our $70 calls are on track to expire as income, although we could be forced to close a bit early or roll if the share price challenges our strike price next week. Currently, we're up nearly $1,000 -- or 71% -- on these calls, which we wrote on May 5. If they expire, we'll consider writing new ones, perhaps at a higher strike price because the stock has recovered recently.

Valmont Industries (NYSE: VMI) June 17 $140 covered calls: With shares at about $135, these calls are also on track to expire as income a week from Friday. If so, we'll look at new calls to write. Although cyclical stocks like Valmont have enjoyed a rally lately, there's still enough reason to consider writing calls on income for them right now. Commodities and emerging markets remain depressed. But if Valmont's stock price rises above $140 by next week, watch your inbox for a rolling or closing trade alert.

WisdomTree Emerging Markets SmallCap Dividend Fund (NYSEMKT: DGS) June 17 $38 covered calls: Just to irk us, the ETF's price has run higher in recent days, touching $38 today. We'll keep watch, of course, and close or roll our calls next week if pricing dictates. As long as DGS is *below* $38, we can let the calls expire for full income on June 17. If it's near or above $38, we'll close a bit early, or we'll roll to a later month and slightly higher strike. But there's no reason to act right now. The June 17 $38 calls still cost $0.45, which is all time value that we can wait to see dissipate.

SPDR S&P 500 (NYSEMKT: SPY) June 17 $200/$190 spread: This defensive bear put spread hedge paid *Pro* $451 when we set it up, and will earn us *additional* profit if the index trades between $200 and $180 by expiration. The S&P 500 is lately above $211, or 5.2% higher than our $200 strike. So, unless the index falls by more than 5% by June 17, we will do nothing but let the full spread expire for our initial credit. If SPY is *below* $200 by a week from Friday, we can close our $200 puts for an additional gain. If SPY is below *$190*, we'll need to close those, too. But right now, it appears likely we needn't do anything but let it all expire. That's likely true even if you have spreads set up at modestly different strikes.

SPDR S&P 500 (NYSEMKT: SPY) June 17 $185/$177 spread: This spread is even further out-of-the-money, and it will most likely expire unused and untouched. It's disaster insurance at this point, clicking into play only if SPY declines by more than 12.3% to $185. You could buy to close the $177 puts for pennies right now if you wanted to remove that remote potential obligation to buy SPY at $177, but we plan to do nothing but wait for it all to expire.

In Summary

So, to sum up: Watch your inbox for a conditional trade alert on American Tower this week. We may send similar conditional alerts next week on our three covered-call positions expiring June 17, if the stocks trade high enough to merit it. Right now, though, American Tower, Skyworks, Valmont, and DGS are all on track to expire as full income, with no action needed. As for our two SPY hedges, we likely won't need to do anything at all, but we will look to set up new index hedges as these expire.

Overall, *Pro* is up a bit this year (see our updated results below), slogging it out for returns while the Nasdaq is down slightly in 2016 and the S&P 500 is up somewhat. We'll continue to own stocks we feel strongly about (the core of the portfolio); we always have new stocks in consideration; we're considering new shorts; and we plan to target steady option income and hedges.

Questions on this month's expirations? Please visit the *Pro* Options Strategies board. And thank you for being a Fool with us!

-- Jeff (TMFFischer)

Pro Guidance Changes

- **American Airlines** (NASDAQ: AAL) call options move to "Sell to Close" per last week's trade alert.
- **Deere & Company** (NYSE: DE) short sale moves to "Hold" as we reassess the position.

Pro Completed Trades

- **SPDR S&P 500** (NYSEMKT: SPY): We set up our June 17 $177/$185 bear put spread for a $0.01 debit, to complete the trade in our 30-day window.

Sell to Close Your Calls on American Airlines

Published Jun 3, 2016 at 3:03PM

Is this for you? This is only for *Pro* members who own January 2017 calls on **American Airlines** (NASDAQ: AAL). But you should consider selling if you own 2018 calls, too.

How You Participate

- **Action:** Sell to close your January 2017 $35 (or other strike price and/or expiration date) calls on American Airlines
- **Allocation:** Sell to close all calls
- **Recent Price of Jan. 2017 $35 calls (bid/ask):** $1.91/1.95
- **Price Guidance:** At prices as we publish, you would use a **limit order** to get the going price of about $1.93 or higher. As the price changes, use an appropriate limit order between the bid and ask price.

What We're Thinking

Without failures, it's difficult to recognize success. Our 16-month investment in call options on American Airlines has been a spectacular failure. Off by about 90%, our $35 calls are on track to expire without value unless American's baggage-heavy stock can take flight again before January.

Lately trading at about $31, the stock is down about 44% since we started our position, having slid from an average of 15 times earnings over 2015 (with a low P/E that year of 6, at about the time we bought) to today's mere 2.8. Most investors don't believe that American can retain anywhere near its current level of profitability. In part, Wall Street is disheartened by a steady decline in passenger revenue per average seat mile (PRASM), down 7.5% last quarter and expected by management to decline 6% to 8% in the current quarter.

American Airlines now believes this PRASM downtrend could continue into 2017. Overall, growth in airline seat capacity and competitive pricing are keeping a lid on investor enthusiasm, to say the least, even as American posts record profits aided by low fuel costs. In fact, much of our (and I should really say "my") original thesis came true: American's profits soared after its restructuring and its merger with US Airways, also thanks to low oil prices (which fell even more than we could have hoped!). But other key parts of my thesis are under attack.

Last year, key competitors vowed to hold the line on pricing, but it appears that fares keep slipping. Competitors have also used cash windfalls to invest in more capacity, rather than saving it for a rainy day. In short, the industry appears to be slipping toward irrational "boom time" behavior again, investing in capacity when oil is cheap, and risking flying too many empty seats when oil is more expensive again.

Looking ahead, I'm not very optimistic about American for a few reasons:

- Oil prices have recently rebounded to more than $50 per barrel, up from less than $30 back in January. American Airlines doesn't hedge its fuel costs (a boon for us -- or it should have been -- as oil fell), so the jump in costs will almost certainly crimp American's future earnings power compared to the past year.
- As mentioned, the airline industry (though not American) has been adding seat capacity throughout the oil price downturn. Rather than taking new capacity offline if fuel costs take flight or passenger demand declines, some airlines may cut fares to fill seats.
- American is investing in a "differentiated" economy-class experience as a way to win more customers -- but will this expensive endeavor really drive more traffic, when many view domestic air travel as a commodity? I don't think differently priced economy seats will drive demand the way American hopes.

But there are other main reasons we're selling our calls. We're selling to close because:

1. We're running low on time, with only about seven months (two quarters) until expiration.
2. As mentioned, American expects PRASM to fall over the rest of this year -- not just incrementally, but by as much as 8% year-over-year this current quarter. Even though the second half of 2016 is expected to be "less bad," it's hard to imagine investors bidding the stock much higher under this cloud.
3. Our calls are out-of-the-money by about 11% (a $35 strike on a $31 stock) and carry 5.5% time value on the strike price (about $1.93 on the $35 strike) -- this time value will steadily dissipate.
4. With the calls still worth $1.93 in time value, the stock needs to increase by about 19% (to $36.93 from $31) by expiration in January *just* for our calls to end with the same value they have today. Playing the odds, we'll take the bird in the hand today. So we'll sell. Even what little capital we can get back today is still capital that we value, and wouldn't want to simply let vanish.

Lessons Learned?

Here are some big, recurring lessons:

A cheap stock can get even cheaper. We all know this, but American flies the idea home. Although earnings have increased in the time we've owned our calls, the stock has only gone down, sending its valuation multiples much lower. Shares traded for about 7 times EBITDA early last year; that multiple is lately 3.7. The stock's P/E multiple has more than halved, to 2.8. It's important to remember that a cheap stock valuation *does not* remove the underlying risk or speculation that may exist in a stock or a business. Wall Street will sell a stock into the ground, down to a P/E of 2, if investors don't believe in it.

Not all stocks in an improving industry will be treated well. Often, winners continue to win, and past losers are ignored. As of Thursday, **Southwest Airlines**' (NYSE: LUV) stock is up 13% over the past year, while American is down 24%. Despite record profits in the industry and at most carriers, not all stocks are benefiting. Wall Street still believes in long-term historical winners like Southwest, but hasn't bought into the idea that legacy carriers like American can really continue to succeed.

Investors might ignore industry improvements they deem temporary. As mentioned, it seems Wall Street doesn't believe that past "losers" like American can positively change their ways for good, especially if investors don't believe the industry will stay as strong as it is today. Wall Street may also believe that the savviest companies, like Southwest, will maintain an evolving edge that will ultimately harm secondary competitors.

Wall Street can be skeptical for a long time. I thought a year to 18 months was ample time for Wall Street to see, quarter after quarter, how American is *different* and *better* this time. Instead, Wall Street has focused on concerns that have bubbled up -- from lower PRASM to competing fares to increased investments in new planes and economy classes. Wall Street's sour mood on American could last for years. The stock may trade cheaply for a long time, and if fuel costs increase much, that could be another headwind.

Choose your option appropriately! High volatility is expected from American's shares, so its options are expensive. To minimize the amount of *time value* we paid, I ended up recommending $35 calls on a $55 stock. This meant we had to invest a significant amount of our capital (we chose 1% total) in intrinsic value.

Usually, this is logical -- if you believe that intrinsic value will hold steady. But in this case, it wasn't smart. We would have been better served buying *at-the-money* or even out-of-the-money call options, risking much less capital per call. Would we still have risked 1% of our total portfolio in those higher-strike calls? Almost surely not. We probably would have trimmed the investment to 0.5%, given the leverage we would have, and spent half as much for a more speculative position.

American's cheap valuation and the near-certainty of its near-term earnings growth (which has indeed played out!) made me mark down the risks in the industry and thus in the stock. I was wrong to do that.

When buying call options, one always estimates the valuation and business risk. But one must also estimate the risk of how Wall Street may treat the shares, and buy calls that appropriately limit your own capital at risk when merited. For instance, be careful buying deep in-the-money calls on a cyclical stock like a semiconductor company; it can fall sharply on its cycles. You're better off risking less and buying a call with a higher strike price. With American, even though the business was priced cheaply and earnings were increasing, the situation was more speculative than I acknowledged, and buying deep in-the-money calls was questionable in hindsight. We could have risked 0.5% total and bought $55 calls for $7 (or something like that) at the start, rather than putting 1% into $35 calls for $25 each. Sure, this is some hindsight, but also a lesson to remember with positions like these.

The Foolish Bottom Line

Even after a lifetime of investing (or nearly 30 years), and even during the past year when *Pro*'s account value is up, there are still times when I feel like most of my decisions are wrong. I've come to realize that those times -- like today -- are important chances to step back, take stock (so to speak) and realize that most of what we're doing together is indeed creating long-term value. That said, at times it's hard not to place a lot of weight and focus on positions that are losing. That's good, to an extent -- we benefit from the reminders and the lessons learned. But it's also important to then move forward with a healthy outlook. Mistakes can make us better, more humble, and smarter investors, if we learn from them.

Will we invest in something like this position again? Surely! But will we do it better? I certainly think so. We'll risk less capital, for one thing, and use different options in cases like this. I've also been looking at shorts in this industry, so we may ultimately make money from the knowledge gained over the past 16 months.

As you invest, it's important to ensure that everything you do is a stepping stone toward more knowledge to feed future decisions. If you do that, most of the choices you make should ultimately lead to better long-term results -- even if they offer short-term setbacks some of the time. Thank you for bearing with us as we learn another lesson.

Alternative Trades

- **Want to keep your calls?** You can keep them if you prefer, if you have so little invested in them that selling them isn't worth it to you. The stock could always rebound, of course; you never know. We're closing for the reasons explained in this report. You could also write diagonal calls against them if you wish, to monetize them a bit while still giving them some room to recover.
- **Other strikes and expirations?** As shared at the start, we would suggest simply closing those, too. They have ample time value to capture.
- **Simply own the stock?** This is a tougher call. We said on day one you could hold on to the stock for the long, long term if you like as an alternative. If we owned shares today, rather than expiring call options, we would *not* likely be selling them yet, with the market so down on the shares right now. We would likely wait and see what happens next. (Our calls simply don't give us the luxury of time.)

Pro Can Help

As we said in our original report, "Tell us we're crazy — er, we mean, ask us questions — on the American Airlines Group board." As we also wrote on day one, "Seat belts on? We're ready for departure (in more ways than one)." So, we departed from our normal course of business. Now we return with more knowledge and, overall, more capital (but no thanks to this position).

Targeting Annualized Returns

Published May 31, 2016 at 2:14PM

Dear *Pro* member:

A few months ago, before new members joined, I wrote a column explaining how we target returns for the *Pro* portfolio. If you haven't seen that, it may be worth visiting. Following first-quarter earnings and updated annual guidance from many of our companies, today I'm updating our return hopes for each company-based stock we own and recommend.

As a reminder, we generally seek at least 10% annualized total returns (dividends included, arriving as cash to the portfolio) from our holdings *and* for the portfolio as a whole. To get there, we believe we need to own several stocks capable of *more* than 10% annualized returns, to help balance the laggards we'll inevitably have. Currently, some of our recent higher-growth stocks, including **AmTrust Financial** (NASDAQ: AFSI) and **Facebook** (NASDAQ: FB), are "growing more mature," lowering our return expectations from here. That's not an awful thing. Keep in mind that **Alphabet** (NASDAQ: GOOG), for example, has generally experienced maturing growth for years, yet has been a leading stock.

Also keep in mind that we don't expect any of these returns to arrive in a steady fashion -- instead, we seek them by the end of a time period measured in years. Stocks could be flat for a few years, and then make up for it with a strong 30% gain. (That simple fact helps explain why market timers usually do much worse than long-term wealth builders who stay in the market.) So, where do our hopes for our positions stand now?

10% Compound Annualized Returns

Obviously we won't always be right, but we always target companies we believe can return at least 10% annualized from our purchase price over the long haul. If a good company falls after we buy it, we may buy more, expecting that new investment to earn more than 10% annualized. Today, 13 of our 22 companies slot into the 10%-desired-return bucket (listed by allocation size):

- **AmTrust Financial Services** (NASDAQ: AFSI), 5.3%
- **Broadridge Financial Services** (NYSE: BR), 5.3%
- **O'Reilly Automotive** (NASDAQ: ORLY), 5.2%
- **Wells Fargo** (NYSE: WFC), 4.8%
- **Oracle** (NYSE: ORCL), 3.8%
- **American Tower** (NYSE: AMT), 3.7% (excluding calls at 0.5%)
- **Parexel** (NASDAQ: PRXL), 3.2%
- **Medtronic** (NYSE: MDT), 3.1%
- **Gentex** (NASDAQ: GNTX), 2.8%
- **TD Ameritrade** (NASDAQ: AMTD), 2.6%
- **Verisk** (NASDAQ: VRSK), 2.2%
- **Valmont** (NYSE: VMI), 2.2%
- **FactSet Research Systems** (NYSE: FDS), 2% once we buy it

Total allocation: 46.2%

Our allocation to investments we believe can return 10% annualized with reasonable risk has grown from nearly 39% a few months ago to 46% today, mainly because AmTrust and O'Reilly were added to this list, as well as FactSet. AmTrust is being cautious as pricing in its core business softens, and though O'Reilly continues to grow quickly -- lately, earnings per share are growing above 20% year-over-year -- we're conservatively moving it to the 10% expectation bucket because of its valuation and a logical assumption that business will periodically slow. We still like all of these investments, of course, and the portfolio is well positioned should financial companies start to benefit from higher interest rates.

15% Compound Annualized Returns

- **Facebook** (NASDAQ: FB), 6.5%
- **MasterCard** (NYSE: MA), 4.5%
- **Starbucks** (NASDAQ: SBUX), 3.4%
- **OpenText** (NASDAQ: OTEX), 3.2%
- **Skyworks Solutions** (NASDAQ: SWKS), 3.1%
- **Papa John's International** (NASDAQ: PZZA), 3%
- **Visa** (NYSE: V), 2.5%

Total allocation: 26.2%; return multiplier in relation to 10% goal is 1.5x = 39.3% influence

With these seven stocks, we hope and aim for at least 15% annualized returns; all have blown by that number in recent years, but we still believe there's enough growth on tap to support similar results in the years to come. If these seven stocks can return 50% more, annualized, than the stocks above, then while they add up to only a 26.2% allocation, their strength in the portfolio is more like a 39.3% weighting or exposure when it comes to reaching our current 10% annualized total portfolio goal. With 10% being our North Star, we could just buy all presumed 10% growers. But buying companies we believe will return more than that in essence leverages us on our way toward our goal, and can let us keep some cash out of the market for future opportunities.

New to this list since last time are Facebook and Skyworks -- they were in the 20% annualized returns bucket last time. Those stronger returns could still happen, but we have to expect less given Facebook's past appreciation and current headwinds from Apple at Skyworks. Keep in mind that we don't expect these returns all at once, or even in a steady fashion. But over a rolling three-year time period, we see a case for even giants like MasterCard and Visa returning 15% annualized.

20% Annualized Returns

- **None at the moment.**

Total allocation: 0%; return multiplier in relation to 10% goal is 2x = 0% influence

Removing AmTrust, Facebook, and Skyworks from this bucket, we're left without any right now. That doesn't mean some of our positions won't return 20% annualized the next three years. Heck, some of our out-of-favor stocks in the 10% bucket (Wells Fargo, Valmont, etc.) could return that much annualized by 2019. But at the moment, we aren't modeling or expecting that sort of annualized return from holdings.

Un-estimated at This Time

- **Apple** (NASDAQ: AAPL), 3.5%
- **Gilead Sciences** (NASDAQ: GILD), 3.1%

Finally, two stocks are currently in a place where we're not estimating how much they may return, although we believe they could return at least 10% annualized from today's price. Both are very inexpensive, but both have large, similar questions hanging over them: Can each find another road to higher growth even though they've already climbed to the top of Mount Everest? And what sort of valuation multiple is Wall Street willing to pay for an extremely successful company that may not grow very much for... years? Right now, Wall Street won't pay much. But if sentiment changes, or growth avenues are found, these two stocks could return much more from here. Given uncertainties at the moment, though, we prefer to be patient and not make too many presumptions; as long we believe 10% annualized returns remain possible (and we do), we can wait and keep analyzing.

Keeping in Balance

Now, when you add up our total allocation toward meeting our 10% return goal, you get, from the top bucket on down: 46.2% + 39.3% + 0% = 85.5%. We may be 85.5% of the way toward our goal. Adding Apple and Gilead with our minimum 10% return assumption, we're at 92.1%, even though we have about 19% in cash (after buying FactSet). But however you slice it, the outcome is the same: We're seeking to invest in more strong *growth* businesses for the portfolio. We want to add more exposure to faster growth leaders.

If we also continue to add low-cost hedges and successful shorts, as well as steady option strategies, we should remain on track.

Questions? Please visit the Memo Musings board. Thank you for being a Fool with us!

-- Jeff (TMFFischer)

P.S. If you want to read more about this construct, and haven't yet, please visit our April 4 Memo on the topic.

Pro Catch-Up Trades: May 31, 2016

Published May 31, 2016 at 1:56PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our Portfolio Building Reports will get you fully invested over the coming few weeks, as much as you want to be.

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **FactSet Research Systems** (NYSE: FDS): Buy 2% in this new position. (*Pro* has 30 days from the report date, May 18, to buy our shares. We won't likely wait that long.)
- **Wells Fargo** (NYSE: WFC): Match our newly larger 4.8% stock position (with shares or short-term, near-the-money put writing if you prefer).

Continue building your portfolio with our Buys, including these highlighted today:

- **Gilead Sciences** (NASDAQ: GILD): Buy 3.1%.
- **O'Reilly Automotive** (NASDAQ: ORLY): Buy 5.2% in halves, over time.
- **Parexel** (NASDAQ: PRXL): Buy 3.2%.
- **Starbucks** (NASDAQ: SBUX): Buy up to 3.4%.
- **TD Ameritrade** (NASDAQ: AMTD): Buy 2.6%.

Shorts:

- **Deere & Co.** (NYSE: DE): Sell short 1.9% in stock.

Options:

- None currently.

Hedges:

- **SPDR S&P 500** (NYSEMKT: SPY): The June 17 put ratio spread we announced on May 4 can be set up for a net cost of $0.00 (yup, zero) at recent prices. On a market drop, the price to set this up may become a bit more favorable for newcomers. As this is far out-of-the-money (SPY trades much higher than our $185 upper strike), we at *Pro* are currently waiting for a market drop to set it up, although we need to make the trade by June 4 to meet our 30-day trade window. So, expect that this week.

Celebrate Our Community: Polaris Award 2016

Published May 26, 2016 at 3:36PM

Pro Polaris Award 2016

The votes are in! Please join us in congratulating phooLon and honoring his invaluable contributions to our community.

As proposed by ADrumlinDaisy (now BrokeInDaBurgh) in 2013, the Polaris Award is "a *Pro* community analogue of the Feste Award, an annual award given to the member who provides the most value to his or her fellow members." Criteria include a regular, frequent, Foolish presence on the *Pro* discussion boards; helpful, expert-level advice; creativity; and efforts to foster a sense of community.

Previous winners include the esteemed and deserving **aleax**, **RockyTopBob**, and **fullofcarp.** This year's winner, **phooLon**, will receive a shiny new discussion-board charm but has declined the monetary prize of $250 to use at Apple or Starbucks. See the full rules here. More to say? Bring it to the Member Suggestions board, and Fool on!

Polaris Award 2016 Contest Rules

Published May 26, 2016 at 11:22AM

OFFICIAL POLARIS AWARD 2016 CONTEST RULES

1. ENTRY: No purchase necessary to enter or win. The contest will begin on 5/26/2016 and end on 6/17/2016. The entry deadline for the contest is 6/10/2016.

2. ELIGIBILITY: This contest is open only to legal U.S. residents, over the age of 18.

Employees and contractors (and their families) of The Motley Fool or any of its affiliates are not eligible. Void where prohibited by law. Contestants residing in those areas where the contest is void may participate in the contest but may not win any prizes.

3. WINNER SELECTION: The member who has the most votes from other members of the Pro community will be declared the winner. Votes will be collected in a manner as stated by TMF with these rules, and each individual in the Pro community can only vote once. Motley Fool employees and contractors may vote, but are not eligible to win.

4. PRIZES: The winner will receive a $250 gift card from their choice of either Apple or Starbucks. [Value: $250]

5. WINNER NOTIFICATION: The winner will be notified within 5 days after the determination date. Inability to contact a winner may result in disqualification and selection of an alternate winner.

6. GENERAL CONDITIONS: The winner will be required to execute and return a Certificate of Eligibility, Consent and General Release form within 14 days of notification. The winner may also be required to complete and return a W-9 for tax purposes. Non-compliance within this time period may result in disqualification and selection of an alternate winner. Any income tax liability is the sole responsibility of the winner. By acceptance of the prize, the winner consent to the use of his or her name and/or likeness for purposes of advertising or trade without further compensation, unless prohibited by law.

7. USE OF CONTEST INFORMATION: All entries become the property of The Motley Fool. The Motley Fool reserves the right to use any and all information related to the contest, including submissions provided by the contestants, for editorial, marketing and any other purpose, unless prohibited by law.

8. CONDUCT: All contest participants agree to be bound by these Official Rules. The Motley Fool in its sole discretion, reserves the right to disqualify any person it finds to be tampering with the entry process, the operation of this website or is otherwise in violation of these rules.

9. LIMITATIONS OF LIABILITY: The Motley Fool is not responsible for late, lost or misdirected email or for any computer, online, telephone or technical malfunctions that may occur. If for any reason, the contest is not capable of running as planned, including infection by computer virus, bugs, tampering, unauthorized intervention or technical failures of any sort, The Motley Fool may cancel, terminate, modify or suspend the contest. Entrants further agree to release The Motley Fool from any liability resulting from, or related to participation in the contest.

10. WINNERS LIST: The names of the winner may be obtained by sending a self-addressed stamped envelope to Pro Member Contest 2016, The Motley Fool, LLC, 2000 Duke Street, Alexandria, Virginia 22314.

Pro Catch-Up Trades: May 23, 2016

Published May 23, 2016 at 2:43PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our Portfolio Building Reports will get you fully invested over the coming few weeks, as much as you want to be.

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **FactSet Research Systems** (NYSE: FDS): Buy 2% in this new position. (*Pro* has not had a chance to buy its shares yet, because we were engrossed in last week's FoolFest event. We have 30 days from the report date, May 18, to buy our shares. We won't likely wait that long.)
- **MasterCard** (NYSE: MA): Buy up to our 4.6% allocation.
- **Wells Fargo** (NYSE: WFC): Match our newly larger 4.7% stock position.

Continue building your portfolio with our Buys, including these highlighted today:

- **Apple** (NASDAQ: AAPL): Buy 3.5% in stock.
- **Gilead Sciences** (NASDAQ: GILD): Buy 3%.
- **O'Reilly Automotive** (NASDAQ: ORLY): Buy 5.1% in halves, over time.
- **Parexel** (NASDAQ: PRXL): Buy 3.1%.
- **Starbucks** (NASDAQ: SBUX): Buy up to 3.5%.

Shorts:

- **Deere & Co.** (NYSE: DE): Sell short 1.9% in stock.

Options:

- **Expeditors International** (NASDAQ: EXPD): Set up a synthetic covered strangle if you haven't, following the Alternative Trade guidance at the end of the May 16 report. Right now, set up the synthetic long using options with a $48 strike price. Buy to open January 2017 $48 calls and sell to open an equal number of $48 puts for a net debit that's lately about $0.10. Then sell to open the August $46 puts and $49 calls for about a $2.60 credit.
- **Skyworks Solutions** (NASDAQ: SWKS): "Sell to open" June 17, 2016, $70 covered calls, one for every 100 shares you own and want to cover, per our May 4 alert. With shares lately near $67, these pay $0.95 to $1 again.

Hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): With patience, the put ratio spread we announced on May 4 can be set up for a net debit of $0.01 to $0.02 at recent prices (though as you'll recall, we sought no cost or a credit on Day One). On a market drop, the price to set this up may become more favorable for newcomers. As this is far out of the money (SPY trades much higher than our $185 upper strike), we at *Pro* are currently waiting for a market drop to set it up, although we personally need to do so before June 4 to meet our 30-day trade window.

Earnings Updates From AmTrust to Visa

Published May 23, 2016 at 12:12PM

Fellow Fools,

With earnings season wrapping up for us here in *Pro*, we're beginning to shift our focus toward finding even more ideas for the portfolio. But before we do, some housekeeping is in order, so let's take a look at how four of our current holdings here in *Pro* fared this past quarter.

AmTrust Financial Services (Nasdaq: AFSI)

The company continues to push forward with its grow-by-acquisition strategy; its $233 million deal to acquire property and casualty insurer Republic Companies is its largest to date. This move will immediately make AmTrust a much more prominent player in Texas, the second-largest insurance market in the U.S. and a market that AmTrust had not previously targeted very heavily. (Within the company's small commercial business division, Texas was the seventh largest state at 2.9% of gross written premiums in 2015.) With $762 million in gross written premiums in 2015, this acquisition will likely increase AmTrust's gross written premiums by about 10% on a full-year run-rate basis.

Despite pricing pressure in many of its markets, AmTrust continues to deliver solid growth. This increase in competition has slightly hurt underwriting profitability, and the company's loss ratios have slowly ticked higher over the past few quarters. However, management has repeatedly stressed a willingness to remain disciplined throughout the underwriting cycle and forgo short-term profits in favor of long-term success, which is critical for success in underwriting.

Deere & Company (NYSE: DE)

If you just skimmed the headlines on Friday, you may have thought the market got Deere wrong -- the stock finished 5.5% lower even though the company "beat" its estimates. But from our vantage point, this wasn't a mistake (and I'm not just saying that because we're short the stock!). Sales continue to be weak, and operational deleveraging is taking its toll on Deere's bottom line. Moreover, the positive surprise in sales was really nothing more than a difference in the timing of shipments between quarters, and the company actually lowered its 2016 net income guidance once again.

This quarter, management also increased its provision for credit losses and took an impairment on both construction and agricultural equipment operating leases. Management noted during the earnings call that the company is taking steps to mitigate the risk on its operating lease portfolio, but we still think the provision the company is reporting is too low.

From our perspective, management's goal of $50 billion in sales by mid-cycle in 2018 is increasingly starting to look like a pipe dream. If you use the company's own guidance for full-year 2016, revenue will need to grow at an annualized rate in 2017 and 2018 that the company hasn't even come close to achieving in the past 25 years. In fact, even if you assume that John Deere will somehow miraculously finish 2016 with 2013's peak-year revenue figure (which is more than 40% higher than the company is expecting to report), management would likely *still* have a difficult time hitting this target, as they've only been able to achieve this type of growth 20% of the time over the past 25 years. The first mention of this 2018 goal that I can find was made back in 2011, before the commodity cycle turned over, and if you ask us it looks like it's about time management updated their expectations.

Verisk Analytics (Nasdaq: VRSK)

Over the past few quarters, we've been watching two things closely with respect to Verisk Analytics — when will the company sell its health-care business, and how will WoodMac continue to weather the storm in the energy sector?

We finally got a definitive answer to the first question this past quarter as Verisk agreed to sell its health-related business to Veritas Capital for $820 million, or a pre-tax internal rate of return (IRR) of about 12%. Although this return is solid, it is below the company's average IRR of 19% for prior deals, probably in part because the news had leaked that the company was beginning to shop the business. But we still like this move, because it enables the company to focus its time and energy on what it does best. After the sale, the overall company will have higher margins, more stable revenue growth, less seasonality, a higher mix of subscription revenue, and stronger free-cash-flow conversion. In a day and age where many companies seem to be interested in empire-building, or simply getting bigger for the sake of getting bigger, this type of discipline is refreshing.

With respect to WoodMac: The business continues to weather the storm in the energy sector better than most, with revenue up slightly on a constant currency basis when you remove the effects of purchase accounting. However, because we want the company to focus on positioning itself to generate strong returns over the next couple of years (as opposed to the next few quarters), we're more concerned with seeing what is happening to WoodMac's client renewal rates and its ability to expand its customer base. We didn't get any specific numbers this quarter, but reading between the lines, it sounds as though things continue to progress in a satisfactory manner.

Total revenue and EBITDA growth for the quarter at WoodMac were 28% and 24%, respectively. May 19 will mark the one-year anniversary of the completion of the WoodMac acquisition, so we shouldn't expect mid- to high-20% growth going forward; however, we remain confident in the company's ability to continue to deliver high-single-digit organic revenue growth and total revenue growth in the low teens, with enviable margins (EIBTDA margins were 50.4% this quarter) going forward.

Visa (NYSE: V)

Though results beat estimates at Visa as well, shares also traded lower after the company followed through with its previous warning that it would have to lower its full-year revenue guidance if economic activity didn't pick up. But this is no John Deere; while we believe the cyclical issues currently afflicting Deere will remain for far longer than the stock's bulls are expecting, we believe the current weakness afflicting Visa is more of a bump in the road. The company is still on pace to generate about $7 billion in free cash flow, not to mention constant-currency EPS growth in the low teens. And despite a possible delay in the closing of the deal to purchase Visa Europe, as well as a change in its terms (in favor of a larger up-front payment), we still think the deal will be accretive to shareholders over the long run. Shares remain a Buy and we're increasing our fair-value estimate a tick, to $82 from $80.

The *Pro* Bottom Line

There wasn't much in the way of surprises with these four companies this earnings season, despite the market's initial reaction to the results. While there are always challenges for any business, generally speaking, our thesis for each is tracking as we would expect.

Want to discuss any of these businesses? Take your thoughts to the AmTrust, Deere, Verisk, or Visa discussion boards!

Enjoy your week,

-- JP (TMFYossarian)

Pro Completed Trades

- **Expeditors International** (Nasdaq: EXPD): We rolled our covered strangle, buying to close our May 2016 $40 put/$45 call strangle, and selling to open an August $46 put/$49 call strangle, for a net credit of $0.10.
- **Gentex** (Nasdaq: GNTX): Our May $15 puts expired as income again. We're watching for new opportunities.
- **Wells Fargo** (NYSE: WFC): Our $52.50 puts were turned into shares, buying us 700 more shares, and bringing our total stake in Wells stock to 4.7%. Match us if you wish, or keep writing puts. Our current thinking (which may change!) is to turn part of this position into an income position with covered calls. Stay tuned.

Buy FactSet Research Systems

Published May 18, 2016 at 10:16AM

Is this for you? This is for all *Pro* members.

How You Participate

- **Action:** Buy **FactSet Research Systems** (NYSE: FDS)
- **Allocation:** 2% to start (*Pro* will buy about 330 shares)
- **Scorecard Status:** Buy First
- **Fair-Value Estimate:** $163 (8.1% higher, and targeting 10% annualized returns)
- **Recent Price:** $150.75
- **Market Value:** $6.2 billion (mid-cap)
- **Dividend Yield:** 1.3% ($2 per year)
- **Price Guidance:** This is thinly traded. Use a **limit order** and initially aim to pay less than $151.50. As prices change over time, this starting guidance will quickly lose relevance; as that happens, **our guidance will remain "Buy First"** until we officially notify you otherwise. Whenever you buy, use a limit order.

What We're Thinking

The ideal *Pro* company has predictable recurring revenue, pricing power, a dependent customer base, expanding opportunities, and smart management. FactSet Research scores eight out of eight on our company quality checklist, and while most companies are struggling to grow these days, FactSet increased its revenue 9% last year to more than $1 billion, with earnings per share growing 16%. That made for 35 consecutive years of revenue growth, and 19 consecutive years of earnings growth -- every year since FactSet went public in 1996. Over the past 21 quarters, earnings per share have grown by more than 10% year-over-year each quarter. The business has the traits we look for most: stable, predictable results with the ability to reinvest healthy free cash flow for more growth.

The Business

Founded in 1978, FactSet's data and analysis platform has become integral to the daily operations of thousands of financial professionals, including investment bankers, institutional investors, hedge funds, and asset and risk managers. Serving more than 3,000 customers with a total 63,500 users, FactSet prides itself on personalized attention, making its customized data a core part of its customers' daily workflow and decision-making. FactSet's consultants paid 46,000 visits to its 3,000-plus customers in 2015, making sure to meet individual needs. Clients in turn reported 97% satisfaction with FactSet's customer service.

For data-hungry clients, FactSet's platform combines news and information from more than 220 third-party data suppliers, 100 news sources, and 80 market exchanges, and it ties in portfolio and risk management analysis and tools as well. Drill-down data can include detailed geographic revenue insights for a company, historical financials going back decades, fine-toothed company and industry comparison, portfolio simulation, predictive risk, alpha testing, and more. Approximately 83% of FactSet's monthly subscription revenue comes from the likes of investment portfolio managers. The rest is from investment banking firms that support mergers and acquisitions, capital market services, and equity research.

Pro's 8-Point Quality Checklist

Let's run FactSet through *Pro's* company criteria.

Sustainable Competitive Advantage

FactSet's extensive historic and contemporary global database, along with its proprietary financial modeling and analysis, provides a high barrier to entry despite the competitiveness of the industry. The company's dedicated focus on customer service further sets it apart. Its customized service offerings are entrenched in clients' workflows, central to their analysis and decision-making. Other than pricing power, perhaps the best sign of a competitive advantage is switching costs. When your work depends on a steady stream of data that you can quickly interpret and incorporate, and your staff of dozens to hundreds is trained to use this custom platform, changing providers carries real switching costs and the risk of disruption.

Pricing Power

Historically, every February, FactSet has increased the price for all customers. It still does, but now price increases are inherent in each contract renewal, and those renewals hit every day, so price increases are spread over the year. Despite contracts that can run into tens of thousands of dollars a year, FactSet has ingrained annual price increases into the client relationship.

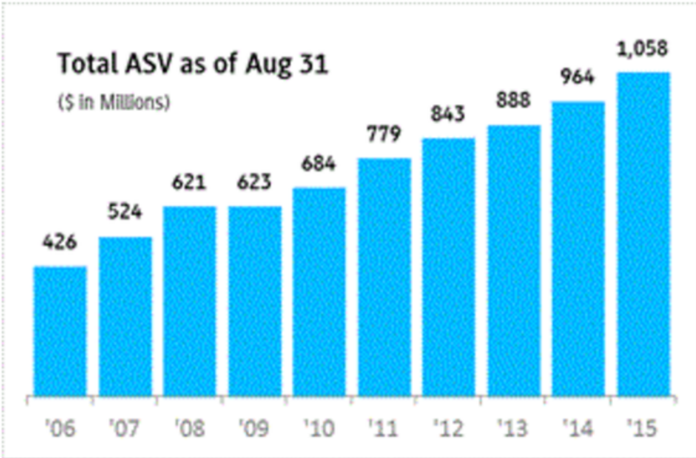
Dependent Customer Base

As of last quarter, FactSet enjoyed a greater than 95% customer retention rate, up from 93% a year ago. This leads to recurring subscription revenue, making for a stable revenue base, especially when coupled with price increases. Client retention rates have been above 90% since 2010, and even then, retention of annual subscription value (FactSet's measure of revenue) ran higher than 95%. Even during the financial crisis of 2008-2009, FactSet was able to increase revenue modestly as most large clients became more reliant on its data.

Predictable Revenue

FactSet's revenue has increased by a 9.5% annualized clip over the past five years, and it was up by 9.5% organically last quarter, too. Recall that revenue has grown for 35 consecutive years. A 95% customer retention rate and annual price increases, along with the addition of new clients (183 new clients in fiscal 2015, for a 6.7% addition), leads to predictable revenue.

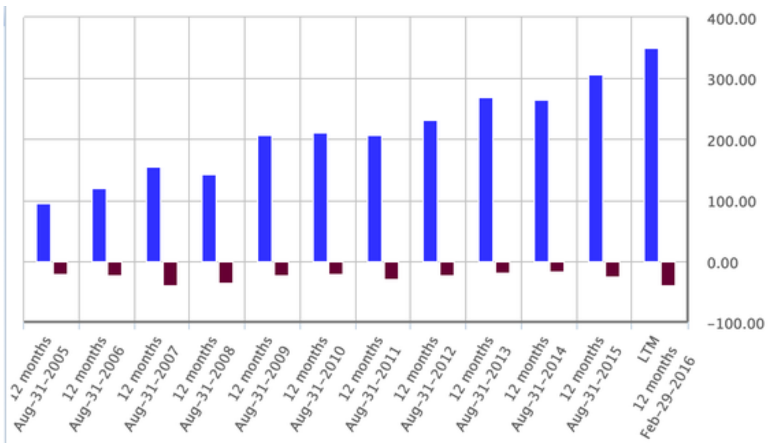
Here's a snapshot of annual subscription value (ASV) from 2006 to last year, starting at less than half a billion dollars and reaching more than a billion in fiscal 2015 (which ended last August).



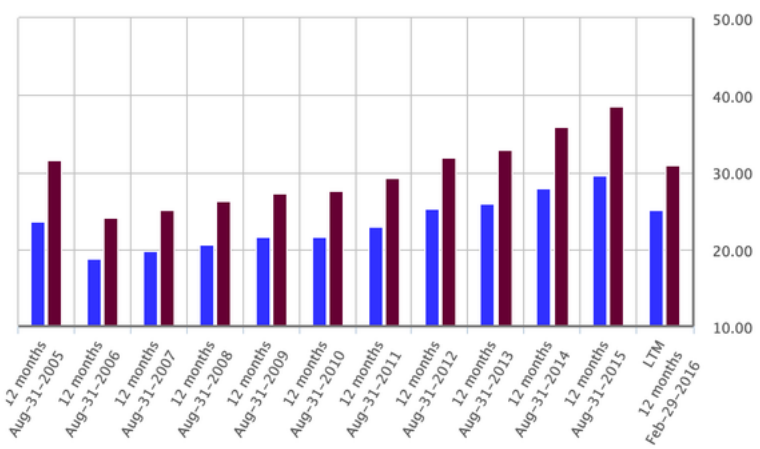
Source: FactSet 2015 10-K filing.

Growing Free Cash Flow with Compounding Returns

Even after recent investments in new servers, a revamped software interface, and more consultants to expand customer service, FactSet is not a capital-intensive business. Free cash flow has consistently hit records, including last quarter. Below is cash from operations (in blue) minus capital expenditures (purple), going back to 2005. Recently, free cash flow topped $300 million. It grew 13.5% in fiscal 2015.



Importantly, FactSet is able to earn strong returns by *reinvesting* its free cash flow. Investing in more third-party data feeds, more customer service, and software and tool development, the company is able to up-sell more offerings to existing customers, raise prices, and keep clients. Return on capital (in purple) and return on assets (blue) have both topped a stellar 20% (for the former in recent years, 30%) since 2008.

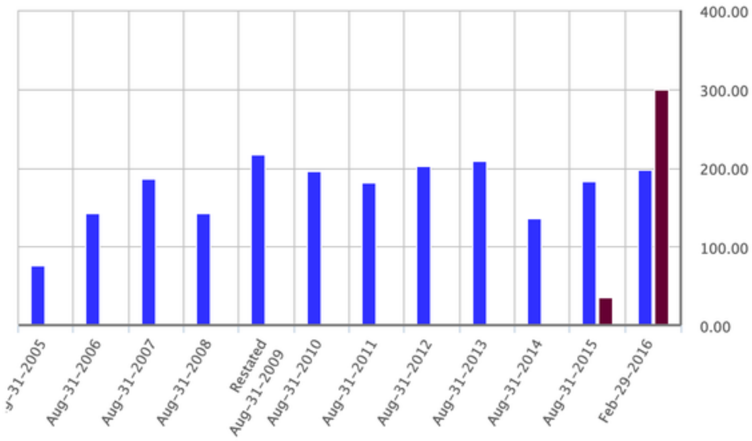


Charts source: Amusingly, competitor S&P Capital IQ

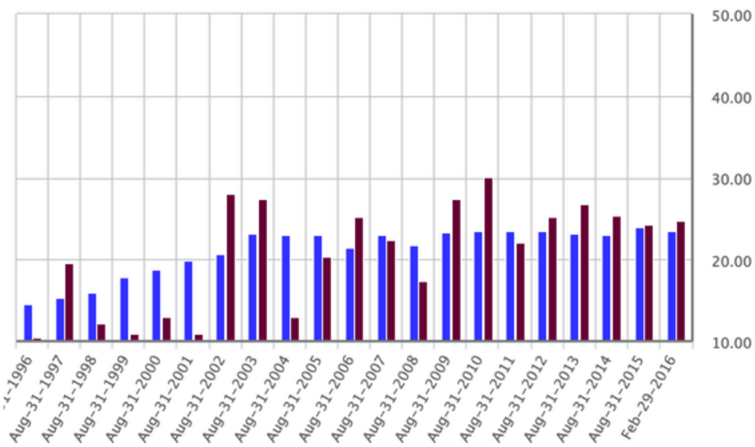
Financial Resilience and Value in Hand

The company has historically been debt-free and cash-rich, it earns free cash flow yearly, and it has increased its dividend every year since 2005. (FactSet has paid a dividend since 1999.)

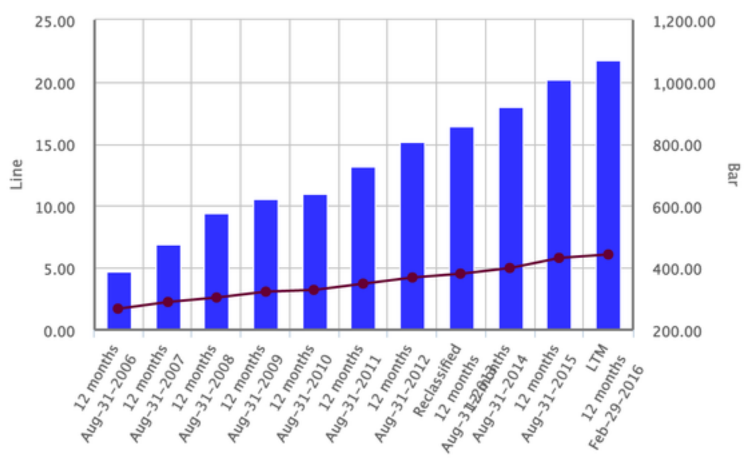
In what we view as smart leverage during a time of low interest rates -- especially given its historically strong returns on investment -- FactSet recently acquired $300 million in debt to fund two acquisitions. FactSet can pay this off from free cash flow over a few years. Below, see cash and short-term investments (blue) and long-term debt ("Prince purple") in millions of dollars.



Today, FactSet enters the *Pro* portfolio as one of our highest-margin businesses, among the likes of **MasterCard** (NYSE: MA) and **Verisk** (NASDAQ: VRSK). Its earnings-from-continuing-operations margin (in blue, shown as a percentage) has been higher than 20% since 2002, and its free cash flow margin (in purple) averages 24% since then.



The company is willing to forgo gross margin percentage points (which decline as management invests in its product) as long as it can keep operating margins steady, making up for it on the bottom line. This has led to years of steady earnings-per-share growth (the purple, with EPS shown on the left side) in line with, or greater than, revenue growth (in blue, with millions in sales on the right).



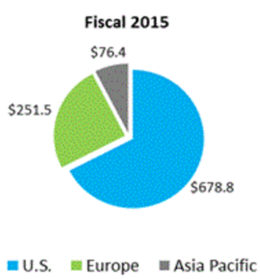
All this consistency comes at a price. We're paying 20 to 24 times free cash flow (depending how you measure it) and about 25 times earnings, and a bit less than 22 times forward EPS estimates. But this is no different from -- actually, it's cheaper than -- most anyone has ever paid for shares of FactSet. The long-term average P/E has been 30.3, and the price-to-free-cash-flow average is 32. Growth has slowed since the early days, but not enough to suggest we're overpaying (even if we can expect some multiple contraction over time). The business is stronger than ever. And today's price represents the valuation multiples this steady business has been able to command, almost continually, since going public in the 1990s. The stock, meanwhile, has appreciated as the business has grown. Here's the P/E and price-to-free-cash-flow history:

Charts: S&P Capital IQ.

Expanding Possibilities

According to industry reports, global spend on market data and analysis was up 4.1%, to $26.5 billion, in 2015. FactSet estimates it has 3% to 5% market share, giving it plenty of room to grow by offering more personalized services. Its largest competitors are Bloomberg, Thomson Reuters, and Standard & Poor's Capital IQ. According to FactSet's 2015 annual SEC filing, Bloomberg's market share was up a tad to 32% last year, while Thomson Reuters' share was down a bit to 25.9%. Standard & Poor's Capital IQ market share is estimated at 3% to 5%, comparable to FactSet's.

With FactSet reporting 9.5% organic revenue growth last quarter, the industry continues to expand in North America and Europe, the core of the business. And there's a great deal of extra room to grow internationally. Here's FactSet's geographic revenue by millions last year, with the U.S. accounting for about 67%:



Broadly speaking, FactSet's data products can be customized to serve professionals in corporate, legal, government, marketing, and academic fields -- anything that may benefit from market, company, and investment-related data, and any entity that invests. Data is compounding daily and needs to be managed and analyzed, leading to steady (if at times low) long-term growth in an industry like FactSet's. The primary driver of growth, though, remains the investment industry. If value in that industry grows (as we believe it will long-term), FactSet's market should continue to grow. For instance, last year, strong demand for fixed income data helped drive results.

The Three C's of Management

We seek clarity, capability, and consistency from management -- and we prefer tenure. We have all that here. Reading conference calls back to 2008, management has been clear and consistent in its message and purpose. The results speak to managers' abilities. Just as importantly, the company traditionally has a greater than 90% retention rate with employees, and has won multiple "best places to work" awards.

CEO Philip Snow, 51, started his career at FactSet in 1996. The CFO is 47 and also started in 1996. The COO is 42 and started in 1995. The global director of sales is 47 and joined FactSet in 2015, after leaving Bloomberg. This young management team is helping keep the company on the cutting edge, and the CEO earns a strong 85% approval rating from employees on Glassdoor.com.

The Foolish Bottom Line

With recurring revenue, a 95% retention rate, pricing power, switching costs, and an expanding market as the need for reliable data and analysis grows, FactSet checks the boxes we seek in a long-term *Pro* investment targeting compounding. A further slowdown in IPOs or mergers and acquisitions, or a fall in the stock market in general, could become a headwind to growth, but historically most customers stay with the company, and better growth resumes during better markets.

Meanwhile, FactSet doesn't carry any of the risks inherent with most "financial"-related companies; it's a subscription business model, selling data. It doesn't have balance sheet risk. Should competitors start to cut prices to win market share (not likely, but possible), we'll need to reassess. But as long as FactSet retains pricing power and can steadily add new clients, it should create North Star-challenging long-term returns. We're glad to start a 2% position today, and may potentially build it higher (with new trade alerts) as opportunities dictate. We may or may not use options on it eventually. Being near our allocation guidance is more important than buying in 100-share blocks.

Fool on!

Alternative Trades

- **Only want to target lower buy prices?** You can "sell to open" puts, one for every 100 shares you would buy at lower prices. Take your pick of June to December puts, choosing ones with strike prices around $150 or a bit lower, but realize this is a Buy First stock and we're starting with a direct 2% stake in shares.

The Market Takes a Bite out of Apple

Published May 16, 2016 at 4:47PM

As widely predicted, **Apple** (NASDAQ: AAPL) reported the first quarterly revenue decline since 2003, helping to further an apparent crisis in confidence redux for the company. It was only three short years ago that slowing iPhone 5s sales pulled the stock down by almost 45%, with investors proclaiming that Apple was a dead company walking. This time around, it's slowing sales for the iPhone 6s/6s Plus that have the market worried, and the stock was recently trading 30% below its 52-week high.

Updated Guidance and Valuation

Updated guidance: Buy (no change)

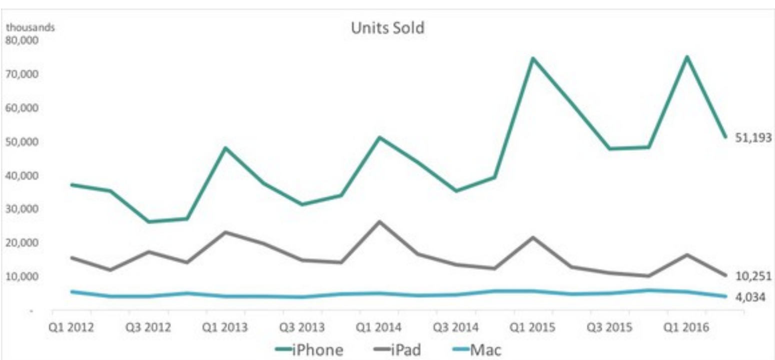
Recommended allocation: 3.3%

Fair-value estimate: $122

Metric	Apple		S&P 500	
	Trailing	Forward	Trailing	Forward
EV/Revenue	2.28	2.39	2.13	--
EV/EBITDA	6.62	7.39	11.04	--
P/E	10.08	10.74	23.21	17.16
P/FCF	8.93		18.47	--

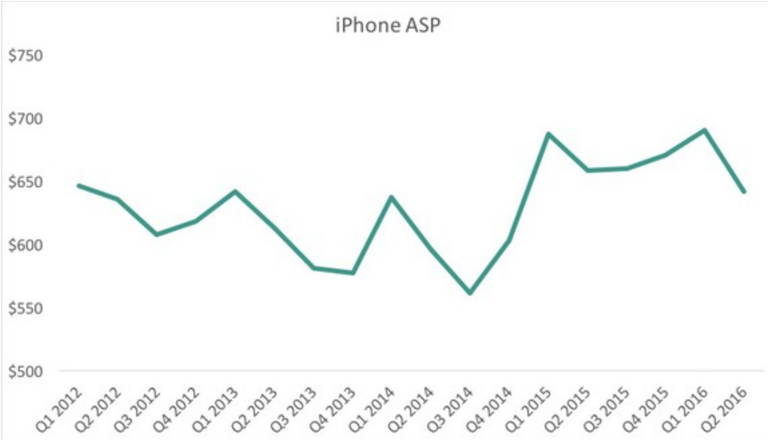
Source: S&P Global Market Intelligence

Results



Source: Company filings

Revenue for the quarter was down 13% (9% in constant currency) as iPhone unit sales and revenues fell 16% and 18%, respectively. A reported $50.6 billion in revenue was within last quarter's guidance, but as is often the case with the stock market, just meeting expectations wasn't good enough; the stock finished the day after earnings more than 6% lower. iPhone average selling price (ASP) also fell this quarter, but it's worth keeping in mind that ASP is still much higher than it was before the introduction of the iPhone 6 Plus, the higher cost of which raised ASP. This metric also continues to be negatively affected by foreign currency fluctuations; although management didn't provide the specific number this quarter, CFO Luca Maestri did note that iPhone ASP would have been $49 higher last quarter with the effects of foreign currency removed.



Source: Company filings

iPad and Mac sales also declined this quarter, but the Services and "Other" divisions were up 20% and 30%, respectively, thanks to strong App Store and Apple Music sales and the Apple Watch continuing to outpace the introduction of most of Apple's prior product launches. .

Pro's Take

I think it's fair to say that with Apple, this time is different. The key here is in determining what exactly we mean by "this time." Either:

- We're referring to the industry as a whole and this time is different because Apple isn't destined to become next Nokia, Blackberry, Sony, etc.

or:

- We're referring to Apple's history and this time is different because Apple will be unable to overcome its reliance on a single product as it's done with the Mac, iPod, etc.

The implications for the company, and subsequently for Apple's stock, are vastly different, so it's important to figure out which side you agree with. Both are appealing from an intuitive standpoint, but this alone isn't enough. Saying that Apple has to go the way of its predecessors simply because of its size is, in my eyes, akin to saying that a stock is a great buy simply because it's trading at a low P/E. Given a large enough sample size, both statements are likely to hold true, but there are always outliers. And to date, Apple has been a huge outlier. As Michael Mauboussin noted in *The Base Rate Book -- Sales Growth*, "Apple's growth in the last dozen years has ... been truly amazing. Out of the 1,251 companies in Apple's size cohort ($6-13 billion), there were only 2 instances of sales growth of 35-40 percent compounded annually over 10 years. Both were Apple." But giving the company a free pass based on its prior successes isn't any better, given that the industry landscape has changed so much and Apple is a vastly different company now.

As of right now, we're not in any rush to lump Apple in with the other fallen titans of the tech industry. Prior to the iPhone 6 upgrade cycle, we had already seen sales slowing as the company started running out of easy wins (moving into new markets, adding new carriers). But with the iPhone 6/6 Plus launch, Apple resumed growing at a pace that we hadn't seen since 2012.

We tempered our expectations for 2016 in response to this, believing that the company had essentially pulled sales forward thanks to the strong demand for the new form factor of the 6 and 6 Plus. That's exactly what appears to be taking place. Its two-year growth rates are commendable for a company of Apple's size, and we still think growth will resume once the iPhone 7 rolls around, albeit at a slower pace than we're seeing now. By then, the primary avenues for iPhone unit growth will likely have shifted toward converting users of other operating systems and shortening the upgrade cycle for existing iPhone users.

Going forward, I also think it's important to consider more than just unit sales and ASP when trying to gauge the success of the iPhone in a given quarter. This is because, as noted by Benedict Evans of Andreessen Horowitz in a recent presentation, the smartphone has essentially become a sun, or the center of a new ecosystem. Mobile is no longer a subsection of the Internet -- it is quickly becoming the Internet, as more and more people begin to access the Internet via mobile devices exclusively. (More than half of Facebook's users only use it on mobile.) So although smartphone sales themselves may be slowing, there are an increasing number of ways for Apple to monetize its position in mobile.

I believe a better way to gauge the health of the iPhone business is by looking at iPhone sales in combination with everything else the iPhone enables, like Services revenue or Apple Watch sales. Speaking of which, services revenue overtook that of both the iPad and the Mac for the first time ever; it's now the company's second-largest division. App Store revenue was up 35% this past quarter, and the purchase value of services tied to the company's total install base rose 27% to $9.9 billion in the March quarter. Apple Music had more than 13 million subscribers as of April 26, meaning it continues to add about 1 million new subscribers per month, a pace similar to what we've seen from market leader Spotify (with 30 million paying subscribers). And although it isn't directly contributing to Apple's financial statements in a meaningful way just yet, Apple Pay continues to exhibit strong growth -- CEO Tim Cook reported that transaction volume was 5 times higher than last year, and the company is adding about 1 million new users per week. And although the company doesn't provide much color on the state of Apple Watch, by most estimates the Apple Watch launch continues to pace ahead of the iPhone in terms of sales.

There is always a fear that people will shift away from iOS to Android, but I think it's important to keep in mind that Android may have won the market in terms of market share, but as of right now Apple has actually won in terms of capturing the most desirable customers.

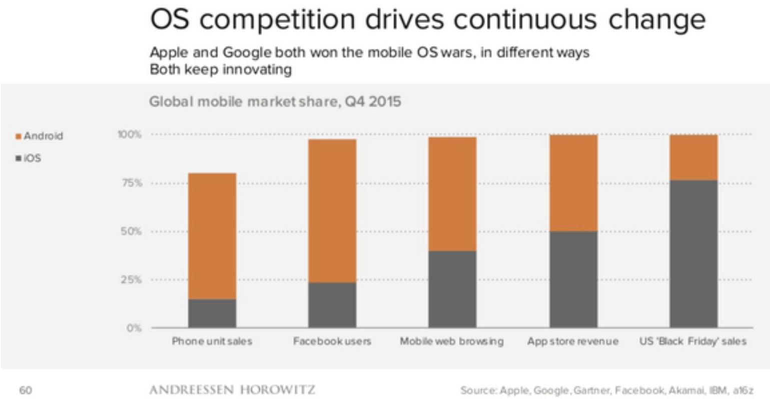


Image source: Benedict Evans, *Mobile is Eating the World*

Maestri also noted on the conference call that, according to business intelligence provider App Annie, the App Store generated 90% more global revenue than Google Play in the March quarter, up from a 75% lead in 2015. In a sense, this is a positive feedback loop: Having the most valuable users on iOS ensures that developers and content creators prioritize putting their apps and content on the iPhone, which keeps the most desirable customers around (and draws in more), which in turn draws in more app and content creators (who doesn't want to go where the money is?), and so on.

I'd be hard-pressed to find another company anywhere close to Apple's size that's so frequently subjected to market manias and panics about its individual stock. As an investor, watching this play out so frequently is equally fascinating and frustrating. We still believe the stock is meaningfully undervalued here, but it's anyone's guess when (or even if) market sentiment will reverse course.

Pro Catch-Up Trades: May 16, 2016

Published May 16, 2016 at 2:55PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our Portfolio Building Reports will get you fully invested over the coming few weeks, as much as you want to be.

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Broadridge Financial Services** (NYSE: BR): Buy our 5.2% allocation, at once or in halves if you like.
- **MasterCard** (NYSE: MA): Buy up to our 4.6% allocation.

Continue building your portfolio with our Buys, including these highlighted today:

- **Apple** (NASDAQ: AAPL): Buy 3.3% in stock.
- **Gilead Sciences** (NASDAQ: GILD): Buy 3.1% in stock.
- **O'Reilly Automotive** (NASDAQ: ORLY): Buy 5.2% in halves, over time.
- **Parexel** (NASDAQ: PRXL): Buy 3.1%.

Options:

- None currently, other than today's **Expeditors** (NASDAQ: EXPD) trade.

Hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): With patience, the put ratio spread we announced two weeks ago can be set up for a cost of $0.04 at recent prices (though as you'll recall, we sought no cost or even a credit on Day One). On a market drop, the price to set it up should get more favorable for newcomers. As this is far out-of-the money, we at *Pro* are currently waiting for a market drop to set it up.

Charts of the Week: Lobbying, an Internet Minute, and the History of Life

Published May 16, 2016 at 1:27PM

Fellow Fools: The Motley Fool would not be named The Motley Fool if it weren't for David Gardner -- and his love of Shakespeare and tomfoolery. Today, David celebrates a milestone birthday, and as we share our gratitude and congratulations with him, the *Pro* team wants to include you! To convey your well wishes to David (as well as any reflective thoughts!), just drop a note to DavidsBirthday@fool.com. And then Fool on! -- The *Pro* team

Dear *Pro* Fools,

My charts series is back this week for its third edition. In this week's Memo, I'll share the five (plus one bonus!) most interesting and/or market-relevant charts I came across this week while perusing the financial blogs and websites I frequent:

1. The American Middle Class: U.S. Metropolitan Areas

EMBED </> REPORT DATA

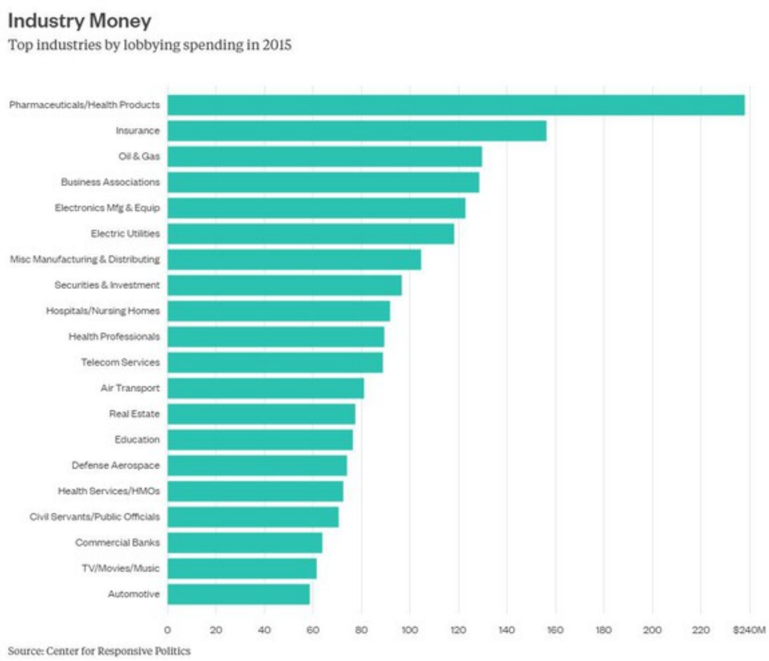
Source: Pew Research

This interactive graphic from Pew Research details the geographic distribution of three tiers of American households -- Upper Income (income greater than or equal to $124,925 per year), Middle Income (between $41,641 and $124,924 per year), and Lower Income (less than or equal to 41,640 per year).

2. History of Life

This fun graphic from Visually (see a larger version here) shows the history of life as we know it, detailing mass extinction events, continental drift, and milestones achieved during various geologic eras.

3. Top Industries By Lobbying Spending (2015)



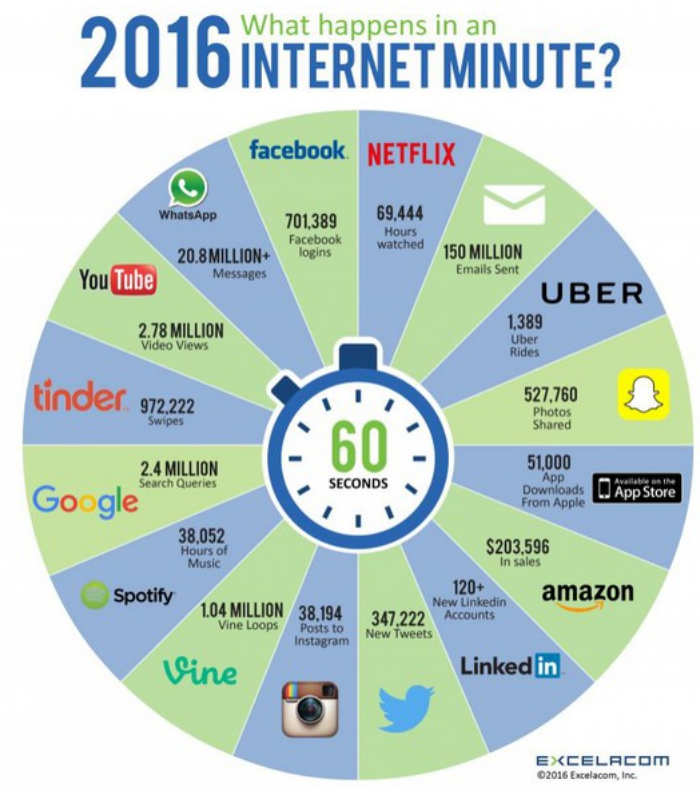
This chart shows the industries with the largest lobbying spending in 2015. Perhaps not surprisingly, the pharmaceutical and health-product industry tops the list by a wide margin. Check out the source article from Bloomberg Gadfly for more charts detailing the industries with the greatest *increase* in lobbying spending over the past five years, as well as the most-reported issues for the industries with the greatest growth in lobbying expenses.

4. U.S. Consumption In Real Time

Source: Couponbox.com

This real-time counter shows U.S. consumption of a variety of categories, and you can watch the stats climb by the second.

5. What Happens In An Internet Minute? (2016)

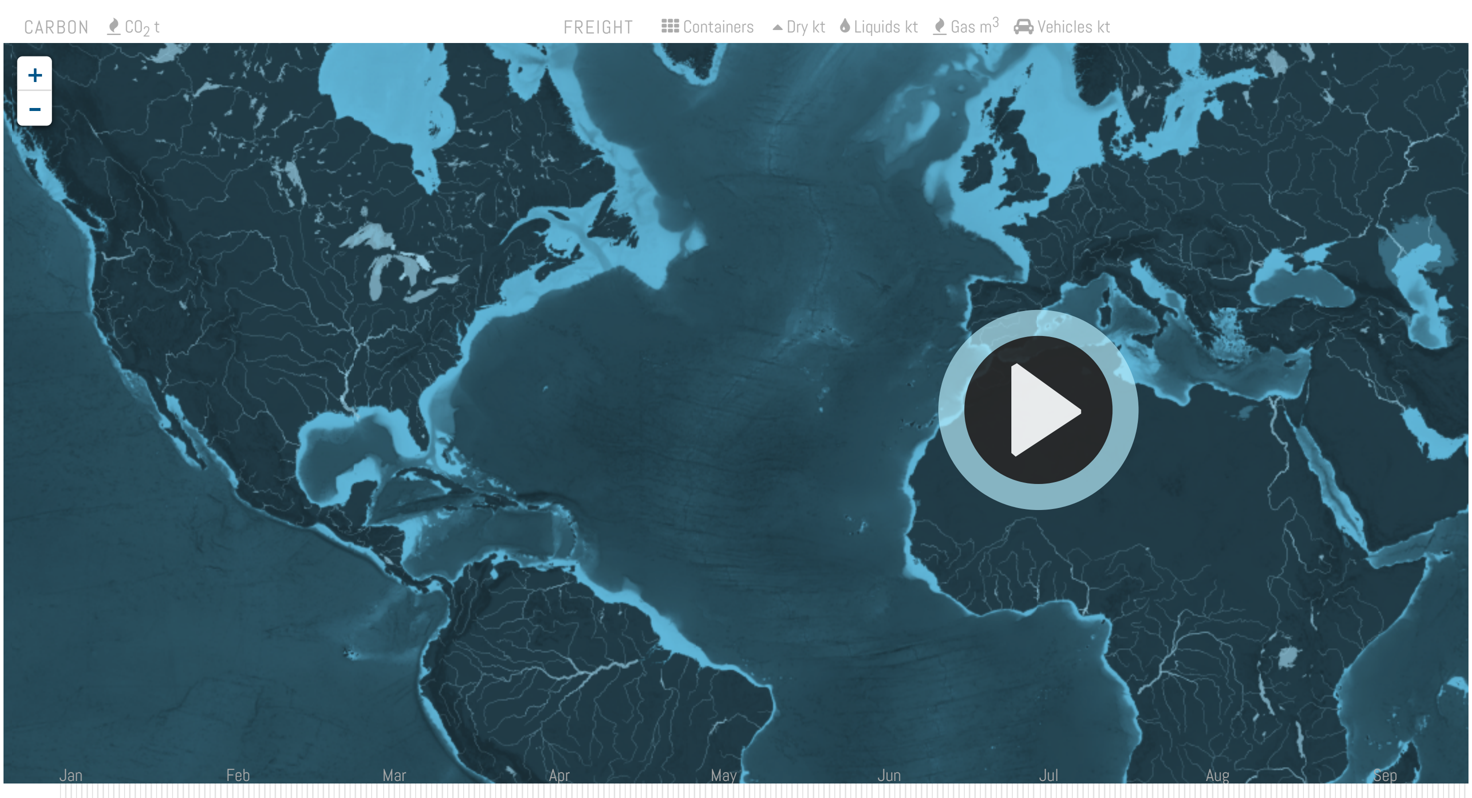


This similar (though static) chart from Excelacom details the activity that occurs across various web/media services every minute in 2016. The numbers are staggering. Compared with 2015, the majority of these numbers have significantly increased. For example:

- **Uber** – 695 more rides per minute (100% increase)
- **Amazon** – $83,836 more in sales per minute (70% increase)
- **Spotify** – 24,752 more hours of music uploaded per minute (186% increase)

This goes to show how consumers are continuously using the Internet more and more each day, pressuring Internet speeds to increase as well (which is a boon for our wireless infrastructure provider, **American Tower** (NYSE: AMT)).

6. Bonus Chart: Global Shipping Routes (2012)



Created by London-based data visualisation studio Kiln and the UCL Energy Institute

I've included a bonus chart this week, just because I think this one is particularly cool. This interactive map from [Kiln] details the movements of the global merchant fleet over the course of 2012, overlaid on a bathymetric map. You can also see some statistics, including a counter for emitted carbon dioxide (CO_2) and info on maximum freight carried by represented vessels, among other functionalities.

The *Pro* Bottom Line

There you have it, Fools -- the third edition of my top five (plus one!) charts of the week. Hope you enjoyed it, and bring any questions or comments to the Memo Musings board!

Best,

-- Billy (TMFBillyTheKid)

Roll Your Covered Strangle on Expeditors International

Published May 16, 2016 at 1:21PM

Is this for you? This is for all *Pro* members with an existing income position on **Expeditors International** (NASDAQ: EXPD) expiring this Friday, May 20, and for all new *Pro* members who want to start this position now. Those who want to own stock instead of a synthetic long, or who are investing in an IRA, should see the alternative trades at the end of this report. And if you're new to options and this is overwhelming, take your time and ask questions on the EXPD board to learn about it; you could also simplify it into a covered-call position, just buying at least 100 shares of stock and writing covered calls on it. Again, see the end of the report.

How You Participate

- **Actions:**
  - **Old position:** Buy to close all existing May 2016 $45 calls. You may also buy to close all existing May 2016 $40 puts for mere pennies, or let them be to expire on Friday (if you do this, don't write new puts until these expire). Leave your 2017 synthetic long alone.
  - **New position:** Write a new covered strangle. Sell to open August 2016 $46 puts and sell to open August 2016 $49 calls. Sell one of each for every synthetic long you have already set up (or every 100 shares of stock you own).
- **Allocation:** Approximately 1.9% look-through exposure on the synthetic long, and another 1.8% exposure through your short puts in the strangle, for 3.7% total exposure to EXPD. Each synthetic covered strangle at today's price represents about $9,300 in exposure to the stock. So, for 3.7% exposure, set up one synthetic covered strangle (one each of all four options involved) for approximately every $250,000 you're managing. *Pro* has 10 contracts of each option in the synthetic long, and then in the written strangle, too.
- **Prices (11:40 a.m.):**
  - **Stock:** $47.50
  - **Options:**
    - **Close old strangle (you can roll your entire strangle, combining these two orders):**
      - Buy to close May 2016 $45 calls, lately about $2.55 (splitting the bid/ask). Aim to pay as little time value as possible to close these calls.
      - Buy to close May 2016 $40 puts, lately $0.05 (or let these alone to expire Friday, and write your new puts then).
      - Combined: **About a $2.60 debit.**
    - **Write new covered strangle:**
      - Sell to open August 2016 $46 puts (bid/ask): $1.60/$1.65.
      - Sell to open August 2016 $49 calls (bid/ask): $1.25/$1.35.
      - Combined splitting the bid/ask: **About a $2.92 credit.**
      - Total price to roll: About a $0.32 credit.
- **Price Guidance:** Close your old positions using limit orders at current pricing, and do so by Friday. Write the new strangle using a limit order of about $2.92 in credit. As prices change, ideally accept no less than $2.80, or 6% on the current share price in just more than three months to expiration. Later, aim for a 2% yield on the current share price per month to expiration.

What We're Thinking

Shares of our favorite overseas shipping facilitator, Expeditors International of Washington, remain a long-term income target for us. We are comfortable having exposure to shares (currently through a synthetic long, which mirrors share ownership without requiring us to pay out capital), and writing put and call options on them to target higher income than usual. Almost since *Pro*'s inception in 2008, Expeditors has had a fairly steady presence in the portfolio, generating returns.

After a record 2015, earnings are expected to flatten in 2016, but that should be enough to keep our option income strategy going and, ideally, to keep the stock in a friendly price range. Overall, we believe this well-run business will continue to deliver respectable results, even if world trade volume slows marginally. Meanwhile, the stock is less expensive than it has been in years, now trading at less than 20 times earnings and 13 times free cash flow.

Asia trade accounts for about 50% of the company's revenue. But of course, many of China's exports are shipped to countries with stronger economies (and cleaner air), including North America and Europe. This gives Expeditors' business some breathing room even when China's domestic economy (including imports) slows, as it's currently doing. Although this year could remain choppy, that uncertainty adds to the option premiums we'll collect, aiding our income strategy, while we ultimately believe Expeditors will keep sailing in a price range, or drift higher.

Why This Strategy?

Although it's a highly profitable, expertly managed niche business in an attractive service space, Expeditors is not on the radar of the average investor. Its valuation is reasonable, and its options pay well. Not expecting a surge in earnings, we're content to keep covering the position with calls. As we're also not expecting a great, *lasting* drop in the share price, we're also comfortable writing puts. Why not just buy the stock to strangle instead of setting up a synthetic long? You may if you prefer! We are opting to keep our cash free, and use the leverage of a synthetic long to make the income we earn on this position more meaningful compared to the modest capital (or non-capital) we invest.

More That Matters

- **Maximum loss:** The same as owning at least 200 shares of stock (100 now, and 100 at $46), minus the option premiums received.
- **Maximum gain:** This new strangle caps our upside at $49, plus the combined option premiums received. The most we can make on this strangle alone is the $2.90 or so in premium paid to us (ignoring that it was a roll, which is a sunk cost), earned if the stock stays anywhere between $46 and $49 by expiration.
- **Follow-up:** By our expiration, we'll manage our covered strangle for more income, writing a new one as this one ends, or rolling if we need to. You'll hear via a trade alert!

Alternative Trades

- **If you're new to *Pro* and want to participate in the full new position:** In a margin account, set up a new synthetic long with the allocation guided at the top of this report (one syn long for every $250,000 managed) by selling to open January 2017 $47 puts, and buying to open an equal number of January 2017 $47 calls. This can lately be done for about a $0.10-$0.20 debit. Then write the August $46/$49 covered strangle as guided at the top of this report.
- **If you just wrote covered calls last time and want to keep doing that:** The May 2016 $45 calls need to be rolled to keep the position going. You can lately close the May $45 calls for about $2.55, and then sell to open new August 2016 $47 calls for about $2.20. We're working to keep the debit low while getting $2 more upside.
- **If you just wrote puts last time and want to do so again, or if you're new and just want to write puts:** Your old puts are expiring as income. As they do, sell to open August 2016 $45 or $46 puts (newcomers can do so anytime), selling one for every 100 shares you would buy, up to a 3.7% potential allocation.
- **If you're new and just want to write covered calls (the IRA-friendly alternative!):** Use a buy/write order to buy at least 100 shares of stock and sell to open the August 2016 $49 calls with us. Lately, this can be set up for a net debit of about $46.25 per share. You can do this with up to a 3.7% allocation.
- **Want to just strangle shares of stock instead?** You may! Rather than set up the syn long, just buy stock in 100-share increments, and then sell to open the August 2016 covered strangle on the stock, writing one strangle for every 100 shares you buy, up to a 3.7% total allocation (shares and short put exposure).
- **Whew!**

Pro Can Help

- **Want more on this strategy?** See our guides to covered strangles and synthetic longs. We're combining the two into a synthetic covered strangle.
- **Questions?** Please ask, Fools! Ship yourself on over to our Expeditors board. We can all help you, especially if you're new!

Wonderful Worlds (That Never Existed)

Published May 16, 2016 at 11:19AM

"Nostalgia is a seductive liar," George Ball once said.

The easiest way to rationalize today's problems is to recall a time when they didn't exist. It gives the impression that our frustrations are temporary and fixable, rather than an ongoing reality of life.

But a lot of the "good old days" we look back on never actually happened. My biggest takeaway from economics is that the past wasn't as good as you remember, the present isn't as bad as you think, and the future will be better than you anticipate. Realizing the good old days weren't as great as we remember goes a long way to becoming thankful for what we have and being optimistic about our future — key traits for investors.

Here are three worlds we nostalgically remember that only occurred in our heads.

1. A Time When Most Workers Had a Pension

The median retirement account balance for workers age 55-64 is $76,381, according to Vanguard. This is perhaps a third of what a typical couple will need for medical expenses alone during retirement.

The first response to something this serious is indignation. The second is nostalgia. "People haven't gotten worse at preparing. Workers used to have pensions," a commenter on a retirement forum recently said. One article remembers a time when pensions were "universally accepted and expected." Another says sharply, "Twenty-five years ago, everyone had a pension."

Well, no.

Pension coverage peaked in 1979, when 38% of private workers participated in a defined-benefit plan, according to the Employee Benefits Retirement Institute. Which is to say, 62% did not.

Compare that to 401(k) participation today: "Nearly 80 percent of full-time workers have access to employer-sponsored retirement plans, and more than 80 percent of these workers participate in a plan," writes the American Benefits Council. The percentage of all workers (full and part-time) participating in some form of retirement plan has been pretty stable over the last 40 years, at around 45%.

There was a time when pensions were standard at large, deep-pocketed companies. But there was never a time when large, deep-pocketed companies employed most Americans. A big share of employment comes from the Eddie's Car Repairs and Sue's Bakeries of the world, which were as unlikely to offer a pension 40 years ago as they are today.

And even as pension coverage has plunged, what remains are so much more generous that total pension income has gone up over time. Nevin Adams of EBRI writes: "Pension income ... represented 20 percent of all the income received by those 65 and older in 2010. In 1975, it was less than 15 percent."

It can't be repeated enough that the only reason we have a retirement crisis today is because, for the first time in history, everyone *expects* to retire rather than working until they die.

2. A Time When the Government Lived Within Its Means

A vocal group of voters and politicians are pushing for a balanced-budget amendment that prevents the federal government from running a deficit. It's based on logic that "American families live within their means. It's time for the American government to follow suit," as one supporter put it.

This idea that deficits must be stopped harkens back to a time when the government spent less than it took in.

Which is a world that has never existed.

The government has run a deficit in 84 of the last 115 years, according to the Office of Management and Budget. That's 73% of the time. The few periods of surplus came during times we now call bubbles: the 1920s and the late 1990s. The only non-bubble period in which the government ran multiple surpluses were the three years after World War II, as military spending fell but war-time taxes remained. It was accompanied by a deep recession. Government debt has increased in 49 of the last 50 years. I suspect the next 50 years will be similar.

People intuitively think the government must have lived within its means in the past because no person could spend more than they make forever and remain viable. But governments aren't people. Governments have indefinite lifespans, with no final date when all debt needs to be repaid. Rather than paying debt off, old debt is replaced with new debt, and life carries on as normal. As long as debt-to-GDP has some level of stability over time — a big *if*, mind you — a government can run a deficit every year, forever. Our government will spend $600 billion more than it takes in from taxes this year. But with a growing $18 trillion economy, the debt-to-GDP ratio should *decline*. In that context, a half-trillion-dollar deficit is rather conservative.

A government *does* have to live within its means. It's just hard to wrap your head around the idea of a perpetual deficit being well within a government's means.

3. A Time When the Market was Calmer and More Orderly

There are more than 34,000 references to "today's volatile market" on Google.

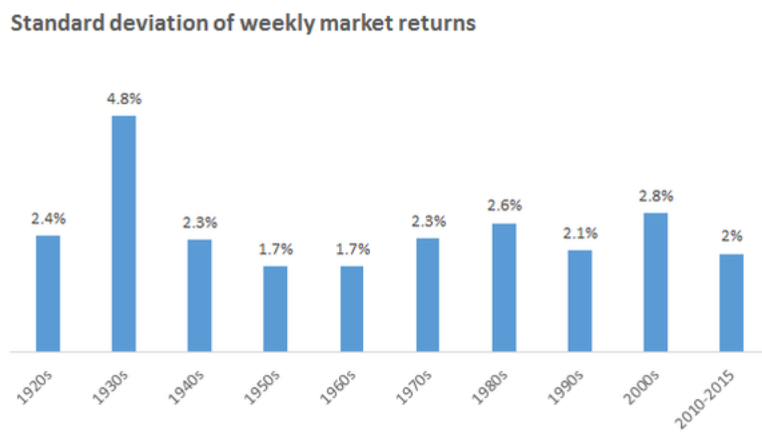
You hear it all the time. An example from this week: "In today's volatile market environment, managing risk and building the 'right' portfolio is harder than ever."

"Today's volatile market" implies that yesterday's market was less volatile — which is a testable assumption. And it's mostly wrong.

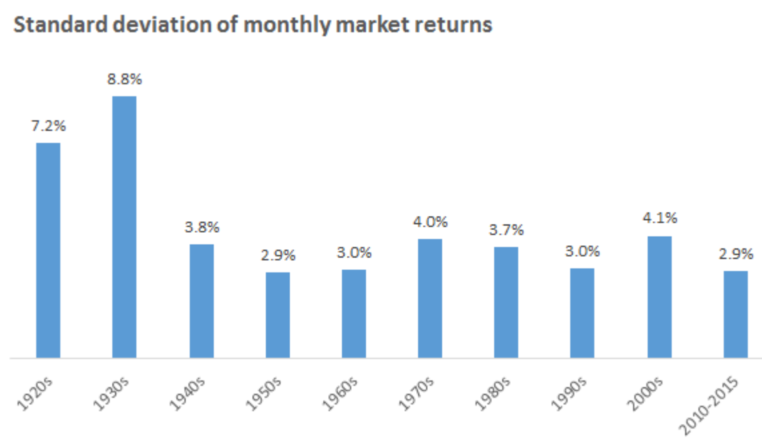
Yesterday's market was, by and large, just as volatile as today's.

I recently calculated market volatility for daily, weekly, monthly, and annual market periods over the last 90 years. At every length of time, recently volatility is nearly equal, if not below, its long-term average.

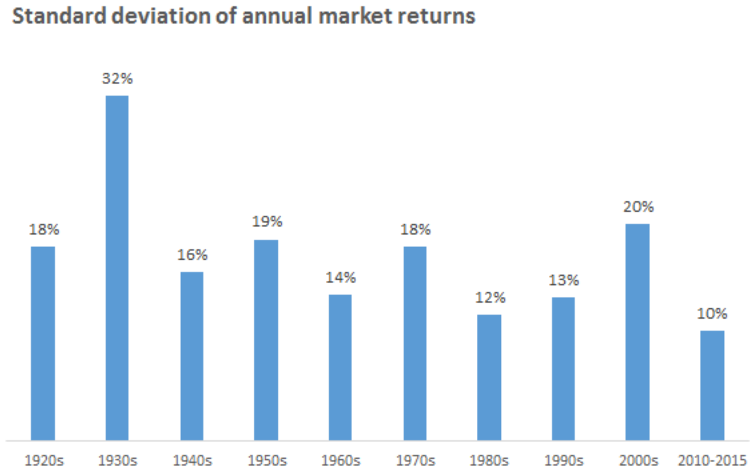
Take weekly volatility of the S&P 500. Recent years are hardly an outlier:



And monthly volatility:



And annual:



I suspect people think today's market must be more volatile than the past because it's been really volatile lately, and they assume no society in its right mind could put up with chaos for ninety years straight.

But we have. The idea that markets used to be more orderly is a lie; that world has never existed.

Falsely imagining today as more volatile than yesterday also explains why so many investors are prone to sell, fidget, rotate, and worry when the market dips. Not understanding the historical context of volatility make declines appear abnormal, like something is broke and needs to be avoided. In reality, volatility is exactly *why* markets have generated good returns over time. If markets were calm, there would be no risk. And if there's no risk, there's no reason for returns above bonds. Why would there be? It has always been that way, and it always will be.

Same as it ever was.

Parexel Reports Growing Margins

Published May 15, 2016 at 1:44PM

Pro's Take: PRXL Fiscal Q3-2016 Earnings

Parexel International (NASDAQ: PRXL)

What Happened?

- Q3-2016 press release
- Q3-2016 10-Q
- Q3-2016 presentation

....

Q3-2016

Sales growth: +5% Y-o-Y (+5.4% in constant currency)

Backlog growth: +9.1% Y-o-Y

Gross profit margin: +323 bps Y-o-Y to 35.9%

Operating profit margin: +242 bps Y-o-Y to 13.2%

GAAP EPS growth: +32.2% Y-o-Y

non-GAAP EPS growth: +34.8% Y-o-Y

....

Guidance Update

The business continues to track well against our thesis despite a competitive operating environment and changing marketplace dynamics. Parexel's largest business segment, Clinical Research Services (CRS), continues to win new business and prove that the biopharma industry is moving toward a strategic outsourcing partnership model. The company's Consulting and Informatics segments are growing as well, and longer-term margin expansion in these smaller segments is helping companywide results.

Updated guidance: Buy (no change)

Recommended Allocation: 3.1%

Fair Value estimate: $65 (no change)

Current Price: $58.52

There is no change to our recently updated $65 Fair Value estimate, which implies a TTM P/E ratio of 24.3x (GAAP) and 19.8x (non-GAAP) and a TTM EV/EBITDA ratio of 13.1x. It also implies a forward P/E ratio of 21.9x (GAAP) and 18.6x (non-GAAP) based on expected Fiscal 2016 earnings. We believe these multiples to be reasonable given the company's growing industry, strong competitive position, ongoing margin expansion, strong ROICs (lately ~20% and increasing), and expected medium-term earnings-per-share growth of 15-20%. Members lacking a (full) position should feel comfortable initiating or adding to their position at current pricing (with shares 10% below our Fair Value estimate), given recent stock price volatility.

Our Thesis

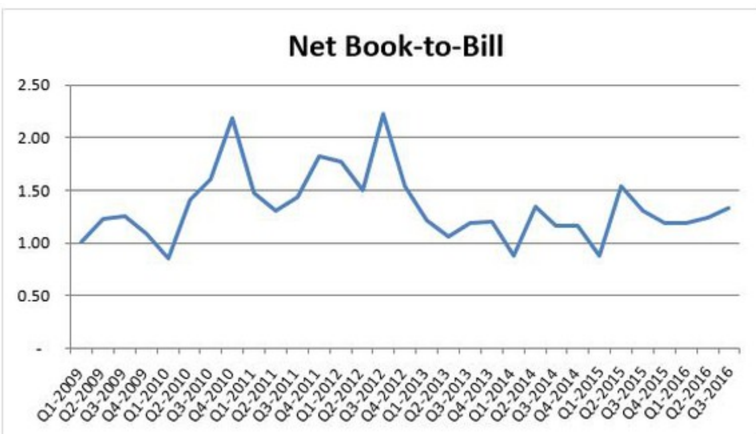
Because of its reputation, global reach, and technology prowess, Parexel International will win its fair share of the growing pharmaceutical development market. In addition, we expect the proportion of R&D dollars outsourced to contract research organizations to grow as large biopharma companies adopt the strategic partnership model and smaller biotechs become responsible for more drug discovery. Finally, as new business wins mature, the true earnings power and margin potential of the company's business will shine through.

The Most Important Things

1) ***Penetration and Backlog*****:** Penetration refers to the proportion of biopharma R&D dollars that go to CROs versus being used in-house for development and increased penetration provides evidence that the biopharma/CRO partnership model is proving out. We can compare the growth of the biopharma industry R&D spend to the growth in Parexel's backlog to determine whether the CRO industry is experiencing continued outsourcing penetration. We also monitor backlog trends to ensure Parexel is sufficiently adding future business – backlog that converts to sales usually represents ~80% of the sales in any given quarter, so strong backlog growth suggests strong future sales growth.

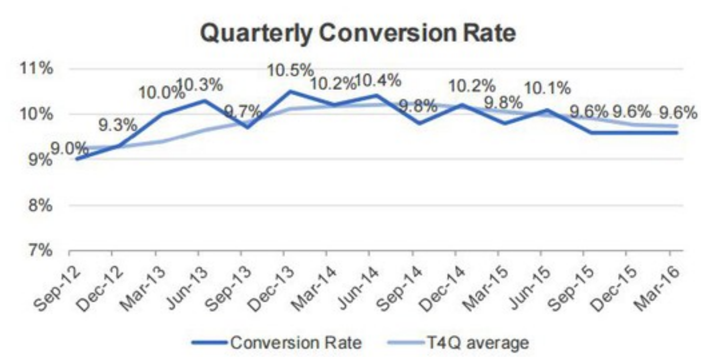
According to recently released industry data, biopharma R&D spend was roughly flat from 2014 to 2015, and it is expected to grow at a 2-3% CAGR from 2015 to 2020. For comparison, Parexel's year-over-year backlog growth in Fiscal Q3-2016 was 9.1% (and 3.3% sequentially), so we can see that Parexel's backlog is growing at a rate higher than that of biopharma R&D spending. This indicates that the CRO industry -- and Parexel in particular -- is continuing to experience increased penetration of biopharma R&D spending.

The company's net book-to-bill ratio increased sequentially to 1.33 due to solid increases in net new business (+7.2% Y-o-Y). A net book-to-bill ratio above 1 indicates that the company is booking more business than they are recognizing, suggesting that future sales growth should increase:



However, revenue growth is affected not just by backlog growth, but also by backlog conversion (percentage of backlog recognized as revenue for a given quarter) and backlog cancellation (percentage of backlog that was cancelled in a given quarter). The cancellation rate in the quarter came in at 5.5%, slightly higher than historical norms of about 3.5%-5% (the cancellation rate fluctuates depending on the type of drugs and the type of studies being conducted). The main reason for cancellations in the quarter was client portfolio reprioritization (rather than performance-related issues).

Lately, the company's conversion ratio has been lower than historical averages and it is trending lower (higher is better):



Management notes that this is due to increasingly stringent regulatory requirements and increasingly complex clinical trials, leading to longer-duration projects that remain in the start-up stage longer than in the past. It is also due to a shift in focus from biopharma companies into more complicated therapeutic areas (such as oncology, immune-mediated disorders, and rare diseases). More than half of Parexel's current projects in backlog relate to innovative compounds in these complex therapeutic areas, which are areas of expertise and competitive advantage for Parexel. Parexel benefits from global scale, a data advantage, and expertise relative to smaller CRO peers, specifically in late-stage (Phase III and IV) studies. This should help Parexel (and the other "top tier", publicly traded CROs) win an increasing share of biopharma R&D outsourcing relative to smaller, less capable peers.

As a result, backlog conversion has declined and the company is seeing a shift in the revenue conversion curve. This decline in the conversion rate will likely persist in the near term as project mix normalizes, and management expects that the prolongation of trials will reach a steady-state sometime in Fiscal 2017 (next year). At that point, revenue growth may begin to become more in line with recent backlog growth. The long-term driver of Parexel's revenue growth remains new business wins and backlog growth.

In any event, as the CRO industry picks up a higher percentage of biopharma R&D spending, we should see revenue and backlog growth outpace the expected 2-3% growth in R&D spending. With 5% growth in service revenue, 7% growth in net new business, and 9% growth in backlog, that's what we're seeing, which provides evidence that our thesis continues to progress.

2) ***Margin Performance***: Companywide gross margin was flat sequentially and increased +323 bps year-over-year. The company's largest segment (representing 79% of total revenue), Parexel Clinical Research Services (CRS) increased gross margins to 32.7% from 29.1% a year ago, the highest it's been since 2011. The gross margin improvements were driven by savings from the company's previously announced Margin Acceleration Program, and a distribution of labor to low-cost locations. The restructuring charges due to this program will be complete by the end of the year and the company's gross margin should continue to improve.

As for the other two business segments, Parexel Consulting (PC) gross margins increased to 47.1% (up from 46.3% a year ago). The PC segment represents 8% of companywide revenue. Parexel Informatics (PI) gross margins increased to 48.3% (up from 47.5% a year ago). The PI segment represents 13% of companywide revenue.

3) ***PI Business Trends:***

Technology is a core competence for Parexel. The company's PI segment is the lifeblood of innovation for transforming the traditional clinical trials process into a more efficient, more effective, technology-driven one. We want to see this business perform well to ensure it remains a competitive differentiator for Parexel and helps it win business in its CRS and PC segments. Now reaching scale, we also expect PI to exhibit operating leverage and become a more meaningful portion of profits.

Revenue growth in this segment was solid at +10.7% year-over-year, coming in at $74 million in revenue for the quarter, the highest quarterly figure for this segment in the company's history. Recently, I'd been disappointed by the trajectory of this segment of the business, as average revenue growth over the past 7 quarters has been just +2.8% compared to 17.5% average growth between 2011-2014.

The last two quarters have been good for the PI segment, and it appears that the company may be on the verge of continuing the momentum in this segment. I've mentioned in the past that our valuation expects PI to grow revenue by 10% annually and achieve 55% gross margins by 2020. These expectations were a significant aspect to our initial thesis, so I'll be watching this segment closely over the next few quarters to see if we need to ratchet down our expectations.

What We Think Now

Helping pharmaceutical companies get drug candidates to market, Parexel is poised to benefit as those companies gradually outsource more of this process to select CRO partners who can perform the work better, faster, and cheaper. We also expect margin expansion as recent investments and restructuring pay off and continued growth of the Parexel Informatics technology segment.

Earnings News From 5 Pro Companies

Published May 9, 2016 at 3:02PM

Dear *Pro* Fools,

Earnings season arrives like a monsoon in *Pro* land, with half a dozen companies announcing results on some weeks. The storm has mostly passed this spring, and we're nearly done reviewing results. Our companies on the whole appear on track, and we're already looking at *new* ideas.

Before we get to anything new, though, we spend time learning more about our current companies each quarter, so these earnings reports matter to us — even though *Pro* looks ahead three years as we seek to build real returns over time.

For now, let's cut to the chase on recent results from five *Pro* stocks.

The Results

American Airlines

American Airlines (NASDAQ: AAL) has not been friendly to us. Although it's now one of the cheapest companies on the market, trading at about 4 times earnings, our hopes for a much higher share price this year are coming down to earth. The main culprit: Passenger revenue per available seat mile, or PRASM, continues to decline at American, down 7.5% last quarter. Next quarter, American expects an additional 6% to 8% year-over-year decline. Supply at other airlines has grown, challenging fare prices. At the same time, American is spending more on employees, including a new profit-sharing plan.

Management previously guided for rising PRASM this year, but last month, American pushed that guidance to 2017. And how will the company grow it again? The plan includes offering different service levels in coach class (to differentiate itself), charging varying prices, and serving different customer wishes. Given how airline tickets are commonly shopped for as a commodity sought out on fare-screening sites, I question how well American will be able to market its new tiered services in coach, let alone sell them. This makes me concerned about the costs associated with this new initiative.

Our January 2017 $35 calls still have time value, and we may soon sell to capture that value and then reassess for 31 days. Do we want to keep believing that Wall Street will reprice American to, say, at least 8 times earnings — a potential double? Or are we being stubborn? Are the skeptics right to think that American's profits will diminish on higher costs, more competition, and eventually higher fuel costs? Thankfully (in a way) our January expiration date forces us to reassess now and make our next decision. We'll share our conclusion with you when we're ready. And we'll certainly have valuable lessons to share.

Our American Airlines 2017 calls remain on Hold. New members are not advised to buy. Those with 2018 calls can act when we act.

Expeditors International (NASDAQ: EXPD) announced results late last week. Once I'm finished looking through them, we'll be rolling our May covered strangle on the stock, moving our strike prices higher. At that point, newcomers can join along, too. Watch your inbox for this update and alert.

Gilead Sciences (NASDAQ: GILD), like **Apple** (NASDAQ: AAPL), is a victim of its past success. The biotech's results were so strong in recent years that it can't grow year-over-year right now, and Wall Street (which loves growth most of all today) has sold the stock lower. Gilead is going for about 8 times earnings, making it even cheaper than Apple. Its Hepatitis C treatments account for the majority of the company's revenue, and even though Gilead is serving more patients, drug prices have come down, so revenue on the drugs slipped 6% from last year to $4.3 billion. This competitive pressure won't go away, so we may have seen peak profit on Hep C, even as Gilead reaffirmed its revenue guidance for 2016.

That said, revenue, cash flow, *and* profit should remain blockbuster-sized, and the stock will get cheaper as management continues to buy back shares — Gilead bought back 17% of shares since 2012. The new CEO is intent on making game-changing acquisitions, too, and the company has the size and cash to do it. An enhanced pipeline via acquisitions could make investors interested again and rerate the stock to a more reasonable valuation. For now, we have a world-class business — like Apple — priced at a discount because it isn't growing today. Management has been able to grow the business incredibly well so far, and we have faith it will be able to again from here.

Gilead remains a Buy at a 3.1% allocation. If you can stay close to that allocation while doing so, consider buying in 100-share blocks. We may seek to make option income on Gilead while we wait.

O'Reilly Automotive (NASDAQ: ORLY) remained a picture of consistency, with same-store sales up a strong 6.1% last quarter on top of giant 7.2% and 6.3% gains the two previous years. That's customer loyalty combined with new customer acquisition skills right there. O'Reilly opened 52 net new stores in the quarter and increased total revenue 10.2%. The results were remarkable for being unremarkable. The industry drivers remain in place: More complex car parts; more miles being driven; more old cars on the road. As these tailwinds continue, O'Reilly should add an additional 150 or so new stores this year. **O'Reilly remains a Buy.** Given our 5.3% stake, members may wish to buy in halves over a few quarters.

Skyworks Solutions (NASDAQ: SWKS) is selling more product for each new generation of smartphone (and to just about all smartphone makers), and grew its Internet of Things sales 18% to represent 23% of revenue. The second half of 2016 should bring the business back to quarter-over-quarter growth, particularly as the new iPhone launches. In 2017, the company sees year-over-year growth continuing. At the same time, fewer competitors can meet the needs of customers, Skyworks is winning new business earlier in the product cycle, and profit margins are headed higher. In other words, Skyworks is on track and trades at 11.5 times earnings estimates one-year forward. The company remains a compelling way to invest in the digital mobile revolution and Internet of Things.

We own a 3.1% allocation, and last week, we sold to open June 17, 2016 $70 covered calls, targeting short-term income. **Skyworks remains a Buy.** Members who have yet to fill their stock allocation should feel comfortable purchasing shares at current prices and writing our new covered calls if wished**.** If you're writing puts on Skyworks with us in *Motley Fool Options*, that's another way to target exposure, but we suggest picking up enough shares to match us in *Pro*, now or later.

The *Pro* Bottom Line

In summary:

- **American Airlines:** Our calls remain on hold. Wall Street may not be willing to apply a respectable valuation to the airline, even though it does to others. American still has to prove that it can compete effectively over the long haul, despite steady pressures. We'll share our guidance on our 2017 calls with you as soon as we've made our decision.
- **Expeditors:** The business looks healthy, and our May covered strangle coupled with a synthetic long has made us money so far this year. We'll be rolling our options to higher strike prices very soon, and we'll welcome newcomers then.
- **Gilead Sciences:** Is Gilead done growing? Ultimately, we don't think so, and once it proves its a savvy biotech operator (and acquirer!) again, Wall Street's returning faith should price the stock well above its current level. The stock remains a buy at a 3.1% allocation. We may need patience and could consider writing options.
- **O'Reilly:** Shares remain a buy at a 5.3% stake (average in over time). The long-term story remains in place.
- **Skyworks:** Shares are a buy at a 3.1% stake. Everything is going well at the business except for the current slowdown in iPhone sales. Keep in mind that we also own Apple, which is Skyworks's largest customer. Combined, we have ample exposure to the mobile revolution.

We're happy to have all of these positions except, naturally, American Airlines right now. We wandered from our usual type of buy, and it hasn't worked out yet. The company could always surprise us, but right now, our time for American is starting to run low as the lessons we're learning are running high. As for the other four companies highlighted here, we believe they will continue to reward us in the long run. If you have any questions, please visit the respective company board or our [Memo Musings board](#).

Fool on!

— Jeff (TMFFischer)

***Pro* Guidance Changes**

- **Broadridge Financial** (NYSE: BR): Fair value estimate goes $2 higher, to $58. The stock remains a Buy First with a 5.1% allocation.
- **Facebook** (NASDAQ: FB): Fair value estimate increases $5, to $107. The stock remains a Buy First with a 6.7% allocation.

***Pro* Completed Trades**

- **American Tower** (NYSE: AMT): We sold to open June 10, 2016 $108 diagonal call on our long AMT calls for $1.46 each.

Pro Catch-Up Trades: May 9, 2016

Published May 9, 2016 at 2:14PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our Portfolio Building Reports will get you fully invested over the coming few weeks, as much as you want to be.

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Broadridge Financial Services** (NYSE: BR): Buy our 5.1% allocation, at once or in halves if you like.
- **MasterCard** (NYSE: MA): Buy up to our 4.6% allocation.

Continue building your portfolio with our Buys, including these highlighted today:

- **Apple** (NASDAQ: AAPL): Buy 3.3% in stock.
- **Gilead Sciences** (NASDAQ: GILD): Buy 3.1% in stock.

Options:

- **Skyworks Solutions** (NASDAQ: SWKS): Sell to open June 17, 2016 $70 calls, aiming for $0.95 or higher. That's about a 1.4% yield on the recent share price, in 39 days. Sell one call for every 100 shares you own and want to cover. We covered all our shares.
- Our other covered calls, announced last week, no longer pay an attractive yield at the moment.

Hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): With patience, the put ratio spread we announced last week can be set up for $0.00 net cost at recent prices.

Broadridge Remains on Track

Published May 9, 2016 at 12:40PM

Pro's Take: BR Q3-2016 Earnings

Broadridge Financial Solutions (NYSE: BR)

Q3-2016

Quarterly recurring fee revenue growth (Y-o-Y): +12% to $399 million

TTM Operating profit margin*: +159 bps Y-o-Y to 24%

Closed Sales growth (Y-o-Y): +7% to $29 million

Quarterly EPS growth (Y-o-Y): +21% to $0.52

**Operating profit / Fee revenue. This removes the impact of distribution revenue, which is a pass-through cost and distorts the true economics of the business.*

Quarter Quick Take

The company has produced a solid start to Fiscal 2016, and it looks like management's guidance for the full year is going to be achievable: recurring fee revenue growth of 10%-12% (YTD +9.9%), Closed Sales of $120-$160 million (YTD $94 million), earnings-per-share growth of 7-12% (YTD +16%), and free cash flows of $350 million-$400 million (YTD $105 million, though typically the vast majority of the company's free cash flow is produced in the seasonally strong Fiscal Q4).

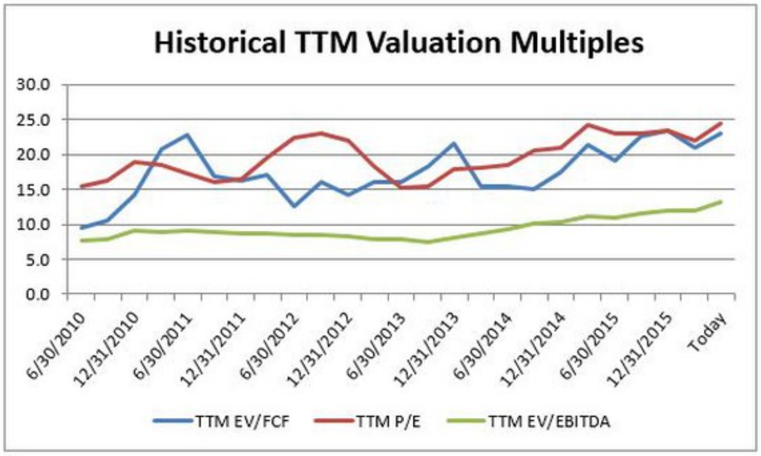
Updated guidance: Buy First (no change)

Recommended Allocation: 5.1%

Fair Value estimate: $58 (up from $56)

Current Price: $60.51

Based on management's guidance, at $60.51 per share, the stock is priced at about 21x projected 2016 cash flow and 24x projected 2016 GAAP EPS. Both of those valuation metrics have increased a bit since the beginning of the year (and relative to the company's history), meaning that the stock is less of a bargain:



However, Broadridge still features stable cash flows, a steady growth profile, an increasingly strong competitive positioning, and expanding margins to show for it. **Our Fair Value estimate increases to $58 per share (from $56), and Broadridge remains a Buy First on our scorecard.** Members who have yet to start or fill out their position can feel comfortable doing so at current prices, or you can write puts if you prefer to target a lower entry price (at current pricing, the $60 puts are a reasonable choice).

Our Thesis

Broadridge has a near monopoly in proxy solicitation and all other investor communications management. It has a very strong franchise in global securities processing and is increasingly helping its customers off-load technology-based cost centers that require accuracy and security. Broadridge offers a defensible, scalable, low-growth business with strong competitive advantages and very predictable cash flow. Its modest growth, capital-light and scalable business, promising new product pipeline, excellent acquisition track record and sound capital allocation policies make Broadridge a sturdy rock to build the Pro portfolio upon. We expect modest growth in fee revenue, slight operating leverage, plenty of free cash flow and a growing stream of dividends to help achieve North Star-like returns.

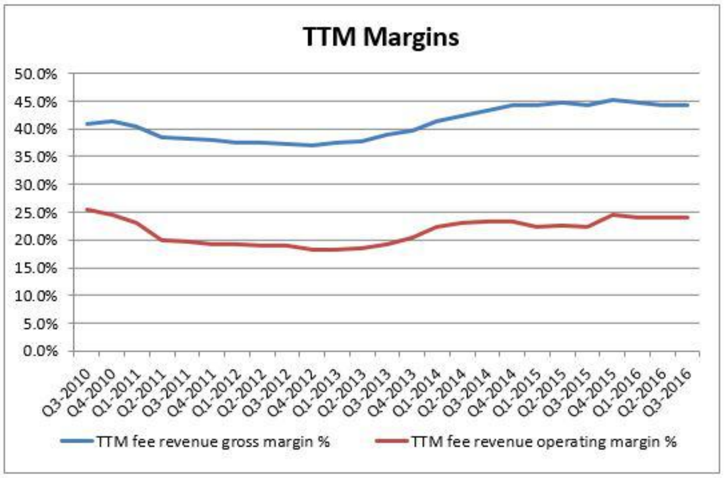
The Most Important Things

1) ***Closed Sales:*** This metric represents anticipated annual revenue for new client contracts signed during the period, and this revenue recurs at extremely high rates (98%+). Tracking closed sales gives us insight into future revenue trends, sales momentum, and market acceptance of the company's offerings.

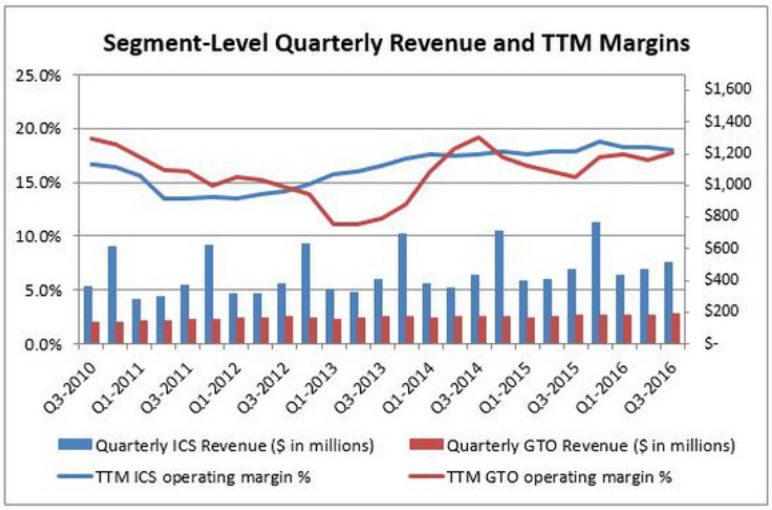
Lately, closed sales have taken a bit of a breather compared to Fiscal 2015, but that's in part because 2015 was an extraordinary year for closed sales. For year-to-date Fiscal 2016 (Q1, Q2, and Q3), the company has reported $94 million in closed sales, which is down about -13% compared to the first half of Fiscal 2015 ($108 million). But when we account for the difficult year-over-year comparison by comparing to the first three quarters of Fiscal 2014 (a 2-year "stack"), the two-year absolute growth comes in at 52% (a 23% CAGR). The three-year growth rate (comparing to Fiscal 2013) is similarly strong at 62% growth (a 17% CAGR).

The run-rate for closed sales for Fiscal 2016 implies full-year closed sales of $125 million, which is within the company's guidance range of $120-$160 million. Additionally, Fiscal Q4 is historically the strongest sales quarter of the year, so the company may have room to reach the high end of its guidance for closed sales by the end of the fiscal year (next quarter).

2) ***Fee Revenue Margin Performance:*** In order to track the true economics of the business, we look at gross and operating profits as a percentage of fee revenue, which ignores pass-through distribution revenue. And because of Broadridge's seasonality (related to annual filing deadlines for its customers) we prefer to look at trailing twelve months (TTM) margins to smooth out quarterly fluctuations. TTM fee revenue gross margins came in at 44.3% (up slightly from 44.2% a year ago), and TTM fee revenue operating margins came in at 24% (up from from 22.5% a year ago):



When looking at each individual segment - Investor Communications Solutions (ICS) and Global Technology Operations (GTO) - margins show a similar, albeit lumpier trend. This graph does a good job showing Broadridge's seasonality and historically strong Fiscal Q4s (note that it shows *quarterly* revenue compared to *TTM* margins):



We'll get a much better sense of how margins are trending after next quarter, historically the company's most important quarter from a sales and cash flow perspective. If the company can continue its performance in closed sales, generate healthy sales growth, and control costs (especially acquisition-related costs), then there may be room for continued margin expansion (especially in the ICS segment) as we finish Fiscal 2016 and enter Fiscal 2017.

3) ***Capital Allocation:*** Although Broadridge is a slow grower, it generates a lot of cash and has low reinvestment needs. Management has a very clear plan to put that cash to work: it targets a 45% payout ratio, and it plans on using incremental debt capacity to pick up the pace of acquisitions (targeting $400-$600 million between FY2015-FY2017) and share repurchases.

On the dividend front, the company has paid out $1.17 per share on a TTM basis, good for a 47% payout ratio and about a 2% yield on the current price. On the acquisition front, the company is making good progress -- the company has spent $218 million on five acquisitions (Direxxis, Wilmington Trust, Thomson Reuters Fiduciary Services and Competitive Intelligence unit, TwoFour Systems, and most recently QED Financial Systems) since its capital stewardship priority update in December 2014. The company has an excellent acquisition track record (a 20%-plus IRR since Fiscal 2007), and they expect acquisitions to account for about 2% of growth in recurring fee revenue out to Fiscal 2017. In the first three quarters of Fiscal 2016, the company has exceeded that goal -- acquisitions have accounted for 4% year-over-year growth in recurring fee revenue so far this year.

As for share repurchases, the company has bought back $97 million in shares at an average price of about $54 per share in the first three quarters of Fiscal 2016. As for debt, the company has added $131 million in debt during the first three quarters of Fiscal 2016 via its revolving credit facility, which has a variable interest rate of LIBOR plus 112.5 basis points (currently about 1.3%). This is consistent with the company's longer-term strategy to run the business at a debt-EBITDAR ratio of 2:1 (based on my calculations the company is currently at about 1.85:1).

What We Think Now

Increased regulation and a focus on productivity (doing more with fewer employees) will push financial firms and public companies to outsource more obscure but critical back- and middle-office tasks to Broadridge. We expect modest but reliable recurring revenue growth to translate to stout earnings and cash flow generation as Broadridge converts the investor communications industry to a more engaged and increasingly digital standard.

Re-Establish Your Diagonal Calls on American Tower

Published May 5, 2016 at 12:10PM

Is this for you? This recommendation is for all *Pro* members who have matched our 3.8% stock allocation in **American Tower** (NYSE: AMT) and **also** own January 2017 or 2018 calls, or are ready to buy them now. For new *Pro* members who do not yet own calls, please check out the guidance under "New *Pro* members" in the "How You Participate" section of this alert. Mind that we are only writing calls to cover our owned calls, **not** to cover our stock position. We recommend that you leave your stock allocation **uncovered** in order to capture further potential upside in American Tower.

How You Participate

- **Trade:** Sell to open June 10, 2016, $108 calls on American Tower. *Please note that these are **weekly** options.*
- **Allocation:** Sell one call for every January 2017 (or January 2018) $80 call you already own (or are buying now). *Pro* will cover its six long calls.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a limit order to split the bid/ask spread at going prices as long as you get at least a 4% yield on your long January 2017 or 2018 call value (see the math below). These weekly options are relatively thinly traded, so **it is critical that you use a limit order** to avoid collapsing the bid/ask spread.
- **Prices** (May 5):
  - **Stock price:** $106.50 (as of 12:00 p.m. 5/5/16)
  - **Sell to open June 10, 2016, $108 calls (bid/ask split):** $1.60
  - **January 2017 $80 calls we own (bid/ask split):** $27.25
  - **Diagonal call yield:** $1.60/$27.25 = 5.9% in 37 days.
- **New *Pro* members:** If you've yet to buy calls on American Tower, go ahead and set up the whole diagonal call trade today. Use a diagonal call order (sometimes referred to as a "calendar spread" order, depending on your broker), buying the **January 2018** $80 calls (rather than the 2017 calls *Pro* owns, in order to give your calls more time to expiration) and simultaneously selling the June 10, 2016, $108 calls to aim for a net debit of $27.25 or so. Invest about 0.6% of your funds in the long calls if you're matching our allocation.
- **Alternative Guidance:** If *Pro*'s volume results in a significant impact on the June 10, 2016, $108 call pricing, or if the stock price changes considerably from the price in this alert, consider looking at various other strikes or weekly expirations for your short call, depending on what you like best. If you choose this route, be aware that *Pro*'s course of action may diverge from yours, depending on what strike and expiration you choose, and depending on the stock-price movements of American Tower.

What We're Thinking

Since last Friday's thrilling conclusion to our first iteration of diagonal calls, we've analyzed American Tower's first-quarter 2016 results and have **updated our fair-value estimate to $120 per share** (from $115). Based on our updated evaluation of the business, we're content to keep our diagonal call position going, selling a new short-dated call to generate income and target further upside from our long-dated owned calls.

The rationale for this diagonal call is much the same as it was for the previous iteration. These new written calls could pay us 5.9% or so on our current long call's value in one month, and we have upside to the $108 strike price -- about 1.5% higher than the current price, which if reached would increase the value of our owned calls by about 5.5%. (This is an example of the leverage that owned calls provide!) If the stock price shoots well above our written call's strike price prior to expiration, we can roll our calls for further income (if the rolling trade looks attractive) while still capturing the full upside of the stock with our uncovered 3.8% stock allocation (currently our sixth largest).

Even if we assume that we will have to sell our long calls in a month when our written calls are assigned, the return on the long calls (including the income from the series of two diagonal calls) would be approximately 33%, well ahead of our North Star since our December 2014 purchase. Of course, we don't plan to close or sell unless we're forced to, so we'd look to roll our calls if we can, targeting further upside on our growing Buy First stock.

More That Matters

- **Maximum gain:** The 5.9% premium earned from writing the calls, plus upside in our owned calls to our short call strike price at $108, which is lately about 1.5% higher than the current price.
- **Maximum risk:** The full value of our long $80 calls, minus premiums received from short calls.
- **Follow-up**: We hope to see these short calls expire for income later this month, and then we will determine whether we want to write new calls. If we need to roll or close, we will.

American Tower Adds More Towers

Published May 5, 2016 at 12:10PM

What Happened?

- Q1 2016 press release
- Q1 2016 supplemental materials
- Q1 2016 earnings presentation

CEO Jim Taiclet:

> "The global proliferation of smartphones is driving significant growth in subscriber demand for higher-bandwidth applications. As a result, during the first quarter, we continued to experience solid leasing demand across our served markets as mobile operators invest in their networks to manage key performance factors, including coverage, capacity and peak network speed.
>
> "Additionally, in India, we recently closed our Viom transaction, the latest step in our strategic initiative to diversify our operations and further establish the Company as a leading global provider of communications real estate in key free-market democracies around the globe. We remain focused on pursuing disciplined investments like Viom as we aim to simultaneously increase return on invested capital and generate double-digit growth in both our AFFO per Share and dividend. We believe this strategy will drive compelling returns for stockholders over the long term."

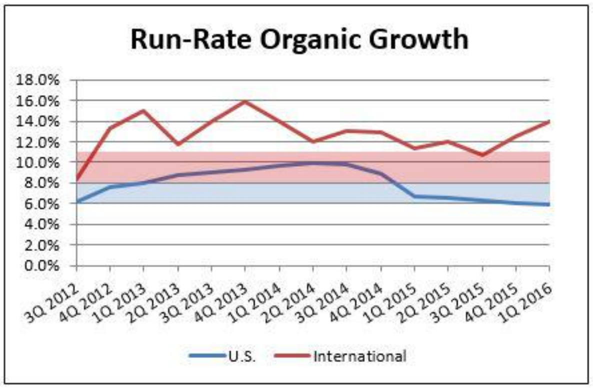
So What?

American Tower (NYSE: AMT) reported a very good first quarter for 2016, with solid organic core growth in revenue and good margin performance across the entire global asset base.

Organic core growth accelerated in both the U.S. and internationally, coming in at 7.1% and 13.2%, respectively (vs. 5.2% and 12.5% last quarter). Organic core growth in the U.S. was partially bolstered by the positive impact of $31 million of decommissioning revenue, compared with $17 million in the first quarter of last year.

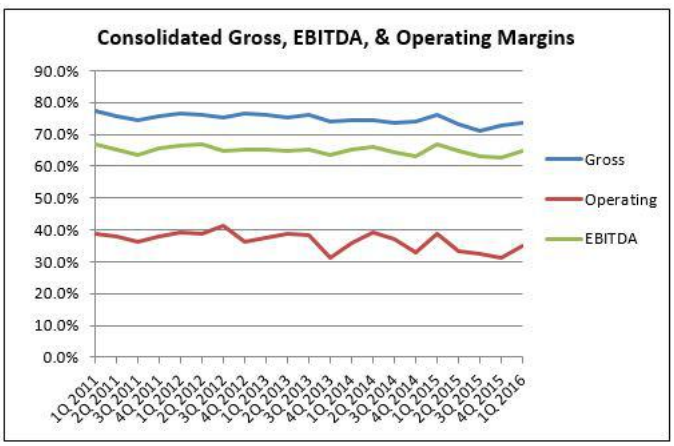
Because of the effects of these non-recurring decommissioning agreements, American Tower has started to disclose a new metric called **run-rate revenue**, which strips out timing-, currency-, and accounting-related effects and is the company's best guess on recurring revenue tied to long-term tenant lease agreements that should continue in the future. This new disclosure should help investors more accurately assess the key drivers of the company's revenue model. In the future, I'll be referring most often to run-rate revenue rather than "core" revenue.

On a run-rate basis, organic growth was 5.9% in the U.S. and 14% internationally. International run-rate organic growth was broad-based across all regions, up 12.7% in Asia (i.e., India); 16.1% in Europe, the Middle East, and Africa (EMEA, which includes Germany, Ghana, Nigeria, South Africa, and Uganda); and 13.6% in Latin America (which includes Brazil, Chile, Colombia, Costa Rica, Mexico, and Peru).



Note: Because this is a new disclosure, the data set is not complete. Where run-rate organic growth data was not available, I used organic core growth as a proxy. Shaded areas are management's target ranges.

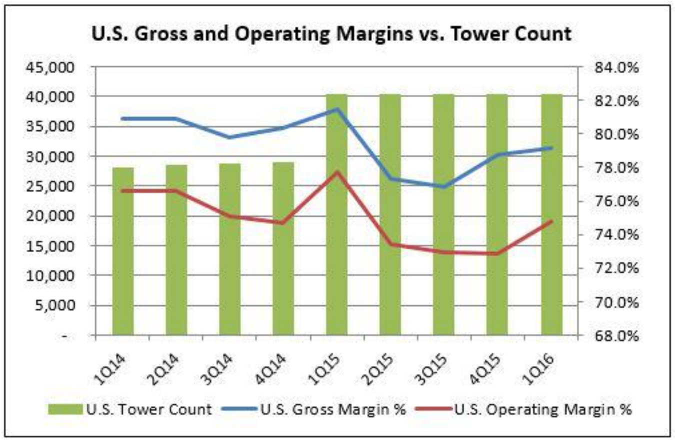
Margins increased sequentially in the quarter thanks to the strong organic growth, cost controls, and the continued integration and leasing of more than 25,000 low-tenancy sites built, leased, or acquired since the beginning of last year. These include newly acquired towers in the U.S. (acquired from Verizon), Nigeria (acquired from Airtel), and Brazil (acquired from TIM).



[Two quarters ago](), I mentioned that "we should see margins start to increase over the next six to 12 months and beyond as American Tower begins to work its way through its application pipeline for the under-utilized Verizon towers," and that's exactly what we're seeing. Management commentary on the call suggests the Verizon portfolio is tracking as expected:

> **CEO Taiclet:** "As to Verizon ... we have a 9% to 10% long-term sort of cumulative average growth rate expectation over 10 years for that portfolio and we still do. So every month or 2, it's not going to change, I can't imagine, materially. We're seeing new business on the sites. They're in really great shape as far as the carrier portfolio for capacity, ground space, the documentation I referred to earlier. So we're progressing through our plan and expect to be able to deliver what we've stated in the past."

U.S. gross margins increased sequentially to 79.1% (from 78.8% last quarter) and U.S. operating margins increased sequentially to 74.8% (from 72.8% last quarter), reflecting those trends:



Internationally, margins declined a bit sequentially as higher margins in EMEA and Latin America were offset by declining margins in Asia, related to the company's recent acquisition of the Viom portfolio in India:

According to management, the new assets in Asia will likely take about 12 to 18 months to become fully integrated. However, since the U.S. segment accounts for about 73% of companywide gross profit and 75% of companywide operating profit, the margin trajectory of the U.S. business will have a far greater impact on the company's near-term performance than the margin trajectory of the international business.

As for debt, the company's net leverage ratio came in at 5, in line with management's expectation of ending 2016 at 5 times leverage or below. The company has plenty of liquidity (more than $3 billion), and no significant debt maturations until 2018.

Yearly distribution growth continues to track ahead of management's 20% long-term growth target, coming in at 21% ($0.51 per share, a 1.9% forward yield on the current share price). Twenty-percent annual distribution growth continues to look like a more than reasonable target for 2016 and beyond.

Now What?

This quarter's report confirms that our investment thesis -- that global growth in data consumption will stimulate wireless carrier network investments, leading to strong tenancy growth and rising returns on capital over time -- is continuing to play out. The company's impressive operating history, excellent management, and strong competitive position in a growing industry give me confidence that American Tower will continue to increase revenue and cash flow at high rates for a long time, providing strong returns on capital (ROIC). Given the effects of the recently closed Viom acquisition in India, the company expects to end the year with nearly 150,000 sites worldwide (compared to just more than 100,000 sites as of this quarter's report), and acquisitions and incremental leasing activity should continue to drive revenue, cash flow, and ROIC higher over the long term:

Source: AMT Q1 2016 earnings presentation. 2016E reflects midpoint of 2016 outlook.

Data and Guidance

- Current Price: $105.43

- Fair-value estimate (**updated**): $120
- Allocation: 3.8% plus a 0.6% diagonal call allocation
- Market Cap: $45.1 billion
- EV/EBITDA (TTM): 19.5

AMT remains a Buy First, with an updated fair-value estimate of $120 per share and an allocation of 3.8% plus a 0.6% diagonal call allocation (see today's alert here for more details). If you've yet to start a position or haven't yet bought calls, now is as good a time as any to match us. The stock may experience volatility in the short term because of its tendency to trade alongside the interest rate-sensitive REIT sector, but over the long term, the underlying strength in business fundamentals should shine through.

Fool on!

Investment Thesis

Starbucks offers a unique blend of sales drivers (domestic and international growth, food and beverage innovation, and channel development, just to name a few) and cost-reduction opportunities (payment innovation, European restructuring, expansion of consumer product margins). We believe the coffee is just a gateway for the company to repeatedly sell customers an experience rooted in comfort, quality, health, community, and conscience. Consumers' emotional ties to this experience are key for Starbucks in expanding the reach of its brand into new products, new platforms, new times of day, and new brands. We expect new store openings across the globe to strengthen the company's brand and cost-based competitive advantages and improve profitability over time.

With a company as large as Starbucks, you might think there isn't much more room for growth. But you'd be wrong. As laid out during the company's 2015 Investor Day presentation, management believes that by the end of 2019, Starbucks will increase its store base to more than 30,000 global locations (up from more than 24,000 today), achieve $30 billion in annual revenue (up from $20.2 billion TTM), and double its annual operating income. Given the global strength of the Starbucks brand, we believe that this is definitely possible.

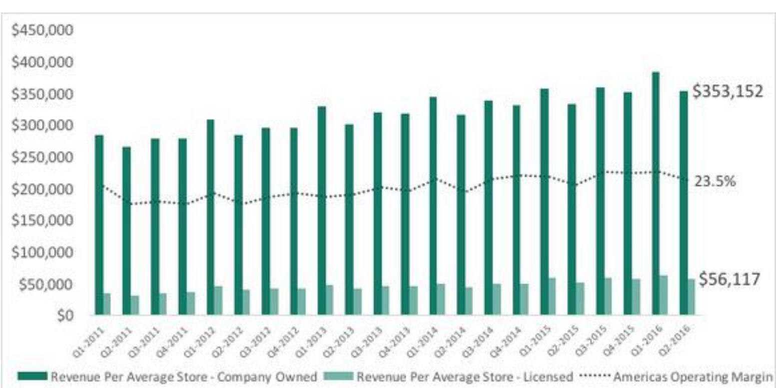
Americas

Here in the U.S., it appears as though the company is attempting to do two things: continue to solidify itself as a "third place" (as in "not home or work," not as in "coming in third") destination of choice for many, while also catering to those in search of convenience. We see both ventures as critical to the company's domestic success going forward, and as of right now, financial results would suggest that Starbucks is on the right track. Comparable-store sales growth was flat year over year and decelerated sequentially, but Starbucks remains a standout performer in the industry.

Source: Company filings

Food continues to be a big driver for the company, contributing two points to U.S. comparable-store sales and accounting for 20% of segment revenue for the first time ever. And both company-owned and licensed stores continue to perform well as the company exhibits operating leverage as it scales.



Source: Company filings, analyst estimates

China/Asia-Pacific

The headline numbers for this division may no longer look quite as impressive now that Starbucks Japan is fully included in the base figures for revenue and comparable-store sales, but the results were actually in line with our estimates. China revenue was up 18%, with the company's latest stores -- opening at a pace of about 10 per week -- continuing to set records for profitability and volume. The company is also hoping to roll out additional digital and loyalty features in China, and its partnership with Tingyi, which will provide more than 1 million points of ready-to-drink Frappuccino distribution in China, will begin in in the third quarter. John Culver, who is the group president of Starbucks Coffee China/Asia Pacific, Channel Development and Emerging Brands (that's a mouthful!), spoke to the size of the opportunity of the latter during the Q&A portion of the earnings call:

And the only thing I would add, Howard, to that is the fact that the single-serve business is really -- does not exist in China nor in Asia at any significant degree. So this is all white space. And as Howard said, we are truly the only global premium coffee brand, both in Japan, Korea, China or the rest of Asia, that's going to be able to leverage a retail footprint and an awareness and a trust level with our consumers on educating them about in-home consumption of single-serve coffee.

Europe, the Middle East, and Africa

Licensing income now accounts for more than 60% of total income for Starbucks' smallest operating segment. After adjusting for a continued shift from company-owned to licensed stores, as well as some foreign-exchange headwinds, the division recorded 7% adjusted revenue growth and system comp growth of 4%.

Channel Development/Consumer Packaged Goods

There's a lot to like about what Starbucks is doing with its second most profitable business segment. Revenue and operating income were up 8% and 17%, respectively, as the company continues to expand its lead in the U.S. market in both premium single-serve offerings and premium roasting grounds. Starbucks is also the leading brand on the K-Cup platform, with 16.3% market share that grew by 3 times the category average this quarter; it will likely post 20% annual growth this year. In this past quarter, the company also reworked and extended its relationship with Keurig. Starbucks now has greater flexibility in adding additional SKUs, as well as the opportunity to sell K-Cups directly into offices, food-service operations, colleges and universities, hotels, and convenience stores. Better yet, Starbucks also announced last month that it has entered into a relationship to bring its single-serve offerings to Nestle's Nespresso unit -- the leader in premium single-serve outside North America -- later this year. The rollout will start in Europe, where Starbucks estimates that single-serve represents more than 40% of all coffee consumed and that 50% of its "best" customers own a Nespresso machine at home.

Digital and Loyalty

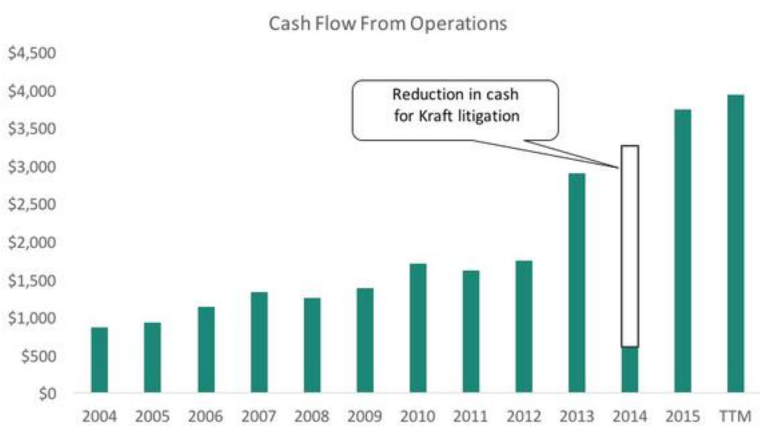
Coming out of the holiday quarter, My Starbucks Rewards (MSR) additions and money loaded to Starbucks cards didn't keep up with the impressive pace set in the second quarter of 2015, when these metrics were surpassingly even better than in the holiday quarter preceding them. This quarter, the company added approximately 1 million new MSR members here in the U.S.; that brings the total to more than 12 million, representing 50% growth over the past two years. And the company now has almost 19 million app users (a 90% increase over the past two years), with these users now accounting for 24% of all transactions here in the United States. The continued adoption of Starbucks mobile payment options, especially Mobile Order & Pay, will be key if the company hopes to continue to deliver strong U.S. comparable-store sales.

There was some initial pushback after the company modified its rewards program to favor its most loyal (read: highest-spending) customers, and certain media outlets reported that the company's customers were "rebelling." But so far, it seems like it was much ado about nothing. Management noted on the call that that rewards membership has accelerated recently, with an impressive 280,000 people signing up in the week prior to the report. We can see how the modification might discourage the frugal customer who was solely buying $1.85 cups of coffee to earn a free drink as cheaply as possible, but we believe the move will be a net positive for the company, as it ultimately rewards Starbucks' best customers and incentivizes spending more with the company. Management also recently announced that it will be partnering with JPMorgan Chase and Visa to create a Starbucks general-purpose prepaid debit card.

Individually, moves like this may not move the needle, but one shouldn't underestimate the company's push to make it possible for customers to earn "Stars Everywhere." The most successful consumer-facing companies are frequently those that are able to develop consumer behaviors that revolve around the company's offerings, and making it possible to earn stars for things other than visiting a Starbucks location does exactly that. Another example of this would be the company's move to introduce the MSR program in the grocery aisle. The company saw an 18% increase in the number of codes that were redeemed in this past quarter, and more than 2 million MSR members to date have redeemed more than 20 million codes from CPGs.

Valuation

From an operational standpoint, Starbucks has been doing extremely well. But, and I'm sorry to sound like a broken record yet again here, that performance doesn't come cheap. In order for the current share price to be justified, the company will likely need to expand its free cash flow at a mid-teens or higher rate over the next 10-plus years. Over the preceding 10, the company has easily eclipsed this, increasing cash flow from operations by 18%.



It'll be hard for Starbucks to maintain this type of growth going forward, but that's not to say that I don't believe it's possible. It's all about execution. We know that management is targeting 30,000 stores by 2020, which would require an increase in store count of about 1,500 per year at a minimum. Total stores increased by 1,677 in 2015, and management expects to open up around 1,800 stores this year. When it comes to rapidly growing companies, there's always a risk of expanding too quickly, but given the performance of Starbucks' recent new locations, this pace seems reasonable and puts that 30,000 number firmly in the company's sights. This means that if Starbucks is able to continue to find new locations that deliver cash-flow returns similar to those at its existing stores, keep capital expenditures in line with historical norms, and achieve global comps in the range of 5% or so, we should see the company report a free-cash-flow growth rate in the low teens over the next four years. These aren't easy targets, to be sure, but with the way Starbucks has excelled from an operational standpoint over the past few years, this is one of the last public companies I'd want to bet against.

Starbucks remains a Buy on our scorecard, and I'm increasing our fair-value estimate slightly, to $50, which would value the stock at 27 times 2016 earnings and 14.3 times EBITDA.

Hedge: Set Up a Second Put Ratio Spread on the SPDR SP 500

Published May 4, 2016 at 12:09PM

Is this for you? At *Pro*, we use hedges to target returns during a market decline. You don't need to hedge to succeed with *Pro*, but if you are at least 80% invested in stocks and *want* to hedge your market exposure, then consider following along. In addition to our other 10% SPY hedge, this additional 10% hedge will lower our market exposure -- if the market falls to our strike prices -- to about a net 55%. Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $185,000. We are leaving our current June 2016 SPY put ratio spread in place; this new spread is a *complement* to that, at lower strike prices in case the market falls further. Some new members have a slight variation of our first June spread from Catch-Up Trades; these members should keep that spread in place, as we are. Again, we want *two* June spreads in place after this alert is fulfilled, the original one with a $200 bought strike price, and this one with a $185 bought strike price. See our recommendations page to see these holdings listed in action.

How You Participate

- **Action:** Use a spread order to set up a put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
- **Allocation:** About 10% of your total portfolio value, measured on the look-through value of the $185 puts you're buying (each put represents $18,500 in hedge value). Set up one 2:1 put ratio spread for every $18,500-sized hedge you want; hedging about 9.7% of our entire portfolio of $2.48 million, *Pro* will sell 26 puts and buy 13 (because 13 puts at a $185 strike = $2,405 x 100 shares per contract = $240,500 look-through put value = 9.7% of our $2.48 million portfolio value).
- **Trade:**
  - **Use a ratio spread order to simultaneously ...**
    - Write ("sell to open") **two** June 17, 2016, $177 puts, and:
    - Buy ("buy to open") **one** June 17, 2016, $185 put. Click "view all" at your broker to see all strikes.
- **Price Guidance (prices as of 9:45 a.m.):**
  - Sell to open **two** June 17, 2016, $177 puts: Lately $0.37 x 2 = $0.74 credit
  - Buy to open **one** June 17, 2016, $185 puts: Lately $0.74 debit
  - **Net debit or credit:** Lately about **$0.00** per spread -- but this price will change. As it does, simply aim for no cost, a small credit, or a tiny debit, always using a limit order.
  - **SPY price:** $204.95
  - **Potential adjustment:** If SPY moves in price before you set up your trade, you may want to move one or both of your strike prices up or down accordingly -- as much as SPY has moved -- while still aiming for a net credit. After our mandatory 24-hour trade delay, we will make such an adjustment if need be, and tell you about it.

What We're Thinking

At *Pro*, we aim to have winners in down, flat, and positive markets -- and that means we need to address all three possibilities at once in our portfolio. Yet our portfolio remains oriented toward the long term and is majority invested in healthy stocks. A hedge on a market index is simply a hedge against a lower market while the rest of our stocks remain free to appreciate. We generally don't try to manage for market declines of 5% or less (that's standard volatility), but when *Pro* is functioning as desired, declines of about 7% or more should result in some of our positions, such as these spreads, becoming nicely profitable. At the same time, the put ratio spreads we use:

- Are harmless to us if the market goes higher (they don't ding our return)
- Are typically cash-free to set up (they often pay us a small credit -- essentially income!)
- Have a low probability of long-term loss

What's the trade-off? As with any written put, we need to be ready to buy the underlying investment; for today's position, that means we're prepared to buy into the S&P 500 index (through SPY) if the price falls below $177, or about 13.6%. If the index declines by more than 17.5%, this hedge becomes a liability, with SPY falling below our breakeven point. If that happens, we would plan to buy *long-term call options* on SPY instead of shares, saving most of our cash in the process. See below for details on that. We don't believe there's much probability of long-term loss because we believe SPY will recover.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2,484,000
- Ten percent of that value: $248,000
- June 17, 2016, spread:
  - Buy to open $185 puts. Thirteen contracts representing 100 shares each = $240,500 in look-through exposure, or about a 9.7% hedge on our current portfolio value, cash included.
  - Sell to open $177 puts -- 26 contracts, half of which are *not* covered by long puts and thus become a potential obligation at a net $169, currently an 8.9% possible stake.
  - At home, you would buy one $185 put and sell two $177 puts for every $18,500 in portfolio value you want to hedge.

Return Details

SPY Price at June 17, 2016, Expiration	Value of 1 Purchased June 17, 2016, $185 Put	Value of 2 Written June 17, 2016, $177 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Recent $204.95
$185 or higher	$0	$0	$0.00 gain per spread -- or any credit or debit for setting up the trade	No gain or loss on any increase in price, or any decline of less than 9.7% (because, remember, we have a spread that kicks in at $200, or only 2.3% lower; like a ladder trade, this one starts well below that first spread)
$182	$3 x 100 = $300	$0	$300	(11.2%)
$180	$5 x 100 = $500	$0	$500	(12.2%)
$177	**$8 x 100 = $800**	**$0**	**$800 (max profit per spread)**	**(13.6%)**
$172	$13 x 100 = $1,300	($5) x 200 = ($1,000)	$300	(16.1%)
$170	$15 x 100 = $1,500	($7) x 200 = ($1,400)	$100	(17.1%)
$169	**$16 x 100 = $1,600**	**($8) x 200 = ($1,600)**	**$0 (break-even)**	**(17.5%)**
$167	$18 x 100 = $1,800	($10) x 200 = ($2,000)	($200)	(18.5%)

SPY Price at June 17, 2016, Expiration	Value of 1 Purchased June 17, 2016, $185 Put	Value of 2 Written June 17, 2016, $177 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Recent $204.95
$165	$20 x 100 = $2,000	($12) x 200 = ($2,400)	($400)	(19.5%)

If SPY declines more than 9.7% from recent levels, making our other hedge profitable (albeit with a declining profit at that point), then this hedge starts to come into play. Our maximum profit is earned on the spread if SPY declines 13.6% from its recent level of $204.95 by our June expiration. The spread will help us a little on an index decline of as much as about 17%; deeper than that, and our short puts turn into an obligation that's in the red.

Follow-Up

Assuming we set this spread up for no cost, it costs us nothing even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $177 put obligation (starting with a net buy price of $169) if SPY is below $177 by expiration.

However, if that does happen, our plan would be to close our puts and buy long-term SPY calls (or something we like even better, whether calls or a stock) instead of buying the ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY shares. So, our potential 8.9% stake in SPY shares will only cost us about 2.2% of our cash if we buy calls instead. This is important, because we would also have an obligation at about $180 to buy more shares, thanks to our previously set up spread expiring the same day. We'll be happy to buy calls on the index at these depressed prices and still keep most of our cash available for other stock or call purchases. We would likely diagonalize those calls, after a rebound, for income.

How It Fits Into *Pro*

Pro hedges to lower our invested market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market can make a difference. We made $10,700 when our last put ratio spread closed in February. Even small gains add up over the years, especially after those gains on market declines are invested in good stocks. This hedge fits well with our goal of hedging in a cost-efficient way, one that doesn't work against us if the market rises. Plus, if offers us protection on a market drop greater than 10% or so. Our current spread loses its value around there (achieving its maximum profit on a smaller drop). These spreads do require regular upkeep, opening new positions as old ones expire, and they are time-sensitive, really only helping at or right near expiration.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:**
  - For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Assuming you already have our higher-strike ($200/$190) bear put spread set up from our Positioning Report, now use a spread order to set up a second one if you like. "Buy to open" June 17, 2016, $190 puts and "sell to open" *an equal number* of June 17, 2016, $180 puts. Recently, this will cost you about $0.63 ($63) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $10 ($1,000) per spread on a decline to $180 or any lower price, but you should be prepared to lose your whole $63 per spread if SPY doesn't decline enough by expiration. This is so far out-of-the money, you have to assume it will expire worthless. It's risk insurance.
- **To lower your market exposure while following our full official trade (and making the position possible in some IRAs):**
  - Set up the official put ratio spread as recommended, but also "buy to open" puts (with the same day of expiration) at a strike price *well below* $177. Buy *half as many* as the number of $177 puts you wrote. When you do so, all of your $177 puts will be "covered" -- half by your $185 puts, and half by the other puts you choose to buy at a much lower strike. Choose how much you want to pay to select your lower strike price to purchase. To us, the $169 strike or lower looks good, recently costing $0.20 or less. You will only need cash in your account to cover the difference between your two lowest strike prices (if you buy $169 puts, that's $8 per share), and your risk is capped, making this potentially IRA-friendly. This makes the total cost of your hedge about a $0.20 debit or less, with no risk beyond that, and it still has $8 in potential ending value.

Pro Can Help

- **Want to talk about SPY?** We have a discussion board for that.

Write Covered Calls on 3 Pro Stocks

Published May 4, 2016 at 11:42AM

Is this for you? This recommendation is for all *Pro* members who own at least 100 shares of the following stocks and who wouldn't mind potentially capping upside on the shares in return for near-term income.

How You Participate

- **Trade:** Sell to open June 17, 2016, covered calls on:
  - **WisdomTree Emerging Markets** (NYSEMKT: DGS) -- $38 calls
  - **Skyworks Solutions** (NASDAQ: SWKS) -- $70 calls
  - **Valmont Industries** (NYSE: VMI) -- $140 calls
- **Allocation:** Write ("sell to open") one call for every round lot of 100 shares of each stock you own. *Pro* will cover all the shares we can, leaving only an odd lot of 50 shares of DGS uncovered; combined, this represents another 7.5% of the portfolio being covered for income.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a limit order to split the bid/ask price spread on each option at going prices. This week, aim for about a 1.5% yield (that's option premium / current price of the stock) given about 1.5 months to expiration. As expiration gets closer, always aim for our usual 1% per month in income to expiration. These options are relatively thinly traded, so i**t is critical that you use a limit order**.
- **Prices** (11:15 a.m.)(as prices change, just divide the going option premium -- splitting the bid/ask pricing -- into the current share price to target around a 1.5% yield; you'll have to accept a bit less lately on VMI):
  - **WisdomTree Emerging Markets:** $37.30; June $38 call (bid/ask): $0.65/$0.85. So, $0.75 is a 2% yield on $37.30 in 44 days. You can accept a bit less if needed. Keep in mind, as the stock falls, the option can pay less and still yield what we wish on the stock price.

- **Skyworks Solutions:** $66; June 17 $70 call (bid/ask): $1.50/$1.65. So, $1.55 is a 2.3% yield on $66 in 44 days. Can accept a bit less if needed.
- **Valmont Industries:** $134; June $140 calls (bid/ask): $1.60/$2.00. So, $1.80 pays 1.3% in 44 days. This is a bit lower than wished, but necessary now as the stock has fallen this morning. We'll accept this income or close to it.

What We're Thinking

After a flat 2015, the S&P 500 is essentially flat so far this year, too, meaning an investor needs to work harder to make returns. That's especially true when you consider the Nasdaq Composite is down more than 5% this year; who among us doesn't own many Nasdaq-listed stocks? The *Pro* portfolio is about flat so far this year, too, so we're considering various reasonable ways to increase our gains, including new longs and shorts. One other great possible way to increase returns is to write, and manage, more options. With these three covered-call options expiring in 44 days, we're targeting about 1.5% in income on each position (and more than that combined, right now). After our June expiration, we may keep income trades going much longer on these targets and others, and roll these options higher if need be.

WisdomTree Emerging Markets (DGS), 1.7% stock allocation

We're writing covered calls on 1,100 of our 1,150 shares, looking to generate more income returns on this index-based ETF from here forward -- unless we have reason to believe emerging markets are about to soar. The options have $1-increment strike prices, which helps make it easier to roll them, and the near-the-money options pay more than our desired 1%-per-month yield. We do need to be ready to roll higher in case the ETF rises in price, but that should not be too difficult. Also, if we lose our shares, we're not that concerned. Assuming we still want exposure to emerging markets, we can turn around and write puts or simply buy new shares. An index should not rise too much, too fast. We have a loss so far, so tax consequences are minimal.

Emerging-market stocks have recovered a bit this year, up about 6% year-to-date. But catalysts for additional gains appear muted in the near term, with relatively tepid economic data coming from China and oil and other commodity prices depressed. Rather than sell our emerging-market exposure, we're hoping we can earn a North Star-like return using options on it for now.

Skyworks Solutions (SWKS), 3.2% stock allocation

Among these three, Skyworks is the one I'm least enthusiastic to cover, but the scales still tip toward covering it for the next six weeks. Along with **Apple** (NASDAQ: AAPL), analog semiconductor producer Skyworks is in its trough quarter for the year, and it's unlikely that catalysts exist for rapid price appreciation over the coming weeks (famous last words!). If Skyworks *does* shoot skyward, we should be able to roll our covered calls higher fairly easily, given strike-price increments of $2.50 per share and decent premiums. It's a great company and business, but Wall Street still relegates Skyworks to the semiconductor industry, so its stock is likely to remain volatile; we should be able to monetize it further by managing options on it periodically. The business remains healthy and profitable. The only big headwind right now is the iPhone sales slowdown at Apple, its largest customer.

Valmont Industries (VMI), 2.2% stock allocation

Our irrigation-system and steel engineering product company has enjoyed a resurgence in price after its recent quarter showed higher profits on cost-cutting. But management doesn't expect real improvement in its business lines in the foreseeable future. As expertly managed as Valmont is, we might be able to write calls on it consistently, especially between earnings reports, to derive a better return from our investment in these slow-growth (right now) industrial industries (no, that is not redundant!). The stock trades at about 21 times expected earnings for 2016.

Summary

Given *Pro*'s goal of earning monthly income by writing options, our hope is that these three in aggregate will result in additional income in June, and then we'll go from there. If you don't own 100 shares of each, don't sweat it. The income is nice, but owning good, dividend-paying stocks like these should benefit you well over the years, even if you can't write options on them to target near-term gains, too.

More That Matters

- **Maximum gain:** In each case, the stock's upside is capped at our call strike price, and the maximum gain on the covered call is the premium it pays us.
- **Maximum risk:** The full stock value, minus the call premium received.
- **Follow-up**: We hope to see these covered calls expire for income, and then decide our next course of action. If we need, we may roll them higher. Anticipating new buys elsehwere, or the abillity to write puts on these three stocks, we are also content to let our shares get sold if it comes to that.

Options Can Help

- **Want to know more about this strategy?** Our Options U guides to writing covered calls and rolling covered calls can help.
- **Questions about this trade?** To ask particular questions about any of these, please visit either the DGS board, or SWKS board, or VMI board.

What Markets May Come

Published May 2, 2016 at 3:24PM

Fellow Fools,

Positive returns over every rolling three-year period, with the aim of doubling our real purchasing power every 10 years: With such a lofty objective, no one can ever accuse us here at *Pro* of choosing a low hurdle to make our lives easier. Regardless of what the market is doing, our North Star will continue to inch higher, which means that if we want to stand any chance of achieving our objective, it's critical that we post a high batting average (accuracy is our first *Pro* Principle, after all).

There is also a psychological appeal to having a high investing batting average, given that it's all too easy to spend too much time worrying about your losers. Why? Well, as Shawn Anchor notes in his book *Before Happiness*, research has found that our brains are essentially hard-wired to devote more attention to the negative aspects of our lives and respond faster to threats than to good news. If you think about it from an evolutionary standpoint, this makes perfect sense. For most of our species' history, being paranoid was an advantage; it increased your odds of living to see another day. We may no longer have to worry about being a tiger's next meal, but we can still see the effects of this tendency on a daily basis — it's the reason we remember our losers more vividly than our winners, and why we often feel the urge to do something whenever a position starts to go against us.

But despite this psychological appeal and our *Pro* principle of accuracy, there are actually positions in our portfolio that we don't mind seeing in the red. In fact, you could even say there are times we outright *enjoy* seeing certain positions move down. Confused? The key here is the need to look at your portfolio as a, well, portfolio. There are a select few investors in the world who will be able to achieve their financial objectives with the performance of one or two stocks. For the rest of us, it's the performance of our entire portfolio that will determine whether our time spent investing is ultimately a success.

Nobody knows what the future will hold, in the market or elsewhere. In fact, University of Pennsylvania researcher Phil Tetlock found an inverse relationship between the accuracy of an expert's predictions and his or her self-confidence -- keep that in mind the next time you hear or read a pundit weaving a compelling narrative about the actions you need to take because of what the market will do over the next month or two! But as I mentioned, there is one thing we do know here in *Pro*: Our North Star benchmark will continue to push higher over time. This means that if we want to stand a chance of meeting our mandate, we need to construct a *Pro* portfolio that takes into account the wide range of potential outcomes for the market. We can't just sit around and hope the market cooperates over the next three years. This is where our hedges and shorts come into play.

Hedges are designed to deliver profits when the markets are falling, helping soften the blow of lost value in our long positions and providing us with cash we can then use to pick up additional shares of any favorite stocks that might have been unfairly punished during the selloff. That said, though we may feel smart whenever our hedges work out, we're actually better served when they don't, because our long positions vastly outweigh our hedges and shorts. We've recently tried to limit the amount of drag hedges can have on our portfolio by using low-cost option spreads, but the fact remains that it's almost always a good thing when our hedges don't work out, because it means the market (and our long positions) are moving higher.

But what about shorts, you say? To be sure, we aim to only short stocks that we expect to deliver absolute returns during the life of our position. But shorts do serve multiple purposes in our portfolio. As Jeff noted in a Memo from last April:

> 1. Our company shorts also serve as market hedges, as a majority of stocks move together. In a down market, our basket of shorts should benefit the portfolio in most cases. While we wait, ideally our short basket is less costly than shorting the market index would have been. And if we're really good, our shorts in aggregate will fall even in a rising market.
>
> 2. Having a basket of carefully chosen shorts increases our short exposure, which allows us to increase our long exposure. This way we can own more great companies for the long haul while staying true to our absolute-returns goal.

Just as is the case with our hedges, it's hard for us to be too upset when a short position is in the red because the overall market is moving higher. For example, our latest direct short, **Deere** (NYSE: DE), is currently down 13%. But over the same time frame, the S&P 500 is up 9.3%, meaning that our position has currently delivered a negative alpha of just 3.7% -- a percentage that really isn't worth losing sleep over, given that the stock fell 4.2% the last time it reported earnings. We also mentioned in our write-up that shorting Deere made us far more likely to keep our position in **Valmont Industries** (NYSE: VMI), a move that has worked out even better than we expected: Valmont's stock has risen by more than 37% since we published our trade alert on Deere.

Every time we reopen our doors, we find that many of our newest members are eager to jump straight into our hedging and short recommendations after signing up. Before you do so, it's imperative that you establish the proper mindset with these positions. To quote Jeff once again (this time from a conversation between us):

> Anyone hedging -- but also shorting -- has to expect the positions to usually work against them when the market rises. That's why they're called hedges and shorts. They're expected to help you when the market falls. Shorting is difficult even in a flat market, let alone a rising one. That's why most of our future is riding on our longs, and our shorts and hedges are just a small form of insurance against larger-than-average market declines. We want our shorts to all work out, but a strong market can overwhelm a strong short thesis -- a rising tide even lifts the boats with small leaks. So keep your shorts and hedges in context. Don't expect gains from them, usually, during a rebounding market.

It's only natural to want to win when it comes to investing. But when you're managing a portfolio like a *Pro*, it's important that you never forget there are actually instances where not only is it OK to lose -- it's actually beneficial.

Best,

JP

***Pro* Completed Trades**

- **American Tower** (NYSE: AMT): We bought to close our April 29, 2016, $105 diagonal calls for $0.10 on Friday, keeping most of the premium as income. We of course still own our long-term calls on AMT.

Pro Catch-Up Trades: May 2, 2016

Published May 2, 2016 at 3:08PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our Portfolio Building Reports will get you fully invested over the coming few weeks, as much as you want to be.

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Broadridge Financial Services** (NYSE: BR): Buy our 5.1% allocation, at once or in halves if you like.
- **Facebook** (NASDAQ: FB): Buy our 6.6% allocation, in halves if you prefer.
- **MasterCard** (NYSE: MA): Buy up to our 4.7% allocation.

Continue building your portfolio with our Buys, including these highlighted today:

- **Apple** (NASDAQ: AAPL): Buy 3.3% in stock.
- **Gilead Sciences** (NASDAQ: GILD): Buy 3.2% in stock.
- **Medtronic** (NYSE: MDT): Buy 3.2% in stock.
- **Skyworks Solutions** (NASDAQ: SWKS): Buy 3.2% in stock. Keep in mind that Apple is Skyworks' largest customer, and the stocks move together much of the time. We're comfortable with a 6.5% combined allocation to these two mobile computing leaders.
- **Parexel International** (NASDAQ: PRXL): Buy 3.2% in stock.

Options:

- No existing ones right now to jump on. Expect new trade alerts for all members soon.

Hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): We plan to issue a new hedge alert soon. Meanwhile, our June put ratio spread can be set up for no cost if you move your lower strike price up. So, you would sell to open two June 17, 2016, $193 puts for every one June 17, 2016, $200 put you buy. Each $200 put represents a $20,000 short of SPY. Use the trade alert for allocation guidance (again, simply adjusting your lower strike to $193, and still paying nothing to set up each spread). We expect a new, second hedge trade to be issued to all members soon, to complement this existing hedge.

The Extraordinary Power of Compound Returns

Published May 2, 2016 at 10:25AM

A few years ago, Warren Buffett went on CNBC to talk about the stock market. An interviewer asked about the market hitting new milestones — the Dow had just crossed 15,000, and currently trades at about 18,000 — to which Buffett offered a memorable response: "I can remember when the Dow crossed 100."

The CNBC crew sat in stunned disbelief. I remember doing the same. As I write this, the Dow is down about 100 points, which is an unmentionable blip. But the entire index was worth 100 points within Buffett's lifetime. And he's not Methuselah. The Dow traded last below 100 on May 26, 1942. Buffett was 11. A not-insignificant number of Motley Fool members were around to see it as well.

The thought of the Dow trading at 100 blows our minds because, as physicist Albert Bartlett put it, "the greatest shortcoming of the human race is our inability to understand the exponential function." The power of compound returns is so strong it's almost too hard to comprehend.

The Dow rising from 100 to 18,000 in 74 years equates to 7.2% average annual growth, which is in fact below the market's historic average. Growing by 7.2% for another 74 years would leave the Dow just north of 3,000,000 — yes, three million — which astounds me more than the thought of it at 100. A 9% annual growth rate, which is closer to average, means the Dow could be closing in on 10,000,000 by the time my son retires. Plus dividends.

These aren't forecasts, and 75-year extrapolations would only be relevant to pre-kindergartners. But our difficulty comprehending the power of compound growth means realistic calculations lead to mind-bending conclusions.

Apple (NASDAQ: AAPL) is the largest public company in the world, with a market cap of $579 billion. The idea of a company worth half a trillion dollars would have seemed preposterous 20 or 30 years ago; the entire country's GDP didn't surpass $500 billion until 1958, and the largest company in 1980 was **IBM** (NYSE: IBM), worth $39 billion. The largest company growing from $39 billion to $579 billion over 36 years is a 7.8% annual growth rate, which seems quite reasonable. Repeating the performance would mean that 36 years from now, the world's largest company will be worth something close to $9 trillion.This sounds absurd, but so did the idea of a $579 billion company 36 years ago.

Wal-Mart (NYSE: WMT) does $480 billion a year in revenue. A conservative growth rate of 5% a year would mean it (or perhaps an upcoming competitor) will do something like $2 trillion a year in sales within 30 years. That's equal to the current GDP of Russia.
The median American household earns $52,000 a year. For the last century, Americans have increased their productivity (the main driver of economic growth) by an average of 1.8% a year. Similar growth over the next 30 years would lead to median household income of more than $85,000 a year, adjusted for inflation, which is an amount that today would put you in the 94th percentile. Not all productivity growth may accrue to the median household — most economic growth goes to a small number of people, which explains income inequality — but real growth of just 1% a year would allow a median household to earn $70,000 in 30 years, and $82,000 in 50 years, adjusted for inflation. Put differently, the median household when my son is an adult will likely be richer than the top 2% of households were when his grandparents entered the workforce.

U.S. GDP is currently $18 trillion. If the economy grows at the same rate over the next 50 years as it did in the previous 50 — no sure thing, but hardly unreasonable — GDP will rise to half a quadrillion dollars a year within my own life expectancy, and $10 quadrillion within a century.

Again, these aren't forecasts, particularly on the timing. The power of compounding returns means tiny differences in annual gains grow into extraordinary differences over time, which makes predictions all the more difficult.

But in the context of reasonable future goals, compound returns can make your current fears seem minuscule, even irrelevant. A few days after the Dow crossed 100 in 1942, it fell 2.9%, from 106 to 103. This three-point move was a big deal at the time. It's the kind of stuff we'd have special reports for on the nightly news. But three points is 0.01% of today's market — utterly negligible.

To take a more recent example, the Crash of 1987 was one of the biggest market events in history. Every finance textbook talks about it. The Dow fell 508 points during the crash, which was extraordinary back then. But it's roughly the same amount the Dow has gained ... in the past nine days.

A Potential Trade on Your Diagonal Call on American Tower

Published Apr 28, 2016 at 1:19PM

Is this for you? This is for all *Pro* members who wrote April 29, 2016, $105 diagonal calls on **American Tower** (NYSE: AMT). If you're a new *Pro* member and you have yet to establish a diagonal call position on American Tower, please ignore this particular alert. If and/or when *Pro* decides to re-establish its diagonal call position after the company reports earnings tomorrow (Friday), new members can join in at that time, when we issue a *new* trade alert instructing you how to do so (likely next week, if we're going to). Remember that all members should already own an unencumbered 3.7% stock allocation to American Tower, so if you have yet to establish the diagonal call, you should still have exposure to the stock's upside.

How You Participate

- **Condition:** If American Tower's stock price is above $105 as Friday's market session nears its close, buy to close your $105 calls. (Leave your owned 2017 or 2018 calls alone. We will keep owning those.)
  - **Trade:** Buy to close your April 29, 2016, $105 written calls.
- **Allocation:** Buy every April 29, 2016, $105 call you previously sold.
  - **Price Guidance:** Use a **limit order** and aim to pay as little time value as possible, but realize you need to close these calls on Friday if the stock is above $105. As of today, since American Tower reports earnings tomorrow, the calls still have about $1 or so in time value that you'll have to pay if you wish to close them. It's more logical to wait until after earnings tomorrow morning, and see where things stand. If the stock is below $105 by the end of Friday, we can let the calls expire as income, doing nothing with them.

- **Prices** (12:30 p.m. ET):
  - Stock: $105.15
  - April 29, 2016, $105 calls (bid/ask): $1.15/$1.30 (by tomorrow this value should be lower, unless of course the stock goes above $105 by more than this amount).
- **Follow-Up:** We're not issuing a rolling trade alert today because rolling may not be possible (and we can't foresee future prices tomorrow -- sorry!); instead, we're waiting until our existing calls are closed before we consider writing new calls on this stock. This will probably be next week or the following week, after we've analyzed Friday's earnings.

What We're Thinking

Since our April 29, 2016, $105 written diagonal calls on American Tower expire on the same day that the company releases earnings, we need to address what to do with our calls if the stock stays above our strike price on expiration day. Since *Pro* itself must wait a day before taking action on its recommendations, we have to issue this alert today if we want to act tomorrow. So here it is.

If luck shines on us, American Tower's stock will be modestly below $105 tomorrow and our written diagonal calls will expire fully as income. If not, and the stock looks like it will end the day above $105, we'll need to take action as detailed above in order to maintain our desired position. We'll buy to close our $105 calls in that case tomorrow, and then reassess the position for a few days, while keeping our 2017 long calls.

How This Trade Fits Into *Pro*

Unless American Tower's stock price declines significantly after the company's earnings report, we're likely to initiate another diagonal call for income before long, again targeting income in between earnings reports (that didn't pan out perfectly this time because AMT chose to announce earnings on Friday rather than in early May, as it often has in years past). We don't want to sell our long call just yet (the underlying stock is rated Buy First on our scorecard), because we see more long-term potential in the business.

Portfolio Positioning Report: April 27, 2016

Published Apr 27, 2016 at 12:06PM

Welcome | Shorting in Short | Hedging ... in Short | Your Exposure | This Stuff Is Optional
Options Are Optional, Too — but Advised! | About This Report
The Positions Themselves (Shorts, Hedge, Options, All the Rest)

Join our live event at 2 p.m. May 4

Dear *Pro* Member,

Our first three Portfolio Building Reports provided you guidance on all of *Pro*'s Buy First and Buy stocks. This final report will do the same for our active short and option positions, many of which we use as hedges. For reasons we'll explain, we don't expect that many of you will initiate all of the positions in this report right away, or perhaps at all. And that's perfectly fine!

Hedging is about lowering your exposure to the risks of the market; to a lesser extent, shorting is as well. These additional investment tools tweak or adjust the risk profile of your *existing* portfolio, so if you're still building your collection of long-term stocks, concentrate on that for now. Stock investments are the core of the *Pro* portfolio, and by owning *Pro* stocks, you are positioned to compound your value over time. We know there's a learning curve for strategies that are new to you, so it's important you know there's no rush; you can incorporate the positions in this report when you're ready. We're here for you in the meantime.

Before explaining these positions, let's review how each strategy works. We'll begin with shorts — a sort of "anti-investment" that we believe will decline in value, adding profits to our portfolio in the process.

Shorting in Short

When you sell something short, you borrow shares of a company or an ETF from your broker and immediately sell them, collecting the proceeds. At various brokers, this trade action is called "sell short," "sell to open," or just "sell." In the future, you'll need to buy the same number of shares back to replace the ones you borrowed and sold. This second step is called "cover," "buy to cover," or "buy to close." You hope to buy the shares back at a *lower price* than when you opened the position. You profit directly on the position if you are able to close it at a price that's advantageous to you.

The difference between your original sell — or short — price and the price you later pay to buy back (and return) the borrowed shares is your profit. If you short a stock at $20 and buy it back later at $10, you've made $10 per share in profit. However, if the stock rises to $30, you've lost $10 per share when you buy it back. We use shorts in *Pro* because they're one way to profit when the market or a company falls, but they come with their own risks — shares can be hard to borrow, fees are often involved, and a short can get closed on you (you're forced to buy it back) if the broker wants the shares back early. So, we need to size our short positions appropriately small.

Hedging ... in Short

A hedge is similar to a short because it gains value when prices fall, but it's different in intent; these positions are taken to *offset* the risk we have in another position or in our market exposure as a whole. So, when we sell short (or use bearish options on) a market-index proxy like the **SPDR S&P 500** (NYSEMKT: SPY) ETF, we are hedging our exposure to the stock market as a whole. A hedge is a form of insurance; it only pays out when you need it, and usually it won't make money. We *know* a market-index hedge will go up in value whenever the market goes down — and that's nice to know. But most times, the market won't fall (or won't fall enough), and our hedge will go unused.

For this reason, we try to spend very little to hedge, but there are sometimes still costs. We have to reconcile this with the fact that hedging lets us stay *more* invested than we otherwise would, given our goal of absolute positive returns. In other words, one key way we profit from our hedges is by using them to help us keep our long stock exposure higher! As with shorting, you should only hedge if you have specific stock market exposure you want to "hedge out." Recently, *Pro* issued a new market hedge using options on the SPDR S&P 500. Tweaked a bit for today (see below!), that is our current market-hedge recommendation for anyone who wants to hedge out 10% of their long exposure, as we are doing (bringing *Pro* right now to about 65% net long).

Your Exposure

To know whether hedging is for you, it's helpful to think about your stock market exposure. This is simply how much of your total portfolio is invested in long stocks. Excluding options and shorts, *Pro* is about 80% invested in long stocks as we work through quarter one earnings. That's high for an absolute-return portfolio (which is part of why we want to short and hedge!). And like many members, you may own other stocks beyond *Pro*'s, so if you've bought all of our stocks, you might be even more exposed to market risk than we are. We're hedging the *Pro* portfolio down to about 70% market exposure with our SPY hedge (other shorts make up the other 5%, bringing us to the aforementioned 65%), and you could (but do not need to) do the same.

The bottom line is: As you consider adding hedges and shorts to your portfolio, first know how much of your portfolio's assets are invested in stocks. That helps dictate how much shorting or hedging you want to initiate to reach the *net* market exposure you desire. *Pro* has averaged about 73% net long exposure since January 2012, but that number will move up and down as our opportunities change. Our exposure is always shown at the bottom right of the Recommendations page. For many years, I've found that about 72% market exposure, along with the use of options, can be enough to earn strong returns with less risk. The past is no promise of future returns, but we're aiming to continue that success.

This Stuff Is Optional

Not every *Pro* member is comfortable with shorting or hedging, and there are practical considerations to take into account as well. First, you need a margin account to sell short, so (unless you use options to go bearish) you can't do it in an IRA. Second, you have to accept that shorts can run strongly against you, so you need cash to cover that risk. Third, you'll usually pay an annualized fee of anywhere from 1% to 5% of the short's daily value to short something. Fourth, in many cases it's hard to borrow shares to short, period. That is the situation with some of our shorts today. Finally, short shares can be bought away from you at the worst time, when they're up in price (a "forced buy-in"). If brokers can no longer find shares to borrow, you're forced to "buy in" at market prices to return your borrowed shares.

So what to do? You can use options to short in some cases -- we do, and we explain how to do so wherever appropriate. You can also consider opening a brokerage account that is particularly friendly to shorting. Interactive Brokers consistently has shares available for shorting; TD Ameritrade often does, and does not charge a fee for shorting. You could also wait and see whether shares become available in your existing, traditional brokerage account, though note that at many brokers, certain shares are basically never available for shorting. Or, if you're not drawn to it, you don't need to short at all.

Options Are Optional, Too — but Advised!

Our options positions are also ... optional, but we strongly advocate learning to use options and following along with ours over time. Options are powerful tools for income, hedging, greater upside, and more. We know from experience they're well worth the time it takes to learn them, and we're here to help you. Options can make you a much more confident and versatile investor, and they can generate a whole new stream of income for you and your family. So, if you're new to using options, you're in a great place! Use *Motley Fool Pro* and our sister service, *Motley Fool Options* (free for the life of your *Pro* membership!), to learn how to use these great tools. On a personal note, if you're going to learn just one simple strategy, I suggest learning how to write puts (link goes to *Motley Fool Options*) for income or to buy a stock lower.

About This Report

Let's return to the main show. This Portfolio Positioning Report and the special live event and Q&A following it on May 4, will (when you're ready!) help you short vehicles we believe will decline; teach you how to hedge your portfolio; and start to generate returns from options. But keep in mind that this is just a start; we'll have many *brand-new* investment recommendations arriving to your inbox as we move forward together, and we'll walk you through them as they're announced in the coming days and weeks. So, if this leaves you wanting more, know that more is on the way!

On the other hand, if this looks overwhelming right now — or if you're still catching up with our core stock positions — that's perfectly fine. You don't need to start these positions now. As mentioned, long positions are the core of the *Pro* portfolio, and our shorts, hedges, and options — while useful and often rewarding — aren't necessary to succeed with *Pro* in the long term, let alone immediately. As you learn these strategies and progress with us, just keep your exposure to the stock market in mind.

In closing, I'll stress again that you shouldn't feel pressured to act immediately. We will continue to make recommendations on an ongoing basis, including in our Monday Catch-Up Trades — and as brand-new opportunities emerge. That's part of the fun! So take your time, and make an investment only when you're ready. Finally, please bring any questions to our Making *Pro* Fit You discussion board.

Foolishly,

— Jeff Fischer, *Pro* advisor

The Positions Themselves

Shorts

- Deere & Company (NYSE: DE)
- Direxion Daily Financial Bear 3X Shares ETF (NYSEMKT: FAZ)

Hedge

- SPDR S&P 500 (NYSEMKT: SPY)

Options

- American Tower (NYSE: AMT)

All the Rest (On Hold)

- Caesars Entertainment (NASDAQ: CZR) short
- CurrencyShares Euro Trust (NYSEMKT: FXE) short
- American Airlines (NASDAQ: AAL) calls
- Expeditors International (NASDAQ: EXPD) strangle
- Gentex (NASDAQ: GNTX) short puts
- ProShares UltraShort Real Estate (NYSEMKT: SRS) short
- Wells Fargo (NYSE: WFC) short puts

Shorts

Deere & Company (NYSE: DE): Sell Short

The farm equipment giant just ended a cycle of tremendous sales growth, and now we believe air is coming out of the tires.

Suggested Short Allocation: 2% to match us
(and this assumes you own about 2% in *Pro* stock **Valmont Industries** (NYSE: VMI)

How It Fits Into *Pro*

For More

- *Pro*'s recommendation history
- Talk about DE on our discussion board

We recently sold short shares of Deere & Company because we believe investors are currently overestimating the true normalized earnings power for this farm equipment manufacturer. As JP writes in our recent report, the latest agricultural "super cycle" gave rise to what we believe was an unsustainable increase in farm equipment sales. If we're right, this has positioned John Deere, the world's leading manufacturer of agricultural and forestry equipment, to report disappointing results going forward as the industry works its way back toward equilibrium.

But this short also serves another purpose – it's a low-cost macro hedge that reduces the impact on our portfolio of potential adverse developments in commodities, the U.S. economy, the global economy (both developed and emerging markets), and currency exchange rates. And given Deere's large book of financing receivables (debt owed to it), the stock also serves as a small counterbalance to our sizable exposure to the financial industry. Finally, it directly hedges our 2% long position in Valmont Industries, which also sells farm equipment, namely irrigation machines.

Availability

Interactive Brokers has 6.4 million shares available for shorting as of April 26 – so that should be enough for anyone here, wink wink. The annual fee to short is about 0.5%. Most all brokers should have Deere shares readily available for shorting. Just be ready to lose money on this short/hedge hybrid if Deere runs against us. It's far from a fly-by-night operation. As long as Valmont goes up more than Deere (and so far it has), then this "paired trade" is making us money.

Direxion Daily Financial Bear 3X Shares ETF (NYSEMKT: FAZ): Sell Short

Daily leverage keeps steady downward pressure on this bearish ETF that we're short.

Suggested Short Allocation: 0.3% to 0.6% (we are currently short only 0.3%,
as the position has shrunk nicely, but we may add to it opportunistically)

How It Fits Into *Pro*

For More

- *Pro*'s recommendation history
- Talk about FAZ on our discussion board

This bearish ETF is meant to provide 3 times (300%) the daily *inverse* results of the Russell 1000 Financial Services Index, which measures the performance of the U.S. large-cap financial services sector. By shorting this ETF, we're effectively 3 times long, on a daily basis, the U.S. large-cap financial sector, which includes the likes of *Pro* holdings **Wells Fargo** (NYSE: WFC) and **Visa** (NYSE: V).

Leveraged, inverse ETFs like this one are flawed because they rebalance their derivative positions daily in order to maintain a constant exposure. Over long holding periods, the costs involved with rebalancing eat away at returns, keeping downward pressure on the vehicle as a whole. Also, returns are compounded daily, which adds to tracking errors. As our original buy report details, we continue to believe that large-cap U.S. financials are inexpensively priced — and we own several of them as a result. That belief makes shorting this flawed bearish financial ETF all the more attractive.

That said, shorting FAZ has become difficult over the years, and our position size has dwindled severely. We lately have a 78% profit on our short! But similar profits should keep coming over the long haul -- like us, any newcomer to a short can make up to 100% on the short, and no more. So, new short sellers like you are in a fine position as this inverse, short, leveraged ETF can keep going down. That said, new members can skip this position if shorting it proves difficult, or use options instead (see the Alternative Trade below) if you have a six-figure account. We own plenty of strong financial companies serving a similar purpose in the portfolio. You have plenty of exposure to the upside we see in financial leaders if you own our stocks.

Availability

This ETF is hard to borrow. Lately, only 80,000 shares of FAZ were available for shorting at Interactive Brokers at a 6.1% annual fee. Periodically, TD Ameritrade has shares available with no fee. Members have sometimes been "bought in" on their shares at Interactive Brokers, for a forced closing of the short.

Alternative Trade

If you can't short shares directly, then you can set up a synthetic short in a margin account. "Sell to open" January 2018 $40 calls on FAZ, and "buy to open" an equal number of January 2018 $40 puts. Lately you will collect a net credit of about $2 to set this up. This makes you short FAZ with a start price of about $38, and sets you up to profit if FAZ declines in price. Only sell one call for every $3,800 in FAZ you are able to comfortably short. On a $380,000 account, one contract of each option would be a 1% allocation. That's about as much as we recommend.

Eagle-eyed members will notice that *Pro*'s short position on FAZ is 0.3% of our portfolio. We're recommending 0.6% to newcomers because we know you'll be unable to short at least one other position in the *Pro* portfolio, namely SRS (more on that later). There are no IRA-friendly alternatives for this short. If you can't short it at all, you could add between 0.3% and 0.6% to one of our three financial companies — Wells Fargo, MasterCard, or Visa — instead.

Hedge

SPDR S&P 500 (NYSEMKT: SPY): Set Up a Put Ratio Spread

Set up for no cost, this market hedge lowers our exposure to stocks and will pay us if the S&P falls about 4% to 10%.

Suggested Allocation: 10% or so; you would set up one spread for every $200,000 you manage

For More

- *Pro*'s original recommendation (please note, we recommend a higher strike price on the lower of the two put options now -- $192 instead of $190. You'd set up a trade as described, but using $192/$200 strike prices.
- Talk about the SPY hedge on our discussion board

Requiring a margin account, this June put ratio spread we set up last month can still be set up for no cost if you move your lower strike price up a bit. So, "sell to open" two June 17, 2016, $192 puts for every one June 17, 2016, $200 put you "buy to open." Again, this can be set up lately for no cost. Each $200 put represents a $20,000 short of SPY, so you would buy one for every $200,000 you manage, to set up a 10% position. Use the trade alert for more allocation guidance (again, simply adjusting your lower strike to $192, and still paying nothing to set up each spread).

Be aware that we plan to issue a second hedge to all members in future, one that profits if the S&P 500 falls further than this June hedge allows for. The two hedges will work together if the market falls more, the new one picking up where this one leaves off.

Alternative Trade

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:** For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, "buy to open" June 17, 2016, $200 puts and "sell to open" *an equal number* of June 17, 2016, $190 puts. Recently, this will cost you about $1.15 ($115) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $10 ($1,000) per spread on a decline to $190 or any lower price, but you should be prepared to lose your whole $115 per spread if SPY doesn't decline below $200 by expiration.

Options

American Tower (NYSE: AMT): Buy to Open January 2018 $80 Calls

Suggested Allocation: 0.6%

These calls target long-term upside on American Tower, adding to our existing stock holding.

For More

- *Pro*'s original recommendation
- Talk about American Tower on our discussion board

We're recommending 2018 calls on American Tower today, but you may notice that *Pro* owns January 2017 $80 calls instead. We bought them before the 2018 calls were listed, and newcomers should consider buying January *2018* $80 calls, to give the investment thesis more time to play out. *Pro* will likely roll its calls out to 2018 (or potentially 2019 later this year) before they expire in 2017, as long as the investment thesis doesn't change. We're seeking leveraged returns if American Tower stock appreciates by 2017 (or 2018 or 2019).

Because we recently established a diagonal call position (our owned long-dated call, plus an overlaid short-dated written call for income) that expires this week, **our guidance for this position is conditional.** We recommend that you **do not** establish this full position immediately, instead waiting until Friday, April 26, when American Tower reports first-quarter 2016 earnings before the market opens.

- **Condition 1:** On Friday after earnings, American Tower's stock price is above $105 and it looks like *Pro* will need to take action to either close the diagonal call position or roll our written call up and/or out.
  - **Action:** New *Pro* members should wait until *Pro* sends out our official rolling or closing alert on Friday and heed the guidance for new *Pro* members in the "Alternative Trades" section of the alert.
- **Condition 2:** On Friday after earnings, American Tower's stock price is below $105 and it looks like our $105 written calls will expire worthless.
  - **Action:** New *Pro* members can go ahead and buy a 0.6% allocation to American Tower January 2018 $80 calls, using a limit order and aiming for a price near the midpoint of the bid/ask spread.

A 0.6% allocation at current prices most closely equates to buying one call for every $450,000 or so you manage. This is a small position by design, so be careful not to over-allocate to the calls; you already own the stock, after all! We may seek to add more to our position later, though, if volatility provides us with lower prices. Members for whom one contract would over-allocate their portfolios can consider buying 0.6% more in stock, bringing your stake to approximately 4.3%. Realize you won't benefit from the leverage the calls will provide, although you will have a better breakeven price and no expiration.

All the Rest of *Pro*'s Positions

As a *Pro* member with an especially keen eye (and great memory!), you will note that we haven't updated you on *every* position in the portfolio yet. Pricing opportunities being what they are and with expirations right around the corner, not all of our positions are primed for new action right now, and not all options positions are timely. Worry not. We will publish Catch-Up Trades when we see new *Pro* opportunities on existing positions, and many of our positions will require upkeep in the form of a whole new alert emailed to everyone, so you can get on board then! One by one, it won't take us long to get there. Here's the status on our remaining positions that are currently "on pause for newcomers" — either on hold or not timely.

American Airlines (NASDAQ: AAL)

Long January $35 2017 calls on hold

Last year, we bought call options to profit on a rising, very inexpensive airline stock. Instead, our first foray into an industry fraught with a legacy of failure is, so far, failing. Our calls are down about 74%, and we're not sure how much longer we'll give them. American Airlines just reported earnings this week that came with lackluster guidance on key metrics, and with our expiration about eight months away, we may soon take our remaining money and go home, tail between our legs. Airlines are not a typical *Pro* investment, which is why we used low-cost call options to dip our toe in the water. So far, color us burned. If the winds change and we believe new members should get on board, we'll alert you. But for now, steer clear.

Caesars Entertainment (NASDAQ: CZR)

Short on hold

Pro is short shares of America's largest casino operator, **Caesars Entertaiment** (NASDAQ: CZR), which has put one of its units into bankruptcy proceedings. The stock is volatile -- we booked a 35% profit on half of our short last year, and our remaining short shares show a 40% profit of late. The outcome of this short position is partly dependent on the courts; lawsuits from large investors are being weighed, but operationally the business (shed temporarily of some debt on the books, and split into new units) is looking better. The court is dragging its heels on proceedings, so we're deciding whether we want to stay short or take our gains and move on. This makes us comfortable telling new members to hold off – wait and see what we decide. If we stay short, we'll tell you, and you can short shares then.

CurrencyShares Euro Trust (NYSEMKT: FXE)

Short on hold

We've been short the euro against the dollar since late 2011. We view this position as a quiet anti-investment; the risk to us is relatively known (and reasonable), and the profit potential remains worth pursuing. As the euro has declined from about $1.30 to a recent $1.10 to the dollar, we currently have a 15% profit on the position. But we pay fees to keep this short, and with interest rates now unlikely to rise quickly in the U.S., the dollar may not strengthen much more against the euro anytime soon. So we are considering closing this short position. Earnings results (taking place right now) may help us to consider how the Fed may act next regarding interest rates, which may help us decide what to do with this currency short. We should have a decision in May and will let you know! If we move from Hold back to Short, you can get on board.

Expeditors International (NASDAQ: EXPD)

Synthetic covered strangle on hold

Shares of shipper Expeditors International have run up sharply the past few months. Our synthetic long expires next January, but we'll have to address our May covered strangle before then. These options were written for income and will need to be rolled to higher strike prices. When we do that by the May expiration, we'll guide newcomers on exactly how to set this income position up.

Gentex

Puts on track to expire

Pro has written May 2016 $15 puts that, if exercised, would have us add about 1.5% in stock to our **Gentex** (NASDAQ: GNTX) position. The goal with these puts is to earn income and potentially add to our existing stock position at lower prices. Since this position is just a few weeks from expiration, we don't recommend that new members join us now. We'll aim to write puts again whenever we see good pricing after these expire -- and at that point all members can join in.

ProShares UltraShort Real Estate

Short on hold

We have a small (0.3%) short remaining in the **ProShares UltraShort Real Estate ETF** (NYSEMKT: SRS). We enjoy watching its slow descent in price, but the ETF only has $36 million in assets now, making it too small to recommend to new members. Plus, outside of our broker (Interactive Brokers), it appears impossible to borrow shares to sell short now — and if you do find them, the annual percentage fee to short is high (recently 5% at IB). Instead, as shared above, we recommend that you sell short 0.6% in FAZ as a long-term alternate. Or just sit this small position out.

Wells Fargo

Puts on track to be assigned

Our $52.50 written puts on **Wells Fargo** (NYSE: WFC) expire in May, and with the stock currently trading slightly below $51 per share, our puts are in-the-money. If current pricing stands and we do not take action, *Pro* will be assigned on its written puts, adding about 1.5% to our Wells Fargo stock allocation. New members are advised not to set up this position yet and to wait for an official follow-up alert from *Pro*.

Within the next few weeks (and dependent upon the price action of Wells Fargo stock), *Pro* will either roll our puts out to a later month -- targeting further income -- or we will let the puts expire and accept shares to increase our stock allocation. If we roll our puts out to a later month, new *Pro* members can write the new puts alongside us (there will be specific guidance for new members in the "Alternative Trades" section of the alert). If we accept new shares of Wells Fargo, new *Pro* members can add 1.5% to their stock allocation **if and when *Pro* does so via assignment of its written puts.**

In Conclusion

We'll likely recommend some of these positions (except the SRS short) to new members once we reaffirm that there's sufficient opportunity still afoot, when pricing improves, or after our options expire. Just watch your inbox for official trade alerts! Also, Monday's Catch-Up Trades could pertain to a few of these.

At the same time, we're not standing still. In this and our three previous Portfolio Building Reports, you have many great *Pro* investments -- all rated Buy First or Buy -- to move into. And of course, we'll continue to send brand-new investment recommendations to all members.

It's not vital that your portfolio be 100% identical to ours (many members deviate considerably), but by becoming familiar with how we invest, learning the strategies we use that you can also employ, and owning many of our core stocks, you should be positioned to succeed well with *Pro* over the time frame that matters. Meanwhile, if you're new to shorts, hedges, and options, start to dip your toes in as your comfort allows. We're here to help, and we believe you'll see many, many great benefits as the years unfold.

Fool on!

Pro Catch-Up Trades: April 25, 2016

Published Apr 25, 2016 at 2:56PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and all of our stocks are rated Buy; the portfolio is meant to work together as a whole.*

New members: Keep in mind, our Portfolio Building Reports will get you fully invested over the coming few weeks, as much as you want to be.

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Broadridge Financial Services** (NYSE: BR): Buy our 5% allocation, at once or in halves if you like. Earnings are due May 5, but with high recurring revenue, results don't often shock.
- **Facebook** (NASDAQ: FB): Start to buy our 6.1% allocation in thirds -- but note that Facebook reports earnings Wednesday, so time your first purchase with whatever makes you comfortable.
- **Gentex** (NASDAQ: GNTX): Buy up to 2.8% in stock. Earnings were last week.
- **Oracle** (NYSE: ORCL): Buy up to 3.8%, or buy in halves. Earnings were last month (here's our review).
- **Wells Fargo** (NYSE: WFC): Buy 3.4% in stock. Earnings are already out.

Continue building your portfolio with our Buys, including these highlighted today:

- **Papa John's International** (NASDAQ: PZZA), buy 2.7% in stock.
- **Skyworks Solutions** (NASDAQ: SWKS), buy 3.3% in stock. Earnings from Apple (a major customer) are due this week. Expect choppiness, as ever.
- **TD Ameritrade** (NASDAQ: AMTD), buy 2.5% in stock.
- **Visa** (NYSE: V), buy 2.5% in stock.

Options:

- No existing ones right now to jump on. Our upcoming Positioning Report may have some, and new ones will be issued as Trade Alerts.

Hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): We plan to issue a new hedge alert soon. Meanwhile, our June put ratio spread can still be set up for no cost if you move your lower strike price up. So, you would sell to open two June 17, 2016, $192 puts for every one June 17, 2016, $200 put you buy. Each $200 put represents a $20,000 short of SPY. Use the trade alert for allocation guidance (again, simply adjusting your lower strike to $192, and still paying nothing to set up each spread). New members, keep in mind our Positioning Report and Event to come in the next week or so. You could wait for those if you wish. These hedges actually pay you more to set them up if the market initially falls, and they won't help us until expiration anyway.

Our most recent short:

- **Deere & Company** (NYSE: DE): Sell short (sell to open) 1.9% worth of shares per our recommendation. Keep in mind, this is also a hedge on our **Valmont Industries** (NYSE: VMI) stock position, which recently jumped on earnings.

Wells Fargo Chugs Along Despite Higher Oil and Gas Losses

Published Apr 25, 2016 at 2:52PM

Wells Fargo (NYSE: WFC)

Updated Guidance: Buy First (no change)

Recommended Allocation: 3.4% with a 1.4% look-through allocation in May 2016 $52.50 puts

Fair-Value estimate: $58 (no change)

Current Price: $50.34

What Happened?

- Q1-2016 press release
- Q1-2016 financial supplement

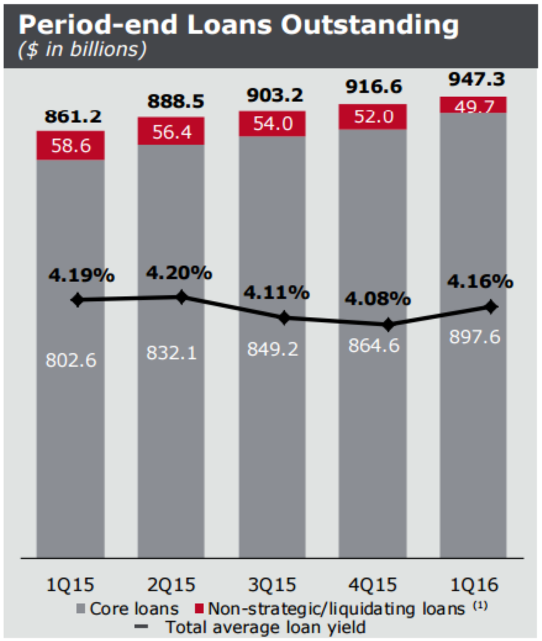
So What?

The 3 key items that I watch for Wells Fargo:

- Growth (or lack thereof) in core loans and deposits
- Trends in credit quality (as monitored via net charge-offs and reserving policy)
- Trends in the efficiency ratio and expense reduction

1) Growth in loans and deposits

I track core loan growth rather than total loan growth because this metric excludes the distortion from the small and shrinking non-strategic/liquidating loan portfolio (which is mostly a vestige from the Wachovia acquisition made during the 2007-2008 financial crisis):

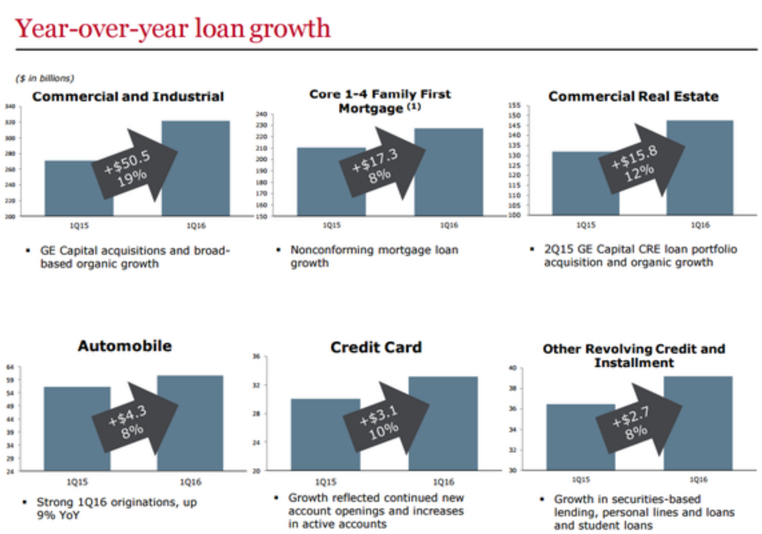


Source: WFC 1Q16 Quarterly Supplement

Organic core loan growth for the quarter accelerated slightly compared to last quarter's 7.8% growth year-over-year, coming in at a solid +8%. When including the $30.8 billion in loans and leases acquired from GE Capital, core loan growth came in at 11.8%:

Source: Company filings, analyst calculations. Dashed line shows growth including the loans acquired from GE Capital (i.e. "inorganic" growth).

There was particular strength in commercial & industrial loans, commercial real estate loans, and credit card balances:



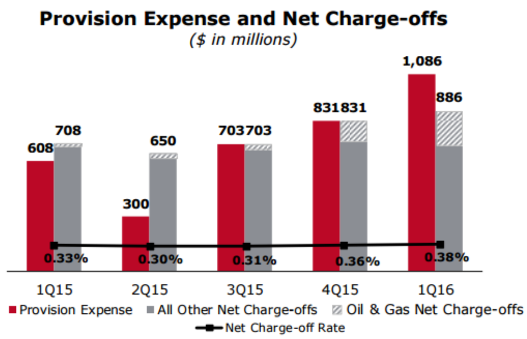
As for deposits, Wells continues to perform well. The company achieved 3.8% year-over-year growth in total average deposits, and 7.3% year-over-year growth in consumer and small business banking deposits. Consumer and small business banking deposits comprise about 59% of total deposits. Funding costs increased a bit to a still-low rate of 0.10%, up from 0.08% last quarter, driven by increased short-term interest rates and commercial deposits.

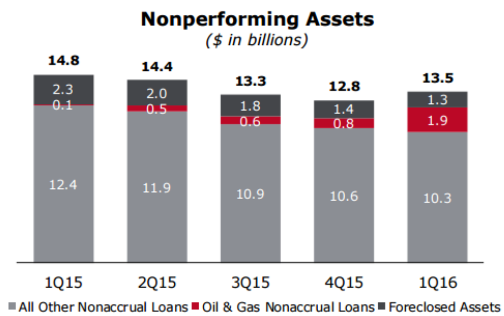
The company's ability to grow deposits meaningfully at a very low cost is perhaps the company's biggest structural competitive advantage. Wells is able to do this by having a nationwide presence with significant geographic density in most markets, optimizing distribution via newer channels (mobile/technology), and strong customer relationship management and product cross-sell achieved via a consistent culture that has been a hallmark of the company for decades.

Net interest margin declined slightly, coming in at 2.90% vs 2.92% last quarter and 2.95% a year ago. The net interest margin is unlikely to meaningfully increase until long-term interest rates rise (who knows when that will happen).

2) Trends in credit quality

Credit quality showed a third straight quarter of sequential decline, with net charge-offs as a percent of total average loans increasing to 0.38% (from 0.36% last quarter, and 0.31% the quarter before). Lower is better. Despite the slight increase, this charge-off rate is still very low and below historical averages. High credit quality has been a consistent theme of the current credit cycle as banks have cut down on risk in response to the turmoil of the 2008-2009 financial crisis.



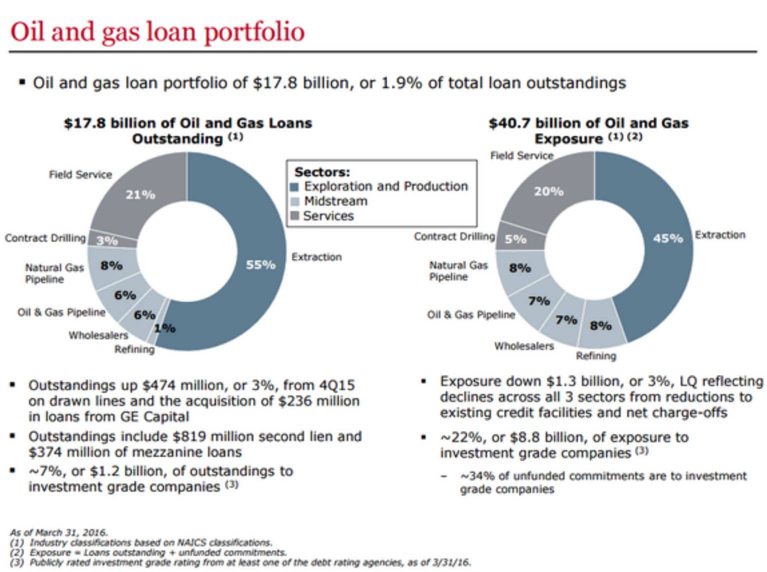


Source: WFC 1Q16 Quarterly Supplement

The reason for the sequential declines in credit quality is the company's exposure to oil & gas loans. Credit quality in the oil & gas industry has decreased over the past year alongside the concurrent decline in the price of oil.

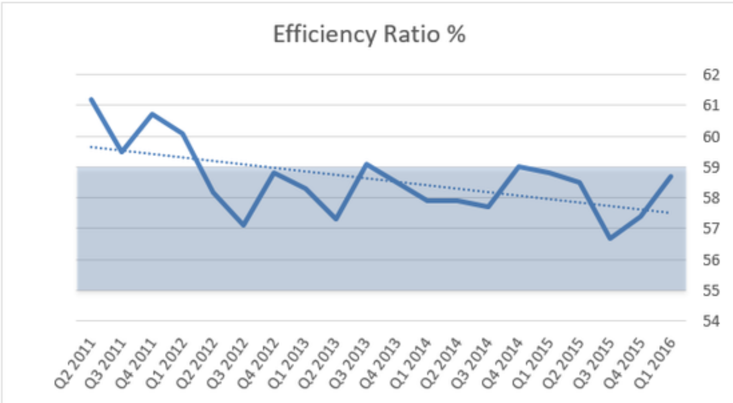
Wells charged off $204 million in its oil & gas loan portfolio in Q1 2016, up from $118 million last quarter. Oil and gas nonaccrual loans (loans where the full and timely collection of interest or principal is uncertain) came in at $1.9 billion, up from $843 million last quarter, working out to about 10.7% of the company's total energy loan portfolio.

However, over 90% of the company's nonaccrual oil and gas loans were current on interest payment, and "substantially all" of the company's oil & gas nonaccruals are senior secured loans. The company has $1.7 billion in reserves on oil & gas loans, which based on a $17.8 billion portfolio works out to a 9.3% reserve rate. The company's entire subset of outstanding oil & gas loans accounts for 1.9% of total loans outstanding. The company's declining credit quality in the oil & gas portfolio is not exactly welcome, but it is certainly not a dire threat to the company's business:



3) Trends in the efficiency ratio

The efficiency ratio (a measure of the bank's overhead costs as a % of its revenue -- lower is better) came in at 58.7%, up from 57.4% last quarter but down from 58.8% a year ago. The efficiency ratio is at the high end of management's target range of 55-59% (blue shaded area in graph):



Source: Company filings.

Management has indicated that they expect the efficiency ratio in 2016 to come in at the high end of their target range, unless interest rates increase faster than expected. The company continues to invest in product development and compliance / risk management technology, including cyber-related spending.

Now What?

All in all, Wells Fargo continues to do what it does best -- steadily grow loans and deposits, and generate a lot of profit. The company's diverse operating model shields it from difficulties in any one particular segment, and this revenue and profit diversity (alongside the company's hallmark conservatism relative to peers) helps Wells Fargo produce consistent results even as the macroeconomic environment shifts and fluctuates.

From our long-term view, underlying business results remain strong, the core earnings power of the business remains intact and is poised for positive operating leverage if and when interest rates and lending spreads rise, and the company's capital return program continues to benefit shareholders. At $50.62 per share, the company yields 3% and trades at 1.46x a growing book value.

Guidance Update

After incorporating this quarter's results into our model, **our Fair Value estimate remains unchanged at $58 per share** (representing a 1.68x P/B multiple), about 15% higher than the current price. Wells Fargo remains a Buy First on our scorecard with a 3.4% allocation and a 1.4% look-through allocation to May 2016 $52.50 written puts. Those who have yet to fill out their stock allocation in this long-term compounder should feel comfortable doing so at current price levels. And if you've yet to match our written put allocation, I'd wait for our Portfolio Positioning Report set to be released on April 27th, which will detail our shorts/options/hedges, and will be available here.

Fool on!

TD Ameritrade Experiences Record Trading Activity During a Volatile Quarter

Published Apr 25, 2016 at 2:52PM

Pro's Take: AMTD Fiscal Q2-2016 Earnings

TD Ameritrade (NASDAQ: AMTD)

What Happened?

- Fiscal Q2-2016 press release
- Fiscal Q2-2016 earnings presentation
- Fiscal Q2-2016 earnings call transcript

President and CEO Fred Tomczyk:

> "We continue to execute well, resulting in solid quarterly performances for each of our major revenue streams. Over what was a volatile quarter for the markets, we gathered $14 billion in net new client assets and helped our clients place a record 509,000 trades per day, on average."

Guidance Update

After incorporating this quarter's results into our model, **our Fair Value estimate remains unchanged at $35 per share**. This valuation does assume a slow increase in interest rates over the next several years, so in the absence of that occurrence, the company may be challenged to grow earnings and the stock price may stagnate. The stock has bounced back strongly since February -- up almost 30% from its 52-week low of $24.88 just a few months ago during a time of increased market volatility and investor speculation about the timing of future interest rate increases. The stock may experience further volatility this week as the Federal Reserve is set to release a statement on Wednesday.

Updated guidance: Buy (no change)

Recommended Allocation: 2.5%

Fair-value estimate: $35 (no change)

Current price: $31.62

The Numbers

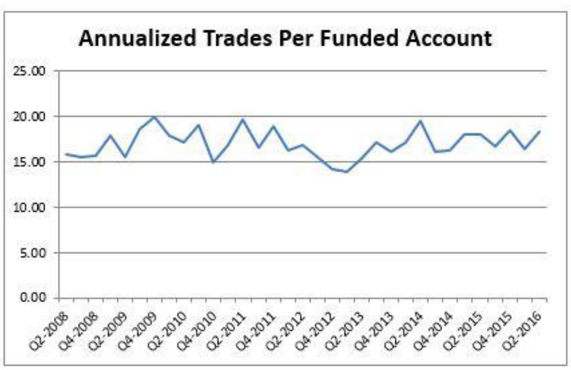
- Record net revenue of $846 million (+5.4% year-over-year)
  - **Transaction-based**:
    - Funded accounts grew to 6.77 million (+4.8% year-over-year)
    - Trades per funded account of 4.59 (vs. 4.13 last quarter vs. 4.50 a year ago)
    - Average commissions and fees per trade of $11.60 (vs. $11.90 last quarter vs. $12.03 a year ago)
    - Totals up to:
      - 6,777,000 x 4.59 x $11.60 = **$361 million** in transaction-based revenue (+2.9% year-over-year)
  - **Spread-based**:
    - Total spread-based revenue of **$382 million** (+7.9% year-over-year)
    - Average spread-based balance of $105.8 billion (+12.2% year-over-year)
    - Thus, Net Interest Margin (NIM) =
      - $382 million / $105.8 billion = 0.361% (quarterly)
      - NIM (annualized) = 0.361% x 4 = 1.44% (vs. 1.49% last quarter vs. 1.50% a year ago)
  - **Fee-based**:
    - Fee-based revenue of $88 million (+3.5% year-over-year)
    - Average fee-based balance of $153.1 billion (-1.3% year-over-year)
    - Thus, Investment Product Fee Yield =
      - $88million / $153.1 billion = 0.057% (quarterly)
      - Investment Product Fee Yield (annualized) = 0.057% x 4 = 0.230% (vs. 0.232% last quarter vs. 0.219% a year ago)
- Record client assets of $711 billion (+2% year-over-year)
- Record interest rate sensitive assets of $112 billion (+11% year-over-year)
- Net new client assets* of $14.1 billion (8% annualized growth rate)
- Diluted EPS of $0.38 per share (+10.9% year-over-year)
- Trailing-12-month (TTM) average return on equity (ROE) of 17% (up from 16.8% a year ago)
- Capital management:
  - Paid $0.17 per share in cash dividends in the quarter (a 2.1% yield on the current share price)
  - Repurchased approximately 8 million shares of its common stock at an average share price of about $28.78 per share ($231 million)
  - Declared a $0.17-per-share quarterly cash dividend (an increase of 13% year-over-year), payable on May 17 to all holders of record of common stock as of May 3.

*excludes changes in client assets due to market fluctuations

Analysis

TD Ameritrade posted a decent quarter for asset gathering in its fiscal Q2-2016, with net new assets (NNAs) up $14.1 billion billion, an 8% annualized growth rate relative to total client assets at the beginning of the quarter. The company's Fiscal 2016 and long-term goal is to grow net new assets at a rate between 7-11%, and this quarter is within that range, but below the 10%+ NNA growth we've seen over the last several years.

The company saw record trading activity during Fiscal Q2-2016, with a record average client trades per day of 509,000 up 7% year-over-year. Trading activity was particularly high in the volatile month of January. During the quarter, there were 16 days with intraday volatility of at least 2%, and 42 days with intraday volatility of at least 1%. This volatility drives increased trades per account:



Source: Company filings and analyst calculations.

Average commissions and fees per trade came in at $11.60, which is down -2.5% sequentially and down -3.6% year-over-year. Management continues to focus on product mix to explain this pressure on commission rates, noting that a higher mix of institutional trades (which is a lower revenue per trade product) and fewer contracts per option trade (due to a higher VIX) are to blame.

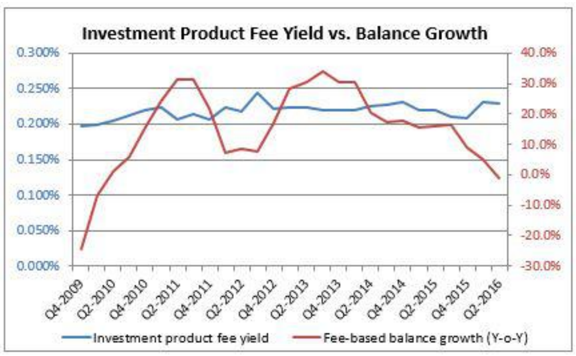
I'm not convinced that mix is the predominant factor in reduced commission rates. The metric is probably also influenced by the emergence of very low-cost brokers (e.g. Robinhood, Interactive Brokers). The commission rate has begun to decline below the low end of the company's recent historical range, but this is not too much of a concern in terms of our assessment of the business, as our valuation assumes a steady decline in commissions and fees per trade over the next ten years:

Source: Company filings and analyst calculations.

The company's record trading activity was partially offset by the lower commissions and fees per trade, and as a result transaction-based revenue increased +2.9% year-over-year. In the short-term, the transaction-based revenue stream will likely continue to bounce around, varying based upon product mix, market volatility, and fluctuations in the commission rate. But over the long run, steady account growth (a 4.4% CAGR over the last 8 years) has led to persistent upward pressure on transaction-based revenue, and that trend seems likely to continue.

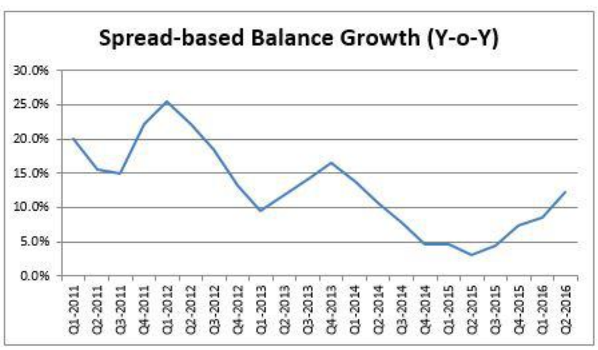
The fee-based segment of the business had a decent quarter, with fee-based revenue up +3.5% year-over-year. The company's fee-based investment balances ended the quarter at a record $161 billion, but the average balance during the quarter was significantly lower, reflecting the market pullback in January and Feburary that later recovered in March.

I wrote last quarter that "the average fee-based balance should decline alongside declines in the market" and that's exactly what we saw. But on the flip side, for next quarter, if the market doesn't experience another pullback, we should see an increase in the fee-based revenue stream as higher market levels support a higher average fee-based balance throughout the quarter:



Source: Company filings and analyst calculations.

As for the spread-based portion of the business, the rate of growth in the spread-based balance accelerated yet again this quarter:



Source: Company filings and analyst calculations

This portion of the business is the one that's sensitive to interest rate changes, so it's nice to see continued acceleration of growth in one of the company's key value drivers. We'll continue to watch this metric over time to make sure it's staying on track, especially now that the first Federal Reserve rate hike has occurred and future additional rate hikes are expected. Spread-based revenue will likely increase throughout 2016 compared to 2015 due to higher spread-based balances and higher yields on earning assets. However, IDA yield growth will be dampened slightly by an increase to the FDIC deposit insurance fund which will begin in July, increasing the FDIC fee TD Ameritrade pays on its insured deposit account agreement with TD Bank.

What We Think Now

TD Ameritrade is bringing in more client assets every year, leading to higher revenue, and as interest rates increase, the company is positioned to grow earnings sharply.

If you have questions, post them on our TD Ameritrade discussion board.

Gentex's Market Penetration Continues

Published Apr 25, 2016 at 2:52PM

***Pro*'s Take: GNTX Q1-2016 Earnings**

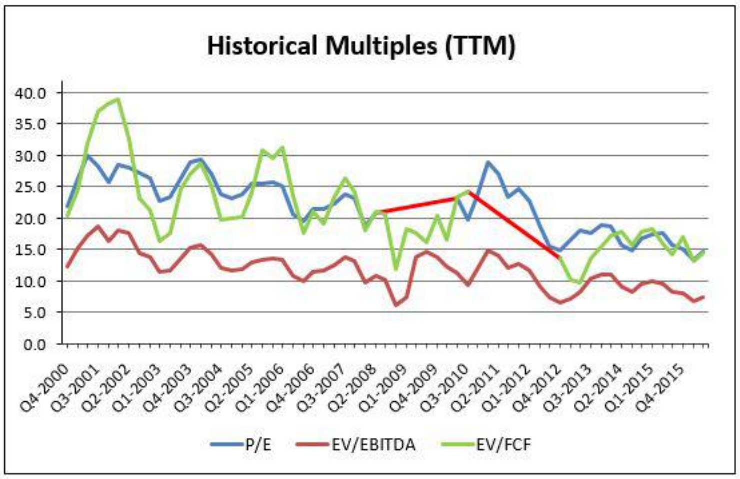
Gentex (NASDAQ: GNTX)

What Happened?

- Q1-2016 press release

Guidance Update

After incorporating this quarter's results into my model, **our Fair Value estimate remains unchanged at $18 per share.** With the stock trading more than 10% below our FV estimate, **Gentex remains a Buy First** on our scorecard. At about 14.5 times trailing-12-month earnings and 7.5 times EV/EBITDA, the company is trading at valuation levels that are about as low as they've been throughout its history despite a robust balance sheet, steady operating performance, and continued success in market penetration and organic growth. If you've yet to start a position or fill out your stock allocation in Gentex, now is a great time.



We also have a 1.5% look-through allocation in May 2016 $15 written puts. Those puts are on track to expire fully as income (as did our two prior iterations of Gentex puts we wrote in August and December 2015), although we are still a few weeks away from expiration. If you've yet to match our written put allocation, I'd wait for our Portfolio Positioning Report set to be released on April 27th, which will detail our shorts/options/hedges, and will be available here.

Updated Guidance: Buy First (no change)

Recommended Allocation: 2.8% with a 1.5% look-through allocation in May 2016 $15 puts

Fair-Value Estimate: $18 (unchanged)

Current Price: $15.95

Our Thesis

Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1) Penetration: Unit growth vs. auto production. Over time, we want to see Gentex's auto-dimming mirrors to continue to gain market share. If the company is increasing units sold faster than auto production, it is moving in the right direction. Quarterly global interior mirror unit volumes grew strongly to +13.6% year-over-year growth (decelerating a bit from +16.2% a quarter ago) vs. ~1% year-over-year growth in auto production in the company's primary markets, showing that Gentex continues to significantly outpace vehicle production growth and capture market share. Q1-2016 interior units sold in North America accelerated to +11.6% (up from +7% last quarter) and Q1-2016 international interior units increased +14.7% (down from +22.1% last quarter).

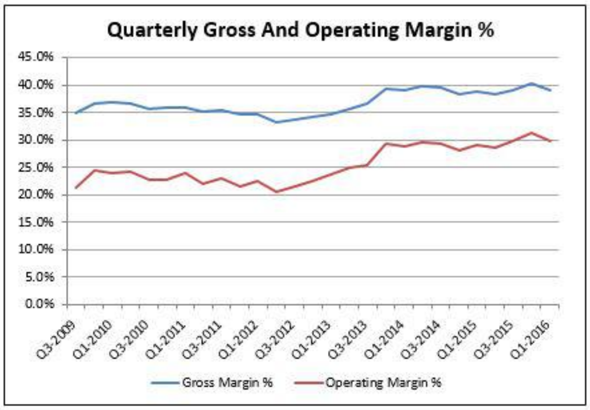
Exterior mirror unit shipments have taken a bit of a breather after a scorching 2015, with Q1-2016 exterior unit volumes up +16.8% in North America (vs. 33.7% last quarter) and +0.4% internationally (vs. 12.8% last quarter). Due to lower exterior unit growth relative to interior unit growth, the exterior mirror attach rate declined to 38.3% (i.e. 38.3% of cars equipped with interior units also were equipped with exterior units), compared with 41.2% a year ago. The deceleration of growth in exterior units can be explained by a difficult comparison to the year-ago period, as exterior unit volumes are still growing nicely and are a key growth driver for Gentex. Compared to Q1-2014 (2 years ago), global exterior unit volumes are up 29.7% (a 14% 2-year compound annual growth rate). Exterior unit growth in 2016 will likely continue to lag 2015's growth rates as demand builds back up, but the overall trajectory of exterior unit growth is sound and market penetration continues.

2) Pricing and value: Unit growth vs. automotive segment sales. Powerful auto makers force annual price concessions on their suppliers, and Gentex isn't immune. Price reductions have recently been in the range of 2.5% to 3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices (ASPs) and gross margins.

In Q1-2016, total units (interior + exterior mirrors) increased +11.3% and automotive segment sales were up +9.2%. This dynamic suggests lower ARPU (average revenue per unit) and is consistent with the expectation of annual price concessions.

3) Margin performance. In Q1-2016, gross margin was 39.1%, up from 38.8% a year ago as annual price reductions were more than offset by purchasing cost reductions and fixed overhead cost leverage. The company expects full year 2016 margins to come in between 38.5%-39.5%, so this quarter's result was right in the middle of that range. Now that annual price reductions have lapped (about 70-80% of annual customer price reductions take effect on January 1), gross margin may have some upside in the latter half of the year since the company experienced elevated expenses in 2015 due to launch costs and worker overtime.

Q1-2016 operating margin performance was 29.8% (vs. 29.2% in Q1-2015). Selling, general, and administrative (SG&A) and research and development (R&D) expenses cam in within normal ranges and are consistent with recent trends:



What We Think Now

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

If you have questions, drive on over to the Gentex discussion board.

Earnings News From 3 Pro Companies

Published Apr 25, 2016 at 2:35PM

Dear *Pro* Fools,

It's that time again -- earnings season! Your *Pro* team has been working hard to analyze our companies' recent earnings reports, and in this Memo I'll take the opportunity to update you on three of the companies I cover for the portfolio: **Gentex** (NASDAQ: GNTX), **TD Ameritrade** (NASDAQ: AMTD), and **Wells Fargo** (NYSE: WFC).

I'll give a quick overview of each company, summarizing results and recapping our investment theses now that I've had a chance to dig into the numbers and monitor business progress. **All three positions remain active holdings on our scorecard for new and veteran members alike.**

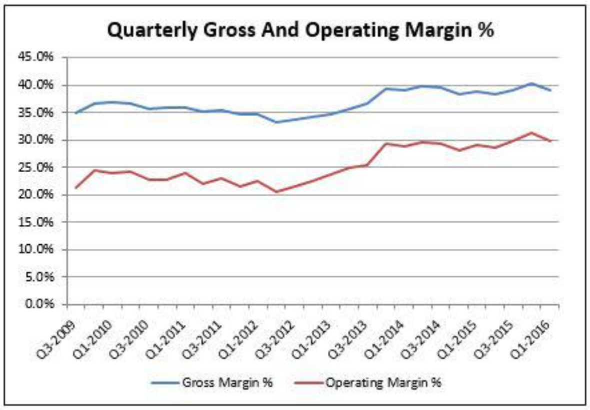
The Results

Gentex

GENTEX
CORPORATION

After a strong close to 2015, our mirror maker followed up with an excellent first-quarter 2016. The company posted 10% year-over-year net revenue growth, 7% EPS growth, and total mirror unit growth (interior and exterior) of 11%. The strong unit growth was achieved despite just a 1% increase in worldwide light vehicle production, so we know Gentex continues to gain market share.

The company's margin performance is sound, with slight year-over-year increases in gross and operating margins relative to last year's first quarter:



Gentex's strong profitability and cash generation have led to a rising cash balance. The company now has $2.39 per share in net cash and investments on the balance sheet (about 15% of the current share price). In addition to the $0.085 regular dividend in the quarter (a 2.1% forward yield on the current share price), management continued its recent string of share repurchases, buying back about $44 million worth of shares in the quarter at an average price of $14.27. This marks seven straight quarters of share buybacks for the company, and as cash piles up on the balance sheet, management appears to be more willing to pursue buybacks as a capital allocation strategy. I view these continued buybacks as a signal of confidence from management, and with Gentex shares trading at historically low multiples and below our estimate of fair value, I think the buybacks are a strong capital allocation decision.

As for *Pro*'s position, we own a 2.8% allocation and have a 1.5% look-through allocation to $15 puts that expire in a few weeks. **Gentex remains a Buy First, and members who have yet to fill out their stock allocation should feel comfortable purchasing shares at current prices.** As for the written put allocation, if you've yet to match us, I'd wait for an update in our Portfolio Positioning Report, which will be released on April 27. There, we will cover our outstanding shorts, options, and hedges. See a full write-up on the quarter here.

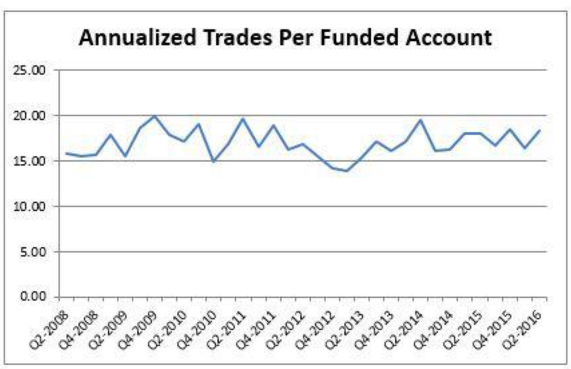
TD Ameritrade

TD Ameritrade

TD Ameritrade delivered a solid second quarter (its fiscal year begins in September of the previous year), boasting record client assets of $711 billion and record quarter-end fee-based investment balances of $161 billion. The company upped net revenue by 5% year-over-year and increased earnings per share (EPS) by 11% year-over-year as operating margins increased relative to the year-ago period.

Underlying business trends at TD Ameritrade are solid. This business is doing what it's done for a long time – gathering assets at a healthy pace, stimulating higher trading activity through its award-winning platforms, and augmenting its transaction- and spread-based revenue with a growing fee-based business.

The company saw a record quarter for trading activity, with annualized trades per account at the higher end of its historical range ...



... but falling commissions and fees per trade led to modest growth (+3%) in transaction-based revenue as higher activity was offset slightly by lower pricing:

Overall, despite lumpy quarter-to-quarter results, TD Ameritrade continues to steadily increase its earnings power while maintaining strong upside to rising interest rates. Meanwhile, we benefit from a stable (and growing) regular dividend, occasional special dividends, and share buybacks. There's no change to our $35 fair-value estimate, and the stock **remains a Buy on our scorecard with a 2.5% allocation**. **Members who have yet to match our allocation can feel comfortable doing so at current prices.** See a full write-up on the quarter here.

Wells Fargo

In the first quarter of 2016, Wells Fargo continues to do what it does best -- steadily increase loans and deposits, and generate a lot of profit. The company reported organic core loan growth of 8% (11.8% if we include acquired loans and leases from GE Capital), and deposit growth was 3.8% (7.3% for consumer and small business banking deposits). Wells Fargo generated $5.5 billion in net earnings, the 14th consecutive quarter of quarterly earnings higher than $5 billion; it's one of only two companies in the country to have achieved this, with the other being fellow *Pro* holding **Apple** (NASDAQ: AAPL).

Credit quality declined slightly as the performance of the company's oil and gas loan portfolio continues to decrease. However, the company has increased reserves to account for worsening performance, and oil and gas loans account for just 1.9% of total loans outstanding. The company's declining credit quality in the oil and gas portfolio is not exactly welcome, but it is certainly not a dire threat to Wells Fargo's business.

In our long-term view:

- Underlying business results remain strong.
- The core earnings power of the business remains intact and is poised for positive operating leverage if and when interest rates and lending spreads rise.
- The company's capital return program continues to benefit shareholders.

At recent prices, the company yields 3% and trades at about 1.46 times book value, which is growing. Our fair-value estimate remains unchanged at $58, and **shares remain a Buy First with a 3.4% stock allocation** and a 1.4% look-through allocation to $52.50 puts that expire in a few weeks. As for the written put allocation: As with Gentex, if you're not yet caught up here, I'd wait for an update in our Portfolio Positioning Report on April 27. There, we will cover our outstanding shorts, options, and hedges. See a full write-up on Wells Fargo's quarter here.

The *Pro* Bottom Line

In summary, after going through results and updating our valuation models, the status of these three companies remains unchanged:

- **Gentex:** No change to fair-value estimate; shares remain a Buy First, with a 2.8% allocation.
- **TD Ameritrade:** No change to fair-value estimate; shares remain a Buy, with a 2.5% allocation.
- **Wells Fargo:** No change to fair-value estimate; shares remain a Buy First, with a 3.4% allocation.

Each of these three companies continues to progress well against our investment theses, and we continue to believe that each will deliver North Star-beating returns (lately around 7.5% to 9% annualized) over the next rolling three-year period.

If you have any questions about this Memo, feel free to stop by the appropriate company's discussion board:

Performance vs. Outcomes

Published Apr 25, 2016 at 11:33AM

Fellow Pro *Fools: Morgan regularly writes about one of the most important aspects of investing well: mindset. And your mindset is largely influenced by your knowledge of stock market history, another topic Morgan covers better than anyone. Morgan writes every week for* Motley Fool One*, and we're fortunate to be able to share some of his columns with you in* Pro*. Today's article suggests that stock outcomes are often unexpected when looked at "logically" (Coca-Cola shares are at a high as soda sales fall?), but when you consider how profits grow at strong companies over the years, good stocks should ultimately keep making new highs in years to come. Enjoy! -- Jeff*

Coca-Cola (NYSE: KO) is fighting 12 consecutive years of soda consumption decline. Its stock is at an all-time high.

Tesla (NASDAQ: TSLA) is changing the world, and orders for its new car are off the charts. Its stock is lower than it was 18 months ago.

Cigarette consumption [has dropped]44% since 1981. **Altria** (NYSE: MO) stock is up 71,000% since 1981.

Walmart (NYSE: WMT) net income has tripled since 2000. Its stock has lost 1.5% since 2000.

Apple (NASDAQ: AAPL) has earned almost a quarter trillion dollars of profit since 2012. Its stock has barely budged.

Profits for **Amazon** (NASDAQ: AMZN) round to zero since 2012. Its stock has tripled.

2009 was one of the worst years for the economy in a century. The market rose 27%.

2015 was a good year for the economy. The market rose 1%.

Brazil's economy is a disaster. Its stock market is flat over the last two years.

America is enjoying the longest streak of [low unemployment]claims in four decades. Its stock market is also flat over the past two years.

And so on.

I'm fascinated with the problem of why really smart people have such a hard time predicting the future. It's mostly because the future is more random than we think. But it's also because future performance (like earnings and economic growth) doesn't tell you half of what you need to know to predict future outcomes — especially to predict precise outcomes. Outcomes are determined by performance within the context of expectations, with importance heavily weighted toward the latter. And if predicting future performance is hard, calibrating them against expectations often borders on sorcery.

Even if you accurately forecast future performance, predicting the outcome from that performance requires answering two questions:

- Are current expectations reasonable?
- What will future expectations be?

The first is possible to answer, but pretty hard. We can look at sentiment and valuations to gauge, based on past trends, whether the current mood seems reasonable. But disagreeing with popular sentiment is easier said than done. Few things feel better than fitting in, and having a viewpoint that goes against everyone around you is a mental battle not one person in 10 can maintain for long. Rather than identifying extremes in current sentiment, it's easier to justify the market's mood no matter what it is. Billionaire investor Howard Marks once wrote:

> The problem is that extraordinary performance comes only from correct nonconsensual forecasts, but nonconsensual forecasts are hard to make, hard to make correctly, and hard to act on.

The second — predicting future expectations — is even harder. To know where stock prices will be in five years, I have to know what mood people will be in, five years from now. Which is as ambitious as it sounds. Ask yourself what kind of mood you yourself will be in in April 2021, and you'll shake your head in laughter. Ask what kind of mood seven billion strangers will be in in April 2021 — that mood, of course, will determine stock prices in five years — and it's hard to keep a straight face. This is where the disconnect between performance and outcomes occurs: Accurately predicting five years of economic growth might not do much for the stock market if, five years from now, people are worried about the future five years from then.

As legendary investor Ben Graham said, "In the short run, the market is a voting machine. But in the long run, it is a weighing machine." Even if future markets are gloomier than they are now, rising profits and compounding business assets can leave investors with a positive return. This "weighing" is why true long-term investing isn't gambling. Real, reliable value is created, even if we don't know exactly when it will flow to shareholders' pockets. It's why we invest in quality businesses for the long run, and have high confidence in doing so.

But the more precisely that people try to forecast, the more they rely on predicting emotions and expectations. In a world where Wall Street analysts focus most of their time analyzing performance — what earnings will do, or what the economy will do — it's no wonder they struggle to predict outcomes.

It's yet another reason we take the long view, without tying our expectations to specific dates, and are open to a range of short-term possibilities.

Thoughts? Bring them to the *Pro* [Philosophy & Strategy board]!

Pro Portfolio Building Report No. 3: April 22, 2016

Published Apr 22, 2016 at 12:14AM

Welcome, Fools! As new members continue to learn more about *Pro*, we get a lot of questions about fair value. The most common one is this:

> **Q:** If a stock is rated Buy or Buy First, but its current price is higher than *Pro*'s stated fair value, is that stock still a Buy or Buy First right now?
>
> - Should I buy it today?
>   - At this price?
>
> **A:** Yes.
>
> - Yes, at least *start* to buy your allocation. Dip your toes in if you're not buying the whole stake yet.
>   - Yes, today's price should still provide the return we seek.

This may seem counterintuitive at first, but with some context, we think you'll see how this approach makes sense for our portfolio. As Jeff writes in a recent Memo called "[The Flaws of Fair Value]" (also linked on our [Guidebook page]):

- A fair-value estimate is the approximate price from which we expect a stock to earn our desired long-term rate of return.
- If a stock is rated Buy on the [Recommendations page], we believe it can deliver a [North Star]-worthy return or better over the coming three years (lately, that's about 10% annualized).

- A fair-value estimate is a snapshot in time; it represents *today's* fair value, usually using the last 12 months as your base.
- A growing company increases its fair value daily, just as you do if you're saving some money each day. All else equal, a stock's fair value ticks up steadily as the company grows.
- We update our fair-value estimates quarterly at most, and usually only bi-annually or annually, given that our estimates (like all estimates) are approximate and model out yearly results.
- We lean conservative, rather than aggressive, with our fair-value estimates.

A great company has multiple extra ways to increase value that we can't bake into our long-term projections, partly because we don't know everything management is planning.

To read more on fair value, click here and here.

Moving on to today's report: Presented below are the rest of *Pro*'s Buy stocks; with these and our previous two reports, plus judicious application of the advice above, you should be ready to keep adding to your *Pro* portfolio as you're comfortable! Stay tuned for our Portfolio Positioning Report on April 27 and our live chat event on May 4, and bring us your questions on the Getting Started & Help discussion board! We're glad to have you.

Best,

-- The *Motley Fool Pro* team

Table of Contents

Buy: Gilead Sciences (NASDAQ: GILD)

Dominant in treating HIV and Hepatitis C, Gilead is a powerhouse biotech company positioned to keep rewarding owners.

Suggested Allocation: 3.6%

For More

- *Pro*'s original recommendation (4/30/14)
- Latest Earnings Update (2/29/16)
- Talk about Gilead

Gilead Sciences (NASDAQ: GILD) helps millions of people fight life-threatening diseases. Its HIV drugs are prescribed to 8 out of 10 new HIV patients and are already helping millions of others enjoy much better lives. HIV treatment represented the majority of Gilead's revenue until its Hepatitis C cures, Sovaldi and Harvoni, were approved in 2014 and 2015, respectively. The most successful drug launches in history, Sovaldi topped $10 billion in first-year revenue, and Harvoni reached megablockbuster status quickly as well.

An estimated 2.7 million to 3.2 million hepatitis C patients reside in the United States, with an estimated 200,000 more joining those ranks per year; a whole 2.8% of the *world* (almost 200 million people) is thought to have this common blood-borne infection. That means millions could conceivably benefit from treatment by Gilead products, while still leaving plenty of room for competing drugs to do well, too. So far, though, Gilead has dominant market share for hepatitis C, just as it does for HIV. The company enjoys first-mover advantage to the hepatitis C market, and its drugs are said to lead in effectiveness with fewer side effects.

Though earnings-per-share growth isn't expected this year following blowout revenue gains last year, stability is predicted, and Gilead shares look inexpensive at around 8 to 9 times earnings, especially as management vows to keep buying back meaningful shares. Gilead has more than 200 compounds in clinical trials, including a focus on oncology, and it's in the market to make acquisitions that would add to earnings. Gilead is one of the most profitable biotechnology companies in the world, and we believe this inexpensive behemoth should be in your *Pro* portfolio.

Buy: O'Reilly Automotive (NASDAQ: ORLY)

Auto-parts retailers are boring, right? Right! But an investment here is up 670% over the past 10 years, and we expect additional returns around the corner.

Suggested Allocation: 5.3% (given this position size, buy in halves over two to four months if you prefer)

For More

- *Pro*'s original recommendation (4/15/14)
- Latest Earnings Update (3/24/16)
- Talk about oh, oh, O'Reilly

America's second-largest auto parts retailer, O'Reilly operates more than 4,500 stores, about one-quarter of them in California and Texas. Auto parts are a big business, estimated at $231 billion, and O'Reilly is an exceptional competitor, with an addressable market size of about $131 billion. Running 24 regional distribution centers and 240 hub stores as part of a two-tiered distribution strategy, the company provides same-day or overnight availability on more than 142,000 items, including many its competitors don't usually stock. Basic auto parts, tools, and services complement those hard-to-find treasures. As a result, O'Reilly's sales are historically split between "do it yourself" retail customers and lucrative, repeat-sales professional services customers (such as auto repair shops), a luxury many smaller competitors don't enjoy.

An extremely well-run company, O'Reilly has seen earnings per share increase by more than 20% every quarter for seven years straight, and same-store sales and margins have been climbing consistently for years. And O'Reilly sees more opportunity ahead: Management plans for 210 new stores in 2016, for margins to tick higher again, and for same-store sales growth of between 3% and 5% in the quarter ended in March. Many tailwinds are helping this U.S.-only company: More people are working, so miles driven are headed higher; the average car is staying on the road longer, needing more repairs; and new cars have more complex parts that are costlier to repair. In the last recession, O'Reilly performed fairly, too, because more people keep their cars longer during hard times, and invest in keeping them running well (though fewer people are driving as unemployment increases).

As one of our largest positions, O'Reilly remains a stock we own for the long haul. Shares remain rated a Buy even though they currently (and historically) trade a bit above our fair-value estimate. After earnings per share rose 25% in 2015, we expect at least 16% growth in 2016, with the chance for acquisitions to move that number higher.

Buy: Parexel International (NASDAQ: PRXL)

Parexel is poised to benefit as pharmaceutical companies gradually outsource more drug development work to select CRO partners who can perform the work better, faster, and cheaper.

Suggested Allocation: 3.4%

For More

- *Pro*'s original recommendation(12/23/13)
- Most recent earnings update (2/2/16)
- Talk about Parexel on our discussion board

Parexel (NASDAQ: PRXL) is one of the world's largest and most respected contract research organizations (CROs). Over more than 30 years, it has built a stellar reputation on helping drug makers navigate complex clinical trial processes quickly, which has enabled it to cement important relationships and have a role in developing more than 95% of the 200 top-selling drugs.

Based on industry data, from 2004 to 2015, outsourcing penetration — the number of development dollars outsourced to CROs — has increased by nearly 70%. Outsourcing is a cheaper alternative to the traditional high-fixed-cost model of staffing lots of white coats across various therapeutic specialties all around the globe. For large drug developers, letting CROs handle the development work — and those massive staffing needs — can boost profits and time to market, and for smaller drug developers who can't afford a huge staff, there is no other choice. As regulators require more efficacy data, larger patient participation, and increasingly global results, navigating the challenges of the 110,000-plus trials being conducted globally has become frustratingly complex, turning large, proven CROs with expertise and global capabilities into value-adding partners rather than transactional customers. We think Parexel will continue to benefit.

Buy: Papa John's International (NASDAQ: PZZA)

Deliver a slice of the profit pie right to your doorstep.

Suggested Allocation: 2.7%

For More

- PZZA position review (5/23/14)
- Most recent earnings update (3/8/16)
- Talk about Papa John's

Papa John's International (NASDAQ: PZZA) operates and franchises close to 4,900 pick-up and carry-out pizza joints in 40 countries and territories. For the past 30-plus years, Papa John's has been making pizza and building its brand around the "Better ingredients, better pizza" tag line. Bringing that unwavering focus to each pie has resulted in the company's perceived quality advantage over its big-chain pizza competitors, which allows it to consistently price a dollar or two higher and attract high-quality franchisees. Now that its brand advantage is sufficiently established in North America, Papa John's is turning its sights abroad, believing that delicious American pizza is a language every taste bud speaks.

As sure as a fresh pizza will be gobbled up by hungry kids, Papa John's delivers results. For 12 consecutive years, the company has recorded flat or positive North American same-store sales growth. Over the last four years, international comps have been in the 5% to 8% range (and consistently higher than comps in North America), offering strong evidence that Papa John's flavors travel well. The company opened 230 restaurants in 2015 and expects about 200 more this year, and because Papa John's is primarily a franchisor, it doesn't have to bear the cost of that expansion (it's taken on by the franchisees). Competing for a share of the global appetite is tough business, but Papa John's has been able to increase sales and profits at commendable rates over the past decade, which has resulted in plenty of cash generation. Management initiated a dividend in 2013 and has consistently bought back stock over the years.

We believe the company will maintain its brand positioning, modestly improve underperforming franchise locations, and continue to be an attractive entrepreneurial outlet for new franchisees abroad. Papa John's should also be able to take modest market share from mom-and-pop pizza shops in established markets as digital ordering continues to gain adoption; it's a tough hurdle for smaller players to overcome. With a little bit of menu innovation and new markets maturing, we believe 3% same-store growth is sustainable over the next five to 10 years. We rate shares a Buy and encourage members to do plenty of field research on this one.

Buy: ProShares Short VIX Short-Term Futures ETF (NYSEMKT: SVXY)

Profit from the long-term nature of stock-market volatility to revert to an average level after each spike.

Suggested Allocation: 0.9%

For More

- *Pro*'s original recommendation (11/25/14)
- Talk about SVXY

Buying shares in — let's make it easy and use the ticker, shall we? — SVXY is a recommendation for *Pro* members who are comfortable owning a small stake in a volatile position that we *may* add to during market downturns. *Pro* is a portfolio service, so all positions are meant for everyone, to the extent you can invest in them and wish to. But this position is not core to what we do, and will be especially volatile, so only follow it if you're comfortable with high volatility in a holding.

This unusual vehicle should increase in value when stock market volatility — as measured by the CBOE Volatility Index (or VIX) — goes down or is range-bound. This ETF *sells short* futures contracts on the VIX that have one month and two months to expiration. Unless expected volatility from the S&P 500, as measured by the VIX, increases above and beyond the premium already baked into the futures contracts being shorted, the positions turn a profit and the ETF goes up in value. Helping further, VIX futures contracts are historically in a state of "contango" as much as 90% of the time. Contango means that future-month contracts are increasingly more expensive than earlier months' and than the current VIX itself (much like a call option has a premium above the current stock price). This is a tailwind for SVXY. As long as volatility stays rangebound overall, then just holding this small stake over the years should reward us. We recommend starting at 0.9% (or round to 1% if you want), and we may add more when the VIX soars — meaning when volatility in the market is high and SVXY is low. We're ready for it! But even if we don't, we believe this small position should create value for us over the long term thanks to the regressive nature of volatility in the market: It spikes, and then grinds back down.

Buy: TD Ameritrade (NYSE: AMTD)

Assets and investment fees are rising; earnings should surge when interest rates head higher.

Suggested Allocation: 2.4%

For More

- *Pro*'s original recommendation (7/11/13)
- Monday Memo on TD Ameritrade's business model (9/15/14)
- Latest earnings update (1/21/16 -- this quarter's update is on the way)
- Talk about TD Ameritrade

Entrusted with more than $700 billion in assets from retail investors and registered investment advisors (RIAs), discount broker **TD Ameritrade** (NASDAQ: AMTD) hosts about 450,000 stock, options, and futures trades on an average day, collects investment fees, and earns interest on billions in cash and interest-earning assets. Its partnership with **TD Bank** (NYSE: TD) (which owns 42% of the company) also gives it a unique position in its industry, allowing TD Ameritrade to earn high-margin interest income on client cash without being saddled with the same capital requirements as a bank; when the current record-low Federal Funds interest rate increases, TD Ameritrade will earn much higher interest income, virtually all of it pure profit.

In the meantime, the company retains its focus on increasing client assets, providing top-notch customer service, and launching more investment products and features. The company has increased net new client assets by at least 10% annualized for the last seven years and counting. We expect management to continue to be excellent stewards of capital, returning profits to shareholders and increasing investor value. All the while, we know higher interest rates will someday lead to much higher net income. But even as we look forward to that, we can admire the company's current results, accept a growing dividend stream, and be ready to enjoy healthy returns.

Buy: Valmont Industries (NYSE: VMI)

Providing irrigation systems, electrical tower support structures, road barriers and more, this industrial company benefits as agriculture needs increase and countries build infrastructure.

Suggested Allocation: 1.9%

For More

- *Pro*'s original recommendation (11/5/13)
- Earnings update: next available in late April
- Talk about Valmont

Founded in 1946, Valmont supplies steel and aluminum poles to infrastructure projects worldwide, including road and traffic lights, stadium and parking lights, and wireless communications poles and support towers, as well as electrical towers. The company also sells highway safety products including barriers and road grating. Then there's water, essential to the world's farmers. Under the name "Valley," Valmont's center-pivot irrigation systems are the world's leading brand. More than 80% of the planet's irrigated acres still use inefficient "flood" watering methods, rather than efficient irrigation, so there's lots of room to run. Suffering lately, the company also has an energy and mining division. Results here -- and in its irrigation business -- will improve if (or when) commodity prices increase. That may be starting to happen now, and management just projected 12% to 15% EPS growth in 2016.

Operating in more than 80 countries, Valmont is a long-term investment in an exceptionally run, cyclical business that's currently in a downturn (which is when you usually want to buy!) from which it may be starting to emerge. Valmont has been an outstanding long-term performer for other, earlier investors, and we believe we could benefit smartly in the long run, too.

Buy: WisdomTree Emerging Markets SmallCap Dividend Fund (NYSEMKT: DGS)

Diversification in emerging markets with small, promising, high-yield companies you've never heard of.

Suggested Allocation: 1.8%

For More

- *Pro*'s original recommendation (11/22/10)
- Talk about DGS

At *Pro*, we like the idea of investing in emerging-market small caps to diversify and target strong long-term earnings growth, along with a dividend kicker.
Enter WisdomTree Emerging Markets SmallCap Dividend Fund (the longest ETF name in the world!*). This exchange-traded fund seeks to match the performance of the WisdomTree Emerging Markets SmallCap Dividend Index, which measures the performance of the smallest 10% of stocks within the Emerging Market Dividend Index (and yields around 3% in dividends).

For *Pro*, owning shares of this well-managed ETF offers exposure to up to 600 of the most promising international business that we couldn't easily buy in any other way. Serving as direct exposure to emerging markets, this is a way to invest in small companies in locations where we don't have a discernible edge but where growth exists — countries like Taiwan, South Korea, Thailand, Malaysia, and Turkey. The benefits of diversifying outside our home market should come home to roost given time -- we've been patient so far. Emerging markets have badly lagged developed markets for the last several years, but eventually they should take the performance baton again, and we should be well served by this position. Meanwhile, we don't mind waiting, because we know that's how diversification works. That's *why* you diversify: so not everything performs or falls at the same time.

*Statement is not true. We own or are short others with equally long names.

Pro Portfolio Building Report No. 2: April 20, 2016

Published Apr 19, 2016 at 7:49PM

Welcome, *Pro* Fool! This report details our current thinking on eight of the Buy stocks in our portfolio. The rest of our Buys will be featured in our third report, coming Friday. Once you've read these and the previous report detailing our Buy First positions, you're ready to start (or continue) building your *Pro* portfolio as swiftly or as slowly as you like.

We want our advice to be uncomplicated: Purchase our Buy Firsts first (again, taking your time according to your situation — there's no rush); purchase our Buys after that; match our allocations as closely as you can (but don't worry about needing to buy in 100-share lots — fewer is fine); and stay tuned for our Portfolio Positioning Event on May 4, when the team will be answering your questions in real time.

We're glad you're here, learning to become an investor who will come out on top in all markets. Bring any questions to the Getting Started & Help discussion board, and Fool on!

Best,

The *Motley Fool Pro* team

Table of Contents

A Note on Fair Value >>

Buy: AmTrust Financial Services (NASDAQ: AFSI)

This shrewd insurer looks to enter markets optimistically, when pricing is favorable because others are struggling.

Suggested Allocation: 5.1%, perhaps bought in two to three blocks over the next two or three months

For More

- *Pro*'s original recommendation (4/3/2009)
- Most recent earnings update (3/7/2016)
- Talk about AFSI

AmTrust Financial Services (NASDAQ: AFSI) was founded in 1998, making it one of the new kids on the block in an industry where many of its competitors have been around for 100 years or more . But this newbie insurer has some serious street smarts. AmTrust likes to compete in niche markets (for example, small, low-hazard workers' compensation policies), waiting until a rough patch demonstrates that the incumbents in a space have loosened their underwriting standards. It's then able to grab market share in an environment favorable to itself, as rivals attempt to cope with prior losses by raising prices.

Over the past 12 months, AmTrust has written $2.8 billion of workers' comp premiums, making it highly likely to finish the year as one of the top five workers' comp underwriters in the United States. But we don't think that means it's doomed to the glacial pace of growth common to many of the larger insurers. The company is moving into the commercial package insurance business (which includes workers' comp); SNL Financial estimated this as a $241.3 billion market in net written premiums as of 2014. AmTrust management believes its commercial package business can become its next billion-dollar platform, and we believe management will continue to find markets ripe for disruption.

Buy: Apple (NASDAQ: AAPL)

The leader in mobile computing products should see more long-term growth than anyone expects.

Suggested Allocation: 3.8%

For More

- Pro's original recommendation (2/14/12)
- Most recent earnings update (2/4/16)
- Talk about Apple

Led by its iPhone, **Apple** (NASDAQ: AAPL) designs computing devices that people love to use. Its products tie into the smooth Apple ecosystem, which centers on the iTunes and App Store marketplaces, as well as the new Apple Pay. Apple services (iTunes, App Store, Apple Music, etc.) generated more revenue last year than more than 70% of the companies in the Fortune 500, while Apple itself is the most valuable company in the world, with more than $230 billion in annual sales. Despite this massive size, the company continues to grow and generate increasing profits for shareholders -- earnings per share were up 27% this past year. The company's integrated hardware and software make for a sticky consumer experience that provides disincentives to switch to a competitor, and as more people use multiple computing devices, Apple makes it easy to transition seamlessly from one of its products to another.

We expect the recently launched Apple Watch and Apple TV to help further entrench the Apple ecosystem into people's daily lives, all while Apple continues to work on developing its next major product and returning massive amounts of capital to shareholders through dividends and buybacks (almost $50 billion in fiscal 2015!). We're not counting on a revolutionary product anytime soon, but we are counting on record numbers of phones being sold to both new and existing customers over the coming years. We want to be in on that conference call.

Buy: Medtronic (NYSE: MDT)

The medical-device industry is complex and regulated, and it provides entrenched leaders with a competitive moat; our leading company is growing in international markets.

Suggested Allocation: 3.1%

For More

- *Pro*'s original recommendation (7/1/2009) ...
- ... and our second buy recommendation (11/9/10)
- The next earnings update is coming in May.
- Talk about Medtronic

In March, the CEO of Medtronic put it like this: "Our formula for long-term success is to deliver consistent mid-single-digit revenue growth, with 200 to 400 basis points of EPS leverage, [and to] return a minimum of 50% of our adjusted free cash flow to shareholders through dividend growth and share repurchases. The expected net result is creating enormous value, with sustainable double-digit [at least 10%] total shareholder returns."

As shareholders of Medtronic, this is exactly what we've seen over the years: Our annualized return on the position is 11.25%, and we think something close to this can continue going forward. Medtronic is a market leader in vital medical devices, be they for the heart, spine, knee, or one of four other key categories. The stock yields 2%, and the dividend has increased annually for the past 38 years, resulting in an 18% compounded annual growth rate (CAGR). Expect continued dividend increases, sales growth of about 4% to 6%, and earnings-per-share growth considerably higher than that — all of which should combine for North Star-challenging returns. While Medtronic has touted itself as a play on international markets, growth in the U.S. has lately regained traction, too. International markets still account for a small minority of revenue, and are growing smartly.

Buy: OpenText (NASDAQ: OTEX)

This company's information management software keeps the digital lives of businesses in order, and its exchange software platform drives business transactions and earns recurring revenue.

Suggested Allocation: 3%

For More

- *Pro* 's original recommendation (8/31/11)
- Most recent earnings coverage (3/10/16)
- Talk about OpenText

A leader in Enterprise Information Management (EIM), OpenText offers customers (governments, universities, corporations) a full suite of software solutions to manage growing reams of digital data. Its three areas of focus are data and information management; information exchange platforms within and across organizations; and analytics, where "big data" is used to gain insights and better run a business. Said differently, OpenText helps customers go digital with their data, or manage what is already digital, including transactions.

The leading independent provider of EIM software, Canada-based OpenText is enjoying strong cloud sales as well as steady license contracts. Its EIM market should increase sales by least 10% annualized (our estimate) over the next four years. In turn, we're looking for at least 10% annualized returns from our ownership of OpenText shares. The year 2016 is an important and exciting one for the company; its new software, called Release 16, is rolling out after its fall 2015 debut. It's designed to integrate nearly everything OpenText software can do, and success should bring many more cross-selling opportunities, as well as new clients. At the same time, deep data analytics is embedded throughout the software for the first time, adding upsell opportunities. OpenText enjoys strong recurring revenue (which represented 84% of its sales in fiscal 2015). We may sometimes recommend options on the stock, as we've done several times in our sister service, *Motley Fool Options*.

Buy: Skyworks Solutions (NASDAQ: SWKS)

This leading designer of analog modules for smartphones and connected Internet of Things devices is growing sharply.

Suggested Allocation: 3.4%

For More

- *Pro* 's original recommendation (8/5/14)
- Latest earnings coverage (3/2/16)
- Talk about Skyworks

Beyond having one of the coolest names in our portfolio, Skyworks Solutions makes technology that powers wireless connectivity in a wide variety of products: Apple and Samsung smartphones, **Medtronic** (NYSE: MDT) medical devices, **Alphabet** (NASDAQ: GOOGL) and **General Electric** (NYSE: GE) products. In the "Internet of Things," millions of physical objects are going online, and Skyworks is uniquely positioned to benefit. Not only does it serve *all* smartphone makers, but the company is diversified across industries to total more than 2,000 customers. How so?

Skyworks sells more than 2,500 high-performance analog semiconductors and related products, supported by more than 2,200 patents. The product list includes amplifiers, attenuators, receivers, switches, diodes, modulators, GPS power and voltage regulators, and more, often sold together as a module for a phone or connected device. Skyworks earns industry-beating operating margins of more than 30% (and they're headed higher) by selling specialized solutions to giant customers with growing connectivity needs. Plus, as wireless complexity increases, fewer companies can deliver the integrated modules customers need, putting Skyworks in an even stronger position. The China opportunity is large as well.

This can be a volatile "chip" stock, but its long-term outlook (which is the time frame we care about!) remains compelling. The company expects its long-term total addressable market to increase by about 15% a year, and Skyworks is increasing its profits more quickly than that.

Buy: Starbucks (NASDAQ: SBUX)

You only think you're there for the coffee — the ubiquitous java purveyor has big plans.

Suggested Allocation: 3.8%

For More

- [*Pro*'s original recommendation] (8/22/2012)
- [Most recent earnings update] (2/5/2016)
- [Talk about Starbucks]

You may not realize it, but "**Starbucks**" (NASDAQ: SBUX) is no longer just a synonym for "coffee." In January 2011, the company dropped the word "coffee" from its logo and has never looked back. Yes, java will be a major driver of the business for decades to come, but in a sense, it's just a front. We *think* we go to Starbucks for the coffee, but those green-and-white cups have been planting the magic beans of a simple but powerful experience, one rooted in comfort, quality, health, community, and conscience.

Starbucks began opening America's eyes to Italian-style coffee shops and beverages more than 40 years ago. Today, it has more than 24,000 stores in 70-plus countries, all of which serve as hubs in its distribution network as they dish out coffee, food, snacks, and experiences in more than 80 million transactions each week This company is continually finding new ways to reach customers; we're grabbing a latte and a cake pop and coming along for the ride.

Buy: Verisk Analytics (NASDAQ: VRSK)

This prototypical Pro *holding provides us with exposure to powerful tailwinds within the financial, energy, and health-care industries, among others*.

Suggested Allocation: 2.2%

For More

- [*Pro*'s original recommendation] (6/23/15)
- [Most recent earnings coverage] (3/1/2016)
- [Talk about Verisk]

Verisk Analytics (NASDAQ: VRSK) may not be a familiar name, but with a strong competitive advantage, high customer retention, robust and contract-based cash flows, a scalable business model, and large (and growing) markets, the company is in many ways a prototypical *Pro* holding. Verisk started as an information utility for the insurance industry, but nowadays it's is a data and analytics powerhouse that provides customers with solutions in all sorts of arenas: raw data, tailored analytics, enterprise reporting systems, policy fraud detection solutions, competitive benchmarking, and legally tested policy language, just to name a few.

One way to invest successfully is to buy out-of-favor industries, and three to five years from now, we may look back and realize that Verisk did exactly that by entering into the energy industry (via its May 2015 acquisition of Wood Mackenzie) in the midst of the current energy slide. We tend to shun commodity-based businesses here at *Pro*, but we believe Verisk's purchase of WoodMac was a good one: The latter is pretty much a copy of the former, but with a different end market. WoodMac is a leading provider of data analytics to the global energy, chemicals, metals, and mining markets, and it actually has higher margins and a greater percentage of subscription-based revenue than Verisk's other business units. We don't profess to have the ultimate insight into what the next six months have in store for WoodMac and Verisk, but we believe shareholders will be very happy with the results over the next three years.

Buy: Visa (NYSE: V)

With its mission to "accelerate the electrification of commerce," industry leader Visa has most of the world left to conquer.

Suggested Allocation: 2.5%

For More

- [*Pro*'s original recommendation] (4/28/15)
- [Most recent earnings coverage] (11/25/2015 — this quarter's update is on the way)
- [Talk about Visa]

The ubiquitous nature of credit and debit cards in America means that many of us can go through life rarely touching cash. Yet even in the U.S., cash still accounts for approximately 40% of transactions, followed by debit cards at 25% and credit cards at 17%. And globally, cash is truly king: MasterCard estimates that 85% of all consumer transactions still take place with old-school paper and coins. But all of that is slowly changing as economies modernize and middle-income families proliferate, bringing more converts to the benefits of electronic payment. With its mission to "accelerate the electrification of commerce," industry leader **Visa** (NYSE: V) has most of the world left to conquer.

We like Visa for many of the same reasons we like MasterCard. And with the recent acquisition of Visa Europe, the company will be adding 523 million card accounts that resulted in 38 billion transactions and $1.67 trillion in point-of-sale spending last year

. Visa is valued at $195 billion, and given its tiny market share, its ceiling should be much higher than that. It fits into *Pro* as a recurring-revenue business that invests its free cash flow in more growth at still higher rates of return, making it a compounding vehicle.

Pro Catch-Up Trades: April 18, 2016

Published Apr 18, 2016 at 2:29PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

New members: Keep in mind, our [Portfolio Building Reports] will get you fully invested over the coming few weeks, as much as you want to be.

Pro's [Buy First stocks] are recommended for your long-term portfolio; buy into them gradually. Some highlights:

- **Broadridge Financial Services** (NYSE: BR): Buy our 5% allocation, at once or in halves if you like.

- **Facebook** (NASDAQ: FB): Buy our 6% allocation in thirds or halves over time (or sell to open May 20, 2016, $106 puts, lately for around $3 each, if you'd like to target buying 100 shares or more at about a net $103 or so).
- **Gentex** (NASDAQ: GNTX): Buy up to 2.7% in stock.
- **Oracle** (NYSE: ORCL): Buy up to 3.9%, or buy in halves.

Continue building your portfolio with our Buys, including these highlighted today:

- **OpenText** (NASDAQ: OTEX): Buy up to 3% in stock.
- **Papa John's International** (NASDAQ: PZZA), buy up to 2.7% in stock.
- **TD Ameritrade** (NASDAQ: AMTD), buy 2.5% in stock.
- **Verisk Analytics** (NASDAQ: VRSK), buy 2.2% in stock.

Options:

- **Gentex** (NASDAQ: GNTX): Opportunistically, when they pay enough per our guidance, sell to open May 20, 2016, $15 puts as detailed in our recent recommendation, to potentially add to your stock.

Hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): Our April hedge expired Friday. We plan to set up a new one soon. Our June put ratio spread can still be set up for a credit if you move your lower strike price up. So, you would sell to open two June 17, 2016, $192 puts for every one June 17, 2016, $200 put you buy. Each $200 put represents a $20,000 short of SPY. Use the trade alert for allocation guidance (again, simply adjusting your lower strike to $192, and still getting a small credit to set up each spread).

Our most recent short:

- **Deere & Company** (NYSE: DE), as a hedge against the market and our investment in **Valmont** (NYSE: VMI): Sell short (sell to open) 1.8% of Deere as per our recommendation.

---

6 Key Things to Learn From Pro

Published Apr 18, 2016 at 12:49PM

Welcome, new Pro *Fools! We're glad you're here. In the following column, first published in November 2015, Jeff shares the key aspects of* Pro *that will help your investing most now and in coming years. As you find your way around, keep an eye on the Guidebook page and your email for the series of Portfolio Building Reports that will get you caught up with us, and please bring any questions to the Getting Started & Help board. Thank you again for being here -- and a special thanks to our veteran members for their Foolish assistance on the discussion boards! -- The* Pro *Team*

Dear *Pro* members:

It's great to see new *Pro* members on our discussion boards, asking questions, engaging in conversation with other members, and making investment decisions suitable to them as they move forward – whether that's mirroring the *Pro* portfolio exactly, or modifying it to suit individual needs.

When we launched *Pro* nearly eight years ago, this type of community discourse between members wasn't possible. Today, those questions are much easier for our veteran members to answer, so they can help new members get up to speed (thank you!). That said, we're still early in this endeavor to grow great value together over many years. We're still just starting.

Today, we'll highlight some of the most important things for all members to learn from *Pro*. But first, let's get some of the most common new-member questions out of the way:

- **Should I invest in an IRA or not?** That's up to you; many members do. Just remember you can't sell short or do all options trades in an IRA.
- **Should I only buy stock in 100-round lots?** That's not important unless we say so; don't buy 100-round lots if it takes you far from allocation guidance.
- **Should I buy all of *Pro*'s Buy-rated stocks, or only the ones below our fair-value estimate?** Yes, buy all the ones that are rated Buy; that's why we rate them Buy! Fair value is a conservative estimate that goes up over time. Your Portfolio Building Reports will get you up to speed on all of our investments, including our shorts and options in early May.
- **Should I sell all of my old stocks or not?** Sell your least favorites if you need to raise funds for *Pro*, but don't be shy about keeping stocks you love.
- **How important is it to match your allocations?** It's fairly important, but not an exact science. If we have 2.7% in a stock and you invest 3%, or vice versa, it's probably just fine. Just be fairly close.
- **Can I buy *Pro* stocks in increments?** Yes. We often recommend that, especially on our larger positions. Buy up to our allocation in halves or thirds over a number of months that makes you comfortable. Some members go all in at once. It depends on your preference.

Those are important initial questions. Now let's look at the bigger picture: What will help your investing *most* over the coming years? Here, in order of importance, we have ...

6 Key Things to Learn From Pro

1. The types of companies we buy.

If you only come away with one thing, it should be this: We buy companies with eight specific qualities (we spell them out in your Guidebook) that will ideally lead to long-term compounding. We aim to buy companies that will steadily grow, reinvest their cash flow in more growth, and compound further as a result. We target businesses with pricing power, predictable revenue, high returns on capital, and other specific traits. Learning to spot these types of winners could change your long-term investment success in a large way.

2. Our preferred time frame -- and patience.

If you're a Foolish investor, this one is easy. You already know that small gains are made in the short term and by trading (if you're lucky), but fortunes are made by holding great businesses for years. We don't sell our favorite businesses on short-term blips or minor valuation concerns. We're investing to compound. You should only buy a stock when you have a rolling three-year outlook, to start.

3. Portfolio construction.

If you internalize those first two factors alone, you should do very well over the rest of your investing life, and (sadly) be miles ahead of most others. But *how* you build and manage your portfolio will help determine the magnitude of your success, and the bumpiness you experience in getting there.

What we hope you'll learn from your *Pro* service about portfolio construction and management is best gathered from at least a few years of following what we do. One constant you'll see is that we want flexibility in our portfolio. We want to be confident and have room to make new investments even when the market is in chaos. So, we seek to construct a portfolio that only holds businesses we believe in (that match our criteria), keeps cash for opportunities, and delivers steady returns despite market volatility -- with at least some positions winning no matter what the market is doing.

For some stats: Since January 2012, our portfolio has averaged 87% long and 15% short, meaning we've averaged 72% net long (or net invested in the market). Yet with less volatility and only 72% market exposure, we've outperformed our always-positive North Star and the S&P 500 -- thanks in part to the strong types of companies we own. Learning portfolio construction is a great endeavor here.

4. Using options for income.

If you're interested in going beyond stocks into options, arguably the single most valuable lesson you can learn here (and in our sister service, *Motley Fool Options*) is how to generate income by selling options. We talk about this so much across both services that I won't go into it more here (see Options U if you want to dive deeper), but suffice to say countless members have changed their investing lives -- and made retirement possible or better -- by learning how to generate income in their portfolios (while still holding stocks for upside!). Among our favorite strategies are written puts, diagonal calls, and covered strangles (and simply buying calls for leveraged upside), and we've made option income almost every month over the past year in *Pro*. Monthly option income on top of our stock investments remains our goal.

5. How and why we hedge.

Carrying some cash is one way to soften the blow of falling markets; another is by learning to hedge the *Pro* way. We typically set up low-cost option hedges on major market indexes, such as the S&P 500 or Russell 2000. Many of our hedges don't cost us money out of pocket (instead, they often carry an obligation to buy shares of the index if it falls sharply, something we're fine with). Most hedge funds pay a large percentage of assets to hedge, but we usually don't. Not doing so has been important to our returns since inception. If you want to learn to hedge, follow our hedging trade alerts (most of which are very low-cost) and attend (or review) our Portfolio Positioning Event on May 4. This event will also address our shorts and current options.

6. Shorting losers.

Finally, selling companies short isn't for everyone, but you can learn how to employ this "expert only" investing style in a way that won't put your portfolio at unreasonable risk – and should help in bad and sometimes even good markets. We seek to short companies that should struggle *whatever* the environment. Position sizing and risk management (including knowing when to close the position) are important, as is having a broker that allows you to stay short (we've had the best luck with TD Ameritrade and Interactive Brokers). Shorts are the final piece of the puzzle to learn here in *Pro*, and we'll have more about on our existing shorts on May 4. (If you can't make the May 4 event, no worries; video and text will both be archived on the event page when it's over.)

It's All a Fun Process

Overall, enjoy the process! Like anything good, it takes time. But if you enjoy it, before you know it you'll own great stocks, and be happy owning them; you'll be calm, because you always think in terms of rolling-three-year time periods for your stocks; you'll have a portfolio that is flexible; you'll be generating regular income from options if you want; and you will be hedging and shorting as much or little as you wish, with confidence. All the while, you'll remain invested for long-term upside. These are the key things we hope you'll learn with us at *Pro* to make you a better investor for life. Just realize that it takes time to make real money in the stock market. In the short term, prices are likely to move in either direction, by varying degrees.

Thank you for being here and for putting your trust in us. And to our great veteran members, thank you for welcoming new members so thoughtfully and thoroughly!

-- Jeff (TMFFischer)

Pro Portfolio Building Report No. 1: April 13, 2016

Published Apr 12, 2016 at 8:51PM

Welcome, Fool! We're glad you're here. This first report is meant to get you up to speed on our Buy First stocks — the companies in your *Pro* portfolio that we believe you should start purchasing first. But before we get to that, a few words about how best to use *Pro* ...

1. **Know who we are and what we're after.** *Motley Fool Pro* is here to help you build a diverse portfolio that aims to generate winning returns no matter what the stock market throws our way. Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, hedges, and ETFs, we aim to achieve positive returns over every rolling three-year period and to double our real purchasing power every 10 years. To stay on course, we developed a guide — our North Star, which is inflation + 7% annually. For more, see our Strategy Guide.
2. **Make *Pro* fit you.** We know not all investors are in the same situation! We can help you figure out how to buy *Pro* investments given your personal situation, including investing in an IRA or coming to *Pro* already fully invested. Check out our advice for every approach to *Pro*: Invested Elsewhere | "Free-Range" | Whoever You Are
3. **Catch up with our portfolio at your own pace.** Start with the stocks in this report, and follow along with our subsequent reports between now and our live event on May 4. You can always see our Buy First, Buy, and Hold guidance (which is the most important -- more important than valuation estimates) on the Recommendations page, and you can get a succinct, up-to-date take on all of our stock positions on our What We Think Now page.

Bring any questions to the Getting Started & Help discussion board, and Fool onward!

-- The *Motley Fool Pro* team

A Note on Fair Value >>

Table of Contents

Buy First: American Tower (NYSE: AMT)

Providing antenna space to wireless providers keeps this company buzzing.

Suggested Allocation: 3.8%

The Internet isn't just for computers anymore; people are getting online everywhere they go, carrying their connections in their pockets. Global mobile data traffic is expected to increase at a compounded annual growth rate (CAGR) of 53% between last year and 2020, and global mobile 4G connections are expected to grow from 1.1 billion in 2015 to 4.7 billion by 2020 (a 34% CAGR). Communications site operator **American Tower** is well-positioned to benefit from this trend.

For More

- *Pro*'s original recommendation (5/6/13)
- *Pro*'s "Buy More" recommendation (3/17/14)
- *Pro's* "Buy Calls" recommendation (12/17/14)
- Most recent earnings update (2/27/16)
- Talk about AMT

AMT leases antenna space on more than 100,000 cell sites (towers, rooftops, and more) to wireless service providers across the globe. Think of it as a multi-tenant apartment building that benefits from sweet lease agreements: The "tenants" are wireless companies, the "apartments" are space to house their equipment, and the "lease agreements" are long-term, non-cancellable, and feature contractual annual price escalations. More than half of AMT's properties are located in 12 (soon to be 13) different countries outside the U.S., including India, Brazil, Colombia, Mexico, Nigeria, and South Africa, and management is intent on expanding the company's international portfolio as it continues to build and acquire more towers.

As wireless data usage grows, AMT benefits. AMT's customers are continually upgrading their antennas, whether it's to improve coverage, to allow their customers to make the leap from 3G to 4G LTE, or to increase coverage density. When they do, AMT increases the lease rate — on top of the scheduled price escalations. Switching costs in this space are high; about 98% of AMT's customers up for renewal each year do so, and more than 60% of its current leases don't renew until 2021 or later.

The stock may experience volatility in the short term because of its tendency to trade alongside the interest rate-sensitive REIT sector, but over the long term, the underlying strength in business fundamentals should shine through. We expect to earn modest income from a growing dividend and strong appreciation as AMT continues to build out its international tower portfolio.

Buy First: Broadridge Financial Solutions (NYSE: BR)

This well-run company dominates the critical behind-the-scenes niches of the financial sector.

Suggested Allocation: 4.9%

For More

- *Pro*'s original recommendation (4/27/10)
- Most recent earnings update (2/5/16)
- Talk about Broadridge

Stock geeks like us know that as shareholders, we're business owners, so our votes on business matters count. **Broadridge Financial Solutions**' (NYSE: BR) investor communications solutions segment ensures this democracy keeps swinging.

Collecting shareholder votes is a difficult process. It's also annoying, highly regulated, and inefficient on a small scale. Broadridge has alleviated all of this pain, and it's come to dominate these activities — in its fiscal 2015, its platforms processed approximately 85% of all shares in the United States. With its decades of shaping the proxy voting market, Broadridge has become the go-to service provider for managing investor communications.

The company's smaller segment, Global Technology and Operations (GTO), accounts for 26% of sales, but it's no less critical to the financial services industry. Every time you click "buy" or "sell" at your brokerage, there's a good chance this Broadridge technology kicks into action — the company processes more than $5 trillion worth of global stock and bond trades each day.

Broadridge is a model of niche domination. Its pricing power, scale-based competitive advantages, and low reinvestment needs turn modest top-line growth into strong bottom-line results — and should result in attractive returns.

Buy First: Facebook (NASDAQ: FB)

Although it's lately riding a wave of popularity, we believe the strong stock is justified, and the business should grow handsomely in coming years.

Suggested Allocation: 6.2% (buy in thirds, or halves, over a few quarters; or, experienced investors can write put options to target buying some of their shares cheaper; "sell to open" one put option for every 100 shares you could buy; since you want shares, sell "near-the-money" puts, with a strike price near the current share price, and that expire in just a month or two)

For More

- Latest earnings update (3/2/16)
- *Pro's* original recommendation (9/18/12 – dated by now! But this shows how we thought about it back then when it was $20 and most were bearish)
- Talk about Facebook

Facebook remains a young story about monetizing the largest, most engaged online audience ever hosted by one company. The company's future is in strong hands; management is showing patience and care as it starts to monetize more of its properties, putting visitor experience first. So far, this approach has paid off, with user engagement up even as more ads appear. The billions of connections maintained on Facebook's properties are making the sites extremely sticky, offering the potential for increased value to advertisers (and thus Facebook shareholders) -- especially as the advertising gets smarter and more targeted.

It's our largest position at a recent 6.2%, and the size of our investment in Facebook feels appropriate given how much growth potential lies ahead and how well-managed the company is. Even from today's price, we estimate Facebook could return about 15% annualized for shareholders over the next five to seven years. Though shares are currently a bit above our fair-value estimate, the stock is rated Buy First on its long-term potential. Key risks include users moving away from Facebook, but so far the company has shown great skill in *increasing* user engagement and stickiness, rather than stunting it. It's also possible that management could spend more than Wall Street expects, though that should mainly be a short-term concern.

Buy First: Gentex (NASDAQ: GNTX)

The maker of auto-dimming car mirrors has a bright future.

Suggested Allocation: 2.6%

For More

- Most recent earnings update (3/3/16)
- *Pro*'s original recommendation (5/29/12)
- Talk about Gentex

In 1982, a small company in Zeeland, Mich., called **Gentex** made an illuminating change. Before that time, Gentex was in the exciting business of manufacturing smoke detectors, but scientists deep in its R&D lair had stumbled upon the technology to make glare-control mirrors for automobiles. In 1987, Gentex mastered electrochromic (auto-dimming) technology, amassed a large patent portfolio, and began its quest to lead worldwide production of automatically dimming mirrors.

If you've ever driven at night, you know why auto-dimming mirrors are important. Any joker who creeps up behind you on the highway can accidentally start a game of ping-pong between their headlights, your rearview mirror, and your retinas, temporarily blinding you. Plus, ever-larger mirrors capture ever more glare. Gentex's auto-dimming mirrors render all of that moot, and they've become wildly popular. Today, the company commands more than 90% of that market.

Currently, about 26% of cars made worldwide have an auto-dimming rearview mirror, and only 8.5% have auto-dimming exterior mirrors. For context, prior to 1987, those numbers were 0% and 0%, so that's heady penetration growth. We expect these mirrors' safety and affordability to spur higher and higher usage; global acceptance could more than double, to 50%, about the level the U.S. enjoys today.

We also believe Gentex's dominant market share will create a virtuous cycle, allowing it to capture attractive profits from that growth. Because Gentex pioneered electrochromic mirror manufacturing, it has more know-how and experience in the field than any other company on the planet. Those decades of experience mean better quality, which fuels Gentex's market-share lead and allows it to achieve efficiencies of scale its competitors can't match.

More and more technology is finding its way to the auto mirror (including the newly launched full display mirror), both because it's a natural interface for drivers and because it's a flexible platform that doesn't require a redesign of the car's interior. Those new technologies can be bundled with Gentex's mirrors to improve pricing and increase demand. Gentex makes the rear view look good, but the view out the windshield looks even better for this steady-growth company.

Buy First: MasterCard (NYSE: MA)

With approximately 85% of the world's commerce still happening in paper money, electronic payment leaders have a lot of room to grow.

Suggested Allocation: 4.5%

MasterCard (NYSE: MA) is among the most attractive businesses in the world. The company rings up revenue every time someone uses a product bearing its name to charge, debit, or pre-pay their way through the cash register. Any credit risk falls to the banks and lenders; MasterCard only facilitates transactions and markets its brand. That leaves the company free to earn high returns running a largely fixed-cost transaction network that becomes more profitable the more people use it.

For More

- *Pro*'s original recommendation (9/8/11)
- Latest earnings update (3/14/16)
- Talk about MasterCard

The company "charged forward" again in 2015 despite slow international commerce and a strong U.S. dollar. For the year, net revenue in local currency advanced 8%, and EPS gained 18% before special items. But right now, an investment in MasterCard -- as with **Visa** (NYSE: V) -- is an investment in growth *beyond* this year, because 2016 looks tepid as emerging markets struggle and the dollar remains strong. Much of the company's growth potential is being coiled up like a spring. That spring should pop when more economies begin to expand again and the dollar weakens. The market knows this, so the stock maintains a premium valuation.

Even so, we recently moved MasterCard back to Buy First and increased its fair-value estimate. The stock trades a bit above that price, but that's been the case for as long as we've been following it. From this price, we target about 11% annualized returns over the long haul.

Buy First: Oracle (NYSE: ORCL)

This old-guard tech giant has reinvented itself into a cloud software leader, with expanding margins and fast-growing cloud revenue.

Suggested Allocation: 3.9%

Oracle is the largest business software provider in the world, with more than 420,000 customers and $37 billion in annual revenue. The giant built its legacy by selling database management software licenses and related hardware, but in recent years it's begun transitioning customers to its new cloud software offerings, in the process hosting customer data on its own premises.

For More

- Latest earnings update (4/1/16)
- *Pro*'s original recommendation (9/17/09)
- Talk about Oracle

This transition has cost it money in recent years. First, Oracle had to invest in hardware, software development, and sales staff. Second, cloud customers bring in less up-front revenue compared with traditional software license sales, creating a strong revenue headwind in the short term. Over the long term, however, cloud customers are more lucrative than old-timey license customers, with the benefits generally starting about three years after making the switch. Oracle is in early stages of this transition, but enough customers are moving to its cloud that Oracle's revenue has not been growing lately.

The good news: Now that investments and other transition costs are slowing, gross margins for the cloud business are going higher, and Oracle expects profit growth to result, especially as cloud revenue increases. We believe Oracle's comprehensive software solutions will help it keep most of its giant installed base and continue to win it new customers, ultimately leading to a larger, more profitable business. After several years of patience, we should start to see this healthy scenario unfold soon and for the coming many years. This Buy First stock looks undervalued today, and we model for at least 10% annualized total returns with relatively low risk.

Buy First: Wells Fargo (NYSE: WFC)

At heart, banks are simple businesses, and Wells Fargo is one of the best of the breed.

Suggested Allocation: 3.2%

If you plan on being cryogenically frozen for 30 years (or more!), **Wells Fargo** (NYSE: WFC) is the type of company you'll want to own before you take the plunge. It's large, it's strong, its operations are diversified, and its customers love it. Wells Fargo's community banking, wholesale banking, and wealth, brokerage, and retirement divisions provide services through more than 8,600 branches and 12,900 ATMs. It's the third-largest bank in America by total deposits, it has a reputation for high customer loyalty and satisfaction, and it's the U.S. leader in residential mortgage and small-business lending.

- Talk about Wells Fargo on our discussion board

At heart, banks are very simple businesses. They borrow money in the short term, through deposits, and lend it long-term, through mortgages and other loans; the spread between the short-term and long-term interest rates, minus losses on the loans, is profit for the bank. That interest income makes up roughly half of Wells Fargo's business; the other half mainly comes from fees, including deposit service charges, commissions, and mortgage-related fees. During low-interest lending environments like this one, it's easy to see why we appreciate these other sources of income growth. Diversification is as important in banking is it is in investing.

Wells Fargo's focus on cutting costs and driving efficiency means further profit growth is in the cards. Management will selectively increase total loans in two ways — by upping lending in general, and by keeping more Wells-Fargo-originated loans on the books. In a world of continued low interest rates, we should expect ever more deposits, declining yields on earning assets, and a continued contraction in net interest margins. But if and when long-term interest rates rise and loan demand accelerates, Wells Fargo's earnings power — bolstered by growth in fee-based revenue — will hit its full stride.

Shares are trading at less than our estimate of fair value, and at recent prices they yield a growing 3.2% dividend. Given current conditions, we expect to continue to earn North Star-like returns from the business. With its impressive assets and a history of good management, Wells Fargo should be galloping along for years to come.

Portfolio Positioning Event: May 4, 2016

Published Apr 12, 2016 at 8:16PM

The *Pro* team held our Portfolio Positioning live chat on this page on Wednesday, May 4, with video streaming below and a text chat under that. Watch the replay and read the text-chat transcript below, and bring any questions to the discussion boards for answers from the team and your fellow Fools alike!

Video Transcript

JEFF FISCHER:

Greetings, Fools, and welcome to the *Motley Fool Pro* Portfolio Positioning event. I'm joined today by J.P. Bennett in this video chat. J.P., how are you today?

J.P. BENNETT:

Pretty good. How about you, Jeff?

JEFF FISCHER:

Doing well, thank you. And we are joined in a text portion of the chat — text only, no sound — by Ellen Bowman at TMFKabellen and Billy Kipersztok at TMFBillyTheKid. They will both be answering questions that you enter into the text portion of the chat. J.P. and I can also see those questions, here, and we will answer some, as well. So we'll chat with you, here, in the video for maybe a half hour, or so, and see how it goes. Then we'll be in the text portion of the chat the full hour, (either two of us or all four of us).

Thank you for being here. We're glad you're here. To veteran *Pro* members, hello again. To brand new *Pro* members, welcome. We are delighted that you're here and that we are here with you. We think you've made a great choice to invest in a Foolish way — let alone a *Motley Fool Pro* way — which is to view your portfolio as a bedrock, as strong companies that we believe will grow over the years and compound your money.

Now, if most of our investments do well, we should do very well. We'll always have some that are laggards. Some that are losers. We will patiently assess those and close them or work on them with options — whatever we feel is best over time — but overall, we're patient as we seek our North-Star-type returns, which right now are running around 10% annualized.

What else is different in *Pro*, though, from owning great stocks, is we use options for income, for leverage, and for protection. A case in point is today's hedge. We also short. We are always looking for more shorts.

J.P. BENNETT:

Always.

JEFF FISCHER:

We probably go through, J.P., 25 or 30 short candidates before we find two or three that we could possibly do, partly because it's very difficult to short many of the stocks that you want to short.

J.P. BENNETT:

It's a hard game to be successful in. That's for sure.

JEFF FISCHER:

It's true, but when you are, it's great. And so far we've had good success shorting. We've had, to my memory, almost all winners.

J.P. BENNETT:

[crosstalk 00:02:28]

JEFF FISCHER:

Exactly. Welcome, again. Here's a little overview of what we'll do. We'll run through the Portfolio Positioning Report and summarize that for you. Hopefully you've all read it by now (it came out last week). And then we'll talk about today's new recommendations, and then we'll tease. We'll name all the companies we're about to buy — no, we won't do that. We'll talk a little bit about looking ahead and what we hope to do, and we'll answer your questions. So very simple, and it should be a fun time together.

A final point is that this will be recorded and archived on the site, along with a transcript, so it will be there for the record.

Let's get started. *How is the live chat going?* Well, it's not our concern right now as long as this video chat is running.

J.P. BENNETT:

We've got some questions in there, now.

JEFF FISCHER:

Oh, good. Questions are starting to come in. Let's go through the Portfolio Positioning Report. If you want to find it yourself, on your Pro site go to the Guidebook tab. Click that and you'll see all of our catch-up reports. And the final one, April 27, about a week ago, was the Positioning Report. In this report we assume that you're starting to build your portfolio. You've bought many of our companies or you're at least on the path to doing that. And now you can start to at least consider the hedges, the shorts, and the options that we recommend, as well.

In most cases, we won't have many active options that you can do right away. We'll step you up to those with new trade alerts, because options are typically timely. And that's true, in some cases, with our hedges and shorts, as well. It's a long way of saying that in this report there were only four trades that we recommended you could do, and the rest (seven of them) are on hold, but we'll get you up to speed on those later.

We'll talk through the four, starting with the shorts, J.P. The first is Deere & Company. We have a recommended short of a 2% allocation. What's the thinking here?

J.P. BENNETT:

Basically we're betting against Buffett.

JEFF FISCHER:

We should have done it on IBM. We thought about it and it would have worked out very well.

J.P. BENNETT:

The thesis, here, is pretty simple. For the past couple of years, we went through what was an agricultural super cycle. Farmers made a ton of money. They saw their land values increase, and in some places exponentially. What did they do with all this excess cash? One of the things they did is buy a ton of new farm equipment. And as far as tractors are concerned, if you look at the historical data, the increase that we saw in the midst of the super cycle, as far as new tractor sales are concerned, was really unprecedented.

So what we expect is now that farm income is starting to drop (and it's been hit pretty hard), there really doesn't look to be any recovery for farmers on the immediate horizon. Land values are also starting to take a bit of a hit and so what we expect is it's going to take some time for the downside of this cycle to play out.

And if you look at the stock, we think that the bulls in the stock are betting that maybe in a year this company is going to be right back to producing cash flows and earnings like they were previously, where we think the normalized run rate is an awful lot lower as they've got all these new tractors and there's really no rush to go out and start replacing them.

So there's an alpha in terms of we think this is going to generate absolute returns, but then there's another aspect of this short in that it does provide a low-cost macro hedge that really helps the portfolio if the economy or just the markets, overall, are getting hit given that this is a cyclical company.

JEFF FISCHER:

If you look at J.P.'s original report here on the *Pro* site, it really details what he just touched on, which is a record number of equipment sales, record prices on farmland, and actually record crop output, as well, which leads ultimately to lower crop prices. All these factors are like a stretched rubber band. It's coming back and we think it will come back further than the market thinks.

J.P. BENNETT:

Exactly. With shorts it's often the case that you need to find a catalyst (a company that's going to struggle) but then it also needs to be a case where the market's expectations are misaligned with reality. Then we think as they continue to produce subpar results, and people start to wake up to the idea that this isn't going to be a quick snapback, then you're going to see a lot of selling pressure and then the stock is going to start to get hit.

JEFF FISCHER:

They also have a large financing department where, if things really went south on them, they could see a lot of defaults and a lot more downside risk there.

J.P. BENNETT:

And they're really trying to push the financing part of the business, as farmers aren't nearly as interested in just straight up buying tractors. They're trying to do everything they can as far as trade-ins, so you're seeing [an increase in the number] of tractors that they finance through their financing arm.

The increase that you've seen in terms of the number of tractors and the absolute value of equipment that they're now helping farms buy is increasing at a very steady clip, and that's helping stabilize their sales to a certain extent. They've already fallen quite a bit, but they'd be down even more if they weren't trying to offer such lucrative terms for farmers to finance new purchases.

JEFF FISCHER:

Then you have depressed commodity prices. Weak emerging markets. Do you know offhand, J.P., the percentage of sales that are outside the U.S.?

J.P. BENNETT:

Offhand, I can't tell you.

JEFF FISCHER:

I know we talked about it a few weeks ago, and it's substantial, suffice it to say. It's maybe one-third, or three-sevenths, or something like that.

J.P. BENNETT:

A fraction. Just keep going on fractions and eventually we'll be right.

JEFF FISCHER:

We'll hit it. It was substantial enough that we liked the short even more because of that.

J.P. BENNETT:

There are a bunch of different ways we think this can play out, and with investing you want to stack the odds in your favor. We feel like we have a lot of potential catalyst, here, for this to work out. But you've got to be patient. You can't predict exactly when the market's going to "wake up," if it does wake up, and start to align its thinking with what we're currently thinking. So sit tight. Currently we're in the red about 10-12%.

JEFF FISCHER:

I think we're around the worst of it and members shorted at higher prices than it fell, and we could put our short on.

J.P. BENNETT:

Yes, we shorted it…

JEFF FISCHER:

Right around the bottom…

J.P. BENNETT:

…and then it just started to take off. So we're down around 10%, and in the grand scheme of things, that really isn't something worth losing sleep over, given that it's only a 2% short. So you need to keep everything in perspective. If you buy a stock and it pops 10%, you immediately don't conclude that this is going to be a winning investment forever. It's the same thing with a short. If you're down 10%, don't conclude that it's game over. The thesis is still intact.

JEFF FISCHER:

That's a good point and good perspective. And speaking to patience, we're glad that while we wait, Deere is a very inexpensive company to short. The annual fee is very low. That said, we do pay approximately a 3% dividend that we'll pay quarterly as short sellers, so that will come out of your account as long as you're short Deere.

J.P. BENNETT:

It's best to think of that as part of the cost…

JEFF FISCHER:

Part of the fee.

J.P. BENNETT:

We've had some other shorts where we've paid an awful lot more than that. Things like World Acceptance.

JEFF FISCHER:

And keep in mind Deere is partly a hedge on Valmont Industries, because the two are both tied to agriculture, emerging markets, and, in some sense, industrial cyclical industries. Valmont has done very well since we shorted Deere and Valmont…

J.P. BENNETT:

It's up like 37%. I'd say that's pretty well.

JEFF FISCHER:

And they're equally weighted. They're both about 2% allocations, and Valmont pays a dividend that's about half of Deere's dividend. So that's a short. Keep perspective, as J.P. said. It's just a 2% position. We don't recommend adding more right now, partly because if Deere runs up quite a bit without merit, in our opinion, we could potentially short more shares.

It's very liquid. Very easy to add to our short lower or, in this case, increase our average short cost and maybe come out with a gain, that way. But we'll see. As a hedge or as a short, even if we don't gain, but the loss is small and it's served other hedging purposes, that helps us.

J.P. BENNETT:

Like I said in the memo, so far we're really down to the market only a couple of percentage points given that the market has done so well. In the grand scheme of things, it really hasn't dragged down our overall portfolio too much, given that a lot of our other stocks have rallied quite nicely as the market's recovered after the past couple of months where there was a lot of fear and uncertainty in what's going to happen.

JEFF FISCHER:

Speaking to rallies and long-term returns, the next short we'll talk about is ticker (FAZ). It's the Daily Financial Bear 3X short. This is an ETF that's been around since the financial crisis, more or less. It did really well during the crisis, but it's done horribly since then because financial stocks were so cheap and they have slowly recovered lost ground. We shorted the short of financials, so we're long. We're 3X long financials by shorting this flawed ETF. It's flawed because of the way it compounds returns. It stacks the odds against it doing extremely well.

So we're up 65-70% on this short, but we still believe in it the same as ever because financial stocks are still inexpensive. The most you can ever make on a short, of course, is 100%, so new members shouldn't look at it as if we've already made 60% so there's not much more to make.

No, anyone who shorts today can make the same 60-70% we've made or more. It just may take time. So we suggested a 0.3-0.6% to short in FAZ. FAZ is difficult to short with most brokers. TD Ameritrade sometimes has shares. Interactive Brokers does have shares, but it's a 4-5% annual fee to short. That isn't that bad, really, and so that's why we're still short shares and still recommend it.

That said, if you're not shorting (and many members do not short), you can, instead, pick up an extra 0.5% in the likes of Wells Fargo or Visa. We have plenty of financial exposure and this ETF was another way (and still is) to increase our financial exposure without putting money out by collecting money into the portfolio instead of by shorting. We like this short for the long term. If you can put it on, great. If you don't, then know that you have plenty of financial exposure by following the *Pro* portfolio.

Those were two of the shorts that you could take on right now. J.P., if you have it pulled up there, do you want to talk about the existing (the earlier June) put ratio spread on SPY?

J.P. BENNETT:

I don't have it up here, but the thinking was very similar to what we have in the report that we just put out. We're going to set up a ratio spread. We don't want it to be where the market falls a little bit and the hedge kicks in. Right now the market has retreated to a point where we are pretty close to our upper put strike being in the money, but if the market falls by a decent amount — a $200-190 spread — then our puts will start to show value and we'll have a gain there.

But if it falls enough, then it flips over and turns into a liability. It was basically around a 10% look-through value, so if you do that one combined with our other ratio spread about 19%, it's important to keep in mind that they do kick in at different levels, so it's not like as soon as the stock falls below $200, both of them immediately kick in. It falls, the first one kicks in. If it keeps falling, then the second one kicks in but the first one turns into a liability.

But like we've said in prior reports where we set up ratio spreads, if that happens, the odds are we'd probably just close the position, turn around, and then buy calls on the market as a much more effective use of our cash to participate in that upside should the market recover. And odds are if the market falls, it ultimately will recover. That's a bet we wouldn't mind making if the market falls a lot.

JEFF FISCHER:

Well said. So the put ratio spreads are a way to hedge, if you want to, without the way we set them up. Without usually putting any money out. Usually we get paid some money, some income, per se, to set these up.

Why is that? Because we are taking on an obligation to buy, in this case, shares of SPY if the market falls sharply. So with the one in the Positioning Report, it was a $200 put we were buying, and in this case we adjusted it a little higher to $192 puts that we are selling. You can still set that up today and do so for very little cost or no cost.

Then the trade we issued today was a $185 put that we're buying and selling $177 puts. And, as J.P. said, those were just to, when the one starts to fall out of use, if the market falls too much, the second one kicks into exposure for us. So it's a way to hedge if the market falls. It expires on June 17, which is only 44 days away, now, and as it reaches expiration, we plan to, as usual, issue new ones for a few months ahead so that we're consistently hedged whenever we want to be.

And right now we do want to be for a few reasons. The market is near the upper end of its historical price range. It's still within the average, but upper end. There's a lot of uncertainty, especially in emerging markets, and earnings aren't really growing, right now.

Ultimately I think this sets us up. This year and a half of flat returns will set us up for a better future — better returns and more earnings growth — because we have easier comparisons that we're putting into place right now. Ultimately it will be a good thing for patient people.

J.P. BENNETT:

I know there's a couple of our stocks where we're looking at the valuation. We still love the prospects for the company, but the valuation maybe seemed a little bit stretched. Flat markets are pretty good because if our companies continue to execute, then they essentially grow into the valuation.

Take, for example, Starbucks. If the stock doesn't go anywhere and just treads water, and Starbucks continues to execute like they have been for the past couple of years, the valuation becomes cheaper over time as their cash flows and their earnings grow. I wouldn't mind a flat market for a little bit.

JEFF FISCHER:

A little bit — especially because we can do things like we did today — write covered calls and find opportunities for things that get beaten down with earnings. We're looking at a handful right now after earnings.

So that's the hedge that we had set up before new members joined and then today we issued a second one. If you have questions on that, hopefully you're asking them in the live text chat right now, which we'll jump to in a minute, or go the SPY board and we can answer your individual questions there, as well. On the S&P 500 SPDR board on *Pro*.

With the Positioning Report, we just had you buy 2018 call options on American Tower, which we are bullish on for the long term. The more people using cell phones, data, and whatnot, the more valuable these towers become around the world. The space that American Tower leases on them, the more valuable that is, more or less. They have long-term contracts with escalator clauses throughout.

Billy is almost done with his earnings review of American Tower and has teased us that the fair value price might go up a fair amount, so our fair value estimate is about to go up on that stock, it sounds like. And now that you bought your long-term call option on American Tower for upside, we will probably have another diagonal call recommendation, soon, for income on that call. Meanwhile, we have almost a 4% allocation in shares for the long term, too.

Those were the four positions that you could take right now as of this Positioning Report. I'll quickly run through all the rest that are on here and why we wouldn't have you do them right now, because you'll visit the recommendation page, see these, not have them yourself, and wonder why that is. *How do I get started on these? Why am I not getting started?* J.P., jump in anywhere you want. A lot of these are my mistakes or successes, in some cases.

J.P. BENNETT:

I was going to say. They're not all mistakes, yet. Some of these turned out pretty good.

JEFF FISCHER:

The first one — and I'm just running through the Positioning Report if you want to look at that alongside us — is American Airlines. We own $35 call options that expire in January, 2017. Right now the stock is about $33. When we bought these, the stock was about $50, so it's been one of our worst positions in my memory in our whole lifetime here in *Pro*. Luckily it was just a call option and we didn't risk more than 1%, but we're on track to lose that 1% right now and we take that very seriously.

American Airlines stock trades at about 3-4x earnings. It started at around 6-7x earnings and we thought the market would reward it as it kept growing profits to about a 10x earnings multiple, which would drive the stock a good 50% and our calls up 100%. Lo and behold, the opposite has happened. The company has grown and the market is rewarding it at about half the earnings multiple that it used to — down to a 3 P/E.

Why is that? Even though American is growing earnings, it isn't growing revenue per average passenger mile and it doesn't expect to until at least next year. Earlier it said it would this year, so it keeps pushing that back. That metric really matters to the market, because if it isn't growing revenue per average passenger mile flown, ultimately the margins are going lower and the prospects for greater profits are diminished, especially if oil prices go up.

So the market is really bearish on American. The stock has gotten hit. We're down to seven months until expiration. Our calls have time value of $3-4 per share, and we might just take that soon, so veteran members are perking up. We might just take what we can get out of the calls and move on, because we could wait a long time for Wall Street to change its opinion on the airline. It was a one-off speculative, as we noted in the first report. The position for us — we wish it were working out differently, but I may be about to wave the white flag on it.

Caesars Entertainment, meanwhile, is the opposite. We've made about 40% shorting Caesars. We closed half of it for that gain and we still have the other half. It's in bankruptcy proceedings, and we're waiting to hear more from judges. We're debating whether we want new members to short the company now that it's down 40% or not. So if we want you to, you'll hear from us on that.

Currency Shares Euro Trust we're also seriously debating closing. We've made about 15%. The euro has fallen a lot if you look at a 5-year chart of the euro versus the dollar. The 5-year chart shows exactly what we're looking for, which is a big drop in the euro. For a currency, a very big drop. And it has since flattened out. We have to decide if we believe there's another leg down for the euro, or not, and act accordingly, so we might be closing this euro short soon. Certainly after three or four years of waiting, we don't want to lose that gain.

Expeditors International — you'll hear from us soon. We're going to roll our covered strangle and we'll get newcomers into that position at that time. That's this month and as soon as next week, probably. There's a little time value still left, but soon.

Gentex — those puts are expiring as income and then we'll probably write new ones.

And then we have a few things on hold, like the Wells Fargo put that we'll roll. We'll get newcomers into that one, as well. And the short of the real estate ETF. It's just become too small in the ETF to short anymore. It's a tiny ETF — about $30 million in assets — so we're having you just sit that one out.

Generally, if you own *Pro* stocks and you do the positions that we said you could (so far those four) and then step into the new ones as we issue them, you'll be caught up probably within a few months as completely as you want to be. Again, you don't need to hedge or short if you don't want to (or use options), but we do recommend definitely options if you have any interest at all. Shorting and hedging, if you have some interest, is definitely worth it in the long run.

J.P., let's briefly run over today's trade alert. I want to see what the questions are about in the live chat, as I haven't seen that yet. We're seeing some come in.

J.P. BENNETT:

It looks like Billy and Ellen are doing a pretty bang-up job in answering most of them.

JEFF FISCHER:

That's great. If there's any big themes, here, in the text chat we can speak to those, as well. I'll ask Ellen if there are any themes and then we'll run through the new trades.

And we hope new members are starting to navigate the discussion boards and asking questions there. We are out there as frequently as we can be. Even more important, in most regards fellow members are out there and they're just being phenomenally helpful. Thank you for that. Almost any question you ask gets an answer and usually pretty quickly.

J.P. BENNETT:

Often quicker than I can get to it. There's already a couple of members that have chimed in…

JEFF FISCHER:

That is true.

J.P. BENNETT:

…which is great.

JEFF FISCHER:

And right now we're going through earnings reports and looking at new ideas, so we may be on the boards a bit less than usual, but we'll be back. These things ebb and flow and we really appreciate the membership out there who is helping.

Ellen says some questions being asked frequently — what about Expeditors today? Yes, that strangle is working out well for us. The synthetic long is up. We've made money so far, and I think the strangle is making a little money, too, even though the shares are $47 and we wrote $45 calls. The put-and-call combo paid us more than $3, as I recall, so we have some money there. But there's still a little time value in the calls. We'll close and roll those as soon as next week.

Someone else is asking why cover DGS. Frankly, it's because we can. Seriously, it's because the options pay decently. This one paid about 2% in 45 days. This year emerging markets have had a good run — up 6% so far. We don't see big reasons why that will continue. In fact, there are more reasons to be concerned that it won't. But either way, we can manage these covered calls.

You really should fault us for not writing calls in the past. We've been waiting patiently several years for emerging markets to do something and they haven't. We've only collected a dividend on this ETF, and we arguably could have been monetizing it a little bit more.

So we'll see how these calls go and we'll manage them. I think we'll make money, ultimately, on DGS whether we keep writing and rolling calls, or let our shares go and write puts to get back in. The bottom line is with emerging markets, it may be another year where they move mainly sideways, but we'll try to set this up so we make money either way.

How do you do options and hedges in IRAs? J.P., do you want talk a little to that? We do have alternative trades in the SPY Reports.

J.P. BENNETT:

That's what I would say. Always look for the alternative trades and see whether or not there's one that you can participate in. As far as shorting and hedging is concerned, we've said it before and we'll say it again. These aren't things that are 100% necessary to be successful in the long run. They are tools that we implement in order to help meet our mandate. For those members who want to strive to achieve similar results, it makes sense for them to do those, but they're not absolutely necessary.

Sometimes the alternative trades just don't make sense for you, or there aren't attractive ones, and we're not going to try and force an IRA alternative if there isn't something we believe in. Some cases maybe you'll have to deviate slightly from *Pro*, but for the most part, if you stick with as many of the positions as you can (and also that you believe in), your results should mirror ours in the long run. But first things first. Always check the alternative trades.

JEFF FISCHER:

Exactly. We'll do our best with every option — short and hedged — to provide an IRA-friendly alternative trade. In the cases where we can't, we'll make a point of saying that so that you're not left wondering about IRAs. We'll just say there are no attractive alternative trades, there.

And by the way, that is what we said with Deere. We didn't want members buying puts on John Deere — they're pretty expensive — or using options, period. We just wanted to short it directly, so if you're in an IRA, unfortunately you can't short Deere. But, as J.P. just said, that's okay. It isn't vital to your success.

J.P. BENNETT:

I know some member who ultimately decided to go with puts. If that's what they wanted to go with, and they understand the risks and rewards, that's perfectly acceptable. The reason we didn't at the outset was we didn't know exactly when this thesis was going to play out.

I think it's important to keep in mind that previously we had really great luck with Caesars and World (we put out a short report) and it seemed like the next day, the catalyst played out. So people who bought puts that expired relatively soon made out very handsomely, but that's not always going to be the case. We didn't know exactly when this thesis was going to play out, so we didn't want members having to constantly re-up and basically continue to buy puts.

Then subsequently when the hammer drops (if it does drop), you're in a situation where it's basically a wash because the stock's fallen a lot. You've made a lot of money with one put that you purchased, but because you had to buy a string of puts, it really didn't work out for you. We weren't comfortable with it, so it's just something that members had to weigh the options, themselves, and see what they believed in, and how soon they thought the thesis was going to play out.

JEFF FISCHER:

Exactly. And like with the FAZ short, there was an alternative trade and there is in the Positioning Report, but it's a synthetic short, and that's if you can't get shares to short, you can set up a synthetic short using options. But, of course, you can't do that in an IRA. FAZ is just another case where there's no IRA-friendly alternative because the put options, by themselves, cost so much.

The hedges that we set up, though, as J.P. said, certainly have IRA-friendly alternatives in each report, so check that out either in the Positioning Report (we give you an alternative trade for the higher strike SPY hedge) and in today's report on SPY, there are alternative trades for this lower-strike hedge. So down at the bottom of the report, see the alternative trades and that should let you set this up in an IRA.

That said, make sure you want to hedge in your IRA. If you have 10 to 20 years to retirement, hedging these funds that you will not touch for 10 or 20 years may not be worth the trouble. That said, if the market falls, it will give you some proceeds that you can then invest in lower-priced stocks, and that's always very nice.

You're partly here to hedge, and we're here to help make it happen if you have any interest in doing that. So we will keep working on IRA-friendly alternatives because we know close to half of *Pro* members, according to surveys, use at least some *Pro* investments in IRAs, so we know it's important to you all.

Let's go back to the live chat. Any other questions there?

J.P. BENNETT:

Billy pointed out the general theme of following Pro exactly versus modifying it for your own circumstances. That's something that's always worth considering. The first thing that you need to keep in mind is that *Pro* is different from the likes of *Stock Advisor* or *Rule Breakers*. Those are just idea-generation services. You pick your own allocation. You pick and choose what you want to do with it. They're not making recommendations based on the [00:32:59] of a portfolio. They're just coming up with they think the best idea is for them every month.

On the other hand, all of *Pro's* recommendations and actions are taking into consideration the portfolio as a whole and how we think those actions will impact that portfolio. So the side effects of deviating from what the recommendations are, are definitely different as opposed to something like *Stock Advisor* and *Rule Breakers*.

That's not to say that you can't do it if you have something that you just don't believe in, or you have something outside of *Pro*. You read a recommendation from someplace else, like *Supernova*, and you love the idea. That's fine. I know plenty of our members allocate some of their portfolio to *Pro* and maybe they allocate a different percentage to *Rule Breakers* and one to *Income Investor*. That's fine if that's the way you think you're best suited to achieve your financial objectives. It's always worth keeping in mind, however, that should you deviate from *Pro*, your returns could be materially different from what we achieve.

JEFF FISCHER:

And they might be materially better, or they might not. But Billy said that exactly right. The main things we hope you'll learn here (and I wrote this in a memo recently) are how we invest, and if you follow us exactly, then you'll definitely learn how we invest and see how our returns are. You'll mirror them.

But if you model how we invest and do it with other stocks, as well, I think it will still benefit you if you target the types of companies that we target, which are generally speaking really strong companies with a lot of qualities that make them that. So study what we look for in a company, and then seek that in other companies, as well, that you're buying.

Then you also learn how to use options and hedge and short. You can put it together in a way where your positions may differ a bit, but you still have the overall approach and philosophy, and that should really benefit you over the long term.

Ellen is saying that someone asked why we chose DGS itself, specifically, and not just the covered calls on it. Because it's kind of a dog. That was a helpful question. I'm happy to answer this. We bought DGS along with Vanguard Emerging Markets way back when…

J.P. BENNETT:

Before my time. Just wanted to throw that out there.

JEFF FISCHER:

In 2009 or 2010. Vanguard Emerging Markets did pretty well and we sold it right near the peak of emerging markets, so bravo. That was good. And DGS has actually done well compared to the other emerging market indexes (VWO and EEM) that we follow — other emerging market index ETFs. We chose it because it's small companies that we couldn't find ourselves in these foreign countries. It pays a decent dividend. The companies are growing, on average, nicely.

But emerging markets, as a whole, have gone nowhere or been hit for the last four or five years. They've seen valuation contraction. They've seen earnings contraction in a lot of cases. So in a bad environment, DGS has done okay compared to a lot of its peers, and for a bad environment we're pretty happy with how it's been managed and how it has, overall, held up all right.

But that's why we chose it, and thankfully we haven't added to it much. I'm glad we did sell our other emerging market exposure. But we kept the small cap exposure because we wanted some small cap exposure around the world with dividend yields, as well, for reasons explained in the original report.

Any other questions? Here's one I'll just read from Mikey: Hello, Jeff and J.P. In order to hedge my IRA, I sold another put at $180 S&P. Since that gives me coverage down that low, would it make sense for me to add the recent SPY hedge there? Thank you guys, and keep up the great work.

That's very kind and thank you. So to hedge the IRA, Mikey sold a put at $180 and they have coverage down that low. Would it make sense to add the recent SPY hedge there? I need more details on that before answering.

J.P. BENNETT:

I'm wondering if he means that he basically converted the ratio of the spread to a more traditional spread. Some of the alternatives that we recommend where he basically caps the losses…

JEFF FISCHER:

In an IRA.

J.P. BENNETT:

Yeah.

JEFF FISCHER:

I bet you're right.

J.P. BENNETT:

But I'd want to know his other strikes. I'm not sure if he's referring to using the $180 in the original report.

JEFF FISCHER:

Mikey, if you can ask that question on the SPY board, we'll be sure to check it and answer it for you. Another question from a member: I have puts on Skyworks. I imagine many members might have put options on Skyworks from Options, itself, or as they build their portfolio. I do not have any stocks, so what does today's covered call recommendation on Skyworks mean from my situation?

It means you don't have to do anything. Luckily covered calls and put options are equivalent in the sense of what they can pay you return-wise. J.P., any other thoughts?

J.P. BENNETT:

I was just going to add there are instances where recommendations will overlap. Like we have Apple in *Pro*, and then we have a bull call spread over in *Options*. Whenever that's the case, you always need to keep in mind your overall allocation. If you have what you believe is a full allocation to Apple in your regular stock portfolio, and then you see a bull call spread recommendation come out in *Options*, you don't have to do that spread. Just make sure you always stay properly diversified. That's one of the tenets to good investing.

JEFF FISCHER:

Definitely. Perfect. As to Skyworks, I feel good about the company. Management is great. Their business is very strong. The stock is volatile and that's okay. That can play in our favor. I think over the long run, we'll continue to earn returns from the stock.

It's been unfortunate to see it give back so many returns, lately, but I think we can also add options into the mix periodically, if not frequently, because they pay well. We know the business well. We can manage the options as best as we can and overall make money in a couple of ways on Skyworks. So I feel good about that position, and whether you're writing puts or own shares and write covered calls, or just own shares, I think in the long run all three will make money.

J.P. BENNETT:

And I think there's something that's always worth keeping in mind with covered calls. One of the biggest fears is you set up a covered call on a stock and then it just zooms away. It goes on an absolute tear. Sometimes that can lead to people really regretting their decisions and so they're somewhat hesitant to write covered calls on those stocks.

My mindset, and I think probably the better mindset to have, is regardless of a position (if it's a long position, or if you're buying stock, if you're setting up covered calls or if you're writing puts) you only want to do those on the best of the best. You don't want to be [doing these if you think] it is a marginal company that probably isn't going to do very well.You don't think the stock is going to go anywhere, so you write a covered call on that.

I would much rather write covered calls on a stock that I believe strongly in, but I want to generate income, as well, so I think it's important to keep in mind that when we're writing covered calls on individual stocks, we're still probably doing that on really strong companies that we have a high conviction in, that may ultimately run away from us.

But to me that is a far preferable alternative than the opposite, where we set up a covered call on a stock we don't strongly believe in. It falls out of bed and then we're stuck with a stock that's down meaningfully, and all we collected was a tiny bit of income which didn't do anything to offset the losses because we have such a large loss from a capital gains perspective.

JEFF FISCHER:

It's a good point. Let's talk a little bit about the trade alert we put out today. We're already

well into this chat and it's flying by.

J.P. BENNETT:

Time flies when you're having fun, right Jeff?

JEFF FISCHER:

It does. We are having fun, now. It's great to be covering earnings. Looking at new companies. Doing research. I'm excited about the next couple of weeks, months, and the next year for new ideas. It seems like some things are getting shaken up.

J.P. BENNETT:

The market isn't just moving straight up. It makes it more interesting as far as active investing is concerned. There's a lot of opportunities on both the long and short sides. Now that we're getting time to devote to that research to find them, I think we'll have plenty of things to recommend in the coming months.

JEFF FISCHER:

And as you said earlier, J.P., after six quarters of the stock market going nowhere, or a lot of stocks going down, as long as those companies have been growing earnings over time, they've become much cheaper. Even if they were just flat, they've become cheaper because their earnings are growing. So as we shake through the giving tree of the stock market, we're starting to see more possibilities and it's fun.

It's also fun to go through newer companies (recent IPOs from the last two, three, or four years). Some of them have really been forgotten and become compelling, so we should add some new names into *Pro* this year, and more than we did last year, I'm betting.

Speaking of today's trades, I think we already covered the SPY put ratio spread quite well. If you are hedging in an IRA, go down to the bottom of that trade and see the alternatives and then right below that, if you have questions, go down to the SPY discussion board and we can answer your questions there, for you, and help you set this up.

One good thing to know is you don't need to rush to set up these hedges. They pay you more when the market's falling than they do right now. So if the market falls and you don't set it up for the next several days or weeks, that's okay. You'll end up getting a better price. Now if the market rises, it's less attractive to set it up. You might get paid less or nothing to set it up. But meanwhile, you haven't needed it, so there's usually not a big rush to set up put ratio spreads for that reason.

And then we said to write covered calls on three *Pro* stocks. Historically we have never written that many covered calls in *Pro*.

J.P. BENNETT:

I can't remember doing something like that.

JEFF FISCHER:

Part of the reason was valuations were all more attractive. We didn't want to cover stocks that we thought would go up imminently. But right now there are more positions that apparently may not go up in the near term as much as we would like. That said, even if they do go up, we're writing covered calls on positions and we believe we can manage the calls effectively because the strike prices are reasonable, the pricing is decent, and so forth.

I don't know what else to say about these three that we issued today (DGS, Skyworks, and Valmont), except to say on the pricing guidance, aim for about 1.5% yield as of right now, because there's a month and a half to expiration and we always target 1% yield per month, more or less. We target more if we can.

If the stock is falling (like Skyworks is lower than when the alert went out), divide what the call option currently pays into the current stock price, and you might still get that 1% or 1.5% or higher yield anyway. So it could be okay to accept a lower premium on this call. You're still getting the yield on the current share price that we're seeking. I think they do all still work out right now and they're all viable to write at the moment.

Again, these will expire in 44 days and before then, or at that time, we'll have updated guidance as needed. If the stocks are lower, the calls all just expire as income. If any of these shares are above our strike price, we'll issue you an alert if we want to roll the calls higher or close them. And if we roll the calls higher, obviously we'll keep the position going with income. If we close the calls, that means we just want to keep the stock uncapped.

We could let some of these shares go. I wouldn't mind selling a few of these positions if it came to that. For reasons cited in the report, I think we can turn around and write puts if we want to get back into these positions, but more than that, we're looking at other ideas. I'm confident we'll have new ideas coming into the portfolio that we may like better than some of these, so that's why we started to write covered calls. If we lose positions, we'll be okay with that.

We have 15 minutes left in the live portion of this, so back to the live chat and we can answer some questions there that Ellen is forwarding to us and then we'll have to wrap this up, for now anyway, and get back to writing reports.

J.P. BENNETT:

Fun, fun.

JEFF FISCHER:

Roger G says: As a previous Options member, I have chosen to translate your Deere short into a long put option to reduce capital at risk. Your take? Well, I'll let J.P. speak to that.

J.P. BENNETT:

We already touched on it a little. We didn't include something like that in the original report for reasons we've already mentioned, but if you're [not] concerned about the capital at risk, and you understand the risk and reward of setting up a position like that, there is no reason you can't do it. It was just our call on what the ideal situation was. It's not that we think that you definitively should not do it. It's just a lot of things in investing are making judgment calls, and we felt like that was the prudent thing for us to do at the time.

JEFF FISCHER:

The good thing about buying puts, instead of shorting, is that you have much less capital at risk. If the shares soar, you're just out what you paid. But, as J.P. said, if you have to do it again and again, those costs add up. But do what you're comfortable with, definitely, and congratulations on using options knowledge to approach the position in a different way. That's great.

Overall, the most important thing, whatever you do, is that you're comfortable with it, because you, alone, have to live with it day in and day out, and when things get volatile, if you're nervous at home or uncertain, you're more likely to make a mistake. To close a position exactly when you shouldn't.

So the key is to be comfortable with it. We're around as much as we can be. We'll send emails. Assurance. Be on the boards when things get really rocky. We'll talk you through positions that we still believe in or get us out of positions if we don't believe in them.

So our finger is always on the pulse and we're always there to help. But even so, only you know what you think about at night, and if something worries you so much that you get out of it on your own at a bad time, then that's unfortunate. So be comfortable, yourself, with each position you take on.

J.P. BENNETT:

I would say one of the biggest things that differentiates good short sellers from bad short sellers is the mindset. To be able to put everything in perspective and to not overreact, because when you're shorting something, in essence you're going against the upward pull of the market over time, so you have to be comfortable with a position momentarily working against you. To just stay calm and levelheaded and think things through before making a decision.

JEFF FISCHER:

That is true. Always take a step back. If you're feeling nervous or emotional, that should trigger in you, *I need to step back, get grounded, and make a rational decision*. Go back to your investing notebook, if you keep one, and look at why you started a position and see where it stands now. Come to the boards, post, and get feedback from others. It's a really good way to help.

Here's a question from RecklessMike. He says: Hello, I'm new to Pro. (Welcome, Mike.) I'm investing $30,000 based on the allocation suggested. Then in July I'll have another $5,000. (That's great.) How do I allocate that $5,000? I trade on Fidelity and I would like to minimize my trading fees. Thanks. PS: Love your cool haircuts. (I love the plural there. I am sure you meant haircut — J.P.'s.)

J.P. BENNETT:

Come on, Jeff. Don't sell yourself short, there.

JEFF FISCHER:

I'm just glad I have some hair. Or maybe not. If I didn't, I'd have more free time. I wouldn't have to shower every day.

J.P. BENNETT:

I think we all appreciate that you shower every day before coming into the office, Jeff.

JEFF FISCHER:

That's a great question, Mike. You're investing $30,000 right now at today's allocations with $5,000 to invest later. And then the follow-up question to that is whether you are adding $5,000, or whatever amount, periodically whenever you can. I would assume so. So to the best of your ability, try to foresee what you're going to add and allocate with that in mind, but also realize we'll have new positions and you'll want some capital to put to those.

It isn't easy — there's no easy answer — but overall, the better you can be close to our allocation advice without being far overweight in any one position, that's the best outcome. Maybe you only own 20 positions that are 5% each, because you want to minimize trading costs, you say. Or even for now 10 positions that are 10% each, maybe, at the max. And knowing that you're adding more cash, that will work those allocations down as you add new positions and new cash.

So focus on the positions you like best. We like all of them — they're all buys — and we don't have a crystal ball to say which will do best, but we think all will meet our goals over the long term. That's why we keep them. That's our hope. And as you add money, move into new positions while keeping your others in check (like 5-7% each hopefully at the most). I said 10% earlier, but I'm backing away from that now.

I hope that helps. I don't know if it does. RecklessMike, if you have a follow-up question, go to the Making Pro Fit You board and we'll check that out and try to answer there.

Robert says: Jeff, J.P., Billy, and Ellen, thank you for your continued emphasis on taking your time. (That's certainly true.) If the market falls, the put ratio spread gets more attractive, initially. (That's true, as well.)

It is all about taking your time. You can't change your financial position immediately. It typically will take at least a number of years to build to that, so try to enjoy the process. J.P., you've been investing how many years, now?

J.P. BENNETT:

Not as many as you?

JEFF FISCHER:

Well, that's easy, but…

J.P. BENNETT:

I can't tell you, offhand. I started when I was a freshman in college.

JEFF FISCHER:

I don't want to give away your age.

J.P. BENNETT:

A couple of years, at least.

JEFF FISCHER:

Five, or six, or seven.

J.P. BENNETT:

Mm-hmm.

JEFF FISCHER:

And he has a great portfolio, from what I've seen and what we've talked about, but like all of us, he's still building it. It's a lifelong endeavor and that's what makes it fun. So do take your time. As we always say, average into positions if you prefer that and we'll be there to keep helping you down that path.

J.P. BENNETT:

It is a marathon — not a sprint.

JEFF FISCHER:

That is true. We have five more minutes. Here's a question from Rich: All three of today's call writing recs are bidding far below the targets. Are we well off simply hoping for a market pop this week to hit better strikes?

No, Rich. Let me look at current pricing [to see] if the market has fallen sharply all of a sudden. It's down a little bit. Skyworks is down a little bit. What I will say is what we said earlier. We're looking for a 1.5% yield on the current share price. So as the share price goes down, even if the option pays a bit less, the yield may still be about 1.5%. So I'm betting that is still the case and that you can still write these options.

There wasn't a dollar-per-share target given in the trade alert because of that. We just listed the current price, but said that that price will change and just aim for a yield on the current share price. Don't anchor on the option price that is in the alert. So read the alert, again. Read the price guidance closely, and you'll see that these should still be viable today as long as they pay about 1.4-1.5% of the current share price.

With that, we only have two more minutes to wrap up, here. J.P., any closing thoughts?

J.P. BENNETT:

I think we covered everything we set out to do at the beginning, which is a bit of a surprise for us. We've been known to go off on tangents and not always meet our objective, but we did a pretty good job staying on track.

JEFF FISCHER:

Good job, J.P. Good answers. I had a good time. And members, we appreciate that you were here. We'll answer one more question. JRF asked:Would you write a covered call on Gentex?We'll have to get back to that. So far we haven't. We believe the stock has more upside, and the calls generally haven't paid that well. We instead have been writing puts on Gentex to potentially add to our position, and that has generated good income in the past year or so and maybe longer. So we're more likely to keep writing puts on Gentex right now, than write covered calls, but down the road we might.

Then a member says they're bewildered that Berkshire and Microsoft are not on the Pro buy list. I think that's partly because we try to find positions that a lot of members don't already have or know about, and instead of Berkshire we've owned Amtrust Financial, which is a small insurance company. Kind of the opposite of Berkshire.

J.P. BENNETT:

You could say that.

JEFF FISCHER:

The returns have been very good. We also owned AIG in the past because it was deeply undervalued, and we own some Berkshire positions, like MasterCard, and we own a lot of financials. Berkshire does, as well.

J.P. BENNETT:

Coca-Cola…

JEFF FISCHER:

Wells Fargo is their biggest position. That's one of our positions, as well. So we certainly keep track of what Warren Buffett is doing. I think why I haven't recommended the position, aside from the fact that it's recommended in most places around the Fool, is Buffett's age, frankly, and the size of the company, now. I think we can get better returns than Berkshire because Berkshire is so big, and so far that's proven true with many of our positions.

And then Microsoft is simply not in our wheelhouse. We have Oracle and we have a lot of other tech exposure. Maybe we should have bought Microsoft, as well, but we haven't. So as we wrap up, we can look at it again. We have had positions on Microsoft in *Motley Fool Options* and Berkshire, as well, in *Motley Fool Options*.

So thank you members, for being here. We appreciate it very much. We hope you are gradually getting started with *Pro* and will ask any questions that you have on the discussion boards. Keep in mind it's a long-term endeavor. We are right now enjoying going through earnings and doing research on new companies. We look forward to adding new things to the portfolio, both long and short, and new options, as well.

As each trade alert arrives, take your time. Read the whole thing. Make sure it suits you and that you're comfortable with it. And then ask any questions that you have on the discussion board.

Overall, if you are majority invested in good companies that we recommend, we think you'll meet your goals in the long run. If you're adding shorts, hedges, and options, it adds more possibility and more potential returns, and we find it a lot of fun, too. That's why we hope you're here. We look forward to seeing you on the boards, and with more trade alerts, and the weekly memo, as well. Thank you again. J.P.?

J.P. BENNETT:

Just enjoy the rest of the week, everyone, and we'll see you on the message boards.

JEFF FISCHER:

Thank you to Ellen and Billy, as well, and we'll see you soon. Fool on!

[End]

The Professional Investor's Pursuit of Something for Nothing

Published Apr 12, 2016 at 10:23AM

Fellow Pro *Fools: Morgan regularly writes about one of the most important aspects of investing well: mindset. And your mindset is largely influenced by your knowledge of stock market history, another topic Morgan covers better than anyone. Morgan writes every week for* Motley Fool One*, and we're fortunate to be able to share some of his columns with you in* Pro*. Today's article speaks eloquently to having realistic expectations for your investments. Enjoy! -- Jeff*

Motley Fool Mindset: Behavior
To know success, know yourself.

It never ceases to amaze me that simple financial difficulties can affect the smartest and most well-connected investors in the world.

Andrew Caspersen, a partner at a prestigious private equity firm, was charged last week with running a $95 million Ponzi scheme. That's news itself, but it's not what first caught my attention.

What made me shake my head was the offering document — basically a marketing pitch — that Caspersen used to lure money into his scheme. One document claimed Caspersen's fund "offers private equity returns (15%) but without the risk."

Huge fifteen-percent annual returns *without risk*. No risk!

Big returns with no risk are what everyone wants in investing. It's the equivalent of saying, "I want a beautiful four-bedroom apartment overlooking Central Park for less than $800 a month," or a weight-loss program that lets you eat donuts on your couch while burning fat. It's preposterous on its face, but the siren song is so beautiful that people can't help but line up to hear more.

Caspersen's alleged victims weren't inexperienced youngsters. They were deep-pocketed, well-connected professional investors, which makes the story all the more intriguing. The dream of getting something for nothing isn't just ae problem afflicting uninformed amateur investors. It runs right up to the top of Wall Street's most seasoned elite.

A friend of mine recently gathered a list of expectations that institutional investors demand from hedge funds before they'd consider investing. These are direct quotes from institutional investors (note, here: "drawdown" means "temporary loss"):

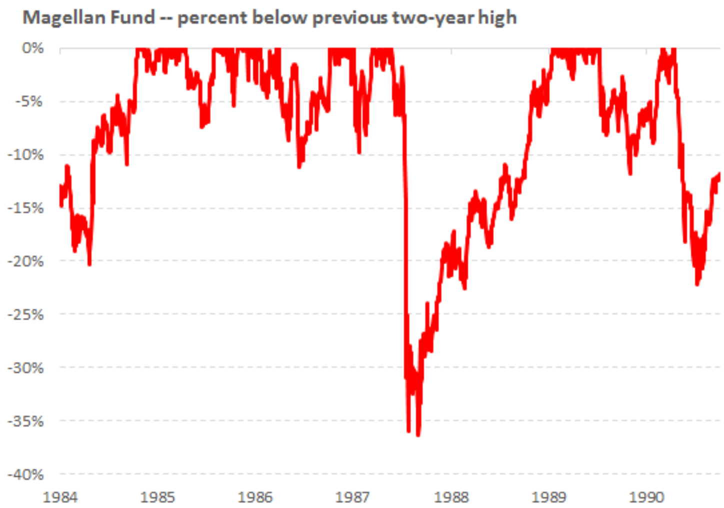
> "*Expects a return of 10% to 15% and drawdowns of no more than 5% to 10%.*"
>
> "*The expected return of the manager is typically between 12% to 15% on a five year annualized basis. Managers with a maximum drawdown of 20% or more will be not considered.*"
>
> "*We target returns of 15% and [maximum drawdowns] should be 7%.*"
>
> "*A strict requirement is that funds must have at least three years of 15% returns. The ratio of annual returns to maximum drawdown must be at least 1.5.*"
>
> "*Currently looking for energy hedge fund managers with net returns greater than 20%. Managers should have the 'right pedigree' and not have a drawdown of greater than 15%.*"

People want a big upside, and little downside.

When you are on this pursuit of something for nothing, as many professionals are, you are more likely to end up getting nothing for something. So it's no wonder that the average hedge fund has underperformed the S&P 500 by more than 100 percentage points since 2009.

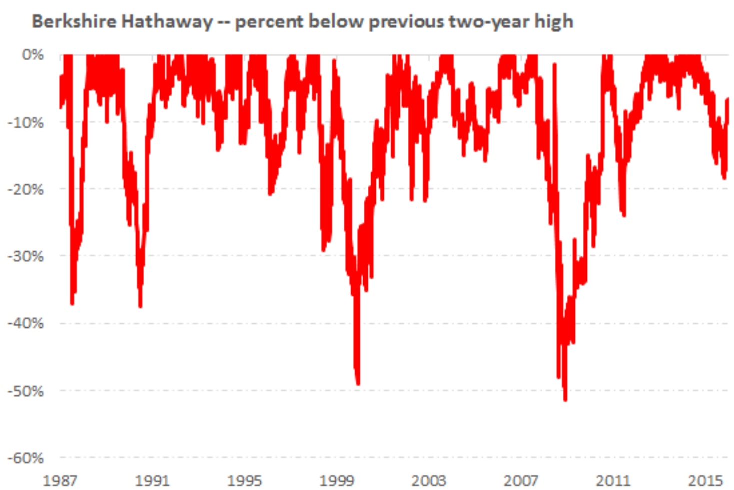
Think about this. Famed investor Peter Lynch made his name running Fidelity's Magellan Fund. Almost all of his gains came in the mid-to-late 1980s, when the fund returned an astounding 19.9% per year, one of the best investing performances in history.

I wondered what percentage of the time during that period Magellan was in a 7% drawdown — the kind of negative performance institutional investors demand on avoiding. It turns out Lynch's fund was 7% below its previous or more about 41% of the time during his miraculous run:



Dig into the data on this chart, and I count eleven separate times Magellan fell into a 7% drawdown during this period. But, remember, suffering just *one* of those drawdowns would have taken the fund off institutional investors' lists of funds worth investing in.

Now consider Warren Buffett's Berkshire Hathaway. Over the last 30 years, Berkshire has gained about 16% a year, which is outstanding. But it's been in a 7% drawdown or worse 48% of the time, including no fewer than 29 separate 10% declines. The average professional investor, seeing this much volatility, would have plugged its nose and walked away, unwilling to accept a bad month in exchange for three decades of sensational returns.



I often think amateur investing may be easier and more fruitful than professional investing. The career pressure to perform, the inability to accept loss, and the incentives for winning in the short run may make professionals more vulnerable to inflated expectations than individuals.

Understanding this reality, calling it out, and realizing that our edge lies in rejecting the pursuit of something for nothing is a lot of what Foolish investing is all about.

Pro Catch-Up Trades: April 11, 2016

Published Apr 11, 2016 at 3:26PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **Facebook** (NASDAQ: FB): Buy our 6.1% allocation in thirds or halves over time (write near-the-money puts if you don't mind potentially missing upside).
- **Gentex** (NASDAQ: GNTX): Buy up to 2.6% in stock.
- **Wells Fargo** (NYSE: WFC): Buy up to 3.2%, or buy in halves.
- **Oracle** (NYSE: ORCL): After our recent update, the stock remains a Buy First. Buy up to 3.9%, or buy in halves.

Continue building your portfolio with our Buys, including these highlighted today:

- **Papa John's International** (NASDAQ: PZZA), buy up 2.7% in stock.

- **TD Ameritrade** (NASDAQ: AMTD), buy 2.4% in stock.
- **Valmont Industries** (NYSE: VMI), buy 1.9% in stock for the long-term upside potential.

Options:

- **Gentex** (NASDAQ: GNTX): Write May 2016 $15 puts as per our recent recommendation, to potentially add to your stock.

Our most recent short:

- **Deere & Company** (NYSE: DE), as a hedge against the market and our investment in **Valmont** (NYSE: VMI): Sell short (sell to open) 2% of Deere per our recent recommendation.

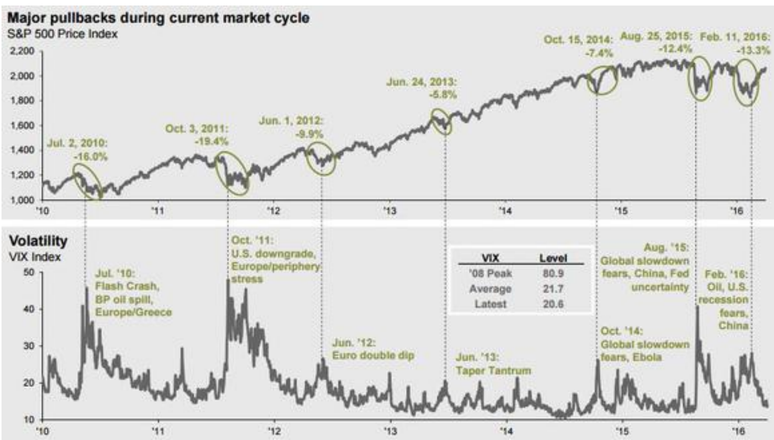
Charts of the Week (Second Edition)

Published Apr 11, 2016 at 12:18PM

Dear *Pro* Fools,

Your self-professed "charts guy" is back at it again. In this week's Memo, "Charts of the Week (Second Edition)," I'll share the five most interesting and market-relevant charts I came across this week while perusing the financial blogs and websites I frequent:

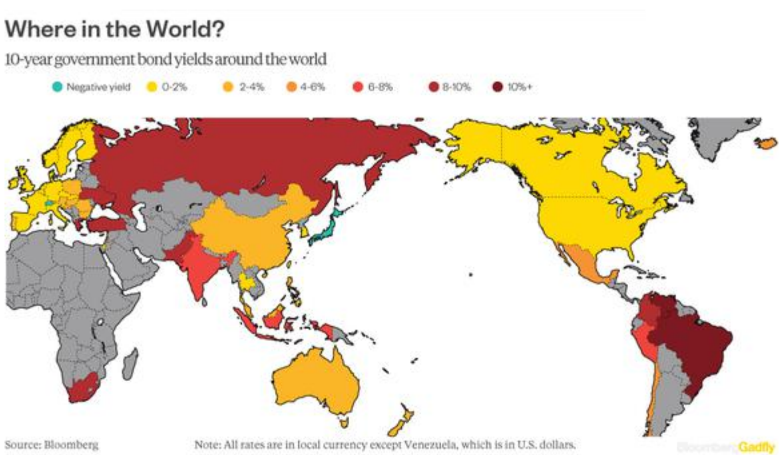
1. Market Pullbacks and Volatility During Current Market Cycle (2010-2016)



Sources: FactSet, Standard & Poor's, J.P. Morgan Asset Management. (Bottom) CBOE.

From one of my favorite quarterly chart books (the JP Morgan Asset Management Guide to the Markets, updated as of the second quarter of 2016), this chart highlights seven major market pullbacks since 2010 (top half), overlaid with the concurrent spikes in the VIX index (bottom half).

2. Dude, Where's My Yield?



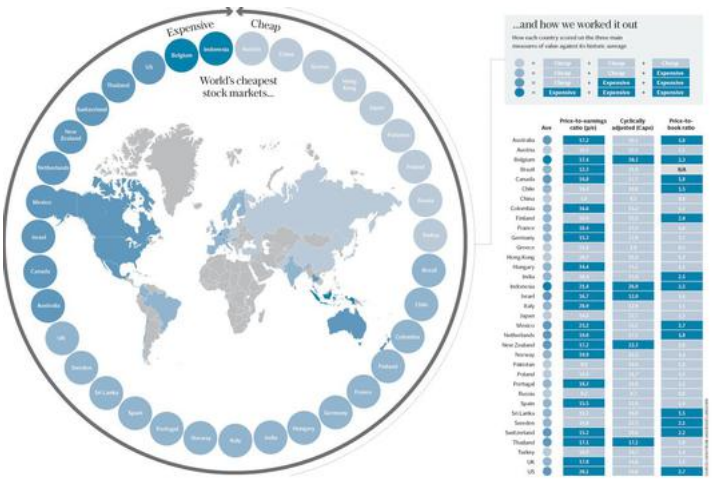
This chart from Bloomberg shows a geographical representation of 10-year government bond yields around the world. With some countries (India, Brazil, Russia) offering yields of 7% to 10% or more, why aren't investors racing to lend to these nations? Because efficient currency markets act to offset that yield for foreign investors when they cash out and have to convert back to their own currencies.

3. Decoupling of Economic Growth and Greenhouse Gas Emissions

This one is probably my favorite graphic this week. This fascinating chart, based on data from the BP Statistical Review of World Energy 2015 and corroborated by recent data from the International Energy Agency, shows how 21 countries (including the United States) have reduced annual greenhouse gas (GHG) emissions since the year 2000 while expanding their economies. Amidst the increased activism and media attention paid to the impact of global climate change, I had been unaware that this positive global trend was unfolding until I saw this.

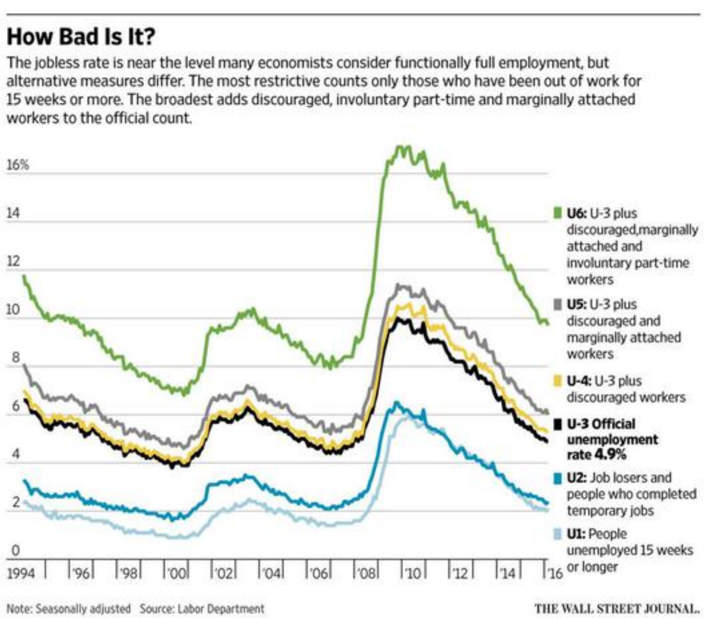
In the United States, an energy consultant recently opined that the primary reason carbon emissions are falling is because of hydraulic fracturing ("fracking"), which has led to a large switch from coal to relatively cleaner-burning natural gas in electricity generation. However, declines in U.S. emissions were offset by increasing emissions in most other Asian developing economies and the Middle East, and a moderate increase in Europe. The next challenge for reduced global GHG emissions is to prevent carbon leakage to other countries as nations move their industries overseas.

4. The World's Cheapest Stock Markets



This excellent graphic from *[The Telegraph]* (view a larger version [here]) shows three valuation measures for each country: the price-to-earnings ratio (P/E); the cyclically adjusted price-to-earnings ratio (CAPE); and the price-to-book ratio (P/B). Each market is then compared to its own historical average to determine its relative "cheapness."

5. Alternative Measures of Unemployment



This graph from *The Wall Street Journal* breaks out different measures of the U.S. Bureau of Labor Statistics' official unemployment rate, known as U-3. It shows the history and trajectory of the five other alternative measures of labor underutilization, which provides a more detailed picture of U.S. unemployment than the single, "official" data point. For more detailed descriptions of U-1 through U-6, see here (under "NOTE").

The *Pro* Bottom Line

There you have it, Fools -- the second edition of my top five charts of the week. Hope you enjoyed it, and bring any questions or comments to the Memo Musings board!

Best,

-- Billy (TMFBillyTheKid)

Write Diagonal Calls on American Tower

Published Apr 5, 2016 at 1:44PM

Is this for you? This recommendation is for all *Pro* members who have matched our 3.7% stock allocation in **American Tower** (NYSE: AMT) and **also** own January 2017 or 2018 calls or are ready to buy them now. We are only writing calls to cover our owned calls, **not** to cover our stock position. We recommend that you leave your stock allocation **uncovered** in order to capture further potential upside in American Tower. If you bought calls on American Tower during the *Pro* on-boarding process, you can follow along with this trade.

How You Participate

- **Trade:** Sell to open April 29, 2016, $105 calls on American Tower. *Please note that these are **weekly** options*.
- **Allocation:** Sell one call for every January 2017 (or January 2018) $80 call you already own (or are buying now). *Pro* will cover its 6 long calls.
- **Price Guidance:** Prices will change as the underlying stock moves, but use a limit order to split the bid/ask spread at going prices as long as you get at least a 3.5% yield on your long January 2017 or 2018 call value (see the math below). These weekly options are relatively thinly traded, so i**t is critical that you use a limit order** to avoid collapsing the bid/ask spread.
- **Prices** (April 6):
  - **Stock price:** $104 (as of 9:35 a.m. 4/6/16)
  - **Sell to open April 29, 2016, $105 calls (bid/ask split):** $1.20
  - **January 2017 $80 calls we own (bid/ask split):** $24.65
  - **Diagonal call yield:** $1.20/$24.55 = 4.9% in 24 days.
- **Catch-Up Trade:** If you're setting up the whole trade today, use a diagonal call order, buying the January **2018** $80 calls (rather than the 2017 calls *Pro* owns, in order to give your calls more time to expiration) and selling the April 29, 2016, $105 calls to aim for a net debit of $25.10 or so. Invest about 0.6% of your funds in the long calls if you're matching our allocation.

What We're Thinking

Since we bought our American Tower calls in late 2014, the position has been somewhat of a laggard. Our original intent was to target leveraged upside as American Tower continued to increase its tower portfolio via acquisitions and steadily increase its cash flow and earnings power.

While American Tower, the business, has continued to execute wonderfully on its growth strategy, until recently, the stock price wasn't playing along. It reached a 52-week low of $83.07 in February:

	December 17, 2014	February 11 2016	% change
# of Towers	69,912	100,131	43%
TTM Total Property Revenue	$3.9 billion	$4.7 billion	20%
TTM Adjusted EBITDA	$2.6 billion	$3.1 billion	18%
Stock Price	$97.14	$83.07	-14%

But since those lows, the market and the REIT sector have roared back strongly, reacting positively to information from the Federal Reserve that further rate hikes will be implemented more slowly than previously expected. American Tower now trades near $104 per share, up 25% from its recent lows and hovering around a 52-week high as we approach first-quarter 2016 earnings, which are expected sometime in early May (the exact date is not yet available)

Given the stock's strong recent appreciation, and *Pro*'s goal of targeting regular income in 2016 to capitalize on a volatile market, we have decided to cover our owned calls with a diagonal call in order to capture some income (and slightly higher upside) prior to the company's earnings report.

Although the original intent of our long call was not income, we are comfortable with the trade-offs we are making with this diagonal call. These written calls could pay us 5% or so on our current long call value in less than one month, and we have upside to the $105 strike price, a little less than 1% above the current price. If the stock price shoots well above our written call's strike price prior to expiration, we can roll our calls for further income (if the rolling trade looks attractive) while still capturing the full upside of the stock with our uncovered 3.7% stock allocation (currently our ninth largest).

Even if we assume that we will have to sell our long calls in a month when our written calls are assigned, the return on our long calls (including the income from these diagonal calls) would be approximately 12%, besting our North Star since our December 2014 purchase. Of course, we don't plan to close or sell unless we're forced to, so we'd look to roll our calls if we can, targeting further upside on our growing Buy First stock.

More That Matters

- **Maximum gain:** The 4.9% premium earned from writing the calls, plus upside in our owned calls to our short call strike price at $105, which is lately around 1% higher than the current price.
- **Maximum risk:** The full value of our long $80 calls, minus premiums received from short calls.
- **Follow-up**: We hope to see these short calls expire for income later this month, and then wait to see earnings results. If we need to roll or close, we will.

Options Can Help

- **Want to know more about this strategy?** Our Options U guide to writing diagonal calls can keep you on an even keel.
- **Questions about this trade?** Consume data and post your questions on our American Tower board.

Pro Catch-Up Trades: April 4, 2016

Published Apr 4, 2016 at 3:56PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **Facebook** (NASDAQ: FB): Buy our 6.4% allocation in thirds or halves over time (write near-the-money puts if you don't mind potentially missing upside).
- **Wells Fargo** (NYSE: WFC): Buy up to 3.3%, or buy in halves.
- **Oracle** (NYSE: ORCL): After our recent update, the stock remains a Buy First. Buy up to 3.9%, or buy in halves.

Continue building your portfolio with our Buys, including these highlighted today:

- **Papa John's International** (NASDAQ: PZZA), buy up 2.6% in stock.
- **TD Ameritrade** (NASDAQ: AMTD), buy 2.5% in stock.

Options:

- **Gentex** (NASDAQ: GNTX): Write May 2016 $15 puts as per our recent recommendation, keeping in mind our "Later" guidance.

Our most recent short:

- **Deere & Company** (NYSE: DE), as a hedge against the market and our investment in **Valmont** (NYSE: VMI): Sell short (sell to open) 2% of DE per our recent recommendation.

How We Target Pro's Returns

Published Apr 4, 2016 at 2:13PM

Dear *Pro* member:

Pro is commonly thought to be a lower-risk portfolio, set up to have lower volatility than the market. But to the extent that we do achieve lower volatility (and so far we've done pretty well), it's thanks to the quality of the companies we buy, the prices at which we invest, and the allocation framework we set up. We are *not* set up to be wallflowers, and we do not lack conviction. In fact, being on average only 72% net invested for many years means that the only way we can achieve a higher return than the S&P 500 -- and come close to our North Star -- is by taking some sort of risk. What kind? Our 10 largest positions make up 45.6% of our portfolio as of this morning -- close to half. Being this concentrated also concentrates your risk, but sets you up to outperform if your largest positions remain handy winners. And there's more.

Aside from our top 10 holdings, we currently have 15 other long investments (two of which are shorts of short ETFs), three shorts, and a handful of options strategies -- a few are longs, one is a hedge, and others are income-oriented. Again, this isn't a portfolio built to hug an index by purchasing many dozens of stocks. We only have 25 longs, and as mentioned, 10 of them make up almost half of the portfolio. We certainly hope and aim for the portfolio to do better than the index to the upside (we basically have to, if we want to stay near our North Star over the years) despite not being fully invested, and we want it to do better in downturns despite being concentrated in a handful of stocks. This strategy can only work if you:

- choose the right companies -- growing businesses that are less likely to suffer much in economic downturns (we use our *Pro* quality criteria to screen for this)
- use hedges that don't drag much on returns during a bull market
- don't run into disasters with open-ended short positions, let alone with your largest stock holdings

But that *still* isn't enough to target the returns you want. You need to get more specific.

Of course, there will be time periods where we don't meet our goals, but so far the ride has been fairly steady for several years. What's driving it? And how *do* we generate healthy returns while only being about three-quarters invested? A lot of the answer has to do with our allocations to companies that we expect to compound at above-average rates. We place our stocks into buckets based on simple but specific minimum expectations, and this helps us manage allocations. Let's look at our happy *Pro* bucket list!

10% Annualized Compound Returns

Obviously we won't always be right, but we always target companies that we believe can return at least 10% annualized from our purchase price over the long haul. If a good company falls after we buy it, we may buy more, expecting that new investment to earn more than 10% annualized. Today, our companies that fall into the 10% desired return bucket are (by allocation size):

- **Broadridge Financial Services** (NYSE: BR), 4.9%
- **Apple** (NASDAQ: AAPL), 3.9%
- **Oracle** (NYSE: ORCL), 3.9%
- **American Tower** (NYSE: AMT), 3.7% (excluding calls at 0.5%)
- **Gilead Sciences** (NASDAQ: GILD), 3.4%
- **Parexel** (NASDAQ: PRXL), 3.3%
- **Wells Fargo** (NYSE: WFC), 3.3% (excluding short puts)
- **Medtronic** (NYSE: MDT), 3%
- **Gentex** (NASDAQ: GNTX), 2.7% (excluding short puts at 1.5% look-through)
- **TD Ameritrade** (NASDAQ: AMTD), 2.5%
- **Verisk** (NASDAQ: VRSK), 2.2%
- **Valmont** (NYSE: VMI), 1.9%

Total allocation: 38.7%

We believe these investments face lower-than-average business and valuation risk, and yet all 12 could return at least 10% annualized the coming years, including dividends. We have more than one-third of the portfolio invested in these bedrocks. Of course, ideally many of these stocks will top that bogey, and we know some won't. Note that some of the companies listed, including Apple, started with expectations for higher than 10% annualized growth -- and delivered -- but have grown to such a size that we expect only about 10% from them now. Verisk, meanwhile, could return more, but we bought at a valuation that has us hoping for a 10% annualized gain.

15% Annualized Returns

- **O'Reilly Automotive** (NASDAQ: ORLY), 5.4%
- **MasterCard** (NYSE: MA), 4.5%
- **Starbucks** (NASDAQ: SBUX), 3.8%
- **OpenText** (NASDAQ: OTEX), 2.9%
- **Papa John's International** (NASDAQ: PZZA), 2.6%
- **Visa** (NYSE: V), 2.5%

Total allocation: 21.7%; return multiplier in relation to 10% goal is 1.5x = 32.5% influence

With these six stocks, we hope and aim for at least a 15% annualized return; all have blown by that number in recent years, but we still believe there's enough growth on tap to support similar results in the years to come. So what? If these six stocks can return 50% more, annualized, than the dozen stocks above, then while they add up to a 21.7% allocation, their strength in the portfolio is more like 32.5% exposure when it comes to reaching our current 10% annualized total portfolio goal. With 10% being our North Star, we could just buy a bunch of presumed 10% growers. But buying companies that we believe will return more than that in essence leverages us on our way toward our goal, and lets us keep some money out of the market.

20% Annualized Returns

- **Facebook** (NASDAQ: FB), 6.3%

- **AmTrust Financial Services (**Nasdaq: AFSI), 5.2%
- **Skyworks Solutions** (NASDAQ: SWKS), 3.7%

Total allocation: 15.2%; return multiplier in relation to 10% goal is 2x = 30.4% influence

These three higher-growth businesses make up 15% of our portfolio -- and if they can return at least 20% annualized, they alone could drive about 30% of our 10% annualized portfolio return goal. Said another way, if each of these stocks returns 20% annualized, it's as good as *twice as much cash* invested but growing by only 10% annualized. Don't believe me? $150,000 going up 20% in a year gives you a $30,000 gain. $300,000 going up 10% gives you... a $30,000 gain.

Now, when you add up our total allocation toward meeting our 10% return goal, you get, from the top bucket on down: 38.7% + 32.5% + 30.4% = 101.6%.

Even though these 21 stocks only represent 75.6% invested capital, if our returns from each are as desired, they'll get us 101.6% of the way to our 10% annualized return goal for the whole portfolio. That has largely been the case so far.

Next, if we add low-cost hedges and successful shorts, as well as option strategies, we should have even stronger returns -- and some winners when the market declines, too.

Keeping the Portfolio Aligned

If I've learned one thing in life, it's that change is constant. Perhaps it's the only constant. But change in a portfolio's construction should not occur frenetically; rather, it should take place gradually, over many years. After several years of rising prices, some of the stocks from which we expect 20% and in some cases 15% annualized returns are looking long in the tooth. This year, Facebook may need to be marked down to a presumed 15% grower, as will AmTrust as the workers' comp business slows. We may not expect OpenText and Starbucks to return 15% annualized much longer, so they could potentially move to the 10% bucket. And some positions, like Valmont, haven't grown at all yet. The point is: To keep the portfolio aligned with our goals using this construct, we gradually need to add more high-growth companies, or we need to invest more of our cash in 10% growers -- whichever we see in the market.

Meanwhile, our shorts of leveraged, short ETFs were made with the aim of returning at least 10% annualized, and they have. We essentially view them as longs. But most of our other company shorts are viewed as "extra" returns achieved beyond our goals (our long stocks alone should lead to our desired returns), and our income is essential but largely "extra" to our returns, too. Finally, hedges -- when they pay off -- pad downturns and add more cash to our coffers, which we can then reinvest, hoping to compound it.

I hope this column helps explain some of the thinking that goes into the *Pro* portfolio and shows why allocation, and where you allocate, matters. We're about 75% invested in core stocks, but if our return projections are right, this should get us to more than 100% of our return goal, while still keeping cash on the side for opportunities. So far, it has. But as with all things, as time goes by we need to make changes and add new positions, working to keep a semblance of this balance. Our hunt for growth companies that entice us to buy them is lengthy. Questions? Please visit the Memo Musings board.

-- Jeff (TMFFischer)

Pro Completed Trades

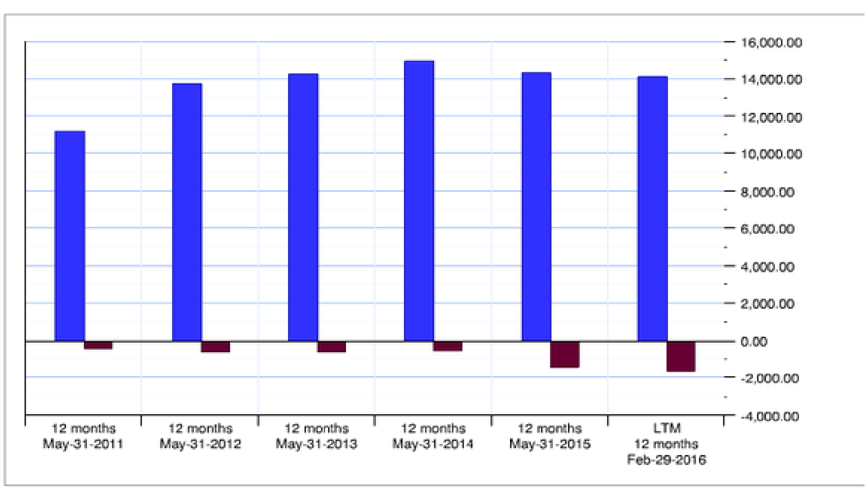
- **Gentex** (NASDAQ: GNTX): We sold to open 25 contracts of the May 2016 $15 puts, collecting an average of $0.36 each, within our guided range for at least a 1.5% yield per month. This could add 1.5% more exposure to the stock.

Oracle Foresees a Brighter Future

Published Apr 1, 2016 at 10:37AM

Oracle (NYSE: ORCL) is the largest business software provider in the world, with approximately 400,000 customers and $37 billion in annual revenue. The giant built its legacy by selling database management software licenses and related hardware, but in recent years it's begun transitioning interested customers to its newer cloud software offerings, as well as hosting customer data on its own premises. This transition doesn't come cheap. First, Oracle had to invest in hardware, software development, and sales staff. Second, cloud customers bring in less up-front revenue compared with traditional software license sales, a strong headwind in the short term. Over the long term, however, cloud customers are more lucrative than license customers, with the switch generally starting after three years. Oracle is in early stages of this transition, but enough customers are moving to the cloud that Oracle's revenue and cash from operations is treading water during the transition.

Cash from Operations (blue) and Capital Expenditures (red)



Source: S&P Capital IQ. Numbers in millions.

But now that investments and other transition costs are slowing, margins are going higher, and Oracle expects this profit growth to expand, especially as cloud revenue increases. Meanwhile, it has to keep battling large competitors including **Microsoft** (NASDAQ: MSFT), **IBM** (NYSE: IBM) and **Amazon.com** (NASDAQ: AMZN), not to mention **Salesforce** (NYSE: CRM) and **Workday** (NYSE: WDAY), in order to retain customers who might use a transition to the cloud as a reason to jump to another provider. We believe Oracle's comprehensive software solutions will help it keep most of its installed base, and continue to win new customers, ultimately leading to a larger, more profitable business. After several years of patience, we should start to see this unfold soon and over the next many years. The stock remains a Buy First, with a 3.9% allocation.

Status	**Buy First**
Fair-Value Estimate	$46 (no change)
Recent Price	$40.95
Current Allocation	3.9%
Dividend Yield	1.5%

Key Long-Term Thoughts

- Several years ago, Oracle began to rewrite all of its software to enable cloud usage. In its March conference call, the company called the move to cloud "a generational shift in technology that is the biggest and most important opportunity" in Oracle's history. Oracle now has more than 11,000 customers using its cloud services, but it's still early in the shift.
- Oracle said it's "not quite at the end of the beginning" of its own business transition to serve the cloud; it's making progress, and we are starting to see results. "We are far enough along that our financial statements will begin to show our success with accelerating revenue growth [and] operating margin expansion over time," according to management -- this should lead to healthy earnings-per-share growth.
- Oracle sells customers a complete enterprise software solution on premises or in the cloud (or both, as many prefer). It needs to convince customers it's nimble, contemporary, and effective, so they don't move to newer competitors. So far, large customer wins are encouraging. In SaaS (Software as a Service) cloud sales, Oracle won 942 new customers last quarter; it now has more than 11,000 customers in SaaS and PaaS (Platform as a Service). Increasing customer counts more quickly than competitors, it's likely taking market share, and its giant installed base of customers combines with the reality of switching costs to put it in a position of strength.
- To simplify: If you sell a traditional software license for $1, after a year you only get a portion of that $1 again in the form of support revenue. But if you sell $1 in cloud services, then the next year, you get $1 again with a renewal. So, cloud is a net revenue win over time.

Secondary Thoughts

- Tackling the competitive question head-on, Oracle said, "We're very comfortable that we can defend our leading position in the database market."
- The earliest cloud renewal rates are coming in strong, and they should get materially better -- the customers who joined a bit later obtained the stickiest cloud applications from the start, and that should drive "very, very high" renewal rates. (Plus, the earliest customers came in on promotions.)
- Oracle's performance in the Asia-Pacific region improved considerably. Business in most of the world now seems fairly stable, with the notable exception of Brazil and its macro problems. Overall, Oracle expects relative stability in legacy businesses and growth in cloud.

The Numbers

- **Outlook:** For Q4 now in progress, SaaS and PaaS revenue should be up 57% to 61%. Cloud Infrastructure as a Service (IaaS) revenue should be -1% to +3%. Total cloud and on-premise software sales should rise 1% to 2%, with total revenue growth being -2% to +1% with currencies. Non-GAAP EPS should be $0.82 to $0.85, compared with $0.78 last year. Looking further ahead to Q1 2017, SaaS and PaaS revenue should be up more than 59%, and margins should be higher. For the full fiscal year 2016, constant-currency on-premise software revenue should be positive, with growth in software support making up for a decline in new license sales. Cloud-related capital expenditures for the full year will be much lower than last year, helping cash flow and margins.
- **Q3 2016 just ended:** SaaS and PaaS revenue were up 57% in dollars. As the transition to cloud continues, much of the rest of the business was flat to down. See the press release for those details.
- The company has lowered its diluted shares outstanding by more than 16% over the past four years.

Weighted Diluted Shares Outstanding (millions)

Position Summary

Valued at less than 14 times free cash flow and 14.8 times forward earnings estimates despite currency headwinds, the business is not expensive; it remains about 12% below our fair-value estimate. As long as we continue to believe Oracle can win enough of the enterprise race into the cloud, the stock remains a long-term buy for your diversified *Pro* portfolio, where it's rated Buy First today at a 3.9% allocation. Experienced members may also write near-the-money put options to try to get shares cheaper and earn income while waiting.

Pro Catch-Up Trades: March 28, 2016

Published Mar 28, 2016 at 3:15PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **Broadridge Financial Services** (NYSE: BR): Following our recent update, the stock moves to Buy First. Buy up to 4.9%, or buy in halves.
- **Facebook** (NASDAQ: FB), buy our 6.4% allocation in thirds or halves over time (write near-the-money puts if you don't mind potentially missing upside).

Continue building your portfolio with our Buys, including these highlighted today:

- **Apple** (NASDAQ: AAPL), buy up to 3.8% in stock.
- **O'Reilly Automotive** (NASDAQ: ORLY): Our fair-value estimate moves up; shares are a long-term buy, up to a 5.5% allocation. Buy in halves if preferred, or write puts on a sizable account.
- **Papa John's International** (NASDAQ: PZZA), buy up to 2.6% in stock.
- **TD Ameritrade** (NASDAQ: AMTD), buy 2.5% in stock.

Options:

- **American Airlines** (NASDAQ: AAL): Buy to open January 2017 $35 calls, lately for about $8.80 each (buy one call for every $880 you are comfortable risking, up to 0.5%). We don't know yet whether we'll extend this strategy beyond 2017, but it's possible.
- **SPDR S&P 500** (NYSEMKT: SPY): Set up the new put ratio spread per our recent recommendation. It can lately be set up for a net credit above $0.20.

Our most recent short:

- **Deere & Company** (NYSE: DE), as a hedge against the market and our investment in **Valmont** (NYSE: VMI): Sell short (sell to open) 2% of DE per our recent recommendation.

Pro Quality Checklist: Gentex

Published Mar 28, 2016 at 1:18PM

Dear *Pro* Fools,

We've now run six of the companies in our portfolio through our *Pro* quality checklist:

- **American Tower** (NYSE: AMT) -- 7.5/8
- **Broadridge** (NYSE: BR) – 8/8
- **Oracle** (NYSE: ORCL) -- 8/8
- **O'Reilly Automotive** (NASDAQ: ORLY) -- 6/8
- **TD Ameritrade** (NASDAQ: AMTD) -- 5.5/8
- **Valmont Industries** (NYSE: VMI) -- 5.5/8

Today, we will continue our checklist series with **Gentex** (NASDAQ: GNTX), our auto-dimming mirror maker. The company is our 16th largest position, with a 2.7% allocation, and we recently wrote puts on it to either bring in income or increase our allocation at a lower price. Here's how it stacks up against our eight criteria.

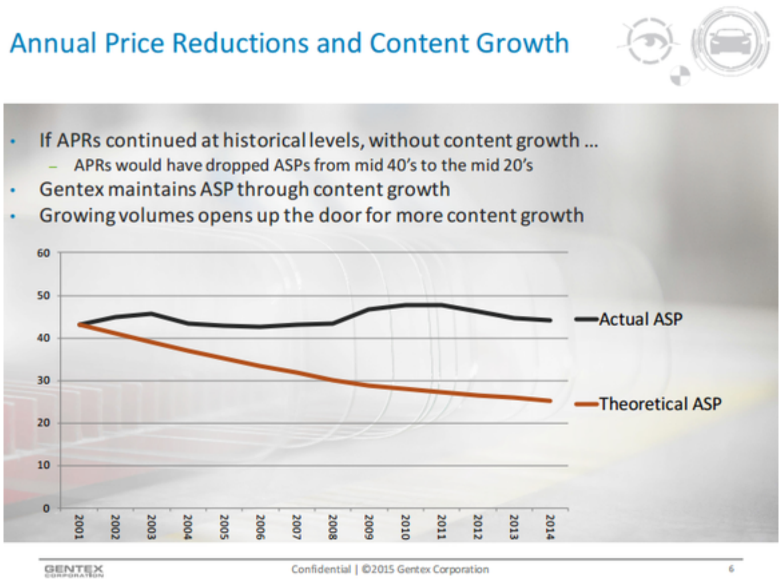
1. A Sustainable Competitive Advantage

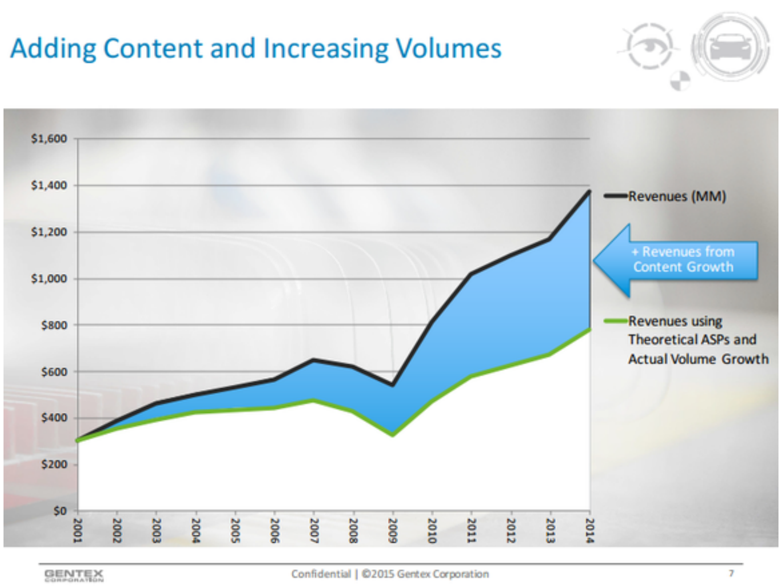
Yes. Gentex's most significant competitive advantage is efficient scale. The company dominates its niche, with 91% market share of the global auto-dimming rearview mirror market in 2015. This market is large enough to reward Gentex with strong returns, but small enough not to attract significant competition. Gentex's strong engineering and R&D functions (R&D is typically 6%-8% of sales) act as an additional deterrent to competitors. As evidence of Gentex's market dominance and competitive advantages, the company's market share in rearview mirrors is up from 83% in 2000.

2. Pricing Power

No. Gentex's customers are large multinational automakers. Like much of the rest of the automotive supply industry, Gentex experiences pricing *pressure* more than pricing power. Gentex's powerful customers subject the company to demands of annual price *reductions* (APRs), which historically are in the range of 2%-3%.

Notably, though, Gentex has been able to combat the annual price reductions by adding new features and additional content to its mirrors. As seen in the graphs below, despite the annual price reductions, the company has actually been able to maintain average selling prices (ASPs) via growth in content (i.e., addition of new features):





3. Dependent Customer Base

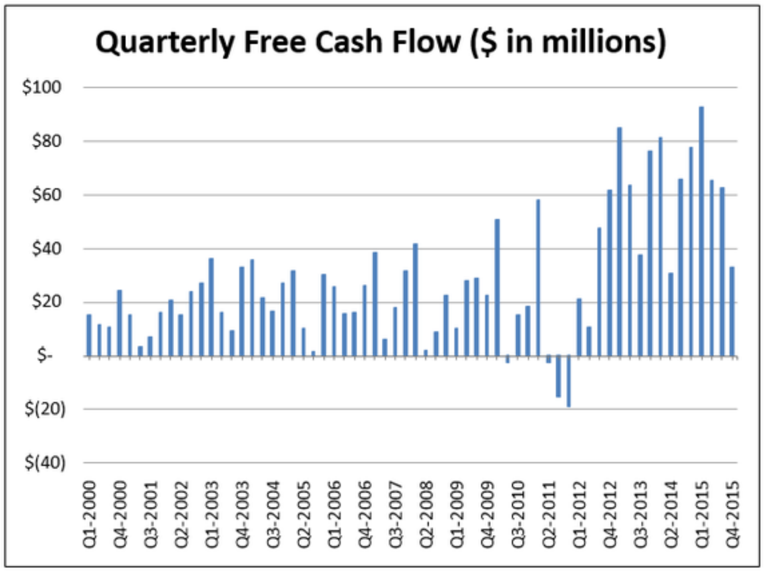
No. Gentex's products are not mission-critical for the company's automaker customers. Its mirrors are typically made available as an option (most often as a part of an options "package") on premium models within an automaker's product line. As the selection rates for the options on premium models increase, they generally become available on more and more models.

4. Predictable Revenue

No. Gentex operates in the automotive industry, which is cyclical and is highly influenced by global levels of economic activity. Automotive production levels and customer orders can be volatile. For example, in the first quarter of 2009, the company reported $94 million in quarterly sales, a 47% yearly decrease from the pre-recession high set just one year prior. If an economic recession shrinks global consumer demand for vehicles, Gentex's sales will suffer.

5. Growing Free Cash Flow With Compounding Returns

Yes. Gentex's dominant market position and competitive advantages lead to strong margins and plenty of free cash flow. Its free cash flow margins since the end of 2000 have averaged 15.7%, and the company's increased market penetration, revenue growth, and expanding margins have led to expanding free cash flow:



Gentex also has the opportunity to reinvest its cash flow at high rates of return. The company has spent more than $800 million since 2000 on engineering, research, and development -- activities that have spurred the content growth mentioned above, which helps the company maintain selling prices and keep margins high.

Additionally, Gentex has shown that it is not averse to making significant acquisitions. In 2013, the company spent about $700 million to acquire HomeLink, a wireless vehicle/home communications product that enables drivers to remotely activate a variety of radio-frequency convenience products for automotive applications (garage doors, home lighting, entry gates, etc). HomeLink has proven to be a strong acquisition already, helping Gentex increase gross margins from the 33%-36% range pre-acquisition to the 38.5%-40% range post-acquisition. In 2015, HomeLink modules (excluding revenue from HomeLink integrated into mirrors) accounted for roughly 11.6% of Gentex's automotive-division revenue.

6. Financial Resilience

Yes. Gentex has a very resilient balance sheet, with strong free cash flow (about 15% of sales, as mentioned above) and a net cash balance of $425 million.

7. Expanding Possibilities

Yes. Gentex has consistently shown the ability to innovate via its engineering, research, and development functions. The company continually seeks to develop new products and is currently working to introduce additional advanced-feature auto-dimming mirrors (for example, the recently introduced full display mirror). Acquisitions into adjacent markets are a possibility as well.

8. The Three C's of Management (Clarity, Consistency, Capability)

Yes. Gentex is led by Chairman and CEO Fred Bauer (age 73), one of the original founders of the business. Bauer has more than 35 years of experience with Gentex, and he has been integrally involved in the operational, engineering, administrative, and financial aspects of the company for his entire tenure. Bauer is also the named inventor on a number of the company's patents and owns more than $100 million in company stock (2.3% of shares outstanding).

The company has a strong bench of managerial talent. The other five executive officers (excluding Bauer) average 43 years of age, and the young executives participate heavily on earnings calls and within the company's operations. Executive compensation is modest (no executive earns more than $2 million in total compensation), and the company's incentive system is sound.

Perhaps the only knock I have on management is the level of disclosure. Gentex doesn't provide a high level of granular detail in its filings, but that's likely just a consequence of being a smaller company that doesn't attract much analyst attention. As the company's Wall Street coverage has grown, management's disclosures and communication to investors have improved.

The *Pro* Bottom Line

In sum, Gentex scores a 5/8 on our *Pro* quality checklist. While it's not the most exemplary *Pro* stock, Gentex's strong competitive advantages and qualitative attributes make it a welcome complement to the rest of our portfolio. Because of the company's exposure to cyclicality, we have to be more careful about position sizing and valuation. That explains our relatively small 2.7% allocation, and our preference for writing puts in order to potentially increase our allocation with a margin of safety. But given the company's low valuation, its increasing market acceptance and penetration, and a technology tailwind in the automotive industry, Gentex should be able to sustain margins and earn North Star-like returns from here.

Fool on!

-- Billy (TMFBillyTheKid)

Guidance Changes

- **Broadridge Financial Services** (NYSE: BR): On the heels of **Facebook** (Nasdaq: FB) and **MasterCard** (NYSE: MA) before it, now this stock moved to Buy First, too. We have a 4.9% allocation.

- **Gilead Sciences** (NYSE: GILD): Although it looks inexpensive, the stock moves down to Buy (from Buy First) given the the lack of growth prospects in the intermediate future. We still believe a North Star return is possible, though. We have a 3.4% allocation.
- **O'Reilly Automotive** (Nasdaq: ORLY): Our fair value estimate increases to $255. The stock remains a Buy, with a 5.5% allocation.
- **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS) Fund: The ETF Returns to Buy, with a 1.7% allocation. So far, putting it on Hold, rather than selling it, was the better, with shares up about 15% since then. Given that we already have cash, we're willing to give this emerging markets ETF a bit more time to show improving performance before assuming that cash would be a better place for this money.

Completed Trades

- **SPDR S&P 500** (NYSEMKT: SPY): We set up our new June 2017 put ratio spread, per our alert. We obtained a credit of $0.37.

O'Reilly's Fair-Value Estimate Revs Up

Published Mar 24, 2016 at 10:39AM

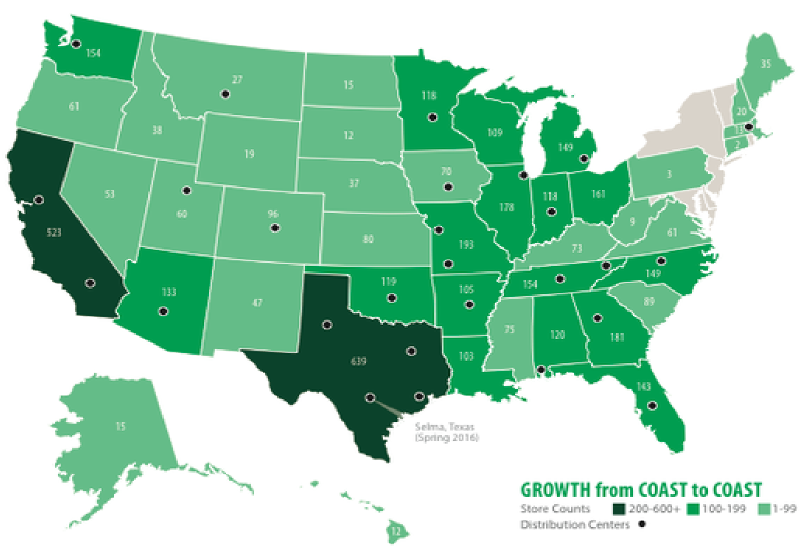
O'Reilly Automotive (NASDAQ: ORLY) owns more than 4,500 retail auto parts stores in the United States, and is lately adding more than 200 new stores per year. An extremely well-run company that has increased same-store sales and margins consistently for years, O'Reilly sees more opportunity ahead. And as one of our largest positions, O'Reilly remains a stock we want to own for the long haul. Shares are rated Buy even though they lately trade about 9% higher than our fair-value estimate (which is, again, an estimate).

Status	Buy
Fair-Value Estimate	$255 (up from $220)
Recent Price	$276
Current Allocation	5.6%
Dividend Yield	0%

Key Long-Term Thoughts

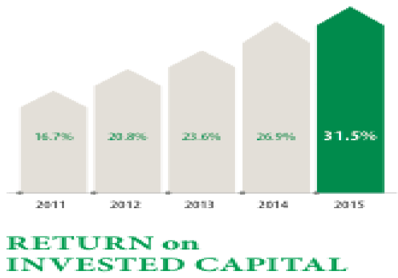
- This story remains all about growth. Little is exciting about selling auto parts unless you're consistently expanding. O'Reilly increased same-store sales 7.7% in the last quarter, and more than 7% in each quarter of 2015, grabbing market share along the way. The last quarter represented the 28th consecutive quarter of EPS growth greater than 20% -- that's seven years running.
- After opening 205 net new stores in 2015 (right on target), the company has sights on opening a net 210 in 2016. In most states, exposure is low enough that growth is on tap.
- Both the professional customer and the do-it-yourself customer contributed strongly to same-store sales growth. Increases in comparable transaction count and average ticket size contributed equally, too. The company credits knowledgable customer service and wide availability of parts (at competitive prices) for driving repeat traffic. Its new loyalty program is helping, too.
- Management continues to consider acquisition targets, including in the Northeast. Many candidates are chains that are not publicly traded and operate 100 to 400 stores.

Store Count by State (source: O'Reilly 10-K)



Secondary Thoughts

- Last year through November, miles driven were up 3.5% year-to-date. They should increase again this year, to a lesser degree. Miles driven, employment rates, severe weather, and gas prices are all drivers of this business.
- The company has an adjusted debt-to-EBITDA ratio of 1.52, well below its targeted 2 to 2.25. Management is using today's low interest rates to add leverage, given the stability of its cash flow. Since the quarter closed, O'Reilly has begun raising $500 million more through a secondary note expiring in 2026, with 3.55% interest rates.
- Management is purposely working its cash level down because of the strong returns it earns on invested capital.



(source: O'Reilly)

- O'Reilly performed well in the last recession, and expects to in the next one; people keep their cars longer during tough times, requiring more repairs to keep them in running order, and this can help offset lower employment and fewer miles driven.
- Lower fuel costs help lower the company's own distribution costs, as well as leading to more customer miles driven. If fuel prices rise meaningfully this year, that could become a headwind compared with a strong 2015.
- The company expects new car sales to remain healthy as more jobs form.

The Numbers

- **Outlook:** With management expecting tailwinds from modest improvements in employment and low gas prices, same-store sales guidance for the first quarter and 2016 is a positive 3% to 5%. First-quarter EPS guidance is $2.41 to $2.51, and full-year EPS guidance is $10.10 to $10.50. On average, analysts expect 16% EPS growth this year, to $10.66. Revenue should be $8.4 billion to $8.6 billion, and gross margin 52.3% to 52.7%. Free cash flow should be $750 million to $800 million, after capex of $460 million to $490 million. Selling, general, and administrative (SG&A) expenses should be up about 2% this year, more than the 1.5% standard, on higher medical costs, a bit more advertising, and more investment in data systems.
- **Q4 2015 and FY2015:** Q4 sales were up 10.5%, EPS rose 24%. For the full year, operating profits hit a record 19%, up 140 basis points over 2014. Full-year 2015 EPS was up 25% to $9.17.
- Gross margins will not keep expanding as rapidly as they have recently; that growth rate isn't sustainable. But ongoing incremental improvements are foreseen.

Market Cap	$27.1B
Cash	$116M
LT Debt	$1.39B
EV/EBITDA	15.9
EV/EBITDA NTM est.	14.4
P/FCF	29.8
P/E	29.7
P/E NTM Est.	25.5

Position Summary

At 5.6%, O'Reilly is our second-largest position. We are always cautious with retail investments, but when you find an exceptional company leading a profitable retail sector, the returns can be rewarding for a long time. With smart distribution of a vast array of parts, helpful customer service, and strong financial returns, O'Reilly continues to look like a standout company. The stock remains a long-term buy for your diversified *Pro* portfolio.

Write Puts on Gentex

Published Mar 24, 2016 at 10:02AM

Is this for you? Since we're looking to add 1.5% to our stake in this company, this alert should be applicable (now or perhaps later) to all *Pro* members, whether you already own shares of **Gentex** (NASDAQ: GNTX) or not. If you don't yet own shares, check out the Alternative Trades section at the end of the report.

How You Participate

- **Trade:** Sell to open May 2016 $15 puts.
- **Allocation:** 1.5% — write one put for every $100,000 you manage; *Pro* will write 25 contracts. In addition to our current 2.7% stock holding, this would bring our total allocation to about 4.2%.
- **Price Guidance:**
  - **Now:** Use a **limit order** to target $0.50 or greater to start (for a 3.3% effective yield in 58 days). **If we all use limit orders** and the stock price cooperates, we may be able to achieve $0.50 today.
  - **Later:** As prices and time to expiration change, those approaching the position should aim to get paid a yield on time value of at least 1% or so per month to expiration. (That means at least $0.15 per month remaining.)
- **Prices (9:50 a.m. March 24):** Stock: $15.31. Options: $0.50 bid / $0.55 ask. Guidance: $0.50.
- **Stock Rating:** Buy First, 2.7% allocation; we're now adding 1.5% in additional exposure through these new puts.

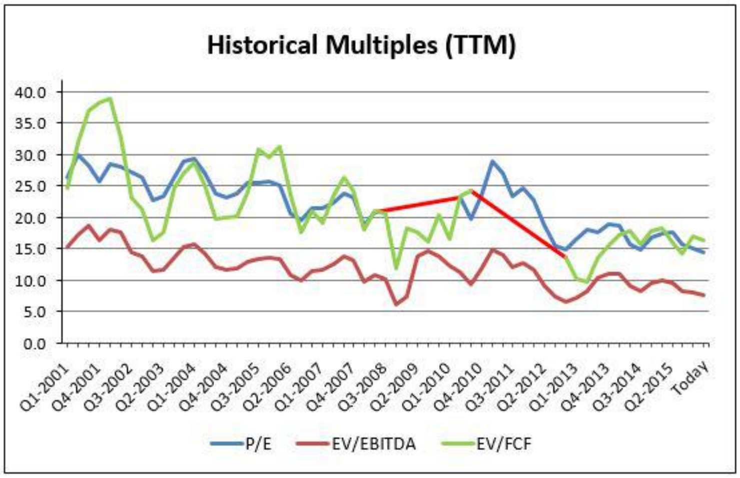
What We're Thinking

After the expiration of our March 2016 $15 puts last week, we've now run three successful rounds of written puts on Gentex, with all three iterations expiring fully as income. We've been running an income strategy on our Gentex position for more than a year, having begun our first round of put-writing in January 2015.

Since then, we've earned $4,259 in options income from our three rounds of written puts, and we've earned $1,826 from five dividend payments in January 2015, April 2015, July 2015, October 2015, and January 2016. Based on our current ownership stake of 4,400 shares, that's income of $1.38 per share. That equates to an 8.9% yield on the current share price, which helps offset some of the stock-price weakness that Gentex has experienced since the end of 2014 (as of today, the stock price is down 15% compared with the closing price on Dec. 31, 2014).

For many of the same reasons I've shared in previous alerts, we've decided to continue our income strategy by writing these new March 2016 $15 puts, targeting both income and the opportunity to buy shares at a lower price. Though we like Gentex's long-term prospects, we prefer to target income on our position alongside the potential to add to our stake at a lower price. With the income for this iteration of the strategy at $0.50, we'll have brought in a total of $2.20 per share with our series of four written puts on Gentex, giving us an effective start price on assigned shares of $12.80. (Your mileage may vary depending on how much you collected in the first two go-rounds and your tax situation.) This is about 16% lower than the current level, and 29% lower than our fair-value estimate; we'd happily buy shares for this price.

That said, we also need to evaluate the strategy on today's new decision alone — are we happy to potentially buy shares at $14.50? At $14.50 per share, we'd be buying shares at 13.5 times trailing-12-month (TTM) earnings, 7.1 times TTM EBITDA, and 15.2 times TTM free cash flow, at the low end of historical ranges over the company's past 15 years. That includes the 2008-2009 period, when auto sales plunged and several automakers looked like they might go bankrupt:



Note: Red lines represent omitted outlier multiples that correspond to recession-depressed earnings and cash flow.

Given that Gentex has executed well this year and that the auto market has continued to demonstrate strength — with seasonally adjusted annual sales of 17.4 million units in February 2016, 6.8% higher than the 16.3 million in February 2015 — we think those multiples are attractive.

More That Matters

- **Maximum loss:** For this iteration of the put strategy alone, our risk is the same as share ownership starting at about $14.50, or 5.3% less than the recent price.
- **Maximum gain:** On this put write alone, our maximum gain is the put premium. At a minimum of $0.50, that's a 3.3% effective yield in 58 days.
- **Follow-up:** For this iteration of the put strategy alone, we'll buy shares at a net $14.50 if the stock is below our $15 strike price at expiration, or we'll roll our puts for another credit. If our puts are on track to expire as income, we may write new puts for more income.

Alternative Trades

- **If you don't own stock already:** We think you should match *Pro*'s 2.7% allocation first — Gentex's shares are a Buy First. Then you can consider writing these puts for income or to add more shares. If one put option exceeds 1.5% of your portfolio, then just buy 1.5% in stock directly *if and when Pro* does so through these puts (we'll alert you if and when we do).
- **Want to write other puts?** Consider writing June 2016 or September 2016 $15 puts if the price on those options holds up better than the March puts after this alert is issued. Right now, the bid/ask on the June 2016 puts is $0.55/$0.65 (a 4% effective yield in about three months) and the bid/ask on the September 2016 puts is $0.90/$1.20 (a 7% effective yield in about 6 months).

Pro Can Help

- See our Options U guide to writing puts if you want more on this strategy.
- Check your mirrors and switch lanes over to the Gentex discussion board.

Hedge: Set Up Another Put Ratio Spread on the SPDR S&P 500

Published Mar 23, 2016 at 3:18PM

Is this for you? At *Pro*, we use hedges to earn returns during a market decline. You don't need to hedge to succeed with *Pro*, but if you are at least 80% invested in stocks and want to hedge your market exposure, then consider following along. This 10% hedge will lower our immediate market exposure to about a net 70%. Those without a margin account should consider the IRA-friendly Alternative Trades at the end of this report, as should those managing less than $200,000. We are leaving our April 2016 SPY put ratio spread alone, as it's far out-of-the-money, so we'll have two going at once.

How You Participate

- **Action:** Use a spread or ratio spread order to set up a put ratio spread on the **SPDR S&P 500** (NYSEMKT: SPY) ETF.
- **Allocation:** About 10% of your total portfolio value, measured on the look-through value of the $200 puts you're buying (each put represents $20,000 in hedge value). Set up one 2:1 put ratio spread for every $200,000 you manage and want to hedge; hedging just over 10% of our entire portfolio of nearly $2.5 million, *Pro* will sell 26 puts and buy 13 (because 13 puts at a $200 strike = $2,600 x 100 shares per contract = $260,000 look-through put value = 10.4% of our $2.5 million portfolio value).
- **Trade:**
    - **Use a ratio spread order to simultaneously ...**
        - Write ("sell to open") **two** June 17, 2016, $190 puts, and:

    - Buy ("buy to open") **one** June 17, 2016, $200 put. Click "view all" at your broker to see all strikes.
- **Price Guidance:**
    - Sell to open **two** June 17, 2016 $190 puts: Lately $2.60 x 2 = $5.20 credit
    - Buy to open **one** June 17, 2016 $200 puts: Lately $4.88 debit
    - **Net credit:** Lately about **$0.32** credit per spread -- but this price will change. As it does, simply aim for a credit, or close to no cost, using a limit order.
    - SPY price: $203.90
    - **Potential adjustment:** If SPY moves in price before you set up your trade, you may want to move both of your strike prices down or up accordingly, as much as SPY has moved, while still aiming for a net credit. After our mandatory trade delay, we will make such an adjustment if need be, and tell you about it.

What We're Thinking

At *Pro*, we aim to have winners in down, flat, and positive markets -- and that means we need to address all three possibilities at once in our portfolio. Yet our portfolio remains oriented toward the long term and majority invested in strong stocks. A hedge on a market index is simply a hedge against a lower market while the rest of our stocks are free to appreciate. We generally don't care about declines of 5% or less, but when *Pro* is functioning as desired, declines of about 7% or more should result in some of our positions, like these spreads, becoming nicely profitable. At the same time, the put ratio spreads we use:

- Are harmless to us if the market goes higher (they don't harm our return)
- Are typically cash-free to set up (they often even pay us a small credit -- essentially income!)
- Have a low probability of long-term loss

What's the trade-off? As with any written put, we need to be ready to buy the underlying investment; for today's position, that means being prepared to buy into the S&P 500 index (through SPY) if the price falls below $190. In this case, if the index declines by more than about 11.7%, this hedge becomes a liability, with SPY falling below our breakeven point. If that happens, we would plan to buy long-term call options on SPY instead of shares, saving most of our cash in the process. See below for details on that.

To help you grasp this strategy and how many spreads to set up, let's run through details on *Pro*'s allocation and our collective possible returns.

- *Pro* portfolio value: $2,492,000
- Ten percent of that value: $249,000
- June 2016 spread:
    - Buy to open $200 puts. Thirteen contracts representing 100 shares each = $260,000 in look-through exposure, or about a 10.4% hedge on our current portfolio value, cash included (you could also round down to 12, but that gets us only a 9.6% hedge; we'd rather round up).
    - Sell to open $190 puts -- 26 contracts, half of which are *not* covered by long puts and thus become a potential obligation at a net $180, currently a 9.4% possible stake.
    - At home, you would buy one $200 put and sell two $190 puts for every $200,000 in portfolio value you want to hedge ($20,000 look-through value per $200 put divided by $200,000 = a 10% hedge).

Return Details

SPY Price at June 17, 2016, Expiration	Value of 1 Purchased June 17, 2016, $200 Put	Value of 2 Written June 17, 2016, $190 Puts	Our Total Return (or Loss) on 1 Ratio Spread	SPY Price Change (%) From Recent $203.90
$200 or higher	$0	$0	$0.32 gain per spread -- or any credit or debit for setting up the trade	Any increase in price, or any decline of less than 1.9%
$195	$5 x 100 = $500	$0	$500	(4.4%)
$190	**$10 x 100 = $1,000**	**$0**	**$1,000 (max profit per spread)**	**(6.8%)**
$185	$15 x 100 = $1,500	($5) x 200 = ($1,000)	$500	(9.3%)
$180	**$20 x 100 = $2,000**	**($10) x 200 = ($2,000)**	**$0 (break-even)**	**(11.7%)**
$175	$25 x 100 = $2,500	($15) x 200 = ($3,000)	($500)	(14.2%)

If SPY declines more than 1.9% from recent levels, this hedge starts to come into play. Our maximum profit is earned on the spread if SPY declines nearly 7% from its recent level of $203.90 by our June expiration. The spread will help us a little on an index decline of as much as about 11%; deeper than that, and our short puts turn into an obligation that's in the red. Our break-even at $180 matches where our April put ratio spread on SPY starts -- we own those puts at $180. So, that's nice overlap. We plan to roll those April options as they near expiration (or set up a new second put ratio spread).

Follow-Up

Assuming we set this spread up for a credit, it will result in a small profit even if the market rises or treads water. On the flip side, we need to be ready to fulfill the $190 put obligation (starting with a net buy price of $180) if SPY is below $190 by expiration.

However, if that does happen, our plan would be to close our puts and buy long-term SPY calls (or something we like even better, whether calls or a stock) instead of buying the ETF. We should be able to do so at a reasonable strike price for about 25% of the cost of buying SPY shares. So, our potential 9.4% stake in SPY shares will only cost us about 2.3% of our cash if we buy calls instead. We'll be happy to buy calls on the index at a depressed price and still keep most of our cash available for other stock or call purchases. We would likely ultimately diagonalize those calls for ongoing income.

How It Fits Into *Pro*

Pro consistently hedges to lower our invested market exposure, or risk. As you know, we aim to achieve positive returns every rolling three years, and inflation plus 7% annualized (our North Star) over longer periods. With these challenging goals, any small advantage we gain in a falling market can make a difference. We made about $10,700 when our last put ratio spread closed in February. Even small gains add up over the years, especially after those gains on market declines are invested in good stocks. This hedge fits well with our goal of hedging in a cost-efficient way, one that doesn't work against us if the market rises. It does require regular upkeep, though, opening new positions as old ones expire, and these spreads are time-sensitive, really only helping at or right near expiration.

Alternative Trades

- **If you're hedging in an IRA or can't write naked puts, or are managing less than $200,000:**

    - For a small cost, you can set up a **bear put spread** instead, a strategy with defined, capped risk that most IRAs allow. Using a spread order, "buy to open" June 17, 2016, $200 puts and "sell to open" *an equal number* of June 17, 2016, $190 puts. Recently, this will cost you about $2.30 ($230) per spread, and that is your maximum risk. Buy as many spreads as you care to risk. This strategy would be worth up to $10 ($1,000) per spread on a decline to $190 or any lower price, but you should be prepared to lose your whole $230 per spread if SPY doesn't decline enough by expiration.

- **To lower your market exposure while following our full official trade (and make the position possible in some IRAs):**
  - Set up the official put ratio spread as recommended, but also "buy to open" puts (with the same month of expiration) at a strike price *well below* $190. Buy *half as many* as the number of $190 puts you wrote. When you do so, all of your $190 puts will be "covered" (half by your $200 puts, and half by the other puts you choose to buy at a much lower strike). Choose how much you want to pay to select your lower strike price to purchase. To us, the $180 strike or lower looks good, recently costing $1.40 or less. You will only need cash in your account to cover the difference between your two lowest strike prices (if you buy $180 puts, that's $10 per share), and your risk is capped, making this potentially IRA-friendly. This makes the total cost of your hedge about a $1.08 debit, with no risk beyond that, and it still has $10 in potential ending value.

Pro Can Help

- **Need a refresher on ratio spreads?** Our guide can help.
- **Want to talk about SPY?** We have a discussion board for that.

Pro Catch-Up Trades: March 21, 2016

Published Mar 21, 2016 at 3:37PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **Broadridge Financial Services** (NYSE: BR): Following last week's update, the stock moves to Buy First. Buy up to 4.9%, or buy in halves.
- **Facebook** (NASDAQ: FB), buy our 6.3% allocation in thirds or halves over time (write near-the-money puts if you don't mind potentially missing upside).

Continue building your portfolio with our Buys, including these highlighted today:

- **Apple** (NASDAQ: AAPL), buy up to 3.8% in stock.
- **Papa John's International** (NASDAQ: PZZA), buy up to 2.7% in stock.
- **TD Ameritrade** (NASDAQ: AMTD), buy 2.5% in stock.

Options:

- **American Airlines** (NASDAQ: AAL): If you've haven't bought calls on AAL, we still believe there is value to be had. But the market needs to start to agree with us. Buy to open January 2017 $35 calls, lately for about $10.30 each (buy one call for every $1,030 you are comfortable risking, up to 0.5%). We don't know yet whether we'll extend this strategy beyond 2017, but it's possible.

Our most recent short:

- **Deere & Company** (NYSE: DE), as a hedge against the market and our investment in **Valmont** (NYSE: VMI): Sell short (sell to open) 2% of DE per our recent recommendation.

Being Wrong vs. Staying Wrong

Published Mar 21, 2016 at 2:40PM

Dear Fools,

Earlier this year, fellow Fool Morgan Housel published an article that I found to be especially relevant for *Pro* investors. In it, he talked about the need to be able to distinguish between when you're being patient and when you're being outright stubborn. Investing and stubbornness make for a dangerous cocktail (especially in the context of a short position). But the prevalence of such a mixture is unsurprising when you consider the concept of cognitive dissonance, not to mention our human tendency to focus on the negatives.

Why is it that we frequently see investors spending so much time focusing on the positions that aren't working out as they had hoped, even if their overall portfolio is trouncing its benchmark? Odds are it's because our brains appear to have a negativity bias. As Ray Williams from *Psychology Today* noted:

> In our brains, there are two different systems for negative and positive stimuli. The amygdala uses approximately two-thirds of its neurons to detect negative experiences, and once the brain starts looking for bad news, it is stored into long-term memory quickly. Positive experiences have to be held in our awareness for more than 12 seconds in order for the transfer from short-term to long-term memory. Rick Hanson describes it in this way: "The brain is like Velcro for negative experiences but Teflon for positive ones."

From my perspective, the issue isn't so much that people focus on finding the duds in their portfolio -- it's what they do after they've identified them. I believe that one of the common threads among all great investors is that they actually embrace their failures, harnessing them to become better investors. They welcome failure with open arms because they view it as a learning experience that will help them with future investing decisions. Unfortunately, this appears to be a bit of an uncommon practice in our field.

Stubbornness -- or refusing to relinquish the "I'm right and the market is wrong" mind-set despite meaningful contradictory evidence -- tends to be a more common reaction to failure. This is likely the result of our brains' attempts to reduce cognitive dissonance, defined as the mental stress or discomfort associated with holding multiple contradictory beliefs or opinions simultaneously. In this case, the dissonance occurs when we're presented with new information (a position we own is in the red) that directly contradicts a prior, strongly held belief (we're above-average investors who don't need to resort to passive investing and spent a lot of time and energy researching that particular position).

The average batting average for players in Major League Baseball's Hall of Fame is around .300, meaning even the all-time greats only got a hit 30 percent of the time. Sports analogies are commonplace in investing, and this particular one is often used to highlight how it is possible to be successful without being perfect. To be sure, not every type of investing strategy will deliver satisfying results if you're right only 30 percent of the time — odds are that venture capitalists will be far more satisfied with those results than value investors. But the value of this saying isn't in the percentage; it's in the idea that you need to refrain from being a prisoner of the moment and look at how your overall results stack up over a more relevant time period. You can still get into the Hall of Fame if you strike out -- and you can still be a good investor even if all of your positions don't pan out.

"It's OK to be wrong, but it isn't OK to stay wrong" is a popular saying among traders, but I believe it is just as important to adopt this mind-set as a long-term investor. As Morgan noted, however, this becomes increasingly difficult the more time, energy, and money we invest into a particular position. The more we invest, the more we want to believe we're right, and the more we want to believe we're right, the more prone we become to confirmation bias, which further reinforces the mistaken belief that we're right.

Our brains may appear to be hard-wired for us to achieve suboptimal investing results, but with deliberate practice, you can overcome this. The key is to be able to identify how your brain works and create a process that forces you to replace destructive tendencies with beneficial ones. For example, whenever you find yourself dwelling on a position that's in the red, force yourself to refocus by think about what it is that really matters -- being right all the time, or meeting your financial objectives? Every investor, even the greats, will take a swing and a miss (or several) now and again. High accuracy is great insofar as it keeps you from losing money, but it doesn't guarantee that you'll meet your financial objectives. If that were the case, there'd be no reason for us to invest in anything other than Treasuries and hold them to maturity. This seemingly subtle change in your mindset can actually have a sizable impact on the way you think about your positions, helping to free you from the urge to dwell on losing positions and recognize when it's time to move on.

Foolish best,

-- JP (TMFYossarian)

Pro Catch-Up Trades: March 14, 2016

Published Mar 14, 2016 at 3:49PM

Catch-Up Trades are timely ideas to help you catch up with Pro *portfolio positions you may be lacking. Remember that we're a full portfolio service, and most all of our stocks are rated Buy already.*

Pro's Buy First stocks are recommended for your long-term portfolio; buy into them gradually. Lately worth highlighting:

- **American Tower** (NYSE: AMT), buy up to 3.5% in stock
- **Facebook** (NASDAQ: FB), buy our 6.3% allocation in halves over time (write near-the-money puts if you don't mind potentially missing upside)
- **Gentex** (NASDAQ: GNTX), buy up to 2.7% in stock
- **MasterCard** (NYSE: MA), buy up to 4.3% in stock

Continue building your portfolio with our Buys, including these highlighted today:

- **Apple** (NASDAQ: AAPL), buy up to 3.7% in stock
- **Papa John's International** (NASDAQ: PZZA), buy up to 2.7% in stock
- **Parexel** (NASDAQ: PRXL), buy up to 3.2% in stock
- **TD Ameritrade** (NASDAQ: AMTD), buy 2.6% in stock

Options:

- **American Airlines** (NASDAQ: AAL): If you've never bought calls on AAL, we still believe there is value to be had. The market just has to start to agree with us. Buy to open January 2017 $35 calls, lately for about $9.90 each (buy one call for every $990 you are comfortable risking). We don't know yet whether we'll extend this strategy beyond 2017.

Our most recent hedge:

- **SPDR S&P 500** (NYSEMKT: SPY): If you haven't set up this put ratio spread yet, the index is much higher now, but if you want to mirror the original alert, you can get close. Lately, you can set up the April 15, 2016, hedge by buying to open $180 puts and selling to open two $173 puts for breakeven. The spread is smaller than the $12 one we initially recommended, but with the market going up, lower-strike puts don't pay as well.

And our most recent short:

- **Deere & Company** (NYSE: DE), as a hedge against the market and our investment in **Valmont** (NYSE: VMI): Sell short (sell to open) 2% of DE per our recent recommendation

---

Pro Quality Checklist: Broadridge

Published Mar 14, 2016 at 1:30PM

Dear *Pro* Fools,

So far, we've run five of the companies in our portfolio through our *Pro* quality checklist:

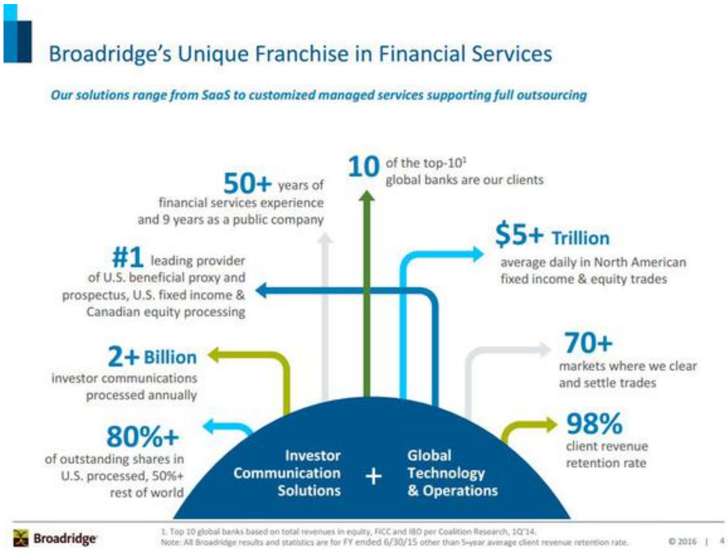
- **American Tower** (NYSE: AMT) -- 7.5/8
- **Oracle** (NYSE: ORCL) -- 8/8
- **O'Reilly Automotive** (NASDAQ: ORLY) -- 6/8
- **TD Ameritrade** (NASDAQ: AMTD) -- 5.5/8
- **Valmont Industries** (NYSE: VMI) -- 5.5/8

Today, we resume our checklist series with a look at **Broadridge** (NYSE: BR), our provider of investor communications and securities processing. The company is our fourth-largest position, with a 4.8% allocation. Here's how it stacks up against our eight criteria.

1. A Sustainable Competitive Advantage

Yes. Broadridge benefits from strong competitive advantages, the most predominant of which is scale. The company dominates its markets, processing approximately 85% of outstanding shares in the U.S. (and about 72% globally) with its proxy services solutions, as well as more than $5 trillion in equity and fixed-income trades per day of

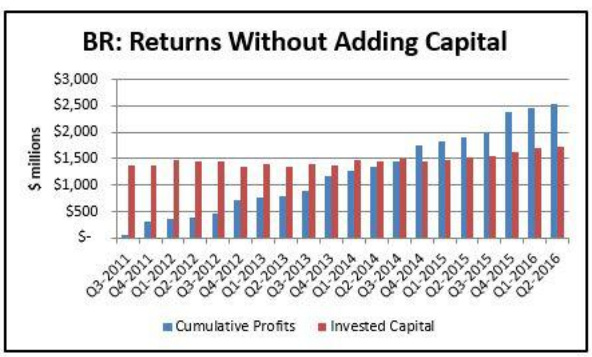
U.S. and Canadian securities, and approximately 60% of U.S. fixed-income trades.



The company's scale, successful acquisitions, and low capital intensity (capital expenditures average 2.2% of sales since 2010) have led to rising returns on capital and strong free cash flow, quantifiable evidence of competitive advantage:

	FY 2011	FY 2012	FY 2013	FY 2014	FY 2015
Fee Revenue Growth %	1.0%	9.4%	5.1%	7.9%	6.5%
Fee Revenue Gross Margin %	37.9%	37.1%	39.8%	44.3%	45.3%
Fee Revenue Operating Margin %	19.3%	18.2%	20.4%	23.4%	24.5%
After-tax ROIC % (average)	15.2%	13.1%	16.3%	19.7%	19.8%
Free Cash Flow ($ in millions)	$ 143	$ 244	$ 220	$ 334	$ 365
Acquisitions ($ in millions)	$ 294	$ 72	$ -	$ 97	$ 203
% Revenue Growth From Acquisitions	4%	3%	0%	1%	2%

Broadridge is an excellent business because it generates highly predictable recurring revenue and requires very little reinvestment, meaning it enjoys copious, low-risk free cash flow. The chart below shows that Broadridge's growing earnings (blue bars) have come without much additional capital investment (red bars):



Broadridge's mission-critical back- and middle-office solutions also lead to strong client retention, with a stellar 98% five-year average client revenue retention rate. We see that Broadridge benefits from high switching costs, which is typical for companies that deal with administrative solutions. Its products are deeply integrated into its clients' processes, so moving to another provider entails a major business disruption.

2. Pricing Power

Yes. Broadridge's dominant market position and limited competition afford it the luxury of largely controlling its pricing. The company's core business is subscription-based, and more than 91% of total fee revenue is recurring. (The rest is event-driven, meaning it depends on the number of special events and corporate transactions processed.) The recurring-revenue clients essentially *have* to renew their contracts with Broadridge, given that the alternative would be setting up their own in-house processing and record-keeping units. That would not make sense from a cost perspective, because Broadridge can perform these tasks cheaper and better thanks to its dominant scale, robust and growing product suite, and expertise.

It's interesting to note that Broadridge benefits from an inverse form of pricing power. Though the company doesn't flex its muscles via outright price increases (internal revenue growth has averaged just 1.4% since 2011, pacing about in line with inflation), the scalability of its tech-based automation platforms allows processing costs to decrease over time. As costs decrease, simply maintaining the same pricing is a de facto increase.

3. Dependent Customer Base

Yes. Broadridge is by far the market leader in helping financial firms untangle non-core but mission-critical tasks such as proxies, prospectuses, trade confirmations, and account statements — the kind of administrative work nobody else wants to do. Its diverse customer base includes retail and institutional brokers, global banks, mutual funds, annuity companies, institutional investors, and corporate issuers. The company counts all of the top 10 global banks as clients, clears and settles trades in 70-plus markets, and processes more than 2 billion investor communications annually. Broadridge's systems help reduce the need for clients to make significant capital investments in operations infrastructure, thereby allowing them to increase their focus on core business activities.

4. Predictable Revenue

Yes. Broadridge benefits from a 98% client revenue retention rate thanks to its reputation for quality and strong client relationships, themselves stemming from 50-plus years of financial services experience. The company earns revenue based on long-term contracts, and as mentioned, more than 90% of total revenue is recurring. Its diverse revenue distribution (more than 1,100 broker-dealers, about 10,000 corporate issuers, and about 800 mutual fund families) leads to predictable (though slow-growing) revenue as stock listings expand, new client contracts are signed, acquisitions increase the company's addressable market, and new ways to manage client data are implemented.

5. Growing Free Cash Flow With Compounding Returns

Yes. Broadridge's low capital intensity and strong competitive advantages lead to plentiful free cash flow. Its free cash flow margins since the beginning of fiscal 2011 have averaged 15.2%, and FCF has increased from $144 millon in fiscal 2011 to $365 million at the end of fiscal 2015 (a 26% CAGR).

Broadridge has a long runway for growth in adjacent products and markets, and management routinely spends a good portion of cash flow on acquisitions -- 51% of cash flow since the beginning of fiscal 2011. The company has an outstanding acquisition track record, spending $777 million in 15 key acquisitions since becoming a public company in 2007. The internal rate of return (IRR) of the acquisition portfolio is tracking to 20%-plus as of the end of fiscal 2015.

The company's size and scale, distribution channel, and client base make acquisitions more successful, as complementary businesses are worth more and are more efficient under the Broadridge umbrella than they are standing alone.

6. Financial Resilience

Yes. Broadridge has a very resilient balance sheet, with strong free cash flow (15% of sales, as mentioned above) and a net debt-to-EBITDAR* ratio of about 1.7. The company's operating income covers interest expense 18 times over. Broadridge produces steady and consistent cash flow, and it has incremental debt capacity to run the business at a debt-EBITDAR ratio of 2:1.

**Debt/EBITDAR ratio is calculated as (Debt + 8x Rent Expense) / (EBITDA + Rent Expense)*

7. Expanding Possibilities

Yes. Broadridge has the ability to grow into adjacent markets via targeted acquisitions. During the past two fiscal years, the company has acquired six different businesses, all complementary to the core business. These include a provider of cloud-based marketing solutions and services for financial advisors, the trade processing business of the Wilmington Trust unit of M&T Bank, the fiduciary services and competitive intelligence unit of Thomson Reuters' Lipper division, a provider of real-time foreign exchange solutions, a provider of fee calculation, billing, and revenue/expense management solutions for asset managers, and a provider of websites and related communications solutions for financial advisors. Broadridge will likely continue to expand globally and into new asset classes and win some more new outsourcing deals, driving growth through new products and tuck-in acquisitions.

8. The Three C's of Management (Clarity, Consistency, Capability)

Yes. Broadridge is led by CEO Richard Daly, an industry veteran for more than 35 years. Daly got his start in the proxy business in 1979 with the Independent Election Corp. of America (IECA), then one of the biggest proxy firms in the business, and founded what is now Broadridge in 1987 to capitalize on the increasing prevalence of electronic record-keeping in the financial services industry. Daly sold his fledgling business to payroll giant **Automatic Data Processing** (NASDAQ: ADP) in 1989, launching the proxy-services group within ADP's Brokerage Services division.

In 2007, Broadrige was spun off from ADP and began trading as an independent public company. Daly has been CEO of Broadridge since the spinoff in 2007, and his deep industry experience and connections benefit the company. Daly owns more than $71 million in Broadridge stock (1.1% of outstanding shares), aligning his interests with those of common shareholders, and management compensation structure (including long-term equity-based incentives) promotes long-term growth in value per share.

Management's communication with the investment community is exemplary (as would be expected from a company whose core product is an investor communications solution), and its capital stewardship strategy is clearly outlined within each investor presentation (see slide 13 here for an example).

The *Pro* Bottom Line

In sum, Broadridge scores a perfect 8/8 on our *Pro* quality checklist. There's a reason this company is our fourth-largest position: It is a model of a *Pro*-type investment. Broadridge's business lies at the nexus of *Pro's* largest sector bets, technology and financials, and it benefits from key trends in the financial services industry including mutualization (i.e. standardization of non-differentiating industry capabilities), digitization, and data/analytics. Broadridge looks set to continue to challenge North Star-like returns from the current price, and the company's capital-light and scalable business, promising new product pipeline, excellent acquisition track record, and sound capital allocation policies make it a sturdy rock to build the *Pro* portfolio upon.

Fool on!

-- Billy (TMFBillyTheKid)

Pro Completed Trades

- **SPDR S&P 500** (NYSEMKT: SPY): On Friday, the *Pro* service's 30-day window to make this trade closed, so we placed our latest hedge on SPY. We bought to open twelve April 15, 2016, $180 puts, and sold to open twenty-four April 15, 2016, $173 puts. The latter, the ones we sold, have a strike price five dollars above the $168 strike in the original alert; that's because we tweaked them so we could still place the trade at breakeven. (To be 100% honest, actually, it cost us one penny.) The index has increased sharply in the last month, so the hedge has been unnecessary, though it initially paid members a credit. We wanted to place a trade as close to the original one as possible, so we're all on the same page. We are now considering hedges at much higher strikes given the market's increase. If you still lack this lower-strike April hedge and want it, see today's Catch-Up Trades. You can do as we did and set up this low-probability hedge for about breakeven.

Pro Guidance Updates

- **Facebook** (Nasdaq: FB) moved to Buy First, and our fair-value estimate increased to $100. We have a 6.3% allocation.
- **MasterCard** (NYSE: MA) moves to Buy First, and our fair-value estimate increases to $84. We have a 4.3% allocation.

MasterCard Is Still a Master of Growth

Published Mar 14, 2016 at 12:10PM

MasterCard (NYSE: MA) "charged forward" in 2015 despite slow international commerce and a strong U.S. dollar. For the year, net revenue in local currency advanced 8%, and EPS gained 18% before special items.

But right now, an investment in MasterCard -- as with **Visa** (NYSE: V) -- is an investment in growth *beyond* this year, because 2016 looks tepid as emerging markets struggle and the dollar remains strong. Much of the company's growth potential is being coiled up like a spring. That spring should pop when more economies begin to expand again and the dollar weakens. The market knows this, so the stock maintains a premium valuation. Even so, we're moving MasterCard's fair-value estimate higher today, and given the predictable nature of this strong business, moving it back to Buy First.

Status:	**Buy First**
Fair-Value Estimate:	$84 (up 6%)
Recent Price:	$88
Current Allocation:	4.3%
Dividend Yield:	0.9%

Key Long-Term Thoughts

- MasterCard is moving smartly in digital payments, security, and new international markets; outside of Visa, a single strong international competitor still doesn't exist, which means much more long-term growth ahead as cash still accounts for 85% of transactions. There's room for all current leaders to grow nicely.
- Operating expenses were up 1%, or 4% on a currency-adjusted basis, again showing the leverage in the business model.
- Rebates and incentives (given to promote use of the cards) were up 20%, or more than revenue. This line should be up a bit less this year, but it remains something we watch in relation to competitive pressures. The industry is only extremely attractive if its competitors don't need to offer too many rebates just to maintain market share.
- MasterCard's services business (immune to rebates, made up as it is of recurring fee revenue) is now about 25% of the company's revenue, with the core business accounting for the other 75%. Margins should tick up over time, with more scale.

Secondary Thoughts

- MasterCard continues to do the legwork for eventual approval to conduct transactions in China.
- Eighty percent of its card issuers are now using SafetyNet, MasterCard's security service, for a fee.
- The service business -- advisors, consulting, information services (analytics) -- remains an important, growing business at MasterCard (and Visa).
- MasterCard is investing considerably this year in China, in MasterPass (now in 29 countries), and in security and the services businesses.
- Europe remains a relatively under-penetrated market when it comes to electronic payments.

The Numbers

4th Quarter Selected Financial Performance
($ in millions, except per share data)

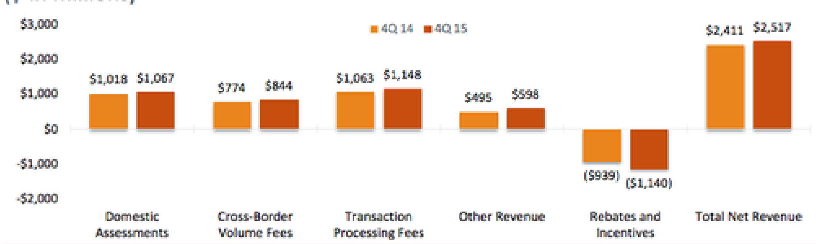
	4Q 15	4Q 14	YOY Growth As Reported	YOY Growth FX Adjusted
Net revenue	$ 2,517	$ 2,411	4%	9%
Total operating expenses	1,410	1,393	1%	4%
Operating income	1,107	1,018	9%	17%
Operating margin	*44.0%*	*42.2%*	*1.8 ppts*	*2.7 ppts*
Net income	$ 890	$ 801	11%	18%
Diluted EPS	$ 0.79	$ 0.69	14%	22%
Effective tax rate	13.1%	20.3%		

Note: Figures may not sum due to rounding.

3 January 29, 2016 ©2016 MasterCard. Proprietary MasterCard

The fourth quarter saw healthy 14% growth in earnings per share as reported, but note the much lower tax rate (13% vs. 20%) thanks to favorable settlements with tax authorities following an audit. Still, adjusted for currencies, EPS growth was very strong at 22%, meaning it was healthy outside of the lower tax rate.

4th Quarter Revenue
($ in millions)



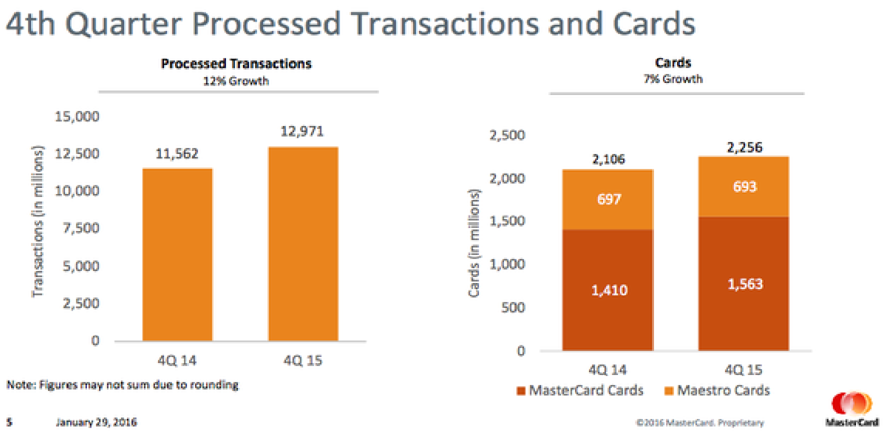
Growth	Domestic Assessments	Cross-Border Volume Fees	Transaction Processing Fees	Other Revenue	Rebates and Incentives	Total Net Revenue
As-reported	5%	9%	8%	21%	21%	4%
FX-adjusted	10%	13%	13%	26%	27%	9%

Note: Figures may not sum due to rounding.

6 January 29, 2016 ©2016 MasterCard. Proprietary MasterCard

Shown above, "other revenue" -- fee income -- is important because of the growth of rebates and incentives in relation to the core transaction business. That growth in recent years has suggested that the industry remains particularly competitive among the top two players -- it's an ongoing land grab.

Transactions were up 12% year-over-year, and the number of cards issued rose by 7% (though keep in mind that many old cards do become inactive):



Outlook

- Management sees challenges persisting in most parts of the world, with the United States likely being the most resilient economy. Europe's economy is expected to grow at its fastest pace since 2011 this year, but from a depressed base. Large emerging-market economies -- including China and Brazil -- look weak. The company's total growth rate in 2016 should be well below its long-term average.
- MasterCard maintains its 2016 to 2018 performance objectives as follows: Net revenue CAGR of low double digits (10% to 12%), operating margin of at least 50%, and EPS CAGR in the mid-teens.
- Its three-year projected growth starts from 2015's $3.12 EPS. This suggests about $4.74 per share in earnings by 2018, putting the $88 stock at 18.5 times those estimates. This may look expensive so far ahead, but there is considerable upside potential to these estimates, and low probability that results will come in much below them.

Market Cap	$98B
Cash	$6.7B
LT Debt	$3.2B
EV/EBITDA	17.0
EV/EBITDA NTM est.	15.8
P/FCF	20.5
P/E	26
P/E NTM Est.	25

Position Summary

Our fair-value estimate of $84 puts MasterCard stock at 20 times expected earnings for next year, a minimum multiple merited by this premium, strongly growing business in an average stock market. When growth one day uncoils, the bottom line could grow in the 20% range again. We're happy to have 4.3% in MasterCard (and 2.3% in Visa) for the long haul, while watching the competitive moat for leaks. MasterCard remains a buy -- namely now, a Buy First.

An Open-Book Update on OpenText

Published Mar 10, 2016 at 10:10AM

OpenText (NASDAQ: OTEX) sells enterprise information management (EIM) software. Meeting its customers where they are, the company's offerings are available by license or in the cloud. The past few years have been marked by choppy license results and (as for most companies) a challenging environment in international markets, worsened by a strong dollar. OpenText has managed through this situation while keeping market share (it appears) and increasing its margins. As it releases new software, called version 16, this fall, success will mean adding more clients and cross-selling.

Status	**Buy**
Fair-Value Estimate	$55 (no change)
Recent Price	$49
Current Allocation	2.8%
Dividend Yield	1.6%

Key Long-Term Thoughts

- The company's most significant new product release, version 16, occurs in the second half of this year.
- The goal is to provide a singular platform for managing, analyzing, and exchanging enterprise information.
- A new opportunity present in version 16 is selling embedded analytics to existing customers, thanks to last year's Acuate acquisition. The new software has analytics embedded everywhere, in the Content Suite, Process Suite, and Experience Suite.
- The CEO has also assumed the role of CTO. No word on how long this is planned to last, but we'd rather see the roles separated.

Secondary Thoughts

- The company is considering acquisitions, and views a choppy, difficult market as an opportunity. It expects to do "multiple and meaningful" transactions this year.

- OpenText is focused on generating more cross-selling opportunities, especially starting in 2017.
- Americas were 56% of sales, Europe/Middle East/Africa 35%, and Asia-Pacific Japan 9%.
- See this outstanding presentation.

The Numbers

- **Outlook:** The current third quarter should have traditional seasonality. OpenText doesn't provide guidance.
- **Q2 2016:** In constant currency, revenue rose 6%, recurring revenue was up 4%, maintenance revenue gained 9%, cloud revenue was up 1% and license revenue jumped 19% (9% in local currencies). Adjusted operating income rose 12% to $172 million. Margins are higher and on track with plans, with adjusted operating margin at 37%.

Market Cap	$5.9B
Cash	$742M
LT Debt	$1.57B
EV/EBITDA	12.8
EV/EBITDA NTM est.	10.0
P/FCF	14
P/E	26.7
P/E NTM Est.	13.5

Position Summary

At 2.8%, OpenText is our 15th largest position, putting it in the bottom two-thirds of our stock holdings. Yet it's reasonably valued, and the EIM industry in general should increase sales by at least 10% annualized over the coming several years. I have suggested writing puts on OpenText for years in *Motley Fool Options*, and we may do a bit of that in *Pro*, too, should we decide to potentially add to our stake. But keep in mind, we also own **Oracle** (NYSE: ORCL) in *Pro*. Both have been slow performers the past two years. Long-term analysis suggests that eventually they'll reward us more strongly again, but we still want to keep our exposure to software reasonable, while considering adding young, higher-growth companies, too.

Papa John's Delivers Consistent Earnings Growth

Published Mar 8, 2016 at 2:32PM

Pro's Take: PZZA Q4 and FY-2015 Earnings

Papa John's International (NASDAQ: PZZA)

....

Q4-2015

Total revenue growth: -2% (vs. +9.7% in Q4-2014)

Operating profit margin: 9.7% (vs. 7.9% in Q4-2014)

EPS growth: +20.1% (vs. +26.1% in Q4-2014)

Domestic comparable store sales: +1.9% (vs. +4.1% in Q4-2014)

International comparable store sales: +5.3% (vs. +8.9% in Q4-2014)

FY-2015

Total revenue growth: -2.5% (vs. +11.1% in FY-2014)

Operating profit margin: 8.3% (vs. 7.4% in FY-2014)

EPS growth: +13.6% (vs. +13.4% in FY-2014)

Net new restaurant unit growth: +230 (+4.9%, vs. +235 and 5.3% in FY-2014)

Domestic comparable store sales: +4.2% (vs. +6.7% in FY-2014)

International comparable store sales: +6.9% (vs. +7.4% in FY-2014)

....

Quarter Quick Take

Papa John's turned in a solid Q4-2014 and wrapped up a strong fiscal year in 2015. Despite pressure on total revenue growth (+2.5% in 2015) due predominantly to lower cheese prices (which impacts Commissary sales to restaurants but has no effect on margins as the company passes on the costs with a fixed markup), Papa John's delivered reported growth of 13.6% in earnings-per-share (EPS) due to higher global restaurant sales growth (+5.3%), expanding operating margins (8.3% in FY-2015 vs. 7.4% in FY-2014) and continued share buybacks (the company reduced its diluted share count by 6.2% in 2015). If not for the $12.3 million legal settlement expense that the company recorded in Q2-2015 to settle a class action lawsuit, Papa John's would have reported +19.4% EPS growth.

2015 was another example of the formula that Papa John's has successfully used to grow its earnings-per-share at a 5-year compound annual growth rate (CAGR) of +16.3% since the end of 2010:

	FY-2011	FY-2012	FY-2013	FY-2014	FY-2015
Net Revenue Growth	8.1%	10.2%	7.2%	11.1%	2.5%
Global Restaurant Sales Growth*	7.7%	10.6%	6.2%	9.8%	5.3%
Operating Margin %	7.1%	7.4%	7.4%	7.4%	8.3%
Yearly Reduction in Share Count	4.3%	5.2%	7.1%	5.8%	6.2%
EPS Growth**	12.2%	17.9%	18.8%	13.4%	19.4%

*This metric includes both comparable store sales growth and net restaurant unit growth

**FY-2015 EPS growth is adjusted for legal settlement expense

It's now been two quarters since *Pro* trimmed its position by one-third via covered calls (selling at a net $68.40 per share). As I write this, at around $57 per share, the stock is currently ~16-17% below those levels, and is now much closer to our fair-value estimate, which prior to this update was $57.50 (last updated in August 2015 here).

But after accounting for 2015 results and rebuilding my valuation model for Papa John's, **we're lowering our fair-value estimate to $54 per share.** The reduction in fair value is more a function of changes in long-term valuation driver assumptions (franchise royalty rates, franchise productivity, net unit growth, and cheese pricing) than it is a reflection of the momentum of the business. It is a good example of one of "The Flaws of Fair Value".

As my familiarity with the business has grown and business results have provided clarity on trajectory, I've altered some important assumptions to more accurately reflect my expectations of the future. While this doesn't mean I think the company is actively destroying value, it does mean that my estimate of fair value has decreased. Despite the valuation decrease, **Papa John's should be able to earn North Star-like returns over the next three years due to a combination of low-to-mid single digit comps growth, modest store unit growth, operating margin expansion, and continued share buybacks.**

Guidance: Buy (no change)

Recommended Allocation: 2.8%

Fair Value estimate: $54 (down from $57.50)

Current Price: $57.25

Given the recent decline in the company's share price, Papa John's is more reasonably valued than it was over much of the last two to three years, despite far less uncertainty regarding the trajectory and sustainability of the company's international expansion. On a TTM basis, at $57 per share, the company trades for 28.7x P/E (27.3x if we exclude the non-recurring legal expense), 20x EV/FCF, and 14x EV/EBITDA.

For context, **Domino's** (NYSE: DPZ) trades at 20.5x EBITDA, **Dunkin' Brands** (NASDAQ: DNKN) trades at 15.5x, and **Starbucks** (NASDAQ: SBUX) trades at 18x. As financial performance has improved (and the share price has declined), Papa John's trailing multiples have contracted as we expected. For those without a position, now is as good a time as any in the last few years to establish a position in this strong business with good operational momentum and a long international growth runway.

Our Thesis

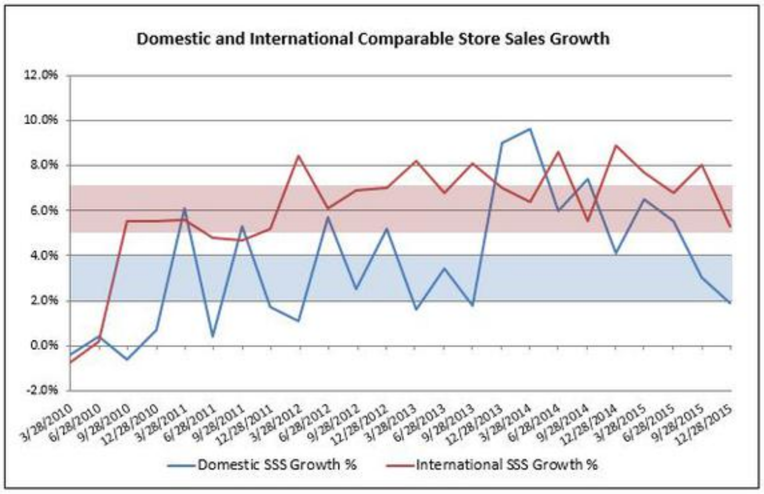
Papa John's has a competitive advantage in North America that stems from its 30+ year-old brand and consistent messaging. It is known, trusted, and perceived to be higher quality than its main quick service restaurant (QSR) pizza competitors, which allows it to charge marginally higher prices. It has a competitive advantage vis-à-vis smaller, independent chains based on scale in the purchasing, marketing, and tech development business areas. We expect these domestic advantages to persist and lead to modest share gains in the mature QSR-pizza market. We believe the company's brand advantages are translating internationally and that Papa John's is laying the groundwork to develop scale-based advantages there, too. With only about 1,500 international restaurants the company has a long runway for growth (compare to Domino's which has over 7,300 international stores and Pizza Hut which has over 7,000 international stores). Our thesis relies on management strengthening the brand via messaging about quality relative to peers, continued investment in technology, and a focus on the health and quality of franchisees.

The Most Important Things

1) Store Performance*:* During Q4-2015, systemwide restaurant sales increased +3.4% (+5.7% when excluding the impact of foreign currency). Domestic comps increased +1.9% while international comps increased +5.3%.

Domestic comps growth continued its deceleration this quarter (down from 6.5%, 5.5%, and 3% in Q1-2015, Q2-2015, and Q3-2015, respectively) due to "extremely competitive pricing" within the category driven by a commodity environment that has been "very favorable" in terms of both cheese prices and beef prices. For a company that relies on a higher-quality brand message, lower commodity prices make it easier for competitors to undercut Papa John's on pricing. For full year 2015, the company achieved 4.2% domestic comps growth, at the high end of the company's initial guidance of 2%-4% that was set out in Q4-2014. Management's guidance for 2016 is for 2%-4% domestic comps growth, in line with last year's guidance, though slightly below what the company achieved in full year 2015.

As for international comps, the company continues to churn out mid-to-high single digit comps performance. At +5.3% for the quarter, this marks the 17th consecutive quarter of international comps above +5%:



**Shaded areas represent management's guidance ranges for full year 2016*

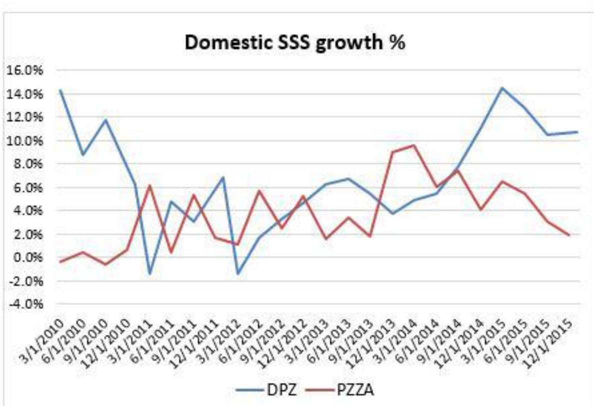
The company's measured expansion continued, adding 107 new restaurants (net) in the quarter and 230 for the full year -- of which 182 were international and 48 were in North America. The company recently opened in its 41st country in Israel and will be opening soon in Spain. The company now has over 1,500 international stores (up from 822 at the end of 2011, a 16.2% CAGR in units).

Management expects full year 2016 openings to come in at 180-210 restaurants, with 75% of the net unit growth in international markets. 195 restaurant openings for 2016 would represent +4% growth versus the existing store count as of the end of 2015. The company's pipeline remains healthy, with 200 domestic restaurants and 940 international restaurants, the majority of which are scheduled to be opened over the next six years.

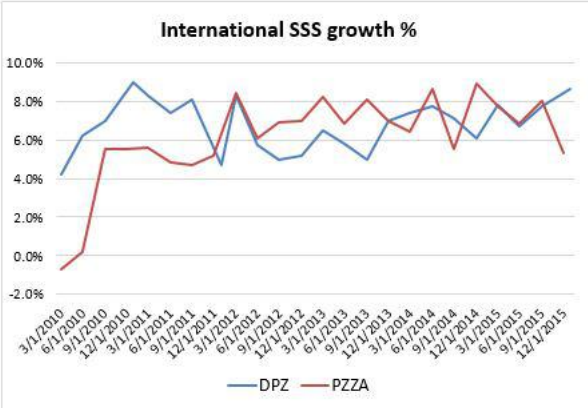
2) Brand: Brand strength is challenging to measure, but we need to monitor it because it is key to the company's brand-based advantages and higher price per pie. Based on recent data, which includes store growth, the domestic pizza market was about flat and the international pizza market grew about 3%-4%. So Papa John's comps (which *exclude* store growth) suggest continued market share gains at the expense of competitors. This is likely due to the company's competitive advantages related to scale (efficient advertising/distribution) and an early lead in technology (digital ordering and loyalty programs).

As for PJ's strongest peer, Domino's domestic comps came in at an excellent +10.7% in the quarter, outperforming Papa John's meaningfully. This past quarter was the fifth consecutive quarter of double-digit domestic comps growth for Domino's, demonstrating excellent momentum. Domino's is much more willing to compete on price than Papa John's which likely helped it earn share during the past year of lower commodity prices and aggressive pricing. The company's strong comps over the past year likely have had some impact from failed product launches in the previous year, which helps year-over-year comparisons. Comps have some cyclicality to them, and Domino's itself doesn't expect the double-digit comps to continue, mentioning that their long-term guidance is 2%-5% domestically, similar to Papa John's guidance range of 2%-4% (an example of how Papa John's tends to err on the conservative side).

But there's no denying that Domino's is on a roll domestically as they continue their marketing initiatives (including reimaging the existing store base), invest in technology, and add a new loyalty program. Domino's gained more U.S. market share than competitors as of the most recently available data (May 2015), increasing in share from 17.7% to 18.8%. Papa John's also increased its market share but to a lesser degree, from 11.7% to 12.2%. Little Caesar's market share increased from 14.4% to 14.7%, and Pizza Hut's market share declined by -1.7%, although they still have the largest market share at 25.1% of the segment. Domino's is more aggressive strategically than Papa John's, which can lead to higher growth when the company executes well. But it also exposes the company to more potential operational missteps and volatility, which is something that Papa John's has largely avoided over the last several years:

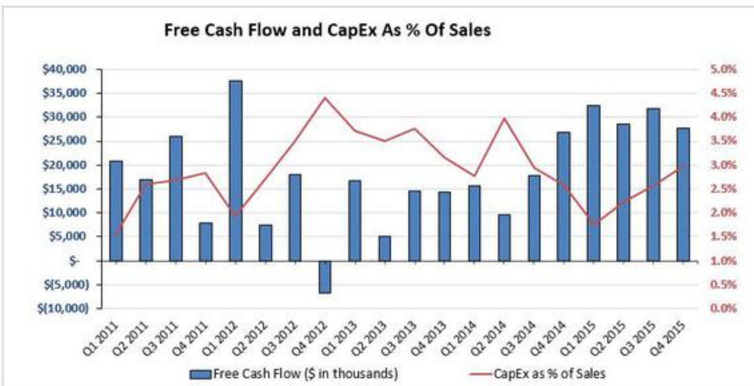


The competition is much more closer internationally, where most of future growth will occur. Both Papa John's and Domino's international comps performance suggest that the pizza concept and the two companies' technology advantages and expansion strategies are translating in the higher-growth overseas markets:



3) Margins: We expect Papa John's capital light business model to eventually result in higher operating margins that propels free cash flow generation. From 2014-2015, the company dealt with depressed margins and free cash flow due to the roll-out of the company's new new proprietary POS system (FOCUS), which as of last quarter is now totally complete.

Now that the investment phase has passed, the company is enjoying higher margins and free cash flow generation, as favorable changes in working capital (related to FOCUS inventory levels) and lower capital expenditures have lifted free cash flow much higher. In this graph, note the inverse relationship between capital expenditures and free cash flow-when capital expenditures are elevated, free cash flow is depressed, and vice versa:



Trailing twelve month (TTM) free cash flow is $120.4 million, the highest in the company's history, and up 73% compared to the year-ago period. Note that free cash flow will likely decrease a bit in 2016 as the company paid the legal settlement in January (in Q1-2016), and the company expects a year of somewhat elevated capital spending (guidance is for $55-$60 million in capital expenditures, up from $39 million in 2015) due to a new domestic commissary in the U.S., company-owned unit development in the U.S., investments in technology, and routine capital replacement. At the current price of about $57 per share, the company is trading at about 18.6x P/FCF, the lowest this metric has been since Q3 2012, and a far cry from the 50x multiple we saw a few times in 2013 amid elevated capital spending.

What We Think Now

Franchising is a good, capital-light business and we think the Papa John's brand will translate well internationally. We expect technology, improved advertising, and menu innovation to propel domestic sales and fund the company's vast international expansion opportunities. Near term headwinds (commodity prices and technology investments) have proven to be temporary and Papa John's should continue to deliver improved financial performance.

AmTrust's Results Reflect Reality

Published Mar 7, 2016 at 3:58PM

With **AmTrust Financial Services** (NASDAQ: AFSI) down 29% from its 52-week high ($35.94, in August) and 17% year-to-date, you might be inclined to think there's something seriously wrong with the company. To be sure, its financial results for the past few quarters weren't as impressive as we've seen in years past, but they're still very solid given the current industry landscape.

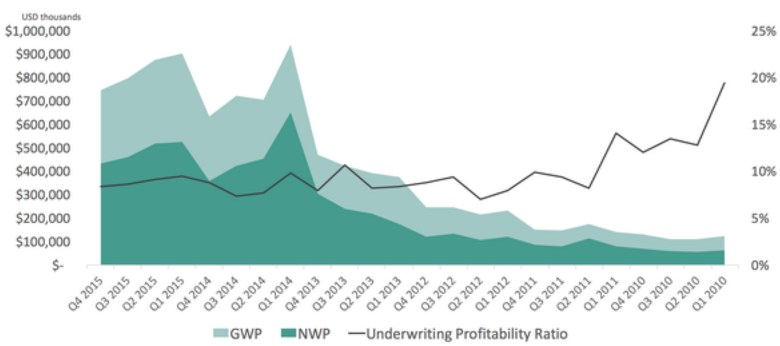
Fair-value estimate: $26 (no change)

The Results

Small Commercial Business

Pricing weakness in 2015 (more on that in a bit) meant that policy count was the primary driver of growth for AmTrust's largest segment. AmTrust's largest states (California, Florida, and New York) were once again the biggest contributors, accounting for 74% of the $321 million increase in gross written premium. The reported growth rates were the slowest we've seen in some time, but if you remove the impact of non-recurring premium from the Tower Group acquisition, gross written premium for this division actually increased 17.4%. Similarly, if you remove this impact from net written premium, growth this year was 13.1%. Though the business is still very profitable, we are seeing margins slowly contract over time. This is likely because of two factors:

- Cherry-picking policies through acquisitions becomes increasingly difficult as the company grows, as you need to assume an ever-increasing number of policies to move the needle.
- The markets in which AmTrust competes are currently becoming more competitive.



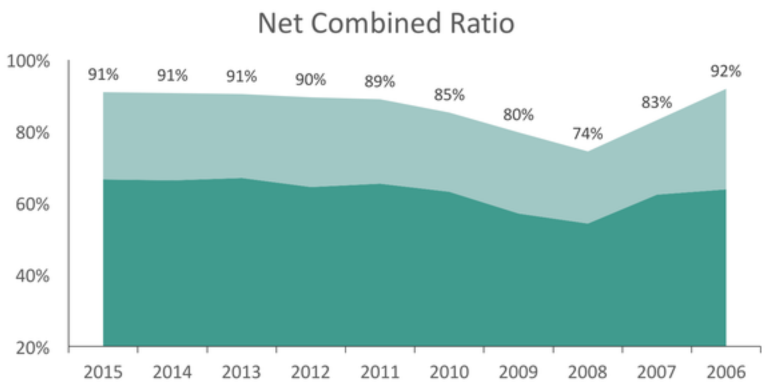
Specialty Risk and Extended Warranty

The division of AmTrust with the most international exposure was once again hit hard by the strengthening U.S. dollar. Negative currency fluctuations of approximately $156 million more than completely offset this segment's European operations in 2015. Absent this effect, growth continues to be healthy and profitability is also solid -- although, once again, not as good as what the company reported in the prior years.

Specialty Program

This division saw some of the most favorable pricing trends, which -- when combined with an increase in policy count -- helped drive the strongest reported growth. Although it's technically defined as a different segment, the specialty program division shares many traits with AmTrust's small commercial business division. This means that much of what we said about the latter holds true here as well.

Combined Ratios and Reserves



For the year, AmTrust's combined ratio ticked up ever so slightly -- just 30 basis points, to 91.0 -- as the specialty risk and extended warranty division and the specialty program division pushed the net loss ratio slightly higher.

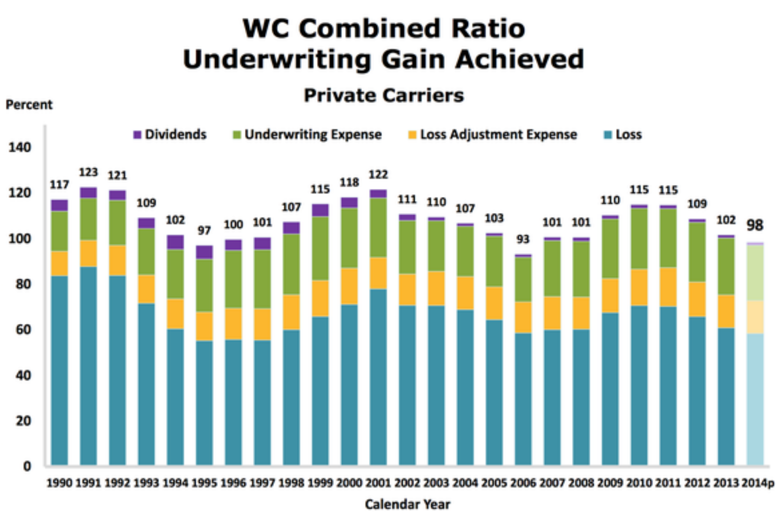
	2015	2014	2013
Loss Ratio			
Small Commercial Business	65.4%	65.7%	65.8%
Specialty Risk and Extended Warranty	67.6%	66.4%	67.2%
Specialty Program	68.2%	67.3%	68.2%
Total	66.7%	66.4%	67.0%
Expense Ratio			
Small Commercial Business	25.8%	25.9%	25.5%
Specialty Risk and Extended Warranty	20.3%	20.6%	18.6%
Specialty Program	27.5%	27.0%	26.6%
Total	24.3%	24.3%	23.5%
Combined Ratio			
Small Commercial Business	91.2%	91.6%	91.3%
Specialty Risk and Extended Warranty	87.9%	87.0%	85.8%
Specialty Program	95.7%	94.3%	94.8%
Total	91.0%	90.7%	90.5%

Reserves appear to be adequate based on accident-year loss developments over the past 10 years. However, given that long-tail policies (those with a sizable gap between between the incident that results in a claim and the settlement of said claim) account for a sizable portion of AmTrust's business, there is always the risk that policies from prior years will come back to haunt the company. This lag between underwriting and paying out claims can make it hard to evaluate long-tail insurers, because you may not see the impact of the soft part of the insurance cycle -- during which completion is more intense and pricing becomes favorable for the consumer -- until years after the policies were written. This is why we've repeatedly noted that we want to see AmTrust actually pull back some when the cycle softens; it's a more timely indicator of management's discipline and willingness to prioritize the long-term health of the business over short-term results.

Pro's Take

The past few years were definitely kind to AmTrust as it aggressively entered into markets in which prices were rising as competitors attempted to cope with prior losses. This enabled the company to rapidly gain market share, and it's now one of the largest workers' compensation underwriters here in the United States. But this growth also means that the company has reached the point where its financial results will more closely resemble what is taking place within the industry.

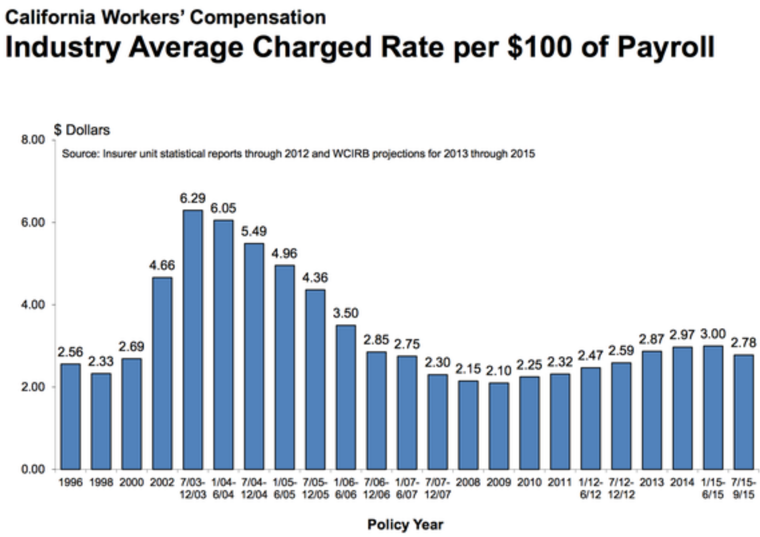
The current state of the industry isn't as favorable for AmTrust, and its results are starting to reflect this. We've seen continued improvement in the industry's combined ratio since its peak a few years back:



Source: NCCI, [State of the Workers Compensation Line 2015]

To a large extent, this move mirrors what is taking place within AmTrust's largest markets, though the levels aren't necessarily the same. For example, California's combined ratio has yet to fall below 100 (signifying underwriting profitability) according to the latest figures from the Workers' Compensation Insurance Rating Bureau of California (WCIRB).

Loss trends and policy count for both the industry and AmTrust continue to be favorable, but unsurprisingly, we've seen this improvement in the industry result in pricing pressure.



Source: WCIRB, Report on September 30, 2015 Insurer Experience

Rates will likely fall further in places like California, putting a damper on AmTrust's results. However, management still likes the way the company is positioned in these markets, and relatively speaking, AmTrust's pricing held up quite well in 2015:

Workers' compensation	+1%
Small Commercial Risk ex-workers' comp	+4.5%
Specialty Program ex-workers' comp	+5.6%

Management has stressed that they're more than willing to pull back on expanding if need be, and to a certain extent it looks like this is already starting to play out. Although this may result in some near-term disappointment, it's exactly what we'd like to see, because undisciplined underwriting has a nasty habit of catching up with companies exactly when they can't afford it. Policy count continues to increase, though we'll be keeping an eye on renewal rates -- the small commercial business division's results were still very solid at 84%, but that's down 300 basis points from the 87% it posted in 2013.

There's no denying that AmTrust has fallen prey to the stealth bear market that's claimed many a Foolish favorite over the past few months. And insurance-industry developments may be partially responsible for the decline, as well. AmTrust's stock has spent the majority of its time above our fair-value estimate over the past few years, something we were comfortable with given that its business model makes it one of the harder stocks in the *Pro* portfolio to value. But it's now declined to the point where the two have essentially converged. This isn't the way we would have liked to see things play out over the past few months -- the price dip doesn't help us much if we currently don't plan on increasing our position, which we don't, because it's already our third-largest. That said, given that we've always attempted to err on the side of caution when valuing AmTrust, our confidence in the stock's ability to deliver satisfactory returns over the next three years has increased with the recent decline in the stock.

The Flaws of Fair Value

Published Mar 7, 2016 at 2:19PM

Dear *Pro* member:

We frequently hear from members who question whether they should buy *Pro* stocks that trade above our fair-value estimate. Our answer is that if a stock is rated Buy on the Recommendations page, we believe it can deliver a North Star-worthy return or better over the coming three years (lately, that's about 10% annualized). However, there are pitfalls in publishing a fair-value estimate, and so we return to the topic periodically to see if we can improve our practices for members.

I could argue for eliminating the published number entirely (as most Fool newsletters do), largely because we all anchor to it, but members do expect to see a fair value here. We could provide a fair-value *range*, which is how we create our fair-value estimates internally. Or we could move to a fair-value *target*, sharing our expectations for where we believe a stock could trade in three years. We're already doing that exercise with our current fair-value estimate, of course: With a 10% discount rate, we expect at least 10% annualized growth on a stock from today's fair-value estimate, making it simple to project where the stock might trade in three years.

Before we go further, let's define fair value, and then talk about its flaws.

A fair-value estimate is the approximate price *from which we expect a stock to earn our desired long-term rate of return*.

So, if we believe a stock is fairly valued at $100 today, and we hope to earn at least 10% annualized on it, we project that it could trade at around $133.10 in three years. This means if the stock is 10% above our fair-value estimate today, it could still appreciate strongly in the coming years, especially if our estimate continues to prove modest.

When it comes to fair-value estimates, many factors are commonly overlooked by investors:

- A fair-value estimate is a snapshot in time; it represents *today's* fair value, usually using the last 12 months as your base.
- A growing company increases its fair value daily, just as you do if you're saving some money each day. All else equal, a stock's fair value ticks up daily as the company grows.
- We update our fair-value estimates quarterly at most, and usually only bi-annually or annually, given that our estimates (like all of them) are approximate and model out yearly results.
- We lean conservative, rather than aggressive, with our fair-value estimates. A great company has multiple extra ways to increase value that we can't bake into our long-term projections, partly because we don't know everything management is planning. We need to base most of our estimates on what we know now, not on new products, services, markets, or acquisitions a company may add.

That last bullet point only touches on the many other factors that will continually change a fair value but that aren't, or can't be, accurately guessed at in a fair-value estimate. Will tax rates change? What will currencies do? When will interest rates go up, and by how much? What if a company decides to buy back 10%, 15%, or 20% of its shares (as some have done in recent years)? What if a company finds a way to increase sales by just 1% more per year than you expected? Extrapolated out 10 years, that leads to a very large difference in today's fair-value estimate.

And that brings us to the biggest flaw of a fair-value estimate: Too often, they're wrong by a great magnitude -- and I mean billions, even tens of billions of dollars. Even hundreds of billions. Nobody predicted in 2002 that the iPod would lead to the iPhone and iPad, and that Apple would go from a relatively tiny company to one worth $572 billion with more than $200 billion in cash and investments. Discounted cash flow models generally model results 10 years forward, and then slap on a tiny terminal growth rate. No one guessed what Apple's 10 years had in store. And how many mature companies grow at a terminal 2% rate per year? It seems a company either withers away, gets bought out, or grows much more quickly than that, reinventing itself, finding new markets, and moving ahead with new life. Think **Apple** (NASDAQ: AAPL), **Disney** (NYSE: DIS), and **Nike** (NYSE: NKE).

Fair-value models from a decade ago couldn't factor in Disney buying Marvel, Pixar, and Star Wars, or Nike selling billions of dollars' worth of product overseas as prosperity spreads in emerging markets.

So, if a fair-value estimate based on what you know *today* causes you to sell a stock (or not buy it), you're missing all the future upside from progress you can't predict.

A discounted cash flow model takes what is known, adds reasonable assumptions, and projects forward. It doesn't take into account the countless events that can -- and will -- change the world, and often valuations, the *most* over the next 5, 10 and 20 years.

That said, fair-value estimates do serve as a better guidepost for buy and sell decisions on lesser companies. If one of our second-tier companies -- one lacking pricing power, or short on growth avenues -- trades above its fair-value estimate, we'll strongly consider parting with it. But when an outstanding business the likes of **Starbucks** (NASDAQ: SBUX) trades reasonably above our fair-value estimate, we want to give it the benefit of the doubt and let it be (or even buy more!), as long as we believe in its future. Anyone who sold Starbucks in the past because it looked expensive has come to regret that decision, at least from a returns perspective. Anyone who hasn't bought Starbucks on valuation concerns underestimated the business, too.

It can't be proven, but it's probable that more wealth has been missed in the stock market because of these three factors than any others:

1. Selling good companies (or selling out entirely!) when the market swoons.
2. Selling great companies after making 100% or so ... only for the stocks to then turn small investors into millionaires over the many years to come, going up 1,000% or more.
3. Not buying great companies because they looked expensive.

The influence of fair-value estimates has probably cost investors as much wealth as any other factor. It's impossible to truly imagine a decade or two ahead, and how much more valuable strong companies can be. Not all will work out, but the winners will dwarf the losers -- and dwarf a 10-year old fair-value estimate.

Foolishly,

-- Jeff (TMFFischer)

Gentex Shines Bright In 2015

Published Mar 3, 2016 at 12:52PM

***Pro*'s Take: GNTX Q4- and FY-2015 Earnings**

Quarter Quick Take

Gentex (NASDAQ: GNTX) reported an outstanding close to 2015, delivering Q4 net revenue growth of 15.7% and total mirror unit growth of 16.2% despite modest auto production growth (1-2%) in the company's primary markets over the same period. With full year 2015 unit growth of 13.6% vs. 2015 auto production growth of 1.6%, Gentex's mirror sales continue to handily outpace global auto production, which suggests that the core element of our thesis (higher auto-dimming mirror penetration rates) is playing out.

In 2015, the company sold 10.8% more interior mirrors (5.5% in North America and +14.1% internationally) and 21.2% more exterior mirrors (+36.5% in North America and +14.3% internationally) than it did in 2014. The company has announced and launched several new products that look to drive growth throughout 2016 and beyond, and as cars become more technology-rich than ever before, Gentex is well positioned to meet that demand.

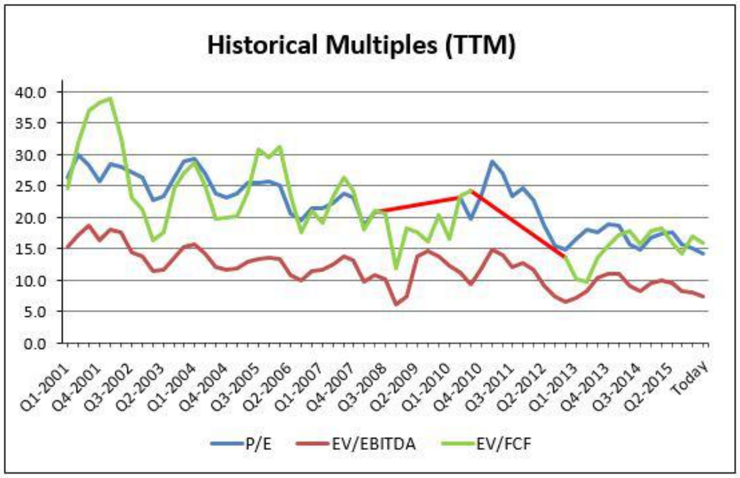
As evidence, consider that in 2013, the company had 37 new launches of its inside and outside electrochromic (EC) mirrors. In 2014, there were 43 new launches of inside and outside EC mirrors. And in 2015, the company has had 63 new vehicle launches. This increased rate of adoption is why Gentex has been able to consistently grow sales often at a rate of 10% or more than global auto production.

Management continues to buy back stock, repurchasing $28 million of stock during Q4 at an average price of about $15.30. Management is historically stingy with repurchases, but as cash piles up on the balance sheet (cash + short term investments are up 12% year-over-year, and cash + investments represent 14.5% of the current share price once you net out debt), management appears to be more willing to pursue buybacks as a capital allocation strategy. I view these continued buybacks as a signal of confidence from management, and with Gentex shares trading at historically low multiples and below our estimate of fair value, I think the buybacks are a strong capital allocation decision.

Guidance Update

In 2015, Gentex continued to do what it does best -- sell its products at a pace well above the rate of auto production growth, and invest in manufacturing and product development initiatives in order to raise average selling prices and reduce manufacturing costs to offset annual price reductions expected by its powerful automaker customers. As global auto production picks up and as more and more automakers integrate technology into their models, Gentex should benefit over the long-term.

After updating my valuation model, **our fair value estimate remains unchanged at $18 per share.** The company's recent outperformance and improvements in penetration and margins were offset by lower expectations for global auto production amid a weaker global macro environment. Yet with the stock trading more than 15% below our FV estimate, **Gentex remains a Buy First** on our scorecard. At just over 14 times trailing-12-month earnings and at 7.5 times EV/EBITDA, the company is trading at valuation levels that are about as low as they've been throughout its history despite a robust balance sheet, steady operating performance, and continued success in market penetration and organic growth. If you've yet to start a position or fill out your allocation in Gentex, now is a great time.



We also have a 1.5% look-through allocation in March 2016 $15 written puts. Those puts are on track to expire fully as income (as did our prior iteration of Gentex puts we wrote in August 2015), although we are still a few weeks away from expiration and the stock is very close to our strike price. If you haven't matched us you can still write the puts, although with just a few weeks to expiration, the absolute amount of income is quite low despite a decent yield.

Updated Guidance: Buy First (no change)

Recommended Allocation: 2.8% with 1.5% in written puts

Fair-Value Estimate: $18 (unchanged)

Current Price: $15.21

Our Thesis

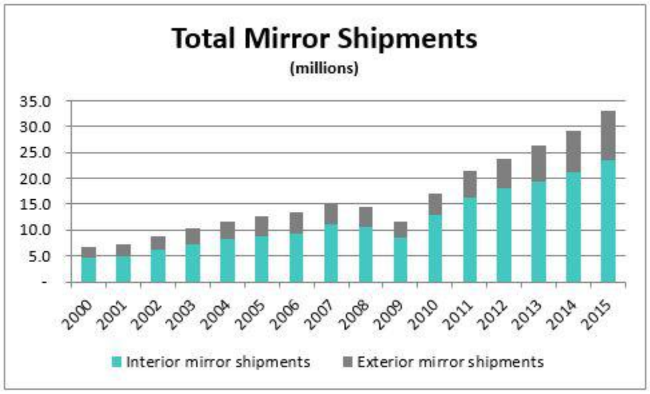
Gentex (1) will continue to penetrate the global light vehicle market with its auto-dimming mirrors as automakers focus on safety and technology and (2) will drive up the value embedded in each unit through new technology and functionality. We expect IP, know-how, and manufacturing-based cost advantages to strengthen over time and help Gentex sustain margins and excess returns.

The Most Important Things

1) Penetration: Unit growth vs. auto production. Over time, we want to see Gentex's auto-dimming mirrors to continue to gain market share. If the company is increasing units sold faster than auto production, it is moving in the right direction. Quarterly global interior mirror unit volumes accelerated nicely to +16.2% year-over-year growth (up from +12.4% a quarter ago). Full year 2015 global interior mirror unit volumes increased 10.7% (up from 9.3% in full year 2014) vs. 1.6% yearly growth in auto production in the company's primary markets, showing that Gentex continues to significantly outpace vehicle production growth and capture market share. Full year 2015 interior units sold in North America accelerated to +12.6% (up from +4.4% in 2014) and full year 2015 international interior units increased +14.1% (up from +13.4% in 2014).

Exterior mirror unit shipments continue to grow even faster, with full year 2015 unit volumes up +36.4% in North America (vs. 12.2% in 2014) and +14.3% internationally (vs. 14.9% in 2014). Full year 2015's exterior mirror attach rate was 40.3% (i.e. 40.3% of cars equipped with interior units also were equipped with exterior units), compared with 36.8% in 2014. Exterior mirrors currently only have about 7% to 8% market penetration relative to global auto production, but that penetration rate is clearly increasing, as evidenced by strong unit growth metrics.

The company continues to do an excellent job growing its units sold at a rate higher than that of auto production, demonstrating strong growth and increasing market penetration:



2) Pricing and value: Unit growth vs. automotive segment sales. Powerful auto makers force annual price concessions on their suppliers, and Gentex isn't immune. Price reductions have recently been in the range of 2% to 3% (well within historical norms). Gentex strives to reduce production costs and add new features to hold the line on average selling prices (ASPs) and gross margins.

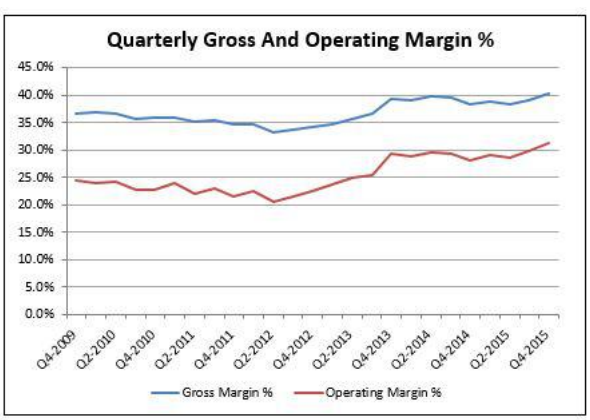
In full year 2015, total units (interior + exterior mirrors) increased +13.6% and automotive segment sales were up +12.4%. This dynamic suggests lower ARPU (average revenue per unit) and is consistent with the expectation of annual price concessions. However, some of the lower ARPU can be explained away by the continued success of exterior mirrors, which have lower ARPU but higher margins relative to interior mirrors. Despite the lower ARPU, the more exterior mirrors Gentex sells, the better it is for the business. They lift the overall margin profile of the business and since exterior mirrors are sold alongside interior mirrors, they are increasing the total dollar value of their products in cars. Here is a relevant question from an analyst regarding ASPs and the response from management:

> **Daniel Lemont Drawbaugh (Analyst):**
>
> *"Okay, great. Also, I guess, looking ahead to that 2017 time frame, can you talk a little bit about where you sort of see ASPs going, not just in 2017, but in 2016 as well? You guys have been pretty good at sustaining those with the additional content. Can you talk a little bit about where you think they'll go by that 2017 time line?"*
>
> **Chief Financial Officer and Senior Vice President Steven R. Downing:**
>
> *"Sure. I mean, if you take out the APRs that we've always talked about kind of being in the 2% to 3% range from an annual price reduction, so that's kind of the headwind. So on average, if you're looking at anywhere from a $40 to $45 price point, you're talking about $1, $1.30 headwind at the beginning of every year. And so we have to find content that helps offset that. Really if you look at '13 and '14, most of what drove that ASP downtrend was the loss of RCD mirrors. So they are a significantly higher-priced product than our average. We had those losses in the North American markets. That negatively affected the last few years. If you take that out, what you would have seen was an overall growth trajectory of our ASPs. That's driven primarily by increasing penetration of electronic content. It is naturally offset a little bit by introduction on lower segment vehicles that we're just introducing on at low -- below corporate ASPs. And then ultimately for us, what we're excited about is when you talk about the advent of Full Display Mirror and its launch over the next several years. We expect that, especially in '18 and beyond, to have a positive impact on ASPs. Now the other deterrent to ASP has always been our outside mirrors. They're below-average ASP. And so as that business grows faster than the inside mirror business, you will see another a negative factor on the ASP mix. If you look at what we're -- the trajectory looks like for next couple of years, we really see those kind of growth rates kind of moving in parallel with each other. So we wouldn't expect a whole lot of negative ASP headwind from the outside mirror business, at least in the next 2-year period."*

3) Margin performance. In full year 2015, gross margin was 39.1%, down from 39.2% in 2014, due largely to foreign currency fluctuations and annual customer price reductions. However, for Q4-2015, the company reported a gross profit margin of 40.2% (vs. 38.4% in Q4-2014), the highest gross profit margin reported by the company on a quarterly basis since the second quarter of 2004.

I mentioned last quarter that as the company works through new product launch inefficiencies and as higher-margin new products make their way through the sales pipeline, gross margin should see a boost. That's what we continued to see this quarter with a sequential increase in gross margin from 39% to 40.2% (the second straight quarter of sequential gross margin improvements), as launch inefficiencies were no longer a headwind and improved product mix, purchasing cost reductions, and fixed overhead cost leverage gave margins a sequential boost.

Full year 2015 operating margin performance was very strong, coming in at 29.7% (vs. 29% in 2014). On a quarterly basis, Q4-2015's operating margin of 31.2% was the highest operating margin reported by the company on a quarterly basis since the first quarter of 2004. The strong operating margin performance is due primarily to SG&A expenses-while revenue increased 12.2% (+$168 million in absolute terms) in 2015, SG&A expenses actually decreased by 8.1% (-$5 million in absolute terms). Management mentioned however that the majority of the decline was due to foreign currency fluctuations (namely the Euro).



Management's 2016 gross margin guidance range is 38.5%-39.5%, indicating flat gross margins compared to 2015. Management's 2016 SG&A and R&D expense guidance indicates slight operating margin expansion, as SG&A and R&D expenses grow more slowly than sales.

What We Think Now

Gentex's safety-enhancing mirrors continue to earn their way into new cars across the globe, resulting in historically high (but we believe sustainable) margins and significant cash flow generation. Technology from acquisitions and in-house R&D should fuel new product development and continue to drive adoption of its feature- and technology-rich auto-dimming mirrors worldwide. The company's strong engineering culture and manufacturing advantages provide competitive advantages that should strengthen over time.

Facebook's Future Gets a Like From Us

Published Mar 2, 2016 at 3:31PM

Facebook (NASDAQ: FB) remains a young story about monetizing the largest, most engaged online audience ever hosted by one company. The company's future is in strong hands; management is showing patience and care as it starts to monetize more of its properties, putting visitor experience first. So far, this approach has paid off, with user engagement up even as more ads appear. The billions of connections maintained on Facebook's properties are making the sites extremely sticky, offering the potential for increased value to advertisers (and thus Facebook owners) for years to come -- especially as the advertising gets smarter and more targeted. Again, this business is in early innings.

Status:	**Buy First** (up from Buy)
Fair-Value Estimate:	$100 (up from $90)
Recent Price:	$109
Current Allocation:	6.3% (our largest)
Dividend Yield:	N/A

Key Thoughts

- Almost all Facebook users use the service on their mobile devices each month. Customers are ahead of businesses in this shift, with the latter only now migrating to mobile and mobile advertising because that's where the eyes are. The migration is still unfolding, promising many more ad dollars headed Facebook's way.
- Instagram's 400 million active users make it and Facebook the company's two largest mobile advertising platforms. Early advertising success on Instagram is excellent; the picture format of the site is perfect for integrated, related advertising. Ninety-eight of Facebook's top 100 advertisers are now advertising on Instagram.
- Facebook will monetize Messenger, WhatsApp, and other properties carefully, putting user experience first and continuing to learn from and improve advertiser results.
- Facebook's advertising growth is broad-based, going beyond e-commerce, consumer products, and retail.

Secondary Thoughts

- More than 800 million people use Messenger monthly; nearly 1 billion use WhatsApp monthly; more than 1 billion used Facebook Groups in a single month last quarter; and more than 500 million use Events each month.
- Facebook Lite and Free Basics is bringing Facebook and the Internet to millions of people (19 million in 33 countries so far) with no or slow connections.
- Facebook's Oculus Rift Virtual Reality device will begin shipping to more than 20 countries by the end of this month, initially targeting gamers (hundreds of games are rolling out already).
- Every member of Congress now uses Facebook to communicate, and political advertising can target specific districts, demographics, etc.
- Sports Stadium is Facebook's early test of real-time sharing around events, including sports (650 million sports fans populate Facebook). Real-time sharing is an important focus for Facebook now.
- The company is testing a new site/service for Facebook users who just want to view videos.

The Numbers

- **Outlook:** We'll see another year of heavy investment in 2016; total GAAP expenses should rise 30% to 40%, and non-GAAP 45% to 55%. Capital expenditures should be between $4 billion and $4.5 billion, up from $2.5 billion last year. And 2016 will be the first year in which Facebook pays significant income taxes in the U.S. on a cash basis. All of this pitted against strong 2015 growth rates will obviously make 2016 EPS growth slower, but it should remain robust at an estimated 35%.
- **Q4 2015:** Ad revenue was up 57% (66% in constant currency) last quarter, while mobile ad revenue rose 81% to $4.5 billion, now making up 80% of total ad revenue. Monthly users reached 1.59 billion, with more than 1 billion visiting every day and almost all users (1.44 billion) using mobile devices. Fourth-quarter average ad prices increased 21%, while ad impressions increased 29%.

Market Cap	$311B
Cash	$18.4B
LT Debt	$0
EV/EBITDA	36.9
EV/EBITDA NTM est.	19.5
P/FCF	53
P/E	84
P/E NTM Est.	35

Position Summary

It's our largest position at 6.3%, and the size of our investment in Facebook feels appropriate given how much growth potential lies ahead and how well-managed the company is. Even from today's price, we estimate Facebook could return about 20% annualized for shareholders over the next five years. Though shares are currently above our fair-value estimate, the stock moves to Buy First on its long-term potential. Key risks include users moving away from Facebook, but so far the company has shown great skill in *increasing* user engagement and stickiness, rather than stunting it. It's also possible that management could spend more than Wall Street expects, though that should mainly be a short-term concern.

Skyworks Stays Strong

Published Mar 2, 2016 at 2:44PM

Skyworks Solutions (NASDAQ: SWKS) is positioned to keep increasing its profits at a healthy clip as more smartphones are sold and connected devices (the Internet of Things) proliferate. Few competitors can match the complex, customized analog semiconductor and related products Skyworks sells to manufacturers, leading to higher profit margins for the company, more long-term product wins, and increased revenue visibility.

After a relatively soft first half of 2016 thanks to **Apple** (NASDAQ: AAPL) clearing out inventory, Skyworks expects to finish the year strong. Apple is its largest customer; Samsung is second. The broad Internet of Things industry, which is currently being led by connected homes, makes up 20% of revenue and growing, with even higher margins than smartphones. Long-term growth rates overall could remain above 10% for many years.

Status:	**Buy** (down from Buy First as we look to decrease the volatility of our Buy First stocks)
Fair-Value Estimate:	$85 (no change)
Recent Price:	$69
Current Allocation:	3.4%
Dividend Yield:	1.5%

Key Thoughts

- Demand for wireless data continues to surge, requiring dramatically higher levels of analog performance from semiconductors, which in turn results in Skyworks being able to sell more product per computing device, at higher profits.
- As a technology integration leader, Skyworks is consolidating market share, and as it does so, its visibility into new product wins and future product architectures is "very strong." Future products being designed now are extremely complex, and well ahead of competing solutions.
- The Internet of Things is happening now, but just getting started, offering many long-term growth avenues. Sales in this division grew about 12% for Skyworks in the first quarter.
- The Skyworks business model is focused on high-value-added integrated solutions to customers at unrivaled scale, with plenty of room to add capacity as needed.
- Profit margins should keep trending higher.

Secondary Thoughts

- The first-quarter product mix was 64% integrated mobile systems (smartphones), 16% power amplifiers, and 20% broad markets (Internet of Things).
- China is a growth driver as the country's phone networks move to 4G; Skyworks sales were up 20% in China in the past quarter, and the country represents 20% of revenue.
- Sales in smartphones should increase by the mid-single digits overall, but the growth rate for Skyworks' addressable market in the phone space should be at least double that.
- Samsung, Skyworks' No. 2 customer, is using ever more complex solutions, as are all China customers. Even value-tier customers are moving into more complex solutions.
- Skyworks plans to return about 40% of cash flow to investors through dividends and buybacks.
- Skyworks has worked with TDK and Qualcomm a long time, and isn't very concerned about their new partnership.
- While connected homes are driving the growth of the Internet of Things right now, it's starting to be seen in automobiles and other important industries, too.

The Numbers

- **Outlook:** Management is targeting a 53% long-term gross margin and a mid-term goal of $8 per share in annualized EPS. For the second quarter of 2016, EPS could rise 8% to $1.24, with gross margins of about 50.5%. For all of 2016, EPS should increase by around 10% or more, followed by higher growth in 2017.
- **Q1 2016:** Revenue was up 15%, operating income 30%, and EPS 27% to $1.26.

Market Cap	$13.98B
Cash	$1.2B
LT Debt	$0
EV/EBITDA	9.2
EV/EBITDA NTM est.	8.0
P/FCF	26.0
P/E	14.4
P/E NTM Est.	12.0

Position Summary

Skyworks' shares may have gotten ahead of themselves when they topped $100 last year; with perfect hindsight, we could have sold then and then bought back lower. Indeed, we might have done just that on a lesser business (where conservative valuation models are the primary driver of decisions). But despite being a semiconductor business, Skyworks does *not* fit that description. It is strong in every way that matters, including growing margins, strong growth rates, more product wins, and so on. The stock is likely to remain volatile, though. We are happy to be long-term owners of shares, which remain a Buy, and we may consider options as another way to monetize the position opportunistically. Our fair-value estimate of $85 is 14.6 times our expected earnings per share for the year ending in September 2016. Having Apple as its largest customer is one key risk, but we know that Skyworks' product is in the next generation of iPhones, and the company is likely already working on the next iPhone after that.

Roll Your Written Puts on Wells Fargo

Published Mar 2, 2016 at 1:15PM

Is this for you? Yes, if you're a *Pro* member following our option writing for income on **Wells Fargo** (NYSE: WFC), and if you (like us) have an in-the-money March option reaching expiration in about two weeks. If your March puts have already been assigned, take a look at the Alternative Trades section at the end of this alert. (If you own 2018 calls on Wells Fargo from *Motley Fool Options*, leave those alone. They have nothing to do with this alert.)

How You Participate

- **Action:**
  - Buy ("buy to close") your previously written March 2016 $52.50 puts.
  - Write ("sell to open") May 2016 $52.50 puts.
- **Allocation:** Write the number of May puts equal to the number of March puts you buy to close. *Pro* will be rolling its seven contracts. The look-through allocation on the puts is about 1.5%.
- **Prices (11:45 a.m. March 2):**
  - **Stock:** $49.32
  - **Options:**
    - Buy to close March 2016 $52.50 puts (bid/ask): $3.05/$3.50
    - Sell to open May 2016 $52.50 puts (bid/ask): $4.00/$4.15
