Jeff Fischer: You can get it online, Tupperware.com. *(Laughter.)* I think you are required to at this point. To be fair, my wife and I just bought our first Tupperware a few years ago, as PRO became acquainted with the company once again. "Fall in love all over again with Tupperware," should be their motto. But it's a company I found; "found", that's a generous word. A company I decided that we should invest in in 2009, given the valuation, the decent yield at the time and the volatility. The premiums on the options were great, so we started writing put options in the mid-twenties and shares soon doubled. We should have just bought shares earlier than we did, but we are still making money on the shares as well.

It is a really unique business model that most members know about, but it is still worth talking about again. Tupperware has 2.7 million sales people around the world, and the U.S. Government directly employs two million, so Tupperware has more people working for it than the U.S. Government. If that's not incredible, what is? And they are making money at it.

Male: Yeah, imagine that.

Jeff Fischer: And they don't need tax revenue to do it. They benefit from their direct sales force, of course, that can go into dense markets like you name it, Hong Kong or Tokyo or any major city in India, where millions of people live and sell these products directly to them, and they are not just any Tupperware product. They are made for that market, they are priced for the market, and they really plug into the current food trends in those markets, even food trends in France change and Tupperware changes to adapt with them. Tupperware actually has the best-selling cookbooks in France, which is always surprising and fun to bring up when you are talking to people about the high cuisine of France. So what we have is a unique sales force and a unique sales channel, and inexpensive products, so it is custom made for developing markets where now some 60% of Tupperware sales are occurring every year.

They had just this last quarter, revenue was up 10% and local currency, emerging market sales were up 19%, and that includes some jumps such as 74% in Brazil and a 30% leap in Italy, which is given everything going on in Italy right now, people are saving, storing more food, but what really happened there is Tupperware, this shows that Tupperware can go into a market, focus on it and improve results there quickly. So there are so many markets that the downside is that they can't focus on all of them at once, but when they need to go into a market and strengthen it, they can.

Tupperware's largest, most advanced market is Germany actually, and they saw a 9% jump in sales in Germany last quarter. So Tupperware is not just an emerging market story, it is also growing in North America and Western Europe as well. Shares are down lately. As I said, they are volatile; below 55 they are a Buy. If they go much lower, into the forties, we probably would move it to Buy First, but right now it is a Buy. You can also write put options. Lately the $50 put options paid quite well, so sell one put for every 100 shares you are willing to buy, and the stock itself yields 2.1% and the fair value is about $15, $16 higher than the recent price, so I think it is a somewhat defensive investment in that a weak economy can help it. Their sales staff tends to grow in a weak economy and they get better quality applicants for the job as well. And of course demand for food storage products goes up in a weak economy as well, as people try to save money and eat at home more frequently. So that's it on Tupperware. It remains a Buy and around a 3% allocation in the portfolio.

So today we outlined three Buys and Papa John's, which is on hold, but the three we talked about can be bought at any time or you can also sell to open put options on all three. Now Bryan, to close, you don't have any Tupperware at home?

Bryan Hinmon: I am ashamed to say that I paid $3.99 I think, for 16 pieces of IKEA storage stuff that is far inferior to Tupperware.

Jeff Fischer: Well, at least you said that.

Bryan Hinmon: Yeah.

Jeff Fischer: Alex, you are like just out of school, you don't even have food at home.

Alex Pape: I have got to tell you, I have no idea who makes the containers that my food is in, which is now a really frightening thought, but they might be Tupperware.

Jeff Fischer: Do you frequently, do you cook for yourself?

Alex Pape: I do. I eat quite a bit of food because of all the running that I am doing, and so it's just not …

Male: There's never any left. He doesn't have to save any. He just eats it.

Alex Pape: It's not cost effective for me to eat out very frequently.

Jeff Fischer: The high metabolism of your twenties; if I could go back to that, I certainly would. Thank you all for being here, and thank you, *Pro* members, and we will be back next week to cover another handful of *Pro* companies. Until then, we will see you on the boards and we will see you Monday in the Monday Memo. Fool On!

Hedging the Pro Way

Published Nov 7, 2011 at 12:00AM

Dear *Pro* Fools,

There are some major positions in our portfolio that we sincerely hope lose money. Lots of money.

Pro Trade Roundup

Charter Portfolio

- Sold short 500 shares of **SPDR S&P 500** at $123.69 (5% for 24% total, representing a 30% hedge on our invested capital; one needn't hedge cash)

Portfolio 2011

- Sold short 85 shares of **SPDR S&P 500** at $124.07 (5% for 23% total; same as above)

Guidance Updates

- **OpenText** moves down to Buy after some price appreciation.

I'm talking, of course, about our hedges. This Memo is meant to help ensure that all *Pro* Fools understand how we're hedging, why we're doing it, and what it means.

Hedging, Not Shorting

When we talk about hedging, we're talking about a whole plethora of ways to protect our portfolio. Note that the key word here is "protect," not "profit." Hedging often involves taking a position in a security that interacts in a predictable way with things you own. You may not have a particularly strong opinion about the security itself — you set up the hedge because of the predictable interaction with a position on which you *do* have an opinion.

Shorting, on the other hand, is all about conviction. Say you short **Barlo's Buggy Whips** because you believe the stock is overvalued and the business is cratering. In that case, you are explicitly aiming to *profit* from the stock's fall. This position is also different from a hedge because Barlo's stock doesn't interact predictably with other holdings in your portfolio. Shorting Barlo's in this example is just like buying a stock, except you're betting it will go down rather than up.

In short: Hedging is a low-conviction strategy aiming for protection. Shorting is a high-conviction strategy aiming for profit.

Hedges Don't Make Us Money

Let me hammer home a crucial point: It is pretty much impossible for a hedge to make you money.

Say what? Take our current hedge on the **SPY Depository Receipts**, to which we've recommended a 30% short allocation against your invested capital (in other words, you do not need to hedge your cash). If the S&P 500 falls 10%, our short position in SPY will be up 10% — but our overall portfolio, which is more than 90% long, will assuredly be down. It just won't be down as much as the S&P 500, thanks to the hedge. On the other hand, if the S&P 500 jumps 15%, our SPY short position will lose 15% — but our portfolio will be up overall.

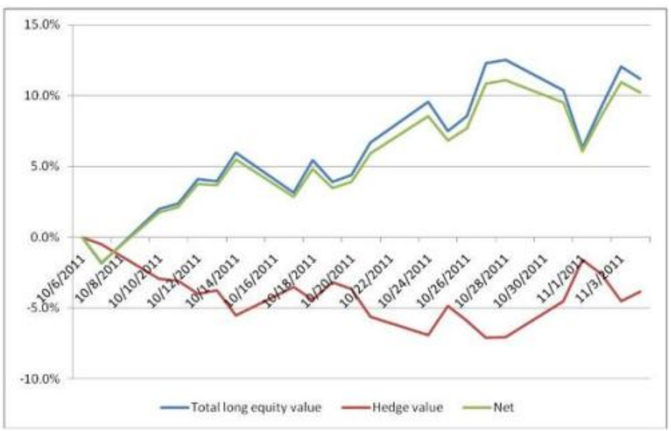
And that, Fools, is the whole point. We sincerely hope to lose lots of money on our SPY short — because every position we hold is in the context of our entire portfolio, and if our SPY short is deep in the red, that means the portfolio as a whole is strongly up. **The value of the whole portfolio is the only value that matters.**

So Why Use Them?

"But wait, Alex," you may be thinking. "If we can't make money from hedging, why do we do it?"

We hedge for three primary reasons. The first, as noted above, is for protection: Hedging can soften the blow to our portfolio if the market tanks, and we can turn those hedged positions into ready sources of cash to deploy in a then-cheaper market. In this way, hedging helps smooth returns and reduce risk — the second reason we do it and a big part of *Pro*'s mission.

The chart below shows the cumulative return of the Charter Portfolio's long equity positions and of our SPY hedge, as well as our net return since Oct. 7, when we shorted our first batch of SPY. For simplicity's sake, I've omitted all our options positions as well as our cash balance. This is just our stocks, our shorts, and the net of the two.



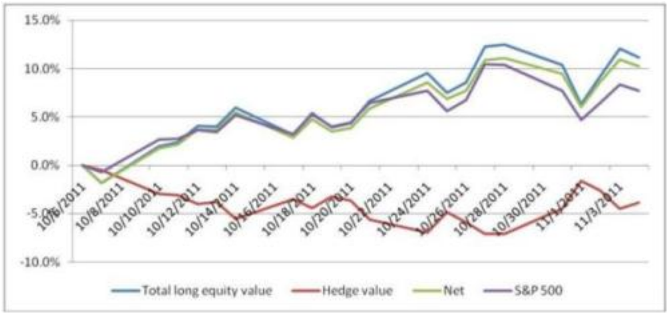
The image above represents our long stock positions and our SPY short. It does not include our options or cash positions. The purpose here is simply to show the effect of our SPY hedge on our stock portfolio.

As you can see, while our SPY short (the red line) has been unprofitable over the past month, our portfolio has continued to make money. This is exactly why it is critical to look at portfolio performance, not the returns of any one position in isolation — especially a hedge.

The third reason we hedge may be the least intuitive, but it is very real. Hedging helps us isolate our investing advantages. We're not market-timers, and we don't have a special edge when it comes to forecasting macroeconomic variables. What we *are* good at is identifying companies and stocks that will be long-term winners. By shorting broad market indices such as the SPY, we are able to isolate that advantage.

To help explain, imagine that we were to hedge 100% of *Pro*'s portfolio by shorting the S&P 500. This would mean betting that our hand-picked stocks outperform the S&P 500 and removing the effects of market volatility from our results. In that case, if the market goes up 10% and our stocks go up 15%, we make 5%. But if the market goes down 15% and our stocks only go down 10% … we still *make* 5%. Now scale this back from 100% hedged to just 30% to help understand how we are *mildly* isolating our advantages.

So is it playing out that way? It's only been about a month since we initiated our SPY short, so this is a very short time frame — but so far, the answer is yes. Here's the same chart you saw above, except I've added the return of the S&P 500 (in purple).



Our stocks (in blue) outperformed the S&P 500 (purple) during the past month's rally. Even better, our hedged portfolio (green) has also outperformed the S&P 500 — even with the drag from our SPY short. Few hedge funds are actually able to achieve this consistently over time, and of course, we are not trying to beat the S&P 500. We are aimed at producing real returns over meaningful periods of time with lower-than-market risk. It's still worth pointing out, though, that with less risk than the market, our hedged stocks beat the market over this admittedly short time period. That's what I mean by isolating our advantages.

It's All in the Portfolio

At its root, hedging is simply a way to protect what you already have. Remembering that will make you less likely to miss the forest for the trees by gauging the performance of a position, especially a hedge, in isolation. Everything we *Pro* Fools do is part of a holistic, integrated portfolio, one we are constantly tweaking and improving. Head to our Philosophy & Strategy board with any questions you have on the topic.

Fool on!

Alex Pape (TMFPapester)

Alex would probably short Barlo's Buggy Whips if it existed.

Earnings Coverage

- Jeff opines on results from **OpenText**, where growth was strong.
- **Tupperware** still rates a Buy as we go over recent results.
- **Covanta** turned 90 days into healthy quarterly results.
- **GrafTech International** is riding the economic roller coaster well.
- **Intel** reported outstanding income, surpassing even our high expectations.
- **Rockwood Holdings** more than doubled earnings per share and looks strong.
- **Plum Creek Timber** predicts more of the same: slow demand for wood, which suits our strangle fine.
- For audio coverage on **Pebblebrook**, **MasterCard**, GrafTech and Rockwood, listen to our latest *Pro* Audio Extra.

Community

- Alex340 posts puts that meet *Pro* criteria.
- MazonCreekRich asks the age-old question, "What Would a Viking Do?"
- TMFMoosie returns from a freak winter storm and what does he do? He posts a *Pro* calendar.

Transcript

Jeff Fischer: Welcome to a new edition of Motley Fool *Pro* Audio Extra. Joining us today, we have analysts Bryan Hinmon and Alex Pape and senior analyst Nick Crow, and I am advisor Jeff Fischer. We are here to talk about earnings with you today. We have all kinds of *Pro* companies announcing earnings this month. We are covering four today. We will be back next week to cover several more. Let's start with Alex.

Alex Pape: Sure, so I am going to talk about Pebblebrook Hotel Trust and Pebblebrook's third quarter was an interesting one [for] two reasons. First, they bought their first hotel last June, so this is the first quarter we have year-over-year results for any one hotel. And also they didn't close many deals this month, so the results are relatively unclouded by things like legal fees and other closing costs. What we have seen is that they are actually doing a really good job. Up until now, we have sort of been on blind faith that CEO John Bortz is buying hotels at a good deal and pulling expenses out of them, but they have revenue up 10% and expenses only up 5.5%, which means that their margins are expanding even faster than we expected. And their occupancy rates in their hotels are 84%. That compares to a national average of 66%. And keep in mind when they bought these hotels they were all below the national average, so that has all come back up in a very short period of time. This was a great quarter for Pebblebrook.

Jeff Fischer: Alex, how much of your confidence in the company do you attribute to meeting management face to face several times now?

Alex Pape: So I think what I have gotten out of meeting management is I thoroughly believe that they are good at cutting costs. Before I met them, I trust that they could buy hotels cheaply because they have done it before; I could see it on paper. But I went through several of the hotels with them in New York after they closed a deal on six hotels there, and they literally showed us things that they did to reduce costs, ways that they made restaurants run more cheaply. How they changed the bottles of Coke from cans to bottles, because that is cheaper and they actually save about $5,000 a hotel a year doing that. Literally just thousands of small things. Once you see that in person, it boosts the confidence.

Jeff Fischer: Excellent. And this is a REIT, of course, so we expect the yield on it to climb as net income climbs.

Alex Pape: Absolutely, and cash has gone up really quickly, so two quarters ago, they weren't making any cash flow. On this quarter, there was just under $29 million, so it is a pretty fast jump and the dividend should follow that over time.

Jeff Fischer: So Alex, any closing thoughts on what you expect from Pebblebrook the next two to three years?

Alex Pape: So I think that acquisition activity for purchases of new hotels is sort of the unknown; it depends on the deals they see. And the dividend will go up as cash goes up, and it will also go up faster if they close fewer deals, because they have less use for that cash, so it depends on that, but either way, the dividend is going up pretty rapidly over the next two or three years.

Jeff Fischer: Excellent. The stock remains a "buy" in the portfolio right now, so we have a 3% allocation.

Alex Pape: Just over 3%.

Jeff Fischer: So match us right now; good time to buy. Nick, let's go to you.

Nick Crow: Let's talk about MasterCard, and I am going to repeat Alex's theme of expanding margins through operating leverage. That's the story here with MasterCard as well. First revenue is up an exceptional 27%, with costs going up slower at only 23%. It is actually better than that if we took out acquisitions, but that is good enough for us to raise operating income 31%, net income 38% and all the way down to us, the shareholders, with EPS of 43%.

Jeff Fischer: That's outstanding.

Nick Crow: That's the beauty of operating leverage, so the costs going up so slowly compared to revenue, all those earnings and more fall to the bottom line, and they are also buying shares. Bought some last quarter. They have got 800 million left that they can buy, and that's going to further juice earnings per share for us.

But the reason why I brought MasterCard to the table today is it is very interesting. The economy feels really shaky, kind of scary right now out there, but worldwide, at least from MasterCard's perspective, gross dollar volume, the amount processed through their cards, was $844 billion. That is an 18% increase over this time last year.

Bryan: Big time.

Jeff Fischer: And what do they attribute that to?

Nick Crow: Well, I don't think they said specifically, or at least not that I have seen yet. I haven't gone through in full detail, but my guess here is one, people are spending more, but more importantly for our long-term thesis here, they are stealing share away from cash and other payment methods.

Male: The war on cash.

Nick Crow: The war on cash; that's awesome.

Jeff Fischer: Nick, any traction on debit cards? We know Visa has lost their stranglehold on debit cards in the U.S.

Nick Crow: We have seen them pick up a couple of small ... well, not small, large regional banks, but small compared to the big five banks that we tend to look at, so they are winning some there. It's an opportunity, but it's not the most attractive opportunity. Card growth did grow about 8% and transactions grew 20%, so basically we are seeing them execute their business model perfectly and debit cards, just a portion of that.

Jeff Fischer: So right now Fools, MasterCard is a "buy," but it is about 10% above our Buy Around price. However, it's MasterCard. It's 10%. In the next three to five years, that 10% is not going to matter much. That said, the results just came out. We need to go through them fully and we will give updated guidance as soon as we do. But on first glance, as Nick just said, really strong.

Nick Crow: Very strong results.

Jeff Fischer: Bryan, let's go to you. Is your company as good as or better than MasterCard?

Bryan Hinmon: In what capacity?

Jeff Fischer: Cash flow generation. A little bit smaller, but I still love it.

Bryan Hinmon: A little bit smaller.

Jeff Fischer: Long-time portfolio holding, GrafTech.

Bryan Hinmon: It's way more fun to talk about graphite electrodes.

Jeff Fischer: I have several at my house.

Bryan Hinmon: *(Laughing.)* Do you really?

Nick: I am already falling asleep.

Bryan Hinmon: GrafTech, this I can promise our members. GrafTech has way more carbon than MasterCard does.

Jeff Fischer: Good. And carbon is (unclear); it is the foundation of life. *(Laughter.)*

Bryan Hinmon: All right, let's snap to it. So GrafTech's quarter was just fine. The numbers look good, but that's because they are including the three recent acquisitions that the company made over the past year or so, so all the numbers look really good. But the big story here, because the market obviously is forward looking and we are buying a company for what it's going to do, not what it has done. The big story here is what's going to happen with GrafTech's contracts in 2012? One of the reason we like the company is because it signs, traditionally, annual contracts. So it has pretty good revenue visibility, and as long as they manage their costs, they make pretty decent returns.

So the problem is steel makers, GrafTech's customers, people who buy the electrodes, they have no clue what economic activity in the business environment is going to be like for 2012, and so really what they are trying to do is they are trying to push off negotiating with GrafTech for their inputs until they have a better feeling for what 2012 is going to look like. And one of the things we expect for next year with GrafTech is much improved contract pricing. But with the business environment uncertain, we are not sure how much better those contract prices are going to be. We expect them to be better; we just don't know if they are going to be super better or just mediocre better.

Jeff Fischer: Right, and since 2009, 2008 really, GrafTech has had trouble on visibility and therefore on pricing. It did improve towards the end of 2009 into 2010, but now the uncertainty has risen again, same problem again.

Bryan Hinmon: Same problem all over again. Now one of the things GrafTech has done really well in 2011 is they have communicated with their customers very clearly about the rising input costs that are going into graphite electrodes, and they basically have been pounding the table saying, This is unsustainable. We can't keep being the ones who take the hit on profitability. So they have put their message out there over and over and over again, and that gives me a little more confidence that they are going to be able to get some of those price increases to stick.

Jeff Fischer: It speaks to the point management communicates very well with us, with shareholders and with customers, and I have always respected that about them. It's a well-run company.

Bryan Hinmon: It sure is.

Jeff Fischer: They really navigated the last downturn well. If we have another downturn, I know they will navigate that as well, but when the economy finally does recover, whether it is 2012 or beyond, I think we still have a value on our hands. The shares remain a "buy" at around 15 lately.

Bryan Hinmon: Yeah, I think that's true. Even though this is sort of a boring business and many people would look at it and say this is just a commodity player, GrafTech is the low-cost producer. They really run their business well, and over the cycle they are able to earn returns on capital of about 15 or 17%, and so that's nothing to shake a stick at.

Jeff Fischer: So GrafTech is a "buy." You can also sell put options to potentially buy shares lower.

Bryan Hinmon: Yeah, and this is one where we have got a lot of volatility, so a little bit of patience. You can probably build a position at a really good price.

Jeff Fischer: Thank you, Bryan. I will now just touch on Rockwood Holdings, which is another somewhat boring industrial company, but if you look beneath the surface, very interestingly, they are a leading producer of lithium and titanium dioxide, which goes into paint and sunscreen and food coloring, and also ceramics, mainly for cars and medical devices, medical hips being one of those devices.

This is really a management and an asset story as well. Strong management managing strong assets very well to grow the revenue and grow the bottom line as they de-lever, as they pay down debt, and Rockwood, as members know, went through a reorganization the past five years. Sold weak businesses, kept and added to strong ones, and is now a very focused portfolio of products that are all doing really well, except one in construction, which is marginal.

So shares are volatile. They trade at 11 times free cash flow, and as with the other three companies we just talked about, I think in three years there is a good chance they will be significantly higher, assuming the economy at least holds its ground, let alone grows a bit. So Rockwood remains a "buy first" right now at around the mid-forties.

Thank you for joining us for this *Pro* Audio Extra on earnings. We will be back next week with four more companies, and until then, we'll see you on the boards. Fool on!

Strong Earnings Drive Our Results

Published Oct 31, 2011 at 12:00AM

Fellow Fools:

Pro Trade Roundup

Charter Portfolio

- Sold short 500 shares of **SPDR S&P 500** at $128.29 (5% for 20% total).

Portfolio 2011

- Sold short 85 shares of **SPDR S&P 500** at $128.14 (5% for 20% total).
- Sold all 40 shares of **Contango Oil & Gas** at $61.80.

Guidance Changes

- **Tupperware** and **Autodesk** move down to Hold on price.

Since *Pro* first opened its doors to members on Oct. 7, 2008, the S&P 500 has returned 21.6% before dividends. *Pro*'s Charter Portfolio is up 34.5% over the same time, amounting to roughly 10% annualized and surpassing our internal aim for a healthy annualized absolute return every rolling three years. We achieved these results largely by purchasing strong companies at attractive prices, and as we look ahead to our next three years, we believe stock ownership will continue to be the most important part of our returns.

As *Pro* investors, we'll continue to reach beyond stocks to use options, short or hedge, and invest in — or against — newfangled ETFs and ETNs. But we want to put most of our capital in companies we believe will deliver healthy returns with reasonable risk even in the face of macroeconomic challenges (over-levered governments, an aging population, cash-strapped consumers). Nobody can predict the macroeconomic situation consistently, especially these days, so most of our energy needs to be focused on finding great businesses that should grow value even in a tepid economy.

Like Snickers, Earnings Season Really Satisfies

Every three months, earnings season gives us new insights into the companies where most of our cash is invested. So far this quarter, all of our companies are continuing to produce more value for shareholders, report on it in a transparent way, and invest for additional value creation. We couldn't ask for much more. Let's run through the recent results from five *Pro* holdings.

BMC Software

BMC Software is down 19% since we bought it just more than a month ago. First came rumors about the departure of some senior sales representatives, then came results that proved the rumors. Although second-quarter revenue grew 11% and operating cash flow was up 27%, new license bookings for BMC's largest software division declined 13% compared to last year. Management now conservatively guides for "low single-digit" revenue shrinkage in its enterprise service management license bookings this fiscal year, compared to previous guidance of "low double-digit" growth. What happened?

The short answer is sales-force attrition: Management says it lost too many tenured salespeople, leaving too few in the field to capitalize on growth opportunities. Management does not believe BMC is losing market share and continues to believe it has optimal products that are in high demand; to that end, the company is rapidly investing in hiring and training new salespeople, hoping that within several quarters, enterprise service sales will start to improve. Encouragingly, all other divisions — including cloud, software-as-a-service, and mainframe service management — are clipping along, with new bookings in the latter up 25%. And non-GAAP operating income grew 13% in the quarter as recurring maintenance contracts lend a strong foundation to the business.

At its recent price of $34, BMC Software trades at only 6.8 times its $875 million in free cash flow. And cash flow remains strong — in fact, management expects record cash from operations this year, adding to the company's large cash balance. Since BMC has identified its sales staff attrition problems and is focused on correcting them, the stock remains a Buy; after reviewing the SEC filings, we may bump it up to Buy First and pick up a few more shares. We'll let you know.

Covanta

Covanta serves the tail end of the consumer market, making money off everything that's thrown away after use. By burning trash and selling the steam as energy, Covanta produced another solid quarter, with revenue up 7% and free cash flow jumping 12% over last year. The company is priced at a cheap 8.3 times free cash flow, and its new dividend yields 2.1%. It remains a Buy First with a fair value up to 50% higher than its current $15 stock price. As with all investing, patience is our watchword here; Covanta is building new facilities, and energy prices may tick higher next year.

Intel

Intel's earnings report featured the highest quarterly revenue, the highest earnings per share, and the most microprocessor shipments in the company's history. We've long argued that Intel skeptics who point to its lack of mobile presence are missing the big picture. Intel dominates the lucrative business enterprise market, and demand for more computing power is growing among corporations around the world. Intel is also a leader in the PC market, which is rapidly expanding in new markets (China is now the world's largest PC market, and Brazil is third). And it's making moves in mobile, too, now that the mobile space represents a profit opportunity worth pursuing on Intel's massive scale. The company expects the first several smartphones with Intel chips to ship in early 2012.

Wrap your head around these numbers: Intel has hired 17,000 people so far this year and expects annual revenue to jump 26% to nearly $55 billion. The company is a driving force behind Ultrabooks (ultra-thin, instant-on laptops), and next year, it expects those devices to begin to replace notebook computers and offer an alternative to tablets. With a 3.3% dividend yield and a stock trading at just 10 times expected 2011 earnings, Intel remains a value even as a Hold on our scorecard. *Pro* members were ideally able to purchase shares when it was a Buy First; as results continue to top even our expectations, we may bump up our $25 fair-value estimate soon. We'll keep you posted.

Rockwood Holdings

Rockwood Holdings is hitting it out of the ballpark this year (a tip of the hat to St. Louis Cardinals fans!), with earnings per share more than doubling. Its lithium business for batteries, its surface treatment business for automotive and industrial use, and its ceramic division for the medical industry are all growing and enjoying pricing power. Total sales increased 17.4% in the third quarter to $941 million, and the company continues to invest in new plants for the future. We expect more long-term profit down the road, but this Buy First stock is sure to remain volatile. Consider selling to open puts at lower strike prices if you want to add to your position.

Tupperware

Tupperware continues to amaze with 68% third-quarter sales growth in India, 22% growth in China, 74% in Brazil, 20% in Singapore … and a 6% sales gain for its Tupperware division in mature North America. Tupperware's direct sales technique is ideal in emerging markets, where more women are beginning to work, families are starting to store food, and prices need to be reasonable. Overall, Tupperware grew sales 10% in the quarter. Shares have popped since we moved the company to Buy last month, so now we're moving it back to Hold on valuation. If you don't yet own your fill, sit tight for now.

It's Not Over

We have more earnings coverage linked below, and we'll have even more in next week's Memo and throughout the week on our discussion boards. Stay invested, stay happy, stay Foolish!

Jeff Fischer (TMFFischer)

Jeff owns shares of Intel, Tupperware, Autodesk, Rockwood, and BMC Software.

Making Volatility Pay, Part 2

Published Oct 24, 2011 at 12:00AM

"I love to think longer-term. The near term is over-analyzed, and I'm utterly bored with it … I like to go out two, three, five years ahead and make those bold calls." — Heidi Wood, Morgan Stanley analyst

VXX or No VXX …

Our recent experience with the VXX ETN has some important takeaways for all *Pro* members:

- **Don't over-allocate.** All of us may pay a price when some members don't follow the game plan. Do not over-allocate.
- **Stay in the position.** You need to be ready to ride through bad situations as long as your thesis holds and you haven't over-allocated.

There are takeaways for the *Pro* team, too:

- **Have patience.** Had I not been so keen to set up a new VXX trade on the first spike in the VIX, we might have shorted at better prices.
- **Black swans happen often.** Often, we don't see history while it's happening. With this position, we were in the wrong place at the wrong tumultuous time.

Fellow Fools:

The refreshing quote above mirrors something I heard Fool co-founder David Gardner say at a recent investing conference. To paraphrase: For investors, a long-term perspective is a key advantage in a short-term world. While others are frantically selling and buying, creating volatility, we can zero in on big-picture opportunities others either miss entirely or actually contribute to by thinking short-term.

When you invest for the long haul, you're much more likely to make a profit. To put it another way, a portfolio is most vulnerable to losses when it's being managed for the short term. This is true even when using options (because all options *strategies* should be thought of in a long-term context, even if an individual option has a shorter-term expiration), ETFs, and exchange-traded notes (ETNs) like the **iPath S&P 500 Short-Term VIX Futures**, the subject of today's Memo.

Shorting Volatility Is a Long-Term Endeavor

In last week's Memo, I shared some of our history with VXX. Our recent loss on the position was unexpected and surprising, and we're determined to learn from it. We're analyzing what went wrong, how we can prevent it from happening again, and what we can do to help ensure profits on the position over the long term.

The first answer is the easiest: We suffered a loss on VXX because we closed the position while it was working strongly against us. We did so for three reasons:

1. We were informed that our broker wouldn't let us stay short the shares after our calls were exercised.
2. We learned that many members were in the same situation and some had over-allocated.
3. Given a remarkable, rapidly changing investment landscape, we wanted some time to analyze our next strategy; given Europe's woes, we assumed volatility would not fall suddenly in the meantime.

We still believe in the thesis behind our VXX position, and not being able to easily stay in the trade has cost us in the short term. Before we get back into the position, we want to make sure all of us have staying power in it.

Too Much Exposure

Many members were over-allocated to the VXX position. Even at its worst, this short was only about 130% against us (and that was only for one day), so it should *not* have caused the liquidity troubles we saw from some members on the boards. But it did — and that, dear Fools, had an influence on what I decided to do this time. I don't plan for that to happen again.

If I were running a flight school and heard some students were taking unsafe risks in the air, I would feel obligated to ground the whole fleet until we could once again ensure safety. Being responsible for our member base means this is our obligation. Far too many members risked too much on VXX, and seeing the outcome for some of those members has been the worst part of my 15-year investing career.

The *Pro* portfolio had liquidity to spare, but some members were getting damaging margin calls, and we couldn't let that continue. We told members who had no liquidity issues that they could stick with the trade if they had ample means, but we hit the pause button for everyone else.

There were other key factors as well, of course. The VIX, the "fear index" VXX exists to track, was in a state of steep backwardation (which helps VXX retain or even grow value) instead of the much more common contango (which aids VXX's decline). And the highly unusual economic troubles in Europe were (and are) keeping markets on edge, making it unlikely that volatility will subside and contango return in the very near future.

Over the long term, though, our short thesis on VXX remains as strong as it has ever been, and we have every intention of getting back into this position. When we do, we want a sustainable position and strategy, and we don't want anyone to over-allocate.

A Bit More History

For perspective on why we're confident in this thesis over the long term, consider our history with VXX. Since we first recommended shorting it in June 2010, it has declined about 60%.

After we issued our first short recommendation, our broker informed us it lacked shares to short. So we issued a new alert, using options to establish an alternate position. Only short-term options on VXX existed at the time, and put options on this ETN are always expensive, so we focused on writing naked calls to collect premium. Whenever the underlying VIX spiked (and we knew it would sometimes), we planned to roll the calls up and keep waiting. Here's how that played out:

Date	Recommendation	Allocation	VXX Start Price	Outcome
June 16, 2010	Short VXX	3%	$105	Unable to short shares
July 15, 2010	Write Naked Calls Instead	3%	$103	Closed the calls once we earned most the profit
Dec. 1, 2010	Write New Naked Calls	6%	$47	Expired for the full profit
Jan. 21, 2011	Write New Naked Calls	6%	$32	Expired for the full profit
Feb. 25, 2011	Write New Naked Calls	6%	$32	Rolled these calls after Japan's Tsunami
Mar. 17, 2011	Roll Naked Calls	6%	$36	Expired for the full profit
July 19, 2011	Write New Naked Calls	7.5%	$23	Closed early at a loss

If we'd been able to short the shares directly — as we initially intended — and had stayed in the trade ever since, we wouldn't have a loss, or a problem, today. Lesson No. 1: Your broker matters a great deal. The naked calls we wrote instead earned us comparatively small gains, and as the ETN declined, we increased our allocation due to lower pricing.

Remember that shorting VXX isn't like shorting a normal stock, where the lower the price, the riskier it may be to short it. When we issued our first short recommendation on VXX in 2010, the underlying VIX was at 26. Today it's 31, suggesting VXX should be up — but the ETN has actually declined from $105 to a recent $42. As long as contango is in place (and it is the majority of the time), VXX loses value as time passes. Shorting this ETN at lower and lower prices does not mean you're taking on more risk as long as the VIX itself has actually held its ground or gone up.

Big Lessons

I see takeaways here for members and the *Pro* team alike. For members:

- **Don't over-allocate.** A lot of unusual events converged on our last VXX position, but what really made it fail was over-allocation. The *Pro* portfolio wasn't in danger, but many members took larger positions than we did, and some had simultaneously written puts on many stocks as well. This left them no liquidity, and thus no breathing room, when the market declined. All of us may pay a price when some members don't follow the game plan. Do not over-allocate.
- **Stay in the position.** Again, you suffer losses when you can't stay in a position when times are bleak. You need to be ready to ride through bad situations as long as your thesis holds; this is much easier if you haven't over-allocated.

And for the team:

- **Have patience.** I watched VXX fall all summer while we remained without a position on it, and I was keen to set up our next position the first time the VIX spiked. That first spike turned out to be small, and had I been more patient, we might have shorted at better prices.
- **Black swans happen often.** Often, we don't realize history while it's happening. We entered our most recent position on VXX soon before the U.S. credit rating was downgraded for the first time. We were in the wrong place at the wrong tumultuous time, and we weren't able to easily wait it out as a group. That last part is key: We need to be able to wait out the hard times any investment can face.

New Trade in the Future

We plan to short VXX again using options.Our thesis hasn't changed: Over the long run, market volatility can only be sustained for so long. Eventually, it will revert to its mean around 20, VIX futures prices will go back into contango for months at a time, and VXX will drift lower and lower.

When we establish a new position, follow our allocation recommendations. Realize that allocation is a big part of our defensive strategy. The VIX will go down to its average, but it will spike periodically. There is no question about that. So we need to be able to wait out those times. It's that simple. Don't over-allocate.

Shorting volatility is a long-term endeavor, just like owning our great stocks is. No oversized bets, Fools. Slow and steady wins the race. Let's think long-term in all things. You may be glad to know that the next time I write about VXX will be in a trade alert; after that, I plan not to write about it for months as we let time do its thing.

Jeff is short shares of iPath S&P 500 VIX Short-Term Futures.

Pro Trade Roundup

Charter Portfolio

- **StoneMor Partners (**Nasdaq: STON): Bought 300 shares (for 3% total) at a net $28.90.
- **iShares MSCI Spain Index** : Bought to close October $34 calls for $1.20.
- **iPath S&P 500 VIX Short-Term Futures** : Closed October $51/$56 bull call spread for a $0.16 credit.
- **Papa John's Pizza** : Bought to close October $32 calls for $1.90.
- **Contango Oil & Gas** : Sold to open November $55 calls for $6 each.

Portfolio 2011

- **StoneMor Partners (**Nasdaq: STON): Bought 100 shares (for 3% total) at a net $28.90.
- **iShares MSCI Spain Index** : Bought to close October $34 calls for $1.20.
- **iPath S&P 500 VIX Short-Term Futures** : Closed October $51/$56 bull call spread for a $0.16 credit.

2011 and Charter Portfolios: Close Half of Your Ratio Put Spread on Wells Fargo

Published Oct 20, 2011 at 12:00AM

What's a Conditional Trade Alert? Our options position on Wells Fargo expires tomorrow, Oct. 21. This alert outlines the different actions we recommend depending on where the stock price settles at that time.

Trade Essentials

- **Actions:** If you followed our last recommendation on **Wells Fargo** (NYSE: WFC), you now have a ratio put spread on the company: October 2011 $25 puts and October 2011 $23 puts. Both of those positions are set to expire Oct. 21.
  - See "How to Follow Along" below for detailed guidance.
- **When:** If shares are below $25, take the appropriate action (outlined below) by the end of the day on Oct. 21 at the latest.
- **Limit Price:** Initially, set your limit order at the intrinsic value of the option (strike price minus stock price) or better.
- **Why Close?**
  - Our ratio put spread expires Oct. 21.

What's Changed?

The macroeconomic environment has worsened considerably since we established our ratio put spread hedge on Wells Fargo in June. But the bank's recent quarter looked strong; despite Europe's troubles, the debt-ceiling debacle in the U.S., and the downgrades of several major countries' debt, Wells Fargo shares are trading right about where they were when we initiated this position. This was a great hedge — we were paid up front to set it up, it provided us protection during a rocky period, and it was ultimately unnecessary. It doesn't get much better than that.

With the share price hovering just above our $25 strike price, we're issuing a conditional alert. Read the next section carefully for instructions.

How to Follow Along

- If shares of Wells Fargo are higher than $25 on Friday, Oct. 21, do nothing. Let this position expire and know you made a little money on it and enjoyed increased peace of mind.
- If shares are between $23 and $25 on Friday, "sell to close" the $25 puts for at least their intrinsic value (intrinsic value here is the option strike price minus the stock price). With shares in this range, our hedge will have kicked into gear; we'll profit most if the price is at exactly $23.
- Whatever the stock price, leave the $23 written puts alone; we expect those to expire worthless, meaning we'll earn our full cash profit on them.
- If shares are knocked below $23 on Friday (the least likely outcome, but we're including it so you're prepared), do the following:
    - "Sell to close" the $25 puts and "buy to close" half of the $23 puts. Aim for a $2 credit to close this part of the spread.
    - Let the other half of the $23 puts expire.
    - Be ready to accept shares of Wells Fargo at a great price.

Head to the Wells Fargo discussion board with questions.

Nick owns shares of Wells Fargo.

Charter Portfolio: Close Your Short Calls on Papa John's Pizza

Published Oct 20, 2011 at 12:00AM

What's a Conditional Trade Alert? Our options position on Papa John's Pizza expires tomorrow, Oct. 21. This alert outlines the different actions we recommend depending on where the stock price settles at that time.

Trade Essentials

- **Actions:** If you followed our last recommendation on **Papa John's Pizza** (NASDAQ: PZZA), you now have a short covered strangle on the company: October 2011 $30 puts and October 2011 $32 covered calls. Both of those positions are set to expire Oct. 21.
    - If Papa John's stock price is above $32 at expiration, "buy to close" the October 2011 $32 calls.
    - Do nothing with your October 2011 $30 written puts.
- **When:** Close by the end of the day on Oct. 21 at the latest.
- **Limit Price:** The spread on these options is wide, so **please use a limit order**. With expiration near, pay little more than the intrinsic value. So, if the stock price is $32.30, look to pay little more than $0.30.
- **Why Close?**
    - Our covered strangle expires Oct. 21.
    - If shares are higher than $32 at expiration, they'll be called away.

What's Changed?

The Joy of Strangles

As we wrote in "Options 703: Strangles": "You write ('sell to open') a covered strangle to profit when a stock stays within a wide price range — or, if it doesn't, to get a better buy price on new shares or a higher sell price on existing shares." Our covered strangle on Papa John's was intended to generate income, and given the steady nature of pizza sales, we tried to maximize our income by writing a tight strangle (with strike prices close to one another).

A tight strangle pays better than a looser one, but it presents its own challenges during volatile times. As expiration nears, it can be tough to know whether maintenance will be needed on either side of the position, or if we can just let it expire and enjoy the profits. Our covered strangle on **Papa John's** (NASDAQ: PZZA) is particularly tight, with just $2 separating the puts and calls — and the company's share price has easily danced below $30 and above $32 this month.

Ideally, Papa John's shares would finish this week at $31.99, maximizing the profitability of our position and requiring no further effort on our part (we could just let the strangle expire and collect our profits). Unfortunately, we have no way of knowing what the stock will actually do. Right now, shares are trading higher than the $32 strike price of our written calls, so we're issuing this conditional trade alert:

- If shares remain higher than $32 as Friday's close nears, we'll need to close our written calls to keep our shares and potentially set up more income-producing options strategies on them in the future.
- If shares are less than $32 at Friday's close, we can leave our written calls alone and let them expire worthless.

How to Follow Along

- If shares are higher than $32 near market close tomorrow (Friday, Oct. 21), "buy to close" your written October 2011 $32 calls.
- If shares are less than $32 near market close tomorrow, sit back, relax, and order a pizza from Papa — the written calls will expire worthless.
- In either case, leave your written puts alone. We expect those to expire worthless, earning us our full cash profit on that half of the position.

Shares of Papa John's are currently trading at about $32.35, and the October $32 calls ask $1.55, so they're carrying about $1.20 in time value (the other $0.35 is intrinsic value, Fool). That is a lot of time value; we'd rather pay much less, so make sure to use a limit order. Keep in mind, though, that if your limit order is too aggressive and doesn't fill, your shares will be called away from you, so don't just set it and forget it.

Papa John's reports earnings on Nov. 1; we'll wait for those results before deciding whether to renew our income-producing strangle strategy. Please bring any questions to our Papa John's discussion board.

Making Volatility Pay, Part 1

Published Oct 17, 2011 at 12:00AM

Although *Pro* invests using time-tested strategies, our approach has always pushed boundaries at The Motley Fool. When we launched in October 2008, we became the first Foolish service to invest using options, exchange-traded funds (ETFs), and exchange-traded notes (ETNs). The Fool had invested only in stocks for almost 15 years, but with *Pro*, it was time to add more tools to the toolshed. At the time, the investing industry was going through a renaissance of sorts, with new ETF and ETN products issued weekly. Some of these were better than others, and among the more flawed offerings were a few ETNs based on the market's most popular volatility index, the VIX.

Pro Trade Roundup

Charter Portfolio

- **10/13:** Set up a protective collar on **AmTrust Financial Services**, writing 39 March 2012 $25 calls and buying 39 March 2012 $20 puts, for a net debit of $0.15.

The **iPath S&P 500 VIX Short-Term Futures** ETN, launched in January 2009, was one of these. In fact, it was the first of its kind, and it remains the largest volatility-tracking exchange-traded vehicle today (as measured by assets). The VXX ETN tends to move inversely to the market because it mirrors the short-term futures contracts on the VIX, also known as the "fear gauge." The VIX uses a proprietary Chicago Board Options Exchange calculation to track the price people are willing to pay for market insurance in the form of put (in relation to call) options on the S&P 500. Higher put prices mean more fear in the market, so a high VIX means fearful investors. On the flipside, when the market is calm, put prices decline, and so does the VIX. Thus, shorting VIX-based vehicles like the VXX ETN is a thesis that market fear will diminish or stay muted — a position that makes sense if you're even mildly bullish or neutral.

The Ideal Short?

Shorting a stock is notoriously risky. The company you short could be bought out at a high premium. Its earnings could exceed your expectations. Shares could soar on speculation. In fact, if civilization is working as it should, the whole market is working against your short: Stock prices are *meant* to go higher as society advances and market valuations grow, so shorting any individual stock may mean swimming against the larger tide.

Shorting a volatility index, on the other hand, offers none of the above risks. The VIX can't be acquired. The index can't report blowout (or any) earnings. And while volatility, and thus the VIX, may soar on sudden market fears (as we've seen over the past two months), we can be confident those fears will eventually subside and the VIX will go back down.

We know this from market history, and heck, we know it from science. Human beings will only tolerate so much fear before they're compelled to act on it by making whatever changes they can. (In the case of the VIX, that would mean selling stocks or buying puts — in other words, capitulating to their emotions.) Fear can build and build as waves of investors give in to it, but eventually it hits a peak.

That doesn't mean it has to peak when you or I or anyone else expects it to, however; people have varying tolerance levels for fear, and new concerns can sometimes pile on top of old. Thus, anyone shorting volatility (in the form of VXX or anything else) needs to be ready to ride out a long-term spike in it. From its long-term average level of 20, where the VIX was sitting around the beginning of 2008, the VIX soared all the way to 80 in October of that year, and it didn't return to 20 again until 15 months later, in December 2009. This August, the VIX hit 48, and while it has declined lately, it's currently hovering around 30 — still well above its average.

Over the long term, if you can wait out a spike in the VIX, eventually you're very likely to make money shorting the VXX ETN. This is especially true because there is one additional factor working in your favor: the pricing of the futures contracts that VXX mirrors.

A Steady Pricing Drag

For this example, let's say the VIX is at 25 and the futures contracts on the VIX that expire in the next two months are at $26.25 and $27.50, respectively. The VXX ETN tracks a rolling collection of these futures contracts; every day, it assumes the exit of some of the current month's contracts and the entrance of some of the next month's, so its collection of tracked contracts always expire in an average of one month. When the price of next month's contracts is higher than the current month's (as is usually the case), the ETN experiences a resulting drag on value, called contango. Contango has depleted the VXX ETN's price by an average of 3% per month since its creation, a very substantial drag that equates to gains only for those shorting it.

Since we first suggested shorting the VXX ETN on June 16, 2010, it has declined from $105 per share to a recent $42 — a drop of 60%. Since inception in January 2009, VXX has lost 90% of its value, and this decline can continue theoretically indefinitely. That's because when VXX's share price gets low enough (into the teens), Barclay's (the issuer) is ready to conduct a reverse split, combining shares so that the price of a single share returns to a much higher price. (The total value for shareholders, and the return to date, doesn't change at all.) The long-term descent in the share price will then continue as long as the VIX is steady and contango remains in place on its futures contracts.

Coming Up Next

So if this ETN is down 60% since we first recommended shorting it and we're confident in our thesis about it, how did the position recently turn into the largest loss *Pro* has ever experienced? I'll continue the saga by explaining that outcome, and how we're going to recover from it, in next week's Monday Memo.

Until then, remember that the VXX ETN is only one of more than two dozen positions in the *Pro* portfolio. While VXX has dealt those of us using it a short-term setback, the portfolio as a whole remains positioned to prosper over the coming months and years. Because the VXX ETN is likely to continue to lose value over months and years, shorting it will likely be a steady part of our portfolio's balanced mix. First, though, we'll use next week's Memo to look at what went wrong last time so we can move forward in a positive way.

As always, visit the Memo Musings board if you wish to discuss the Memo. Fool on!

Jeff Fischer (TMFFischer)

Jeff is short shares of iPath S&P 500 VIX Short-Term Futures.

Upcoming Earnings

- **Oct. 17: Wells Fargo**
- **Oct. 18: Intel**
- **Oct. 19: Covanta , Rockwood Holdings**
- **Oct. 24: Plum Creek Timber**

This Week's Expirations

Charter Portfolio

- **Papa John's** (Nasdaq: PZZA): If shares continue to trade between the strike prices of our strangle, it'll expire for the full income, and we'll look to write another. If share prices move too much, we'll consider rolling the strangle before Friday.
- **Wells Fargo** (NYSE: WFC): The stock is between the strike prices on our ratio put spread. After we've digested this morning's earnings, we'll let you know (via a trade alert, if action is warranted) what we're going to do. Nothing too pressing, but stay tuned.
- **StoneMor Partners** (Nasdaq: STON): Our written puts will be exercised and we'll be assigned shares per our original plan. This puts more of our equity into this high-yield position.

Portfolio 2011

- **Wells Fargo**: Same as Charter Portfolio.
- **StoneMor Partners:** Same as Charter Portfolio.

Charter and Portfolio 2011: Contango Oil & Gas

Published Oct 13, 2011 at 12:00AM

Attention, *Pro* Fool: Contango is a thinly traded stock with thinly traded options. You **must use a limit order** when placing your trade! If you are unsure how to do so, please head to our Member Suggestions & Help discussion board.

Trade Essentials

- **Action**: Write ("sell to open") November 2011 $55 covered calls on all 100-block shares of Contango you own, one call for every 100 shares owned.
  - If you own fewer than 100 shares (or own an odd-lot number of shares), **use a limit order** to sell all shares you own on which you cannot write calls.
- **Recent Stock Price Range:** $53 to $60
- **Recent Options Prices:** November 2011 $55 calls bid/ask: $5.70/$6.90
- **Limit Guidance:**
  - Calls: **Use a limit order**, aiming for $6 or more
  - Stock: If you are selling shares directly, **use a limit order** only at the current price
- **Why Sell?**
  - We want to write covered calls to secure a sell price as close to $60 or higher as possible; alternatively, you can just sell your shares today for a bit less than that
  - Lower natural gas prices are making it hard to justify Contango's stock price
  - This is a tiny position in both portfolios, and selling will help us focus on higher-conviction investments
- **Alternative Trade:** If you cannot get the recommended $6 or more for the November $55 calls, consider writing ("selling to open") January 2012 $55 calls.

What's Changed

Our admiration for natural-gas exploration and development company **Contango Oil & Gas** (NYSEMKT: MCF) hasn't waned one iota since we purchased the stock. Led by CEO Kenneth Peak, this company continues to shun anything that doesn't create immediate value, such as employees (it has just eight), debt (it has none), and share dilution (the company is actually *negative* dilutive, meaning its share count has shrunk over time). What has changed is our opinion of the company's valuation: We no longer think it's cheap.

The value of Contango's business hinges on two main factors:

1. Natural gas prices
2. The success of the company's drilling program

Let's tackle the latter first. It costs Contango between $15 million and $25 million to drill an exploratory well. Most companies drilling the same kinds of wells in the same areas as Contango find natural gas about 25% of the time. Contango is above average at what it does, so it may actually achieve a marginally higher hit rate than that. But the company is tiny compared to many of its peers. Its small stature means it can only afford to drill about four or five wells per year, and it puts all of its focus — and money — into that drilling. This means that if Contango does hit pay dirt, it's a huge deal for the company — but there's also a very real chance that Contango could exhaust most or all of its capital very quickly and be left with just a bunch of empty holes in the ground.

Contango's value exists within a range. If the company's drilling is successful, its worth is near the upper end of that range; if not, it ebbs toward the lower end. Unfortunately, today's price is closer to the upper end, which means the market is already expecting Contango to drill some successful wells. And Contango's current share price is more difficult to justify given today's lower natural gas prices, no matter how successful its drilling might be. If that drilling is unsuccessful or natural gas prices stay this low (let alone continue to drift lower on the argument that newfound shale gas continues to be plentiful), Contango's stock has too much downside risk to make the risk-to-reward scenario attractive enough compared to other positions we own or are considering.

Contango makes up just 0.9% of the Charter Portfolio and 1.1% of Portfolio 2011. These are tiny positions from a portfolio-management perspective, but we would be uncomfortable adding to them at today's prices (which is our bogey for any small position as we focus the portfolio: build the small position to 3% to 5%, or eliminate it).

We want to write covered calls to secure a sell price as close to $60 or higher as possible; alternatively, you can just sell your shares today for a bit less than that.

How to Follow Along

Contango's options and shares are very illiquid, so it **is imperative that you use a limit order when you place your order, or the price will decline rapidly**. *Pro* will follow suit by writing covered calls within 30 days of this trade alert. If you have any questions, please head to our Contango discussion board.

The Motley Fool owns shares of Contango.

Making Pro Fit You

Published Oct 13, 2011 at 12:00AM

Update: Fellow Fools, you can find an updated version of the "Making *Pro* Fit You" report here — for maximum usefulness and enjoyment, please use that version!

Dear Fellow Fool,

We manage the *Pro* portfolio using a wide range of tools — including long and short stock, option, and ETF strategies — to earn absolute returns with low volatility. But we know no two members have identical investment situations, and that means not all members will have access to every portfolio strategy. That's where this report comes in. Its purpose is to help you find the best way to use *Pro* according to your individual situation.

We'll address four possible scenarios in detail. You may find that more than one applies to you:

- **Free-Range:** For members with free range to employ all the same tools as *Pro*.
- **IRA:** For members building a portfolio in an IRA account.
- **No Complex Options:** For members who lack broker permission to execute complex options strategies.
- **Old Fool, New to *Pro* / Fully Invested:** For members joining *Pro* from another Fool service or members who are already fully invested.

Whatever your situation, we recommend all members first read the "Free-Range" section. Bring any questions to our discussion boards, and Fool on!

Alex Pape (TMFPapester)

Free-Range

So you're new to Pro *and able to follow every* Pro *portfolio move to a T? Here's what to do. (Again, we recommend you read this section even if you are not entirely "free-range.")*

As You Get Up to Speed
Match our portfolio positions and allocations, starting with the Buy First and Buy positions — and do so gradually. Build these positions over the course of a couple of months. If you're comfortable with options, you can consider writing puts to try to buy some of our Buy stocks cheaper. Post on the discussion boards to get the community's feedback about any trades before you make them, if you like. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Once You've Settled In
Once you've built your Buy First and Buy positions, all you need to do is wait for further trade alerts from the team. Remember, though, that trade alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — another gradual step toward shaping the portfolio we want. You may decide to modify the strategy we choose for a trade; for example, you may wish to write puts instead of buying a stock outright. If you choose to deviate from our recommendation, make sure you (a) understand why we chose the strategy we did and (b) have a reason that the modified strategy better fits your portfolio.

Your *Pro* Perspective
The most important thing to remember is that *Pro* is a portfolio service, not a collection of investment ideas. All of our positions exist in the context of our portfolio; if you elect to pick and choose *Pro* investments, it is critical that you understand how they fit into your portfolio. Our trades are intended to integrate with existing positions.

IRA

IRAs are tax-deferred accounts that usually prohibit shorting and all but the simplest of options strategies.

As You Get Up to Speed
Gradually move into our Buy First and Buy stocks, building your positions over several months. Most IRAs don't allow put writing, so you should simply purchase shares of these positions over time. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Once You've Settled In
You can follow our simple stock-buying trade alerts directly. Most IRAs allow you to write covered calls, so you can also follow those trade alerts directly. Other options trades may not be possible in an IRA. In that case, check the trade alert for a list of alternate trades; for example, when we write puts to try to buy shares of Stock X more cheaply, you might be able to simply buy shares of Stock X. (If there are no alternate trades, we'll say so.) As for shorting, some inverse ETFs can be purchased in IRAs (purchasing an inverse of something is similar to shorting that thing). As with options, we'll mention these alternatives in the trade alerts if they exist and we approve of them.

Your *Pro* Perspective
IRAs are tax-deferred accounts, so they're great for income-generating strategies like covered calls, high-yield dividend stocks, and ETFs with large taxable distributions. They do have limitations, though, and you may find that the inability to follow all of our recommendations leaves a hole in your portfolio. If that's the case, you may be able to fill the gap with additional income-generating strategies — for example, by writing covered calls on *Pro* stocks you'd be willing to sell at your strike price.

However, their tax-deferred status means that IRAs are not great for high-risk, high-reward trades — losses in an IRA cannot be used to reduce the taxes on other gains. And because IRAs do not allow the use of margin or shorting, you will likely find it difficult to follow along with most of our hedging strategies using only an IRA account. If that's the case for you, we recommend keeping an eye on both your cash balance and *Pro*'s hedging strategies. When the *Pro* portfolio adds hedges, increase your cash balance; when we pull hedges off, reduce your cash balance by investing more in our Buy and Buy First Stocks. Consider opening a separate non-IRA account if possible. You can then manage both your IRA and non-IRA accounts as a single portfolio, with income-focused and shorter-term strategies in the IRA and more complex, speculative, and short trades in the second account.

No Complex Options

You need permission from your broker to undertake complex options strategies, which not all members have upon joining. Here's what to do in the meantime.

As You Get Up to Speed
Follow along with our "Free-Range" instructions for getting up to speed — match our portfolio positions and allocations, starting with the Buy First and Buy positions. Make sure you do so gradually; build these positions over the course of a couple of months. If you're comfortable with options, you can consider writing puts to try to buy some of our Buy stocks cheaper. Post on the discussion boards to get the community's feedback about any trades before you make them, if you like. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Once You've Settled In
You can follow most of our trade alerts directly — except, obviously, those involving complex options strategies. In those cases, there's often a simpler alternative, such as writing puts, writing covered calls, or buying or shorting a stock or ETF directly. We outline possible alternatives in every trade alert. If we issue a trade alert using an income-generating strategy you're unable to employ and there are no workable alternatives, consider using the strategies you do have at your disposal to generate income elsewhere in your portfolio.

Your *Pro* Perspective
First of all, you should continue to request higher options permissions from your broker every couple of months until they are granted. Account size is one factor brokers consider when making this decision, so to up your odds of success, consider consolidating accounts or moving funds to the account in which you wish to trade options.

In the meantime, don't lose sight of the big picture; remember that we're building a portfolio. If you can't make a particular options trade, you may be able to make an alternate trade or you may need to sit that trade out — either way, it's no big deal. That said, you'll want to pay particular attention to any trade alert in which we use options for hedging purposes (for example, a synthetic short or a ratio put spread on an ETF or an index). Trades like these are important to our integrated portfolio, so don't ignore them. If alternatives are available, we'll outline them. If not, you may want to take action elsewhere in your portfolio to meet similar goals. As always, hit the discussion boards with questions about any particular situation.

Old Fool, New to *Pro* / Fully Invested

Members joining Pro *from another Fool service and those who are already fully invested will need to consider changes to both their portfolios and their mindsets.*

As You Get Up to Speed
If you're already fully invested, you'll need to sell existing positions to add *Pro* picks. We recommend that you do this gradually and deliberately.

- List your existing positions in order from your highest-conviction holding to your lowest-conviction holding.
- If you own stocks from another Fool service, you can use that service's guidance on those stocks in building your list.
- If you don't know why you own a stock, that's a good reason to sell it.
- Be mindful of your sector and geographic allocations. You don't want to unintentionally end up owning nothing but oil or European stocks just because they were your favorites.
- If you're struggling with what to sell, post to the discussion boards — the *Pro* team can't give you individual advice, but our community members can and frequently do.
- When you're ready, incrementally sell your lowest-conviction stocks and use the proceeds to move into our Buy First and Buy stocks. Wait for us to issue new guidance before you establish positions in our stocks on hold, our options strategies, and our short positions.

Once You've Settled In
Follow the "Free-Range" instructions for this step — once you've built your Buy First and Buy positions, all you need to do is wait for further trade alerts from the team. Remember, though, that trade alerts don't mean "Act on this immediately!" Rather, each trade alert is part of a holistic strategy — one gradual step toward shaping the portfolio we want. You may decide to modify the strategy we choose for a trade; for example, you may wish to write puts instead of buying a stock outright. If you choose to deviate from our recommendation, make sure you (a) understand why we chose the strategy we did and (b) have a reason that the modified strategy better fits your portfolio.

Your *Pro* Perspective
If you're joining us from another Fool service, it is critical that you understand the differences between *Pro* and some other Fool services. At *Pro*, we are building a portfolio, not offering investment ideas. *Stock Advisor* and *Rule Breakers*, for example, offer stock ideas from which members can pick and choose. In contrast, *Pro*'s trades are intended to be integrated building blocks of an overall portfolio. We cannot emphasize this enough: Anytime you decide to deviate from the *Pro* portfolio, make sure you understand how the trade in question is intended to fit with our portfolio — and how the modified trade will fit with yours. With every trade, keep the portfolio context in mind.

Charter and 2011 Portfolios: Close Your Bull Call Spread on VXX

Published Oct 12, 2011 at 12:00AM

Trade Essentials

- **Actions:** Sell to close your Oct. 22, 2011, $51 calls and buy to close your Oct. 22, 2011, $56 calls on the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) ETN
- **When:** Close by the end of the day on Oct. 22 at the latest
- **Limit Price:** Initially aim for a credit of $0.60 or higher. As expiration nears, you'll receive a lower credit to close the spread (unless VXX rises).
- **Why Close?**

- Our bull call spread expires Oct. 22.
- We opened this position to hedge our short on VXX; that short was recently closed.
- As we build our short position in the **SPDR S&P 500** (NYSEMKT: SPY) ETF, we no longer need this spread, and it's expiring soon anyway.

What's Changed?

We set up this bull call spread on Sept. 26 as a hedge on our large position in iPath S&P 500 VIX Short-Term Futures. Three days later, our broker told us our short of VXX (via naked calls) had been exercised and would be closed within a few days because of a lack of shares available for shorting. We opted to close the position ourselves and reassess our approach; we're now investigating ways to set up a new bearish position on VXX in a simpler, lower-risk way that all members can follow if they like.

We initially kept this VXX bull call spread in place even after we closed our VXX position, as a hedge against a falling market. But as we noted last week, we're consolidating our shorts and hedges into one main position in the SPDR S&P 500 ETF, so we have less need for this other market hedge. Thus, we're closing this spread to concentrate on our SPY position and because we're no longer short the underlying VXX. (If you are currently short VXX and want to continue hedging that position, you can keep the spread open.)

How to Follow Along

To close this position:

- Sell to close the Oct. 22, 2011, $51 calls
- Buy to close the Oct. 22, 2011, $56 calls
- Use a spread order

Based on current prices, you'll recoup about $0.60 of the $1.40 or so you paid to set up the spread — nearly half the cost. If you're still short VXX and wish to keep this hedge in place, you don't need to take any action; just realize that as expiration nears on Oct. 22, with VXX at less than $51, the spread is currently positioned to end without value.

The *Pro* Bottom Line

After four successful positions, our fifth short on VXX turned into the most difficult position in *Pro*'s history. The short was closed at a loss, and this late-to-the-party hedge on it is at a loss, too. Data suggests that only a minority of *Pro* members follow our trades on VXX, but of course, the most recent loss has been painful for those who do. Given the high probability for success over long periods of time, we plan to continue taking positions on VXX in the future. We've learned from recent events, though: With future VXX trades, we'll cap our risk each time, lower our volatility in the position, and make sure all members are ready to keep the position for a long-term outcome that should be favorable.

To discuss closing this spread by Oct. 22, please visit the VXX discussion board.

Jeff is short iPath S&P 500 VIX Short-Term Futures.

Charter and 2011 Portfolios: Close Your Synthetic Short on EWP

Published Oct 12, 2011 at 12:00AM

Trade Essentials

- **Actions:** Sell to close your Oct. 22, 2011, $30 puts and buy to close your Oct. 22, 2011, $34 calls on the **iShares MSCI Spain Index** (NYSEMKT: EWP). (You can do this with a single spread order.)
- **When:** Close by the end of the day on Oct. 22 at the latest.
- **Limit Price:** Initially aim for a debit of around $1 or lower. As expiration nears, the debit should lessen, assuming the index doesn't rise above $35. If it does, it will cost more to close the position.
- **Why Close?**
  - Our synthetic short expires Oct. 22.
  - The options are even more expensive than before, so rather than roll this position forward, we're closing it in favor of the larger hedge in the **SPDR S&P 500** (NYSEMKT: SPY) ETF we announced last week.

What's Changed?

When we set up a synthetic short on the iShares MSCI Spain Index in early September, we wrote, "Europe is the biggest black box in our investing world right now." Nothing much has changed since then on that front: Europe has continued to promise solutions to its financial crisis while kicking the "reveal date" for those solutions further into the future; Belgium's second-largest bank, Dexia, was just bailed out by France and Belgium in the first sign that the crisis has crept into the heart of Europe's stronger countries; and Greece did not meet the provisions of its austerity plan, nor is it expected to meet them in the future without still deeper cuts.

Still, the latest word is that Greece should receive its next small bailout tranche in early November, and investors are also hoping that Germany and France (unlikely co-conspirators, to say the least) will make good on their promise to propose a comprehensive solution to the entire crisis by the end of this month.

These hopes have led the market to its largest rally since March 2009. Nobody knows whether this is just the other side of downside volatility or the beginning of a true market recovery, and the stakes remain high. As we noted last week, we're consolidating our shorts and hedges into one main position in the SPDR S&P 500 ETF. We're building that position bit by bit, aiming for a 30% allocation (hedging 30% of our invested capital). With that hedge, we don't need to continue expensive option trades on the Spain index, so we'll close this synthetic short before it expires Oct. 22.

How to Follow Along

Shares of EWP are currently trading at about $34.30, but the October $34 calls ask $1.55, so they're carrying more than $1.25 in time value. Acting now is akin to paying $35.55 to close the calls. While that's not terrible, we will let a bit more time pass (and a bit more time value dissipate) before we take action. That strategy is not without some risk; if the index rises to more than $35.55 before expiration, it'll be more expensive to close our position. On the other hand, if the index dips below $34 by expiration, we'll be able to close the calls for very little (or simply let them expire).

Either way, we'll wait in hopes of a better price. If you'd rather close now, aim to close both legs of the synthetic short for around a $1 debit total. Alternatively, you could wait to close the calls but sell to close the puts you own to recoup some capital (if it's worth it after commissions). The index is unlikely to fall below $30 again by Oct. 22, although if the European credit crisis flares up, anything is possible.

To close both sides of the spread simultaneously:

- Buy to close the calls you wrote
- Sell to close the puts you purchased
- Use a spread order with a net debit limit price

The *Pro* Bottom Line

This synthetic short was like a delicious but small Spanish tapa: It was tasty at the start, but it didn't last long. The position was profitable for a while, but the market's sudden ascent removed the profit and turned it into a small loss. Rather than roll the strategy forward and pay a premium for put options again, we're focusing our hedging efforts on shorting the SPDR S&P index directly. This is another step toward focusing on a single major hedge in the *Pro* portfolio, something we think should help simplify the service for members while meeting our hedging objective.

Where Our Portfolio Is Headed

Published Oct 10, 2011 at 12:00AM

Pro Trade Roundup

Charter Portfolio

- Sold all shares of **ProShares Short S&P 500** at $45.22.
- Sold short 2,000 shares of **S&P 500 Depository Receipts** at $116.14 (10% of 30% target).

Portfolio 2011

- Sold all shares of **ProShares Short S&P 500** at $45.24.
- Set up a protective collar on **AmTrust Financial Services**, writing four March 2012 $25 calls and buying four March 2012 $20 puts, for a net debit of $1.
- Sold short 170 shares of **S&P 500 Depository Receipts** at $116.12 (10% of 30% target).

If you're a new *Pro* member, you could be forgiven for wondering whether our recent flurry of trading activity — 15 recommendations since the beginning of September — is the norm around here. But as longtime *Pro* Fools can testify, the past couple of months have been anomalous in more ways than one. We've been trading much more actively than usual in recent weeks as we work toward a portfolio that's focused, balanced, and perhaps most importantly, largely macro-agnostic for now.

At the moment, there are only two possible economic futures as far as the market is concerned: Either Greece will default or it won't. If it does, that default may or may not result in a debt and credit crisis across Europe. In response, Europe will or will not slip into a recession, and the United States will or will not do the same. We'll probably know the outcome of it all within six months — but in the meantime, the market is as jittery as a martini shaker on a Friday night. Keep in mind that the news could be nothing but positive at every turn, which would actually send stocks higher. But if the worst comes to light, the consequences for investors are bound to be significant.

In positioning the *Pro* portfolio to respond to all this, we're conscious of the binary nature of the potential outcomes. We want to maintain strong upside exposure because we believe resolutions will (eventually!) be found to today's sizable economic problems. But we also want to be hedged to a meaningful degree (and flexible with our hedges) because Europe's woes could spread and a recession could set in at home and abroad. Finally, we want to maintain a cash balance to take advantage of new opportunities.

Last but not least, we know we can't outmaneuver the market day to day or month to month. Nobody can. Smart people don't even try. Instead, we're positioning our portfolio to survive and thrive during an unpredictable economy, whatever the market does.

Balance and Flexibility

We're working toward the following allocations, which we think will serve us well at least until we have some true resolution in Europe:

Strategy (Investment)	Allocation	Positions and Process
Bullish (Stocks, Options, ETFs)	80% to 90%	We always aim to build 3% to 5% positions in strong companies with reliable revenue that are trading at attractive prices. We'll sell companies in which we already own smaller allocations if we find we don't want to add to them, and we'll protect large positions if we think it's warranted (as we did with our recent protective collar on **AmTrust Financial**.
Bearish (Index Hedges)	30%	As our other short positions expire or are closed over the course of October, we'll build to our recommended 30% short in **SPDR S&P 500**. With just one main short position, we can easily increase or decrease our allocation as the economic outlook becomes clearer. We'll also keep our ratio put spread on the **PowerShares QQQ Trust** to hedge our bullish tech holdings.
Cash	10% to 20%	We'll aim to keep 10% to 20% of the portfolio in cash for new opportunities and to employ options.

We definitely remain bullish over the next three years and beyond, and the stocks we own — superior companies with strong potential, purchased at attractive prices — represent that long-term view. But we also know it could get worse before it gets better. By maintaining hedges and cash, we'll be better able to ride out (and even see some profits from) the falling market a new economic crisis would bring. With our portfolio 30% hedged and some cash on the side, we can sidestep some (though not all) of any potential downside, and with most of our money invested in stocks, we won't miss out on upside.

To prepare for better days whenever they arrive, we've been selling some stocks that we believe have modest upside potential (for example, **GlaxoSmithKline and NextEra Energy**) to buy beaten-down stocks (such as **Autodesk** and **BMC Software**) that may be volatile for a while but offer higher potential profit when the market finds its feet again. We're also keen to sell small positions to which we don't want to commit more capital; this will allow us to give more attention (and more capital, in some cases) to the positions we like best for the long haul.

Managing, Not Trading

When a *Pro* trade alert hits your inbox, remember: Despite the name, we're not "trading" a position in isolation. We're managing a portfolio, and that means each move is made in the context of every other position. In other words, a trade alert doesn't mean "we must leap on this single idea right now!" It means "here's another step along the way as we continually work toward a balanced portfolio we like." Especially in a market this volatile, it's important to move incrementally.

We know many members pick and choose ideas from our recommendations rather than mirroring the portfolio to a T. This really upsets our senior analyst, Nick Crow, but if you're determined to go rogue, Nick will forgive you on one condition: Before you go your own way, you must promise to make sure you understand the full context behind each position we announce. That means understanding how a trade fits into our portfolio and how it may — or may not — fit into yours. We'll do what we can to help spare you Nick's wrath by writing more about our portfolio in future trade alerts.

Positions to Add

Upcoming Earnings

- **Oct. 17: Wells Fargo**
- **Oct. 18: Intel**
- **Oct. 19: Covanta**

The current stock market is literally among the most volatile in history, and it isn't reacting to the usual stimuli (business results). Instead, its current moves have been in reaction to politics — largely European politics. Given all this, very few investors are in their comfort zones right now, but choppy waters create opportunities for long-term-minded Fools like us. If you're still building your portfolio, there's no shortage of interesting opportunities on our Buy list.

Tupperware is back to a Buy based on price. With its stock down 27% since July, you'd think the company was a European bank rather than a purveyor of little plastic containers that are enjoying strong growth in emerging markets. Tupperware can do well in weak economies if it plays its cards right; such economies offer more customers (more people eating at home and storing leftovers) and better employees (a brighter and more eager employment pool of potential sales reps). Tupperware is a good buy today, but realize that in this environment, even a 50-year-old household name is volatile.

Trash-to-energy leader **Covanta** is down about 18% since we bought shares, even though it has almost no exposure to Europe and enjoys long-term revenue contracts in the U.S. This entrenched business has a $2 billion market cap and about $275 million in free cash flow expected this year, and you can buy shares at a cheap 7.2 times expected free cash flow — a 14% free cash flow yield. I'm willing to bet Covanta is buying its own shares at these prices, given its aggressive buyback program.

Specialty chemicals and lithium producer **Rockwood Holdings** has been shellacked on fears about Europe, where 54% of its 2010 net sales were generated. Rockwood has enjoyed tremendous industry- and company-specific strength since we bought shares early this year, but with the euro losing value, earnings growth may slow when overseas sales are converted back to dollars — even if Europe's woes don't get worse. Even so, it's hard not to like Rockwood at today's prices if you have a time frame of longer than a year. The stock should be a strong performer once the euro-dust settles.

Elsewhere in the portfolio, **Pebblebrook Hotel Trust** is a value, too. Our favorite REIT already yields 3.3% (and that number is due to grow), and it's priced at less than the replacement cost of its upscale urban hotels. European politicians do have their hands full these days, so perhaps they aren't traveling to swanky American hotels as often lately, but business was still very healthy at Pebblebrook last quarter. BMC Software, **OpenText**, and **L-3 Communications** are also cheap on a cash-flow basis.

Next Week's Memo

In our Monday Memo for Oct. 17, we'll look at what happened with our **iPath S&P 500 Short-Term VIX Futures** position, what we learned, and how we'll recover. In the meantime, join the conversation on our VXX discussion board or add your wisdom to the VXX wiki page.

As we shape our portfolio, we have two main considerations in mind: Stocks look like good values right now, but there's also the potential for a credit crisis and recession close ahead. We recommend buying good stocks cheaply while steadily inflating your hedges; do those things with us, and together we'll get through whatever rapids are around the next bend in the economic river. To discuss Mr. Market's wild ride or this Memo, visit the Memo Musings board.

Foolishly,

Jeff Fischer (TMFFischer)

Jeff owns shares of Autodesk, GlaxoSmithKline, Rockwood Holdings, and Tupperware Brands. He is short iPath S&P 500 VIX Short-Term Futures and has options on BMC Software.

Charter and 2011 Portfolios: Set Up a Protective Collar on AmTrust Financial

Published Oct 4, 2011 at 12:00AM

Trade Essentials

First Things First

- **Company: AmTrust Financial Services** (NASDAQ: AFSI)
- **Recent price:** $22
- **Market cap:** $1.3 billion
- **Website:** www.amtrustgroup.com
- **Type of holding:** Financials, small cap, core
- **Strategy:** Protective collar (capping our downside at $20, minus the cost to set up the collar)
- **Follow it:** Add to My Scorecard

- **Action**: Set up a protective collar on your existing shares of **AmTrust Financial** (NASDAQ: AFSI).
  - Buy to open March 2012 $20 puts
  - Sell to open March 2012 $25 calls
- **Allocation**: Purchase one put and write one call for every 100 shares of AmTrust you own
- **Option prices (bid/ask)**:
  - March 2012 $20 puts: $1.05/$1.85
  - March 2012 $25 calls: $0.55/$1.25
- **Limit order guidance:** Your broker may allow you to enter this order as one transaction. Aim to split the bid/ask prices on each option for a net debit (cost) of $0.55. As prices change, try to set up your protective collar for $1 or less.
- **Alternative trade**:
  - If you don't want to cap your upside, just purchase the March 2012 $20 puts.
  - If you're less inclined to protect against financial Armageddon, you can leave your AmTrust position alone.
- **Why Set Up This Protective Collar?**
  - If there's another economic crisis, investors are likely to throw out all stocks in the financial sector — babies and bathwater alike.
  - This strategy will limit our downside to protect our gains.
  - We don't see a near-term catalyst that would cause shares to jump beyond the written call strike price of $25 (15% higher than they are now).

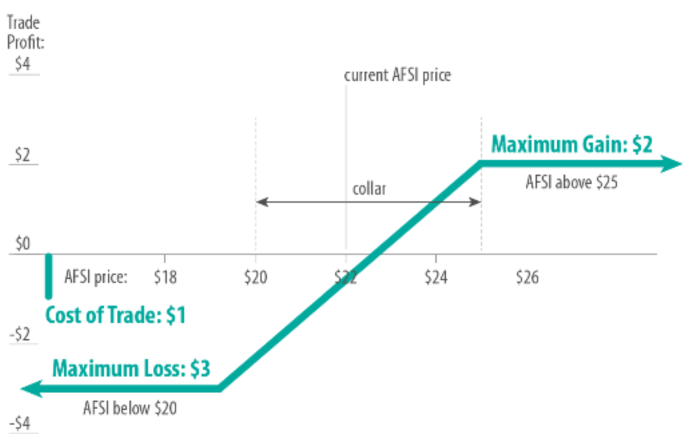
What's New?

Face it, Fools: We don't live in a vacuum. We don't invest in one, either, and worries about Europe's debt woes are beginning to spread to the market at large — first and foremost to the companies in the financial sector who may be holding those debts. If the dominoes in that sector start to fall, we could see a broad-based sell-off of anything that has even the slightest hint of financial stink. (For the details of our macro thinking, please read this recent trade alert.) The talking heads call this phenomenon "contagion," but we call it "sell and ask questions later." That means even AmTrust Financial Services — our obscure, healthy, growing warranty and workers' compensation insurer — could get shellacked without regard for its positive business attributes.

Why This Strategy?

Think of this protective collar as a six-month insurance policy to protect our largest stock position against massive distress in the financial sector. It actually has very little to do with AmTrust specifically, aside from the fact that the company operates in the financial sector. The *Pro* portfolio has already enjoyed triple-digit gains from AmTrust, and we see more in the future; we're simply acknowledging the reality that the company will likely not be spared from a broad-based sell-off of financials if it comes. It also risks being the victim of investors looking to raise cash in the face of margin calls — long-term winners like AmTrust may be the first thing such investors sell.

To protect our downside, we're buying March 2012 $20 puts, which will cap our loss if AmTrust drops below that strike price. To defray the cost of buying these put options, we're also writing March 2012 $25 call options. We're not crazy about limiting our upside (we still think AmTrust is a Buy worth $28 per share), but the lack of a near-term catalyst, the litany of macroeconomic headwinds, and the ability to adjust our covered calls if needed all combine to make us feel better. The graphic below outlines the possible results of this collar at expiration in March 2012. It assumes the collar costs us $1 to establish and uses a current share AFSI price of $22. This collar means that we will profit as our AFSI shares rise up to $25 (at which point our gains stop); our losses are capped if the shares fall beyond $20 (about 10% lower than today's price).



How to Follow Along

Next Steps

- Questions or comments? Bring them to the AmTrust discussion board.
- Afraid your collar is wrinkled or yellowed? Head over to the All About Options discussion board.

Many brokers will allow you to place this trade as one order. The options parlance is "protective collar," but it may simply be entered as any two-legged order. For every 100 shares of AmTrust Financial you own, purchase ("buy to open") one March 2012 $20 put and write ("sell to open") one March 2012 $25 call. Assess the bid/ask spread of each option and set up the collar for the lowest price possible. At current prices, you could be able to do so for a net cost of about $0.55; as prices change, that cost may rise to $1 or higher.

If AmTrust powers through the pressures on the financial sector and continues to march ever higher, we'll look to buy back our written calls or to roll them up and/or out as expiration nears. We like AmTrust and its strong business, and barring unforeseen developments, we want to own it for years to come.

If you don't already own shares of AmTrust, the near future may bring you the chance to buy shares of a super company at an even better price. Make sure you've got cash on hand, and if AmTrust is tossed aside with its catastrophe-prone financial brethren ... be greedy.

Jeff owns shares of AmTrust.

Trade Adjustment: iShares Russell 2000; Pro's Latest Short Strategy

Published Oct 4, 2011 at 12:00AM

Hey, *Pro* Fool! Is This Trade for You?

What we're doing:

- Last month, *Pro* recommended shorting shares of the **iShares Russell 2000** (NYSEMKT: IWM) ETF. Because our broker lacked shares, we were unable to short this ETF in the *Pro* portfolio, and thus we're adjusting our trade at the end of our 30-day trade window.
- We now intend to short a different index, the well-known **SPDR S&P 500** (NYSEMKT: SPY) ETF, instead. *Please note that we're also increasing the allocation to this short position from 10% to 30%.*
- We're selling our shares of the inverse **ProShares Short S&P 500** (NYSEMKT: SH) ETF because we prefer to short SPY.

How this affects you:

- If you are 10% short IWM after last month's alert, keep that position and short 20% in SPY to add to it.
- If you follow *Pro* to the letter, close IWM and the SH inverse ETF and establish a 30% short position in SPY.
- If you can't short directly, or don't want to, direct the same allocation (30%) to the SH inverse ETF.

The bottom line:

- We want our portfolio to be 30% short. Use whatever combination of SPY, IWM, RWM, and/or SH suits you.
- The market is volatile, so you may want to move into this position incrementally. *Pro* may short three 10% positions over the next month.

Trade Essentials

- **Actions:**
  - Sell existing shares of SH
  - Sell short SPY
- **Allocation:** Short (or hedge) 30% of your invested portfolio value (excluding cash) in SPY
- **Recent SH price:** $48
- **Recent SPY price:** $110
- **Sell SH around:** Market price; use a limit order
- **Short SPY around:** $107 or higher
- **Why Short SPY?**
  - If Europe's current debt woes are not resolved, markets could face another credit crisis.
  - This could contribute to another recession, and this time governments may have fewer options for recourse.
  - The stakes are too high not to continue to hedge a significant part of the portfolio.

What's Changed?

We want to make sure the *Pro* portfolio is invested only in positions in which we have high confidence. We also want the portfolio to be at least 30% hedged. To add to our short positions, we recommended shorting shares of the iShares Russell 2000 ETF last month, but our broker couldn't fulfill our order. This alternative trade will serve a similar purpose in our portfolio via the most basic hedge out there: shorting the SPDR S&P 500 ETF directly. Our broker, Schwab, assures us that there are plenty of shares of SPY available for everyone, and there's no fee to short. (Bravo.) In short (sorry), we will be shorting the world's major stock market index to the tune of 30% of our portfolio's value over the next month.

If you've been following our earlier recommendations (and were able to execute them all), you should already have the following positions:

- 10% short in IWM
- At least 5% in SH
- 7.5% short in the **iShares MSCI Spain** (NYSEMKT: EWP) ETF
- A ratio put spread on **PowerShares QQQ Trust** (NASDAQ: QQQ)

That adds up to more than 30% short, but *Pro* wasn't able to execute the IWM trade, the Spain position expires this month, and the QQQ position is relatively small on an absolute basis. Excluding the latter two, we still want to be 30% short in the major indexes, so we're shorting 30% in SPY for two reasons: It's simpler to have one big short position, and our broker claims to be able to fulfill this one.

To understand why we're still recommending a large short position, you need to consider both the macroeconomic environment and the *Pro* portfolio in general.

The Big Picture

Shorting 101

- When you sell short, you borrow shares from a broker and immediately sell them, collecting the proceeds. You hope to later buy the shares back (returning them) at a lower price. If so, you pocket the difference as your profit. If the price rises, you'll have to buy back at a higher price, resulting in a loss.
- When you short something that pays a dividend, you need to pay the dividend. SPY pays approximately 0.5% every quarter.
- You must have a margin account to sell short. However, if the market rises, the rest of your portfolio should be rising, largely negating your short position. And if the market falls, you make money on your short — meaning the margin shouldn't be an issue either way on an appropriately sized position.
- To open the position, the command is usually "sell to open" or "sell short." To later close it, it will be "buy to close" or "buy to cover."
- For more, check out the *Pro* Guide to Shorting.

The stakes are high for financial markets right now, and the potential outcome is binary. Either Europe will get its sovereign debt problems in order, or the situation will worsen across the continent. If Greece defaults in an orderly fashion, which appears all too likely, the repercussions may be felt around the world in ways we can't estimate. Portugal's debt problem may resurface next, just as banks are trying to grapple with the Greek fallout.

These are big, sweeping problems. The only way out is for the Eurozone's 17-nation governing body to find a big, sweeping solution — and unfortunately, the odds seem stacked against it. So far, the prevailing solution has been to kick the debt can down the road with more loans and to impose strict austerity measures on afflicted countries so they decrease spending. However, this causes the economic output of those countries to shrink even more, exacerbating the debt problem further and causing social unrest to boot. If the Eurozone doesn't get its financial house in order, a recession there could spread to the United States.

Speaking of these fair shores, the U.S. government is grappling with similar debt and deficit issues. Twenty years ago, politicians were talking about the need for the federal government to have a balanced budget by 2010, when the Baby Boomers would start to retire en masse and thus drain federal resources — but the warnings were ignored, and now the situation is even worse. Around the developed world, governments including our own are strapped with record debt, large deficits, and fewer prospects for strong economic growth, just as the largest part of the population starts to retire.

This is a demographic challenge we've talked about in *Pro* since early in our service's history, and it suggests enough potential for economic hardship that we should be keeping shorts in place most or all of the time. There's no question governments need to become financially healthier, but austerity measures shrink the economy rather than grow it, and that results in less federal revenue. This may qualify as the mother of all Catch-22s.

Meanwhile, should another recession arise, there may be few official options left. The U.S. government has already thrown some $2 trillion in stimulus money at the economy and has lowered interest rates as much as possible; the national debt is at record levels, and both the public and politicians are lax to keep spending. All that means a future recession may be harder to pull out of than the last one. The recession of 2008-09 ended with a feeble recovery even after a few trillion in new spending; today, home prices are barely stable, foreclosure rates remain high, and the average consumer still needs to get rid of debt. In an economy plagued by record borrowing, weakened conditions like these can take years to improve.

The Portfolio Picture

In the past, we've tried various ways of getting the *Pro* portfolio to 30% hedged. A few of those trades have proved difficult to execute for members, *Pro* itself, or both. Today's recommendation is meant to be simple for all *Pro* Fools (including ourselves) to carry out and follow.

With this trade, the *Pro* portfolio will finally be a bit more than 30% short, and upcoming planned trades should leave us with a bit more than 10% cash. Nonetheless, we'll remain about 80% to 90% long in stocks and will continue our search for worthy new positions on the cheap — meaning we'll enjoy plenty of upside should it arise. Finally, remember that when things look bleakest, stocks may be poised to perform the best they have in years (because everyone has already sold and valuations are too cheap). Are we at that point yet? Possibly not. But either way, we want to set our portfolio up to hedge a macro-driven decline, allow our selectively chosen businesses to outperform, and keep a cash balance that lets us be opportunistic.

How to Follow Along

To sell short, you simply "sell to open" the shares of the ticker you're shorting (SPY). Short the equivalent of 30% of your portfolio (so if your portfolio is worth $100,000, short $30,000 worth of SPY). But note: *Given the extreme volatility of the market, and the size of this position, you may want to short in two or three increments over a number of days or weeks. We plan to do this in* Pro *over our 30-day trade window.* If you already have other short positions on indexes, you can keep them open and short enough SPY to reach 30%. (For example, if you shorted 10% in IWM as we suggested a month ago, you can keep that position open and only short 20% in SPY.) Again, the idea is to be 30% short on market indexes.

To consolidate our short positions and raise cash, we will also be selling our shares of ProShares Short S&P 500 ETF and shorting SPY instead. If you can't or don't want to short directly (for instance, you're investing in an IRA), you can keep your shares of SH instead — to mirror our thinking, add to them incrementally to increase your allocation to 30%.

To follow along:

- Sell your existing shares of ProShares Short S&P 500
- Sell short shares of SPY instead at a 30% allocation (consider doing so in increments over time)
  - If you can't sell short or don't wish to use margin (which shorting requires), just keep your shares of ProShares Short S&P 500; add to them if you wish to match our allocation
- If you're already short iShares Russell 2000 (or own the inverse RWM ETF), you can keep that short and build your short allocation to 30% by shorting 20% in SPY. You can also close your IWM short and just short all 30% in SPY; it's up to you how precisely you want to mirror the *Pro* portfolio.

Basically, hedge your long portfolio by shorting indexes to the tune of 30% of your portfolio's value. You can reach this allocation through any combination of SPY, IWM, SH, or RWM.

What Will Make Us Close?

If Greece's problems are truly resolved (not just kicked down the road six more months) and the economic outlook improves, or if SPY gains more than 7% to 10% from our short price, we may exit this position. We may also exit incrementally if the environment suggests we can start to take on more risk.

Talk about these trades on our new SPDR S&P 500 discussion board. We'd also like to know whether this report was helpful to you, and if there's anything else you'd like to see in our reports. Let us know on the Member Suggestions & Help discussion board.

Find Your Portfolio in the Marble

Published Oct 3, 2011 at 12:00AM

Dear Fellow Fools,

What are your investing goals? There's no right or wrong answer to that question, but you should have *an* answer. After all, if you don't know where you're going, you might end up somewhere else.

New: The *Pro* Wiki

We've created a wiki for *Motley Fool Pro*! It's editable by members, and we hope it serves as a useful repository of ideas and information. Click here to check it out and add your contributions!

Purely to provoke thought, consider the goals of First Eagle Investment Management:

1. Avoid permanent impairment of capital.
2. Grow the real purchasing power of the fund over the long term.

If that leaves you thinking the First Eagle fund managers must be conservative, risk-averse, and even stodgy, you'd be right. But check out their track record — their bellwether **Global Fund** (SGENX) fund has averaged a remarkably steady 12.4% annual return for the past 41 years. That includes 12.5% annual returns for the past decade, during which time the S&P 500 rose a scant 2.4% per year.

If you also thought those two goals sound close to ours here at *Pro*, you'd be right again. Our mission — to earn you consistent, recurring profits with high accuracy and low overall risk — is similar to that of First Eagle. That's why Bryan Hinmon (TMF42) and I seized the opportunity to hear Matthew McLennan, portfolio manager of the First Eagle Global Fund, speak in Washington, D.C., last week. In his prepared remarks and his answers to our questions, McLennan waxed eloquent on First Eagle's goals, investment philosophy, and road map.

Keep It Simple

Investing in line with First Eagle's two goals is quite simple. The fund managers pay attention to what's going on in the world to avoid losing money on foreseeable risks, then try to deploy money to investments that will appreciate more quickly than inflation.

First Eagle uses a wide lens when deploying capital. All possibilities are on the table: Businesses around the globe, commodities, real assets like quarries and timberlands, and of course cash. I always think of cash as an active investment (not the passive absence of investment); McLennan, who calls cash "an option on deployment and distress," would likely agree.

Against this vast backdrop of investment possibilities, First Eagle rarely trades. This dichotomy of possibilities and actions reminds us how simple good investing can be: Look at lots of stuff, form opinions on some of that stuff, and then buy only the stuff you really, really like when the price is right.

The Least-Worst Option

Another benefit of the wide-lens approach is that it keeps you actively comparing alternatives. Is South American timberland more attractive than Australian coal mines? Is Malaysian farmland more attractive than Italian debt? When you start asking questions like this — and your first goal is to avoid permanent loss of money — you start using phrases like "the least-worst option."

The least-worst option for your money, according to McLennan, is (drum roll, please) *businesses*. We agree — after all, take a look at *our* portfolio. When your primary goal is to not lose money, investing in dynamic, living organizations, capable of adaptation and susceptible to thoughtful analysis and nuanced opinions, is a strong choice.

Is There a Portfolio in Here?

More than 16,000 public companies trade on U.S. exchanges. At *Pro*, we generally want to own about 20. (That's why we smile when we read the occasional "Why don't we own shares of Patty's Circus Snacks ? It looks cheap!!!" post on our boards.)

We don't need to have many opinions, just a few high-conviction ones. Our challenge isn't to recognize when we like something — it is getting through as many possibilities as we can. The more quickly we identify unattractive investments as such, the better. As McLennan put it, building a portfolio is like starting with a block of marble and chipping off all the pieces you don't like. The goal is to let the statue emerge from within.

Simple, Not Easy

This perspective on investing inverts the problem as most people see it. Instead of building a portfolio from the ground up, it takes the opposite approach: Pretend you own everything, then decide what to sell. This hammers home the simplicity of good investing (keep the stuff you really, really like). But it's certainly not easy.

I encourage you to take a few minutes and run through this mental exercise. Pretend you own *everything* — the South American timberland, the Italian debt, and everything in between. What would be your first obvious sells? There are no parameters on this question — anything from individual stocks to entire asset classes are fair game. Which chunks of marble would you chip off first? Share your thoughts with us and the rest of the community on our Philosophy & Strategy board.

Oh, and if you really want us to buy shares of Patty's Circus Snacks, make a case for it on the boards. We haven't yet chipped the Carnival Cookery sector off of our portfolio's marble block — but we do require fleshed-out arguments before we make any investment.

Have a great week.

Foolishly,

Alex (TMFPapester)

Pro Trade Roundup

Charter Portfolio

- **GlaxoSmithKline**: Sold all shares at $42.20
- **Pebblebrook Hotel Trust**: Bought 400 shares at $15.08
- **iPath S&P 500 VIX Short Term Futures**: Set up a bull call spread: Bought to open 25 October 2011 $51 calls and sold to open 25 October 2011 $56 calls for a net debit of $1.60

Portfolio 2011

- **Pebblebrook Hotel Trust**: Bought 75 shares at $15.09
- **iPath S&P 500 VIX Short Term Futures**: Set up a bull call spread: Bought to open three October 2011 $51 calls and sold to open three October 2011 $56 calls, for a net debit of $1.60.

- Gambling or Speculating ?

{double-click to post your FAQ and answer here - or just ask a Q }

Target List

In the interest of keeping things moving, let's post a list of questions that we feel keep getting asked because members haven't been able to find the answer easily. Then anyone can come back and paste or contribute good answers later.

What do I do with my SA/RB/other positions when I join Pro?

This thread contains a wealth of information about how members work with recs from many different MF services.

And Alex Pape published this definitive guide on how to start to implement Pro recs.

I tried to follow the rec, but my broker said I don't have enough permissions.

What happens when/if my short calls are assigned?

How close to options expiry should I be expecting an update rec?

How do I navigate around these message boards?

What is time value / intrinsic value and how do I calculate it?

- **"Buy-Around" price**
  Q: Greenpeace11 asks:

  I am relatively new to Pro and was wondering about "Buy Around" suggested prices. Some of the technicals based newsletters and analysts suggest not to buy a stock until it has made a move up to a certain price point. Several of the Pro recommendations are currently trading at significantly lower prices than the "buy around" recommended prices. Do we wait to buy until they have moved up to the "buy around" prices or get in as low as possible? Thank you.

  A: TMFMoosie answers:
  Short answer: **buy as low as possible.**

  The technical services may see moving above a price point as a *catalyst* that will move the stock even higher.

  Pro primarily uses fundamental company analysis as the basis for the company's worth, and then setting a "buy around" comfortably *below* that point.

  Pro catalysts will vary, but will rarely, if ever, be divined by looking at a historical price chart. So, as long as the original thesis has not changed (and Pro will alert us if it does), lower prices are better.

  A: Addition by TMFMoosie: **Always use a limit order**. Set the limit at the most you're willing to pay,and then forget about it. The company recommendations at Pro are designed to be longer-term holdings. There's no rush.

- **Gambling V. Speculation**
  TMFFischer > *Far too many people treat the market like a casino even though the largest example of market success (Buffett) has always done anything but.*

  Q: *At what point are we assessing risks and probability and taking appropriate positions ? At what point are we just "Gambling" ? Is it like this:*

  - Odd 1 in 20 = Gambling
  - Odds 1 in 5 = Hedging
  - Odds 5 to 4 in favour = Investing ?

  A: spinningwood >

  - Gambling = What you call what you did, when it didn't work out and you lost big.

- Speculating = What you call what you did when you suddenly have a whole LOT more money than you used to have, at least until the speculating inevitably turns into gambling.
- Hedging = What you do until greed and boredom convince you to abandon the hedges so you can time the market. Many hedgers suffer from PHD (Post Hedge Depression) when their timing trade turns out to have been a gamble.
- Investing = You have more money than you used to have.... or will some day...or at least you hope that will be the case....

A: TMFCrowe > Knowing the probability of success is only one part of the equation. Rather than try to explain a concept you already know, I'd like to share one of my very favorite articles on investing. It's written by a professional handicapper. Here is an excerpt:

What you really want to do is determine which most-likely winners are good prices and which most-likely winners are bad prices. It is a very simple equation:

Price X Probability = Value

The entire world of investing is that simple too. Here is what I mean. If a horse has a 33 percent change of winning a race, and if you can get odds of 2-to-1 on him (which means tripling your money), there is no value - the horse is priced correctly. If a horse is 6-to-5 (which means you will only get back 120 percent of your bet) and he is only 33 percent to win, then he is a terrible bet. If you're going to get 4-to-1 (quintupling your money) on a 33 percent chance winner, then it's a great bet.

The majority of people who play horses refuse to think that way. They sometimes say that no horse is worth taking a short price on. That's just not true. If a horse is 90 percent to win a race and you're going to get a 50 percent ROI, then he is one of the greatest bets in history. They sometimes say that all long shots are over-bet and that you should never bet on a long shot. That's not true either. If a horse has a 10 percent chance of winning a race and he's 20-to-1, then you're getting double the value than you should.

You owe it to yourself to read the rest here: http://www.leggmason.com/thoughtleaderforum/2007/conference/...

A - Z of Options

American style: Options contracts that can be exercised at any time after purchase and before the expiration date.
See also: European style.

Assignment: When the options writer (also called the seller) is forced to buy (for a put writer) or sell (for a call writer) the underlying stock. Essentially, your counterparty has exercised its option contract, which you wrote, to buy or sell the underlying stock.
See also: counterparty, exercise.

At-the-money (ATM): An option whose underlying stock is trading at its strike price.
See also: deep in-the-money, far out-of-the-money, in-the-money, out-of-the money, strike.

Bearish: An options strategy (and outlook) that achieves its maximum payoff when the underlying stock drops in price. For example, if you are bearish on a stock you know well, you could buy a put or a bear put spread.
See also: Bullish, long, neutral, short.

Beta: A measure of the sensitivity of the price movements of a stock in relation to the movement of the broader market. A stock with a beta of 1.00 will theoretically move 1% for every 1% move in the market. A stock with 20% more or less price volatility than the broader market will have a beta of 1.20 or 0.80, respectively. Beta can be calculated by regressing the historical returns of the stock against the historical returns of the broader market index

The concept of beta does not translate directly into option pricing. It should not be confused with implied volatility, which only measures the volatility of the stock itself and ignores the broader market. A low-beta stock could theoretically have very high implied volatility.
See also: Greeks.

Bid: The price buyers currently are offering to pay.
See also: ask, bid/ask spread, mid.

Bid/ask spread: The difference between the bid and ask prices. For very liquid markets, it might be as narrow as a few pennies, but for thinly traded markets, the spread can be very wide. Options markets are less liquid than stock markets, so it is important to use a limit order to set your price.
See also: ask, bid, limit order, mid.

Binomial Model: An options pricing model that's useful for American-style options because it can help predict when early exercise is possible. It uses an iterative process that allows for pricing options at different points prior to expiration.*See also: Black-Scholes Model.*

Black-Scholes Model: One of the most well-known options pricing models. It incorporates time until expiration, strike price, stock price, dividends, implied volatility, and interest rate. It is based on several simplifying assumptions, but put simply, it calculates the value of a call option as the stock price multiplied by the probability of ending up in-the-money, less the present value of the strike price paid on the expiration date. The model is named after Fischer Black and Myron Scholes.

See also: Binomial Model.

Break-even price: The price the underlying stock needs to reach at expiration for an option investor to neither make nor lose any money. In strategies involving more than one option, there can be more than one break-even point.

Bullish: An options strategy (and outlook) that achieves its maximum payoff when the underlying stock appreciates in price. For example, if you are bullish on a stock you know well, you could buy a call or a bull call spread.
See also: bearish, long, neutral, short.

Buying Calls

Buying a call isn't necessarily the best way to benefit from a stock's growth. It depends on the Time Value. When you buy a call you are buying Time Value and it will erode as the expiry date approaches.

On the other hand buying the right call on the right growth stock can give you great leveraged returns with not much money at risk.

Make Sense? No ? There's a good starting point here:
http://newsletters.fool.com/50/optionsu/intermediate/buying-calls.aspx

Buying Puts

Buying puts. This is a very bearish thing to do. It can be hedgey too.

Buy to close: The brokerage command to exit an option contract in which you originally wrote ("sold to open") the put or call.
See also: buy to open, close, cover, sell to open, sell to close.

Buy to open: The command some brokerages use to enter an option contract in which you intend to buy a put or call.
See also: buy to close, close, cover, sell to open, sell to close.

Call option: The right, but not the obligation, to buy the underlying stock at a set price (the strike price) at or before the option's expiration date. A call rises in value as the stock price rises and declines in value when the stock price falls.

Chicago Board Options Exchange: The largest options exchange and creator of listed options in the U.S. It is owned by the **CBOEGroup** (Nasdaq: CBOE) and also specializes in futures trading. (If you want to sound savvy at cocktail parties, refer to the Chicago Board Options Exchange by its acronym and pronounce it *see-bo*, as in, "See Bo Derrick in the film*10*.")

Contract: Each standard option contract represents 100 shares of the underlying stock, provided no splits or other adjustments (i.e., corporate mergers) take place. (We'll be very specific about what to buy or sell if any non-standard options ever make it to *Motley Fool Options*.) A contract is quoted at the price for one share, so multiply by 100 to get the full contract value. For example, buying two option contracts for $1.50 actually represents 200 (2 x 100) shares of stock and would therefore cost $300 ($1.50 x 200).

Covered Call ("Writing" or "Selling" a covered call)

Popular stategy! Basically, you sell someone the option to buy your shares at a certain strike price. You receive a premium as soon as you have sold the call. It's called "Covered" because you own the shares.

Covered Calls are a classic way to generate investment income on shares you like and believe will go up, but they won't go up too quickly.

Covered Calls are a fine way to sell shares at a price you are happy to sell at - a covered call protects your profit.

Excellent Guide! - Covered Calls At a Glance

There's more detail on Page 3 of the Options U Intermediate Handbook
http://newsletters.fool.com/50/optionsu/2011/11/11/options-u...

Aleax: Never write a covered call on a stock you own, unless you know you'd be *delighted* to let said stock go at the strike price (plus the premium). You may or may not get a decent chance to roll the call as expiration nears, but it's absolutely crucial that you be quite happy letting the stock go if it soars to the sky.

Covered Strangle

A covered strangle is where we write a **Put** at a lower price, and write a **Covered Call** at a higher price. We have strangled the stock price between lower and higher. This strategy is useful for stocks which we are expecting to stay at more or less the same price by Expiry date. Here's an example: Covered Strangle on Plum Creek Timber

And here is a guide to Strangling: Options 703 - Strangles

Note: "*you write a strangle to profit when a stock stays within a predetermined price range or is relatively stable..... Writing a strangle offers more flexibility than writing a straddle because you "split the strikes" — set it up with a different strike price on your calls than on your puts — and you use strike prices that are "out-of-the-money," or well above or below the stock's current price, giving you more room to profit.* "

Close: Exit an option contract.
See also: buy to close, cover, sell to close.

Cover: Another term for closing out a short position.

See also: buy to close, close, sell to close.

Deep in-the-money: The condition of an option that has a large amount of intrinsic value. A call option is deep-in-the-money when the underlying stock is trading at a price much higher than the strike, and vice versa for a put option. A deep-in-the-money option will typically have little time value.
See also: at-the-money, far out-of-the-money, in-the-money, out-of-the-money, intrinsic value, strike.

Delta: Delta, loosely, can be three things:

1. Delta is roughly the amount the option changes in value as the stock changes in value. If you're the sort of person who likes to spend a quiet evening alone with math, you'll recognize that delta is the first derivative of the value of the option with respect to the value of the underlying. If a call option has delta of 1.00, then it rises in value $1 for every $1 increase in the stock. A delta of 0.60 means it would rise $0.60 for every $1 increase in the stock, and so on. Since the call is less expensive than the stock, the $0.60 increase represents a greater percentage change for the option than the $1 change in the stock. Put options carry *negative* deltas, but this, if you think about it, makes sense. Since a put option profits when then underlying stock declines, and vice versa, we should expect an inverse relationship. A put with a delta of -0.60 would mean that its price rises $0.60 every $1 *decrease* in the underlying stock price.

2. Delta is roughly the probability that an option will expire in the money (though not necessarily at a profit). A deep in-the-money call is, statistically speaking, almost certain to expire in-the-money. Thus, it has a delta very close to 1.00. The negative sign on a put option's delta is unimportant in this context — the absolute value is the important thing. A put with a delta of -0.50 has a rough statistical probability of expiring in-the-money of 50%.

3. Delta is roughly the number of shares the position represents. A deep-in-the-money option trades almost the same as 100 shares of stock, so it has a delta of very close to 1.00. Here, negative delta does carry meaning. A purchased put option will have negative delta, reflecting that it is equivalent to some number of shares being sold short.

See also: gamma, Greeks.

European style: Option contracts that can only be exercised at expiration.
See also: American style, Black-Scholes model.

Exercise: Invoking the right (as granted by the option contract) to buy (if a call) or sell (if a put) shares of stock at the strike price.
See also: assignment, counterparty, strike.

Exercise price:*See: strike.*

Expiration date: The date on which the option contract becomes void, and the option holder no longer has the right to buy or sell stock granted by the option. This is typically after hours on the Friday before the third Saturday of the month.

Extrinsic value:*See: time value.*

Far out-of-the-money: The condition of an option when the underlying stock is trading at a price much lower than the strike for a call, or much higher for a put. Far out-of-the-money options have little intrinsic value but retain some time value depending on the time left until expiration.
See also: at-the-money, deep in-the-money, in-the-money, out-of-the-money, strike, time value.

Free cash flow (to the company): Money leftover for creditors and shareholders when all of a company's operational and investment expenses (think equipment upgrades, acquisitions, taxes) have been paid. This figure arguably provides a more accurate picture of the company's profits and financial strength than net income or earnings per share.

Gamma: One of the five "options Greeks" (delta, gamma, rho, theta, and vega), this shows how fast delta changes with respect to the underlying stock price. The larger the gamma, the faster delta changes; gamma is maximized when the stock price equals the option's strike price.
See also: delta, Greeks.

Greeks: The four primary Greeks are delta, rho, theta, and vega, and are risk measurements used to monitor the sensitivity of an option's price with respect to a change in one of the underlying contributors to option valuation — stock price, interest rates, time to expiration, and volatility. A fifth common Greek, gamma, measures the sensitivity of an option's delta with respect to changes in the price of the underlying.
See also: delta, gamma, rho, theta, vega.

Hedge: An offsetting position meant to reduce the price, volatility, or risk of an investment.

Historical volatility: The annualized standard deviation of the stock's price changes. Typically, daily price changes are used.
See also: implied volatility.

Horizontal spread

See: time spread.

Implied volatility: A prediction of the volatility of an underlying stock; it's calculated using the current market trading price of the option. Implied volatility may or may not bear any resemblance to actual historical volatility.
See also: historical volatility.

In-the-money (ITM): Indicates that an option has intrinsic value. Calls are in-the-money when the underlying stock is above the option's strike price (a stock is at $22 and the call has a strike price of $14, allowing the holder to buy the stock at $14). Puts are in-the-money when the underlying stock is below the option's strike price (a stock is at $22 and the put has a strike price of $30, allowing the holder to sell the stock at $30).
See also: at-the-money, deep in-the-money, far out-of-the-money, out-of-the-money, strike.

Intrinsic value: An option's value if it were to expire immediately; i.e., the value in direct proportion to the underlying stock's current price. For calls, intrinsic value is the current stock price minus the strike price. For puts, intrinsic value is the strike price minus the current stock price.
See also: premium, time value.

Last trading day: The final day on which trading takes place on an option contract prior to the settling of the contract, usually the third Friday of the expiration month.
See also: expiration date.

LEAPS (Long-Term Equity Appreciation Securities): Options that, when first offered, expire at least two years in the future. Most new LEAPS become available between September and November, depending on which option cycle the underlying company is on. They will almost always be for a January expiration, but are sometimes offered for a February or March expiration. We like LEAPS because they provide longer-term choices for an investment thesis to play out.

Leg: One piece of multi-option strategy. It also refers to entering or exiting a multi-option and/or stock strategy ("leg in" or "leg out") at disparate times and prices chosen to benefit the intended strategy, but with the potential risk that better prices will never be available.

Limit order: A modification to a brokerage command to buy or sell that allows you to buy or sell at a set price or better. These are particularly useful for illiquid stocks, as well as the option markets, for which there is often limited liquidity.
See also: market order.

Liquidity: Refers to how heavily traded a stock or option is, and usually corresponds to how wide the bid/ask spread will be. A heavily traded stock or option will have lots of liquidity and thus usually a narrow bid/ask spread.

Long: Having ownership of a security. If you own 100 shares of a stock, you're long the position. If you have purchased a whole mess of puts on something, you're long a whole mess of puts. It can also be a slang term meaning you feel positively about something. For example, TMFTheDoctor is long corgis, caffeine, and David Tennant.
See also: bearish, bullish, neutral, short.

Market-maker: Typically, a floor trader on an exchange whose job is to accept bids and offers from other traders — be they big institutional traders or Joe and Jane Optionsmember. The main job for a market-maker is to maintain liquidity and ensure that prices are more or less fair.

Market order: Typically the default order type for an options trade. It tells the broker to place your trade at whatever price is currently available on the market. Since options are often thinly traded, market orders can be very dangerous, as the bid/ask spread can be wide and a market order will simply buy at the ask or sell at the bid.
See also: bid/ask spread, limit order.

Mid: The midpoint between the bid and ask. When using a limit order, it's often advantageous to set it to the mid — sometimes called "splitting the bid/ask" — and move outward from there if the order doesn't get filled.
See also: ask, bid, bid/ask spread.

Naked: Taking a short position in an option without having a position in the underlying security as collateral. The concern of a naked position is that it carries theoretically unlimited risk. A naked call will begin showing a loss as the underlying stock rises, and the stock could possibly go to infinity (and beyond!) causing extreme loss on the naked call. A naked put does not carry quite as much risk: A stock can only fall to zero (Oh Joy!), so the position's potential loss is limited to the value of the stock.
See fully-clothed, semi-clothed

Neutral: An options strategy (and outlook) that achieves its maximum payoff when the underlying stock doesn't change in price.
See also: bearish, bullish, long, short.

Net operating profit after taxes (NOPAT): NOPAT (aka NOPLAT) is a taxed version of a company's operating income, or EBIT.
*(**NOPAT**: Net Operating Profit After Tax; **NOPLAT**: Net Operating Profit Less Adjusted Tax.)*
NOPAT is a useful metric for comparing the operating profitability of companies with different debt loads because it excludes the interest burden that comes with debt. A simple way to calculate NOPAT is EBIT x (1 - Tax Rate). A more accurate method adjusts the reported tax to exclude the *tax shield* provided by the tax exemption on interest payments: Adjusted Tax = Reported Tax + (Interest x Tax Rate); NOPAT = EBIT - Adjusted Tax.

Open: As a verb, open refers to entering an option contract; as an adjective it refers to whether you are still holding the position.
See also: buy to open and sell to open.

Open interest: The total outstanding open contracts on any particular option. If you buy or sell to open, pat yourself on the back! You've just upped the open interest. If you buy or sell to close, you've just decreased it. (Fine, you can give yourself another pat.)

Option cycle: Expiration dates available for various classes of options (not everyone gets to go at once). There are three cycles, offset monthly: January/April/July/October; February/May/August/November; and March/June/September/December. Regardless of cycle, there is always an option for the current month and the next month. Beyond that, the expirations correspond to whatever cycle the stock is assigned to. There will always be at least four expiration months trading.

Options Clearing Corp.: A middleman, operating under the Securities Exchange Commission, whose role is to police option buyers and sellers to ensure the obligations of an options contract are fulfilled. The OCC clears and settles trades for options exchanges (like CBOE) and takes on counterparty risk. It is also a useful resource for options questions.

Out-of-the-money (OTM): The opposite condition to being in-the-money. Here, an option has no intrinsic value, only time value. For example, if a stock is trading at $8, its call options with a $10 strike price would be out-of-the-money.
See also: at-the-money, deep in-the-money, far out-of-the-money, in-the-money, strike.

Premium: The total price of an option contract; the sum of an option's intrinsic value and its time value.
See also: intrinsic value, time value.

Put Broken Wing Butterfly

Poor butterfly!

But an example of this Strategy is Set up a Put Broken Wing Butterfly on Expeditors International

An iron butterfly is the combination of two spreads: a bear call spread and a bull put spread. If you're unable to set up a four-legged butterfly trade in one order with your broker, then handle the Bear Call Spread and the Bull Put Spread elements as 2 trades.

Put option: The right, but not the obligation, to sell a stock at a set price at or before the expiration date. A put's value increases as a stock's price falls.

Put ("Selling" or "Writing Naked Puts")

Writing Puts is a classic way of buying shares that you wish to buy anyway - but at a lower price. You sell the option. You receive a premium. That premium can be deducted from the strike price to give you a lower buy price!

Make sense ? No ? Read the great introduction here: http://newsletters.fool.com/50/optionsu/2009/08/10/writing-p...

More detail: Page 15 of this doc http://newsletters.fool.com/50/optionsu/2011/11/11/options-u...

Note: When you sell a Put option you are selling someone the right to sell **you** shares at a certain strike price. Now, whoever bought the Put from you can just ***make*** you buy those shares at the agreed strike price at any time up to Expiry Date!! Inconvenient if the share price is temporarily much lower than that strike price. Mind you, worry not, this "assignment of shares" doesn't happen too often.

Normally you'll reach the Expiry Date and the actual price will be lower - in which case you'll have to buy the shares at the higher strike price. Or the actual price will be higher and your put will expire for nothing. You keep the premium in either case.

It's best to keep **Cash** set aside to cover your Written Puts (i.e. buy the 100 shares at the strike price). It's best not to use margin for this. Read more in the introductions about this.

Return on equity (ROE): Return on equity is the profit earned on capital that stockholders have contributed to the company. Let's say a company has issued $100 million worth of stock, $100 million worth of bonds, and $50 million in preferred stock. This imaginary company brings in $25 million in profit, and pays out $5 million in interest payments on its debt and $5 million in dividend payments to the preferred shareholders. It is left with an adjusted net income of $15 million and total equity of $100 million, so it has an ROE of 15%.

Return on investment (ROI): Return on investment is the profit earned on funds put at risk. If you buy 100 shares of a stock trading at $10, and it rises to $12, you have an ROI of 20%.

Return on invested capital (ROIC): Return on invested capital is the profit earned on all sources of capital contributed to the company. Going back to the ROE example, the company has a total capitalization (equity + debt + preferred stock) of $250m. There are various ways to measure return on invested capital, but one of the simplest ways is to take net income and divide it by total capitalization. So if this imaginary firm brings in $25m in net income, it has an ROIC of 10%. Although slightly more complicated, we prefer to calculate ROIC using net operating profit after taxes (NOPAT) in the numerator.
See also: NOPAT, return on equity.

Rho: One of the five "options Greeks" (delta, gamma, rho, theta, and vega), this indicates an option's sensitivity to changes in short-term interest rates. Option premiums get more expensive when interest rates go up.
See also: Greeks.

Rolling forward, out,up, or down: A follow-up action in which you cover (or sell) an option you originally sold (or bought) and reinitiate that position at a different strike and/or expiration. "Rolling forward" (also called "rolling out") involves closing options that expire in the near term and opening options with longer-term expirations. "Rolling up" involves closing options with a lower strike price and simultaneously opening new options at a higher strike price (while maintaining the same expiration). "Rolling down" involves closing options at a higher strike price and simultaneously opening new options at a lower strike price.
See also: cover.

Sell to close: The brokerage command to exit an option contract in which you originally bought ("buy to open") the put or call.
See also: buy to close, close, cover.

Sell to open: The brokerage command to enter an option contract in which you intend to write (a.k.a. sell) a put or call.
See also: buy to open, open.

Spread: Any option strategy in which you buy and write ("sell to open") options of the same type (call or put) on the same underlying stock.

Straddle: A direction-neutral options strategy consisting of a call and a put with the same strike prices and expiration date. It profits from a large move, up or down, in the underlying stock.

Strangle: Similar to a straddle (a strategy consisting of a call and a put with the same expiration) but with different strike prices. It profits from large moves, up or down, in the underlying stock. A strangle is cheaper to set up than a straddle but requires a larger move in the underlying stock to become profitable.

Short: Having an obligation position in a stock or option. When you go short a stock, you're borrowing the asset, selling it, and hoping to profit by buying it back at a lower price. Shorting a stock reflects a bearish outlook. In an options context, it reflects the writing of options. In *Motley Fool Options*, we often pair our short options with our long options. For example, in a bull call spread, you are long one call at one strike and short another call at a higher strike. Despite having one short leg, it's still overall a bullish position.
See also: bullish, bearish, long, neutral.

Strike: Also known as the "exercise price," this is the price at which the option holder can buy (in the case of a call) or sell (in the case of a put) the underlying stock.

Synthetic: A way of using options, sometimes in conjunction with long or short positions in the underlying stock, to mirror the profit and loss potential of a different position. For example, a synthetic long can be created by buying a call and selling a put with the same expiration dates and strike prices. The profit payoff on such a strategy is identical to that of simply buying the underlying stock at the strike price; however, in a margin account the cost to establish the position is considerably less.

Synthetic Covered Strangle

A synthetic covered strangle is a variety of Diagonal Call. It's a 3 legged trade. We buy a long-term ITM call, and a short-term OTM Call AND finance it with a long-term ITM Put. Essentially it's a Synthetic-Long we have covered with a profitable call. It's useful when the stock is reckoned to rise over the next long time period (we're very bullish) as Synthetic Covered Call leverages capital at risk.

Here is a a live trade example using Microsoft from the Options team:
Set up a synthetic covered call on microsoft

Synthetic-Short

Some prefer a real single malt.

A Syn-Short is just like directly shorting the stock. But here you sell naked calls and buy puts at exactly the same strike price. Hopefully for a small net debit or even a net credit.

There's a great introduction here : http://newsletters.fool.com/50/optionsu/advanced/synthetic-shorts.aspx

And here's a Syn-Short in action: PRO: Set up a Synthetic Short on CurrencyShares Euro Trust

Syn-Short

Here's an insight from Aleax on the boards:

Q > I'd like to set up a syn-short but I am worried about the 'naked' unlmited loss. Should I short directly instead?

A> The upside and downside of a syn-short are exactly the same as for an outright short (net of "trading friction" aspects: a syn-short owes no payments in lieu of dividends nor shorting-fees, but options commissions are higher and bid-ask spreads wider; many of the hoped-for gains from a syn short [those due to the purchased put leg] can be taxed as long term capital gains if the position is held for > 1 year, while the outright short is always subject to short term rates [as is the short-call leg of the syn-short]; I think that's about it for trading friction aspects).

So you should be worried about the syn-short if, and only if, you would be exactly as worried about the outright short.

Tax-wise you prefer larger gains on the put leg and smaller ones on the call leg; so from this POV you want the syn short strike to be high (if you do close for gains in > 1 year, you'll have more money in your pocket, after taxes). This costs more money up front to establish than a syn short with a strike ATM or lower than ATM; but less ongoing purchasing power for maintenance margin. Also, the way-OTM short call stands hardly any risk of premature assignment.

Of course, if you set your strike so high that writing the call gives you, in your opinion, too little money to bother, you might omit writing the call (and thus avoid the theoretically unlimited risks) and turn it into a simple deep-ITM put purchase;-). (If the call would have too little TV to bother writing, the put will have too little TV to worry about buying it, either;-). Aleax

Also see Aleax's longer response to question Are there disadvantages to Syn-Long v. owning the stock ?

Theta: One of the five "options Greeks" (delta, gamma, rho, theta, and vega), this measures an option's sensitivity to time, or how much the option price decays per day.
See also: Greeks.

Time decay: The reduction in an option's value through the passage of time.
See also: theta.

Time spread

A strategy (also called a horizontal spread) with two or more legs from different expirations. Calendars and diagonals are prime examples of time spreads. A calendar involves buying an option in one expiration and, at the same time, selling that same strike in a different expiration. Strictly speaking, a diagonal is a time spread but *not* a horizontal spread.

Time value: The premium that the market is willing to pay for the potential upside of the option until expiration. Its value accounts for beneficial unknowns and volatility until expiration. For a tradable option, deduct intrinsic value from the trading price to arrive at time value. Options are wasting assets, meaning time value declines as expiration draws closer.

"Time Value" is vital in understanding options. Jeff Gilles gives a graphical introduction in "Video: The Value of Time"

See also: intrinsic value, time decay.

Uncovered:*See: naked.*

Underlying: The stock being bought or sold at the expiration of the option contract. Since stocks are pieces of businesses, it makes sense to understand that business, its valuation, and its prospects before overlaying options strategies on them.

Vega: One of the five "options Greeks" (delta, gamma, rho, theta, and vega), this indicates an option's price sensitivity to a change in volatility. Higher volatility makes options premiums more expensive.
See also: Greeks.

Vertical spread:

A strategy using two puts, or two calls, with the same expiration but different strikes. A bull call spread is a type of vertical spread.

See also: bull call spread.

Volatility: An estimate of the amount that the underlying stock's price is expected to fluctuate in a given period of time. Generally, volatility is measured by the standard deviation of the continuously compounded returns of the underlying stock.

Write: To sell an option contract. We prefer to use "write" when referring to selling an option contract in general, but specifically this refers to selling a *new* option contract. The option seller is referred to as the option writer.

Wing spread:

A strategy constructed from the combination of a pair of spreads that profits most when the stock does nothing. A trader could also construct a so-called "broken wing" spread, where one side has a slight bias. Butterflies and iron condors are good examples of wing spreads. They're referred to as such because, if you were to make a profit/loss diagram, the center has a kind of body shape (where the profit is if the spread is sold, or where the loss is if the spread is purchased), and the sides have a vague wing shape to them.

Questions about Options

FAQ from Pro Members answered by Pro staff and members

Question on Option Strategy with helpful reply:

I am still trying to figure out how to play leading company in high growth emerging market segment (enticing premium in exchange for high volatility)...

I see Jeff has provided an official answer and of course that's much more meaningful than my opinion (as I'm an amateur) but I think I'll offer that opinion anyway.

I've been well served over the years by a mixed strategy on such names -- build up (ideally buying on dips, of course, but in a very buy-and-hold mood anyway) a maybe-slightly-underweight position to never be touched again until it's a multi-bagger or the investment thesis sours; *on the side*of this core position, accumulate a somewhat smaller "trading position" meant for short- to mid-term profitable trading -- buy low, sell high.

Options help for the latter objectives (write puts on slight dips when trying to beef up the trading position rather than wait for deep dips; write covered calls on slight rallies when trying to whittle down the trading position rather than wait for steep rallies) though one could also just buy and sell shares (writing options can be more profitable when the market's implied volatility for the name is exaggerated compared to your assessment of what realized volatility is going to be).

Optimal duration to expiration for the written calls on the trading position varies, but they won't be all that long term (you want time value to erode, and it really doesn't erode fast at all for too many months if you write, say, 6-months-out or longer) and usually not too short-term to avoid excessively enriching your broker via commissions and the market makers via bid-ask spreads (the exception, where really short-term trades are warranted, is when you judge the market is badly mis-evaluating an impending event such as an earnings call or forthcoming relevant legal or regulatory decision).

As I said, this mixed approach is what overall tends to work out for me -- not every time, of course!, but often enough to keep me in the game.

For example, that's why I wrote calls on only half of my DDD shares -- I mentally re-tagged half the shares as a "trading position" and the other half as a "buy-and-hold position", so as to have my cake and eat it too.

Warning: whether this approach is psychologically tolerable to you depends on your character -- I have a sunny disposition so I tend to see the outcome of mixed strategies mostly in a "could have been worse!" [if I had picked the wrong pure strategy] mood, but if you know that your own reaction would mostly be a sour "could have been better!" [if you had picked the right pure strategy], then they're better avoided.

BTW, I'm kind of glad that my 5000th post comes on a subject where I have definite (though amateurish) experiential-based preferences that are pretty far from the mainstream -- at least this way the post should be interesting (perhaps controversial), compared to one where I just reaffirmed a broadly held opinion I agreed with, no?
-) Aleax

What are the disadvantages of a Syn-Long v. owning Stock ?

Question:

You give pros and cons for alternatives with the exception of synthetic longs. What is the "con" of this approach?

If there is no con, only pros, why does anyone buy stock?

Reply:

The disadvantages of a syn-long compared to outright stock purchase are as follows. TL;DR: there are plenty -- beware!-)

(1) You're constrained to multiples of 100 shares (except on the few stocks that now offer mini-options, in which case, multiples of 10 shares can be held) -- with stock

purchase you can size your position more precisely and adjust it as you go.

(2) Fees, commissions, and, crucially, bid-ask spreads (i.e, all components of "trading friction"), are much higher for options than for shares. No big deal if you want to buy today and hold for almost two years, but anathema for more frequent trading.

(3) Taxes can work for or against you, but for a typical syn-long (established ATM) it will be against, if the stock price does rise.

If you buy 100 shares and sell them in Jan 2015, you will have (assuming the stock price did rise) long-term capital gains, taxed somewhere between 15% and 23.8% depending on your tax bracket. (Any qualified dividends you get in the meantime are also taxed at this same rate).

If you buy an ATM Jan 15 call and write an ATM Jan 15 put, and by Jan 15 expiration the stock has risen, you'll have long term capital gains on the call -- but your gains on the puts you write are always treated as short-term, no matter your holding period.

Those gains will be the whole premium you receive today for writing the put, and they'll be taxed at your ordinary marginal rate (up to 43.4% -- don't forget the 3.8% ACA surtax on "non-earned income").

To minimize this tax effect of a syn-long, pick a strike such that the call is deep-ITM (so the put will be deep-OTM and the premium you receive for writing it will be much lower -- since that's the part of your gain that will be taxed more dearly, you want it as low as possible from a tax viewpoint). This does increase the net debit you'll need to pay to initiate the position (i.e, reduce your leverage).

(4) your written put could be exercised at any time (if the stock dips below its strike, and low enough to reduce its time-value to near 0), forcing you (esp. assuming you want to stay in the position) to incur extra commissions and fees. Picking a strike well below the money reduces this risk, as well as reducing your taxes (see [3]).

(5) in a cash account, syn-longs make no sense, since you'll need to keep aside the whole exposure the written put gives you -- i.e, for a typical ATM syn-long, the same amount you'd have to fork over to just purchase shares.

(6) in a margin account, syn-longs are a mixed blessing.

If you buy shares, your purchasing power while you hold them is only reduced by your shares' maintenance margin -- typically 25%; most of your equity in those shares is available to margin other positions, if you wish (i.e, it's part of your account's purchasing power).

Options don't work that way. Your equity in the purchased long call does not help your purchasing power at all. Your liability in the written put does require maintenance margin, typically expressed as "Proceeds of the sale plus 20% of the underlying value less out of the money amount OR proceeds of sale plus 10% of underlying value, whichever is greater" but, beware, "proceeds of sale" actually means current, mark-to-market value of the put.

Suppose for simplicity that the syn long strike is 100 and the share price dips to 70 -- low enough to leave the put with no time value.

If you own 100 shares, this makes your maintenance margin 100 * 70 * 0.25 -> $1,750, so you still have 7000 - 1750 -> $5,250 of your equity in the shares available as purchasing power (e.g to help ensure the maintenance margin for other positions).

If you're long a 100-strike call (which does not matter to margin) and short a 100-strike put, the put's current value will be [at least] 30 (all IV, no TV), the "underlying value" is 100 (what you need to be ready to pay if assigned), and there is no "out of the money amount" (since the put is way IN the money after the dip). So the maintenance margin is 100 * (30 + 0.2 * 100) -> $5,000 -- this *reduces* your account's purchasing power... so, you'd better have cash or outright-owned shares in the account, to keep your overall purchasing power positive -- otherwise, best case, you'll get a margin call (and need to urgently inject more cash into the account and/or liquidate positions), worst case, your broker will just liquidate some or all of your positions without even bothering to tell you (I believe only IB, Interactive Brokers, routinely does the latter -- most brokers do pay you the courtesy of a margin call, at least -- but it's still NOT a nice position to be in).

Of course you did have to pay about $10,000 to initiate the outright all-cash share purchase, but still, under a bad dip like the above, the net effects on margin and purchasing power are even slightly worse for the syn-long than for the share purchase. People new to syn-long may not think in term of margin because they incur no margin *debt*, but, beware, you DO risk a margin call (at best!) if you have a syn-long and fail to keep ample cash in the account (or plenty of outright-bought shares to provide purchasing power to cover your maintenance margin).

(7) it's a highly leveraged play -- don't let the fact that you're not incurring margin debt and paying interest on it fool you into ignoring the sheer fact that you ARE leveraging (a lot, if you use an ATM strike -- or worse, an OTM one -- for your syn-long; less if you choose lower strikes, committing more cash up front). When all is said and done this will amplify your gains, if gains you have, but it will also amplify your losses, if losses occur. So, be wary about position sizes in syn-longs, especially on more volatile stocks! If you would normally buy a position size of 500 shares, with a syn-long it might be more prudent to go for 4 contracts, or maybe even just 3 if the stock is very volatile. Yes, this does reduce your potential gains if all is shiny -- but it reduces your potential losses just as much.

I'm sure I've forgotten some issues, but I hope I've highlighted enough to cause readers to do careful due diligence before embarking on syn longs. Remember the key idea with options trading (and most everything else in life): TANSTAAFL -- "there ain't no such thing as a free lunch". You're wise to dig for down-sides BTW, and I hope I helped.

Me, I don't do syn-longs -- if and when looking for a stock ownership substitute, I buy deep-ITM LEAPS calls instead, if I can find a strike that's liquid enough to not kill me with wide bid/ask spreads yet have very little time value (today's very low implied volatilities help;-).

I only get a few of the above down-sides (e.g, higher commissions, fees and spread-related trading friction -- but I did mention that usually matters little [unless the spread's ridiculously wide] when intending to hold for a reasonably long time; no buying-power help -- but then I use margin only very lightly and prudently anyway). And I do get one key extra advantage: limited worst-case losses compared to either outright share purchase or syn-longs.

After all, to reduce tax hits and risks of premature assignment, as I mentioned above, one should aim for a strike way below the money even when establishing a syn-long. But -- at such a strike, the written puts pay very little. So why even bother writing them, thus incurring (albeit to a limited degree) all of the above down-sides, and NOT getting the "limited loss" effect should the company go bankrupt overnight? Just buy the deep-ITM call and be done with it... at least, that's what I do, myself!-)

Similar reasoning can be applied to syn-shorts when you're bearish on a stock -- except that the plainer alternative of outright short sale comes with plenty of baggage of its own (which the outright purchase of shares, and the option positions, don't); so I do use plenty of syn-shorts (though sometimes I just buy a deep-ITM put instead, if and when I can find a narrow-spread, very-low-TV one;-).

Which reminds me of one special case where a syn-long would be very attractive (in theory -- haven't actually done that): when you're bullish on a stock that's so heavily shorted put/call parity breaks down, so premiums on puts are stellar compared with ones on calls. In such a case, "buy low, sell high" sure looks attractive, and that translates to a syn-long (typically a split-strike one). But, this post is already too long, so I'm not going to harp on that special case!-) Aleax

Which Account Do I Use for Options?

(a very helpful post from VelobiciOptions)

> Well, there is more than one opinion regarding which type of account is best for writing covered calls and puts.
>
> One reason options have a bit of a reputation for danger, is that it is easy to lose track of how much money one is committing when writing puts. In a taxable account, one can write a put and the "buying power" decrease by a fraction, often 30%, of the amount of money required should the put be assigned. In an IRA, that is not an issue, all puts are fully cash secured and the reported "buying power" decreases by the amount of money required by assignment. In that way using an IRA account is much safer....its just not possible to get over-extended when writing puts. So, you might want to start with paper-trading, then use an IRA account, and lastly a taxable account.
>
> That said, there are certain types of positions that dont work well in IRA accounts:
>
> | **Position Type** | **IRA Account?** | **Taxable Account** |
> |---|---|---|
> | **Sell Naked Calls** | No | No (1) |
> | **Sell Covered Calls** | Yes | Yes (2) |
> | **Sell Puts** | Yes (100% cash) | Yes (margined) (3) |
> | **Sell Strangles** | No (see note) | Yes (4) |
> | **Sell Straddles** | No (see note) | Yes (4) |
> | **Buy Bull Call Spreads** | Yes | Yes (2) |
> | **Buy Diagonals** | Yes | Yes (2) |
> | **Buy Synthetic Longs** | No (see note) | Yes (5) |
>
> (1) Motley Fool Options, and as far as I know Motley Fool Pro has never written naked calls
>
> (2) In both cases the stock, or purchased call, secures the call and the profitability is the same
>
> (3) IRA's are not marginable, so 100% of the cash needed to secure the put is set aside within the account for the life of the put. Taxable accounts allow the use of margin and do NOT set aside 100% of the money required, but rather only a portion
>
> (4) Straddles and Strangles combine a sold covered call with a sold put. In an IRA this would require us to purchase the stock and 100% cash secure the put....too expensive. Often the profitability of stangles and straddles is based upon receiving both the call and put premium without having to set aside 100% of the cash required should the puts be assigned.
>
> (5) Synthetic Longs require the purchase of call options which are funded by the sale of put options. In a taxable account, the put is partially funded via margin. In an IRA the put is fully funded, which costs just as much as buying the stock at the strike price. Might as well buy the stock and receive the dividends, if any.
>
> Whew! Well, that's how I understand these at this time.
>
> Please don't be bashful with any corrections or questions.
>

Moosie's Option Spreadsheets

Spreadsheet page

The spreadsheets are just some tools I built, mostly to analyze various option strategies. No rocket science here. They have an embedded Black-Scholes calculator. Feel free to change these and make them your own, or use them as a guide to build your own from scratch. Or use them as is.

The charting sheet is a handy way to make profit-loss graphs similar to those Pro includes in the recommendations.

You'll be able to use these in Windows, and Mac, except not Mac Office 2008. v2004 and v2011 work fine. Microsoft left VBA out of the 2008 Mac version.

Strategy Cheat Sheet

This is some documentation included in the optiontradingtips.com spreadsheet. Nice and concise.

MARKET DIRECTION	IMPLIED VOLATILITY: Low	IMPLIED VOLATILITY: Neutral	IMPLIED VOLATILITY: High

VXX in a Nutshell (10/2/11)

Jeff writes,

> I hope to go through the posts since yesterday and answer what I can soon, but for now, I'm hoping to sum up VXX in a short post:
>
> Thesis: VXX would lag any jump in the VIX considerably, by as much as 50%. So, even if the VIX spiked, VXX's gains would be modest by comparison -- though it could double or more, as we said -- and we could ride it out. It's a fairly "perfect" short in that VIX can only go so high and is guaranteed to come back down eventually. Like any investment, that could take a few years, but rarely takes more than 6 to 12 months with the VIX (historically).
>
> Support: Attending the CBOE Risk Management Conference, VXX was the butt of many jokes. Barclay's nearly apologized for launching it, saying they nearly shelved it, but ultimately launched it because there was such demand. They said they knew contango would steadily destroy its price, but that it would hedge about 50% of the jumps in the VIX on average. And that's better than nothing. So everyone, including us, I think missed the degree to which VXX could potentially perform under certain circumstances. Clearly the market missed it or the calls would never have been so cheap (in hindsight).
>
> Realization: This is the first time we've seen a serious VIX crisis since VXX started trading. In it, VXX is performing much better than even its creator suggested. It is up more than 100%, more than the VIX itself. The quick realization is that if the VIX spikes very quickly and stays up for a long time, the power of backwardation can persist and be a strong tailwind behind VXX.
>
> Where we stand: In other words, the original thesis has to be thrown out. VXX will not *always* just gain on average 50% of the gains in the VIX. During short spikes, it has. During long spikes that stair-step higher, VXX can start to gain even more than the VIX. So, it can gain as much or more than the VIX during the worst of VIX spikes. Once this reality started to be realized (and it all happened quickly), we set up the bull call spread to help wait out backwardation and make something on it. (Even so, a sudden drop in fear could cause the VIX to drop sharply and make such hedges useless. There's no way around it: volatlity positions will be volatile. Because volatility is caused by emotion as much as anything.)
>
> What to do now: If you're short VXX (as I personally am) or short VXX calls, consider hedging it with long calls or bull call spreads as long as backardation persists so strongly (we'll be tracking it daily here in the VXX Daily Log post). If you can't stay short VXX (just as we can't in Pro), then close it (we have no choice anyway) and then together we'll aim to set up a new position assuming 1) it looks good 2) we want to. I strongly believe we will set up a new position. I just don't know if it'll happen in days, weeks, or months.
>
> Bottom line is we have new information on how VXX can behave. If we could stay short, and if all members could stay short, we'd just hedge 50% to 100% of our short VXX position to ideally profit on the hedge as VXX rises, and then remove the hedge when we think VXX is ready to start declining again. Since

we can't stay short, and given that VXX is in backwardation, and given what we've learned just the last few weeks, we want to reassess to try to find the best way to approach the position again (again, assuming we want to; which I think we will).

Final context: if today's fear was caused by something else (like a nuclear reactor meltdown, for instance), there's no way we'd have the same concerns as we do now, because that fear would subside and backwardation with it. However, today's fear is caused by much larger, much longer-running concerns (and they're being decided by politics, which are extremely uncertain -- some politicians would even like to see things get worse before they get better, so they can gain power). Given the nature of the problems right now, fear or uncertainty could persist a long time. Nobody knows, but VIX could see 60 again if things don't get better. Even if VIX doesn't rise, backwardation could stay for weeks or months. So, we'd want to hedge the short at this point; and if we're forced out, we want to consider the best way to get back in given all of the context (some of it new) surrounding it in this instance.

I have to run. Sorry for the hasty post.

Best,

Jeff

P.S. VXX is actually proving, in this case, to be a very good hedge against a very big crisis of confidence. Store that away in your mind. If the VIX is in the mid-teens it can't go much lower (well, it does touch 8 or 9 sometimes); VXX may actually be a hedging tool at those levels that responds much more strongly than a drop in the market. The S&P is down about 14% and VXX is up 110%.

P.P.S. Another Fool asked why Charter should have to close VXX just because Port 2011 is. It's not an easy choice, I know, but really we want everyone on the same page as much as possible, and the portfolios are supposed to mirror one another. And plus we assume Charter will be called on its shares very soon, too.

Daily VXX Log (10/1/2011)

Jeff writes,

Greetings,

In this thread, I'm going to post the daily close for VIX, the two-month VIX futures (that VXX uses) and VXX -- so we have a running log and can track how it behaves day by day under backwardation and, later, contango.

```
So, on 9/30/11:

VIX 42.96 +10.6%

VXX $53.37 +7.0%

S&P 500 -2.5%

Oct Futures 42.10 +3.50 +8.3%

Nov Futures 37.75 +2.45 +6.4%

1-month backwardation: 10.3%

Oct Futures expire 10/18

Nov Futures expires 11/15
```

==========

How soon will we enter the short VXX position again? Again, it depends on what comes our way. It could be days or it could be weeks. I'm personally sitting on my direct short that I've had for about a year with TD Ameritrade. I may hedge it with some calls while backwardation persists (so if I don't post on the VXX board for four days, I've made a trade and need to wait; I'll ask Nick to post the daily log), but I plan to continue to keep the short for the long term. Priorly, I planned to keep it indefinitely, but now I would plan to close it once VIX persists in the teens, and then wait for a spike at some point to short it again.

I agree with other points recently made here that VXX could go higher before it starts its long grind down along with the slowly unwinding fear of the market. This would be due to backwardation and also the slow-moving nature of European politics, and the especially combative (rather than productive) nature of U.S. politics, precisely at a time when we need smart collaboration. But isn't that what renders a nation apart? The very fact that when the stakes are high, so is the in-fighting?

Meanwhile, I've hated the dual experience that I've had with VXX. Holding it short myself after Pro couldn't put on that same position has produced close to zero stress the past year. Trying to emulate that position in Pro with options has eventually led to a small disaster (we will recover, but some of us will probably live a few years less now -- and no investment is worth that). However, I believe that with persistence we will make good on the investment, and in the coming weeks or months when volatility starts its long grind down, the gains should be relatively "easy" to make on VXX. Will it happen for certain? Usually I'd say yes, of course volatility will steadily subside with time. Right now, though, I'll say it may take longer than we think, and we may see even higher VIX prices first. I mean, either Europe and the U.S. will start to get their houses in order, or we may be headed to a major financial calamity. So, as much as I hate to say it, politics are key to our future now, more than ever.

Keep in mind that shorting VXX should afford plenty of time for profit, because it moves on the futures of the VIX, and the futures are -- as we all know -- trading at a discount to the VIX. So, even when the VIX starts to decline, the futures and thus VXX should decline a bit less for now with backwardation in place, affording us ample time to put on a position. However, depending on how large any fianncial/political shocks are in the coming weeks, VIX could be elevated a long time. From October 2008 until March 2009 the VIX stayed above 40. That's partly why I suggest those who are staying short VXX hedge it with bull call spreads or simply buy calls. As long as volatility is elevated, the calls will hold decent value, and you should be able to close them and recoupe some of your cost if it turns out you don't need them.

So, here begins our daily VXX log -- with an eye on getting back into the short in a way that will work for Pro and members who can't be short directly, taking into account all the dynamics of this position and the current "fear-trap" that the VIX and its futures are in right now. I'll make each daily post in this same thread so that it can be followed as one long threaded conversation.

Best,

Jeff

VXX Unofficial FAQ (8/14/11)

Rhyssan writes,

Disclaimer: This FAQ is not endorsed by the Pro. It is intended to answer common questions for those who want to do their own trading on VXX.

1. What is the VIX?
1a. Why is trading on the VIX interesting?
1b. Can I buy the VIX directly? What about options on the VIX?

2. What is VXX?
2a. What are contango and backwardation?
2b. Where can I find the prices of VIX futures?
2c. Why is shorting VXX an attractive trade?
2d. What are the dangers of trading VXX?

3. What is XIV?
3a. Why is XIV an attractive trade?
3b. What are the dangers of trading XIV?

4. Which is better, shorting VXX or buying XIV?
4a. I don't like shorting VXX, what are my other options?

5. How important is understanding margin?
5a. How do I determine my risk?
5b. How can I do this trade and be completely safe?

6. My short position has been forcibly closed by my broker! What can I do?

7. The VIX just went up, but VXX went down! Is something wrong?

1. What is the VIX?

This article hits most of the common questions about the VIX:

http://vixandmore.blogspot.com/2008/04/ten-things-everyone-s...

You can display graphs and current pricing of the VIX using the ticker "^VIX" on finance.yahoo.com. There is no way to display the VIX on finance.google.com [and if anyone finds a way, please let me know!].

1a. Why is trading on the VIX interesting?

Historically, the VIX has always reverted back to the mean, usually (but not always) in a few months or less. Therefore, one can theoretically expect that betting the VIX will drop when the VIX is high will eventually be profitable.

The challenge is to stay solvent while waiting for that bet to play out.

1b. Can I buy the VIX directly? What about options on the VIX?

You can't buy or sell the VIX directly. Options exist on the VIX, but they are cash-settled European style options. Make sure you understand how European style options work before trading them.

2. What is VXX?

VXX is an ETN that mimics holding a mix of 1 and 2 month futures on the VIX. Each trading day it pretends to sell a portion of its near month holdings and use the proceeds to buy more of the next month future contract.

2a. What are contango and backwardation?

Contango and backwardation describe the shape of the futures curve. If the second-month future (the future expiring two months from now) is priced higher than the near-month future, the contracts are in contango. If the second-month future is cheaper than the near month, the contracts are in backwardation.

The VIX futures are normally in contango (prices in the future are higher, representing uncertainty). During a spike in the VIX, they are normally in backwardation (the market "knows" the VIX mean reverts, and therefore expected prices in the future are lower).

The contango or backwardation that we care about is on the near and second month futures, since those are the futures that are held by VXX. If the futures are in contango, then the monthly loss to VXX due to contango is simply (second_month - near_month) / (near_month)

http://boards.fool.com/1228/contango-is-increasing-steadily-...

2b. Where can I find the prices of the VIX futures?

http://cfe.cboe.com/products/Products_VIX.aspx

In the upper right corner, the VIX is listed first. The next line down is the near month futures contract. Each line after that is one month further out.

2c. Why is shorting VXX an attractive trade?

As one can see from looking at a graph of VXX's past performance, contango eats steadily away at the long term value of the fund. By shorting it for the long haul, one can take advantage of that steady drain on its value. Additionally, by shorting VXX when the VIX is high, over the long run both contango and mean reversion should help the trade be profitable.

http://boards.fool.com/1228/standford-to-expand-on-bills-ans...

2d. What are the dangers of shorting VXX?

i) Backwardation - during a spike in the VIX (theoretically the best time to take advantage of mean-reversion) backwardation can be very damaging.
ii) Margin - short positions require margin to hold. If the VIX/VXX spikes further than expected, margin calls can easily result. Likewise, brokers can change margin requirements, forcing a short position to be closed early.
iii) Psychology - VXX short positions that are timed badly can move heavily and rapidly in the wrong direction. This can cause very large paper losses that might be difficult to cope with.

Closing a short VXX position early (voluntarily or not), after it has moved heavily in the wrong direction can cause huge realized losses, far out of proportion to the theoretically possible profit.

3. What is XIV?

XIV is an ETN that attempts to perform as the inverse of VXX.

3a. Why is XIV an attractive trade

Going long XIV mimics a short VXX position, but without requiring margin. This removes the threat of a margin call, as well as allowing the trade in an IRA. This makes it a very attractive alternative to shorting VXX.

http://boards.fool.com/1228/xiv-backtesting-results-29188316...

3b. What are the dangers of trading XIV

Just like a short VXX position, XIV can suffer significant losses in an extended period of backwardation. There is also tracking error (XIV is a relatively new fund, so exactly how the tracking error behaves under different circumstances isn't yet fully known). Additionally, XIV is an ETN, so there is counter-party risk (if the bank that issues XIV goes bankrupt, XIV could go instantly to zero). Lastly, if the VIX made a huge spike upwards in a single day, XIV could theoretically lose so much value that it would never recover.

4. Which is better, shorting VXX or buying XIV?

There is no right answer. Neither is without risk. Both have advantages. Some in the community are using XIV for tax-deferred accounts and VXX shorts in taxable accounts, but this by no means universal.

http://boards.fool.com/1228/xiv-vs-vxx-29046993.aspx

4a. I don't like shorting VXX, what are my other options?

Each of these is likely a topic unto themselves, as they all have advantages and disadvantages. But here is a brief list of possible trades to consider:

- Shorting VXX directly
- Synthetic VXX shorts (Cons: limited time frame, friction costs. Pros: no risk of forcible closure.)
- Buying XIV
- Naked VXX calls (Cons: full risk, limited return, easy to accidentally overweight. Pros: Pro favors them, usually easy to roll defensively.)
- Very wide VXX spreads aka naked calls with deep OTM protection (Cons: less profit, potentially difficult to take defensive action if the entire spread becomes buried. Pros: quantifiable risk.)
- VXX or VIX spreads (Cons: high risk of full loss, difficult to take defensive action. Pros: tradeable in IRAs, high returns,)
- buying VXX or VIX puts (generally frowned upon, since huge premiums during a spike make decent returns difficult)

http://boards.fool.com/1228/protection-strategy-for-short-po...
http://boards.fool.com/1228/i-am-able-to-short-200-shares-at...
http://boards.fool.com/1228/due-to-account-restrictions-i-co...

5. How important is understanding margin?

Really really **really** important. Unless you fully understand the margin formula, you cannot determine how large of a short VXX position (or naked VXX calls) you can support. Naked options will rapidly increase their margin requirement as they move from OTM to ITM. Minimum margin requirements for options are set by the CBOE, but individual brokers are free to set more stringent requirements. Also be very aware that brokers can change those requirements without notice, typically at the worst possible time.

Guessing or estimating the margin requirements is not advisable, especially when calculating them out is quite easy:

http://boards.fool.com/1228/i-remember-a-post-a-while-back-a...
http://boards.fool.com/1228/i-guess-it-is-technically-about-...

There is a margin calculator here:

http://www.cboe.com/tradtool/mCalc/default.aspx

However, it only calculates the initial margin (although you can play with the "current" price to estimate maintenance margins). It also only calculates the CBOE minimum, which might not be what your brokerage uses.

5a. How do I determine my risk?

Based on simulations by dangerscott and bdyer64, if VXX had existing during the 2008/2009 spike in the VIX, it would have increased about 4x-5x from its starting point. One could therefore assume that a 5x increase of VXX from its low point might represent a good guess at a theoretical max, and then calculate out margin requirements for all VXX short positions accordingly. Given the difficulty of estimating the loss of Buying Power due to potential decreases in long positions, action by brokers to increase maintenance requirements, and other unknowable factors, this can only ever be a guess.

http://boards.fool.com/1228/lets-assume-i-have-an-account-wi...

5b. How can I do this trade and be completely safe?

Sticking to buying XIV and using spreads will prevent an unexpected margin call, but realize that this may cost some potential profits and/or increase the risk of a total loss of investment. There is no way to be sure that the trade won't fail and all money invested will be lost.

Ultimately, although going short VXX (in whatever fashion) is an attractive trade that seems likely to do well, there is no "free money" or "sure thing" here.

6. My short position has been forcibly closed by my broker! What can I do?

If you still believe in the trade you can replace it with a synthetic short, probably using the longest-dated options available. You'll typically pay significant frictional costs (several dollars per share).

7. The VIX just went up, but VXX went down! Is something wrong?

No. It happens a lot, especially when the VIX changes direction sharply. VXX is based on the VIX futures, not the VIX. And the VIX futures don't always move in the same directly the VIX does.

Credits: Everyone. Seriously, this FAQ is not in any way my original work; most of the information is drawn from many posts from a wide variety of authors. Generous contributions of time and effort from many people make this community what it is; trying to name them all would probably take more time than putting together this FAQ.

dangerscott Section

dangerscott knows a lot about the VXX !

Q > I'm curious, why do you use a long call that's higher than your short calls? I ask, because my experience with calendar spreads usually involved a lower-priced, further-out, long call and then selling a series of higher priced, short calls against the long call. Since your strategy seems at odds with my experience, I'm trying to wrap my head around the logic/math of it.

dangerscott > VXX is not a normal stock, it is expected to decline over time so you don't want to spend too much buying an in-the-money long call. The long call's main purpose is as insurance against a VXX spike. It has a second purpose to reduce margin usage on the sold short calls. For that reason, I keep the strikes fairly close.

TMFMoosie on tax loss harvesting

I don't get too fancy with tax loss harvesting, but I do it when, like Jeff said, it makes sense for other reasons.

I'm chiming in again because if you like to be efficient about this, **GainsKeeper** is a wonderful service. I primarily use them to generate a very correct Schedule D with a single click at year-end. I love that they deal with all corporate actions that affect your holdings, like say a company issues a special dividend, part of which is a return of capital. They address proper cost basis of spinoffs (though I had to "help" them once, by pointing out they had it wrong, and they corrected it right quick).

GK flags wash sales, and points out what they feel are optimal sells from a tax perspective. (I often disagree, because of course taxes aren't my primary concern, but it is helpful nonetheless).

GK has a what-if tool that shows tax effects in your accounts before you trade.

Overall, very nice. I've used them for maybe five years now.

Cheers,
-joe

About Master Limited Partnerships (MLPs)

The following piece of information was copied from the financial newsletter "Income Superstars" (Issue 28 | February 2013) by Nilus Mattive. I couldn't link it directly, so it's been copied exactly. I thought it nicely summarizes the issues and advantages of the tax treatment for MLPs - brief and easy to understand, yet comprehensive enough to mostly get the picture of what's going on.

Master Limited Partnerships (MLPs) ... should be kept in regular taxable accounts.
Unlike regular corporations, a master limited partnership's income is treated as if it is earned by the partners (i.e. investors) and it is allocated to them based on their individual stakes. The partners also share in any other events that typically affect taxable income such as deductions and credits.
So although an MLP's hefty cash distributions may look like regular dividends, the bulk of the money you might receive is considered a return of capital and NOT taxable investment income.
What does this mean? That much of your distributions are tax deferred — just as if they were ALREADY in a traditional IRA plan!
That's reason enough to keep MLPs out of an IRA. But there's also another reason. It's a long and boring story, but here's the short version: Any amount of income that exceeds $1,000 will be taxable even if the MLP is held INSIDE a taxsheltered account. That's because it will be considered "unrelated business income". And please note that the $1,000 limit is not applied to each individual holding but rather the income you might be receiving from all your MLPs.

North Star

" North Star" is a new guiding light for PRO.

"*Pro*'s Mission

Our mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to meaningfully increase the real purchasing power of capital over every rolling three-year period and to double our real purchasing power every 10 years.

***Pro*'s North Star: Inflation + 7% annually**

Our North Star is a guide for our investing behavior. Like the real North Star, we can use it to navigate. It is not a destination; rather, it's an omnipresent fixture that offers us direction and reminds us of what we're striving toward."

A North Star Story

Imagine that you are an intrepid soul – perhaps a Viking -- sailing over uncharted waters, striving always to sail due west. The days are monotonous and boring, long hours of rowing, day after day of nothing but ocean and sun.

Then one day, your lookout freezes, then shouts in panic – there is a storm ahead. Soon all can see it, a raging maelstrom of wind and rain, massive beyond belief, spanning the horizons and bearing down on you at speeds you could not match with ten times the oarsmen. There is no avoiding it, no chance to run – you must furl the sails, unstep the mast, and turn into the teeth of the storm, rowing furiously to the rhythm of the drum.

And then it is upon you, and there is nothing but wind -- howling, screaming wind -- and rain, rain that is different than any rain that has ever fallen on land, rain that seems to come from the sea itself, driven at speeds beyond belief. And – there is darkness, deep, abiding darkness, broken only by Olympian flashes of lightning that reveal, for a flickering instant, the mountainous waves all around you.

There are no breaks, no lulls; you understand now why the ancients worshipped, but even more, feared, Neptune and Poseidon. You row like a madman – which you are; no sane man can survive in this raging nightmare. You row for hour after hour, as adrenaline fades and you become so weary that you would almost – but not quite, not yet -- welcome the cool embrace of the depths.

And then, suddenly, it is over, somehow, you have made it through. Almost everything that was on the ship is lost to the sea, including many of your shipmates; you are blown far off course, with no idea of your location or orientation. Your weariness is overwhelming, and beneath it lurks a sense of despair and hopelessness. You are lost . . .

Then the clouds part overhead, and, joyful tears streaming from your eyes, you see the familiar constellation Hellewagen, and there, above the end of the wagon, five times the height of the wagons interior, is fabled leiðarstjarna, the Lodestar – or as we know it today, Polaris, the North Star – the one true star, always fixed in the sky, always reliable, friend to lost sailors. Keeping the North Star dead astarboard, you sail west, no longer lost.

So, my interpretation, {which is of course in no way authoritative**}, is that the North Star is not a target or a destination; it is instead a fixed and steady reference point that allows Pro to steer a course that is straight and true. Should INTC be bought or sold? We do not look merely at its value, or its dividend; we also look at the role it would play in our portfolio, and whether by adding it we continue to sail straight and true, with the North Star on our right - i.e., are we on track to earn the desired return over the long haul?.

And this is kind of an important distinction – the distinction between a guiding reference point and a target – because viewed as a target, the North Star could actually be a problem. Suppose there is a year where Pro's return is only 2% as we enter Q4 – if the North Star is a target, the pro team might be incentivized to take great risks to try to meet the North Star "hurdle." And this would be bad.

Instead, I see the North Star as a long-term guideline that helps the pro team evaluate every holding and every opportunity – the test being, over the long haul, will this investment help us stay on course to meet the North Star objectives?

Now, I recognize that this discussion may not actually be of much help in understanding the North Star, possibly because I am in error in my view of it, and more probably because of the elliptical nature of this post.

But, at a minimum, I expect that this post has achieved at least one thing – it has dissuaded you from ever sailing out of sight of shore!

MCRich

Pro-Specific Terminology

<Tentative caveat by fullofcarp> The following caveat applies to many Pro-specific uses of words: "...and if you don't understand exactly why **that particular** definition is used here at Pro, trust us old-timers, Pro tried a few different ways to deal with this issue during its first couple of years and settled on this one because no wording has proven perfect, but this one seems to work much better than the others."

Buy around price <Tentative definition by fullofcarp> Pro's purchase-price guidance is honest enough to point out that valuation estimates are just that--estimates. Therefore, although it is always better to buy something for a lower price, even if the price rises a little bit (about 5 percent, for example), that doesn't mean that it's no longer a good deal. For smaller-sized companies with less liquidity (Pro doesn't have enough influence to affect prices at a company like Intel or Apple, but many of its recommendations are for much smaller companies), there is often a "TMF pop" immediately after a recommendation and members often complain about not getting into the trade in the opening minutes. Occasionally the price will continue to rise and refusing to pay a few pennies above the "buy around price" will mean that you never make the trade, but often the price will "eventually" settle down, perhaps hours or days or months later, providing patient members with the opportunity to open the position at their desired target price. Hence the purposeful ambiguity of the "buy around price" concept.

Addition by TMFMoosie: Always use a limit order. Set the limit at the most you're willing to pay, *and then forget about it*. The company recommendations at Pro are designed to be longer-term holdings. There's no rush.

Terms & Slang

Bearish Like a Bear. Eating fish and berries. (Delightful! -TMFKabellen)

Beta: A measure of the sensitivity of the price movements of a stock in relation to the movement of the broader market. A stock with a beta of 1.00 will theoretically move 1% for every 1% move in the market. A stock with 20% more or less price volatility than the broader market will have a beta of 1.20 or 0.80, respectively. Beta can be calculated by regressing the historical returns of the stock against the historical returns of the broader market index. (Added by JE from Options Glossary. please change/add)

Bullish Like a Bull in a China Shop (how apt! JE May 2013)

Free cash flow (to the company): Money leftover for creditors and shareholders when all of a company's operational and investment expenses (think equipment upgrades, acquisitions, taxes) have been paid. This figure arguably provides a more accurate picture of the company's profits and financial strength than net income or earnings per share. (Added by JE from Options Glossary. please change/add)

Hedge: An offsetting position meant to reduce the price, volatility, or risk of an investment. (Added by JE from Options Glossary. please change/add)

Historical volatility: The annualized standard deviation of the stock's price changes. Typically, daily price changes are used.(Added by JE from Options Glossary. please change/add)

Limit order: A modification to a brokerage command to buy or sell that allows you to buy or sell at a set price or better. These are particularly useful for illiquid stocks, as well as the option markets, for which there is often limited liquidity. (Added by JE from Options Glossary. please change/add)

Liquidity: Refers to how heavily traded a stock or option is, and usually corresponds to how wide the bid/ask spread will be. A heavily traded stock or option will have lots of liquidity and thus usually a narrow bid/ask spread. (Added by JE from Options Glossary. please change/add)

Long: Having ownership of a security. If you own 100 shares of a stock, you're long the position. If you have purchased a whole mess of puts on something, you're long a whole mess of puts. It can also be a slang term meaning you feel positively about something

Market-maker: Typically, a floor trader on an exchange whose job is to accept bids and offers from other traders — be they big institutional traders or Joe and Jane Optionsmember. The main job for a market-maker is to maintain liquidity and ensure that prices are more or less fair. (Added by JE from Options Glossary. please change/add)

Market order: Typically the default order type for an options trade. It tells the broker to place your trade at whatever price is currently available on the market. Since options are often thinly traded, market orders can be very dangerous, as the bid/ask spread can be wide and a market order will simply buy at the ask or sell at the bid.See also: bid/ask spread, limit order. (Added by JE from Options Glossary. please change/add)

Mid: The midpoint between the bid and ask. When using a limit order, it's often advantageous to set it to the mid — sometimes called "splitting the bid/ask" — and move outward from there if the order doesn't get filled. (Added by JE from Options Glossary. please change/add) See also: ask, bid, bid/ask spread.

Return on equity (ROE): Return on equity is the profit earned on capital that stockholders have contributed to the company. Let's say a company has issued $100 million worth of stock, $100 million worth of bonds, and $50 million in preferred stock. This imaginary company brings in $25 million in profit, and pays out $5 million in interest payments on its debt and $5 million in dividend payments to the preferred shareholders. It is left with an adjusted net income of $15 million and total equity of $100 million, so it has an ROE of 15%. (Added by JE from Options Glossary. please change/add)

Return on investment (ROI): Return on investment is the profit earned on funds put at risk. If you buy 100 shares of a stock trading at $10, and it rises to $12, you have an ROI of 20%. (Added by JE from Options Glossary. please change/add)

Return on invested capital (ROIC): Return on invested capital is the profit earned on all sources of capital contributed to the company. Going back to the ROE example, the company has a total capitalization (equity + debt + preferred stock) of $250m. There are various ways to measure return on invested capital, but one of the simplest ways is to take net income and divide it by total capitalization. So if this imaginary firm brings in $25m in net income, it has an ROIC of 10%. Although slightly more complicated, we prefer to calculate ROIC using net operating profit after taxes (NOPAT) in the numerator.

See also: NOPAT, return on equity. (Added by JE from Options Glossary. please change/add)

Short: Having an obligation position in a stock or option. When you go short a stock, you're borrowing the asset, selling it, and hoping to profit by buying it back at a lower price. Shorting a stock reflects a bearish outlook. In an options context, it reflects the writing of options. In Motley Fool Options, we often pair our short options with our long options. For example, in a bull call spread, you are long one call at one strike and short another call at a higher strike. Despite having one short leg, it's still overall a bullish position. (Added by JE from Options Glossary. please change/add)

See also: bullish, bearish, long, neutral.

Volatility: An estimate of the amount that the underlying stock's price is expected to fluctuate in a given period of time. Generally, volatility is measured by the standard deviation of the continuously compounded returns of the underlying stock.

Useful Hedging Articles

- Hedging the Pro Way Excellent article by TMFPapester
  "There are some major positions in our portfolio that we sincerely hope lose money. Lots of money..."

  Alex Pape explains "Hedging Not Shorting" and shows how hedging works within the whole portfolio to produce good returns.

  Alex explains we hedge for 3 reasons:
  1. **Protection**: Hedging can soften the blow to our portfolio if the market tanks, and we can turn those hedged positions into ready sources of cash to deploy in a then-cheaper market.

2. Hedging **smooths returns** and **reduces risk**
3. Hedging helps us **isolate our investing advantages**. We're not market-timers, and we don't have a special edge when it comes to forecasting macroeconomic variables. What we are good at is identifying companies and stocks that will be long-term winners. By shorting broad market indices such as the SPY, we are able to isolate that advantage.

- Pro: Making Volatility Pay Part 2

Hedging

Template by TMFMoosie: who knows nothing! Please fill in details, add topics.

- Holistic portfolio approach
  - Macro hedge requires macro view
  - Mental exercise: start by hedging 100% of the portfolio, so all market movement is cancelled out. What remains is pure alpha of each company.
  - Back off from that, tuning in desired level of protection.
    - Want some up market "lift", sacrifice is some loss on market drop, only partially muted by hedge. No free lunch.
- For insurance, not net profit (welcome the loss, offset by rest of portfolio)
- Sizing
- Correlation
- Vehicles to use
-
  - Flaws
    - Tracking error
    - Obfuscated calculation (VXX anyone?)
    - Shorts are always more complicated than longs (broker call shares, must pay dividends, etc.)
  - Leverage (2x, 3x ETFs)
  - ETF or ETN?

  - Specific tickers...

Questions With Answers

Hedging v. Direct Shorting

Fool Pro are also thinking about targeted shorts as well as Hedging.

Jeff:

Yup, I agree, targeted shorts are best, but only once you've really done all your homework; there are some company shorts that are very easy to be comfortable with once you've turned over every stone possible. Those are rare and hard to find, but they're out there.

But Sears was a very popular short (and one I was looking at), and look at this year: it's up $159% from $32 to $82 since Jan. 1. A lot of that is likely a short squeeze. In this market, shorts in heavily-shorted stocks are getting crushed in many instances. But I would have never predicted that move and was looking at it as a possible short more than 100% ago. Research ultimately found it too opaque (its primary owner can pull too many strings).

So, like said, shorts take a long time (for me) to dig into and really become comfortable with. And then when you find them, it's nice, and usually works out. But it sure is a long process for me. And not always fruitful.

I like the idea of shorting flawed ETFs just as much. UNG is one, but there's big tail risk with NatGas around $2.40. FAZ is another. I'm not three-x bearish on financials. Are you? VXX of course once the VIX spikes. Other leveraged ones. We'll get on these or others one by one as opportunities look right.

Best, Jeff

Help! PRO recommendation to short the SPY. Allocation is 30% of portfolio (excluding cash)

Q: "*Aaagh! The Pro Recommended SPY Short is 7% down, I'm "losing" money!! and the market is rising!! Is it time to exit ??*"

> **A**: **Relax**.. read more

Q "*Huh?* PRO *are now recommending reducing the Short of SPY back down to 20%. I thought we were relaxed*."

> **A: Read More. Note Highlights.**
>
> Jeff (back in February 2012) Europe's debt crisis has yet to be resolved, but the U.S. seems to have avoided a double-dip recession for now. That fact has sent the market steadily higher since December. But we are *not* closing one-third of our S&P 500 hedge because we believe stocks will continue to go higher in the near term. We don't make short-term stock market guesses. Instead, we're beginning the process of closing this hedge for a handful of much more tangible, disciplinary reasons:
>
> - Yesterday, this short reached a 9.7% loss for us. In our initial report, we said we'd look to exit if it moved 7% to 10% against us. We simply need to limit our losses, even if we might disagree with the market (many people grow their losses disagreeing with the market).

- Also yesterday, the Federal Reserve suggested that it would keep interest rates near zero for nearly twice as long as previously expected — all the way through 2014. By making money cheap (and punishing savers), the Fed is hoping to increase lending and push people's assets out on the "risk curve" — into stocks and other investments that pay a return. There's at least a chance this will help prop the market up.
- We sold our 5% position in **L-3 Communications** (NYSE: LLL) on Monday, and we're on track to sell our nearly 5% stake in **Ebix** (Nasdaq: EBIX) via February covered calls. We do plan new buys, but as we decrease our long exposure and raise cash, we can dial down our hedges.
- We moved to a new broker last week (Interactive Brokers), so we now have a full new array of shorting possibilities that should serve us better than the SPDR S&P 500 ETF. We plan to gradually move to targeted shorts and continue using options to hedge.

What do do ? Market Timing v. "Easing In"

PRO have recommended shorting the SPY index. Here, a discussion arises about when would be the best market time to close this Short SPY position. 8 % loss ? 10% loss ? There is talk of "Market Timing" which is not generally reckoned to be a Pro Foolish strategy.
Aleax gives an excellent reply and introduces us to the concepts of DCA (Dollar-Cost-Averaging) and VCA (Value-Cost-Averaging)
Q: "*Or otherwise you'd be trying to time the market which you wouldn't do*"

A : Aleax **I don't see "easing into" a position as "market timing"**. The traditional equivalents when building up a long position are the classic and often convenient "dollar cost averaging" and the less well-known, less convenient, but better-performing "value cost averaging".
In **DCA**, you set up a total amount A you're willing to spend in a position, an end time T days from now by which you want to be fully invested, and N, the number of slices you want to use in the build-up; then every T/N days you spend A/N dollars buying shares. The result is to dampen market fluctuations. It's convenient if you have funds coming in regularly and periodically, as many savings plan do.
In **VCA**, you also set T and N, but, instead of A, what you initially set up is V -- the total value you want your position to have at the end of the set-up period (as opposed to the total cost basis, which DCA uses)
So, every T/N days, you look at the current target value for your position; if this is slice I of N, you're aiming for your position at this time to be worth I/N times V -- this is "C", your "current target". Your position currently is actually worth some X which depends in part on how much you've already bought, in part on how the market has been fluctuating. If X is already larger than your C, don't buy anything (in "aggressive VCA", you'd actually sell X - C to bring you down to the target, but I prefer "lazy VCA" where no selling is done). If X is smaller than C, buy C - X more to get you up to the current target.
VCA dampens market fluctuations even further (lazy VCA does so prudently, aggressive VCA, well, more aggressively;-). In many practical real-live situations, it's not as convenient as DCA since you can't predict beforehand exactly how much you'll be spending (your cost basis) and the amount of spend per "slice" on your way to your target; however, it's more effective than DCA when the asset you're buying is trading in a very range-bound way with lots of fluctuations between a lower and an upper bound (AKA "a horizontal channel").
In case you hadn't noticed, SPY's been in a very marked horizontal channel for 10 weeks now, between about 112 and 122 with few small and very temporary excursions outside the channel. Nothing wrong in noticing this pattern and trying to trade with it, rather than against it, is there?
So here we're considering building a short position (one equal to 30% of our long-shares position) so things are a bit different than in the canonical case (of building up a long position) I just outlined.
Shorts act in a way that may be counter-intuitive if you're not experienced with them: they grow to be a larger % of your portfolio when they're performing badly for you (growing in price), and vice versa -- just the opposite of long positions. OTOH, if you have ample buying power (which you will when you're aiming to build a short position that's just 30% of your long ones' total), there's no need to worry about lacking cash to increase a position -- you get cash when you sell shares short (you do need buying power to provide margin for your short position, but I already mentioned why that should be abundant anyway, so, no worry). So DCA has no intrinsic advantage of convenience when compared with VCA for this very peculiar case.
Also, the target is a moving one -- it's "30% of your long position"... and the total value of your long position varies daily (these days it will tend to have high correlation with the market, BTW -- correlations recently have been far higher than historic norms would suggest).
I can find no literature on DCA/VCA equivalents for short positions (much less short positions w/a varying target!) -- maybe exactly because, while DCA and VCA are trading strategies, they're exactly the reverse of what traders want (maximize short-term profits by being lucky in calling the tops and bottoms of the market): they dampen variability. So, I developed my own back-of-the-envelope approach to deal with this situation.
First, I'm assuming the 110-122 channel will continue for a while -- a decisive break-out either way will cause me to reconsider, and switch tactics if I don't have the total desired hedge amount yet.
Given this, I look at the possibility of increasing the hedge size, VCA-like, every time SPY gets close to or beyond 120 -- but if I decide I should, then I do that in a fixed-size small slice, in a multiple of 100 shares (so I'm holding a multiple of 100 at all times and can switch to options-on-SPY if and when that looks best).
Depending on volatility, doing that by writing naked calls just above resistance may be best (weekly options are good for this kind of trading). Vice versa, every time SPY gets down close to 113 or so, I'll consider (aggressive-VCA-like) whether I should trim my hedge's side, maybe by writing OTM "covered puts" just below resistance.
Should Pro recommend some variation of that? Nah -- the potential advantages are truly marginal -- if everything goes perfectly I expect to make maybe 80-90 basis points (of my portfolio) from all of this trading complexity, and that's only because I'm with OptionsHouse so my commissions and fees are truly small; if my portfolio was smaller and/or my broker charged high commissions, every potential advantage would be eaten up by trading friction -- too many small transactions, you see.
Pro needs to make recommendations that are simpler and will work best for the general membership; those of us who have a little bit more trading experience, larger portfolios, and/or better brokers (aspects probably not uncorrelated to each other;-), can presumably fend for themselves (or just get three 10% slices at 10 days' apart from each other to "ease in" in the simplest way -- DCA-like). Getting this position via options is particularly strange and requires your desired position to be several hundred SPY shares short -- as well as being eager to do trades in complicated ways and paying small commissions. I applaud Pro for avoiding any such rec and just doing their own version of simplified DCA/VCA mix to ease into the position.

Aleax reply to be edited // JE

I am so glad that I posed the Limit Order vs GTC question. Bob and you have thrown a lot more light on the subject than I thought was needed and I thank you both for it. However,to fortify my defensive poition, is there any book you can suggest that will give me greater understanding of Market Makers and their modus operandi.

There are cheap books (trying to cram in lots of elementary to intermediate option knowledge and maybe some technical analysis to boot and with a cherry on top about market makers), and then there's Larry Harris,http://www.amazon.com/Trading-Exchanges-Market-Microstructur... . $100 list, $60 at Amazon, $54 for the kindle edition (but you really need to read the latter on a PC, Mac or iPad -- the screens of actual kindles are too small), $53 used; 600+ pages of solid information.

It's a textbook (but not dry or heavily mathematical: quite readable actually!), intended as a complete coverage of practical market microstructure issues for, say, an MBA or the like, and covers ALL kinds of markets, not just options ones. Quite an investment of money, time, and energy. But as the top comment says, "I now run a hedge fund. We make about 10,000 trades/day. I wish I had read this book years ago. I've had to pay Mr. Market a large sum to learn many of these lessons".

I would complement it with McMillan's "Options as a Strategic Investment" (even pricier and bigger, both highly mathematical and very practical, and really options-centric of course) which is what all market makers in options have to study to get a job and also THE definitive text on options, but, that's by the by -- McMillan does not give any of the nitty-gritty of market making that Harris covers well!

Till such time that I learn more, I shall stick with LIMIT ORDERS only.

And once you do learn more, you'll use limit orders pretty exclusively: market orders (with the exception of small-ish trades in very liquid securities) are for the birds!-)

Foolish Use of ETFs

***Don't* hold inverse and/or leveraged ETFs** for any substantial period, especially in volatile market.

The SEC clarifies why at this URL.

In brief: perfect daily tracking of an index in a leveraged or inverse fund arithmetically *guarantees* mis-tracking cumulating on many-days periods, especially on high daily fluctuations up and down.

E.g. assume SH perfectly tracks the inverse daily result of SPY. One day SPY starts, say, at 100, and goes up 10% that day to 110; then SH, also say starting at 100, that day must go down 10% to 90. Then the next day SH goes 10% down to 99 -- note that 10% up and 10% down (in either order!) do **not** cancel each other out, but end up -1% over the two days together. Indeed, SH goes up 10% from 90 -- also to 99.

The perfect daily inverse tracking ensures that after the two days in question both SPY and SH are -1% at 99. Clearly, this shows that SH is not an acceptable hedge for SPY over longer periods of time, especially under conditions of high daily gyrations up and down.

And indeed in real life look at this graph showing YTD performance of SPY and SH (as to the date of this writing, Oct 18 2011): while apparently the way they move is an exact mirror image, the small cumulative tracking error means that as of close today they're both down -- SPY -3.67%, SH -2.33% (just yesterday it was SPY -2.52%, SH -3.49% for the year to that point -- these *are* volatile times!-). IJR - S&P SmallCap 600 Index

- *Q: Is IJR or SBB a good substitute for SPY ?*
- **A:** Aleax responds: http://boards.fool.com/1228/what-about-sbb-does-sbb-track-the-inverse-of-spy-29613113.aspx

  IJR is fairly correlated with SPY of course, but "peppier" (beta 1.16), and small caps don't always move in sync with large caps (SPY is dominated by large caps, actually most of the weight is with mega-caps since the fund is weighted by market capitalization).

  Over the last month, IJR +1.28%, SBB -3.71% -- I personally would not call this acceptably close to reverse-tracking, even just on a one-month basis.

Let me try to show why on an algebraic tack since simple arithmetic does not seem to put this question to rest. Think of an index "growing by 1%" in a day as equivalent to "being multiplied by 1.01" and viceversa losing 1% as "being multiplied by 0.99". Generalize that 1.01 to a generic X which equals "1+P" with P being the percentage as a fraction (positive for growth, negative for loss). OK so far?

So if the index has a 1+P multiplier in a given day the perfect inverse will have a multiplier of 1-P -- still following?
Then the next day say 1+Q for the index, thus 1-Q for the inverse.

For the two days together, the index has (1+P)(1+Q) overall: i.e. 1+P+Q+PQ. The inverse, (1-P)(1-Q): 1-P-Q+PQ. Look at the signs carefully: the +P+Q and -P-Q parts are indeed inverse of each other; but the PQ part has the same sign for both the index and the "daily inverse" fund, as the minus signs cancel out in multiplying.
For example if the index goes up a lot one day, say P = 0.10 (a 10%-up move) and down as much the next day, Q = -P (a 10%-down move), the +P+Q cancels out -- but the PQ part is overall -0.01, so the index is overall down 1% for the wild two-days pair. But so is the inverse!!!

For less-volatile days the deterioration of the tracking is smaller, but it's cumulative -- it just keeps churning. For example, YTD, IJR is down -- -6.29%, SBB is too, -2.64% -- some "hedge"...! Depending on your holding period cash is actually a better hedge... at least it's flat YTD;-), not down together with the reference index.
This is particularly important in times of high daily volatility, which, as it so happens, is exactly what we've been experiencing for many weeks now. Stay away from inverse or leveraged funds, except perhaps for short spells of time in reasonably quiet markets...!

IWM - Russell 2000 small-caps

SBB - S&P SmallCap 600

- ProShares Short SmallCap600 (ETF)

- **Q:** *What about SBB? Does SBB track the inverse of SPY well enough to be a reasonable substitute? I took a quick look at the chart and yup, it looks fairly opposite! :-)*
- **A:** Aleax responds: http://boards.fool.com/1228/what-about-sbb-does-sbb-track-the-inverse-of-spy-29613113.aspx
  Inverse-tracking ETFs all track daily, which inevitably means tracking deteriorates with time -- the shape may look OK to the naked eye, but, if you look at the numbers, hmmm, not so much. Use IJR perhaps.
  Proper benchmark for SBB is IJR (S&P Small Caps) -- IJR

SH - Short S&P 500

- ProShares Short S&P 500 inverse track of S&P 500
- SH is a Foolish ETF see SH page

Wiki: Getting Started With Pro

Published Oct 2, 2011 at 12:00AM

Template started by TMFMoosie

Please add to this list, or begin fleshing out details. Put yourself in the position of the new member. Literally "what do I do now?".

- Step 1: Read Making Pro Fit You
  - This is a good overview of adjusting to Pro as a new member. It addresses varying options permission levels and being already fully invested elsewhere.
- Step 2: *Keep reading*.
  - There's no rush to get invested. Looking back ten years from now, a week or three delay in plunking down the cash will seem insignificant.
  - Pro is much more than just recs like "Buy Company X, 2% allocation". The "other half" of Pro is what you're learning now. Read everything on the site. Pay more attention to the conceptual stuff. Reading between the lines, you'll begin to get a feel for the underlying whole.
  - *Authors: List of great links to official and boards content here, please. Point newbies to the content that most helped you! Some company stuff may be useful, but this is really "teaching someone to fish" time.*
- Step 3: On your mark...
  - Choosing a broker
  - Setting up options permissions
  - Placing complex trades
  - paper trading a new platform
  - How much investable cash do I *really* need?
- Step 4: Get set...
  - Allocations
  - Pacing
  - Hedges, and why they may be for later
  - Option catch-ups: concept (shifting strikes, expiration), pro/con
- Step 5: GO!
  - Buy Firsts
    - Yeah, but still just do thirds, or similar. Avoid inadvertent market timing. (maybe that phrase is a glossary link)
  - Buy "seconds"
    - Especially consider using written puts, or covered calls, to get a better cost basis.

Wiki: Brokerages

If you want to add another broker, don't worry about this Table of Contents. Just create a section below, and type!

Nick published a general guide to brokerages.

Checking out that link above, it's a long thread on the boards but I couldn't see Nick's comparison table anymore, which I know for sure existed in the past. But the Fool has a brokerage table on the public sites, which can be accessed here: http://www.fool.com/how-to-invest/broker/index.aspx

For more details and the latest ranking by Barron's, please see the following links:

Barron's 2013 Online Broker Review

Barron's Best Online Brokers of 2013

What follows is some more detailed information from current users of each:

TD Ameritrade (who have acquired and integrated ThinkOrSwim)

Likes:

1. The ThinkOrSwim trading platform, which lets you do just about anything from a stock or options perspective.   Makes me feel like a professional. This is a powerful platform that is easy to learn and handles complex option trades very well.

2. The Website is very convenient for managing multiple accounts and the cash transfer functionality is excellent - basically you can initiate ACH transfers in either direction between an account and one of several registered bank accounts.

3. Customer service is exceptional. Every time I've called with a question I've been able to get an answer from a knowledgeable person. If I have an issue or just need education on something like ToS they handle it professionally and patiently. In addition, I didn't have to go through a maze of phone trees to get to a live person.

4. My TD branch has a local broker who is very helpful and responds anytime I call him. He even went so far as to give me his personal cell and to encouraged me to call anytime.

Dislikes:

1. Technical issues started appearing in Fall 2011 as they get to the advanced stages of integration with ToS - as described here.

2. Some of their rules relating to account types are irritating. For example they will only allow one account of the same type and beneficiary to have margin-level privileges, which are required to trade defined-risk spreads. Although they accommodate Coverdell ESAs, they treat them differently to IRAs, so one can't trade spreads in them at all.

Other:

Commissions: looks like I'm paying about $7 for stock trades and $2-3 per options contract.

Commissions: FYI - Depending on the size of your account you can negotiate significantly better rates. While they may not match some of the bargin basement brokers they are extremely competitive and for the level of customer service I receive I'd much rather pay a bit more. They beat the negotiated rates I had at ETrade by 50%.

In addition to the ToS platform, they also have a platform targeting less sophisticated traders called "Trade Architect". Perhaps someone who has used it could provide a description.

Note: ThinkOrSwim now works on Linux!

Wells Fargo

As one of the first online brokerages WFC offers an older web platform and user interface. Service is good, but options permissions require experience and a high net worth. If you have a banking relationship and a PMA account with the bank - e.g. if your mortgage is with them (or if you maintain at least $25k in balances and are willing to open a checking account) - then you can get 100 free equity trades per year, per account.

New...as of February 2013:

Wells Fargo Brokerage will change the 100 free trades policy. Beginning April 1, 2013, only grandfathered brokerage account holders will keep their 100 free trades per year if other conditions as mentioned above are met. New brokerage customers though will NOT get 100 free trades anymore. They offer a lower commission rate though that'll be $6.95 independently of the number of trades per year. The commission fee so far for trades above the 100 free trades is $8.95 and will stay like that for the soon grandfathered accounts.

E*Trade

Remember, making amusing commercials does not qualify you to build and operate a good brokerage service.

I used E*Trade for 15 years. Moved to Interactive Brokers in 2007 for the cheap rates. E*Trade tried several times to keep the business, but they couldn't come close to the rates, even though my account was fairly sizable. They asked me where I was going, and didn't know who IB was. They don't view them as a competitor. Interesting.

I liked E*Trade during my time there. Customer service was top notch. Darn near perfect. Cash management and movement tools were good (and still are, I still have my online banking with them). When I left, rates were competitive with TDAmeritrade, and probably Fidelity. Those are who they view as their competitors. I think it was $10 for a stock trade, and $10 *base* for an options trade, plus 70 cents per contract. Assignment was $20. Power E*Trade offered a better trading platform (IB still blows it away), and cheaper commissions, but only after you've spent a ton of money per quarter at the higher level. At the time, I found that kind of tiered system to be common. Don't know about now, but that, and pricing was why I left. But I still like them. For someone who needs a little hand holding from time to time, or someone to research a transaction, E*Trade will be a good choice, in my opinion. -- *TMFMoosie*

Scottrade

Most of the times that a new member posts a question about options permissions or how to use their broker, the broker in question is either E*Trade or ScottTrade.

Scottrade has very limited platform for trading options. If you use them, you'll want to upgrade to their OptionsFirst product, which seems to be a separate account. Pro option strategies are integrated with the whole portfolio, so make sure you can move *everything* to OptionsFirst, I guess. I have not used Scottrade, but have heard this complaint many times.
Anyone use Scottrade? Care to share your experience? *(double-click this page to start editing) -- TMFMoosie*

I used Scottrade when I first started but have since left them behind as I've moved into options trading. OptionsFirst was a separate account, and even that didn't make strangles or straddles intuitive. Not that I had some international holdings from the Hong Kong exchange and some Pink Sheets that I could not transfer to TradeKing. --kiplin

By the end of April 2015 Scottrade will have dropped the OptionsFirst platform in favor of utilizing Interactive Brokers for their complex options trading. Because I am not a high volume trader I am leaving Scottrade because of this change because IB charges $10/month/account "inactivity fee". I have four separate accounts and IB's low prices (and they are really sweet) wouldn't offset that hit for me. If most of your business is stocks, not options, then the customer service at Scottrade is unbeatable. I'll really miss them. Patrick H

Interactive Brokers

Likes:

1. Very low commissions. As low as 1$.

2. Very large inventory of shares for shorting. (During Pro's VXX experiement of Auguts 2011, IB was one of the only brokers who had shares of VXX available for shorting)

3. Allows you to engage in nearly every trade type - within the limits of your account type. So you really need to understand what you're doing or else you can get into a ton of trouble.

Dislikes:

1. The trading interface can take some time to get used to.

2. Not as many bells and whistles as other brokers. (for example no 10-minute retirement tool like available at Schwab)

3. A few complaints about IB's customer service when their system botched trades

Institutional focus: TMFMoosie's experience with IB...

IB was originally an institutional broker. And they still have a huge institutional client base (hedge funds, pension funds and the like). Because of this institutional focus, they had a Financial Advisor account setup, so if you manage money professionally, you have a master account, like an umbrella over each separate client account. Certain things can only be done by the advisor, like trading, perhaps, depending on how the advisor sets it up. And certain things, like making withdrawals, are restricted to each client.

IB hasn't changed this model for individual investors. If you have multiple personal, or family accounts, and want them linked together, you have to open a Financial Advisor/Friends & Family account structure. So, with my four "real" accounts, I now also have a fifth: the Master.

Opening accounts:

This presents some clunkiness when opening accounts. I've been with IB since 2007, so some of the details are hazy. Each account setup is separate. At some point, the advisor (you, logged in as Master) sends an invitation or something, to the client (also you). I know I had one bump because the application process wouldn't let the email address of master and client to be the same, so I had to get another freebie from gmail, just to go through the sign up. 'Cause that's where they send the verifications and stuff. Maybe they've fixed that, I don't know.

Market Data:

During the opening process, and/or afterwards, you need to decide on market data. Unlike other brokers, IB runs a very lean cost structure, which they pass along to you. They also pass along certain fees charged by the exchanges.

All brokers have to cover their market data costs somehow. Most of them keep the commission structure simple, if not very low. The problem is that you end up paying for data feeds from security types you may never use, like futures, bonds, pink sheets, indices, foreign, etc.

IB charges for market data separately from their rock-bottom commissions. It's on a cafeteria plan, so you just sign up for, and pay for, what you need.

Initially, just sign up for the US Bundle. It's all US stocks and ADRs, futures, and currencies. Real-time pink sheet data is extra ($3/month). Note, even though you may not need currencies or futures, they're included, and interestingly, by default all permissions are in place for you to trade these vehicles. I found this useful when pondering bearish positions on Europe and the Euro.

A few of the more popular indices are extra, perhaps because the exchanges understand their popularity, and charge for them. A buck or two per month. Or, you could do without, and just look at google finance once in a while.

The US Bundle costs $10/month, to the Master account, but the fee is waived if you generate $30 in commissions across any of the accounts in the month.

You can easily change your market data subscriptions via the web-based Account Management page. (Log in directly, or follow a menu item from the Java-based TWS trading platform). The changes take effect immediately.

Keep a little cash in the Master. I move $100 bucks into it once in a while. This is used to pay for any market data above the US bundle. Or the bundle itself if I don't trade much that month.

I just checked, and in the last nearly five years I've spent $185 in data fees. Most of this was $10/month in the months when I was just getting things started, and a several month period in which I had few trades. Perhaps not small enough to ignore, but I don't worry about it, either. Net, this is still much cheaper than other brokers.

Minimum fees:

IB caters to the more active trader/investor. So if you just buy stocks once in a while, and rarely sell, and want dividend reinvestment (DRIP), you may be better off elsewhere.

But run the numbers first. They do charge a monthly minimum, but the commissions are SO cheap, that even one trade can make it a wash, and two can beat most other brokers in terms of total fees.

Now, this is where it gets confusing. And this is where I get frustrated with IB. I wish they'd fix this, but overall this isn't a showstopper for me.

The minimum is $10/month per account. And I'm almost certain this even includes the Master, which is just dumb, because that's a placeholder that merely exists as an umbrella, and to attach market data to.

So, for my set up, 4+1 accounts, I have a "nut" of $50/month. If I generate $50 in commissions across any of the accounts, no fees are charged. But if it's less than the $50 total, each account is prorated. So, assuming my master generates nothing; and I spend $49 in the margin account, and zero in the IRAs. You'd think I'd owe a buck, right? I wish. I would owe 10 for each account, less any commission in that account. Since I generated no other commissions, I'd owe $40, $10 each including the master. The margin account is safe, because that's where I did the $49.

I keep tabs on this near the end of the month. If it looks to be a close call, I'll do some no-op in-and-out trade, just to spend the commission. Stupid, but spending say $5, to save $40? Worth it.

If you're like me, you're thinking, wait, if IB is this dumb, should I want to have them as my broker? I think it's useful to realize that this is one of the ramifications of the historical view of financial advisor account setups. There was no concept of all the accounts being owned by the same person, or family.

I recommend complaining about this once (so they know), and then forgetting about it. It has nothing to do with the trading platform, which is also affected by the institutional focus, but this time it benefits us. Some feel it's a steep learning curve, but I think it's worth it. It's like a 50-caliber gun. Loaded. You can shoot yourself if not careful. But with a little experience, you can really "do some damage" :)

Charles Schwab

Likes:

1. Provides a nice tool to report called "Portfolio Analysis" which calculates the Time-Weighted Return over a number of different periods and provides comparisons to benchmarks.

2. In their Guidance section, I like their "10-minute retirement assessment" tool. Gives the user some nice results to allow one to consider how much should be saved for retirement.

Dislikes:

1. Not as easy to short as other brokers such as IB, and when shorting is possible the fees can be quite high.

OptionsHouse (OH)

As of Oct 1, 2013, the stocks flat rate has increased to **$4.75** for new OH users.

Trading platform is very easy to use.

If you'd want to see all current OptionsHouse promotions, simply go to:
http://www.optionshouse.com/promotions/

Before I list the individual promotions and links to them, one word of advice. When you apply online using the promotion code, only one code can be used. But, they apparently do stack those promotions. You may have to call them though and ask for it. You can either do that by calling to open up the new account and then ask for the 100 free trades **AND** the ACAT transfer fee rebate of $100. Or you can apply for a new account using one of the promotions and then call afterwards and ask for one of the other promotions in addition. I have gotten two promotions for opening one new account in the past. So it might still work.

Now regarding the individual promotions:

I personally would see the one as most interesting that gets you 100 free trades when you open and fund a new account with $5,000 or more. The promotion code is

FREE100, but you can also use that link: http://www.optionshouse.com/signup?promo=FREE100
It's interesting that I think you get those 100 free trades also if you have already an account with OptionsHouse but open an additional, new one. This promotion always works - no need to go through a referral link for that.

Another promotion offers a $100 cash rebate to cover any transfer fees when you move your stock, option, or mutual fund holdings to OptionsHouse via an ACAT (account transfer). The promotion code is: ACAT100REFUND. And the direct link: http://www.optionshouse.com/signup?promo=ACAT100REFUND

The third promotion that's currently listed gets you a $25 cash rebate to cover the fees for a wire transfer to OptionsHouse. Promotional code: WIRE25REFUND. The direct link: http://www.optionshouse.com/signup?promo=WIRE25REFUND

Fidelity Investments

Fidelity is really into mutual funds, but since they do so much trading, they allow their customers brokerage, trusts, business, retirement, institutional, and other types of accounts. However, only one brokerage account has margin per SSN, even if you have 10 separate brokerage accounts. They try to compete with mid-priced full service online brokers, so the usual online stock trade is very competitive. However, if you have a large amount of money in various account or if you trade frequently (more than 200 per year?) you can get a decent discount on both stock ($7.95 vs. $5.95), option ($0.70 vs $0.65) and currency trade fees. I'm sure larger account balances or high trading volumes can negotiate even better rates.

Fidelity allows trade access to most major foreign exchanges and at least 7 major currencies. So you can also add currency trades to your stock and options activities. However, unless you apply as a very experience trader (and they accept), Fidelity will restrict some of the riskier activity from normal customers. They also make you apply for option and spread trades in retirement accounts, but you may not get approved at your desired level. You may have to go through a probationary period to prove you know what you're doing before they allow "riskier" trades in retirement accounts. This paternalistic approach may or may not be an irritant to someone who wants unfettered access to all trading types.

For the most part, Fidelity has no problems executing most Pro and Options trades. However, Fidelity may also not have enough shares for shorts on both stocks and index ETF, or certain option contracts. I ran into that during the Motley Fool Alpha's brief life, and a couple times with some Pro ETF trades.

- The Healthy Investor

Panic Questions In A Volatile Market With Relaxing Answers

- **Q**: *Aaagh! SPY Short is 7% down, I'm "losing" money! and the market is rising!! Is it time to exit ??*

  A: TMFPapester > **Remember our goals**. Remember our time frame. Remember why we shorted.

Absorb new information thoroughly before acting. Watch the performance of your overall portfolio, not one position, and especially not a hedge in isolation. Trade only hesitantly.

Stay calm, thoughtful, independent-minded, and long-term focused.

A: TMFFischer > I understand the desire to cap losses in any direction (on a long or short), but if you do that too much in a very volatile market, **you risk taking losses in both directions when stocks keep see-sawing**.

This has certainly been a challenging/impossible market if you're trying to maneuver it on a short-term basis. Nobody knows what the market will do next, but if you can think in terms of months at least for your hedges, and years for your longs, it may help. This month (October 2011) has presented the most volatile (to the upside) market since 1974. The month before was one of the most volatile period.

In a market like that, it's very easy for positions to face sudden losses and you to second-guess the position. But overall, you should have made a lot of money back this month. Keep that in mind (never complain with gains) and keep in mind the long-term goal of growing capital while keeping calm. These months will be a bad memory before long, and as long as you have maintained your portfolio value, we'll all be ready to grow that value, wiser for this experience.

I doubt volatility is over (is it ever really over?) but that's why we can't obsess with it. We have to invest despite it, being mostly long in businesses we believe in, and hedging or shorting as we're comfortable doing so. In good times, our longs should grow our value strongly despite hedges; in bad times, the hedges will help.

- **Q**: *Long position XYZ has tanked today! I'm down 25% !! XYZ sure does not look like a horse with 4 good legs to say the least*.

  A: Jeff Fischer: Remember we have a multi-year outlook on any stock we buy. To keep your blood pressure lower and help insure investing success over the years, keep reminding yourself of this. The **daily price moves don't mean much** of anything.

- **Q**: *Short position ABC has shot up today! I'm up 125% !! ABC sure doesn't look like a horse with 4 good legs anymore ;P*

  A: foolinsd: Personally I'd close the position if I'm happy with the return. But listen to Jeff *to keep your blood pressure lower and help insure investing success*... Check out the following link for Jeff's response to a specific example: http://boards.fool.com/1228/hi-dave-we-think-in-terms-of-3-years-with-most-of-30498752.aspx

Good Answers To Worry On Various Subjects

Patience.

The Healthy Investor

- aleax > No joke -- two independent research results, one in China and one in the US, both show correlation between **market volatility and heart attacks** (apparently, that occurs among people who own stocks and watch their performance more often, though I don't think from the Financial Times summary that this is established as firmly as the correlation itself).
  http://www.ft.com/intl/cms/s/0/d1e4dd0a-03da-11e1-864e-00144...

- **Forget Heart Attacks! Worry about...**

  Your brain.

  Here's two articles I found more than a bit scary (having just passed the annual milemarker and finding myself on the wrong side of the curve).

  #1: Summary - It's all over at 53 and you become more like a sheeple each year, eventually attaining the status of "drooling mumbling set of deep pockets with a bulleye on your back".
  http://kiplinger.com/magazine/archives/investor-psychology-p...

  #2: Summary - Maybe good news. Maybe financial skills don't begin to atrophy until 60 and maybe those who were well above average all along (should bode well for subscribers here) can hold their until much later in life (this would be my hope).

  This link even inlcudes a test. Everyone here should knock out a 10/10 on this one. Try it.

Charter and 2011 Portfolios: Close Your Short on VXX

Published Sep 30, 2011 at 12:00AM

Hey, *Pro* Fool! Is this trade for you? This trade is only for investors (following either Portfolio 2011 or the Charter Portfolio) who have a short position, or naked calls, on VXX from our original July trade.

Trade Essentials

- **Action:** Buy to close all of the shares you hold short. (If you have December 2011 $22 calls that haven't been exercised yet, buy to close those as well.)
- **Recent Price:** $52
- **Price Guidance:** Use a **limit order** at current prices.
- **Why Buy to Close This Short?**
  - Our naked calls were (or will be shortly) exercised and our broker doesn't have shares available for shorting.
  - Once we clear the deck, we'll reconsider how to short VXX with fresh eyes.
  - Tailwinds that won't last are pushing VXX higher now, so our next position needs to take that into account.

What's Changed?

When Calls Are Exercised

When you write uncovered calls (or calls where you don't also own shares), and those calls are exercised, you end up being short the shares. If your broker has shares to lend you indefinitely for shorting, that's not a problem — that's what you intended to do anyway. You then have a true short. If your broker doesn't have shares to lend you, though, they will close the short within a few days. That's what's happening to us on VXX: We can't stay short the shares. We'll look to initiate a new short on VXX with options in the near future.

Our short calls on the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) ETN were exercised in Portfolio 2011 today, and we expect the same in the Charter Portfolio. When you write uncovered calls and they're ultimately exercised, you automatically borrow shares and short them in your account. However, our broker doesn't have shares available to short (unless we pay high fees, and even then we have no promise that we'll be able to borrow the shares for as long as we want), so the broker is in the process of closing our short. This in itself is not a big deal: We can always reopen a new short using options, aiming to earn back returns when we think the tide of volatility is turning. Before we do that, though, we're going to take some time to decide the best way to short VXX again under current circumstances.

With Europe moving slowly to find solutions to its debt crisis, it will not be surprising if the market's volatility remains elevated for weeks, possibly months. Meanwhile, the futures contracts on the Chicago Board Options Exchanges' implied volatility measure — the VIX — are in backwardation. With the VIX at 41, the VIX futures for October, November, and December were recently bouncing around 41, 37, and 34, respectively. Lower prices on futures contracts will help to keep VXX's price high, which is why we hedged it earlier this week with a bull call spread and why VXX was up this week even though the VIX was down. (See Monday's trade for more on backwardation and what it means.)

Given Europe's unique slow-motion debt crisis, we're going to consider all of the options available to us for at least a little while before shorting VXX again. But have no doubt: We want to profit on VXX during its eventual and inevitable decline. We simply want to do so in a way that makes sense given the extra risks presented by backwardation and Europe — and the possibility that such risks could persist for awhile. For now, we'll close the short so we can look at it with detachment and determine our strategy to profit when the VXX does decline.

How to Follow Along

We realize that different members have many different positions on VXX, and that many of those positions were undertaken according to individual circumstance. You'll need to determine what is best for you and your portfolio if you choose to keep those positions open. *Pro* will decide on our next approach to VXX as soon as possible, but it may be some time before we're ready to initiate a new strategy with a new trade alert. If you're comfortable with the strategy you currently have, you should consider keeping it. For those aiming to follow the *Pro* portfolio closely, here is some general guidance:

- If you wrote December 2011 $22 calls with us and want to mirror us, buy to close those calls.
- If you are short shares and want to mirror what we do next (and don't want to risk further losses in the meantime), buy to close the short for now. Or buy to close it once you see our next VXX strategy, if you like that strategy better.
- If you already rolled your December calls to a later month and you're comfortable with your position, you can keep it; you could also close it while waiting to see what *Pro* does next. If you have concerns about your new position, you may want to close it and wait for our next strategy.

Finally, we are keeping our new bull call spread open on VXX. It serves as a hedge on further volatility and will profit if backwardation and volatility take VXX higher.

The Bottom Line

This short has more than doubled against us as VXX has gone from a net $25.50 to higher than $51 — but we know that in time, volatility will once again subside and VXX will continue its long contango-driven drift lower. (After all, VXX has lost 87% of its value since inception in 2009. In the long run, this trend won't change.)

When the tide turns, we want to earn back our losses on VXX as it drops. I don't doubt that with patience, we can earn this capital back and then some. But in the present moment, we need to face the fact that many factors are working against this short. We'll need to reinitiate it carefully; we want to get back on board when it seems most likely to start working in our favor sooner, not later.

Questions? Please visit the VXX discussion board.

Jeff is short VXX.

Audio Extra: The Pro Philosophy

Published Sep 30, 2011 at 12:00AM

Advisor Jeff Fischer and analyst Nick Crow discuss the *Pro* philosophy in this Audio Extra. Listen in as they address:

- How to feel comfortable holding a stock through volatility
- Whether it's harder for a business today to sustain a wide moat than it was a decade ago
- How options can increase our ability to match our investing theses to the opportunities we see
- Why *Pro* doesn't "overdiversify"
- What both of them are watching over the next four to six months

Transcript

Chris Hill: Welcome to a *Motley Fool Pro* Audio Extra. I am Chris Hill and I am joined in studio by *Motley Fool Pro* Advisor Jeff Fisher and Senior Analyst Nick Crow. Guys, good to see you.

Jeff Fisher: Chris, thank you.

Nick Crow: Hi, Chris.

Chris Hill: We are going to talk about your approach at *Motley Fool Pro* and sort of what you guys are trying to accomplish over the next three to five years. But I want to start, Jeff, with something you had written when the service launched three years ago, an essay entitled "How We Invest." And the first point you make in there, "Accuracy is our top priority." What do you mean by that?

Jeff Fisher: OK, Chris, what we mean by that is we want the vast majority of our positions, whether they are long, short or options to close profitably. We put a number on it at 75%, so we want at least three out of four of every strategy we do to end with a profit. Why do we do this? That is a very high benchmark. Peter Lynch …

Chris Hill: I was going to say, that is aiming kind of high.

Jeff Fisher: Mr. Lynch always said if you can hit six out of ten times, so 60%, you will do great. So we are aiming for more than that. But really it serves to ground us. Before we make an investment, we really have to ask ourselves how confident are we that in the end we will make money on this ... stock or option strategy or combination, and we try to look at it from several different angles where if this happens, can we make money in another way. Say shares fall 20%; can we then use options to make money anyway on that position in the end? So we are always looking for a way to end positions in the green.

Chris Hill: So Nick, I mean sort of old-school Fools are sort of used to an approach where you have got a portfolio, you are looking for a total when you take all of them together, you are looking to beat the S&P 500, but in this case, you are really much more focused on absolute gains.

Nick Crow: Absolutely. When we look at the S&P 500, we see a benchmark that we are not that interested in. And benchmarking for us can be a very unprofitable exercise, as investors the last 10 years have looked at. So we want to find great businesses, hold them for a long time, use options to generate steady income, and if we can do that over a period of time, that benchmark is going to be irrelevant.

Chris Hill: Jeff, another point you make. When it comes to stocks, we are focused on superior businesses we can hold for three to five years. We have certainly seen our share of volatility this year.

Jeff Fisher: Yeah, right now especially.

Chris Hill: That seems like it is maybe tougher to achieve, holding businesses for three to five years.

Jeff Fisher: If you find a business model that gives you a lot of confidence, it is easier to hold through volatility, like right now. The type of business we like to focus on has true sustainable advantages because your profits are not worth much if a competitor can come in and start to eat at them, take them away, and has a lot of recurring revenue. By that we mean kind of naturally recurring revenue, like a software company that has subscribers who re-up every year. Or AmTrust [Financial] Services in the portfolio; 80% of their customers, insurance customers, renew their contracts every single year. Autodesk, which we bought recently, has some 40% of revenue as maintenance revenue that recurs every year. So when you have that stability, it makes it much easier for a company to maintain revenue through volatile periods and then grow during the better periods.

Chris Hill: You mentioned among those attributes the whole notion of a competitive advantage. One of the things we talk about here at The Motley Fool is the term "moat" — how big a moat does an individual business have. Is that tougher for businesses to come by today? Is it tougher for a business to really sustain a wide moat than it was maybe 10, 20, 50 years ago?

Jeff Fisher: I believe it is. It is a more competitive world right now, partly due to technology and all the information that is at your fingertips now. If you are a company who knows how to do your research and believe me, all these publicly listed successful companies know what they are doing when they research their competitors. You can find ways to nibble away at competitive advantages.

So what you will see in *Pro* is we buy a lot of companies that have been around 10, 20, 30 years already, if not longer because they have this moat that they have actually dug out over decades before that it is much harder to now cross for competitors.

Chris Hill: Nick, one of the other points in the essay, "We are not options traders." How do you think of yourselves when it comes to options?

Nick Crow: We see options as increasing our flexibility and our ability to match our investment thesis to the opportunity that we see using options. And you can't just do that in long stocks, so we can have a stock that we are very comfortable in, has great competitive advantages, but we don't see that stock price rising very much and still generate a great return off that. So whereas a trader, they might be looking at short-term price movements this week; we have no advantage in that. We look at great business and try to find the best way to profit from them.

Chris Hill: Jeff, when I think about options trading, in my rudimentary way, I just imagine guys in a room staring at a computer screen and they are executing trades just because the computer model is telling them to do that. It sounds like what you guys do is very much the opposite of that.

Jeff Fisher: It's true. It's very fundamentals-based, as Nick said. It is based on our knowledge of the underlying company and then what we expect its shares to do, and whatever our expectations are or what our analysis tells us, we can overlay an options strategy on top of that so we can make very solid businesses that may not have rising share prices, make those profitable by using options.

The great thing about options is they compliment your stock portfolio so well. We are majority invested in equities that we want to hold three or five years or longer, because that is the only way you make real money investing. You have to let your investments compound. David Gardner points out that almost everybody seems short-term these days. Everyone's focus is minute-by-minute, and that is absurd, of course, but what that does is give us the advantage by being long term because we are seeing things in a way that almost everyone else isn't, and you can find opportunities that way.

So our equities are long term. Options of course expire within a few years, so they can be shorter term within a few years to a number of months, but they complement and enhance your stock holdings and performance.

Chris Hill: One last point on how you guys invest at *Motley Fool Pro*, and that is you say, "We won't over-diversify." Is that even possible? That is like one of the first things I learned about investing. You have got to diversify.

Nick Crow: It's possible.

Jeff Fisher: Well, lately it hasn't mattered much. Literally, the market — everything is moving together, as you know. It's like 2008 again. So members, when you look at your portfolio and everything is down one day, look at the whole market. Everything is down. I met people at conferences who think that they are making mistakes with what they have bought; the market is not discriminating between one equity and another. Everything is moving together. We will get through this time and then quality will rise up again, just like it did in 2009, 2010. So Chris, your question?

Chris Hill: Well, I mean, you say "we are not going to over-diversify." What does that mean in terms of the holdings at *Motley Fool Pro*?

Jeff Fisher: If you own 18 to 30 stocks across different industries, you are well diversified. You really don't need to own more than that. Right now we own about two dozen, and we are diversified and we can follow every company closely. If you get above 30 or so, in my opinion, you start to own more than you can follow. The other advantage of owning fewer is we can then focus on what we do own and see opportunities to use options on those positions too. If we have too many positions, you take away some of your focus, you are going to miss opportunities.

Chris Hill: Nick, when you are looking at the portfolio, are some stocks or some investments sort of in a category where they are sort of off to the side? Like I don't have to focus as much on them in the short term and others are much more, getting a lot more of your attention on a week-to-week basis?

Nick Crow: Certainly. Some businesses are those types of businesses where you could really own for ten years and have no fear with them. We purchased one those recently, MasterCard. You could really hold MasterCard for a long time and feel very comfortable without watching the day-to-day business developments. Other businesses, like we talked moats earlier, might have a narrower moat. You might have to watch that business much more closely. Sometimes we are also the catalyst for (unclear) for businesses, so we are looking at those conference calls, checking on competitors much more frequently.

Chris Hill: To close, what is something that you guys are each watching over the next three to six months? It could be an individual company, a trend, an industry, something that is an opportunity that *Motley Fool Pro* members can keep their eyes on as well?

Jeff Fisher: Great, Chris. Have you heard about Europe and what's going on there?

Chris Hill: I have heard a little something about Europe, yeah. They seem to be having some financial trouble.

Jeff Fisher: So the *Pro* team has spent the last several weeks looking for opportunities there to buy, not to short, because we think it will be resolved with time and we want to be ready when we see prices that are just too cheap to pass up. So we are looking at Europe for possibilities of stocks or ETFs to buy for a recovery.

Chris Hill: Nick, what about you? What is one thing you are keeping your eyes on over the next three to six months?

Nick Crow: Three to six months, well, in addition to the Europe situation, we have also been looking at retail. Retail in the U.S. has been beat down, consumers not spending very much. Consumer confidence is back to lows again, so we are looking for opportunities in that sector as well.

Chris Hill: All right, Nick Crow, Jeff Fischer, guys, thanks for being here.

Jeff Fisher: Thank you, Chris.

Chris Hill: I am Chris Hill. Thanks for listening, and remember, the conversation continues right here on the *Motley Fool Pro* website. Just click the "community" tab and we will see you online.

Click here to download our Strategy Guide in PDF form.

Listen In!

Advisor Jeff Fischer and analyst Nick Crow talk about the *Pro* philosophy in detail in this Audio Extra.

- Between our real-time trades, our Monday Memos and other communications, and our active discussion boards, things can move quickly in *Pro*-land.
- Despite that fact, advisor Jeff Fischer and the analyst team are some of the calmest, most reasonable investors you're likely to meet anywhere.

We think that combination of nimble thinking and sound, sensible decision-making is part of what makes *Pro* so great, and to highlight the second half of the equation, we've put together this Strategy Guide. It's a compilation of key articles going back to *Pro*'s earliest days, showing that the *Pro* approach to investing is steady and rational, featuring strategies that work over the long haul.

The articles you'll find here also tie into *Pro*'s mission statement. Our mission is to earn you consistent, recurring profits with a high level of accuracy using a combination of stocks, options, and ETFs. We use stocks for long-term gains and options for shorter-term strategies. We've updated the articles in places to reflect how our early predictions have played out three years down the road; we've also included links to the original versions of each article on the *Pro* site.

Fool on!

Ellen Bowman, *Pro* editor

Charter and 2011 Portfolios: Set Up a Bull Call Spread on VXX

Published Sep 26, 2011 at 12:00AM

Attention, *Pro* Fool! Is this trade for you?

- If you're an **experienced member** who already has a short position on the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) ETN and you want to hedge that position, this trade is for you.
- If you're an **experienced member who lacks a position on VXX**, this trade can be independently considered as a hedge against a decline in the S&P 500 and against an upswing in the VIX.
- If you're a **newcomer to *Pro***, this trade is not essential for you. You can ignore this trade alert, especially if you're already short the S&P 500 through other means, such as **ProShares Short S&P 500** (NYSEMKT: SH).
- Finally, remember that you need approval to set up options spreads.
- Questions? Visit our iPath S&P 500 VIX Short-Term Futures discussion board.

Trade Essentials

- **Action:** Set up a bull call spread on the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) ETN
  - Buy ("buy to open") October 2011 $51 calls
  - Write ("sell to open") October 2011 $56 calls
- **Allocation:** On a cash basis, we're investing as much as we care to risk, because the most we can lose on this trade is the net cost to set it up. In the Charter Portfolio, we'll have 25 contracts of each option (approximately $4,000 at risk, or 0.3% of the portfolio). In Portfolio 2011, we'll have three contracts of each (approximately $495 at risk, or 0.25% of the portfolio).
- **Recent ETN Price:** $50.35
- **Recent Options Prices (Bid/Ask):** October 2011 $51 calls: $4.55/$4.65; October 2011 $56 calls: $3.00/$3.10
- **Preferred Price:** Aim to set up this bull call spread for a net debit of about $1.65 or less.
- **Why Set Up This Bull Call Spread?**
  - We're currently short VXX via our written naked calls. We still believe in the long-term thesis behind that short, but in the meantime, we can hedge some of our short VXX position with a bullish spread on the same vehicle for relatively little cost.
  - If volatility, and thus VXX, continue to rise in the short term, this spread will mute the losses.
  - Given the "backwardation" of VIX short-term futures contracts today (whereby current months are more expensive than future months), VXX will creep higher in the short term unless the underlying VIX falls meaningfully. This position will capitalize on that creep higher.

What's Changed?

This add-on trade is intended to hedge some of our existing short position in the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) ETN.

Why are we doing this? VXX tracks the VIX, the market's measure of expected volatility, which has jumped from 23 on Aug. 1 to 41 on Friday. Our short position on VXX has more than doubled over the same time. We're currently in a situation known as "backwardation," where the short-term futures contracts VXX tracks become less expensive in each subsequent month. (This is in contrast to the usual contango slope, where the futures are more expensive in each month ahead.) Today's "backward" pricing is occurring because investors believe the VIX will decline from current levels in future months, so although the VIX trades at 41 now, the futures trade at lower prices each month ahead.

When current-month contracts are more expensive than future-month contracts, as they are now, VXX gains some monetary ground each time it "sells" current contracts to "buy" future ones, which it does on a small scale every day (we use quotes because it doesn't actually buy and sell anything – it just tracks an index that does). While this is the case, the VXX will likely continue to tick higher; all the VIX has to do is simply hold its ground.

The VIX has only spent 3% of the time since its 1990 inception at levels above 40, but it may levitate here a bit longer. This is an anxious time in the markets, with all eyes on government leaders in Europe and the U.S. (and who doesn't get tense when relying on politicians?). Greece needs to win approval for its next bailout payment by early October, and the U.S. needs to agree on a deficit-cutting budget by late November. These concerns and others may keep the VIX elevated over the coming weeks.

Why This Strategy?

In setting up a bull call spread position on VXX while at the same time holding a large short position on it, we find it comforting to remember F. Scott Fitzgerald's observation that "the test of a first-rate intelligence is the ability to hold two opposed ideas in the mind at the same time, and still retain the ability to function." We won't claim to have first-rate intelligence (we watched too many *Simpsons* episodes back in our day to make that claim), but the statement is fitting. The purpose of this new bull call spread is to make some money if volatility doesn't subside soon. At the same time, our existing short position on VXX remains in place, and we still expect it to play out in our favor as the VIX (and the volatility it tracks) eventually declines. This hedge won't cost us much over the coming weeks, and if we end up not needing it, we may be able to close it and recoup some of what we paid.

We're able to set up this spread inexpensively because the "skew" on VXX call prices is so high. In the current fearful environment (which we find childish, but that's another topic), investors are paying handsomely for all VXX calls. That means calls that are out of the money (at higher strike prices) are only modestly less expensive than at-the-money calls. This situation makes it possible for us to set up a $5 spread for a cost of only about $1.65. If VXX rises above $56 before expiration next month, we'll earn the difference, or $3.35 on our $1.65 at risk. If VXX stays below $51, the spread will move toward expiration unused, drifting toward $0, so we'll need to close it to recoup as much as our $1.65 as possible.

We're using October options because they allow for the least expensive spread possible, and because backwardation on the VIX futures is more likely to last weeks rather than months. (In other words, backwardation may cause VXX to tick up for a short while even if the VIX doesn't, but it's rare for backwardation to last for months on end.) Even if backwardation *does* last longer, we can always set up another spread once this October one plays out. The VIX futures were briefly back in contango last week, when the VIX was nearing 30, but then jumped into steep backwardation again as the market declined. It will likely take at least a few weeks for the futures to approach contango again, and that assumes the VIX doesn't go higher -- hence, this hedge.

How to Follow Along

- **Buy ("buy to open")** October 2011 $51 calls.
- **Write ("sell to open")** October 2011 $56 calls.
- **Use a spread order:** Aim to set up this bull call spread for a net debit of about $1.65 or less per spread.
- **Maximum profit:** $3.35 if VXX is higher than $56 by expiration (203% return on risk)
- **Maximum loss:** $1.65 (the cost of setting up the spread) if VXX is below $51 by expiration
- **Margin Requirement:** None. The only cost is that of setting up the spread.
- **Allocation:** Only invest an amount of money you're comfortable losing.
- **Flexibility guidance:** If the price of VXX changes considerably by the time you're ready to make this trade, you can move your strike prices up or down accordingly, aiming to set up a similar spread for the same cost or less.

The Foolish Bottom Line

Next Steps

Questions? Visit our iPath S&P 500 VIX Short-Term Futures discussion board.

Our short position on VXX is an intermediate-term position (at least) as we wait for markets to become less volatile. In the short term, we want to hedge at least some of it over the coming month with a relatively inexpensive bull call spread, which makes sense with the VIX futures in backwardation – a condition that favors VXX ticking higher unless the VIX declines. Although I believe the world's problems are too well known to go unresolved, it may be weeks or months before investors start to calm down, and volatility may stay elevated in the meantime. As long as that's the case, we'll look to set up inexpensive spreads like this to hedge our short on volatility.

Pro *will set up a bull call spread on VXX in the next one to 30 days, per The Motley Fool's trading policy. Jeff is short VXX. See the* Pro *portfolio here.*

Plan for Volatility

Published Sep 26, 2011 at 12:00AM

Dear Fellow Volatility Investors,

345% Potential in 1 to 3 Years

Like it or not, volatility is a part of today's market (hence the salutation above). At *Pro*, we initiated the latest iteration of our naked calls on the **iPath S&P 500 VIX Short-Term Futures ETN** – a bet against both a specific flawed instrument and against volatility in general – just two months ago, but when a position goes against you like this one has, time seems to stand still. If you wrote calls with us, you may also feel like these two months might as well have been an eternity in Dante's fourth circle of hell. (That's where the greedy are punished, if you were wondering.) If you're feeling shell-shocked after watching VIX breach the traditionally "fearful" $40 mark four times recently (the last spike being the most painful for those in need of relief), I want to reassure you: Have no fear -- but do have a plan.

Above: A graphical depiction of our two-month history with VIX and VXX. Source: Yahoo! Finance.

If you're wondering how to get from zero to plan, we have a few ready-made plans outlined below. They're yours for the taking, as protection against fear.

Plan A: Be Like *Pro*

If you're matching our moves trade by trade and matching our allocation percentages, you already have a plan in place. With our skipper, Jeff Fischer, at the helm, the future will be calmer (he has a calming effect on the seas*), and our course to profit is already plotted. Part of *Pro*'s plan is to off-set additional short-term losses if volatility goes higher by setting up a low-cost hedge on our position -- see today's trade as an example.

*Well, maybe not. But he does believe in worrying less while others worry more, and he is careful not to make emotion-driven or hasty decisions. Jeff is a great partner on any investing journey, and he shines during difficult periods.

Plan B: Follow in the Spirit of *Pro*

Jeff Fischer and David Gardner Live!

Motley Fool co-founder and veteran investor David Gardner will be the keynote speaker at eTrade's Investor Education Day in Washington, D.C., tomorrow, Sept. 27, from 9 a.m. to 4 p.m. David will be joined by *Pro* advisor Jeff Fischer, who will share his thoughts on how to invest for success in today's volatile market and develop a portfolio built for profits and protection. We hope you can join us for this free, informative event. Click here to register!

First things first: If you're over-allocated, over-leveraged, and/or have run out of buying power, you need to get your financial house in order – even if that means realizing losses. Investing needs to be survivable before it is profitable.

Like many of you, I invest in the spirit of *Pro*, but I don't follow *Pro* trades to the letter. Maybe your allocation to various positions is different than the *Pro* portfolio's, or you passed on VXX to invest in the **VelocityShares Daily Inverse VIX Short Term ETN** instead. (Or maybe you, like me, invested in both.) Perhaps, again like me, your written calls were assigned and your broker couldn't find shares to short. In situations like that, being out of sync with *Pro* isn't entirely of your choosing.

If that's the case, you need a plan of your own. As I tried to explain to a boastful asset manager at a cocktail party this weekend, lucky isn't a plan. This woman was telling everyone who would listen how smart she was for having moved all her clients to 90% cash in August. When pressed, she provided a glimpse of her brilliance: All of her discretionary accounts had been "stopped out" (mechanical forced selling at usually lower prices). When I asked about her plan to start moving back into equities, she had no idea; this was her first experience with stop orders. Cocktail parties are aggravating, and I need to stop going to them – but now (like her!), I'm off course.

My Plan

Backwardation and Contango

Contango is when prices for a commodity are higher on longer-dated futures contracts than near-term contracts, while backwardation is the opposite (prices get lower as the delivery date gets more distant). Find more investing definitions on our investing wiki, Foolsaurus.

If you're new to *Pro*, or if you don't currently have a position in our beloved but flawed VXX ETN, you're probably wondering whether you should establish a new position now. VXX may have topped out at $50, or it may continue to climb higher; time will tell, but in the meantime, you could certainly do worse than shorting it now. Months from now, the brilliance of shorting VXX today will likely be obvious. My guess is that backwardation will continue to drive the VXX price upward, so I will wait a bit longer. While my VXX calls were assigned, I still have exposure to volatility through XIV shares. I plan to get back into VXX by using options to create a synthetic short once backwardation returns to low single-digit levels (hopefully on its way back to contango, which eats away at VXX's value and bolsters our long-term short thesis on the position). If you need help crafting your plan, or have a plan you'd like to share, please post it on the VXX discussion board.

No Fear?!

At the top, I suggested that you should have no fear. That might sound ridiculous after watching naked calls on VXX go from negative $3.50 to negative $25 and beyond, as seen below, but I think it's very doable.

Source: AOL Daily Finance.

Over the years, I've met many "fearless" people -- enough that I feel comfortable putting them into three buckets. (I can also boast that I've learned the key to fearlessness, which I'll share in the third bucket.) The first category is, of course, fearlessness through naïveté -- it's easy to be fearless when you don't know danger is near. For most people, naïveté is ideally a transitive state, since it can easily turn into stupidity when not remedied. The second bucket is occupied by the truly insane, those who don't register fear when logic says they should. I have no expertise in this area, but I hope to avoid it and those afflicted by it (and I advise you to do the same). Then there's the third bucket, where we *Pro* Fools should aim to land. Often, you must do your time in Bucket No. 1 before you can graduate to Bucket No. 3 -- so if you've only recently been made aware of the dangers of margin, forced selling, or overallocation, there is hope.

Bucket No. 3 is fearlessness through preparation. The well-prepared have nothing to fear. They have already thought through multiple reasonable (and unreasonable!) contingencies and decided how they'll react to each one. The best part is, it's not hard to get there: If you've read this far and are considering your next actions, or if you're already following our guidance closely, you're well on your way to separating yourself from the fear-generating talking heads.

Last week, Jeff built a strong case for a fear bubble, arguing that much of the recent panic is overdone. Click here to read that article.

Thank you for being a part of *Pro*, and stay fearlessly Foolish!

Nick Crow (TMFCrow)

Pro Trade Roundup

Charter Portfolio

- **StoneMor Partners**: Sold to open three October $30 puts for $1.10.
- **BMC Software**: Bought 1,100 shares (3.5%) at $41.88.
- **Powershares QQQ Trust**: We set up a ratio put spread, selling to open 40 Dec. 17, 2011, $46 puts and buying to open 20 Dec. 17, 2011, $51 puts. Net credit: $0.17.
- **NextEra Energy**: Sold all shares at $55.03. Bought to close nine January 2012 $60 calls at $0.60. We are keeping our written puts in both portfolios open. (We're happy to buy NextEra again at a lower price. In fact, we aim to keep writing puts on it to approximate or exceed the annual dividend it was paying us, which was $2.20 per year.)

Portfolio 2011

- **StoneMor Partners**: Sold to open one October $30 put for $1.10.
- **BMC Software**: Bought 200 shares (3.5%) at $41.82.
- **Bristow Group**: Sold to open two December $40 puts for $2.50.
- **Powershares QQQ Trust**: We set up a ratio put spread, selling to open eight Dec. 17 $46 puts and buying to open four Dec. 17 $51 puts. Net credit: $0.17.

Guidance Updates

- **Intel**, **Oracle**, and **Bristow Group** move down to Hold. They're each at least 8% above our buy-around guidance.

Coverage & Community

- Rail shipments remain healthy in the U.S., suggesting a new recession is less likely.
- MazonCreekRich provides a Gloomy Gus update.
- DolonAltekar reflects on his new, *Pro*-inspired feelings about the market.

Charter and 2011 Portfolios: Buy More Pebblebrook Hotel Trust

Published Sep 23, 2011 at 12:00AM

At a Glance

- **Action:** Buy enough shares to bring your current allocation up to 3%
- **Recent Price:** $14.27
- **Buy-Around Price:** $21.50 (but **use a limit order** near current prices)
- **Alternate Trade:** None. This stock is cheap and its options rather illiquid. Stick with a simple stock purchase.

What's New?

In the time we've owned hotel REIT **Pebblebrook Hotel Trust** (NYSE: PEB), our shares have dropped more than 25%. Although I (Alex here) feel this sell-off is overdone, I'm not surprised by it. Hotels' performance is closely tied to the overall economy, which has shown signs of weakness. On top of that, investors tend to group REITs together — often unfairly. Pebblebrook, with its narrow focus on upscale, urban, independent hotels, has precious little in common with hotel REITs that own portfolios of branded (think Holiday Inn or Marriott) or economy properties. For us, that means that a stock that was cheap to start out with is now even cheaper.

I attended Pebblebrook's first analyst conference last week, and after the presentation, I spent two hours touring some of the company's recently acquired midtown Manhattan properties with the executive team. The experience reaffirmed my thoughts about Pebblebrook (that it's well-run, opportunistic, and overlooked), and I also came away with an even higher degree of respect for the management team. Here are my key takeaways:

They are really good at what they do.
Pebblebrook's management team has improving hotel operations down to a science. CEO Jon Bortz spent more than 11 years honing this process (on exactly the same kinds of hotels) when he ran **LaSalle Hotel Properties** (NYSE: LHO), and his management team at Pebblebrook includes several members of that former crew. The team describes its process as a hunt for "nickels and dimes," and team members find dozens upon dozens of these small savings in everything from energy conservation measures to laundry systems to switching from Coca-Cola bottles to cans (seriously).

They are disciplined.
Bortz and his team know their niche, and they don't stray from it. They recently removed three cities from their list of target markets because, after looking at new hotels there, they decided they didn't fully understand those markets. They don't acquire new properties unless the opportunity is elephant-sized in a world of antelope. And now, with the stock price so low, they weigh each potential acquisition against buying back their own shares. This is exactly the kind of smart, shareholder-friendly behavior we want from the stewards of our capital.

The stock has big upside.
During their most profitable periods under their previous owners, Pebblebrook's collection of hotels brought in a smashing 61% more EBITDA than they did in 2010 (keep in mind that Pebblebrook only purchased its first hotel in June 2010). Pebblebrook's management is already pushing EBITDA back up. But here's the exciting part: Those previous highs were achieved *before* Pebblebrook bought the properties and let its asset management teams loose to renovate, revamp, and streamline. All those nickels

and dimes add up fast (for example, Pebblebrook has already cut $1.5 *million* in annual savings at the Viceroy Miami), and that money flows directly to EBITDA. The upside for the company's hotel portfolio from here is huge — even if Pebblebrook never buys another property.

Why This Strategy / How to Follow Along

We love us some Pebblebrook. With the stock price so low, we want to top off our position to bring it back to 3%. We recommend you do the same. Head to the Pebblebrook discussion board with your questions.

Alex and The Motley Fool own shares of Pebblebrook.

Pro on Investing Today

Published Sep 23, 2011 at 12:00AM

Dear Fellow Fools,

The Golden Rules

Right now, the golden rules of stock investment remain truer than ever:

- Only invest money in stocks that you won't need for three to five years. Any cash you expect to need within a few years should not be in the stock market. Neither should your emergency cash savings.
- Only buy stable, thriving companies that are very likely to create value over the next three to five years — as we've done in *Pro*.
- Don't put your investment account at risk by using excessive margin or putting too much money into just a few positions.

In addition — difficult though it can be — don't sweat daily price swings. As a *Pro* Fool, your investments of last week, and last year, were made with the intention of staying in the market for several years. What stock prices do in the meantime, while sometimes hard to watch, is largely irrelevant right now. Prices are only relevant years down the road when you're ready to sell, and we do know that the lower prices go today, the greater the odds they'll be much higher years from now.

The more worried others are about the stock market, the less worried you generally need to be.

Or, as Warren Buffett famously put it, "Be fearful when others are greedy, and greedy when others are fearful." Lately, the whole world seems worried and fearful. Concerns about the economy have sent worldwide stock markets on a particularly choppy ride over the past few weeks — with most of the "chop" happening to the downside.

And our *Pro* portfolio has not been immune. We've recommended three "shorts" since the month started, but we haven't been able to place them all ourselves (our broker lacked shares and some prices changed before we could trade); we hope members acting before us had a better outcome. Even if those trades had gone off without a hitch, though, this short-term market turn would have been unkind to our long-term positions. It's inevitable that as investors, we will miss some market turns or be caught on the wrong side of some positions. This is one of those times. But as long as our analysis is correct — and we are confident that the strategies that have been successful for us for years will work again now, too — we will ultimately come out in the green. And for new members buying today, opportunities are excellent.

Fear That Serves No Purpose

Fear is sometimes useful: It kept our ancestors out of the way of enormously toothed mammals, and it keeps us out of the way of speeding cars. But it doesn't do us any good when we're focused on something as shapeless as the economy. Unfortunately, the Federal Reserve seems to have forgotten this fact, doing its part to stoke the latest fears of economic weakness. In justifying a new Treasury-buying program on Wednesday, the Fed cited "significant downside risks" to the economy, and the mere act of naming this risk seems to have brought it to life in the markets.

Perhaps as much as anything else, the collection of statistics we call "the economy" is a barometer of confidence. If the population is confident about the economic future, people will spend and companies will hire. If not, they won't. Leading U.S. companies have more cash on their balance sheets today than at any time in modern history, but lack the confidence to spend it, and the Fed's words only gave the country another reason to worry — a perfect, and unfortunate, example of FDR's famous proclamation that "the only thing we have to fear is fear itself."

The Rules of Investing

Despite the bleak headlines, it still appears likely that the U.S. economy will hold its ground or slowly improve over the coming year and beyond — but only if we keep fear at bay. If countries and societies choose to panic, they may bring their own worst fears to life. What we need right now, here and abroad, is strong leadership that can calm the masses, instill confidence, and move us toward emotional and economic recovery. Eventually all of those things will occur, but until they do, we're probably in for a bumpy ride. This means the golden rules of stock investment remain truer than ever (see the sidebar above).

Sticking to Strategies That Work

We'll continue to position the *Pro* portfolio to perform strongly over the coming three years and beyond. We do want to make steady use of shorts and hedges to smooth out any sudden declines, but when our core investments decline and we get bruised, we'll brush ourselves off and keep moving forward. Our companies are much stronger now than they were a few years ago, cash balances are high, and valuations are generally even lower than they were in March 2009, when the market last bottomed. I'm extremely confident that the investments we've made and the new ones we're making will position all of us to profit over the only time frame that will ultimately prove relevant, which is the coming few years and beyond. I believe even the short positions on volatility that have been so challenging for many veteran members over the past weeks will be a profitable strategy in the end.

In the meantime, invest for the years ahead, and remember to keep the fun in your life today. Our discussion boards offer some of both: Talk about the market's roller-coaster ways on the Philosophy & Strategy board, or get away from it all with a conversation about pirates, tomatoes, or your first car on our Social Banter board.

Thank you for being a part of *Pro*, and have a Foolish weekend.

Best,

Jeff Fischer (TMFFischer)
Advisor, *Motley Fool Pro*

Charter and 2011 Portfolios: Set Up a Ratio Put Spread on QQQ

Published Sep 21, 2011 at 12:00AM

Attention, *Pro* Fool! Read this before you make this trade. This is an options trade that aims to protect our portfolio against a major decline in our holdings in the tech sector. If you're not yet comfortable with options, if you aren't able and willing to invest at least $4,600 in this trade in the future, or if you are not heavily invested in stocks in general or the tech sector in particular, *you may not need or want to make this trade*. Visit our PowerShares QQQ Trust discussion board to talk about it further.

Trade Essentials

- **Action:** Set up a ratio put spread on the **PowerShares QQQ Trust** (NASDAQ: QQQ)
  - Sell to open two $46 puts expiring Dec. 17, 2011
  - Buy to open one $51 put expiring Dec. 17, 2011
  - Note: We are using the options that expire Dec. 17. There are also "quarterly" options on QQQ that expire Dec. 30. We are **not** using the quarterly options.

- ### Ratio Put Spreads

  A ratio put spread is a primarily defensive strategy in which you buy puts (usually with a strike price below the underlying investment's current price) and pay for them by writing twice as many puts at an even lower strike price. If the stock falls below the higher strike price, you begin making money; if it falls substantially below the lower strike price, the spread could end up losing you money. See our Introduction to Spreads or visit our Complex Option Strategies discussion board for more. You can also visit our first (now completed) ratio put spread trade to learn more about the strategy.

- **Allocation:** We'll write twice as many puts as we buy. The written puts will represent 14% of our current portfolio value, but half of this is insured by the purchased puts, so our true exposure is 7%. For Charter, we'll sell to open 40 $46 puts and buy to open about 20 $51 puts. For Portfolio 2011, we'll sell eight $46 puts and buy four $51 puts.
- **Recent ETF Price:** $56.31
- **Recent Options Prices (Bid/Ask):** Dec. 17, 2011, $46 puts (the written puts): $0.81/$0.83; Dec. 17, 2011, $51 puts (the purchased puts): $1.64/$1.65
- **Preferred Price:** Aim to set up the ratio put spread for zero cost, so that the amount you're paid for the puts you write covers the cost of the puts you buy.
- **Alternative Trade:** You could just buy the Dec. 17, 2011, $51 puts if you prefer more robust disaster insurance and are willing to pay up for it.
- **Why set up this ratio put spread?**
  - For little to no cost, we can protect our portfolio if the tech stocks we hold experience a sharp decline.
  - We have a large cushion: For us to lose money on this spread, shares of the PowerShares QQQ Trust would have to decline more than 26%, *and* we'd have to pass on buying shares of QQQ at that point in anticipation of a recovery.
  - No upside risk: We don't lose anything on this position if the market stays flat or rises.

The Big Picture

At *Pro*, we have always been fans of technology: Jeff stood in line all night outside an early Apple Store on Fiji to buy a first-generation Lisa, and Nick once killed a guy with a remote-controlled trident. (Note: Anecdotes may not be 100% true.) That affection for the innovative is reflected in the *Pro* portfolio by our current holdings in the sector, be they big names like **Intel** (NASDAQ: INTC) or lesser-known companies like **OpenText** (NASDAQ: OTEX). We have high confidence in our hand-picked tech stocks, but if the sector as a whole hits a rough patch, we want to be prepared. That's why today we're using options to set up zero-cost insurance on our tech-sector stocks.

Here are the positions we are specifically aiming to hedge with this trade, along with our current allocation to each in the Charter Portfolio:

Company	Current Allocation*
Autodesk (NASDAQ: ADSK)	3%
Intel (NASDAQ: INTC)	7.4%
OpenText (NASDAQ: OTEX)	2.9%
Oracle (NYSE: ORCL)	5.2%
BMC Software (NASDAQ: BMC)	3.5%
Total	22%

* Includes options exposure.

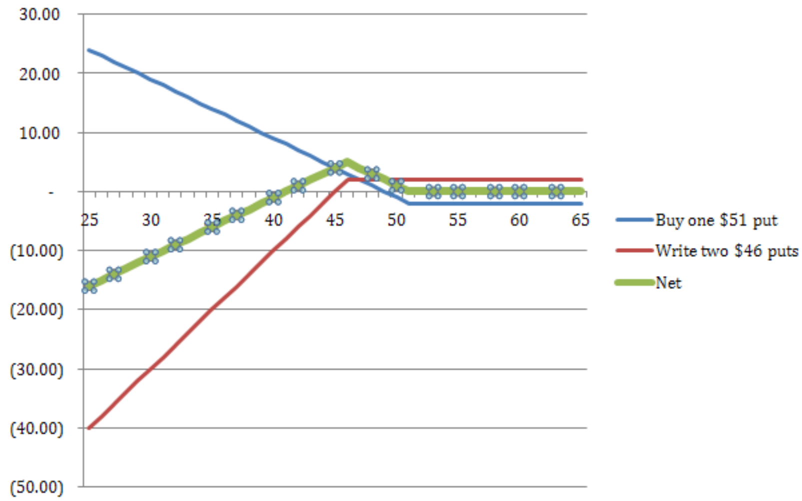
We're singling out this subset of our stocks for a specific hedging strategy because they tend to be rebels — collectively, their movements are only 49% correlated with those of the S&P 500. That's a low figure, and it means a broad index ETF, like the common **SPDR S&P 500 ETF** (NYSEMKT: SPY), isn't a suitable vehicle to hedge them, because there's not much guarantee that the stocks will actually move in tandem with the overall market. On the other hand, these four stocks are 91% correlated with the **PowerShares QQQ Trust** (NASDAQ: QQQ), which tracks an index of the 100 largest non-financial companies listed on the Nasdaq. In other words, if our tech stocks take a nosedive, we can be confident the PowerShares QQQ Trust will follow suit. We're hedging about two-thirds of our large tech exposure.

The Strategy

Again, this ratio put spread is best thought of as insurance against a large market decline. We don't expect our tech holdings to decline sharply (if we did, we wouldn't own them), but the markets have been volatile and investors emotional, and we want to protect ourselves against a greater than 10% index decline — especially since we can do so for free. If the PowerShares QQQ Trust goes up, stays flat, or declines slightly, this trade will have no effect on our portfolio (other than the buying power we need to hold open our extra $46 puts). *Only* if QQQ falls 10% or more will this spread "kick in" as our purchased $51 puts, which allow us to sell QQQ at $51, become more valuable — cushioning the blow to our portfolio in general and our tech stocks in particular.

The trade involves *writing* puts at a lower strike price and using the proceeds to *buy* puts at a higher strike price. You write twice as many puts as you buy, which allows you to set up the spread for free or possibly even for a net credit.

A visual representation might help explain. The chart below shows how much money we stand to make on this trade, assuming we set it up for zero cost. The range of possible outcomes is based on the potential price of the PowerShares QQQ Trust when these options expire Dec. 17, 2011. Remember, we're writing two $46 puts for every one $51 put we buy.



As long as the PowerShares QQQ Trust stays above $51, this position is neutral for us (it creates no profit but costs us nothing). If shares fall below $51 (a 10% drop from today's level), we begin to make money on the trade. We book our maximum profit of $5 per purchased put if QQQ is at $46 at expiration (a 19% drop). And it would have to fall more than 26%, to our breakeven price of $41, before we start to lose money on this spread.

Here's how the math breaks down: If the PowerShares QQQ Trust declines to $46 or lower at expiration — that's a fall of 19% or more — then half of our written puts will obligate us to buy a 7% allocation at $46, unless we close them instead. (Again, that allocation represents half of our written puts; the other half are offset by our purchased puts.) However, in the case of such a decline, our purchased puts will net us $5 per share in profit, so our effective buy price would be $41, or 27% below current prices.

Please note that we are *not* explicitly betting that the PowerShares QQQ Trust will decline. But if it does, it will bring our hand-picked tech stocks down with it, and we want to protect against that possibility. One more time, this is *insurance*.

How to Follow Along

For every uncovered put you write for this trade, you must be able and willing to invest $4,600 at some point down the road ($46 strike price x 100 shares = $4,600). Some brokers will allow you to set up a ratio put spread with a single trade, which saves you commissions. The details:

- **"Sell to open"** Dec. 17, 2011, $46 puts.
- **"Buy to open"** Dec. 17, 2011, $51 puts, one for every two puts you sell.
- **Limit prices:** Use limit orders near the midpoint of each bid/ask spread. This should allow you to set up the two legs of the trade with zero net cost. It may even be possible to set up the spread for a small net credit. If you have to make the legs of the trade separately (if your broker won't let you enter it as a single "spread" order), aim to complete both orders in quick succession so that a sudden move in the market doesn't affect your prices mid-trade.

If you have questions about this ratio put spread, please visit our new PowerShares QQQ Trust discussion board. You can also see our "Introduction to Spreads" lesson in Options U. over at our sister service, *Motley Fool Options*; as a Pro member, you have free *Options* access.

Jeff owns shares of Autodesk, Intel, and Oracle and has an options position on BMC Software. The Motley Fool owns shares of Autodesk.

Charter and 2011 Portfolios: Buy BMC Software

Published Sep 20, 2011 at 12:00AM

Trade Essentials

- **Action:** Buy 3.5%
- **Buy Around:** $43 (Use a **limit order**, Fool!)
- **Fair Value:** $56
- **Alternative Trade:** If you want to try buying shares cheaper, try writing puts: "Sell to open" October 2011 (or later) $41 (or lower) puts.
- **Why Buy?**
  - BMC's software allows customers to operate more productively and save money.
  - Almost 50% of its annual revenue is recurring, which means increased stability.
  - Shares trade at a healthy discount as investors fear a slowdown in the government sector.

The Big Picture

First Things First

- **Company Name: BMC Software** (NASDAQ: BMC)
- **Recent price:** $41.70
- **Market Cap:** $7.4 billion
- **Website:** www.bmc.com
- **Type of Holding:** Software, Value
- **Follow It:** Add BMC to My Scorecard

The more technology sinks its wires into every aspect of modern life, the more businesses need tools to manage that technology efficiently. If synchronizing your laptop, tablet, and smartphone to work smoothly together has your head spinning, now imagine you're running a business with thousands of employees, all relying on a giant computer network to get things done. This is where **BMC Software** (NASDAQ: BMC) strides in. Offering companies an integrated way to manage their entire electronic arsenal, BMC ties together corporate mainframes, computing clouds, applications, and databases so they work smartly and efficiently as one.

BMC Chairman and CEO Robert Beauchamp says the company's main product, Atrium, is "the glue that connects all the technology that a company buys — all the hardware, the software, the people — to what they are doing with these computers, so they know what they've got and how it's performing." Simply put, BMC products help a company manage its technology so it does the best job possible at a lower cost. Atrium can reduce network downtime up to 75%, deliver results 30% more efficiently, and help a company implement new technologies up to 50% more quickly, all while keeping a close eye on the overall system.

Productivity gains and cost savings make BMC's software an essential tool for companies, governments, and large organizations that need to manage their diverse information technology (IT) components. The company is credited with founding the software niche called Business Service Management (BSM), which is a fancy way of saying, "We'll help your business technology run better, my friend." As an industry pioneer, BMC has grown revenue every year since 2002.

The Business

BMC's solutions are used by many of the largest companies in the world, including 96% of the Forbes Global 100 and 81% of the Fortune 500. Founded in 1980 and named after the last initials of its three founders (in case you were wondering), BMC has approximately 15,000 customers, including retailers, manufacturers, hospitals, and education institutions. But its most significant clients are financial services companies (including banks) and government agencies. The company primarily sells to large enterprises that have intense (read "expensive") IT demands and that commit to services for the long haul to avoid disruptions. Like any software company worth its salt, BMC has expanded its software offerings as its client base has grown and expressed its needs. BMC now offers several dozen product lines, including IT asset management, storage management, and controls and compliance.

The company is divided into two main businesses:

- **Enterprise Service Management** (ESM): The larger of the two, this division includes IT service assurance (is the technology working?), service function and automation, support (such as problem management), and Atrium to tie it all together. In 2010, BMC started offering popular on-demand Software-as-a-Service (SaaS) in this division.
- **Mainframe Service Management** (MSM): This division focuses on IT requirements for mainframe computer data and performance, middleware management (the software that connects two separate applications), and data management, among many others, again integrated with a version of Atrium. Cloud services and virtualization are also offered as companies move more data offsite and save costs with server virtualization.

Finding and solving information bottlenecks, suggesting business priorities and better workflow processes, assuring compliance and 100% reliability — BMC's software runs the gamut of corporate technology needs. BMC considers its largest competitors to be **IBM** (NYSE: IBM), **CA,** (NASDAQ: CA), and the struggling **Hewlett-Packard** (NYSE: HPQ), and it enjoys partnerships with **Cisco Systems** (NASDAQ: CSCO), **Dell** (NASDAQ: DELL), **Red Hat** (NYSE: RHT), **Oracle** (NYSE: ORCL), and **Microsoft** (NASDAQ: MSFT), among others. The line between partners and competitors can a blurry, rapidly changing one when it comes to software, but BMC's installed base of customers and deep bench of products provide it with strong competitive advantages. Most customers sign long-term contracts that bundle BMC's software with ongoing maintenance services. The cost to customers is measured in various ways, including mainframe computing capacity, number of servers in use, number of gigabytes, number of users, and others.

Financials and Valuation

In its 2011 fiscal year, which ended March 31, BMC clocked more than $2 billion in revenue, 49.6% of which was maintenance revenue — the recurring, subscription-based revenue we like so much in *Pro* because it lends more stability and predictability to a business. Sales were split evenly between domestic and international, and operating margins (how much of every dollar was left after paying all operating costs) were a healthy 25.8%. Research and development was a respectable 8.5% of revenue, assuring us that the company isn't resting on past success. As a testament to management's focus on wringing value from the business, cash from operations is up 82.1% since 2007 while revenue is "only" up 30.6%.

BMC Annual Results (Years ended March 31)	2007	2008	2009	2010	2011
Revenue	$1,580	$1,732	$1,872	$1,911	$2,065
Operating Margin	13%	21%	20%	26%	26%
Cash From Operations	$420	$594	$580	$635	$765

Sources: BMC annual report and Capital IQ. Numbers in millions.

This is not a capital-intensive business. Capital expenditures haven't exceeded $28 million in any of the past three years, so the cash from operations shown above is nearly the same as the free cash flow generated by BMC each year. (Free cash flow is the money it has left with which to do whatever it wishes.) For the last 12 months through June 30, BMC's free cash flow was a record $839 million, pricing the stock's $7.4 billion market value at only 8.8 times free cash flow. (Include BMC's $1.58 billion in cash and equivalents against only $298 million in long-term debt, and the free cash flow multiple drops to 7.) Our fair value estimate values shares at 12 times free cash flow, or $56.

What Would Make Us Sell

The stock did in fact trade at $56 in July. It plunged to its recent $41 after first-quarter 2012 revenue grew 9% to $502 million, just landing shy of the $507 million estimate. The revenue "miss" on its own wasn't a big deal, but investors were also spooked when BMC said orders from the U.S. public sector were weak and some sales were taking longer to close in Europe (these factors *are* a big deal for anyone selling to the government). BMC's abundance of government contracts sent investors running for the doors as the U.S. debt-ceiling crisis mounted and some European governments appeared ready to teeter.

These risks aren't gone; BMC could see more softness as governments tighten belts. Much of this risk is already reflected in today's low valuation, but if business is especially weak, we'll revisit our thesis. We'll also keep a close eye on maintenance revenue and new license contracts. Both are key drivers; Wall Street continues to expect healthy growth from BMC and, as July showed, won't stand for disappointment.

The Foolish Bottom Line

Short-term thinking on Wall Street is letting us buy shares of one of the world's most successful software companies at a discount. Run by a straight-talking management team with a long-term focus, BMC has earned the business of many of the world's most prominent companies and governments and has rewarded shareholders with steady value creation that we believe will resume once current uncertainty clears. To discuss the company, visit our new BMC Software discussion board — and get ready to rock your IT knowledge!

Jeff has an options position on BMC and owns shares of Oracle. The Motley Fool owns shares of Cisco Systems, Microsoft, Oracle and IBM.

Portfolio 2011: Write Puts on Bristow Group

Published Sep 19, 2011 at 12:00AM

Pro first recommended buying **Bristow Group** in our Charter Portfolio in July 2010. For *Pro*'s original thesis, read our buy report on Bristow.

Trade Essentials

- **Action:** "Sell to open" a 3% position in December 2011 $40 puts (for Portfolio 2011, that's two contracts)
- **Recent options price (bid/ask):** $2.60/$3.90
- **Preferred price:** Fly a helicopter right down the middle of the bid/ask prices — use a limit order around $3.25 at first (that's an option yield of 8%)
  - As prices change, shoot for an option yield above 4%, because you want to be paid at least 12% annualized and these expire in three months. On a potential $40 commitment, 4% in yield equates to a minimum $1.60 option payment to you.
- **Stock fair value:** $50
- **Alternative trade:** Buy a 3% position in the stock outright near our $39 buy-around price
- **Why write puts?**
  - The long-term demand for helicopter flight hours to service deep-water offshore oil production is strong.
  - Bristow benefits from predictable and recurring revenue streams, which enable it to make sure it has the newest and jazziest fleet of helicopters.
  - Shares are undervalued already, and writing puts gives us a chance to secure an even better purchase price.

What's New?

First Things First

- **Company: Bristow Group**
- **Recent price:** $41.50
- **Market cap:** $1.5 billion
- **Website:** www.bristowgroup.com
- **Wanna buy a whirlybird?** You can!
- **Type of holding:** Long-term, energy services
- **Strategy:** Guide to writing puts
- **Follow It:** Add to My Scorecard

As shares of helicopter services company **Bristow Group** continue to hover above $40, the September puts we sold to open back in June expired on Friday. We were happy to bank 100% of our put premium, but because we weren't assigned shares, we still lack an allocation to Bristow in Portfolio 2011. Today, we're maintaining our discipline and writing another round of puts that will again allow us to get paid while we wait for shares to come into striking distance of our $39 buy-around price.

Last month, Bristow released solid first-quarter 2012 earnings and provided earnings guidance for the full year. Management expects EPS in the range of $3.55 to $3.90, which implies a forward price-to-earnings ratio of 10.5 to 11.5 — far from pricey, but not quite in the bargain-basement territory we'd like to see given the asset-intensive and politically sensitive conditions that rule Bristow's business.

With its 571 aircraft, Bristow continues to have a leading market position in the major oil and gas regions of the world. Its industry-leading safety performance helps keep costs low and provides an advantage when bidding for contracts. We steadfastly monitor Bristow's performance to make sure its balance sheet and financial returns are moving in the right direction, and we'll happily write these puts to get paid while we wait for the results to fly in.

Why This Strategy?

You need options approval to write puts, and the trade command is "sell to open" or "sell." (*Do not buy these options!*) Sell one contract for every 100 shares of Bristow you're willing to purchase later (each contract represents an obligation to buy 100 shares, or $4,000 worth, of Bristow stock). Writing these options will pay you the option premium up front, and we'll wait until expiration on Dec. 16 before taking any further action.

Our initial potential profit is whatever the puts pay us (we're hoping for at least $3.25 each); we have an obligation to purchase shares of the stock if they fall below the $40 strike price by expiration. If we get shares, our net buy price will be $36.75 (we'll buy the shares at $40, but still keep the $3.25 the puts pay us). Since we fully intend to take ownership if assigned the shares in December, we note again that you should make sure you have $4,000 available, per contract, to purchase shares. If the shares remain higher than $40 by expiration, the options expire unexercised, and we simply keep the put premium as income.

How to Follow Along

Next Steps

- Questions or comments? Still getting used to all this options jargon? Visit our Bristow discussion board.
- Stoked to learn more about writing put options? Head over to the All About Options discussion board.

You can simply buy shares near our buy-around price of $39 if you prefer, but we're cheapskates — and we want to earn income while we wait. If converted into shares, these puts would allow us to buy shares about 14.5% cheaper than the recent price and at just 0.9 times tangible book value. If the shares remain above $40 at expiration, we won't get to buy shares, but we'll earn a decent return on this trade and look to write puts again.

Portfolio 2011 will write puts on Bristow in the next one to 30 days, per The Motley Fool's trading guidelines. See Pro*'s holdings here.*

What to Expect When You're Expecting Expiration

Published Sep 19, 2011 at 12:00AM

Dear Fellow Fools,

345% Potential in 1 to 3 Years

Stocks are in a slump — down more than 10% since late July. Warren Buffett and world-class value hedge fund managers Whitney Tilson and Bill Ackman see a buying opportunity. And here at The Motley Fool, we recognize these special situations, too.

Now, the Fool's own "special ops" wiz, Tom Jacobs, is calling one stock "simply the most inefficiently priced I've ever seen." He's revealing it for **free**, along with an inside look at his service, *Motley Fool Special Ops*. To get the goods, simply click here.

Last Friday came and went without much ado in the market as a whole; the S&P barely budged. But over in our *Pro* portfolio, there was a little more excitement. Four of our options positions expired, three in Portfolio 2011 and one in the Charter Portfolio. Those new to options might not know that they always expire on the Saturday following the third Friday of each month, and if this was your first options expiration Friday (or even if it wasn't), you're probably wondering "so what?" and "what now?" We're glad you asked. Here's what happened with each position.

Bringing In More Broadridge

In May, we recommended writing September $22.50 puts on **Broadridge Financial Solutions** in both portfolios. Our aim was to bring our allocation up to 3% in both portfolios while paying even less than our $23 buy-around price. If we weren't assigned shares, we'd still happily accept the $1 we were paid for each put in exchange for maintaining our discipline. (Indeed, that's the essence of writing puts Foolishly.)

The market as a whole has fallen 9% since that recommendation, and Broadridge was down 5% as of Friday, putting us in the position to accept shares via our written puts. We did just that over the weekend, buying 700 shares in the Charter Portfolio and 300 shares in Portfolio 2011 — bringing us about in line with our 3% goal in each portfolio.

We're happy with this outcome. Broadridge is a stable business with high levels of recurring revenue, and it produces a lot of cash. We expect it to continue paying us back through dividends and smart reinvestment of that cash. While the pace of acquisitions should slow, we think Broadridge will continue to convince large financial institutions to outsource data-heavy functions. The company's dominance in investor proxy voting and other communications makes it a portfolio bedrock. If you missed out on May's written puts and the subsequent assigned shares, you can buy shares today at about $21, a discount to our $23 buy-around price and an attractive margin of safety to what we think they're worth.

Grabbing GrafTech

In the Money

Put options are "in the money" when the underlying stock is below the option's strike price. See our Options Glossary for more definitions

GrafTech International has taken us on a wild ride — we recommended writing puts in April and have been holding on to our hats ever since. The share price was cut in half in a matter of days during August's generally chaotic market, largely because global GDP growth estimates were reined in. For better or worse, GrafTech's business is tied to manufacturing and global output, and investors sprinted for the door when things seemed to be slowing down. Our puts expired in the money, and over the weekend, we purchased 500 shares.

GrafTech's stock price has recovered nicely, though we do expect more volatility in the future. We like the company because it's a low-cost manufacturer of graphite electrodes, which are used in the most efficient steel-production process. Input prices have been working against GrafTech for some time now, but we expect the company's recent price hikes to help stem that pain. GrafTech will spend the next two quarters signing contracts to build its book of business for the coming year, and we expect benefits from recent acquisitions and efficiency improvements. GrafTech's no-nonsense management continues to execute in difficult times. If you don't own shares already, take advantage of the recent pullbacks; shares are well below our $19 buy-around price.

Breaker, Breaker, 1, 2 on Bristow

We often end our written put recommendations by saying that if our puts expire worthless, we'll look to write additional puts later on. Well, that's exactly what we did with today's recommendation to write December $40 puts on **Bristow Group** in Portfolio 2011. This recommendation follows on the heels of our September $40 puts, which expired over the weekend (we earned 100% of our written premium). Our buy-around price on Bristow is $40, and writing puts to buy shares at that level maintains that discipline and pays us well if shares stay stubbornly higher.

Business continues to be strong at Bristow, and management is helpfully opening the company's playbook regarding actions that could increase profitability even further. Looking at the appropriately named "Bristow Value Added" (check out slide 14 here for details) in coming quarters, we can see where management will be focusing its attention and where future trouble spots may be. Bristow's opportunities remain strong, and we will be happy to finally establish a position in Portfolio 2011 if our December put options allow it. If not, we'll look to write additional puts later on. (You shoulda seen that one coming.)

Three Trades for Today

When our options near expiration, we're forced to ask "what now?" regarding each relevant position. That's an exercise we encourage you to go through, too. Regarding Broadridge and GrafTech, we're reminded that the strength of their competitive positions should trump near-term pressure on their shares. If you don't own these solid businesses, bone up on our original theses and consider buying. With Bristow, we're going back to the well to take advantage of the hefty premium we can earn by writing puts.

Mark your calendar for another options expiration Friday on Oct. 21!

Bryan (TMF42)

Pro Trade Roundup

Charter Portfolio

- **MasterCard** : Bought 120 shares (3%) at $324.29
- **Autodesk** : Bought 1,400 shares (3%) at $27.90
- **Broadridge Financial Solutions** : Bought 700 shares (1%) at $21.48 via put options, bringing the Charter Portfolio to a 3.3% current allocation
- **StoneMor Partners** : Sold to open three October $30 puts (about 0.6%) for $1.10

Portfolio 2011

- **MasterCard** : Bought 21 shares (3%) at $324.63
- **Autodesk** : Bought 250 shares (3%) at $27.90
- **StoneMor Partners** : Sold to open one October $30 put (about 0.6%) for $1.10

- **Broadridge Financial Solutions** : Bought 300 shares (2.5%) at $21.51 via put options
- **GrafTech International** : Bought 500 shares (3%) at $16.79 via put options

Charter Portfolio and Portfolio 2011: Write Puts on StoneMor Partners

Published Sep 15, 2011 at 12:00AM

Hey, New *Pro* Fool!

Read this before you make this trade. In yesterday's "Get Up to Speed With Options" feature, we promised you a "newbie-friendly" options trade soon, and voila — here it is! In this trade, we're writing puts on StoneMor Partners. When we write ("sell to open") put options, we usually have two goals in mind: to potentially buy shares of our favorite companies at better-than-market prices, and to earn income while we wait for the right price. Keep these points in mind as you follow along:

- Always use limit orders and follow our pricing guidance.
- Each put option you write obligates you to potentially buy 100 shares of the underlying stock — that's $3,000 worth of StoneMor shares. If that doesn't jive with the size of your portfolio, check out the alternate trades below.
- To play along, you'll need level 2 options approval from your broker or enough cash to cover your potential obligation.
- The trade command for writing put options is "sell to open."
- The *Pro* guide to writing puts provides granular detail on the process.

Trade Essentials

- **Action:** Write October 2011 $30 puts on **StoneMor Partners** (NYSE: STON)
  - For Portfolio 2011, we're selling to open one put. If we are assigned shares, this will bring our allocation to about 3.5%. (New *Pro* Fools are encouraged to follow Portfolio 2011.)
  - For the Charter Portfolio, we're selling to open three puts. If we are assigned shares, this will bring our allocation to 3.1%.
- **Recent Stock Price:** $29.15
- **Recent Options Prices (Bid/Ask):** October 2011 $30 puts: $1.25/$1.75
- **Preferred Price:** Aim to split the bid-ask prices (lately $1.50); initially, it's ideal to accept no less than $1.25. As prices change, ideally accept no less than a 3.3% yield (or about $1) if the stock rises.
- **Alternate Trades:**
  - Instead of writing puts, you could simply buy enough shares to bring your total allocation to 3% to 3.5%. If it's practical for you, buy in 100-share lots; this will help if we use options on these shares in the future.
  - If you'd like the potential to earn additional premium, you can sell to open January 2012 $30 puts, lately about $2.70.
  - Finally, you could buy shares worth 2% of your portfolio (the stock is within 4% of our buy-around price) and write these puts for the remaining 1% to 1.5%.

Why Write Puts?

- StoneMor's business is recession-resistant, and the stock has been remarkably steady through the recent market turmoil.
- We recently recommended selling dividend payers **GlaxoSmithKline** (NYSE: GSK) and **NextEra Energy** (NYSE: NEE), so we want to increase our exposure to this high-yielder.
- These puts will likely award us stock at a price cheaper than we would pay today; if they don't, we'll still pocket about a 5% return in 36 days.

What's New?

Precious little has transpired at StoneMor Partners since we took our initial 2% position in July — and that's exactly the way we want it. This cemetery owner and operator is the picture of stability. Sales of burial plots, caskets, and other "death care" merchandise are high on predictability and low on risk, a combination that makes this business about as recession-resistant as they come. The stock seems to reflect this: Since we bought the stock, the market has plunged 8%. StoneMor, on the other hand, is up 4%.

All that, and the shares are still yielding north of 8%. The unusual accounting requirements to which StoneMor is subject continue to befuddle the market — which allows us to keep collecting this outsized dividend yield. (For details on the accounting distortions, check out our original trade alert or the StoneMor discussion board.) And that dividend is just as safe as when we first purchased shares; the company has about $100 million in cash and liquid assets, which are the short-term fuel for the dividend, and the business (the long-term dividend generator) remains robustly healthy.

Why This Strategy?

Selling to open these in-the-money puts will have one of two outcomes for us:

In the Money

Put options are "in the money" when the underlying stock is below the option's strike price. See our Options Glossary for more definitions.

- If shares are less than $30 in October, we are obligated to buy them (100 for each put) at a net cost basis of about $28.50.
- If shares are higher than $30 in October, we have no obligation — we just keep the premium we were paid for our puts, earning 5% in income in just over a month.

Either result is attractive to us. We primarily own StoneMor stock for income (although we do expect some capital appreciation). These puts will either allow us to buy more shares at a cheaper price than today (which translates into a higher dividend yield) or simply pocket income directly, which is rarely a bad thing.

If you have yet to establish a position in StoneMor, you can catch up by following our third alternate trade listed above: Buy shares worth 2% of your portfolio (the stock is within 4% of our Buy Around price) and write these puts for the remaining 1% to 1.5%. Or, if you're a purist or don't want to use options, you can simply purchase a 3% allocation (the first alternate trade).

How to Follow Along

Write enough October $30 puts to bring your total allocation of StoneMor, if the puts are exercised, to between 3% and 3.5%. Again, the trade command is "sell to open" or "sell." (*Do not buy these options!*)

Each contract represents an obligation to buy 100 shares, or $3,000 worth, of StoneMor stock. Writing these options will pay you the option premium up front, and we'll wait until expiration nears (Oct. 22) to determine our next move.

- Questions about writing put options in general? Head to our All About Options discussion board.

Alex does not own shares of any company mentioned. Jeff owns shares of GlaxoSmithKline. The Motley Fool owns shares of StoneMor Partners.

Get Up to Speed With Options

Published Sep 14, 2011 at 12:00AM

Dear Fellow Fools,

A big part of *Pro*'s investment approach involves the use of options to boost profits, smooth out volatility, and maintain our valuation discipline. If you're new to the world of options, we know they can be confusing at first. We want to help you get up to speed using options so you'll have this useful weapon in your investing arsenal. To help you get comfortable, we've compiled this list of resources — consider it your road map to conquering options.

Foolishly,

Bryan Hinmon (TMF42)

Options Resources

Your membership in *Pro* entitles you to free access to our sister service, *Motley Fool Options*, which features a full curriculum of options education organized into three "degrees" — basic, intermediate, and advanced. These degrees are designed for you to learn at your own pace and to give you a reference when you need one. If you're new to options, start with the basic degree. You can find handbooks to the basic and intermediate degrees here:

- Options U: Your Guide to the Basic Degree (aka "Options for Beginners Handbook")
- Options U: Your Guide to the Intermediate Degree (aka "World Domination Cannot Be Far Behind")

If you have questions about the degrees, bring them to the *Motley Fool Options* Options U. discussion board here:

- Options U.: *Motley Fool Options* Discussion Board

And if you're a more advanced investor or are looking to tackle more complicated options strategies:

- Check out the guides for our Advanced Degree

Finally, if you have questions about which broker to use, how much money you need to trade options, or other administrative issues, check out our FAQ:

- Options Help FAQ

Whatever level you're starting from, we've got you covered. Aside from the library of information at your disposal in *Motley Fool Options*, we have an incredibly knowledgeable and gracious community of members offering their help, advice, and insights 24 hours a day. Feel free to join the conversation (or just monitor the scuttlebutt) on *Pro*'s All About Options board. We hope these resources give you everything you need to build an options education with a solid foundation. Fool on!

Charter Portfolio: Sell GSK and NEE, Buy to Close Covered Calls on NEE

Published Sep 13, 2011 at 12:00AM

What About Portfolio 2011? The following trades are for the Charter Portfolio. In Portfolio 2011, we have written puts to purchase shares of GlaxoSmithKline and NextEra more cheaply than today's prices. We're leaving those puts open because we'd be content to buy either stock lower in Portfolio 2011 — and if that happens, we'd reconsider them for Charter Portfolio, too.

Trade Essentials, GlaxoSmithKline

- **Action:** Sell all shares
- **Recent price:** $40.50
- **Alternative Trade:** You could write near-the-money covered calls (October 2011 $41 calls or October 2011 $42 calls) if you own 100 shares or more of GlaxoSmithKline and would rather try to sell higher, but this is not as defensive as selling.

Trade Essentials, NextEra Energy

- **Action:** Sell all shares; buy to close January 2012 $60 covered calls
- **Recent prices:** Stock, $53.65; January 2012 $60 calls, $0.60 ask

- **Alternative Trade:** None.

Why Sell?

- These defensive positions held up well during the market's recent rout; now they're a good source of cash.
- We'll reinvest this money in stocks we believe will have more upside in a market recovery.
- We'd also buy these stocks back cheaper in the future, so we're leaving our puts open in Portfolio 2011 and would revisit shares in the Charter Portfolio if lower prices are met.

What's Changed?

U.K.-based **GlaxoSmithKline** (NYSE: GSK) and Florida-based **NextEra Energy** (NYSE: NEE) have performed as hoped, providing us with growing dividends and playing defense for our portfolio by typically holding up better than average during market declines. We're selling them now to raise cash from two positions that didn't appreciate much during the last bull market so we can put that cash to work in positions we believe will perform better over the coming few years. Selling large dividend payers is never easy, but we're looking to earn more than 5% per year on this money in the future. The more the market declines, the more upside potential there is in the promising stocks we're considering.

How to Follow Along

We'll sell all of our shares of these two companies in the next one to 30 days. As for our covered strangle on NextEra, consisting of January 2012 $50 puts and January 2012 $60 covered calls: We'll buy to close the $60 covered calls for a profit in the next one to 30 days (at the same time we sell our shares), but we'll leave the $50 puts open. If NextEra stock is less than $50 in January 2012, we'll be obligated to buy shares (in the same amount we're selling today) in the upper $40s — more than 10% cheaper than they are today, an outcome we'd be happy to accept.

If you want to write covered calls instead of selling GlaxoSmithKline, as in the alternative trade listed above, feel free, but be aware that we plan to invest the cash raised from these two positions over the coming weeks and months.

If you have questions about these trades, please visit the GlaxoSmithKline and NextEra Energy boards.

Jeff owns shares of GlaxoSmithKline.

Riding Through Volatility

Published Sep 12, 2011 at 12:00AM

Fear and panic are ruling the markets right now. These emotions will subside eventually, as they have every time before, and calm — or something akin to calm — will return. But until it does, we need to ride out the storm.

The Recent Roller Coaster

How to Play the Coming Market Rally

Stocks are in a slump — down more than 10% since late July. Is this a buying opportunity*?* Warren Buffett and world-class value hedge fund managers Whitney Tilson and Bill Ackman certainly think so. Here at The Motley Fool, we recognize these opportunities, too. And one Motley Fool portfolio manager wants to prove it by revealing a top recommendation, for free, in an exclusive video. To make sure you see it, simply click here.

One of our goals at *Pro* is to earn steady returns with less volatility than the market overall. If you've been following all of our trades, though, you'll notice that since August, we've actually had *more* volatility than the market. There's one main reason for that: We're short volatility through the **iPath S&P 500 VIX Short-Term Futures** exchange-traded note, which aims to track the famous volatility index known as the VIX by mirroring short-term VIX futures contracts. To put it more simply, we've been short volatility during a politically charged budget squabble on Capitol Hill, the first U.S. credit-rating downgrade in history, and a looming potential default in Greece — all of which have, shall we say, rattled the market. Someday we'll be able to claim victory (and profess courage) for holding the position through these events.

But for now, this short position alone has removed 6% in value from the Charter Portfolio just since the beginning of August. We're effectively short the VXX at $25.50, and it was up to $46 as of Friday — an 80% jump. This sort of move can happen with any individual short, and it would be especially painful if we didn't believe the price would eventually come back. But we do: The VXX's price is all but guaranteed to deflate once investor fear subsides and the underlying Chicago Board Options Exchange VIX index settles down.

As mentioned, the VIX is a "volatility index" that serves as the most popular measure of implied volatility expected from the S&P 500. It was above 38 as of Friday, suggesting 38% annualized volatility. During most periods of crisis, the VIX has peaked somewhere in the 30s or 40s; 10 years ago, in September 2001, it hit 43.74. In November 2008, it climbed as high as 80.86 (that's extremely unusual) before quickly declining. In calmer times, it reverts to the teens. The VIX has only spent 3% of its time above 40 over the past two decades, and its average has been just 19.

So being short volatility as measured by the VIX has hit our portfolio in the past month. But we know the price will come back down if we just wait out the fear-driven spikes. We also know the VIX can't be acquired, can't report blowout earnings, can't buy back its own shares — in other words, there's not much else it can do to surprise us. I'd much rather be short the VIX for long periods than many, or even most, public companies.

Have Cash, Will Ride

As of Friday, our VXX short was 8.4% of the Charter Portfolio and 7.4% of Portfolio 2011. When volatility starts to go down instead of up, these positions will quickly start to add value back to the portfolios — and it is a question of when, not if. Volatility will likely begin to subside once Europe's credit crisis finds some resolution and the U.S. budget and employment picture starts to clear up. If it becomes evident by the end of the year that we'll avoid a double-dip recession, the VIX should fall sharply, and these short positions will steadily pour value back into our portfolios. But it's key that we have liquidity — the financial flexibility and means to ride out market volatility while it remains inflated. Any short can work against you for a long time, but with this particular short, we have the enormous benefit of knowing that if we wait long enough, it will work for us again.

As we're waiting, I'll repeat: While fear reigns, our portfolios are going to be more volatile than usual. When we short volatility again in the future — and we will — we may use more specific strategies, like option spreads, to mitigate the effect on our portfolio. But for now, we need to deviate from our usual goal and simply accept greater volatility. Concurrently, we're working to position the portfolio strongly for the eventual recovery we know will occur. Expect more sells (followed by new buys) as we work to refocus our investments for the coming years.

It's Not Greek to Us

At the moment, all eyes are on Greece, a nation with a long history of spectacular collapse. You usually need to fly high in order to fall far, but this time Greece never even took flight. It simply joined the Euro nations when it shouldn't have been allowed to. With a debt-to-GDP ratio topping 140% last year, Greece is not likely to get out from under its burden without technical or actual default on its debts. As frightening as that sounds, Greece represented only 1.9% of the European Union's GDP in 2010 (and less this year), so its total debt is somewhere around 2.5% of the EU's annual GDP. In other words, the EU *can* save Greece if it wants to. The alternative is to let Greece fall out of the Eurozone, which would allow the EU to shore up its strength and save its ammunition to make sure other countries with larger economies — like Italy or Spain — escape greater problems. Right now, it looks like there's a 50/50 chance at best that Greece will be saved.

The Foolish Bottom Line

We'll continue to invest in strong, promising companies. We'll continue to suggest hedges that make sense to investors who want to cushion downside risk (even if our broker leaves us unable to place some of those trades ourselves). And we'll wait for volatility to decline and our largest short position to unwind in our favor. We're even open to adding to that position at some point. We welcome your comments and questions — join us on the VXX discussion board or the Memo Musings board.

Foolishly,

Jeff Fischer (TMFFischer)

Jeff is short VXX.

Pro Trade Roundup

Charter Portfolio

- Sold all shares of **Jack Henry & Associates** at $28.95.
- Sold all shares of **Vanguard Emerging Markets** at $42.96.

Portfolio 2011

- None.

Guidance Updates

- **GlaxoSmithKline** moves to hold pending a review.

This Week's Expirations

Charter Portfolio

- **Broadridge Financial Solutions** : September $22.50 puts (for 700 shares) are due to be exercised. We will either accept more shares or roll the puts following a review of our cash position. We'll announce any roll by Wednesday.

Portfolio 2011

- **Broadridge Financial Solutions** : September $22.50 puts (for 300 shares) are due to be exercised. We will accept these, our first shares in Portfolio 2011. Members who did not write puts can buy shares cheaper directly to match.
- **GrafTech International** : September $17.50 puts (for 500 shares) are due to be exercised. We'll accept these new shares, our first in Portfolio 2011. Members who did not write puts can buy shares cheaper directly to match.
- **Bristow Group** : September $40 puts (for 200 shares) are due to expire or potentially be exercised (the stock is $41.50 and could dip by Friday). We'll accept shares if the stock declines below $40 by expiration.

Coverage & Community

- Adding to our recent Monday Memo, *Pro* member mrhumanbeing shares traits and practices of successful investors in this excellent post.
- Bryan (TMF42) walks you through how to read our trade alerts, and Ed (spinningwood) chimes in with his own thoughts on how to approach *Pro*.
- TMFMoosie posts a *Pro* earnings calendar. October isn't far away!
- Alex340 posts puts that match*Pro* criteria — and covered calls, too.
- New members continue to get started and invest steadily. Bravo!

Audio Extra: Covanta, StoneMor, and OpenText

Published Sep 9, 2011 at 12:00AM

Jeff and Alex sit down to chat about **Covanta**, **StoneMor Partners**, and **OpenText** — all recent *Pro* purchases and current Buy First or Buy stocks. Learn why the team is visiting a local trash-to-energy plant, how Alex stumbled upon a cemetery owner with an oversized dividend, and why Jeff is revisiting an old favorite stock. After listening, head to the Covanta, StoneMor, or OpenText discussion boards with your questions and thoughts.

Transcript

Alex Pape: Hello, Fools, and welcome to today's *Pro* Audio Extra. I am analyst Alex Pape. I am joined by our advisor, Jeff Fischer.

Jeff Fischer: Hey, Alex; good to see you.

Alex Pape: Jeff, thanks for joining me. So today we are going to talk about three recent buys we have made in both the charter and Portfolio 2011. So let's get started with Covanta. Jeff, how did you come across this company?

Jeff Fischer: This is everyone's favorite trash-to-energy company. It is a well-known name, rolls off the tip of the tongue. Covanta is the country's largest, as I just said, waste-to-energy company. It brings in garbage from municipalities, things that you and I may be throwing away, and turns it into energy. It provides about 5% of the country's renewable energy source this way. It also recycles the metals that it brings in, and that adds quite a bit of revenue to the business as well.

It is a value company, to answer how I found it. It trades at only about nine times free cash flow and eight times EBIDTA, so it is inexpensive. You might expect more like a 12 multiple [for a company] like this that has steady free cash flow generation. The kicker, what makes it really interesting now, is management is finally really trying to create shareholder value. They started a dividend last year, which is about 1.9%, and a large share buyback program. They have bought back 6% of shares in about a year, and they are going to continue that. And they are raising capital. They are selling plants in other countries to raise capital and return it to shareholders as well so they can focus on their most efficient waste-to-energy plants here in this country.

Alex Pape: And Covanta actually has one of its plants right here in Alexandria, Virginia, where Fool HQ is headquartered, and the *Pro* team is very excited to go out and check it out for the first time.

Jeff Fischer: We are, and you know, I know Covanta is listening right now. They need to call me back. I have called them; we are playing phone tag. We need to get out to see that plant. We realize, though, we are not in a big rush because we may lose one team member on that visit, you know, just slip over a rail into the ... no, they are very strict about what you wear and where you can walk and it is quite an operation. From what I hear, you have to really cover your ears and everything else. They process tons of garbage per day and burn it into energy, so.

Alex Pape: Great. So we will move on to StoneMor Partners.

Jeff Fischer: Yeah, Alex, this is one you brought to our attention. Really unique ideas. Why do you think *Pro* members should own it?

Alex Pape: Sure. So StoneMor is a master limited partnership that is the second largest operator and owner of cemeteries in the United States, so it is an incredibly predictable, low-risk, recession-proof business. For some reason, it is yielding north of 8% in terms of its dividend yield.

Jeff Fischer: It is a very high yield. That usually signifies a distressed company, that the yield may not last.

Alex Pape: Sure. If one of the analysts sees a dividend that high, you instinctively think, OK, what's wrong here? What's wrong here: There is nothing actually wrong with the business, but the company StoneMor is subject to a series of bizarre accounting requirements. When they book a sale, they have to divert cash into trusts that are legal requirements to make sure that they have the financial ability to meet their responsibilities to deliver whatever they sold, be it a burial plot or a casket, later on. The exact details of all that accounting are in our buy report on the boards.

So I just want to share with you how exactly we came across this. We actually published a series of articles on Fool.com, the other side of the business, that talked about dividends that looked unsustainable, and one of the companies we mentioned was StoneMor. One of our analysts, not on our team, but one of the other services, ran into the CEO of StoneMor at a cocktail party, and the CEO went to him and said, Hey, what's this article all about? You guys don't have the story right at all.

And so we set up a phone call and I got to spend a couple of hours with the CEO going line-by-line on their entire, all of their financial statements, and he just explained to me all of the distortions that are made. When you do it all out, it is just as obvious, as simple a business as it might seem like it would be, to own and operate a cemetery, very straightforward. And so once you understand that, you can see exactly why the market misprices it. And so we simply just step in, and we are happy to accept an 8%-plus dividend on a stock that looks undervalued, and we can just take that home every day.

Jeff Fischer: Yeah, Alex, and I wonder if the story is getting out slowly because since we have purchased shares, the market has fallen sharply, and this has held up like a rock.

Alex Pape: This has, so it does make sense.

Jeff Fischer: The report spells it all out, but it is fascinating how they have taken money, their pre-sales basically, they have taken that money, but they can't really book it or use it. It goes on as a liability, and so that is why the debt looks enormous, part of the reason why the debt looks so large and the cash flow looks so small, but it is all just accounting.

Alex Pape: It is gimmickry that they have to abide by and they have no control over, but does not reflect what is happening in underlying cash situation for the company.

Jeff Fischer: So that is StoneMor, STON.

Alex Pape: So let's move on, Jeff, to OpenText, one of your recent buys. Do you want to tell the members a little bit about this one?

Jeff Fischer: It is a recent buy and an old buy too. I first came across this company several years ago and it has been a recommendation I have made a few times over the years, so that is only good; more familiar with the company. I have known the same management team for years, known the business, watched them grow up. OpenText is the largest enterprise content management software company ...

Alex Pape: That's a mouthful.

Jeff Fischer: It is. ECM for short ... in the world, second only to IBM, who has slightly more market share. But this software, all it does is help a company or a government manage and control its files, its data and its regulatory filings -- which is now a large issue, as everyone knows, for financial companies especially, but also legal companies. Any sort of company that is regulated, they have to keep their papers or e-data in order and correct. This software helps make sure they do it, that they never miss a deadline.

So OpenText has been growing steadily over the years and management has also been acquiring companies, and like many great software companies do, you can buy add-on software programs, [that's] basically what you are doing when you are acquiring a smaller company. Add it on, sell it to your existing customers, and grow that way.

So that is what OpenText is doing, and they also are moving into business process management, which just helps a company manage its strategies and its decision-making processes and all that, so it is content with thinking behind it too. It is strategy in relation to your content, so it molds very well with their enterprise content software. Now you are managing your strategy process as well.

BPM, as it is called, business process management, is about a $2 billion market right now, growing around 15% per year, and OpenText just bought two of its leaders for close to $500 million, so they put a serious commitment into it. The shares, around $58, trade around 12 times expected normalized earnings for this coming summer -- for next June. So it is reasonably priced, given that they have been growing well above that mark, and should for quite a while to come. A well-run company.

Alex Pape: Well, Jeff, thanks for joining me, and members, thank you for joining us. If you have any questions, as always, head to the boards. That's it for this Audio Extra. Until next time, Fool on!

Charter and 2011 Portfolios: Buy MasterCard

Published Sep 8, 2011 at 12:00AM

Trade Essentials

First Things First

- **Company: MasterCard** (NYSE: MA)
- **Share Price:** $340
- **Market Cap:** $43 billion
- **Website:** www.mastercard.com
- **Type of Holding:** Growth, Core
- **Follow It:** Add MasterCard to My Scorecard

- **Action:** Buy 3%
- **Buy Around:** $325 (use a limit order around or below this price)
- **Fair Value:** $390
- **Alternative Trade:** If you're investing more than $30,000 in the stock, you can consider writing puts to attempt to buy shares cheaper.
- **Why Buy?**
  - Acceptance and use of payment cards like those offered by MasterCard is growing around the world.
  - Payment cards are stealing market share from cash.
  - The company's business model is highly profitable.

The Big Picture

When it comes to moving money around, few companies rival **MasterCard** (NYSE: MA). As the second-largest payments processor in the world (after **Visa** (NYSE: V)), it processed $2.7 *trillion* in gross dollar volume in 2010, up 10.7% year over year. The company rings up revenue every time people around the world use a product bearing its name to charge, debit, or prepay their way through the cash register.

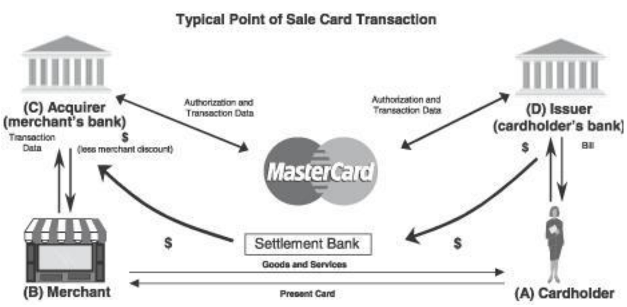
The global economy is struggling, but MasterCard can grow even as GDP stagnates. The switch from cash to plastic is an enormous, worldwide secular (read: not cyclical or seasonal) trend, one that many take for granted. And it's still in its early stages: The total amount of annual financial transactions worldwide was recently estimated to be at least $34 t*rillion*. *You* might not use the green stuff much anymore, but 85% of those transactions are still completed with cash, leaving plenty of room for MasterCard to grow.

MasterCard CEO Ajay Banga calls the company's mission "the War on Cash." Luckily for MasterCard, cash is a weak competitor, one Banga describes as "expensive" and "inefficient": "You have to print it, transport it, secure it, store it and change it." Credit, debit, and prepaid cards are a breeze by comparison. And while such cards may seem ubiquitous in the U.S., Americans actually only use them for 32% of personal consumption expenditures. Cash, check, and electronic funds transfer round out the remaining 68%. This represents an enormous opportunity for MasterCard to steal market share even as the U.S. economy continues to struggle. Globally, the potential benefits from both market growth and increased market share are even greater.

The Business

MasterCard already operates in 210 countries and more than 150 currencies, and those numbers are only growing as emerging economies across the globe accumulate wealth and become more urban. At home and worldwide, credit cards are being accepted in more places and cash is accepted in *fewer* places (including, now, on many airplanes). MasterCard is highly visible as part of all this, facilitating transactions and marketing its brand — but it's the banks and lenders who take on any credit risk and are actually exposed to the card users' finances. Relieved of those worries, MasterCard is free to earn high returns on capital running a largely fixed-cost transaction network that becomes more profitable the more people use it.

So MasterCard facilitates transactions from cardholders to merchants via the cardholders' issuing banks. This is known as a four-party payment system. Here's a map of the typical transaction (cross your eyes if that helps you read it):



Source: Company filings.

The magic begins when a cardholder (A) makes a purchase from a merchant (B) using a MasterCard bank card. The card-issuing bank (D) authorizes the transaction, then uses the MasterCard network to pay the merchant bank (C) the purchase price, minus fees.

As a major multinational company with worldwide distribution, MasterCard enjoys geographically diverse revenue streams. Only 40% of revenue is generated in the United States, and international sources make up a larger share each year. Its revenue comes from three major sources: domestic assessments, at 35% of 2010 gross revenue; transaction processing fees, at 29%; and cross-border volume fees, at 25%.

Domestic assessment fees are paid by both the issuing bank and the receiving bank when the merchant and cardholder are in the same country. These fees are set based on transaction volume. Cross-border volume fees are exactly the same except the transaction occurs across country lines and includes currency conversion fees. Transaction processing fees (for authorization of payments, clearing and settlement of those payments, and the connectivity required to make it all happen) apply to both domestic and cross-border transactions and are based on the number of transactions.

Financials and Valuation

Its operating margins of greater than 50% mean that more than half of every dollar MasterCard earns becomes operating profit. By this measure, MasterCard is one of the most profitable companies in the S&P 500. As MasterCard builds its network around the world, its incremental cost per transaction is marginal after an initial investment, so profit increases faster than revenue.

Metric	Six-year CAGR*	Three-year CAGR*
Net Revenue	13.5%	10.8%
Operating Income	39.8%	35%

Sources: Capital IQ and analyst calculations. *Compound annual growth rate.

The company boasts better than 40% returns on capital and equity, and management is guiding for continued long-term excellence. Its targets are annual net revenue growth in the 12% to 14% range, with earnings-per-share growth of greater than 20% annually. Those aren't low hurdles, but we won't be surprised if MasterCard leaps over them. In the most recent quarter, MasterCard surprised analysts with a 33% jump in net income over the same quarter last year, well ahead of its own projections as transaction volume continues to grow.

Unsurprisingly, though, quality and growth don't come cheap. This $43 billion company trades at 21 times trailing free cash flow and 18 times its earnings-per-share estimate from Capital IQ for this fiscal year. Using a free cash flow to firm (FCFF) model, we value MasterCard shares at $390 using a 9.5% discount rate, and frankly, as long as the business model doesn't change much, time may prove this much too conservative. As the table below shows, MasterCard's financials have steadily improved since its 2006 IPO.

Metric	2006	2007	2008	2009	2010
Net Revenue	$3.3 billion	$4.1 billion	$5.0 billion	$5.1 billion	$5.5 billion
Gross Volume	$2.0 trillion	$2.3 trillion	$2.5 trillion	$2.5 trillion	$2.7 trillion
Transactions Processed	16.1 billion	18.8 billion	21.0 billion	22.4 billion	23.1 billion
Operating Margin	20%	28%	40%	48%	51%
Return on Capital	21%	24%	46%	54%	40%
Return on Equity	3%	40%	(10%)	54%	42%

Sources: Capital IQ and company filings.

Competitors

Feeble, inefficient cash and checks might be MasterCard's primary competitors, but Visa, **American Express** (NYSE: AXP), **Discover Financial Services** (NYSE: DFS), and literally thousands of other payment processors are anything but weak — and they're all fighting for market share.

In time, digital transactions, not cash, will be the de facto method of payment worldwide, and that opportunity is large enough for many players to profit. That said, reigning champions Visa and MasterCard have a significant lead over smaller competitors. They also aren't burdened with credit risk like the other giants, American Express and Discover, both of which actually lend money as well as facilitating payments.

Its biggest competitor, Visa, is twice its size, but MasterCard is accepted at more locations than any other brand, not least because it boasts the only globally interoperable PIN point-of-sale network. And Visa's considerable lead in debit cards in the U.S. is actually an opportunity for MasterCard: The Durbin Amendment (which you may know as the oft-delayed legislation that outlines the specifics on debit interchange fees) contains exclusivity provisions that will allow MasterCard to enter into debit agreements with banks that once did business exclusively with Visa. MasterCard is already gaining traction in debit card agreements.

This is not to say that cards will be with us forever. The next evolution in payments may well be an application on your smartphone — but MasterCard will get a piece of that action, too, thanks to partnerships like those it has with Google Wallet and Citibank. And what if it's the major telecommunications companies, not the banks, who end up controlling the lucrative mobile-payments channel? It just so happens that MasterCard is there, too, now that the telcos' phone payment joint venture, the ISIS mobile wallet, will include the major payment networks. The bottom line is that a trusted network (and "brand" host) is necessary to connect all of the major players in any digital transaction, and that means MasterCard and its ilk will be involved with any new applications, snapping up market share.

What Would Make Us Sell

Any business model that mints cash this quickly and enjoys such tremendous economies of scale with only a few major competitors risks attracting the attention of regulators. Add the fact that it's involved with commerce, and you know MasterCard is required to give the government in every country in which it operates has a say in how it does business. If new regulation here or elsewhere were to impair the economics of MasterCard's business model, we would sell.

Expensive litigation and massive settlements are another major risk. With a company this big and profitable, we expect new litigation in general, so that won't make us sell. But if a particular case threatens the permanent viability of the business, we'll bow out. Finally, capital allocation is a key criterion by which to measure the effectiveness of any management team, so if we see MasterCard's management making questionable acquisitions as new payment processors pop up, we may have to reassess. Of course, the company may be right to acquire its most viable mini-competitors, but we'll keep a close eye on the prices paid versus the value received.

The *Pro* Bottom Line

Next Steps

- Talk about MasterCard on our new discussion board
- Add MasterCard to My Scorecard

MasterCard has one of the most attractive business models the world has ever seen. The "priceless" ad campaign won over the world and helped established MasterCard as a global brand. As the world moves from analog to digital payments, we expect each additional card, transaction, and uptick in dollar volume to increase MasterCard's profitability for shareholders.

Share of MasterCard: $340. Sharing the commercial that reminds you of the *Pro* community: priceless.

Pro's September 2011 Ketchup Report

Published Sep 8, 2011 at 12:00AM

Dear *Pro* Member,

Prefer to Print?

If you'd rather read a hard copy of this report, you can download a PDF version here. (Please note that the conclusion of the PDF version states that purchasing all of these stocks at our recommended allocations would mean investing 49.5% of your capital. The correct figure is 51.5%. We regret the error!)

As you begin your investing journey with us, we want to guide you to buy strong, healthy companies at prices that offer more than ample upside against reasonable downside risk. Buying stocks with favorable risk-vs.-reward scenarios sets your portfolio up to prosper when the market is enjoying its sunny periods and helps it hold up better during the inevitable squalls. At *Pro*, we also use options and shorts to smooth out down periods (or, if possible, avoid their effects entirely), but our long-term core stock holdings will form the backbone of our investing success.

To help you get started, this report highlights each of our Buy First stocks (which are the same in both our Charter Portfolio and our Portfolio 2011), giving you our current thinking and suggested allocation for each. We then do the same for the Buy stocks in our Charter Portfolio we think you should consider now. (Because Portfolio 2011 was designed to "catch up" to the Charter Portfolio, all Buy stocks in Portfolio 2011 are also Buy stocks in the Charter Portfolio. For more on the two portfolios, click here.) The market's wily mood swings of late mean almost all of these stocks are within our Buy Around price guidance — in other words, you've picked a good time to start.

That said, please remember it's not a race: You can buy these stocks at a pace that works for you. If you want to buy full allocations now, that's fine, but you can also start with half positions (as we frequently suggest) and look to fill your positions completely if and when better prices come along. If you have experience with options, you can also consider buying half positions and writing ("selling to open") put options to potentially buy the remainder of your desired positions more cheaply. But for now, let's focus on buying some stocks.

Fool on!

Jeff Fischer, lead advisor (TMFFischer)

Buy First Stocks

Covanta

As one of the world's largest "waste-to-energy" producers, **Covanta** turns countless tons of trash into energy that it then sells to utilities. It may not sound glamorous, but this business creates steady free cash flow that management is using to create shareholder value: The company recently initiated a dividend and a large share buyback program. — *Jeff Fischer*

- **Guidance:** Buy First
- **Recommended allocation:** 3%
- **Recommendation history**

Intel

Intel is one of the best technology companies on the planet, producing the microprocessors in 80% of the world's computers. With its exceptionally cheap stock price and dividend yield of more than 4%, Intel offers healthy upside with reasonable risk. — *JF*

- **Guidance:** Buy First
- **Recommended allocation:** 4% to start, up to 6% later (reach your maximum allocation gradually, as we did)
- **Recommendation history**

Medtronic

Leading medical-technology company **Medtronic** is known for its impressive research and development engine. Fears surrounding increased competition and a changing health-care landscape have made shares of this very profitable business available on the cheap. — *Bryan Hinmon*

- **Guidance:** Buy First
- **Recommended allocation:** 3% to start, up to 5% later
- **Recommendation history**

OpenText

OpenText sells software that helps companies and governments manage their content and data more efficiently. With market share second only to that of IBM, the company is the darling of the enterprise content management industry and a possible takeover candidate someday. — *JF*

- **Guidance:** Buy First
- **Recommended allocation:** 3%
- **Recommendation history**

Pebblebrook Hotel Trust

Pebblebrook Hotel Trust is a real estate investment trust that buys upscale hotels from financially challenged owners and turns them around. At today's price, you can purchase shares for well below the asset value of the company's hotels, and if the economy worsens, Pebblebrook will have even more opportunities to acquire additional hotels from squeezed sellers. — *Alex Pape*

- **Guidance:** Buy First
- **Recommended allocation:** 3%
- **Recommendation history**

Rockwood Holdings

One of the world's leading producers of lithium for lithium-ion batteries, **Rockwood Holdings** also sells specialized chemicals serving hundreds of industries. Management is intensely focused on increasing free cash flow, and the business is having an exceptional 2011. — *JF*

- **Guidance:** Buy First

- **Recommended allocation:** 3% to start, up to 5% later
- **Recommendation history**

Buy Stocks

3D Systems

3D Systems is a small but exciting company that produces printers — for industries and consumers — that actually print objects in three dimensions. The ability to create prototypes this way saves money on product development for automakers, health-care companies, and countless other manufacturers. The stock is volatile, but it has a bright long-term future. — *JF*

- **Guidance:** Buy
- **Recommended allocation:** 2% to start, up to 3% later
- **Recommendation history**

AmTrust Financial

AmTrust Financial believes it's good to be small. The company specializes in a slew of niche insurance businesses that aren't profitable for or attractive to the big boys and girls of the insurance industry, and its impressive technology platform for policy management helps keep costs down. — *BH*

- **Guidance:** Buy
- **Recommended allocation:** 3% to start, up to 6% later
- **Recommendation history**

Bristow Group

Bristow Group flies cargo, crew, and supplies to and from offshore oil-production rigs. It has an unmatched fleet of large, high-tech choppers to service the deepest of deep offshore activities — and a safety record that would make Smokey the Bear rejoice. — *BH*

- **Guidance:** Buy
- **Recommended allocation:** 3% to start, up to 5% later
- **Recommendation history**

Broadridge Financial Solutions

Broadridge Financial Solutions is so good at keeping tabs on investors that financial-services companies across the globe are happy to entrust it with this necessary function. Broadridge's expansive record-keeping, vote-tabulation, and distribution software helps financial institutions save money in their communications with investors and brings in stable, recurring, and contractual revenue. — *BH*

- **Guidance:** Buy
- **Recommended allocation:** 3% to start, up to 5% later
- **Recommendation history**

Ebix

Ebix provides an electronic software platform for transactions across multiple insurance businesses. Its shares offer value and growth, and this young success story should mature into something built to last.

- **Guidance:** Buy
- **Recommended allocation:** 3%
- **Recommendation history**

GrafTech International

GrafTech International is the world's lowest-cost producer of graphite electrodes — hunks of carbon used in efficiently melting and reshaping steel. GrafTech's quest to lower its input costs and make steel production greener will serve it well if the global economy strengthens. — *BH*

- **Guidance:** Buy
- **Recommended allocation:** 3% to start, up to 5% later
- **Recommendation history**

L-3 Communications

L-3 Communications is a champion defense contractor, and right now, its world-class capabilities and technology are available at a bargain price. Even if cuts to the defense budget do come, L-3's essential services that are less at risk than the average program — yet its stock is on deep discount. — *Nick Crow*

- **Guidance:** Buy
- **Recommended allocation:** 3% to start, up to 5% later
- **Recommendation history**

Oracle

The world's leading business software company, **Oracle** is growing impressively as it serves an enormously diverse customer base and product line, and the stock is currently inexpensive. — *JF*

- **Guidance:** Buy
- **Recommended allocation:** 3% to start, up to 5% later
- **Recommendation history**

ProShares Short S&P 500

ProShares Short S&P 500 is an inverse ETF that moves opposite the S&P 500. If your portfolio is heavily invested in stocks and you need a short-term hedge that can be measured in months, this ETF can help smooth out down days. However, it doesn't perform well over long periods, so it's not meant to be a long-term holding. — *JF*

- **Guidance:** Buy
- **Allocation:** 3% to start, higher if you need a larger hedge
- **Recommendation history**

StoneMor Partners

StoneMor Partners is the second-largest U.S. owner and operator of cemeteries. Thanks to unusual accounting requirements that make it easy for investors to underestimate the company's profitability, the market is consistently confused about this master limited partnership. We're taking advantage by buying units and locking in the remarkable 8.2% dividend. — *AP*

- **Guidance:** Buy
- **Recommended allocation:** 2%
- **Recommendation history**

Wells Fargo & Company

Wells Fargo & Company is the most conservative and consistent operator in the out-of-favor banking industry, and its shares are significantly undervalued given the increased earning power of the Wells Fargo and Wachovia combination.

- **Guidance:** Buy
- **Recommended allocation:** 2%
- **Recommendation history**

WisdomTree Emerging Markets SmallCap Dividend Fund

The **WisdomTree Emerging Markets SmallCap Dividend Fund** combines the best of many worlds (or countries), focusing on small companies with high growth and strong dividends in emerging markets that are typically off the beaten path. Get your international diversification with a nearly 3% dividend yield to boot, all in one easy ETF.

- **Guidance:** Buy
- **Recommended allocation:** 2.5%
- **Recommendation history**

The *Pro* Bottom Line

Purchasing all of these stocks at our recommended allocations would mean investing 51.5% of your capital. That would leave you plenty of cash left over for new recommendations and to incrementally add to your favorites in our portfolio as opportunities come along. If you prefer, you could also average into our Buy First and Buy stocks over time, committing to filling these allocations over the rest of the year. In the end, it's not vital to have every allocation exactly just so; it's more important that you're buying good stocks at good prices, comfortable with what you own, and that you're ready to let time be your ally, growing value for you as an investor.

Whether you "catch up" all at once or gradually, we're excited to have you on board, and we'll continue to have new stock buys, option trades, and short positions available for you in real time.

Welcome again to *Pro*! Please ask any questions on the *Pro* Getting Started discussion board. Fool on!

Alex owns shares of Pebblebrook Hotel Trust. Jeff owns shares of AmTrust, Ebix, Intel, Oracle, and Rockwood Holdings. Nick owns shares of 3D Systems, Amtrust, Intel, L-3 Communications, Rockwood, Wells Fargo, and WisdomTree Emerging Markets SmallCap Dividend Fund.

Charter and 2011 Portfolios: Buy Autodesk

Published Sep 7, 2011 at 12:00AM

Trade Essentials

First Things First

- **Company Name: Autodesk** (NASDAQ: ADSK)
- **Recent price:** $26
- **Market Cap:** $6 billion
- **Website:** www.autodesk.com
- **Type of Holding:** Growth, Software
- **Follow It:** Add Autodesk to My Scorecard

- **Action:** Buy 3%
- **Buy Around:** $27 (use a **limit order**, Fool!)
- **Fair Value:** $38
- **Alternative Trades:** If you want to try for shares even cheaper, try writing puts: "Sell to open" October 2011 $26 or $25 puts, or "sell to open" January 2012 $26 or $25 puts
- **Why Buy?**
  - Autodesk's software can help build nearly everything in the world. The company offers superior design products to the markets it serves, and its pricing policy is winning market share.
  - Autodesk has been successful in selling packaged suites of its existing software and signing subscription-based recurring maintenance contracts, both of which should make its products even stickier and continue to improve profitability.

- Autodesk’s end markets are cyclical and may slow more in a recession, a fear that has knocked the stock down — meaning that this great business is now selling at a pedestrian price.

The Big Picture

The first rule of carpentry is "measure twice, cut once." Carpenters are smart: Careful attention to detail helps reduce costly mistakes. (Plus, they use flat pencils that don’t roll off a workspace — why haven’t those gone mainstream yet?) Today’s carpenters are higher-tech than their brethren of yore, using computer software to concoct designs and to test, analyze, and even automatically manufacture the finished goods. But the desire to reduce errors and waste across a product’s life cycle (from drawing to testing to production) remains as strong as ever, increasing demand for software to help efficiently manage the entire design process — a market opportunity worth more than $25 billion in annual sales.

And carpenters aren’t the only ones who use such software. In the midst of an epic build-out of buildings and roads in numerous emerging countries around the world, urbanization is accelerating, and so is the infrastructure needed to support it. In developed markets, builders are modifying existing structures to embrace energy efficiency. Defense against natural disasters and terrorist threats is now a standard part of the building design process. And even everyday consumer products are becoming more technologically complex in a quest for cost savings.

In every case, computer software is essential for designing, modeling, and stress-testing the solutions. All of these factors bode well for **Autodesk** (NASDAQ: ADSK), the undisputed leader in fancy-schmancy design software — and no stranger to veteran *Pro* members.

The Business

Autodesk sells its software to creative professionals in the manufacturing, architecture, engineering, construction, media, and entertainment industries, to name a few. Over its 28 years in business, more than 10 million users at 800,000 companies have used Autodesk’s products. And whether you know it or not, you’ve probably been touched by Autodesk today: The highway you drove to work on, the building you work in, your cell phone, and the movie you watched last night could all have been designed using Autodesk software. The company claims more than 30% of the computer-aided design (CAD) market, a feat it achieves only because customers stick with it. Many Autodesk professionals are lifelong loyalists, having learned to use the software in college and proudly presenting their knowledge front and center on their resumes.

We’re big fans of Autodesk’s business model, which seeks to democratize high-tech design. Less loftily, Autodesk is good at making money, too — its automatic-upgrade "maintenance" contracts have been successful for both the company (because they bring in more profit than a regular license) and customers (who are guaranteed the latest and greatest version of the software). Renewal rates are persistently high because the software is essential and rejoining after a lapsed subscription is costly. The number of subscription users has more than doubled to 3,000 over the past five years, and recurring-maintenance revenue has grown from 18% of total revenue to 40% — we like the added stability this offers during rocky economic times.

Autodesk’s competitive advantages are also critical to its success. Those include:

- High switching costs. Learning a new design software program is difficult and time-consuming. Autodesk is the market leader, meaning a large number of designers and companies are firmly committed to using its products year in and year out.
- Network effects. Autodesk’s software has become the standard in many industries, and as companies along the design and manufacturing chain work on increasing communication and collaboration, a standard language is vital. Autodesk’s large installed base means its network of users is vast, valuable — and strengthens as it grows.
- A global ecosystem. Autodesk has more than 2,000 highly trained resellers, 3,400 developers (who have created products using the company’s open-architecture software), and 1,200 authorized training centers. This structure helps keep users trained, creates jobs, and widens the pool of people who want Autodesk’s software to continue to reign supreme.

Financials and Valuation

Autodesk plows $0.25 of every sales dollar back into research and development to keep its products top-notch, and it spends a decent chunk on training and updating its sales force (which consists of a direct sales team for large accounts and value-added resellers for higher-volume sales). Even so, net profit margins that eclipse 10% have been the norm over the past five years (which, as you may recall, included a not-insignificant recession). And when it comes to free cash flow, Autodesk is minting money — it keeps nearly $0.17 of every dollar of sales to reinvest in its business and make acquisitions.

Besides the macro trends cited above, Autodesk should also benefit from its improving product line. The company’s recent push into selling suites (bundles of existing software that work well together, like **Microsoft** (NASDAQ: MSFT) Office), expanding its simulation and collaboration features, and investing in its direct sales force should continue to drive growth. With no debt and $6 per share in cash, Autodesk is in great financial shape to survive near-term economic bumps and still take advantage of any opportunities that may arise — just as it did through the 2008-2009 credit crisis.

Autodesk’s shares have taken a pounding recently, falling from $45 to a recent low near $25. (We sold our previous shares higher last January via covered calls, ending with a 78% profit.) Current prices reflect expectations of scant growth for Autodesk over the next decade, with no further improvement in profitability. Management, on the other hand, believes the company can achieve 12% to 14% revenue growth and can sustain 30% operating margins. Even if those numbers prove too ambitious, shares of this premium business should trade higher — near $38 appears reasonable to our spreadsheet data cells. Today, we can buy shares for less than 14 times free cash flow, a steep discount to the five-year average of 26.

What Would Make Us Sell

Several factors could crimp our investment in Autodesk.

- Evidence of a prolonged global economic slowdown will affect the willingness and ability of Autodesk’s customers to upgrade their design software, hurting sales and margins.
- If the company isn’t more successful in combating the piracy of its software in emerging markets, its growth targets could prove difficult to achieve.
- Poorly performing acquisitions could dampen future returns and tie up management’s time.
- Although Autodesk has a diverse reseller network, 16% of its annual sales come through a single value-added reseller, **Tech Data** (NASDAQ: TECD). The company’s longstanding relationship with Tech Data is reassuring, but if that sours or if Tech Data’s financial health slips, we’d reconsider.
- Of course, if the money the company is spending on research and development doesn’t translate into products with features that clients want, renewal rates may fall.

The Foolish Bottom Line

Next Steps

- Add ADSK to My Scorecard.
- Talk about this trade on our Autodesk discussion board.

Autodesk is a company we know well here at *Pro*. We originally purchased shares back in the dark market days of January 2009. It remains one of our favorite businesses because of its strong competitive position, necessary (and cool!) products, recurring revenue, healthy balance sheet, and cash-generating ability. We also like that the company's management team is made up of straight shooters who own shares alongside us. Today, we can buy into a well-above-average business with solid long-term prospects at an attractive price — a formula for designing a winning portfolio.

Bryan owns shares of Microsoft. The Motley Fool owns shares of Autodesk and Microsoft.

Charter and 2011 Portfolios: Set up a Synthetic Short on the iShares MSCI Spain Index

Published Sep 6, 2011 at 12:00AM

Do You Need This Hedge?

Hey, new *Pro* Fool! Read this before you make this trade. If your portfolio is largely in stocks, a hedge like this one can help protect your portfolio from the effects of a general market decline. If you are not heavily invested in stocks, then you may not need this hedge or could make a smaller allocation. Visit our iShares MSCI Spain Index discussion board with any questions.

Trade Essentials

- **Action:** Set up a synthetic short on the **iShares MSCI Spain Index** (NYSEMKT: EWP): Sell to open October 2011 $34 calls and buy to open an equal number of October 2011 $30 puts.
- **Allocation:** 7.5% of the portfolio measured by the exercise value of naked calls we write (this allocation assumes you're largely invested in stocks — see the yellow box above for more).
- **Recent ETF Price:** $32
- **Recent Options Prices (Bid/Ask):** October 2011 $34 calls: $1.45/$1.90; October 2011 $30 puts: $1.95/$2.25
- **Preferred Price:** Aim to set up the synthetic short for as small a debit as possible. Splitting the bid/ask prices could muster close to zero cost, but more likely it'll cost around $0.40 per contract.
- **Alternative Trade:** None
- **Why Short the iShares MSCI Spain Index?**
  - If the sovereign debt crisis in Europe worsens, the cost of borrowing in Spain will continue to rise and it may not be able to pay its debts.
  - If economic problems worsen in Europe at large, Spain will likely feel a disproportionate amount of pain given its already weak economic position
  - Many European countries require financial assistance, and it's likely that (limited) aid will have to be spread too thin to be very effective.

The Big Picture

We're using options to set up a short position on the **iShares MSCI Spain Index** (NYSEMKT: EWP).

Europe is the biggest black box in our investing world right now. Greece is technically defaulting on its debt and now faces 47% interest rates on its two-year bonds, crushing its odds for an economic recovery. Ireland and Portugal have already been through sovereign debt collapses, and fears are increasing that Italy and Spain may be the next to face serious financial hardship. Further, these nations' obligations are so large that a bailout may not be possible.

Worries about the financial health of the Eurozone risk becoming a self-fulfilling prophecy. Investors are growing increasingly nervous and are demanding higher interest rates to loan money to the governments in question. As rates rise higher, the governments can no longer afford to issue new debt, at which point their existing obligations can't be paid.

The interest rate on Spain's debt has already cracked 5% for its 10-year notes, and if it continues to rise, the country's ability to pay its existing obligations faces worsening odds. Analysts suggest that rates much higher than 5% challenge the country's ability to finance its large debt burden, so the European Central Bank has been buying bonds from Spain to try to help keep rates low — but lately they're ticking higher again. If the ECB's support wavers, or if its strategy doesn't work, trouble may flare and Spain's financial situation may worsen; the country may face a possible default.

We are not predicting this will happen. We don't know. But since it's a real possibility, hedging against it makes sense. This is disaster insurance. If Europe continues to suffer, Spain — with its high unemployment rate and debt load, coupled with weak GDP growth — is likely to suffer even more.

Why This Strategy?

It is impossible to obtain shares of this index fund for direct shorting (none are available at the brokers we checked). Setting up a synthetic short, which comes close to replicating a short position using options, is our next best choice. We're using strike prices that give us a cushion on our short calls (which are the risk-bearing part of our trade). If Europe begins to get its financial house in order, Spain's ETF could rebound 7% to $34 before our short calls began to be squeezed. And if Europe can't come to agreement on how to solve its debt crisis and Spain's index falls more than 6% in dollar terms, the puts we purchase will begin to add value to our portfolio. We're using October options because they're the only ones offering a wide variety of strike prices and fairly tight pricing. As our expiration nears, we'll consider rolling into later options.

How to Follow Along

Setting up a synthetic short involves selling naked calls, so you need a margin account and ample equity to keep the trade open. "Sell to open" October 2011 $34 calls on EWP and "buy to open" an equal amount of October 2011 $30 puts. At the time of publication, you could make this trade for a net debit of around $0.40 per share. If the iShares MSCI Spain Index has moved significantly in price by the time you read this, move your strike prices accordingly so that your chosen strike prices "straddle" the ETF price the same way on either side. If you do this, the net cost to set up the trade shouldn't change much over the coming days.

If you have questions about this short, please visit our new iShares MSCI Spain Index discussion board. You can also see our guide to selling short.

Charter and 2011 Portfolios: Short the iShares Russell 2000 ETF

Published Sep 6, 2011 at 12:00AM

Do You Need This Hedge?

Hey, new *Pro* Fool! Read this before you make this trade. If your portfolio is largely in stocks, a hedge like this one can help protect you from the effects of a general market decline. If you are not heavily invested in stocks, then you may not need this hedge or could make a smaller allocation. Visit our [iShares Russell 2000 discussion board] with any questions.

Trade Essentials

- **Action:** Short the **iShares Russell 2000** (NYSEMKT: IWM) ETF
- **Allocation:** 10% of current portfolio value (assuming you're largely invested in stocks — see yellow box above for more).
- **Recent Price (Sept. 2):** $66.44
- **Preferred Price:** Not very relevant. Our approach to this trade is relatively short-term, and you can set up a position like this one whenever you want a hedge in your portfolio.
- **Alternative Trades:** You could *buy* (not short!) shares of the **ProShares Short Russell 2000** (NYSEMKT: RWM) ETF, which moves inversely to the index. Be aware, though, that this ETF doesn't do its job perfectly; it has only gained 9% this year while the index has lost 15%. You could also buy puts on IWM, paying the high premiums in exchange for limited risk (you only risk what you pay for the puts).
- **Why Short the iShares Russell 2000?**
  - Two of our previous hedges — including a [ratio put spread] on this index and a [synthetic short] on the SmallCap 600 index — expired in August, and we want new hedges in this uncertain environment.
  - We've used options to hedge with this index in the past, but shorting shares directly is less costly at the moment because options prices are so high. Shorting is also more immediately beneficial if the market declines.
  - We think the small caps in the Russell 2000 are likely to decline more than the S&P 500 index in a weak market.

The Big Picture

The **iShares Russell 2000** (NYSEMKT: IWM) tracks 2,000 of the market's small caps with a median market value of around $500 million. The index is typically more volatile than the S&P 500, and it trades at a premium to its large-cap brethren; the argument is that earnings growth at small companies is generally more impressive than at giants of industry. That may be the case when the economy is rosy, but in challenging economic times like these, small companies usually suffer more — meaning small-cap stocks can make dramatic swings downward.

We've made money investing against the iShares Russell 2000 in the past. In March, we [set up a ratio put spread] that expired Aug. 19. Today, high options prices make that strategy less appealing, so we're shorting shares directly instead.

How to Follow Along

To sell shares short, you need a margin account. Using a typical "stock trade" order, you'll enter "sell short" IWM as your trade command. Your broker will borrow shares and sell them immediately, and the cost will appear in your account as a negative value. If the underlying investment (IWM) declines, you can buy back the shares cheaper when you no longer want the short and keep the difference as your profit. If IWM goes up, you may eventually need to buy it back at the higher price, and the difference between your buy price and the price at which you sold short would become your net loss. (Hedges are unusual in that a modest loss is usually an acceptable outcome, because it means the rest of your portfolio presumably went up in value; the hedge was to soften the blow if the opposite occurred.)

Finally, be aware that shorting carries extra risk. Although it's usually unlikely, your broker could force you to cover (or buy back) the short if shares rise sharply or if the broker needs share inventory (remember, you've borrowed shares in order to sell them). That situation is unlikely to arise with a position in a large, liquid index like this one, but it's something you should always be aware of. Also, some brokers charge you an extra fee to sell short.

If you have questions about this short, please visit our [iShares Russell 2000 discussion board]. You can also see our [guide to selling short].

Charter Portfolio: Sell Jack Henry & Associates and Vanguard Emerging Markets

Published Sep 6, 2011 at 12:00AM

New to *Pro* ? These trades apply to holdings from our Charter Portfolio. If you've just joined us, you likely don't own either stock — but we invite you to read along for our latest thinking on both!

Trade Essentials

- **Actions:** Sell all shares of Jack Henry & Associates and Vanguard Emerging Markets
- **Recent Prices (Sept. 6):** Jack Henry & Associates, $27.65; Vanguard Emerging Markets, $41.60
- **Why Sell?**
  - Jack Henry stock is trading near our $30 fair value, and we see stronger opportunities elsewhere
  - Vanguard Emerging Markets is 33% invested in China and Brazil, and GDP growth in both countries is slowing; as a defensive move, we're taking our profit

What's Changed?

Jack Henry & Associates (NASDAQ: JKHY) has returned more than 45% for the Charter Portfolio since [our original recommendation] (we sold half our position about 9% lower than today's prices when [our covered calls] were exercised). We're selling our remaining shares, which make up 2.6% of our portfolio, because the stock is within striking distance of our $30 fair-value estimate and we believe we have better opportunities elsewhere.

Our remaining position in **Vanguard Emerging Markets** (NYSEMKT: VWO) has nearly doubled since our initial Charter Portfolio recommendation, hugely outpacing a 50% gain in the S&P 500 over the same period. We first purchased shares in late 2008 with the belief that emerging markets would lead us out of the recession, and they did outperform the U.S. stock market for a few years — we sold half our position in 2010 because, as we wrote then, "our thesis that emerging markets would recover more quickly than the U.S. and Europe has borne fruit."

However, the situation has flip-flopped in 2011, with the S&P 500 down much less than the emerging-market index. When the U.S. and Europe experience an economic slowdown, the pain can easily spread to emerging markets. In fact, the effects there can be even worse, since these economies are more volatile and their growth depends on strong demand from developed nations. The slowing of record GDP growth in China and Brazil is already raising concerns. China's construction boom, which has fueled the local economy, is proving unsustainable, especially as the government reins in speculative lending. And in Brazil, GDP growth has slowed by more than half from last year as the government focuses on taming inflation.

Yet as of July 31, approximately 18% of the Vanguard Emerging Markets fund was invested in China and 15% in Brazil. This 33% focus is up from 27% when we first bought in, at a time when both economies looked more promising. Vanguard Emerging Markets now looks highly concentrated in two regions that are likely to experience turbulence over the coming few years as massive internal investment slows and developed nations continue to struggle. We're content to exit our remaining 1.8% position with an excellent gain.

How to Follow Along

Pro will sell all of our shares of Jack Henry & Associates and Vanguard Emerging Markets in the next one to 30 days. Pleasantly, both positions represent long-term capital gains for us and members. Until the money is reinvested, these combined sales will add about 4.5% in cash to the Charter Portfolio. If you have questions, please visit the Jack Henry or Vanguard Emerging Markets discussion boards.

Don't Fall Prey to Doomsayers

Published Sep 6, 2011 at 12:00AM

Dear Fellow Investors,

Doomsayers have control of Wall Street right now. With the financial crisis of 2008 fresh on everyone's mind, it's easy for messages of impending disaster to take root and spread. As a result, gold is making headlines every day as investors bet against the world's entrenched monetary system. That's how dark the perception is for many at the moment.

Pro Trade Roundup

Charter Portfolio

- **OpenText** : Bought 700 shares at $58.75 (3% allocation).

Portfolio 2011

- **OpenText** : Bought 130 shares at $58.81 (3% allocation).

Guidance Updates

- **AmTrust Financial Services** was moved up to Buy after we increased our fair-value estimate and buy-around price for the stock.
- **Jack Henry & Associates** and **Vanguard Emerging Markets** have been moved to Sell (read today's trade alert).

Falling markets have always been a fact of investing life, of course. But the difference between today and, say, 30 years ago is that now, the message of doom never relents. Countless 24-hour cable news channels fill our screens, their talking heads discussing most everything in a breathless, urgent tone. On the Internet, anyone can claim the end of the world with at least some credibility if they only write well. And everywhere you turn, someone is trying to feed on — and profit from — financial fear with an email or an ad banner or a new book or a billboard. In short, the news of our financial systems' death is greatly exaggerated — and endlessly repeated.

In fact, it's so rare to hear someone offer a *positive* slant that when they do, you're almost beside yourself with relief. Warren Buffett is one such man. Jeremy Siegel is another. I'd happily put myself in their company.

But calm thoughts, even those offered by intelligent and thoughtful experts, are drowned out in today's fearful environment. The media cycle will turn again, and I can almost guarantee that the next turn will include phrases like "The economy is starting to mend," and "Europe is getting a grip on its financial problems," and "Housing and employment are finally showing signs of improvement." But until then, we need to live with a volatile, hypersensitive market amongst ongoing claims of doom — perhaps for many more months.

Sleep Better With Hedging

For most of this year, *Pro* has carried short positions (positions that profit on market declines) on three market indexes. Two of them expired Aug. 19, and today we announced two new short positions to replace them alongside our existing 6% holding in **ProShares Short S&P 500**. Combined, we'll be around 23.5% short, and in the near future, we'll likely add to these short positions or recommend new ones, potentially shorting shares worth 30% or more of our portfolio's total value — whatever amount makes us comfortable as the landscape evolves.

I don't personally subscribe to the belief that world currencies are doomed to ruin, but we're investing in a time of great uncertainty on a governmental level, and the outcomes of government decisions are impossible to predict. Sizable hedges provide peace of mind in turbulent times without capping the upside for the rest of our investments. And with a few bold moves in the right directions, governments in the U.S. and Europe could start to stabilize the situation — but that's a topic for another day.

Taking Action

Pro is likely to be active in the coming days and weeks. Expect a steady stream of trades as we position our portfolio the way we want it for the coming year and beyond. For our typical stock positions (shorts and hedges are an exception), we think in terms of three years or longer, so the moves we make in the near future will likely shape our portfolio for some time to come.

As the macroeconomic environment continues to change, we'll want to swap out some of our holdings for new ones. As we do, remember that investing is not a race. Follow our new positions when you're ready. When we buy a company, we're not investing to make money in the next day or week. We're investing to make money over the coming *years,* so follow us when you can, and don't worry if your trade comes weeks after ours.

If you're largely invested in stocks, as *Pro* is, you'll want to consider following our shorts and hedges as well, depending on your experience level and risk tolerance. If you're mostly in cash, you may not need to short or hedge at all. In that case, lower market prices — if they come along — will be a growing opportunity for you to use that cash to buy our favorite stocks.

Welcome, New Members!

We'd like to welcome all our new members once more! Get caught up on your *Pro* Memos with the Aug. 22 edition, in which *Pro* analyst Bryan Hinmon (TMF42) discusses our results, and the Aug. 29 edition, in which I outline the traits we all need to invest successfully. We'll also be sending a "Ketchup Report" this week that will help you get up to speed on our portfolio.

As we ride through a volatile time together, remember to keep a three-year perspective on the stocks you buy. Not only is the long-term view the only successful one when it comes to investing, but as a bonus, it will also help keep you calm. We'll use shorts and options to (ideally) profit in the near term, and we'll move through — and out of — this economic tumult together. Questions? Please visit the Memo Musings board.

Thank you to all members for being a part of *Pro*, and stay Foolish!

Jeff Fischer (TMFFischer)

Coverage & Community

- New members, please introduce yourselves on the Meet & Greet board! As you start to purchase our Buy First and Buy stocks, watch for new trades as well. Our special guide to help you get started will land in your inbox this week.
- How do you integrate your investments from other Motley Fool services with *Pro* investments? Don't miss this great discussion!
- Bryan (TMF42) outlines the reasons behind our guidance change on AmTrust Financial.
- Ready to think about October? TMFValuemoosie posts an earnings calendar.
- Nick (TMFCrow) provides extra guidance on how to use the boards.
- Stop by the Pro Philosophy & Strategy board anytime — it's a great place to discuss the market and *Pro*'s investment strategy.

A Special Message Regarding Your 3-Year Membership

Published Sep 2, 2011 at 12:00AM

One of the most important things we've learned over the years is that investing takes time. We couldn't be happier that you agree! Whether you're a longtime Fool or brand-new to the world's greatest investing community, we're excited to have you as we learn, grow, and take on the market together.

We'll be in contact regularly over the next couple of weeks with features to help make your transition into *Pro* a smooth one. If you have questions in the meantime, hit up our lively, members-only *Pro* discussion boards, where there's no such thing as a stupid question.

Before you go, make sure you check out this quick message from Jeff:

o4NXZyMjrRSCq9oSbchoFXK7pdbCj5iN

Thank you again for taking us up on our longest membership term. We're investors for the long run — and we're thrilled to have that in common with you!

Transcript

Jeff Fischer: Hi, I am Jeff Fischer, your advisor at *Motley Fool Pro* and co-advisor at *Pro*'s sister service, *Motley Fool Options*. First of all, congratulations on making a very smart choice by joining *Motley Fool Pro* with a three-year membership. You have put yourself in an excellent position to prosper over the coming three years and beyond. Your long-term outlook makes you uniquely suited for *Pro* because it shows that you realize, as we do, investing is not a short-term endeavor, not something that can be declared done, let alone won, in mere months or even a year or two.

By joining our premium service for the longest timeframe we offer, you have positioned yourself to invest with us correctly, intelligently and successfully. This kind of long-term perspective is half the battle when it comes to making great money in the stock market. The other half is investing knowledge, which our *Pro* team offers you in spades.

Before I talk to you about *Pro* for a moment, let's touch on your three-year membership just a bit more. This is the first time The Motley Fool has offered a three-year, full money back guarantee to anyone, and we are excited that 75% of new *Pro* members took us up on this offer. You might think that we are being overly generous or that some will take unfair advantage of this. After all, what other financial company offers you three years of service with a full refund available any time? No one that we know of.

I have talked with Tom Gardner, The Motley Fool's co-founder and CEO, about this. Why make this offer and why now? Here's what Tom said: In today's unusually volatile market, he doesn't believe it is enough to give members 30 days to evaluate our services to determine that you have made a great, long-term decision. A three-year, full guarantee is much more beneficial to members who want to see and benefit from the investing value we are offering you.

Our three-year offer is also much more aligned with the Fool's long-term investing mission and encourages members to remember this. Although *Pro* is the first, Tom wouldn't be surprised if such long-term memberships are the future of the Fool, and could become a great boon for Fool members like you. After all, nobody invests in the stock market for just one year; your investment services should reflect the reality that any investment in the market is a multi-year commitment.

Now let's talk about *Pro*, because there is another key aspect to your three-year membership: the amount of learning you can achieve over this amount of time. *Pro* is not just about helping you achieve strong profits; that is important, of course, and that is consistently our No. 1 goal, but we believe that learning, like investing, is a lifelong pursuit. As a *Pro* Fool, you will learn an incredible amount over the next three years about investing strategies and how to develop and refine the temperament you need to succeed with investing for the rest of your life.

Perhaps your main desire is to compound your returns strongly, or perhaps you are more concerned with earning steady cash income, month after month, using sensible option strategies like we do in *Pro*. Either way, the portfolio you build with *Pro* will help you meet your goals with less risk than the market overall. In fact, on our options strategies for income, we have historically made money up front on more than 80% of our trades, month after month. We have been similarly successful on our stock and ETF positions; with our focus on achieving the highest level of accuracy possible, it means that a vast majority of our closed positions have ended profitably.

Now, *Pro* is still a fairly young service, and I know our best days are ahead of us. As our three-year anniversary rolls around in October, we are on course to have a strong track record achieved through very volatile times. But we expect the next three years will be even better, and we are excited that you have committed to investing and profiting right alongside us.

Congratulations again on a smart choice. Watch your inbox for steady investing guidance over the coming days and weeks — and, yes, years — and please let us know on the boards if there is anything we can do to help you get started. We are in this investing relationship together, to make money together, so don't be shy to introduce yourself on *Pro*'s Meet and Greet board. We are delighted you are here, and we look forward to investing successfully with you for the years to come — and enjoying ourselves along the way. Fool on!

Your long-term outlook makes you uniquely suited for *Pro* because it shows that you realize, as we do, investing is not a short-term endeavor, not something that can be declared done, let alone won, in mere months or even a year or two.

By joining our premium service for the longest timeframe we offer, you have positioned yourself to invest with us correctly, intelligently and successfully. This kind of long-term perspective is half the battle when it comes to making great money in the stock market. The other half is investing knowledge, which our *Pro* team offers you in spades.

Before I talk to you about *Pro* for a moment, let's touch on your three-year membership just a bit more. This is the first time The Motley Fool has offered a three-year, full money back guarantee to anyone, and we are excited that 75% of new *Pro* members took us up on this offer. You might think that we are being overly generous or that some will take unfair advantage of this. After all, what other financial company offers you three years of service with a full refund available any time? No one that we know of.

I have talked with Tom Gardner, The Motley Fool's co-founder and CEO, about this. Why make this offer and why now? Here's what Tom said: In today's unusually volatile market, he doesn't believe it is enough to give members 30 days to evaluate our services to determine that you have made a great, long-term decision. A three-year, full guarantee is much more beneficial to members who want to see and benefit from the investing value we are offering you.

Our three-year offer is also much more aligned with the Fool's long-term investing mission and encourages members to remember this. Although *Pro* is the first, Tom wouldn't be surprised if such long-term memberships are the future of the Fool, and could become a great boon for Fool members like you. After all, nobody invests in the stock market for just one year; your investment services should reflect the reality that any investment in the market is a multi-year commitment.

Now let's talk about *Pro*, because there is another key aspect to your three-year membership: the amount of learning you can achieve over this amount of time. *Pro* is not just about helping you achieve strong profits; that is important, of course, and that is consistently our No. 1 goal, but we believe that learning, like investing, is a lifelong pursuit. As a *Pro* Fool, you will learn an incredible amount over the next three years about investing strategies and how to develop and refine the temperament you need to succeed with investing for the rest of your life.

Perhaps your main desire is to compound your returns strongly, or perhaps you are more concerned with earning steady cash income, month after month, using sensible option strategies like we do in *Pro*. Either way, the portfolio you build with *Pro* will help you meet your goals with less risk than the market overall. In fact, on our options strategies for income, we have historically made money up front on more than 80% of our trades, month after month. We have been similarly successful on our stock and ETF positions; with our focus on achieving the highest level of accuracy possible, it means that a vast majority of our closed positions have ended profitably.

Now, *Pro* is still a fairly young service, and I know our best days are ahead of us. As our three-year anniversary rolls around in October, we are on course to have a strong track record achieved through very volatile times. But we expect the next three years will be even better, and we are excited that you have committed to investing and profiting right alongside us.

Congratulations again on a smart choice. Watch your inbox for steady investing guidance over the coming days and weeks — and, yes, years — and please let us know on the boards if there is anything we can do to help you get started. We are in this investing relationship together, to make money together, so don't be shy to introduce yourself on *Pro*'s Meet and Greet board. We are delighted you are here, and we look forward to investing successfully with you for the years to come — and enjoying ourselves along the way. Fool on!

Charter and 2011 Portfolios: Buy OpenText

Published Aug 31, 2011 at 12:00AM

Trade Essentials

- **Action:** Buy 3%
- **Buy Around:** $58.50 (use a **limit order** at prices around or below this price)
- **Fair Value:** $70

- **Alternative Trades:** Want to try to buy shares at a lower price? "Sell to open" October $55 puts, lately paying you $2.30, or November $55 puts, which have lately paid $3.40. Sell one put for every 100 shares you'd be willing to buy. You may also consider selling $60 puts. (New to options? See our guide to selling puts to buy shares cheaper.)
- **Why Buy?**
  - As more businesses go digital, the demand is growing for document-management software.
  - Compliance requirements have grown since the credit crisis, and OpenText's software manages this need while increasing companies' productivity.
  - OpenText may be acquired as the industry consolidates.

First Things First

- **Company: OpenText** (NASDAQ: OTEX)
- **Share Price:** $57.40
- **Market Cap:** $3.3 billion
- **Website:** www.opentext.com
- **Type of Holding:** Growth; Software
- **Follow It:** Add OpenText to My Scorecard

The Big Picture

The days of filing cabinets and hanging paper folders may be numbered, yet the need to manage data is more critical than ever. (Those of you who have visited Fool HQ know that some desktops here are cleaner than others!) Thankfully, there are new solutions to manage information in the online age: Using software to wrangle piles of digital files is called Enterprise Content Management (ECM), and **OpenText** (NASDAQ: OTEX) excels at it.

Using OpenText's ECM software, businesses can manage the entire lifecycle of otherwise unstructured data, including invoices, email, legal documents, multimedia, spreadsheets, and websites. As companies eliminate paper, Gartner Group estimates that the ECM industry will grow an average of 10% per year.

This growth is being driven by three primary factors:

- A digital flood of data, including multimedia info, that requires special archiving
- The increased need for regulatory compliance following the financial crisis
- Businesses' desire to increase productivity and lower costs through efficient data management, especially in these tight times

OpenText's software offers customers regulatory peace of mind, helps them use their data more efficiently, and gives them a healthy return on their investment. And it's one of the only companies in the world entirely devoted to all this. Its last independent pure-play competitor (the no-longer appropriately named Autonomy) is being acquired at a hefty 60% premium -- $10 billion in all -- by **Hewlett-Packard** (NYSE: HPQ), so we shouldn't be surprised if OpenText winds up in another large software provider's crosshairs as an acquisition target someday. Given that profitable software companies are usually acquired at healthy premiums to market prices, we would welcome a buyout as a viable exit from our position.

The Business

For now, OpenText is the world's largest independent ECM software provider, second in market share only to **IBM** (NYSE: IBM). Its clients include some of the biggest businesses, government agencies, and professional-services companies in the world. OpenText calls itself "The Content Experts," but it could just as easily call itself a partner expert: Its key, long-standing, and strong relationships with **Microsoft** (NASDAQ: MSFT), **Oracle** (NYSE: ORCL), and **SAP** (NYSE: SAP), along with numerous acquisitions, have helped it capture nearly 18% of the market in the growing ECM software industry. (IBM has just a hair more than 18%).

OpenText's Rivals, by Global ECM Market Share

- IBM: 18.2%
- *OpenText: 17.9%*
- EMC: 11.6%
- Microsoft: 5.9%
- Autonomy: 5.5%
- Oracle: 5.3%
- Others: 35.6%

Source: Gartner Group, 2010

What's more, OpenText is moving firmly into Business Process Management (BPM) software on the heels of two recent acquisitions valued at more than $440 million. BPM software works to optimize processes within a business, and OpenText believes that's the glue that ties all of a company's digital content together -- which makes BPM software a natural add-on to its ECM offerings. Along with new BPM products, OpenText has recently launched social-management software, cloud offerings, and mobile versions of its programs that its clients can use anywhere on the go.

OpenText serves more than 46,000 customers around the world in diverse industries and government branches. Many of them contribute regular revenue to OpenText; about $151 million, or 52% of OpenText's revenue last quarter, came from recurring maintenance sales from existing customers. Through the years, recurring revenue should become an ever larger part of OpenText's sales, adding stability and predictability to the business.

With 53% of fiscal 2011 sales coming from North America, 40% from Europe, and only 7% from Asia and elsewhere, OpenText has plenty of room to grow globally, and its recent sales in Latin America have been strong. Moreover, whenever it launches or acquires new products, OpenText has a large client base for cross-selling opportunities.

Financials

In June, just as OpenText was celebrating its 20th anniversary, the company announced that its fourth-quarter revenue grew 19% year over year, to $285 million. For all of fiscal 2011, sales rose 13%, to $1.03 billion, free cash flow grew 16%, and adjusted earnings per share jumped 30%, to $4.02 ("adjusted" includes non-GAAP measures, mainly to account for acquisitions). OpenText's 2011 operating margin was 27.5%, smack in the middle of management's 2012 target of 25% to 30% -- though recent acquisitions will likely lower that margin before it rises again. These healthy growth numbers suggest that OpenText is holding its own or gaining when it comes to market share.

As the table below shows, OpenText's financials have improved steadily over the past five years. When I first bought OpenText for my personal portfolio in 2007, Wall Street disliked its low return on equity, but I saw a business positioned to steadily improve. I think this will continue.

	2007	2008	2009	2010	2011
Revenue	$595.7	$725.5	$785.7	$912.0	$1,033.3
Net Income	$21.7	$53.0	$56.9	$89.2	$123.2
Cash From Operations	$110.9	$166.0	$176.2	$180.2	$223.2
Capital Expenditures	$5.3	$6.9	$12.2	$19.3	$36.7
Free Cash Flow	$105.6	$159.1	$164.0	$160.9	$186.5
Return on Equity	4.4%	9.1%	8.6%	11.3%	12.8%

Fiscal years end June 30. Dollar amounts in millions.

Now that we know OpenText is performing well as a business, let's look at its stock price. The $3.3 billion company trades at 17.6 times trailing free cash flow and 12.3 times estimated earnings for the year ending next June. It would be reasonable for shares to trade around 15 times expected earnings, or about $70 -- and that's 23% above the recent share price, so the stock has ample room to advance.

What Would Make Us Sell

OpenText has bought up a bunch of companies, effectively succeeding through making acquisitions -- something that's common in the software world. However, we'll be analyzing all of OpenText's new acquisitions (it still has several in mind) to see whether they make sense for the business, and we'll be wary if the company starts to overreach. Given the fragmented ECM industry, we don't want to see OpenText permanently lose any market share to its competitors. If it does, we'd have to revisit our investment thesis. After all, we're assuming that the company will continue to gain market share, and this growth is core to our long-term success with OpenText.

The Foolish Bottom Line

I've known OpenText for several years, but this investment is as interesting as ever, thanks to the company's recent acquisitions in BPM software and the industry consolidation in ECM. OpenText has plenty of room to grow independently, and one day it could even be bought by a software giant. Either way, we stand to enjoy strong profits the coming years as more companies turn to OpenText to manage data and comply with regulations. To follow along with our investment recommendation, members should buy a 3% stake in OpenText along with *Pro*. Welcome aboard!

A Peek at What to Expect From Pro

Published Aug 31, 2011 at 12:00AM

Have Trading Questions? You're Invited to Our Live Chat!

Tune in to our live chat from 3 to 5 p.m. ET today. Jeff and the team will discuss this morning's trade step by step and answer any questions you have about *Pro*. Please join us!

Coverage & Community

- Nick Crow (TMFCrow) provides extra guidance on how to use our vibrant discussion boards.
- Introduce yourselves on our Meet & Greet board, and tell us specifically how we can help you!

Welcome to everyone here!

Pro's doors closed to new members yesterday, and we already have a waiting list – a clear sign that more investors want to focus on making absolute profits and guarding those profits against this volatile market. But you made the cut, Fool, and now we're moving forward together. Our common goal is to earn recurring gains with a high level of accuracy, despite what the market throws our way. There's no question we'll see market volatility again, and our community will welcome the investment opportunities that only volatility can bring. Meanwhile, we'll invest where we see a high likelihood for strong returns over months and years, with reasonable risk.

If you're new to *Pro* and missed our latest Monday Memo, please read it to help you get oriented; things are going to get moving here. We plan to bring you a steady stream of new trades each week for the foreseeable future. Be sure to get options permission from your broker if you haven't already.

Pro is combining stocks, options, and ETFs to build a portfolio that profits in any market. In upcoming memos and special features, we'll share our approach to valuation, our *Pro* philosophy, tips and instructions on using margin, and more. We'll also be sending you a special "Ketchup Report" in early September that will feature our current thinking on all of our holdings and help you, well, catch up to the *Pro* portfolio.

In the meantime, you can find out more about your *Pro* service here:

- Learn our seven mantras in How We Invest.
- See our unique asset-allocation plan in Breaking Down Our Portfolio.
- Put *Pro* to work for you with Making *Pro* Fit Your Profile and Secrets of a Winning Portfolio.
- Visit What to Do: Buy First, Buy, Hold and Sell Explained for details about using our guidance.

FAQs

We've tried to tackle some of your most common questions below. If you have a question that hasn't been answered here, please post it on any of our discussion boards.

Q: What's the best way to get started?

A: Visit your getting started guide. (Invest a little time for long-term rewards. That works for more than just money, Fools.)

Q: Which portfolio – Charter or Portfolio 2011 – should I follow?

A: *Pro* began investing in the Charter Portfolio in 2008, and our veteran charter members should continue to follow it. Portfolio 2011 was established earlier this year to build positions in many of the stocks we love from the Charter Portfolio. New and veteran members alike who need to "catch up" can follow along with Portfolio 2011 trades. (Set your email preferences for trade alerts here.) Trades on brand-new positions will be done in both portfolios at the same time, until the two portfolios eventually become mirrors of each other, as intended.

Q: How do I use *Pro* and *Motley Fool Options* together?

A: *Motley Fool Options* is a sister service to *Pro*, and it's free to every *Pro* member. It offers additional options ideas, education, community support, and strategies that can complement your *Pro* portfolio if you're seeking more ideas. We spend quality time coming up with *Motley Fool Options* ideas, too, of course, and the strategies there work alongside a *Pro*-based portfolio. In fact, *Pro* inspired the launch of *Motley Fool Options*. So, use both as you see fit, but try not to confuse the two services. Always double-check your trade alert emails to see which service recommends the trade.

Q: Which positions are best in an IRA?

A: Only a handful of options trades (ones that require margin, such as spreads) and shorts won't be possible in an IRA. Otherwise, most *Pro* investments can be made either in an IRA or a regular account. Most options are short-term gains, so you might consider doing as many of those as you can in a tax-advantaged account (assuming you're not planning on using the options income anytime soon). Investments with a high dividend yield, which you might want to own for years, may pay off best in an IRA. The rest is at your discretion.

Q: Do I need to buy shares in 100 round lots?

A: Proper allocation on a percentage basis is more important than buying in round lots. If we plan to use options on a position in the future (which requires 100 share lots), we'll let you know beforehand in the trade alert.

Q: How do I get up to speed using options?

A: Gradually! Start slowly, learning one basic strategy at a time (writing puts or covered calls). Read our *Pro* guides to options, and ask questions. You can find much more information, including educational videos, in the Options U. section of *Motley Fool Options*. Our trade alerts will be as specific as possible to help you get started using options.

Q: What should I do with my existing holdings?

A: If you need to free up some capital to invest in *Pro* positions, sell your least-favorite holdings whenever you're ready to invest in a *Pro* recommendation.

Q: How are trades announced?

A: We'll email you a trade alert during business hours that includes our thoughts behind the investment. *Pro* itself will make the trade one to 30 days later, giving you first crack at it.

Get Comfortable, and Think Big

Don't feel rushed. Investing is about thinking big – big picture, big time frame – and *not* about getting wrapped up in the moment (which is the exact opposite of what you want). We're here to steadily earn profits over time, and whether you make every trade with us or half of them, we want your outcome to be just as satisfying.

Welcome once more to our new *Pro* members, and thank you again to charter members for all your help in the community. We're happy we're all in the door and can do what we like best now: invest for profits.

We'll be visiting your inbox again with another trade alert soon. Until then, Fool on!

Jeff Fischer (TMFFischer)

4 Traits Great Investors Need

Published Aug 29, 2011 at 12:00AM

You're Invited to Our Live Chat!

Advisor Jeff Fischer and the *Pro* team will host a live chat from 3 to 5 p.m. on Wednesday, Aug. 31, to welcome new members and talk about an upcoming trade. Just click here to join the chat or set yourself an email reminder. See you there, Fool!

Your Next Monday Memo: Tuesday, Sept. 6

- Your next Monday Memo will arrive on Tuesday, Sept. 6, because Fool HQ will be closed for the Labor Day holiday.

Guidance Updates

- **Contango Oil & Gas** and **NextEra Energy** move down to Hold as we consider future portfolio moves.

Dear *Pro* members,

Nick, Bryan, Alex, and I would like to welcome our new *Pro* Fools -- and to thank our incredible veteran members for greeting them with such warmth and aplomb. We have an exceptional community here, and as we near the end of our third year, we're delighted that so many of you have chosen to join us for the next three years. Investing is not a one-year endeavor; it's lifelong.

Pro invests for the long term, and whether "long" or "short" stocks, that means being in the market through its inevitable ups and downs. Given the unpredictable nature of the stock market and its ability to incite fear in otherwise rational people at the worst times, it's true that without a few key attributes, it's hard to be a successful investor for long. To find success in the stock market, you *must* have:

1. A long time frame.
2. A steady temperament.
3. Liquidity.
4. The desire to keep learning.

Especially during volatile markets, it pays (literally and figuratively) to remember these. (Feel free to write them down and tape the list to your computer monitor, or print them out and stick them on your mirror, or convert them to an interpretive dance routine -- whatever will keep you from forgetting them.)

Timing *Is* Everything

Contrary to popular belief, there is one way you can time the market consistently: by committing to investing in it over an extended period of time. The Motley Fool has always espoused that you should only invest in stocks using money you won't need for at least three years, and ideally five or more. In other words, don't invest in the stock market with the money you need for the mortgage next month, your child's tuition in a few years, or a vacation to Africa in 2013. If you do, you're just inviting stress -- and unavoidable losses -- if stocks go down.

And when markets decline, our stress levels rise, which only compounds the potential heartache. The stress triggers our instinctive "fight or flight" reaction, and our time horizon shrinks. We get so wrapped up in the moment that we forget it's the distant future that matters when it comes to our investments. You can lessen the risk of falling prey to these tendencies if you truly only invest in the stock market with money you won't need for three to five years or longer.

Temperament Runs a Close Second

Besides an honest long-term commitment to investing, successful investing also requires the resolve and calm to stick with your convictions. Warren Buffett has said he believes temperament is the single most important factor in investing success, and to that end, he has spent his lifetime mastering the resolve to buy stocks when others are fearfully selling because the outlook looks dark (as it has lately). Common sense tells us this is both logical and brilliant: When the economic picture looks bleak, stock prices are discounted, but eventually the outlook will brighten, and prices will rise. So of course you want to buy when stocks are down -- and yet so many investors only buy when the outlook is bright and prices are up.

To be a successful investor, you must resolve to keep buying and holding good businesses when others are selling. Here at *Pro*, we also aim to smooth meaningful declines with hedges or shorts, a process that can help both our returns and our temperament. Our two hedges that expired earlier this month, set up with options on market indexes, added about 2% to the Charter Portfolio's coffers as the market declined more than 10%. Two percent may not sound like much, but it is, and it's a strong relative gain as the market fell. We're currently looking to set up new hedges to mute any potential losses through autumn.

Liquidity Trumps All

I'm now going to be bold and contradict Buffett a bit. I believe that ultimately, liquidity is even more important than temperament -- you can be the calmest investor in the world, but if you run out of liquid assets, you may have no choice but to sell at the worst time. To maintain liquidity, you need to hold cash, maintain healthy buying power, and have a portfolio that remains flexible even when the market (or some of your positions, whether long or short) are under great stress.

At *Pro*, we aim to maintain extra flexibility by having short positions that go up when the market declines. Selling the shorts at that point is an easy way to raise cash to invest in discounted equities, even if the rest of our portfolio has declined with the market. That said, shorting must be done prudently: Direct shorts (as opposed to using options) open you up to potentially unlimited losses, and your broker could "call you out" of your short position or increase your margin requirements to maintain the short (another reason to always maintain ample buying power and cash).

One of our current shorts (through naked calls), the **iPath S&P 500 VIX Short-Term Futures**, recently spiked from $24 a share to $42. We're willing to wait out the jump as we always said we would, but it does have us on our toes -- we need to watch our cash to make sure we can continue to ride the short higher if necessary. The steep increase in volatility (and thus in VXX) is very likely temporary, so eventually we should profit on its decline -- which is all the more reason we need to be prepared to keep riding it out.

'... What Do You Do?'

This leads to the final attribute a great investor needs: a willingness to keep learning in order to improve. Over the 24 years I've been investing, I've made plenty of mistakes -- some small, some large, but always a few every year. I like to think that I don't make the same mistake twice and that each one has helped me in a lifelong goal to become a better investor. Because in the end, investing is a lifelong pursuit. We never plan to stop. We'll be investing for a lifetime, because we believe stocks -- along with our options and other strategies -- will remain one of the strongest possible ways to grow our assets.

Our goal at *Pro* is to earn consistent returns over the years, and to do so with steadiness, strength, and a minimum of worry -- always improving along the way. As we build a track record, we're confident that over the next three years, we're going to keep improving. We'd love to hear your insights, too. Please visit our Memo Musings board and share some of the investing lessons *you've* learned. Doing so will help all of us in the *Pro* community improve together.

Foolishly,
Jeff Fischer (TMFFischer)

Jeff is short VXX.

Your Pudding, Ma'am

Published Aug 22, 2011 at 12:00AM

Ever since we launched *Motley Fool Pro* nearly three years ago, we've been vocal about our mission to earn consistent profits with a high level of accuracy — to make money in any market. And we've certainly been handed a variety of market conditions since *Pro*'s October 2008 opening. Intraday swings of 5% are the new normal these days, and volatility is everyone's new favorite topic. The market's daily chaos is enough to make one wonder whether the *Pro* approach to investing is working, or if we're just playing a (lower-case "f") fool's game.

The Numbers

I'm a former hedge fund guy, and my mind occasionally wanders back in that direction (it's a difficult condition to cure entirely). So when I found myself pondering whether *Pro* is fulfilling its mission, I decided to crunch some hedge fund-y risk and return statistics for *Pro*'s Charter Portfolio over two time periods:

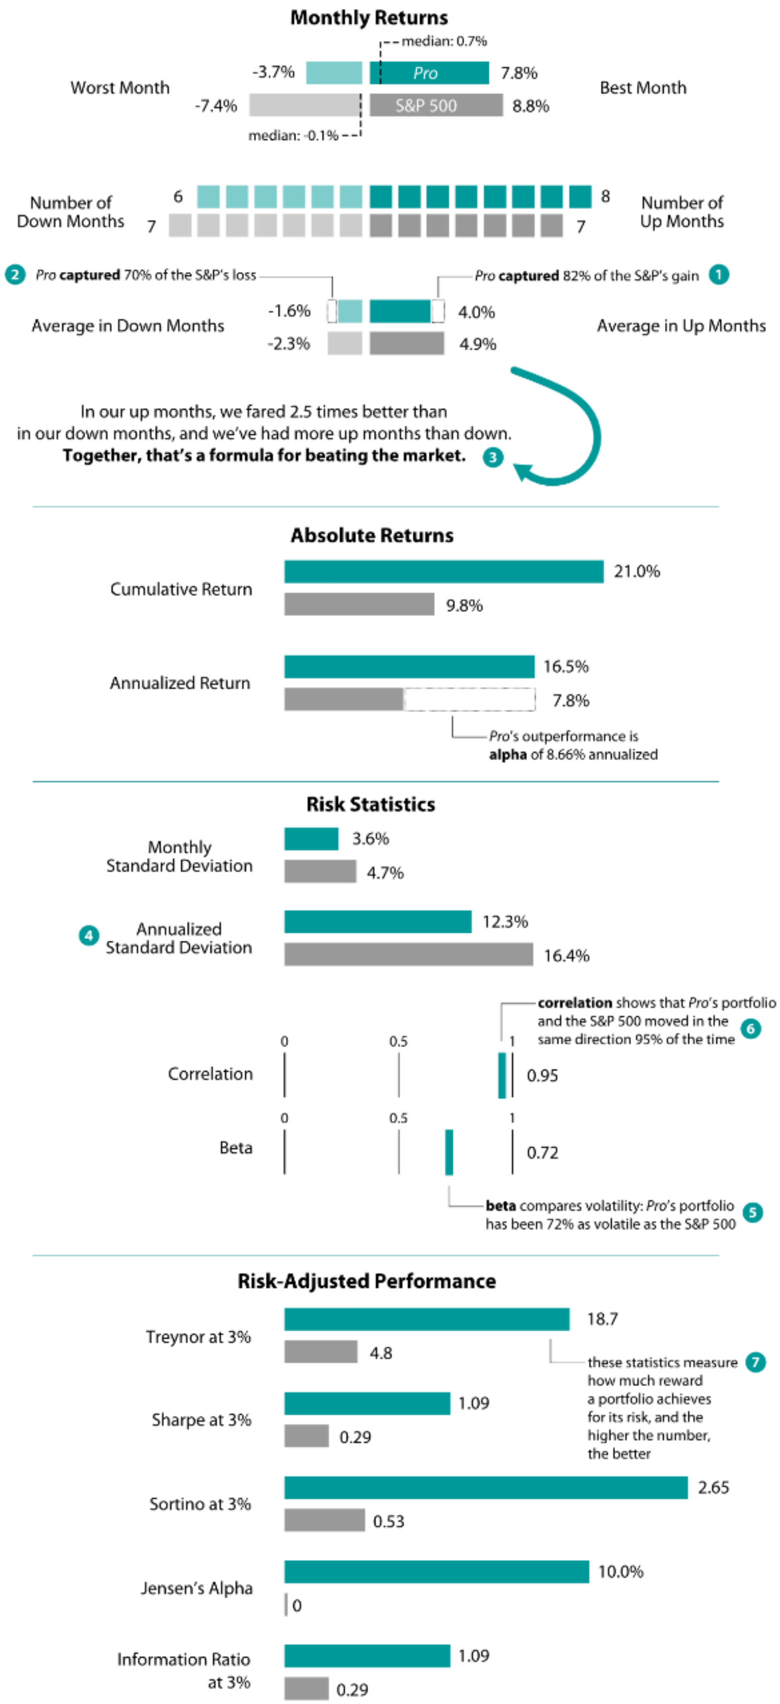
1. From inception (Oct. 7, 2008) to the present (Aug. 17, 2011)
2. From May 31, 2009 (when the Charter Portfolio was nearing our estimate of “fully invested”) to the present (Aug. 17, 2011)

The data in the graphic below highlights the second of those time periods, because *Pro*'s cash cushion in the early days distorts those statistics too much to rely on. (I'll post them on the Memo Musings discussion board for you to investigate if you choose.) In contrast, for the last 15 months or so, *Pro*'s cash position has been strategic; we've kept some cash as dry powder and some to cover any potential option obligations.

In a minute, I'll demonstrate how the numbers have reinforced my belief in the *Pro* approach — but before we dive in, remember these things:

- These statistics are based on month-end statement values for the Charter Portfolio and on the portfolio's value as of Aug. 17, 2011. They are my calculations and are intended for informational purposes only.
- We're well aware of the strengths (doesn't the chart look snazzy?) and weaknesses (we're looking at you, non-normality) of many of the statistics given. They're not perfect, but taken together, I think these statistics provide valuable information.

Fellow data lovers, let's dive in. (And if you're numerophobic, feel free to skip ahead for my takeaways!) Click on the image to see a larger version.



Sources: Month-end Charter Portfolio values (starting with market open Oct. 7, 2008, and ending with market close Aug. 17, 2011); Yahoo! Finance; author's calculations.

The Proof Is in the Pudding

So what can this data tell us about *Pro*? Use the numbers below to follow along with my key takeaways.

- **We make money while losing less.** So far, when the market goes up, *Pro* earns 82% of the S&P's average increase **(1)**. And when the market goes down, *Pro* declines only 70% as much as the S&P's average decrease **(2)**. Because our up months are 2.5 times as large as our down months **(3)**, and because we have more up

months than down, we've been able to outperform the market.
- **We zig and zag less than the market.** There are plenty of ways to measure risk, and the academic types tend to focus on standard deviation. In this case, standard deviation is just a measure of how far our returns tend to differ from the average. *Pro*'s annual standard deviation is 25% less than the market's — 12% to the S&P's 16% **(4)**. Another measure of risk is our portfolio's "beta," a metric that compares the volatility of *Pro*'s returns to the volatility of the market's returns. We're about 72% as volatile as the market **(5)**.
- **We don't invest in a vacuum.** Correlation measures the degree to which Pro moves in the same direction as the market. I was surprised to see the high correlation (0.95) between *Pro* and the market **(6)** — that number means we move with the market about 95% of the time. Over time, we hope to become less tied to the performance of the market.
- ***Pro* shines when we look at risk and reward together.** Each of the risk-adjusted performance statistics **(7)** attempts to quantify how much reward a portfolio achieves for the given risk it takes on. (Feel free to hop on the Memo Musings board to chat with me about any or all of the statistics; Wikipedia has great introductions to the Treynor ratio, Jensen's alpha, the information ratio and more.) These differ in how they measure risk and reward, but in general, the higher the number, the better — and *Pro*'s numbers are off the charts. Sure, I'm biased, but *Pro*'s risk-adjusted return statistics really are quite impressive; they indicate that we're squeezing out a bunch of return from each unit of risk we take.

The *Pro* Bottom Line

All in all, these numbers are compelling, reassuring, and impressive (we hope!) — but in the end, they're not what really counts. Let the hedge-fund consultants keep their fancy spreadsheets, risk-adjusted performance statistics, and portable alphas. At *Pro*, our performance (the cart) is a function of our investing philosophy (the horse). These stats stem from how we approach investing. They are an outgrowth of our sensible, cautious, long-term approach.

So is the proof in the pudding? Yes — but we care about a different flavor of pudding here. We believe that removing a little portfolio volatility (by owning businesses with recurring revenue streams and by using options when appropriate) gives you the mental and emotional edge you need to keep your wits about you and invest through any inevitable short-term market noise. If *Pro* is helping you do that, and if you're having fun living your life and sleeping well at night, you can rest assured that the numbers are taking care of themselves. That is investing the *Pro* way, and it's a flavor of pudding we can all dig into.

Onward,

Bryan (TMF42)

From the Boards: Good Old Rocky Top

Over on our discussion boards recently, members decided that a *Pro* Fool known as OldFart1946 needed a new user name. The contest to rename him ended today, and the former OldFart1946 (pictured at right with his loved ones) had this to say:

And the winner is:

RockyTopBob from good old Leo who now has to either accept his new name of 1110001000101 or say at least something about it ;-) I mean, come on Leo, that was so cool and Rich probably thought it up himself.

If you live anywhere near Knoxville TN, the home of the UnivTN Vols, you live to hear Pat Summit, probably the best women's basketball coach alive, sing Rocky Top. I think that darn song sticks in your brain so Leo owes a thank you to Pat.

As Nick previously said he hopes to get a T-shirt for the second-place entry which is no surprise ? TenISeeBob. Thanks Martha! I really was leaning towards this but every time I thought about it I saw Bo Derek leaving the ocean in her braided hair (I never noticed the bikini). I'm certainly less than a one and I don't want those Fools on SA calling me Bo ;-). As I said before, thanks to Rich's kids for making my life on the boards fun.

I also liked all the Boomer ones but they were all so close. How could I pick one?

Hope you liked the pictures of my better half and my better quarter. They are both the light of my life.

Regards,

Bob (RockyTopBob)

More Coverage & Community

- MazonCreekRich decides to enjoy his summer by providing some great analysis for *Pro*.
- There are a ton of valuable lessons to be learned, and relearned, on the VXX discussion board.
- Fools have a great debate on patience, opportunity, and missing the boat.
- It's fair to say we're all glad to have Jeff back.

Trade Roundup and Guidance Changes

Trade Roundup, Charter Portfolio:

- **iShares S&P SmallCap600 ETF**: closed 16 August 2011 $71 puts for $7.90
- **iShares Russell 2000 ETF**: closed 15 August 2011 $72 puts at $4.72 and closed 15 August 2011 $81 puts at $13.68
- **Rockwood Holdings**: assigned 600 shares at net $47.20 per share

Trade Roundup, Portfolio 2011:

- **iShares S&P SmallCap600 ETF**: Closed one August 2011 $71 put for $7.90
- **iShares Russell 2000 ETF**: Closed three August 2011 $72 puts at $4.69 and closed three August 2011 $81 puts at $13.65
- **Rockwood Holdings**: Assigned 100 shares at net $47.10 per share

Guidance Updates:

- **Rockwood Holdings** moves **up to Buy First** on price.
- **Bristow Group** moves **up to Buy** on price.
- **AmTrust Financial Services** moves **down to Hold** on price in relation to other positions.

Upcoming Earnings:

- **Aug. 23:** Medtronic

You can see all of Pro*'s holdings on our [Recommendations page](#).*

Charter and Portfolio 2011: Close Your Remaining Put Spread on IWM

Published Aug 17, 2011 at 12:00AM

Trade Essentials

- **Action:** Buy ("buy to close") August 2011 $72 puts; sell ("sell to close") August 2011 $81 puts
- **Recent price (bid/ask):** August 2011 $72 puts, $1.66/$1.76; August 2011 $81 puts, $10.11/10.43
- **Limit order guidance:** Use a spread order if your broker offers it, and aim for a credit close to $9 (right now, trades at $8.35 should fill, but feel free to work the spread through Friday)
- **Why Close?**
  - These options are set to expire on Aug. 20.
  - Our bear put spread is near its maximum profit.

What's Changed?

We established our ratio put spread on the **iShares Russell 2000 Index ETF** (NYSEMKT: IWM) in March as protection against completion of QE2, the government stimulus program. The Russell 2000 index has fallen 14% since then, and shares of the ETF are now below $72 — so the remaining legs of our bear put spread (we closed half of our puts earlier this month) are set to expire at their maximum profit.

Brokers have different methods of handling options expiration; this alert is to warn you to keep an eye on yours. You'll make the maximum profit possible if you let your $72 puts expire worthless, but the recent spike in market volatility has these puts trading with quite a bit of time value considering expiration is only three days away. Close this spread opportunistically until then, or if your broker will net the transaction (make a cash settlement) for you on expiration, you can just let your spread expire on its own.

- **Questions?** Visit the IWM discussion board.

Pro*'s Charter and Portfolio 2011 will close this bear spread in the next one to 30 days, per The Motley Fool's trading guidelines. You can see all of* Pro*'s holdings on our* Recommendations page.

Charter and Portfolio 2011: Close Your Synthetic Short on iShares S&P SmallCap 600 Index

Published Aug 16, 2011 at 12:00AM

Trade Essentials

- **Action:** Sell to close your August 2011 $71 puts
- **Recent price (bid / ask):** $7.90 / $8.20
- **Limit order guidance:** Use a limit order near the bid price
- **Why Close?**
  - These options are set to expire Aug. 19.
  - We bought them as a hedge, and they've done their job; we can now put that cash to work elsewhere.
  - The index these options track has fallen 14%.

- **Alternative trade:** In addition to selling the puts, consider closing ("buying to close") your August 2011 $75 naked calls, especially if you're nearing the limits of your portfolio's buying power. You can also take no action and let the calls expire at the end of this week.

What's Changed?

Our synthetic short on the **iShares S&P SmallCap 600 Index** (NYSEMKT: IJR) expires at the end of this week, and we intend to close our August 2011 $71 puts before that happens. We established this position in May as a hedge against a potential drop in value for the approximately 25% of the *Pro* portfolio that's invested in mid- and small-cap stocks. The index has dropped 14% since then, so the hedge has served its purpose well. We could have exited earlier for a larger profit, but the comfort this position gave us during volatile times was worth the price. We'd like to redeploy this capital into individual positions, but we're on the lookout for opportunistic hedges, too.

Questions? Visit the IJR discussion board.

Pro *will close its remaining IJR puts in the next one to 30 days, per The Motley Fool's trading guidelines. You can see all of* Pro*'s holdings on our Recommendations page.*

Playing Calvinball With the Market

Published Aug 15, 2011 at 12:00AM

Dear Fellow Fools,

The market let me down.

Pro Trade Roundup

Charter Portfolio

- None

Portfolio 2011

- **Medtronic** : Purchased 150 shares at $31.60
- **Oracle** : Purchased 200 shares at $26.44
- **GlaxoSmithKline** : Wrote three November 2011 $37 puts for $1.40

Upcoming Earnings

- **Aug. 16: Jack Henry**

This Week's Expirations

- **Rockwood** $50 puts: If our puts are in the money at expiration on Aug. 19, we'll accept shares.
- **iShares S&P SmallCap 600** synthetic short: Expect a trade alert this week.
- **iShares Russell 2000** spread: Expect a trade alert this week.

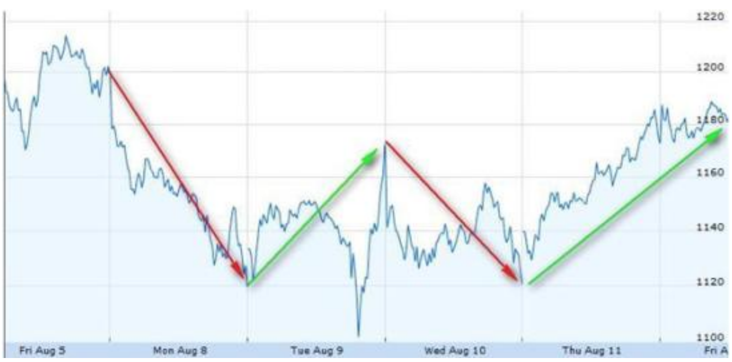
Let me explain: On Saturday, I went to another one of those affairs where the only person I knew was my spouse. You know the type of party, the kind where your other half provides strict instructions about what (and what not) to wear, where the last five minutes of the drive are spent trying to remember the names of people you expect to see but have only met once before. My favorite part of the chitchat at events like these is trying to decipher the expression on the face of my interlocutor after I say I work at a company called "The Motley Fool."

This is where the market let me down. After a week of whipsawing 5% market reversals, it seemed like investing would at last be the topic *du jour* at my spouse-sanctioned party. Surely the market crash we'd just experienced would be on everyone's mind, making for some interesting conversation.

... Nope

Turns out that as volatile as last week felt while we were in the midst of it, in the end, the S&P 500 only dropped 1.7% — from 1,199.38 on Aug. 5 to 1,178.81 one week later. If it weren't for margin calls — most induced by options clearing and settlement company Penson — and a parabolic but likely temporary VIX spike, last week would be one of many uneventful weeks in the market, the kind that immediately fade from memory and are never thought of again.

So was it a non-event? The conversations at the party I attended, centering as they did on recent high school graduates' chosen majors, whose child was working where, golf handicaps, Republican presidential candidates, Obama's second term, early retirement, and labradoodles, certainly seemed to suggest that few casual investors even noticed the market's gyrations.



Sources: Google Finance; analyst drawings.

Never the Same Game Twice

Of course, *Pro* members are not casual investors. To us, last week was *not* a week to forget — it was full of great opportunities to learn. And though the image above might seem to suggest it, "trade the S&P every other day" is not one of those lessons. To the contrary, to invest the *Pro* way, we need to invest for the long term — but that means we need to be able to hold for the long term. To that end, I'd like to introduce the three lessons of investing Calvinball (where the only permanent rule is that "you can't play it the same way twice"):

1. Beware changing rules.
2. Brokers are not to be trusted.
3. Buying power deserves a margin of safety.

To my knowledge, last week was only the second time ever that regulators have banned short-selling in an attempt to prop up the financial sector. This time it was France, Spain, Italy, and Belgium manipulating the market; last time, in September 2008, it was the SEC. Being an investor in a market where the rules are constantly changing requires caution. Even if the rules don't change, there's always the risk that you won't be able to hold onto your shorts (figuratively and quite possibly literally) as long as you'd planned. Remember that to sell shares short, you first need to borrow the shares — and if those shares are no longer available in the future, you may be forced to cover at the worst time and lock in large losses.

Try this at home: Call up your broker and ask about the margin requirements for **iPath S&P 500 VIX Short-Term Futures** (NYSE:VXX) naked calls. Listen carefully to the answer you get. Then call and ask again. Chances are that you'll hear two different answers, and both might be wrong. Worse yet, the clearinghouse, not the broker, might be the one calling the shots. Witness the pain caused when Penson doubled its margin requirements and reduced the time to cover from 72 hours to 24 hours with zero advance notice (my heart reaches out to you Fools caught by that move).

That leads us to the third lesson: Portfolio optimization and redundancy exist on a continuum. *Pro* errs toward redundancy. Demand a margin of safety when deciding how much capital you want to support your short obligations; recent history suggests that you should avoid using margin *and* make sure you have double the minimum requirement. This way you'll still have capital to invest when opportunity knocks, and you'll be able to hold your current positions longer if you so desire.

Stress-Testing Yourself

Giving your portfolio a stress test is one thing, but stress-testing *yourself* is entirely different. I think temperament is the most important predictor of investing success (notice how calm Jeff is? Not a peep all week!). The key is to align your investments with your temperament. Ask yourself how you felt last week. When the S&P dipped toward 1,100, did you start to want out? Did you suddenly feel you'd taken on more risk than you'd intended? Or were you cool and calm, hoping the stocks you wanted got even cheaper? Most Fools are somewhere in the middle of that spectrum — and last week was the perfect opportunity to gauge where *your* temperament falls. Now is the time to adjust your portfolio, your cash balance, and your leverage to levels that allow you to sleep at night when the market is tanking. A rising market is a poor time to determine your temperament, so act fast, lest you be lulled back into overconfidence.

The *Pro* Bottom Line

Markets are always changing, but a few observations apply to all of them — up, down, or sideways. In the long term, stocks will reflect the values of the underlying businesses, but over short time frames, prices are driven by fear and hope. New creations like penny pricing and 'bots that exaggerate trading volume only seem to magnify short-term swings, but these inefficiencies (offered to us under the guise of increased liquidity) bring opportunity. As a *Pro* Fool, you've got the tools and temperament to hit the fat pitches — no matter what version of Calvinball the market is playing this week.

Portfolio 2011: Buy Oracle

Published Aug 9, 2011 at 12:00AM

Pro first recommended buying **Oracle** in our Charter Portfolio in September 2009. To read *Pro*'s original report, see the recommendation history.

Trade Essentials

- **Action:** Buy 2.3%
- **Buy around:** $27
- **Fair value:** $32
- **Preferred price:** $26
- **Alternate trades:** "Sell to open" September 2011 $25 puts or December 2011 $25 puts. Sell one put for every 100 shares you'd buy. (New to options? See our guide to selling puts.)
- **Why buy?**
  - This dominant business still enjoys solid growth prospects.
  - It's on sale.

The Big Picture

First Things First

- Company: **Oracle**
- Market cap: $131.8 billion
- Website: www.oracle.com
- Type of holding: Core; Software, Technology
- Follow it: Add Oracle to My Scorecard
- See our original recommendation of Oracle

Oracle got to be the world's largest enterprise software company — and earned its place in *Pro*'s Charter Portfolio — by demonstrating three decades of ruthless dominance in its space, and that trend shows no sign of stopping. Competitors currently in the No. 1 position in any business line in which Oracle is No. 2 should be aware they have targets on their backs. Just ask IBM: Oracle now has a larger software business and a database business twice the size of the former front-runner's. With shares trading below our buy-around price for the first time in nearly a year, now is the time for Portfolio 2011 to first invest in this core holding.

Oracle is a large company, as evidenced by the variety of other companies it's acquired, but we can simplify its offerings into three basic categories: software, which generated 68% of sales in the last fiscal year; hardware systems, with 19%; and services, with 13%. Software — which includes the licensing, updates, and support of database, middleware, and applications software -- is still the most important, but it's the business hardware segment that's drawn the most attention recently, thanks to the difficult and controversial acquisition of Sun Microsystems last year. After that acquisition, Oracle is able to boast Sun's formidable server, storage, and networking capabilities where it previously had no hardware presence. The services segment, meanwhile, includes consulting, education, and (as much as the name appears to irritate Oracle founder and CEO Larry Ellison) "Cloud Services."

Recurring revenue from its subscription-based business model made up nearly 50% of the $36 billion in revenue Oracle raked in last year which give the company a high degree of stability. Better yet, 25% of every dollar of revenue makes its way to free cash flow. We wouldn't be surprised if Oracle generated $10 billion in free cash flow in the coming year.

Valuation

At a recent $26 per share, Oracle shares are $1 below our buy-below price. That's just 11 times earnings estimates for the year (the Charter Portfolio got in at a not-too-shabby 14 times 2010 estimates) and 13 times current free cash flow (the same valuation as the Charter Portfolio's first purchase).

Risks and When We'd Sell

Honestly, our primary risk right now has nothing to do with Oracle itself: We risk buying too early into a bear market. We're guarding against that possibility by buying an innovative, well-capitalized company (it has more cash than debt ... about $13 billion more!) — one the world would notice if it were to go missing. Also, we're only buying half of the Charter Portfolio's allocation for the moment; we hope to buy the other half at even cheaper prices.

Of course, there are a few business risks as well. With a serial acquirer like Oracle, we want to see discipline in future acquisitions. During the last conference call, Ellison addressed those concerns by commenting, "Anyone who looks at the valuations today [of the smaller software companies Oracle would consider acquiring] ... we don't think they make any sense." Controversial though he may be, we're in good hands with Ellison; love him or hate him, the man turned $2,000 into a $132 billion powerhouse.

The *Pro* Bottom Line

Market corrections are no fun, but the one thing I do appreciate about them is the opportunity to buy into my favorite businesses at values I didn't think I'd ever see again. This is exactly such an opportunity — a chance to buy a dominant business that still enjoys attractive growth prospects at a good price. Jeff's closing words on our first recommendation still hold true: "At current prices, Oracle offers ample upside and limited long-term downside, while giving the *Pro* portfolio exposure to one of the world's foremost technology leaders."

Bring any questions or comments to our Oracle discussion board, and Fool on!

Pro Portfolio 2011 will buy a 2.3% stake in Oracle in the next one to 30 days, per The Motley Fool's trading guidelines. You can see all of Motley Fool Pro*'s holdings on our Recommendations page.*

Portfolio 2011: Write More Puts on GlaxoSmithKline

Published Aug 9, 2011 at 12:00AM

At a Glance

- **Action**: Write ("sell to open") November 2011 $37 puts
- **Allocation**: 4% (for *Pro*, that's three contracts)
- **Stock price**: $39.50
- **Buy around**: Below $40
- **Option price**: $1.60 (use a limit order around the market price)
- **Alternate trades**:
  - Buy a 4% allocation in shares. (*Pro* will probably continue using options, but it's not vital; you can simply own shares.)
- **Why buy?**
  - The U.K.'s largest pharmaceutical and health-care products company trades at a defensive price and offers a safe 5.2% dividend yield.
  - Most of the company's patent expirations are behind it, and it has dozens of new products in trials.
  - A focus on emerging markets diversifies the business and expands the potential for long-term revenue and profit.

What's Changed?

First Things First

- **Company: GlaxoSmithKline** (NYSE: GSK)
- **Market cap**: $100 billion
- **Website**: www.gsk.com
- **Type of holding**: Health care; defensive income
- **Follow along**: Add GSK to My Scorecard

The price. That's the only difference since our last round of **GlaxoSmithKline** (NYSE: GSK) puts expired worthless. This behemoth is now worth more than $100 billion, and it still controls an estimated 6% of the global pharmaceutical market (revenue-wise) and employs nearly 100,000 people in more than 100 countries. Now it's once again trading at our buy-around price, and better still, puts pay more than they did last time.

Why This Strategy?

Glaxo offers steady income and slow appreciation with reasonable risk. *Pro*'s Charter Portfolio has a 4.1% position, and if these shares are put to us, Portfolio 2011 will more than match that allocation at $35.40 per share. That's a full 12% lower than Charter's cost basis (though of course without the income from dividends and covered calls generated over nearly two years of ownership). If we're not put shares, the current premium still offers a 4.3% yield (15.5% annualized) in just more than three months. Writing puts is great way to aim for share ownership with less risk than current market prices offer.

How to Follow Along

You need options approval to write puts, and the trade command is "sell to open" or "sell." *Do not buy these options!* Sell one contract for every 100 shares of Glaxo you're willing to purchase later (each contract represents an obligation to buy 100 shares, or $3,700 worth of stock; we're selling three for about a 4.9% allocation, which is as close as we can get to 4% on our recently reduced portfolio balance). Writing these options will "pay" you the option premium today, and we'll wait until expiration in November to make our next move.

Our initial potential profit is the put income, and we have an obligation to buy shares if the stock falls below the $37 strike price by expiration. Since we intend to take ownership if we're assigned shares in November, be certain you have $3,700 available, per contract, to buy shares. Otherwise, just buy shares of Glaxo outright (up to 4%).

Next Steps

- Questions or comments?. Visit our GlaxoSmithKline discussion board.

- Visit our guide to writing puts.

We'll be paid $1.60 per contract, placing our net buy price 10% below the recent share price; that makes this a defensive income trade. And if we nab shares, we'll enjoy a 5.2% yield as we wait for the price to rise.

Pro*'s Portfolio 2011 will write puts representing about a 4% stake in GlaxoSmithKline in the next one to 30 days, per The Motley Fool's trading guidelines. You can see all of* Pro*'s holdings on our Recommendations page.*

Total Investing Nerds

Published Aug 8, 2011 at 12:00AM

Special Note: This Too Shall Pass

Dear Fellow Fools,

To say the markets have been getting slammed lately would be an understatement. *Pro* Fools are well aware of the various risks to our economy, so there's no need to list them here, but what might be less obvious is that we can see through these dark clouds. *We will make it through this market correction*.

There is no way to know whether what we're experiencing will turn out to be a quick 20% drop or a more prolonged, and thus more painful, bear market. What we do know is that we have the best tools possible in our toolbox. The drops in our stocks' prices are dampened by our hedges, which will eventually provide the capital we need to add to our favorite businesses and thus benefit from the mispricings and miscalculations of a panicky market.

To demonstrate just how silly a metric relative performance is: Right now, I think the *Pro* portfolio is at its all-time highest versus the S&P 500 (9.5% ahead of the index), but it sure doesn't feel that way. We would much prefer to be lagging while enjoying much higher absolute profits. Those higher profits will come again, but only if we take a long-term perspective, make measured adjustments to the portfolio, and stay the course. Brighter days always follow the storm.

If you have your doubts or just need to talk it out, come see us on the discussion boards.

Fool on!

Nick Crow (TMFCrow)

Dear Fellow Fools,

When Reza and I (Elizabeth here) joined the *Pro* service as interns eight weeks ago, we had little idea what to expect. The team seemed friendly, but a little unusual. Three analysts and an advisor sat in close proximity with no apparent hierarchical boundaries. Debates on the merits of various companies frequently transpired over the note-covered whiteboards that separate each desk. We already knew our time at The Motley Fool would be no stodgy Wall Street experience, but this brought things to a whole new level. And then they started asking *us* for our opinions.

The *Pro*-cess

Downgrade Discussion

Foolish advisors and analysts hosted a live chat this morning discussing what the S&P's downgrade of the United States' credit rating to AA+ means for your money. Read the full transcript here.

Guidance Updates

- **Intel** and **Medtronic** move up to Buy First on valuation
- **3D Systems** , **Rockwood Holdings**, **NextEra Energy**, **Oracle**, and **GlaxoSmithKline** move up to Buy on price

Pro Trade Roundup

Charter Portfolio

- **Kinetic Concepts** : Sold all shares at $64.67.
- **iShares Russell 2000 Index** : Bought to close 15 contracts at $4.23.

Portfolio 2011

- **iShares Russell 2000 Index** : Bought to close three contracts at $4.29.

Earnings Ahead

- **Aug. 8: Bristow Group**
- **Aug. 9: Ebix**
- **Aug. 10: Cisco Systems**
- **Aug. 11: Broadridge Financial**

For us as interns, this turned out to be the perfect environment in which to learn. And I hope it highlights one of the many things that make the *Pro* service so valuable: Advisor Jeff Fischer and analysts Nick Crow, Bryan Hinmon, CFA, and Alex Pape all have a serious passion for investing. They all know there's an endless amount to learn about any given company and multiple perspectives to take. Criticism is highly valued, and only the strongest ideas survive the bludgeoning of questions. That said, while there is a chain of command to process important decisions, it's highly flexible and always respectful, so every idea makes it to the floor.

The love of investing doesn't stop when the team leaves HQ, either. On our first social outing with one *Pro* analyst, it took all of 10 minutes before talk of cash flows, management, and competitive advantage infiltrated the evening. Simply put, these guys live and breathe investing. Then they deliver the crisp distillation of their best ideas to you, the *Pro* members, so you can think about other things — for at least a few hours of the day.

Lessons for Growing Investors

Reza and I aren't just interns, we're developing investors — and being immersed in this culture for two months has yielded several key lessons for us in that regard. We've learned to filter through the noise that surrounds every company. Virtually endless information is available on any potential investment, but only a few key factors actually drive a business. The *Pro* team has taught us how to synthesize these key factors to develop a coherent, simple thesis. The general rule is: If a fifth-grader wouldn't understand your thesis, it's too complicated. And there are no bonuses for the use of jargon.

With *Pro*'s recent purchase of StoneMor, we saw the team's decision-making process from the very beginning. It started with Alex exploring the company's prospects from as many angles as possible, seeking to discover what the market was missing, leaving no stone unturned. After building out a model that fit with the company, he pitched the idea in a presentation to the rest of the team. His pitch came down to one key driver that would decide the merit of this investment: Wall Street's misunderstanding of the company's financials. The entire discussion was presented in the context of this one factor. For us interns, this was like an investing epiphany: What makes a great investor is the ability to filter through all of the information, discard the noise, and identify the one or two things that really matter.

The team's knowledge of how to analyze a company astounded us throughout our time here. Each member has a level of understanding that goes beyond textbooks, one that comes from the talent and skill they've cultivated over their many years investing, both at the Fool and elsewhere. And you as members have taught us invaluable lessons, too — with your questions and comments on the boards, and by giving us insight into what you expect from an advisor. To that end, we'd like to say thank you to all members for welcoming us into your community. On behalf of *Pro* and everyone here at the Fool, we invite you to experience our community here at Fool HQ firsthand. Stop by and meet the team in person if you ever have the chance. They'll always be happy to have you.

Every member of the *Pro* community should know they are in good hands. The *Pro* team puts every ounce of their combined abilities into the recommendations they give you and into the relationship they build with you through all forms of communication. The team takes pride in the quality of its recommendations to a degree I never saw from other advisors in my previous internships. Their goal is to give the best advice they can give, no matter what other market participants are doing.

The Most Bang for Your Buck

Although we can't advise you on any particular stock, we can nonetheless leave you with a recommendation: Follow each *Pro* trade closely and diligently. Doing this will probably take you to the edge of your comfort zone from time to time (if it hasn't already), but if you've chosen to be a member of *Pro* in order to grow your investing know-how and performance *to their maximum potential*, you've got to embrace the new and slightly foreign. (As interns, we're experts on that last part.) That's how we grow as investors.

Everything we've seen here tells us you've got a great partner in the *Pro* team — and the service has the track record to back it up. The bottom line, according to two Foolish interns: Break out of your comfort zone and trust these guys. They know what they're doing.

Stay Foolish, friends!

Charter and Portfolio 2011: Close Half of Your Puts on IWM

Published Aug 5, 2011 at 12:00AM

Trade Essentials

- **Action:** Buy to close half of your Aug. 20, 2011, $72 puts on the iShares Russell 2000 Index
- **Allocation:** In the Charter Portfolio, we're closing 15 of 30 contracts; for Portfolio 2011, it's three of six
- **Recent Price, IWM:** $72
- **Recent Price, $72 Puts (Aug. 20, 2011 expiration):** $2
- **Note:** We wrote the $72 puts that expire Aug. 20, not the weekly options that expire earlier.

What's Changed?

The **iShares Russell 2000 Index** (NYSEMKT: IWM) recently hit $72, meaning we've reached the maximum profit point on our ratio put spread (as noted in our original report from March). Although the $72 puts still have time value, meaning we haven't quite reached the absolute maximum gain, we're nonetheless closing the "naked" puts in our ratio put spread, eliminating our potential obligation to buy shares of the index. We'd rather focus on putting our capital into individual positions.

We'll continue to own our $81 puts (the other half of our spread) for now, and we'll also keep half of our written $72 puts open. These two positions alone turn our ratio put spread into a bear put spread with capped risk, and we'll earn the maximum profit on the spread if the index is at $72 or lower by expiration in two weeks. Thus, you should **only buy to close one half of the $72 puts you have written** — effectively closing your ratio put spread, ending any obligation to buy shares, and retaining a bear put spread on the index.

Portfolio 2011: Buy More Medtronic

Published Aug 5, 2011 at 12:00AM

Trade Essentials

- **Action**: Buy 2% more shares, aiming for a total of 4%
- **Recent Price**: $34
- **Buy-Around Price**: $39
- **Fair-Value Estimate**: $48
- **Why Buy?**
    - We believe Medtronic is well positioned to deal with the changing dynamics of its industry.
    - Currently trading for less than 10 times free cash flow, shares look cheap.
    - The company's focus on chronic diseases and international growth provide firm footing on which to stabilize declines in other segments.

What's Changed?

Not much has changed at **Medtronic** since I last ran down the recent goings-on. The company continues to work on clearing the name of its Infuse product line, which ran into some allegations that the company was bribing researchers for good reviews. We're not worried about that situation — the products are still considered safe by the FDA. Instead, we've been focused on what we consider to be the more important, structural changes going on in the medical technology industry.

Specifically, we expect industry profitability to contract over the long term given the increasing data and trial requirements necessary to bring products to market. Profitability will also be challenged by potentially lower reimbursement rates from federal health-care programs, which seems to be the market's current motivation in bidding shares down. Even so, we believe these factors favor large, diversified, and innovative incumbents like Medtronic, companies that have the ability to spread the costs of a more efficient global research team, offer multi-product discounts to hospitals, and continue to innovate.

Shares are trading below $34, which is less than 10 times our estimates of free cash flow — even assuming a higher cost environment, stunted sales, and lower return on research spending. Frankly, this is an attractive price at which to add to a great company with sound long-term prospects. Investors willing to wait out the current malaise should be rewarded, and in the meantime, Medtronic will continue to buy back shares and raise its dividend.

How to Follow Along

We're boosting our allocation from 2.1% to 4% in Portfolio 2011 to better align with our 4.2% allocation in the Charter Portfolio. **We're also lifting Medtronic to Buy First status**. If you've got questions, head to the Medtronic discussion board.

The Motley Fool owns shares of Medtronic. See all of Pro*'s holdings on our Recommendations page*.

Charter Portfolio: Sell Kinetic Concepts

Published Aug 3, 2011 at 12:00AM

Trade Essentials

- **Action:** Sell all Kinetic Concepts shares
- **Recent Price Range:** $66 to $68
- **Limit Guidance:** Sell as close to $68 as possible; a bit lower is fine to lock in the profit
- **Fair Value:** $68.50 (the planned price at which the company will be taken private)
- **Why Sell?**
    - Shares are only 2%-3% below the proposed buyout price, but the deal may not close until late this year
    - We can free up the cash now to use in new positions
    - If the deal falls through, the downside risk is much larger than our 2% to 3% in remaining upside

What's Changed?

As was announced on July 13, a consortium of private investors is slated to purchase **Kinetic Concepts** (UNKNOWN: KCI.DL) for $68.50 per share. Led by private equity firm Apax Partners, along with controlled affiliates of the Canada Pension Plan Investment Board (CPPIB) and the Public Sector Pension Investment Board (PSPIB), the transaction is expected to close by the end of this year. First, though, there's a 40-day period during which Kinetic Concepts can solicit other offers. We initially wanted to hold through much if not most of those 40 days, but we're halfway through that period now, and growing uncertainty regarding the economy makes it increasingly doubtful a higher offer will show up.

Although some shareholders are suing to stop the private-equity buyout, we're happy with the valuation it assigns to our shares (the $68.50 buyout price is above our $54 fair-value estimate), so we're content to sell as close to that level as we can and call this investment a success. Up nearly 200% since our 2008 and 2009 stock purchases, Kinetic Concepts has done exactly what we hoped: provided a strong return with low risk.

We're selling a bit early for another reason, too: risk management. Kinetic Concepts' management and Apax Partners have signed a financing deal with Morgan Stanley, BofA Merrill Lynch and Credit Suisse that will reportedly raise $2.6 billion in debt to take Kinetic private. These loans, along with financing from CPPIB and PSPIB, are expected to raise the $68.50 in cash required to buy out shareholders. Although we don't have a good reason to suspect the deal won't come through, there's always a chance that one piece of the equation could fall apart, especially if the economy weakens and takes credit terms with it. Rather than risk a potentially significant decline in the share price if the takeover gets tripped up, we'll forfeit a bit more upside to take our gain now and free up our cash.

How to Follow Along

KCI shares are liquid, so you won't have any trouble selling them. Ideally, sell on an up day for a modestly better price; *Pro* will need to sell within 30 days of this trade alert. (Our tax implications from selling now are the same as if we waited for the buyout: a long-term capital gain on our shares.) If you have questions, please visit the

KCI discussion board.

Jeff owns shares of KCI.

Earnings and Your Brain

Published Aug 1, 2011 at 12:00AM

Dear Fellow Fools,

Your brain is like Tiger Woods — impressive in its achievements, seemingly well-suited for its tasks, but nonetheless prone to embarrassing stunts with disconcerting frequency.

Guidance Changes

- **WisdomTree Emerging Markets Small-Cap Dividend Fund** and **L-3 Communications** move down to Buy. For the WisdomTree fund, that's because low GDP growth in the world's largest importer, the U.S., puts emerging markets at greater risk; for L-3, it's because the pending U.S. debt deal caps future federal spending increases, split 50/50 between defense and non-defense.

Pro Trade Roundup

Charter Portfolio

- **Pebblebrook Hotel Trust** : Bought 800 shares (1%) at $19.68.
- **StoneMor Partners** : Bought 1,100 shares (2%) at $28.20.

Portfolio 2011

- **Pebblebrook Hotel Trust** : Bought 140 shares (1%) at $19.69.
- **StoneMor Partners** : Bought 180 shares (2%) at $28.20.

Earnings Ahead

- **Aug. 2:** Pebblebrook, **Papa John's International**
- **Aug. 5:** StoneMor Partners
- **Aug. 8: Bristow Group**
- **Aug. 9: Ebix**

Charged with making sense of the world around us, our brains process remarkable amounts of information. Given the sheer torrent of data gushing toward us like a fire hose aimed at a teacup, our minds can't help but take shortcuts. And shortcuts, according to my high school cross-country coach, are bad.

It's the heart of quarterly earnings season, so you can find the whole *Pro* investment team — Jeff, Nick, Bryan, and me — buried under burgeoning stacks of press releases, 10-Qs, and conference-call transcripts. As we devour all of this new information, our brains will try to scuttle down their well-worn shortcuts. The best way to counter the tricks our brains are able to play on us (even *programmed* to play on us, one could argue) is simply to be aware of them. As we continue to relay our thoughts on *Pro* companies' earnings, I think this is a good time to share five "mind tricks" that I personally try to combat with cognizance.

Games Brains Play

Inconsistency Avoidance

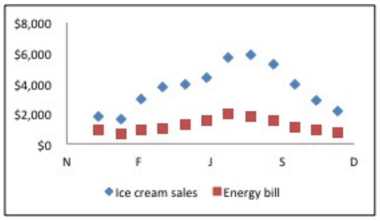
Humans don't like to change our minds, and the inertia of our past decisions can be strong. This can be positive at times — for example, an intern labeled as "smart" will strive like hell to maintain that reputation (not that we used such mind tricks on our own interns …). But unless we're vigilant, we can also anchor to past decisions that might not have been sound in the first place, or fail to update our thinking in light of new information.

Recency Bias

Recency bias is the result of overweighting recent events when drawing conclusions — for example, looking at oil companies' recent strong profits and concluding that oil stocks are great investments. Take a broader view and you'll see that while oil companies' profits are indeed high — oil is near $100 a barrel at the moment — this is a cyclical industry, one in which peaks are eventually and inevitably followed by valleys. Similarly, one could argue that technical analysis (using stock charts to make very short-term trading decisions) is a giant recency bias error.

Influence From Mere Association

The overzealous manager of an ice cream shop finds that the higher his energy bill, the higher his ice cream sales for that month. He concludes that his energy consumption drives ice cream sales.



Source: Alex, who swears he doesn't normally make up data.

Of course, this is ridiculous. Ice cream sales are higher in the summer, when temperatures are higher — and when temperatures are higher, so are energy bills. It's the weather that has a causal relationship with both ice cream sales and energy bills; the relationship between the latter two factors is mere association, not causation. As absurd as the ice cream shop manager's conclusion is, we see such conclusions made in investing all the time. Don't become a cautionary tale; focus on the true drivers of an outcome, not the often irrelevant (though sometimes distracting) associated events.

The "Loss Double-Ouch Phenomenon"

Research has shown that we feel losses twice as strongly as we do gains. You can see this on our discussion boards all the time: There is little conversation about stocks that go up, but when a stock gets a haircut, its discussion board nigh explodes. This tendency becomes even more relevant when you consider the human instinct to avoid pain and seek pleasure; if pain is more painful than pleasure is pleasurable, it can drive our risk tolerance to detrimentally low levels. There is a probably a more technical term for this, but I call it the "loss double-ouch phenomenon."

Ambiguity Avoidance

Humans do not like ambiguity. Let me rephrase that: We *loathe* ambiguity. To counter it, our brains want to reach a conclusion — often *any* conclusion — quickly. This is, in my opinion, the most dangerous of the five mental shortcuts I've outlined here. Unfortunately, it is also the most powerful, because our propensity to avoid ambiguity is both propelled and amplified by the other tricks. After all, a brain motivated to reach a conclusion but facing conflicting evidence could easily find itself clinging to a past decision (inconsistency avoidance), relying only on the most recent data (recency bias), assuming an outside factor is responsible for a current situation (influence from mere association), or deciding to hold a down stock to avoid realizing a loss (the loss double-ouch phenomenon). To combat these ill effects, always remember: Sometimes the best conclusion is no conclusion at all.

It is, I hope, with this mental gimmickry in mind that you read through your *Pro* team's earnings coverage on our discussion boards. You'll find the links under "Coverage and Community" below.

Foolishly,
Alex Pape (TMFPapester)

Charter and 2011 Portfolios: Buy StoneMor Partners

Published Jul 28, 2011 at 12:00AM

At a Glance

Use a Limit Order

Shares of StoneMor Partners are thinly traded, so make sure you use a limit order, Fools. Also, be aware that you must own shares by Aug. 2 to receive the next $0.58 dividend.

- **Action:** Buy 2%
- **Recent price:** $26.20
- **Buy-around price:** $27 (lowered from $28 on 4/16/12) (**use a limit order** near current levels; shares are thinly traded)
- **Fair-value estimate:** $32 (lowered from $34 on 4/16/12)
- **Why buy:**
  - The 8.9% dividend yield is secure, and the payout should grow over time.
  - Bizarre accounting rules have the market thoroughly confused about this company.
  - StoneMor operates a highly predictable, low-risk, recession-proof business.
- **Alternative trades:** None. We recommend buying shares directly to get the dividend. Owning shares will set us up to use options later for additional yield if we so desire.

- **Tax considerations:** If possible, purchase StoneMor in a taxable account. If you can't, a tax-deferred account is fine — you won't be penalized, but you won't reap the additional tax benefits of holding this MLP in a taxable account.

The Big Picture

There are a million ways to make a million bucks. Death care is not among the most glamorous, but I (Alex here) know the cash it generates is worth just as much as that made by selling iPads—and it's steadier and more predictable to boot.

First Things First

- **Company:** StoneMor Partners
- **Market cap:** $510 million
- **Website:** www.stonemor.com
- **Type of holding:** Yield
- **Important date:** You must own shares by Aug. 2 to receive the next $0.58 dividend

- **Follow it**: Add STON to My Scorecard

StoneMor Partners (NYSE: STON) owns and operates 260 cemeteries and 58 funeral homes in 27 U.S. states. The company sells three things: space (burial plots or cremation niches), merchandise (burial vaults, caskets, and grave markers), and services (installation of the burial vaults, caskets, and other merchandise). About 60% of the time, sales are made at the time of a death (called "at-need" sales); the other 40% are made beforehand ("pre-need" sales).

The Business

StoneMor has plenty of space left to sell — it will take about 260 years, on average, for its cemeteries to fill up. That said, revenue at each individual cemetery only grows at about 3% annually, keeping up with inflation but not much more; this is basically a function of a steadily growing number of deaths and small price increases. StoneMor's real growth, therefore, comes from acquiring new cemeteries, and fortunately, there are plenty to choose from.

The cemetery market is highly fragmented, with the four biggest companies (StoneMor is No. 2) collectively owning just 20% of properties. Among its peers, StoneMor is unique for its pre-need sales program, which is by far the most developed in the industry and is championed by an 800-person sales team. This is an advantage for two reasons: Pre-need sales are more profitable than at-need sales, and the pre-need sales program gives StoneMor the scale to buy and operate even small cemeteries profitably (salespeople sell plots regionally rather than at each individual cemetery) — something a company relying entirely on at-need sales would be unable to do.

Let's Do the Math

So far, this sounds like a pretty straightforward business, right? Buckle up: It's about to get messy — and math-y.

StoneMor is a master limited partnership (MLP), so it pays out much of its profit to unitholders (MLP-speak for "shareholders") in the form of distributions (MLP-speak for "dividends"). Take a look at its earnings, cash flow, and payout over the past three years.

Metric	2008	2009	2010
Net income	$4,556	$(4,388)	$(1,417)
Cash flow	$21,144	$14,729	$3,106
Distributions	$25,658	$27,253	$32,443

Numbers in thousands.

Huh? A cursory glance at these numbers would send most investors running for the hills. After all, how can a company with negative earnings and shrinking cash flow increase its payout? How much longer can a company that's only generating $3 million a year in cash continue to pay out $32 million a year in distributions?

Surprisingly, the answer is: *A long time*. This company is forced to abide by accounting rules that thoroughly distort its actual financial results, and that leaves it dramatically misunderstood by the market.

The source of the problem is trust requirements. When StoneMor books a sale, it has to put 15% of the price of the burial plot into a trust. If the sale was pre-need, StoneMor also has to put 75% of the price of the merchandise into a trust. These are legal requirements designed to make sure StoneMor is able to meet its financial commitments (i.e., eventually deliver a casket it sold pre-need), but until the money is needed, it is invested by third-party investment managers. The money in trusts — a sizable chunk of at-need sales and the the bulk of pre-need sales — never shows up in the financial statements as revenue.

But here is the bizarre but absolutely critical point: *StoneMor can pull that money out of the trusts whenever it wants simply by delivering the service or product it sold*. For instance, if StoneMor sells a pre-need plot, by preparing that plot for use ahead of time, it can pull out most of the money it put in trust for that plot.

The four executives who run StoneMor are savvy allocators of capital. They pull cash from the trusts when they decide to increase the company's distributions or when they have the opportunity to buy new cemeteries. Otherwise, they leave it alone to be conservatively invested — the trusts (which are heavily over-funded) have averaged about a 6% annual return.

Financials and Valuation

So just how secure is StoneMor's distribution? If the company were to shut down its operations and liquidate its trusts, it could maintain its current distribution for 12 more quarters. That's three more years of an outsized dividend even if the business shut its doors tomorrow. How many other companies yielding 8.9% can say that?

Of course, we don't expect StoneMor's highly predictable business to suffer, let alone vanish overnight. On the contrary, assuming its future cemetery acquisitions perform as well as its past ones (and after 137 acquisitions, management has this down to a science), its new purchases should really drive growth. Management spends varying amounts on acquisitions from year to year based on the opportunities it sees, but over time we expect StoneMor to spend at least $20 million to $25 million annually to that end. Given those numbers, units (MLP-speak for "shares") are worth between $30 and $38 — but even though that would make them significantly undervalued today, we are not buying them expecting much (or any) capital appreciation. We want to lock in the 8.9% annual distribution (a fantastic yield which we might later juice even more with options), and we consider any increase in the stock price to be icing on the cake. That said, we also don't expect the stock to lose much or any ground.

What Would Make Us Sell

StoneMor's general partner (the part of the MLP structure responsible for managing the business) is majority-owned by a private equity firm. As StoneMor's payout increases, more and more of the distribution is diverted to the private equity firm instead of to the unitholders. I've (Alex here) already accounted for this in my valuation, but if management shows a willingness to maximize the distribution (perhaps under pressure from the private equity firm) to the detriment of the business, we'll likely sell our shares. We'll also sell if the dividend ever looks threatened, or if the business isn't performing well enough to at least maintain the current share price.

The *Pro* Bottom Line

I initially came across StoneMor a few months ago — and after a quick look at its yield and financials, I dismissed it, only revisiting it after fellow Fool analyst Andy Louis-Charles ran into the company's CEO and alerted me of its intriguing possibilities. That's exactly the point with this company: It is very easy to miss the real picture. StoneMor Partners is a giant math problem, and most investors are simply unwilling or unable to do the legwork necessary to see the steady profitability of the business and the security of the distribution. We're looking forward to collecting those 8.9% dividend checks, so *Pro* will invest a 2% stake in StoneMor Partners in both the Charter Portfolio and Portfolio 2011. We will make that trade in one to 30 days, per The Motley Fool's trading guidelines.

Bring any questions or comments to our StoneMor Partners discussion board, and Fool on!

See all of *Pro*'s holdings on our Recommendations page.

Charter Portfolio and Portfolio 2011: Buy More Pebblebrook Hotel Trust

Published Jul 26, 2011 at 12:00AM

At a Glance

- **Action:** Buy 1% more shares, aiming for a total of 3%
- **Recent Price:** $19.70
- **Buy-Around Price:** $21.50
- **Alternate Trade:**
  - You can write $20 puts to possibly purchase shares lower, but be sure to use a limit order — these options can be quite illiquid.

What's New?

Not much. Since both the Charter Portfolio and Portfolio 2011 bought an initial 2% stake in **Pebblebrook Hotel Trust** (NYSE: PEB) in May, little has fundamentally changed within the company. The stock, on the other hand, has fallen about 8%, even as CEO Jon Bortz and team have put a whopping $572 million more to work in new properties in just the last nine weeks. The new purchases include the Viceroy Miami, the W Boston, and a 49% interest in six New York City luxury hotels. This last purchase initially threw us — and many members — for a loop, but after detailed conversations with Pebblebrook's CFO, which I (Alex here) shared with members in an Audio Extra, we've come away with our confidence in this management team not only intact but actually enhanced.

Pebblebrook continues to have cards to play in any future economic scenario. If the economy improves, hotel profitability, which is strongly correlated with GDP growth, will get a boost, and Pebblebrook's existing hotels will generate more cash to fuel the company's dividend. On the other hand, a deteriorating economy should mean more opportunities for Pebblebrook to close fantastic deals with squeezed hotel sellers. Although shares may suffer with the market in a weaker economy, ultimately they should benefit from such a scenario. If you are feeling uncertain about the economic outlook, Pebblebrook should be a good fit for your portfolio.

Why This Strategy?

We'd like to add to our shares now because we like the price, and we'd like to buy ahead of Pebblebrook's earnings report on Aug. 3. This earnings report will be the first to include a full year's worth of numbers for any of the company's hotels (Pebblebrook made its first deal last June), so it's possible unfamiliar investors will catch a glimpse of the financials and realize just how cheap the shares remain. Also, there is a chance that Pebblebrook will announce a dividend increase. I wouldn't bet outright on either of those events, but they are possible — and with shares simply *cheap* at around $20, we'd prefer to fill out our allocation now (and possibly be pleasantly surprised next week) rather than find ourselves wishing we hadn't waited.

How to Follow Along

We're boosting our allocation from 1.8% to 3% in both the Charter Portfolio and Portfolio 2011. Buy shares using a limit order, and head to the Pebblebrook board for discussion.

Alex and The Motley Fool own shares of Pebblebrook. See all of Pro*'s holdings on our Recommendations page*.

Audio Extra: Alex on Pebblebrook

Published Jul 26, 2011 at 12:00AM

Pebblebrook Hotel Trust's recent New York City hotel deal seems unusual for this company. After hashing out the details with the CFO, though, analyst Alex Pape's confidence in this operator's savvy remains as strong as ever. Listen in as Alex tells it like it is — complete with terms like "control freaks" and "trust fund babies."

pmNDVvMjqqOJZvxMRAmtnzPMqQrpruYH

Transcript

Elizabeth Moran: Good afternoon and welcome to the latest *Pro* Audio Extra. I am Elizabeth Moran, intern with the *Pro* team. I am joined by Alex Pape, analyst with the *Pro* team.

Alex Pape: Hey, Elizabeth.

Elizabeth Moran: And we are here to talk today about the recent Pebblebrook deal. Alex, can you just give me an overview of what is going on?

Alex Pape: Sure. So the one-liner description is, Pebblebrook bought 49% of six hotels in New York City from the Denihan Group, which is a private hotel owner and operator.

Elizabeth Moran: Okay, so this for Pebblebrook is a lot of firsts. It is their first time in New York City, it is their first time with a partnership and it is their first time with a minority stake. So let’s start with why New York?

Alex Pape: Sure. So I spent about an hour on the phone with Pebblebrook’s CFO talking about all this stuff. He said that they have been looking at New York for a while and that one of the reasons is that, in addition to Santa Monica and D.C., New York City is one of the three best markets for hotels right now and it actually sports the highest occupancy rate at about 90%. That compares to 60 to 70% for most luxury hotels elsewhere in the country.

But New York City itself is a city with a very low hotel supply. It is very hard to build there, and even more importantly, it is the city in the U.S. that benefits the most from international travel, so there is a long-run, sustainable growth factor there for New York that doesn’t necessarily apply to other cities. To D.C. somewhat, but most other cities don’t get that as much.

Elizabeth Moran: I see, so there are a lot of compelling reasons for Pebblebrook to be involved in New York City, but why these specific hotels?

Alex Pape: Sure, so these six hotels are all in Midtown Manhattan and there are two reasons why they like them: location and room size. So the locations, there is The Benjamin, is right across from the Waldorf Astoria. They have another hotel that is right across from Madison Square Garden and Penn Station. These are spectacular locations for upscale hotels.

So the average room size for all luxury hotels in New York City is between 225 and 275 square feet. These hotels are between 420 and 610 square feet, so it is substantially larger. So Pebblebrook sees an opportunity to go in and reduce room size and increase room count. So if you look at this on a price-per-key basis, they are looking at more what this could be on a price-per-key basis after they are done renovating.

Elizabeth Moran: I see. So this is still unusual for Pebblebrook and kind of diverts from their usual strategy. Can you explain why this particular deal happened? How we kind of got here?

Alex Pape: Sure. So that is really what this is all about. Pebblebrook is, besides being great at opportunistically picking off hotels at good prices, they are also; they are going to go in and improve the operations, make things more efficient, so it is really strange that they are taking a minority stake in multiple hotels.

So why this came about is a great question. As I spoke to Pebblebrook's CFO, Raymond Martz, he even described themselves, his words, not mine, as "control freaks". So this is unusual. There are a few things to keep in mind here. The hotels that they have been looking at as possibilities in New York City run between $300 and 400 million for the ones they like. Their portfolio is $1.1 billion. It is simply unreasonable for them to put that much money into one hotel in one city, and so they haven't done it yet. So buying into a portion of six hotels allows them to do this in a way that doesn't jeopardize them from a portfolio standpoint.

Now why are they working with Denihan? So Denihan has actually a really long relationship, not with Pebblebrook but with their CEO, Jon Bortz. In Bortz's previous vehicle, which is called LaSalle, he worked with Denihan. He actually had Denihan manage some of their hotels, including one right over here on Capitol Hill. Over the last decade-plus, Patrick Denihan, CEO of that company, has consulted with Bortz on hotel issues, operating issues, so they have a very close relationship.

Something very interesting has happened within Denihan, which is a totally private company, is that it is a family-run business and there are many, many family members involved, and now it spans three or four generations. Well there are essentially some "trust fund babies", for lack of a better term, who want to cash out their stake of Denihan, but they can't because it is a private company. And there are other members of Denihan that want to take the brand and take it national. There is a conflict within the family.

So Denihan went to Citigroup to find them an equity partner, and they said, Hey, you know what? We already have a relationship with Pebblebrook, why don't we approach them? And Pebblebrook was certainly receptive, for all the reasons I just gave.

So the weird thing about this is okay, why is it a 49% stake they are taking? Why are they not 50-50? Especially for a company that is self-describing as "control freaks". Well there is a very good reason, and it is a reason that cannot show up in the press release, and that is because it is saving them money. So economically it is a 49-51 split. That means cash flow, debt, everything, 49-51 economically speaking.

It is 49% economically because in New York, if you take a 50% stake, purchase 50% of a business, you trigger a transfer tax. That is about a 2.5% tax. That would run about $15 million for Pebblebrook, so they are saving $15 million by not doing that.

They also, by taking this stake and getting the debt as part of the deal, instead of taking their own loan out against hotels they would buy separately, they are saving a 2.5% recording tax, that applies in Manhattan, which is about another $15 million that they are saving.

And a third thing, this $600 million in debt that is their proportional share of the debt, is a 3.5% interest rate. It is incredibly low. If Pebblebrook were to go out and get a rate themselves in that market, they would get between 5.5% and 6.5%, so that 200 basis point difference comes out to another $20 million that they are saving just on interest payments by going this route rather than on their own. And so, according to their CFO, this is not the kind of leverage that they want to for the long term, but it is opportunistic right now and it is simply smart.

Another aspect of the deal, five years down the road, either party is allowed to make an offer to buy out the other party, and the way that it works is there are six hotels, so instead of buying like half of their stakes, they can just sell individual assets, so they will essentially say, We don't have half of six hotels; we have three and the other party has the right of first offer to buy them out.

So what this means is the way that Pebblebrook sees it, if down the road their portfolio is bigger and they can support it and they are really liking how these hotels are doing, they can buy the other half. And as of right now, that is essentially their plan.

So the two great things about this business, this deal, is that it is opportunistic and it gives them a ton of optionality down the road to expand their exposure to New York, if they want to. But if they don't, they don't have to.

Elizabeth Moran: So this deal that seems a little bit iffy on the surface, overall this doesn't make you uncomfortable, you think it is a good thing?

Alex Pape: Not at all. I mean, honestly, reading the press release I was confused. I think like a lot of members I saw this and I said, This is very un-Pebblebrook. Why are they doing this? But there are very good reasons, and if you were the CEO of Pebblebrook, you simple can't put in a press release, "Hey, we have trust fund babies who want to cash out of our partner and we are trying to avoid paying massive taxes in Manhattan." There is nothing illegal there going on whatsoever, but you cannot put that in a press release, so there are very good reasons.

Elizabeth Moran: Gotcha, makes perfect sense. So that wraps up today's *Pro* Audio Extra. Thanks for joining me. I am Elizabeth Moran here with Alex Pape, and we will see you next time. Fool on!

Ebix Uncut and Unedited

Published Jul 26, 2011 at 12:00AM

A provider of software to insurance companies, **Ebix** is a longtime holding in *Pro*'s Charter Portfolio and a recent addition to Portfolio 2011. It's also one of our most controversial stocks where Wall Street is concerned. A frequent target of short-sellers and class-action lawsuits from ambulance chasers, Ebix has been accused of everything from unsustainable tax rates to questionable acquisitions.

Management is happy to answer questions, so we jumped on the chance to connect you with Ebix's CEO, Robin Raina. Raina is the man responsible for turning Ebix from a money-losing failure into one of the best growth stories of the past decade. The following is Raina, uncut and unedited — just as Ebix wanted it — answering questions from *Motley Fool Pro* and *Motley Fool Rule Breakers* members.

Questions and Answers

Fool analyst TMFSysun (Sean Sun) asks:
Unfairly or not, Ebix is in the bear's spotlight — a position where it absolutely cannot afford to make *any* mistakes. How does Ebix plan on trying to become more like Caesar's wife — beyond suspicion entirely? How is Ebix improving its internal financial and governance controls?

Raina:

I am not sure whether Ebix is in the bear or bull spotlight but am sure that it is getting some attention at present. Leadership and management are about doing things in the most efficient manner that you can. "Caesar's wife must be above suspicion", but then suspicion lies in the eyes and minds of the beholder. Companies need to do things the right way because that is simply the right thing to do, not just because the company is being closely watched.

As long as a management team tries to put in its best at all times, in a transparent, honest & sincere manner that is good enough in my book. To quote GB Shaw, "A life spent making mistakes is not only more honorable, but more useful than a life spent doing nothing." As long as we make mistakes, that we learn from and we do not keep repeating our mistakes, I would think that is okay. We are focused on execution and performance, while ensuring that we do it with utmost integrity and efficiency. We are not trying to follow another blue chip company 3 we are trying to create hopefully an example that others can emulate in the future.

Somebody recently wrote about BDO raising a concern about our controls in the year 2003. That was the first year of their audit and SOX was the last thing on Ebix's mind at that time since Ebix was a tiny company fighting to simply survive. What was not given any attention was the fact that BDO did not cite those deficiencies in subsequent years of their audit, clearly telling you that BDO did not have any control issues after their first audit.

Ebix has some of the best internal financial and governance controls that any company in the world can aspire for. It is not just because SOX mandates you to do that — it is because that makes our business efficient, cost effective and better than others. Ebix runs all its operations and processes over the Internet using internally built systems with checks, controls and balances in it. Our entire business is run using an internally built enterprise tool "iemployee" that is accessible in an anytime, anywhere, anyplace basis over ipads, droids, iphones, blackberries, Macs, PCs etc. This was implemented in the year 2007. All our contract administration is done using that system, our sales management, travel bookings, expense tracking & payment, human resource recruitments, leave tracking, attendance management, payroll, banking, cap-ex management, PO generation, IT management, revenue tracking, expense forecasting etc. everything is done using our "iemployee" system. All processes require multiple approvals, central head office approvals, finance approvals at various levels, tracking of payments, automated PO creation etc. while an audit trail of every transaction is kept by the system. All this is done over the Internet across 6 continents in minutes while ensuring budget sanctity, approval sanctity, and controls that can be trailed back at any time. We implemented these systems because besides controls, it gave us a better handle on our business — we can predict things a bit more easily than others, we have better control over all aspects of our business as we have this systematic centralized system to check everything, and also it keeps everybody at all levels in check. To us, it is about efficiency besides checks and balances. If a company aspires to run a 40% or more operating margin business, it does not have a choice but to put internal controls and governance controls in place. We believe that we do extremely well on controls and can teach the best of firms across the world on how to do it in a systematic manner on a large scale while making their businesses more efficient. We actually plan on launching this new "iemployee" service on an on-demand basis over the cloud, to help companies implement better controls in place. We believe that there is a big market for these kinds of services in the financial world — we see us selling this on-demand product to large accounting firms besides insurance companies and banks.

Besides that, improving governance and internal controls is an ongoing continued process that can never stop. Like any other company, we keep testing our controls and fixing anything that needs improvement. That will obviously continue.

Fool member ultimatespinach asks:
When the former chief executive and board members of Peak Performance Solutions filed suit alleging Ebix wrongfully denied them a $1.5 million earn-out following the acquisition of Peak, you were quoted by Bloomberg News as saying, "It's a black-and-white issue. They had to hit $6.5 million. It's pure revenue. Nobody contested anything until the last day. It's in everybody's interest to have as much revenue as possible." Clearly, it was in everybody's interest for Peak-related revenues to blow past the threshold, but assuming they ended up somewhere in the vicinity of the threshold, isn't it true that it is in fact not in the interest of Ebix or its shareholders to pay the earn-out? Doesn't claiming otherwise threaten your credibility?

Raina:
Much has been said about the Peak suit while the Company has kept its answers to itself since it s a matter being looked at by the courts at present. Let us all reserve our judgment for now until a court either rejects the Peak accusations or holds Ebix guilty of any wrongdoing. The suit alleges understatement of revenue not overstatement as some people made it out to be. The agreement with Peak shareholders mandates audited GAAP numbers to be used for the earn out calculation. The audited numbers were a lot lower than $6.5 million. If they had a dispute with that number, then the contract mandates that they need to give Ebix a 30-day notice, then submit reasons for dispute on revenue. After all this, it could lead to arbitration, failing which it would go to a court. The funny fact is that they have not done any of that including giving us a 30-day notice or taking it to arbitration. One wonders why they were in a hurry to file a suit and report it to the public, when the contract does not even allow them to do that. So, let us hold our thoughts for now and not pass any judgment on Ebix practices or management, based on this suit that alleges a few hundred thousand in understatement.

Till recently, Ebix has been one of the few public companies that have had very few legal disputes in the last decade or so. We must be doing something right to not be the subject of many disputes over the last decade.

Public companies can not keep cutting checks for fear of avoiding any suits — we have paid many earn outs over the last decade and most of the owners, their managements and at times family members, of businesses bought by us over the last decade still work for us today. Incidentally, that includes Peak too even today. We believe that it is in the interest of shareholders that Ebix does the right thing — pay a earn out when it is due and not pay it under pressure, when it is not due.

Company credibility is hurt when company does something wrong and that is established as a fact. It might suit some people's interests to exploit an unproven allegation amounting to a few hundred thousand dollars even if it may not have any basis. But then, the same people are not going to look very good if that allegation is proven to be a complete fabrication — so let us hold our judgment for now.

ultimatespinach also asks:
As a company that owes much of its growth to acquisitions, do you believe the dispute with the former Peak executives and board members might make future possible acquisition targets question the good faith of Ebix and therefore make such acquisitions more difficult?

Raina:
Firstly, Ebix has grown by acquisitions and through organic means both. Let us talk through any acquisition we made and compare their revenue in the preceding quarter before the acquisition and say revenue from that service in Q1 of 2011 - you will immediately discover that Ebix has done a good job of growing the business. Every time we make an acquisition, we take a hair cut on deferred revenues immediately and that haircut can vary between 3 to 7% of the acquired company's revenues. All growth analysis that I have seen has ignored this 3-7% hit taken by Ebix immediately post acquisition, in revenues from the acquired player. Also this growth has been achieved at a time when the insurance industry was shrinking and having the worst years in a few decades.

As regards any suit impacting future acquisitions, people are a lot smarter than making their judgment based on an unproven exception. We have paid lots of earn outs over the years and still continue to do so. As I said earlier, most of the owners of acquired businesses still work for us including many family members of the Peak shareholders. Our acquisition pipeline is strong and not impacted by any of this. This suit does not get any attention by anybody other than the noise seekers in the investment world, who might have their reasons to do so. In the investment world today, if the Company does not have any bad news, then people become catalysts to creating the bad news — people sometimes forget that truth always finally prevails. Truth decimates everything that comes in the way — we are firm believers in the power of truth, integrity and honesty though we realize that in the short term repeated chants of "cows can fly" might unfortunately get some followers — at least for now.

TMFTypeoh asks:
Any thoughts on paying a one time, special dividend? I would think that would scare some of the shorts away, at least in the short term. It might give some credibility to EBIX as a legit business as well.

Raina:
As regards dividends, at this point nothing is ruled out. Let us wait and watch.

One thing is pretty clear that the Board has committed to purchasing $100 million of Ebix stock from the open markets and retiring that stock. Once Ebix has purchased $75 million or more of its stock, I intend to recommend to the Board to increase the purchase authorization to $160 million from $100 million.

We are buying our own stock because we see this as an accretive transaction for our shareholders and because we see this as buying stock in a Company that is producing 40% or more in operating margins, and is still trading at rather low cash multiples. We are not buying the stock because we want to support our stock price or drive the shorts out. That would be knee jerk or rather short-term thinking and we prefer to think about our shareholder's interests in the long term.

Lastly, after being in existence for 35 years, powering hundreds of thousands of users across the globe, powering hundreds of billions of insurance premiums, or having majority of the blue chip names of the insurance and financial world as customers or having 30 + offices across the world with customers in 69 countries or having one of the highest customer retention rates in the insurance industry or producing 11 years of consistent growth in terms of cash, income, revenues and EPS for a business that a decade back was a $12 million revenue business with a $19 million loss; if Ebix still needs a dividend to prove to a particular investor that it is a legit business, then something is wrong with the world we live in today. Dividend payment or non-payment should be a rational decision based on growth strategy and merits, rather than proving anything to anybody.

SimFool777 asks:
I am wondering if the current short attacks might be related to the EZ Data Puts. Does Ebix know if EZ-Data still holds the put options or if they sold them to someone who might have the financial clout to implement a short attack? Is the stock buyback intended to try to keep the price above $15.11. Does Ebix intend to offer put options in future acquisitions?

Raina:
We do not believe that it has anything to do with the EZ Data puts. Those puts anyway run out in October of 2011. We are not buying our stock back to keep the stock above a particular price. We purchase stock because it is an accretive transaction for our shareholders.

Stock puts constructed properly have a good upside for the acquired shareholder and very limited downside for Ebix. When we gave the $25 million stock put to EZ Data shareholders, it provided for us to pay them $22.5 million against that $25 million value in the 25th month. For us, that would be like an interest free payment after 2 years and we get to pay 10% less. For EZ Data owners, it gave them an upside into the future with a 10% downside cover. That interested them and ultimately got the deal done.

Whether we use it in the future for another acquisition will depend on many metrics associated with that acquisition. I do not rule it out neither can I tell you that we will use it for sure.

kcanant asks:
We are interested in your philanthropy; how are things going with the RR Foundation?

Raina:
RRF is committed to helping the underprivileged across the world irrespective of color, religion, sex, caste or creed. We believe that pain feels the same across the world. My belief is that poverty is a religion by itself and it transcends every divide.

RRF supports the education of thousands of kids today while offering them mid-day meals, clothes, medical care and hope for a possible future. One of my dreams has been to build 6,000 homes for Delhi slum dwellers that were thrown out of the city by the Govt. of India in the name of cleansing the city, for the 2010 Commonwealth Games. These homes cost around $2,000 each to build — we have handed over 1157 homes as of now while another 297 homes will be handed over by end of August 2011. Recently I produced a documentary film "Dilli" to give a voice to these slum dwellers. The film shows these homes as also traces the lives of these slum dwellers from Delhi. The response to the film has been rather overwhelming — as of now the film has won 6 film festival awards, besides being selected to the finals of 17 international film festivals. Recently NBC's Documentary channel signed an exclusive 2-year agreement to telecast the film in the US and West Indies beginning September 2011. All this has served to get the voice of these underprivileged people heard across the world and we feel rather humbled to have played a role in making that happen. You can read more about it on www.dillifilm.com

I have always believed that coffin does not have a pocket. Being in charity has given my life a balance, a perspective that keeps my feet on the ground. I realize that materialism is evanescent, while giving & peace of mind are something that nobody can take away from you. Charity is not about giving money — it is about giving one's time and care for the ones who need it. The blind kids that we educate care less for the money that we provide them, they care a lot more for the warmth of a hand that gives them the sense of belonging and affection. Sometimes people who have no money are more charitable than people who give lots of money.

The foundation is a facilitator in the process of changing lives and imparting hope — one life at a time. We will keep striving to do so.

EricLin asks:
Given the amount of cash committed to share buybacks, does this mean the end of acqusitions? If not, how will acquisitions be financed? Via debt or equity?

Raina:
Our business continues to produce good amount of cash. We expect and believe that our cash flow generation abilities will continue to grow over time, as we expand our business and sales force.

We have a strong acquisition pipeline at present. We believe that we have the means to finance these acquisitions. With interest rates being very low and our continual ability to generate strong cash flows, our preferred medium of financing an acquisition is debt. Any Company's Bankers keep a close watch on the Company's AR, cash & collection record; and they have the best understanding of whether a company deserves that debt. Thus, Bank of America could be a logical choice for us though it will always be a decision made on the best possible interest rate and the best possible flexible terms given by an institution.

pwil asks:
How does Ebix plan to support its existing US legacy systems in the future?

Raina:
Ebix has continued to support any legacy systems that it inherited from the business that the Company had before we reinvented the business as a on-demand SAAS play, a decade or so back. The good news is that the only legacy business we support today accounts for less than 1 % of our worldwide revenues.

Supporting a legacy business is like supporting an antique car. You can support it as long as you want but the spare parts and servicing keeps getting more expensive every year. Ebix intends to follow that rule and support the systems as long as we can, while ensuring that it holds viable economics for Ebix.

antmark asks:
How does Mr Raina view EBIX's tax risk exposure stateside, specifically on transfer pricing?

Without robust contemporaneous transfer pricing documentation for Code section 482 purposes, an IRS audit challenging the arm's length nature of payments to India or Singapore affiliates could wipe out a significant part of free cash flow (and impact future taxes).

On a related note, while CB&H may have "decades of experience in audits and tax work with large international accounting firms" (quoting from the Barron's article), does CB&H have (and has it demonstrated) sufficient capability to handle the transfer pricing of services and intangibles? Proof of the pudding will be whether CB&H-prepared documentation (whether for EBIX or other clients) have passed IRS audit scrutiny previously.

Raina:
To put things in perspective, BDO Tax Partners in 2005-2006 put Ebix's tax structure in place. Subsequent to that, it has been reviewed and enhanced by Ernest &Young, with help from other firms like BKD, Frazier Deeter etc. besides multiple offices of E&Y across the world. Ebix's infrastructure setup of putting development and IP in Singapore & India was put in place much before any tax planning was contemplated. Also Ebix's inheriting of NOLs in the United States was something that was not planned but happened since Ebix had lots of losses in the pre-2000 era. Our tax structure worldwide was thus driven by our infrastructure and efficiency needs of putting development & IP in a place, which could give us global economies of scale at the highest levels of efficiency.

Ebix took care not to transfer any IP out of the US and thus does not expect any issues on that account. All our IP centralized in Singapore was either built and funded by Singapore or directly acquired by Singapore through an acquisition.

Our transfer pricing is not done by CB&H. The transfer pricing, updates and reviews are done by E&Y with help from their various offices, and BKD. That is a continuous exercise and not just a onetime exercise. Every position of the Company has a strong documented basis, written by these top quality firms who are rated one of the best in this work worldwide. CB&H is our US auditor who checks all this from an auditor perspective and they have an international tax practice that specializes in this field.

Besides following the advice of the best in the business, the Company always has taken conservative positions and built large FIN 48 reserves to offset any adverse transfer pricing rulings. Also our US NOLs in all those periods serve to largely offset the cash impact of any adverse ruling.

As Ebix releases its valuation allowance in Q2 of 2011, a lot of this will become a moot issue with Ebix worldwide effective tax rates going up to 16-20%. Most of those taxes will be in the United States as our international tax rate is primarily driven by Singapore's perpetual tax rate of 10%. India's low tax rate will become a bit irrelevant once all development & IP is centralized in Singapore. At a tax rate of 16-20%, we will be paying a bit more tax than most global software companies in the United States today.

snafflekid asks:
What prevents another company from buying some Salesforce.com cloud computing time and creating an Ebix copycat?

Raina:
Ebix is not just a technology player — Ebix is an insurance domain expert. That is the biggest barrier to entry to the insurance industry that thrives on regulations that change by state and line of business. In any case, all the businesses that we power do not own any IP for the service that we provide to them. Ebix owns all IP and provides the service on a "right to use" basis. Also Exchanges in the most case require large aggregations to move from one software player to another, which is rather impractical and that is another barrier that is difficult to get over for a competitor.

***Pro*advisor Jeff Fischer (TMFFischer) asks:**
Have any current Ebix customers or potential customers mentioned *Barron's* or any of the short-seller articles as a point of concern?

Raina:
The short answer is No. My guess is that our customers know a lot more about us than any media article can tell them about Ebix.

Thank You

Thank you to everyone who asked questions, and to Mr. Raina for taking the time to respond with great detail. We hope you enjoyed hearing Ebix's CEO answer your questions. Ebix is currently rated a "Buy" in Pro, with a buy around price of $18 and fair value of $24. If you have questions about the company, please visit the Ebix discussion board. —*Jeff Fischer*

Pro's Young History: A Strong Start

Published Jul 25, 2011 at 12:00AM

Time flies when you're having fun: We're already nearing our third anniversary here at *Pro* (Oct. 17, to be specific). We'd like to sincerely thank each and every member (with a special shout-out to those charter members who have been with us from the start), and we hope you've found the journey as memorable and rewarding as we have. The traditional third anniversary gift is leather, but we regret to say we won't be shipping out any leather gifts when the big day comes this fall. (Well, maybe a digital image in your email ...)

Get Rich With ...

Covered strangles? Written puts? Buy-and-hold stalwarts? At *Pro*, we want to help you make money with all of those and more, and we'd love your suggestions on how we can improve.

We're in the heart of earnings season, the government is keeping everyone on their toes, and we have two important index hedges expiring in August, so we have to focus twice as hard right now on managing our holdings and possible new hedges. To that end, we're going to keep this Memo simple but ideally valuable. Today, I want to review our numerical history.

To See Where You've Been, Keep Good Records

This summer, *Pro* has been fortunate enough to employ two excellent interns, Reza and Elizabeth. (You'll hear both of them share their impressions of *Pro* in a Memo of their own soon.) Reza spent a good amount of time creating a new master *Pro* data spreadsheet for us — thank you, Reza! I'm going to share some of that data with you here, showing you our equity, cash, and total value since Jan. 31, 2009.

The information below is as of the last day of each listed month. The numbers are from our actual Schwab brokerage statements. We launched in October 2008; the data below begins in January 2009. Take a look at where we started, how steadily we invested, and where we've gotten so far:

Pro Charter Portfolio History

Date	Equity Value	Cash Value	Total Value
January 2009	$124,762.50	$786,704.65	$1,000,152.85
February 2009	$153,387.40	$684,930.71	$975,645.21
March 2009	$181,735.80	**$728,213.32**	$1,003,316.52
April 2009	$196,829.00	$744,778.18	$1,047,436.38
May 2009	$252,651.60	$683,871.57	$1,086,643.17
June 2009	$321,248.10	$627,546.35	$1,087,902.85
July 2009	$434,735.40	$548,500.05	$1,140,652.45
August 2009	$451,116.70	$559,336.95	$1,159,843.44
September 2009	$492,684.60	$561,218.71	$1,184,821.71
October 2009	$511,362.50	$516,933.79	$1,164,195.89
November 2009	$577,992.90	$426,764.03	$1,188,113.25
December 2009	$628,636.90	**$401,348.50**	$1,222,428.40
January 2010	$631,660.60	$405,123.72	$1,186,098.72
February 2010	$693,399.00	$402,495.97	$1,210,872.21
March 2010	$835,989.20	$285,650.03	$1,253,466.83
April 2010	$869,690.70	$286,024.57	$1,270,353.47
May 2010	$787,815.00	$260,802.06	$1,205,171.46
June 2010	$723,885.40	$258,252.58	$1,160,779.38
July 2010	$808,359.20	$232,777.34	$1,218,571.94
August 2010	$809,626.30	$190,891.88	$1,177,695.98
September 2010	$881,406.60	$203,567.60	$1,270,028.00
October 2010	$939,427.20	$193,406.08	$1,301,418.28
November 2010	$986,666.70	$99,030.52	$1,297,326.52
December 2010	$1,062,880.60	$89,984.16	$1,382,924.51
January 2011	$908,392.10	$256,671.68	$1,415,696.08
February 2011	$973,442.90	$205,135.03	$1,448,956.03
March 2011	$994,180.40	$117,178.32	$1,458,898.40
April 2011	$1,129,564.10	$34,579.67	$1,527,933.17
May 2011	$1,117,975.80	$35,145.60	$1,504,655.00
June 2011	$1,113,642.10	$99,930.10	$1,499,041.70

Groovy, Yeah?

Members sometimes ask, "How are *Pro*'s returns so far? How would you measure them?" Especially after perusing this data, I would not-so-humbly say that at this point our returns are excellent. And the chaser to that is: We need to keep our expectations in check.

Remember that our goal is steady, absolute returns with high accuracy and reasonable risk, which usually means holding some cash, shorts, and hedges. As of Friday, the Charter Portfolio was up 56.4% while the S&P 500, including dividends, was up 51.2%. We *do not* invest to beat the S&P 500. That's not our focus; steady profits are, and they're two different things. But investors who can top the index by a point or two a year on average end up with a very large advantage over time. And as you know, the vast majority of professional investors and mutual funds don't top the index at all.

Guidance Changes

- **3D Systems** : Following a sharp rebound, the 3D-printer company moves down to Hold on valuation.
- **Rockwood Holdings** also moves to Hold on valuation.

Pro Trade Roundup

Charter Portfolio

- **Covanta** : Bought 2,700 shares (3%) at $16.96.
- **iPath S&P 500 VIX Short-Term Futures** : Sold to open 45 December $22 calls at an average $3.48.

Portfolio 2011

- **Covanta** : Bought 450 shares (3%) at $16.92.
- **iPath S&P 500 VIX Short-Term Futures** : Sold to open seven December $22 calls at an average $3.50.

Earnings Ahead

- **July 25: Plum Creek Timber**
- **July 26: GlaxoSmithKline** , **Kinetic Concepts**
- **July 27: NextEra Energy** , **Rockwood Holdings**, **Tupperware**
- **July 28: 3D Systems** , **GrafTech International**, **L-3 Communications**
- **July 29: AmTrust Financial**

What's especially pleasing about our results is that we've achieved them with much less risk than we would have faced if we had put 100% of our cash into the S&P 500 index in October 2008. When the market bottomed in March 2009, we still had a giant $728,000 in cash (highlighted in bold in the data above). You could say we're idiots not to have invested it all in the market immediately at the bottom (I jest; hindsight is 20/20), but it's more important over time that we adhere to our philosophy of investing steadily for absolute gains in strong positions. Thus, we only invest at a comfortable pace. By the end of 2009, we still had $401,000 in cash (see the second bolded number above) — 40% of our starting value. Even nine months later in September 2010, we had $200,000, or 20% cash, along with some inverse ETFs that we had paid for.

I can guarantee you that very few other funds out there that were 72% in cash in March 2009 and 40% in cash in December 2009 (with some shorts as well!) have kept up with or surpassed the record-strong S&P 500 since then. This year, the *Pro* charter portfolio is up 13%, six percentage points ahead of the S&P 500's 7% gain. That is not common by any means for a hedged portfolio (like ours) in an up market. Sadly, we can't expect this all the time. I've always said, and still believe, that we'll do better than most any index over many years — but that is not our goal. Our lower-risk strategy will put up healthy relative returns in sideways markets, but will usually cost us some relative returns in strong markets.

Big Wall Street Investors Must Really Stink

Our results so far come despite the fact that *Pro* usually gets subpar prices on its own trades because of our waiting period. Sometimes, in fact, that regulation leaves us missing out altogether on some big trades. The four of us on the team easily spend 40 hours combined each week on the discussion boards, and many more hours writing reports and articles. Meanwhile, we deliver more ideas over at *Motley Fool Options*, available free to all *Pro* members. My point is that we demand a lot of ourselves here at *Pro* (and at *Options*), because we know how important your money is to you. We want to take reasonable risks and keep a balanced portfolio. I want to promise you realistic long-term returns, and I want you to have realistic expectations, even though I hope we'll over-deliver. We're off to a strong start for a young service that's investing during trying times, and we want to compound our results on our own terms over the years.

With that, it's back to earnings and investing. Read on below to see our new earnings coverage. And please post any thoughts on the Memo Musings discussion board.

Thank you for being a valued *Pro* member, and Fool on!

Jeff Fischer (TMFFischer)

Transcript

Rich Greifner: Greetings, Fools. It's *Duke Street* Advisor, Rich Greifner here, and today I am joined by a special guest. We have got Motley Fool PRO Advisor, Jeff Fischer.

Jeff Fischer: Thank you, Rich.

Rich Greifner: Thank you, Jeff. Thanks for joining me.

Jeff Fischer: Of course, my pleasure.

Rich Greifner: And Jeff, I was really intrigued by a trade that you guys at PRO made this week. This week you wrote naked calls on the VXX exchange-traded note. Now this is the fifth time that PRO has taken a bearish position on this instrument. Jeff, this seems like a really cleaver trade, but I just want to make sure that I fully understand it and that members fully understand it. So let's start at a high level. Why is the VXX exchange-traded note such a compelling short?

Jeff Fischer: Because it tracks the futures contracts to the VXX and VIX, and we will explain what all of this means, of course.

Rich Greifner: So that did not sound very compelling to me, but rest assured, this is a very compelling investment thesis.

Jeff Fischer: It is tracking futures that have a higher price than the current index is worth today. So say you wanted to buy a pound of coffee two months from now.

Rich Greifner: Okay.

Jeff Fischer: Odds are you are going to have to pay up to guarantee your price right now.

Rich Greifner: Sure.

Jeff Fischer: This is the same sort of situation. People are willing to pay a premium right now to protect against volatility. The difference between paying a premium for a VXX futures contract and paying a premium for coffee is sometimes coffee won't pay much of a; say it was a bumper crop year. There won't be much of a premium, if any, on futures contracts. But with volatility, volatility, spiking volatility in the market is always a possibility so there is always a premium, almost always, 70, 80% of the time or more, a premium to buy volatility contracts on the market, which makes perfect sense.

Rich Greifner: So let's take this up to a high level. Let's just begin at the beginning, going through the nuts and bolts of this trade. The VXX seeks to track the VIX, the VIX Index. Now stay with us, folks. Jeff, can you quickly explain what is the VIX?

Jeff Fischer: Perfect. It was invented in 1993 and it is meant to provide the implied volatility or the expected volatility in the S&P 500 over the next 30 days at any given time. It is measured; the number that it is measured in is a percentage, so the VIX has averaged, back testing back to 1990, has averaged a 19 reading, which is 19% annualized volatility in the S&P expected, up or down, which makes again perfect sense if the market has averaged about 10% annualized returns, more or less, over its history.

So what the VIX does, it takes option contracts for the next two months and it uses a formula to measure the expected volatility in the market. For instance, if the VIX is trading at 15, a level of 15, that tells us that the market expects the S&P to move less than 4% or so in either direction in the coming month.

Rich Greifner: Okay, and the VIX is currently low twenties?

Jeff Fischer: It is currently; it is fairly volatile. It was 20 a day or two ago; now it is 19. It may be different a day from now.

Rich Greifner: Okay, so I think I understand the VIX, but tell me, why does the VXX do such a poor job of tracking the VIX?

Jeff Fischer: So you have the VIX, this magical fear gauge. People call it the fear gauge because it goes up when the market is going down, generally, and that is because people are willing to pay more for put prices at that time. For instance, Rich, you know this. In 2008, the VIX went from its 20 or so average; it spiked all the way up to 80 during the worst of the fear.

Rich Greifner: I recall that.

Jeff Fischer: Then it reverts to the mean; it goes back down and it has been below 20 most of this year. It spiked up for Japan up to 2 during the tsunami, but then right back down to the teens.

Rich Greifner: Okay.

Jeff Fischer: Which gets to why VXX is so good. If you can wait it out, volatility, implied volatility, is always going to revert back to the mean. I say "always" meaning measured over a period of a few years, generally speaking.

Rich Greifner: Sure.

Jeff Fischer: The market is not going to expect extreme volatility from the market indefinitely. Basically we get these hits, these surprises. Volatility spikes up, the market takes that into account and then volatility goes back down.

So why VXX is such a terrible tracker of the VIX is because it uses the forward two months' futures contracts on the VIX to derive its price. And so I can tell you right now what those futures prices are. As of our taping, the VIX is at 19 and VXX, this exchange-traded note that tries to track the VIX, is investing in July futures contracts that trade at 20.15 or 6% above the current VIX and August contracts that trade at 6.3% above the current VIX.

So it is paying the 6% premium just for one month ahead, and it rolls these contracts every single day. So it will sell these contracts as they expire and buy one a month ahead and pay a premium again. So this is called "contango", where you are always paying more for a futures contract than the contract that you are selling.

Rich Greifner: And so it is a fundamentally flawed tracker. You can't track the VIX perfectly, and it is paying a premium to attempt to do so.

Jeff Fischer: Right, and VXX is not alone in this. So many commodities' ETNs, as you know, try to track a commodity by using futures prices, and they pay contango as well. A famous one is UNG, the U.S. Natural Gas Fund. It suffered the same thing.

Rich Greifner: I recall. But what is interesting to me, though, is if that may work over the short term, but over the long term, this is just a losing strategy for the VXX, and if you go back and look at its stock chart over a long-term horizon, it is just falling off a cliff.

Jeff Fischer: Oh yeah, straight down. It has been around a couple of years now and it has lost 80, 90% of its value. It has done a couple of reverse splits, four for one, and it is in its charter that when it gets below a certain price, it will do a reverse split to get the price back up. But the result is…

Rich Greifner: That is just optics, right?

Jeff Fischer: Oh yeah, completely. For a short seller, you have made that 80, 90% and you will continue to make money, ideally. I had a point is was going to say, but go ahead, Rich, with your….

Rich Greifner: Well, I was just going to say, so because this is a fundamentally flawed tracker, then it doesn't necessarily matter what the VIX is doing over the long haul, even if the VIX does spike, we are confident that the VXX is headed down in a long, slow, downward spiral.

Jeff Fischer: Yes, there is a lot of truth to that. Now the VIX could spike, say it doubles from 20 to 40, which it can do, of course.

Rich Greifner: Sure.

Jeff Fischer: Historically, VXX has gone up less than half as much as the VIX because it is already; the futures it is tracking already takes into account at least a fair spike in the VXX at all times. So the VXX might double, the CTN might go up half as much , the VXX might go up half as much, but if you wait as the VXX goes back down, this will go back down as well.

Rich Greifner: And so that is why you are confident entering into this trade today, even though who knows what might happen. You know, debt problems in Europe, debt problems in the U.S. That doesn't overly concern you?

Jeff Fischer: Right, right. The history with PRO, and I think many *Duke Street* members will know this. We tried to short VXX initially directly last year, and the shares are hard to get. Our broker couldn't get them. So we started writing naked calls, and the benefit to this, at least, is we get a premium, to begin with. So the VXX is 19, but with the premium that that calls pay us, our short price is effectively 26 or so on the VXX, so we have that cushion built in on top of everything else.

But you are right, to your point. Over the long haul, the contango generally eats away about 3% of the value in VXX every month, which annualize that, that is a large, steady decline. For instance, VXX has lost, and I don't have the numbers in front of me, but at 36% this year while the VXX itself is actually up a little bit.

Rich Greifner: So that is really not a great tracker then.

Jeff Fischer: It is far, far from it.

Rich Greifner: Now Jeff, if members had a broker, like say hypothetically interactive brokers. I know many *Duke Streeters* choose to use them; that enabled you to short the VXX at a low cost, would you recommend that instead of writing the naked calls?

Jeff Fischer: Yes, it is an alternative trade; I have got PRO as well, to short VXX to be clear, directly, if you can do it. It is a trade we recommend. I personally am short shares. I have been since last year, and I will add to it on any spikes in the VIX, which lead to a spike in VXX. But start incrementally with the VIX only at 19 or 20, it is not that elevated, so start with a partial position. When the VIX spikes into the high twenties or the thirties, add to your short.

Rich Greifner: Well there you have it, Fools. I hope that cleared up any questions you might have had on this complicated trade. That did it for me, but if you Fools have additional questions, feel free to hit the *Duke Street* discussion boards, the PRO discussion boards, where Jeff and his tea will be happy to help you out.

Thanks for joining me, Jeff.

Jeff Fischer: Thank you, Rich.

Rich Greifner: Thanks for listening, everybody. Fool on!

Charter Portfolio and Portfolio 2011: Write Naked Calls on VXX

Published Jul 19, 2011 at 12:00AM

Trade Essentials

- **Action:** Write ("sell to open") December 2011 $22 naked calls
- **Allocation:** 7.5% if we end up shorting shares. For the Charter Portfolio, that's around 43 contracts, and for Portfolio 2011, it's seven.
- **Recent ETN price:** $23
- **Recent ETN options price (bid/ask):** $4.50/$4.80
- **Recent measure of the VIX:** 21. The CBOE's measure of put prices to call prices gauges the implied volatility expected in the S&P 500; it is measured as a percentage, so 21 means 21% expected annualized volatility.
- **Preferred limit price:** Check current prices and aim for at least $4.50 if feasible; as prices change, accept no less than $4
- **Alternative trades:**
  - Sell shares short directly, starting with a 5% allocation since you lack a price cushion
  - Write naked calls at higher strike prices if you want more breathing room
  - If you're already short shares, continue to hold your short in anticipation of more long-term price decay

What's New

First Things First

- **ETN: iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX)
- **Price (July 19):** $23
- **Type of holding:** Short
- **Past VXX reports:** Click here
- **Website:** ipathetn.com
- **Follow it:** Add VXX to My Scorecard

This trade marks the fifth time we've taken a bearish position on the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) exchange-traded note. Aside from our initial effort to short the ETN directly in June 2010, this is our most aggressive position so far. By writing modestly *in-the-money* naked calls, we're mimicking a short position down to our strike price of $22. (We would consider shorting the ETN directly, but our brokerage makes this impossible — see "How to Follow Along" below.) This strategy does offer an added bonus that shorting directly doesn't: Writing calls means we get paid a premium. The calls are currently paying about $3.50 in time value and $4.50 total, so we're effectively shorting the ETN near $26.50. A small decline to $22 or below by expiration will leave us with a full $4.50 profit, and there's a reassuring 15% cushion between the recent ETN price and our $26.50 break-even price.

This ETN aims to track the famous volatility index known as the VIX by mirroring short-term VIX futures contracts. However, it doesn't do so accurately — at best, it tends to go up less than half as much as the VIX on a daily basis, and do much worse over many months. While the VIX is up 21% in 2011 as of July 18, the VXX ETN has lost 36% of its value year to date. The data suggests that the VIX would need to jump about 25%, to 26 or higher, sometime soon for the ETN to reach our break-even price. This disparity is because of contango, to which the ETN loses an average of 3% a month — much more when the VIX goes down.

To understand contango, you first have to understand how the VXX ETN works. The ETN tracks (but doesn't actually invest in) the prices of near-term VIX futures contracts on a daily basis, "selling" near-dated VIX futures to "buy" VIX futures that expire a month later. This roll incurs a cost (or negative "roll yield") more than 70% of the time; that situation is called contango, and it reliably eats away at the ETN's value. Because the VIX can spike at any time, its futures almost always carry a premium, so the ETN is almost always hamstrung by contango. (It's unusual in that regard — most commodities that also have futures contracts don't have to worry about such sudden spikes on a continual basis.)

If this ETN loses its just 4.5% between now and its December expiration, we earn the full $4.50 profit. Contango alone between now and December should account for a loss of more than 4.5%, so unless the VIX rises more than that, the ETN will ultimately lose value.

Setting up this position now takes some nerves of steel, which may end up helping it work well. Financial anxiety is riding high these days. Wall Street is concerned with government debt, even though it's unlikely any Western government will default this year. Instead, the powers that be will try to kick the can down the road for at least another year (longer in the U.S., given the upcoming presidential election). If the VIX does reach and maintain a higher price on growing market fear (say, if European debt woes spread beyond Greece to Spain), we may look to roll our calls to a higher strike price or later expiration date by December, seeking to maintain a credit. Or we may even add to our position if the VIX rises above 30.

Why This Strategy?

Over the long term, I have more conviction about shorting this vehicle than any other short I've made. The way this ETN is structured, it's almost certain to lose value over several months, and especially over a year or more. The main risk here is liquidity, or you simply having enough assets to ride out a big loss: If you're short the ETN when the VIX suddenly goes parabolic (which does happen — it jumped from around 20 to 80 in 2008), you could suddenly be staring at a 100% or 200% loss. If you have the means in your portfolio, you can add to your short or wait it out (*Pro*'s plan in such a situation), because implied volatility will eventually subside and the ETN will deflate. But if you don't have liquidity, you could be forced to take a loss at the worst time. Thus, you should only short as much as your portfolio can reasonably handle, and remember that when a short rises against you, your allocation to it grows.

That said, recent events add to my confidence regarding the ETN's flaws. During the seven-week market decline we witnessed this spring, the VIX briefly reached a high of 22.73 on June 16, rising from a low of 14.72 on April 28 — so it gained 54% in about seven weeks. The ETN gained a much smaller 11% in the same time, to $25.74 from $23.15. That's even worse than par for the course. Contango should continue to work in our favor, steadily decaying the ETN's price to make our short profitable, and making it harder for the ETN to rise to our break-even price by a month or two from now even if the VIX does spike.

Why December? We want enough time for things to calm down, and in case volatility spikes soon, we appreciate the larger premium that December affords us compared with options expiring in earlier months.

How to Follow Along

Many brokers charge a fee to sell something short if shares are scarce. VXX shares are not available for shorting at the Fool's Schwab account unless we want to pay a 7% fee, and shorting would also mean we risk the shares being called away on us early. By writing in-the-money calls instead, we avoid paying fees and retain more control of our position. Once December nears and the calls have lost most of their time value, we can roll them if the ETN is still above $22.

You need full options approval and margin permission to write naked calls (calls in which you don't own the underlying shares). Our profit is limited to what the calls initially pay us. If you can short shares directly and cheaply (some brokers, like TD Ameritrade, don't charge for shorting), that remains an attractive long-term alternative, but you should move incrementally and increase your position if VXX spikes. A direct short gives you greater long-term profit potential, but it means you don't start with a pricing cushion the way we do with these naked calls.

Trade Details

- **Action:** Write ("sell to open") December 2011 $22 calls (one for every 100 shares you'd short).
- **Recent price (bid/ask):** $4.50/$4.80
- **Break-even price:** $26.50
- **Recent VXX price:** $23
- **Difference from break-even**: 15%
- **Maximum profit**: Whatever the calls pay you, if VXX ends below your strike price
- **Risk:** Unlimited; the higher the VIX goes, the higher VXX will go (to a lesser degree), but eventually implied volatility should deflate

Fools, if you make this trade, be aware of the risks of shorting anything, let alone a volatility-tracking note. This is a high-conviction position when time is on our side, but we might see large price movements in the meantime. In that case, we'd need to roll the position forward or update our strategy. While doing so, we may have to sit on very large paper losses. If you have more questions about this trade, our past reports should help you get up to speed. As always, please bring your questions about this trade to our VXX board.

Jeff is short shares of VXX. See all of Motley Fool Pro's holdings on our Recommendations page.

It's Time to Raise the Roof

Pro Trade Roundup

Portfolio 2011:

- **Bristow Group** : Sold to open 2 September $40 puts for $0.30 (we had to make the trade in our 30-day window).

Dear Fellow Fools,

If the little "debt war" on Capitol Hill has you singing the blues, remember it could be worse. Heck, 150 years ago the country was in a civil war that lasted four years and nearly brought the nation to its knees. Bickering over a debt ceiling doesn't compare at all, but it does have the market on pins and needles. Grab a cool spot in the shade, and let's talk about it.

Why Limit Yourself?

Congress started the debt ceiling in 1917, imposing a quaint $11.5 billion limit. Today **Apple** alone is valued 29 times higher than that. The purpose of the debt limit was *not* to restrict going above it — if that were the case, the country would soon have gone out of business — but to have a limit in place so that lawmakers would think about what they were spending and be required to increase debt in an orderly, visible fashion.

Now the debt limit stands at $14.29 trillion, a number that's hard to fathom. To put it in context, the U.S. gross domestic product (GDP) was $14.6 trillion in 2010. Because our debt has more than doubled from $6 trillion in 2002, it now nearly equals the country's annual GDP.

Putting this into even *greater* context, excluding your home mortgage, imagine if you had as much debt as your household's annual gross income, and imagine you were paying interest on it. Now imagine your monthly income left you about 40% shy of making your monthly bills. In other words, you aren't making ends meet without borrowing more dough every month! You have years of extreme parsimony ahead or need a big jump in revenue just to pay existing obligations. In fact, you start to question your ability to ever dig out.

Ebix Q&A

Have a question for Ebix CEO Robin Raina? *Pro* is hosting another question-and-answer session with him, and we want to field your questions. Post them on the **Ebix**board soon.

Take It to the Limit, One More Time

The United States is in this position. As our debt hits the limit again, Congress needs to "raise the roof" so the country can sell more treasuries and raise more money — more debt — that will merely be used to pay *existing* obligations. The country is running a monthly deficit of approximately $125 billion, so if the United States can't sell more debt, it will be unable to pay about 40% to 45% of its monthly bills starting August 2. Which entities could lose out? Perhaps interest on debt, Social Security, unemployment, park services, Medicare, veterans, and federal employees, among others. Do you see any nonessentials on that list?

What's the Holdup?

So the debt limit needs to be raised, not so we can fast-track new spending, but just so that the country can meet obligations that are already on the books. The irony is that some of the same lawmakers refusing to raise the debt ceiling already tacitly agreed to do so months ago when they signed bills requiring funding into law. Lawmakers knew the approved spending would hit the limit, so almost nobody on Capitol Hill is above reproach. But this is nothing new under the sun.

Since 1962, the debt ceiling has been raised 74 times, and 10 of those instances have occurred since 2001. If it isn't raised now and bills aren't paid, the credit rating of the United States will notch lower, interest rates will go up, and the entire country will suffer higher borrowing costs. That might be enough to bring on another recession.

What Will Happen?

Although politicians are playing hardball, it's likely that they'll reach a compromise to avert financial disaster. But there's little question that the United States needs to increase revenue or cut wasteful spending – or both – so let's hope the debt impasse helps push lawmakers in the right direction. The trajectory of our debt compared with our revenue is not sustainable. With adjustments, the trajectory can be changed gradually, and that alone should start to bring greater peace of mind. But it's not going to be easy.

How to Invest

The uncertainty, doubt, and pessimism of others are an investor's three best friends. Without an abundance of these emotions, asset prices would always be too high, and nobody could ferret out opportunities to buy stocks at discounts. Uncertainty such as that in today's current market can create opportunities, especially when so many companies remain cash-rich and highly profitable. We just need to be as certain as possible that solutions will appear and the market will right itself.

Charter and 2011 Portfolios: Buy Covanta

Published Jul 15, 2011 at 12:00AM

First Things First

- **Company: Covanta** (NYSE: CVA)
- **Guidance:** This is a **Buy First** stock in *Pro*'s portfolios.
- **Market cap:** $2.4 billion
- **Dividend:** $0.30 per share, or 1.8%
- **Website:** www.covantaenergy.com
- **Type of Holding:** Renewable energy, long-term
- **Options:** We may write puts or covered calls later, but options aren't essential to this investment.
- **Follow along:** Add Covanta to My Scorecard

At a Glance

- **Action:** Buy 3%
- **Recent Price:** $16.45
- **Buy Around:** $17.50 or below (use a **limit order** at current prices)
- **Estimated fair value:** $24
- **Why buy:**
  - Covanta turns trash into energy and controls more than two-thirds of the industry's U.S. market share.
  - Management is focused on returning value to shareholders with a new dividend and share buybacks.
  - The stock is inexpensive enough to be a take-over target, though it should rise independently, too.
- **Alternate trade:** Sell to open December $17.50 puts, targeting a potential buy price of about $16 or lower.

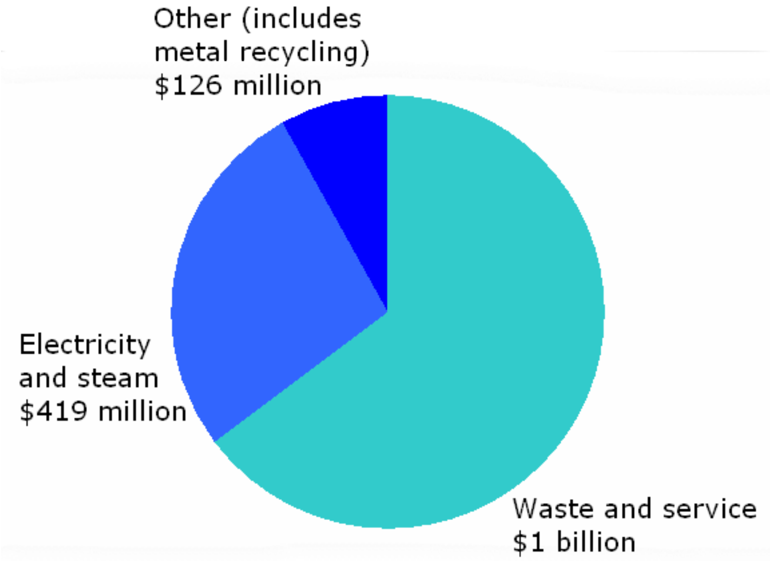
The Big Picture

Covanta (NYSE: CVA) makes money three ways — and they'll all pretty trashy. The company is paid by municipalities to dispose of their garbage, and it processes approximately 5% of all U.S. waste. It then turns most of this trash into power, which it sells to utilities, generating more than 5% of the country's renewable energy (excluding hydro power). Finally, it recycles the metal that comes through its plants (enough to make 300,000 hybrid cars a year), earning a revenue stream that grows as garbage volume and metal prices increase. Put it together, and Covanta stands to clean up whenever trash volume increases, energy costs go up, and metal prices rise.

Covanta owns and operates 44 energy-from-waste (EFW) plants, the largest of which can process up to 2,500 tons of refuse per day. Most of Covanta's operations are in the United States, but the New Jersey-based company is expanding in Europe, where governments are friendly to EFW companies.

EFW is a growing business as landfills are overflowing, coal plants are being shuttered, oil prices are rising, and nuclear power plants are on a path to be decommissioned in places like Germany. Covanta is taking advantage of this and has more than half a dozen major new projects in the works worldwide.

Covanta 2010 Revenue



Source: 2010 10-K filing.

The Business

The United States is the proud producer of 370 million tons of garbage a year. That's nearly 1.2 tons per person and accounts for almost 20% of the world's trash. About 24% of it is recycled, 69% is dumped into landfills, and 7% is turned into energy. Covanta accounts for more than two-thirds of that conversion, and it's one of the world's largest EFW facility owners.

About half of Covanta's trash-disposal business is done through long-term contracts that are directly linked to an inflation index, so as inflation rises, Covanta should at least maintain margins and increase its profit. Much of its energy is sold on a contract basis, too. Each ton of trash reliably generates about 550 kilowatt hours of electricity and 50 pounds of recycled metal.

This business appears to have hit a new level of reliability and stability. Management expects its "trash to cash" model to generate steady free cash flow for years, so it recently initiated a $0.30 per share annual dividend -- for a 1.8% yield -- and an aggressive stock buyback program, repurchasing 6% of outstanding shares so far. Covanta plans to return an additional $100 million to shareholders through various means after it sells two coal-powered operations in India and Bangladesh this year for about $280 million.

Covanta is flying under the radar even though it enjoys dominant market share and steady (if slow) growth opportunities. It's run by an experienced management team that is candid and detailed in its financial reporting. Insiders own 18% of the stock, and a handful of respected value investor shops own an equally large combined stake, including Neuberger Berman with 7.6%.

Financials and Valuation

Despite the maintenance costs on its monster-sized plants that run to hundreds of millions of dollars annually, Covanta consistently churns out free cash flow, lately to the tune of about $300 million annually. This lets the company return money to shareholders and continue to invest in new plants, many of which are funded at least in part by the municipalities requesting them.

Year-Ended	2005	2006	2007	2008	2009	2010
Revenue	$979	$1,267	$1,431	$1,402	$1,384	$1,582
Operating cash flow	$208.3	$319.0	$363.3	$402.6	$397.2	$431.0
Free cash flow	$184.8	$264.7	$277.6	$314.7	$323.6	$316.2

Source: Capital IQ. Numbers in millions.

As of March 31, Covanta held $327 million in cash, $1.5 billion in long-term debt, and $636 million in project debt — debt that municipalities raised to pay for plant construction. A municipality will pay a fee over the life of its contract with Covanta that goes to retire this debt, so even though it's on the balance sheet, it's low-risk debt that's covered by existing contracts. Overall, Covanta's leverage ratio stands at a reasonable 2.5, even as it's building plants that will add to cash flow.

Management expects 2011 free cash flow of $250 million to $300 million, valuing the $2.4 billion company at 8.1 to 9.7 times this year's expected free cash flow. Management expects adjusted 2011 EBITDA (earnings before interest, income taxes, depreciation and amortization) of about $500 million, putting the company's price tag, including all net debt (even municipality-sponsored debt), at 8.5 times 2011 EBITDA. That's "acquisition worthy" territory, with 10 to 12 times EBITDA, or up to 44% higher, justifiable to a buyer, which is in line with a fair value estimate of up to $24. Let's not forget that Covanta also enjoys the benefit of owning several plants that each have a replacement value of hundreds of millions of dollars and would take years to get permits for and build. Chris Mayer of the Capital & Crisis newsletter estimates that 11 of Covanta's plants combined are worth $17 per share in replacement value alone.

What Would Make Us Sell

As compelling as Covanta is from a business and valuation standpoint, it's not without risk. Although its returns are above its costs of capital, Covanta earns a single-digit return on capital and equity, and municipalities are aiming to reduce their costs, which could crimp negotiations as contracts come due. Low natural gas prices decrease the price paid for energy from waste, and a drop in metal prices has a direct effect on Covanta's income.

As a holding company, Covanta's structure is complex, and its investments in projects around the world add uncertainty. Additionally, the company is subject to energy regulations wherever it operates, and it spends steadily to keep plants running — last quarter they ran at 90% capacity. Any plant slowdown can affect profits.

Pro Bottom Line

Because Covanta's garbage-to-energy services improve the world, demand for them should continue to grow. Run by a long-term-minded management team with high insider ownership, Covanta is starting to unlock shareholder value even while it continues to invest in growth. This should lead to a higher valuation down the road. For now, *Pro* will invest a 3% stake in Covanta in both the Charter Portfolio and Portfolio 2011. We will make that trade in one to 30 days, per The Motley Fool's trading guidelines.

The Unprecedented Present

Published Jul 11, 2011 at 12:00AM

On what principle is it, that when we see nothing but improvement behind us, we are to expect nothing but deterioration before us?

> — Thomas Babington Macaulay, *Review of Southey's Colloquies on Society*, 1830

Dear Fellow Fools,

Pessimism is pervasive these days. The world banking system nearly collapsed, unsustainable debt loads threaten to dismantle several European countries, and world trade has taken a battering, just to name a few of the more poignant ailments.

Pro Trade Roundup

Charter Portfolio:

- **7/7/11:** Sold all shares of **Sprott Physical Gold Trust** at $13.26.

Portfolio 2011:

- **7/7/11:** Sold all shares of **Sprott Physical Gold Trust** at $13.27.

Pessimism is also enticingly newsworthy, and it has become a hallmark of the intellectual. Matt Ridley, author of *The Rational Optimist* (which I recently read and recommend, and which may or may not have influenced my choice of topics in today's Memo), says that "If you say the world has been getting better, you may get away with being called naive and insensitive. If you say the world is going to go on getting better, you are considered embarrassingly mad."

This Time Is No Different

The media seem to suggest that, at this moment in history, all improvement is behind us, and the future holds nothing but economic and social decay. We are at no such inflection point.

Pessimism is nothing new — thinkers since Socrates have argued that our decline is imminent. Think even within your own lifetime: A fresh batch of pessimists seasons each decade, each just as audaciously confident that it is perched precariously on the fulcrum of history. So far, they have all been wrong.

Frankly, pessimism is irrational, given any reasonably long time horizon. Human progress has been indomitable — check out Hans Rosling's excellent video of the history of human progress, 200 years in four minutes. The world we live in is richer and healthier, better fed and entertained, and more disease-free, sanitary, and interconnected than it was even a decade, let alone two centuries, ago.

Progress is not just about hoping genius will strike someone, somewhere. Systematic factors contribute to consistent improvement; chief among them is our propensity to trade and barter — that is, to participate in markets. Markets allow the transfer of goods, services, financial assets, and, just as importantly, ideas. It is the exchange of ideas — a better way to build a bicycle, a method to prevent cholera, a smarter way to invest — that leads to progress. Through this lens, the "problems" of our time, just as those in the past, actually present tremendous opportunity for clever business people, entrepreneurial thinkers, and savvy investors.

Skeptically Optimistic or Optimistically Skeptical?

What does this mean for how we invest at *Pro*? Regardless of your personal style, no investment is made in a vacuum. They are all in context, and every investor's mental framework is inextricably tied to the investment decisions she makes. We all harbor heuristics — our simplified models for solving problems — and we must force ourselves to regularly evaluate them. And when we do so, we can commit no greater error, in my opinion, than to give too much weight to the present or recent past in drawing our conclusions.

Not that your *Pro* team is blindly optimistic — far from it. In fact, we might be described as professional skeptics. That's why we limit our portfolio's position sizes, hedge our exposure, and use options to define and limit our risk. We each bring a healthy dose of skepticism to new investment ideas; with so many companies out there, we insist on putting any promising possibility through the wringer. But skepticism and pessimism are not the same thing, and at the end of the day, the weight of economic history tells us that optimism is the rational viewpoint.

Fools, I encourage you to evaluate your own view of the world. Optimists are contrarians these days, and though it can be difficult to go against the grain, evaluating evidence independently and drawing your own conclusions is critical to becoming an outstanding investor. Of course, you're never alone, so share your thoughts with the *Pro* community on our Philosophy & Strategy discussion board.

Foolishly,

Alex Pape (TMFPapester)

The Investor's F-Word

Published Jul 5, 2011 at 12:00AM

Did You Know ...

No investor goes into an investment thinking it's going to happen to them. We spend our days and nights reading the Ks and Qs with a skeptical eye and trying to filter signals from the noise of conference calls. As careful analysts, we make adjustments for operating leases, underfunded pension-benefit obligations, and poorly reserved loan loss accounts to arrive at our estimate of a business' fair value. Still, it happens: One of our brethren goes down. Another investor, this one with a reputation for near-prescience — and with the benefit of better information — loses big because of the investor's F-word: fraud.

Sadly, this scenario is far from hypothetical. I'm referring to hedge-fund manager John Paulson's recent $107 million whipper on **Sino-Forest** — and that's a generous estimate; he lost about $700 million from the peak. Yes, one of the few people anywhere to profit from the housing crisis, a man who made billions on what's been called "the greatest trade ever" — using complex derivatives like credit-default swaps to short the housing market and the financial firms leveraged to it — just lost hundreds of millions investing in … trees.

Nearly a Zero

Source: Google Finance.

The catalyst for Sino-Forest's crash was Muddy Waters Research. The short-sellers there uncovered fraud at Sino-Forest (overstating volume by treating an entity as both the customer and the supplier), then told the world about it using a megaphone (aka a widely distributed 39-page sell report — sound familiar?). The stock opened at $18.21 before the report was issued and has traded as low as $1.29 in the weeks since — ouch. Without getting into the details, suffice it to say that Paulson's hedge fund was Sino-Forest's largest investor, had been invested in the company for years, and even had direct access to management. In Paulson's company's own words:

Pro Trade Roundup

Charter Portfolio:

- **NextEra Energy** covered strangle: Sold to open nine January 2012 $50 puts and nine January 2012 $60 calls. Combined credit: $2.40.

Portfolio 2011:

- **NextEra Energy** : Sold to open three January 2012 $55 puts. Credit: $2.60.

Ex-Dividend Dates

- **Cisco** , today (July 5)
- **Medtronic** , July 6

> Our investment team conducted considerable due diligence on Sino-Forest. We reviewed Sino-Forest's public filings, participated in conference calls with the investment community, followed up privately with management on specific questions, discussed Sino-Forest with analysts that covered the company, and regularly met in-person with management. A member of our team also went to China to visit Sino-Forest's operations and to meet with a major customer and representatives of the Chinese government on forestry matters.

It's humbling for a respected investor to come forth with that level of disclosure. It certainly appears that Paulson and his team did their homework, and based on the size of the position and the length of time they'd owned it, they were seemingly certain management was honest. In other words, if it can happen to them, it can happen to anyone.

What's a *Pro* Investor to Do?

Fraud is a particularly worrisome risk factor for every investment we make. We base our analysis on publicly available information, and we reach our conclusions based on our insights and unique interpretation of the facts. When any of those facts turn out to be lies, the *entire* analysis is therefore no good. Even more analysis is unlikely to help in that case — we need another tool to protect us.

Position Size Matters

Once we decide on an investment to buy (or short), we determine how much we want to invest. Position size is a key component of portfolio management, closely linked to our level of diversification and the overall volatility of our portfolio. This is a delicate balance, because our holdings need to be large enough to move the performance needle when they work out but small enough that they don't permanently impair the portfolio if we're incorrect — or, much worse, if management turns out to be perpetrating fraud.

Though we're confident in everything we buy, our confidence exists on a continuum — it isn't an on/off switch. Thus, if we find an exceptional company with a large margin of safety, we may invest 5% over multiple purchases. We don't make initial investments larger than that (except as a portfolio hedge), no matter how lucrative the opportunity appears — we're far too aware of the risks of overconfidence. If we find a business we are less certain of, or one with risks that are highly correlated to our portfolio, we may only allocate 2.5% to it. Sticking to these guidelines means the most we can lose on any investment is about 5% of our capital — a poor result, to be sure, but readily recoverable.

Foolishly and always vigilant,

Charter and Portfolio 2011: Sell Sprott Physical Gold Trust

Published Jul 1, 2011 at 12:00AM

At a Glance

- **Action: Sell all shares** (use a limit order near current market prices)
- **Recent price (7/1/2011):** $13
- **Why sell:**
  - As the U.S. stops pumping money into the treasury market, it's likely that interest rates will head higher, competing with commodities that do not provide cash flow. Freeing up this cash will allow us to act more quickly on new, more compelling investing ideas as they arise.
  - We remain more confident in our ability to analyze businesses than gold.

What's Changed?

We originally purchased shares of **Sprott Physical Gold Trust** (NYSEMKT: PHYS) to guard our uninvested cash against inflation and the decline of the dollar as the Federal Reserve pumped money into the economy. In the original trade alert, we wrote:

Don't confuse gold with an investment *per se*; instead, think of it as a place to hold wealth until you're ready to invest in something else. In that sense, holding gold is like holding cash — except hopefully much better, since cash is being devalued. Also, remember that ownership of a strong business is better than gold, because high-quality equities should increase in price with inflation ...

Gold served its purpose for us as a passive, protective holding; in the Charter Portfolio, we made 9% on cash that would otherwise have been idle. Now, as the Fed's program ends and interest rates look ripe to rise in coming months, we're selling so we can deploy that cash elsewhere. Rising interest rates can have a dampening effect on commodity prices, since commodities don't provide investors with interest or cash flow. As more investors are drawn to interest-bearing investments, they may sell commodities, which are currently a "crowded" or popular investment class.

Plus, gold is, at heart, a play on perception. As is true of any asset, its price is determined by supply and demand. Because industrial uses for gold are scarce (just one-quarter of 1% of the world's total gold supply was consumed in industrial processes last year), its supply and demand comes from investors, rather than businesses. Therefore, it is important to know who these investors are and on what basis they buy and sell gold.

Unsurprisingly, central banks as a group own the most gold — but they don't have as much as you might think. Together, they hold just 18% of the 162,000 tonnes of global supply, and that figure doesn't tend to change much; central banks bought almost exactly as much gold as they sold last year. Gold-focused ETFs also don't own much — the largest, **SPDR Gold Trust** (NYSEMKT: GLD), owns just 1,213 tonnes, or about 0.7% of the total. That means that about 80% of the gold supply, or 130,000 tonnes, is owned by *everybody else*. It's nearly impossible to sort out how much is held institutionally, but suffice to say that a boatload (that's the official term) of gold is held by retail investors.

Fear — of inflation, depreciating currency, political unrest, economic stagnation, or recession — is likely the primary driver of retail-level investment in gold. And (un-Foolish) retail investors are notorious for their emotion-driven, fear-and-greed-based investment decisions. An *active* investment in gold (as opposed to our current passive "placeholder" exposure) would have to be at least partially based on our perception of the general investing community's perception of fear-inspiring macroeconomic variables.

Feeling dizzy yet? This is how gold became a hedge, at least in recent years: It went up as the economic outlook worsened and investors piled in. Today, we're not convinced the economy will continue to worsen; we strongly believe governments are going to end "easy money" policies (in fact, they already are), after which interest rates will eventually rise to higher levels more in line with the historical norm, perhaps sapping interest in some commodities like gold.

To be sure, we are *not* arguing that gold is overpriced — or that it is under- or fairly priced, for that matter. But the government stimulus that helped drive commodities higher is ending, and we still have much more confidence in our ability to analyze businesses that produce cash flow than we do in our skills at predicting investors' reactions to gold.

How to Follow Along

We'll be selling all of our shares in Sprott Physical Gold Trust from both portfolios in the next one to 30 days. Lately, Sprott trades at a greater than 3% premium to its Net Asset Value, so be sure to use a limit order near current market prices to exit your position. Head to the Sprott Physical Gold Trust discussion board with your questions and thoughts.

Jeff and Alex do not own shares of any company mentioned. The Motley Fool owns shares of Sprott Physical Gold Trust.

Charter Portfolio and Portfolio 2011: Write Naked Calls on VXX

Published Jul 1, 2011 at 12:00AM

Trade Essentials

- **Action:** Write ("sell to open") January 2012 $17 naked calls
- **Allocation:** If we end up shorting shares around a net $23, our allocation will be 5%. For the Charter Portfolio, that's 32 contracts, and for Portfolio 2011, it's six contracts.
- **Recent ETN price:** $21
- **Recent measure of the VIX** (CBOE's measure of put prices to call prices to gauge the implied volatility expected in the market, measured as a percentage): 17
- **Recent ETN options price (bid/ask):** $6.00/$6.30
- **Preferred limit price:** Check current prices and aim for at least $6 if feasible; as prices change, accept no less than $5
- **Alternative trades:**
  - Sell shares short directly, starting with a 5% allocation
  - Write naked calls at higher strike prices if you want more breathing room
  - If you're already short shares, continue to hold your short in anticipation of more long-term price decay

What's New

First Things First

- **ETN: iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX)
- **Price (June 30):** $21
- **Type of holding:** Short (short naked calls)
- **Past VXX reports:** Click here
- **Website:** ipathetn.com
- **Follow it:** Add VXX to My Scorecard

This trade will mark the fifth time we've taken a short position in the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) exchange-traded note. Aside from our initial effort to short the ETN directly in June 2010, this is our most aggressive position yet. By writing *in-the-money* naked calls, we're mimicking a short position, right down to our strike price of $17. (We would consider shorting it directly, but our brokerage makes this impossible — see "How to Follow Along" below.) In addition, the calls will pay us around $2 in time value, so we're effectively shorting the ETN near $23. We stand to profit on a fall to $17 or below, and we have a reassuring price cushion of nearly 10% between the recent price and our $23 break-even price.

This ETN aims to track the famous volatility index known as the VIX by mirroring short-term VIX futures contracts. Fortunately for us, it's not very good at it: While the VIX remains near the 17.75 level at which it started 2011, the VXX ETN has lost 43% of its value year-to-date. This is largely because of contango, to which the ETN loses an average of 3% a month (and much more when the VIX goes down). The VXX ETN tracks (but doesn't actually invest in) the prices of near-term VIX futures contracts on a daily basis, selling near-dated VIX futures to buy VIX futures that expire a month later. This roll incurs a cost (or negative "roll yield") more than 70% of the time; this situation is called contango, and it reliably eats away at the ETN's value. And because the VIX can spike at any time, its futures almost always carry a premium, unlike most commodities that also have futures contracts..

If this ETN loses its typical 3% a month between now and our calls' expiration in mid-January 2012, it will end around $17 per share. Of course, in some months it could lose more, and if there's extreme volatility, it could gain ground. However, as long as the VIX remains within its recent range of 14 to 20 for most of the time between now and January, this short should end profitably for us.

Wall Street is concerned with government debt these days, but it's unlikely any Western government will be allowed to default. Instead, the powers that be will probably kick the can down the road for at least another year — longer in the U.S., given the upcoming presidential election. If the VIX does reach and maintain a higher price on growing market fear (say, if woes spread beyond Greece to Spain), we'll look to roll our calls to a higher strike price or later expiration if need be, while seeking to maintain a credit.

Why This Strategy?

Over the long term, I have more conviction about this short than any other I've made. The way the VXX is structured, it is almost certain to lose value over months and (especially) years. The main risk here is liquidity: If you're short the ETN when the VIX suddenly goes parabolic (which does happen — it jumped from around 20 to 80 in 2008), you could suddenly be staring at a 100% or 200% loss. If you have the means in your portfolio, you can add to your short or wait it out (*Pro*'s plan in such a situation), because implied volatility will eventually subside and the ETN will deflate. But if you don't have liquidity, you could be forced out at the worst time. Thus, you should only short as much as your portfolio can reasonably handle, and remember that when a short goes against you, your allocation to it grows.

That said, recent events add to our confidence in VXX's flaws. During the six-week market decline we witnessed this spring, the VIX briefly reached a high of 22.73 on June 16, rising from a low of 14.72 on April 28 — so it gained 54% in about seven weeks. The ETN gained a much smaller 11% from $23.15 to $25.74. That's even worse than par for the course; the ETN generally gains a maximum of half as much as the VIX on spikes, so the VIX probably needs to jump at least 20% to 25%, to above 21, for the ETN to rise 10% (which would bring it to our $23 break-even price). Keep in mind that contango will be working in our favor most or all of the time, steadily decaying the ETN's price to make our short profitable.

The VIX was at 17.27 as of Wednesday. Its July futures closed at 18.50, August's at 19.35, September's at 21.50, October's at 22.60, November's at 23.05, December's at 23.20 and January's at 24.75. The VXX ETN only mirrors contracts for the next two months, but these numbers illustrate its ongoing uphill climb. Right now, the contango from the current VIX price to its August futures is a large 12%. The lower the VIX, the steeper the contango tends to be, which helps explain the ETN's tepid reaction to the VIX's 54% rise this spring: The futures had already priced in the possibility of a large jump.

How to Follow Along

Many brokers charge a fee to sell an investment short if shares are scarce. Shares are not available at the Fool's Schwab account unless we want to pay a 7% fee to short them, which would also bring the risk of the shares being called away on us early. By writing in-the-money calls, we avoid paying fees and retain more control of our position. Once January nears and the calls have lost most of their time value, we can roll them if VXX is still above $17.

You need full options approval and margin to write naked calls (calls in which you don't own the underlying shares). Our profit is limited to what the calls initially pay us. If you can short shares directly and cheaply (some brokers, like TD Ameritrade, don't charge for shorting), that remains an attractive long-term alternative, but you should move incrementally and increase your position if VXX spikes. A direct short does give you more profit potential, but it means you don't start with a pricing cushion the way we do with these naked calls.

Trade Details

- **Action:** Write ("sell to open") January 2012 $17 calls (one for every 100 shares you'd short)
- **Limit price:** Near market prices, recently $6
- **Break-even price:** $23
- **Current VXX price:** $21
- **Difference from break-even**: 9.5%

Fools, if you make this trade, be aware of the risks of shorting anything, let alone a volatility index. This is a high-conviction position when time is on our side, but we might see large price movements in the meantime. In that case, we'd need to roll the position forward or update our strategy. While doing so, we may have to sit on very large paper losses. If you have more questions about this trade, our past reports should help you get up to speed. As always, please bring your questions about this trade to our VXX board.

Jeff is short shares of VXX.

Published Jul 1, 2011 at 12:00AM

Synthetic shorts, ratio put spreads, paired trades … the team must be talking about shorting and hedging! Join in as the whole *Pro* team discusses how we view shorts and hedges, using them to smooth returns and profit on falling prices and increase our financial security. Happy Fourth of July weekend!

10b3hrMjro6JjIdZzaiOzBAwSfIqa38o

Transcript

Jeff Fischer: Welcome to a new edition of Motley Fool *Pro* Audio Extra. The whole team is here with us today. There is senior analyst Nick Crow.

Nick Crow: Hey, Jeff.

Jeff: Analyst Bryan Hinmon.

Bryan Hinmon: Howdy.

Jeff: And analyst Alex Pape.

Alex Pape: Hey, guys.

Jeff Fischer: I am advisor Jeff Fischer. Thank you for joining us. We are here today to talk about shorting versus hedging.

Nick Crow: Jeff, why don't you define for us the difference between shorting and hedging?

Jeff Fischer: That's a good place to start, Nick. We'll start with shorting. The way we think about shorting is it is when you are looking to profit directly on a decline, no matter what the market does. So you are shorting a certain sector of the market or typically a certain stock, and you are hoping that it declines no matter what the market does, so it isn't exactly a hedge; it's a short. It's a conviction trade, just like a long is.

Nick Crow: We are trying to profit directly from that short.

Jeff Fischer: From a fall, exactly, whatever the market does. Hedging, on the other hand, is to protect a part of your portfolio or your entire portfolio by hedging out some of its downside. We have done that in *Pro* lately by hedging three different indexes. Now the thing about hedging an index, you know when the market is going down, the index is going down. There is no way around it, so it is the perfect hedge. What it does is smooth out some of the losses that you will see elsewhere in your portfolio.

Bryan: So Jeff, do you view shorting directly as a little more aggressive than hedging?

Jeff Fischer: I do. I think you need to have high conviction to short an equity. Let's talk about an individual equity because one, it can be acquired. News could break that you don't anticipate. There's of course risk of a short squeeze, or any other sort of news that can send a stock much higher. So when you are shorting shares directly, you need to have a high conviction.

Additionally, you can only make so much in a short. If we look at a short and think that we can make 20% or 30%, then we need to make sure that is our best idea as opposed to a stock we could buy and make at least that much with lower risk.

Bryan Hinmon: And that is a good segue into what I look for when I am shorting, when I am looking for a short candidate. And really I like to look at three things. The first is sort of a combination of two, but the most important thing that I look for is the match up of what the expectations are for the company and how that relates to the company's valuation. Because you can have a wonderful business, but if the expectations that are baked into that stock are so out of whack, even fantastic results can be a huge disappointment to the market, and that can be a real opportunity there. So the combination of sky-high expectations or unrealistic expectations with an expensive valuation is a really good place to start, I think, for a short candidate.

Jeff Fischer: It's a good place to start, Bryan, I agree, as long as you understand that valuation arguments can take a long time to play out, which you know they can. I shorted, this was, what a mistake. I owned Amazon for years, did really well on it. Several years ago when it looked very expensive, I shorted it on valuation. It didn't work out. It did for a short while, actually.

Bryan Hinmon: Yeah, that goes perfectly into my second point. The second thing I look for is a catalyst. Now those are always hard to identify and they are always hard to quantify, but if you can find at least a clear catalyst, then you have really got the makings of a decent short candidate.

Jeff Fischer: What about you, Alex? What do you look for in a short or what sort of hedging do you prefer to do?

Alex Pape: Sure, I will answer both of those questions. First, I am very much aligned with Brian, to look for shorts. General details, I strongly dislike shorting stocks that have a high dividend, because you have to pay that dividend, of course. I also dislike shorting stocks that have a lot of hard assets (unclear) short stocks have more intangibles.

Although I do like a valuation that has become detached from reality, if it is totally detached, I shy away from that, just because once the market decides to be totally unreasonable, you have no idea how long it will be unreasonable for. It is just like your Amazon story.

Bryan Hinmon: Playing in the tales can be dangerous.

Alex Pape: But personally, I am a big fan of pairs trades. So pairs trades are when you buy a stock and simultaneously short usually a similar stock. I like these trades for industries or situations in which there is one factor that affects both stocks or an industry that is totally out of your control. So a good example would be, say the for-profit education industry right now, which there is looming regulation and the whole industry kind of swings and ebbs and flows the various news.

But if you could pick out a mismatch between how one company is run qualitatively versus another or is valued versus another and you buy the better run or undervalued stock, in short you overvalue a poorly-run stock, you are now purely betting on those two stocks converging and you have totally eliminated the industry argument.

The same idea would be for oil stocks. You have no control over the price of oil, but if you can bet that two stocks are mispriced relative to each other, I think that is a good bet.

A few things to keep in mind with pairs trades. First, I would always think of the two stocks together as one position. You are not directly betting that the stock you are shorting is going to go down; all you are betting is that the difference between those is going to converge. So not necessarily saying that stock X is going to go down and stock Y is going to go up; all I am saying is that that is going to converge and they might both go up, might both go down. It can make money either way.

The second thing is to remember that because you have two separate positions, you could lose money on both sides, so you definitely need a strong stomach for these. You need to have high conviction.

Nick Crow: Pairs trades are also leveraging trades. You sell that one stock short, use those proceeds and buy the others. So people who run full funds full of long/short portfolios that way, use those to leverage their portfolio in the same way that we might use options here.

Jeff Fischer: Have any of you had a pairs trade go bad on you, where both positions are going exactly the wrong way, and if so, how emotionally and then how tangibly did you deal with that?

Alex Pape: I have never had one end that way.

Jeff Fischer: You are setting expectations high. *(laughter.)*

Alex Pape: I have had one move that way before I closed it out. It hurts. You really question your convictions, so you really have to stick to your guns.

Jeff Fischer: Or be right, and eventually be right.

Alex Pape: We can't all be Nick Crow.

Jeff Fischer: That's the way many options trades start out. They may start looking completely wrong, but if you stick to your convictions, they work out. Nick, let's talk about using options to short and hedge.

Nick Crow: We like options obviously here at *Pro* and use them frequently. One of my favorite things is our ability, like you said, to hedge for actually no cost, like we have done here with Wells Fargo, and in a lot of ways, same with our small-cap index we have been doing it on. The nice thing there is that it kind of does two things for us. One, hedges generally are going to reduce your return as the market goes up, but in this case, using options instead of shorting something, whether it be a cost to carry or maybe you have to pay the dividend or other considerations, there is no cost for us here. That is not to say that there is a free lunch; the downside is that we have promised that at some later date that if these drop a lot further than we are expecting, that we are willing to pick up shares or pick up some of that index.

Jeff Fischer: That's true, but I find it much easier to short in the way that we have when there is no cost, or even a credit up front. Like we have heard, everybody wants insurance and wants protection, but nobody wants to pay for it.

Nick Crow: Yup.

Jeff Fischer: And the options strategies that we have used give you kind of the best of both worlds.

Nick Crow: Absolutely. And you had mentioned earlier that you only short an individual security when you have really high conviction, and these are perfect that way because they aren't necessarily high conviction trades; our high convictions trades are the rest of our portfolio, all the things that we own in there. That's what we have high conviction in. What we are doing is reducing the risk overall using these costless hedges. It's excellent.

Jeff Fischer: That's true. So overall on *Pro*, what we are aiming to do is smooth out returns with our hedges and cushion any downside, and we focus on shorting indexes to do that, because there is no question an index is going down if the market is going down.

When we see stocks that we want to short, specifically we will do that when we have high conviction. Then we have not done any pairs trades yet, and I know we are looking at a small handful now, especially now that the team is larger and Alex is here and has a lot of interest in them, as does Bryan. So there may be pairs trades in our near future as well.

Thank you for joining us; thank you, guys.

Alex Pape: Thanks, Jeff.

Bryan Hinmon: My pleasure.

Jeff Fischer: And we will see you on the boards, and Fool on!

The Motley Fool Pro Touchstone Report

Published Jun 29, 2011 at 12:00AM

Dear Fellow Fools,

Before we find ourselves enveloped by July's earnings season, we want to take a moment to review the investments we've made together over the past several months. In each case, we want to be sure you know our thesis, our perception of the risk, why we invested how we did, and what to do today if you're still catching up. This Touchstone Report focuses on 11 of our new positions initiated over the past three months in one or both *Pro* portfolios — including those investments that haven't yet behaved the way we want them to. Download it here, and enjoy! If you have questions, please bring them to our Philosophy & Strategy discussion board.

Foolishly,

Jeff Fischer (TMFFischer)

There's More to Pro Than Profits

Published Jun 27, 2011 at 12:00AM

Unique and profitable investment ideas, a lower-risk portfolio thanks to hedging strategies, and portfolio management done in plain view — these things are *Pro's* bread and butter, and they're the main reasons you're here. That said, if that's all you know about *Pro*, you're likely missing out. There's much more to the *Pro* site, and today I'd like to point out some features you may be overlooking.

Get Rich With ...

Covered strangles? Written puts? Buy-and-hold stalwarts? At *Pro*, we want to help you make money with all of those and more, and we'd love your suggestions on how we can improve.

Happy Fourth!

Your next *Pro* Memo will hit your inbox Tuesday, July 5. Have a spectacular holiday!

Cogent Content

Given that you're reading this particular Monday Memo, it's a safe bet you know the Memos exist. These columns are our weekly chance to touch base with you, and we hope you find them as valuable to read as we do to write. We use the Memos to tweak guidance on existing positions; if there's action we feel you should take, we'll always send a Trade Alert, but if we're making minor guidance changes, we'll list them in the Memo. We'll also use the Memo to point you to our earnings and other news coverage and to share updated thoughts behind our investing philosophy.

You are hereby invited to grab a hammock and a refreshing beverage and settle in to read every Monday Memo ever written — you can find them all in our Memo archive. (If for some crazy reason you'd rather start smaller than that, try the "Don't-Miss Memos" listed on this page.) If you peruse the archive, you'll notice that at least once every year, we review our philosophy from start to finish in a three- or four-part series. Additionally, I personally like to review our old Memos occasionally to make sure we're staying consistent with what we've said — and if we're not, to make sure any changes are for the better.

Our Extras archive also holds a small mountain of premium content. Here you'll find our Audio Extras: taped segments in which the *Pro* team discusses businesses, explores strategies, and interviews the management teams at our companies. You'll also find all of the extra or special content we send you, including guides to valuation, options strategies, articles explaining our investing philosophy, and more. If you scroll to the earliest pieces listed under "Extras," you'll find original content like "Secrets of a Winning Portfolio" that I wrote to provide a framework for *Pro* as the service launched.

Guidance Updates

- **GrafTech International** moves up to Buy because of a lower price.
- **Ebix** moves down to Buy from Buy First, since it's already more than 10% above our buy-around price.
- **3D Systems** moves down to Buy as a nod to our increased risk aversion while we continue to go through its financials.
- **Vanguard Emerging Markets** moves down to Hold while we consider its increased exposure to China.

Pro Trade Roundup

Charter Portfolio

- **NextEra Energy** covered strangle: Sold to open nine January 2012 $50 puts and nine January 2012 $60 calls. Combined credit: $2.40.

Portfolio 2011

- **NextEra Energy** : Sold to open three January 2012 $55 puts. Credit: $2.60.

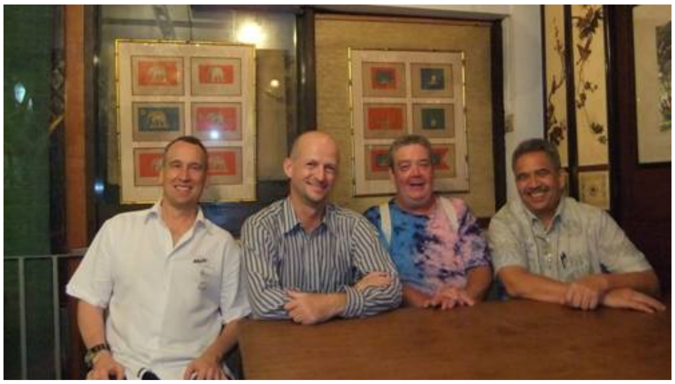
You'll find all of the Memos and Extras under the "Alerts & Coverage" tab atop the *Pro* site. If you click that tab, you'll find all of our *Pro* options guides listed on one page — including our latest, on neutral calendar spreads — along with every Trade Alert we've issued. You can access all of our trades from that list, or, if you know the ticker of the company you want information about, just enter it in the search box at the top right of any page to get all of the trade alerts, news coverage, audio features and other information we've provided on that company. Your search results will also provide any ticker's CAPShot report, which is an exclusive *Pro* measure of certain qualities of a stock or ETF.

Under our Recommendations tab, you'll find a list of every position in both *Pro* portfolios, as well as details on performance, current guidance on each position, and our levels of cash on hand. From the portfolio itself, you can click on any ticker to jump to the trade alerts.

Beyond this, don't forget that your *Pro* membership grants you ongoing free access to *Motley Fool Options*, which includes several a la carte options recommendations each month, a large options-using community, and Options U., where you can learn even more options strategies.

Commonsensical Community

Here at *Pro*, if you're not making good use of our outstanding member community, you're missing a great opportunity. There are *Pro* members all around the globe, and they bring their diverse experiences, professional proficiencies, and investing knowledge to our boards. Ask a question, and you're likely to get a helpful answer within a day, if not sooner. The community holds many more discussions than the *Pro* team can follow (though we try!), so it's living up to the Fool's dream of "investors helping investors." Friendships arise there, too, as you'll see in the following photos. You're looking at the first-ever Bangkok, Thailand, *Pro* member meeting, which was arranged entirely on our Social Banter board. Four *Pro* members who reside in the Land of Smiles met to discuss investing and much more. From left to right: Ron (asiatraveler), Andy (elbrombo), JR (HarryWho), and "Duke Street Jim." By the time the second photo was taken, it appears JR had run home to research a hot stock tip.



My (Multitalented) Scorecard

Finally, the My Scorecard tool is a great way to track your portfolio and performance. While My Scorecard doesn't handle options yet, it keeps tabs on all your stocks and ETFs, measures your performance against the market index, feeds you news on your positions from all of your premium Fool services including *Pro*, and shows you whenever someone has posted to a discussion board for any of your positions. My Scorecard is an easy way to keep up with your investments at the Fool.

Coming Up Next

This week, we expect a new trade alert or two and a new Audio Extra in which the entire *Pro* team discusses hedging and shorting. We're also soliciting your feedback through this survey, so please tell us how you think *Pro* can be improved. Finally, enjoy your Fourth of July holiday next Monday! We'll be back Tuesday, July 5, with a new Memo.

Foolishly,

Jeff Fischer (TMFFischer)

Coverage & Community

- Jeff says **Oracle** ended its fiscal 2011 with strong results, and it's on deck for a possible trade in Portfolio 2011.
- **Pebblebrook Hotel Trust** gets some *Wall Street Journal* coverage, and Fools discuss a big New York deal.
- Nick (TMFCrow) has Basel and SIFI on his mind, along with **Wells Fargo**, as bank regulation heats up.
- Alex340 shares puts that match *Pro* criteria (some are on former *Pro* stocks), as well as covered call ideas.
- Russell (TMFEldrehad) looks at short-term picks in CAPS.
- We've got interns! Elizabeth Moran (TMFElleMoran) and Reza Handley-Namavar (TMFReza) have joined the *Pro* team for the summer. Look for these great young Fools on the boards, too!

See all of Pro's holdings on our Recommendations page.

Charter and 2011 Portfolios: NextEra Energy

Published Jun 24, 2011 at 12:00AM

Trade Essentials

- **Actions:**
  - **Charter Portfolio: Write a covered strangle.** Write ("sell to open") January 2012 $50 puts (to potentially double shares already owned); write ("sell to open") January 2012 $60 covered calls (one for every 100 shares already owned).
  - **Portfolio 2011: Write puts.** Write ("sell to open") January 2012 $55 puts only.
- **Allocation:**
  - **Charter Portfolio**: Nine contracts of each option; we'll potentially double our shares owned to about 6%
  - **Portfolio 2011:** 6% (that's three put contracts)
- **Recent option prices (in between the bid/ask prices):** January 2012 $50 puts, $1.40; January 2012 $60 calls, $1.25; January 2012 $55 puts, $3.05
- **Preferred strangle limit price (Charter Portfolio):** $2.65 credit, combined (higher is better; check prices and aim for at least $2.65 or more initially, and as prices change, accept no less than $2.30)
- **Preferred $55 put writing limit price (Portfolio 2011):** $3 or higher (as prices change, accept no less than $2.50)
- **Recent share price:** $56.30
- **Buy around:** $53.50
- **Fair value:** $58
- **Alternate trades:** Buy shares directly if they drop to $53.50 or lower.

The Big Picture

First Things First

- **Company: NextEra Energy** (NYSE: NEE)
- **Market cap:** $23.7 billion
- **Website:** http://www.nexteraenergy.com/
- **Type of holding:** Income, utility
- **Original report:** [Stock Buy]() (October 2009)
- **Follow it:** [Add NEE to My Scorecard]()

When the economy gets cloudy, investors get defensive — and few things on Wall Street spell "defense" better than a stable utility business. **NextEra Energy** (NYSE: NEE) is one of North America's largest energy providers and the continent's top producer of wind and solar energy. Headquartered in Florida, NextEra operates in 28 states and Canada. More than 50% of the company's power-generation capacity comes from cheap natural gas, while wind chimes in second at nearly 20% of capacity, followed by nuclear at 13% and oil around 11%.

This company operates in two divisions. The first, Florida Power & Light Company, is a regulated utility in Ohio (fine, fine, we mean Florida) that serves 4.5 million customers, primarily with natural gas, wind, and nuclear energy. The second is the unregulated NextEra Energy Resources division, which is the country's largest producer of renewable energy. NextEra Energy Resources serves customers nationwide, primarily with wind and natural gas energy. Its top-of-the-list A- credit rating and its history of steady growth in both earnings and its dividend make NextEra one of the most respected utilities in the country, winning multiple "sustainability" awards each year.

Risks to the company include greater regulation of nuclear energy, although these plants make up a minority of the company's power base, and a failure to eventually win rate hikes in the regulated Florida market. To see our past coverage of NextEra, [click here]().

Why This Strategy?

Charter Portfolio: We already own a stake of NextEra in the Charter Portfolio, so we're looking to amp up our profits while staying defensive. This January 2012 $50/$60 strangle stands to pay us around $2.65 per share, for a 4.7% yield on the current share price and about a 3.8% payment on the equity needed to hold the strangle open. Meanwhile, we'll enjoy two more dividend payments on our existing shares that will add to our seven-month return. Should a sale come into play, our existing shares would be sold at a net $62.65, well above our estimate of fair value.

Portfolio 2011: With its 3.9% yield, NextEra is one of the most generous dividend stocks in the Charter Portfolio. But buying on dips is especially wise with a slow-moving utility stock, so we prefer to write puts for Portfolio 2011 to earn a healthy profit while waiting for a better buy price. And we're not in a hurry: We want to maximize income. Writing January 2012 $55 puts at $3.05 equates to a 5.5% yield on cash in about seven months — likely better than the return we'd get from buying the stock outright, and with less risk. And if we end up with shares, our price at acquisition will be $51.95, well below our $53.50 Buy Around price and with a greater than 4% dividend yield.

How to Follow Along

- **To write a covered strangle (Charter Portfolio):** You must own at least 100 shares of the stock and be willing to sell them at a higher price, and you should also be happy to buy at least 100 more at a lower price. Use a "strangle" order with your broker to sell to open January 2012 $50 puts and $60 calls on NextEra, aiming for a credit of around $2.65 the day we issue this trade.
- **To write puts alone (Portfolio 2011):** You need to be ready and able to buy 100 shares (totaling $5,500 in this case) for every put you write if the stock is below the $55 strike price by expiration next January. Your net buy price in this case would be about $51.95. If you are required to have cash set aside to write puts, you need to have all the cash for the potential stock purchase idle. If you write puts on equity (or your buying power), you'll only need 10% to 30% of the total potential purchase price set aside in cash, but you still should be prepared to buy the stock next year with 100% cash rather than using margin.

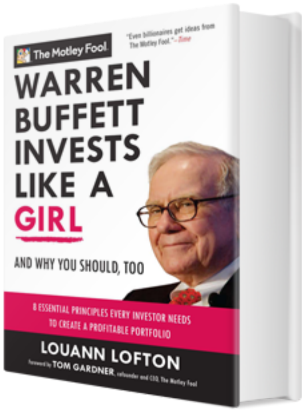
TradeStation: Cashing In on a Thesis

Published Jun 20, 2011 at 12:00AM



Reserve Your Copy Now and Save 35%

Ready to embrace your feminine side a little? Or are you just a diehard Buffett groupie looking to learn something and have fun? There's only one way to guarantee you won't be left out tomorrow, June 21 … when The Motley Fool's brand-new book, *Warren Buffett Invests Like a Girl*, hits shelves. Click here to preorder your copy. Your copy will be guaranteed and you'll save 35% off the list price!

By any measure, **TradeStation Group** was a successful investment for *Motley Fool Pro*. In the Charter Portfolio, we purchased shares of the small brokerage on Oct. 1, 2010 for $6.65 each. In Portfolio 2011, we bought shares on March 10 for $6.79 each. On April 20, the company announced it was being acquired by Monex Group, a Japanese broker, at $9.75 per share — a 32% premium to the market price and about a 45% profit for both *Pro* portfolios.

As Done a Deal as Could Be Done

When we heard the news of the acquisition, we shared our happiness with members on our TradeStation discussion board and cited the deal in some Monday Memos. The cash offer was completed two weeks ago, and TradeStation owners who tendered their shares through their brokers had them sold away at $9.75 each. If you did *not* tender your stock, you will still receive cash of $9.75 per share from your broker, but it may take several more days. Your broker should have been in touch with you about this, but judging by posts on the discussion boards, many *Pro* members didn't notice any communication from their brokers about whether to tender shares, and some of those who did receive this information didn't know whether to accept the offer or not.

If other stocks we own receive tender offers in the future (and we might see many over the years), we'll communicate our intentions as clearly as we can — you shouldn't have any doubt on where we stand.

Prescient Prognosticators

When we initially shared the news of the TradeStation acquisition, we reminded members of two key theses that originally made us buy the stock: that interest rates would eventually head higher, catapulting the company's earnings, and that TradeStation was an attractive takeover candidate (likely at a strong premium) as the brokerage industry continued to consolidate.

Pro Trade Roundup

Charter Portfolio:

- **Wells Fargo** ratio put spread: Sold to open 24 October $23 puts; bought to open 12 October $25 puts. Net credit: $0.22 per share.

Portfolio 2011:

- **Ebix** : Bought 400 shares (about 3%) at $20.65.
- **Wells Fargo** ratio put spread: Sold to open 4 October $23 puts; bought to open 2 October $25 puts. Net credit: $0.25 per share.

Earnings & Events

- **June 23: Oracle** is scheduled to report earnings. (We own Oracle in the Charter Portfolio.)
- Jeff published a new strategy guide: Neutral Calendar Spreads.

We'd started with a partial position in the company and had planned to add to it this spring or summer, based on how soon we expected interest rates to change. Then the buyout arrived, albeit earlier than anticipated. Our second thesis was fulfilled, and the acquisition price was smack-dab at *Pro*'s fair-value estimate (flashback reminder: the "fair" in "fair value" applies to a seller *or* a buyer).

Collect Your $9.75; We'll Seek More

As TradeStation shareholders collect their buyout payments, we're busy seeking the next acquisition target. We believe more consolidation is likely in the brokerage industry. In March, **Schwab** agreed to pay a premium to buy **OptionsXpress**. Majority owner Thomas Peterffy may eventually want to sell his baby, **Interactive Brokers**, and the company would almost surely fetch a healthy premium. **MF Global Holdings** is struggling, perhaps making it a candidate for acquisition as well.

Beyond brokerage houses, the major market exchanges are sure to continue to consolidate — the competitive benefits of doing so are undeniable. With this in mind, I've been evaluating **CBOE Holdings**, aka the Chicago Board Options Exchange; **Intercontinental Exchange** and **CME Group**, the leading futures exchanges; and **Nasdaq OMX**, which will need to merge with another company if it wants to better compete with **NYSE Euronext**.

Time will tell if we want to invest in any of these in hopes of owning another company before it's scooped up at a premium by an acquirer.

Options 803: Neutral Calendar Spreads

Published Jun 17, 2011 at 12:00AM

Why use neutral spreads?

- To earn a profit on a range-bound or flat stock or index.
- To earn a high percentage return on your capital at risk.
- To limit your risk, even if the stock or index moves sharply.

Pro's Options 801 guide introduced spreads, and Options 802 detailed the popular bearish spreads (you can see all of *Pro's* guides to options strategies under our Coverage tab). Now we'll begin to examine neutral spreads, starting in this guide with the neutral calendar spread (also called a time spread). If you believe the market or a stock is going to stay within a specific range, a neutral spread can generate profits with limited risk.

The Neutral Calendar Spread

If *Back to the Future* had been about options, Michael J. Fox and Christopher Lloyd would have put their heads together over calendar spreads. Calendar spreads are also called "time spreads," because in essence, you're selling time. You write an option that expires in the near future, and you also *buy* the same strike-price option with a much later expiration date. The "spread" you're looking to capitalize on is a growing difference in time value. The near-term option you write should lose its time value quickly, while the option you purchase (which protects your written option) will retain most of its time value. You usually close the spread as the earlier option nears expiration, thereby profiting from its larger erosion of time value compared with your later option. You are not predicting the movement of the underlying investment, which can travel within a certain price range and still allow you to profit. You're just looking to capture time value with limited risk.

Calendar Spread Details

Actions: Write ("sell to open") an at-the-money or near-the-money option typically expiring in a few months. Buy ("buy to open") an option at the same strike price with an expiration date typically two to three months later than that of the written option.
Trade type: Net debit. You pay to set up the trade.
Desired outcome: The option you write expires worthless or with little value; you close it and the later- dated option (which retains more of its value) simultaneously, keeping the difference in time value erosion as your profit.
Maximum loss: The debit you pay to set up the trade. If the underlying investment moves too sharply in either direction, the time value difference between your two options will diminish (as both options turn into intrinsic value, starting to mirror the stock price), leading to losses that can't exceed your initial debit.

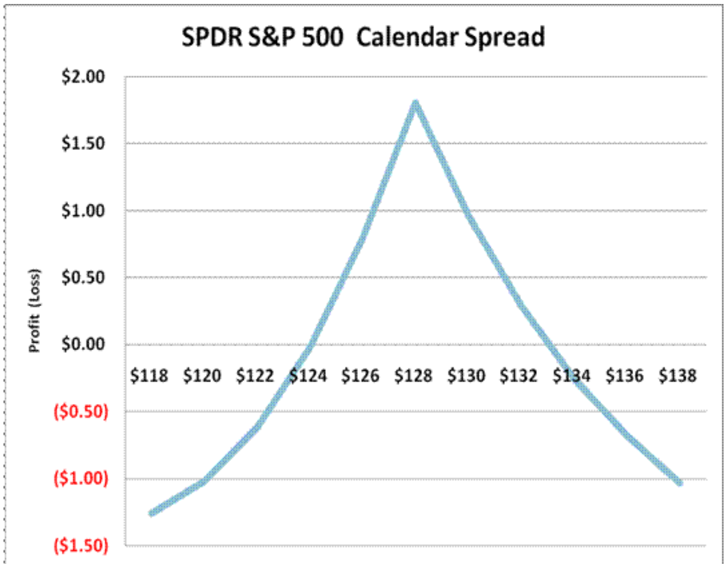
As the "time spreader" setting up this trade, you should be mindful that volatility could alter the dynamics of the position. If the share price becomes more volatile as your near-term option reaches expiration, your longer-term option could increase in price, increasing your profit as you sell it. If volatility declines, however, your long-term option may lose more time value than you anticipated, lowering your profit potential. Either way, because you use this strategy on an underlying investment you expect to remain relatively flat, you should be anticipating relatively flat volatility, too.

Example Trade

Using the **SPDR S&P 500** ETF, let's set up a calendar spread example. The S&P 500 ETF trades at $128, and you believe it will stay near that price for the next few months. You write (or sell) $128 calls that expire in two months, for which you're paid $3.34 per contract. You also buy $128 calls that expire in four months, which cost you $4.88 each. Your net debit for the spread is thus $1.54 per option ($154). Here's how your trade could work out, with the index at various prices, as expiration nears on your two-month written calls:

Index price at expiration of written two-month $128 calls	Value of two-month written calls at expiration (originally written for $3.34)	Written calls profit/(loss)	Value of purchased four-month $128 calls (originally bought for $4.88) with two months remaining	Long calls profit/(loss)	Spread profit/(loss)
$118	$0	$3.34	$0.28	($4.60)	($1.26)
$120	$0	$3.34	$0.52	($4.36)	($1.02)
$122	$0	$3.34	$0.92	($3.96)	($0.62)
$124	$0	$3.34	$1.52	($3.36)	($0.02)
$126	$0	$3.34	$2.33	($2.55)	$0.79
$127	$0	$3.34	$2.82	($2.06)	$1.28
$128	$0	$3.34	$3.34	($1.54)	$1.80
$129	$1	$2.24	$3.98	($0.90)	$1.34
$130	$2	$1.34	$4.50	($0.38)	$0.96
$132	$4	($0.66)	$5.83	$0.95	$0.29
$134	$6	($2.66)	$7.29	$2.41	($0.25)
$136	$8	($4.66)	$8.86	$3.98	($0.68)
$138	$10	($6.66)	$10.51	$5.63	($1.03)

As the table shows, this calendar spread would be profitable after two months as long as the ETF is within about 6% band around its starting price (between $125 and $133). If the index remains flat, this time spread could pay about $1.80 per option, for a 117% return on the $1.54 in capital at risk. If the index moves approximately 2% to 4% (down or up), the trade could still offer a strong return on your risk.



You can see in our table the trade is slightly more profitable as the ETF moves *above* the $128 strike price rather than when the ETF is slightly below it. This is because our example uses call options, and your purchased call will have more value if the index is higher. You would consider using put options to set up a calendar spread if you were more bearish than bullish (but still expected a generally flat market), because a put calendar spread will perform a bit better than a call calendar spread when prices decline. A careful investor will look at current call and put prices and weigh market sentiment to decide whether to use calls or puts. In most environments, though, calls hold value longer, so call calendar spreads are preferable (because you want the option you buy to retain as much value as possible).

Follow-Up Trades

As your written calls near expiration, you should "buy to close" them if they trade near parity — that is, if they are in-the-money, have almost no time value remaining, and move up and down in unison with the underlying stock. Close them to avoid having them exercised. If you still believe in the trade, you might then write new calls that expire in only a month. Otherwise, you should "sell to close" the longer-term calls you purchased earlier. If the underlying investment hasn't wandered much, you'll be left with a profit. Either way, you should be prepared to close the entire spread by the expiration of the first option if you don't want to extend the strategy.

If something drastic happens before then — say, the underlying investment drops 7% — you might close your purchased calls early to capture as much value as you still can, thus shrinking your loss, while letting your written calls expire (assuming you can hold them on margin). However, if you do nothing, your loss is still capped at the initial debit you paid to set up the trade ($1.54 in our example). Conversely, if you use puts to set up a calendar spread and the underlying investment moves sharply higher, you could close the puts you had purchased to recoup some value. When a neutral calendar spread ends around breakeven or offers a small profit or loss, and your opinion hasn't changed, it's usually easy to continue the strategy with new trades.

Pro's Bottom Line on Calendar Spreads

When neutral calendar spreads are profitable, the return on your investment can be large. However, the underlying investment needs to stay in a fairly tight range for this type of spread to earn a profit, and if it's more volatile than expected, you need to be ready to forfeit your whole investment. Thus, when you think an investment is going nowhere and you want returns from it anyway, consider a neutral calendar spread with money you can afford to lose. You won't lose more than that initial cost, and you may earn a strong return thanks merely to time — even while the underlying investment earns nothing at all.

- **Next in this *Pro* series:** More neutral spreads, including condors and butterflies.

Portfolio 2011: Write Puts on Bristow Group

Published Jun 15, 2011 at 12:00AM

Note: *Pro* first recommended buying **Bristow Group** in our Charter Portfolio in July 2010. For *Pro*'s original thesis, read our buy report on Bristow.

Trade Essentials

- **Action:** Write ("sell to open") September 2011 $40 puts
- **Allocation:** About 3% (for Portfolio 2011, that's two contracts)
- **Stock price:** $44.25
- **Buy around:** $39
- **Option price (bid/ask):** $1.00/$1.75
- **Preferred price:** Use a limit order around the middle of the bid/ask (lately, around $1.40), but don't go lower than $1.20 (for a 3% cash yield in three months)
- **Stock fair value:** $50
- **Alternative trades:**
  - Buy a 3% position in the stock if it declines to near our $39 buy-around price
- **Why write puts?**
  - The long-term demand for helicopter flights to service deepwater offshore oil production is strong.
  - Bristow benefits from predictable and recurring revenue streams that help it ensure it has the newest and jazziest fleet of helicopters.
  - We like the financial improvement we've seen so far, but being defensively minded, we're writing puts to potentially secure an even better purchase price.

What's New?

When the Deepwater Horizon rig caught fire and oil began spewing into the Gulf of Mexico in April 2010, every stock associated with oil saw its "blowout preventer" fail, too, and shares across the industry plummeted as a result. Your *Pro* team used this market overreaction to pick up shares of helicopter services company **Bristow Group** for 0.84 times tangible book value — a pretty good discount to the historical multiple.

We were comfortable overlooking market sentiment because business in the Gulf doesn't drive our thesis on Bristow. Only 6% of its operating profits come from the Gulf of Mexico, and the company earns 65% of its revenue from "reservation fees" (i.e., without even flying). Bristow has a dominant position ferrying crew and cargo to deepwater production platforms in every major production region from Norway to Nigeria. As well, the company's recent investment in the leading chopper service company in Brazil — Lidér — provides it with exposure to another booming deepwater market. Judging by Lidér's fourth quarter performance Bristow's investment is already paying off.

Why This Strategy?

Bristow continues to improve its balance sheet and financial returns. We'd love to begin building a position in this company for Portfolio 2011 near our $39 buy-around price, and writing puts may allow us to do so.

How to Follow Along

The trade command is "sell to open" or "sell." (*Do not buy these options!*) Sell one contract for every 100 shares of Bristow you're willing to purchase later. (Each contract represents an obligation to buy 100 shares, or $4,000 worth of Bristow stock.) Writing these options will "pay" you the option premium up front, and we'll wait until expiration nears (on Sept. 16) to determine our next move.

Our initial potential profit is whatever the puts pay us (we're hoping for $1.40, or $140 per contract); we have an obligation to purchase shares of the stock if they fall below the $40 strike price by expiration. If we get shares at that price, our net buy price will be $38.60 ($40 minus the $1.40 the puts pay us). Since we fully intend to buy the shares if we're assigned them in September, make sure you have $4,000 available, per contract, to purchase shares.

You can buy shares outright if shares dip to within a dollar or two of our $39 Buy Around, but we're happy to write puts and earn income while we wait for the stock to near that level. If converted into shares, these puts would allow us to buy shares about 13% cheaper than the recent price and for just 0.95 times tangible book value. If the shares remain above $40 at expiration, we won't get to buy them, but we'll earn a decent return on this first put trade (3% on our cash in just over three months).

Next Steps

- Questions or comments? Still getting used to all this options jargon? Visit our Bristow discussion board.
- Stoked to learn more about writing put options? Head over to the All About Options discussion board.

Portfolio 2011 will write puts on Bristow in the next one to 30 days, per The Motley Fool's trading guidelines.

What's Up With the Market?

Published Jun 13, 2011 at 12:00AM

So, Fool … what's up with the market? The obvious answer is "not much." As you've doubtless noticed, stocks have declined over each of the past six weeks; the Dow Jones Industrial Average booked its longest losing streak since 2002, and the Nasdaq Composite and Russell 2000 have both dipped into negative territory for the year. That said, as of Friday's close, the mighty S&P 500 is still up 1% for 2011, and *Pro*'s Charter Portfolio is up 4.2%.

Pro Trade Roundup

Charter and Portfolio 2011

- **TradeStation** : All of our shares were tendered as the company was acquired. Like all shareholders, we received $9.75 per share in cash.

Granted, that single-digit number might seem like small comfort after watching Charter Portfolio stocks **Bristow Group** and **GrafTech International** decline 16% and 20%, respectively, from their recent peaks, along with other decliners in our midst. But let's keep our perspective: Most of our Charter stocks remain much more valuable than they were mere months ago, and the S&P 500 ended Friday only 7% below its May 2 high. By this measure, the market's drop has not even qualified as a "correction" yet —the S&P would have to be down 10% to 15% for that description to apply.

What would happen if we *did* see a so-called correction? Like any other change in the market, it would bring us some new opportunities; perhaps we'd sell some positions that had held up well in order to buy new stocks at greater discounts. It would mean a profit for our short positions, which we could then close to reinvest the proceeds in discounted stocks. Is such a correction likely? By some measures, sure — the average stock market decline since 1946 has lasted four months and sent the S&P 500 14% lower, and by that measure, we're already halfway there.

Declines of this sort are common, happening an average of once every two to three years. That's one good reason not to sweat such things too much. You don't want to lose your hair, go gray (or grayer!), eat badly, be cranky around the house, or just plain stress out over something that happens regularly every few years. Plus, if you're investing for tomorrow, what's the point of excessive worry today?

Short Exposure

Even so, we have strategies to help us comfortably earn profits in weak markets, too. In the Charter Portfolio, our short and defensive exposure shapes up like so:

Position	Portfolio Allocation (as of Friday, June 10)	Details
ProShares Short S&P 500	5%	$74,000 position
Ratio Put Spread on **iShares Russell 2000 Index**	8.4%	15 August puts at $81 strike = 1,500 shares @ $81 = $121,500 look-through value
Synthetic Short on **iShares S&P 600 SmallCap**	7.8%	16 August puts at $71 strike = 1,600 shares @ $71 = $113,600 look-through value
Total Short Allocation	**21.2%**	

Cash	7.1%	$103,005 in cash on $1.44 million total value
Sprott Physical Gold Trust	3.3%	$47,260 position (we view gold as a cash equivalent, though it's more volatile than currency)
Total Shorts and Cash/Hard Assets	**31.6%**	

With nearly 32% of its current "look-through" assets defensively positioned (not including the puts we've *written*, which lower our defensiveness), the Charter Portfolio is reasonably ready for a larger decline, although we could certainly add to our short positions if our concern grows. We may also benefit from raising more cash to invest later, presumably at lower prices, since the put options we own don't represent much buying power down the road.

Here's how that works: In the Charter Portfolio (as well as in Portfolio 2011), we bought August 2011 put options on two market indexes to profit on a potential decline. Those puts carry "time value" that will diminish as expiration nears, making them less effective as a hedge by about $1 per share by expiration — about one-third of the current total put value. And the absolute value of the puts is modest. Selling our defensive puts in the Charter Portfolio would only raise $12,800 in new cash (although selling the ProShares Short S&P 500 ETF, which we own outright, would raise a considerable $74,000). So the puts we own are not a large source of future cash; the role of these shorts is to help hedge us against sharper market declines, at which point their value would grow more rapidly.

Portfolio 2011

By comparison, Portfolio 2011 is still 59% in cash as we're working to thoughtfully build its positions (although we do have several written put options that restrict a portion of this cash). It also carries about 18% in look-through short exposure, some from purchased puts and some directly in the form of the ProShares Short S&P 500 ETF. Portfolio 2011 can easily afford to buy stocks when they decline. And keep in mind: Our short positions achieved through options didn't cost us anything; in fact, we set them up for a small credit. So Portfolio 2011 may be quite defensive, but we didn't pay up for it.

Made in China

Rule Breakers analyst Sean Sun and the Fool's international investing experts are headed to China to research companies in the world's fastest-growing economy. You can follow along with the team's photos, videos, tweets, and commentary, and sign up to receive email dispatches from the road.

Why a Drop May Be Modest

Now let's dabble in the dangerous game of market predictions. There are several reasons why a potential market decline may be more "reasonable" than "rout" this time. The S&P 500 trades at a reasonable 12.8 times forward earnings estimates, and earnings are what ultimately drive market prices. As long as U.S. companies can maintain their earnings trajectory, the market may ultimately not care much about unemployment, Europe's problems, the Middle East, or much of anything else. After all, stocks rise through horrible wars, natural disasters, and persistent unemployment and wage stagnation — the market is not known for its compassionate nature.

That said, companies have already cut costs to the bone, surprise macro-economic shocks are always possible, economic growth may slow, and governments worldwide need to reel in debt and spending. Given all this, hedging (especially in low-cost ways) remains attractive, and *Pro* is here to help you do it.

Foolishly,

Jeff Fischer (TMFFischer)

Charter and 2011 Portfolios: Set up a Ratio Put Spread on Wells Fargo

Published Jun 10, 2011 at 12:00AM

Note: *Pro* first recommended buying **Wells Fargo** (NYSE: WFC) in our Charter Portfolio in December 2010. For *Pro*'s original take, read our initial buy report.

Trade Essentials

- **Action:**
- Buy ("buy to open") one October 2011 $25 put for every block of 100 shares you already own. Then write ("sell to open") *two* October 2011 $23 puts for every put you just bought.
- **Allocation:** 5% if we end up buying the shares at these prices (for the Charter Portfolio, that's 12 bought puts and 24 written puts; for Portfolio 2011, it's two bought and four written).
- **Recent stock price:** $25.75
- **Options prices (bid/ask):** $1.74/$1.76 for the $25 puts; $1.06/$1.08 for the $23 puts
- **Preferred price:** Aim for a $0.35 or higher net credit initially; as prices change, accept no less than break-even.
- **Alternative trades:**
  - Wells Fargo is rated a Buy, so if you don't yet own shares, consider buying a partial position today and setting up this ratio put spread on those shares.
- **Why set up a ratio put spread**?
  - We collect a small premium and sacrifice zero upside to establish this hedge.
  - It partially protects us against short-term threats to the stock price, such as increased regulation.

- If the stock price is down 10.7% when these options expire, we can add to our position with a net cost on new shares of $20.64 — a 20% discount from today's price.

What's New?

Wells Fargo's stock price has fallen 15% since the Charter Portfolio first bought shares at $30.39. When a stock we own gets cheaper, we consider adding to our position — but not before we consider the changing landscape. In this case, the share price dropped even though critical elements of our thesis unfolded as expected. The Fed loosened the reins on the stagecoach last quarter, allowing Wells Fargo to raise its quarterly dividend to $0.12 per share (up from just $0.05) and to repurchase 200 million shares (worth about $6.4 billion). This exceeded the expectations we outlined in our original report but fell short of the catalyst we'd hoped for.

Even this increased dividend is lower than my (Nick, here) estimate of what Wells Fargo could safely pay shareholders. And these few bits of good news did little to outweigh the other challenges Wells Fargo has faced in the past seven months — the CFO leaving with little explanation, Moody's placing the company's debt "on review for possible downgrade," and the increased uncertainty created by Fed Governor Daniel Tarullo when he spoke of raising bank capital requirements "20% to more than 100% over the Basel III requirements." All of this plus a poor lending environment made us revisit our choices given the current share price.

Why This Strategy?

A ratio put spread combines a bear put spread with a written put. There are two possible outcomes in this case:

- If the stock's price dips moderately between now and October, but ends that period above $23, we will partially hedge the decline in our existing shares.
- If the stock is below $23 by expiration and we don't close it, we will buy additional shares at a discount to today's price.

The ratio put spread itself is most profitable if the stock is at $23 when the options expire. If it's below $23, it will offer us a net purchase price on new shares of $20.64, 20% below the recent share price. And if the share price climbs from here, we keep the $0.26 credit per share (a 1.4% yield), meaning we profit either way.

How to Follow Along

Buy one October 2011 $25 put for every block of 100 shares you already own. Then write two October 2011 $23 puts for every put you just bought. Of those, one will be an uncovered written put, meaning it represents the potential obligation to buy 100 more shares — so be aware that for each uncovered put you write, you need to be willing and able to invest $2,300 if Wells Fargo's share price is below $23 at expiration. Finally, try to set this up in one trade if your broker supports it. To review:

- **Buy ("buy to open")** October 2011 $25 puts, one for every 100 shares you own
- **Sell ("sell to open")** October 2011 $23 puts, two for every put you buy
- **Recent prices:** The $25 puts cost $1.76; the $23 puts pay $1.06 each
- **Limit price:** Aim for a $0.35 or higher net credit if feasible; don't pay a debit.

The Foolish Bottom Line

By setting up this ratio put spread, we're getting paid a bit for the privilege of protecting our position in Wells Fargo from a moderate drop in share price, and we're giving ourselves the opportunity to buy shares 20% cheaper. If we purchase more shares as a result of this strategy, we'll have a full 4% to 5% position in Wells Fargo — and good reason to look forward to the resurrection of the banking industry.

Portfolio 2011: Buy Ebix

Published Jun 7, 2011 at 12:00AM

Trade Essentials

- **Action:** Buy 3%
- **Buy around:** $18
- **Fair value:** $24
- **Preferred price: Use a limit order** to buy shares near market prices, ideally around $18.
- **Alternate trades:** "Sell to open" July $17 or $18 puts (sell one put for every 100 shares you'd buy), or do the same with later-dated puts near these strike prices. (New to options? See our guide to selling puts.)
- **Why buy?**
    - Providing a comprehensive software platform to insurance providers, Ebix boasts strong customer retention and cross selling opportunities

- Steady recurring revenue has led to record annual free cash flow, from $5 million in 2005 to $53 million today
- The shares can be volatile, but they appear inexpensive at the moment, trading at only 12 times earnings

The Big Picture

Ebix is one of the most volatile positions in our Charter Portfolio, which is surprising given how steady the business has been. The company provides software that's helping to bring the enormous insurance industry into the digital age. A *Pro* member who goes by 4wheelfool on our discussion boards describes it well.

First Things First

- Company: Ebix, Inc.
- Market cap: $724 million
- Website: http://www.ebix.com
- Type of holding: Small-cap, software
- Follow it: Add Ebix to My Scorecard

"What Ebix does is tie all the insurance pieces together with [its] back-end software," 4wheelfool writes. Insurance companies produce mounds of data, and all of it needs to be tracked and transferred between departments. As 4wheelfool puts it, "You need to track payments on policies, claims, sick days, name changes, beneficiary changes. You need to track workers comp, managed home care, employee benefits, annuity transfers and balances in variable life insurance. You need to comply with governmental policies, and therefore need to track whatever statistics you need to show you are in compliance for an audit. Any delay or mix-up in transferring or recalling data usually leads to egg on your face at best, a lost customer at worst."

Ebix has six areas of focus: property and casualty, life and annuity, risk management, business process outsourcing, software development services, and health and employee benefits. Currently, there are various companies that deal with each of these areas, and Ebix is consolidating these smaller businesses as quickly as it can, to smooth the flow of information across these segments with an all-in-one solution.

To consolidate multiple insurance needs into one software package — and grow its customer base in the process — Ebix has been making several small acquisitions each year, buying into new areas of business and incorporating them into its multinational software. In this way, management is able to both create cross-selling opportunities and increase the value of its insurance "network" as more customers join it. The company's main commerce-driven product, EbixExchange, brings in recurring revenue.

Valuation

Ebix does business with many major insurance companies, but the company itself remains small, with only $140 million in trailing-12-month sales. Management suggests the total possible market size is much larger. The leadership team isn't content to focus on North America; it sees large opportunities overseas, including in Australia and South America, both areas where Ebix has made acquisitions. At its current price near $18 per share, the company trades at 14 times free cash flow and 12 times estimated earnings for 2011.

Management recently tripled the size of its share buyback program to $45 million and suggests that more will follow. And last Friday, the company's CEO, Robin Raina (already a 10% stakeholder with nearly 4 million shares), bought $500,000 worth of new stock on the open market at $17.29 per share.

Risks and When We'd Sell

Even with several years of profitable growth behind it, Ebix still has the feel of a scrappy young company. The strong-willed CEO dominates each conference call, and his less-than-conventional approach has drawn short-sellers to the stock. Additionally, the company's acquisitions lend themselves to complex accounting, and most of its research and development staff is based in India (the CEO's home country), both of which have caused critics to call into question the company's tax practices in the United States. These factors have led many investors to bet on the stock to fall, which has made the shares extremely volatile. Here at *Pro*, we believe in the integrity of the company and remain focused on the business results. We will sell if we ever come to doubt management's word in any instance, or if the business appears to be experiencing lasting weakness.

The *Pro* Bottom Line

Consistently on *Forbes*' list of fastest-growing companies, Ebix is a young success story. Its shares offer value and growth, and the company should mature into something built to last. Right now, skeptics have created a buying opportunity, sending shares 38% lower since March. If Ebix can prove those skeptics wrong, we will be quite happy to own shares for a long time to come. Following the CEO's lead, we're using the price opportunity to buy a stake for Portfolio 2011. Buy ahead of us if you're comfortable with a volatile small-cap company.

Next Steps

- Questions or comments? Visit our Ebix board.
- Once you've bought Ebix, add it to My Scorecard.

Pro Portfolio 2011 will buy a 3% stake in Ebix in the next one to 30 days, per The Motley Fool's trading guidelines. Jeff owns shares of Ebix. You can see all of Motley Fool Pro*'s holdings on our Recommendations page.*

Pro's Biggest Lessons Learned

Published Jun 6, 2011 at 12:00AM

Profitable investments bring excellent investing lessons … but we're saving that merry topic for another Memo. Today, I'd like to discuss some of the also-valuable lessons *losers* can provide. In the stock market, having losers is inevitable, and while revisiting them to learn from them won't necessarily make us feel like dancing, it will help us avoid making the same mistake twice. You'll laugh, you'll cry, you'll be glad you're sitting down — join us as we take a look at our largest value-destroyers and find some intelligence-increasers.

Pro Trade Roundup

Charter Portfolio

- **Plum Creek Timber**: Wrote a covered strangle, selling to open November 2011 $35 puts and November 2011 $43 calls, for a combined credit of $1.73 per contract.
- **iShares S&P SmallCap 600 Index** ETF: Set up a synthetic short, selling to open August 2011 $75 calls and buying to open August 2011 $71 puts, for a combined credit of $0.25 per contract.
- **Rockwood Holdings**: Wrote August 2011 $50 puts, receiving $2.80 in credit.

Portfolio 2011

- **Plum Creek Timber**: Sold to open November 2011 $35 puts for $0.94 per contract in credit.
- **iShares S&P SmallCap 600 Index** ETF: Set up a synthetic short, selling to open August 2011 $75 calls and buying to open $71 puts, for a combined credit of $0.15 per contract.
- **Rockwood Holdings**: Wrote August 2011 $50 puts, receiving $2.90 in credit.

U.S. Natural Gas Fund

In October 2009, the price of natural gas dipped to $3.80 per million BTUs after trading at nearly $14 a year earlier. I'll take full "credit" for the way this one played out: I believed that natural gas prices would rebound in the next 18 months, so we set up a synthetic long (writing 2012 puts and buying 2012 calls) on the **U.S. Natural Gas Fund**, the country's largest natural-gas ETF. As of Friday, natural gas trades at $4.70, up 23% from late 2009, but the U.S. Natural Gas Fund is down an indigestion-causing 50% over the same period. The big lesson here: Seeing your thesis play out is meaningless if you chose a poor investment to express that thesis.

The culprit in this case was contango. A fund that buys futures contracts to track the price of something often pays a premium for new contracts each month (or each day) and sells its older contracts for less. This continual price drag is called contango, and it eats away at the value of the fund — in some cases even as the underlying commodity or vehicle goes up in price. The impact of contango was stronger than I expected with the U.S. Natural Gas Fund, and within four months of setting up our investment, we were writing diagonal calls to offset our losses. In retrospect, we should have just closed the position entirely at that point.

We hung on another eight months, but finally, less than a year after setting up our synthetic long, we exited for a $15,657 loss, losing 1.56% of the Charter Portfolio's starting value. Ouch. But it wasn't for naught: The experience drove home the dangerous reality of contango, and now we seek to *short* investments suffering from it. My favorite has been the **iPath S&P 500 VIX Short Term Futures** exchange-traded note. In June 2010, we suggested shorting this contango-hampered vehicle with a target allocation of up to 10% of the Charter Portfolio's value — I was that confident we'd be successful.

The ETN is down a whopping 78% since then, a drop that could have added 5% to 8% to our total portfolio returns (a multitude greater than the loss we suffered from U.S. Natural Gas). Unfortunately (as veteran members know), *Pro* was unable to short shares after issuing the trade alert. We resorted to writing naked calls, and we've earned a healthy (but relatively small) $14,100 so far. That gain does largely cover our U.S. Natural Gas Fund loss, and I expect with time this will turn into a large overall profit — and a Foolish example of learning from a mistake.

- See our UNG trade history and VXX trade history

MELA Sciences

With **MELA Sciences**, we saw a speculative opportunity that had the potential for strong profits — but in chasing it, we bought a company that didn't match up with our lower-risk, absolute profit philosophy, and we did so when both excitement and the share price were riding high.

MELA Sciences' lone product was a skin-cancer detection machine called MELAFind, and FDA approval seemed probable after Phase III trial results. We purchased call options in anticipation. After several review delays, an independent FDA advisory panel *did* actually (narrowly) suggest market approval for MELAFind. This would have been a success for us — but the FDA itself criticized the trial so strongly that nobody expects the agency to follow the panel's advice when it finally does make its final ruling. MELA Sciences' stock languishes around $3, our calls expired worthless, and we walked away from making speculations like it again (while reaffirming to members our mission of steady profits with lower risk).

Despite losing $7,900 on MELA Sciences (0.79% of the Charter Portfolio's starting value), we've made money on the health-care sector overall. And our experiences with MELA Sciences taught us that, as our mission dictates, we want to stick to profitable leaders rather than rolling the dice on revenue-lacking upstarts.

- See our MELA trade history

Covered Calls

The U.S. Natural Gas Fund and MELA Sciences are our two big losers since *Pro* launched in 2008. We've had a few smaller losers, too — including bearish spreads on **Caterpillar** and **Abercrombie & Fitch** — but they were minuscule by design, not risking more than 0.3% of the portfolio. So our other large financial mistakes took place on the "sell side" — capping our upside too early on winning positions, notably **Autodesk** and **Kinetic Concepts**.

Writing covered calls on Autodesk was mainly a defensive decision, because the stock looked aggressively valued. If we hadn't done it, we may not have held the stock much longer anyway, as it continued to increase in price. Kinetic Concepts was arguably the bigger gaffe: Fearing a weak quarter, we set up a protective collar (writing covered calls to buy puts). Earnings were healthy, and the stock didn't fall, so we should have closed the covered calls all but immediately. Waiting in an effort to save a few bucks ultimately made us forfeit $19,700 in upside as the stock gained ground. In the future, if we find ourselves there again, we'll close the calls and not mind the few thousand dollars in cost.

Other companies on which we wrote covered calls that led to shares being sold away from us, only to rocket higher afterward, include **Lindsay** and **Waters**. And while all of these positions did earn us a profit, they still serve as a great reminder: Think twice before using covered calls on smaller companies (those with market caps of less than $5 billion), because these stocks can surprise you with quick upside. As we've always said (and as these stories prove), covered calls are usually best as an income strategy on sleepy stocks that you won't likely regret selling — usually the giants of Wall Street.

In Summary

We won't berate ourselves for being defensive — that's how we invest, seeking to earn healthy returns with reasonable risk. But buying U.S. Natural Gas Fund despite its contango and going "off charter" to speculate on MELA Sciences easily count as mistakes, as does not closing our covered calls on Kinetic Concepts. The good news: We've learned from each instance, and they've made us better investors. We'll always have some losers (no investor is perfect), but our goal is to make money overall, minimize the losses, and avoid repeating mistakes. This meshes well with *Pro*'s mission to earn you consistent, recurring profits using stocks, ETFs, options, and shorts with a high level of accuracy. We might add to our mission one more goal: to keep improving along the way.

Want to share your own biggest mistakes? Join us on the Memo Musings board.

Coverage & Community

- TMFDatabasebob posts his in-depth quarterly analysis of **Ebix**.
- Jeff reviews *Pro*'s goals for 2011 — how are we doing?
- macroBill asks what it means to write puts on buying power rather than all cash.
- alex340 lists put options that meet *Pro* criteria (some are on stocks no longer in *Pro*).
- goateyes asks about stop-loss orders, and stamleo points the way.

Charter and 2011 Portfolios: Write Puts on Rockwood Holdings

Published Jun 2, 2011 at 12:00AM

Trade Essentials

- **Action:** Write ("sell to open") August 2011 $50 puts
- **Allocation:** About 2%, for a total of nearly 5% (for the Charter Portfolio, that's six contracts; for Portfolio 2011, it's one)
- **Option price (splitting the bid/ask prices):** $2.40 (after reviewing prices, try a limit order around $2.40 if feasible; as prices change, accept no less than $1.50)
- **Stock price:** $51.40
- **Buy around:** $49
- **Alternative trades:**
  - Write July 2011 $50 puts, recently $1.50
  - Consider buying shares directly if you don't own any yet, starting with up to a 3% allocation. Rockwood is a Buy.
- **Why write puts?**
  - Rockwood's business is likely to improve throughout the year
  - We want to own more than our current 2.8% allocation, but we'd like a lower buy price
  - Ideally, we can keep writing puts for income until all our dreams come true — that is, until we can buy Rockwood at a lower price or retire on a monkey-filled island

What's New?

Pro last wrote puts on **Rockwood Holdings** (NYSE: ROC) in March, and they expired as income in May; in April, meanwhile, the company reported record earnings. The only significant news since then was the sale of 8 million shares of common stock by Rockwood's primary shareholder, Kohlberg Kravis Roberts & Co — the firm that turned Rockwood around over the past several years and earned a large profit in the process. KKR still owns more than 7 million shares of Rockwood after selling the aforementioned 8 million to **Goldman Sachs** (NYSE: GS) at an agreed $53.77 per share. We don't read much into the sale — KKR is probably lightening up on Rockwood to invest in other turnaround opportunities.

As we explained in our original buy recommendation, Rockwood (with KKR's help) spent much of the past decade reorganizing to focus on its most profitable businesses, including its lithium division, which is expected to grow sales 30% this year. Across business lines, Rockwood is seeing increasing pricing power, and management has expressed confidence for the year ahead.

Why This Strategy?

Although Rockwood remains a Buy and all *Pro* members should ideally own at least a partial position, its shares can be volatile. Writing puts is simply more defensive than chasing share prices that have been rising for several months. If the price does keep rising, we'll benefit in two ways — appreciation of the shares we own and more income from the puts. If shares dip below $50 by our expiration, we'll get to fill out our allocation at a more attractive price.

How to Follow Along

Do not buy these puts. We're *selling* (writing) them and being paid in the process. For every put you write, you're obligated to buy 100 shares of stock if the stock price is below the strike price by expiration. Here's the math behind the trade:

- **Trade:** "Sell to open" August 2011 $50 puts
- **Option price:** $2.40 (use a limit order; higher is better, but as prices change, accept no less than $1.50)
- **Potential net stock buy price:** $47.60
- **The stock is:** 2.7% above our strike price and 7.3% above our potential breakeven price
- **The puts yield:** 4.8% on cash in 79 days (16% if using equity or buying power to hold the trade open)

Next Steps

- If writing puts is new to you, check out our guide. If you have questions about this trade, visit our Rockwood Holdings discussion board.
- Want a refresher on Rockwood? Visit its trade history.
- To track your Rockwood returns or watch the stock, add it to My Scorecard.

Jeff has an options position on Rockwood. See all of Motley Fool Pro*'s holdings on our Recommendations page.*

Charter and 2011 Portfolios: Plum Creek Timber

Published Jun 1, 2011 at 12:00AM

Trade Essentials

- **Actions:**
  - **Charter Portfolio: Write a covered strangle.** Write ("sell to open") November 2011 $35 puts (to potentially double your position to 5%); write ("sell to open") November 2011 $43 covered calls (one for every 100 shares already owned)
  - **Portfolio 2011: Write puts.** Write ("sell to open") November 2011 $35 puts only
- **Allocation:**

- Charter Portfolio: 10 contracts of each option; we'll potentially double our position to 5%
  - **Portfolio 2011:** 5% (for Portfolio 2011, that's four put contracts)
- **Recent options price (splitting the bid/ask prices):** November 2011 $35 puts, $0.97; November 2011 $43 calls, $0.90
- **Preferred strangle limit price:** $1.87 credit, combined (higher is better — check current prices and aim for at least $1.85 initially; as prices change, accept no less than $1.50)
- **Preferred $35 put writing limit price:** $0.95 or higher (as prices change, no less than $0.80)
- **Recent share price:** $40.10
- **Buy around:** $34
- **Fair value:** $40
- **Alternate trades:**
  - **Charter Portfolio: Want a larger premium?** If you're willing to take on more risk (of either having your shares called away or being required to buy more) in exchange for a higher option payment, you can consider moving your strangle strike prices up and down, closer to the current share price with either option.
  - **Portfolio 2011: Want a better chance to buy shares?** You can write puts at a higher strike price to earn a higher premium and increase the likelihood that you will be required to buy shares — but to manage risk, make sure your strike price is only $1 or $2 higher than ours.

The Big Picture

Plum Creek Timber (NYSE: PCL) is the largest private landowner in the United States, with about 7 million acres of timber nationwide. The company's experienced management aims to harvest timber sustainably when prices are healthy and let the assets grow (literally) when they aren't. The company also profits from buying and selling land, sometimes selling to developers, other times to conservation groups.

First Things First

- **Company: Plum Creek Timber** (NYSE: PCL)
- **Market cap:** $6.5 billion
- **Website:** www.plumcreek.com
- **Type of holding:** Long-term, income, natural resource asset
- **Strategy:** Strangles Guide
- **Follow it:** Add PCL to My Scorecard

Plum Creek earns enough free cash flow, one way or another, to finance its healthy $1.68 yearly dividend, giving the stock a 4.1% yield today (and 5% on the price at which the Charter Portfolio first bought the stock in 2008). We're happy to keep earning this hearty yield in the Charter Portfolio, and we want to boost our income further (once again) with our fourth covered strangle on the stock. We also want to position Portfolio 2011 to potentially buy shares at lower prices. (New investors wishing to learn much more about the business can check out our original buy report.)

What's New

Though the prices of many commodities have grown like the mighty oak, Plum Creek Timber has yet to benefit from the higher prices for sawlogs (timber grown primarily for lumber) and pulpwood (timber grown primarily for paper), nor has the company enjoyed enough of an increase in volume to move the profit needle. We've been holding off on repeating our covered strangle here for several months as a precaution against commodity speculation sending shares much higher, but timber has not caught fire like many other commodities. Even if timber were to increase substantially in price, Plum Creek can only harvest so much each year, so benefits will likely be muted.

With little new construction demand on the horizon, we feel comfortable writing our fourth covered strangle on the stock, a move that may end with us buying more shares around our preferred buy price or selling our current shares for more than our estimate of fair value. For Portfolio 2011, meanwhile, we can write puts to potentially buy shares much cheaper. We're satisfied to focus on Plum Creek options while we wait for a housing recovery.

Why This Strategy?

With a 4.1% yield (and our frequent option writing), Plum Creek has generated steady income for our Charter Portfolio since 2008, though the shares alone have gained only modestly compared to the S&P 500. We're choosing an expiration nearly six months in the future because it pays higher premiums than an option with an earlier expiration.

- **Charter Portfolio:** This strangle provides members with a potential net buy price on new shares of $33.11, below our $34 preferred buy price. And if the stock stays between our two strike prices (a range of $35 to $43), we'll earn the full premium of around $1.87 per share (a 4.6% yield on the current price), plus two $0.42 dividend payments (not yet announced, but expected in August and November) for another 2% in yield. If the stock rises above $43, we enjoy a potential net sell price of $44.87, more than 10% above the current price and our fair value estimate.
- **Portfolio 2011:** Writing puts alone nets us a potential buy price near $34 — our preferred buy price and about 20% less than the recent share price. The yield on cash for the put trade alone isn't large (2.8% in nearly six months), but it's around 9% if you're writing puts on buying power rather than cash. Portfolio 2011 members may or may not end up with shares at our low desired price, but we'll at least earn option income.

How to Follow Along

- **Charter Portfolio:** To write a covered strangle, you must own at least 100 shares of the stock, and you should be happy to buy at least 100 more at a lower price.
- **Portfolio 2011:** To write puts alone, you need to be ready and able to buy 100 shares for every put you write if the stock is below your strike price ($35 in this case) by expiration in November.

Members following Portfolio 2011 might feel a little "yield envy" because they'll miss out on the dividend provided through share ownership. If this is you, remember that the upcoming dividends are already part of the calculations behind the put premium we're getting.

Next Steps

- Questions or comments? Visit our Plum Creek Timber board.
- Check out our guide to strangles.

What Makes Our Stocks Special — and Better

Published May 31, 2011 at 12:00AM

There are two qualities that should be evident in every position we take and every strategy we use here at *Pro*. We want our investments to be special (compelling, serving an important need or opportunity, worth your attention), and we want them to be better than the competition (better fundamentals, better management, better returns with less risk). We look for businesses with a competitive edge and investing strategies that offer us flexible advantages. Today, let's discuss how two of our positions measure up.

Trade Roundup

Charter Portfolio

- **SPDR KBW Regional Banking ETF** ETF: Sold all 2,200 shares at $25.67.
- **Broadridge Financial Solutions**: Wrote 7 September 2011 $22.50 puts for $1.05 credit.
- **Pebblebrook Hotel Trust**: Bought 1,400 shares at $21.67.

Portfolio 2011

- **Broadridge Financial Solutions**: Wrote 3 September 2011 $22.50 puts for $1.05 credit.
- **Pebblebrook Hotel Trust**: Bought 230 shares at $21.67.

Tupperware Brands

This one is easy. **Tupperware** CEO Rick Goings mentions three things he thinks make his company better than others (and we agree):

1. **The company owns its sales channel.** Rather than relying on retailers who have a say in product pricing and shelf placement (and can thus make sellers charge less), Tupperware enjoys a network of more than 2 million employees who earn a living selling its products.
2. **Its products have a gross margin of 60% to 80%.** To avoid becoming a "commodity" business (one whose products are indistinguishable from competitors'), Tupperware only green-lights products that provide a strong profit margin. If a container can be sold for $10, Tupperware will pay between $4 and $2 to produce it, generating gross margin of 60% to 80%. To command this type of sales margin, something has to be special about those products.
3. **It aims to generate 25% of sales each year from new products.** This goal forces Tupperware to innovate, places new products in play for the sales staff, and keeps Tupperware parties lively.

Combine these qualities with a massive opportunity in emerging markets (sales in South America rose 60% last quarter, 80% in India, and 44% in Indonesia; the latter is the world's fourth-most populated country), six decades of resilience in developed markets (sales in North America jumped 17% last quarter), a steady share buyback program, and a dividend that is slated to rise as earnings do, and you have a dynamic growth company with lower-than-average risk.

Yep, "dynamic growth" — believe it or not, that's Tupperware. When I first turned the company up on a value-stock screen, I thought, "What new tricks can this old dog have?" This one proves you can't judge a container by its lid. You need to pop the top to see what's really going on — what makes it special and better.

Both *Pro* portfolios currently hold Tupperware. If you want to increase your exposure to the company, you can consider writing ("sell to open") October 2011 $60 puts, recently bidding $2.55 per contract (that's about a 4% yield on cash in four and a half months).

3D Systems

Much younger than Tupperware and dependent on technological advantages, **3D Systems** (NYSE: DDD) is still special: The company invented 3D printing, and it has important ties with the automotive and health care industries (among others). Its sights are also set on a larger consumer market, as the company realizes that 3D printing could one day be a tool for mass personalization. Management targets recurring revenue of about 75% of annual sales and expects margins to rise as it sells more and more patented printing materials.

In the past year, 3D Systems introduced 10 new printers and expanded its patent trove to more than 400. For much more about the business, check out Bryan Hinmon's (TMF42) summary of last week's Investor Day. We sent Bryan on an adventure involving an Amtrak train and several New York City cabs so he could meet company brass and bring his story back to *Pro* members.

Why This? Why Now?

With every investment we make, we should be telling you why we've chosen this opportunity for our money now — in other words, what makes it special and better. Whether it's the strong track record of CEO Jon Bortz at **Pebblebrook Hotel Trust**, or the wicked contango that makes shorting **iPath S&P 500 VIX Short-Term Futures** delightfully profitable, or the reported 98% customer retention rate at **Ebix**, *all* of our positions should have key qualities that make them worthy of *Pro* — and ultimately profitable as well. In our next quarterly review, we'll outline these qualities for each position we hold.

Questions or comments? Visit our Memo Musings board.

Fool on,

Jeff (TMFFischer)

Jeff owns shares of Tupperware, 3D Systems, and Ebix and is short shares of iPath S&P 500 Short-Term VIX Futures.

Coverage and Community

- The tender offer for **TradeStation**, highly profitable for members at $9.75 per share, should be completed in June. Members don't need to take action but may vote for or against the takeover if they wish. *Pro* cannot legally provide voting guidance.
- Check out *Pro*'s take on **Medtronic**'s earnings.
- Bryan (TMF42) summarizes his experiences at **3D Systems**' Investor Day event and members share their thoughts.
- Did ya catch it? Jeff, Nick (TMFCrow), and Bryan sang the praises of three *Pro* companies in Friday's Audio Extra.
- Want to get upset? Nick shares that Congress and their aides are somehow great stock pickers. Go figure.
- Alex340 posts put options that meet *Pro* criteria.

Charter and 2011 Portfolios: Set Up a Synthetic Short on iShares S&P SmallCap 600 ETF

Published May 27, 2011 at 12:00AM

At a Glance

- **Actions:**
  - Write ("sell to open") August 2011 $75 calls
  - Buy ("buy to open") August 2011 $71 puts
- **Allocation:**
  - 8% in Charter Portfolio (16 contracts of each)
  - 3% in Portfolio 2011 (one contract of each)
- **ETF price:** $73.77
- **Options prices (bid/ask):**
  - $75 calls: $2.05/$2.25
  - $71 puts: $0.80/$5 (this will tighten as trades begin, but you must use **limit orders**)
- **Limit order guidance:** Using a "spread order," aim to set up the synthetic short for around zero cost.
- **Why set up a synthetic short?**
  - With little or no out-of-pocket costs, we can profit on a decline in small-cap stocks, hedging more of our equity exposure.
  - We lose nothing on the trade if the market stays within our range.
  - If the index gains more than 2%, our short will lose money by expiration, but the accompanying gains in the stocks we own should more than compensate.

The Big Picture

Approximately 25% of *Pro*'s Charter Portfolio is invested in mid- and small-cap stocks — companies like **3D Systems** (NYSE: DDD), **GrafTech International** (NYSE: GTI), and **Tupperware** (NYSE: TUP). These stocks are more prone to volatility than their larger counterparts. Over the past two years, smaller and riskier stocks have led the market rally, but if investors' moods sour as government stimulus wanes, those same smaller stocks will likely experience the brunt of the selling. With today's recommendation of a synthetic short on the **iShares S&P SmallCap 600** ETF (NYSEMKT: IJR), the aim is to hedge more of this portion of our portfolio, smoothing our returns if the market declines.

First Things First

- **ETF**: **iShares S&P SmallCap 600 Index** (NYSEMKT: IJR)
- **Type of holding:** Short/hedge; U.S. small caps; must use margin account
- **Website:** [us.ishares.com]
- **Follow along:** [Add to My Scorecard]
- **Learn more:** *Pro*'s [guide to synthetic shorts]

The Charter Portfolio has 12.5% short exposure through our holdings in the **ProShares Short S&P 500** ETF (NYSEMKT: SH) and a ratio put spread on the **iShares Russell 2000 Index** ETF (NYSEMKT: IWM). When we add today's short of the iShares S&P SmallCap 600, we'll have about 20.5% short exposure in the Charter Portfolio as we head into June (and 17% in Portfolio 2011, but we have ample cash in that portfolio). That's not as risky as it might sound at first, though: The majority of our short exposure is in options positions that won't harm us if the market goes up (as with our ratio put spread) or if the market goes up a little (as with this new synthetic short).

The Vehicle

The iShares S&P SmallCap 600 ETF holds (unsurprisingly) [600 stocks], the bulk of which weigh in (also unsurprisingly) on the smaller side. With more uncertainty here regarding earnings than at larger companies, but also the potential for greater earnings growth, small caps are typically more expensive on a price-to-earnings basis than large companies (except when small caps are in a bear market), and that's true today. As of April 29, iShares puts the average P/E of the stocks in this index at a lofty 25 (the current average for the S&P 500 is just 16). In fact, plenty of companies in the SmallCap 600 don't enjoy any earnings at all — but that said, we're shorting the index as a hedge against a market decline in general, not pointing fingers at ugly businesses.

How to Follow Along

You set up a synthetic short by writing naked calls and using the proceeds to buy puts. (You can learn much more in our [strategy guide].) For every naked call you write, you're effectively shorting $7,500 worth of this index. **If this is too rich for your portfolio, don't place this trade.** At our strike prices ($75 for the calls, $71 for the puts), this position won't end better than breakeven unless the index falls at least 3.7% and will turn unprofitable if the index gains 2%. However, the short protects more of our portfolio against a large market decline (say, 5%, 10% or more), which is the goal.

To set up the trade:

- **"Sell to open"** August 2011 $75 calls
- **"Buy to open"** August 2011 $71 puts
- **Net cost to set up the trade:** As close to $0 as possible — possibly even a net credit
- **Allocation:** Set up one synthetic short (one contract of each option) for every $7,500 worth of the index you wish to short.

The *Pro* Bottom Line

This strategy has little or no out-of-pocket cost (only the margin necessary to write naked calls). It will be profitable for us if there's a modest to meaningful decline in the small-cap stock index between now and the Aug. 20 options expiration.

Alternative Trades

- Instead of setting up the synthetic short, you could just write naked calls if you want to be a little defensive but aren't very bearish. If you do, realize that this is a short with limited upside (just what the calls pay you) and unlimited risk.
- You might only buy the puts (or similar puts) if you're bearish, don't mind the cost, and don't want to short naked calls.
- You could short the ETF directly if you don't wish to use options and want more short exposure. Realize it pays a 0.9% dividend.
- Hold tight and do nothing if you have ample cash and don't feel a need to short.

Next Steps

- Questions or comments? Visit our iPath SmallCap S&P 600 discussion board.
- Track IJR in My Scorecard.

Pro *will write naked calls and buy puts on the iShares S&P SmallCap 600 ETF in the next one to 30 days, per The Motley Fool's trading policy. Jeff owns shares of 3D Systems and Tupperware. You can see* Pro*'s holdings on our Recommendations page.*

Charter and 2011 Portfolios: Buy Pebblebrook Hotel Trust

Published May 26, 2011 at 12:00AM

At a Glance

- **Action:** Buying a 2% allocation in Pebblebrook Hotel Trust.
- **Current price:** $21.03
- **Buy around:** $21.50 **(use a limit order)**
- **Fair-value estimate:** $35
- **Why buy:**
    a. Desperate sellers are leading to great deals on hotels right now.
    b. We get to piggyback on an industry veteran's opportunistic purchases.
    c. A rising yield should mean either a rising stock price or fat dividend checks.
- **Alternative Trades:** None.

I had to sell my car before I left for college, and to minimize my vehicular downtime, I waited until the last minute. With a week to go, I desperately listed the car on eBay, and much to my relief, an out-of-state buyer quickly expressed interest. When the fellow flew in to close the deal, though, my relief turned to horror: He was a used-car dealer prepared to nickel-and-dime me to the bitter end. With no leverage (I *had* to sell this car before I left), I was forced to accept a price I didn't like while the buyer made out like a bandit.

Use a Limit Order

This stock is thinly traded, so **make sure you use a limit order on this trade**, Fools.

First Things First

- **Company:** Pebblebrook Hotel Trust
- **Market cap:** $1.1 billion
- **Website:** www.pebblebrookhotels.com
- **Type of holding:** Real estate; distressed assets
- **Follow it:** Add PEB to My Scorecard

I learned a valuable investing lesson that day: The best time to buy is when the seller has no choice but to sell. Today, we have a chance to put my extracurricular education to work with **Pebblebrook Hotel Trust** (NYSE: PEB), a REIT that's buying upscale hotels from distressed sellers on the cheap.

You Can Check Out Anytime You Like ...

Remember 2005, when everyone and their grandma was suddenly a real estate expert? The same thing happened in hotels, as industry laypeople — in this case private equity firms, sovereign wealth funds, and the like — woke up thinking they knew how to invest in hotels. These newcomers fueled a tremendous spike in the value of hotels changing hands: 2007 deals reached $45 billion, 10 times the amount of just five years earlier. But when the real estate market crashed and occupancy rates kept dropping, those brand-new hotel owners began to wish they hadn't taken out such big loans to buy their properties. And just as their interest payments began to look insurmountable, the liquidity in the hotel market vanished, leaving our speculative hoteliers high and dry.

Then came the storm. The hotel loans began coming due in 2010, and many poorly performing hotels simply haven't generated enough cash to pay them off. Refinancing isn't an option (banks have their eyes wide open about real estate risks these days), and the commercial mortgage-backed security market, historically a go-to hotel financing source, barely exists right now. Many hotel owners are left like me the day before college, with only one choice: to sell for whatever they can get.

Let's Be the Buyer This Time

An abundance of desperate hotel sellers can lead to opportunistic deals aplenty for a savvy buyer. That's exactly what we have in Jon Bortz, the hotel industry veteran who came out of retirement to launch Pebblebrook Hotel Trust and get in on the fun. Pebblebrook's modus operandi is simple: The company buys upscale hotels in major coastal U.S. cities as cheaply as it can. Bortz focuses on these upscale, urban properties because they're hit hardest in recessions but bounce back the fastest and perform the best in good times. And since the U.S. economy is just coming off record lows, this is the place to be.

Pebblebrook has four ways of creating value for shareholders:

1. **Buy without the debt.** Pebblebrook buys the hotel itself, not the company that previously owned it, so it acquires the properties without any of the accompanying debt. Sometimes it's as easy as that, as with the Doubletree Bethesda (not too far from Fool HQ), which was making interest payments four times the size of its operating income. The moment Pebblebrook signed the purchase papers, the debt was wiped away and the hotel was instantly profitable.

2. **Buy at a discount.** Bortz has plenty of cash and lots of hotels to choose from (Pebblebrook's CFO told me the company evaluated more than 100 properties last year). Meanwhile, the seller on the other side of the table might be underwater on a loan and desperate to sell before the bank forecloses on the property. The result is spectacular deals, with Pebblebrook picking up hotels at an average 10% to 15% discount to their replacement value.
3. **Economic recovery.** Hotel profitability correlates strongly with general economic growth, and hotel fundamentals are bouncing back, with industry average revenue per room jumping by 5.6% in the first quarter of 2011. An improving economy will make the purchase prices of Pebblebrook's hotels seem even cheaper as the company is able to raise rates and bring in more cash.
4. **Operational improvements.** Before handing off the day-to-day operations to a management company, Pebblebrook puts its new hotels through the hotel equivalent of fraternity initiation, sending in specialized teams (a food and beverage team, for example) to wring out inefficiencies. Bortz doesn't make new purchases based on potential improvements, but sometimes the company finds gold under the pillows: At the Sir Francis Drake hotel, the teams were able to realize a quarter of a million dollars in annual savings.

Financials and Valuation

Simply put, Pebblebrook's financials are a disaster. The company bought its first hotel in June 2010, meaning it hasn't quite been a full year since any of its properties came under the Pebblebrook umbrella — so year-over-year comparisons are impossible and quarterly comparisons close to meaningless. Further, many of the newly acquired hotels need some love (hotel owners underwater on their mortgages rarely devote cash to upkeep), so the capital expenditures for the first three to 15 months after buying each hotel aren't representative of their levels going forward. The bottom line is this: Unless an investor is willing to do a ton of homework, he or she will woefully lowball Pebblebrook's true worth.

And what is that true worth? If you take the value of all of the company's hotels, add its remaining cash, and subtract debt, you get $19.84 per share. Of course, hotels are businesses that generate cash flow. But even leaving that out of it, those calculations mean that if the company were to liquidate tomorrow, the stock's value would be just 5% below today's price. That's not much of a downside.

On the upside, keep in mind that since REITs pay out almost all of their income as dividends, they often end up priced based on yield, like bonds. Once Pebblebrook invests all of its currently available capital, which I think will happen by the end of 2012, I estimate the company will have the capacity to pay $1.48 to $1.62 per share in dividends. Based on average hotel REIT yields, that would imply a share price in the low $40s, which discounted back to today gives a fair value of about $35. And here's the best part: If the market doesn't bid up the shares as the dividend increases, we could find ourselves receiving 7% dividend checks (at today's prices) within a couple of years.

What Would Make Us Sell

This investment relies heavily on two things: the availability of great deals and the guy who closes on them. If the stock appreciates toward our fair value and the hotel deal pipeline dries up, we'll move on. And if Jon Bortz checks out, we likely will, too.

The *Pro* Bottom Line

Next Steps

- Add Pebblebrook to My Scorecard.
- Talk about this trade on *Pro*'s Pebblebrook discussion board.

Hotel deals abound for savvy buyers, but you and I can't go out and make them (what do I know about running a hotel?). Pebblebrook allows us to take advantage of this situation without having to take on a second job at the concierge desk. With shares trading well below fair value and a clear dividend path to getting them there, we're going to book a few rooms and stay awhile.

Alex and The Motley Fool own shares of Pebblebrook Hotel Trust. See Motley Fool Pro*'s holdings on our recommendations page.*

Charter Portfolio: Sell SPDR KBW Regional Banking ETF

Published May 24, 2011 at 12:00AM

At a Glance

- **Action:** Selling all shares
- **Recent Price (5/24/2011):** $25.22
- **Why Sell:**
  - By selling a lower-conviction holding, we can raise cash to put to work elsewhere.
  - The level of uncertainty in the banking industry is not improving as much as we expected, and small banks like those tracked by this ETF are seeing fewer benefits than the giants.
  - As community banks continue to languish, we prefer to concentrate our exposure to the sector in one large, leading bank: **Wells Fargo** (NYSE: WFC).
- **Alternative trade:** Write June $25 covered calls to facilitate a sale. Write ("sell to open") one call for every 100 shares you own. If the stock's price is higher than $25 when the options expire June 18, your shares will be sold at that price, plus the $0.60 per share the calls pay today.

What's Changed?

The sleepy **SPDR KBW Regional Banking** (NYSEMKT: KRE) ETF has barely changed since *Pro* first purchased it a year ago. Its 50 banks continue to look cheap on a historical basis, trading at an average of 1.3 times book value (up from 1.1 when we first bought shares, and still well below the 1.7 to 1.8 multiple they fetched before the financial crisis). Other key ratios, like net interest margin (up to 3.8% from 3.7%) and return on equity (a meager 5.3%), are largely unchanged as well. Demand for loans has remained low, and an increase in that demand is the only thing that can drive small banks like these to a higher return on equity and thus a higher multiple to book value.

What *has* changed in the meantime is *Pro*'s Charter Portfolio. We now own shares of Wells Fargo, and our exposure to the financial sector has also grown through the price appreciation of earlier purchases **AmTrust Financial Services** (NASDAQ: AFSI) and **Jack Henry** (NASDAQ: JKHY). We continue to have hope for **Broadridge Financial** (NYSE: BR), as well. Given this ample exposure to the sector, selling SPDR KBW is a prudent way to raise cash that can be put to better use in higher-conviction ideas.

The banking industry will probably face an improving — but still challenging — lending environment throughout this year and next. In Wells Fargo, we're confident that we've backed a leader that should gain market share as the industry recovers, so we can say a peaceful goodbye to the smaller players that make up SPDR KBW. To demonstrate, let's compare the two (using the same ratios that were well-covered in SPDR KBW's original recommendation):

Wells Fargo vs. SPDR KBW

Investment	Price-to-Book Ratio	Return on Equity	Dividend Yield	Tier 1 Capital	Net Interest Margin	Non-Performing Loans
Wells Fargo	1.2	11%	1.7%	11.5%	4.3%	3.3%
SPDR KBW	1.3	5.3%	1.9%	13.8% (20 of 50 reporting)	3.8%	2.3% (24 of 50 reporting)

Data as of May 13. Source: CapitalIQ, a division of Standard & Poor's.

How to Follow Along

We'll be selling all of our shares in the next one to 30 days. If you own shares, we recommend you sell them, as well, using a limit order at your desired sell price. At the time of publication, selling would net us a small profit — one we can add to the dividends we received from SPDR KBW over the past year, solidifying our profit. Be disciplined, however; there's no impending reason to rush for the exit, so take care to get the price you want. To discuss this trade, please visit the SPDR KBW Regional Banking discussion board.

Pro *will make this trade sometime in the next one to 30 days. See our holdings on our Recommendations page.*

Wobbly Market Ahead?

Published May 23, 2011 at 12:00AM

When the stock market is rising, many of us look at our portfolios and feel a sense of control. We think we've made good choices that are playing out well, resulting in profits. (We might say, "I rock! I need to keep investing this way.") And when the market is tumbling, we look at our shrinking portfolios and start to question what we've done, wondering whether bad decisions are behind the losses. ("Am I losing control?")

Kick Back in the Hammock ...

... next Monday for Memorial Day! Your next *Pro* Memo will be published Tuesday, May 31. Have a wonderful holiday!

Guidance Updates

- **AmTrust Financial Services** moves down to Buy on valuation.
- **Tupperware** moves down to Hold on valuation.

Upcoming Earnings

- **Medtronic**: May 24

Coverage and Community

- BrokeintheBurgh's son posts his analysis of **Contango Oil & Gas**. This 16-year old has chops!
- 4wheelfool works in the industry, so he explains just what **Ebix** does. Meanwhile, stamleo shares a summary of the conference call.
- IMWINN points out that **Broadridge Financial Services** is a bit below $22.50; *Pro* explains why options aren't usually exercised until expiration.
- Capitalappreciat asks if *Pro* would consider **Altria Group**.
- Alex340 posts put options that match *Pro's* general criteria (note that some stocks listed are no longer in *Pro*).
- TMFEldrehad tackles some interesting CAPS blogs, including silver, Mexico and politics.

In either case, little has generally changed except the mood of the market. You probably own the very same stocks in both scenarios — ones you liked initially, but then started to question without any good reason as prices slipped. But we don't have to fall victim to Wall Street's mercurial whims. The best investors *know* they don't have control over share prices — ever. So they don't celebrate quick gains any more than they blame themselves for quick declines.

Instead, the Warren Buffetts (and *Pro* members) of the world buy stakes in companies that are delivering growing free cash flow to shareholders in the form of higher earnings, dividends, and share buybacks, and through simple business growth. We don't buy slips of paper that change in price by the hour. We buy partial ownership in living, breathing organizations. And we know that we can't control a stock's price on any given day, week, or month — but we can control the prices at which we buy and sell.

As we described in a recent Monday Memo, for each company we recommend, we suggest a "buy around" price that's less than our estimate of fair value. We buy at these discounted prices in hopes that we can stack the eventual results far in our favor. From our fair-value estimate, we expect a typical stock we recommend to provide an annualized return of at least 9% to 11%.

And when do we sell? In most cases, when a company has risen about 10% to 20% above our fair-value estimate, it's essentially a year or two ahead of itself. In that case, the potential rewards may not be worth the potential risks any longer, so we'll consider selling. We'll sell in other situations, too (our thesis isn't playing out; we've found something better; we want to be defensive), but in most cases, fair value guides us.

But We're About More

What I've described above is fundamentals-based, valuation-based investing. We know it works over the years.

But *Pro* is about more than that. As a member of this service, you're also here to sell short, use sensible options strategies, and produce regular income with high accuracy. When we combine these approaches with our long-term stock investments, we believe we have the best of all investing worlds.

The market has been steadily rising for the past few months, so some of our more defensive tactics have lain dormant (thankfully), usurped for the time being by a buy-and-hold approach. But other times, we'll need to work harder than that to make the kind of profits we aim for. As the government's various stimulus programs slowly wane, we may be entering a tougher investing environment over the coming months and years, and I want to start putting more of our strategies to good use again.

Of course, the government may have still more monetary tricks up its sleeve. But sooner or later, the stock market must stand on its own, and like a toddler, it's likely to wobble at first. That's where *Pro*'s multifaceted approach can return in full Technicolor. Ideally, our tactics will help you profit in various environments, but keep in mind that dipping prices do *not* mean your stock investments are no longer sound. Those living, breathing companies you bought haven't stopped creating free cash flow overnight; a falling price simply means that nervous investors are selling.

Few of us enjoy watching our shares decline, but volatility is a given on Wall Street — and to those of us who keep our eyes open, it brings new opportunities for profit. Meanwhile, we'll work to create profits during dips, too.

Fool on,

Jeff (TMFFischer)

Jeff owns shares of AmTrust, Ebix, and Tupperware. See Motley Fool Pro'*s holdings on our Recommendations page*.

Charter and 2011 Portfolios: Write Puts on Broadridge Financial Solutions

Published May 17, 2011 at 12:00AM

First Things First

- **Company: Broadridge Financial Solutions** (NYSE: BR)
- **Market cap:** $2.8 billion
- **Website:** www.broadridge.com
- **Type of holding:** Long-term, information technology
- **Strategy:** Guide to Writing Puts
- **Follow It:** Add BR to My Scorecard

At a Glance

- **Action:**Write ("sell to open") September 2011 $22.50 puts
  - 1% for *Pro*'s Charter Portfolio (for 3% total); seven contracts
  - 3% for *Pro*'s Portfolio 2011; three contracts
- **Recent options price (bid/ask):** $1.45/$1.70
- **Preferred price:** Use a limit order at the mid price, but don't go lower than $1.35 (for a 6% yield in four months)
- **Stock fair value:** $27.50
- **Alternative trades:**
  - For Charter Portfolio, buy an additional 1% position in the stock outright (our Buy Around price is $23).
  - For Portfolio 2011, buy a 3% position in the stock outright.
- **Why write puts?**
  - Broadridge has a dominant position in investor communications and is becoming a go-to provider for outsourced securities processing.
  - The company earns stable revenue thanks to recurring communication schedules and multiyear contracts.
  - Sluggishness in the company's event-driven segment is masking progress in new, higher-growth business lines.

What's New?

Shares of our favorite proxy manager and securities processor, **Broadridge Financial Solutions** (NYSE: BR), haven't done much lately. The market voted "nay" on the company's second-quarter earnings back in February as management lowered fiscal 2011 earnings targets by 15.6%. Although third-quarter earnings provided investors a bit of reassurance, the lack of event-driven mutual fund communications has caused the first nine months of the fiscal year to be a rough period for Broadridge. But we don't think the event-driven business is dead and gone — we just think it ebbs and flows, and we're in a serious ebb right now. Still, the company's earnings power remains strong, and cash flow is robust.

Additionally, we've become more confident in the growth of Broadridge's securities processing segment. During the second quarter, an as-yet-unidentified global bank decided to outsource its securities processing duties to Broadridge. The contract is the largest and most profitable one Broadridge has ever won and affirms the value that financial institutions see in outsourcing their mundane but mission-critical tasks. Contract wins such as this recent one, combined with the company's 99% client-retention rate (read: happiness quotient), should provide firepower when Broadridge's sales force sits on the business end of the mahogany desk at the next big bank.

The company's most recent deal, an agreement to distribute sales-reporting data to the hundreds of fund clients of **Charles Schwab** (NYSE: SCHW), could open the door for additional high-margin recurring revenue as those clients demand additional data reports. Broadridge is uniquely positioned to provide this data, and it represents a deepening of the relationship between Broadridge and mutual fund families.

Why This Strategy?

You need options approval to write puts, and the trade command is "sell to open" or "sell." (*Do not buy these options!*) Sell one contract for every 100 shares of Broadridge you're willing to purchase later (each contract represents an obligation to buy 100 shares, or $2,250 worth of Broadridge stock). Writing these options will "pay" you the option premium up front, and then we'll wait until expiration on Sept. 16 to know our next move.

About This Trade

Fools with a discerning eye may notice that the puts we're writing are in-the-money, meaning that the current stock price ($22.42) is below the strike price ($22.50) of the put options we're selling. Given the sleepy nature of Broadridge's stock and the wide strike-price availability, we're able to get healthy option premiums by writing our options so close to the money. The cost of doing so is that we're highly likely to be assigned shares, but given our view on Broadridge stock and the net purchase price of these additional shares, we feel the risk is justified.

Our initial potential profit is whatever the puts pay us (the options are bid $1.45); we have an obligation to purchase shares of the stock if they fall below the $22.50 strike price by expiration and we don't adjust our trade. If we get shares, our net start price will be around $21.05 (we buy our shares at $22.50, but still keep the $1.45 the puts pay us). Because we fully intend to take share ownership if assigned the shares in September, make sure you have $2,250 per contract available to purchase shares. Otherwise, just buy Broadridge shares in the suggested allocation (1% for Charter and 3% for Portfolio 2011) per the alternative trade.

How to Follow Along

You can simply buy shares if you prefer, but we're cheapskates and want to earn income while we wait to buy shares closer to $21. If converted into shares, these puts would allow us to buy shares about 6% cheaper than the recent price and at just 14 times average free cash flow. If the shares remain above $22.50 at expiration, we won't get to buy shares, but we'll earn a decent return on this trade and look to write puts again.

Next Steps

- Questions or comments? Still getting used to all this options jargon? Visit our Broadridge board.
- Stoked to learn more about writing put options? Head over to the All About Options board.

Pro Charter Portfolio and Portfolio 2011 will write puts on Broadridge in the next one to 30 days, per The Motley Fool's trading guidelines.

Staying on Top of 3D Systems and Ebix

Published May 16, 2011 at 12:00AM

Cancel Your *Pro* Membership!

This week only, The Motley Fool is asking you to "give up" your *Motley Fool Pro* membership. And you'll never receive another invitation from us again. Here's why: For a few days only, you can apply your current membership fees to the one service that offers everything you'll ever need as an investor — including uninterrupted, full access to *Motley Fool Pro* and *Motley Fool Options*! *Motley Fool Duke Street* is our response to the No. 1 request we receive from you and your fellow members. If you're interested, please click here to go to dukestreet.fool.com.

Dear Fellow Fools,

Two of our stocks recently suffered bruising declines — **3D Systems** and **Ebix** — so let's take a renewed look at both.

When any of our stocks fall by 5% to 15% without news, it usually doesn't mean much. Fickle market volatility of this nature will correct itself if we're buying good companies at good prices. But when a position falls by 20% or more, we automatically take a new look to make sure we're not missing something, our estimates are reasonable, and we've roundly considered the risks. If the stock in question is trading far below our fair value estimate, we look especially hard, because such a sizeable discrepancy suggests either that we're seeing something the market isn't, or we're missing something.

Upon making these reviews, we need to decide whether we want to use the opportunity to buy more, just sit tight, or find our error and sell.

3D Systems Flattened

In barely a month, 3D Systems has declined by 25% from our purchase price, more than that for many members. Recently at $37, the stock trades at a 47% discount to our fair value estimate, so either something is amiss with our analysis or Wall Street is badly mispricing the company. We believe it's the latter. Wall Street appears to be punishing 3D Systems for a quarter that merely *met* expectations, and for *growing* the operating margin, but at a rate that didn't meet some analysts' high expectations.

Before making too much of the stock's recent spelunking, though, we must acknowledge that this is a volatile stock. Over the past 52 weeks, shares remain up by more than 140%. Of course, we would like to have discovered 3D Systems earlier, but its recent ascent, rather than scaring us off, suggests to us that other investors have been seeing the same thing we are: a company with excellent long-term potential, still selling at a discount to that potential.

Today, 3D Systems trades at 19.9 times earnings estimates for 2012, with earnings expected to grow by 66% this year and 36% in 2012. In addition, the company's steady stream of small acquisitions adds extra upside potential to earnings. On a measurement we like better, the stock trades at a reasonable 36 times trailing free cash flow — a reasonable number, given how strongly free cash flow should compound from today's small starting base.

The long-term potential is what truly attracts us to this investment. The company is valued at less than $1 billion, although in 10 years or less, if it maintains a market value north of 5 times sales as margins expand, we could come to own a $3 billion business, for a clean triple. In other words, 3D Systems' $176 million in annual revenue could expand this decade to $500 million as more and more large companies and industries move to 3D prototyping and manufacturing.

We started with a partial position (3%), and patience and study have kept us from adding to it. **But for new investors, we're moving 3D Systems up to Buy First** because of its cheaper valuation and long-term potential. Buy only if you can own it for years (although we may eventually use options, too) and you don't mind volatility. In the housekeeping department, 3D Systems will split its stock 2-for-1 on May 19, so when you wake up that day, you'll own two shares instead of one, each at half the previous price. The company is also moving its listing to the New York Stock Exchange on May 26, with the new ticker symbol of DDD. It's switching to the granddaddy of the U.S. exchanges in hopes of generating more worldwide visibility and respect. That same day, 3D Systems is holding an investor conference in the Big Apple. *Pro* will cover it for you.

Flummoxed by Ebix

Our early days with Ebix in *Pro*'s Charter Portfolio remind me of our start with 3D Systems. Soon after our purchase, Ebix fell through the floor (a rare event for a *Pro* stock), and some investors wondered whether we'd made a grave error. We bought more after it declined. Hardly a year later, shares were hitting new highs, we had a 70% gain, and it seemed that we were vindicated for sticking to the financials and ignoring less-than-flattering rumors about Ebix's accounting and tax treatment (you can read more here).

Alas, since March, the stock has lost a third of its value as rumors and short sellers haunt it again, and we're back to about breakeven. If we saw a good reason for the decline, it might not be as frustrating, but no relevant news has come from Ebix — just another healthy earnings report.

Putting aside the qualitative argument that Ebix has a CEO who's difficult to pin down, on quantitative measures the business looks healthy and inexpensive. Shares trade at 14.6 times free cash flow, 13.3 times estimated earnings for 2011, and 300 times our patented "What the Heck?" index. Recent financials, which I'm still going through, don't raise obvious red flags. **Ebix remains on Hold** for now, but when we emerge from our analysis, we need to decide whether the stock still belongs in the Charter Portfolio. If so, we'll seek to buy it in Portfolio 2011, too. Stay tuned.

What's Your Take?

For general questions or comments, visit our Memo Musings board. Want to chime in on 3D Systems or Ebix? Click on the company names.

Foolishly,

Jeff (TMFFischer)

See Motley Fool Pro'*s holdings on our Recommendations page. Jeff owns shares of Ebix and 3D Systems and has options on 3D Systems.*

Guidance Changes

- **3D Systems** moves up to Buy First on price.
- **SPDR KBW Regional Banking** ETF and **Sprott Physical Gold Trust** move down to Hold pending portfolio management decisions.

Options Expirations on May 21

- **Both Portfolios:** Written puts on **Rockwood Holdings**, naked calls on **iPath S&P 500 VIX Short-Term Futures**, and covered calls on **ProShares Short S&P 500 ETF** are all set to expire as full cash gains. No action is needed by you. Happy with the income, we're looking to initiate new positions, and we'll issue trade alerts if we do.
- **Charter Portfolio only:** Written puts on **Plum Creek Timber** are set to expire as a full cash gain.
- **Portfolio 2011 only:** Written puts on **GlaxoSmithKline** are due to expire as a full cash gain.

Coverage and Community

- New *Pro* analyst Alex Pape (TMFPapester) jumps right in with analysis of results from **Contango Oil & Gas**.
- Buy First stock **AmTrust Financial Services** is scoring new highs. We have a summary of strong first quarter results.
- Bryan (TMF42) tackles quarterly results at sleepy (so far) **Broadridge Financial Solutions**.
- *Pro* member Wrenchbender57 asks where to find free cash flow. Bryan (TMF42) points him to a source.
- Lately $98, is oil's fair value only $60 per barrel? Fools discuss the claim that comes from ... Exxon Mobil.
- Russell (TMFEldrehad) has the weekly scoop on CAPs.
- Jeff (TMFFischer) dedicates his work to his dad.

See Motley Fool Pro'*s holdings on our Recommendations page. Jeff has options on Rockwood Holdings, is short iPath S&P 500 VIX Short-Term Futures, and owns shares of GlaxoSmithKline and AmTrust Financial Services.*

Wherefore Art Thou, Fair Value?

Published May 9, 2011 at 12:00AM

At *Pro*, we concentrate on bringing two vitally important features to you, our members: profitable investment ideas and clear guidance. We know that either one is all but useless without the other. Today, we want to focus on the latter aspect of our mission, explaining once and for all what we mean by "fair value," "buy around," and other key terms with starring roles in our recommendation alerts and on our Portfolio pages.

Cancel Your *Pro* Membership!

On Tuesday, May 17, 2011, The Motley Fool will ask you to "give up" your *Motley Fool Pro* membership. And you'll never receive another invitation from us again. Here's why: For a few days only, you can apply your current membership fees to the one service that offers everything you'll ever need as an investor — including uninterrupted, full access to *Motley Fool Pro* and *Motley Fool Options*! *Motley Fool Duke Street* is our response to the No. 1 request we receive from you and your fellow members. If you're interested, please click here to go to dukestreet.fool.com.

Fair-Value Estimate

I'm beginning to believe that we should call this a "fair-price" estimate, because too many investors read "fair value" to mean "*full* value," and that certainly isn't true. A fair value means a fair price — for a seller *and* a buyer. When a stock reaches fair value, it's trading at a level that should provide our desired rate of return (usually 9% to 11% or more annualized, depending on the risk involved) if all goes well.

So why do so many people *sell* at fair value? The argument is that a fairly valued stock no longer has a "margin of safety." Since the stock doesn't trade at a discount any longer, any missteps by the company could result in a haircut for the share price. Investors will also sell a stock that has reached its fair value so they can buy a new stock that's currently at a discount. This is how "fair value" has come to mean "sell price" in many investing circles.

That's not often the case at *Pro*. If we buy a stock at a healthy discount and it rises to our fair-value estimate (as with **Oracle**, for example), we read that gain in price to mean that our analysis was on the mark — we accurately identified an undervalued stock. We then double-check to make sure the stock could continue to reward investors. We may just be starting our long partnership with a stock when it reaches fair value — it could still bring us steady returns on an annualized basis from then on. We'll also consider options strategies to complement returns on fairly valued holdings.

But not all "fairly valued" stocks will stay in our portfolio. When we see a discounted stock worth buying and need cash to do so, we will sell our least favorite stocks that are at or above fair value. Or, if we want to get more defensive, we'll sell some shares near fair value. Whatever the situation, though, remember that fair value doesn't mean full value. It means *fair* — and we'll keep holding as long as we believe there's steady upside potential.

Buy-Around Price

If we believe a stock has especially low risks involved, our buy-around price may actually be close to the stock's fair-value estimate, as was the case with utility leader **NextEra Energy**. Over most of its history with *Pro*, the stock had a buy-around price of $52 and a fair-value estimate of $55. We were comfortable with only a 5% or so "margin of safety" (discount to fair value) because we believed the downside risk was modest.

Contrast that with **Rockwood Holdings**, which had an original buy-around price of $43.50 and a fair value of $56. We advised you to buy that stock at a 22% discount to fair value because it's a younger business that's new to us and thus may pose more risks. However, as we see Rockwood pay down its debt and strongly improve its operations, we are more comfortable buying closer to fair value. (See below for our updated price guidance on Rockwood and other stocks.)

We suggest buy-around prices to you as a way to manage risk. If you only buy stocks at a discount to fair value, your risk should be lower in good markets and bad. Keep in mind, though, that this guidance is flexible; if you buy within 5% to 8% (roughly) of the price we recommend, you should be capturing the favorable risk-to-reward outcome we always seek for you.

Always try to buy stocks as cheaply as possible, of course, but don't risk missing out on a healthy investment because you insist on buying 5% cheaper. Look at our fair-value estimate as your barometer: You can still expect a healthy return even from a fairly valued stock, but it has little room for error, so risks may be higher. As always, average in over time, consider options strategies to get a lower price, and buy companies that really interest you — ones you want to own and keep learning more about with us.

Limit Orders

In most cases, we suggest using limit orders to make a purchase (or a sale). This is partly to keep market makers from taking advantage of you and filling your order at a suboptimal price, and partly to help ensure we *Pro* members don't all trample in at once and make pricing worse for everyone. Even if you want to buy a stock around current market prices, use a limit order at those prices so you don't get a "bad fill."

Guidance Summed Up

- **Fair Value:** The price from which to expect your desired annualized return (usually at least 9% to 11% for us, dividends included).
- **Margin of Safety:** The difference between the current share price and the fair-value estimate — if a stock is below fair value, it's said to have a margin of safety.
- **Buy Around:** Our rough guidance of where to buy a stock (within 5% to 8% of this price); the more defensive we want to be, the lower our buy-around price in relation to our fair-value estimate. If we see very low risk in a position, we may even advise that you buy near fair value.
- **Limit Orders:** Generally, use limit orders to assure you get a decent price, even if it's the market price at the time.

Please read below for important news about the introduction of a new *Pro* team member, Alex Pape, and our guidance changes. Questions or comments? Visit the Memo Musings board.

Foolishly,

Jeff Fischer (TMFFischer)

Welcome Analyst Alex Pape!

Since joining the Fool through its highly selective Analyst Development Program, analyst **Alex Pape** (TMFPapester) has delivered value with winning ideas in *Special Ops*, *Income Investor*, and *Million Dollar Portfolio*. Today, we're excited to welcome Alex as an analyst exclusively on *Motley Fool Pro* and *Motley Fool Options*. Alex is at heart a value investor with a soft spot for investments with identifiable catalysts, and we're confident he'll bring interesting, profitable new ideas to the forefront for members.

At the same time, we wish Andrew Sullivan (TMFRedwood) all the best as he leaves The Motley Fool to travel the Far East before moving out west. We know he'll enjoy the adventures of travel and his life in a new location, but we'll miss Andrew and thank him for his great work here. (Every *Pro* investment is followed by at least two team members, so there will be no interruption in coverage.) To welcome Alex and bid Andrew farewell, please visit our Meet & Greet board.

Coverage and Guidance Updates

- **GrafTech International**: As the newly merged business begins to show its promise, our fair value rises from $21 to $25 and our buy-around price from $17.50 to $19 (writing $20 puts is possible).
- **Jack Henry**: The business continues to grow as it digests acquisitions. Shares remain on hold.
- **NextEra Energy**: Stabilizing results in Florida and continued improvements in its unregulated segments increase the standing of this green utility leader. We're raising our fair-value estimate from $55 to $58 and our buy-around price from $52 to $53.50 (writing $55 puts is possible).
- **Papa John's International**: A strong quarter is tempered by an outlook for rising food costs; our covered strangle remains our preferred strategy. No guidance change.
- **Rockwood Holdings**: Increased confidence in the business and its pricing power, as well as early repayment of debt, lead us to bump our buy-around guidance higher yet again, this time from $45 to $49 (fair value remains $56, and writing $50 puts is possible).
- Following these updates, Charter Port and Portfolio 2011 will consider new positions soon, so be on the lookout for upcoming official trades. Get all current buy-around and fair-value guidance on the Charter Portfolio page.

Community

- U.S. member Ron (asiatraveler) has moved to Thailand and checks in with the *Pro* community as he gets settled into his new home. Can other *Pro* members around Bangkok reach out to Ron and show him around?
- Member OrangeAndBlue asks how to protect a 401(k) from a downturn, and *Pro* members step up to help.
- It has been a little quiet lately as the *Pro* team works through earnings — member DolonAltekar asks what to expect next for Portfolio 2011, and Jeff chimes in.
- Jeff summarizes the CBOE Risk Management Conference he attended (this is Part One; more to come later).
- Russell (TMFEldrehad) takes a look at the "concentrated pick list" and its implications for CAPS.

Earnings Calendar

- **May 10**: **Broadridge Financial**, **Bristow Group**, **Contango Oil & Gas**, **Ebix**
- **May 11**: **Cisco Systems**

Jeff owns shares of Oracle and Ebix and has an options position on Rockwood Holdings.

Doing the Quarterly Shuffle

Published May 2, 2011 at 12:00AM

Attention Fools: Your *Pro* team will not be online this Thursday and Friday, May 5 and 6, as we attend our annual company meeting — what we Fools call Foolpalooza. We'll see you next Monday with your regularly scheduled Monday Memo.

Guidance Updates

- **Intel** moves down to Buy after a large price gain.
- **NextEra Energy** and **GlaxoSmithKline** move down to Hold on valuation.
- **3D Systems** , **Tupperware**, and **Rockwood Holdings** are still being evaluated after earnings.

Dear Fellow Fools,

The *Pro* team spends four months of every year going through our few dozen companies' quarterly earnings reports — as well as the earnings releases of the many other companies we're watching. It's a job in and of itself, with our typical review period stretching several days as we comb through SEC filings and conference call transcripts and dig for answers to new questions. Options prices often change after earnings reports are released and investors reassess a company's risks, so we review options chains to find new opportunities.

This is why, during earnings season, *Pro* goes relatively quiet while we put our heads down and work — but there's no way around this. Knowing our investments closely is key to our success.

Mind Your 10's and Q's

Public companies put their best faces forward when they issue quarterly press releases. To get the full picture, we need to weed through a company's SEC filing — better known as the 10-Q report.

All public U.S. companies are required to file 10-Q's within 40 to 45 days of the end of the fiscal quarter. Some companies make it easy, filing the 10-Q the same day as the earnings release — as **3D Systems** did last week. Others make you wait. Without seeing the 10-Q, we may be missing pertinent information, so we're not likely to raise our guidance for a company until we've studied its filing.

SEC reports give us financial information that we can't usually find in the press release. We analyze the cash flow statement and look for revealing footnotes tucked under the balance sheet or income statement. We also look for more details on debt and credit terms, stock grants, and upcoming share dilution. We compare the SEC filing with our own estimates for a company, making sure that the two are similar as a sign that our valuation isn't challenged.

Sometimes after particularly strong earnings news — as **Rockwood Holdings** had last week — members ask whether we'll raise our fair value estimate. Sometimes we will, but that's mainly because we're conservative with our fair value estimates to begin with. One quarter alone is rarely enough to increase a company's fair value (no matter what any Wall Street broker tells you). A discounted cash flow model aims to forecast a few decades of earnings, so it would take a big surprise to move a value range that already has a built-in margin for error.

If you want to review a company's 10-Q, bookmark this SEC page. Enter your company's name or ticker symbol, and you can check out the 10-Q and the mother of all reports — the annual 10-K. We spend a whole lot of time in 10-K land here at *Pro*.

We're on Call

Community & Coverage

- Jeff (TMFFischer) summarizes the results from **Rockwood Holdings**.
- Nick (TMFCrow) chops up recent numbers from **Plum Creek Timber**.
- Andrew (TMFRedwood) summarizes **3D Systems**' first quarter and reminds investors to be patient. Meanwhile, members actively discuss the company and its volatile stock.
- Member Angelstar888 joined *Pro* in January but is just getting started. Several members help him get the ball rolling.
- Another new member, trouttt, asks, "Should I still buy near fair value?" and Jeff responds. (Watch for an upcoming Memo all about this topic.)
- Some CAPS participants have picks that are highly concentrated in one industry. TMFEldrehad discusses the implications.

Another key part of *Pro*'s quarterly review involves going over the conference call that most management teams host immediately after reporting results. Here you can get candid answers and insights that aren't in the press release or the 10-Q filing. In fact, I'd say that conference calls tell me more about the state of the world economy than anything else because management teams at multinational businesses frequently discuss the economy as they see it region by region.

Most companies post audio replays of their conference calls on their investor relations website for weeks afterward. However, audio is a time-consuming way to review the call. We usually wait for the transcript of the conference call from Capital IQ (a service the Fool subscribes to), which usually posts it within a day or two. Going through the call point-by-point drives home our understanding of the situations a company faces. Analysts usually ask questions that dig into any concerns surrounding the company, and various mangers answer. Then, we summarize the conference calls for you on *Pro*'s company discussion boards (see our links to the side in each Monday Memo).

Conference calls also tell you about a company's culture. **Tupperware** and **Ebix** are run by CEOs who like to answer most questions — Ebix almost to a fault. At **Oracle**, CEO Larry Ellison plays a small but vocal role in most conference calls, making his points, but letting his management team answer most queries. The conference call is where we learned about Tupperware's plans to improve its situation in Japan and why it believes it has tremendous room to grow in emerging markets. We learned that **Intel**'s management team believes the PC corporate refresh cycle isn't even half over yet and that Ebix plans to launch software that integrates all of its offerings. We also learned that 3D Systems' management team believes the company is right on track.

Putting It All Together

Upcoming Earnings

- May 3: **AmTrust Financial Services**, **Jack Henry & Associates**, and **Papa John's International**

Each time a *Pro* company announces results, right after reading the press release, we scoot over to the SEC website for the full details in the 10-Q filing, review the conference call, and assimilate the new information (and, quarter by quarter, our knowledge grows). We compare all the financials in the SEC filing with our estimates to make sure we're still in the ballpark. This can take several days for each company, so we'll go where we're most needed — 3D Systems' stock has fallen every day since the company announced earnings last week, so that's where our focus is right now rather than on a company whose stock jumped after earnings, such as Tupperware or Rockwood.

As veteran *Pro* members know, depending on the quarter (did a lot of companies surprise us?), we'll issue a full quarterly update the month after earnings, updating all of our relevant holdings. Guidance changes also trickle in through every Monday Memo as stock prices make big moves (see our sidebar). Questions? Please visit the Memo

Musings board.

Foolishly,

Jeff Fischer

Jeff owns shares of AmTrust Financial, Intel, Tupperware, GlaxoSmithKline, Ebix, Oracle, and 3D Systems, and has options positions on Rockwood Holdings and 3D Systems.

Don't Fire Until You See the Whites of Their Eyes: Part 3

Published Apr 25, 2011 at 12:00AM

If you missed the first two parts of our Memo series on evaluating management, check out Part 1 on **TradeStation** and Part 2 on **Ebix**.

I sit next to *Pro* analyst Andrew Sullivan (TMFRedwood) every day, but I know next to nothing about his investment process. (We're usually too busy chatting about his international escapades to actually discuss important stuff like that.) So it was great to steal a few minutes of his time to learn how he evaluates management and what he looks for on company visits. Along the way, we talked about his recent sit-down with the brain trust at **3D Systems**, *Pro's* most recent new Buy recommendation.

Guidance Change

TradeStation , a stock in both our Charter and 2011 portfolios, is set to be acquired by **Monex**. We've moved it to Hold.

What to Look For: Sullivan-Style

Bryan Hinmon: I'll start with the same question I asked Fool.com analyst Eric Bleeker last week: What role does investigating a company's management play in your investment process?

Andrew Sullivan: It plays a huge role — management is an essential part of the investing process. Companies are collections of people working together to achieve goals; understanding people and culture opens a window into how successful the company will be. Management is important, but more so is the culture of the rank and file that drives the company.

BH: Have you ever been surprised by a culture during a company visit?

AS: Absolutely. Culture is almost impossible to understand unless you step foot in the offices and meet the people. One culture in particular surprised me: that of **PowerSecure International**, an energy-services company I've written about. After reading SEC filings and doing my research, I had a negative opinion about the company — I didn't like the rapid changes in its business units. But I decided to visit anyway.

My initial impression couldn't have been more wrong. During my visit, I saw that PowerSecure is essentially a company of entrepreneurs, and innovation courses through its corridors. Once I understood that, my qualms eased, and I became excited about PowerSource; companies like this are rare and can create tremendous value. Sometimes the surface (financials, reports, documents) looks unflattering, but under the surface (culture, innovation) lies a powerful engine. Those crucial, sub-surface ingredients didn't show up in any 10-K or proxy statement I read, but even if they did, I still wouldn't have known how real they are without seeing for myself.

BH: When you visit a company, what are you looking for?

AS: Every company's business, industry, and situation are so different that you can't compare them, but in general, I look for frugality, humility, and honesty in management. Another thing I'm on the lookout for is a sense of engagement in employees.

Upcoming Earnings

And they're off!

- **April 25: Plum Creek Timber**
- **April 26: Kinetic Concepts**
- **April 27: GlaxoSmithKline** , **Rockwood Holdings**, **Tupperware**, and **GrafTech International**
- **April 28: 3D Systems**
- **April 29: NextEra Energy**

BH: Both Eric and I have a few go-to questions we like to ask managers. Do you have any "can't-miss" questions?

AS: I always ask about the company's background. To understand where a company is going, you have to know where it has been and what it's capable of. Another question is what the CFO and CEO spend most of their time on — this gives you insight into short-term performance. Finally, I ask about the biggest challenges facing the company and, similarly, what its biggest competitive threats are. This helps me gauge how long a company's competitive edge will last.

Staring Into the Eyes of 3D Systems

BH: You recently met with the team at 3D Systems. How did management respond to your questions?

AS: First, I learned that 3D Systems invented the technology behind 3-D printing. Chuck Hull, who came up with the idea in 1986, founded the company and is still chief technology officer. Second, it was clear that management is spending a lot of time making 3-D printing accessible to the masses. The company is creating consumer-focused software and applications — sort of like an app store, if you will — for 3-D printing. The easier the company makes 3-D printing, the more the market will grow. 3D Systems' other priorities include expanding sales to the health-care market and making acquisitions, an area in which management is skilled. Lastly, on competition, I learned that the replacement materials for 3D Systems' printers are highly engineered, and this gave me confidence that the company can protect its competitive position for a good amount of time.

Community & Coverage

- Jeff (TMFFischer) digs into **Intel's** earnings and prints a fine (albeit 2-D) post on 3D Systems.
- Nick (TMFCrow) covers **Wells Fargo**'s latest earnings.
- Bryan (TMF42) explains why you shouldn't feel sorry for *Pro;* we signed up for this gig.
- In case you were wondering: How Bullish is the Pro?

BH: What were you able to learn that you hadn't known from simply reading up on the company?

AS: Honestly, I was lukewarm on the stock given its then-recent run-up, so I wasn't expecting to be excited. That opinion was reversed by a few factors. First, I discovered that the management team is a true gold mine. It's focused on business strategy, and I think it will guide the company in ways very rewarding to shareholders. I also learned that the company's growth is for real — it is on the cusp of something great. Finally, the people are very engaged; one new executive even relocated from San Francisco to 3D's headquarters in South Carolina because of the passion she feels for the company. So, the total experience was completely different than seeing the company on paper.

BH: But knowing you, I'm sure you've maintained a dose of skepticism. What should we look for to make sure the company is progressing as you expect?

AS: We need to watch sales growth and margin expansion. I'm confident in the company, but if growth isn't as strong as we think, it could affect 3D Systems' value.

The *Pro* Bottom Line

Andrew's final answer is a good takeaway for our three-part series: If the strategic direction and culture that management builds don't actually drive operational execution, we shouldn't care about management. So if you're taking the time to investigate the wizards behind the curtain, make sure you're also linking it all back to business performance. The jury is still out on 3D Systems, but Andrew sure likes what he sees.

Bryan Hinmon (TMF42)

Next Steps

- If you'd like to ask Andrew any questions about his visit to 3D Systems, give him a holler on the 3D Systems discussion board.
- Follow all our coverage of 3D Systems by adding it to My Scorecard.

Trade Roundup

Portfolio 2011

- **GrafTech International** : Wrote five September 2011 $17.50 puts for $0.75 each.

Andrew owns shares of PowerSecure International. Jeff owns shares of Intel. Nick owns shares of Wells Fargo.

Portfolio 2011: Write Puts on GrafTech International

Published Apr 20, 2011 at 12:00AM

First Things First

- **Company: GrafTech International**
- **Market cap:** $2.9 billion
- **Website:** www.graftech.com
- **Type of holding:** Long-term, industrials
- **Strategy:** See our guide to writing puts
- **Follow It:** Add GrafTech to My Scorecard

At a Glance

- **Action:** Write ("sell to open") September 2011 $17.50 puts
- **Allocation:** About 3% (for *Pro*'s Portfolio 2011, that's five contracts)
- **Stock price:** $20
- **Buy around:** $17.50
- **Option price (bid/ask):** $0.85/$1.25
- **Preferred price:** After reviewing prices, try a limit order of about $1 if feasible; as prices change, ideally accept no less than $0.80 (or 1% yield per month to expiration).
- **Why write puts?**
  - GrafTech is one of the leading manufacturers of graphite electrodes used to produce steel and has few competitors, but its stock trades a bit higher than where we'd like new buyers to jump in.
  - We expect electric arc furnace steel production (more on that later) to keep swiping market share from traditional steel-making methods, which should boost demand for GrafTech's products.
  - While we're waiting for a global economic recovery and infrastructure build-out, GrafTech is focused on constraining costs and investing in its less cyclical, growing, highly engineered business segment.

What's New?

Pro first recommended buying **GrafTech International** in our Charter Portfolio in December 2008. Since then, GrafTech has grown larger and bought out its leading supplier. For *Pro*'s most recent analysis, read our updated guidance.

Guidance for Charter Portfolio Members

The Charter Portfolio already has a full position in GrafTech (4.9%). If we choose to increase our target allocation, we'll let you know, but we're not taking new action in our Charter Portfolio at this time. However, if you're a veteran member who doesn't yet own shares or you're looking to own more, you can follow this trade alert for Portfolio 2011.

Why This Strategy?

When it comes to supporting global economic growth and infrastructure build-out (i.e., building bridges, rail lines, and the like), steel is a hot commodity. The most economical and energy-efficient way to melt steel is by using an electric arc furnace to melt scrap metal, which can then be formed, cooled, and used for all sorts of projects. GrafTech makes graphite electrodes, which serve as conductors of heat and electricity inside those furnaces. (We're talking extreme heat here: Temperatures reach half that of the sun!) In short, if you need steel, graphite electrodes are your friend, and GrafTech has 14% global market share selling them.

Plus, thanks to its April acquisition of Seadrift Coke, GrafTech now looks to be the low-cost leader in its industry. It has few competitors, and any company that wants to shoulder its way into this industry faces high barriers to entry, including cost, manufacturing knowhow, and the importance of long-term customer relationships — barriers that allow GrafTech to keep cranking out healthy (and growing) profits with relatively little interference from new competition. Combine these advantages with a straight-shooting long-tenured CEO and a healthy balance sheet, and we don't mind owning what others may consider to be a simple cyclical manufacturing firm.

As for growth, we expect global economic growth and infrastructure spending to increase eventually. Until then, GrafTech will continue to benefit as electric arc furnace production grabs market share from traditional steel production methods. Also, GrafTech's smaller segment, high-tech engineered solutions, has strong growth potential thanks to its exposure to expanding alternative energy and electronics markets.

How to Follow Along

We're looking to add shares of GrafTech near or below our $17.50 Buy Around price by writing puts. If shares don't drop below our strike price, we'll be patient and happily keep our option income. We think shares are reasonably valued at current prices, as reflected in our Hold rating. But at a net price around$16.50, we would want to scoop up shares to initiate a 3% (3.3% to be exact) position. If you can't write puts, sit tight and wait for an opportunity to buy shares outright near $17.50.

You need options approval to write puts, and the trade command is "sell to open" or "sell." (*Do not buy these options!*) Sell one contract for every 100 shares of GrafTech you're willing to purchase later. (Each contract represents an obligation to buy 100 shares, or $1,750 worth of GrafTech stock.) Writing these options will "pay" you the option premium up front; then we'll wait until expiration nears (on Sept. 17) to determine our next move.

Our initial potential profit is whatever the puts pay us; we have an obligation to buy shares of the stock if they fall below the $17.50 strike price by expiration. If we get shares, our net start price will be around $16.50. (We buy our shares at $17.50, but still keep the $1 or so the puts pay us.) Since we fully intend to take share ownership if assigned the shares in September, make sure you have $1,750 available, per the contract, to snap up shares.

Next Steps

- Questions or comments? Still getting used to all this options jargon? Visit our GrafTech discussion board.
- Stoked to learn more about writing put options? Head over to the All About Options board.
- Want to track GrafTech? Add it to My Scorecard.

Pro Portfolio 2011 will write puts on GrafTech in the next one to 30 days, per The Motley Fool's trading guidelines.

Don't Fire Until You See the Whites of Their Eyes: Part 2

Published Apr 18, 2011 at 12:00AM

In last week's Monday Memo, I wrote about taking tally of company management, how I've built that step into my investing process, and what I looked for and learned during my visit to **TradeStation Group**'s headquarters.

My process works for me, but it ain't for everyone. So I sat down with Fool.com tech guru Eric Bleeker to learn about his process and hear whether he uncovered any valuable information during the **Ebix** investor conference and his face-to-face chats with CEO Robin Raina and CFO Robert Kerris. Here are excerpts from our conversation:

Guidance Change

Kinetic Concepts , a stock in our Charter Portfolio, moves down to Hold on valuation.

Important Dates

Did someone say earnings?

- **Monday, April 18: TradeStation Group**
- **Tuesday, April 19: Intel**
- **Wednesday, April 20: Apple** and **Wells Fargo**
- **Thursday, April 21: L-3 Communications**

What to Look For: Bleeker-Style

Bryan Hinmon: What role does investigating management play in your personal investment process?

Eric Bleeker: It's important because having a candid talk with the CEO can give you impressions you might not get from a highly scripted conference call or other speaking events. For a company with a flamboyant CEO, I think it's even more important — and that's true of Ebix's Robin Raina. His character and charity dealings were part of a recent short-seller attack, and he tends to have an infectious optimism about the business, which makes it difficult to take some of his statements at face value. Being face-to-face with a manager allows me to ask some change-up questions or probe more deeply into his focus on creating long-term value. The answers to these sorts of questions are much more valuable to me and provide me more insight into management than just looking at compensation or stock ownership.

BH: Has one of your "change-up" questions ever led to a surprising revelation?

EB: We had a prominent fund manager stop by the Fool to give a talk. In the late 1990s, he spoke with Enron's Jeff Skilling, and during the course of the interview, Skilling revealed that he'd transferred a manager to England to move her farther away from corporate upper-level managers. After hearing about such poor managerial decisions, the fund manager decided to exit his Enron position — well before the company's implosion. Such examples of mismanagement aren't common, but speaking to managers in a setting where they feel comfortable makes them more likely to shoot from the hip. You can glean insight into whether their decision-making is long-term and in step with shareholders' interest.

BH: That makes my skin crawl. What sort of things do you look for when you visit a company?

EB: My purpose is almost always focused on assessing how strong a company's competitive advantages are and whether management is properly focused on the long term. I try to get management talking about the company's strengths and weaknesses, and then I can see whether recent decisions align with their responses. If the CEO highlights a weakness and the company hasn't taken any actions to shore it up, you can have a problem. Even worse, management could be flat-out in denial and tell you that no weaknesses exist. I like to see management be candid about self-criticism.

BH: Anything else?

EB: I like to keep it big-picture. At the Ebix event, many of the other analysts seemed to care only about a relatively minor valuation allowance. I understand that accounting questions can be a canary in the coal mine, but I was stunned by the complete lack of focus on the larger issues that will drive Ebix's value.

Can't-Miss Questions

BH: What are a few questions you always ask managers?

EB: I've got a few. For one, I like to ask about the two main areas driving the business. You get to see managers' thought process on what they think their main strengths are and how well they can articulate a long-term plan for them.

Also, it's always nice to see management independently bring up Foolish traits. For example, when I spoke to Jason Rhode, CEO of **Cirrus Logic**, he independently brought up the fact that creating an award-winning culture keeps talent in place and inspires the company's design process. His praise of the company's unique culture as a key strength wasn't something I was used to hearing from semiconductor CEOs, but it really impressed me.

Then, a question that nicely dovetails with that is asking who the company thinks of as its main competition — and what advantages its competitors possess. This is a bit like the "What is your greatest weakness" question" we all dreaded heading into college. You have to give credit to executives who give a really honest and humble answer.

Staring Into the Eyes of Ebix

BH: There has been a lot of noise around Ebix lately. A poignant opinion piece published on an investing website attacked the company and basically called it a fraud. Did Ebix address this when you were there?

Coverage & Community

- *Pro* members explore how after-hours trading may affect your expiring options.
- Member alex340 runs down calls and puts that look attractive.
- Jeff (TMFFischer) ambles down memory lane with an old Rule Breaker.

EB: The company refuted the article point by point. Ebix remains a heavily shorted stock, but management has become better about addressing short-seller concerns. The fact that the company is still being targeted says something about a need for more transparency, but the presentation at the investor conference was also geared toward addressing each concern as directly as possible. Providing more transparency on these issues will only better reward shareholders, and Ebix should be able to do that without compromising any of its strategic interests.

BH: What's your take on the business?

EB: The company's EbixExchange platform looks very well entrenched in the insurance industry. Some of the low-hanging fruit seems to have been taken, and larger cross-sales — such as expensive customer-relationship-management modules — will be difficult to sell to larger issuers. But Ebix still has quite a bit of room for growth with its products that allow information to flow more freely from insurance originators to the carriers who hold the policies.

BH: So Ebix isn't a fraud?

EB: That's the billion-dollar question, isn't it? I'll say this: I think management did a pretty good job of addressing recent short-selling accusations. There's still more work to be done, but better research has shown that many of the short-seller complaints were the result of sloppy analysis. Some of the company's recent acquisitions do make me a bit gun-shy, though. I don't find them as core to the business, which plays into the line of thinking that the company is obscuring organic growth through an overly acquisitive strategy.

BH: What could derail the company's further growth?

EB: Kind of leaning back on that last response, Ebix is making more acquisitions, and the way it proceeds with its acquisition strategy might define the company's future.

BH: Can you expand on that?

EB: I'd be leery of future acquisitions that push the company away from its core operating fields. By this, I'm talking about areas such as health care. Although the company may feel strongly about its A.D.A.M. acquisition, it strikes me as getting further and further away from Ebix's key strength of creating software to automate an insurance industry. A.D.A.M. is essentially a health portal that ties into health-benefits packages. I can see how this presents some cross-sale opportunities, but expanding into this area also strikes me as a large risk. I'd rather see the company putting its cash to work in establishing exchange networks in lucrative developing markets. For now, Ebix should focus on enhancing its presence in attractive and hard-to-disrupt fields, and then come back for the more tangential growth areas later.

The *Pro* Bottom Line

It's clear that Eric likes to focus on the big picture when talking with management. Consequently, his concerns about Ebix center more on the quality and direction of recent acquisitions than anything else. Next week, we'll get *Pro* analyst Andrew Sullivan's takeaways from his visit with our most recent Buy recommendation, **3D Systems**.

Foolishly,
Bryan Hinmon (TMF42)

Next Steps

- Think speaking to management is bunk? Some investors do — *Pro* analyst Nick Crow (TMFCrow) included. Share your thoughts on our Memo Musings discussion board.
- Have a question for Eric about his Ebix visit? Shout it out on our Ebix discussion board.

Trade Roundup

Charter Portfolio

- **3D Systems** : Bought 600 shares (2%) at $49.90 on April 11.
- **Contango Oil & Gas** : Bought 200 shares (1%) at $60.69 on April 12.
- **Papa John's Pizza** : Bought to close 14 April $27 calls at $4.50 each. Sold to open 14 October $30 puts and 14 October $32 calls (a covered strangle) for $2.90 combined, all on April 15. Our April $25 puts expired for the full cash gain.
- **Apple** : Bought to close 2 April $330 puts at $0.83 on April 15.
- **L-3 Communications** : Bought 500 more shares (2.7%) at a net $77.70 via put options on April 16.

Portfolio 2011

- **3D Systems** : Bought 150 shares (2.8%) at $50.06 on April 11.
- **Medtronic** : Bought 154 shares (2.5%) at $40.44 on April 11.
- **Contango Oil & Gas** : Bought 40 shares (1%) at $60.99 on April 12.
- **L-3 Communications** : Bought 100 more shares (3%) at a net $77.70 via put options on April 16.

Eric owns shares of Cirrus Logic. Jeff owns shares of Apple and Kinetic Concepts. The Motley Fool owns shares of Apple and Cirrus Logic. Motley Fool Alpha LLC owns shares of L-3 Communications.

Charter Portfolio: Buy to Close Puts on Apple

Published Apr 14, 2011 at 12:00AM

At a Glance

- **Action:** "Buy to close" April 16, 2011, $330 puts *if* Apple shares dip below $330 by Friday
- **Recent option price** (bid/ask): $0.74/$0.77
- **Preferred price:** As little (and as little time value) as possible; if the stock remains above $330 Friday, you can just let the puts expire for $0.
- **Recent share price:** $334
- **Allocation:** Close all puts (2 in Charter Portfolio)

What's New?

On January 4, we announced a trade to write ("sell to open") April $330 puts on **Apple** (NASDAQ: AAPL), and the next day we received $18.50 per share as payment. At the time of that alert, Apple traded at $332 — nearly the same price as today. Since then, however, the value of our puts has shriveled to $0.77, paying us almost everything they possibly can. We want to capture this income, so if the stock dips below $330 on Friday, we'll buy to close these puts for a profit, rather than accepting the shares.

Why This Strategy?

First, this is a useful strategy for Fools who want to protect their capital while pocketing some profits (two main goals of *Pro*'s Charter Portfolio). Plus, we continue to believe that, at least for now, we may be able to make more money — or as much money — by writing puts on Apple as we could by owning shares, and with less risk. In fact, we're already about $17 per share ahead of where we'd be had we bought the stock.

There's also the fact that Steve Jobs has been on medical leave since January 17. Wall Street has high expectations of Apple, and Jobs' absence is concerning, at least in the short term, given the company's need to keep innovating. Finally, anytime you write puts and can earn most or all of the "expiring" income they offer, rather than accept the shares, it usually makes sense to take the timely income and look to write puts again — unless you believe the stock is bound to rise sharply soon. Taking all these factors into consideration, we will buy to close our puts if the stock declines below $330 by Friday. If it doesn't, we'll just let the puts expire for the full gain.

How to Follow Along

To make this trade, "buy to close" your existing April $330 puts. **If Apple shares stay above $330 by the end of Friday, you would not need to close your puts — they would simply expire. We're assuming that this will happen, but we're ready to close the puts if Apple shares slip.** Either way, we stand to make most or all of the profit on our written puts.

Profit on Written Apple Puts	
Premium received from selling April $330 puts	$18.50
Current cost to buy to close	($0.77)
Net gain*	$17.73
Gain on cash	5.3%
Annualized gain	Around 19%
Return on equity (using 30% cash, or $99 per share)	17.9%

* Gain is based on the cash or equity needed to hold the trade open and excludes commissions.

Our returns will be higher if Apple shares stay above $330 Friday and the puts simply expire for the full cash gain. To repeat, that's what we're hoping for, but if it doesn't turn out that way, we'll buy to close these puts — and then consider our next possible position on Apple.

- Questions? Please visit our Apple discussion board.
- *Pro*'s Charter Portfolio will buy to close its puts on Apple if the stock is below $330 on Friday.

Jeff owns shares of Apple. The Motley Fool owns shares of Apple.

Charter Portfolio: Roll Your Covered Strangle on Papa John's

Published Apr 13, 2011 at 12:00AM

At a Glance

- **Actions:** Buy back ("buy to close") your April 2011 $27 calls. Using a strangle order, write ("sell to open") October 2011 $30 puts, and write ("sell to open") October 2011 $32 covered calls. (We also wrote $25 April 2011 puts as part of our original covered strangle, but we are leaving those alone because we expect them to expire worthless. See below for more details.)
- **Recent share price:** $30.79
- **Allocation:** No change; we are still covering all of our shares in Papa John's, about half of our targeted 5% allocation, and we're writing puts to potentially buy the other half.
- **Alternative trades:**

  - **If you own at least 100 shares but don't want to buy more:** You can just write the covered-call side of the strangle, which will bring you income.
  - **If you don't want the obligation of holding two sets of puts on Friday, April 15:** Either buy back ("buy to close") both legs of your original strangle first, or just close the covered-call leg, let the puts expire, and wait until Monday, April 18, to reestablish the covered strangle.

What's New?

Papa John's International (NASDAQ: PZZA) has performed well despite rising commodity costs and competitive discounting. Another challenge beyond the company's control is the NFL lockout. As David Flanery, former CFO, said in a recent conference call, "football and pizza work great together." Let's hope negotiations go well so players can return to the gridiron — and give fans an excuse to stock up on extra pies for the game.

Papa John's shares have continued to appreciate since we bought them, but if we don't take any action now, we'll lose our shares upon expiration because they're currently trading above our written calls' strike price. We like the steady nature of Papa John's business and aren't keen on letting go of our shares too soon. So, to hold onto them and capture more upside, we're rolling our calls and reinstituting our covered strangle.

Why This Strategy?

If you're starting to feel a hint of déjà vu, it's for good reason: Last October, we rolled our covered strangle on this pizza purveyor (back when the stock traded for $26.90). Now, rather than let our calls be exercised at the $27 strike price, we can roll our covered strangle for a $2.25 credit. The new covered strangle offers us $34.25 as a potential net sell price, 15% better than our current strangle's $29.80. If the stock stays between $30 and $32 by expiration, we get to pocket the premium.

What We're Doing	What It Costs
Payment received for writing April $25/$27 strangle	$2.70
Cost to "buy to close" April $27 calls	($3.90)
Net cost to close April calls	**($1.20)**
Payment received for writing October 2011 $30/$32 strangle	$3.30
Total net credit from "rolling up"	**$2.10**
New net sell price if called	$34.25
Net sell price from last roll if called	$29.80
Return from "rolling up" to October (excluding commissions)	**14.9%**

How to Follow Along

We recommend you:

- **Buy back ("buy to close") the April 2011 $27 calls for about a dime more than intrinsic value, currently $3.90.** (You can leave your April 2011 $25 puts alone; we expect those to expire worthless this Saturday.)
- Then, using a strangle order, **write ("sell to open") October 2011 $30 puts, and write ("sell to open") October 2011 $32 covered calls.**

Remember: To write a covered strangle, you must own at least 100 shares of the stock, and you should be happy to buy at least 100 more at a lower price. In this case, write one covered call for every 100 shares of Papa John's you own, and write one put for every 100 additional shares you would be willing to buy.

Trade Details

- **Use limit orders, Fools:** These bid/ask spreads are wide, so aim for execution around the midpoint of each.
- **Recent options bid/ask:**
  - Sell to open October 2011 $30 puts, $1.70/$2.00
  - Sell to open October 2011 $32 calls, $1.60/$2.00
- **Combined credit target:** $3.30 or so per share, net credit (use a strangle order)
- **Effective options yield:** 10.7% of recent share price ($30.79) in six months; half that on the full potential purchase
- **Potential net buy price of new shares:** $27.90 (9.4% below current price)
- **Potential net sell price on our current shares:** $34.10 (10.8% above current price)

Keep in mind that anytime you write puts, your broker sets cash or equity aside to cover your potential stock purchase. In this case, these $30 puts pay a 6% yield on cash set aside over the next six months. If Papa John's stock is between $30 and $32 on expiration, both options will expire for the full cash gain, allowing us to renew this strategy once again.

Don't Fire Until You See the Whites of Their Eyes: Part 1

Published Apr 11, 2011 at 12:00AM

Trade Roundup

- April 11: Portfolio 2011 bought 154 shares of **Medtronic** at $40.44.
- April 11: Charter Portfolio bought 600 shares of **3D Systems** at $49.90.
- April 11: Portfolio 2011 bought 150 shares of **3D Systems** at $50.06.

The above command is attributed to William Prescott, an American officer at the Battle of Bunker Hill. (My time living in Boston taught me that the battle was actually on Breed's Hill, but I won't quibble here.) And while I'm a fan of American history, I'm an even bigger fan of investing, so I can't help but view Prescott's command through my investing lenses. Doing so reminds me of the need to gaze into the eyes of the decision-makers at the companies where we park our hard-earned investing dollars.

After all, companies are driven by the handful of leaders who shape a culture that guides decision-making at every level of an organization. And here at *Motley Fool Pro*, we don't like to make a full allocation to a company unless we've gazed into the eyes of its key leaders.

So today's Monday Memo is the first in a three-part series that will pull back the curtain on what we Fools do, think, and look for when we investigate, talk with, or visit company management teams. Today, I'll describe my recent visit to **TradeStation Group** to show you how I evaluate management, and in your next two Memos, I'll interview Fool.com analyst Eric Bleeker and *Pro* analyst Andrew Sullivan about their recent visits to **Ebix** and **3D Systems**.

If digging down on management isn't central to your investing process, I urge you to consider adding it.

Important Dates

This Friday, April 15, is expiration Friday! We have three options positions to keep an eye on:

- **Apple** $330 written puts: Beware! Each Apple written put represents a $33,000 potential obligation. If you don't want these shares, "buy to close" your puts.
- **L-3 Communications** $80 written puts: We're prepared to take shares if the stock closes below $80 on Friday.
- **Papa John's International** $25/$27 covered strangle: We're considering our options, but rolling this strangle before the end of the week looks likely.

What to Look For

That's because management is a key investing consideration. It's so important that it's one of the first steps in my investment process — No. 3, to be specific. I like to weed out as many companies as fast as I can to avoid wasting time, so some of the first things I read about a company are its proxy statement (SEC form DEF14A) and its annual shareholder letters. Then I try to answer three questions:

1. Are the members of the executive team also owners in the business?
2. Are the compensation incentives properly aligned to encourage good, long-term decision making?
3. Is there a long-term vision in place, and is it clearly articulated?

If the answers are yes, I've improved my chances of investing in a management team that will keep a long-term mindset, even if it means minor turbulence in the short term. The best situations arise when a management team meets the above conditions *and* diplays passion for the company.

When I visit a company, I always take note of inconsistencies. If a company touts its cost-consciousness, I balk upon seeing lavish headquarters. Or if the company prides itself on being egalitarian, I'll raise my eyebrows at assigned parking spots. These things may sound inconsequential, but I'll bet that rank-and-file employees are aware of such discrepancies and that it affects their daily attitudes and actions.

Can't-Miss Questions

Whether you're speaking to management over the phone or in person, every investor should have a few go-to questions. For example, I always ask:

1. Which CEOs outside your industry do you admire, and why? Which competitor do you most admire, and why?
2. How do you allocate your time on a daily basis?
3. What qualities are must-haves when you're looking at a new hire?

I also try to hit on the metrics the company looks at internally, five-year plans and expectations, how success will be measured for key initiatives, reinvestment opportunities, and how budgets are set and capital projects assessed.

Staring Into the Eyes of TradeStation

I recently visited the company headquarters for *Pro* holding TradeStation. The visit left me with a more positive view of the company and its place in our *Pro* portfolio: I have a clearer picture of the company's culture, the stickiness of its software, and its avenues for growth. Equally as reassuring, though, were the answers to the can't-miss questions I tossed at CEO Sal Srendi and CFO David Fleischman.

Srendi cited Steve Jobs as a CEO he admires because of Jobs' ability to create products that consumers "don't even know they want." With its trading software, Srendi said, TradeStation is trying to take a problem and create an entirely new solution that becomes indispensible, just as Jobs has so successfully done.

As for which of TradeStation's competitors Srendi admires, he chuckled and said he respects all of his competitors because they have built big businesses. He said he has to respect them because of their size relative to TradeStation. But his undertones were clear and full of confidence: Bigger doesn't mean better.

The two executives told me that they spend their time meeting with department managers (the decentralized organization lends itself to this), listening to customers' suggestions, and thinking about how to enlarge the business. They noted that a mediator runs the company's strategy meetings, which ensures that everyone has a voice. And both men are incredibly data-driven and like to be in tune with how business is trending. Fleischman carries around an accounting calculator (an HP 12C for you finance geeks out there) and keeps another in his car.

When I asked about the characteristics of new employees, Fleischman reiterated that TradeStation is a technology-driven company that happens to have a brokerage business built around its software. The problem is that the average techie doesn't necessarily fit the profile of a brokerage employee. So the key, he said, is to find an incredibly talented tech-minded worker who genuinely cares about customer service. That combination lends itself to hiring workers who buy in to TradeStation's mission and will stay with the company for a long time.

The *Pro* Bottom Line

Company visits and management conversations can be dangerous: You're unlikely to hear any bad news, and many executives have climbed the corporate ladder because they're charming. But at *Pro*, we believe that making an investment without trying to get a feel for management is little-f foolish. Instead, we'll continue to research this valuable piece of the investment puzzle, take our management interactions with a slug of skepticism, and only invest our dollars alongside decision-makers we believe in.

Fool on!

Portfolio 2011: Buy Medtronic

Published Apr 8, 2011 at 12:00AM

Pro first recommended **Medtronic** in our Charter Portfolio in July 2009. We've since written puts and bought additional shares. Click here to see our complete recommendation history.

First Things First

- **Company**: **Medtronic**
- **Market cap**: $42 billion
- **Website**: www.medtronic.com
- **Type of holding**: Core; health care
- **Options**: We may eventually write puts to increase our allocation to 5%.
- **Tax considerations**: Medtronic pays a 2.5% dividend.
- Add Medtronic to My Scorecard.

At a Glance

- **Portfolio 2011 action**: Buy 2.5% (for Portfolio 2011, that's 150 shares)
- **Recent price**: $40
- **Buy around**: $39
- **Fair-value estimate**: $48
- **Alternative trades**: If you prefer to write puts, the May $38 contracts (recently $0.60) and August $38 contracts (recently $1.27) are reasonable ways to try to purchase shares.
- **Why buy**:
  - Medtronic has a bulging product pipeline, dominant market share in key segments, and underappreciated growth potential.
  - Innovation is hard-wired into the company's culture, where nearly $0.10 of every sales dollar flows right back into research and development.
  - Medtronic generates an enviable profit margin and high returns on capital and has a strong balance sheet.

The Big Picture

It's not all rainbows and unicorns in the medical-technology world. Competition puts constant pressure on the leading technologies, the recession has slowed surgery volumes, hospitals are trying to cut costs at the expense of device makers, and the Patient Protection and Affordable Care Act is poised to levy a 2.3% excise tax on medical devices beginning in 2013. If that weren't enough, the Food and Drug Administration is adding complexity and cost to its clinical trial process by requiring more evidence-based data.

Even so, the medical-technology business is attractive, in part because the global population is growing older. In the United States alone, the 60-plus crowd is expected to grow from 18% to 25% of the population over the next 20 years. Add in the facts that chronic disease is the leading cause of mortality in the world (responsible for 60% of all deaths) and that spending on health care has historically risen at a rate faster than per capita incomes, and the medical-technology market remains large and growing.

Why Buy?

Our favorite medical-technology company hails from Minnesota and generated nearly $16 billion in revenue last year. **Medtronic** is the largest independent med-tech company, which has allowed it to outspend its rivals on research and development and build a global sales and distribution network to bring products to market faster than other companies. Its broad product portfolio (spanning cardiac rhythm, cardiovascular, diabetes, spinal, and other markets) aids it in negotiating with the hospitals, physicians, and governments that buy its products. And because physicians must be trained specifically to use the company's products, once the purchasing decisions are made, switching to a competing product is costly in terms of time and money.

The result of these competitive advantages is a financially healthy company. Medtronic generates gobs of free cash flow — about $3.8 billion per year over the past five — that it uses to acquire promising technologies, pay dividends, and buy back its stock. And although the company caries $10.8 billion in debt, investors aren't worried about Medtronic's ability to pay its bills. In early May, the company issued $1 billion worth of bonds at a rate less than 1 percentage point above Treasury rates.

But the sector-based fears cited above, combined with some slowing end markets and the search for a replacement CEO (Bill Hawkins is planning on stepping down this month) give long-term investors a chance to buy shares of this health-care bedrock at only 10.7 times forward earnings. We think shares are priced for little growth, which simply doesn't jive with the company's current products or bulging pipeline. If medical-technology companies regain investors' favor, the shares should have heart-pounding upside. Open your 2.5% stake in Medtronic today.

Next Steps

- **Want to follow Medtronic?** Add it to My Scorecard.

The Motley Fool owns shares of Medtronic.

Portfolio 2011 will buy a 2.5% stake in Medtronic in the next one to 30 days, per The Motley Fool's trading guidelines.

Charter and 2011 Portfolios: Buy 3D Systems

Published Apr 7, 2011 at 12:00AM

First Things First

- **Company: 3D Systems** (NYSE: DDD)
- **Market value:** $1.4 billion
- **Type of holding:** Long-term
- **Options:** Available, but you don't have to use them.
- **Follow along:** Add 3D to My Scorecard.

At a Glance

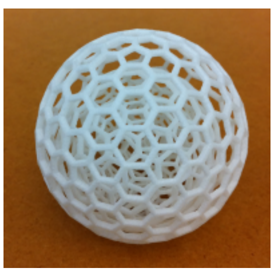
- **Buy around:** $21
- **Fair value:** $27
- **Alternative trade:** Write ("sell to open") any puts that would allow you to potentially buy shares cheaper, selling one put for every 100 shares you could buy.
- **Why buy:**
  - Immense growth potential
  - Leader in a disruptive industry
  - Attractive recurring revenue model

The Big Picture

If you haven't heard of three-dimensional printing, get ready — because it's revolutionizing design and manufacturing. The technology works like a souped-up ink-jet printer, but rather than putting ink on paper, it deposits layers of material and fuses them together, over and over on top of one another, until you've created a three-dimensional object. The value is immense because you reduce scrap, tooling costs, and the time it takes to get a product to market.

Company Visit: Inside 3D Systems

I had the privilege of visiting 3D Systems' headquarters in Rock Hill, S.C., last month. It is a fascinating and futuristic place (think machines building machines humming behind glass enclosures.) The lobby has a model Formula 1 car, a vacuum cleaner, and a car dashboard — all made by 3D Systems. I was impressed with the energy and the extremely competent and frugal executive team.



This is a ball manufactured using 3D Systems' printing technology. The company can print 300 of these balls at a time!

I'll share more about my visit in an upcoming Monday Memo. Stay tuned!

Three-dimensional printing is still a tiny market; the two biggest players reported combined annual sales of just $282 million last year. But industry leader **3D Systems** (NYSE: DDD) sees $1.4 billion in potential annual sales to the medical, dental, and aerospace markets alone — all industries that need high-value, low-volume parts that lend themselves to 3-D printing. Beyond that opportunity, the price of 3-D printers has come down to just $1,300, which could lead to incredible growth in personal printing, creating applications and industries no one's even thought of yet. We want to get ahead of this trend, so we're buying 3D Systems, the leading 3-D printing company.

Business

3D Systems invented the 3D printing industry in 1986, the year Chuck Hull founded the company and patented its first printing technology, stereolithography. Stereolithography uses a polymer resin that is cured by an ultraviolet laser one layer at a time, eventually building three-dimensional objects. Since those early days, 3D Systems has added five more 3D printing technologies, including selective laser sintering, which is similar to stereolithography except that it uses plastic and metal powder instead of liquid as the base material. These two technologies are the core of the company's business, although 3D Systems has a total of six so-called print engines, which gives it the flexibility to address all sorts of needs.

3D Systems has three major revenue lines: printers, printing materials, and services. Here's how they break out in terms of revenue and recent growth rates.

	Description	2010 Revenue	2009 Revenue	Year-Over-Year Growth
Printers	Large-scale production and personal printers	$55 million	$31 million	77%
Materials	The highly engineered "ink" of the production process	$58 million	$50 million	16%
Services	A business that creates parts on demand for end users	$47 million	$32 million	47%
Total		$160 million	$113 million	42% (27% organic)

Source: 3D Systems

The power of the company's business model is in the sale of consumable materials. They're not just ink in a cartridge — these materials are highly engineered, and 3D Systems sells them in a smart unit with electronics, which means they're unlikely to be quickly commoditized by the Lexmarks of the world. Materials revenue correlates with printer use and generates high margins, so unless customers stop using their printers, 3D Systems should benefit from highly predictable and profitable revenue growth from materials as it sells more printers each year.

Strategy

3D Systems' management team understands business strategy. Unlike its competitors, 3D Systems knows that its business isn't selling printers — it's helping creative minds turn design into reality. That's why it has the broadest product line in the industry and has bought many custom-order parts businesses over the past two years. Another way 3D Systems distinguishes itself from its competitors is that it's not vertically focused on pushing a particular printer out the door. Instead, it creates a horizontal set of solutions that meets all the needs of the design-to-manufacturing business. This also extends the company's brand.

Financials

The strategy is bearing fruit, as the numbers show. Sales jumped by $47 million in 2010 and profit expanded $19 million — a huge year-over-year improvement that shows how 3D Systems' operating leverage increases as its fixed costs are absorbed.

	2010	2009	2008	2007	2006
Revenue	$160 million	$113 million	$139 million	$157 million	$135 million
Operating Income	$21 million	$3 million	($6 million)	($5 million)	($19 million)
Net Income	$20 million	$1 million	($6 million)	($7 million)	($31 million)
Operating Cash Flow	$32 million	$8 million	($4 million)	$3 million	($9 million)

Source: Capital IQ.

Management expects it can earn $111 million in operating income on $300 million of sales, a stunning 37% operating margin. Even better, more than 70% of those sales would be recurring. This would translate into earnings of $66 million (a 22% net margin). Given 3D Systems' 27% organic growth last year, not to mention the potential for accretive acquisitions, I'm betting the company will hit these numbers quickly. Considering 3D Systems' potential to generate $66 million worth of earnings in fairly short order, today's $1.4 billion market cap is reasonable.

Valuation

3D Systems trades at only $1.4 billion with essentially no debt. It has fantastic (and improving) margins and is growing quickly. It's already revolutionizing the manufacturing process in many industries and looks poised to continue this trend. The opportunity here is tremendous, and I think 3D Systems' upside is a multiple of its current market cap — perhaps about $3 billion.

For another look, here's how 3D Systems stacks up with its closest competitor, **Stratasys** (NASDAQ: SSYS). As you can see, the two companies have similar market caps but diverging financials.

	3D Systems	Stratasys
2009 Sales	$113 million	$98 million
2010 Sales	$160 million	$117 million
Year-Over-Year Sales Growth	42%	19%
2009 Operating Income	$3 million	$6 million
2010 Operating Income	$21 million	$13 million
Patents and Applications	502	245
Market Cap	$1.4 billion	$1.1 billion

Source: 3D Systems.

Although both companies should do well as the 3-D printing industry develops (and Stratasys' growth could accelerate as its distribution arrangement with **Hewlett-Packard** (NYSE: HPQ) matures) we think 3D Systems is the better opportunity.

Egad! How Do They Do That?

How does 3D printing work? *The Economist* breaks it down in a fascinating article.

What Would Make Us Sell

As with any cutting-edge company, new disruptive technologies and competitors are key risks, but we think 3D Systems has a large enough lead and moat to maintain its leadership in 3-D printing. We expect the overall 3-D printing market to expand prodigiously, which would benefit all players. Still, we are wary of new technologies or signs that 3D Systems' products are losing appeal, so we'll keep close watch on both revenue growth and margins.

The Foolish Bottom Line

3D Systems' technology is breathtaking, and more importantly, so is its business model, characterized by low capital spending, immense operating leverage, recurring revenue, and fantastic growth potential. By investing in 3D Systems, we're buying into a classic growth story — one in which the riskiest years are already behind the company. I expect 3D Systems to solidify its leading position and become the industry standard in 3-D printing. What's more, the technology could lead to markets and profits we can't even conceive of yet. Don't hesitate to open a 3% position in 3D Systems today.

Next Steps

Do You Behave Like a Pro?

Published Apr 4, 2011 at 12:00AM

We Love Your Inbox

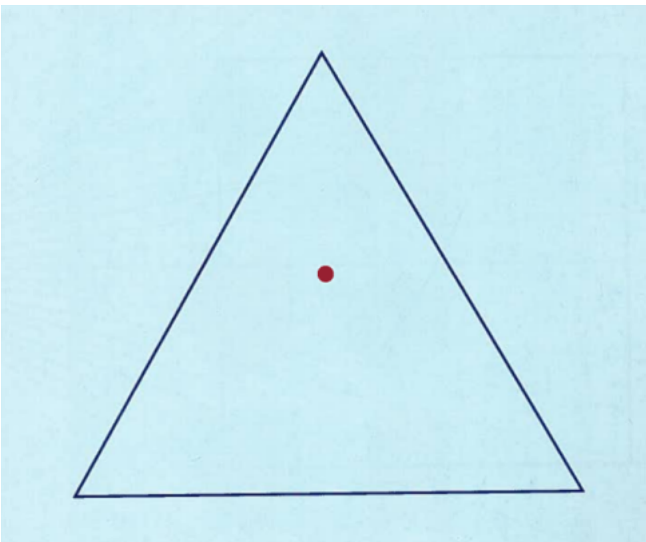
Fools, we're making two small changes to simplify your *Pro* email experience. Instead of sending you Trade Complete emails when our *Pro* portfolios have made the trades already recommended to you, we will now provide a new Trade Roundup section in each Monday Memo, outlining all of our transactions from the week before. We will of course continue to email you our buy and sell trade alerts in real time, allowing you to make the trades before we do — and ideally at better prices.

At least half of being a *Pro* investor is having the right temperament. Fortunately, if you weren't born this way, it's something you can learn. In today's Memo, I'll show you how to improve your ability to think about investments.

Heuristically Thinking

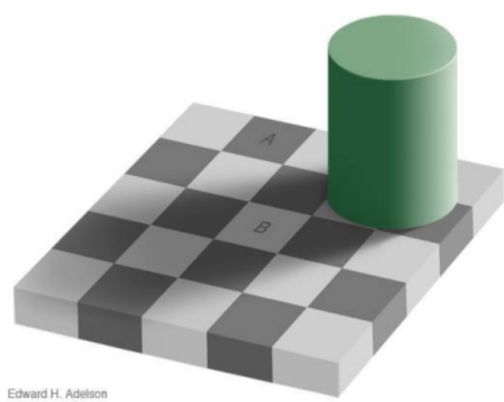
Our brains are hard-wired to help us survive in the wild — just think about our fight-or-flight instinct. But we often have to solve problems that can run counter to our pattern-seeking, choice-comparing, fleeing-to-safety mental coding. So we use heuristics, experience-based methods learned through trial and error, to quickly solve problems. This elaborate system of shortcuts serves us very well in "the real world," but when it comes to investing, heuristics might cause you to zig when you should be zaggin'. Check it out:

Is the red dot halfway up the triangle?



If you're like most people, the dot appears to be higher than halfway up, even though halfway is exactly where it is. Here's another example, just for fun:

Which square is darker, A or B?



It might take some convincing, but both squares are exactly the same shade of grey. They look different because we use our eyes to determine the color of objects in the world — not the amount of light being reflected off a surface. Our visual system, like the rest of our cognitive systems, is very good at solving particular problems but not other, related problems.

To tie all this back to investing, it would be good to know when we might be as easily tricked; that way, we can fight back.

Upcoming Earnings

Pro Fools, keep your eye on the boards in the coming weeks, as your team covers any significant earnings announcements from *Pro* holdings.

Beginning on Monday, April 18, and continuing for a solid month, we'll have timely updates on company progress, Buy Around prices, and fair-value estimates — all available on the company discussion boards. See you there!

Cognitive Errors

The field of behavioral finance has helped identify the mental shortcuts we use and the cognitive errors associated with them. Here are a few cognitive errors *Pro* investors should defend themselves against:

Anchoring: Focusing on a number is one of the most dangerous traps investors can fall into. If you've ever hesitated to make an investment simply because the price moved a bit, you were probably anchored. Alternatively, if you're holding a losing position just to get back to breakeven, you're anchoring on the price you originally paid.

- *Pro* tip: Focus on value, not price, and allocate your money to the most promising opportunities — even if that means recognizing loss.

Hindsight Bias: Through the deceptive gift of hindsight bias, past events appear to be more predictable than they were in real time. Worse yet, when we look back, we actually believe that we knew what would happen before it did, even if we didn't make a prediction.

- *Pro* tip: The future is inherently unknowable. Keeping a journal and writing down the reason you bought a stock or your thoughts on the market will help keep you from tricking yourself.

Myopic Loss Aversion: We are more sensitive to investment losses than gains, and we measure outcomes too frequently. In fact, our emotional ability to take on risk increases the less frequently we measure results. When we measure results too frequently, we make decisions based on the next minute, day, or month rather than a longer period consistent with our investing goals. This results in higher stress and lower returns over time because our decisions are inconsistent with our actual time horizon.

- *Pro* tip: Check your portfolio performance infrequently, and base your decisions on your actual investing horizon.

Coverage & Community

- Andrew (TMFRedwood) talks about a company too small for *Pro*.
- TMFDoodleBugger shares his thoughts on Contango's risks.
- Stamleo defends *Pro*'s performance while flexing his own muscles at the same time.

Overconfidence: In the example above, how sure were you that the "B" square was lighter than the "A" square? Even upon close inspection of the graphic, you may have doubts. Overconfidence is being surprised more frequently than you anticipate. For example, analysts might set their valuation ranges too narrowly (i.e., the high end is too low and the low end is too high), which can lead to surprises when a stock quickly outruns their top-end valuation scenario. That's one reason *Pro* doesn't always insist on selling when a stock reaches our fair-value estimate.

- *Pro* tip: Let your winners run (and let us let your winners run, too).

Investors make interesting choices when faced with risk and uncertainly. After all, what's investing if not risking capital to earn a return in the uncertain future? By being aware of your biases and using our tips, you too can behave like a *Pro*.

Give Back

Investors join *Pro* because they want to steadily grow their portfolio while managing their risk. Jeff, Bryan, Andrew, and I work vigilantly to deliver on this goal. But after they join *Pro*, many members express their amazement not about the *Pro* team's efforts but about our vibrant community. If you haven't visited or posted on the boards recently, you're missing out! Here are some easy boards to participate in:

- Meet & Greet: Light social atmosphere. Get to know your fellow *Pro* Fools and even share success stories, like paying off your membership in one week.
- Philosophy & Strategy: Talk about *Pro*'s strategy and investing tenets in general. This is also where you'll find the ever-popular earnings calendar brought to you by TMFValuemoosie.
- Social Banter: If you have something to talk about that's not related to investing, this is the place to go. The bar is low here: If *you* find it interesting, someone else will, too.

There's also a message board for every *Pro* holding, past and present. Just head here and look for the ticker you're interested in whenever you need the latest scuttlebutt or want to share your analysis. Some members thrive on doing their own research or on sharing their expertise in the industry in which they've made a career. Great examples of giving back are Stamleo's recent post on **Ebix** and community Fool TMFDoodleBugger's discussion of **Contango Oil & Gas**.

Last but not least, if you have an emergency of the Pro 911 variety, you can reach us on the poorly named *emergency only*24-hour board. Be sure not to cry wolf — we have families, too.

Pro Fools are always polite and use descriptive subject lines when they post to our boards. We hope to see your first post soon!

Foolishly,
Nick Crow (TMFCrow)

Nick owns shares of Ebix. The Motley Fool owns shares of Contango.

Charter and 2011 Portfolios: Buy Contango Oil & Gas

Published Mar 31, 2011 at 12:00AM

Pro wrote put options on Contango Oil & Gas in November 2011 that expired as income — here's the original recommendation. Buying shares directly was an alternative trade then. With today's trade, we're going to buy shares first and aim to write puts later. But as with the first time, we fear a rising stock price on our buy alert, so **please use a limit order**.

First Things First

- **Company: Contango Oil & Gas** (NYSEMKT: MCF)
- **Market Value:** $970 million
- **Type of Holding:** Energy, commodities
- **Options:** They're available, but you don't have to use them.
- **Follow Along:** Add Contango to My Scorecard.

At a Glance

- **Action:** Buy 1% of a potential 4% position
- **Recent Price:** $61.80
- **Buy Around:** $62.50 (This stock is very thinly traded. **Please use a limit order!**)
- **Fair Value:** $70; higher if natural gas prices rise
- **Alternative trades:** Write any $60 puts, or May, July, or October 2011 $55 puts.
- **Why Buy:**
  - As the lowest-cost natural gas producer, Contango Oil & Gas profits even on today's depressed gas prices.
  - Contango's estimated reserves on hand are worth more than the company's market value, and *much* more if natural gas prices increase.
  - This conservative company is debt-free and well-managed.

What's New?

Everything we admired about **Contango Oil & Gas** (NYSEMKT: MCF) when we wrote puts on the stock last November remains true. With just eight full-time employees, Contango outsources all of its gas exploration and only pays contractors when they hit pay dirt. Eschewing debt and shareholder dilution, this prudent company has bought back 13.5% of its shares since June 2007. Meanwhile, it remains the lowest-cost natural gas producer.

Contango estimates that its 2011 finding-and-development costs are running at just $1.20 per million cubic feet equivalent (Mcfe) of natural gas. The company's total production cost in the final quarter of 2010 was just $2.76/Mcfe, compared with the industry average of $5.72/Mcfe (an average of 42 competing companies). Even with natural gas at a low price of $4.28/Mcfe, Contango earns a healthy profit. Plus, because it doesn't hedge, if natural gas prices rise, Contango's earnings will, too. With oil prices up nearly 40% since last November and nuclear power now under fire, the future of natural gas looks more promising than before.

Plus, just a few days ago, the company delivered 37.5 billion *new* reasons to like it: the discovery of another estimated 37.5 billion cubic feet equivalent (Bcfe) of natural gas.

Why This Strategy?

This stock is thinly traded, with fewer than 100,000 shares changing hands on a typical day. That's why we tried writing $55 puts last November to buy our shares (when the stock was $53), but the stock increased, and we ended up with only our option income. This time, we'll buy just a 1% position of the stock to start, hoping that by starting small, we won't move the stock much. We want to own some shares, and we'll probably write puts later to try to add to our stake. **Please use a limit order to buy your shares** — if we all do, we shouldn't push up the stock price much.

Given the higher prices for oil and Contango's new gas discovery, our fair-value estimate for the stock has increased and is about 13% above the current price. Remember: Fair value is the price from which to expect your desired annualized return (fair value means "fair" for both a buyer and a seller, after all); any buy price *below* fair value represents your so-called margin of safety. In this case, the company's fair value will increase further if natural gas prices rise. But what we like about Contango is that it's making money even on today's lower gas prices.

How to Follow Along

Buy 1% to start — dip your toe in with a limit order. Let's see how much the stock moves before considering our next strategy. If you'd rather, consider our alternative trades (listed at the top) of writing puts. Remember that you're obligated to buy 100 shares for every put you write if the stock drops below your strike price by expiration. Finally, to see a recent (and Foolish) overview of the company, check out the slides for its March 28 investor presentation (opens a PDF file).

Next Steps

- For our full company report, read our original recommendation.
- Questions or comments? Visit our Contango discussion board.

Pro will buy shares of Contango Oil & Gas in both portfolios in the next one to 30 days, per The Motley Fool's trading rules.

The Motley Fool owns shares of Contango.

Ketchup Report: Portfolio 2011

Published Mar 30, 2011 at 12:00AM

Dear Fellow Fools,

We're delighted you've joined *Pro*, one of The Motley Fool's premier services. You've made a great choice. Since 2008, we've been helping members just like you own outstanding businesses at good prices, earn steady income, expand your investing toolbox with education and new strategies, and find little-known ways to earn profits. In January, we introduced Portfolio 2011 with $250,000 of the Fool's own money. This portfolio is just getting started and holds mostly cash, so it's easy to get up to speed with us. We believe the best way to succeed with us to invest with us, so we've put together this exclusive Ketchup Report to show you which stocks to invest in today. Welcome again! We look forward to helping you profit year by year.

Jeff Fischer, advisor
Motley Fool Pro

Buy First Stocks

If your portfolio doesn't yet mirror ours, start by matching our percentages in these stocks. They represent the most attractive risk-to-reward opportunities today.

AmTrust Financial Services

- **Allocation:** 3%
- **Buy Around:** $18.50

Synopsis: By selling workers' compensation insurance to small companies as well as extended service and warranty coverage, **AmTrust Financial Services** targets specialized, profitable insurance niches in North America and Europe. The strategy has worked, with AmTrust's gross written insurance premiums and operating income growing faster than 30% and 40% each year over the past five. The $18.50 stock trades at just 7.6 times expected earnings and 1.5 times book value — a good deal for a solid stock. —*Jeff Fischer*

- **Read more:** See AFSI's recommendation history.
- **Have questions?** Head to our AFSI discussion board.
- **Follow along:** Add AFSI to My Scorecard.

Intel

- **Allocation:** 5%
- **Buy Around:** $20.50

Synopsis: About three-quarters of the computers shipped today have **Intel** inside, and the company rakes in high-margin revenue by selling high-powered chips for servers, too. Wall Street is down on Intel for missing the mobile market up to this point, but Intel argues the economics of mobile haven't made sense until recently. Now, the company is going after the cellphone and tablet markets with promising new chips. At the same time, chip use in emerging markets is growing, and computer users in developed markets are upgrading their machines after a lull during the recession. Intel trades at just 10 times earnings. —*JF*

- **Read more:** See INTC's recommendation history.
- **Have questions?** Head to our Intel discussion board.
- **Follow along:** Add INTC to My Scorecard.

L-3 Communications

- **Allocation:** 2.5%
- **Buy Around:** $80

Synopsis: L-3 Communications is the sixth-largest company in the defense industry and has only been around since 1997. It provides high-tech electronic systems to the Department of Defense and other government agencies, and it has a growing position in the intelligence and surveillance markets. L-3 generates impressive free cash flow (7% of sales), and because investors are concerned about budget cuts for defense spending, you can now buy the stock for less than our $80 buy-around price and write puts to fill out your position at attractive prices. We believe the mission-critical nature of L-3's products and services will insulate it from cuts in defense spending. (Note: Be careful to buy shares of LLL, not LVLT. The company name is L-3, *not* Level 3!) —*Bryan Hinmon*

- **Read more:** See LLL's recommendation history.
- **Have questions?** Head to our LLL discussion board.
- **Follow along:** Add LLL to My Scorecard.

WisdomTree Emerging Markets SmallCap Dividend Fund

- **Allocation:** 3%
- **Buy Around:** $55

Synopsis: Most of the large, established companies in the *Pro* portfolio have international exposure — but **WisdomTree Emerging Markets SmallCap Dividend Fund**, or DGS (we try not to waste too pixels by repeating the fund's long name), gives us even more. The exchange-traded fund exposes us to emerging markets — countries like Taiwan, Korea, and South Africa. But the fund is careful to avoid investing in ultra-speculative small caps; it requires that its holdings have the financial wherewithal to pay dividends. We like the fund's balance of financial conservatism that comes with dividend discipline combined with its exposure to growing markets. Historically, dividend-paying emerging-market small caps have outperformed their non-dividend-paying brethren, and right now they're a good bargain, too. The average P/E ratio of the fund's holdings is only 12. —*BH*

- **Read more:** See DGS' recommendation history.
- **Have questions?** Head to our DGS discussion board.
- **Follow along:** Add DGS to My Scorecard.

Buy Stocks

After you've invested in our Buy First stocks, we suggest you buy these strong stocks next as you build your portfolio.

ProShares Short S&P 500

- **Allocation:** 5%
- **Buy Around:** $43.50

Synopsis: The **ProShares Short S&P 500** is an exchange-traded fund that trades *inverse* to the S&P 500, so when the market index falls, this ETF will *rise*, providing us a 1:1 inverse relationship on a daily basis. Buy this ETF if you want a hedge or a short for your portfolio. If you're mostly in cash, you may not need one. —*JF*

- **Read more:** See SH's recommendation history.
- **Have questions?** Head to our SH discussion board.
- **Follow along:** Add SH to My Scorecard.

Rockwood Holdings

- **Allocation:** 4.5%

- **Buy Around:** $45

Synopsis: Rockwood Holdings is the country's leading low-cost, high-quality lithium producer, providing battery-grade lithium to electronics makers and the growing electric auto industry. Rockwood also makes synthetic chemicals used in hundreds of industries, treating things like disc brakes, airplane bodies, paints, and stains. The company is paying down debt and improving its margins. The stock is trading above our buy-around guidance, but remember that buying shares 5% to 7% higher than our buy-around price is reasonable. You can buy some to start your position, or you can follow the spirit of our recent put-writing trade. *—JF*

- **Read more:** See ROC's recommendation history.
- **Have questions?** Head to our ROC discussion board.
- **Follow along:** Add ROC to My Scorecard.

Sprott Physical Gold Trust

- **Allocation:** 3%
- **Buy Around:** $12

Synopsis: We're always on the lookout for reasonably priced portfolio insurance here at *Pro*, and gold fits that mold. We view gold as protection against inflation, a decline in the value of the U.S. dollar, and in the worst case, an economic collapse. Although we generally focus on the performance of individual companies and their competitive positions, it's silly to ignore the macroeconomy altogether, so we chose the **Sprott Physical Gold Trust** as a vehicle to own gold bullion. (The bars are held at the Royal Canadian Mint if you want to touch them). Shares of Sprott Physical Gold Trust are a bit higher than our suggested buy-around price, but given the metal's volatility, you should have an opportunity to start a position before long. *—BH*

- **Read more:** See PHYS' recommendation history.
- **Have questions?** Head to our PHYS discussion board.
- **Follow along:** Add PHYS to My Scorecard.

TradeStation

- **Allocation:** 1.5%
- **Buy Around:** $7

Synopsis: Named by *Barron's* as "best overall" and "best for frequent traders," online broker **TradeStation** caters to active, highly valuable rules-based traders, such as small hedge funds. In addition to profiting from this niche, TradeStation stands to cash in on its customers' cash balances if interest rates rise. Given all this, we think TradeStation could be an attractive acquisition target for a larger broker. Establish your position near $7 a share, but **use a limit order** because this small cap is thinly traded. *—Nick Crow*

- **Read more:** See TRAD's recommendation history.
- **Have questions?** Head to our TRAD discussion board.
- **Follow along:** Add TRAD to My Scorecard.

Tupperware

- **Allocation:** 3%
- **Buy Around:** $55

Synopsis: This isn't your mother's Tupperware. Flying under most people's radar, **Tupperware** has been growing strongly all over the world as consumers in emerging markets are becoming wealthy enough to buy food for storage. Tupperware continues to innovate and plug into local cultures everywhere it operates, so much so that Tupperware sells the best-selling cookbooks in … *France*! Who would have guessed it? The stock price can be choppy (and you might need to pay a bit more than our buy-around price), but we expect continued growth in emerging markets. *—JF*

- **Read more:** See TUP's recommendation history.
- **Have questions?** Check out our TUP discussion board.
- **Follow along:** Add TUP to My Scorecard.

Wells Fargo

- **Allocation:** 2.5%
- **Buy Around:** $31

Synopsis: Now the country's fourth-largest bank (after acquiring Wachovia in the throes of the financial crisis), **Wells Fargo** has more locations in more communities and the highest customer satisfaction rating of any large bank. The injection of Wells Fargo's sales culture into Wachovia branches offers an opportunity for meaningful growth. The stock is significantly undervalued compared with its earning power, and we expect to be rewarded with ever-increasing dividends as the bank's best-in-class management team returns equity to shareholders. Buy some shares to start your position or write puts for the potential to pick up the stock cheaper. *—NC*

- **Read more:** See WFC's recommendation history.
- **Have questions?** Check out our WFC discussion board.
- **Follow along:** Add WFC to My Scorecard.

In Summary

Welcome again to *Pro*! We hope our Ketchup Report helps you catch up with the trades Portfolio 2011 has made since late January. Remember, Portfolio 2011 is aiming to mirror *Pro*'s Charter Portfolio, so that's what we're building toward. If you want to skip ahead a bit, you can look at the Charter Portfolio and consider additional positions there that interest you.

Finally, please note that we didn't include options positions in this report because options prices can change quickly. We'll have plenty of new options trades for you, and experienced options users can try to mirror the options already in place in Portfolio 2011 as long as the trades are still viable.

Thank you again for joining *Pro*! We look forward to becoming better investors together.

Jeff Fischer owns shares of AmTrust, Intel, and Tupperware and has written puts on Rockwood. Nick Crow owns shares of AmTrust, Intel, L-3, Wells Fargo, and WisdomTree Emerging Markets SmallCap Dividend Fund. Motley Fool Alpha LLC owns shares of L-3.

Portfolio 2011 Ketchup Report

Whether you've been investing with Portfolio 2011 since January or since last week, you might have some catching up to do. That's why we've created our Ketchup Report, coming your way this week. Stay tuned for this quick-and-dirty run-down of all the stocks in Portfolio 2011.

Welcome, *Pro* Fools,

The ambitious goal of today's brief Memo is to encapsulate *Pro* in 500 words or less. As we invest together, our strategy drives our success, so it's important to reevaluate often to ensure that we're on the right track — whether you're a new *Pro* member or a veteran.

What We Do

- We invest for absolute profits with high accuracy; we want at least 75% of our positions to close profitably, well above Peter Lynch's 60% benchmark for investing success.
- We buy strong businesses at reasonable prices for long-term performance.
- We use options (writing them, mainly) for short-term profits.
- We sell short and use hedges to target profits when prices fall and to smooth returns.

Are You New to *Pro*?

Welcome! Take your time getting to know us by checking out the links below. Try to read one a day in the coming week.

- Own Stocks the Pro Way
- Use Options Like a Pro
- Pro Tips and ETF Strategies
- Building Shorts Into Your Portfolio
- Making Pro Fit Your Profile
- Four Pro Investing Truths

And please introduce yourself to the vibrant *Pro* community. Come on over to our Meet & Greet discussion board. We're excited to meet you!

How We Do It

- Our portfolio can have as many long or short positions as we like. We've mainly been long since our launch in 2008. (Charter Portfolio is about 12% short right now; Portfolio 2011 has a bigger short position because it's not as fully invested.)
- We don't sweat small market moves of 10% or less. You can't outmaneuver those. Instead, we're like a blue whale in the vast investing ocean, large and unshakable. But we want to be agile enough to swim the best direction when the market makes large waves, moving much more than 10%.
- We believe cash flow should be an important part of most portfolios. We generate regular cash flow by writing options, which provides us with extra income we can actually *use*. (Stocks are long-term compounding vehicles, not short-term cash-flow generators like options.)

Guidance Changes

- **Intel** moves up to Buy First because of its low price.
- **Rockwood Holdings** moves down to Buy because of its price and because we're writing puts to try to fill out our position. But we're moving our buy-around price up modestly, to $45, and if you don't own shares, you should feel confident about buying the stock even a bit above $45. We want you to own shares of the largest lithium producer in the country.

Coverage & Community

- Veteran member antmark shares his take on *Pro*.
- Fools discuss the sudden volatility in **Ebix**.
- Jeff expounds on *Pro*'s purpose.
- Fools discuss the differences between *Pro* and *Motley Fool Options* (and how to use them and other Foolish services).
- This Week in CAPS: Member TMFEldrehad looks at some shooting five-star stocks.
- Our favorite discussion of the week: Fools shares their poems about the joy of options.

Why You're Here

- *Pro* is a flexible, balanced way to invest. I've been working on this process for about 10 years — and it's become stronger with the team and community here. It's worked well in strong and poor markets.
- *Pro* is driven by a lasting desire for financial independence. It has nothing to do with beating a market but with living a life.
- Many *Pro* members have told us that *Pro* has markedly improved their investing, including their approach, emotions, flexibility — and performance. We've enjoyed investing together during incredibly challenging times.

How You Should Measure the Service

- We announce our trade intentions before we make the trades, so you can invest before we do. *Pro* usually pays a price for this, but that's because we put you first.
- Judge your returns, not ours. Only *your* returns correspond to achieving your goals.

- Ask yourself: Do our recommendations make you money? Do we respond to potential changes in an investment? Do we make our strategies and intentions clear? That's how we serve you.
- Investing is a long-term endeavor. We realize you want reassurance that your *Pro* membership is money well spent. So to start, judge our past accuracy, judge our level of involvement in the service, and then judge your returns over time. We're confident that *Pro* will *make* you money over time, not cost you — and, importantly, make you a better investor.

I'm almost out of words, Fools. Thank you for taking the time to review our investment strategy, and if you're new to *Pro*, welcome! We hope this overview was helpful. We're glad you're a *Pro* member. We'll be in touch again soon!

Jeff Fischer (TMFFischer)

Jeff owns shares of Ebix and Intel and has written puts on Rockwood Holdings.

- Questions about this Memo? Post them on our Memo Musings discussion board.

Charter and 2011 Portfolios: Write Covered Calls on ProShares Short S&P 500

Published Mar 25, 2011 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") May 2011 $44 covered calls
- **Allocation:** Write one call for every 100 shares owned
- **ETF price**: $41.55
- **Option price (bid/ask):** $0.45/$0.55 (After reviewing current prices, try a limit order of $0.50; don't sweat over nickels, but try not to accept less than $0.40.)
- **Potential ETF sell price:** $44.45 to $44.55
- **Alternative trades:**
  - Write May 2011 $45 calls for more breathing room.
  - Don't own shares yet? If you want a hedge in your portfolio, buy shares in 100 round lots and write these covered calls on them. (You can do a buy/write covered calls order for a net debit in the low $41-range.)
- **Why write covered calls:**
  - We defray the cost of this hedge.
  - We still have meaningful upside on the position.
  - We can roll the covered calls higher if we seek more upside later.

What's New?

"Honey, it's time to hedge the hedges!"

This is one resilient stock market. Portugal's finances are reeling; Libya is in a revolution; Yemen, Bahrain, Syria, Egypt, and other countries are politically unstable; Japan is struggling through multiple disasters; radiation is drifting over Europe; and U.S. home-sales numbers are the worst in generations. And through all this, the S&P 500 is still gaining ground, sending the inverse **ProShares Short S&P 500** (NYSEMKT: SH) ETF lower.

As we said when we recommended the ETF, we don't believe the stock market is overvalued. Still, it's vulnerable to shocks or — dare I say? — a return to the realization that *things aren't great out there*, economically or otherwise, and that the risks we see today are real and that more risks lie ahead. So, why cover our short at all?

Why This Strategy?

Stock markets are resilient. They notoriously climb walls of worry, especially if valuations are reasonable. Even though we own this inverse ETF (which goes up whenever the S&P 500 goes down) to protect against market shocks, we can also hedge our position to defray its costs. So we like writing reasonably priced covered calls on the ETF — they allow us to offset the cost of hedging while retaining the upside we see in the position.

How to Follow Along

Remember, **do not buy these calls** — we're selling them and being paid in the process. For every 100 shares of ProShares Short S&P 500 you own, write ("sell to open") one covered call. You're obligated to sell your ETF position if it's above the strike price by expiration and we haven't adjusted the trade. Let's review the trade details:

- **Trade:** "Sell to open" May 2011 $44 calls
- **Option price:** $0.45/$0.55 (aim for $0.50; ideally, accept no less than $0.40)
- **Net sell price:** $44.45 to $44.55
- **ETF price:** $41.55
- **The ETF is:** 5.6% below our strike price and 6.6% below our net sell price
- **The option yields:** About 1.8% on the current ETF price, in 56 days

Next Steps

- If this strategy is new to you, read our guide to covered calls; then visit our ProShares Short S&P 500 discussion board to ask questions.
- **Follow Along:** Track your ProShares Short S&P 500 returns in My Scorecard.

Charter Portfolio and Portfolio 2011 will write covered calls on ProShares Short S&P 500 in the next one to 30 days, per The Motley Fool's trading guidelines.

Charter and 2011 Portfolios: Write Puts on Rockwood Holdings

Published Mar 23, 2011 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") May 2011 $45 puts
- **Allocation:** About 2% for a 4.5% total (for *Pro*'s Charter Portfolio, that's six contracts; for Portfolio 2011, it's one)
- **Stock price**: $48.50
- **Buy around:** $43.50
- **Option price (bid/ask):** $1.45/$1.55 (After reviewing prices, try a limit order around $1.50 if feasible; as prices change, accept no less than $0.90.)
- **Potential buy price:** $43.50 to $44.10
- **Alternative trades:**
  - Write August 2011 $45 puts, recently $3.
  - Consider buying shares directly if you don't own any yet, starting incrementally, and looking to buy more at lower prices.
- **Why write puts?**
  - Rockwood's first earnings report since we bought shares was strong.
  - We want to own more Rockwood than the 2.5% position we already hold, but we'd like to target a lower buy price.
  - Ideally, we can keep writing puts for income until all our dreams come true — that is, until we can buy Rockwood at an unbelievably low price or else we get a pony.

What's New?

Rockwood Holdings (NYSE: ROC), which produces specialty chemicals and lithium, has gained 11.6% in the six weeks since *Pro* bought shares. The S&P 500 lost 3% in the same time. That is fine and dandy, but we'd like to own more Rockwood shares. The company reported record strong earnings last month, and it voluntarily paid off more than $400 million in long-term debt, decreasing its annual interest expense by about $40 million. That's a very large plus to add to the bottom line of a company that had net income of just $239 million last year.

As we explained in our original buy recommendation, Rockwood has spent much of the past decade reorganizing itself to focus on its most profitable and promising businesses, including its key lithium division, which is expected to grow 30% this year. As of February, the company is seeing increasing pricing power in its key markets — and plans to use it — and remains confident about the year ahead. Furthermore, as oil prices rise, Rockwood's synthetic products offer a lower-cost alternative.

Why This Strategy?

Although Rockwood remains a Buy First and all *Pro* members should ideally own a partial position, its shares are nearly 3 times as volatile as the S&P 500. In a market downdraft, we might get our desired price for new shares. If not, at least we own a partial position, and we'll seek to earn more put-option income.

Writing puts is more defensive than chasing shares in a market that's risen for several months. Although Rockwood has little direct exposure to Japan, it remains to be seen how the disaster there will affect the hundreds of industries — including batteries for electronics — that Rockwood serves, not to mention the overall global economy.

How to Follow Along

Remember, **do not buy these puts** — we're *selling* them and being paid in the process. For every put you write, you're obligated to buy 100 shares of the stock if it's below the strike price by expiration and we haven't adjusted the trade. *Pro* would be ready and happy to buy shares in the mid-$40s. Here are the trade details:

- **Trade:** "Sell to open" May 2011 $45 puts
- **Option price:** $1.45/$1.55 (try a limit of $1.50; accept no less than $0.90)
- **Net start price if we get shares:** $43.50 to $44.10
- **Stock price:** $48.50
- **The stock is:** 7.7% above our strike price and about 10% above our breakeven
- **The option yields:** 3.3% on cash in 59 days

Next Steps

- If writing puts is new to you, check out our guide on the strategy. If you have questions about this trade, visit our Rockwood Holdings discussion board.
- To track your Rockwood returns or watch the stock, add it to My Scorecard.

Charter Portfolio and Portfolio 2011 will write puts representing about 2% in Rockwood Holdings stock in the next one to 30 days, per The Motley Fool's trading guidelines.

Jeff is short April $40 puts on Rockwood.

- Member alex340 shares puts that match our criteria. (Just note that some are on stocks long gone from the portfolio.)
- Vote spinningwood for the Feste award!

Dear Fellow Fools,

As tragedy roils Japan, our thoughts remain with the families and friends affected by the disaster. When something this monumental happens, we'll help the victims however we can, and we'll also reassess our investments as we continue to work toward earning absolute profits with you.

Last week, the *Pro* team combed through all of our holdings to discover how the companies may be affected by the news in Japan. In today's Memo, we've summarized our findings and provided you with discussion board links for more information.

Although the regions hit hardest by the earthquake, tsunami, and nuclear disaster account for just 3.6% of Japan's economy, the area is home to many electronics factories, and that could cause supply-chain disruptions for companies across the globe. Japan is still the silicon wafer capital of the world but not nearly as much as it was 10 years ago. Chip manufacturing is now spread across many countries; however, Japan's sophisticated plants remain unmatched in some niches. So we must consider not only the impact of temporarily lower sales to the world's third-largest economy but also the possibility of supply-chain problems for our companies. Fortunately, few of them appear meaningfully vulnerable:

Immediately Affected by Japan	Why?
iPath S&P 500 VIX Short-Term Futures ETN	Implied market volatility — as measured by the VIX index — spiked last week, sending our exchanged-traded note higher. We rolled up our naked calls to a more defensive strike price. But if nuclear fears subside, the VIX should settle down.
ProShares Short S&P 500 ETF	We planned to short the S&P 500 even before the disaster in Japan. If economic concerns grow, this hedge may help.

Potentially Affected by Japan	Why?
Apple	Japan accounted for 5.9% of Apple's 2010 sales, and several key components for the iPad are probably made only in Japan, so Apple could face worldwide product delays in coming weeks. The iPad launch in Japan was delayed. But our long-term thesis here is unchanged.
Cisco Systems	About 3% to 4% of annual sales come from Japan. Product disruptions aren't likely but are possible.
GlaxoSmithKline	More than 7% of annual sales come from Japan, but our thesis remains unchanged.
Intel	About 10% of 2010 sales came from Japan, but Intel CEO Paul Otellini sees little effect from the disaster and says Intel's sales could pop as Japan rebuilds. We bought more of the cheaper shares in Portfolio 2011.
Medtronic	An estimated 6% of Medtronic's sales come from Japan, so we expect some effects but nothing that changes our thesis.
NextEra Energy	Operating a handful of nuclear power plants in the U.S., the company may face more scrutiny leading to higher costs. Our concern is moderate today, though.
Oracle	About 5% of sales come from Japan, and 14% of Oracle's long-lived assets are there. Still, the impact should be minimal given the recurring nature of Oracle's subscription revenue.
Tupperware	Contributing 2% of sales, Japan is small but still meaningful to Tupperware.

Little to No Likely Effect	Why?
Ebix	Ebix has an office in Japan and sells software in Japanese, but its sales there are small.
GrafTech International	Many competitors are based in Japan. Needle coke pricing may increase, benefiting GrafTech.
iShares Russell 2000 ETF	We're 12.5% short including this position and ProShares Short S&P 500, which could be helpful. But this ratio put spread needs until August to bear real fruit.
Kinetic Concepts	The company entered the Japanese market in 2010, so the country is likely to be less than 1% of 2011 sales.
L-3 Communications	L-3 sells mostly to the U.S. government; however, some electronics supplies may be delayed, although we have no evidence or reason to suspect it.
Rockwood Holdings	None of Rockwood's companies have offices or listings in Japan. Sales to the country are likely modest, although several competitors reside there.
Vanguard Energy ETF	Several of the ETF's holdings supply chemicals, oil, or gas to the Japanese electricity markets, but the crisis seems to have spared most of the large integrated oil companies and servicers.
Wells Fargo & Co.	Wells Fargo has no direct exposure to Japan.
WisdomTree Emerging Markets Small Cap Dividend Fund	No assets are allocated to Japanese companies.

No Apparent Relationship to Japan	Read More on the Boards
AmTrust Financial	AFSI and Japan

Vanguard Emerging Markets ETF	VWO and Japan

Now that we've reviewed *Pro*'s 29 positions, we're able to report that the devastating events in Japan haven't changed our long-term outlook for any of them. We may see some periods of weakness, but if so, we'll also look to seize opportunities.

Upcoming Events

- **March 24: Oracle** reports earnings after the market closes.
- **Next Monday Memo: Tuesday, March 29.** Your next Monday Memo will arrive one day later than normal, on Tuesday, March 29, because Fool HQ will be closed Monday. We're moving our office that day — please pardon our dust.

If the economic ramifications of Japan's disaster grow more serious, we may become more defensive on the positions that are most likely to be affected, so we're monitoring them closely. (For example, we look forward to learning more about Oracle's results on Thursday.)

As always, you can see where we stand on every position by visiting our Charter Portfolio page and noting our Buy First, Buy, and Hold guidance. If you have questions or comments, please visit our Memo Musings discussion board.

Wishing Japan a swift recovery,
Jeff Fischer (TMFFischer)

Jeff owns shares AmTrust, Apple, Ebix, GlaxoSmithKline, Intel, Kinetic Concepts, Oracle, and Tupperware. He is short VXX and has options positions in Rockwood Holdings. Motley Fool Alpha LLC owns shares of Cisco Systems and is short IWM.

Charter and 2011 Portfolios: Roll Up Naked Calls on VXX

Published Mar 17, 2011 at 12:00AM

At a Glance

- **Action:** "Buy to close" March 19, 2011, $34 calls; "sell to open" an equal number of May, 21, 2011 $39 calls
- **Recent Options Prices:** March $34 calls: $1.80; May $39 calls: $3.80
- **Preferred Price:** Roll up for a net credit of $2 per contract or higher (see "How to Follow Along" below if prices have changed considerably when you read this)
- **Allocation:** -6% (as a short) if turned into short shares
- **Recent VXX price:** $35.60
- **Recent Measure of the Volatility Index (VIX):** 26
- **Alternate Trades:**
  - Sell short VXX directly, starting with a partial allocation, or adding to one
  - "Sell to open" June $39 calls, to have more time
  - Sell to open June $43 calls, to have more breathing room
  - Buy shares of **VelocityShares Daily Inverse VIX Short-Term Futures** (NYSEMKT: VXX) exchange-traded note. If you do this, know that the ETN doesn't track as well as a short of VXX. Still, it's the best available alternative if you're not writing naked calls or shorting VXX.

What's New?

Must you ask? The famous VIX index is a measure of market fear, and few things frighten people more than a potential nuclear accident. While Japan grapples with a life-and-death situation, the VIX has jumped from 20 on March 11 to 29 at yesterday's close, for a 45% gain. This sent the **iPath S&P 500 VIX Short-Term Futures** (NASDAQ: XIV) exchange-traded note up 14% over the same period, from $33 to yesterday's $37.63. It also put our $34 naked calls on the VXX under water, so we're going to take action.

We know that the volatility index moves in two ways: It spikes higher, and then it grinds down as fear subsides and investors stop buying put options (which drive the index). Given how the index moves, we don't want to run away from a VIX-related short on a spike — we want to stand our ground, short more if we can, or start a new short if we don't have a position. Because we already have one, we're adjusting it.

Even though the world has utterly changed for Japan (and for all of us, in indirect ways), market volatility will eventually accept these new realities as normal. As panic subsides, the volatility index will probably decline, as it has historically done, making our short profitable. Japan's potential nuclear crisis obviously remains the largest-known risk we face. We need to try to compensate for that risk as best we can while not running away from a position at the precise time when, historically, we should hold our ground. To help guide us, we're using the history of the VIX and our knowledge of the inferior performance of this ETN.

Why This Strategy?

That's why we're rolling our calls out and up, which gives our trade more time to play out and allows us to get paid in the process. After Japan's crippled nuclear reactors are calmed, the market is bound to stabilize, as will volatility. What we don't know is how long this will take. But we do know the history of the VIX. Here are key peak measures:

Date	VIX Level
Aug. 23, 1990	36
Oct. 30, 1997	38
Oct. 8, 1998	46
Sept. 20, 2001	44
Aug. 5, 2002	45
Aug. 16, 2006	31
Nov. 12, 2007	31
Nov. 20, 2008	81
May 20, 2010	45
Yesterday (March 16, 2011)	29

Source: Chicago Board Options Exchange

Remember, those are key *high* points in the volatility index. Historically, the VIX has traded above 30 just 9.5% of the time since 1990. It has traded above 40 only 3% of the time. The index's historic average level is 19. That compares with volatility in the S&P 500 of 16.2% since 1928, using rolling five-year realized volatility calculated by Societe Generale. (This shows how the VIX trades at a premium to realized volatility, which is partly why our short of volatility works over the years.)

Anyway, all these numbers suggest that if Japan's situation worsens, the VIX could potentially gain 50% or so more from this morning's 26, to hit levels reached during other crisis peaks. A 50% gain would put the VIX near 40, a level it rarely hits. Now, stay with us here: If the VIX gains 50%, to 40, the ETN we're betting against could gain about 25%, putting it at about $45 compared with this morning's $35.60. (Even Barclays Capital, which issues the ETN, says the best rule of thumb is that the ETN will gain about half as much as an increase in the VIX — again, because the futures prices that the ETN tracks already carry a premium that assumes higher volatility.)

As we roll up our naked calls, we're using a $39 strike price and receiving about a $2.50 net credit, so our breakeven on this trade is $41.50. This is close to the $45 the ETN could reach in a severe situation if the volatility index rises to 40. If that happens, we should be able to roll the position again without much hardship. So we're aiming to set up a position that remains flexible even if the VIX soars to 40. And if the VIX rises 30% or less, our new naked calls should end with a partial to full profit. (A 30% gain from 26 would put the VIX at 34 — and should put the ETN at about $41.)

So we're not running away from volatility when it spikes. We still have a fairly assertive position that will end in a good profit in two months if the VIX cools down, but it's also a defensive position that should allow us to roll again if the VIX soars to 40.

How to Follow Along

To make this trade, "buy to close" your existing March 19 $34 naked calls — paying the going market price when you're ready — and at the same time, "sell to open" the same number of May $39 calls. **Prices change rapidly, so if they're much different from the ones in this report, you'll want to adjust your trade so you still get a net credit as you roll. Also, if the ETN is below $34 by Friday, you may not need to close your naked calls at all — they may expire. But we're assuming we'll need to close.** If you look into possible rolls beyond the one we're suggesting here, you can follow this math as an example:

Rolling Up Cost and Credit	Call Prices
Premium on hand from writing March $34 calls	$0.52
Cost to close March $34 calls	($1.80)
Net cost	($1.28)
Premium gained from writing May $39 calls	$3.80
Net credit (possible profit)	$2.52

Trade Details

- **Action:** Buy ("buy to close") March 19, 2011, $34 calls. Sell ("sell to open") May 21, 2011, $39 calls.
- **Allocation:** Charter Portfolio is again writing 25 contracts, and Portfolio 2011 is writing four. Our original -6% allocation for both portfolios still fits (it's negative because it's a short). Each written call represents a $3,900 short of the VXX exchange-traded note.
- **Preferred pricing:** Roll up for a net credit, ideally $2 or higher. If you have to change strike prices because the options prices have changed, aim to do so.
- **Break-even price (if rolled at a $2.50 credit):** $41.50
- **Recent VXX price:** $35.60
- **Difference to breakeven**: 16.6%

As we've said each time we've recommended a trade on VXX: If you make this trade, be aware of the risks of shorting a volatility-tracking instrument. This is a high-conviction position when time is on our side, but we might see large price movements in the interim. In that case, we'd need to roll the position forward or update our strategy. So you need liquidity to stay in the position. Finally, if you don't already have a position in VXX, shorting the exchange-traded note directly — if you can get shares — is still the preferred course of action. View the direct short as a long-term position to profit on slow pricing decay.

Next Steps

- As always, please bring your questions about this trade to our VXX discussion board.
- Track VXX in My Scorecard.

Pro *will roll its naked calls in both portfolios in the next one to 30 days, per The Motley Fool's trading rules.*

Jeff is short shares of VXX.

Portfolio 2011: Buy More Intel

Published Mar 17, 2011 at 12:00AM

At a Glance

- **Action**: Buy 2% for a total 5% (for Portfolio 2011, that's 250 more shares for a total of 600)
- **Recent Price**: $20
- **Buy-Around Price:** $20.50
- **Fair Value:** $25
- **Alternate Trades**:
  - Write ("sell to open") May 2011 $20 puts or May $19 puts
  - Write June 2011 $19 puts to be most defensive

What's New?

Since Portfolio 2011 bought a 3% stake in **Intel** in February, little has changed with the company. Yet the world at large has changed. Even as Intel continues to produce high-quality chips that power most of the world's computers, Japan — home to the world's third-largest economy — is experiencing its worst crisis since World War II. The human suffering is unimaginable, and our thoughts are with everyone in the country.

We hope that life and business can soon go on as usual in Japan, and, indeed, Intel's assessment of the situation may indicate at least business stability ahead for the country. Surprisingly, the company expects the effects of the earthquake and tsunami to have a minimal impact on its business.

That's because although Japan produces about 60% of the world's silicon (according to research from IHS iSuppli), most of the production is in the southern part of the country, away from the destruction in the north. Intel's suppliers indicate that shortfalls may be negligible. Additionally, silicon plants in other countries are moving to pick up production slack. Furthermore, Intel doesn't do any manufacturing in Japan and said most of its customers manufacture computers in China.

Perhaps the larger concern to Intel, then, is the fact that more than $4 billion of its $43 billion in 2010 revenue came from Japan. Sales to Japan could be dented at least this quarter and the next one as business takes a back seat to survival and safety. As Japan digs out and rebuilds, however, new technology — containing lots of computer chips — may demand plenty of its investment yen. Intel's CEO Paul Otellini has suggested that there may be a spending pop on technology as Japan rebuilds infrastructure.

Why This Strategy?

Hugging $20, Intel's stock trades at 10 times trailing earnings, a discount of about 50% to the S&P 500's average multiple. We're not greedy — we don't think Intel deserves to gain 50% to trade at 15 times earnings, but our $25 fair-value estimate is at least 25% higher than the current stock price (and still just 12.5 times earnings).

In the current frenzy over computer tablets (which seems overblown to us), Intel needs to prove to investors that the mobile and desktop PC markets will remain integral to the world economy and that the company won't get left behind in the tablet wars. Intel's chips are slated to appear in several tablets this year, and its server and traditional PC markets (in which mobile computing is expected to increase sales by double digits this year) remain strong enough to keep the company growing. After initially cannibalizing some mobile computer sales, tablets will probably boost the overall computing market.

The largest short-term risk is of course Japan. The national disaster could end up affecting Intel more than the company (and we) currently estimate. That should be a temporary hit to Intel's business, but not a fundamental change. If Japan's situation worsens, Intel's sales in the country may be hit harder this year, and its supply chain could still weaken. These are short-term risks.

Intel's stock is down 8% since we first bought it for Portfolio 2011, with most of the decline occurring in the last two weeks. The current dividend yield is 3.6% at $20 per share, allowing us to capture both a healthy yield and a low stock price as we fill out the position.

How to Follow Along

We have plenty of cash in Portfolio 2011, so we're comfortable investing despite uncertainty about Japan's economy. If the market continues to decline, we'll be buying more stocks, averaging in at lower prices. If you lack our cash cushion or need to be more defensive, consider our alternate trades of writing ("sell to open") puts on Intel for a lower potential buy price or income if shares stabilize. Write one put for every $2,000 you'd be willing to invest in Intel. Portfolio 2011 plans to buy 250 shares directly, giving us 600 total, for a 5% allocation in the technology giant. We might write covered calls on Intel later, but using options isn't essential to this investment.

Next Steps

- Questions or comments? Visit our Intel board.
- Once you've bought Intel, add it to My Scorecard.

Portfolio 2011 will buy an additional 2% stake in Intel in the next one to 30 days, per The Motley Fool's trading guidelines.

Jeff owns shares of Intel.

Charter and 2011 Portfolios: Buy ProShares Short S&P 500

Published Mar 14, 2011 at 12:00AM

At a Glance

- **Action:** Buy 5%
- **Recent Price:** $42
- **Buy Around:** $43.50 or less
- **Alternative Trade:**
  - Write puts at $42 or less. If the market *rises*, you could be sold shares, starting your short at a lower price.
- **Why Buy:**
  - This short ETF moves inversely to the S&P 500, making it a hedge for a mostly bullish portfolio.
  - If the market declines, the value of this position will increase, becoming a greater source of cash for new bullish buys at lower prices.
  - We plan to write covered calls on this ETF in the future, lowering our cost basis and increasing our odds for a gain. Not many shorts allow for that strategy.

First Things First

- **ETF: ProShares Short S&P 500** (NYSEMKT: SH)
- **Type of holding:** Short-term short/hedge; U.S. large-cap index
- **Options:** We'll probably write covered calls later, so consider buying 100-share lots if you want to follow along (though you don't have to use options).
- **Tax considerations:** Short-term gains or losses are likely.
- **Follow along:** Add ProShares Short S&P 500 to My Scorecard.

The Big Picture

When you want to hedge your many long positions, the inverse **ProShares Short S&P 500** (NYSEMKT: SH) ETF is a relatively simple, low-cost, and liquid way to put a short position into play. The reasons for investing inverse to the S&P 500 today read like a boilerplate list of market risks: rising commodities costs, stagnant wages, low consumer confidence, stubborn unemployment, the approaching end of federal stimulus, enormous deficits on a state and federal level, unrest in the oil-rich Middle East, a weak Oscars show, a stock market that has gained for months on end, and more. We know that stocks can climb a wall of worry, but with market indexes reaching levels last seen before the financial crisis, investors might be getting ahead of themselves.

The S&P 500 — home to **ExxonMobil** (NYSE: XOM), **Apple** (NASDAQ: AAPL), and **General Electric** (NYSE: GE), the index's three largest components — is trading at a reasonable 14 times forward earnings and yielding about 2.2%, so by going short, we're really hedging against the possibility of unpleasant surprises in the coming months, whether in the Middle East or the United States or from earnings that start to roll out again in April. Perhaps the largest risk on the immediate horizon, though, is the chance of still higher oil prices. If oil were to rise an additional 10% to 20%, it would be more likely to crimp the economic recovery, which could lead to lower earnings. And the mighty S&P 500 would not be spared.

The Vehicle

We first owned shares of ProShares Short S&P 500 from November 2009 to October 2010, and although the market gained significant ground over that time, we sold the ETF at a modest loss partly because we wrote covered calls on it three times, lowering our cost basis.

We don't intend to hold the ETF as long this time, because although it tracks the inverse of the S&P 500 well over a handful of months, its tracking historically slips over long periods. This is because the ETF uses derivatives (mostly swaps) to achieve its investment objective. The good things about the ETF are that we don't pay to borrow shares for shorting and we don't need to reimburse anyone for the dividends the S&P pays — but we still face friction costs given how the ETF invests. Its tracking should be admirable over our targeted time period of less than a year, though:

Vehicle	Q4 2010 Returns*	2010 Returns	3-Year Returns	Returns Since Inception (June 2006)
ProShares Short S&P 500	-10.35%	-16.59%	-5.51%	-5.46%
S&P 500	10.76%	15.06%	-2.85%	2.48%

**All returns as of Dec. 31, 2010.*

Source: ProShares Short S&P 500. Includes 0.92% net expense ratio. (Google Finance and other sources show a much weaker long-term performance for the ETF because they wrongly exclude the distributions made in profitable years, namely in 2008.)

On a quarterly or even one-year basis, the inverse ETF has tracked well. Looking back three years, however, the ETF failed on its promise, declining even though the market dropped 2.8%. When we short anything in *Pro,* we do so with months rather than years in mind, and in this case we'll be more diligent than ever about that. We also know the ETF can track a bit less well when the market drops than when it rises, but we're ready to miss a few points in exchange for the ease of use and liquidity of the ETF — as well as our ability to alter the risk and reward profile by using covered calls.

Future Strategy

As we did the last time *Pro* owned shares of the ETF, we plan to write covered calls (one for every 100 shares of the ETF owned) in the near future, hedging our hedge and lowering its cost basis in the process. In fact, the ability to write calls on a short position is what first attracted me to this ETF, and it helped *Pro* considerably the first time we owned it. The idea is to write covered calls that expire in about two months and allow for 7% to 8% upside before they would come into play. If the market declines, sending the ETF *up* that much for us, we'll consider taking our profit (letting our shares get called away) or rolling our covered calls up to a higher strike price, targeting more profit potential from the short ETF. If the market *rises*, making the ETF *decline*, we'll try to roll our covered calls down for another payment to help insure a profitable outcome — or at least minimize any loss. Watch your inbox for a potential covered-call trade alert, where we'll provide all the details.

How to Follow Along

If you want to take a position in your portfolio that moves inverse to the S&P 500, join us by buying ProShares Short S&P 500 ETF. If you wish to potentially write covered calls, buy the ETF in 100-share lots, for about $4,200 per lot (invest up to 5% of your portfolio).

The Foolish Bottom Line

As of Friday, the S&P 500 was just 2.9% below its recent high, even though volatility has increased lately. Taking an inverse position on the S&P 500 will either reward us as the market finally gives up some of its healthy gains, or we'll chase this position with covered calls if the market regains its footing and scores new highs. Ultimately, the market will enter a down spell (it always does) — but we don't know when. Just the same, adding this hedge is a sensible way to lower the downside risk of our long-biased portfolio.

Next Steps

- Questions or comments? Visit our ProShares Short S&P 500 board.
- Once you've bought the ETF, track ProShares Short S&P 500 in My Scorecard.

Pro will buy shares of ProShares Short S&P 500 ETF in both portfolios in the next one to 30 days, per The Motley Fool's trading rules.

Jeff owns shares of Apple. The Motley Fool owns shares of ExxonMobil and Apple.

Charter and 2011 Portfolios: Buy ProShares Short S&P 500

Published Mar 14, 2011 at 12:00AM

At a Glance

- **Action:** Buy 5%
- **Recent Price:** $42
- **Buy Around:** $43.50 or less
- **Alternative Trade:**
  - Write puts at $42 or less. If the market *rises*, you could be sold shares, starting your short at a lower price.
- **Why Buy:**
  - This short ETF moves inversely to the S&P 500, making it a hedge for a mostly bullish portfolio.
  - If the market declines, the value of this position will increase, becoming a greater source of cash for new bullish buys at lower prices.
  - We plan to write covered calls on this ETF in the future, lowering our cost basis and increasing our odds for a gain. Not many shorts allow for that strategy.

First Things First

- **ETF: ProShares Short S&P 500** (NYSEMKT: SH)
- **Type of holding:** Short-term short/hedge; U.S. large-cap index
- **Options:** We'll probably write covered calls later, so consider buying 100-share lots if you want to follow along (though you don't have to use options).
- **Tax considerations:** Short-term gains or losses are likely.
- **Follow along:** Add ProShares Short S&P 500 to My Scorecard.

The Big Picture

When you want to hedge your many long positions, the inverse **ProShares Short S&P 500** (NYSEMKT: SH) ETF is a relatively simple, low-cost, and liquid way to put a short position into play. The reasons for investing inverse to the S&P 500 today read like a boilerplate list of market risks: rising commodities costs, stagnant wages, low consumer confidence, stubborn unemployment, the approaching end of federal stimulus, enormous deficits on a state and federal level, unrest in the oil-rich Middle East, a weak Oscars show, a stock market that has gained for months on end, and more. In fact, the ability to write calls on a short position is what first attracted me to this ETF, and it helped *Pro* considerably the first time we owned it. The idea is to write covered calls that expire in about two months and allow for 7% to 8% upside before they would come into play. If the market declines, sending the ETF *up* that much for us, we'll consider taking our profit (letting our shares get called away) or rolling our covered calls up to a higher strike price, targeting more profit potential from the short ETF. If the market *rises*, making the ETF *decline*, we'll try to roll our covered calls down for another payment to help insure a profitable outcome — or at least minimize any loss. Watch your inbox for a potential covered-call trade alert, where we'll provide all the details.

How to Follow Along

If you want to take a position in your portfolio that moves inverse to the S&P 500, join us by buying ProShares Short S&P 500 ETF. If you wish to potentially write covered calls, buy the ETF in 100-share lots, for about $4,200 per lot (invest up to 5% of your portfolio).

The Foolish Bottom Line

As of Friday, the S&P 500 was just 2.9% below its recent high, even though volatility has increased lately. Taking an inverse position on the S&P 500 will either reward us as the market finally gives up some of its healthy gains, or we'll chase this position with covered calls if the market regains its footing and scores new highs. Ultimately, the market will enter a down spell (it always does) — but we don't know when. Just the same, adding this hedge is a sensible way to lower the downside risk of our long-biased portfolio.

Next Steps

- Questions or comments? Visit our ProShares Short S&P 500 board.
- Once you've bought the ETF, track ProShares Short S&P 500 in My Scorecard.

Pro will buy shares of ProShares Short S&P 500 ETF in both portfolios in the next one to 30 days, per The Motley Fool's trading rules.

Jeff owns shares of Apple. The Motley Fool owns shares of ExxonMobil and Apple.

Charter and 2011 Portfolios: Set up a Ratio Put Spread on IWM

Published Mar 9, 2011 at 12:00AM

At A Glance

- **Action:** Write ("sell to open") August 2011 $72 puts; buy ("buy to open") August 2011 $81 puts (buy one put for every two puts you write).
- **Allocation (based on the written puts):** 15%, but half of this is insured by our purchased puts, so our true exposure is 7.5%. Charter Portfolio is writing 30 puts and buying 15, and Portfolio 2011 is writing six puts and buying three.
- **Index price (as of 3/8/11 close):** $82.50
- **Option prices:** For the $72 puts, $2.75. For the $81 puts, $5.50.
- **Limit prices:** Aim to set up the spread for about zero net cost.
- **Why set up this ratio put spread:**
  - With little or no out-of-pocket costs, we can profit on a decline in small-cap stocks.
  - We'll buy a 7.5% stake in the index if it declines at least 12.7%, and we benefit by having a break-even price that's another 12.5% below that.
  - We'll lose nothing if the market stays steady or continues to rise.

First Things First

- **ETF**: **iShares Russell 2000 Index** (NYSEMKT: IWM)
- **Type of holding:** Short/Hedge; U.S. small-cap index
- **ETF info:** us.ishares.com
- **Follow along:** Add iShares Russell 2000 Index to My Scorecard.

The Strategy

Pro's ideal shorting strategy earns us meaningful profit if the underlying investment declines, has low risk of permanent losses, and — the Holy Grail of shorting — doesn't work against us if the market goes up. Ratio put spreads fit the bill nicely. The strategy involves writing puts (as we've often done), and using the proceeds to *buy* puts at a higher strike price. You write twice as many puts as you buy, which sets up the spread for zero cost (or better yet, a credit to your account).

Ratio put spreads offer two strategic possibilities at once: They allow you to profit on a decline, and, *if* your bearish expectations play out, they set you up own shares of the underlying investment at much lower prices.

In a nutshell: The strategy conserves your cash while increasing your bearish exposure, ensures that you don't lose anything if the market doesn't decline, and commits you to purchasing shares only at much lower prices. Overall, the defensive part of this strategy works best when there's a reasonable decline in an investment's price — around 10% to 15%. The following table explains how the trade could play out:

iShares Russell 2000 Index (NYSEMKT: IWM) market price:	**$82.50**
Write ("sell to open") August $72 puts:	Receive $2.75 per contract
Buy ("buy to open") August $81 puts:	Pay $5.50 per contract (buy half as many contracts as you wrote)
Net cost to set up trade:	$0 (Note: you don't need to target the above prices, which of course will change; just seek prices that net you near zero cost; if the market moves meaningfully, you can even adjust the strike prices to do so.)
Maximum profit:	$9 per share at $72 (12.7% lower than the market price)
Break-even price:	$63 (23.6% lower)
Partial profit:	Anywhere from $63 to $81 at expiration
Upside risk:	None. If the ETF remains above $81, the trade expires at no cost.
Downside risk:	If the index declines 12.7% or more, half of our written puts obligate us to buy a 7.5% allocation in the ETF at $72 (unless we close the puts early). (The other half of our written puts are canceled out by purchased $81 puts.) However, since our purchased puts will earn $9 per share in *profit* when the ETF hits $72, our break-even point on the total strategy, and our effective buy-price on our 7.5% allocation, is actually $63, or 23.6% lower than today's market price. If the index falls more than that, we start to suffer losses.
Sounds great. So what's the catch?	If you write 100% cash-secured puts, you need to set aside $7,200 per uncovered written put. If you're using equity as collateral, you'll need much less. Either way, this is cash that will not be invested in the market during the coming months. Additionally, most profits on a spread won't be earned early on, but closer to expiration. Finally, to repeat, we'll see losses on our 7.5% allocation if the ETF falls below our break-even price of $63.

The Big Picture

In the seven months since the unflappable Ben Bernanke hinted that the Federal Reserve would go on an asset buying spree, the **iShares Russell 2000 Index** (NYSEMKT: IWM) ETF has gained 35%. (The ETF tracks the Russell 2000 Index, a measure of U.S. small caps.)

The average company in the venerable index now trades at an estimated 20.7 times trailing earnings (excluding the unprofitable companies!), though the index has averaged just 17.7 times earnings over the past 20 years. That's a 14% difference.

If the market runs into trouble, the 2,000 small companies in the index — which have a median market value of just $510 million — are more likely be tossed around than are the giants of Wall Street. In fact, the Russell 2000 was 20% more volatile than the S&P 500 in the past year, so a 10% decline in the S&P could bring the Russell 2000 within our buy range. At our break-even price of $63, we'd be buying the index for about 15.8 times average earnings, below the long-term average.

Why bet against the index in the first place? Well, along with its rich-looking valuation, as commodity prices rise, many smaller companies have fewer ways to hedge or pass higher costs on to customers — and that makes them vulnerable to earnings disappointments. Several other factors also give us reason to be cautious: Many government stimulus programs initiated in 2009 are quietly winding down, the latest quantitative easing program (QE2) is slated to end in June (although it's very possible it'll continue), and the specter of inflation and higher interest rates is growing. Plus, higher oil prices threaten to derail GDP growth, and political uprisings in the Middle East may continue.

We don't want to throw the whole market under the bus, however. We still like the stocks we own, and we believe in the long-term value offered by strong companies. (The S&P 500 only trades at 15.5 times reported earnings, compared with 19.7 at the end of the average bull market, according to Bloomberg.) So, we continue to hold and buy promising companies, and this is why we're willing to *buy* the index that we're effectively shorting, but in this case, only at much lower prices, and only after we use it as a short or hedge first.

How to Follow Along

For every uncovered put you write for this trade, you need to be willing to invest $7,200 down the road. Some brokers allow you to set up a ratio put spread with a single trade, saving commissions. Here's the rundown:

- **"Sell to open"** August 2011 $72 puts
- **"Buy to open"** August 2011 $81 puts, one for every two puts you sell
- **Recent prices:** $72 puts pay $2.75; $81 puts cost $5.50.
- **Limit prices:** Split each bid/ask price with limit orders that would have you pay a net sum of zero to set up the two trades. It may even be possible to be paid a small credit. If entering the trade as a single spread order, aim for zero cost or a small net credit.

If you have to make the legs of the trade separately, aim to complete one right after the other so a sudden move in the market doesn't throw off your prices mid-trade.

Here's how the profit table looks on the smallest possible position (writing two puts to buy one):

iShares Russell 2000 Index price	One purchased $81 put	Two written $72 puts	Total return (or loss)
$81 and higher	$0	$0	$0
$80	$1 x 100 = $100	$0	$100
$75	$6 x 100 = $600	$0	$600
$72 (maximum profit)	$9 x 100 = $900	$0	$900
$70	$11 x 100 = $1100	($2) x 200 = ($400)	$700
$67	$14 x 100 = $1400	($5) x 200 = ($1000)	$400
$65	$16 x 100 = $1600	($7) x 200 = ($1400)	$200
$63 (breakeven)	$18 x 100 = $1800	($9) x 200 = ($1800)	$0
$60	$21 x 100 = $2100	($12) x 200 = ($2400)	($300)

Our Charter Portfolio plans to buy 15 puts, making our maximum profit at $72 per share $13,500 (1,500 x $9 per contract). With no cash outlay to set up the trade, this would be a healthy gain as the index declines 12.7%. Portfolio 2011 will buy three puts.

Keep in mind that the above returns won't occur smoothly or immediately. The table represents returns *at expiration*. Before then, if the market falls, our written puts will be a "two-timing" drag on our returns, even as our purchased puts deliver gains. As with most spreads, we'll need to wait for expiration to achieve full results. Additionally, if the index falls more than 12.7%, the defensive benefits of our strategy start to diminish and will disappear if the index drops 23.6%.

The Foolish Bottom Line

With little or no out-of-pocket cost to us, this strategy profits on a meaningful decline in small-cap stocks. We'll be positioned to buy a 7.5% stake in the index if it declines 12.7% or more, while we'll enjoy a break-even price that's an additional 12.5% below that. But we lose nothing if the market stays steady or continues to rise.

Next Steps

- *Pro* members discuss when to buy and buy-around guidance.
- On our Social Banter board, members are debating the merits of the dish versus DirectTV. Join in!

Dear Fellow Fools,

Investing is a bit like painting: When you start with a blank canvas, you're usually not sure what you're going to end up with, and it typically turns out differently than what you imagined. Fortunately, any blemishes in your work won't diminish your long-term success — in investing, anyway. In fact, blemishes are a necessary part of the process. With this in mind, let's review three key aspects of your *Pro* service and how they can help you. Then I'll talk a little bit about ETFs and how we use them in *Pro*.

1. Buy-Around Price

For every stock we recommend, we provide a buy-around price for day one, and then you can find that guidance on our portfolio pages forevermore. "Around" is part of the name for a reason. Usually, buying anywhere *around* the stated price is in the spirit of our recommendation. Investing is sloppy, valuation models are imprecise, and market prices change by the second. For any investment that turns out to be a winner, it won't matter if you bought 5% higher than our idealized price from day one.

We provide buy-around guidance for two reasons: We hope to help keep the investment trading in a tight range on the day we make the recommendation, and we want to provide a general benchmark from which we believe the position meets a healthy risk versus reward. Buying 5%, 6%, or 7% higher than our buy-around price isn't going to ruin that because the upside potential in the stock is also imprecise — and will almost surely rise above our original expectations with enough time and business success. Be patient, try to buy at attractive prices, but also realize that buy-around prices aren't precise — they're a guideline.

2. Fair-Value Estimates

Speaking of imprecise, anyone's fair-value estimate is an exercise in horseshoes and atom bombs: You're just trying to get close; you're aiming to be in the ballpark. Usually at *Pro*, we create a range for a stock's potential fair value by running three outcome scenarios and then using a price in the more conservative side of that range. But you should keep in mind precisely what "fair value" means: It's a fair price for a transaction, and any transaction includes a seller — *and a buyer*.

Upcoming Events

- **March 14: Ebix** earnings
- **March 19: iPath S&P 500 VIX Short Term Futures** calls expire

When a stock trades at its estimated fair value, it suggests that from that price on, the stock will provide your desired rate of return going forward (with stocks, generally 9% to 11% annualized). So when a stock is trading at fair value, that doesn't automatically mean you should sell. You should only sell at fair value if you're defensive and only want to own stocks trading at *discounts* to fair value. Otherwise, holding stocks that trade around fair value is fine. They should continue to reward you steadily until more than a few years of growth are prematurely factored into the share price (for example, if they're 18%, 20%, or more above fair value). At that point, you should consider swapping the stock for ones that trade at a discount to fair value instead.

3. *Pro*'s Trades

We don't have a crystal ball for short-term price movements. After we announce a trade alert, *Pro* must wait 24 hours before we can make the trade, and we have 30 days before we *need* to complete it. We'll usually try to complete trades early in our time window (at which point our Trade Complete email is sent to you) because prices can easily move against us if we wait, especially with options. But we don't have a magic formula for getting better short-term prices. We issue trade alerts when a trade is attractive, and then we hope the price cooperates with us within reason. Once again, *investing is an imprecise art*. *Pro* historically receives weaker prices on the majority of its investments (you can't expect otherwise when you announce trades and then must wait to make them), but even so, we're fast on the heels of our goals.

Using ETFs to Prosper

In our recent Monday Memos, we've been discussing how to run a *Pro* portfolio. We talked shop on stocks, comparing them to a marriage, and provided an overview of options. Now it's time to touch on exchange-traded funds and how we use them at *Pro*.

Like mutual funds, these handy investment vehicles can hold large baskets of investments (such as stocks, bonds, or commodities). ETFs trade on an exchange like stocks do, provide transparency by regularly reporting holdings, and in most cases, they charge reasonable fees. All of that goes a long way in explaining why they're the fastest-growing investment class on Wall Street.

Investors use ETFs to execute a variety of strategies, such as investing in commodities, foreign markets, sectors, and currencies; or to make inverse or leveraged bets (just to name a few). ETFs play an important role in a *Pro* investor's portfolio, making it easier to diversify and own stakes in many kinds of assets. As such, ETFs will typically make up about 15% to 20% of our *Pro* portfolios. We tend to hold an ETF as long as we believe an attractive, long-term, macro investment argument remains in place.

A Few ETFs We Own

In 2008, our Charter Portfolio bought our first stock-based ETF, **Vanguard Emerging Markets**. The fund invests in more than 800 companies concentrated in developing countries, such as China, Brazil, India, and Korea. As we suspected, rumors about the end of the world back in 2008 proved a tad premature, and the ETF gained 80% in the following months, prompting us to sell half our position. We still own the rest, and it remains a long-term Buy alongside our more recent addition, **WisdomTree Emerging Markets SmallCap Dividend Fund**. Although they're been out of favor lately, emerging markets should return to the limelight as investors realize that the United States has slow growth prospects without the Fed priming the pump.

A few months after our Charter Portfolio bought into emerging markets, we invested in the **Vanguard Energy** (NYSE: VDE) ETF, which holds the largest U.S.-based oil and gas companies. Oil was trading near $40 per barrel then, pushing down the share price and making the fund a value. The shares have since appreciated along with oil prices — which have been soaring lately. If you believe — as we do — that leading energy companies will continue to create value in the coming years, this ETF is an easy way to own many of the best energy companies in the country.

Our Charter Portfolio also owns the **SPDR KBW Regional Banking** (NYSE: KRE) ETF, which holds 50 of the country's leading regional banks and trades in aggregate modestly above book value. The ETF provides a diversified way to invest in an out-of-favor sector and spread out your risks while waiting for a recovery.

Each of the ETFs we hold in our Charter Portfolio is a Buy or Buy First, so you can expect us to start investing in them in Portfolio 2011, too.

New ETFs and Pitfalls to Avoid

Newfangled ETFs are rolling out all the time. One that's caught my eye is the **U.S. Commodity Index Fund**. It invests in a basket of 14 commodity futures after choosing from 27 possibilities every month. It bases its selections on quantitative-based models that consider every aspect of the futures prices. In a nutshell, the ETF seeks to minimize contango (the pesky nature of futures contracts typically costing more each month) and maximize backwardation (the relatively rare condition in which futures contracts become cheaper). So far, the young ETF has performed well, and according to the prospectus, the fund's methods would have returned 20% annualized the past 10 years.

Your *Pro* team considers new ETFs on a regular basis, but they all have one important thing in common: None of them uses much leverage. Many of today's ETFs are leveraged to seek 2, 3, or even 4 times the daily price movement of an underlying asset. Leverage like this will diminish the value of an ETF over long periods of time, so you won't see *Pro* embracing "ultra" or leveraged ETFs. We're also looking to *short* vehicles that simply track futures contracts to try to mirror the price of a commodity, rather than owning the commodity itself. Contango and the monthly cost of rolling futures contracts eats into the value of these investments. This is part of the reason we're bearish on the **iPath S&P 500 VIX Short-Term Futures** (NYSE: VXX) ETN.

Keys to ETF Investing

With ETFs — as with any investing — the key to being successful is knowledge. Specifically, before you open a position, be sure you:

- Understand how the ETF invests and have confidence in the method.
- Invest in ETFs that charge reasonable fees, generally less than 1% per year, although more complex ETFs can merit higher fees to get the job done.
- Know your time frame. Some ETFs are longer-term investments (such as emerging markets), while others are shorter-term (such as shorting ETFs).

To learn more about ETFs, visit The ABCs of ETFs and our discussion board, ETF Center. Do you have an ETF you particularly like (or dislike)? Please post it on our board!

Invest well!
Jeff Fischer

Jeff owns shares of Ebix and is short VXX.

Charter Portfolio: Buy to Close Covered Calls on Kinetic Concepts

Published Mar 7, 2011 at 12:00AM

- **Action:** "Buy to close" March 2011 $45 calls
- **Options price:** $6
- **Share price:** $50.80
- **Time value:** $0.20

What's New?

In a fascinating turn of events, wound-care company **Kinetic Concepts**' (UNKNOWN: KCI.DL) stock recently went into hyperdrive when the company told the SEC that it no longer plans to pay royalties on patents it had been licensing from Wake Forest University for years. The patents relate to Kinetic Concepts' negative pressure wound therapy products, which represent the majority of the company's revenue. But following a multi-year battle, a Texas federal district court ruled in October 2010 that the patents Kinetic Concepts was licensing were invalid. This ruling increases the chances that competitors, such as **Smith & Nephew** (NYSE: SNN), may eat into market share, but Kinetic Concepts is turning that financial risk on its head, at least for now.

Kinetic Concepts' management figures that if the courts don't recognize the patents, why should the company continue to pay royalties on them? In an apparent breach of its contract with Wake Forest, the company plans to stop writing licensing checks, saving itself more than $80 million per year. (It paid Wake Forest $86 million, $89 million, and $93 million each of the past three years.) The company expects Wake Forest to fire back with a lawsuit (nobody walks away from that much coin without a fight), claiming breach of contract or patent infringement. But because the patents were ruled invalid in at least one court, Wake Forest may have a tough case on its hands, and Kinetic Concepts plans to fight vehemently.

Why This Strategy?

The company earned $267 million in free cash flow last year, and that could jump at least 20% more than previously expected this year if Kinetic Concepts simply stops making royalty payments. This certainly wasn't factored into our fair-value estimate, which could climb much higher if Kinetic Concepts escapes all future royalty payments. This outcome remains to be seen, though. If the courts find the company in breach, shareholders could be slapped hard when Kinetic Concepts has to pay fines and back payments. Meanwhile, rather than rumbling in the courtroom, the company is choosing to fight competitors in hospital rooms, aiming to offer better products at competitive prices. Although we believe the company has several key edges (including some of its own patents), pricing pressures could increase.

Thus, we have a true investing conundrum: Free cash flow, which drives valuation, may leap this year. The company trades at 13.9 times trailing free cash flow, but a lack of royalty payments could boost free cash flow enough to knock that multiple down to nearly 11 in a year's time. However, the company may have to fight long legal battles to undermine the patents after years of previously fighting to *support* them. Kinetic Concepts' past may come back to haunt us if a judge holds the company's previous arguments against it. So, which way to turn?

For now, we'll let free cash flow be our guide. The sudden upside surprise to our free-cash-flow estimate suggests a higher potential valuation for Kinetic Concepts. Although we're not quite ready to increase our fair-value estimate given the uncertain nature of the outcome here, we are closing our covered calls on the stock. We'll revisit the strategy a bit later, confident that we'll find ways to earn extra income on Kinetic Concepts if its stock stagnates but happy to uncap our upside right now as this news unfolds.

How to Follow Along

For every covered call you originally wrote on Kinetic Concepts, "buy to close" the same number using a limit price at or near current market prices. Keep your stock. If you have questions about this trade, please visit our Kinetic Concepts board.

Charter Portfolio will make this trade in the next one to 30 days, but before expiration on March 19, per The Motley Fool's trading rules.

Jeff owns shares of Kinetic Concepts.

Charter and 2011 Portfolios: Buy Tupperware Brands

Published Mar 3, 2011 at 12:00AM

Pro first recommended **Tupperware Brands** (NYSE: TUP) in our Charter Portfolio in June 2009. For our earlier takes on the company, see the recommendation history.

At a Glance

- **Action**: Buy 1% in Charter Portfolio for a 3% total; buy 3% in Portfolio 2011.
- **Recent price**: $55.65
- **Buy around:** $55 (use **a limit order** to promote price stability)
- **Fair value estimate**: $64
- **Alternative trade**: Write ("sell to open") April 2011 $55 puts, recently $1.80; or July $50 puts, recently $1.55. Sell one put for every 100 shares you'd buy. (See our guide to writing puts).
- **Why buy**:
  - Even with 56% of its 2010 sales coming from emerging markets, Tupperware's potential revenue overseas is much larger.
  - The company benefits from its sales system, which relies on personal representatives and group parties rather than shelf space in competitive retail chains.
  - Tupperware's strong financial footing means an increasing dividend, a healthy share buyback program, and continued investment in innovation and growth.

First Things First

- **Company**: **Tupperware Brands** (NYSE: TUP)
- **Market cap**: $3.6 billion
- **Website**: www.tupperwarebrands.com
- **Type of holding**: Consumer discretionary; mid-cap
- **Options**: Available but not necessary
- **Tax considerations**: Tupperware pays a 2.1% dividend.
- **Follow along**: Add Tupperware to My Scorecard.

The Big Picture

Tupperware (NYSE: TUP) keeps on cooking. This longtime purveyor of plastic storage goods for the kitchen is as fresh as ever, with 15% sales growth in emerging markets last year and record levels of free cash flow creation. The secrets to Tupperware's success include a local, "feet-on-the-ground" sales force in every region it enters (it had 2.6 million sellers at the end of 2010, up 8%), innovative products that are tailor-made for the local food market (for example, rice products figure prominently in regions such as China, where sales grew 23% last year), and its unique "group presentation selling" that inspires representatives to sell a large amount of products in social settings while also teaching customers how best to use the products.

Tupperware's sales in Asia-Pacific emerging markets jumped 28% last year in local currency, with Indonesian sales growing 40% — even though Tupperware has done business in the country for 19 years and sales there had already doubled in 2009. Revenue in Malaysia and Singapore grew 24% last year, and Indian sales rose 50% as that country ended 2010 with 50% more sellers than a year before. Despite this growth, India is still a small part of sales.

Although Tupperware had a banner year in France (and is the leading seller of cookbooks in that global culinary capital, if you can believe it), its sales in many developed markets aren't growing much or at all. But the United States, for example, represents less than 5% of the world's population, and the emerging regions where Tupperware *is* growing are home to the bulk of the world's people.

The wind should be at Tupperware's back as the world's most populous regions host a growing middle class (who can finally afford to buy food for storage) and as more women enter the workforce (some as Tupperware sellers). This is a long-term megatrend that Tupperware could enjoy for years as long as it continues to innovate against competitors, train new staff well, and smartly manage its finances. As CEO Rick Goings says, the company is "still in the early stages of geographic penetration in our emerging markets" — and it can expand geographically *and* increase productivity in the regions.

Financials

Given Tupperware's exceptionally strong growth in emerging markets last year, 2011's year-over-year comparisons will be tougher, but the company still expects to remain a growth company. For the full year, excluding one-time items, the company foresees earnings per share of $4.23 to $4.33, up 14% to 16% compared with $3.72 in 2010. The stock trades at 13 times the middle of that range. Free cash flow is expected to moderate compared with last year's $243 million as the company invests more in working capital to support higher sales, but we welcome that investment in the future. Cash is also slated to be spent on a $400 million share buyback program (a significant sum for a $3.6 billion company) through 2015, while the dividend is anticipated to grow in line with earnings.

Next Steps

- Questions or comments? Visit our Tupperware board.
- Once you've bought TUP, add it to My Scorecard.
- If you want to buy shares gradually or try to buy lower, consider our alternative trades above: writing puts.

Pro's Portfolio 2011 will buy a 3% stake in Tupperware, and our Charter Portfolio will buy 1% more for a 3% total in the next one to 30 days, per The Motley Fool's trading guidelines.

Jeff owns shares of Tupperware.

Portfolio 2011: Buy TradeStation

Published Mar 1, 2011 at 12:00AM

Pro first recommended **TradeStation** in our Charter Portfolio in September 2010. For our original take, read the full buy report.

At a Glance

- **Portfolio 2011 action:** Buy 1.5%
- **Recent price:** $6.70
- **Preferred price:** About $6.70 or lower (use a limit order)

- **Type of holding:** Intermediate-term, interest rate and volatility hedge; financial brokerage
- **Alternate trade:** None
- **Why buy:**
  - Online broker TradeStation caters to active, highly valuable rules-based traders, such as small hedge funds.
  - If interest rates rise, TradeStation stands to profit on customers' cash balances; if volatility increases, customers will make more trades and pay more commissions.
  - TradeStation operates in a profitable niche and is an attractive acquisition target.

The Big Picture

Brokerages make most of their money in two ways: by (1) charging commissions on trades and (2) earning interest income on their customers' cash balances and margin accounts. **TradeStation**'s management recently moved to boost both of these revenue streams by entering foreign exchange (a.k.a. Forex) trading and securities lending (that is, it lends investors stocks to short).

The key drivers to our investment thesis — short-term interest rates and volatility — have remained low since we first recommended TradeStation in September 2010. But eventually, short-term rates and volatility will rise, giving the company a boost. We'd rather buy shares now and wait for the eventual turn of the business's driving forces. We're opening a 1.5% position in Portfolio 2011 to match the Charter Portfolio's allocation.

Why Buy?

TradeStation caters to highly profitable, active, and rule-based traders — a niche of the online brokerage community. On average, its clients generate more revenue and interest income and carry larger balances than its major competitors', such as **optionsXpress** and **TD Ameritrade**.

TradeStation is only the seventh-largest online broker, with just more than 3% of the estimated active investor accounts in the United States. But its award-winning trading platform continues to attract new accounts, and it should thrive in a market with even marginally higher interest rates and volatility. At today's price of $6.70, TradeStation would make an attractive acquisition for any number of online brokers.

A Special Request

TradeStation is a thinly traded stock with a diminutive $262 million market cap. The last time we recommended it, shares popped as much as 6%. **Please use limit orders and be patient.** With discipline, you, all of your fellow *Pro* members, and *Pro* itself will be able to buy TradeStation at an attractive price. Please start with a very tight limit order near the current price ($6.70) and work from there.

Next Steps

- Questions or comments? Chat it up on our [TradeStation discussion board].
- Want to follow TradeStation? [Add it to My Scorecard.]

Portfolio 2011 will buy a 1.5% stake in TradeStation in the next one to 30 days, per The Motley Fool's trading guidelines.

Four Pro Investing Truths

Published Feb 28, 2011 at 12:00AM

Pro Extra: Chat With Medtronic

The Fool is hosting a live chat with **Medtronic** tomorrow, Tuesday, March 1, from 4 to 5 p.m. ET. Just head over to Fool.com to ask *your* questions!

Dear Fellow Fools,

In our recent Monday Memos, we've discussed how *Pro* invests in stocks and options, and we'll talk about how we use ETFs and shorts soon. But because the market dipped last week, now is a good time to explain a bit more about how *Pro* views investing in general. That's because whenever market volatility increases, we want you to know where we stand and how we're thinking. Here are four of our key investing truths:

- We're not knee-jerk investors who zig and zag with every market move.
- We use options mostly for short-term gains and own stocks for the long haul (to us, that's years, not months).
- We will adjust our strategy most when we believe a *serious* change is afoot — meaning a market decline (or gain) of *at least* 10%.
- We are moving toward being more concentrated and making larger investments in our strongest-conviction ideas.

Earnings

Finally, no earnings to watch out for — the first time in seven weeks! Now we can focus more on updating our positions and making adjustments.

Let's expound a bit more on each point.

We're Not Ginger Rogers to the Market's Fred Astaire

Dancing this way and that, the stock market can be volatile — in both directions — but its motions mean little if it's just retreading where it was before. And basically, that's all the market has done since 1999: jitterbug around without actually going anywhere. Only good stock pickers and options investors have created value on Wall Street during long spans in which index returns have been modest. For this reason and so many others, we don't try to zig and zag with modest market moves. Doing so is costly, it can't be done well (if at all), and it typically ends up destroying value even while the market ends up flat.

Instead, we use options (and shorts) to target shorter-term gains, and we aim to hold our core stocks in superior companies and ETFs for long-term gains. We'll only seriously adjust the slant and strategy of our portfolios — by rapidly raising cash, for example, or initiating large shorts or hedges — when we believe there is a strong chance the market will decline at least 10% and really 15% or more. There's simply not enough wiggle room in a 5% or 10% decline to risk chasing it, and these small moves usually happen too quickly to merit changing your investment strategy to try to benefit.

So small zigs and zags in the market don't faze us. We look for new opportunities within those price moves. But if we believe a *more serious* market change is in the cards, then it's our imperative to take much greater action beforehand. To be clear, nobody can predict the market's next dance step, but valuation and the macro-environment are our guides, and they've provided good "leads" in the past.

If you're not into dancing, try this as a visual reminder: As a *Pro* investor, you're not a twitchy little mouse; no, no; you're a giant Blue Whale, swimming at your own pace while the market (perhaps represented by krill) skitters all around. We know our ultimate destination: forward, and at an even pace.

Manage Risk, Swim Forward, and Concentrate — All at the Same Time

We may be bullishly oriented for much of the time and only adjust course when risk seems too great or we see many more shorting opportunities than potential buys. Even so, at all times, we need to manage our investments with risk in mind. With the Fed's easing program likely to end, interest rates probably heading higher, local governments in dire straits, commodity costs rising, politics in the Middle East flaring, and Europe in a straitjacket, there are plenty of reasons to be on guard. As you read this, I'm at the Chicago Board Options Exchange Risk Management Conference, busy learning the latest strategies for managing portfolio risk. But the key will be to manage our risk while continuing to swim forward as much as we can, rather than stopping entirely. This is right in line with our goal:

Coverage & Community

- Nick (TMFCrow) covers **TradeStation**'s earnings.
- **GrafTech**'s results get early approval from *Pro*, with more analysis coming.
- Jeff (TMFFischer) shares a short idea that came oh so close to becoming an official *Pro* recommendation.
- Russell (TMFEldrehad) shares his thoughts on gaming the system in CAPS.

Pro's mission is to earn you consistent, recurring profits with a high level of accuracy using a combination of stocks, options, and ETFs.

Another way we'll achieve stronger results over the years (now speaking to bullet point four above), is by concentrating our dollars in our highest-conviction ideas. We'll probably always own at least a few dozen positions, but some may only make up a few percent of the portfolios, and others may eclipse 7%, 10%, or even more of our portfolios. We want to put more of our cash into the positions we're most convinced will have a profitable outcome. Shorting the **iPath S&P 500 VIX Short-Term Futures** ETN is one such position — with time, short sellers are almost certain to continue to make money due to the structural flaws of the ETN. From day one, our potential allocation to this short has been as high as 10%. It could rise even higher given the right opportunity.

Healthy Returns, Lower Risk, and a Good Life

Sum it all up, and we want to achieve robust returns through concentration, with reasonable risk while maintaining — quite simply — a good, Foolish life. You don't need to be tied to your computer to succeed on Wall Street — not with our *Pro* strategies. Instead, you just need to use proven strategies that consistently work, and use them on good opportunities. It's our job to help you find them. And it's *your* job to not sweat the small stuff. Zigs and zags are just part of the fun. It's major dislocations that we need to keep an eye out for.

Fool on!
Jeff Fischer (TMFFischer)

Jeff is short the iPath S&P 500 VIX Short-Term Futures ETN.

Charter and 2011 Portfolios: Write Naked Calls on VXX

Published Feb 25, 2011 at 12:00AM

First Things First

- **ETN: iPath S&P 500 VIX Short-Term Futures** (NYSE: VXX)
- **Closing price (Feb. 24):** $33.68
- **Website:** ipathetn.com
- **Type of holding:** Short (short naked calls)
- Add VXX to My Scorecard

At a Glance

- **Action:** Write ("sell to open") March 19, 2011, $34 naked calls
- **Allocation:** 6% if we end up shorting shares; for our Charter Portfolio, that's 25 contracts. For Portfolio 2011, it's four contracts.
- **Recent options price (bid/ask):** $1.30/$1.34
- **Preferred price:** Use a limit order near current price; if trading later, accept no less than $1.
- **Recent ETN price:** $31.80
- **Alternative trades:**
  - Sell shares short directly, starting with 3%.
  - Write naked calls at higher strikes (or later months) for more breathing room.
  - Set up a January 2013 synthetic short ("sell to open" calls near the recent share price, and "buy to open" the same strike puts).
  - Buy the *inverse* of this ETN, the **VelocityShares Daily Inverse VIX Short TermETN** (NASDAQ: XIV), starting with 3%.
  - If you're already short shares directly, continue to hold your short for more long-term price decay.
  - If you're unable or not ready to make this trade yet, no problem. We plan to repeat this in the future, and you can join in when you're ready.

What's New

This is the fourth time we're taking a short position in the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) exchange-traded note, and it almost surely won't be the last. The reasons are simple: First, when stock market volatility spikes, it's always been temporary. Investors have yet to expect high volatility in the S&P 500 indefinitely. Second, this ETN follows the short-term futures of the popular VIX (or volatility) index, and those futures contracts almost always carry a premium that erodes day by day, eroding the value of this ETN. These two factors make this vehicle a preferred short at *Pro* at opportune times.

The S&P 500 declined Tuesday through Thursday, sending the VIX to its largest weekly gain since May 2010, when fears about Europe's debt problems rocked the market. The VIX gained 30% between last Friday and yesterday, from 16.43 to 21.32. (The index isn't quoted in dollars, by the way; the number of the VIX represents the expected level of annualized volatility in the index, so as of yesterday, it was calling for 21.3% annual volatility.) In typical fashion, the VIX Short-Term Futures ETN gained much less than the VIX's 30% jump this week — just 16%, from $29.03 to $33.68. The lag is because the futures contracts it mirrors already assume a higher future price at nearly all times — it's already baked in. What's most important now is the question of whether volatility will continue to rise considerably during the next month while we're shorting volatility. Nobody can know for certain, but we have our doubts.

Unrest in Libya and higher oil prices have been blamed for this week's spike in market volatility, and although Libya's woes are serious and we wish the people well, the country is only the world's 15th-largest oil producer, accounting for 2% of the world's supply. What's more, Saudi Arabia, other OPEC members, and the United States have said they can cover any oil shortage. Speculators are sending oil prices higher on the assumption that turmoil in the Middle East will worsen, and it might, but given OPEC's statute to supply the market, it's unlikely that the total oil supply will be adversely affected. Once this sinks in with the speculators, oil prices will probably deflate a bit. That, in turn, may decrease market volatility. But even if volatility remains elevated, our short position has breathing room.

Why This Strategy?

With the volatility index at 21.3 at yesterday's close, the short-term VIX futures contracts that our exchange-traded note tracks closed at 21.85 for March and 22.35 for April. Blended together (as the ETN does, tracking both), that's a 3.7% premium to the VIX. Further, the options we're writing have a strike price of $34, or 6.9% higher than the ETN's recent market price. And they'll pay us about $1.30, adding 3.8% more to our break-even price, to $35.30. In sum, the ETN needs to gain about 11% from the current price before our short position is at breakeven. For the ETN to do that, the VIX likely needs to gain at least another 14%. Even that may be understated because futures prices typically rise each day the VIX rises, causing the ETN to pay more as it rolls its futures contracts daily, weighing on the ETN.

Although the VIX could of course gain 14% if investors remain frightened, we're comfortable with our cushion in the next 21 days to expiration. We know that if the VXX rises more than this, we can roll our naked calls up (to a higher strike) and out (to a later month). We could also close the position and convert it to a synthetic short.

Why start with this strategy, then? We *are* interested in setting up a 2013 synthetic short, and/or buying the *inverse* ETN to the VXX (see the alternative trades above — that's an easier way to start this strategy). Ideally, though, we'd start those longer-term positions when the VIX is higher than today's 19.6 (its lifetime average is 19), because those positions don't carry a cushion before breakeven. But barring a higher VIX, we're able to emulate one by writing naked calls at a higher strike. That said, you should know that we want long-term positions in this short, so we're actively considering a 2013 synthetic short or owning the inverse ETN alternative trade starting this year, too, to complement short-term opportunities like writing naked calls.

How to Follow Along

You need full options and margin approval to write naked calls — these are calls in which you don't own the underlying shares. Our profit is limited to what the calls initially pay us, unless the ETN rises above our strike price and we're able to short shares (although we're more likely to roll the calls for another payment or change strategies; shares for shorting are unavailable at our broker). If you can short shares directly, that's still an attractive long-term choice, though you should move incrementally and short more on further spikes. You have more profit potential shorting directly, but you don't start with a pricing cushion the way you do with naked calls.

Trade Details

- **Action:** Write ("sell to open") March 19, 2011, $34 calls (one for every 100 shares you'd short).
- **Allocation:** For our Charter Portfolio, that's 25 contracts. For Portfolio 2011, it's four contracts. We recommend a 6% allocation for both portfolios. Each written call represents a $3,400 short of VXX. **Note: Options are available that expire March 4; we're writing the March 19 options.**
- **Limit price:** Near market price, recently about $1.30 or higher (accept no less than $1)
- **Break-even price:** $35.30
- **Current VXX price:** $31.80
- **Difference to breakeven**: 11%
- **Return on investment (at $1.30):** 4.1% if the calls expire, earned in 21 days

Fools, if you make this trade, be aware of the risks of shorting anything, let alone a volatility index. This is a high-conviction position when time is on our side, but we might see large price movements in the meantime. In that case, we'd need to roll the position forward or update our strategy. If you have more questions about this trade, our past reports should help you get up to speed. As always, please bring your questions about this trade to our VXX board.

Jeff is short shares of VXX.

Charter and 2011 Portfolios: Write Puts on L-3 Communications

Published Feb 24, 2011 at 12:00AM

Pro first recommended buying **L-3 Communications** (NYSE: LLL) in our Charter Portfolio in November. We recommended it for in Portfolio 2011 in January. To read either of these reports, see the recommendation history.

First Things First

- **Company**: **L-3 Communications (NYSE: LLL)**
- **Market cap**: $8.9 billion
- **Website**: www.l-3com.com
- **Type of holding**: Defensive, value
- **Use of options**: *Pro* may continue to use options, but they're not vital. (You can simply own shares.)
- **Important date**: L-3 goes ex-dividend Friday, Feb. 25. **To receive the next dividend, buy shares today.**
- **Tax considerations**: Shareholders enjoy a 2.3% dividend; options could increase short-term returns.
- **Follow along**: Add L-3 Communications to My Scorecard.

At a Glance

- **Action**: Write ("sell to open") April 2011 $80 puts for a potential 2.5% in our Charter Portfolio or 3% in Portfolio 2011
- **Charter Portfolio**: Write 5 contracts for a potential 2.5% (nearly 6% total)
- **Portfolio 2011**: Write 1 contract for a potential 3% (6% total)
- **Stock price**: $80.50
- **Buy around**: $80

- **Option price (bid/ask)**: $2.70/$2.90 (use a limit order around market prices, generally between the bid/ask; later, accept no less than $2)
- **Alternate trades**: Buy shares directly, or write $75 puts to be more defensive.
- **Why buy?**
  - The defense contractor offers world-class capabilities and technology.
  - Its stock is an excellent value.
  - This defensive company's business isn't dependent on the general economy.

The Big Picture

We like the value that defense contractor L-3 offers: It's a leading player in an industry that's well out of favor, which means we're getting a good price for a quality company. We also like its defensive qualities in today's uncertain market. Growth might be slower for defense companies than their private-sector counterparts, but defense contractors for the most part enjoy steady revenue that doesn't depend on the economy or consumers.

The key issue here is the government's budget, and with defense accounting for about two-thirds of Uncle Sam's discretionary spending, the industry's allotment is being pressured on both sides of the aisle. But as we said in our earlier write-up, we don't expect this to have much of an impact on L-3.

That's because L-3 provides mission-critical technology and defense services that should survive budgetary tightening. Plus, as we've now seen, the Pentagon doesn't plan to shrink the defense budget much at all. In fact, defense spending is scheduled to grow modestly through 2014, and then flatten, not plunge. Leading defense companies should still perform satisfactorily in this environment — and their cheap shares should recover. Indeed, since *Pro* first bought shares in November, L-3 stock has started to gain some ground.

What's more, since our latest recommendation, L-3's board of directors increased the quarterly dividend by 12.5%, from $0.40 to $0.45 per share. This puts the annual dividend at $1.80, or a 2.3% yield.

Why This Strategy?

We started a half position in L-3 in the low $70s because it was a fantastic price for the company. We've been rewarded with an 8% rise in the stock, but we still want to fill out our position.

Although $80 is still a good price for the stock, another sensible strategy at this point is to write put options, which allow us to collect income and have a chance at eventually buying the shares several dollars cheaper than the current price.

How to Follow Along

You need options approval to write puts, and the trade command is "sell to open" or "sell." **Do not buy these options!** Sell one contract for every 100 shares of L-3 you're willing to purchase later. Each contract represents an obligation to buy 100 shares, or $8,000 worth of stock; we're selling five contracts for about a 2.5% allocation in the Charter Portfolio and one contract in Portfolio 2011. Writing these options will "pay" us the option premium today, and we'll wait until expiration in April to see the outcome.

- **Initial potential profit:** About $2.70 per share, or 3.3% cash income in 51 days; the return is 11.1% if buying power is used to hold the trade open, alongside 30% cash.
- **Break-even (or start price):** $77.30, or 3.9% lower.

Because we intend to take ownership if we're assigned shares in April, be certain you have $8,000 per contract available to buy shares. Otherwise, just buy L-3 stock outright per our alternative trade, bringing it to 5.5% to 6% of your portfolio.

Next Steps

- Questions or comments? Still getting your feet wet with options? No worries. Visit our L-3 Communications board to ask questions, and check out our guide to writing puts.
- Add L-3 Communications to My Scorecard.

Charter Portfolio and Portfolio 2011 will write puts potentially representing about a 2.5% to 3% stake, respectively, in L-3 Communications in the next one to 30 days, per The Motley Fool's trading guidelines.

Andrew has an options position in L-3 Communications.

Returns: What Matters Most?

Published Feb 22, 2011 at 12:00AM

Upcoming Earnings

- **Feb. 22: Medtronic**
- **Feb. 23: Papa John's Pizza**
- **Feb. 24: GrafTech International**

Returns are always a hot topic on our *Pro* discussion boards, and most investors fall into one of three camps. There are investors who pay attention to:

1. Relative returns
2. Absolute returns
3. Or — gulp — those who don't measure their returns

Relative-return investors measure their investing performance against a benchmark — usually the market or a proxy for it, like the S&P 500. They're like competitive runners who are constantly checking the lanes next to them to make sure they're beating their rivals.

Absolute-return investors, on the other hand, tend to be happy as long as their portfolios are growing, regardless of how the overall market is performing. They usually have some hurdle rate or other measurable goal. These are the runners who are happy simply to be putting one foot in front of the other, moving forward at their own pace and ignoring the other racers.

Investors in the third group don't measure their performance at all, and they're in the worst shape.

Which camp are you in, Fool? Sometimes it's not the one you think. Here's one way to find out.

Cash Balances Hold the Key

The history of your cash balance might hold the key to whether you're an absolute- or relative-return investor. Look back over your time investing. Do you tend to be fully invested? If so, you're probably in the relative-return camp. These investors tend to be more fully invested than their absolute-return brethren, and this makes sense because, by definition, there will always be stocks that will beat the average return of a benchmark. On a relative basis, it makes sense to buy your fill.

Or do you build up a cash pile every now and again? Absolute-return investors can't always find stocks that meet their desired rate of return, or the available opportunities don't fully compensate them for the risk, so cash often makes up a larger percentage of their portfolio.

Bull Markets: An Achilles Heel

Both of these measurement methodologies have weaknesses — and they're related. Bull markets are the Achilles heel for both types of investors (and runners), though they affect the portfolios differently. In a bull market, one investor might permanently impair his capital as he chases returns, and the other might suffer from performance envy that could lead to a strategy shift.

Coverage & Community

- Jeff (TMFFischer) weighs in on earnings from *Pro*'s newest stock: **Rockwood Holdings**.
- We love to see this type of conversation on our Philosophy & Strategy discussion board.
- This week in CAPS: TMFEldrehad shares his thoughts on contrarianism in CAPS.
- Looking to boost your knowledge using covered call options? Check out the class going on at *Motley Fool Options* right now!

Here's why. When all stocks are rising in bull markets, fully invested relative-return investors seem like heroes. They put every new dollar to work as soon as it's earned lest the returns lag behind the market. Each subsequent purchase quickly shows a profit, further emboldening the investors. Unable to resist the allure of more upside, they can be nearly blind to the increasing risk in their portfolios. As they chase the market all the way up, these investors risk exposing their heels to the potent arrow of a market correction. After a drop, and without a significant cash cushion to deploy, they can face a permanent loss of capital.

Absolute-return investors, on the other hand, might start selling their shares at lofty prices, writing calls, or building hedges to reduce their portfolio's risk during a bull market. But they can also suffer from return envy as their cash pile drags on their portfolio and as their fully invested brethren's returns keep climbing — especially as attractive opportunities evaporate in the quickly rising market. If a bull market lasts long enough, some absolute-return investors will question whether their targeted return of 10%, 12%, or even 15% is attractive enough. The seemingly easy money made in an index might prove too tempting. But if they change strategy now, they too may be shot in the heel with Paris's deadly arrow.

The *Pro* Way: Measure What Matters

Here at *Pro*, we're absolute-return investors. It's not that we have anything against the relative-return camp — we're just not in the same race. We focus on meeting our financial goals — and yours. For most of us, that means investing as a means of providing and maintaining a comfortable lifestyle for ourselves and our families. We strive for measured growth and income while not risking the nest egg that took so long to build. That's why we focus on accuracy and use options to limit our risk while earning income. This is the *Pro* way!

Returns that provide for your financial goals are what matters most in investing. So when you're looking at your results, measure what matters. If your returns provide for your goals and your current strategy has a high probability of continuing to provide that level of return, why would you care what anyone else is doing? Or what the market is doing? Keep your eyes on your goal, and you'll run a good race — and likely end up ahead.

As always, thank you for being a member of *Motley Fool Pro* and for making our community the best one in all of Fooldom. Please share your thoughts and experiences on our Memo Musings board.

Fool on!
Nick Crow (TMFCrow)

Portfolio 2011: Write Puts on GlaxoSmithKline

Published Feb 16, 2011 at 12:00AM

Pro first recommended buying **GlaxoSmithKline** in our Charter Portfolio in December 2009. To read *Pro*'s original report, see the recommendation history.

First Things First

- **Company: GlaxoSmithKline**
- **Market cap**: $97 billion
- **Website**: www.gsk.com
- **Type of holding**: Health care; defensive income.
- **Use of options**: *Pro* will probably continue using them, but they're not vital. (You can simply own shares.)
- **Tax considerations**: Shareholders enjoy a hefty dividend; options could increase short-term returns.
- **Follow along**: Add GlaxoSmithKline to My Scorecard.

At a Glance

- **Action**: Write ("sell to open") a 4% position in May 2011 $37 puts (for *Pro*, 3 contracts)
- **Stock price**: $38.27

- **Buy around**: Below $40
- **Option price**: $1.20 (use a limit order around the market price)
- **Alternate trades**:
  - Buy a 4% allocation in shares.
- **Why Buy?**
  - The U.K.'s largest pharmaceutical and health-care products company trades at a defensive price and offers a safe 5.3% dividend yield.
  - Most patent expirations are behind the company, and it has dozens of new products in trials.
  - A focus on emerging markets diversifies the business and expands the potential for long-term revenue and profit.

The Big Picture

GlaxoSmithKline is a $97 billion behemoth that controls an estimated 6% of the global pharmaceutical market (revenue-wise) and employs nearly 100,000 people in more than 100 countries. The U.K-based company is the second-largest industry bellwether behind competitor **Pfizer** (NYSE: PFE), and it has strong, steady cash flow; a diverse portfolio of drugs; and a stable of consumer products now entering new markets, including China.

We like Glaxo's focus on smaller, bolt-on acquisitions and the way it has diversified its business in the face of potentially game-changing patent expirations. CEO Andrew Witty initiated a three-pronged strategy in 2008 to simplify the operating model, become more globally diversified, and deliver greater value to customers (hey, great idea!).

Drug sales in the United States and Europe remain weak due to generic competition, but emerging markets offer an especially large opportunity. According to a study by UBS, seven developing countries — Brazil, Russia, India, China, Korea, Mexico, and Turkey — could account for 70% of drug-sales growth by 2020.

Why This Strategy?

We never expected fireworks from Glaxo — instead, we sought steady income and slow appreciation with reasonable risk. *Pro*'s Charter Portfolio has earned enough dividends and covered-call premiums to generate nearly 7% in income on our investment in just over a year, while the stock has gone … nowhere. Shares are down 5% from our average purchase price. Litigation costs related to older drugs have weighed on the company, and although legal concerns remain, the company is confronting them head on, and good news continues to float up from the business.

Management increased the annual dividend 7% in 2010 and announced a $1.6 billion to $3.2 billion share buyback program last month. (That's potentially more than 3% of outstanding shares). Add in the 5.3% dividend yield, and the potential exists for up to 8.3% in "earnings yield" per share over a year before the stock moves anywhere. After the 2010 results were released, the CEO said:

> "*…whilst our operating environment remains challenging, I believe we have made significant progress through restructuring. … Our business is more balanced and is generating underlying sales growth. Our broad and diverse pipeline is generating increasing potential. Our cash generation is strong and we are enhancing returns to shareholders. …I remain confident that we can generate increased value for shareholders and deliver even better outcomes to patients and consumers.*"

The underlying sales growth that Witty refers to has primarily been driven by the company's focus on emerging markets. This is where Glaxo shines. With a clear focus on developing drugs for emerging markets, Witty has helped increase sales to these growth markets to 13% of Glaxo's total revenue. We expect further growth, too, as the company's 13,000 emerging-market sales reps continue to grow sales at an impressive 20% rate.

These efforts have transferred to the company's financials, with cash from operations rising 9% last year excluding legal costs. Yet the company trades at only 7 times levered free cash flow and 11 times expected earnings. For a company with more than 30 product candidates in late-stage trials (10 reached Phase 3 trials in the past year), the price looks inexpensive. With Glaxo trading at a discount to the market and offering an above-average yield, the rewards should outweigh the risks in the coming year.

In today's high-flying market, however, we're content to be defensive and approach the stock by writing puts — insuring that we only potentially buy shares at a cheaper price and earn income while we wait. Writing puts alone will pay us more over time if the stock stays in a range. That said, if you want to buy the stock outright, shares are below our $40 buy-around price and offer a 5.3% yield, with the next dividend payment due in early May.

How to Follow Along

You need options approval to write puts, and the trade command is "sell to open" or "sell." *Do not buy these options!* Sell one contract for every 100 shares of Glaxo you're willing to purchase later (each contract represents an obligation to buy 100 shares, or $3,700 worth of stock; we're selling three for about a 4.4% allocation, as close as we can get to 4%). Writing these options will "pay" you the option premium today, and we'll wait until expiration in May to make our next move.

Our initial potential profit is the put income, and we have an obligation to buy shares if the stock falls below the $37 strike price by expiration. If we get shares, our net start price will be about $35.80 (we buy our shares at $37, but we still keep the $1.20 that the puts paid us). Since we intend to take ownership if we're assigned shares in May, be certain you have $3,700 available, per contract, to buy shares. Otherwise, just buy Glaxo outright (up to 4%) per the alternative trade.

Paying us $1.20 per contract, these puts yield 3.2% in income on the potential share purchase price in just over three months, or about 13.4% annualized. Our potential net buy price is 6.5% below the recent share price, making this a defensive income trade. And if we nab shares, we'll begin to enjoy a 5.4% yield and wait for the price to rise.

Next Steps

- Questions or comments? Still getting your feet wet with options? No worries. Visit our GlaxoSmithKline board to ask questions.
- Visit our guide to writing puts.

Pro*'s Portfolio 2011 will write puts representing about a 4% stake in GlaxoSmithKline in the next one to 30 days, per The Motley Fool's trading guidelines.*

Jeff owns shares and has written covered calls on GlaxoSmithKline.

Use Options Like a Pro

Published Feb 14, 2011 at 12:00AM

Next Memo: Tuesday, Feb. 22

Fool HQ will be closed Monday for Presidents Day, so we'll send your Memo next Tuesday.

Dear Fools,

Last week, a new *Pro* member stopped by Fool HQ in Alexandria, Va., and told me that he's having trouble keeping up with our trade alerts. I reminded him that investing isn't a race and that it's OK to take more time to get started.

Maybe you're feeling the same way, so today, I'll remind you to act when *you're* ready. If you can't make all of our trades when we do, pick and choose your favorites, and invest in those. You'll be able to catch up on many of our trades later.

Earnings and Expirations

Feb. 15: AmTrust Financial Services earnings

Feb. 16: Rockwood Holdings earnings

Feb. 18: Naked calls on **iPath S&P 500 VIX Short-Term Futures** expire

Feb. 24: GrafTech International earnings

We're excited to get Portfolio 2011 up to speed and to keep sharing new ideas for both portfolios — and we have more investing ideas than we can write up — so please know that trade alerts will continue to arrive in your inbox at a steady pace. But don't feel rushed; use our research and ideas to move at your own pace.

Options the *Pro* Way

For now, let's keep learning about the ways we'll put those ideas into action. Last week, we discussed the *Pro* approach to buying stocks. Today, I'll outline the options side of our *Pro* investing strategy.

While we generally seek long-term capital gains from stocks, most of our options are used for *short-term* income or gains. By combining these strategies (along with ETFs and shorts, which we'll cover in our next Memos), *Pro* investors can make profits in the coming weeks *and* the coming years, accomplishing our goal of earning steady, recurring profits with high accuracy in both the short and long term.

Coverage & Community

- Bryan (TMF42) tackles **Broadridge Financial Solutions**' results.
- Nick (TMFCrow) chops up **Plum Creek Timber**'s earnings.
- Member "becomeit" asks, "What's a realistic goal with options investing?"
- Jeff elaborates on what makes **Rockwood Holdings**attractive for the long haul.
- Andrew (TMFRedwood) shares his very favorite recent article about risk.
- Russell (TMFEldrehad) writes about finding top Pro CapShot stocks. Don't miss it.

Options in Two Minutes

Let's go over a few key points about options. If you're new to the concept, I hope this explanation will show you that they're not as intimidating as they may seem. If you're an old hand, keep reading for a few *Pro* trades we like right now.

First, the basics: An option gives its owner the right to buy (with a call) or sell (with a put) a stock at a set price (the "strike price") by a set expiration date. An option's value depends on the price of its related stock; a "call" option goes up when a stock rises, while a "put" increases in value when a stock falls. ("Call up, put down" is an easy way to remember this.) Each option contract represents 100 shares of stock, so options allow you to control many shares for less money than it could cost you to buy the shares outright. However, the *Pro* approach often assumes we'll convert the options into a full stock trade, so we'll use this leverage sparingly.

Options FAQ

- *Pro* is a separate service from *Motley Fool Options*. Both services offer similar educational material that can be used together (and both have a great community of Fools), but *Motley Fool Options* recommendations are not part of the *Pro* portfolio. However, they do provide strong additional, even complementary, ideas.
- Options can be exercised (turned into a stock transaction) by the owner (the buyer) at any time, but they are rarely exercised before expiration.
- The option writer *does not* control when an option is exercised. The owner (buyer) does. Any option that has value at expiration is automatically exercised unless you close it beforehand.
- You can trade options in an IRA, including writing covered calls and, in some cases, writing puts.
- Options are priced based on intrinsic value (the difference between the strike price and the stock's share price) and time value (the amount of time until expiration). The longer until expiration, the more time value an option holds. We like to "sell" time value.
- The more volatility expected in a stock, the higher its option prices (reflected in time value).
- Option writers generally want to write options that expire in six months or less, to collect income more quickly. Option buyers generally want to buy options that expire in one year or longer, to have more time to be right.
- Not all stocks have options traded on them; options require enough investor interest and volume.
- U.S. options expire at the end of the third Friday of the month of expiration.
- To see options prices, obtain a stock quote at your broker and click "option chain."
- To get started using options, apply for options trading permission with your broker; level 2 or 3 will get you started.

We write options (or "sell," "short," or "sell to open" — they all mean the same thing) much more often than we buy them. That's because the odds are stacked in favor of the option writer: Writing options means we get *paid* to make the trade, and given a pricing cushion, we are typically able to profit on the option even when the related stock bounces around. The option *buyer*, meanwhile, *pays* to make the trade — and to make any money, the buyer must be correct about the price of the stock by a certain date. That's difficult to do, which is why we write (or "sell to open") options more often than buying them.

We use options strategically, as part of portfolio management. Options work hand in hand with stocks, and your *Pro* portfolio should come to reflect that. Finally, although most options do make money in the short term, we're not *traders* of options. We use them tactically and appreciate the fact that they expire in a matter of weeks or months.

Strategies — and Trades — We Like Today

Pro will use more than a dozen options strategies, depending on what's most appealing at the time. But we rely on just a handful, and knowing how to use even one or two strategies is enough to change and improve how you invest. The following two strategies are likely to be the most useful over your lifetime.

Writing Puts

If you'd be happy to buy shares of a stock for less than the current price, you can write ("sell to open") put options. You would write, or sell, one contract for every 100 shares of stock you're willing to buy at a set price (the strike price of the option). A real-life *Pro* example — a trade you can consider making today — serves as the best illustration.

Let's say you want to buy some shares of medical devices giant **Medtronic**, but you'd prefer to pay less than the recent market price of $39.50. You could write ("sell to open") May 2011 puts at a strike price of $38, which would recently pay you $1.30 per contract (a total of $130 for each put you write, as each option contract applies to 100 shares of stock). Given the potential stock buy price of $38, receiving $1.30 per share equates to a 3.4% option payment (or yield) in only about three months — around 13% on an annualized basis. That's decent income on the money you should set aside to maintain this trade.

By selling these puts, you've sold a contract into the market that says, "If Medtronic declines below this $38 strike price before this option contract expires, I'll buy it at that set price." In exchange, you get paid the $130 for each put the moment you sell the contract.

If Medtronic does fall below $38 by the time the option expires in May (earnings reports could sharply change the stock price, of course), your brokerage account will buy the shares automatically at expiration. Because you keep the $1.30-per-share option payment you received, your net start price on Medtronic is actually only $36.70 — nicely below today's price. If Medtronic is *above* $38 by the expiration date, the options expire unused, you still keep the option income you were paid, and you can write another put.

Let's look at another example. **Intel** recently traded at $21.70. Its May 2011 $21 puts pay you about $0.70 per share right now, and you could buy shares for $20.30 if Intel falls below $21 by expiration. If not, that's a 3.3% yield on cash you'd set aside for only three months.

This strategy can work well on our *Pro* stocks listed as Holds due to valuation, too, because you can target a buy price in our preferred range. For example, helicopter services provider **Bristow Group** is currently a Hold because it's trading near $46, and our preferred buy-around price is $39. But you can write ("sell to open") September 2011 $40 puts on Bristow and recently be paid about $2 per share. That's a 5% payment in seven months, so it isn't a huge profit, but it would net you a buy price far below today's if Bristow declines: about $38. If Bristow simply stays above $40, you'd get to keep the income and could write new puts.

Whether you're looking to build a portfolio, add to an existing position, or earn income, writing puts on companies you admire is an excellent options strategy. At *Pro,* we frequently also own some shares of the targeted stocks, so we have upside exposure, too. This is a good move if you believe a stock has meaningful upside — after all, you won't want to miss all of that potential gain by only writing puts.

Writing Covered Calls

The flipside of writing puts is writing covered calls. Writing covered calls on stable companies is a steady income strategy used by active hedge funds and poolside retirees alike. When you *already* own at least 100 shares of a stock, and you're willing to *sell* it a bit higher, you can write ("sell to open") covered call options. (They're called "covered" because they cover a stock you already own.) This strategy does limit your upside on that stock because you're obligated to sell it at the strike price even if it rises higher (you can adjust your option trade later to gain more upside — this is called "rolling up"). But on the plus side, the amount of the strike price (or sell price) is your decision, made when you set up the trade.

Let's look at a real-life *Pro* trade you could make using this strategy. For every 100 shares of **SPDR KBW Regional Banking** ETF that you buy around a recent $27, you could write one June 2010 $28 *call* option that recently pays you around $1 per share. You collect $100 right now on one covered call contract, and you promise to sell your 100 shares at $28 if they reach that price (or higher) by the June expiration. (Including the call income, your net sell price per share would be $29.) The $1 per share you're paid for the contract is a 3.7% yield (and downside cushion) on a $27 purchase price. That income is earned in about four months. And if you do sell at a net $29, you'll see a 7% total return on your stock over the same time (excluding dividends). On the other hand, if the ETF is still *below* $28 by the June expiration, you keep the option income, keep your stock, and can write new covered calls for more income. Meanwhile, the covered calls cushion against a decline in the stock. You can see why so many income-oriented investors enjoy this strategy.

Start There

These two *Pro* options strategies may be the ones you use most as you get started. *Pro* will use many others, including buying calls to leverage gains; buying puts to protect positions or to short a stock; writing covered strangles (selling both puts *and* covered calls on a stock to double our income, which we're doing with **Papa John's International** (Nasdaq: PZZA) in the Charter Portfolio; using option spreads to earn large returns on investment with low risk; buying straddles to profit on big price moves in either direction; and more. All of these strategies and others are explained in our Options Guides. But you should start with just one or two strategies — the ones we outlined today.

More Options Resources

It's a lot of information to absorb, but remember that the more you read about options, the better you'll understand them. Here are some of the options education materials available to you as a *Pro* member:

- Options 101: The Basics and Four Key Strategies Outlined
- Options 201: Writing Covered Calls
- Options 301: Writing Puts
- All About Options discussion board

There's even more good info in our Options FAQ sidebar, and please ask any questions on our All About Options discussion board.

Charter Portfolio: Buy to Close Plum Creek Covered Calls

Published Feb 14, 2011 at 12:00AM

At a Glance

- **Action:** "Buy to close" May 2011 $39 calls on Plum Creek Timber
- **Current prices:** May 2011 $39 call bid/ask: $3.45/$3.60
- **Preferred prices:** Use a limit order near the ask price, recently $3.60

What's New?

Our May 2011 covered strangle on **Plum Creek Timber** (NYSE: PCL) is three months from expiration, but we're taking some action early. That's because the stock's $0.42 quarterly dividend payment exceeds the scant $0.25 in remaining time value on our covered calls. So with the ex-dividend date of Feb. 16 quickly approaching, we'll "buy to close" our May 2011 $39 calls early. This lets us keep our stock and uncap its upside potential — which is in line with our belief that limiting the upside opportunity on commodity investments could be a suboptimal strategy in today's resource-focused world.

That said, we'll leave the other leg of our strangle — the May 2011 $36 puts — alone, expecting either to earn the full cash gain or to buy additional shares at this lower, attractive price. Overall, our covered strangle is still earning us a small profit even though we're closing the covered-call leg at a loss — meanwhile, we've also enjoyed significant share price appreciation. And we've earned these gains with less risk, thanks to our strangle.

Why This Strategy?

To review, a covered strangle has two components, or legs: You write ("sell to open") covered calls on shares you already own to potentially sell higher, and you also write puts that could potentially purchase you additional shares if the stock falls below the puts' strike price by expiration. You can make both trades at once, or you can "leg into" them, making one side of the trade at a time, sometimes weeks or months apart (as we did for our first strangle on Plum Creek).

By closing our covered calls, we'll keep our shares and uncap further appreciation potential in the stock, which is likely if lumber prices keep climbing. We're happy to own Plum Creek and enjoy its healthy dividend, and (for now at least) we no longer want to risk losing our small ownership stake in American timberland.

How to Follow Along

Buy back your written calls by placing a "buy to close" limit order near the ask price. Do nothing with the written put and stock portions of this strangle. If you have questions about this trade, please let us know on the Plum Creek Timber board.

Charter and 2011 Portfolios: Buy Rockwood Holdings

Published Feb 10, 2011 at 12:00AM

First Things First

- **Company: Rockwood Holdings** (NYSE: ROC)
- **Guidance:** This is a **Buy First** stock in *Pro*'s portfolios.
- **Market cap:** $3.2 billion
- **Website:** www.rocksp.com
- **Type of holding:** Materials, natural resources; core, long-term
- **Options available:** Yes; we may write puts or covered calls later, but options aren't essential here.
- **Important date:** Earnings on Feb. 16
- **Follow along:** Add Rockwood Holdings to My Scorecard

At a Glance

- **Action:** Buy 2.5% of a potential 5%
- **Recent price:** $42.30 per share
- **Preferred price:** $43.50 or lower (**use a limit order near current prices**)
- **Estimated fair value:** $56
- **Why buy:**
  - This diverse company sells specialty chemicals and engineered materials that make much of modern life possible.
  - As the leading producer of lithium, which is used in batteries and electronics, Rockwood should ride the growing waves of mobile computing, green energy, and electric cars.
  - Trading at 11 times expected 2010 free cash flow, stock gains are in the cards — this management team is obsessed with increasing Rockwood's free cash flow.
- **Alternate trades:**
  - Write ("sell to open") March 2011 $40 puts, or write May 2011 $40 puts.

The Big Picture

The ingenuity of the human race is on full display at **Rockwood Holdings** (NYSE: ROC), and the results touch your life every day. The disc brakes in your car, the airplanes you fly in, the paint on your home, the fibers in your clothing, the batteries in your electronics, and the pharmaceuticals in your cabinet — even the packaging around your groceries — all may contain Rockwood's specialty chemicals and engineered materials.

The company's revenue grows as industrial, manufacturing, and consumer activity increase. Even during weak economies, though, Rockwood is able to maintain healthy sales because it provides critical components to products (not optional add-ons). If that's not enough to pique your interest, Rockwood is also the world's leading producer of lithium, the critical component in batteries used in mobile phones and computers — and now for green energy and electric cars.

The Business

Rockwood's modest $3.2 billion in market value belies its global reach. With 87 manufacturing facilities in two dozen countries, Rockwood serves more than 60,000 customers, including many of the world's most-respected companies, such as Daimler, **Arcelor Mittal** (NYSE: MT), **Sherwin-Williams** (NYSE: SHW), and others — and many have been customers for 10 or more years.

Rockwood's customized solutions are often critical to an end product's success, but the cost it charges is usually small compared with the total cost of the end product. This gives Rockwood long-term pricing power in some of its business lines. It takes specialized expertise to manufacture many of the company's offerings, and they're expensive to master and bring to production, so would-be competitors face a high barrier to entry.

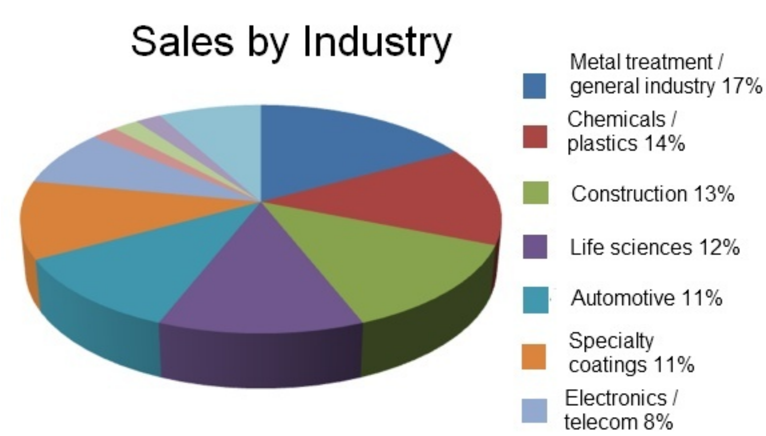
Now, on to these offerings. Our cars, airplanes, bridges, and ships would corrode rapidly without Rockwood's products, our paint would run down the walls, our tires would lose their shape, and wood would decay much sooner. To begin to understand a company this diverse, we need to take a birds-eye view of it. To see each of Rockwood's five business lines and which types of industries they serve, let's cue our massive (but infinitely helpful) table:

Business	% of Total 2009 Sales	Principal Products	Principal End-Use Markets
Specialty Chemicals	34%	• Lithium compounds & chemicals • Metal surface treatment, corrosion protection • Synthetic metal sulfides • Maintenance chemicals	• Auto and aircraft metal treatment • Batteries for mobile computing, electronics, cars, and green energy storage • Steel and metal working • Disc brakes • Life sciences (pharmaceutical synthesis and polymers)
Performance Additives	23%	• Iron-oxide pigments • Wood protection • Synthetic and organic thickeners	• Construction and renovation of all kinds, coatings, plastics • Personal-care products, paper manufacturing, foundries • Water treatment
Everyone's favorite: Titanium Dioxide Pigments	22%	• You guessed it: titanium dioxide pigments • Barium compounds • Zinc compounds	• Synthetic fibers for clothing (valuable as cotton prices increase) • Plastics, paper, paints, coatings • Pharmaceuticals
Advanced Ceramics	14%	• Hip and joint replacements • Ceramic tapes and cutting tools • Wear and corrosion • Armor components	• Medical (hip-replacement surgeries) • Industrials • Electronics • Automotive • Defense (vehicle protection)
Specialty Compounds	7%	• High-specification compounds, such as thermoplastic elastomer	• Voice and data transmission • Cables • Food and beverage • General packaging • Footwear

Source: Rockwood's 2009 10-K filing

Because Rockwood sells thousands of solutions to countless industries, no single customer accounts for more than 2% of the company's net sales. In fact, Rockwood's top 10 customers combined account for just 8% of total revenue. Geographically, more than 50% of 2009 sales came from Europe (weighted heavily in Germany), 27% came from North America (mostly in the United States), and 21% came from the rest of the world.

Rockwood has a leading or respectable position in each of its five businesses, though some of them, such as performance additives, are filled with competitors and are therefore fragmented. (This allows Rockwood to make small, bolt-on acquisitions to increase its earnings.) Its largest business is specialty chemicals — Rockwood is the world's second-largest supplier after Henkel. This business line focuses on surface-treatment products and solutions, where Rockwood sells more than 5,000 flavors — many proprietary — to the auto, air, and general industry markets. (Eat that, Baskin-Robbins!) Here's how total sales break down by industry (with 22% of sales not shown because they're small and split among multiple industries):



Source: Rockwood's 2009 10-K filing

Leadership in Lithium

Although Rockwood doesn't rely on any single industry, it's the global leader in lithium, with 40% to 50% market share. Lithium is the world's lightest metal and (chemistry pop quiz!) the least dense solid element. All living things contain a trace of lithium, including you and me. Still, it's rare, and no element has a greater ability to store energy, making lithium essential in the creatively named lithium and lithium-ion batteries that power most portable electronics. Lithium is also used in industrial applications, including alloys, ceramics, and glass (other Rockwood niches).

The market for lithium has grown 10% annualized for the past 10 years, and management expects the rise to continue. The company is developing a new generation of conductive lithium salts for the battery market that executives believe can drive "significant growth." Rockwood also offers a more diverse range of products and specialty compounds than its biggest lithium rivals, **FMC** (NYSE: FMC) and **Sociedad Quimica** (NYSE: SQM).

So just where can you find all this lithium? It's used in cell phones, laptops, consumer electronics, tablets, airplane bodies, and batteries that capture the energy created at wind and solar power plants, as well as in electric cars — including the new Chevy Volt and Nissan Leaf (which use hundreds of battery cells). But whereas a phone needs a few grams of lithium, a car battery needs several *kilograms*.

Meryl Witmer, general partner at Eagle Capital Partners in New York, estimates that having 1 million electric cars on the road would double the world's demand for battery-grade lithium. Already working with multiple car companies, Rockwood mines lithium out of enormous brine ponds it owns in Nevada and Chile. Rockwood believes it has more than enough supply to meet future demand, so it's not looking to acquire smaller companies, even though there's a gold-rush mentality elsewhere in the lithium industry. Rockwood believes it is the world's lowest-cost producer of high-grade lithium, giving it an enviable position to increase profit as demand grows.

The market for electric cars may indeed become large eventually. **FedEx** (NYSE: FDX) recently deployed test electric vehicles, and CEO Federick Smith said that in some cases, the company achieved 70% to 80% cost savings per vehicle compared with its fleet of gas guzzlers. As battery production grows (lowering the cost to customers), electric vehicles may find widespread appeal. The Chinese government is committed to an electric vehicle future, and President Obama ambitiously aims to put 1 million electric cars on the road by 2015. Germany wants 1 million by 2020. Still, less than one-third of Rockwood's total sales come from lithium, so there's plenty of room for this business line to grow — and plenty of other lines to fall back on.

Financials and Valuation

Buyout company **Kohlberg Kravis Roberts** (NYSE: KKR) created Rockwood in 2000 by acquiring the chemical product lines of Laporte for about $1.2 billion. Mix in a number of acquisitions, some dispositions, and just five years later KKR took Rockwood public. With results improving under strong management, Rockwood shareholders have done well — the stock is up 110% since August 2005, driven by steady gains in revenue and operating cash flow. Here's how the numbers have progressed:

Year-End	12/2005	12/2006	12/2007	12/2008	12/2009	LTM to 9/30/2010
Revenue	$2,584.7	$2,714.7	$3,065.2	$3,380.1	$2,962.9	$3,355.6
Operating Cash Flow	$257.6	$302.6	$368.5	$296.6	$369.6	$445.7
Long-Term Debt	$2,640.8	$2,697.4	$2,450.2	$2,783.9	$2,457.6	$2,125.6

Source: Capital IQ. Numbers in millions.

The company still carries significant debt of $1.9 billion net of cash (as of Sept. 30, 2010), but that's down from $2.5 billion in 2005. Chief Financial Officer Robert Zatta is intent on generating strong free cash flow and using it to pay down debt or make small, highly accretive acquisitions.

Rockwood is on track to generate nearly $4 per share in free cash flow in 2010 — we'll see results on Feb. 16. *Pro*'s conservative fair-value estimate of $56 a share equates to about 12.7 times 2011 estimated free cash flow. Like our Charter Portfolio holding **Plum Creek Timber** (NYSE: PCL), Rockwood is partly an investment in natural assets, so it might look expensive on a price-to-earnings basis (17.5 times 2011 estimates), but we need to include extra value for Rockwood's lithium holdings. The mines are admittedly hard to value but appear conservatively priced.

What Would Make Us Sell

Since its IPO in 2005, Rockwood has posted relatively low and sporadic net margins and returns on equity, although it now seems to be on the right track. It faces pricing pressure in some of its more commoditized markets, so we need to be ready for bumpy results. And since Rockwood carries meaningful debt, more than ever we'll keep a close eye on the company's free cash flow (the company is well below its debt covenant, so it has breathing room). Our investment case could be weakened by poor management decisions, a fall in lithium prices, loss of multiple key customers, a failure to innovate, key management departures — basically, a litany of boilerplate risks could make us reconsider. For instance, if oil prices fall sharply, incentives for electric cars would decline, and that could affect lithium pricing. Thankfully, there's no apparent *single* risk that could mortally wound our long-term investment case, but if many things go wrong, we'd need to reconsider the position.

Pro Bottom Line

Rockwood's long-term promise in many diverse businesses, its lithium leadership, a reasonable valuation, improving financials, and strong management make the company a compelling long-term investment. As long as management continues to prudently manage cash, profitably grow the business, and leverage the opportunities ahead, we look forward to owning this growing business alongside you. Power up your portfolio with lithium — we'll start with a half position and look to "recharge" it later.

- **Talk About It:** To ask questions or share your thoughts, please visit our new Rockwood Holdings discussion board.
- **Follow Along:** To track your Rockwood returns or watch the stock, add Rockwood Holdings to My Scorecard.

Pro's charter and 2011 portfolios will buy a 2.5% stake in Rockwood Holdings in the next one to 30 days, per The Motley Fool's trading guidelines.

Portfolio 2011: Buy Intel

Published Feb 8, 2011 at 12:00AM

Pro first recommended buying **Intel** in our Charter Portfolio in November 2008. Since then, we have used various strategies on the stock. For *Pro*'s past Intel trades, check out our recommendation history.

At a Glance

- **Action**: Buy 3% of a potential 6%
- **Recent price**: $21.69
- **Preferred price**: Use a limit order to buy shares below $22
- **Fair value**: $25
- **Alternate trade**: "Sell to open" April or May 2011 $21 puts (see our guide to selling (or writing) puts).
- **Why Buy?**
  - Intel has dominant competitive advantages in growing markets.
  - The company continues to manage for the long term, spending on R&D and manufacturing capacity.

- Its dividend and share-buyback program would entice conservative investors if the stock falls much beyond the current price, so the stock is unlikely to drop much lower than its current level.
- The stock is cheap and has an attractive risk-return profile.

First Things First

- **Company: Intel**
- **Market cap**: $121 billion
- **Website**: www.intel.com
- **Type of holding**: Large-cap tech; core
- **Options available**: Yes; we may use options later.
- **Follow along**: Add Intel to My Scorecard.

The Big Picture

Every three or four years, the personal computer dies — or at least that's what the technorati would have us believe. The most recent assassins: tablets and smartphones. More specifically, **Apple**'s iPad and iPhone, which the technorati argue are changing the way the world computes — and that any company that's not part of the Apple ecosystem will suffer a long, painful demise. But here at *Pro*, we just don't buy it.

PC shipments increased 13.8% in 2010 and have averaged 10% annual growth since 2006. The PC revolution should continue this momentum: Research firm Gartner expects worldwide PC shipments to rise 15.9% this year. We think this PC refresh cycle has sturdy legs, as its catalysts appear diverse and robust:

- PC affordability is higher than ever
- Mature PC markets continue to grow as having multiple PCs in one household becomes more common
- Demand from emerging countries continues to rise
- Corporate upgrades are strong thanks to Windows 7 and business visibility

Server markets have been plugging along, too. Corporations are cash-rich and have been spending on their technological infrastructure. Taken together, demand for the brains (microprocessors) and nervous systems (chip sets) of the world's PCs and servers should remain strong for years to come.

Why Buy?

Intel dominates its market niches — chips for PCs and servers — and those markets should remain viable for years. The company expects to generate more than $50 billion in revenue this year, an increase of 15% from 2010. We expect Intel to bolster its competitive position in key markets by spending $7.3 billion on research and development this year. That's more than competitors **Advanced Micro Devices** and **ARM Holdings** generated in revenue during all of 2010, combined! This stable cash cow of a business allows Intel to expand its reach into the higher-profile and still-developing world of mobile computing.

Simply put: Intel has the size, technological savvy, and financial resources to compete and win in whichever markets it chooses. Although much of Wall Street thinks Intel has missed the boat on tablets and smartphones, starting "late" isn't of much concern because of the speed, scale, and accuracy with which Intel can flex its design, manufacturing, and partnership muscles. We say, tablets and phones beware!

- Intel has two current chip offerings for tablet computers, dubbed Moorestown and Oak Trail. As sales of non-iPad tablets grow, Intel will benefit.
- The company's presence in phones has been in the works for some time, and its Medfield chip is currently being beta-tested by customers and further fine-tuned. It should contribute to revenue in 2012.

Even though Intel's core business looks strong and its new products appear ready to tackle new markets, the stock trades near historical lows in terms of EBITDA, earnings, and cash flow (with the current price at about 12 times free cash flow). We wouldn't be surprised if management decided to send a message by snapping up shares — which currently yield 3.4% in dividends — under Intel's recently upped $14 billion repurchase program.

Intel is the largest holding in *Pro*'s Charter Portfolio (assuming we exercise our purchased calls), and the stock is a Buy given the company's low risk profile and our $25 estimate of fair value. We're putting Intel into Portfolio 2011, and we recommend you add it to your holdings, too.

Next Steps

- Questions or comments? Visit our Intel board.
- Once you've bought INTC, add it to My Scorecard.

Pro Portfolio 2011 will buy a 3% stake in Intel in the next one to 30 days, per The Motley Fool's trading guidelines.

The Motley Fool owns shares of Apple.

Own Stocks the Pro Way

Coverage & Community

- Bryan (TMF42) digs into the earnings from **Bristow Group**, which remains on Hold.
- Newly minted Londoner Todd (TMFPhila) shares his thoughts on **GlaxoSmithKline**'s earnings in proper English.
- Be ready for your companies' earnings releases by following along with Joe's (TMFValuemoosie) earnings calendar.
- Russell (TMFEldrehad) posts his 100th CAPS commentary, sharing what he's learned along the way.
- Member SLader100 asks how many positions are too many.
- There's a groundswell of support that *Pro* member spinningwood be nominated for the Fool's Feste Award.

Dear Fools,

I've said it before, but it bears repeating: Buying a stock is a little like a marriage.

That's because if you want to compound your (investing) happiness over the years, you need to focus on having a long-term relationship (with strong companies).

Here at *Pro*, we put our faith in the fact that quality businesses increase shareholder value over the years. And of course, we need to be invested in order to benefit. This is why, although we will occasionally sell short and use options, the majority of *Pro*'s assets will predominantly be invested in strong companies.

In fact, we'll be 70% or more invested in stocks most of the time — the remainder will be dedicated to options, ETFs, shorts and cash. It may surprise you to hear this, but stocks — not options or shorts — have been the most volatile part of our portfolio and have demanded the most patience.

Given the fickle nature of stocks, you should only buy them when you're ready to hold a company for a number of years, or as long as the business merits that line of thinking. Of all the assets you'll hold in your *Pro* portfolio, stocks are the longest-term investment. Remember that as you step up to buy.

Upcoming Earnings

- Tuesday: **Broadridge Financial Solutions**
- Thursday: **Cisco Systems**
- Feb. 15: **AmTrust Financial Services**

What We Buy

Let's go back to our marriage analogy for a moment. When you buy a stock (or tie the knot), you hope the relationship only gets better for years and years, but realistically, you need to be ready for some rough patches along the way. Thus, you need to choose your (stock) partner carefully. At *Pro*, we do that by focusing on:

- Sustainable competitive advantages (this protects profits)
- A diverse and expanding customer base (this provides growth)
- Recurring revenue streams (this lends stability)
- Strong and expanding free cash flow (the lifeblood of any company)
- A healthy balance sheet (it's easier to take advantage of opportunities when you're cash-rich)

Most of our companies are valued using discounted cash flow models that lay out at least a few possible scenarios. We seek strong potential appreciation with only reasonable downside risk. Our primary goal is to close our positions profitably, avoiding permanent losses. We need to be comfortable with what we own and the price we're paying, because this allows us to wait out market volatility and not lose sleep.

Why We Sell

As long as our stocks are reasonably valued, we want to avoid paying commissions and taxes, skipping dividends, and missing upside — meaning we don't want to trade in and out of our long-term stocks. Instead, we'll consider selling when:

- The position looks fully priced
- The original thesis has been fulfilled or has weakened
- The stock no longer fits with the portfolio, or we find something we like better
- The potential reward in the position no longer seems worth the risk

More Resources

- Making *Pro* Fit Your Profile
- How We Invest
- Secrets of a Winning Portfolio
- *Pro* 's Guide to Finding Great Stocks
- The *Pro* Way to Value Stocks
- *Pro* 's Guide to Selling

We want to defensively raise cash, selling our least favorite holdings (maybe on our way to shorting the market in a bearish environment).

Although we don't try to time price swings in our long-term stocks, we'll often use options on them when we see pricing opportunities. This can give us the best of both worlds: long-term gains in our stocks, and short-term gains with their options.

Finally, we're not shy about revisiting stocks we've sold for new opportunities (although this is almost certainly bad marriage advice). After all, it makes sense to leverage the time investment we've made in learning a company's business. In any case, we'll review each sale with you at least a year later to see what's happened since and what we could learn.

Stocks are the longest-term part of what we do here at *Pro*. But we're also here to earn profits in the short term, even when the market doesn't go up. We'll discuss that topic in next week's Memo on options.

Stay tuned as we plan more new trades for you this week, putting our words into action.

Portfolio 2011: Write Puts on Wells Fargo & Co.

Published Feb 2, 2011 at 12:00AM

Pro first recommended buying **Wells Fargo & Co.** in our Charter Portfolio in December 2010. For *Pro*'s original take, read our initial buy report on Wells Fargo.

At a Glance

- **Portfolio 2011 action:** Write ("sell to open") a 2.5% position in March 2011 $33 puts (for *Pro*, two contracts)
- **Recent options price (bid/ask):** $1.19/$1.21
- **Preferred price:** Use a limit order at the bid, initially $1.19 or higher (3.6% yield).

- **Stock fair value**: $37
- **Alternative trades:**
  - Buy stock instead.
  - Write (“sell to open”) April $32.50 puts, recently $1.32, to be more defensive.
- **Why buy:**
  - Wells Fargo features a best-in-class management team.
  - The stock is significantly undervalued.
  - The injection of Wells Fargo’s sales culture into Wachovia stores offers an opportunity for meaningful growth.

First Things First

- **Company: Wells Fargo & Co.**
- **Market cap:** $176 billion
- **Website:** www.wellsfargo.com
- **Type of holding:** Long-term, diversified financial company
- **Strategy:** Guide to writing puts
- **Follow it:** Add to My Scorecard

What's New?

We’re happy to report that not much has happened at **Wells Fargo & Co.** since we first purchased shares in December. In the recent fourth-quarter earnings release, management shared its excellent business results and record net income figures. We weren't surprised, but the future — not the past — is the real story. We consider this to be the best-of-breed financial institution, with a sales culture that benefits customers and stakeholders alike.

Deposits are growing at a much faster rate than loans, which bolsters the already strong balance sheet while providing huge future earnings potential, if or when a demand for loans returns. Even if recovery-driven loan demand is far off, shareholders should expect to profit anyway, as Wells Fargo implements its "cross sell" culture into its acquired Wachovia footprint.

One catalyst on the horizon, outside of the excellent business trajectory, is the potential to regain control of the company's dividend — currently held captive thanks to those pesky TARP restrictions. Management has submitted a request to regulators to increase its ability to return capital to investors. Even if the request is delayed, today's inexpensive share price is an opportunity for *Pro* to build what we expect to be a profitable long-term holding.

Why This Strategy

You can simply buy shares if you prefer, but we're writing puts to earn income while we wait to buy shares a bit cheaper. If converted into shares by the time the options expire in March, these puts would allow us to buy shares about 3.6% cheaper than the recent price. We're writing the at-the-money puts ($33 strike-price puts on a $33 stock) to maximize the premium we earn and have better odds of getting shares. If the shares end up above $33 at expiration, we won’t get to buy shares, but we'll earn an att ractive annualized return on this trade and look to write puts again.

Charter Port

Since Charter Port bought a 2.8% stake in Wells Fargo shares recently, we’re not taking new action there at this time. However, if veteran members don’t own shares yet, or are ready to potentially buy more, you can follow this trade alert for Portfolio 2011.

How to Follow Along

You need options approval to write puts, and the trade command is “sell to open” or “sell.” (*Do not buy these options!*) *Sell one contract for every 100 shares of Wells Fargo you’re willing to purchase later (each contract represents an obligation to buy 100 shares, or $3,300 worth of Wells Fargo stock). Writing these options will “pay” you the option premium up front, and then we’ll wait until expiration on March 18 to know our next move.*

Our initial potential profit is whatever the puts pay us; we have an obligation to purchase shares of the stock if they fall below the $33 strike price by expiration. If we get shares, our net start price will be $31.81 (we buy our shares at $33, but still keep the $1.19 the puts pay us). Since we fully intend to take share ownership if assigned the shares in March, make sure you have $3,300 available, per contract, to purchase shares. Otherwise, just purchase Wells Fargo in the suggested starting allocation (2.5% up to 3%) per the alternative trade.

Next Steps

- *Questions or comments? Is this your first options trade and you need a hand? Visit our Wells Fargo board.*
- *Stoked to learn more about writing put options? Head over to the All About Options board.*

Pro Portfolio 2011 will write puts representing a 2.5% stake in Wells Fargo in the next one to 30 days, per The Motley Fool's trading guidelines.

Nick owns shares of Wells Fargo.

Charter Portfolio and Portfolio 2011: Buy Sprott Physical Gold Trust

Published Feb 2, 2011 at 12:00AM

Pro first recommended **Sprott Physical Gold Trust** (NYSEMKT: PHYS) in our Charter Portfolio in October 2010. For our original take, read the full buy report.

At a Glance

- **Portfolio 2011 action:** Buy 3%
- **Charter Portfolio action:** Buy an additional 1% (for a total 3% position)
- **Recent price:** $11.80
- **Preferred price:** Around $12 or lower, and around a 4% premium or lower to net asset value (found here)
- **Type of holding:** Defensive
- **Why buy:**
  - Protect capital from currency devaluation.

- Hedge against inflation.
- Diversify with a commodity that doesn't always correlate to market indexes.

The Big Picture

We're initiating a 3% position in Portfolio 2011 and adding just under 1% to our original portfolio's 2.2% position in **Sprott Physical Gold Trust** (NYSEMKT: PHYS).

You'll find our original rationale for buying gold here. We still believe in this thesis, and a pair of events since then supports it. First, in a bid to create inflation and kick-start the economy to life, the Federal Reserve announced a massive $600 billion purchase of Treasury debt, a move that further devalues the dollar in relation to gold. And in perhaps the highest-profile mainstream public comments favorable to gold, World Bank President Robert Zoellick made this statement in November in the *Financial Times*:

"The [new monetary] system should also consider employing gold as an international reference point of market expectations about inflation, deflation, and future currency values. Although textbooks may view gold as the old money, markets are using gold as an alternative monetary asset today."

Zoellick's comments were pleasantly unexpected but clearly in sync with our views. Gold is money and becomes even more coveted when central banks like the Federal Reserve debase their paper currencies. As this saga continues, gold is an asset you can turn to to protect your wealth.

Why Buy?

It's always a good idea to have some assets defensively positioned, but even more so today given high levels of unemployment, government spending, and arguably, the stock market. Plus, the Federal Reserve is propping up asset prices and bent on creating inflation. This strikes us as a heady brew of optimism mixed with poor fundamentals, and our response is to position some assets outside of the stock market. Our goal at *Pro* is not only the appreciation of wealth, but also the *protection* of wealth — and gold meets those standards. Gold also provides potential insurance should another financial catastrophe occur, so why wait? Now is an excellent time to get started by adding Sprott to your portfolio.

Next Steps

- Questions or comments? Chat it up on our Sprott board.
- Once you've bought PHYS, add it to My Scorecard.

Portfolio 2011 will buy a 3% stake in Sprott Physical Gold Trust in the next one to 30 days, per The Motley Fool's trading guidelines. The Charter Portfolio will increase its stake in Sprott Physical Gold Trust to a total of 3% in the next one to 30 days, per The Motley Fool's trading guidelines.

A Peek at Our 30-Day Plan

Published Jan 31, 2011 at 12:00AM

Welcome to everyone here!

Pro's doors closed to new members last week, and we already have a waiting list — a first for us and a clear sign that more investors want to focus on making absolute profits. But you made the cut, Fool, and now we're moving forward together. Our common goal is to earn recurring gains with a high level of accuracy, despite what the market throws our way. There's no question we'll see market volatility again, and our community will welcome the investment opportunities that only volatility can bring. Meanwhile, we'll invest where we see a high likelihood for strong returns over months and years, with reasonable risk.

Charter Port Upcoming Earnings

With so many earnings reports the coming weeks, expect action for either portfolio if we get pricing opportunities.

- Jan. 31:**Plum Creek Timber**
- Feb. 1: **Jack Henry & Associates**, **Kinetic Concepts**, **Tupperware**
- Feb. 2: **Bristow Group**
- Feb. 3: **GlaxoSmithKline**

Coverage & Community

- TMFValuemoosie posted a full earnings calendar.
- New *Pro* members continue to introduce themselves on the Meet & Greet board.
- Andrew (TMFRedwood) shares thoughts on **L-3 Communications'** earnings.
- Jeff posts a summary of **Apple's**recent results.
- **Intel** increased its dividend 15% and authorized a $10 billion share buyback. It also closed on its Infineon acquisition, increasing Q1 revenue guidance, although Intel will pay to fix a chipset flaw (remember when it found flaws much more frequently?).
- Two long threads: Should investors relax standards to chase the S&P 500? And Andrew shares his bear case, starting a great discussion.
- *Pro's* social banter board has hosted discussions about everything from beer, to food smokers, to where to get the best pizza — but right now, the topic has turned to mortgages. Fools can't help but talk about finance!
- Russell (TMFEldrehad) takes a look at what it takes to be “average” in CAPS — and discovers that the “average” CAPS participant may be anything but.

If you're new to *Pro* and missed last week's Monday Memo, please read it to help you get oriented; things are going to get moving here. We plan to bring you a steady stream of new trades each week for the foreseeable future, including our first options trade for Portfolio 2011. Be sure to get options permission from your broker if you haven't already.

Veteran members, we're also working on new recommendations for our Charter Portfolio, so stay tuned.

Here's a look at what you'll be learning in these Memos in the month ahead:

- **Feb. 7:** How to buy stocks like a pro
- **Feb. 14:** Our options strategies and how to make them work for you
- **Feb. 22:** Our ETF and short strategies

- **Feb. 28:** Putting it all together — stocks, options, ETFs, and shorts — to build a *Pro* portfolio

We'll also be analyzing the ongoing earnings season (see the sidebar each week for links to our discussion board posts), and bringing you continuing coverage of all our *Pro* investments.

FAQs

Your *Pro* team hosted a live chat last week, and we were honored that more than 1,200 *Pro* members participated. Nick, Bryan, Andrew, and I answered as many questions in 90 minutes as we could, but of course we didn't get to them all. If you still have a question for us, please post it any on of our discussion boards. A transcript of the chat is available for reading at your leisure, and we thought it would be useful to zip through some of your most commons questions here:

Q: What's the best way to get started?

A: Visit your getting started guide. (Invest a little time for long-term rewards. That works for more than just money, Fools.)

Q: Which portfolio – Charter or Portfolio 2011 – should I follow?

A: *Pro* began investing in the Charter Portfolio in 2008 and our veteran charter members should continue to follow it. Portfolio 2011 is starting now, and it's for all new members to follow. The new portfolio will buy the most attractive positions in the Charter Portfolio, so veteran members who need to catch up can also follow along with Portfolio 2011 trades. (Set your email preferences for trade alerts here.) Trades on brand new positions will be done in both portfolios at the same time, until the two portfolios eventually become mirrors of each other, as intended.

Q: How do I use *Pro* and *Motley Fool Options* together?

A: *Motley Fool Options* is a sister service to *Pro*, and it's free to every *Pro* member. It offers additional options ideas, education, community support, and strategies that can complement your *Pro* portfolio if you're seeking more ideas. We spend quality time coming up with *Motley Fool Options* ideas, too, of course, and the strategies there work alongside a *Pro*-based portfolio. In fact, *Pro* inspired the launch of *Motley Fool Options*. So, use both as you see fit, but try not to confuse the two services. Always double-check your trade alert emails to see which service recommends the trade.

Q: Which positions are best in an IRA?

A: Only a handful of options trades (ones that require margin, such as spreads) and shorts won't be possible in an IRA. Otherwise, most *Pro* investments can be made either in an IRA or a regular account. Most options are short-term gains, so you might consider doing as many of those as you can in a tax-advantaged account (assuming you're not planning on using the options income anytime soon). Investments with a high dividend yield, which you might want to own for years, may pay off best in an IRA. The rest is at your discretion.

Q: Do I need to buy shares in 100 round lots?

A: Proper allocation on a percentage basis is more important than buying in round lots. If we plan to use options on a position in the future (which requires 100 share lots), we'll let you know beforehand in the trade alert.

Q: How do I get up to speed using options?

A: Gradually! Start slowly, learning one basic strategy at a time (writing puts or covered calls). Read our *Pro* guides to options, and ask questions. You can find much more information, including educational videos, in the Options U. section of *Motley Fool Options*. Our trade alerts will be as specific as possible to help you get started using options.

Q: What should I do with my existing holdings?

A: If you need to free up some capital to invest in *Pro* positions, sell your least-favorite holdings whenever you're ready to invest in a *Pro* recommendation.

Q: How are trades announced?

A: We'll email you a trade alert during business hours that includes our thoughts behind the investment. *Pro* itself will make the trade one to 30 days later, giving you first crack at it.

Get Comfortable, and Think Big

We have an active month (and year!) ahead of us, but don't feel rushed. Investing is about thinking big – big picture, big timeframe – and *not* about getting wrapped up in the moment (which is the exact opposite of what you want). We're here to steadily earn profits over time, and whether you make every trade with us or half of them, we want your outcome to be just as satisfying.

Welcome once more to our new *Pro* members, and thank you again to charter members for all your help in the community. We're happy we're all in the door and can do what we like best now: invest for profits.

We'll be visiting your inbox again with another trade alert soon. Until then, Fool on!

Jeff Fischer (TMFFischer)

Portfolio 2011: Buy AmTrust Financial Services

Published Jan 27, 2011 at 12:00AM

Are You New to *Pro*? Start Here!

Jeff recommends new Portfolio 2011 members begin with a stake in **AmTrust Financial Services**. *Pro* first recommended AmTrust in our Charter Portfolio in April 2009. For *Pro*'s original take, read our initial buy report on AmTrust.

At a Glance

- **Action**: Buy 3%
- **Recent price**: $18.30
- **Preferred price**: Use a limit order to buy shares near market prices, ideally below $19.
- **Fair value**: $21 to $23
- **Alternate trade**: "Sell to open" June 2011 $17.50 puts (sell one put for every 100 shares you'd buy). These puts recently pay $0.70 for a potential stock buy price of $16.80 (see our guide to selling (or writing) puts).
- **Why buy**:
  - AmTrust has a history of profitable growth and a well-defined strategy for the future.
  - The company benefits from conservative management and strong recurring revenue in attractive niche insurance markets.
  - The stock should appreciate as the company's book value grows, giving shares significant long-term potential.

When a young Warren Buffett recognized the attractive qualities of insurance companies early in his career, it had a profound implication for his success. It helped him realize what makes for an attractive business model: one that collects cash up front, allows the company to use that cash (invest it), requires much less cash to run the business (in this case, to pay insurance claims), and makes sure customers pay for the service on a *recurring* basis. These factors make for the most attractive businesses in the world — and happen to perfectly describe insurance companies.

First Things First

- **Company**: **AmTrust Financial Services**
- **Market cap**: $1.1 billion
- **Website**: www.amtrustgroup.com
- **Type of holding**: Financials, small cap, core
- **Follow along**: Add AmTrust to My Scorecard.

Why Buy?

The insurance company *Pro* is recommending today, **AmTrust Financial Services**, went public in 2006 and has increased its book value — a key measure of a financial company's worth — from less than $300 million to nearly $700 million in less than five years, more than doubling the company's worth. AmTrust offers specialty property and casualty insurance products — namely, workers' compensation for small businesses that typically have five to 20 employees. It also sells extended service and warranty coverage on consumer and commercial products, offering extended warranties on a diverse array of third-party products and services, including TVs and computers. By tracking claims in real time, the company can adjust warranty premiums on the fly, increasing rates for suspect products. AmTrust is active in the United States and Europe.

The company targets under-served and fragmented niches, where there are fewer larger insurance company competitors. This translates to profits: AmTrust's return on equity is routinely above 20%. And the company continues to grow by buying small competitors and "rolling them" into AmTrust's larger, farther-reaching, and better-oiled machine. Leveraging AmTrust's technology, geographic reach, sales force and risk assessment capabilities, the acquisitions become more profitable than they would have been on their own (it's economies of scale in action). The strategy has worked, with gross written premiums and operating income growing faster than 30% and 40% each year over the past five.

Because customers renew their policies with AmTrust more than 80% of the time (there's that recurring revenue we talked about), AmTrust's management is able to invest its float — the cash earned on its policy premiums — in various ways. We like that management has remained conservative and stuck to investing in top-rated, short-term bonds. While cautious, this choice will enable easy reinvestment into bonds that pay more if interest rates rise, providing an additional boost to book value.

Finally, with its stock trading at 1.4 times expected book value for 2010 and less than 8 times expected 2011 earnings, AmTrust is selling for the same value multiple as it did when we initially bought shares in 2009. The stock has appreciated steadily as the insurer's book value has grown, and patient investors should be rewarded with much more appreciation. As we wrote in our original buy report, we hope to own AmTrust for many years, enjoying the value creation made possible by a steady, lower-risk business.

Next Steps

- Questions or comments? Visit our AmTrust board.
- Once you've bought AFSI, add it to My Scorecard.

Pro Portfolio 2011 will buy a 3% stake in AmTrust Financial Services in the next one to 30 days, per The Motley Fool's trading guidelines.

Jeff owns shares of AmTrust.

Portfolio 2011: Buy DGS

Published Jan 26, 2011 at 12:00AM

Pro first recommended **WisdomTree Emerging Markets SmallCap Dividend Fund** in our Charter Portfolio in November 2010. For our original take, read the full buy report.

Charter members, you don't need to participate in this trade unless you missed the recommendation in November 2010 and want to get on board now.

At a Glance

- **Action:** Buy 3%
- **Recent price:** $53
- **Preferred buy price:** $55 or below (and as close to the NAV as possible)
- **Why Buy:**
  - Small companies in emerging markets provide strong long-term growth opportunities.

- The ETF gives your portfolio diversification into growing foreign companies that are otherwise difficult to access.
- The dividend reflects stability among the ETF's leading small-cap holdings.

The Big Picture

Investing in small companies in growing countries such as South Korea, Turkey, and Taiwan was difficult before exchange-traded funds (ETFs) came along, and one in particular has caught our attention: **WisdomTree Emerging Markets SmallCap DividendFund**.

First Things First

- **ETF: WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSE: DGS)
- **Total assets:** $743 million
- **Website:** WisdomTree
- **Type of holding:** International, small-cap, yield, core
- Add DGS to My Scorecard.

The ETF's name is a mouthful, but it says it all. (We'll save ourselves some breath and just call it by its ticker, DGS.) With one simple purchase, we can invest in hundreds of small companies that aren't listed on U.S. exchanges but are thriving in 19 developing countries, including Brazil, Chile, India, Israel, the Czech Republic, and more. With a healthy dividend that will likely range from 3% to 4% annually and the promise that DGS will "grow up" with emerging markets, this small-cap ETF is a great core holding for a portfolio seeking international exposure.

Why Buy?

According to Ibbotson Associates, companies with small market values outperformed large companies by an average of 2.1% per year from 1926 to 2008, and by an even greater amount in recent decades — 3.6% annually from 1973 to 2008. Additionally, companies that pay dividends outperform those that don't, and Standard & Poor's reports that dividends accounted for 44% of the S&P 500's return over the past 80 years. Finally, in the decade that ended on Dec. 31, 2009, the MSCI Emerging Markets index returned 10.2% annualized, while the MSCI USA Index dropped 1.2% per year. Past results can't guarantee future performance, it's true — but for eight decades, small has outperformed large and dividend-payers have topped the alternative, and for many years, emerging markets have outdone developed ones. With this investment, we seek to capitalize on all three factors.

At the same time, we want to avoid the big risks that are usually associated with emerging markets and small companies. The ETF owns more than 400 stocks spread across five continents (all except North America and Australia), so our risk is greatly diversified by country, sector and business. Our valuation risk is reasonable. As of Jan. 24, the index that the ETF tracks traded at 12.8 times trailing earnings and had a dividend yield of more than 4%. The allocation by country was recently led by Taiwan, Korea, South Africa, Thailand, and Turkey – followed by Israel, Brazil, Hong Kong, Malaysia, Chile and seven others.

Investing in small companies in these countries would have been difficult (or impossible) in years past, but this ETF gets the job done for a reasonable 0.63% annual expense ratio (which is taken out of the dividends). This is the type of diversification we hope to buy and let ride for years, enjoying the quarterly dividend and business expansion along the way.

Next Steps

- Questions or comments? Chat it up on our DGS board.
- Once you've bought DGS, add it to My Scorecard.

Portfolio 2011 will buy a 3% stake in DGS in the next one to 30 days, per The Motley Fool's trading guidelines.

Live Chat on Thursday

From 2 to 3:30 p.m. Thursday, Jan. 27, your *Pro* team will be on hand to answer your questions in real time. Just click here to join the conversation and send yourself an email reminder.

With *Pro's* doors now closing, we'd like to again welcome our new members, and we look forward to beginning to invest in Portfolio 2011 with you this week! The three most important things you need to know before you begin are:

- How to get around our website
- How the *Pro* service works
- How we invest

So that's exactly what we'll cover in today's Memo. Veteran members, I ask for your indulgence and hope you'll find this Memo useful as well.

Orientation

We've developed a three-step welcome kit for new *Pro* members. It explains how we invest (which I'll also outline below), how trade alerts work, and much more. If you're new, I highly encourage you to start with these three steps by clicking here. If you've already gone through the steps, here's a brief refresher:

- The *Pro* Monday Memo is sent to your inbox every Monday at 4 p.m. ET. This is your weekly touchstone column for *Pro*. I suggest you read it (including all the sidebars) carefully because it aims to concisely keep you up to date with your *Pro* service. (You can see all of our Memos here.)
- As a new member, you'll want to follow the trade recommendations for Portfolio 2011. We'll invest Portfolio 2011 to match the holdings of our Charter Portfolio as closely as possible — by suggesting that you start positions in our current favorites. When we discover a new trade that's relevant and appropriate for both portfolios, we'll recommend it to both portfolios simultaneously. If you're a veteran *Pro* member, you should continue to follow our Charter Portfolio, but you might enjoy making the "catch-up" trades we're recommending for Portfolio 2011, too. We're starting by buying **L-3 Communications** in Portfolio 2011.
- You can set your email preferences to receive trade alerts for both portfolios or just one. We send Trade Alerts anytime during market hours, and they explain the investments we're recommending. After we send an alert, *Pro* makes the investment at some point during the next one to 30 days. Once we make the trade, you receive a Trade Complete email.

- *Motley Fool Options* is the sister service to *Pro*, free to you as long as you're a *Pro* member. It offers *a la carte* options ideas, education and more — and every Friday at 2 p.m., *Motley Fool Options* will send its Options Weekly column to your inbox. Just don't confuse the two services, and we believe you'll greatly enjoy both!

Community & Coverage

- Drop by the Meet & Greet board to say hello. The *Pro* team and veteran members like spinningwood, fullofcarp, silverhawk27, and many others are there to greet you. (Thanks, veterans!)
- *Pro* senior analyst Nick Crow (TMFCrow) has the lowdown on **Wells Fargo**. Its recent earnings look promising.
- This Week in CAPS: Member TMFEldrehad discusses why CAPS stock ratings are relative — and why that's important.

Charter Portfolio Trades

We start the week with a slightly different Charter Portfolio following a slew of options expirations. Namely, we:

- Let **Autodesk** and **Procter & Gamble** be called away (sold) above or at our fair-value estimates, via covered calls.
- Had covered calls on **GlaxoSmithKline** and puts on **Contango Oil & Gas** and **Tupperware Brands** expire as income.
- Let naked calls on **iPath S&P 500 VIX Short-Term Futures** expire as income.
- Had long calls on **MELA Sciences** expire as worthless despite the company's product getting a nod from an FDA advisory panel. Oh well.

Upcoming Earnings

- Jan. 25: **NextEra Energy**
- Jan. 27: **L-3 Communications**
- Jan. 31: **Plum Creek Timber**
- Feb. 1: **Kinetic Concepts**, **Tupperware Brands**, and **Jack Henry & Associates**

Education

Your *Pro* team is happy to help you invest every step of the way, but understanding what you're doing is key to enjoying it — and making sure you can profit from our strategies for a lifetime.

- For the broadest overview of our investment strategy, you'll want to read our Go-To Resources, including how we invest, and introductory guides to exchange-traded funds (ETFs), shorting and options, and more. Take your time. We're using strategies developed over more than a decade. You can learn them over the course of a few months.
- If you're using options strategies with us (you don't need to, though we recommend it), bookmark our Options Guides homepage. We'll keep adding guides, and there's more in our sister-service *Motley Fool Options*' Options U., too.
- The *Pro* community is outstanding. If you have questions, post them on our vibrant discussion boards, and you'll get help.

Invest Like a Pro

Finally, the reason we're all here: to grow value. Furthermore, to become better investors — expert investors — who have financial freedom and enjoy investing in many more ways than before. You need to know where we stand, so let's summarize:

- *Pro* invests for absolute profits, not relative returns. That means we want positive returns measured over any meaningful time period (generally, every rolling two years or so — one year is too short), regardless of what the market does. We don't care about the S&P 500, which has been flat for nearly 11 years. Instead, we want to earn profits regardless of how the market performs.
- We invest with financial freedom in mind. You can't live on the proceeds of a flat index, and you can't live on relative returns. You *can* live on regular proceeds earned from recurring options income and positive absolute gains.
- Our mission is to earn you strong, recurring profits with a high level of accuracy — while taking reasonable risks.
- Building focused portfolios, we use stocks and ETFs to earn long-term returns, and we use options and shorts to earn shorter-term returns.
- Read our Trade Alerts carefully when they hit your inbox. We offer alternate trades and try to anticipate (and answer) your questions in the alert. Please ask any questions on our discussion boards before you make the trade.

Finally, let's not forget that we're investing during extraordinary times. The market has seen record-breaking volatility over the past two years, making Wall Street seem more like a slot machine than a sensible venue that allows participants to own equity and businesses to raise equity to grow. Keeping in mind what the market *really* is, we don't fear volatility and falling prices. In fact, we welcome both as opportunities.

Welcome Again

Take your time as you get started with *Pro*. If you're going to do well as an investor, you'll want to be disciplined, practiced, and patient. We're here to help, and we're ready to get started — but you're the boss, and you should only start when *you're* ready.

We look forward to announcing new trades this week. It's going to be an active 2011, but always take your time, ask questions, and don't rush. Welcome to *Pro*! We'll invest smartly together and earn strong profits in the coming years.

Foolishly,

Jeff Fischer (TMFFischer)

Jeff owns shares of Apple, GlaxoSmithKline, Kinetic Concepts, Tupperware, and is short the *iPath S&P 500 VIX Short-Term Futures*.

Charter Portfolio: Write New Naked Calls on VXX

Published Jan 21, 2011 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") February 2011 $35 naked calls
- **Allocation:** 6% if we end up shorting shares; for *Pro*, about 24 contracts
- **Recent options price (bid/ask):** $1.35/$1.45
- **Alternate trades:**
  - Sell shares short directly, but do so incrementally
  - Write naked calls at higher strikes (or later months) for more breathing room
  - Set up a January 2013 synthetic short ("sell to open" calls at the recent share price, and "buy to open" the same strike puts)
  - If you're already short the shares directly, continue to hold your short for more long-term price decay

What's New

Since we recommended you invest against (or sell short) the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) exchange-traded note in December, this clunker has declined 33% while the VIX index it's based on has dropped 23%. And since we first recommended this short last June, it's lost 70% while the VIX has lost 33%.

First Things First

- **ETN: iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX)
- **Recent price: $31.77**
- **Website:** ipathetn.com
- **Type of holding:** Short (short naked calls)
- Add VXX to My Scorecard

Although the VIX — the market's most popular measure of implied volatility — is one point below its lifetime average of 19 now and could tick higher, our confidence in shorting this flawed VIX-tracking vehicle remains strong. Veteran *Pro* members should know the VIX, the VXX, and this exchange-traded note's tracking issues well by now, but if you don't, our past reports will get you up to speed.

Why This Strategy

With the VIX recently at 18, the short-term VIX futures contracts that VXX tracks were recently priced near 19 for February and 21 for March — so the ETN we're shorting is already priced for a VIX of around 20, or about 10% above the recent VIX price. This suggests that the index needs to gain at least 10% in the coming month just to keep the price of the ETN at current levels. If the VIX doesn't rise that much, the futures (and the ETN) will slowly lose value. Aiding us further, we're writing naked calls that are 10% above the current ETN price, so we estimate we'd need the VIX to gain about 20% to bring the ETN near our strike price, and even more to get the ETN near our break-even price.

Even that may be understated because futures prices will go up each day the VIX goes up, causing the ETN to pay more as it rolls its futures contracts daily. Because of this drag, on days when the VIX jumps, the ETN has typically continued to gain about half as much or less. On Thursday morning, the VIX was up 8% and the ETN was up less than 3%. Given how the futures work, we might even need a 25% move or higher in the VIX to get to our break-even price of near $36.40 on this written naked call. We're comfortable with that, especially because we can roll the naked calls up if necessary and keep waiting for the VIX to settle down and for decay to eat the ETN's value.

But how likely is a 20% to 30% jump in the VIX during the coming month? It would require a meaningful series of declines in the S&P 500 or a large shock to the market. According to Barclay's (the ETN issuer), we would probably need at least a few consecutive days of 2% to 3% declines in the S&P 500 for a gain in the VIX to build to something close to 20 — or a one-day decline of more than 4%.

If the S&P 500 loses in a day ...	... then the average increase in the VIX is ...
0% to 1%	1.05%
1% to 2%	6.86%
2% to 3%	10.33%
3% to 4%	14.88%
Greater than 4%	17.21%

Sources: Barclays Capital Analysis, 1/90 – 4/10, and Bloomberg

But even if the VIX jumps 22% in a day on a large market decline (from 18 to 22, say), the ETN may go relatively nowhere for the pricing reasons we just discussed. For example, in the last full week of November, the VIX jumped the most in a single week since May 2010 – from 18.7 to 22.2, or 18%. But the ETN gained less than 1% the same week. Why? The futures it tracks already assumed a VIX above 20, just like now. The ETN won't always do so poorly (sometimes it will jump even more than the VIX), but this displays how badly the ETN *can* lag. And that's why we're comfortable shorting it at higher strike prices even with the VIX near its lifetime average.

How to Follow Along

You need full options and margin approval to write naked calls (meaning calls where you don't own the underlying shares). Our profit is limited to what the calls initially pay us, unless the ETN rises above our strike price and we're able to short shares (although we're more likely to roll the calls for another payment and keep waiting; shares for shorting are unavailable at our broker). If you can short shares directly at your broker, that's still an attractive long-term choice, although you might move incrementally and short more on spikes. You have more profit potential shorting directly, though you don't start with a pricing cushion the way you do with naked calls.

Trade Details

- **Action:** Write (sell to open) February 2011 $35 calls (one for every 100 shares you'd short — for *Pro*, about 24 contracts for a 6% allocation; each written call represents a $3,500 short of VXX)
- **Limit price:** Near market prices, recently around $1.40 or higher
- **Break-even price:** $36.40
- **Current VXX price:** $31.77
- **Difference to break-even**: 14.5%
- **Return on investment:** 4.1% if the calls expire, earned in 29 days

Fools, if you make this trade, you need to be fully aware of the risks of shorting anything, let alone a volatility index. This is a high-conviction position when time is on our side, but we might see very large price movements in the meantime. In that case, we'd need to roll the position forward.

Please bring your questions to our VXX board.

Jeff is short VXX.

Charter Portfolio: Buy to Close Your Tupperware Covered Calls

Published Jan 19, 2011 at 12:00AM

At a Glance

- **Action:** "Buy to close" all January $45 calls
- **Preferred price:** Use a limit order near or at current market prices (lately, $1.95).
- **Recent share price:** $46.80

What's New?

Since *Pro* set up a covered strangle on **Tupperware** (NYSE: TUP) in September, the stock has gained 15% thanks to the company's plas-tastic third quarter. Our strangle, made up of $35 puts and $45 calls, has padded this profit a bit further. But now that these options are about to expire, we're closing our January $45 calls. That lets us keep the stock for more upside and allows us to use additional options strategies on Tupperware down the road.

We'll also let our existing January $35 puts expire for a full income gain on Friday without taking any action. After that happens, we'll hold no options on the stock -- for now. Because Tupperware is only a 2% position in our Charter Portfolio and shares trade below our $50 estimate of fair value, we don't need to defensively cap the upside today, and if the stock declines following Tupperware's Feb. 1 earnings, we may want to take advantage of the dip and buy more shares.

Why This Strategy?

Simply put, at today's valuation, Tupperware may have more room to run.

The stock trades for less than 13 times its expected 2010 earnings of $3.62 per share and for 11.3 times its estimated 2011 earnings (though that estimate could always change). With a dividend yield of 2.5%, the company's business isn't too shabby either: Return on equity has increased to a stellar 34%, up from 27% just five years ago.

And the company's growth in emerging markets also remains compelling: Developing economies accounted for 59% of Tupperware's recent sales. And with its at-home sales-force, Tupperware provides *Pro* with exposure to consumer retail without needing to rely on margin-sapping retail outlets.

The company expects a fairly modest 4% to 6% gain in fourth-quarter revenue measured in local currency, though earnings-per-share growth is expected to reach 17% in 2010, followed by a 14% gain in 2011. A weak euro might create a slight challenge in 2011, but the stock's current price seems to already account for this.

How to Follow Along

Simply "buy to close" your January 2011 $45 calls on Tupperware, using a limit price close to current market prices. Try to pay as little as possible above the current market value. So, if Tupperware is trading at $47, pay as close to $2 as possible to close your $45 calls. Currently, we can close the calls at a modest profit, and we'll simply let the $35 puts expire for the full profit.

Questions? Please visit our Tupperware board.

Jeff owns shares of and has covered calls on on Tupperware.

Intel's Surf Shop and Apple's Jobs Loss

Published Jan 18, 2011 at 12:00AM

I'm delighted to welcome new members to *Pro* this week! Ours is a great community of investors, and it shows every day. Case in point: Many veteran *Pro* members have already given our newest investors a warm welcome on our discussion boards. Please consider joining in if you haven't already, or you can send a shout-out during *Pro*'s next live chat on Thursday, Jan. 27.

This Week's Trades

Pro's Charter Portfolio will issue a few maintenance trades on existing options positions this week. If you're new to *Pro*, you can ignore these trades — but rest assured that this is the type of ongoing guidance and coverage you can expect from *Pro* as you follow along with Portfolio 2011. For now, we recommend new members open a position in **L-3 Communications** (read our trade alert) and keep an eye on your inbox for our next idea. It's headed your way next week!

I'm also happy to be initiating Portfolio 2011, a $250,000 real-money portfolio that our new members will be able to follow from scratch. It's been created to help new members optimally build their portfolios to match *Pro*'s Charter Portfolio, so veteran members don't need to follow along with Portfolio 2011 — unless you want to, of course. If you have any questions about the new portfolio, check out our FAQ on Port 2011. We also have a guide on using our newly revamped website.

And now, let's turn our attention to the one reason we're all here: strong investments for consistent profits.

Intel, Surfing, and One Great Wave

Last week, one of our favorite tech companies — and one that we've recommended both buying outright and via call options — **Intel**, delivered a record fourth quarter thanks to strong sales of microprocessors used in servers.

What's more, Internet traffic in 2010 surpassed *all* of the previous years combined, and with *1 billion* additional people expected to start surfing the Net over the next five years, the demand for servers is not likely to subside. Intel provided record first-quarter guidance and predicted that "everything gets better" in 2011, with refreshed products, a better economy, and more potential customers. The company expects 10% revenue growth in 2011 as computer shipments increase 13% to 14% from last year. You'd think investors would be excited by all this, but they shrugged instead, and Intel's stock drifted downward. Maybe they were simply stunned by the numbers: Most of Wall Street seems downbeat on Intel, with many analysts talking about impending doom for the chip giant because of tablets and smartphones.

Upcoming Earnings

- Today: **Apple**
- Jan. 19: **Wells Fargo**
- Jan. 25: **NextEra Energy**

Coverage & Community

- Jeff digs deeper into Intel's earnings.
- This week in CAPS: TMFElderhad considers the "follow the leader" phenomenon.
- kan100 joins *Pro* and gets an extremely warm welcome.
- Introduce yourself on our Meet & Greet board.
- Many of you have posted your New Year's Resolutions — take a look!
- TMFValuemoosie shares an earnings and dividend calendar.

It's true that Intel is arriving "late" to the smartphone market (although, truly, this market is just getting started), but management insists that getting into the niche didn't make economic sense until recently. Instead, Intel needed to focus on making higher-margin server and PC chips until it could produce a mobile phone product at margins that counted. Now it's doing so with its Atom chip. You can't say that Intel is late to the tablet market, though, because demand began in earnest just last year, and Intel says its chips will be used in dozens of tablet designs starting this year. Yet since last summer, Wall Street's common refrain has been that Intel will lose out to mobile devices. Intel claims the opposite: that mobile devices will expand the computing market, benefiting the company. *Pro* has a 6% stake in Intel, so you know which side of the argument we take.

In our *Pro* community, even usually skeptical members like spinningwood are impressed with Intel's new Sandy Bridge chip capabilities. We're also optimistic about the company's plans to put security on a chip, which is important for mobile devices. Beyond these technological advantages, Intel offers the world's best and most reliable microprocessor manufacturing. Intel rival **ARM Holdings** doesn't manufacture it own chips; it simply designs them and then outsources the building.

Not all is perfect at Intel. The company will spend about $4 billion more than last year on new manufacturing capabilities, putting a dent in free cash flow. And competition in mobile devices will remain heated. So even if investors once again come to appreciate Intel's many advantages, it's unlikely the $21 stock will soar more than 20% anytime soon (our fair value is in the mid-$20s). But we'd happily take that gain given the low risk we see in this stock. Intel trades at only 10 times earnings estimates for 2011, and its dividend yields a nice 3%. Your *Pro* team is still digging through the recent earnings, but we like what we see at Intel, so the stock remains a Buy in our Charter Portfolio.

A Temporary Loss of Jobs?

Steve Jobs is taking a third leave of absence from **Apple** to focus on his health. He'll remain CEO and make key decisions, but he's handed operations over to COO Tim Cook. Cook took over for five months in 2009, and Apple's stock gained more than 60% during that time. We hope Jobs, who turns 56 this year, will find health. *Pro* never invests in any company expecting management to remain the same forever, so Jobs' news doesn't change our investment argument — even though Jobs casts a longer shadow than most CEOs do. If he doesn't return to Apple soon, we'll need to closely watch the company's progress. (The second-generation iPad is expected to come out this spring and the iPhone 5 later this year.) In the meantime, Apple announces its latest earnings this afternoon, so join us on our Apple discussion board to talk shop and ask questions.

That's it for the Memo this week, Fools. Thank you for being a *Pro* member, and welcome again to our new members! We'll be in touch with investment ideas soon.

Jeff Fischer (TMFFischer)

Jeff owns shares of Apple and Intel.

Portfolio 2011: Buy L-3 Communications

Published Jan 14, 2011 at 12:00AM

L-3 has been a Buy First stock in *Pro*'s Charter Portfolio since November 2010. You can read our original recommendation of the company here.

Few industries were less beloved by investors in 2010 than the defense industry, and shares of **L-3 Communications** didn't escape that scorn. The stock declined more than 16% over the past year even as the S&P 500 gained 12% — and this is where we see opportunity. When a sector becomes so disliked, it typically means stocks are being mispriced. That's especially true if you can find a company in the sector that doesn't deserve to be beaten up along with its lesser peers.

LLL, Not LVLT

Make sure you buy the right company! We're recommending **L-3 Communications** (NYSE: LLL), *not* **Level 3 Communications** (NYSE: LVLT).

At a Glance

- **Action:** Buying 2.5% of current portfolio value
- **Estimated fair value:** $100
- **Preferred buy price:** Around $80 or lower
- **Type of holding:** Long-term, defense contractor
- **Why buy:**
  - World-class capabilities and technology
  - Fantastic price
  - Defensive company that is not closely correlated to the economy

We believe L-3 fits that mold. The stock is at a historically low valuation because of fears that U.S. defense spending will shrink — fears we don’t share. First, L-3 provides mission-critical technology and defense services that should survive budgetary tightening. Second, as we've now seen, the Pentagon doesn't plan to shrink the defense budget much at all. In fact, defense spending is scheduled to grow modestly through 2014, and then flatten, not plunge. Leading defense companies should still perform in this environment — and their cheap shares should recover. Indeed, since our first purchase in November 2010, L-3 stock has started to gain some ground.

We still believe it's inexpensive, and we appreciate its other fine qualities, too: Defense industry stocks like L-3 offer stability because the Pentagon will keep spending even if the economy weakens. The sector isn't closely correlated to the market, so it can hold up better during market declines. And while L-3 is priced for flat or no growth in the coming years, we believe the company can grow enough to pleasantly surprise investors. This is a contrarian investment, the kind that usually offers lower risk and good results to patient investors. We recommend starting a position of about 2% to 3% to match the Charter Portfolio.

Charter Portfolio: Roll Up Your Kinetic Concepts Covered Calls

Published Jan 14, 2011 at 12:00AM

At a Glance

- **Action:** Buy to close January 2011 $39 calls; sell to open March 2011 $45 calls
- **Preferred limit price:** $4 debit on the two trades combined
- **Recent option prices:**
  - January 2011 $39 calls: $6.50
  - March 2011 $45 calls: $2.40
- **Alternate trades:**
  - If you prefer a higher call payment with more upside, you can roll up to options with later expiration dates (and potentially higher strike prices) — for example, June 2011 $46 calls or January 2012 $47.50 calls.

What's New?

The protective collar we set up on **Kinetic Concepts** (UNKNOWN: KCI.DL) prior to its October earnings release has turned into a menacing strangler choking the life from our stock. That's been especially true this week as shares jumped amid rumors that **Johnson & Johnson** (NYSE: JNJ) may be considering a buyout of Kinetic competitor **Smith & Nephew** (NYSE: SNN). Such an action would make Smith & Nephew a more formidable foe, so Kinetic Concepts' spiking share price seems curious. It's likely the market is simply slapping an acquisition-related premium on the whole industry, but we're not impressed by such short-term influences. Instead, we're focused on Kinetic Concepts' business.

The Story So Far

We initially wrote our protective collar as protection against a possible drop in Kinetic's share price. However, the stock has climbed higher. We closed the put half of the collar in October, but our written call has increased in value significantly since then. We aren't eager to sell our shares, since they're still below what we think they're ultimately worth. These new calls are meant to be the first in a series that will allow us to regain our upside and earn back what we've missed due to the covered calls.

After two sketchy quarters in early 2010, performance appears to be stabilizing. Management reiterated its fourth-quarter 2010 sales guidance this week, suggesting flat year-over-year revenue, which should bring healthy (though not skyrocketing) earnings. On an estimated 4% increase in 2011 revenue, the company is expected to grow earnings 6% this year.

Speaking of acquisitions, Kinetic Concepts recently acquired TechniMotion Medical. Incorporated in 2007, TechniMotion offers ergonomic products (like lifts and chairs) for the safe handling of patients. Terms were not disclosed, so we suspect it's a small acquisition. Kinetic would market any new products gained in the purchase through its large sales network.

Sales are down lately in the therapeutic side of Kinetic's business, and margins are low. Of all the company's divisions, we've been least excited about this one; we even believed Kinetic might put its therapeutic bed division up for sale, which would have boosted overall margins. This acquisition of TechniMotion makes that unlikely. We don't want to read too much into it, but the acquisition suggests that growth opportunities may be lacking in other areas of the business (otherwise, why expend resources on this division?) and that Kinetic remains committed to lower-margin therapeutics.

However, we still estimate Kinetic's fair value is around $54, so it makes sense to keep the $45 shares as long as we believe in the business — even if we need to roll up our ill-fated covered calls at a net cost. We will work to earn our way out of this deficit over time.

Why This Strategy?

We're rolling up to a call with an expiration in the near future this time. This is much more common when using diagonal calls, so why are we doing it in this situation? Because writing at-the-money calls expiring in just two months means that any dip in share price below $45 would benefit us quickly, allowing us to make back $2.40 in option value; we could then write new covered calls. Plus, with only two months until expiration, gains in the stock are more likely to be modest (acquisition rumors aside), making it easier to roll up if necessary. Also, we're paid much more on a *daily* basis by writing covered calls that expire soon, given that time decay is more rapid as expirations near. Finally, with implied market volatility so low as measured by the VIX, we'd rather not lock into writing options that expire a year from now (for example), since the VIX is bound to increase at some point, which would help lift options prices across the board.

There's also a healthy incremental gain to be earned here over the next two months, so this makes sense as the first step in what could be many more rolls. Let's look at our roll-up:

Math of Rolling Up	
Cost to close January 2011 $39 covered calls	**($6.50)**
Premium on hand from original collar (from closing puts early)	$0.18
Total cost to close calls	**($6.32)**
Payment received writing March 2011 $45 calls	$2.40
Total cost of rolling up	**($3.92)**
Strike price increase	$6 (from $39 to $45)
Total extra upside gained	$2.08
New net sell price if called	$41.08
Incremental return on stock	**5.3%**
Incremental return on cost to roll	**53.2%**

See? Clear as mud!

Seriously, let's look it over. The cost of rolling this time is $3.92, but we gain $6 in our potential stock sales price, for a net $2.08 gain. We don't plan to let the shares be called away, but if they were, our return would be 5.3% higher than we would have received this month (not bad for a difference of just two months). The incremental return on our cost to roll is also worthwhile. Again, we'll pay a net $3.92 to roll, and we stand to earn $2.12 extra if our shares are called away — that's a 54.6% return on the capital we're adding to the trade over these two months. That's certainly a worthwhile endeavor, especially since the new position will start with 5.3% downside protection in Kinetic Concepts (the premium received for the $45 calls).

The ideal outcome: Kinetic shares remain around $45 or a bit below, so we earn the full call premium by March and repeat the process. If Kinetic heads higher, we'll look to roll up again, ideally for a credit on the next trade (by expiration, we'll have until the stock reaches $47.40 to roll at a credit). As with a diagonal call (which Jim Gillies has demonstrated so well over in *Motley Fool Options*), if the stock takes a breather, we'll start to earn back some of our lost upside, and we can reload the trade in just 60 days. If shares keep going higher, we'll be earning more than we would have by doing nothing today, and we'll have flexibility to keep pursuing it with new strategies as March nears. Since the stock is still safely below our fair-value estimate, shadowing it higher with an incremental covered call strategy makes sense. But the flatter Kinetic's stock remains, the more we'll ultimately earn from the strategy.

How to Follow Along

Simply buy to close your existing calls and write an equivalent number of the new calls, using limit orders near market prices. Some brokers allow you to close and roll to new covered calls with one trade command (for a reduced commission). In that case, look to roll for a $4 debit or less. Questions? Please visit the [Kinetic Concepts board](). Jeff will be there licking his wounds from this broken collar — which we'll now seek to mend.

Jeff owns shares of Kinetic Concepts. The Motley Fool and Motley Fool Alpha *own shares of Johnson & Johnson, which is also an* Inside Value *and* Income Investor *recommendation.* Motley Fool Options *has a diagonal call position on the stock to boot. (J&J gets around!) Smith & Nephew is a* Global Gains *recommendation.*

Get to Know Our New Site

Published Jan 11, 2011 at 12:00AM

Welcome, *Pro* member, to our new site! As you've no doubt noticed, we've done a lot of updating, and there's even more to come over the rest of this month as we welcome a new set of members and launch a new portfolio. We're excited about the changes we've made, which were developed directly from your feedback, and we want to make sure you're finding your way around your new home. This page is our attempt to provide you with all the tools you need to make the most of *Motley Fool Pro*!

Check Your Email Preferences

Members who have been with us for awhile will receive alerts for the Charter Portfolio. New members (starting in January 2011) will receive alerts for Portfolio 2011. If we recommend a trade for both portfolios, everyone will get it. You can manage the email you get from *Pro* and any other Fool services [here]().

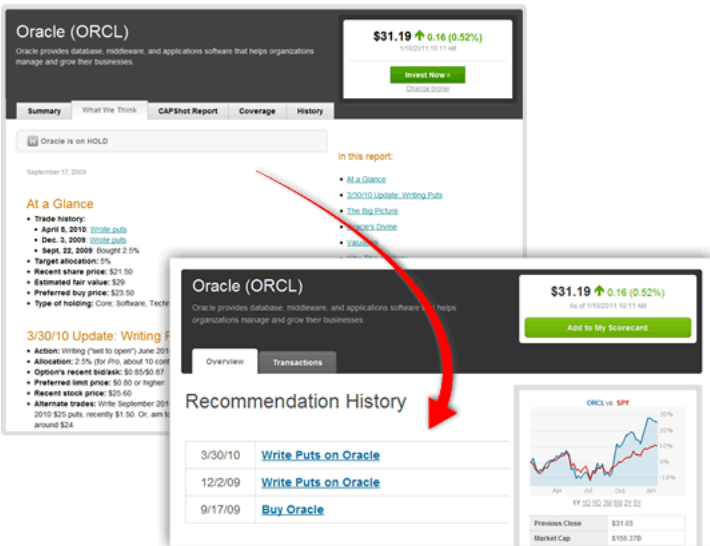
Tutorial

We've put together a short video in which Jeff shows you how to navigate the new site. Check it out for a quick-but-comprehensive overview of what's changed.

After you've watched the video, check out the new home page, which we've designed to be the hub of *Pro*. We brought much of what you love about the old *Pro* site front and center. Here you'll find the latest alerts, our Monday Memos, up-to-date details on the market in general, timely messages from the *Pro* team, and the latest community board posts, all in one place.

Navigating the Recommendations

Previously, all of our recommendations, re-recommendations, sell recommendations, and other coverage on a holding was concentrated in one big file. We thought that was unwieldy (and we know many of you did, too), so we've changed the format. Now, instead of clicking on "What We Think" to see all our coverage, you can click on "Overview" and choose from a chronological list of everything we've written on that holding:



Looking for Something?

Trade Alerts

Old Site: Alerts were shown in the yellow box at the top of the home page (and on individual recommendation pages, where applicable).
New Site: Use the "Alerts & Coverage" tab at the top of the home page or the "Latest Alerts" tab located below the "carousel" (less formally known as the big box) at the top of the page. You can also see a list of our most recent content — alerts, memos, extras, board posts, and more — in the "watercooler" that extends down the center of the home page.

Monday Memos

Old Site: The most recent Monday Memo was always linked from the top of the home page, and the archive could be found under "Memos" by clicking on the "Features" tab.
New Site: The "carousel" at the top of the home page will link to whatever content we think is most important to share with you — this will sometimes be the memo, but not always. Either way, you can find the most recent memo by clicking the "Monday Memo" tab below the carousel. A complete archive of our memos can be found under "Memos" by clicking on the "Alerts & Coverage" tab.

Cast Your Vote

Did you know you can now recommend a story you particularly enjoyed on the *Pro* site? Use the "Rec This" box (beneath the yellow square in the top right corner of the page).

Portfolio Information

Old Site: The "Portfolio" tab showed all of our holdings and gave relevant information about them.
New Site: The "Recommendations" tab displays the most recent recommendations for both our Charter Portfolio and Portfolio 2011. You can click on either to see a full listing of our holdings (current and closed) and transactions, as well as new information like our fair-value estimate and buy-below price.

CAPShot

Old Site: By clicking on the CAPShot tab at the top of the home page, you were able to enter a ticker to learn more about the company, see its CAPShot score, and generate a CAPShot report.
New Site: You can now access the CAPShot Score by typing in a ticker in the search box at the top of any page. However, the CAPShot report is currently under construction; we will notify you when it's up and running.

Portfolio 2011 Questions?

Check out our FAQ for the answers to common questions about the upcoming new portfolio.

Give Us Feedback

We genuinely want to know your thoughts on the new *Pro* site — so much so that we've created a board for you to share them. Click here to tell us how you feel on the New Site Feedback board.

Jeff Shows You the New Site

Published Jan 11, 2011 at 12:00AM

Frequently Asked Questions About Portfolio 2011

Published Jan 11, 2011 at 12:00AM

We launched Portfolio 2011 when we welcomed new members to *Pro* in early 2011. Here are some questions and answers to help you determine what it means for you.

What is the new portfolio all about?

Portfolio 2011 was introduced to help new members (or those who aren't yet caught up) build positions in many of the stocks we love from the Charter Portfolio (*Pro*'s flagship $1 million portfolio, which was launched in October 2008). Portfolio 2011 was loaded with $250,000 of the Fool's money that Jeff is investing to resemble the Charter Portfolio.

Will Portfolio 2011 exactly resemble the Charter Portfolio?

No. We won't buy every Charter Portfolio stock in Portfolio 2011. Why? Some stocks have climbed in price or are too risky for new purchases right now. We can use options, however, to target lower buy prices on some stocks.

Which *Pro* portfolio should I follow?

If you joined before 2011, we recommend that you follow *Pro*'s Charter Portfolio. Of course, Jeff and the *Pro* team will continue to actively manage this portfolio and will send you Charter Portfolio trade alerts when they have new recommendations for you.

If you're new, we recommend you follow along with Portfolio 2011, beginning by establishing positions in our Buy First stocks. Any member who just wants an extra layer of investment advice may elect to follow both portfolios (you can change those settings here). Just remember, the Charter Portfolio is the "master" portfolio, and Portfolio 2011 intends to build toward mimicking it, rather than deviating from it.

Will I receive Charter Portfolio / Portfolio 2011 trade alerts?

If you want them! You can customize your email settings here.

When you have new recommendations, which portfolio gets them?

When Jeff and the *Pro* team find a brand-new investment idea, one email will be sent to both groups with the subject line, "Trade Alert: Charter Portfolio and Portfolio 2011." All brand-new investments will be made in both portfolios.

As always, if you have any questions, just bring them to the boards and we'll be on hand to answer!

How You Can Score a Goal

Published Jan 10, 2011 at 12:00AM

MLK Day

***Pro* will arrive in your inbox one day later than normal next week**, on Tuesday, Jan. 18, after the country celebrates Dr. Martin Luther King.

Last week, Jeff shared his resolutions for *Pro* in 2011. Specifically, he wants all of us to:

- Have fun together
- Invest only in high-conviction ideas
- Ignore meaningless volatility
- Focus our capital in the best ideas
- Spend our time on value-adding activities

Jeff's list motivated me to set my own personal investing resolutions for the New Year. As I looked over my list, I realized that some of my resolutions could also benefit you. By sharing them, I hope they inspire you to set your own goals — more on that front in a moment. For now, here are my goals for 2011. See if you recognize yourself if any of them.

My Foolish Resolutions

Coverage & Community

- Earnings season begins soon, kicking off with **Intel** (Nasdaq: INTC) on Jan. 13. TMFValuemoosie posted an earnings calendar.
- This week in CAPS: TMFEldrehad looks at cold 1-Star stocks and shares a personal investing lesson.
- Jeff and *Duke Street*'s Rich Greifner talk about **Apple**. Listen to their conversation here.

Upcoming Events

- Stay tuned for official guidance on our options positions expiring on Jan. 22.
- Meet **Tom Gardner, Bill Mann, Tim Hanson, and Joe Magyer** — plus Steve Forbes and dozens of top market commentators — at the **World MoneyShow Orlando.** It's **February 9-12**, **2011,** at **The Gaylord Palms Hotel & Convention Center**. Call **800-970-4355** and mention **priority code 020967** to register FREE today.

1. **More closely match *Pro*'s portfolio.** I'm ashamed to say that my portfolio looks nothing like *Pro*'s, and I imagine I'm not alone here. But I want this year to be different. As I've often quipped around Fool HQ, I think advisors and analysts owe it to you to eat our own cooking by deploying our money side-by-side with yours. Thanks to recently revamped and more Foolish trading restrictions, my portfolio will look much more like *Pro*'s by the end of the year. And thanks to our soon-to-be-released Portfolio 2011, you'll have the guidance you need to do the same. (Watch your inbox for more info on Portfolio 2011 — the details are coming soon.)
2. **Control my emotions, not ignore them.** At the extreme, markets are generally governed by fear and greed, so it's easy to conclude that smart investing should be emotionless. But we shouldn't lose sight of the value emotions bring to both life and investing. After all, they're what make us human. Plus, research in behavioral finance teaches us that people who, through illness or injury, have lost the ability to feel emotions are also unable to make decisions. Investing is about making decisions based largely on opportunity cost and the opportunities provided by other investors' overreactions. Embracing and controlling my emotions will make me a better investor.
3. **Learn something new and share it.** It's been said that to teach something is to learn it twice. I love to learn — and teach — so this goal serves as a reminder to share what I learn as I learn it.
4. **Switch to a better, cheaper broker.** Are you paying commissions that are too high? Does your broker make shorting or options more difficult than they need to be? Me too. This is a long time coming: I'm going to switch brokers or renegotiate my rate with my current broker.
5. **Be interesting and interested.** You *Pro* members have taught me a lesson through our Social Banter board: Not everyone is comfortable chatting about investing. I hadn't realized that! But as soon as we opened our new banter board, I saw that everyone seems to be willing to share a little about topics they're knowledgeable about. As a general rule, if you find something interesting, so will someone else. So I can be *interesting* by posting to our boards, and I can show that I'm *interested* not only by recommending posts I like but also by writing a line or two in response to someone else's post. My favorite off-topic topic: cars!

So there you have it, Fools. I hope some of my goals struck a chord with you. Now, I encourage you to come up with your own. Doing so is a powerful motivator as long as you follow a few rules:

1. Keep your goals simple and attainable.
2. Write them down.
3. Hold yourself accountable by sharing your goals with others.
4. If possible, track your performance.

Pro can help you with the second and third parts: Just share your goals on our Memo Musings board. No excuses — it's open 24 hours!

Better Every Day

I stole the "better every day" concept from my fellow analyst Bryan Hinmon. It's one of his Motley core values, and it aptly demonstrates Bryan's commitment to learning. So whether you plan to join me in the resolutions above or you want to write your own, I challenge you to get better every day. Stop by our Memo Musings board to share your goals — and to encourage your fellow Fools to achieve theirs.

Thank you for being a *Motley Fool Pro* member and for making our community the best one in all of Fooldom.

Fool on!

Welcome to *Motley Fool Pro*! Get ready to start building a robust portfolio, learn smart new investing strategies, and profit in any market.

New Member Orientation Week: Feb. 6 — Feb. 10!

Monday, Feb. 6, through Friday, Feb. 10, is New Member Orientation Week, when we'll share everything you need to know to make the most of your new service and start building your *Pro* portfolio! Here's what you can expect:

- **Monday:** New-member Monday Memo featuring our exclusive North Star report, the ultimate navigational guide to *Pro* investing.
- **Wednesday:** Must-have options guide to make sure you have the knowledge you need to use these important tools.
- **Friday:** The Ketchup Report, to help you get in lockstep with the *Pro* portfolio, no matter what your portfolio looks like now.
- **Also Friday:** Live chat with the team, where you can ask any questions you may have about the service, our philosophy, or our trades.

Jeff Fischer and the rest of the *Pro* team are here to help. Let's start with the key things you can expect as a *Pro* member.

How We Invest

Pro's mission is to earn you consistent, recurring profits with a high level of accuracy using a combination of stocks, options, and ETFs. The *Pro* team (meet Jeff and the gang here) is accomplishing this by investing $1 million of the Fool's real money. Our tool kit is full of strategies to help you achieve double-digit returns while minimizing risk.

How *Pro* Works

Watch this quick introduction from Jeff to learn more about the *Pro* web site and all the exclusive resources that are now at your disposal. (You can find a transcript of this video here.)

Staying in Touch

Our Members Say ...

"What *Pro* and the *Pro* community have done for my investment knowledge, confidence and ability to build a portfolio that I can sleep with at night are immeasurable." — *Gerald H., Wichita, Kan.*

"My experience has simply been more than words can adequately describe and I cannot imagine not being a member. My best investment ever was joining the Fool, and *Pro* in particular." — *Matt D., Pittsburgh*

All the important news from *Pro* gets delivered directly to you via email. Here's what to expect in your inbox:

- **Trade Alerts**: We announce all of our trades ***before*** we pull the trigger so you can act before we do. We send these email alerts at any time during normal market hours (we post them here on the *Pro* web site, too). Trades always come with a full report that explains our thinking. After we announce a trade, we wait one to 30 days to make the trades for the *Pro* portfolio.
- **Monday Memos**: Stay on top of *Pro* happenings — every Monday at 4 p.m. ET, we'll send you stock news, market insights, community highlights, and more.
- **Guides, Audio Extras, special updates**: Become a better investor! Learn about *Pro*'s strategies, listen to the team talk stocks, and get the latest on happenings in your portfolio.

Next Step: Invest

Now that you know what to expect at *Pro*, you're ready for your next step: building your portfolio alongside us. To get started, head over to Step 2: How You Make Money with *Pro*.

Audio Extra: Jeff Fischer on Apple

Published Jan 6, 2011 at 12:00AM

Jeff sits down with *Motley Fool Duke Street*'s Rich Greifner to discuss *Pro*'s latest recommendation, a little company you've probably never heard of called Apple. Just click the player below to hear why Jeff likes Apple, why using options is attractive (though a direct purchase works, too), and which three apps he thinks you should download..

Sell Quanta Services

Published Jan 5, 2011 at 12:00AM

At a Glance

- **Action:** Selling all shares
- **Recent Price (1/5/11):** $21
- **Why Sell:**
  - We're raising cash from one of our lower-conviction, higher-valued stocks.
  - The power industry continues to operate under uncertainty, with Congress unlikely to agree on a progressive energy bill anytime soon.
  - Large projects may continue to be delayed, but after a recent spike, we can sell the stock into strength.

What's Changed?

We have no reason to throw a company we bought nearly a year ago under the bus. **Quanta Services** (NYSE: PWR) has performed well in a difficult time for the energy industry — our investment has gained nearly 20% in 11 months. However, our portfolio is almost fully allocated, and we want to raise cash to be more defensive and ready for new opportunities — and only hold high-conviction ideas along the way. This makes Quanta a natural candidate for freeing up some funds. At 27 times earnings and 20 times estimates for 2011, Quanta is one of the more expensive stocks in the *Pro* portfolio, even though the business continues to move slowly.

Quanta will probably face an improving but still challenging business environment in 2011. We expect activity in the power transmission industry will likely remain subdued thanks to the lack of an energy bill from Capitol Hill, and large projects may face more delays. Quanta still has the long-term promise that we outlined in our original report — building transmission lines, natural gas lines, and other telecommunications infrastructure — but the lack of traction in its industry, Quanta's negative free cash flow the first three quarters of 2010, and our desire to raise cash makes taking our profit a sensible choice.

How to Follow Along

We announced our intent to purchase Quanta on Jan. 27, 2010, so we're a bit shy of one year in holding the position. If taxes matter to you, you could wait until you lap the one-year point since your purchase so that your gains are taxed at long-term capital gains rates, although of course you'll risk the stock declining.

If you'd like to write covered calls instead of selling today (for instance, you may not need to raise any cash), you could consider writing February 2011 (or even later-dated) covered calls at $21 or thereabouts. Downside risk in the stock should hold in the high-teens. To discuss this trade, please visit the Quanta board.

Write Puts on Apple

Published Jan 4, 2011 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") a 4.4% position in April 2011 $330 puts (for *Pro*, two contracts)
- **Recent option price:** $20
- **Preferred price:** $17 or higher (5% yield)

First Things First

- **Stock: Apple** (Nasdaq: AAPL)
- **Market Cap:** $304 billion (at $332 per share)
- **Website:** www.apple.com
- **Type of Holding:** Consumer tech, long-term
- Add to My Scorecard

- **Why Write Puts:**
  - All three of Apple's core products serve the booming mobile computing market
  - Shares look reasonably valued, but we're being defensive by targeting a lower net start price
  - We're seeking 15% or greater annualized returns with less risk
- **Alternate trades:**
  - Buy stock
  - Write puts at higher or lower strike prices, and other months of expiration, depending on your risk tolerance and desired time frame
  - Write January 2013 puts and buy calls of the same strike and month, setting up a synthetic long

The Big Picture

Aldous Huxley, the author of Brave New World, once noted "man's almost infinite appetite for distractions." He didn't mean it as a compliment, but it would be hard to argue with his point. Humans' love for an entertaining diversion shows no sign of slowing, and thanks to mobile devices like notebooks, smartphones, and tablets, we can satisfy our desire for diversion wherever we are. We can also work, shop, get oriented, socialize, play games, and more, so it's no surprise the world is embracing mobile technology at a rapid pace.

Research firm IDC expects the worldwide mobile computer industry to grow unit shipments by a strong 22% in 2011, 19% in 2012, 17% in 2013, and 15% in 2014. Gartner Research estimates that smartphones currently account for just 19.3% of worldwide mobile phone shipments, even though smartphone shipments soared by 96% in the third quarter of 2010. In other words, about 200 million smartphones were sold in the past year, but more than double that number — at least 500 million — could be shipping annually by 2015. Then there's the nascent tablet market — from fewer than 15 million in 2010, it could reach annual unit sales as high as 57 million in 2015, according to ABI Research.

The personal-technology boom that has accompanied the ubiquity of the Internet over the past 10 years is now going mobile and spreading around the world, entering emerging markets and gaining speed. There's one company in this sector with an industry-leading brand but a relatively small share of the global market — and it can't make enough products to satisfy demand during product launches. It's **Apple** (NASDAQ: AAPL), of course, and its best days are almost surely still to come.

The Business, Financials, & Valuation

The world's most valuable consumer technology company, Apple ended its fiscal 2010 in September with a record $65 billion in revenue, representing 52% growth over the prior year. Revenue broke down like so:

- iPhones (now in their fourth year) accounted for $25 billion in sales (39% of the total), up 93% from last year.
- Mobile computers topped $11 billion in sales (17% of the total), up 18%.
- The iPod brought in $8 billion in revenue (13% of the total), up 2%.
- Music-related sales were nearly $5 billion (8% of the total), up 23%.
- iPad sales were nearly $5 billion as well (8% of total), up from zero.
- Desktop computers topped $6 billion in sales (9% of total), up 43%.
- Odds and ends made up the rest, including $2.5 billion in software revenue.

Although Apple's total sales are those of a giant company, you can see in our handy list above that many of its individual product lines remain relatively modest in size — especially given the vast global market — and most should continue to grow as the iPhone and iPad continue to draw in new customers.

For more context on Apple's place on the world stage, consider that the United States accounted for 37% of the company's revenue last year, while the Asia-Pacific region accounted for just 13% — despite growth of 160% over the prior year, Apple only had $8 billion in Asia-Pacific revenue. A potentially giant market remains available for tapping as this enormous region grows wealthier.

If mobile computer, smartphone, and tablet sales growth comes anything close to expectations into 2014 (and if the company's other segments remain on track), Apple could handily top $100 billion in annual sales. (It will take 20%, 15%, and 12% sales growth over the next three years, respectively, to get there.) In that scenario, Apple could rake in approximately $24 billion in yearly free cash flow by 2014, ballooning its current $51 billion cash and investment balance. If this occurs, the stock could gain 50% by 2014 and still be priced at a free cash flow multiple in the mid-teens. Add in the company's cash balance, and the valuation looks even more reasonable. Today, Apple trades at 17 times expected earnings for the year ending in September 2011 — and about 14 times those earnings when you subtract cash and investments per share.

Apple looks even better when you consider that it's likely to grow its computer sales at a faster clip than the industry as a whole; its current share of the U.S. market is a modest 10%, and that number is even lower internationally. Apple is expected to dominate the booming tablet market at least through 2012 — being one generation ahead of most competitors — and maintain strong market share beyond then. In the first two quarters of the product's existence, Apple sold 7.5 million iPads; those gadgets are likely to drive new Apple computer sales, too, just like the iPhone before them. For its part, the iPhone will get new life in the U.S. once it's no longer exclusive to **AT&T**

(NYSE: T). According to Gartner, Apple has 17% market share in the worldwide smartphone industry, and this market could more than double in size over the next four years.

With a growing customer base and steady product "refreshes" (including a new iPad expected early this year), Apple is riding the mobile computing wave to secure its place as one of the most profitable companies in the tech world.

The Strategy

You can simply buy shares if you prefer, but we're returning to our old friend, thewritten put, to take a bullish stance on Apple that's a bit more defensive. If converted into shares at expiration four months from now, these puts would allow us to buy shares 6% cheaper than the recent price. If we don't get the shares, we'll earn about a 15% annualized return on this trade and will look to write puts again.

- **Trade:** Sell to open April 2011 $330 puts
- **Allocation:** 4.4% (for *Pro*, two contracts)
- **Recent option price:** $20
- **Return on cash**: 6% in 102 days
- **Return on buying power**: 18%
- **Break-even price**: $310 (6.6% below the recent share price)
- **Alternate trade**: If writing a put for a potential $33,000 stock purchase is too rich for your blood, you can simply buy shares to establish a position. See our other alternate trades atop this report.

Keep in mind that buying the stock would outperform this put-writing trade (on an all-cash basis) if Apple rises to $352 or higher over the same time frame.

What Would Make Us Sell

The magnitude and speed of Apple's recent success has led some skeptics to proclaim they don't believe it can last. In a highly competitive consumer industry, Apple offers some of the highest-priced (and highest-margin) products. But margins are due to come down as Apple's product mix shifts and technology prices continue their long, slow decline. Apple is already losing market share in the smartphone market as **Google** (NASDAQ: GOOG) Android phones are sold across multiple networks; Apple's phone sales will continue to grow overall, but at a slower pace as the law of large numbers comes into play.

Looking ahead, Apple needs to continue to innovate faster than the competition to command premium prices on its products, and it can't miss any game-changing technology breakthroughs. Add to this pressure cooker the unfortunate fact that CEO Steve Jobs has had health issues. If Jobs leaves the company, its stock price will likely fall until investors are reassured that Apple will continue to thrive without his leadership. Slowing growth, reliance on a CEO, lower margins, and competing product launches could all make the stock volatile. If the business appears threatened in a lasting way, we'll exit our position.

Pro Bottom Line

The rebirth of Apple is one of the greatest business stories of our generation, but it's still in its early chapters. Skeptics question Apple's staying power, even though **Microsoft** (NASDAQ: MSFT) has proven that dominance in computers can last decades once people rely on your technology. Apple's growth is driven by younger generations who are forming tech alliances early in life and who are spending a larger percentage of their budgets on the sector. Apple has a nearly fanatical fan base, it's true — but there's substance to the company itself, and its trajectory appears to be set for at least the coming years as mobile computing devices take hold. With shares reasonably priced, the upside potential still appears to outshine the risk. Buff up that shiny silver MacBook and meet us on the Apple board to discuss it.

Jeff owns shares of Apple and Google. The Motley Fool owns shares of Apple and Google.

5 Pro Resolutions for 2011

Published Jan 3, 2011 at 12:00AM

Welcome to a new year with *Pro*! We hope your holidays were relaxing and enjoyable, and that you're as excited as we are to get back to business in 2011. To start off on the right foot, we're devoting this Memo to five resolutions (or principles) we believe all investors should follow. We'll also touch on where *Pro* is going next — with some exciting news.

Coverage & Community

- Members share their wishes for a happy new year.
- Earnings season begins soon, kicking off with **Intel** on Jan. 13. TMFValuemoosie posted an earnings calendar.
- Jeff summarized the recent strong results at **Oracle**.
- Care to give a dime to charity? Keep posting on the boards! *Pro* is leading the pack in number of posts made during this year's Foolanthropy campaign.

Jan. 22 Options Expirations

Pro has a slew of options up for expiration in 19 days; we'll take action on some of them well before that, and we'll keep you posted even when no action is required.

But first, a quick look back: The *Pro* portfolio closed 2010 with a 13.7% return. For the record, that's ahead of the indexes we care any modicum about (the MSCI World, the S&P 500, the Schwab Hedged Equity Fund, and a couple of others). Of course, we continue to invest *not* for relative returns, but for positive (absolute) gains with high accuracy and, ideally, less risk — but for those keeping score, beating the market in a short period is a small bonus.

That said, while investing is serious business, we must also remember that we're all Motley Fools, and our quality of life outside of investing matters greatly as well. At *Pro*, we honor that by using strategies that give us a high level of confidence (and income in most any market), which keeps us calm and lets us enjoy our Foolish lives. What better way to start 2011 than by recommitting to our focus on this — and all of our core values?

Our 5 Resolutions

1. **Let's enjoy the year.** Maybe it goes without saying, but if you're not enjoying what you're doing, it might not be worth your time. We want membership in *Pro* to continue to be an enjoyable experience, without losing sight of protecting our assets and generating strong returns. As a model, we can look to a great example of having fun while investing: the contests run by Ed (spinningwood) on the Social Banter board. To help you enjoy your investing overall (and to boost your performance), it's key to keep a longer-term perspective.
2. **Invest in high-conviction ideas.** Life has plenty of uncertainties, and investing will always have them, too — but you can mitigate their impact by only investing in high-conviction ideas that let you sleep at night. You won't always be right, but if the majority of your portfolio is earning you returns over the years while keeping you confident, that's great success.
3. **Recognize the difference between price volatility and business health.** Tragically, countless investors are shaken by price volatility (wide movements in the market that affect a stock); they forget that a stock's price action sometimes has nothing to do with the actual business behind it. Was **Kinetic Concepts** dying as a company when the stock fell from $52 to $18 in 2008? On the contrary; the business — and its profit — continued to grow. Don't let market volatility shake your confidence in high-conviction ideas.
4. **Focus your capital.** When you have a strong idea, consider adding *more* money to it. It's rare that any single position should take up more than 7% to 10% of your initial capital, but too often investors find excellent ideas and then don't commit *enough* to them. You can be focused yet remain amply diversified with as few as 12 positions.
5. **Don't be penny-wise and pound-foolish (small "f"!).** And finally, here's a resolution that's more touchy-feely, but just as important: Focus your attention, time, and energy on things that *add* value to your life and weed out the things that don't.

Ready for What Comes

Pro's approach to investing this year will depend on what the market gives us, but currently it's likely that we will:

- Add more company or sector-specific shorts to hedge our largely invested portfolio.
- Sell lower-conviction ideas to add to higher-conviction ones (new or existing).
- Add new option-writing strategies to continue to generate significant income without needing to add capital.
- Buy options to leverage the cash we have.
- Continue to watch the evolving ETF industry to profit on the knowledge we've gained along the way.

We're also excited to share that *Pro* has a new site debuting soon! The shiny new interface will offer you a more interactive home page, a redesigned portfolio page with useful information all in one place, and much more; you can expect to see us announce the new site in the next few weeks. Also, *Pro* will open to new members this month for the first time since June. In doing so, we'll offer every member (both new and old) the chance to follow a new real-money portfolio: Portfolio 2011. As we did with our current portfolio (which we're calling the "Charter Portfolio"), we'll be building this portfolio from the ground up, providing advice on exactly what we'd buy or use options on right now. Keep in mind that the new portfolio will be designed to allow new members and veterans alike to "catch up" to the Charter Portfolio, rather than break new ground. We'll share more details with you soon.

All of that, plus more special reports, company interviews, live chats, and (of course) new investment ideas, mean the whole team is ready to have an excellent year with you.

Left to right: Adrienne Perryman, publisher; Bryan Hinmon, CFA, analyst; Andrew Sullivan, CFA, analyst; Jeff Fischer, lead advisor; Todd Wenning (now in the UK, but just an email away); Nick Crow, senior analyst; Ellen Bowman, editor.

We'll remain focused on our resolutions, and also on *Pro*'s bottom line: to earn you profits while following our mission.

With that, Happy New Year to everyone! Thank you for being a *Pro* member. You'll hear from us again soon. In the meantime, visit the Memo Musings board for any questions or comments.

Foolishly,

Jeff Fischer (TMFFischer)

Jeff owns shares of Kinetic Concepts, Intel, and Oracle.

Pro Looks Back — and Forward

Published Dec 20, 2010 at 12:00AM

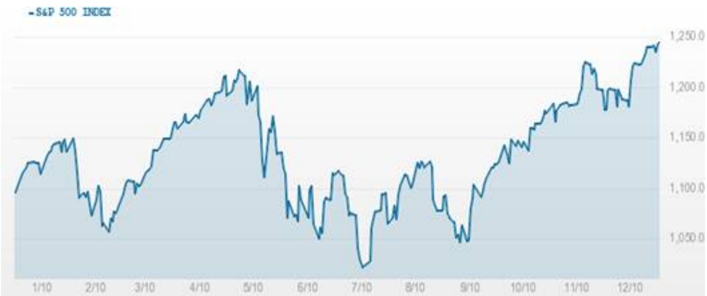
No Memo Next Week

Just a reminder: There will be no *Pro* Monday Memo on Dec. 27, but we'll be back in your inbox on Jan. 3. Enjoy your holiday!

At *Pro*, we've always believed that the unexamined investing life is not worth living — nor is it illuminating. So with 2010 drawing to a close, let's review some highlights of our last lap around the sun and the lessons we learned from each.

Will the Past Be Prologue?

Stocks took a brief breather in January from the soaring heights of 2009, but they were back to their old ways from February through May, then took a nosedive for much of the summer only to return with renewed energy in late August. At that point, the propane in the market's tank was ignited courtesy of Alan Greenspan's show of "unending" support from the Federal Reserve, along with healthy earnings announcements across the market. As of Friday, the S&P 500 had gained 11.5% this year — a more than respectable showing.



Source: Google Finance

These gains are helping soothe a nation that is still in "wound-licking" mode, with unemployment remaining near 10% and well-known financial problems on both the federal and state levels. If the stock market is any indication, though, the nascent economic recovery may be here to stay. Even the threat of debt default in Greece and Ireland didn't derail the train for long, and Europe's leaders are as eager as Fed chief Ben Bernanke to keep the new economic gains on track.

So we're entering 2011 with two-fisted support for market stability from the reserve banks of the world, and with a decent chance of up to 3% GDP growth in the United States. According to *Barron's*, the average S&P 500 company could turn that gain into 7% to 8% sales growth, and around 11% to 15% earnings growth — making the index's current P/E of 13 on 2011 earnings estimates appear reasonable. Some of the least expensive sectors in the market include health care and large-cap technology, and *Pro* is heavily weighted in both.

How Long Can the Government Hold the Line?

All that said, we'd be silly to think the New Year will offer nothing but smooth sailing. At some point, governmental stimulus efforts will need to wane, and the economy will be left to stand on its own two feet. And of course, when it comes to the stock market, the only certainty is uncertainty; markets are always being rocked by surprises from left field. And despite decent growth prospects, there are business fundamentals to consider, too.

Companies have learned to do business on the cheap over the past few years, and operating margins are collectively near record highs. As hiring reignites, those margins are likely to decline, so don't expect a lower unemployment rate (when it finally happens) to necessarily mean better stock market performance right away. In fact, it may mean the *opposite* for a while. Companies need to invest in people to achieve the benefit of higher sales, and the market usually dislikes the decline in margins that process initially brings. Additionally, year-over-year growth comparisons were quite easy in 2009 and 2010, but for many companies, relative growth will look much smaller in 2011.

2011 Prediction Foolery

Last year, I predicted the S&P 500 would stay in range of 1,000 to 1,200 (hardly a bold call on my part). The actual results:

- **Low (July 1):** 1,010
- **High (Dec. 13):** 1,246

This year, with the index at 1,245, I suggest it'll stay in a range of about 1,100 to 1,425. That suggests 11% downside risk and 14% upside. Again, not so dramatic! So in the name of fun, I'll be a bit more specific below.

Given:

- the market's valuation
- the likelihood of slow but steady GDP growth as business and consumer confidence ticks upward
- the fact that deleveraging of debt has likely passed the halfway point, at which time recoveries usually improve

… my Foolish prediction for this year is a 6% to 14% gain in the S&P 500. Now, nobody can predict the market, so *Pro* won't bank on those numbers; we'll keep investing for absolute returns and accuracy with lower risk. But this certainly tells you my leanings going into the new year.

Looking Back at 2010

On the broadest of measures, *Pro* had a respectable year. Our portfolio can be long or short, extremely hedged or un-hedged (as opposed to "unhinged"!). We went through most of the year with a short or two, covered calls on many positions, and six figures in cash, but we still came out ahead.

Vehicle	YTD Return (through Dec. 17)
Pro Portfolio	12.2%
S&P 500	11.5%
MSCI World Index	7.6%
Schwab Hedged Equity (SWHEX)	6.2%

We made some losing decisions this year (more on those below), and our shorts were proven unnecessary in a rising market. Given that, we're fortunate to have a lead. We invest for absolute gains and accuracy, rather than consciously chasing any index (we think that way danger lies). However, we know many of you care about index performance, and in the long haul we believe we'll handily top the S&P 500 — but that's not our yearly ambition; we'll leave such short-term concerns to edgy Wall Streeters.

Some other indexes are relevant to us as well. The MSCI World Index is an apt comparison for our portfolio — it captures all the markets in the world, and *Pro* can invest anywhere. If other parts of the globe are doing well, this index will show it. Meanwhile, a popular hedged equity fund provides an idea of how unmitigated equity hedging strategies performed this year (in a nutshell, not great on a relative basis, since the market went up).

Where the Wild Gains Are

The *Pro* portfolio didn't have any monster gainers this year, but we did profit from respectable gains in a majority of positions, and our losses were mild. That added to our index-topping results, even considering some losers that aren't listed because we sold them.

Company	YTD Return Through Dec. 17
Bristow Group*	54.1%
Autodesk	53.9%
AmTrust Financial	47.9%
Ebix	42.9%
GrafTech Intl	28.7%
Oracle	28.3%
Jack Henry	28.1%
Cameco	22.6%
Vanguard Energy	17.0%
Vang. Emerging Markets	15.1%
Quanta Services*	11.6%
Papa John's Intl.*	10.4%
Kinetic Concepts	9.7%
Procter & Gamble	6.9%
Tupperware*	4.8%
Intel	4.7%
NextEra Energy	2.9%
WisdomTree Emerg. Mrkt. SmallCap Dividend (NYSE:DGS)*	2.0%
Sprott Physical Gold*	1.5%
KBW Regional Banking*	-1.5%
TradeStation*	-1.8%
L-3 Communications*	-4.0%
Broadridge Financial*	-4.3%
Plum Creek Timber	-5.7%
GlaxoSmithKline	-6.4%
Medtronic	-14.9%

These stock and ETF returns include live positions only. *Indicates the return is from *Pro*'s purchase date this year through Dec. 17. Otherwise, the return shown is from Dec. 31, 2009 through Dec. 17, 2010.

When we include dividends and options income (which are not shown above) in our returns, the only meaningful loser in 2010 that we currently hold is **Medtronic**. The company is down 15% this year, but overall we're still profitable on the position. We used this year's decline to buy more shares, because we believe higher prices are ahead for the medical-devices giant. It's not surprising that health care, finance, and defense stocks are sulking on the bottom of our list, since they were the market's worst-performing sectors. It also makes sense that many of our new positions (noted with a star in the chart above) are flat or down. Usually it takes time for a thesis to play out, so ideally these young positions will help lead the way in years to come.

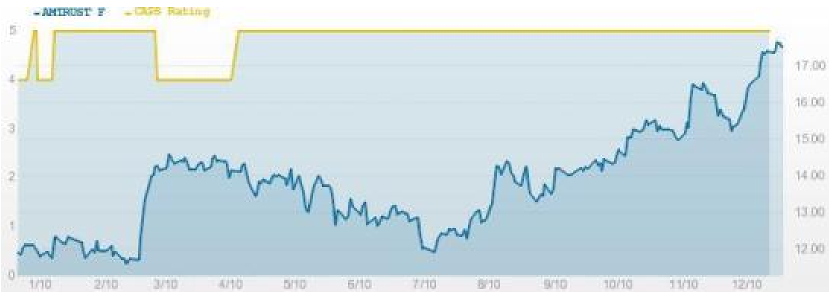
Favorite 2010 Investments

One of my favorite new *Pro* investments in 2010 was shorting the **iPath S&P 500 VIX Short-Term Futures** ETN. That's ironic, given that *Pro* couldn't actually short shares itself (the price of doing business with Schwab); we've only made a few thousand dollars writing naked calls, instead of the at least $30,000 we'd have enjoyed from shorting directly. Many *Pro* members, myself included, were able to short directly, while the Fool was stuck with Schwab — as you can tell, I'm not hiding my disappointment. But there is good news: As long as this ETN exists, opportunities exist to short it or use options against it, and we intend to do that as often as we're able. This may be as perfect a short as you'll find, since the VIX index drifts downward following its every spike (if history is a guide), and futures prices dilute this ETN day after day.

Next up, I fell for **Bristow Group** nearly as soon as Bryan Hinmon (TMF42) brought it to the team's attention. Buying the leading offshore helicopter services provider below book value during the dreadful **BP** oil spill was a great move, rewarding us soundly. Bristow is up 54%, while the oil-services company we defensively sold — **Flowserve**— is only up 28% from our sell price. Our only regret: We should have bought even more Bristow! Our desire to focus more dollars on our highest-conviction ideas will guide us next time. Here's Bristow versus Flowserve and the S&P 500 (six months):

Source: The Motley Fool

Other favorites from this year included sleepy little **AmTrust Financial Services**, up 47%. I've followed the company since its 2006 initial public offering, and I enjoy that it's still largely under the radar. Also, giant **Oracle**, up 28%, is outperforming my early expectations by a wide margin. Last week, Oracle showed again how it's hitting on all cylinders, with a 47% increase in revenue year-over-year. Both stocks were rated "Buy First" for most of the year, and AmTrust still is. Here's AmTrust's 2010 ascent (it still trades at a mighty low P/E of 7.7, and 1.5 times book value):



Source: The Motley Fool.

Costly Decisions and Lessons Learned

You can't invest without making mistakes. In fact, even profitable investments likely contain a mistake or two (selling too soon, buying later than you could have, or not buying enough, for example). So in a sense, there are *no* mistakes in investing — because *every* position includes small mistakes!

Instead of mistakes, then, let's think in terms of good decisions and bad decisions (and all kinds in between). Holding some top winners un-hedged was a good decision on our part. Writing covered calls on **Autodesk**, **Cameco**, and **Lindsay** were bad decisions.

Cameco and Lindsay are partly investments in commodity prices (uranium for Cameco, agriculture for Lindsay). Capping your upside on a commodity-driven investment is a bad decision. The valuations of Cameco and Lindsay did beg for covered calls, but that ignored the potential for a surge in the price of the commodities underlying each investment. Uranium and wheat prices soared the last three months, and both stocks climbed well past our fair value and net sell price. We should have left the stocks uncapped to sell when prices took off.

Autodesk looked richly priced, too, but it's a high-margin business, so gains in sales excited investors and ignited the stock to levels well above our potential sell price. The lessons to remember here are meaningful:

- **Rarely write covered calls on commodity-driven businesses** (or a commodity); you still have all the downside risk of the commodity, but you're capping the upside. It doesn't make good sense.
- **Rarely write covered calls on high-margin, recurring-revenue, low-cost business models** like software. These stocks have strong upside if you give them time and they keep succeeding.
- **Write covered calls on your income-generating positions** that you buy specifically for covered-call writing, and on stocks with business models that don't lend themselves to fast or leveraged upside (like utilities).

I won't belabor the following points (we've talked about them often this year), but holding the **U.S. Natural Gas Fund** ETF as long as we did was unnecessary and grew our losses. We believed in our thesis, but that was no match for an ETF rife with flaws. We no longer plan to invest in futures-based ETFs, and in fact, we'll be shorting them until we make back this loss and more. Who knows — these types of funds may be our favorite shorts for years to come (for as long as investors will tolerate their existence).

Finally, **MELA Sciences** was a bittersweet pill that knocked nearly 1% off the *Pro* portfolio's starting value. The company's one product actually won approval from a FDA advisory panel, but the FDA is likely to reject it anyway. We hope MELA succeeds eventually, but this investment ended *Pro*'s toe-dipping in speculations, so we can focus on our core mission.

Here's to 2011

As we roll into 2011, our mission is clear: We want strong conviction in everything we own, and we will continue to focus on earning you absolute profits with high accuracy.

Our outlook on the year ahead is less guarded than at any time since our inception, but we're under no illusions. The economy and stock market could turn on a dime, so we'll continue to be as diligent as possible in our decisions. You need to take a stance in investing if you hope to make money, and we will, but we'll adjust that stance if we see lasting storm clouds on the horizon. (For the record, if they appear, we think they're likely to come from overseas right now.)

Barring that, we're happy to enter 2011 with the confidence that, yes, the world *can* come through a financial debacle of massive proportions and grow even stronger afterward. There are still many problems to be handled, of course — the record budget deficits and debt of today may bring larger challenges in future years — but an improving economic world seems likely in 2011. It's not worth hoping for anything less.

The *Pro* team and I thank you for being a member, and we wish you and your family a peaceful holiday — and a happy 2011. As always, to share your thoughts, please visit the Memo Musings board.

Jeff Fischer (TMFFischer)

Jeff owns shares of AmTrust, Oracle, and Intel. He is short the iPath S&P 500 Short-Term VIX Futures ETN, has covered calls on Tupperware, and has written puts on GlaxoSmithKline.

Recent Action

- This weekend, covered calls on **NextEra** and written puts on **Broadridge Financial** expired as income. And covered calls sold away our shares of **Cameco**. We'll watch for follow-up trades on each position.

Coverage & Community

- TMFEldrehad looks for stocks currently in the doghouse that are worthy of further research.
- spinningwood provides some leaked video of Jeff and Nick at TMF's Christmas party.
- Alex340 shares puts and calls that match Pro criteria.

A Pro Grab Bag

Published Dec 13, 2010 at 12:00AM

Today's Memo is a Foolish holiday grab bag, wrapped up in bright paper with a ribbon on top. Below, we'll touch on the time frame for our investments, fair-value adjustments, our future, some trade ideas, and more. Think of it as a festive buffet table full of delicious *Pro* morsels (minus the fruitcake).

Guidance Changes

- **AmTrust Financial**: Fair value raised to $21 (from $18). Buy Around price increased to $17. Remains Buy First.
- **NextEra Energy**: Shares returned to Buy (from Hold) on price. But Buy Around guidance lowered to $52 from $55.

Long-Term Vs. Near-Term

Sing it with us: *On the first day of* Pro*, our employer gave to us … $1 million to invest*. As has been our goal since the beginning, a large portion of that money is being invested in core stocks for the long haul — as long as ownership looks attractive, that is. Such a long-term view will sometimes mean waiting through periods where a stock may have "gotten a bit ahead of itself" — because we believe the years ahead will provide still more rewards. So when we put a stock on Hold due to price, as we did with **Oracle**, it usually isn't because we believe the company's future is getting weaker (if we did, we'd sell). It simply means new investors face more risk because of price than those who bought at lower levels with us, but we're happy to keep holding the position — and we still have good expectations for the stock.

Fair Value and Buy-Below Adjustments

On the second day of Pro, we started to give / investment gui-i-i-dance. (OK, so it's a little clunky — we're not professional songwriters!) Today, we're moving our fair-value estimate for **AmTrust Financial Services** up from $18 to $21. The $17.35 stock is up 67% for us and still trades near the same price-to-book valuation as it did on Day One, because the company has grown its book value just as rapidly as its share price. The stock remains a Buy First because risks still look moderate. Our Buy Below price moves up to $17, which still allows at least 23% upside.

Options Extravaganza

We've compiled all of our options guides (so far) into one printer-friendly document — download it here!

Upcoming Events

- **Dec. 16: Oracle** earnings release. $0.46 per share expected.

Coverage & Community

- **Ebix** shared a corporate update that suggested good organic growth.
- We're stunned by the activity on the Social Banter board, which already has more than 2,200 posts — largely thanks to Ed (Spinningwood), who has been heading up multiple fun winter contests. For every post you make, the Fool will donate $0.10 to a deserving school, so pitch in!
- Can it be? January earnings season is already around the corner. TMFValuemoosie posts an earnings calendar.
- Want more *Pro*-based put-writing and call-writing ideas? Alex340 delivers again — we could call him Santa Claus!
- Bryan (TMF42) shares an article on **Procter & Gamble**'s franchising businesses.
- TMFEldrehad checks out some five-star CAPS stocks with the wind at their backs.

Also, we're moving our Buy Below price on **NextEra Energy** to $52 or lower, from $55 originally. We lowered our fair-value estimate on NextEra to the mid-$50s (from $60) in our October review because of the company's failure to obtain rate hikes and its ambitious capital-raising activities. NextEra remains an income position; you can write puts to buy the stock in the low $50s or below, and write covered calls to sell in the mid-$50s or higher.

Fully Invested Pro = More Discipline

On the third day of Pro, we took stock of all we owned. We're more invested than we've ever been, but that doesn't mean we'll slow down. Far from it: Being invested is only half the battle. We always need to make sure we're invested where we want to be, and we must keep seeking ideas that are *better* than what we already own. Some positions — such as NextEra and **Procter & Gamble** — are slow-moving, so if we find something with more potential, we'll swap for it. That said, we seek to maintain a balance of smaller (if riskier) companies with more potential, and large, unshakeable companies for stability.

Our options investing also becomes more disciplined the more invested we become. With the bulk of our capital committed to positions, if an option has earned us most of what it can pay us, we'll be even more compelled to close it early and open a new one for more income.

Cash in Hiding and Ready for Trading

We'll let **Cameco** be sold away this weekend through covered calls. There's a good chance **Autodesk** will be sold in 2011, too. We view these positions, and others such as Procter & Gamble, in large part as "cash in hiding." If we want cash for brand-new positions, we have a short list of current positions (typically on Hold) that we could sell today for that purpose. So we're never really done — and we're never really out of cash or cash proxies. Acknowledging this, we always aim to make our investing sensible: long-term in nature, but active when we believe activity will benefit us. We never want to become so active that it becomes a chore, and we never want our activity to ultimately cost us results.

When Do We Go Short?

Sometime in the future, there will likely come a time when we are big sellers of stocks and enter many short positions. That time isn't right now, despite the gains we've seen this year. Governments around the world have committed nearly everything they have (or can print) to keep asset prices stable or rising. And whether or not it's the right choice in the long run, this strategy is working in the near term. This is a powerful market driver; the U.S. Federal Reserve is hoping that a rising stock market becomes a confidence-building loop that feeds the economy, too. Meanwhile, the S&P 500 trades at about 13 times estimated 2011 earnings, so it doesn't appear expensive yet.

Pro Trades You Can Make

If you're lacking some *Pro* positions and want to try to buy lower, you can consider writing put options. Below, I've listed some ideas that look attractive. (These aren't official *Pro* recommendations, but they are trades I'm confident are worth your consideration if you're lacking exposure.) Remember not to over-allocate to any one position, and realize that all of these stocks could also be bought directly today, too — instead of writing puts. Not all of these meet the guidelines for income put-writing that I created, but they are all attractive when it comes to potentially buying the stock.

- Write (sell to open) January 2011 $70 puts on **L-3 Communications**, recently $1.70.
- Write February 2011 $35 puts on **Medtronic**, recently $1.
- Write March 2011 $41 puts on **Kinetic Concepts**, recently $2.10.
- Write March 2011 $50 puts on NextEra Energy, recently $1.20.
- Write March 2011 $17.50 puts on AmTrust Financial, recently $0.85.

Foolishly,

Jeff Fischer (TMFFischer)

Jeff owns shares of AmTrust and Oracle.

Buy Wells Fargo & Company

Published Dec 10, 2010 at 12:00AM

At a Glance

First Things First

- **Company name:** Wells Fargo & Company
- **Market cap:** $156 billion
- **Website:**www.wellsfargo.com
- **Type of Holding:** Long-term, diversified financial company
- **Follow It:** Add to My Scorecard

- **Action:** Buy 2.5% of current portfolio value
- **Recent Price:** $30 per share
- **Preferred price:** $31 or lower
- **Estimated fair value:** At least $37
- **Why buy:**
  - Best-in-class management team
  - Significantly undervalued
  - The injection of Wells Fargo's sales culture into Wachovia stores offers an opportunity for meaningful growth
- **Alternate Trades**
  - Write ("sell to open") April 2011 $29 puts for $1.75 (recent bid/ask: $1.77/$1.80)
  - Write ("sell to open") April 2011 $28 puts for $1.40 (recent bid/ask: $1.41/$1.42)
  - If you really want shares, write ("sell to open") January 2011 $30 puts for $1 (recent bid/ask: $1.04/$1.07)

The Big Picture

By Nick Crow (TMFCrow)

Our little financial crisis is really growing up. It's now more than 40 months old, which means that according to child development experts, it should be able to ride a tricycle without assistance. Sadly, the Fed is still far too overprotective, continuing to provide assistance to the big banks while many small regional banks go on failing (there have been nearly 150 failures this year alone).

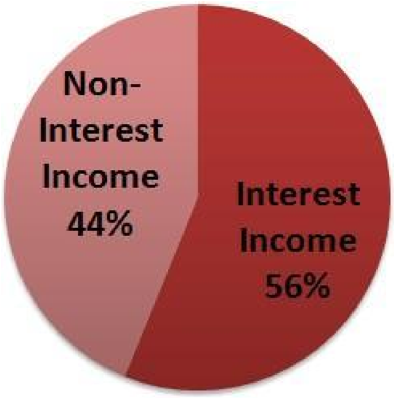
Mortgage servicers' lack of diligence is the current issue *du jour*; foreclosure reports are so bad, in fact, that all 50 state attorney generals are investigating. The potential losses to the industry have been estimated as high as $52 billion. Regulation is another hot topic; though we've yet to see sweeping changes, we do expect capital requirements to increase perhaps after a second round of regulatory bank stress tests. Banks that fail the stress tests (which determine under which extreme circumstances a bank can remain solvent) may have to raise equity capital, diluting the value of existing shares.

Concerns like these have brought the **SPDR KBW Bank ETF** (NYSEMKT: KBE), which represents 24 of the largest banks in the U.S., down 20% from its April peak; meanwhile, the S&P 500 has been essentially flat. But when an industry is mired in uncertainty, courageous investors can profit handsomely. When the banking sector as a whole is down, why not buy the best company within it? *Pro* Fools, it's time to take a renewed look at **Wells Fargo** (NYSE: WFC), a 158-year-old American institution that can still be had for a bargain price.

The Business

Banks have such a simple business model that I used to think any idiot could run one. And as the last couple of years have proven, some idiots did just that. In essence, banks make their money in two ways. First, they borrow money in the short term (for example, through deposits) and lend it long-term (for example, through mortgages); the spread between those interest rates, minus losses on the loans, is profit for the bank. (If it's obvious to you that a bank would want a cheap, stable deposit base, and that it should only lend money when it's confident it will be paid back, then you could have been a better CEO than many banks enjoyed over the past few years.)

The other way banks make money is by collecting fees for services (for example, credit card fees or service charges; this is known as non-interest income). Wells Fargo does a great job of managing both profit streams better and more consistently than its peers, and it maintains a steady balance between the two:



It also earns a much better spread than other banks. The best way to observe this is through an industry metric known as net interest margin (NIM):

Metric	Wells Fargo	Average, Peers*	Average, All Banks
Net Interest Margin	4.25%	2.93%	3.75%

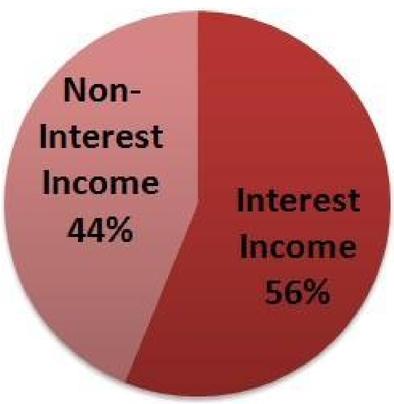
*Peers: Citigroup, Bank of America, and JPMorgan Chase. Sources: Capital IQ and Federal Reserve.

A high net interest margin isn't the source of competitive advantages, but the result of them — specifically, a lower cost of deposits and being a low-cost producer in a commodity business.

Metric	Wells Fargo	Average, Peers
Cost of Funds	0.8%	1.2%

Source: Capital IQ.

I expect Wells Fargo's NIM to continue to expand (it's typically closer to 5%) as the company's lower cost of acquisition for deposits and better lending process continue to spread to the branches it acquired in its takeover of Wachovia in 2008. The company also benefits greatly from operating in 80 different business lines — check out the diverse non-interest income stream below:



Though many of these areas are under regulatory scrutiny — most recently debit and credit card fees — this income stream is diversified enough that changes in one area will not permanently impair Wells Fargo's earning power.

Wachovia: Not a Wasteland

When you double the size of your business overnight, there's a huge opportunity for error. But if you can double your business for free, it's hard to go wrong — even if the business you acquire is in crisis. I think Wells Fargo showed some serious managerial brilliance when it paid up to snatch the struggling Wachovia out from under **Citigroup** (NYSE: C), and the market is overlooking all the benefits Wells Fargo is reaping from the move.

First, there's the savings. Wells Fargo will save an estimated $19.4 billion in taxes because of the acquisition (partially thanks to the $74 billion in writedowns on Wachovia portfolios). This savings exceeds the announced purchase price by more than $5 billion — not bad at all for a business that CEO John Stumpf expects to be a real winner. Better yet, thanks to increased efficiency resulting from the takeover, Wells Fargo has already saved a spectacular $4.25 billion annually in costs.

Much more important to shareholders are the long-term benefits of applying Wells Fargo's cross-sell culture to Wachovia. According to the American Customer Satisfaction Index, Wachovia was No. 1 in customer service among major banks for many years — by carrying over those best practices, Wells Fargo can benefit from that legacy. Given the companies' complementary strengths and the relative lack of overlap in geographical distribution, Wells Fargo should be able to tap the Wachovia sales channel to help hit its stated objective of eight products per customer. This potential source of growth is underappreciated by the market — and feared by Wells Fargo's competitors.

Financials & Valuation

Wells Fargo's excellent business results also show up in the return ratios below. Generally, we'd like to see a bank's return on assets (ROA) higher than 1% and a return on equity (ROE) approaching 15%. As you can see below, banks in general are nowhere near those numbers — but Wells Fargo is posting more attractive numbers and is quickly regaining its strength. When comparing ratios, it's important to remember that assets may vary in quality from bank to bank; for that reason, I've also included a couple of bank-specific asset quality ratios.

Metric	Wells Fargo	Average, Peers	Average, All Banks
Return on Assets (ROA)	1.1%	0.1%	0.6%
Return on Equity (ROE)	11%	1.3%	5.4%
Asset Quality Ratios:			
Allowance for Losses on Loans & Lines / Total Loans	3.1%	5.3%	3.6%
Non-Performing Loans / Total Loans	3.7%	3.1%	5.4%

Sources: Capital IQ and Federal Reserve.

Wells Fargo is also undervalued relative to its worth. The typical free cash flow model of valuation doesn't work for banks, because it's impossible to forecast a bank's capital expenditures and working capital needs. Instead, I assumed in my calculations that Wells Fargo would pay out its available free cash flow to investors as a dividend once regulators allow it to once again control its own dividend policy. Among other resources, regulators use Tier 1 capital ratios to determine how well-capitalized a bank is; I used the same projections under a few different scenarios to determine how much of a dividend management would be able to pay and when.

Under one less–than-rosy scenario, I assumed Wells Fargo would be forced to keep its dividend at the current $0.05-per-quarter level through 2012, rising to $0.10 by 2013. This increase and timing would be punitive, because the company should be able to return to a much more substantial dividend by next year. In this scenario, I gave management free rein by 2014, assuming it would raise the payout ratio to 35% that year, later peaking in 2016 at 40%. That would mean quarterly payments as high as $0.44 — much closer to historic levels and consistent with management's long-term goal of returning capital to shareholders.

At this rate, capital ratios should improve every year thanks to retained earnings, even under the more strict calculations that accompany the Basel III banking supervision proposals currently under development. By discounting these dividends at 11%, I arrive at fair value of about $37 a share. If the economy in general (and the banking sector in particular) regains its footing, this valuation will prove too conservative — which would not be a bad thing.

What Would Make Us Sell

We expect further pain for the banking industry, so such pain alone is unlikely to spur us to sell. We will continue to monitor changes in regulation and in Wells Fargo's financial position. If changes in either one seem to represent permanent changes to the economics of the business, we'll consider selling. However, we're prepared to wait out any short-term volatility — in fact, we may actually add to this position if better prices present themselves. This is a long-term holding based on a best-in-class management team and a difficult-to-replicate sales culture in an important industry.

Pro Bottom Line

Wells Fargo's top-notch management team fosters a competitive cross-sales culture with a banking network that now spans the country, thanks to the Wachovia acquisition. The market isn't giving enough value to the Wachovia half of the company; that nearsightedness, combined with the continued uncertainty surrounding the industry as a whole, affords us an attractive entry price. The coming months (and years) may be bumpy, but we expect to profit as management returns to a shareholder-friendly dividend policy. To discuss Wells Fargo & Company, hop aboard the stagecoach over to its board.

The Fool owns shares of Bank of America and JPMorgan Chase.

Accurate Investing, Reasonable Risk

Published Dec 6, 2010 at 12:00AM

We've redoubled our focus on our mission at *Pro*, as I wrote in a memo last month. In that memo, I noted high accuracy (at least 75%) and reasonable risk as two of our main goals, which led *Pro* member bwe53 to the boards to ask what exactly we mean when we talk about those two concepts.

It's an excellent question, and one I was happy to tackle in a board post. But I also felt it deserved a more public explanation. I want every *Pro* member to feel confident in our mission — not just how we achieve it, but just as important, what it means.

What We Seek

When we say we seek high accuracy, we mean we want *at least* 75% of our positions to close profitably. Peter Lynch made famous the idea that if you're right 60% of the time on Wall Street, you'll do well investing. No offense to Mr. Lynch, but we want to make money much more often than that. By the time we close our position, we want each stock or ETF to be profitable, with options and dividends included if need be.

Talk for Good

As part of our annual Foolanthropy mission, for every post you make on any Fool discussion board, we're donating $0.10 to Washington, D.C.'s Thurgood Marshall Academy. Why not head to our Social Banter board? Do it for the kids!

Upcoming Events

- **Dec. 16: Oracle** is set to announce earnings.
- **Dec. 18:** Our covered calls on **Cameco** will be exercised, selling our shares; written puts on **Broadridge** and covered calls on **NextEra Energy** will expire as income. We don't currently plan any action on these.

Coverage & Community

- Andrew (TMFRedwood) posts a strong valuation work on gold, leading to a lively discussion.
- Members discuss *Pro*'s own trading rules and how they could be tweaked to get *Pro* more timely prices.
- *Pro*'s new Social Banter board is smokin'! Topics vary from smoked food to Ed (Spinningwood) lamenting the cold in Florida. (Those of you in, say, Buffalo may or may not have sympathy.)
- Meanwhile, we hope our new 24-Hour Questions board won't be *quite* as active, though we look forward to helping you get your questions answered fast.
- Alex340 generously shares puts and covered calls that meet *Pro*'s criteria.
- Russell (TMFEldrehad) posts about catalysts in CAPS and **Netflix** .

And as for risk: What does "reasonable risk" mean to us? First, it means our eyes are not closed to market realities. We know Wall Street can get ugly fast, and we'll take our lumps at times like everyone else. But on any stock or ETF we buy, we estimate that the maximum downside risk from our start price is at most 20% to 30% — any more than that, and shares start looking stupid cheap.

So, the first part of "reasonable risk" is that we want only around 30% downside, tops, from our entry price. But we also want to avoid permanent loss of capital at all costs. Happily, as long as our thesis about an investment remains unchanged, we don't believe any losses in that investment will be permanent. In other words, even if a position does fall, we won't panic — in fact, we'll most likely think it's become such a bargain that we'd love to buy more. Then ideally all it takes is a bit of patience for our thesis to play out, and our investment should be right back to profitable.

That said, our 75% guideline exists for a reason. Even the best investors are tripped up occasionally, and we're no different; some of our investments will fall and never recover, and we'll no longer want to own them. In some cases, we may even choose to sell at a loss. Nonetheless, these three goals continue to guide our investment choices:

- Accurate absolute profits
- Reasonable downside risk
- Avoidance of permanent losses

If we're able to achieve all three, our gains will compound all the more, because avoiding losses is half the battle to investing success.

So, How Are We Doing?

After a bit more than two years and about 50 investments, *Pro* has closed six positions at a loss (12%), and they were all shorts or speculative positions (the latter of which we no longer seek):

- **U.S. Natural Gas Fund** — a futures-based ETF
- **MELA Sciences** — a speculation
- **ProShares Short SmallCap 600** — a short ETF
- **ProShares Short S&P 500** — a short ETF
- **Abercrombie & Fitch** — bear spread
- **Caterpillar** — bear spread

The market's upward swing contributed to losses in any short position we took, and given that those investments are hedges, that's not actually the worst thing in the world. Some members even say they *hope* their shorts lose money, because it means the rest of their portfolio is going up. We wouldn't go that far — we want our shorts to be accurate, too — but we understand their point. The U.S. Natural Gas Fund has been by far our largest loser, clipping $15,000 from the portfolio, or 1.5% of our starting value. Speculative MELA Sciences was our second-largest loss, costing us about $8,000.

Combined, the two took 2.3% of our starting capital. We'll never make those types of mistakes again. In fact, now we're aiming to make the natural-gas-fund losses back by shorting other futures-based vehicles, like **iPath S&P 500 VIX Short-Term Futures**. And MELA Sciences is a good example of another Peter Lynch lesson: He went 0-for-25 whenever he bought companies with great stories but no revenue. Every single one lost him money. Upstart MELA Sciences won an approval recommendation for its product from an FDA advisory panel last month, so we may be proven right about its great story — but we still lost money on the investment.

So those were our losers. What about the rest (read: the vast majority)? Looking at our core, longer-term holdings, only a handful are down, most notably the **SPDR KBW Regional Banking** ETF at 6% and **Medtronic** at 5%. We remain confident in our theses on both and believe time will cure these losses. Overall, our accuracy on open and closed positions is well above our 75% goal (in fact, it's closer to 90%). If we hadn't strayed into speculations like the U.S. Natural Gas Fund and MELA Sciences, we'd be sitting prettier, but we've learned good lessons — and that holds value for us now and in the future.

Headed to Miami

Jim Gillies (of *Motley Fool Options*) and I are headed to Miami this Saturday to present on butterfly and condor options strategies at an OptionsXpress event. Attendance is free — we look forward to meeting many of you there! Click here for more info. (And speaking of accuracy, we have a similar goal in the *Motley Fool Options* service, and over there, 87% of our selections — 35 of 40 — are profitable.)

Our New 24-Hour Board

Pro's discussion boards are active and wide-ranging, which is a feature, not a bug — but it does mean it can take time for us to find and answer some of your questions. That said, we know you sometimes have a question you'd like answered within 24 hours at most (like "Do I still make this trade?" or "How do I make this trade?").

To meet your needs on that score, we've created a new 24-hour question board where you can post any timely query that needs quick attention, and we'll make sure you get an answer (from us or other members) within 24 hours, weekends excluded. Please use the board sparingly, only when you truly need a response that day (its usefulness is diminished if we all cry wolf!). Our company-specific boards are always available as a first resort. We hope you find the 24-hour question board useful!

Foolishly,

Jeff Fischer (TMFFischer)

Jeff owns shares of Oracle and is short shares of iPath S&P 500 Short-Term Futures.

Write Naked Calls on iPath S&P 500 VIX Short-Term Futures

Published Dec 1, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") January 2011 $47 calls
- **Allocation:** 6% if turned to shares; for *Pro*, about 18 contracts
- **Recent price (bid/ask):** $4.20/$4.80
- **Alternate trades:**
  - Sell shares short directly, but do so incrementally
  - Write naked calls at higher strike prices for more breathing room

What's New

Pro first recommended selling short shares of the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) exchange-traded note (ETN) on June 16. At the time, the ETN traded at a split-adjusted $105, and the VIX index — the market's most famous measure of volatility, which the ETN aims to emulate — traded at 25.9. (The VIX index isn't measured in dollars, but as a percentage that shows the S&P 500's expected volatility over the next month, annualized — so in June, it was 25.9%.)

First Things First

- **ETN: iPath S&P 500 VIX Short-Term Futures (NYSEMKT: VXX)**
- **Website:** ipathetn.com
- **Type of holding:** Short (short naked calls)
- Add to My Scorecard

Today, the ETN trades at $46, and the VIX is at 22. In other words, the ETN has lost 56% of its value since June, while the VIX has only dropped 15%. We've argued before that this ETN tracks the VIX poorly, a thesis that has rewarded *Pro* short sellers in the past and is likely to remain true the majority of the time. In fact, the more we watch and study this ETN, the more comfortable we are investing against it.

Why This Strategy

Since the iPath ETN aims to move in tandem with the VIX index, we initially only wanted to short it when we expected the VIX to decline (when we issued our June recommendation, it was above 30). The Chicago Board Options Exchange VIX — otherwise known as the "fear gauge" — had averaged 19 since inception, with 2008 and 2009 being the only years its average for the year was higher than 30. We figured that if we effectively shorted the VIX anytime it climbed to 30 or above, we'd eventually be rewarded. According to Bloomberg, the VIX has traded above 40 a mere 3% of the time since 1990, so our upside risk going short at 30 looked reasonable, and we expected our rewards to be realized when the VIX drifted back down to its average level of around 20.

Today, the VIX is only about 22, but the iPath ETN tracks it so poorly that we're comfortable betting against the ETN even now. Why? Because the iPath ETN actually mirrors not the VIX itself but the VIX short-term futures index, which is invested 50/50 in futures contracts that expire one and two months in the future. The index rolls these contracts daily to keep a constant maturity of one month. Most of the time, futures contracts on the VIX carry a premium (rather than a discount), so rolling daily means paying up daily, along with racking up other fees. This has made for dismal price and tracking performance from the ETN compared with the VIX. Even when the VIX soars when market fear jumps (as it did last week), the ETN tends to jump only about half as much, if not less, because the futures contracts it mirrors already have some premium built in. (Take a look at how the VIX short-term futures have moved in relation to the VIX itself with this PDF.)

Barclays, the issuer of the ETN, warns investors in its documents that VXX is not usually meant to be a long-term position, but rather a short-term trading vehicle; that's due to all the factors we just cited, not to mention its 0.89% yearly fee. On Sept. 30, Barclays showed how the VIX short-term futures index that the ETN tracks has performed recently compared with both the VIX itself and the S&P 500:

Vehicle	3-Month Return	6-Month Return	1-Year Return
S&P 500 VIX Short-Term Futures Index (which the ETN tracks)	(44.65%)	(17.30%)	(64.79%)
CBOE SPX Volatility Index (VIX)	(31.38%)	34.74%	(7.46%)
S&P 500 Index	11.29%	(1.42%)	10.16%

Source: Barclays, www.ipathetn.com. Numbers as of 9/30/2010.

During the last three months measured in the table above, the S&P 500 jumped 11%, and the VIX fell 31%. The VIX short-term futures index on which the iPath ETN is modeled fell nearly 45%, or 1.5 times as much as the VIX. Over longer periods of time, that relationship gets even worse. Over the prior six months, the VIX actually increased 34% as the S&P 500 dipped, but the VIX short-term futures index *fell* 17%. And over the past year, the VIX only declined 7%, but the VIX short-term futures index fell nearly 65% (taking the ETN with it). All of this is the cost of doing business when you're paying a premium to roll futures contracts daily and the market is stabilizing.

So we know that the iPath ETN is poised to perform poorly in a stable and rising market. But as short sellers, are we at risk when implied volatility jumps and the VIX rises? Yes — but the risk seems more moderated than one might think. During the week ending Nov. 26, the VIX jumped the most in any week since May — from 18 to 22, a 23% change. The ETN, meanwhile, gained less than 3%, rising to $45.80 from $44.50 during that same period. The ETN won't always do so poorly in comparison (sometimes it will jump even more than the VIX), but this does illustrate just how badly the ETN *can* lag behind — and why we're comfortable betting on its deterioration over time.

It's helpful to know how high the VIX might leap when the market falls. According to Barclays:

If the S&P 500 Loses This Much in a Day:	Then the Average Increase in the VIX Is:
0% to 1%	1.05%
1% to 2%	6.86%
2% to 3%	10.33%
3% to 4%	14.88%
Greater than 4%	17.21%

Sources: Barclays Capital Analysis, 1/1990 – 4/2010, and Bloomberg.

Losses in the S&P 500 over many days running could lead to higher and higher volatility, putting a squeeze on our short position. As the table above shows, even a 2% drop in the S&P could add 10% to the volatility index. With just a few bad days from the S&P, we could see a very large leap in volatility — for example, in the event of a new crisis, the VIX could easily soar from its current 22 to 40 or more. In such a case, we'd need the deep pockets and patience to ride it out. We should be helped by the fact that the ETN has lately tended to gain only about half as much as the VIX (or even less) during strong jumps in volatility, and it loses much more value over stable periods measured in months. Thus, time should be on our side as short sellers. As our first table reminds us, even a 34% gain in the VIX over six months resulted in a 17% loss in the ETN. That type of scenario won't always be the case, but the facts argue that it *usually* will.

Additionally, we're being paid a premium (all in the form of time value) to write naked calls, so our effective short price is already more than 10% above the ETN's current price, providing a cushion as we get started. As time value in the calls dissipates, we can roll into new calls aggressively as VXX falls or rises, effectively staying "short" this ETN for as long as we believe that's a good position. If the ETN moves against us, we'll look to roll up our naked calls as time value diminishes, so we can keep the position going while waiting for a decline in volatility -- and for the position to move in our favor.

The world may look sketchy right now, with the two Koreas firing literal and verbal potato bombs, Ireland in a pickle, and the rest of Europe in a financial jam. But we've been seeing governments do all they can to support stability, and we don't believe they'll back down now. Plus, each shock wave to the market seems smaller than the last. When Europe's problems first surfaced in May, the VIX soared from 15 to 40 in mere days. Now, on the recent news from Ireland and Korea, the VIX has only hopped from 18 to 23. Most important, our long-term conviction level about this short is strong, and we want to capitalize on it.

How to Follow Along

You need full options and margin approval to write naked calls (i.e., calls where you don't own the underlying shares). This is effectively the same as shorting a stock, except that our profit is limited to what the calls initially pay us. If you can short shares directly at your broker, that's an attractive choice in this case, too. You will have more profit potential if you short directly, but you won't start with a time-value pricing cushion the way we will with our naked calls. In fact, we at *Pro* would short shares directly, averaging into our position over time, but our broker (Schwab) does not have shares available for shorting. Other brokers do, so if you're interested, check with yours. Meanwhile, our naked calls are a way to profit in the same direction.

If our short calls were turned to a short stock position, it would equate to 6% of the *Pro* portfolio's value (about 18 contracts). That's unlikely, however; instead, we'll look to roll the calls whenever time value is low. We want to stay on top of the position.

Trade Details

- **Action:** Write (sell to open) January 2011 $47 calls (one for every 100 shares you'd short)
  - For Pro, about 18 contracts
  - Each written call represents a $4,700 short of the ETN
- **Preferred limit price:** $4 or higher
- **Break-even price:** $51
- **Current price:** $46
- **Return on investment:** 8.7% if the calls expire, earned in 52 days

Make this trade carefully; you need to be fully aware of the risks of shorting anything, especially an ETN that attempts to track futures on a volatility index. This is a high-conviction position when time is on our side, but we may experience big price movements in the interim, and we'll need to use our equity if that's the case. Finally, although it's unlikely, if volatility is expected to fall in the future, this ETN may be able to roll its futures contracts for a *profit* each day, meaning it will trade higher even when the market isn't falling. We'll watch futures prices for any signs of this. Please ask any questions on the VXX board.

Jeff Fischer is short shares of VXX.

What Would Ben Graham Think of Pro?

Published Nov 29, 2010 at 12:00AM

Here at the Fool, we're dedicated to helping everyday investors achieve wealth. At the core of what we do is the belief that you — not a fund manager who follows the crowd, not a financial advisor whose fees are the same whether she makes you money or loses it — are in charge of your financial destiny. By making investing accessible, comprehensible, and hopefully even fun, we want to help you ensure that destiny is a prosperous one.

Do Some Good

Foolanthropy 2010 begins today! For every post you make on any Fool discussion board, we'll donate $0.10 to Washington, D.C.'s Thurgood Marshall Academy. Why not head to our Social Banter board to chat for a good cause?

Important Goings-On

- It's not too late to see Jeff (TMFFischer) in Miami! Click here to register for the free optionsXpress seminar on Saturday, Dec. 11.
- Todd's (TMFPhila) new UK service, *Dividend Edge*, is officially open! Check it out by visiting the Fool UK website.
- If you still haven't checked out the Fool's *Stocks 2011*, you can find it here— it's free for *Pro* members.
- *Pro* values its communications with you. Jeff discusses what that means.

Coverage & Community

- Jeff explains what's meant by "reasonable risk" and 75% accuracy.
- Fools discuss *Pro*'s newest recommendation (code name DoGS).
- Andrew's column on the Fed incites a long and Foolish discussion.
- SilverHawk27 inquires about the **Broadridge Financial Solutions** annual shareholder meeting.
- **Medtronic**'s earnings get a nod from Jeff, even though challenges to the company are rampant.
- We continue to examine recent earnings from *Pro* companies, and are still fine with what we see.
- TMFEldrehad revisits how to find top-scoring CAPShot stocks using the CAPS Stock Screener.

Given all that, I can't help but wonder what Ben Graham would think of the Fool, and of *Motley Fool Pro* in particular. Known as "the father of value investing," Graham is the author of *The Intelligent Investor*, dubbed "the best book about investing ever written" by Warren Buffett. The genius of *The Intelligent Investor* is in its accessibility; Graham's goal was to make investing comprehensible to the readers of his time (sound familiar?). In the book, he advocated thinking like a business owner and preached that investors shouldn't be concerned with short-term movements in stock prices.

In fact, he noted that he wished every day to do something foolish, something creative, and something generous. So it seems safe to say that Graham was a very Foolish man indeed. But what would he think of *Pro*?

Do It Yourself

To put it politely, Graham was skeptical of Wall Street. He noted that advisors, bankers, brokers, and investment counselors are all willing to take your money in exchange for investment advice, but he warned that investors who choose that route "should not expect better than average results." His cautionary tale on this topic actually takes up an entire chapter in *The Intelligent Investor*. Ever the teacher, Graham advised being a bit more enterprising; he suggested working "in active cooperation" with your chosen advisor. If that isn't an endorsement of the *Pro* community — investing alongside other like-minded investors and engaging in spirited conversation on the discussion boards— I don't know what is.

Po-tay-to, Po-tah-to

Graham constantly extolled the difference between a speculation and an investment. An investment, of course, is based on thorough analysis, and it provides safety of principal and therefore a satisfactory return. In essence, this concept is called "margin of safety," and Graham demanded it of his investments. At *Pro*, we're in total agreement. Our search for bargain-priced businesses with recurring revenue streams and advantageous competitive positions is our way of ensuring safety of principal and a margin of safety. Our suggested buy prices and Buy First/Buy/Hold classifications are simply more tangible gauges of this concept.

Go Exotic

The Graham-Newman Corporation, Graham's investing vehicle, was not afraid to use exotic strategies. Aside from investing in the "cigar butts" he is so well known for (companies discarded by the market at large but that still contain some value), Graham was willing to buy companies in liquidation, engage in merger arbitrage, go long-short, or even take an active role in demanding change at the companies he owned. While *Pro* hasn't yet used these techniques, we have embraced numerous options and shorting strategies. In both cases, the goal is to identify a situation in which the risk we take on with our investment is outweighed by an adequate reward. I think our focus on maintaining the value of principal through the Foolish use of options and shorting would have gotten a nod of approval from Graham.

Where We Differ

Graham did not have much confidence in his ability to forecast. As a result, his analysis focused on balance sheets rather than income statements. He preferred to buy assets for less than they were worth — what he called "bargain issues." In a perfect world, Graham would have wanted to purchase a hundred or so companies trading at two-thirds of their net current assets (defined as current assets less total liabilities) or less. *Pro*, on the other hand, has no such issues in its portfolio; the ever-increasing availability of information since Graham's time has made these companies difficult to find. And while we're no more confident in our ability to forecast than Graham was, we are much more reliant on the use of "guesstimates" of future cash flows to assess what we think a business is worth.

Toward the end of his investing career, Graham turned sour on in-depth fundamental analysis. In 1976, he proclaimed, "In the old days any well-trained security analyst could do a good professional job of selecting undervalued issues through detailed studies; but in the light of the enormous amount of research now being carried on, I doubt whether in most cases such extensive efforts will generate sufficiently superior selections to justify their cost." Here at *Pro*, we respectfully disagree; we think bargains can still be found with a bit of legwork and elbow grease. It's definitely tough to do, though, which is one reason *Pro* prudently uses options to tilt odds in our favor.

Value, in Graham's eyes, was mathematical fact. Stocks were either statistically cheap relative to their assets, or they weren't — in which case, he wasn't willing to pay up. Graham disciple Warren Buffett once held to this belief, too; it was Charlie Munger who convinced Buffett to change his mind by pointing out that a business franchise can have quite a bit of value. We're with Munger (and now Buffett) on this one: We look for great businesses first, then use patience and options to get a better price. And we're willing to pay up from time to time — our former position in **Expeditors International of Washington** and current holding in **Autodesk** are prime examples.

Value Investing the *Pro* Way

Pro is far from a traditional Graham-centric value investing service — and that's OK. *Pro*'s mission of achieving high accuracy, finding superior businesses, and using options to tweak our risks and returns doesn't read like an excerpt from *The Intelligent Investor*. But our focus on developing our investment community, ensuring a margin of safety, and maintaining principal is right out of the Graham gospel. Given his willingness to adjust his thinking to reflect current realities (a trait that can be seen in each subsequent publication of his treatise *Security Analysis*), I think Ben Graham would be open to *Pro*'s way of investing.

Do you think the Father of Value Investing would enjoy *Pro*? Let us know on the Memo Musings board.

Andrew Is Fed Up With the Fed

Published Nov 22, 2010 at 12:00AM

Join Jeff and Jim in Miami!

optionsXpress has invited our very own Jeff Fischer and *Motley Fool Options* Associate Advisor Jim Gillies to present at its seminar in Miami on Saturday, Dec. 11, and you're invited! Jeff and Jim will present on iron condors and butterfly spreads — both strategies let you sell premium for income while capping your risk, and can even be done in your IRA. If you'd like to attend, click here to register today. Admission is free!

By Andrew Sullivan, CFA (TMFRedwood)

I've had it with the Federal Reserve. In fact, you could say I'm fed up with the Fed. It doesn't understand how the economy works. As our central banking system, it should be forward-thinking, a model for other nations — but instead, it's stuck in the past, man!

In my first memo, I'm going to show you why I think the Fed's economic models — and its entire way of thinking — are out of date, and I'll introduce you to the exciting new economic concepts taking their place. By the end, I hope to convince you that the Fed is playing the wrong game — and that its actions are therefore ineffectual and maybe even deleterious to the economy.

Economics According to the Fed

The Federal Reserve follows neoclassical economics. In a nutshell, neoclassical economics is the mainstream thinking you read in textbooks — that individual actors pursue profit and happiness in a marketplace, resulting in equilibrium between supply and demand. According to this theory, fluctuations and disturbances to the equilibrium are due to external shocks (for example, the oil embargo of 1973).

NYC Tweetup!

Meet Tom Gardner at an investor Q&A **Wednesday, Dec. 1,** at 6 p.m. at the ING Direct Cafe on 58th and 3rd. Warm up with snacks and giveaways, and bring your questions! For more information and to RSVP, click here, and if you can't make it, follow the event on Twitter @themotleyfool.

Guidance Changes

- **SPDR KBW Regional Banking ETF** and **Broadridge Financial Services** move down to Buy to tighten the focus of our Buy First list, and pending a possible portfolio addition in the financial sector.
- **Quanta Services** moves down to Hold pending our full review of recent results.

Upcoming Event

- Tuesday: **Medtronic** releases earnings.

Coverage & Community

- Bryan serves up his take on **AmTrust Financial**'s solid quarter.
- Andrew shows why rumors of the defense budget's demise are overstated.
- Bryan shares some of what drives his investment thinking.
- spinningwood responds to Nick's take on the economy.
- Alex340 shares puts and calls that match Pro criteria.

Neoclassical economics is the culmination of two centuries of work on reducing the big, messy, interconnected world of economics into a rational, mathematical science in order to make the economy seem explainable and predictable. Of course, in the real world, the economy is incredibly complicated, so to fit it neatly into models, economists had to take shortcuts. For example, neoclassical economics assumes: a closed, static, and linear system; the absence of transaction costs; rational behavior on the part of all participants; and that excess profits are arbitraged away. Without these simplifications, it would be almost impossible to model the economy — at least, so says the Federal Reserve, which pays an army of 17,000 people $1.5 billion a year to crunch and analyze numbers with this model in mind.

The problem, however, is that many of those assumptions are plain wrong, resulting in a model with unstable foundations. It's as if economists spent scores of years constructing a beautiful mansion only to find out they'd been building on quicksand. The reality is that neoclassical economics (whether Keynesian or supply-side) doesn't explain actual economic activity very well at all.

How the Economy Really Works

The economy is very different than what textbooks and famous economists tell us. It isn't a system in which supply and demand settle neatly at equilibrium — in fact, this fundamental tenet of neoclassical economics is almost entirely wrong. Equilibrium means a state of balance between opposing forces, yet markets are almost always in disequilibrium because supply and demand are constantly changing and there's an inevitable time lag as these changes are communicated to the marketplace.

The economy is more like an ecosystem than the static, closed system that traditional economics suggests. It is both complex and open, meaning that energy flows into and out of it, and this (and evolutionary dynamics) produces change. Contrary to established thought, there is really no useful distinction between micro- and macroeconomics: Macro behavior emerges out of, and is thus directly connected to, the interactions of all the units in the system. Individual agents learn, adapt, and change their behavior over time through interactions with other agents and the environment, rather than through the faceless auction mechanism neoclassicists assume.

This means that large fluctuations, change, and unpredictable behavior arise *from within the system*, not just from external shocks. Experiments like the beer distribution game have shown that rational behavior at the individual level does not, in fact, lead to equilibrium in the system as a whole — instead, it produces large, macro-level fluctuations. This is completely at odds with traditional economic theory.

So we have a system that is nonlinear, open, evolving, in flux, and with endemic change based on the actions of individual members. Contrast this with the linear, closed, static, and equilibrium-based view of traditional economics. Perhaps the most important implication is that business cycles are an intrinsic part of economic growth *driven by the dynamics above* — and, therefore, policy measures designed to increase growth and employment *based on traditional, neoclassical thought* might not be correct or adequate. Plus, they may be applied at the wrong times.

Implications

It seems apparent that the models the Federal Reserve uses don't adequately explain how the economy really works. So if the Fed is taking actions based on those models, how can they be the right ones? I'm convinced the Fed is playing a game of checkers in a world with knights, pawns, rooks, and bishops. So long as it adheres to outdated, inaccurate theories, I expect its actions to produce little, if any, positive benefit for the economy — unless it happens to get lucky.

We need a better solution. What would that look like? Well, a case can be made for jettisoning the Federal Reserve and returning to sound money (backed by gold or silver). But outside of monetary policy, the clear solution is to invest in ourselves by supporting growth and innovation. We should spread best practices in education, increase science and technology spending, unchain the patent office, reduce regulation for small businesses and entrepreneurs, simplify the tax code, and increase communications spending. America needs to be the world leader in nanotechnology, robotics, genetics, social media, and other exciting growth areas. Money should be spent laying the foundations for growth, not propping up a system that is practically begging to be cleared out.

You and I are two of the individual agents making up this economic ecosystem, and (if you believe what I've told you!) great, sweeping changes will arise from *us*, not from outside stimulus. So bring your thoughts to the Memo Musings board, and let's talk (economic) revolution!

Buy DGS

Published Nov 22, 2010 at 12:00AM

At a Glance

- **Action:** Buy 3%
- **Recent price**: $52
- **Preferred price:** Below $55 (and as close to NAV as possible)
- **Why Buy:**
    - Small companies in emerging markets provide strong long-term growth opportunities.
    - Allows diversification into growing foreign companies that are otherwise difficult to access.
    - The ETF's 3.5% dividend reflects stability among its leading small-cap holdings.

The Big Picture

First Things First

- **ETF: WisdomTree Emerging Markets SmallCap Dividend Fund** (NYSEMKT: DGS)
- **Total assets:** $743 million
- **Website:** WisdomTree
- **Type of holding:** International, small-cap, yield, core
- Add to My Scorecard

By Jeff Fischer

According to Ibbotson Associates, companies with small market values outperformed large companies by an average of 2.1% per year from 1926 to 2008, and by an even greater amount in recent decades — 3.6% annually from 1973 to 2008. Additionally, companies that pay dividends outperform those that don't, and Standard & Poor's reports that dividends accounted for 44% of the S&P 500's return over the past 80 years. Finally, in the past 10 years measured to Dec. 31, 2009, the MSCI Emerging Markets index returned 10.2% annualized, while the MSCI USA Index dropped 1.2% per year. Past results can't guarantee future performance, it's true — but for eight decades, small has outperformed large and dividend payers have topped the alternative, and for many years, emerging markets have outdone developed ones. By buying shares in the **WisdomTree Emerging Markets SmallCap Dividend** (NYSEMKT: DGS) ETF, we seek to capitalize on all three factors.

The Fund

With the ability to invest in 19 emerging economies, this ETF holds 486 stocks, each weighted by size based on the yield of the regular cash dividends it pays. To qualify for the fund, a company must have paid at least $5 million in cash dividends on the common stock in the past year, and the top payers get the highest weighting. That said, only two positions represent more than 2% of the fund, and the vast majority are less than 1%; this diversifies our risk, but ideally it won't mean sacrificing long-term performance. The fund's dividend yield currently tops 3.5%, with payouts that are taxed as ordinary income, and the expense ratio is a reasonable 0.63% a year. Resizing or adjusting holdings based on yield led to turnover of 38% in the past year (in other words, nearly four out of 10 positions were sold or bought), which is a bit high, but not unacceptable.

The fund seeks to mirror the WisdomTree passive index of the same (long) name, which draws its positions from the smallest 10% of companies in the WisdomTree Emerging Markets Index. The average company size in the small-cap index is about $1.3 billion. For comparison, that makes each company about 93% smaller than the average $17.9 billion company held in the **Vanguard Emerging Markets** (NYSEMKT: VWO) ETF, which *Pro* also owns. These two international ETFs (one large-cap and one small) are attractive individually and when held together. Further, the WisdomTree Emerging Markets SmallCap Dividend ETF is invested primarily in smaller economies rather than hotly followed giants like China and Brazil. We like that its focus is mostly off the beaten path.

Fund by Country	Allocation	Fund by Sector	Allocation
Taiwan	19.19%	Industrials	23.43%
South Africa	11.04%	Financials	18.99%
Korea	10.54%	Consumer Discretionary	17.60%
Thailand	9.80%	Information Technology	10.91%
Turkey	9.04%	Materials	9.07%
Israel	8.29%	Consumer Staples	6.96%
Brazil	7.78%	Utilities	6.42%
Hong Kong (China)	5.95%	Health Care	2.87%
Malaysia	4.59%	Energy	2.21%
Chile	4.23%	Other	1.54%

Source: WisdomTree, 11/17/10.

The number of middle-income families in the countries named above is growing, and these nations are becoming more urbanized. Thus, it's reassuring that nearly 25% of the ETF is invested in consumer discretionary and consumer staples, and nearly a third is in industrials and materials — key sectors for budding economies. The heavy weighting in financials is also reassuring (no, we're not joking; local finance is driving much of the regional growth). Other countries represented include Indonesia, India, Argentina, Czech Republic, Hungary, Philippines, South Korea, Mexico, and Poland.

Many of the top countries represented in this ETF lack the eye-popping growth in gross domestic product that you see from the likes of China and India, but this doesn't worry us, because Vanguard studies have shown that GDP growth is actually not tied closely to stock performance. In fact, high GDP growth can invite speculation, and that often burns investors in the form of high stock prices. By sticking to companies with strong yields, we hope this ETF will avoid many high-flying economies and their low-yielding stocks, but still appreciate thanks to value, yield, and reasonable growth. Let's look at its top holdings.

Top ETF Holdings (click for website)	Country	Industry	Allocation
Discount Investment Corp	Israel	Holding company	2.44%
Ford Otomotiv Sanayi AS	Turkey	Automobiles	2.29%
CorpBanca SA	Chile	Financials	1.52%
AES Tiete SA	Brazil	Utilities/energy	1.30%
Dogan Sirketler Grubu	Turkey	Holding company	1.21%
WisdomTree India Earnings Fund	India	Diversified India ETF	1.19%
U-Ming Marine Transport	Taiwan	Marine cargo transport	0.97%
Foschini Ltd	South Africa	Retail and consumer finance	0.89%
Oil Refineries Ltd	Israel	Yeah, oil refineries	0.75%

Hanwha Chem Corp	South Korea Petrochemicals	0.75%

Source: WisdomTree, 11/17/2010.

Beyond the top 10 holdings, the ETF owns 476 more companies spread over its 19 countries, offering us as good a glimpse into the world of small business as we are likely to get. These aren't fly by-night operations but rather solid companies averaging a bit more than $1 billion in market value, typically growing handsomely in developing economies and paying healthy dividends.

Valuation

We didn't spend two years running all 486 companies through discounted cash flow models in local currencies, but WisdomTree tracks the average valuation of the companies comprising the ETF's underlying index. As of Sept. 30, 2010 (the last date available), the index traded at an average price-to-earnings ratio of 12.69, suggesting reasonable downside risk and plenty of long-term potential. Accounting for recent appreciation, the current price puts the index at about 13 times earnings, 1.7 times book value, 9 times cash flow, and less than 1 times sales.

Prices for these small caps appear reasonable in aggregate, with our ETF fair-value estimate closer to $60 per share. Consider that the average company in the Vanguard Emerging Markets ETF trades at 16 times earnings and 2 times book value, and the small caps we're buying here look attractively priced, with the valuation taking into account the extra risk and added potential of small companies. We don't want to brush over valuation, but we're investing in this diverse ETF based on the long-term macro thesis that emerging-market small caps will reward investors over many years, and dividends only add to the attraction.

What Would Make Us Sell

If this ETF underperforms other emerging-market indexes for a long period (perhaps due to high turnover), its fees increase unreasonably, or the valuation starts to look aggressive, we will consider selling. We'll also monitor the financial strength of WisdomTree itself. We're not likely to sell just because emerging markets happen to decline for a period. We're ready to wait out the volatility that we all know emerging markets and small caps can throw at us. This is a long-term holding based on a broad macro argument.

Pro Bottom Line

Combine reasonably priced healthy small caps, emerging markets, and a decent dividend yield. Now add time. We should have a recipe for long-term rewards. To discuss the Emerging Markets SmallCap Dividend ETF, jet on over to its board. (By the way, we'll shower accolades on the Fool who can best shorten the ETF's name down to something palatable.)

Reigniting Our Mission

Published Nov 15, 2010 at 12:00AM

Join Jeff and Jim in Miami!

optionsXpress has invited our very own Jeff Fischer and *Motley Fool Options* Associate Advisor Jim Gillies to present at its seminar in Miami on Saturday, Dec. 11, and you're invited! Jeff and Jim will present on iron condors and butterfly spreads — both strategies let you sell premium for income while capping your risk, and can even be done in your IRA. If you'd like to attend, click here to register today. Admission is free!

As *Pro* begins its third year, members are renewing their subscriptions in record numbers and reporting widespread satisfaction with the service. We're immensely grateful for that — we're here for your benefit, after all — and we're dedicated to maintaining your confidence in us. Currently, that means buying more of our Buy First stocks and making certain our portfolio only holds high-conviction ideas in allocations large enough to really count.

Looking Toward Our Junior Year

Year to date as of Friday, the *Pro* portfolio is a bit ahead of the S&P 500's 7.5% gain. Although short-term results usually mean little to us (we don't pay great heed to the index, either, except over many years), I'm still glad for this small victory. Why? Because this has been my least favorite investing year since 2004. While most positions performed well in the *Pro* portfolio in the past year, I nonetheless made more mistakes and spent more time on problem positions over that time than in several previous years combined.

Important Dates This Week

- Tuesday: FDA releases briefing on **MELA Sciences**' clinical trial.
- Thursday: FDA advisory panel issues recommendation for MELA Sciences' product. **Autodesk** reports earnings.
- Saturday: November 2010 puts written on **Caterpillar** and **Plum Creek Timber** expire. We're taking no action on these.

Coverage & Community

- Alex340 shares puts that match *Pro* criteria and covered calls to consider.
- Thinking about buying a straddle on a stock that may rocket or tank? Share that monkey on your back on our new Speculative Trades board.
- Traveling soon and have questions? Want to meet *Pro* Fools near you? Read a great book? Post on our new Social Banter board to get the discussion going.
- TMFEldrehad discusses CAPS and *The Cat in the Hat*.

I'll pin these disappointments on a sophomore slump; while we learned a great deal (and made some money) during our second year, I'm happy to be starting year three. Year one was filled with excitement as we launched this ship in search of a successful maiden voyage; year two was partly about finding our service's boundaries by pushing them a bit. We did that with some novel positions that have created our only meaningful losses to date. We're still dealing with some of those, but their flaming remnants light our way to a more certain path. We know our boundaries without question now, and our mission for you is lit brightly:

With at least 75% accuracy, earn members consistent, recurring profits alongside strong, long-term capital appreciation using a combination of stocks, ETFs, options, and shorts in a strategic portfolio of reasonable risk.

As always, we'll use options and shorts to achieve near-term gains in weaker markets, while stocks and ETFs will create long-term value; by combining the two, we strive for strong annualized returns over our lifetime.

Our Renewed Focus

I don't like making mistakes. I don't like having to explain losing investments. I don't like permanent losses — and I've always been better at addition than subtraction. In running a service this large, with this many successful members, I don't think we're best served by spending time on speculations, tiny allocations, and investments that don't move the needle. I also don't want to own or follow anything other than exceptionally high-conviction ideas, and we aim to find investments so strong you'll almost never want to sell them.

So what does all this mean for you? Year three is about making sure we're focused where we want to be, and that every position counts. The more focused we are, the more nimble we are, because we know our positions more intimately. Finally, all of this makes us even more likely to create value over time.

How We'll Win

Our ideal number of portfolio positions hasn't changed, but we've tweaked some other numbers. We seek to own stocks and ETFs in the numbers shown below, as well as shorts and options as a varying percentage of the portfolio:

Investment	Hold at Least	Hold at Most	Current Holdings
Stocks	15	25	21
ETF Positions	5	10	4
Total Core Holdings (Stocks & ETFs)	**20**	**35**	**25**
Options (Port %)*	0%	Undefined, but likely 10% to 20% on average	About 10% (today, it's our long calls and short put obligations)
Shorts (Port %)	0%	50%	About 2% (currently, all short calls)

* It's not necessary to use options to employ our strategy, but we will often recommend their use in varying degrees. Measuring the percentage of the portfolio that an option represents depends on whether we plan to convert that option to shares or not, so it's not cut-and-dried; percentages may vary greatly.

Our core holdings should each make up around 3% to 5% of the portfolio (measured by capital invested, not current value), a large enough percentage to ensure each one is meaningful. Some of our very highest-conviction ideas may get as much as 10% of our capital. With some strategies, such as option strangles, we may only own 2.5% of an actual stock, but our use of options could potentially double that position. Our shorts and options will vary in size depending on what opportunities we see in the market. In every case, though, it's most important that *each position should count*. That means we should only own as many stocks as we can know and follow extremely well, and our conviction in each position should be rock-solid — if it isn't, we should cut or replace it.

My Scorecard Contest Winners!

Anita Carty of Portsmouth, Va., won an array of Fool goodies; **Mike Guiremand** of Thousand Oaks, Calif., won a year's subscription to a Foolish publication; and a Fool with the username of **SMK1**, hailing from Westerly, R.I., won a year's subscription to a Foolish publication, plus one to give away to a friend or family member. Relive the *Pro* My Scorecard contest here!

Meanwhile, stock-based ETFs are a great way to further diversify the portfolio, making macro-based investments in regions, assets, or sectors that we don't want to (or can't) address with individual stocks. Overall, we're aiming for a portfolio that's well-diversified without losing any focus.

The above has always been *Pro*'s approach to investing, but as we go into our third year, we want to recommit to it — and to firmly set our boundaries against deviations from it, such as outright speculations or tiny positions. We want to be highly accurate with our investments, make each position count, and rarely close anything at a loss. This means making very careful buy decisions.

This is *Pro*. We know why we're here, and we want our results to count for you.

Earnings and New Boards

We've seen several earnings reports recently. If we ever find information suggesting that the thesis behind any position is in danger, we'll let you know immediately. Barring that, though, we need time to examine each report and SEC filing thoroughly to bring you the best analysis we can. We'll update each holding as soon as possible.

In the meantime, to keep expanding the excellent *Pro* community, we've added two new discussion boards. The first is called "Speculative Trades." *Pro* is investing for accurate profits, not speculating — but if you do get that speculative itch every once in a while, you can share your ideas here with fellow members. The second board, "Social Banter," is our new social board. Share your favorite pizza joint in your area (really, please do!); list books you've enjoyed; ask questions before you travel to a new city. Discuss anything *except* investing or politics.

We hope *Pro* is one of your favorite homes for investing ideas, commentary, and advice — and that these boards make that home even warmer for the coming winter.

To comment on the Memo, visit the Memo Musings board. Forward we go. Fool on!

—Jeff Fischer (TMFFischer)

Sell MELA Sciences Stock; Buy Calls

Published Nov 11, 2010 at 12:00AM

At a Glance

- **Actions:**
  - **Sell all shares** with a limit order near current market prices
  - **Buy to open** one January 2011 $7.50 call for every 100 shares previously owned (or now desired); again, use a limit order near market prices

- **Allocation:** Lowered from 0.5% to 0.15% (but the calls allow us to keep the upside potential of a larger position)
- **Nov. 10, 2010, Prices:**
  - Stock: $7.00
  - Options: $1.50
- **Why Sell Stock and Buy Calls?**
  - The FDA advisory panel is set to release briefing documents on the company's only potential product, MelaFind, on Nov. 16, and the risk of product denial or delay appears greater than it did a year ago.
  - This strategy allows us to greatly reduce our capital at risk while still keeping most of the upside potential.
- **Alternate Trades**
  - **Don't want to own calls?** You can continue to own the stock if you wish, but realize that it's a speculation; downside risk is both immediate and extremely high. *Only speculate with money you can afford to lose.*
  - **Don't have a position in MELA Sciences**, perhaps because it's been on Hold in the *Pro* port? Buy calls with us now if you want to speculate on the product's outcome. *Again, only speculate with money you can afford to lose.*
  - **Already own calls, a strangle, or a straddle?** If you're comfortable with your existing position and your capital at risk, you can keep it.
  - **Want to buy puts for defense?** We'd advise you to think again; the puts are so expensive that it deters us from buying them. These cheap calls are our best way of limiting risk.

What's New?

In October 2009, *Pro* made our first speculative investment, buying $5 call options on **MELA Sciences** (NASDAQ: MELA) in anticipation of an imminent FDA decision on the company's only potential product, skin-cancer detector MelaFind. The FDA panel was subsequently delayed, our call options were exercised into stock in April, and we've been waiting for a new FDA action ever since. Now, the big day is finally near: The FDA is set to release its briefing documents on MelaFind's clinical trials on Nov. 16 (this Tuesday), and an FDA advisory panel is scheduled to provide a product recommendation to the FDA on Nov. 18.

Basically, MELA Sciences' fate is now in the hands of a small group of professionals who will either suggest FDA approval for MelaFind or recommend denying it. A denial would likely send the stock into the dustbin for years, while a recommendation to approve the product could at least double the stock price. Either way, while the FDA probably won't issue its final say for a few months, the stock should react immediately to the panel recommendation; the FDA rarely deviates from a panel's advice.

Which outcome is most likely? Last year, the odds seemed to favor product approval due to strong trial data and convincing benefits from this non-invasive device (as noted in our original report below). MelaFind screens for the most dangerous type of skin cancer, known as melanoma; the condition is curable when found early but deadly when it's not, so the need for a product like MelaFind is so strong that the FDA granted it an expedited review.

Today, though, even though the recent abstract of the MelaFind study shows promise, it also raises more questions than we would have expected from an airtight trial. The final data actually suggest to us that the FDA may delay approval and request further studies, which would imply years more work before another shot at approval. Thus, we'll say it yet again: *Only speculate on MELA Sciences with money you can absolutely afford to lose*. The only reason we're continuing to speculate at all is because we can do so with extremely limited downside while still capturing most of the upside.

To provide more context, let's review what has transpired with MELA Sciences this year.

- **The Good:**
  - After receiving a non-approvable letter from the FDA in March, MELA Sciences immediately began working with the agency to arrange a panel hearing at which it answered questions outlined in the letter. Together, the two further defined how MelaFind should be used, and this increased specificity may increase its odds of approval.
  - MelaFind detected 98% of all melanomas in the phase III trial (on more than 1,800 lesions), making it far more accurate than the typical dermatologist. As a complementary tool for dermatologists, MelaFind makes sense.
  - The FDA recognizes the need for a tool to help doctors with this deadly disease. MelaFind appears safe as a backup tool along with traditional procedures.
  - Company insiders have continued to buy shares this year. It's doubtful they'd invest even small sums in the stock unless they had confidence in the outcome.
- **The Questionable:**
  - Management has not been forthright in answering detailed questions about the statistics used in the trials, nor has the company disclosed the questions the FDA originally asked in its non-approvable letter in March. This is highly unsatisfactory and would normally make us run; as it is, we're *almost* running by significantly decreasing our capital.
  - The trial appeared to be less than perfect, with 8.8% of lesions in the sample having to be thrown out because of device problems; the use of MelaFind did not meaningfully lower the number of biopsies needed; and there's no hard data on MelaFind's relative sensitivity, because any melanomas missed by doctors (but found by MelaFind) were not recorded. The trial largely relies on other, earlier studies to suggest that MelaFind works better than doctors.
  - Mela Sciences admits that the general population is materially different from the subjects of the study. The study only included lesions tagged by doctors as possibly being melanoma. MelaFind's task was to identify which were cancer. It did so with 98% accuracy, but the FDA may argue that more studies on other population groups are needed. (Countering this potential risk, the company suggests MelaFind should be used in cases where cancer is suspected, like those in the trial, to confirm or deny it.)
  - The company sold 2.2 million new shares in July at $7.50 each. Management may have been hedging its bets by raising more money before the FDA panel's decision. If management were confident that approval was imminent, it might have waited for a higher share price before diluting the stock.
  - Finally, the way management has talked around some trial questions suggests the company may have been somewhat sloppy (statistically speaking) in some aspects of the trial. Again, it's not as "airtight" a trial as we'd like; it infers a lot, and we prefer to see proof.

Weigh the good against the questionable, and it's truly anyone's guess whether MelaFind will be approved. In the year since our original recommendation, the questions surrounding the product have increased considerably. So, to stay invested but greatly decrease our risk, we're going to sell our 1,000 shares of stock for proceeds of around $7,000 and invest just $1,500 or so in 10 call options instead. By doing so, we'll take our exposure down from 0.5% of the Pro portfolio to less than 0.15%. This is simply risk management, which is exactly the right way to use options sometimes. If MelaFind fails, this investment will barely nick our portfolio. If it succeeds, we'll be happy owners.

Why This Strategy

With a binary situation like an FDA product approval, the outcome is either ticker-tape parades and champagne bottles or gloomy, empty defeat; there's no in-between. Thus, it makes little sense to risk a meaningful amount of capital in such a situation when you can risk 20% of that amount and still maintain most of the upside. This is why we originally bought call options on MELA Sciences rather than stock, and it's why we want to be in that position again as the big day approaches.

To illustrate the reasons we've chosen this strategy, let's consider the advantages and trade-offs. The following table compares your gain or loss at various share prices if you own 10 January 2011 $7.50 call options at a cost of $1.50 each, versus owning 1,000 shares of the stock at a recent value of $7 each.

MELA Sciences' Potential Share Price	Gain (Loss) on 10 $7.50 Calls Bought for $1.50	Gain (Loss) on 1,000 Shares From Recent $7 Price
$0	($1,500)	($7,000)

MELA Sciences' Potential Share Price	Gain (Loss) on 10 $7.50 Calls Bought for $1.50	Gain (Loss) on 1,000 Shares From Recent $7 Price
$2	($1,500)	($5,000)
$4	($1,500)	($3,000)
$6	($1,500)	($1,000)
$8	($1,000)	$1,000
$10	$1,000	$3,000
$12	$3,000	$5,000
$14	$5,000	$7,000
$16	$7,000	$9,000
$18	$9,000	$11,000
$20	$11,000	$13,000

Obviously, no matter how bad it gets, the most we can lose on our 10 call options is the $1,500 it cost to buy them. That's much easier to absorb than a potential $7,000 loss, which is what we'd face if we owned the equivalent amount of stock and it subsequently went to $0. And the higher the stock goes, the more gains we capture with our call options anyway. At $20 per share, the call options capture four-fifths of the upside of the stock while only risking one-fifth the capital. We like those numbers. If MelaFind is approved, we expect the stock to head at least into the mid-teens, and we'll compound our small investment several times. If it's denied, the stock's likely headed to about $2 and we'll walk away empty-handed — but relatively unscathed.

How to Follow Along

- **Sell your stock.** Use a limit order near current market prices; we don't want *Pro* members pushing the share price down.
- **Buy to open January 2011 $7.50 call options.** Use a limit order near current market prices (lately, $1.50 per contract, or $150 each). Buy one contract for every 100 shares of MELA Sciences you previously owned or currently want exposure to.

Any transactions you make should be done before Tuesday, Nov. 16. When the FDA releases its trial debriefing that day, it will likely provide big clues about what the panel is going to decide on Nov. 18, and the stock will almost certainly react. On the 18th, the stock will probably be halted from trading until the final recommendation is issued. We expect to lose the full value of our calls with any outcome other than approval, so one more time: *Only speculate here with money you can afford to lose*.

Pro Bottom Line

Given *Pro*'s stated goals of steady returns with high accuracy and lower risk, MELA Sciences, which we brought on board early in the game, may be the last of its kind in our portfolio. It never seemed to quite fit in, so others like it aren't likely to follow. Therefore, enjoy the thrill of a pure speculation while we have it! Furthermore, the amount of time the team spent reading and thinking about this position was entirely too much for a 0.5% holding. This illustrates another problem with speculations: Your mind is always trying to find an edge, to figure out what's inside the "black box" of the speculation, and that energy usually ends up being wasted. We can spend our energy much more effectively and profitably on companies we know will increase cash flow over time.

We wish MELA Sciences great luck next week; its product could save lives. If MelaFind is approved, we'll be thrilled for patients. If it's denied, we'll be disappointed — but again, for patients more than for ourselves. To discuss MELA Sciences, please visit its board. —*Jeff Fischer*

Buy More of Medtronic

Published Nov 9, 2010 at 12:00AM

At a Glance

- **Action:** Buy enough shares to bring your allocation up to 5% (for *Pro*, that's about 530 more shares, giving us 1,900 total)
- **Preferred price:** Around $36 or lower
- **Current price:** $35.75
- **Alternate trades:** You can write puts to possibly purchase shares lower if you're a stickler for price. December 2010 $35 puts pay around $1, while January 2011 $35 puts recently paid $1.55.

What's New?

Chicken Little is making a cameo in the health-care arena, with *Pro* Buy First recommendation **Medtronic** (NYSE: MDT) and its medical technology friends significantly underperforming the S&P 500 over the past six months. The issues *du jour*, however, haven't changed in more than a year: lower-than-expected patient procedure volume, longer product development cycles, and the ever-present "health-care reform uncertainty." Medtronic did little to allay those fears with its first-quarter earnings in August, when it lowered its fiscal 2011 earnings guidance.

We believe Medtronic is managing its business properly to survive these temporary industry issues. First, it's continuing to invest in research and development — the company expects to launch 60 new products over the next two years. In fact, it invests more each year than **Stryker** (NYSE: SYK), **Zimmer Holdings** (NYSE: ZMH), and **St. Jude Medical** (NYSE: STJ) combined. We also think Medtronic's broad product line and launch experience give it a leg up in dealing with heightened FDA trial and testing demands. Rolling in new products through acquisitions (such as those of Invatec and ATS Medical) adds growth through Medtronic's global distribution and offers good reinvestment rates. The company's competitive position is intact, and the lowered stock price compensates us more than fairly for the industry's risks.

Why This Strategy?

We're buying shares outright instead of writing puts because we think shares are cheap enough already. Paying 9 times free cash flow and 10 times the low end of forward earnings estimates for a company with excellent tailwinds and a culture of innovation makes good, Foolish sense.

How to Follow Along

We're giving our allocation a jolt from 3.4% to 5% of the *Pro* portfolio's current value, and we suggest you do the same. Buy shares using a limit order, and join us on the Medtronic board for discussion. —*Bryan Hinmon, CFA*

The Dollar's Death ...

Published Nov 8, 2010 at 12:00AM

By Nick Crow (TMFCrow)

If you've spent any time at all on *Pro*'s Philosophy & Strategy board recently, you know that many members have abandoned our "We're Defensive, Not Apocalyptic" mind-set in favor of fear, despair, and perhaps preparations for the apocalypse. And why not? The stock market has crashed not once but twice in the last decade or so. We at *Pro* recently bought gold — the ultimate defensive investment, some would say — through the **Sprott Physical Gold Trust**. The Fed is expanding its balance sheet by another $600 billion through the new round of quantitative easing (QE) it announced last week. Listen to the talking heads and you'll become convinced that everything is being manipulated and nothing is real. If your head is spinning, it should be: You and I *are* being manipulated.

Earnings on Deck

- Tuesday: **Ebix**
- Wednesday: **Cisco Systems**

Coverage & Community

- **Broadridge Financial Services** reported results, and Bryan (TMF42) has the skinny. The stock remains a Buy First. You can also write puts.
- **GrafTech International** chimed in with strong results but a subdued outlook. What does that say about the world economy? We like the direction of the business, but the stock remains a Hold on price.
- Is it time to be even less defensive? Jeff is leaning in that direction.
- Pro member alex340 posted puts and calls (for writing) that match *Pro* criteria.
- Get the full earnings calendar from TMFValuemoosie.
- TMFEldrehad pits Main Street against Wall Street in his latest CAPS analysis.

Get Your Bearings

Any time you find yourself in peril, whatever the specifics, you need to do two things to avoid further danger: Breathe deep, and find a point of reference. Then, just take the next rational course of action. The same is true when thinking about macroeconomics. With that in mind, take that deep breath now, and take the following quiz to find your point of reference.

- **Question 1:** What is currently backing the U.S. dollar?
- **Question 2:** How much has the United States' total net borrowing (private and public) increased since the financial crisis?

If you don't know the exact figures, give a general answer (for example, "it exploded" is a common response to question two).

Are you finished? Great, now we know where we *think* we are — which may be an entirely different place from where we *actually* are.

Rumors of My Death

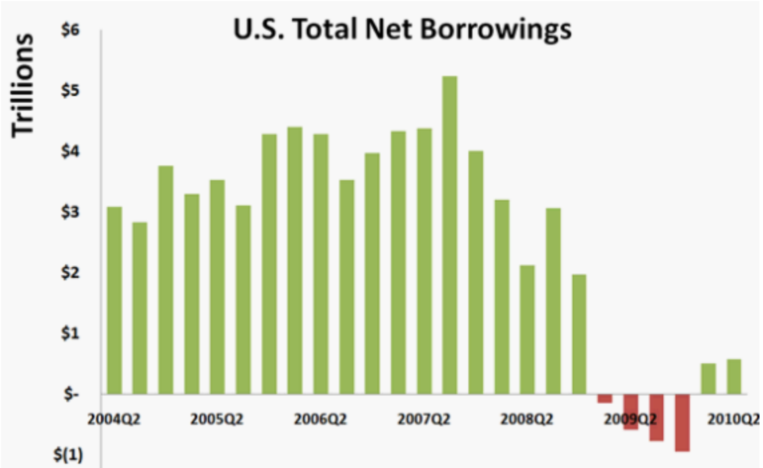
If you answered "nothing" to question one, at face value, you are correct. The U.S. dollar is not redeemable for gold (or any other commodity). However, our currency does bear the inscription, "This note is legal tender for all debts, public and private." Because dollars are legal tender, they are "backed" by all of the goods and services in our economy. And even in its current weakened state, we have one hell of an economy. For this reason, it follows that as long as this country produces desirable goods and services, our dollars are worth more than the paper they're printed on.

To paraphrase Mark Twain: Rumors of the dollar's demise are greatly exaggerated. Intelligent monetary and fiscal policy are indeed important, but I believe the importance of a commodity backing for any given currency is overstated, and I don't think fiat currencies — those without such a backing — are headed for an imminent collapse.

Ideologies aside, I'd bet most answers to question one were pretty similar. Question two, on the other hand, is a doozy. I mentioned above that you and I are being manipulated; this is where much of that manipulation of our perceptions is taking place. We're being told that the Fed is bankrupting us through the monetization of our debt (also known as "quantitative easing," or QE in shorthand) and that because of the crushing load of this debt, the world will no longer want our dollars. Thus, the argument goes, hyperinflation — and with it, soaring interest rates — will follow.

The thing is, if this explosion of our debt load were actually occurring, it would show up in the total net borrowing of the U.S., and there would be a commensurate increase in interest rates; investors would demand a higher return in exchange for taking on the increased risk of our increased debt load. This brings us to the *real* answer to question two.

Americans' borrowing (federal, state, local, financial company, nonfinancial company, and household) has actually decreased dramatically since the start of the financial crisis. Yes, that's right, our debt has actually *imploded* – not exploded, as you may well have thought. When we're talking about trillions of dollars, it's easy for our heads to start spinning again, so here's a chart to focus on:

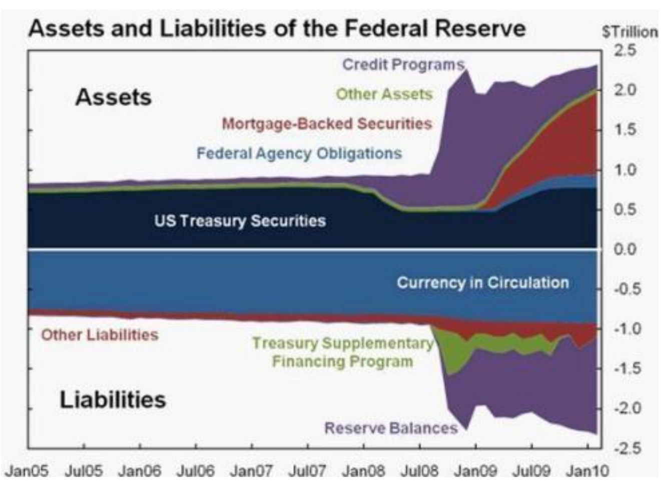


Source: Federal Reserve

So what happened here? Why didn't borrowing shoot through the stratosphere? As it turns out, we, the people (and businesses) of America actually have some influence. While the U.S. government was ramping up its borrowing at record rates, U.S. households and companies of all types were de-leveraging even faster. Reducing expenditures to pay off debt is Foolish with a capital F, but when we move *en masse* — well, we move *en masse*. Every dollar we save or use to pay down debt is a dollar that's not being spent — in other words, it's not contributing to economic activity. Fortunately (as much as it pains me to characterize it that way), the government stepped in via the first round of quantitative easing, stimulus spending, bank bailouts, and so forth, or that red area you see in the chart above may have dipped into the trillions, which would have further slowed our economic recovery by negatively affecting GDP and therefore our ability to service debt.

Both Sides of the Coin

At its core, QE is simply a way for the Fed to lower long-term interest rates and add to banks' lendable reserves by buying large quantities of Treasuries or other financial assets from member banks. You may have heard that this is akin to printing money, but the reality is more nuanced. Let's start by taking a quick look at how the Fed accounts for changes on its balance sheet. When the Fed makes loans or buys assets, it creates both an asset on its balance sheet (loans and securities) and a deposit liability (reserves). In essence, the Fed borrows from member banks to buy assets from other member banks. The net increase in liabilities, therefore, is zero. The following chart shows the overall effect on the Fed's balance sheet from the last round of quantitative easing and stimulus; we should expect a similar change in the balance sheet from the next $600 billion in purchases over the next eight months.



Source: Federal Reserve

Though the balance sheet has expanded, assets still offset liabilities, as the fundamental rules of accounting would suggest. Look at just one side of this coin, as many commentators have, and it's easy to assume that $2 trillion change and means Fed Chair Ben Bernanke & Co. are trying to destroy us. While the expansion of the balance sheet does illustrate the gravity of our economic difficulties – things are bad — it doesn't in and of itself put America in the poorhouse.

Nothing to Fear?

I know what some of you are thinking: If the dollar is backed by all the goods and services we produce, and our nation's debt as a whole is lower now than before the crisis, *and* the Fed is taking action to lower already low interest rates … why are we hearing so much talk about inflation?

This question gets to the crux of the dilemma of reality vs. perception. Unless we're all concerned about — perhaps even terrified of — future inflation, low interest rates won't stimulate consumers to borrow and spend or businesses to borrow and invest. Without increased demand, there will be no new jobs, all those bank reserves won't be borrowed and reinvested, and we won't pull ourselves out of this slump.

It's an economic version of the chicken-or-the-egg question. Expectations of high inflation are one way to stimulate demand and investment; if you think everything is going to get more expensive, you'll buy and invest now before that happens. And increasing demand for goods and services is the only sustainable way out of our mess. So far, low interest rates and costly incentives have only helped to maintain current levels of consumption. For that small success, we should be thankful — and when thinking of the future, we should in fact be hopeful, for this too shall pass ... eventually.

So, Fools: Breathe deep, ignore the noise about hyperinflation (or appreciate it for its potentially demand-stimulating effects; just don't believe it unquestioningly), and let's get back to being defensive, not apocalpytic.

Bring your comments and questions to our Memo Musings board — and Fool on!

Roll Your Covered Strangle on Plum Creek Timber

Published Nov 8, 2010 at 12:00AM

At a Glance

- **Action:**
  - Buy back ("buy to close") November 2010 $36 calls at market price.
  - Write ("sell to open") new strangle: May 2011 $36 puts (to potentially double shares owned to 5%) and May 2011 $39 covered calls (one for every 100 shares owned).
- **Preferred strangle price:** $4.20 net credit, combined
- **Recent share price:** $38.97

Questions?

Please visit our guide to strangles for more on the strategy.

Important Date

Plum Creek's dividend is set to be registered on Nov. 16; to keep your shares, you'll want to roll your November covered calls before that date.

- **Alternate trades:**
  - **If you don't own Plum Creek:** Write one leg of this strangle, the May 2011 $36 puts, for $2 or more.
  - **If you own at least 100 shares but don't want to buy more:** You can just write the covered calls, or simply keep holding your shares.
  - **If you don't want the obligation of holding two sets of puts:** We're letting our November $31 puts from our last strangle expire Nov. 20. If you want to close those early, "buy to close" both legs of your existing strangle at once.
  - **Want more room to roam?** You can consider strike prices above and below ours, moving your strangle up or down.

What's New

Plum Creek Timber (NYSE: PCL) reported sapling-sized revenue and earnings for its third quarter but made operating improvements in each division, though business remains challenging. The stock held up after the news, maintaining its stature among investors as a hard asset and a hedge against inflation. We bought in two years ago to own timber assets and enjoy a 5% dividend, and we've added significantly to our earnings since then by writing options. We don't want to sell now — especially since we can continue our covered-strangle strategy to gain more potential income, a higher net sell price, and a reasonable potential buy price on new shares. Our main arguments for owning Plum Creek remain in place: If the economy mends, housing and timber demand will grow, and a resurgence in the economy could lead to inflation, which in turn would lead to higher commodity prices.

Why This Strategy?

We want to keep our Plum Creek shares but also remain defensive given the surge the market has enjoyed since August. Buying to close our November $36 calls for a net cost of about $1 per share, we can roll into a May 2011 strangle that currently pays us $4.20 per share. We're choosing an expiration six months in the future to receive considerably higher option payments compared with earlier expiration months — this allows us to be more defensive should downward volatility return to the market, and also enjoy a higher net sell price if stocks keep rising. Here's a look at our roll-up:

What We're Doing	What It Costs
Payment received for writing original November 2010 $31/$36 strangle	$1.90
Cost to "buy to close" November 2010 $36 calls	($2.90)
Net cost to close November $36 calls	**($1.00)**
Payment received for writing May 2011 $36/$39 strangle	$4.20
Total net credit from rolling up	$3.20
New net sell price if called away	$42.20
Original net sell price if called away	$37.90
Upside from rolling up (excluding commissions)	**11.3%**

Aside from achieving a higher potential sell price, the strangle also provides a potential net buy price on new shares of $32.80, below our $34 preferred buy price. And if the stock stays between our two strike prices, we'll earn the full net income of $3.20 per share. This is a tighter strangle than we usually write (with strike prices only $3 apart), reflecting that we want to maximize our option income despite lower-than-usual option premiums and that we're comfortable with the stillwide effective price range this strangle provides (shown below).

How to Follow Along

We recommend that you:

- **Buy back ("buy to close")** the November $36 calls using a limit price near the market price (recently $2.90). (You can leave your November $31 puts alone if you're comfortable doing so; we expect those to expire worthless on Nov. 20.)
- Then, using a strangle net credit order, **write ("sell to open")** May 2011 $36 puts and May 2011 $39 covered calls.
- **Preferred strangle price:** $4.20 net credit (remember, this credit will go down over time; a lower credit is still acceptable if you make the trade later).

To write a covered strangle, you must own at least 100 shares of the stock, and you should be happy to buy at least 100 more at a lower price.

Trade Details

- **Roll-up credit:** About $3.20 after paying to close our November covered calls
- **Potential net buy price of new shares through $36 puts:** $32.80 (15.8% below current price)
- **Potential net sell price on current shares through $39 calls:** $42.20 (8.3% above current price)

Anytime you write puts, your broker sets cash or equity aside to cover your potential stock purchase. In this case, the $36 puts pay a 5.3% yield on cash set aside over the next six months. Questions? Please visit our old-growth (hey, we've had it since 2008!) Plum Creek Timber board. *—Jeff Fischer*

Sell to Close Your Puts on Caterpillar

Published Nov 5, 2010 at 12:00AM

At a Glance

- **Action:** Sell to close November 2010 $80 puts
- **Allocation:** Sell all contracts
- **Recent option price (bid/ask):** $0.59/$0.61 (use a limit price near current prices)
- **Recent share price:** $83.33
- **Why sell:**
  - Expiration is nearing and the stock is above our option's $80 strike price.
  - The option still has time value that we can recapture, decreasing the loss on our bearish spread.
- **Alternate trades:**
  - If you have a bearish spread on Caterpillar that expires later than November, you can wait on it.

What's New?

Since we announced a bear put spread on **Caterpillar** (NYSE: CAT) on Aug. 17, the S&P 500 has gained nearly 12%, experiencing its best September since the 1930s. On the heels of this rally, time is running out for this spread; with expiration just two weeks away, the stock has rushed higher with the market, putting it above the $80 strike price and threatening our $75/$80 bear put spread with a full expiration. We can sell to close our $80 puts early to regain some value (they still carry time value, given how volatile these shares can be), and we will let our written $75 puts expire, taking no action on that leg of the trade. We'll earn 100% of what the $75 puts paid us, but lose most of what we paid for the $80 puts, making the trade a loser overall.

Thankfully, this has been a modest loss, since spreads cap the risk to our initial investment. Had we shorted 500 shares of Caterpillar directly at $69.50 (the stock's price when we issued the spread), we'd be begging for mercy right now. This bearish trade has been a good reminder of how quickly the market can smash short positions, and why spreads — even though they limit profit potential — can be a good approach to shorting when you're looking for a reasonable hedge with less risk. Our thesis left room for the shares to move 9% before our spread turned unprofitable, but the market was so strong that it wasn't enough.

So what's up with Caterpillar specifically? The company turned in strong results last quarter, partly because high commodity prices are driving more demand for mining equipment. That demand may not subside anytime soon, since commodity prices are rising as the Fed continues to pump money into the economy. However, the stock doesn't look inexpensive, and even after earnings, it didn't gain ground. Instead, broader market gains stepped in to drive Caterpillar higher.

All in all, this was still a reasonable short with reasonable risk. We'll take our loss and step aside for now. We've learned more about Caterpillar in the process, and the company will take its place in our possible investment arsenal.

If you have questions on selling to close the $80 puts, visit the CAT board. And remember: For now, we're taking no action on the $75 puts we wrote, instead planning to let them expire on Nov. 20. You can close them for more than a 90% gain if you'd rather clear the deck today. Finally, we have from now until the Nov. 20 expiration to sell to close our $80 puts; if shares fall enough, we'll get a higher price, and if they go up, we'll get less. *—Jeff "get that earth mover off of me" Fischer*

Buy L-3 Communications

Published Nov 4, 2010 at 12:00AM

At a Glance

Note: It's LLL, not LVLT. Make sure you buy the right company! We're recommending **L-3 Communications** (NYSE: LLL), *not* **Level 3 Communications** (NYSE: LVLT).

- **Action:** Buying 2.5% of current portfolio value
- **Target allocation:** 5%
- **Estimated fair value:** $100
- **Preferred buy price:** Around $80 or lower
- **Type of holding:** Long-term, defense contractor
- **Alternate trade:** Write January 2011 $70 puts for a 2.5% to 5% position
- **Why buy:**
  - World-class capabilities and technology
  - Fantastic price
  - Defensive company (see what we did there?) that is not closely correlated to the economy

The Big Picture

By Andrew Sullivan, CFA (TMFRedwood)

The deck appears to be stacked against defense companies. After a years-long surge in spending for two wars, America has removed combat troops from Iraq and is working on doing the same in Afghanistan. There's also the small problem of tight purse strings at home (have you heard about our deficit?) as well as growing sentiment among policymakers that defense contractors need to take on more risk, and possibly more loss, when it comes to cost overruns in the development stage of contracts.

The Community's Take

L-3 is more value than growth, so it has a low CAPShot score. However, nearly all of the CAPS All-Stars who've rated it believe the stock will outperform.

Given all this, investors worry that revenue growth at defense contractors will slow or even turn negative in the coming years and that profit margins will be squeezed. These fears have pushed contractors' stocks down to historically low multiples of earnings and free cash flow. This gets us excited for two reasons. First, we think worries about cuts in defense spending are overblown, and at any rate, a certain amount of softness is already built into share prices. And second, some companies can still excel under these circumstances yet have been unduly lumped in with the unimpressive masses, giving us bargain-shopping opportunities. We think we've found one of those bargains in **L-3 Communications** (NYSE: LLL).

It's clear that we live in a dangerous world — Iraq and Afghanistan remain unstable, Iran and North Korea are working toward acquiring nuclear weapons, and terrorist attacks (planned and executed) are common. Unfortunately, none of this is likely to disappear anytime soon, meaning we'll have to keep spending money on preparation and prevention. And while spending has ramped up, it is still low in historical terms: Defense spending is 4.8% of our GDP, far below the almost 10% it reached in the 1960s and even the 6% of the 1980s.

Some companies are better positioned than others to navigate an uncertain future, and we think L-3 is one of them. It's a surprisingly agile large cap with a wealth of mission-critical technology and capabilities at an appealing price. New, unproven, and frequently over-budget programs are common, but companies like L-3 with proven products and solutions in high-growth areas like electronics and communications should fare much better than their peers.

Defense in general is a wonderful industry to own because of its predictability, barriers to entry, and stability during uncertain economic times; even if the market is in a funk, defense tends to hold steady, a plus for our portfolio. So we're happy to get exposure to the industry at a great price. But we're choosy here at *Pro* — we want the very best companies, no matter what the industry. When it comes to defense, this means companies that are insulated from budget declines and that have excellent growth prospects. Given those criteria, L-3 stands out above the rest.

The Business

Founded in 1997, L-3 has spent more than a decade assembling a portfolio of cutting-edge businesses in intelligence and communications, electronics, aircraft maintenance, and government services. In that time, sales grew from $700 million to $15.6 billion, turning L-3 into the sixth-biggest company in the defense industry.

L-3's products include aircraft black boxes (they're actually orange), thermal imaging sights, secure smartphones, sophisticated data links, unmanned aerial vehicles, aircraft flight simulators, metal detectors and baggage-screening systems, and even missile protection systems for head-of-state aircraft. The company also trains foreign militaries and police forces, provides linguistic services, and upgrades aircraft for new missions.

A sterling example of the way in which L-3's many skills can come together is Project Liberty, a contract to convert small King Air aircraft into intelligence-gathering assets. L-3 delivered the first such aircraft last year, only eight months after receiving the contract, an unheard-of pace for a program of this nature. For Project Liberty, L-3 built on its skills in aircraft modification as well as sensors and electronic communications; in total, it used five of its divisions to create a compelling package, one it delivered to the Air Force in record time.

This captures one of the things we like about L-3: Because it owns both the mission-critical surveillance and communications equipment that senses and transmits data *and* the facilities that physically integrate it onto the aircraft, it is in an excellent competitive position when it comes to bidding on work like Project Liberty.

L-3's aircraft modification business has garnered a lot of attention, and for good reason: With the pace of advancing technology, it is often cheaper simply to upgrade planes with new equipment than it is to procure new ones. In our view, that means L-3's skills here should pay off. But its electronics and communication businesses are also in the sweet spot of Defense Department needs. Products in those categories add a lot of value and are becoming more prevalent in combat; their importance and critical nature insulate the company from budget cuts. Typically, it's the expensive jets, ships, and untested programs that are most vulnerable to cuts — areas where L-3 doesn't have much exposure.

Financials and Valuation

This $73 stock generated earnings per share of $7.60 in each of the past two years and should earn just more than $8 this year and next. Simple math ($8 divided by $73) puts the earnings yield at an attractive 11%, of which 2 percentage points ($1.60) is a dividend. Except for a brief time in early 2009, L-3 is currently trading at all-time low multiples for just about every valuation metric you can think of. For a strong company with low-risk, world-class assets and attractive growth prospects that are only slightly correlated to the economy, this appears to be an ideal investment opportunity. We peg fair value for L-3's shares at more than $100.

What Would Make Us Sell

Although fears of a slowdown in defense funding are reflected in L-3's stock price, a sharp decline in the nation's defense budget is still a significant risk. Other risks include contract losses and, to a lesser extent, ballooning costs in fulfilling contracts. And while we like the aircraft upgrade business, work in that field can experience turbulence, making it harder to forecast. Finally, because L-3 isn't particularly correlated to the economy, its stock could underperform the broader market should the economy take off.

Pro Bottom Line

L-3 has an impressive array of capabilities and technology, all of which remain in high demand by our military services. Since most of L-3's sales are to the government, an investment provides us stability should the broader market fall, making it an economically defensive stock. And to top it off, we're getting a wonderful price. This company is rarely on sale, and we're eager to take advantage of it.

Please discuss L-3 on our board.

Andrew owns call options on L-3 Communications.

Earnings Galore and a Fond Farewell

Published Nov 1, 2010 at 12:00AM

Life has many exuberant moments, but compromise is nonetheless a part of each day. You'd love to pursue your dreams in every spare minute, but the garbage isn't going to take itself out. You want to see the world, but you could probably stand to explore your own neighborhood first. When it comes to investing, you want to make money with less risk, but when you hedge, you cap your upside. And none of this is necessarily a bad thing — in the end, the point of any good compromise is to make things better than before.

Who's Cheating Who?

Don't miss the *Pro Education Extra* we published last week — "First, Do No Blunder" — in which Bryan Hinmon (TMF42) makes sure no *Pro* positions are "cheating" on us.

Earnings on Deck

- Tuesday: **Jack Henry & Associates**
- Wednesday: **AmTrust Financial**, **Papa John's International**, and **Quanta Services**
- Thursday: **Bristow Group** and **Broadridge Financial**

Coverage & Community

- Looking to write more puts or covered calls? Alex340 posted possibilities on *Pro* stocks.
- Hungry for even more earnings? TMFValuemoosie shares an earnings calendar.
- Who's got the "write" stuff on CAPS? TMFEldrehad highlights the superstars of stock pitches.
- Stamleo started a thread on *Pro's* approach to shorting thus far. It's sure to be an active conversation!
- Member Kzeek asks,"Why not roll these Cameco covered calls for more upside?" That question can be asked of several positions, and Jeff gives his answer.

That's true of the news we want to share with you today, too. Analyst Todd Wenning (TMFPhila) has been a steady part of *Pro* since day one, offering calm advice on the boards, sharing insightful stock ideas, and living up to the *Pro* mission every day. Todd has done so well, in fact, that he's been asked to move to London to be the advisor on The Motley Fool U.K.'s newest service, *Dividend Edge*. He's a dividend investor at heart (and a lover of British comedy), so Todd and his wife are excited to pack up the dog and move across the pond. The flip side, of course, is that he hates to distance himself from the *Pro* community.

First, we want to sincerely congratulate Todd. We look forward to watching the new service launch, and we're certain it will be a transcontinental success. Second, we want to commemorate his departure — and while we'll certainly miss having Todd as a full-time part of *Pro*, this compromise makes sense for him as he takes the next step in his investing career. Plus, as busy as Todd will be learning the ropes in a new country (driving on the left, learning the proper use of "Cheerio"), we won't lose sight of him. He still plans to cover some of the companies he brought to *Pro,* and he'll show up on the boards, too. We're even hoping for a special report every once in a while, with Todd serving as our eyes and ears in the U.K., providing us additional investing perspective from Europe.

The expanding *Pro* team continues to cover all of our existing holdings (and pursue new ideas, many of which are in the works right now). But before we move forward, we pause to show Todd our gratitude. Working with him has been a pleasure over the past two years, and he's left a strong legacy at *Pro* with stock positions like Plum Creek, Kinetic Concepts, and Jack Henry. Now I look forward to the next phase of our relationship. To join us in wishing Todd well at his new service, please post on the Meet & Greet board.

Earnings Onslaught

Last week was a reminder of why we find ourselves needing blood-pressure medication every three months. Earnings were issued at a fast and furious pace, and we worked to maintain a calm, long-term disposition despite the excitement. Four *Pro* companies reported, all of which look decent upon first study.

Kinetic Concepts had the type of quarter we've been waiting for after two quarters of somewhat worrisome results. The third quarter wasn't perfect, but it was a step in the right direction as margins improved and earnings were stronger than anticipated. Revenue is still on the soft side, with no real growth, but the company is meeting with early success in Japan and plans to enter India and China, so there is plenty of potential ahead. At a discounted valuation, KCI remains a Buy. You can also write (sell to open) various put options in the mid-$30s to potentially get shares cheaper. Meanwhile, our protective collar on the shares (which we entered into in case a disappointing earnings announcement brought the stock price down) has proved unnecessary, and we're aiming to end it for zero cost. We've sold to close our puts and are now managing our covered calls.

Plum Creek Timber reported ho-hum results; the buzz saws aren't being used much since demand remains soggy. Management is letting its forests grow and will increase its sustainable harvests when demand increases. Meanwhile, real-estate transactions are adding value. These tranquil results are fine with us, because we want to continue our covered strangle income strategy on Plum Creek. Our current options expire in November, so we'll look to roll our strangle into a new one this month. You can write puts in the lower $30s if you don't have a position yet. We have a preferred buy price of $34 or below.

Procter & Gamble hit on all cylinders in its most recent quarter, growing unit volume by 8% and organic sales by 4%. Bryan Hinmon (TMF42) provides a strong review of the quarter, but the stock remains on Hold solely because of its valuation. We also plan to continue writing covered calls on our shares as long as we own them. Our current $65 covered calls expire in January, and so far they've earned 41% of what they could pay us.

GrafTech International reported a 55% jump in revenue and nearly triple the previous quarter's net income as graphite electrode demand increased at steel mills. The company expects a flat fourth quarter as the economic recovery remains tenuous (steel-mill operating rates are falling again lately), but management has made GrafTech exceptionally profitable even in this mixed environment. We're still going through its results and will have updated guidance soon.

To discuss any of our companies, please visit their respective boards. To discuss the Memo, head over to the Memo Musings board. Again, we wish Todd all the best in London, and we can't wait to see if he develops a British accent on the boards.

Foolishly,

Jeff Fischer (TMFFischer)

Buy Calls on Intel

Published Nov 1, 2010 at 12:00AM

At a Glance

- **Action:** Buy ("buy to open") January 2013 $10 calls
- **Allocation:** 1% of *Pro*'s starting value, for a 6% total allocation to Intel.
- **Details:** We'll invest about $10,000 in the calls, buying about 10 contracts.
- **Recent stock price:** $20.55
- **Option price:** Lately, about $10.65. Use a limit order that results in an effective buy price ($10 strike, plus what you pay for the call options) as close to Intel's current stock price as possible.
- **Alternate trades:**
  - Buy shares of Intel directly; it remains a Buy First stock.

- Or, buy to open January 2013 $12.50 or $15 calls if you'd rather invest less capital. These options have a bit more time value attached, though.
- Or, write ("sell to open") $20 puts if you'd rather try to buy the stock cheaper.
- If you already own January 2012 call options, we think holding until they're profitable makes sense. You can roll to the 2013 call options later, or add those options independently.

What's New

Intel (NASDAQ: INTC) is already the second-largest position in the *Pro* portfolio, sitting at a 5% allocation. Our call purchase will put us near 6%, and we'll be at 7% if we turn these new calls into shares. We're comfortable investing this much in the computer-chip giant given its current price — just over 10 times free cash flow and earnings, which is about a 40% discount to the S&P 500's average valuation. Management expects the PC market to show solid growth again next year (12% to 18%) and broad-based strength in computing devices to continue in the long term thanks to emerging markets, corporate upgrades, and growing tablet and Internet TV markets, among other factors. Wall Street is still pricing Intel as if it's a highly cyclical, boom-and-bust company, but those cycles appear to be smoothing out as the computing industry grows more diverse and global.

In addition, the *Pro* team (along with some lucky *Pro* members) met with Intel in San Francisco last month, and each of us came away impressed. We would never base an investment decision on a meeting alone, but we feel Intel's growing technological lead over its competition in the core computer processor market (where it's about two years ahead of rivals), along with plans to put **McAfee** (UNKNOWN: MFE.DL) security software onto chips, may further cement the company's CPU leadership for years. Meanwhile, it's nearly all upside for Intel's mobile chip division, where the company holds minimal market share. Now that Intel has the production capacity for both computers and mobile devices, it doesn't need to choose one or the other.

Imagine the U.S. without computers. It's impossible, isn't it? Five years from now, that'll be true in even more places around the world. We believe Intel will remain profitably dominant in the meantime, so we're willing to increase our investment in it while it's down.

Why This Strategy?

The market's measure of expected volatility, the "VIX," is trading near its historical average of 20, meaning option prices are relatively low. This can be a good time to buy options, because if expected market volatility goes up, option prices can increase as well (even if stocks don't). Meanwhile, we're buying deep-in-the-money calls on Intel that have virtually no time value (meaning no extra cost above the stock price). So we're controlling shares of Intel for about half the capital outlay of buying stock (around $10 per share instead of $20) without paying a penalty to do so. This leaves more cash in the *Pro* portfolio, and if Intel shares gain 25% at some point (which we think is likely, given that our estimate of their intrinsic value is in the mid-$20s), our calls should gain 50%. Plus, we have a lot of time. These new LEAP options expire in January 2013, giving us two years and two months for Intel to appreciate.

The downside is that we'll miss Intel's 3.1% dividend yield (since the calls won't be paid the dividend), but 5% of our portfolio is already invested in Intel stock that does collect the dividend. And our $10 calls will have value in 2013 as long as Intel is above $10 (and it hasn't been below that price since 1996). We can turn the calls into shares at any point (especially if we want more time for the strategy). But for now at least, we plan to own just the calls in this case and (hopefully) enjoy significant capital appreciation on them as Intel's stock recovers.

How to Follow Along

Buying call options is a similar process to buying stock, except the command at many brokers is "buy to open." Buy one call option for every 100 shares of Intel you want exposure to. At recent prices, each call you purchase will cost $1,065 and represent $2,065 worth of Intel stock. The call will appreciate or depreciate with the stock, and may gain additional value if market volatility increases.

If Intel stock ...	Then January 2013 $10 calls on Intel ...
Gains 10%, to $22.50	Gain about 20%, to $12.50
Gains 22%, to $25	Gain about 40%, to $15
Gains 46%, to $30	Gain about 90%, to $20
Falls 26%, to $15	Fall 55%, to $5
Stays in a range and is ultimately unchanged	Do the same, and we can turn the calls to shares or sell by expiration

If you have questions, please visit our Intel board.

—Jeff Fischer

Write Puts on Contango Oil & Gas

Published Nov 1, 2010 at 12:00AM

Portfolio Manager's Corner: In researching natural gas companies, I kept returning to an unconventional leader, **Contango Oil & Gas** (NYSEMKT: MCF). Employing only eight people, outsourcing all of its exploration, and only paying contractors when gas is discovered, the company also has the cheapest known gas production costs in the industry and a deeply invested management. With this investment, we're seeking a way to profit if natural gas prices rebound — if that happens, this company will benefit directly, but it's also profitable today. The author of this report, *Motley Fool Special Ops* analyst Toby Shute, is a respected expert in the energy field, and his work brought Contango Oil & Gas to my attention. We're grateful that he agreed to be a guest here. Enjoy! *—Jeff Fischer*

At a Glance

- **Action:** Write (sell to open) January 2011 $55 puts. Both the options and the stock are thinly traded, so be sure to use a limit order.
- **Allocation:** 4% (for *Pro*, about nine contracts)
- **Option price (bid/ask):** $3.50/$4.70
- **Limit price:** Aim to split the bid/ask (in other words, somewhere between the two, but realistically closer to the low end)
- **Preferred stock buy price:** About $53
- **Fair Value Estimate:** $60 (will increase if natural gas prices rise)
- **Recent share price:** $52.90
- **Type of holding:** Energy/natural gas
- **Alternate trades:** Don't want to write puts? Buy shares with a strict limit order. The stock is thinly traded, so we're writing puts to try to net a buy price closer to $50 without driving the stock up in the process. If you buy shares instead, buy slowly in 1% increments and use limit orders. And if you only want to buy at an even lower price, write January 2011 $50 puts, recently about $2.
- **Why buy:**

- As the lowest-cost natural gas producer, Contango Oil & Gas profits even on today's low gas prices.
- Estimated reserves on hand are worth more than the company's market price, and *much* more if natural gas increases in price.
- This conservative company is debt-free and well managed.

The Big Picture

By Toby Shute (TMFSmashy)

Poor natural gas. While commodities like copper, gold, and coffee are zooming higher, this handy hydrocarbon fetches a seriously depressed price today. Recently priced on the spot market at $3.37 per million British thermal units (BTU), natural gas isn't trading at much of a premium to the industry's average cash cost of production. This suggests that the industry as a whole is not profitable today.

Contango's Ready for Its CAPShot

The company scores a scorching 10 out of 12 on its CAPShot, and 98% of the top CAPS players expect it to outperform. To hear more from the company, read "The Contango Story" (PDF).

A swift reduction in drilling would cut onshore gas supply and boost prices, but several factors have so far prevented this. First, many producers hedged their production early enough to lock in significantly higher prices. Second, vast swaths of acreage in places like the Haynesville shale needed to be drilled in order for producers to hold on to their leases. Third, a lot of foreign energy giants have partnered with smaller independents on these gas shale plays, and for these companies, learning how to exploit the deposits is at least as high a priority as turning a short-term profit. Finally, lots of producers are targeting "wet gas" or hybrid plays that also produce higher-value liquids. These plays offer strong profits even at very low natural gas prices.

Some of these factors should abate in the year ahead, but as with any prediction, it's unclear exactly when supply will roll over and gas prices will recover. For that reason, we need to choose an investment vehicle that allows us to be patient as we wait for this market's self-correcting mechanisms to kick in.

About a year ago, *Pro* looked to capitalize on the eventual rebound in natural gas prices via the **United States Natural Gas Fund** (NYSEMKT: UNG) ETF. That didn't work out, since the "contango," or upward-sloping curve, of futures prices ended up eroding the value of the fund as it rolled its contracts from month to month. Now, we're more interested in picking up a producer that can operate profitably today as well as offering exposure to higher prices down the road. To this end, the company we want to own is called — oddly enough — Contango Oil & Gas.

The Business

The average natural gas producer might be suffering today, but Contango isn't average in any sense. Among North American companies, it's the lowest-cost producer of natural gas that I'm aware of, with an all-in cost structure barely north of $2 per thousand cubic feet equivalent (mcfe) — about a third cheaper than the average company's cost.

This cost leadership didn't come about by accident. Rather, it directly flows from the operating philosophy of the company's CEO and chairman, Ken Peak, who founded the company with his life savings of $400,000 in 1999. By that time, Ken had already worked in the energy industry for 26 years and had learned all the ways that an exploration and production company can run itself into a ditch. Contango is structured to avoid these pitfalls, which generally stem from excessive costs, misaligned incentives, and perhaps the greatest danger of all, too much debt.

Exploration (or "finding") costs are kept low at Contango through partnerships with proven freelance prospect generators. These explorers are paid nothing up front; they only make money when Contango drills successful wells. The outsourcing of nonessential functions extends well beyond prospect generation — the company has just eight employees. That keeps general and administrative costs extremely low. Contango also carries no debt, so interest costs are negligible.

It should be fairly obvious that piling financial leverage (debt) on top of operating leverage (sensitivity to small changes in revenue) in a business as volatile as oil and gas production is not the greatest idea for a small company, but countless companies go down this path. They risk bankruptcy when commodity prices drop, whereas Contango is essentially bulletproof.

In addition to avoiding debt like the plague, Contango also seeks to minimize shareholder dilution. The company has actually repurchased a higher dollar value of shares than it has issued since inception. Contango's management and board of directors control approximately 22% of the stock, so their incentives are very well aligned with those of outside shareholders.

As an operator, Contango focuses on "wildcat" exploratory drilling in the shallow waters of the Gulf of Mexico. These are high-risk wells that cost about $15 million to drill, assuming failure (and failure is to be expected most of the time). Successful wells cost more to bring into production — and Contango has had some seriously successful wells.

Specifically, the Dutch and Mary Rose finds were the two largest discoveries on the Gulf of Mexico shelf in 15 years — combined, they were the largest in 25 years. With 10 of the company's 12 offshore wells producing from these fields, Dutch and Mary Rose account for the lion's share of the company's production and reserves. Contango is unlikely to find a field this size again, but this discovery underlines the talent of its partners in exploration.

In addition to its offshore focus, Contango has an onshore joint venture drilling low-risk wells. These tend to generate an unspectacular rate of return, but the operation is a way of putting cash to work that would otherwise earn close to 0% in Treasury bills. The company has also placed the occasional "side bet" on other ventures, including a liquid natural gas project and an early shale gas play. These returned 34 times and 8.6 times Contango's investment, respectively. Other investments in the past have been a bust, but they were small enough not to have a material impact on the company's financial well-being. Peak has proven to be a phenomenal allocator of risk capital.

Financials and Valuation

In its fiscal year that ended in June, Contango averaged a price of $5.74 per mcfe sold. Natural gas, which averaged $4.47 per mcfe, accounted for 76% of production. Oil and other liquids, while a much smaller component of production, kicked in more than 40% of revenue, so they're picking up the slack while natural gas slumps. By policy, the company doesn't hedge any of its production, so it keeps full exposure to any gains in natural gas prices.

Contango is currently producing at a rate of approximately 100 million cubic feet equivalent per day. Using last year's average, that translates to around $17.5 million in monthly revenue. After $3 million for production expenses and overhead, that leaves $14.5 million in monthly pre-tax cash flow, or $174 million annually.

Contango last reported approximately $60 million in net cash on hand. With an enterprise value of roughly $765 million, the business therefore trades for 4.4 times estimated pre-tax cash flow. That is cheap (bordering on stupid cheap!).

Another way of looking at Contango's valuation is to look at the PV10 number, which is the pre-tax present value of the company's reserves, discounted at 10%. Contango had 314 billion cubic feet equivalent (Bcfe) of proved reserves as of June 30, worth an estimated $970 million. That's at a price of roughly $4 per mcfe of gas and $76 per barrel of oil, so a rebound in gas prices would send this figure hurtling higher.

What Would Make Us Sell

Contango's Dutch and Mary Rose field is a killer asset that should be producing for the next 15 to 20 years. The field did have a downward reserve revision this year of 48.5 Bcfe, which is disappointing (though executives gave up some bonuses and stock options as a result, which is not). We don't expect further negative surprises, but if they arrive, we will have to question the reliability of Contango's reserves.

Contango's other great asset is its people. Peak's role at the helm is key to our thesis, and the continued engagement of the company's brilliant exploration partners is important as well. If any of these critical players packs it in, we're likely to follow suit. At age 65, Peak may well be looking to sell the company at an opportune moment over the next few years. (He already tried to do so in 2008, before the sharp decline in commodity prices derailed that plan.) A profitable sale of the company could be our most likely exit.

Why This Strategy?

Contango is lightly traded, with fewer than 100,000 shares trading on a typical day. For this reason, and to net a buy price closer to $50, *Pro* is suggesting you write (sell to open) January 2011 $55 puts, recently bidding $3.50 and asking $4.700. These options guarantee that we'll get shares in January unless the price (recently $52.90) increases to more than $55. If it does, we'll at least earn healthy option income of about 8% over the holding period, and we'll try this strategy again. Use a limit order on your options, and write one put for every 100 shares (worth $5,500) of Contango stock you want to buy.

Pro Bottom Line

Given its emissions profile relative to coal — the dominant source of electric power in this country — we think natural gas has a bright future in the decades ahead. Its sudden abundance is weighing on short-term prices but should encourage the industry and lawmakers to use natural gas as a bridge to even cleaner energy sources. Contango, an unhedged, low-cost producer, offers us a way to capitalize on higher gas prices down the road while we ride the coattails of one of the industry's best capital allocators.

The Motley Fool owns shares of Contango.

Pro Extra: First, Do No Blunder

Published Oct 27, 2010 at 12:00AM

Long before Greek financial negligence threatened the stability of the European Union, Greek moral prudence shaped the ethics of modern medicine. The concept behind the phrase *primum non nocere,* which translates to "first, do no harm," is thought to have originated in Greece in the fifth century B.C.E., and to this day, these are often the first words uttered by new physicians. That maxim, properly finance-ified, can do wonders for the health of your portfolio as well — so we're taking our stethoscope to the chest of our *Pro* portfolio to make sure we're not doing any harm.

"Primum Non Peccare"

Primum non peccare. Directly, this translates to "first, do no blunder"; Foolishly, it translates to "c'mon, just don't invest in blowups." In fact, it seems like one of the only aspects of investing that everyone can agree on:

"*Rule No. 1: Never lose money. Rule No. 2: Never forget rule No. 1.*"
—Warren Buffett

"'*Avoiding loss should be the primary goal of every investor.*"
—Seth Klarman

"*My basic advice is don't lose money.*"
—Jim Rogers

"*Don't focus on making money; focus on protecting what you have.*"
—Paul Tudor Jones

At *Motley Fool Pro,* we believe the best way to employ this rudimentary wisdom is to focus on accuracy and avoid big losses. And the math backs us up; an investment that loses 75% needs to return 300% to get back to even, while a loss of 20% needs to recover only 25%. The lesson is clear: Avoid blowups.

Identifying Blowups

When we analyze businesses for possible inclusion in our *Pro* portfolio, we spend a considerable amount of time assessing their prospects. We strive to add only companies with bright and stable futures, and we keep an eye on them to make sure our thesis remains sound. Sometimes, though, a company's financial statements begin to provide clues that all is not well. When our portfolio and watch-list companies start to display yellow flags, we are quick to step back and dig deep to figure out what's going on, so if a blowup is coming, we can step safely away.

One of our tools is noted value investor James Montier's "C-Score," which we like because it's easy to use, quick to administer, and statistically proven to be an effective tool for avoiding massive losses. The C-Score ("c" is for "cheating") captures the likelihood that a company is engaging in six common flavors of earnings manipulation. Because of the vagaries of GAAP accounting, a "fail" in any one test isn't necessarily damning; Montier advises being concerned only about companies that fail five or six of the pass/fail criteria. As you'll see, all but one of our *Pro* companies are well within these guidelines. (As for the one that isn't, appearances can be deceiving — we'll explain why we remain confident in that one, too.)

The Select Six

You don't have to be a CPA (or wear a trench coat and smoke a pipe!) to uncover financial shenanigans. Some basic arithmetic and a healthy dose of skepticism go a long way. Below are the six items Montier pinpointed, the ones we at *Pro* keep a close eye on to make sure a company's reported numbers match economic reality. The Foolish explanation of each in the third column should help debunk the belief that measuring earnings quality is akin to brain surgery.

Warning Sign	How We Measure It	What It Means
Increasing net income	Recent NI/CF vs. historical	Cash flow is harder to fudge than net income, and the two should be approximately equal over time. If we notice a

(NI) vs. cash flow (CF)	NI/CF	spike in NI relative to CF, we need to find the cause and make sure it's legitimate, not just loose accounting.
Increasing days sales outstanding (DSO)	Recent DSO vs. historical DSO	DSO measures how long it takes for a company to collect the sales it has booked. Rising DSO indicates that the company may be forcing sales and not demanding payment on normal terms. Remember, it's the cash collected that's available to spend — not the booked sales.
Increasing days sales of inventory (DSI)	Recent DSI vs. historical DSI	DSI tells us how long it'll take a company to clear out its inventory. It's like the produce in your fridge — the longer it's in there, the more likely it is that you'll have to throw it away. Rising DSI may indicate a slowing of sales.
Increasing other current assets (OCA) vs. total assets (TA)	Recent OCA/TA vs. historical OCA/TA	You've got a junk drawer, right? The OCA line item on a company's balance sheet is basically the CFO's equivalent of a junk drawer, where many a pesky item can be stashed. If the level of OCA/TA jumps substantially, we worry that something may be lurking inside that closed drawer.
Declining rate of depreciation	Recent depreciation rate vs. historical depreciation rate	Depreciation is an expense that represents past investments in physical plants and equipment. Managers have some leeway in determining how much of a previous investment is applicable in current periods. If this figure starts to plummet, we take note.
High total asset growth	Recent TA growth/sales growth vs. historical TA growth/sales growth	Two possible explanations for asset growth that outpaces sales growth are decreasing efficiency and earnings goosing by way of acquisitions. We don't like to see either one.

Checking *Pro*'s Blowout Preventer

So how does the *Pro* portfolio stack up? Pretty well, it turns out (and we'd expect nothing less!). Using the most up-to-date information filed with the Securities Exchange Commission, we found that only one *Pro* equity investment fails five or more of the yellow-flag tests. We had one perfect score, and more than 90% of our stock holdings failed three or fewer of the challenges. (Keep in mind that we excluded our investments in ETFs and focused solely on our 23 direct equity or options positions.) Two or three failures are very rarely enough to raise a yellow flag, and we remain confident in each *Pro* holding.

Number of Tests Failed	Number of Companies	% of Total
Zero	1	4.4%
One	6	26.1%
Two	7	30.4%
Three	7	30.4%
Four or more	2	8.7%

Studs and Duds

Leading the pack with a perfect score is **GrafTech International**. We weren't surprised at this result: GrafTech has one of the most forthright and honest management teams of any company we own, and it's no wonder this translates into lucid financial statements. In fact, most top C-Score performers have top-notch management.

On the other hand, **Plum Creek Timber** is the cellar dweller among our companies, failing all six tests. Given that, we felt justified in wondering whether Plum Creek is cooking the books. After looking deeper, though, we think the company's failing score is more reflective of a unique business than of fraud or financial chicanery.

Plum Creek makes money from its timberland assets in one of two ways: It sells wood from its trees, or it sells off the land. As illogical as it may seem at first glance, sometimes this means doing nothing. For example, if management finds sawlog and pulpwood prices to be unacceptably low, Plum Creek simply won't sell its wood. Along the same lines, if real estate prices are irrationally low in management's opinion, the company is just fine with sitting on its assets. Because of the long-term mindset and asset-management nature of Plum Creek's business, it's difficult to compare the company's results from quarter to quarter or even year to year — its business picture differs dramatically in each reporting period.

While we think cash flow is important (and we love the company's fat dividend), the value of Plum Creek is derived from its timberland assets, and we don't think that value is easily tracked via GAAP accounting. As a result, we aren't concerned with its DSO, DSI, or depreciation schedules. When we dig deep into the company's filings, we find that the cryptic "other assets" category is mostly made up of "assets held for sale." Given that this is a legitimate part of Plum Creek's business, we're comfortable that this category doesn't represent anything fishy either.

The Foolish Bottom Line

As Foolish investors, we have to remain objective. It's important to make sure we aren't explaining away yellow flags because we're in love with a company or a thesis. In the case of Plum Creek, we're fully aware of the business pressures it faces as a result of nonexistent new-home construction and low timber prices. But beneath the bark, everything checks out. We'd be more concerned if a company that produces high-tech products, such as **Intel**, had rising DSO, DSI, and assets — its products become obsolete and outdated much more quickly. But the value of Plum Creek's wood is still good in our view.

Yellow flags can turn red in a hurry. At *Pro*, we're always on the lookout to avoid costly blunders, and we aren't afraid to sell if need be. We guard against these situations with thorough investigation of a company's financial statements and careful assessment of its management before we make each recommendation, but even we may be fooled (lower-case "f") from time to time. With periodic checkups and sober judgments, though, we can make significant progress in our aim to *primum non peccare*.

Write Covered Calls on GlaxoSmithKline

Published Oct 27, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") January 2011 $41 calls
- **Allocation:** Write one call for every 100 shares of GlaxoSmithKline owned (for *Pro*, that's 14 contracts)
- **Recent share price:** $39.20
- **Option price (bid/ask):** $0.80/$0.90
- **Preferred limit price:** Aim to split the bid/ask, recently getting about $0.85
- **Special requirement:** You must own at least 100 shares to write a covered call.
- **Alternate trades:**
    - **Don't own 100 shares?** The stock remains a Buy with a 5% yield, and you can own it without covered calls on it, too.
    - **Don't own any shares?** Buy shares directly; or write December 2010 $39 puts; or write January 2011 $39 or $37.50 puts.

What's New?

When we originally purchased **GlaxoSmithKline** (NYSE: GSK) in December 2009, we didn't expect fireworks from the U.K.'s largest pharmaceutical company, especially given its beleaguered state. But we did expect a good margin of safety, a growing 5% dividend, and the possibility of writing options on the position to generate more income.

The company has delivered on two counts: The stock has ultimately stayed in a close price range despite several product setbacks, including the downfall of diabetes drug Avandia, and the dividend has been hiked higher. Regarding the third part of our strategy, however, we've yet to pursue option income — until now.

Quarterly results last week were flat, but management expects better days given Glaxo's resilience through recent hardships. With most large patent expirations now behind it, the company can focus on growing in emerging markets and developing new products for mature markets. But both initiatives will take time.

Why This Strategy?

We're maintaining our fair-value estimate in the upper $40s but are beginning to write covered calls to align with our income objective on this position. The stock just went ex-dividend, meaning current shareholders will be awarded the next dividend payment on Jan. 6, 2011. Therefore, our January covered calls will expire before the *next* ex-dividend event in late January. That means our shares are safe from an early, dividend-related exercise of the covered calls while we collect extra option income along the way.

We plan to manage these calls actively, though, rolling them if the stock is higher than our strike price by expiration. We don't want to let GlaxoSmithKline go at too cheap a price, and we should be able to avoid that and still make some money along the way.

Here are the potential outcomes:

If:	Then:	*Pro* 's Take:
Shares are greater than $41 at expiration ...	Our position would be called away at an effective sell price of around $41.85.	Assuming we still want to own the stock, we would roll our covered calls before expiration, keeping our shares.
Shares are less than $41 at expiration ...	We keep our shares, and the option payment becomes income.	Great. Ideally, we can do this several times in 2011 — and however long we own the shares.

How to Follow Along

For a refresher on covered calls, please see *Pro*'s guide to covered calls. Remember, you write one call for every 100 shares you own. You may cover all of your shares or just some — we're covering all of ours. Here are the numbers:

- **Trade:** Write ("sell to open") January 2011 $41 calls
- **Recent share price:** $39.20
- **Recent option bid/ask:** $0.80/$0.90
- **Option yield (at $0.85):** 2.1% of the share price (in 86 days)
- **Upside to our potential sell price ($41.85):** 6.7%

Since we view Glaxo primarily as an income position, we're willing to write lower-paying covered calls not too far from the current share price, with the intention of rolling the calls if need be. The point is to get extra income started here in case the stock continues to trade sideways. Only if Glaxo soars well beyond $41 by January will the strategy backfire by capping our upside, and we consider that scenario very unlikely.

Writing puts? If you place the alternate trade and write puts, you're obligated to buy shares of Glaxo if they decline below your strike price and you don't take follow-up action. Glaxo put options pay fairly well.

To discuss our Glaxo trade, please visit its board. —*Jeff Fischer*

Sell to Close Puts on Kinetic Concepts

Published Oct 26, 2010 at 12:00AM

At a Glance

- **Action:** Sell to close November $35 puts
- **Recent share price:** $38.55
- **Option price (bid/ask):** $0.25/$0.30
- **Limit price:** Aim to split the bid/ask, or set a limit at the market bid. The clock is ticking!

What's New?

As we noted in our last update, **Kinetic Concepts** (UNKNOWN: KCI.DL) had us spooked. The company had posted two weak quarters, and other U.S. medical-device companies had posted lackluster results recently as well, with hospitals in the U.S. and governments in Europe both looking to rein in spending. Some of our fears were realized when Kinetic reported its third-quarter results on Tuesday — revenue came in below expectations, barely higher than a year ago. But Kinetic's earnings per share pleased investors, thanks to higher profit margins. The company spent less than expected on research and development (a timing issue), enjoyed a lower tax rate thanks to more product sales in international markets, and took advantage of the weak U.S. currency when turning foreign sales back into dollars.

All this spelled relief for investors, who sent shares up more than 5% on Tuesday, to more than $38. Barring any shocks, this news renders our protective $35 November puts unnecessary, and even though they bid little, we're going to sell them to recapture the remaining value. Meanwhile, we're keeping our January 2011 $39 covered calls in place for now. We'll manage those just like any covered call, looking to roll up (to a higher strike price) or out (to a later expiration month) before the January expiration if needed to keep our shares and upside potential.

Why This Strategy?

We set up our protective collar (writing covered calls and buying puts) to buy ourselves insurance against an earnings disappointment for essentially no out-of-pocket costs. With the earnings news behind us, that insurance is no longer necessary, and our goal now is to capture as much of the remaining time value in our puts as is possible while maintaining our upside on the shares.

The first step is to sell to close the puts we own for their residual value. The second step will be to manage our covered calls. Since Kinetic Concepts remains a Buy, and we currently don't want to sell our shares at $39, we'll look to manage our calls as need be. If the stock remains below $39 by expiration, the covered calls will expire and the whole protective collar will end with a small profit. If KCI rises above $39 before expiration, we'll look to roll the calls.

How to Follow Along

Today, simply "sell to close" the puts that you had earlier *purchased* (not written). There's no need to do anything else. If you only bought one or two puts, make sure they're worth selling after commissions are taken into account. If not, then you can keep them as very cheap insurance against any shock to KCI over the coming month.

The protective collar has served its purpose. Now, we aim to unwind it one part at a time. Please post any questions on the Kinetic Concepts board. *—Jeff Fischer*

Fools for San Francisco

Getting to Know You

By Nick Crow (TMFCrow)

Let's face it: I'm not Jeff Fischer. And since *Pro* and *Duke Street* members are remarkably intelligent people, I knew they would immediately pick up on that fact when I took the stage at last weekend's member event in San Francisco. I figured there was a real risk of being booed offstage, but even though members had to hear from me and Todd instead of Jeff, not one piece of fruit was thrown. In fact, our members were absolutely spectacular — greeting us warmly, asking many intelligent questions, and even passing along their compliments. I was humbled that so many people were profiting along with us. Most members seemed to match our portfolio very closely, and every Duke Streeter I polled said that *Pro* was their favorite service. (Oh, hi, *Duke Street*, how you doin' over there?)

Live From San Fran ...

If you missed our member event in San Francisco, you can check out the PDF of the accompanying slides right here!

Earnings on Deck

- Today: **Plum Creek Timber**
- Tuesday: **Kinetic Concepts**
- Wednesday: **Procter & Gamble**
- Thursday: **GrafTech International**

Coverage & Community

- Bryan talks **Tupperware**here.
- Bruce sheds light on **GlaxoSmithKline**.
- Jeff discusses the **TradeStation** thesis and Todd analyzes costs.
- TMFEldrehad explains how accuracy ratings work in CAPS and why they're important, despite their imperfections.
- alex340 posts puts and calls that match *Pro* criteria.

For me, the most enjoyable part of the event was meeting our members and putting faces to screen names. The first members I met at our happy hour came from as far as Fairbanks, Alaska. That really put the pressure on — when people travel to hear from you, it's especially important to make that trip worthwhile.

We fully intend to have more member events in the future, but for those of you who couldn't make it to this one, let me run through the Foolish presentations:

After kicking off the event, *Duke Street* advisor Rich "I Like Big Moats" Greifner taught an awesome class on the sources of competitive advantage. With an abundance of wit and audience participation, he covered economies of scale, network effects, intellectual property, and switching costs. (**Autodesk**'s investor relations guy must have wished that this class had come *after* his presentation, because he later fumbled his answer to a member's question on competitive advantage. Fortunately, another member clued him in on the idea that, once a customer is trained on the company's software, Autodesk benefits from high switching costs.)

To kick off *Pro*'s portion of the agenda, Todd gave a presentation called "We're Defensive, Not Apocalyptic" describing *Pro*'s outlook for the economy. His argument hung on a headwind-and-tailwind framework. The headwinds — such as lingering high unemployment and continued problems in the housing market — have generally been well-covered by the media, but Todd gave even more insight into these ideas with excellent graphs and commentary.

Recent events have made everyone and their mother experts on macroeconomics (*Pro* members even more so than the average!), and audience members had fun trying to pick Todd apart, lobbing unanswerable questions like "Will the market go up or down?" and "Will we have inflation or deflation?" that I think were designed just to see how well Todd could dance. Always a show-stopper, Todd answered each of these queries with a detailed version of "it depends" that elucidated the complications of trying to forecast the un-forecast-able.

I was up next, and luckily for me, the audience turned out to be hungry for more education on options. In a presentation called "Why Use Options?," I explained four options strategies, illustrating them with companies familiar to *Pro* and *Options* members. Each strategy was designed to either buy stock lower, sell stock higher, earn income, hedge, or profit from leverage. The real highlight, at least for me (and hopefully for the members who asked questions!), was the robust question-and-answer period.

Million Dollar Portfolio lead advisor Ron Gross also joined us in San Fran, leading a discussion on portfolio construction. He offered a timely update on **Infinera**, whose shares had plunged 35% just a few days earlier. He assured investors that the market had overreacted and that this was a great *MDP* "Buy First" stock, but that it was not without risks. (And after a 35% drop in one day, was there any doubt?)

We had a wonderful time meeting members, and we're already hearing feedback that the members enjoyed it, too. Nothing is more gratifying than spending time with fellow *Pro* Fools — we hope to see you in the audience next time.

Intel and Autodesk Meetings

By Todd Wenning (TMFPhila)

In addition to spending time with *Pro* Fools in San Francisco, we also had the opportunity to meet with representatives from two of our portfolio companies, **Intel** and Autodesk. Together, these two represent more than $150,000 in market value for our portfolio, so suffice it to say that we were really looking forward to these meetings.

On Thursday morning, we headed over to Autodesk's beautiful downtown gallery, which shows off the many ways Autodesk software touches lives — from the buildings we live and work in to the cars we drive and the movies we watch. It was an impressive display, to say the least. Still, we tried not to let the enormous Lego dinosaur or the *Avatar* exhibit distract us from the business at hand.

The issue I most wanted to address in the meeting was software piracy, and to their credit, the Autodesk representatives we met were forthcoming about the issue, even describing a scavenger hunt they conducted in Bangkok, Thailand, to find the cheapest knock-off of AutoCAD they could find. (In 20 minutes, one guy found a $10 version of a $15,000 piece of their software.)

As alarming as that may sound, management believes that the dispersion of pirated versions of their software is actually helping them gain acceptance in emerging markets, much as it did for **Microsoft**'s Windows years ago. In addition, as nascent companies become legitimate, they also want legitimate software, and Autodesk works with them to transition from pirated versions to the real thing.

Both Intel and Autodesk gave presentations at our member event on Friday. (Much of what we heard from Autodesk on Thursday was repeated at the member event, so I won't cover it again here.) Just about everyone I spoke with after the meeting came away impressed with the Intel presentation — and impressive it certainly was. Among other things, the Intel representative showed how the company's processors were technologically one to two years ahead of competitors' chips and how embedding McAfee security directly into the silicon chip will vastly improve upon current security standards.

Our biggest question for Intel was why it effectively exited the mobile device business in 2006, only to work toward getting back in the game today. The representatives' response, in short, was that at the time, they didn't yet have enough production capability to efficiently manufacture tiny processors alongside the larger processors used in PCs and servers; today, on the other hand, they do. I'm sure there's some regret within the company that they didn't stick to mobile over this period; however, it does sound like they are better prepared to ramp up production today.

Overall, the two meetings confirmed our current strategies regarding both companies. Intel, with its strong competitive advantages, massive cash-flow generation, and healthy 3.2% dividend, deserves to be a cornerstone of our portfolio, while Autodesk — though it's technologically astounding — is best left as a hold in combination with a covered-call strategy.

Bring your questions and comments to the Memo Musings discussion board.

Todd owns shares of Microsoft, TradeStation, and Kinetic Concepts. The Fool owns shares of Infinera and Microsoft.

If You Didn't Go to San Francisco ...

Published Oct 25, 2010 at 12:00AM

... Be sure to put some PDFs on your screen. Actually, even if you *did* join us at our member event in San Francisco on Oct. 21 and 22, you might want to take a look at this PDF of the slides that accompanied our presentations. Enjoy!

Set Up a Protective Collar on Kinetic Concepts

Published Oct 21, 2010 at 12:00AM

At a Glance

- **Actions:** Write January 2011 $39 calls; buy November 2010 $35 puts
- **How many contracts?** Buy enough puts to protect all of your Kinetic shares, then write an equal number of calls. For *Pro*, that is 18 puts and 18 calls.
- **Recent share price:** $36.57
- **Option prices (bid/ask):**
  - **January 2011 $39 calls:** $1.15/$1.30
  - **November 2010 $35 puts:** $0.80/$0.95
- **Limit price:** Use limit orders at or near the current market prices. Because we'll earn more for writing the January calls than we'll pay for the November puts, this protective collar should result in a small net credit.
- **Alternate trades:**
  - **Don't own 100 shares?** Strap in and sit tight. Kinetic is still a value, rated Buy.
  - **Don't want to partake in both parts of this trade?** You can choose just one or the other — either write the covered calls for a small price cushion, or buy the puts for protection. You could do neither and just continue to hold your shares. Or you could protect just some shares.

What's New?

Halloween is just around the corner, but it's **Kinetic Concepts** (UNKNOWN: KCI.DL) that has us a bit spooked. Although not blood-curdlingly horrible, the company's past two quarters were less than stellar. Management blamed hospital and government austerity measures, price competition in Europe, and poor currency exchange rates, among other factors, and the weak performance drove the company to modestly lower full-year sales and earnings guidance in July. We wonder if that will be the last time we see a warning flag.

Too often, one quarter's disappointment can lead to another. Kinetic is set to announce third-quarter reports before the stock market opens on Oct. 26; investors are already sensitive to bad news thanks to the recent adverse patent ruling, and a third earnings whiff in a row would leave Kinetic wounded, so we want to protect our shares just in case. We recommend protecting the downside on your shares of Kinetic by establishing a protective collar.

Why This Strategy?

There are two parts to establishing a protective collar. To protect ourselves on the downside, we purchase put options. And because we're cheap, we then write covered calls with a longer expiration and higher strike price, which bring us income to pay for our puts. In other words, we protect our downside and retain access to more upside. This is no trick; it's nearly all treat.

We're choosing to write covered calls that expire in a few months so we can ensure the premium will be sufficient to finance the purchase of protective puts. The puts, meanwhile, expire in just a month — long enough for the market to digest Kinetic's earnings and come to grips with the recent court ruling.

If ...	Then ...	*Pro* 's Take
Shares are below $35 at the November put expiration	Our puts will have value, offsetting a decline below $35 in the stock.	Since we're taking away the cost of the puts (by writing calls), any value they have is upside. If Kinetic falls, we're protected below $35.
Shares are above $35 at the November put expiration	If we still own them, the puts will expire without value.	Our covered calls paid for the puts, so this is fine — we have no net loss. Our attention would then be on our covered calls.
Shares move above $39 before the January call expiration	Our covered calls will be in a position to make us sell our shares.	We'll consider rolling or closing our covered calls if we want to keep our stock.

The main risk to our strategy will appear if Kinetic's stock moves higher than $39; at that point, we'll start to miss out on upside. It's unlikely we'll want to sell at $39 if the business remains healthy, so if the stock does exceed $39, we'll look to roll our covered calls or close them out. How likely is that outcome? The currency situation has improved since management's last comments, with the euro recovering lost ground, but other than that, it seems unlikely Kinetic will surprise strongly to the upside this quarter. As always, though, you never know!

How to Follow Along

It doesn't matter whether you write the covered calls or buy the puts first, but *please* use a limit order for each trade. Cover all of your Kinetic shares by purchasing puts, and write an equal number of calls. Use a limit price near the current bid (to write calls) and ask (to buy puts) — or try splitting the bid/ask.

Trades

- **Write ("sell to open") January 2011 $39 calls, recent bid/ask:** $1.15/$1.30
- **Buy ("buy to open") November 2010 $35 puts, recent bid/ask:** $0.80/$0.95
- **Amount**: Purchase one put for each 100 shares of Kinetic you own, and write an equal number of call options.

If Kinetic's stock price disappoints and falls to $33, for example, our $35 puts will be worth $2 per share, covering most of the stock's drop. On the other hand, if it jumps to $40, we'll need to take follow-up action on our written calls to keep our shares.

This is our first protective collar, so read up on the strategy if you need a refresher, and please post any questions on the Kinetic Concepts board.

—Jeff Fischer

Go-To Resources From the Pro Team

Published Oct 20, 2010 at 12:00AM

Updated Feb. 1, 2012

Dear *Pro* Fool,

We've put together this list of resources to serve as an overview of the content available on the *Pro* site and as an easy reference guide you can use anytime you find yourself feeling stuck. (Of course, if you're just hungry to know everything there is to know about *Pro*, it can help with that, too.) To share suggestions or let us know what you think, please visit the Member Suggestions & Help discussion board.

Onward!

A Brief Overview

Here's what you'll find on the *Pro* site:

- **Home :** Start here to get a roundup of anything new on the site. The "carousel" at the top will feature the content we think is most important to share with you, and you can always find our latest memos, features, and alerts using the tabs below it.
- **Recommendations :** View our portfolios and find out how our stocks, ETFs, and options are performing; get transaction details; and see Buy First, Buy, Hold, and Sell guidance at a glance.
- **Alerts & Coverage :** See the very latest alerts, Monday Memos, and other features, and access the full archives of each. (Of course, we'll email you anytime there's an exciting new feature to share.)
- **Community :** Our discussion boards are home to investors of all levels, from beginner to expert. *Pro* Fools come here to talk stocks, share advice, and have fun.
- **My Scorecard :** Use this customized tracking tool to see how your stocks are doing and access analysis of your favorite companies.

You'll also receive email from us. Here's what to expect in your inbox (you can customize your email settings here):

- **"Trade Alert" emails:** We announce all of our trades *before* we pull the trigger so you can act before we do. We send these alerts at any time during normal market hours. Trades always come with a full report that explains our thinking. After we announce a trade, we wait one to 30 days to make the trades for the *Pro* portfolio.
- **Monday Memos:** Stay on top of *Pro* happenings — every Monday at 4 p.m. ET, we'll send you stock news, market insights, community highlights, and more.
- **Guides, Audio Extras, special updates:** Become a better investor! Learn about *Pro*'s strategies, listen to the team talk stocks, and get the latest on happenings in your portfolio.

Our Mission and Philosophy

Pro's mission is to earn members consistent, recurring profits with a high level of accuracy. Using a combination of long and short stocks, options, and ETFs, we aim to meaningfully increase the real purchasing power of capital over every rolling three-year period and to double our real purchasing power every 10 years. The *Pro* team (meet Jeff and the gang here) is accomplishing this by investing $1 million of the Fool's real money.

Our North Star

Our North Star is a guide for our investing behavior. Like the real North Star, we can use it to navigate. It is not a destination; rather, it's an omnipresent fixture that offers us direction and reminds us of what we're striving toward. ***Pro*'s North Star = inflation (as measured by the Consumer Price Index) + 7% annually.** Click here for much more on our North Star.

Buy Sprott Physical Gold Trust

Published Oct 19, 2010 at 12:00AM

At a Glance

Portfolio Manager's Corner: We've owned silver in the past here at *Pro*, so we're no strangers to the value of holding precious commodities. The granddaddy of shiny metals, gold — which is as divisive an investment as any — will serve the portfolio as a kind of "short sale" on government policies. If currencies continue to lose value because of debt and inflationary policies, then gold should appreciate. On the other hand, if investors regain confidence in major currencies, then gold will likely stagnate or decline — but our stocks will gain value. It's best to view gold as another form of currency: a place to put some cash to protect against dollar devaluation. Gold also hedges our new **TradeStation Group** (NASDAQ: TRAD) stock. If interest rates decline, TradeStation will suffer, but gold should gain value, and vice versa. Enjoy Andrew Sullivan's first *Pro* report, and then join in the discussion on the board. *—Jeff Fischer*

- **Action:** Bought 3%
- **Preferred buy price:** Around $12 or lower, and around a 4% premium or lower to net asset value (found here)
- **Type of holding:** Insurance/defensive
- **Why buy:**
  - Protect capital from currency devaluation
  - Hedge against inflation
  - Diversify with a commodity that doesn't always correlate to market indexes

The Big Picture

By Andrew Sullivan, CFA

Gold is the classical music of finance: Modern thinkers often consider it boring and out of date, but its intrinsic beauty never goes away. Assets like stocks, bonds, and mortgages usually outperform gold, it's true, but the precious metal always has value. And it does outperform other investments at times — in fact, it has done just that for the past decade. If you're seeking full diversification and stability against economic hardship, gold can have a place in your portfolio.

Gold protects against the decline of the dollar and inflation, both of which appear likely, if not inevitable. A decline in the dollar's buying power is particularly probable; a weak dollar is stated Treasury Department policy, and our national budget and trade deficits will likely lend heft to such a decline. Meanwhile, the Federal Reserve is so scared of deflation that it actually wants inflation, something that's rarely happened before. The Fed is aiming for estimated annualized inflation of 1% to 2%, and it has the tools to make this happen. America's money supply is not tied to a fixed quantity of gold or silver, and this kind of system tends to be highly inflationary.

Unlike paper currency, gold bullion is ideal for protection against economic collapse — and as a currency in its own right. Its "hard" money characteristics are one reason why we wouldn't be surprised to see the return of gold-backed currencies in the future, especially if confidence wanes in key currencies like the U.S. dollar, the British pound, and the euro. Fortunately, as investors, we can own gold directly — and cheaply — through the **Sprott Physical Gold Trust** (NYSEMKT: PHYS) fund.

Our Vehicle

There are many ways to invest in gold, including the physical material itself, mining companies, mutual funds, and exchange-traded funds. The most attractive and direct option is simple physical gold, and luckily, there's a vehicle that makes such an investment easy: Sprott Physical Gold Trust, a closed-end fund that invests almost all of its assets in gold bullion. That bullion is stored at the Royal Canadian Mint, and the fund's shares trade on the New York Stock Exchange.

How It Works

Sprott is a trust but is similar to a closed-end fund in that its units trade on an exchange. Shares can therefore trade above or below net asset value (NAV). Since Feb. 25, the premium has ranged from 0% to 24%. Unlike most closed-end funds, the trust has the ability to offer new units, but we expect these offerings won't meaningfully dilute existing holders. Learn more about Sprott on its website.

Sprott's trading on an exchange is certainly convenient, but it also means its price can rise above or below its net asset value (NAV), suggesting it might not track gold perfectly. We're not worried, though; since its inception in February, its premium to NAV has ranged from 0% to 24%, with an average of 8% to 13%. At $12, you're buying at about a 4% premium, well below the average. We have more upside than downside here; it's unlikely that the premium would go much lower before opportunistic buyers stepped in. In addition, a slight premium seems fair given that transaction costs with a gold dealer would be at least 4%.

It's also possible that this investment might not track gold perfectly because of expenses and fees. But it's important to note these costs are low compared with the cost of a safe-deposit box, for example, or of insurance if you own gold at home. Annual expenses and fees at Sprott are only 0.65%, even lower than those of the popular **SPDR Gold Trust** (NYSEMKT: GLD) ETF.

We've chosen Sprott over well-known exchange-traded funds (ETFs) like the SPDR Gold Trust and **iShares Gold Trust** (NYSEMKT: IAU) for three reasons. First, the tax rate on the sale of those ETFs is 28%, compared with a potential 15% for Sprott (see below). Second, individual investors are able to withdraw actual gold from Sprott, unlike the SPDR and iShares offerings. Third, we judge counterparty risk to be much higher with the others. (That means that when push comes to shove — if there's a run on gold, for example, or a global currency collapse — if you own the SPDR Gold Trust or iShares COMEX Gold Trust, you might not have claim to as much physical gold as you think.)

As mentioned, there's a potential tax benefit with Sprott: If you make a Qualified Election Fund (QEF) election and hold them for more than a year, your Sprott units may be taxed at 15%, rather than the 28% rate that applies to gold bullion. (The trust is based in Canada, and Canadian withholding taxes may apply to distributions, if any. See here for more details, and consult a tax advisor if necessary.)

Valuation

A good way to measure the relationship between gold and the dollar is to divide the market value of the United States' gold reserves (currently 8,133.5 tons) by the money supply — the total number of dollars in circulation. A higher percentage suggests high uncertainty (and fear). This index usually hovers in a range of 2% to 4% but has reached a high of 12% in the past (1980). Today, even after gold's steady rise to more than $1,300 per ounce, it stands at just 4%. In other words, we are nowhere near prior highs, because the increase in the price of gold (the numerator) has been more than outmatched by a record high increase in the money supply (the denominator).

Beloved for Centuries

In ancient Egypt, gold was used primarily for religious purposes, as a divine symbol of the sun. It was first used as currency in modern-day Turkey by King Croesus of Lydia in the 6th century B.C.

We also need to remember that the "record high prices" we're reading about are misleading, because gold's former high of $850 in 1980 isn't adjusted for inflation. That number would be close to $7,000 in today's dollars when using the original consumer price index (CPI) methodology and about $2,200 when using revised methodologies. In other words, we aren't even close to the inflation-adjusted highs we reached in 1980 — we're 70% below them. All that aside, history is on the side of gold. Currencies come and go, and debt-laden governments are backed into a corner today with record deficits. As long as that remains the case, gold could slowly rise as a store of value. We'll have plenty more to say on gold's price on Sprott's discussion board.

What Would Make Us Sell

Gold is a speculative investment; it offers no yield and no guarantee of its future selling price. You should view it the same way you'd view owning any hard currency. Don't confuse gold with an investment *per se*; instead, think of it as a place to hold wealth until you're ready to invest in something else. In that sense, holding gold is like holding cash — except hopefully much better, since cash is being devalued. Also, remember that ownership of a strong business is better than gold, because high-quality equities should increase in price with inflation — that's why *Pro* urges you to maintain a diversified, equity-based portfolio alongside your gold holdings.

Our risks include:

- Timing (gold prices could fall or stagnate for years)
- Interest-rate hikes, which we expect will come eventually and which will make gold less attractive compared with dollars
- Increased gold scrap-metal supply bringing more gold onto the market
- Government confiscation or taxation of gold
- A possible collapse in prices (a possibility with any commodity bull market)
- Underperformance in a crisis (gold declined along with stocks in 2008, for example)

We would likely recommend that you sell your shares if fear or uncertainty builds into a crescendo over several quarters or years, sending gold much higher. Or we may advise you to sell if world economies and currencies stabilize and gold thus seems less necessary as a hedge. Finally, we may suggest you cap your losses if gold falls more than 20%. A 20% loss on a 3% position would ding the portfolio 0.6% overall. We'll keep our eye on potential inflation, the state of currency, central banks' actions, and mining supply.

Pro Bottom Line

The Community's Take

Sprott Physical Gold Trust scores four stars out of five on CAPS, with 46 of 50 All-Star members expecting outperformance. To learn still more about Sprott, visit its website.

We're recommending gold to protect some of our dollars against inflation and currency depreciation; it can also serve as insurance against another financial crisis. On an inflation-adjusted basis, gold isn't anywhere close to its historical highs, and yet currency risks are probably greater today than at any time in recent history, and the monetary supply continues to rise. All this makes us confident that this is still a logical time to shift some wealth away from paper and into gold.

To discuss Sprott Physical Gold Trust, please visit its discussion board.

New Investment Ideas Headed Your Way

Published Oct 18, 2010 at 12:00AM

As we shared with you in September, the *Pro* team added three new analysts in recent months in order to better serve the growing service and our growing portfolio. All of us — new analysts and old-timers alike — are excited about making *Pro* better, stronger, and more robust, and we've spent a lot of time figuring out how we can best work together to achieve that end.

I've been investing the *Pro* way for several years, so I'm comfortable with how well this full-portfolio solution works over time. Now, every analyst on the team brings something different that we can incorporate — and this means a wider range of individual strengths dedicated to bringing high-quality investment ideas to you and to the *Pro* portfolio. Of course, every step of the way, we're focused on staying true to our mission of earning steady returns with reasonable risk and high accuracy.

Guidance Changes

- **Tupperware** moves to Hold on valuation.

Visiting *Pro* Companies

- Todd Wenning and Nick Crow head to California this week, where they'll meet some Fool members — and visit with execs from **Autodesk** and **Intel**. We look forward to their report!

Earnings on Deck

- Oct. 21: Tupperware and **TradeStation Group**
- Oct. 23: **GlaxoSmithKline** and **Caterpillar**

Coverage & Community

- We summarized **Intel**'s Q3 conference call and results. The stock is in the doghouse — but is it deserved?
- It's getting busy. TMFValuemoosie posted an earnings calendar for past and present *Pro* stocks.
- Alex340 posted interesting put writing opportunities and covered call possibilities on *Pro* stocks.
- TMFEldrehad moves up to the No. 2 ranking across all of CAPS! And other stars appear, too.

"Be a Fool" Contest Update: New Deadline

Still interested in winning a free trip to Fool HQ? Good news! We're extending the deadline on our "So You Want to Be a Fool" contest to Oct. 28. Submit a writeup on a stock not on our scorecard for a chance to win an all-expenses-paid trip to our *Million Dollar Portfolio* member event in December. See the revised rules here!

People sometimes whisper that I know every industry inside and out, that I can read a company's return on equity in its CEO's eyes, and that I never sleep. Well, those rumors — while flattering — aren't actually true: There are industries and investments I don't follow or know well. But now there's an even better chance someone at *Pro* may know them front to back, providing us with a clear avenue into new areas. That means broader diversification, more coverage, and the ability to cash in on opportunities that we might otherwise miss. Plus, our ideas are stronger and our theses more solid because of the additional perspective each analyst brings.

After the secret *Pro* initiation ceremony (involving candles, a cliff ledge, and a hair clipping from Warren Buffett), I asked each (surviving) new analyst to share his absolute strongest investment idea. These are smart guys, so they will have many great suggestions through the months — and I want to hear the ones they are *most* passionate about right now. They're working on just that, and in each case, if the idea passes muster and there's a sensible place for it in the portfolio, then we'll work to move forward with it and get it issued to you. Of course, not every idea will pass the test, but if an analyst fights hard to recommend something he strongly believes members should own (or short), he will naturally have every chance to be heard. That's why he's on the team. When it's for *Pro*'s benefit, a strong argument may put us into ideas we wouldn't have otherwise considered.

Where the Ideas Are

The first of these new ideas will roll out to you soon, with a new trade alert from Andrew Sullivan (TMFRedwood). This is just the start of the research and recommendations to come as Nick Crow (TMFCrow), Bryan Hinmon (TMF42), and Andrew work to put their stamp on the *Pro* portfolio.

You should know that Bryan has already brought **Bristow Group** and **Broadridge Financial Services** into the *Pro* fold. (Both are solid companies that just happen to start with “Br,” just like “Bryan” … coincidence?) Over the last two years, too, Todd Wenning (TMFPhila) suggested many of *Pro*'s featured companies, from **Kinetic Concepts** to **Lindsay** to **Plum Creek Timber** and others. Our Australian correspondent, Bruce Jackson (TMFGoogly), brought us **GlaxoSmithKline** and **Medtronic**. (Often, I'll add options strategies to the stock ideas presented.) All that said, a majority of our holdings (some 60% — or 23 of our 39 tickers) have been my sole original brainchild (or mistake!). And now that our team has grown, I should have even more time to add original ideas.

Finding new ideas and strategies is one of the things I enjoy most about investing. (The other is the *Pro* community, and I hope this larger team will give me more opportunity to talk with you on the discussion boards.) Selfishly, I want the best ideas in the portfolio to be my own, and the new *Pro* analysts want the same for theirs. This is the kind of healthy competition that's mutually beneficial for all of us, and for you as a member. Still, we'll always require that every recommendation we issue makes sense in a portfolio context; serves a need among our holdings; and matches our mission and philosophy at least 95% of the time. (Sometimes we may deviate for special situations — *Pro* can, and should, remain open to anything. But we expect those to be few and far between.)

Working Together to Prosper

To sum up, *Pro* remains a cohesive service with a single portfolio manager, and our growing pool of talented analysts is widening our landscape. This promises to make the service stronger, more diverse, and more nimble. Meanwhile, the team and I always need to keep a close eye on the macro events going on in the world. We need to keep up on whether we want the portfolio to stay mostly long, as opposed to going much more short; to be clear on when to sell stocks and which ones; to know when to do more hedging; and so on — the same research we've always done, but with even more minds behind it. (For the record, since 2009, it has paid to be mostly long, as we have been.)

Enjoy the new investment recommendations we'll be sending your way soon! And remember to stay diversified. Aim to match the *Pro* portfolio as well as you can, since we diversify for a reason.

To discuss the Memo, please visit the Memo Musings board.

Foolishly,

Jeff Fischer

Jeff owns shares of GlaxoSmithKline.

Roll Your Covered Strangle on Papa John's Pizza

Published Oct 14, 2010 at 12:00AM

At a Glance

Written by Nick Crow

- **Actions:** Buy back ("buy to close") your original October 2010 $25 calls. Using a strangle order, write ("sell to open") April 2011 $25 puts, and write ("sell to open") April 2011 $27 covered calls. (We also wrote $22.50 October 2010 puts as part of our original covered strangle, but we are leaving those alone because we expect them to expire worthless. See below for more details.)
- **Recent share price:** $26.90
- **Allocation:** We are covering all of our shares in Papa John's, about half of our targeted 5% allocation, and we're writing puts to potentially buy the other half.

Got Questions?

Please visit our guide to strangles for more on the strategy, and feel free to ask away on the Papa John's or All About Options discussion boards!

- **Alternate trades:**
  - **If you don't own Papa John's:** We suggest writing one leg of this strangle, the April $25 puts, and aiming for a payment of $1.20 per share or more.
  - **If you own at least 100 shares but don't want to buy more:** You can just write the covered-call side of the strangle, which will bring you income.
  - **If you don't want the obligation of holding two sets of puts on Friday, Oct. 15:** Either buy back ("buy to close") both legs of your original strangle first, or just close the covered-call leg, let the puts expire, and wait until Monday, Oct. 18, to reestablish the covered strangle.

What's New

When we first bought shares of **Papa John's International** (NASDAQ: PZZA) in August, we set up a covered strangle. As we explained at the time, this strategy entails buying the stock itself, writing puts to potentially buy more shares cheaper, and writing covered calls to potentially sell our existing stock higher. The shares have appreciated nearly 13% since we bought them, quickly outpacing the market. While this is a welcome outcome (though it's too short-term to warrant excessive celebration), there's a downside as well: We're now at risk of losing our shares, because they're currently trading above our written calls' strike price. Since we like the slow and steady nature of this pizza purveyor, we think we can capture more upside by rolling our calls and keeping our shares.

Pro member thinkingman99 recently posted a poll on the *Pro* discussion boards asking what members thought we'd do, and about 90% of those who responded said they expected us to allow our shares to be called away at the end of this week. It's nice that we're still able to surprise some of you more than two years into this journey!

Why This Strategy?

Rolling the covered strangle is a low-risk way to continue to earn income on Papa John's, a company that just recently joined the *Pro* portfolio. We'd rather not let our calls be exercised at the $25 strike price, because we can roll our covered strangle (in other words, renew our current strategy) for a $2.80 credit. The resulting new covered strangle offers us $29.80 as a potential net sell price, 13.7% better than the original $26.20, and is at the top of our conservative valuation range.

The Math	The Numbers
Payment received for writing October $22.50/$25 strangle	$1.20
Cost to "buy to close" October $25 calls	($2.00)
Net cost to close October calls	**($0.80)**
Payment received for writing April 2011 $25/$27 strangle	$3.60
Total net credit from "rolling up"	**$2.80**
New net sell price if called	$29.80
Original net sell price if called	$26.20
Return from "rolling up" (excluding commissions)	**13.7%**

How to Follow Along

We recommend that you:

- **Buy back ("buy to close") the October 2010 $25 calls for around $2.** (You can leave your October 2010 $22.50 puts alone; we expect those to expire worthless this Saturday.)
- Then, using a strangle order, **write ("sell to open") April 2011 $25 puts, and write ("sell to open") April 2011 $27 covered calls.**

Remember: To write a covered strangle, you must own at least 100 shares of the stock, and you should be happy to buy at least 100 more at a lower price. In this case, write one covered call for every 100 shares of Papa John's you own, and write one put for every 100 additional shares you would be willing to buy.

Trade Details

- **Use limit orders:** These bid/ask spreads are wide, so aim for execution around the midpoint of each.
- **Recent options bid/ask (as of Oct. 14):**
  - Sell to open April 2011 $25 puts, $1.30/$1.70
  - Sell to open April 2011 $27 calls, $2.15/$2.45
- **Combined credit target:** $3.60 or so per share, net credit (use a strangle order)
- **Effective options yield:** 13.4% of recent share price ($26.90) in six months; half that on the full potential purchase
- **Potential net buy price of new shares:** $22.20 (17% below current price)
- **Potential net sell price on our current shares:** $29.80 (10.8% above current price)

Keep in mind that anytime you write puts, your broker sets cash or equity aside to cover your potential stock purchase. In this case, these $25 puts pay a 5.6% yield on cash set aside over the next six months. If Papa John's stock is between $25 and $27 on expiration, both options will expire for the full cash gain, allowing us to renew this strategy once again.

4 Tips for Investing Success

Published Oct 11, 2010 at 12:00AM

When it comes to knowing our companies well and keeping up with each, we have you covered. Our recent Thesis Review is just one small part of the steady work we do to ensure we know our investments inside and out — and to share that knowledge with you.

But while knowledge is undeniably important, there's *another* side to investing that you need to master: your emotions. How you think about investing drives your approach to the subject, which feeds your investing behavior, which in turn brings you success or failure. So it's important that you have a level head as you make your way through your investing career. The following tips will help you keep calm, whatever the market throws at you.

Options Expirations

- Oct. 16: **Papa John's International** covered strangle. We plan to let it be exercised but will of course alert you if this changes before Friday.

Earnings Ahead

- Oct. 12: **Intel**
- Oct. 19: **Tupperware**
- Oct. 21: **GlaxoSmithKline** and **Caterpillar**

Community & Coverage

- Read our summary of **Oracle**'s recent record-strong quarter.
- Alex340 posted puts that meet Pro guidelines and calls that do, too.
- BrokeInTheBurgh makes his 500th board post both epic and educational.
- Bryan (TMF42) follows up on TPap's live chat question about the management pay structure at **Ebix**.
- Todd (TMFPhila) waxes macro.
- Russell (TMFEldrehad) revisits "Stocks in the Doghouse" on CAPS — and the big gainers you can find there.

Tip No. 1: Diversify

Being diversified is the only way to achieve success over the years. Owning various sectors and assets ensures you'll have exposure to any that do well — and at various times, most of them eventually will; you just don't know when. Nearly as important, diversification gives you peace of mind. If your portfolio is too concentrated, volatility can shake your confidence at the worst times. To that end, the *Pro* portfolio is made to work as a whole; you should own as many of its positions as you can. For proper diversification, we suggest owning at least 12 stocks across various industries, as well as some stock-based ETFs. Once you own more than a few dozen stocks or so, the benefits of diversification can start to diminish.

Tip No. 2: Accept Losses

You should diversify because you never know which positions will do well and which won't. You will always have losers when you're investing in stocks; what's most important is how your portfolio performs overall, despite those losses. Peter Lynch said, "In this business, if you're good, you're right six times out of 10," suggesting that 40% of your investments will lose money. Don't beat yourself up about that; it's just part of investing. Focus on how your portfolio does as a whole, learn what you can from your losers, and move forward happily when you have profits overall. The bottom line is that losses are an inevitable part of the landscape. You can't keep them from happening; you can only control your reaction when they do.

Tip No. 3: Have a Three- to Five-Year Time Frame

Any time you buy a stock or stock-based ETF, be thinking in terms of at least three to five years. You may not end up actually holding the investment that long, but every step along the way, you should be thinking, "Is this something I want to own in the next three to five years?" If you lack a meaningful time frame, you're gambling on short-term outcomes that you can't control. The longer you give a healthy business to perform, the more "control" you have over the outcome.

Tip No. 4: Follow the 20% Rule

When I worked with Tom Jacobs, now the advisor for *Motley Fool Special Ops*, I heard this rule from him. He in turn had heard it from former hedge-fund manager (and returning Fool) Matthew Richey, and it was originally put forth by Bernard Baruch: You'll rarely buy or sell a stock within 20% of the bottom or top of its price range, so aim to make money in the larger, safer 60% "middle" range instead. This rule helps you make rational investing decisions — without fretting about missing the top or grabbing the very bottom. Logical, calm investing leads to a higher rate of accuracy, and we're aiming for accuracy of at least 75% — well above Peter Lynch's guideline. We're better equipped to meet, and surpass, this goal when we go after the "sweet spot" in a stock's price range, rather than wasting energy trying to be perfect market-timers.

Always Be Ready for the Fat Pitch

Sometimes, investing is about earning steady returns while waiting for that really fat pitch that puts your returns far over the top. While you're waiting, you want to keep your portfolio growing gradually, so you can succeed even if that fat pitch doesn't come along. But if you stay in the game, you're likely to encounter a handful of fat pitches every decade — and they can make a large difference.

Add It All Up

Follow these four tips, and you'll be well on your way to becoming a calmer and more successful investor. At *Pro*, we're investing to make money as steadily as we can with reasonable risk. Mistakes don't make us lesser investors. In fact, learning from them actually makes us *better* investors. What matters most is our total return, but it's also important to enjoy the process.

Trades en Route

Pro is working on several new trades for the coming days and weeks. As always, you'll first receive our "Trade Alert" email, with a full report on the company in question and an explanation of why we've chosen our position. We'll then have 30 days to make the trade ourselves; when we do, you'll receive our "Trade Complete" email. We look forward to continuing our journey together — so be patient, understand each investment, and enjoy the process!

Please visit the Memo Musings board to comment or share *your* tips for your fellow *Pro* investors.

Jeff Fischer (TMFFischer)

Jeff owns shares of Oracle.

Portfolio Survival

Published Oct 4, 2010 at 12:00AM

In his book *Deep Survival: Who Lives, Who Dies and Why,* Laurence Gonzales paints the ability to survive as a philosophy as much as a set of skills. A mix of fascinating science and thrilling anecdotes, the book is a great read for investors even though there isn't a lick of finance in it.

Fresh on the heels of our *Pro* thesis review, we've decided to engage in some portfolio survival training ourselves. How should you react to new information, guidance changes, and prime avalanche conditions? Well, we're glad you asked …

Guidance Changes

- **MELA Sciences** moves to Hold today pending a possible strategy change on our part.
- **ProShares Short S&P 500** moved to Sell last week. We've moved **U.S. Natural Gas Fund** ETF to Sell as well, as we look to close all our positions in it.
- **Ebix** , **NextEra Energy**, **Oracle**, and **Procter & Gamble** moved to Hold in our thesis review. **Quanta Services** moved to Buy.

October Expirations

- Our **Papa John's International** covered strangle expires Oct. 15. We'll announce any trade adjustments before then.

Trades Completed

- We sold our remaining shares of **Lindsay** and bought shares of **TradeStation Group**.

This Week's Special Event

- We're having a live chat about our thesis review on Wednesday, Oct. 6. Set your reminder!

Coverage & Community

- October earnings are already here! TMFValuemoosie posts an earnings calendar for past and present *Pro* stocks. Kicking things off: **Intel**(Nasdaq: INTC) on Oct. 12.

- Always helpful, Alex340 posts puts and calls that meet *Pro* criteria. For example, there are put-writing opportunities available on Ebix.
- Member cindyjeffsmith is building his *Pro* portfolio with a heavy initial emphasis on options and asks, "Am I moving too fast?"
- To sell at fair value or not? Jeff says it's all situational.
- **GrafTech** (NYSE: GTI) expects its Seadrift acquisition to close by the end of 2010.
- **Bristow Group** (NYSE: BRS) provided details about its new CFO.
- Russell (TMFEldrehad) shows once again how the data suggest that CAPS stock ratings matter.

Don't Get Sloppy

Most climbing accidents occur on the descent. Why? On the climb up, you're inspired and motivated to achieve your goal: Reach the summit! But when you get there, the "oh no" moment hits you — the summit was only the halfway point. Now tired, less motivated, and likely without a clear plan, you must descend.

With investing, finding a great investment can feel like reaching that summit. After days of studying 10-K filings, debating competitive positioning, and building financial models, you finally pull the trigger. It's hard not to feel victorious, but the footing is still treacherous. If we don't keep abreast of new information and make good decisions about when to sell or when to use options, we can find ourselves struggling, like climbers who get sloppy on their descent.

When Jeff recommended writing puts on **Nasdaq OMX Group**(Nasdaq: NDAQ) in late 2008, the company appeared to be building out its global footprint and taking market share. Luckily, Jeff didn't get sloppy. Nearly a year later, he noted that "small, cutting-edge competitors with much lower cost structures, including BATS and Direct Edge, have been eating away at Nasdaq OMX's market share." He remained objectively focused on the developing competitive landscape, changed his growth assumptions, made sure the stock had a solid floor beneath it, and became open to capping upside by writing covered calls.

Don't Fall in Love With the Plan

Things change. Experienced thrill-seekers know that minor changes in environmental factors can have disproportionate effects on outcomes. Think about setting out to hike a snow-covered peak: You spent hours planning the trip, plotted your course, bought new snowshoes, and took several days off work. Now let's say an unexpected storm begins rolling in just as you're departing from the lodge. After investing all this time and energy, would you have the sense not to embark on your dream hike after all? Delaying the start time might mean you wouldn't make it to the peak, and you remember reading that avalanche conditions are worst after a fresh snowfall ... I know, I know, you bought new snowshoes and took time off from work — you couldn't possibly just call it quits and sip hot chocolate!

At this point, as Gonzales would say, the hiker has "fallen in love with the plan" — her decision-making, even in light of the new weather information, is clouded.

This happens to investors all the time — we won't forget *Pro*'s investment in the **U.S. Natural Gas Fund**(NYSE: UNG) ETF. We were so confident in our thesis that we initially thought we could overcome the weaknesses in the investment vehicle we were using. Then we tried to buy more time for the thesis to emerge — and for the ETF to align with it — by writing covered calls. Alas, time ran out, and in the end, all of our best-laid plans were for naught. The "weather" around the fund kept worsening, but we had fallen in love with the plan, so we kept pushing ahead to the bitter end. We were trying to profit on a rise in natural gas prices, but this investment was not the way to do that. Next time, we need a better plan.

Do the Next Right Thing

Gonzales writes of a man — lost in a national park for several days and on the verge of hypothermia — who refuses to build a fire because he knows campfires are not allowed in the park! A fire would provide warmth, and the smoke could alert rescuers, but the man is unwilling to allow new information (being lost, hungry, and freezing!) to influence his plan. This shows a remarkable respect for Smokey the Bear — and even more remarkable stupidity.

If your plan — or investing thesis — has changed, take the next right action. When we saw slowing growth, lowered guidance, and stalling regulatory support for **Quanta Services**' (NYSE: PWR) business, we paused. Based on that information, coupled with the company's constantly changing rules about management compensation, we lowered our recommendation from Buy First to Buy. Sure, we still like the long-term thesis, but we see more risk than we did previously, and tempering our support was the right thing to do with this new information. Quanta will stay on close watch.

Foolish Survival

Together we can survive, and thrive, in today's market. In fact, I believe that using the *Pro* philosophy — finding solid businesses with recurring revenue streams at attractive prices, coupled with calculated options positions and timely macro positions — is the best way to do just that. It's a winning formula of strategic positioning and tactical adjustments. So please, give the *Pro* thesis review a read, revisit the companies in your portfolio, assess how the businesses are performing in light of new information — and do the next right thing. That's what we're aiming to do in *Pro*, every step of the way.

To discuss our thesis review and ask any questions you might have about *Pro*, don't miss our live chat for *Pro* members from 3 to 4:30 p.m. Wednesday, Oct. 6. The whole team will see you there.

Foolishly,
Bryan Hinmon (TMF42)

Motley Fool Pro's Thesis Review

Published Sep 30, 2010 at 12:00AM

Welcome to *Motley Fool Pro*'s thesis review! To download this special report, click here.

Our review looks at each active holding in the *Pro* portfolio to see if it is performing as we originally expected, and gives you investable actions, a fair-value estimate, and guidance advice for every pick. (For a summary of the changes you'll find in the report, see our table on the very last page.) Many of our positions look appealing for buyers right now.

If you have any questions or comments, post them on the discussion boards or bring them to our live chat about the portfolio review from 3 to 4:30 p.m. ET on Wednesday, Oct. 6.

As we start our third year, we're in the best position yet to invest for steady returns with low risk. We're glad you're with us at *Pro*. Let's make the coming year highly, accurately profitable.

Close All Positions in United States Natural Gas Fund

Published Sep 30, 2010 at 12:00AM

At a Glance

- **Action:**Close all positions in UNG
  - Sell to close January 2012 $10 calls
  - Buy to close January 2012 $12 puts
- **Recent prices (9/30/10):** Calls, $0.45; puts, $6
- **Alternate trades:**
  - If you own shares of UNG, we recommend selling them.
  - If you only wrote puts or only bought calls, we recommend closing them.

Take Note

To close an existing options position, you must take the alternate side, netting your position to zero. We are "selling to close" our long calls. We are "buying to close" our short puts.

Natural-gas spot prices are up modestly since we recommended a position in the **U.S. Natural Gas Fund** (NYSEMKT: UNG) ETF nearly a year ago (at $4/MMBtu today, compared to about $3.80 then). But that hasn't been enough to help the ETF, which has declined 48% over the past year. The culprit was the fund's ever-increasing contango, or costs associated with rolling monthly futures contracts. We placed the ETF on hold at the beginning of the year, then wrotecovered calls that defrayed our loss by more than 12% ($2,000), but our synthetic long option position on UNG is still the biggest loser in the *Pro* portfolio's history: Though it's only about 3% of our total holdings, it has knocked about 1.5% from the portfolio's starting value.

We've spent a lot of time discussing this ETF's shortcomings and how to overcome them. As we outlined in our most recent Memo, we've decided that our time would be much better spent instead finding ways to *short* ETFs like this: specifically, ETFs that use futures contracts in attempts to track the price of an underlying asset. Futures contracts are like options — they carry time value, which stacks the odds against the buyer. Owning ETFs that are *buying* time value runs counter to our own practice of *selling* time value month after month in many of our options trades. With the U.S. Natural Gas Fund ETF, we made the classic mistake many call buyers make: believing that a large enough jump in price (natural gas prices, in this case) would lead to a profitable outcome regardless of the erosion of time value. Of course, natural gas costs never rose enough to send UNG sustainably higher, and contango was far worse than estimated. (In many cases, "backwardation" in futures prices can actually *help*, but not this time.)

However, there is some good news. We've learned a lot about ETFs and the natural gas industry from this experience, and we're now looking to invest directly in the industry or its companies. We still believe gas prices will eventually appreciate, and some low-cost producers are making a profit selling gas even at today's low prices. Though natural gas supplies in storage still sit near record levels, part of our thesis is nonetheless environmental: Fracking (hydraulic fracturing) for natural gas needs to be better regulated for safety, which would increase costs and slow production. We had hopes that the Environmental Protection Agency would take a stand on the issue — but either way, we want some exposure to the industry's most profitable sellers.

There's a second bit of good news, as well: We could (and hope to) earn back these losses in the future by shorting ETFs similar in structure to UNG. Finally, if you're considering the tax implications, we've had many short-term gains this year, and booking this loss in UNG will offset many of them.

How to Follow Along

Some of you may have never closed options positions before, so proceed deliberately.

- We will **"sell to close"** the January 2012 $10 call options we own, lately getting about $0.45 per share (not horrible, given that the ETF trades near $6).
- And we will **"buy to close"** the January 2012 $12 puts, paying out around $6 per share (this will take cash from our account).

If you have any bullish position in the ETF (be it owning the shares directly or owning calls), we suggest selling it. If you have questions, please post them on our U.S. Natural Gas Fund board.

Sell ProShares Short S&P 500

Published Sep 30, 2010 at 12:00AM

At a Glance

- **Action:** Selling all shares
- **Recent price (9/29/10):** $48.75
- **Alternate trade:** Write October $48 covered calls on your shares to potentially sell a bit higher.

Although we're closing our shares of the **ProShares Short S&P 500** (NYSEMKT: SH) ETF at a modest loss, it wasn't a wasted investment. We initiated our position in November 2009, so for 10 months, this holding acted as a small insurance policy against market disasters. Ultimately, this insurance cost us only about 0.28% of the portfolio's starting value (as of Wednesday's closing price). That's a reasonable cost to carry a short position over such a relatively long time, and if the S&P 500 had fallen 10%, 20%, or more, the profits would have made our position very worthwhile. For those keeping score, at recent closing prices, we lost about 8% of our investment in the ETF (or $5,000), but we earned $2,200 writing covered calls, so our net loss is about $2,800.

We could continue to write covered calls on the ETF and keep the position as a hedge, so why aren't we? In one word: tracking. The ProShares Short S&P 500 ETF has been inversely tracking the S&P 500 less accurately than we'd like. If you look at the table of numbers from our original November 2009 report, you'll see that at the time, the ETF was tracking well — especially over a time period of six months or so, which is about as long as we expected to hold it:

SH Change	Time Frame	S&P 500 Change
(0.68%)	1 day	0.65%
2.20	5 days	(2.25)
(2.20)	1 month	1.72
(6.70)	3 months	5.61
(18.76)	6 months	18.83

As of Nov. 2, 2009. Source: Google Finance charts.

Today, these numbers are not as pretty. Because the ETF aims to inversely track the S&P 500 on a daily basis, and one day builds onto the next, the market's mostly sideways action in 2010 appears to be eating into returns more than usual, especially over longer time periods.

SH Change	Time Frame	S&P 500 Change
(2.81%)	5 days	2.54%
(9.72)	1 month	9.96
(12.33)	3 months	11.91
(2.27)	6 months	(1.69)
(8.25)	Year-to-date	3.43
(16.8)	History	(3.7)

As of Sept. 29, 2009. Source: Google Finance charts.

Most disturbing, the S&P 500 is *down* over the past six months, but shares of SH are down even more (a 2.27% loss in the ETF vs. a 1.69% loss in the index). And year-to-date, the S&P 500 is up only 3.4%, but the ETF is down more than 8%. Since we've been holding the ETF longer than we expected, that's *far* too wide a discrepancy for us to accept over our time frame. Finally, over the ETF's history — which began June 21, 2006 — the S&P 500 has lost more than 3%, but the ETF is down nearly 17%. If you had bought the ETF in 2006 to protect your portfolio, you'd be livid.

We purchased the ETF because, unlike most inverse ETFs, it *isn't* leveraged 2-to-1, but even on its simple 1-to-1 basis, we're seeing that it doesn't work well over time. The 0.95% annual fee doesn't help. Add it up, and — especially if you believe in the S&P 500's potential over the coming few years — this ETF may be a much better *short* candidate than something to own for any longer than a few months. Fortunately, we've paid a very modest price to come to this conclusion.

How to Follow Along

We'll be selling all of our shares in the next one to 30 days. If you own shares, we recommend you plan to sell them, as well.

- If this is the only short you own, and you want to keep a short in your portfolio a bit longer, realize this *isn't* a panic sale. You can take your time. The ETF should track well over the coming month; we just don't want to own it for months on end.
- If you own calls in SH, or have written puts, we recommend closing those positions in due course, too.

We're also *not* suggesting with this sale that we think the market is going to keep going higher. It very well may not do so in October, and we're seeking a better way to hedge the market while we prepare to sell these shares.

Long story short: This ETF is more of a trader's vehicle than an investor's, so we're preparing to exit. It served its purpose over the past 10 months as we came to this conclusion, we ended up paying modestly for the "insurance" it provided, and we've learned something valuable for the future. If you have questions or comments, please visit the ProShares Short S&P 500 board.

Sell Lindsay

Published Sep 28, 2010 at 12:00AM

At a Glance

- **Action:** Selling all shares
- **Recent price (9/28/10):** $43.27

On Sept. 17, we sold 300 shares of **Lindsay** (NYSE: LNN) when the covered calls we wrote expired above the $40 strike price. We were pleased to sell our shares at a net $49.50 (including what the puts in our strangle paid us). This left us with a somewhat awkward and very lonely 20 shares; luckily, the recent bull market in commodities allows us to sell these shares at a good price within our fair-value range.

Use a Limit Order

This is a thinly traded stock, so please enter a **limit order** near the current price, rather than using a market order.

How to Follow Along

Since the majority of our shares were called away, many *Pro* members don't own shares of Lindsay at all. If this is you, sit tight.

- If you own orphaned shares alongside us, a sell is an easy choice to avoid further risk — after all, we've made a very healthy 37% on these shares without accounting for option income.
- If you own a full position in Lindsay, we recommend selling for the same reasons we are. If you have shares that are already covered with calls, you can let that trade play out.
- If you've written puts that would net you shares in the low $30s, you can also wait on those.

We'll continue to watch Lindsay with an eye toward buying it back when the risk-to-reward ratio is more favorable; at least, we'll look to write $35 puts when they pay well. The stock's price has been quite volatile since day one, and given the irregular nature of irrigation-systems sales and the volatility of commodity prices, we may have the opportunity to reestablish a position in the future.

To discuss this trade, please visit the Lindsay board.

Portfolio Review Live Chat

Published Sep 27, 2010 at 12:00AM

We released a comprehensive review of our entire portfolio on Thursday, Sept. 30, and we took your questions and comments about it (and about anything else you wanted to discuss) on Oct. 6. Download the review here, and check out the transcript of the live chat below!

A Door Slams Shut on Flawed ETFs

Published Sep 27, 2010 at 12:00AM

Pro's My Scorecard Contest, Week 3!

The final week of our My Scorecard contest also features the biggest challenge: Community Picks. Head to *Pro*'s My Scorecard Contest board and guess the three companies, in order, that are most widely held by the *Pro* community on My Scorecard (as of today, Sept. 27). Submit your guess by Monday, Oct. 3, to be in the running for a one-year subscription to your choice of the following: *Motley Fool Stock Advisor, Motley Fool Hidden Gems, Motley Fool Inside Value, Motley Fool Rule Breakers, Motley Fool Rule Your Retirement,* or *Motley Fool Global Gains*, as well as one to give away to a friend or family member!

Changes are at hand for the *Pro* portfolio. Soon, we will no longer be buying or owning any ETFs that use futures contracts to attempt to track an underlying asset — whatever that asset may be, from a commodity like natural gas to an inverse index like the short S&P 500. On the flipside, we are now actively looking for funds like this that we can *short*, as we recommended with **iPath S&P 500 VIX Short-Term Futures**.

Annual Review Coming Soon!

- Watch your inbox this week for *Pro*'s annual review. We'll look at every live recommendation in the portfolio and offer our latest guidance. Don't miss it — and set a reminder now for our live chat about the review, coming Oct. 6!

Our Chat With Ebix CEO Robin Raina

- On Thursday, Sept. 23, *Pro* members took part in a live chat with Ebix CEO Robin Raina. Click here for the transcript!

Recent Trades

- On Sept. 23, we wrote a covered strangle on **Tupperware**, as per our Sept. 2 recommendation.

Coverage & Community

- Want to be part of the annual review? Please answer these three brief *Pro* polls: What do you want next? What's most memorable? What do you enjoy most?
- Alex340 shared puts and calls that meet *Pro* criteria.
- With October around the corner, TMFValuemoosie posted an earnings calendar for *Pro* stocks, past and present.
- Jeff is looking ahead to the next year of investing.
- **Caterpillar** is scratching our returns (meow-ch!); we're hoping to close half the spread profitably and wait on the rest.
- TMFEldrehad puts the word out: Make the case for your favorite stock in CAPS.

Compete to get your recommendation published, win free subscriptions, and earn an all-expense-paid trip to Fool HQ for our annual *Million Dollar Portfolio* member event. For details, click here!

Tracking Hot Air

To explain this move, let's start by examining our investment in the **U.S. Natural Gas Fund** ETF, which has been listed as a hold for most of the year because of its problems tracking the price of natural gas. The commodity's price has remained steady since we released our investment thesis last year, but the ETF that attempts to track it has fallen 44%, making it our biggest absolute loser and knocking about 1.5% from the *Pro* portfolio's return.

The problem is that every month, when this ETF rolls old futures contracts on natural gas into new ones, it typically pays up to do so. This "contango," as it's called, eats away at the ETF's value. We realized this early and started writing covered calls against the calls we own on the ETF; our hope was to significantly counter the erosion in value, while waiting for a large enough gain in natural gas prices to provide the ETF a boost and provide us an exit. That hasn't happened, and now the covered-call-writing opportunities are slim, too. With the ETF below $6.50, we could write January 2011 $7 calls, but the calls we own have a $10 strike price, so we're exposed to $3 of uncovered risk if UNG gains ground. That's hardly logical.

In other words, our options are running out on UNG. We've done all we can to give it a second and third chance. It remains on hold, on its way to a sell. We have been holding out for the coming winter, which *may* provide a spark to natural gas prices that would benefit UNG, but as natural gas supplies grow, even that hope is dimming.

Tracking Only Losses

Up next is **ProShares Short S&P 500**. For awhile this year, the S&P 500 was down year-to-date, and yet our holding in this inverse ETF was barely breakeven for us. We've been writing covered calls against this position, too, and thank goodness, because this ETF's performance has also worsened with time — again, largely because it uses futures contracts.

As of Monday morning, the S&P 500 is up 2.75% for the year, while the ProShares Short S&P 500 ETF is down a much greater 7.5%. Even when the S&P 500 was *down* for the year in August, this inverse ETF was down modestly, too. It hasn't worked as intended. We moved this to a hold, too, as its tracking performance worsened.

It'll be an easy choice to exit this position soon, because its performance has worsened the longer we've held it. Over the past 12 months (as of Monday morning), the S&P has gained 9.92% and SH has lost 14.6%. Since the ETF's inception in 2006, the S&P 500 has lost 8% and the ETF has *lost* … 29%. Abysmal. We always intended to hold this inverse ETF for a relatively brief time, since we knew that over many years, tracking issues would be a concern. But even over the months we've held it, tracking has been disappointing, and we would have lost much more if we hadn't written covered calls (instead, we're not that far from breakeven). Once we finally sell it, we may even look to *short* it. Watch your inbox for pending trade alerts. Our only remaining decision is whether to sell directly soon, or aim to exit with a short-term in-the-money covered call to get paid extra.

Problems Become Opportunities

Recognizing the flaws with these ETFs, we're looking for more to sell short or use bearish options on. That's because over time, funds using futures contracts are fighting an uphill battle thanks to their constantly eroding value. If we do conduct more short or bearish trades on these funds, we just need to make sure the fund managers don't change the way they manage the funds while we hold them.

Eventually, though, they'll need to — because most ETFs that track this way are going to end up dead. And on the way to the trash heap, they're going to become an even bigger media story than they are now. That *Pro* ever purchased two of them was unfortunate. As with buying call options, we thought we could beat time's slow decay and win on catalysts, but decay worsened and big enough catalysts didn't pop up. However, now we can turn the tables and make money on these flawed vehicles in the other direction, as we did with VXX. In the end, I think we'll even end up with net profits on the knowledge we've gained. We've learned, and we're moving forward.

Meanwhile, we'll continue to enjoy the use of strictly *stock-based* ETFs, like **Vanguard Energy**, **Vanguard Emerging Markets**, **SPDR KBW Regional Banking** and the other stock-based or direct-investment-based ETFs on our radar.

Questions? Please visit our Memo Musings board.

Pro Chats With Ebix CEO Robin Raina

Published Sep 22, 2010 at 12:00AM

Early this month, Sean Sun and Karl Thiel of *Rule Breakers* joined me to chat for nearly an hour with **Ebix** CEO Robin Raina. Ebix is rated a "Buy" in the *Pro* portfolio, and shares are up 28% year-to-date while the S&P 500 is up just 1%. And this winning performance isn't new; since 2006, Ebix has been one of the market's best-performing stocks, up 870% while the major indexes are down.

Bite-Sized Ebix

Want just the highlights of our chat with Raina? Check out the short version of this transcript here.

Driving this success is Ebix's desire to be an end-to-end provider of software solutions to the immense insurance industry, which is mired in slow and costly paperwork and eager to move into the digital age. The company's senior management team hasn't changed in the past 10 years; they've all been busy building a business that serves more than 300,000 users, almost all of which renew their contract with Ebix each year.

More than 71% of Ebix's revenue is derived from its insurance exchange, a virtual marketplace where insurance agents, brokers, and providers meet to quote, write, conduct, and mange insurance transactions, using Ebix's end-to-end solutions. Along the way, Ebix's software auto-processes and corrects mistakes; makes a policy binding with electronic signatures; registers the transaction; and services the policy over the years. Ebix can also port the policy to another carrier and provide ongoing data regarding commissions and rates as policies are renewed and adjusted. Every step of the way, Ebix collects a small transaction fee, as well as an annual membership fee from exchange users.

To become the industry standard, Ebix is acquiring niche insurance software players and adding them to its growing network. Each acquisition has added to Ebix's earnings, and as you'll read in our transcript, Raina feels that Ebix is on very solid footing as it continues to seek growth through acquisitions, new products (like annuities and life insurance), new markets, and cross-selling. Along the way, the company is focused on the values of integrity, perseverance, transparency, and giving back to society.

Enjoy the transcript of our talk, and then be sure to join us Thursday for a live chat with Ebix's CEO, so you can ask your own questions!

Interview Transcript

Sean Sun: So, Robin, I am going to kick this off by asking you to explain very quickly what Ebix does, and particularly if you could walk us through the exchange system that has really become the main revenue driver for Ebix recently. If you could also walk us through who the players are and where we, as laymen, fit?

Robin Raina: Understood. Ebix is mainly in the business of deploying exchanges; 71% of our business as of last quarter was exchanges. We are overall, in addition to exchanges, an enterprise-level player. That is a key word to remember with Ebix, and this is a key differentiator with respect to anybody else in the market--and I mean anybody across the world of insurance.

What I mean by "enterprise-level player" is that we are an end-to-end player. Our entire focus is straight-through processing, which means we provide not only exchanges, but all the other facets that come with an exchange

Now, we interact with wire houses, broker-dealers, investment advisors, banks who are trying to sell insurance, so we provide them a CRM (customer relationship management) system. That CRM system will interface with our exchange and then that exchange would interface with our carrier's system, our company back-end system, (and) all could interface with some other back-end system, anybody's system.

When you deploy an exchange, you are dealing with almost 100+ entities in any transaction. And when you are dealing with these entities that is a cross-selling opportunity for us. To cross sell them a system that they can use not only to exchange; but that allows data to flow into the back-end system that they use each and every day.

Karl Thiel: Robin, can I just jump in there and ask you to explain what an insurance exchange is?

Robin Raina: An exchange can have different meanings in different contexts, but [in our case]... we only do B-to-B (business-to-business) exchanges. We don't do B-to-C (business-to-consumer) exchanges. An exchange is basically a system to drive paper out. When stock exchanges weren't there, or the E*Trades of the world weren't there, you ultimately had a paper-based process. Then E*Trade came in and they drove the paper out. Exchanges came through and you were able to do online transactions on the fly.

Now, what we do in insurance is we will remove the entire paper out of the process. In insurance, you are either buying insurance as a consumer, as a broker or a bank, a wire house, or an investment broker dealer. You are buying insurance, so ... you are trying to get multiple prices. An exchange comes into the process to allow you to buy that insurance (and) to get multiple quotes. (The) first (step) is to get multiple quotes, (and) be able to do what's called a sales illustration, (which is a presentation of) the multiple choices we have available from each carrier and the permutations of it.

The second step is (when) you want to buy a policy. Your option is to do it over paper or do it through an exchange, and if you do it through an exchange, that exchange will make sure that when a policy data is sent to the carrier, it is always the data that the carrier wanted. Because, in the industry today, 70% of the time, when brokers send the end-policy data to the carrier -- this is (an) industry figure in life insurance, for example -- ... carriers say this is not in good order, this is missing data.

So that is called auto processing. You are processing a policy. Now, when you are processing the policy, you might want to bind the policy online, which means electronic signatures might be required. We do that also. We provide electronic signatures to bind the policy legally online.

Thirdly, you want to maybe do a money clearance transaction. You want to transfer money from one bank to another, and register the transaction, let's say, with a regulatory body. Let's say (it's) a new dealer tax-deferred instrument. You need to register that transaction and make sure first of all (that) it's FINRA (Financial Industry Regulatory Authority)-compliant, but it also ends up with the DTCC (Depositary Trust & Clearing Corporation) to make sure the transaction is registered. We do all of that also.

Now let's say the policy is sold. This policy has to be serviced because in a post-sales scenario, the insured will have needs. You could do it over the phone, but even if you did it over the phone, you need to use ideally an exchange to be able to service that policy, and that is what we also do.

Now, we also go beyond that and we are now deploying newer tools to port the policy. S(ay) you are a Merrill Lynch, you are a large client, and you could be a large wire house, a bank, whatever, and you are dealing with multiple carriers and you want to port the policy - (in other words) move the policy from one insurance company to another. We are now deploying portability exchanges for you to be able to do that online.

So, when you consider all of this, it is ultimately now (a) process (of) a broker working with a carrier. (For example) the broker wants to find out, what (his/her) commission. (The broker asks) What is my commission split (because there might be a split on commission)? The installment split? What is my billing? What is happening on my billing? All of that data needs to be downloaded back into the broker's system. We do all of that, too.

So, it is an entire end-to-end process, and now we interface these exchanges into a CRM system. ... That user that broker, that producer, that IBD guy, the wire house user could now (be) sitting within the CRM, (and) do a transaction. To that user, it doesn't even matter. They don't need to be on an exchange. They don't even need to see the exchange because exchange works in the background.

Sean Sun: So who is accessing the exchange?

Robin Raina: Everybody. All these entities that I talked about would be, in this example, accessing it. We could hand over the data to (any) one and they could access it, so everybody will see only the portion that they need to see.

Sean Sun: So, to clarify one point, you said that you guys work specifically with B-to-B. Now that means that if I, the individual, want to get insurance, I am not going to be able to access your exchange product.

Robin Raina: I will give you a real example. Let's say you are on HSBC Bank's website... (and) you want to buy life insurance. You can. You can get quotes from their website. When you get those quotes you are a consumer. That quote is coming from our system in the background. That is our internal exchange, but..., to the consumer, it is unknown that they are using our system. For us, that website is interfacing into their backend. We do that for tons of other players.

Jeff Fischer: Right. Robin that was a great explanation. Thank you for that...Hopefully I can state this question clearly, too. So among all these B-to-B transactions, if a business isn't on your exchange yet and they are trying to make a transaction with someone who is, how does that play out?

Robin Raina: Let's say there is a large broker, or a large bank. Pick any name, Wachovia, Merrill Lynch, Ed Jones; they are large players in life and annuities, for example. They are working with 20 different carriers. Does a Wachovia producer want to go into 20 different systems? Because every carrier will have their own system. Today, that is what happens typically. If Wachovia hadn't deployed our platform, now each one of those people would have had to go in 20 different systems to get 20 different codes, all to process 20 different policies. They don't want to do that. It is a terrible waste of time and money.

Jeff Fischer: Of course.

Robin Raina: The carrier also realizes that the broker doesn't want to do that. So there is no carrier who (will) tell you 'I don't like exchanges.' Those days are completely gone. Today it is a matter of time and pace. Carriers tend to be slow, and they have tons of systems internally. They (also) make acquisitions, so when you have made acquisitions, you now have 40 different systems and you are trying to make ... sense out of all these 40 systems.

So that takes a long time, and then they have to convince their business folks, we like the exchange, go with it. But you know what (they say)? Make sure it doesn't impact us at all. We don't want even for one day, our business being down. So, that is where the organization has to have a little bit of courage because it will be a bit painful. When you are trying to replace 40 systems with one, everybody has to be in sync and so that is what takes people internally a little bit of time, but nobody debates it.

Karl Thiel: So where do you see the industry heading in the future?

Robin Raina: The industry is definitely headed the electronic way. There is absolutely no carrier who will tell you that it's not going to happen. It is definitely (going in) that direction.

Karl Thiel: Do you think it naturally heads towards a very limited number of exchanges?

Robin Raina: With or without Ebix, that is the way it will head.

Jeff Fischer: And Robin, are many of your new customers just showing up at your door because of network effects?

Robin Raina: Absolutely, absolutely. The network effect, day after day, creates opportunity for us. What is a pressure point in the industry? We focus on the pressure point. (For example, say the) largest producer of annuities (is) Wachovia. Or you know the second largest is Merrill. Wouldn't it be nice to just bring Wachovia and Merrill to your platform first? Because you already know that if they are working with 20 carriers each, all of those carriers will want to be on a platform the next morning because they don't want to lose the business, correct?

Sean Sun & Jeff Fischer: Right.

Robin Raina: That is how the industry works. So when we launched [an annuity exchange], we didn't go to the carriers first. We went to the brokers, the largest distributors. (We) convinced them even before we built it. Once we convinced them, we had 67 carrier representatives in one room, even before we had started building the system. Why did that happen? Because we didn't call them. Those distributors called them, and distributors drive the industry, so you have to focus on the pressure point, and that creates a network effect.

Sean Sun: So are these exchange points going to obsolete your traditional insurance brokers?

Robin Raina: No, not really. I don't think that is going to happen because people still want consulting, knowledge and so on, because we are not disintermediating the broker. At the end of the day, these brokers are the ones who are also using our system, so you are not really disintermediating. That is a totally different dynamic. It can happen, but it is not going to happen because we created exchanges. .

Karl Thiel: If I can change gears slightly, can you talk about healthcare as a strategy for growth? It seems like a fair number of your recent acquisitions have been focused in that area.

Robin Raina: Absolutely.

Technologically, [health care reform] is creating a lot of issues for carriers to understand what the government is going to do. How it is going to do it and what is the framework in which it will operate. But look outside the U.S. and you will see that you could go into any African country, any Middle Eastern country, any Asian country and what is the hot topic in every country? Health insurance. Everybody is talking about it. Any of these countries where the quality of health insurance isn't as great is an opportune area for us, because everybody wants to change it. There is no government which will say we don't want to change it. Today we at least are in front of extremely large deals across the world. These are very large deals which could change possibly the future of this company.

Now, I can't guarantee that those deals will happen, but the good news is we are bidding on those deals. We are getting short-listed on those deals, and these are deals of large sizes, $20 million deals, $70 million deals. We didn't have that opportunity earlier. That opportunity has come to us because first our size grew; we became a respectable name worldwide, but besides that, the health sector is where the larger size deals are happening worldwide.

In the U.S. itself, we think there is uncertainty, but uncertainty shouldn't be confused with a lack of opportunity. If anything, the Health Reform Act cleared up a lot of doubt, good or bad. Where the uncertainty now lies is more in the area of how is the government going to define certain frameworks across the states? How is it really going to implement what it has said? ... Because insurance companies can't do it alone. We'll wait for the government to define the framework so that they can accordingly adapt their technology around it.

Sean Sun: One thing that I am really interested in, and I know a lot of our members are as well, is your Robin Raina Foundation. I have been reading stuff about how you guys have been building free homes in India, right? That was one of the biggest initiatives that you guys have done. Would you care to talk a little bit about that?

Robin Raina: Absolutely. That is my passion, to be honest. If I was told to choose between work and charity, I could give up on my work in a microsecond. My board understands that, it is not a hidden fact. My board understands that Robin is a complete package. This is how he is, good or bad, it is not impacting his work, but this is my passion.

I get very inspired by the underprivileged how they fight every day. 1 I am not religious at all, but I always have believed that poverty is the single biggest religion that binds the underprivileged across the world.

Whether you are in Pakistan or Middle East or you are in the U.S. or Russia, pain always feels the same, and the underprivileged have a lot of pain. At the end of the day, our job is to try and do something about it, so from that perspective, the foundation today does multiple things. Our prime focus is education for the underprivileged child. That is our prime focus because we think that will change, that can help build their future, and not only of those children, but of their families. Because in underprivileged areas, if you can have one good, educated child or all the children educated, their future will change, because the parents will benefit from it.

Having said that, we have deployed a lot of schools in the slums. We also have around 4,000 kids that we educate today at any time, and these are kids who are now in engineering school, medical school, lawyers. There are blind kids who have finished their masters; there are blind kids who are doing software development now. And then you have small kids from the age group one-and-one-half years old to virtually 27 years old, who are basically getting educated. We provide the meals, the breakfast, the lunch and healthcare and so on.

Then we started on this home project, which has become my passion in the last three years. In October 2010, India is going to be hosting the Commonwealth Games.

I am one of the strongest critics of the government in India now. To give you an example, I just came out of India three weeks back. I did the rounds of probably 50 different television stations and newspapers being extremely critical of the government. Some people think it is unpatriotic. I have not really cared about it because to me what is unpatriotic is not taking care of your own citizens. What they did when they decided to host the Commonwealth Games, they threw the slum dwellers of Delhi out, to cleanse Delhi, to show it off to foreigners that are coming for the Commonwealth Games.

In the name of cleaning the city, they threw them out. They created the second largest slum in the Indian subcontinent. It has 50,000 families now who basically are living in shanties, in slums, grass huts. There is no water. There is no drainage. There is no healthcare, and the government seems completely immune and seems more concerned about putting palm trees to hide them, and that is what they are doing for Commonwealth.

On one side, the government is spending an estimated $20 billion on this game, to make the infrastructure better. They are spending $227 million on one stadium, to refurbish it. Worse is, they could have spent a few million dollars just trying to provide a simple drainage system, which they didn't do.

Many years back, we were pleading with the government of India to at least, if you threw them out, give them some land. The government of India legalized their land for a very small sum of money that these slum dwellers had to pay, which they did. It was very, very small, like $150, which is incidentally a lot of money for a slum dweller there.

I came up with this project to build 6,000 homes. The 6,000 homes that we are trying to build are all concrete homes on the small pieces of land, but the idea is to provide everybody at least a basic civility of two rooms.

And that is all we are trying to do. I started on that project towards, I think, the end of 2007. Now we have handed over 1,157 homes.

Absolutely free, but this will continue for a decent amount of time. The challenge is not only to build the homes, but to provide the mechanisms around it--the healthcare, the medical facilities, the educational means. We are building schools also. The government hasn't woken up to anything as yet.

Karl Thiel: If you don't mind my asking, how do you balance that with your work life, just time wise?

Robin Raina: I feel that life is too short and you have to live it fully. I am one of those (people) who doesn't like sleeping. I feel sleeping is something you just have to medically do to just handle yourself. So basically, every day, I go to sleep at 3:30 AM. That is my cycle seven days a week. I start early in the morning, and if I get three and a half hours of sleep, I am pretty happy. If I am lucky on a weekend, I get four and a half hours sleep, but typically that is my cycle.

Jeff Fischer: That is brutal. Incidentally...

Robin Raina: If somebody called me and said my son fell into a swimming pool and I am in the midst of a big meeting, a large $20 million deal, what am I going to do? I am going to leave, get out and run to the hospital. Because it is my son, because he is my priority.

That is what I tell people. If you make charity a priority, it will automatically become easy. You will work, it's easy, you have to do work; it is not a choice. But in today's world, everything happens over the Internet. I could be at a U.S. Open and I could do exactly the amount of work that I do in the office because I could carry my iPad. I could do virtually everything across the world and be connected on a minute-to-minute basis. As you know, everybody does that today.

Jeff Fischer: Robin that is just really commendable what you are doing. It is just fantastic. Incidentally, I heard Bill Gates only sleeps three to four hours a night as well, so you are in great company there.

Robin Raina: Well, I think very highly of Bill Gates. And I am a Buffett fan. My thinking in business was influenced in early days by Buffett a lot purely because I like simplification. You see (in the) early days, when I joined (Ebix) in '99 and this company was heavily in losses, people used to say: 'What is your vision?' I used to say, 'I will tell you my great vision as long as you don't tell anybody outside the room. And the vision was (that the) selling price has to be a lot more than the cost price, and people would laugh at it. They would say, that is your plan? I would say, yes, exactly.

I like simplification in life. We get so caught up into all our plans and visions that, at the end of the day, we lose the basic premise of business...like selling price has to be a lot more than the cost price. I started talking about 30% margins in those days when this company was losing money and everybody thought I was nuts. Then I started talking about 40% once we got to 30% and so on.

Buffett has always been my hero. I think it takes a lot of courage to do what he did recently by donating the kind of money he did. Bill Gates, also, is a fantastic human being. Then there is a gentleman that I am always in awe of, and that is Chuck Feeney, the gentleman who owned the DFS Duty-Free Shops. There is a book on him called *The Billionaire That Wasn't*. He basically had donated everything except $1 million of his holdings to charity when everybody thought he was a billionaire.

I think I am one of those. I am not religious. I never worried about what country I belong to. I feel we are all human. We just create all these boundaries around ourselves.

Sean Sun: So Robin, you have obviously had some really extraordinary achievements. I am curious, as a younger person, how did you become you? Not only on your philanthropic side, but also from a business perspective. You joined Ebix when you were 30, I think, right? Then you were quickly promoted and...

Robin Raina: Thirty-two.

Sean Sun: And you have obviously taken Ebix to incredible heights in just the past decade, and yet you also harbor this strong desire to do right by humankind and the underprivileged. How does that develop? Was this something that came from a family background or did this just come independently? I would love to hear about that.

Robin Raina: Well, thank you. I think what I did gain from my father and my mom was ...I think from my father I gained a lot of integrity. My father always taught us the value of sincerity and integrity and that hard work has no substitute. My family was extremely secular, My parents were Hindus, but I was given a Christian name on day one. I didn't change my name in the U.S. I have studied in a convent in school. The names in my own family, my son has a Muslim name, my daughter has a Russian name, and so on.

My mom transferred a lot of her courage to me. I could see she was a housewife, but I saw the courage she had, that intense courage always that I grew up with. I will tell you an interesting story. When I was 23 years old, I had finished my engineering (degree) and I was starting to work for Dell. Dell had a joint venture in India and I was brought in as a management trainee. I was considered one of the top guys in sales in the country at that time. And my picture came up in the largest IT magazine as the top sales guy in the country. In those days, the numbers used to be different, but I was considered to have done well.

I got three promotions in one year, meaning I was young and I lived on it. At the age of I think 24 or so, Compaq asked me to be a managing director and go to Ho Chi Minh City and head Vietnam for Compaq, because I was quite well known at that time...(as) a troubleshooter. (People thought), 'he will solve (it); he will do some good stuff.' I rejected it, and most people at that time thought he is either too arrogant or he is absolutely nuts.

People used to say, what do you want to be when you grow up? And I used to say I want to be famous. And that was a standard line I used to say, and I just felt that when I was a kid, I had this yearning that I can do bigger stuff. I always felt if I walked into that Compaq job, I will be lost in that company and I will never be on my own. At that time I was a young kid who virtually didn't know what I was doing, but there was an internal fire and I think what has probably helped me to whatever little success I have had, has been that I go by my convictions. I have always believed that if you want to do anything in life, you should be able to match eyeball to eyeball and do it. Because you can only do it if you have integrity. You can only do it if you are a straight talker. You can only do it if you don't have anything to hide.

Also, I have always believed that the simple way to success in business is hard work, sincerity, perseverance, and transparency. You have to be transparent with your clients. If you have a problem, don't hide it; pass it on. Tell the client sooner rather than later. That client will respect you more. Let's say you are trying to hide it and then the problem becomes a bigger problem. I have always felt that if you can be open with your clients, committed to your clients, sincere to your clients and you believe in what you do, and lead from the front, everything will happen for you.

I, to some extent, feel that some of those values have gone through Ebix worldwide. That is probably my biggest achievement, forgetting all the numbers. I think my biggest achievement there (has been that) I have been able to hold my entire senior management team. My senior management team has stayed 10 years now. Secondly, I also have had the customer attention. Why don't we lose any clients versus others? We have 300,000+ users; we might be losing some retail brokers somewhere. But anybody who even accounts for $50,000 of revenue for us annually? In seven years, we haven't lost that client.

So why haven't we done that? I think it is the attitude of our employees, that they are absolutely transparent to their customers. I think that helps.

Sean Sun: I think that is a great message. I personally benefit from listening to that, and I think our members are certainly going to benefit from knowing what makes Ebix (tick). We are always asking, what is Ebix's special sauce? Why is it so different and why has its performance been so good? We love insights like this.

Robin Raina: Thank you.

Jeff Fischer: Members ask a lot of questions, so I am just going to fire some off really quickly and help them get answers. The first one is: Can we continue to expect more acquisitions in the next few years? We know you are growing through acquisitions that then result in a lot of up selling and cross selling.

Robin Raina: Yes, absolutely, yes. Ebix has cash. We see Ebix as a growth story. So having said that, we don't want to issue dividends simply because we believe that we can reinvest this money and get better returns for our shareholders. I will give you a simple example. What is the largest-growing market for insurance in the world right now? It is Brazil. If you look at Brazil, when the market is growing at that pace, last year it grew at around 28%. The overall economy has continued to grow. I believe the timing is absolutely right for Ebix to take a much larger place in that market as an enterprise, end-to-end local player. We will pursue acquisitions in that area...because we want to take an early position so that as a market keeps expanding, we can take the gains out of that market, and of course the cross-selling helps. Similarly, in different geographies, you would possibly see us moving in terms of acquisitions.

Jeff Fischer: How do you feel about the whirlwind of activity that Ebix has had the last two years -- say of acquisitions? Do you ever have fears that you are trying to grow too quickly or do you feel that you are on very solid footing?

Robin Raina: We think we are on extremely solid footing simply because we have not had one acquisition go wrong for us. One of the reasons we are successful is because we ... have a very financially disciplined approach. We walk away from acquisitions if one metric moves left and we wanted it to be in the center, and we are absolutely adamant on financial metrics and on discipline. Having said that, every acquisition we have made has been accretive from day one.

When we have made acquisitions, we don't only look at the positives of that acquisition, we calculate what is the worst that can happen. We look at when the worst happens, assuming the worst happens, what will it do to the company? We don't want that answer to be that it will hurt the company badly. If that is the answer, we will stay away from that acquisition. We try to balance our risk from that perspective, so I think that has been one of our reasons for our success.

Jeff Fischer: Great, great.

Robin Raina: There is one question which I would like you to ask, if you don't mind. Because I saw two days back an article from The Motley Fool that a gentleman wrote on margins and A/R and cash flows. And I would like to address that for a minute.

Jeff Fischer: Sure, please.

Robin Raina: Thank you. I don't know who wrote it, but I give him credit for doing the math. I think sometimes people don't realize that when you look at operating cash flows, they are looking at operating cash flows at a given point of time. So let's say somebody said in '08 Ebix recovered operating cash flow of 90% with respect to its income. That is not a good way to look at it. What the good questions should have been, is simply asking the company how much money, A/R, do you have? Which is out in the open for more than 12 months? How much A/R do you owe? Because that will tell you whether ‘08's 10% difference, or whatever the difference was, whether that money was collected or not -- the difference between cash flow and income. Because you immediately know there is a timing issue rather than anything wrong with any difference between the two.

The simple answer to that is, as of second quarter of 2010, Ebix A/R, for more than 12 months, was around $600,000, total, across the world. For a company which did $32.1 million last quarter to have $620,000, and I must tell you, all of that is fully reserved for. In addition let me also tell you that we will get that money. Let's say there is a client sitting in China. (With) the Chinese government, you need approvals to send money out. Sometimes it gets delayed for whatever reason internally because a company gets acquired...I can't go into names, but this is very normal.

It becomes a red flag when there is a difference between net income and cash flow. That difference never gets collected or does not get collected to the fullest degree. The answer that I just gave you, the $600,000, tells you that everything in '08 was collected, which means that operating cash flow...the net income and operating cash flow, there was no difference between the two in reality. Because operating cash flow is measured at a given point of time, and that given point of time could be driven lower or higher because of any reason. It could be a vendor paid either more or less in that quarter, it could be any reasons. People at times pay attention only to the; they need to look at the overall picture rather than at a given point of time.

Karl Thiel: Robin, just on the general theme of skeptics, it is certainly notable that there is a fairly high level of short interest in Ebix and I just wonder if you have any thoughts on why that is or what you think about that?

Robin Raina: Well, I think first of all, I respect the shorts. I am not going to go and beat them in any way because I feel we live in a democratic country and in a democratic country, some people think President Obama is a genius and some think exact opposite of him. I don't know which one is true, time will tell. His results will show whether he is making dumb decisions or he is making the smartest decisions in the world.

So from my perspective, I think of the shorts the same way. They are making decisions for themselves. I would like to believe they are making the wrong decisions, but when you look at it, ultimately I have gone through some of the documents and so on, and one of the things that has been talked about is Ebix has had frequent auditor changes. That has been one of the main topics of discussion. The implication is that Ebix probably has had bad relations with their auditors. I will address that as directly as I can.

Who has been our auditor in the last, let's say, eight years? In eight years, our international auditor was BDO. What they don't remember is when we moved from BDO in the U.S. to another firm. BDO is still our auditor for six years plus in all other countries where they were. If we had bad relations, BDO would not be our auditor in Australia, Singapore, Sweden, and so on. They are still our auditor.

Has another previous auditor, HA&W, has had bad relations with us? I will tell you something which you probably don't know. The main partner on our account, with HA&W, just nominated my CFO Robert Kerris for the CFO of the Year in *Atlanta Business Chronicle*. That doesn't look like a partner who was unhappy with us. He was the partner throughout on our account. Also, HA&W still works for us. They do our FAS109; help us with FIN48) and so on.

Our present auditors, I think I will let them talk about it, but we have a fantastic relation with them. They recently nominated us for an exemplary client award. The website is ClientAdvisorAwards.com. So I think that was one of the topics that was talked about by the shorts.

Then there are others; I could go (into) and address each one of them. For example, one was the same issue about maybe their cash flows aren't catching up with their net income, and that is not true. I just gave you the answer to that one.

I also would like to say to your community, a good way to look at whether a stock should be shorted is (to ask) what is the management and what is the CEO (is) doing with his own stock? No senior manager of Ebix is in a selling mode in the last four years. Ebix, when I joined, was a few-cent stock. My buying prices are a few cents. When you look what the price has done, from there to here, there is a big difference.

How much stock have I sold in 10-plus years? I think I have sold slightly higher than a hundred thousand shares. I have donated a bit to charity. Everything else I have held on to, which means I had 4.5 million shares. I think I still own 4.2 million shares after being here for almost 10 plus years. I think either I am absolutely stupid or I am a genius. Time will tell what am I, and I am not honestly very sure about what am I. But I know that I believe in myself and I believe in the company, so I am holding on to my stock.

Pro Chats With Ebix CEO Robin Raina (Short Version)

Published Sep 22, 2010 at 12:00AM

*The full transcript of our interview with **Ebix** (Nasdaq: EBIX) CEO Robin Raina can be found here, but we've picked out some highlights below!*

Sean Sun, *Motley Fool Rule Breakers* analyst: So, Robin, I am going to kick this off by asking you to explain very quickly what Ebix does, and particularly if you could walk us through the exchange system that has really become the main revenue driver for Ebix recently. If you could also walk us through who the players are and where we, as laymen, fit?

Robin Raina: Understood. Ebix is mainly in the business of deploying exchanges; 71% of our business as of last quarter was exchanges. We are overall, in addition to exchanges, an enterprise-level player. That is a key word to remember with Ebix, and this is a key differentiator with respect to anybody else in the market — and I mean anybody across the world of insurance.

What I mean by "enterprise-level player" is that we are an end-to-end player. Our entire focus is straight-through processing, which means we provide not only exchanges, but all the other facets that come with an exchange

Now, we interact with wire houses, broker-dealers, investment advisors, banks who are trying to sell insurance, so we provide them a CRM (customer relationship management) system. That CRM system will interface with our exchange and then that exchange would interface with our carrier's system, our company back-end system, (and) all could interface with some other back-end system, anybody's system.

When you deploy an exchange, you are dealing with almost 100+ entities in any transaction. And when you are dealing with these entities that is a cross-selling opportunity for us. To cross sell them a system that they can use not only to exchange; but that allows data to flow into the back-end system that they use each and every day.

Karl Thiel, *Motley Fool Rule Breakers* analyst: If I can change gears slightly, can you talk about health care as a strategy for growth? It seems like a fair number of your recent acquisitions have been focused in that area.

Robin Raina: Absolutely.

Technologically, [health care reform] is creating a lot of issues for carriers to understand what the government is going to do. How it is going to do it and what is the framework in which it will operate. But look outside the U.S. and you will see that you could go into any African country, any Middle Eastern country, any Asian country and what is the hot topic in every country? Health insurance. Everybody is talking about it. Any of these countries where the quality of health insurance isn't as great is an opportune area for us, because everybody wants to change it. There is no government which will say we don't want to change it. Today we at least are in front of extremely large deals across the world. These are very large deals which could change possibly the future of this company.

Now, I can't guarantee that those deals will happen, but the good news is we are bidding on those deals. We are getting short-listed on those deals, and these are deals of large sizes, $20 million deals, $70 million deals. We didn't have that opportunity earlier. That opportunity has come to us because first our size grew; we became a respectable name worldwide, but besides that, the health sector is where the larger size deals are happening worldwide.

In the U.S. itself, we think there is uncertainty, but uncertainty shouldn't be confused with a lack of opportunity. If anything, the Health Reform Act cleared up a lot of doubt, good or bad. Where the uncertainty now lies is more in the area of how is the government going to define certain frameworks across the states? How is it really going to implement what it has said? ... Because insurance companies can't do it alone. We'll wait for the government to define the framework so that they can accordingly adapt their technology around it.

Jeff Fischer: Members ask a lot of questions, so I am just going to fire some off really quickly and help them get answers. The first one is: Can we continue to expect more acquisitions in the next few years? We know you are growing through acquisitions that then result in a lot of upselling and cross-selling.

Robin Raina: Yes, absolutely, yes. Ebix has cash. We see Ebix as a growth story. So having said that, we don't want to issue dividends simply because we believe that we can reinvest this money and get better returns for our shareholders. I will give you a simple example. Buy TradeStation Group

Published Sep 22, 2010 at 12:00AM

At a Glance

By Todd Wenning and Jeff Fischer

- **Action:** Buying 1.5%
- **Target allocation:** 3%
- **Estimated fair value:** $9 to $11
- **Preferred buy price:** Around $6.70 or lower
- **Type of holding:** Intermediate-term; financial brokerage
- **Alternate trade:** None
- **Why buy:**
    - TradeStation caters to active, highly valuable "rules-based" traders like small hedge funds; the company increased the number of its accounts during the recession.
    - If interest rates rise, TradeStation stands to profit on customers' cash balances; if volatility increases, customers will make more trades and pay more commissions.
    - TradeStation is in the process of becoming a "risk-free principal" dealer in the forex (foreign exchange) market.

Keep in Mind

Please be sure to **use a limit order** on this trade! At $240 million (the smallest company we've recommended), TradeStation's size means it can have a wider bid-ask spread than a larger company, so limit orders are your best bet for getting the price you want. Don't push the stock up with market orders.

CAPShot: 3 of 12. TradeStation is currently in a down cycle, but it should score much higher in "normalized" periods, especially on profit margin, revenue growth, and return on equity.

The Big Picture

Brokerages make most of their money in two ways — through commissions on trades and interest income from customers' cash balances and margin accounts. Unsurprisingly, these companies suffered during the economic crisis of the past three years, as industry competition brought commissions lower and interest rates fell to essentially nil.

While commission rates are likely to remain competitive, we believe interest rates will inch higher at some point in the next two to three years, which will provide brokerages with a much-needed boost in income. We also think the market's volatility and volume will increase over the next three to five years, which will bring more trading activity by institutional investors and day traders, particularly in the derivatives market. The proceeds from that activity should more than offset any commission revenue lost to fierce competition. In short, we think this industry has strong upside potential in the coming years.

Brokerages that cater to individual investors, like **TD Ameritrade** (NYSE: AMTD) and **optionsXpress** (UNKNOWN: OXPS.DL), will benefit in this environment, but we think those focused on active and institutional investors will do even better. According to a Celent Communications report, "active" traders (those who trade at least 10 times per month) make up just 5% of the 30 million to 40 million online brokerage accounts in the U.S. That 5% is only 1.5 million to 2 million accounts — but that small fraction generates roughly 50% of the total revenue for the industry. (This figure doesn't include the institutional investor market, such as hedge funds, money managers, and commodity traders, which oversees trillions of dollars in assets.)

TradeStation Group (NASDAQ: TRAD) is only the seventh-largest online broker, with just more than 3% of the estimated active investor accounts in the U.S. But its award-winning trading platform has attracted new accounts during the recession, and it's poised to thrive in a market with higher interest rates and volatility.

The Business

TradeStation began in the early 1980s as a software producer. It became a broker-dealer in 2001, but sophisticated trading software is still at the heart of what the company does, and it remains perhaps its strongest competitive advantage.

Specifically, the TradeStation trading platform provides an important resource to "rules-based" traders, those whose trades are based a customized set of rules encompassing a number of predetermined factors. The platform allows investors to back-test rules-based equity, options, futures, and foreign exchange (forex) strategies against years of intraday data (18 years for domestic equity, 27 years for futures, and six years for forex), then see how those strategies would perform in real time today. The company also augmented its portfolio testing offerings with its recent $5 million acquisition of Portfolio Maestro, a small investing software company.

The platform's strategies are created with TradeStation's proprietary EasyLanguage software code, which allows traders to create unique sets of rules. Clients pay monthly platform fees unless they meet rather low thresholds for trading activity, in which case the fee is waived.

In March, the company launched TradeStation Strategy Network, an online marketplace that allows traders to share their codes with others (sort of like "apps" for a smartphone). We believe this offering will strengthen the TradeStation community and create a stronger competitive advantage for the company.

TradeStation is respected in its industry, having won several *Stocks & Commodities* magazine readers' choice awards: best institutional and professional platform eight years running, best online analytical platform seven years running, and best stock, options, and futures trading system six years running. It also won *Barron's* top award for online brokers in 2009, beating out well-regarded competitors ThinkorSwim (since acquired by TD Ameritrade) and **Interactive Brokers** (NASDAQ: IBKR).

Competition for new accounts is intense among brokerages, but TradeStation is making bold and wise moves to attract sophisticated, active traders. Last year, it reorganized its futures trading business from one that simply introduced accounts to a third party (which maintained custody and control of the client assets) into a futures commissions merchant, which allows TradeStation itself to retain custody and control. It's also in a similar process regarding its forex business, working to become a "risk-free principal" dealer, which will connect the company's trading platform to a liquid forex market.

Finally, TradeStation announced just this week that it is entering the securities lending business for its prime brokerage clients. This is another move that will give it more control over these lines of business, and it will allow the company to better serve its clients by making the trading process more seamless.

With about 50,000 accounts, TradeStation is well behind optionsXpress (with 365,500) and TD Ameritrade (with 7.8 million). But the accounts it does have are much more profitable than these competitors'.

Metric	TradeStation	optionsXpress	TD Ameritrade
Client Assets Per Account	$45,170	$19,157	$47,500
Daily Average Revenue Trade Per Account	1.86	0.13	0.05
Sales Per Account (TTM)	$2,832	$670	$329
Interest Income per Account (TTM)	$179	$50	$47
Client Cash Per Account	$25,614	$2,438	$436

Data as of most recent quarter. TTM = trailing 12 months.

TradeStation clients not only trade more frequently but also generate more interest income. That's because they keep more money in cash to secure derivatives trades (derivatives trading makes up 54% of TradeStation's commissions and fees) and trade on margin more often.

This setup is why we believe TradeStation is in a strong position to benefit from higher interest rates. In the last conference call, management stated that an increase of just 1 basis point (one-hundredth of 1%) in the yield of Treasury bills and notes would increase the company's net income by roughly $45,000.

For reference, in 2006, when one-year Treasury bills yielded about 4.5% (compared with less than 0.5% today), TradeStation made roughly $1,300 per account on interest income (versus $179 today) — $4,000 per account overall with commissions and software fees included. Further, the average duration of TradeStation's investment portfolio is between six and seven months, meaning that its bonds will mature rather quickly. Thus, if interest rates rise, the company will be in a strong position to roll its fixed-income investments into higher-yielding bonds.

Financials and Valuation

Most brokerage companies have a net cash position (more cash than debt), but TradeStation's net-cash-to-market-capitalization ratio (17%) is especially impressive, and it makes the company an attractive acquisition target.

Free cash flow generation has been consistent as well, thanks in part to the company's strong operating leverage. Because TradeStation is built around its software platform, it makes significant investments in software upgrades every few years. Between cycles, though, it doesn't need to spend as much, which leads to faster net income growth relative to sales growth (hence the leverage).

For our valuation, we assume TradeStation will continue to pick up new accounts at an annualized rate of between 6% and 7% over the next decade. That's well below the company's 20% account growth rate over the past five years, and it would mean a likely increase of just more than 1 percentage point in TradeStation's market share. We also believe TradeStation's strong position in the derivatives market, its growing forex business, and its appeal to rules-based traders will keep accounts coming in.

We also assume that interest rates will inch up slowly starting in 2013, leading to average revenue per account of $3,100 for the next decade — conservatively below the 2006 average of $4,000.

In our discounted-cash-flow-to-equity model, we model for 2% terminal growth and discount the cash flow at 12%, which gives us a fair value range of $9 to $11. With TradeStation's stock recently trading near $6.40, this provides you with substantial upside of 40% to 71% and a comfortable margin of safety.

What Would Make Us Sell

First, if market volatility decreases and remains at those lower levels, it would dampen growth in the derivatives markets — and, by extension, the number of trades from which TradeStation generates revenue.

Second, if low interest rates persist longer than we expect, TradeStation's interest income per account would remain near today's low.

Third, if TradeStation's move into the futures and forex markets isn't well received by active traders, account growth could fall behind our expectations.

Finally, a large, ill-advised acquisition of a competitor would force us to reevaluate our valuation. We did factor in the need for more capital expenditures to support our growth estimates, but that doesn't extend to a major acquisition.

The Pro Bottom Line

By our estimates, TradeStation is trading near fair value today, assuming interest rates and volatility remain the same over the next decade. That said, we expect interest rates and volatility to *rise* in the next three to five years. TradeStation would benefit from that, as well as from the growing derivatives market. Today, it's winning market share in its prime demographic, and we think its long-term trajectory looks strong. The likelihood of higher interest rates and volatility down the road only sweeten the story.

Todd Wenning owns shares of TradeStation. The Motley Fool owns shares of Interactive Brokers.

Monday Memo: Pro Grows Bigger and Better

Published Sep 20, 2010 at 12:00AM

We hope you participated in Week 1 of the *Pro* My Scorecard Contest — and we're here to kick off Week 2.

Pro **'s Picks:** Go to My Scorecard and add at least two of *Pro*'s Buy First stocks to your stocks or watch list by Sunday, Sept. 26. Perhaps you've just upped your allocation or just haven't had time to enter a past purchase into the tool — well, now's the perfect time! Many of you may already have two Buy First stocks on your Scorecard (shiny gold stars for you), in which case, you'll automatically be entered to win this week's prize: a one-year subscription to the Motley Fool newsletter of your choice!

If you want more details, you can find them here. Stay tuned for next week's challenge, which will be announced in the Sept. 27 Memo. Fool on!

We're never content with *Pro* — and that's fantastic news for you. We want to continually improve the service and steadily increase your returns while taking reasonable risk. To both ends, we're excited to announce that the *Pro* team here at Fool HQ has recently expanded, adding to our skill set, and with the new team in place we have many new initiatives in store for you as we start *Pro's* third year.

In a moment, you'll hear directly from the new *Pro* analysts. But before that, we have a *Pro* first: *You* can participate in a live chat this week with **Ebix** CEO Robin Raina. Set your reminder for the Thursday event, and bring your questions for the company. Mr. Raina has kindly offered a full hour of his time while he's working in Brazil, and you can bet we were thrilled to fill that slot in his schedule. Be sure to join us!

And Ebix is just the start. We're scheduling talks with execs from all of our *Pro* companies, making steady access to management one of our priorities. You'll hear everything they have to say as our meetings take place month by month. This goes hand-in-hand with offering you more multimedia events, including more *Pro* Audio Extras, Video Extras, and live investing chats. *Pro* will become a bit more of a multimedia service, and we'll publish more special features, too, including new valuation guides, brand-new options strategies, CAPS reports, and more (did I mention that we've added three new analysts?).

Of course, "more" isn't better unless there's more *value* involved, so our goal is to continue improving as investors, come to know our companies and strategies even better, and grow our returns together—and for you to enjoy it each step of the way.

Guidance Changes

- **Oracle** moves down to Buy due to valuation after a large earnings-driven gain.
- **SPDR KBW Regional Bank ETF** moves up to Buy First due to valuation.
- **Quanta Services** increases to Buy First due to valuation.

Recent Trades

- Sold most **Lindsay** and about half **Jack Henry & Associates** via covered calls, due to valuation. Short puts on Lindsay expired as a full gain.
- Covered calls on **ProShares Short 500 S&P ETF** and on **U.S. Natural Gas Fund ETF** expired as full gains. We're considering our next moves.

Still Pending

- We need to write a covered strangle on **Tupperware**, per our Sept. 2 recommendation.

Coverage & Community

- With shorting on his mind as the Fool launches *Big Short*, Russell (TMFEldrehad) revisits one way that he uses CAPS to find shorting candidates worthy of further consideration.
- dk1000 opines that **Netflix** may do serious damage to cable companies, as almost 30% of young people surveyed are using Netflix instead of cable.
- Earnings are getting closer: TMFValuemoosie has an earnings calendar.
- Alex340 posted puts and calls that meet *Pro* criteria.

This Weekend's Sells

One last bit of business before the analyst introductions: In a recent Monday Memo, I wrote that "this market may require more" from us as it trades in a range. In that spirit, and following three positive weeks for the S&P 500, we let most of our shares of **Lindsay** and half our shares of **Jack Henry & Associates** be called away this weekend through covered calls. We're happy to sell Lindsay near our fair value estimate, and to lock in a profit on many of our Jack Henry shares after the company made an expensive acquisition. Jack Henry was one of our largest positions but is now a more modest 2.5%. We sold shares at a net $26.29 including our option income, for a

35% gain in more than a year. Including option premiums, we sold our Lindsay shares at a net $50.50 (the strangle paid us well). We still have 20 shares of Lindsay left, because we owned an odd lot — but we'll deal with those in the future.

Meet the New *Pro* Analysts

Now, the more exciting stuff: Three new analysts are joining Todd, Bruce, and me as we dig for the best investment ideas for you here at *Pro*. You'll find their introductions below — have fun getting to know them a bit better!

Nick Crow (TMFCrow)
Senior Analyst

Hi, *Pro* Fools! I recognize many names on the *Pro* boards, and since I'm joining this community from our sister service, *Motley Fool Options*, I hope that I'm familiar to most of you, too. Here's what you might not know about me: My professional life began as a paratrooper in the U.S. Army, after which I worked as a rock-climbing instructor during college. Realizing that if I continued on that course my brain would outlast my body (or they might otherwise both perish prematurely), I turned to banking, where I witnessed the perils of behavioral finance first-hand. I left the bank just two months before the financial crisis (who says timing doesn't count) and moved my family cross-country to enter The Fool's rigorous Analyst Development Program. Now I give back to that program by leading our next crop of market beaters in stock-pitch meetings here at Fool HQ.

My investing style is as eclectic as my background. I've been investing for about 15 years and am a deep value guy at heart. I like to use options to manage my portfolio, but I invest in special situations and distressed debt, too. After stints on *Inside Value* and *Champion Funds*, I think I've found my home because — like *Pro* — I'm a go-anywhere, risk-averse investor. Of course, risk is subjective; for me, it means trying to altogether avoid permanent impairments of capital and investment situations that don't pass the sniff test. When I'm not digging for investment ideas for *Pro* and *Options*, you'll find me spending quality time with my wife and daughter.

Bryan Hinmon, CFA (TMF42)
Analyst

Howdy, *Pro* Fools! I joined the Fool and the *Pro* team in late February, which makes me pretty new around here — but I've logged a decade of Fooldom altogether. Hopefully by now we've run across one another on the boards. Prior to landing at the Fool, I managed money for a small hedge fund in Boston. Earlier in my career I split time between the beach and investment research responsibilities for an asset management firm in Naples, Fla.

All along, my investment philosophy has centered on patience, risk management (often using options), and a focus on valuation. I'm naturally drawn to boring and ugly companies, and I refuse to pay too much for them . Seeking balance, I married an incredible woman who is adventurous and beautiful, and she doesn't refuse to pay too much for anything . I became a CFA charter holder this year, and right now I'm celebrating the playoff-bound Tampa Bay Rays and the return of football season (Go Bucs!).

Andrew Sullivan, CFA (TMFRedwood)
Analyst

*Sziasztok**, *Pro* members!* My background is in equity research, specifically aerospace and defense stocks. After school, I spent five years on Wall Street and managed to find time to earn a CFA charter. I soon realized the sell side wasn't for me and took some time off to travel, which included a 5,753-mile train trip across Russia and stints in Japan, Hungary, and the Czech Republic. But investing is my true love, so in 2008 I joined the *Inside Value* team and have since worked on *Income Investor* as well.

My investing style is overwhelmingly focused on safety of capital and usually this translates into "buy low" — not in terms of generic ratios, but in terms of business worth. In that vein, much of my time is spent on the little-known second course of Warren Buffett's imaginary business school: "How to Think About Markets." This course (to my understanding) teaches patience and careful entry points for investments. You can never change your buying price, so my philosophy is to make it exceptional. Average entry points will earn you average returns.

One final note: I'm bearish on the market and a big fan of gold (putting me in the minority at Fool HQ), but I hope to unearth undervalued stocks for you — because they exist in every market. And I'll be keeping my oculi open for potential short candidates.

**Sziasztok is hello (plural) in Hungarian*.

Say *Your* Hello!

If you'd like to greet our new analysts or ask them questions, please visit the Meet & Greet board — they'll be checking in to respond. If you have questions about today's Memo, please visit our Memo Musings board. And we all hope to see you on Thursday in the chat room with Ebix. Don't miss the sidebar for more *Pro* links and news.

Stay Foolish!

Pro My Scorecard Contest Official Rules

Published Sep 13, 2010 at 12:00AM

Here are the official rules for the *Motley Fool Pro* My Scorecard contest. They will be updated as each challenge is announced. Enjoy!

Week 1 Challenge: Your Pick
Winner: Anita Carty, Portsmouth, Va.

1. ENTRY: No purchase necessary to enter or win. The contest will start on Sept. 13, 2010, and end on Sept. 19, 2010, at 11:59 p.m. ET. To be eligible, you must have at least one (1) stock in My Scorecard (as a purchase or on your watch list) by Sept. 19, 2010. If you already have a stock listed, you are automatically eligible and don't need to do anything further. If you don't have any stocks listed, please add at least one before the end of the contest period.

   To enter without inputting any stocks in My Scorecard or other obligation: On a piece of paper or 3x5 card, print your name, address, city, state, ZIP code, and email address; list a stock you own or are watching; and mail it in a stamped envelope to Motley Fool Pro Contest, The Motley Fool, 2000 Duke Street, Alexandria, VA 22314. Although you may enter as often as you'd like, only one entry per postmarked envelope is permitted. All entries must be postmarked no later than Sept. 19, 2010.
2. WINNER SELECTION: The Motley Fool will randomly select one winner from among the eligible participants. Therefore, the chances of winning depend on the number of eligible entries.
3. PRIZES: The winner will receive a copy of Jason Zwieg's *Your Money and Your Brain* signed by the *Pro* team (approximate retail value: $15) and a Motley Fool T-shirt, mug, and jester cap.

Week 2 Challenge: *Pro*'s Picks
Winner: Michael Guiremand, Thousand Oaks, Calif.

1. ENTRY: No purchase necessary to enter or win. The contest will start on Sept. 20, 2010, and end on Sept. 26, 2010, at 11:59 p.m. ET. To be eligible, you must have at least two (2) *Motley Fool Pro* "Buy First" stocks in My Scorecard (as a purchase or on your watch list) by Sept. 26, 2010. If you already have two *Motley Fool Pro* "Buy First" stocks listed, you are automatically eligible and don't need to do anything further. If you don't have two active "Buy First" stocks listed, please add the requisite amount before the end of the contest period.

   To enter without inputting any stocks in My Scorecard or other obligation: On a piece of paper or 3x5 card, print your name, address, city, state, ZIP code, and email address; list two *Motley Fool Pro* "Buy First" stocks; and mail it in a stamped envelope to Motley Fool Pro Contest, The Motley Fool, 2000 Duke Street, Alexandria, VA 22314. Although you may enter as often as you'd like, only one entry per postmarked envelope is permitted. All entries must be postmarked no later than Sept. 27, 2010.

2. WINNER SELECTION: The Motley Fool will randomly select one winner from among the eligible participants. Therefore, the chances of winning depend on the number of eligible entries.
3. PRIZES: The winner will receive a free one-year subscription to any of the following: *Motley Fool Stock Advisor, Motley Fool Hidden Gems, Motley Fool Inside Value, Motley Fool Rule Breakers, Motley Fool Rule Your Retirement,* or *Motley Fool Global Gains* (approximate retail value: $149-$299).

Week 3 Challenge: Community Picks
Winner: SMK1, Westerly, R.I.

1. ENTRY: No purchase necessary to enter or win. To be eligible, you must make a post or reply on the Motley Fool Pro My Scorecard Contest discussion board guessing the top three (3) stocks held or being watched by *Motley Fool Pro* subscribers, in order, as of Sept. 27, 2010. The contest will start on Sept. 27, 2010, and end on Oct. 3, 2010, at 11:59 p.m. ET. Only one entry per person. If you post more than one entry, only the first post will be considered for purposes of this contest. **Alternate Means of Entry:** On a piece of paper or 3x5 card, print your name, address, city, state, ZIP code, and email address; write your prediction of the top three stocks owned by *Pro* members; and mail it in a stamped envelope to Motley Fool Pro Contest, The Motley Fool, 2000 Duke Street, Alexandria, VA 22314. Only one entry per postmarked envelope is permitted; if you enter more than once, only the entry received first will be considered for purposes of this contest. All entries must be postmarked no later than Oct. 4, 2010.
2. WINNER SELECTION: The Motley Fool will randomly select one winner from among the eligible participants. Therefore, the chances of winning depend on the number of eligible entries.
3. PRIZES: The winner will receive a free one-year subscription to any of the following: *Motley Fool Stock Advisor, Motley Fool Hidden Gems, Motley Fool Inside Value, Motley Fool Rule Breakers, Motley Fool Rule Your Retirement,* or *Motley Fool Global Gains* (approximate retail value: $149-$299) and an additional free one-year subscription to give to a third party as a gift.

Rules Applicable to All Challenges

1. ELIGIBILITY: This contest is open only to legal U.S. residents, over the age of 18. Employees and contractors (and their families) of The Motley Fool, LLC, or any of their affiliates are not eligible. Void where prohibited by law. Contestants residing in those areas where the contest is void may participate in the contest but may not win any prizes.
2. WINNER NOTIFICATION: The winners will be notified within 14 days after the determination date. Inability to contact a winner may result in disqualification and selection of an alternate winner.
3. GENERAL CONDITIONS: The winners will be required to execute and return a Certificate of Eligibility, Consent and General Release form within 14 days of notification. The winners may also be required to complete and return a W-9 for tax purposes. Non-compliance within this time period may result in disqualification and selection of an alternate winner. Any income tax liability is the sole responsibility of the winners. By acceptance of the prize, the winners consent to the use of his or her name and/or likeness for purposes of advertising or trade without further compensation, unless prohibited by law.
4. USE OF CONTEST INFORMATION: All entries become the property of The Motley Fool. The Motley Fool reserves the right to use any and all information related to the contest, including submissions provided by the contestants, for editorial, marketing, and any other purpose, unless prohibited by law.
5. CONDUCT: All contest participants agree to be bound by these Official Rules. The Motley Fool, in its sole discretion, reserves the right to disqualify any person it finds to be tampering with the entry process or the operation of this website or is otherwise in violation of these rules.
6. LIMITATIONS OF LIABILITY: The Motley Fool will not be responsible for late, lost, or misdirected email or for any computer, online, telephone, or technical malfunctions that may occur. If for any reason, the contest is not capable of running as planned, including infection by computer virus, bugs, tampering, unauthorized intervention, or technical failures of any sort, The Motley Fool may cancel, terminate, modify, or suspend the contest. Entrants further agree to release The Motley Fool from any liability resulting from or related to participation in the contest.
7. WINNERS LIST: The names of the winners may be obtained by sending a self-address stamped envelope to Motley Fool Pro My Scorecard Contest, The Motley Fool, 2000 Duke Street, Alexandria, VA 22314.

The Pro My Scorecard Contest

Published Sep 13, 2010 at 12:00AM

We Have Winners!

Winners of the My Scorecard contest are:

- **Week 1: Anita Carty** of Portsmouth, Va., has won an array of Fool goodies!
- **Week 2: Mike Guiremand** of Thousand Oaks, Calif., has won a year's subscription to one of the following: *Motley Fool Stock Advisor, Motley Fool Hidden Gems, Motley Fool Inside Value, Motley Fool Income Investor, Motley Fool Rule Breakers, Motley Fool Rule Your Retirement,* or *Motley Fool Global Gains*!
- **Week 3:** A Fool with the username of **SMK1,** hailing from Westerly, R.I., has won a year's subscription to any of the above publications, plus one to give away to a friend or family member!

Thanks to all who participated!

Maybe it's the start of another football season. Maybe it's the multi-day, 64-person office ping-pong tournament we just finished. Whatever it is, Fool HQ is abuzz with competition these days — and we've decided to bring a little of this killer instinct to you. Put up your dukes and get yourself ready, Fool: We're having a contest, and there are prizes at stake!

We'll have three challenges in all, and we'll announce each one in the Monday Memos on Sept. 13, 20, and 27. We'll update this page with details of each challenge as it is announced, so check back! You can also read the official rules here.

Week 1: Your Pick

- Start Date: Monday, Sept. 13

Head to My Scorecard between now and next Sunday, Sept. 19, and enter Your Pick. Did you just buy a stock? Add it! Is there one out there you're watching? Add it without entering buy information. Then head to the My Scorecard board to tell us about the stock you just entered.

What's at stake? We'll randomly select one winner to receive an array of glorious Foolish goodies. Be prepared to impress your friends; you are now one step closer to being decked out in Fool gear!

Week 2: *Pro*'s Picks

- Start Date: Monday, Sept. 20

To be eligible to win this one, you'll need to have at least two of *Motley Fool Pro*'s "Buy First" stocks in My Scorecard (as a purchase or on your watch list) by Sunday, Sept. 26. If you already have two "Buy First" stocks listed, you're automatically eligible and don't need to do anything further; if you don't, head over to My Scorecard now to add them!

What's at stake? We're upping the ante on this one. One randomly selected winner will receive a free one-year subscription to one of the following: *Motley Fool Stock Advisor, Motley Fool Hidden Gems, Motley Fool Inside Value, Motley Fool Rule Breakers, Motley Fool Rule Your Retirement,* or *Motley Fool Global Gains*. And tell us what you're doing on the My Scorecard discussion board!

Week 3: Community Picks

- Start Date: Monday, Sept. 27

The final week of our My Scorecard contest also features the biggest challenge: Community Picks. Head to *Pro*'s My Scorecard Contest board and guess the three companies, in order, that are most widely held by the *Pro* community on My Scorecard (as of today, Sept. 27). Submit your guess by Monday, Oct. 3, to be in the running for a one-year subscription to your choice of the following: *Motley Fool Stock Advisor, Motley Fool Hidden Gems, Motley Fool Inside Value, Motley Fool Rule Breakers, Motley Fool Rule Your Retirement,* or *Motley Fool Global Gains*, as well as one to give away to a friend or family member!

Banking On Patience

Published Sep 13, 2010 at 12:00AM

Calling all members! As you'll recall from last week's Memo, we're kicking off our three-week-long My Scorecard contest *today*.

Your Pick: Head to My Scorecard between now and next Sunday, Sept. 19, and enter Your Pick. Did you just buy a stock? Add it! Is there one out there you're watching? Add it without entering buy information. Then head to the My Scorecard board to tell us about the stock you just entered.

What's at stake? We'll randomly select one winner to receive an array of glorious Foolish goodies. Be prepared to impress your friends; you are now one step closer to being decked out in Fool gear!

Stay tuned for next week's challenge, which will be announced in the Sept. 20 Memo.

Struggling Industries

There's one bad thing about having a concentrated portfolio: Sometimes it doesn't listen to you, because it's concentrating too hard.

… Anybody? Is this thing on? I'm here all week …

Ahem. In any case, *Pro* does have a focused portfolio, and lately, some of the industries we're focused on have been lackluster.

Breaking News

- Our $21 September puts on **Intel** were exercised early, netting us 1,800 more shares at $20.27. Intel is one of our largest positions, and we remain confident in the computing leader.
- We're having a live chat with **Ebix** CEO Robin Raina on Sept. 23, and you're invited! Get the details here.

Guidance Changes

Medtronic moves up to Buy First; **GlaxoSmithKline** moves down to Buy; **ProShares Short S&P 500** moves down to Hold; and **Lindsay** and **Plum Creek Timber** move down to Hold on price.

Coverage & Community

- Got Twitter? Now you can follow *Pro*!
- See the top-scoring CAPShot stocks as of today.
- TMFEldrehad looks at shooting stars (five-star stocks, that is) on CAPS.

Unhealthy Health Care

Of the $1 million *Pro* has invested in the stock market, more than 15% is in large health-care companies: **GlaxoSmithKline**, **Kinetic Concepts**, and **Medtronic**. As of Friday, those companies are down 7%, 12%, and 24% respectively this year, excluding dividends. All three trade at single-digit multiples to free cash flow, making them among the least-expensive stocks in the portfolio. Why? Because investors remain wary of the recent health-care bill and of lower government spending in Europe, and worry that hospitals might be unwilling to ramp up investments.

But where there's concern, there's opportunity. The health-care bill may slow the industry for now, but as the uncertainty lifts, it should result in millions more people with insurance — and that means more customers for health-care businesses. Europe may be talking tough, but we've yet to see a government actually commit to less health care for its people (unsurprising, as that would be a career-ender for any politician). Finally, demographics favor the health industry as baby boomers worldwide need ever-increasing care.

Meanwhile, each of our three health-care companies trade at about 9 times free cash flow, so downside risk should be limited, making them good defensive plays. Today, we're moving beaten-down Medtronic to Buy First from Buy. You can also write attractive puts on the company in the low $30s. As for Kinetic Concepts, we're waiting to see how management executes next quarter; the last two quarters were light, but KCI remains a Buy on price. Finally, GlaxoSmithKline rebounded smartly this summer, and we're starting to look at defensive covered calls on the company — despite its valuation, a larger recovery in price may be slow in coming. Glaxo is moving to Buy from Buy First.

Uncool Tech

We have even more money invested in technology and software than we do in health-care stocks, with greater than 35% of our invested capital dedicated to shares of **Intel**, **Oracle**, **Autodesk**, **Ebix**, and **Jack Henry & Associates** — as well as a spread on **Cisco Systems**. We could also count **Broadridge Financial** in the industry.

For years, I've preferred software and technology investments to most others, thanks to their strong profitability, growth, and recurring revenue. So our high weighting here doesn't concern me; I'd be more worried if we *lacked* exposure. However, Intel has been weighing on our portfolio, declining sharply this summer after management retracted overly optimistic guidance and moved to buy **McAfee** for $7.7 billion. I believe this acquisition is promising for Intel's positions in cloud computing, mobile, and enterprise security, and the company's core business looks inexpensive today at 9 times free cash flow and with the stock yielding 3.5%. Intel remains a Buy First.

Tech Needs Health Care; We Need Patience

All told, some of our tech stocks need a little "health care" to perk up, while some of our health-care stocks are counting on tech to make their industry more efficient and able to reach more people. Meanwhile, about 50% of our invested funds are in two industries that require patience — but we're sitting on good prices while we wait. Also on the bright side, stocks such as GlaxoSmithKline, Ebix, Autodesk, and Broadridge have shown signs of life lately, and options can aid us in the meantime. The bottom line: Our outlook remains positive for both industries and the companies we own within them. If you're lacking positions among our Buy First and Buy stocks (see them all here), look to pony up or at least write puts.

Options Expirations and Reversing Course on SH

This Friday is shaping up to be a busy one, with four options positions set to expire at the end of trading on Sept. 17. Our $21 puts on Intel were exercised early, and they doubled our stake in the chip giant, with a start price on new shares of $20.27 (the stock is around $18.30 today). Our $25 covered calls on part of our Jack Henry position will expire as a nice cash gain as long as the stock remains below $25. Our $35/$40 strangle on **Lindsay** is close to expiring as a full cash gain, but if Lindsay runs above $40 by Friday, we're likely to let our stock be sold away for a good profit.

Our diagonal calls on **U.S. Natural Gas Fund** are going to expire for the full gain, and we'll either write new diagonal calls very soon, or exit the losing UNG calls we own if we can't write attractive calls again. With UNG near $6, our January 2012 $10 calls are a crazy long shot now, but they continue to carry some value today that we don't want to forfeit.

Finally, our covered calls on **ProShares Short S&P 500** are due to expire as a full gain for the third time. However, this short ETF isn't tracking as well as it did last year. As of Friday, it's down 4% for the year while the S&P 500 is down 0.5%. Obviously, the short ETF should be up 0.5% if it were tracking closely, but it isn't, and its deviation has grown worse lately rather than improved. We're putting the ETF on Hold and looking at an exit plan. Don't buy it now, and we'll have more about it soon. In the meantime, we seek much better short-selling or hedging opportunities.

Coming next week: What's in store for *Pro* in the coming year, including our growing team and ambitious service goals.

Jeff owns shares of Oracle and GlaxoSmithKline.

Monday Memo: Measuring Up and Calling All Members

Published Sep 7, 2010 at 12:00AM

Measuring Up

By Jeff Fischer

Welcome to this special Tuesday edition of the *Pro* Monday Memo! In a minute, I'll be introducing *Pro* publisher Adrienne Perryman for a special announcement. But before I do, let's take a look at two key metrics for each company in our portfolio. Looking at these key measures will help us understand how financially strong and flexible our businesses are, as well as where most sales are coming from, so we can better pinpoint the geographic risk and diversification each company presents.

We'll start with price-to-free cash flow, which measures the market value of a company against the amount of free cash flow it creates annually. Free cash flow is the actual value generated by a business — the money brought in that is unencumbered, and thus available for the business to spend how it wishes. Historically, the stock market has averaged a free cash flow multiple around the mid-teens, but as with so many things in investing, the devil is in the details. A high-growth business may trade at 80 times free cash flow — as **Google** did when it went public — and still end up being a great buy. But a weak company may fetch only 10 times free cash flow and still not be worth considering.

The *Pro* portfolio holds many healthy businesses trading at low multiples to free cash flow, most notably **Intel**, **Broadridge Financial**, and our health-care businesses — not surprising given that health care and technology are out of favor at the moment. The upside is that odds favor a meaningful rebound in price if these businesses stay steady or improve.

Company	Share Price (9/3/2010, 11 a.m.)	Price to Free Cash Flow (or to book value where appropriate)	Percentage of Sales *Outside* the United States (trailing 12 months)
AmTrust Financial Services	$14.25	1.3 times BV	53.0%
Autodesk	$29.60	16.5	69.3%
Bristow Group	$34.80	0.9 times BV	80.2%
Broadridge Financial	$22.00	9.4*	27.5%*
Cameco	$25.88	28.6	51.0%
Cisco Systems	$20.90	13.0	50.0%
Ebix	$18.75	16.5	24.9%
GlaxoSmithKline	$39.10	8.9	64.0%
GrafTech International	$15.50	28.0	82%
Intel	$18.25	9.2	85%^
Jack Henry & Assoc.	$24.40	12.7	0%
Kinetic Concepts	$33.20	9.3	25.9%
Lindsay	$39.50	12.4	40%
Medtronic	$32.85	9.4	41%
MELA Sciences	$7.00	N/A	N/A
NextEra Energy	$54.55	1.7 times BV	0%
Oracle	$22.65	13.4	57.2%
Papa John's Int'l	$25.22	11.7	3.9%
Plum Creek Timber	$35.40	19.8	0%
Procter & Gamble	$60.00	13.0	58%
Tupperware Brands	$42.50	12.7	68%
Quanta Services	$18.75	51.0	3.3%
Average		16.4~	40.2%

*BR's FCF excludes gains from discontinued operations, and its amount of foreign sales is a *Pro* estimate.
^Many Intel sales to Taiwan and China end up in products sold to the United States.
~ Excludes those measured on book value and our MELA speculation.
Trailing-12-month free cash flow and sales outside the U.S. calculated by *Pro* using Capital IQ, company SEC filings, and *Pro* estimates.

Some outliers in this list do appear expensive, including **Quanta Services** and **Cameco**. But Quanta deals with large contracts that can suddenly send cash flow much higher, and Cameco's valuation is largely dependent on the value of its uranium holdings in the ground. In all, we're comfortable with the valuation of our stocks on this measure.

Coverage & Community

- Member jgunnar provides look-through earnings on *Pro* companies. He also asks, "Is it time to retire the tech label?" David Gardner responds, "Yes!"
- Jeff spoke with **Ebix** CEO Robin Raina on Friday in a Foolish interview. The transcript will be available later this month.
- Alex340 posts puts and covered calls that match *Pro* criteria.
- It's never too early to plan for earnings! TMFValuemoosie posts a calendar.
- Bruce Jackson (TMFGoogly) asks if large-cap stocks are the bargain of a lifetime.
- In the wholly Foolish department, Bob (trurl9) shares how a golfer set a course on fire — literally.
- Interesting stuff: Tom (tcsonic) shares that China is looking deep undersea for commodities.
- Our **U.S. Natural Gas Fund** investment (on Hold) continues to suffer. Jeff shares thoughts on its fate.
- *Pro* analyst Bryan Hinmon (TMF42) likes **Intel**'s strategy.
- TMFEldrehad discusses how to use the CAPS screener as a tool to find possibly high-scoring CAPShot stocks.

The second factor we're looking at, as you can see in the table, is the percentage of sales derived *outside* the United States in the past year. Although last week's positive economic news on unemployment and manufacturing helped lighten the mood in the U.S., many investors are still concerned about American economic strength and are wondering whether they should increase their international exposure. Personally, I'm more concerned about international markets than I am about the United States' economy. Either way, though, we at *Pro* have significant overseas exposure, and we're paying attractive prices for it, while avoiding the many sovereign risks that buying a stock in China (for example) can present. We are likely to add more direct international exposure in the future, but we don't feel we're lacking exposure overseas.

Coming up later this month, we'll issue a special full review of each company in the *Pro* portfolio, examining whether our thesis for each investment remains strong. And with that, I'll hand the reins over to Adrienne — thanks for reading!

Calling All Members!

By Adrienne Perryman

Maybe it's the anticipation of football season. Maybe it's the multi-day, 64-person office ping-pong tournament we've got going on (unfortunately, I was knocked out in round 1, but I will have my revenge). Whatever it is, Fool HQ is abuzz with competition these days — and we decided to bring a little of this killer instinct to you. Put up your dukes and get yourself ready, Fool: I'm here to declare a contest, and there are prizes at stake!

Starting next Monday, Sept. 13, we'll announce the first of three parts of the *Pro* My Scorecard Challenge. You use the tool, right? All truly Foolish investors do (see what we meant about that smack-talkin'?). If you haven't added any stocks yet, give it a whirl — it's simpler than you think. Simply enter the ticker of a company you own or are thinking about buying in the Add More Positions box, then click "ADD." You can also add stocks from *Pro*'s portfolio page by selecting "Add" in the "I Own This Stock" column. From then on, every article published by any service you own, every board post, and every Fool.com article about *your* companies will be delivered to your (virtual) doorstep. And although My Scorecard doesn't handle options trades, you can still enter the underlying stock to see how the company is performing.

We'll announce the first My Scorecard Challenge in the next Monday Memo, so be on your toes. The next two Memos, on Sept. 20 and 27, will feature details on the following challenges, and the contest will wrap up on Oct. 4. As I mentioned, there will be prizes (and bragging rights). In the meantime, head to the new My Scorecard board to talk strategy, talk smack, or talk stocks — we'd love to hear it!

Write a Covered Strangle on Tupperware

Published Sep 2, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") January 2011 $45 covered calls on all shares owned, and write ("sell to open") an equal number of January 2011 $35 puts.
- **Allocation:** We own half of our targeted 4% allocation in Tupperware, and we're writing puts to potentially buy the other half (for *Pro*, that means five calls and five puts).
- **Preferred limit price:** Enter a strangle net credit order for $3.90 or more.
- **Alternate trades:**
  - **If you don't own Tupperware:** We suggest writing one leg of this strangle, the January $35 puts, aiming for a payment of $1.60 per share or more.
  - **If you own at least 100 shares but don't want to buy more:** You can just write the covered call side of the strangle, which will bring you income.
  - **If you aren't using options:** Buy 2% of Tupperware around $40 or lower.

What's New

After **Tupperware Brands** (NYSE: TUP) reported second-quarter results in July, the stock melted 7.5% because of accounting problems in the company's Russian division. We hate this kind of surprise as much as anyone, but management dealt with these head-on, finding and reporting them of its own volition. Because of adjustments in earnings to correct past mistakes and unfavorable foreign-currency conversions, Tupperware lowered its full-year earnings estimates from $3.72 to about $3.56 per share.

Apart from the Russian accounting adjustments, which the company corrected (and which it assures us are not to be repeated), the rest of Tupperware's business remains largely on track. Management is forecasting full-year local currency sales growth of 6% to 8%, with emerging markets leading the way, particularly China, India and Indonesia — three countries that represent *half* of the world's population. In other words, the impressive earnings growth of the past two years is likely to continue. If economies weaken, Tupperware should be able to hire more qualified sales staff, who can then sell to more people looking to save money on food storage. If the global economic picture strengthens, on the other hand, emerging-market sales should continue to grow as more people can afford extra food.

With Tupperware's stock hovering around $41, it trades at an inexpensive 11.5 times the new 2010 earnings estimates and 13.2 times trailing free cash flow, and it has a dividend yield of 2.5%.

Why This Strategy?

This is the fourth time in the past 15 months that we've recommended using options to buy Tupperware stock, sell it, or generate income. We generated income with our first two trades, and in February, we bought a 2% allocation of the stock and wrote a covered strangle to potentially buy our second 2%. Somewhat conveniently, that $40/$50 covered strangle expired just before Tupperware's second-quarter earnings, generating 100% income for the *Pro* portfolio.

We are again writing a covered strangle on our Tupperware shares — writing puts to potentially buy more stock lower and writing covered calls to potentially sell the shares we own higher. We'll be happy either way, and while we wait until the January expiration, we're also happy to keep our existing stock and earn the 2.5% annualized dividend in the meantime.

On Tupperware alone, the *Pro* portfolio has now cleared $7,650 in realized option income and $250 in dividends. That's $7,900 on our $22,765 cash investment. This 34% return doesn't show in Tupperware's numbers on our portfolio page, but it makes the holding an easy winner; when accounting for the buying power that we put aside to write Tupperware puts, the return on investment is still well above 20%, demonstrating how option income strategies can add to your returns even in tepid markets.

How to Follow Along

We recommend buying shares around $40, and continuing to write options on Tupperware if you're using options; our fair value on the stock is still around $50.

To write a covered strangle, you must own at least 100 shares of the stock, and you must be happy to buy at least 100 more at a lower price. You write a covered call on every 100 shares you own, and write a put for every 100 additional shares you would buy. A strangle uses different strike prices, which means it provides a wide range in which to profit. Generally, you write a strangle when you expect a stock to stay in a certain range. Remember, you can also execute only one side of the strangle, if that suits your situation better.

Trade Details

- **Recent options bid/ask (as of Sept. 2):**
  - Sell to open January 2011 $35 puts, $1.60/$1.80
  - Sell to open January 2011 $45 calls, $2.10/$2.35
- **Combined credit target:** $3.90 or more per share, net credit (use a strangle order)
- **Effective options yield:** 9.4% of recent share price ($41.40) in less than five months
- **Potential net buy price of new shares:** $31.10 (24.9% below current price)
- **Potential net sell price on our current shares:** $48.90 (18.1% above current price)
- **Profit range on options:** Anywhere above $31.10

Again, this covered strangle provides you a wide range in which to profit — anywhere from $31 to $49, without the need to involve a stock transaction if you don't want to. If Tupperware is between $35 and $45 by Jan. 20, 2011, both options will expire for the full cash gain, which is what happened last time we used this strategy. At that point, we may repeat our strategy.

If you're new to covered strangles, you may want to review our strangles guide, and ask any questions on our Tupperware board.

Bruce is short Tupperware options.

Monday Memo: Framing the Big Picture

Published Aug 30, 2010 at 12:00AM

In investing as in life, the way you frame things can make a big difference.

Even if you start out calm, regularly proclaiming "My stocks are going down!" will eventually leave you concerned or fearful — and this could make you want to sell for no other reason but to escape falling prices. The implication there, though, is that you would only buy again when prices are already on their way *up* — with the end result that you'd be selling and buying at exactly the wrong times.

Now let's frame the whole concept differently. Instead of "My stocks are going down," we can say, "Investors are valuing businesses less generously lately, so the small slice of each business I own is worth less right now, too." This framing offers a logical look at the situation, gives you context on why it's happening, reminds you that you're not alone with your investments, and even lends itself to a logical response: "I don't want to sell while others have pushed prices lower. I'll wait for a time when investors are paying *up* for these businesses."

Coming Up

- **Labor Day:** Next week's Monday Memo will hit your inbox on Tuesday, Sept. 7. Have a great holiday!
- **Coming to *Pro* in September:** A special report that reviews the thesis behind every investment we hold; a member contest that begins next week; a new options guide; trades (of course); and more.

Review: Last Week's Trade Alerts

- Write a covered strangle on **Plum Creek Timber**.

Coverage & Community

- *Pro* analyst Bruce (TMFGoogly) provides the lowdown on **Medtronic**'s latest quarter.
- **Ebix** will merge with A.D.A.M., a provider of software solutions to the health-care industry. This should add to earnings in year one.
- *Pro* member learninbyfoolin posts a creative video sharing suggestions on how to improve *Pro* — talk about effective! We're already talking about the ideas.
- Ever-popular *Pro* member alex340 shares new puts that meet *Pro* criteria — and now (hold onto your caps) covered calls that meet *Pro* criteria, too!
- *Pro* member latimerburned shares his Fool-inspired investor-revolt blog post.
- Bryan (TMF42) provides an updated *Pro* stock fair-value table.
- Joe (TMFValuemoosie) has a *Pro*-related earnings calendar.
- Russell (TMFEldrehad) highlights the usefulness of tags in CAPS to find investment ideas.

In the way you frame a situation, you can replace an emotional response ("My stocks are falling! Should I sell?") with a logical one ("Businesses are being given lower valuations by investors today. It's not a great time to sell my part of them. In fact, could I buy more?").

A Portfolio Suitable for Framing

Framing is also important when it comes to your portfolio. Once you have a portfolio that's close to fully allocated, each new investment decision you make should, at least in part, be framed by the context of your existing portfolio and its many holdings.

When we saw **Cisco Systems** decline sharply on Aug. 9 — even though the outlook for the business over the next few years looks exceptional — I was drawn to the potential opportunity. However, the *Pro* portfolio already has large positions in several technology leaders, including **Intel**, **Oracle**, **Autodesk**, and **Ebix**. A Cisco stock purchase would have added even more exposure to the industry, which didn't make sense from a portfolio perspective (unless we had sold existing tech holdings to make room for Cisco, which we didn't want to do).

Our other alternative was to use a less capital-intensive strategy. This led to the decision to set up a bull call spread on Cisco. Our net investment representing 3,000 shares of Cisco (with a potential net cost of $55,080 in 2012 if turned to stock) cost us only $10,000 today. The spread also gives us ample downside protection, which is especially important because of our already large exposure to technology. Since our spread cost us a net $3.36 per share and could return $1.64 per share, we stand to achieve a 49% return on investment in 17 months if Cisco is above $20 when our options expire. Earning nearly $5,000 on a $10,000 investment, with the main requirement being that Cisco doesn't decline much, looks like an attractive return with reasonable risk. Even in the context of the tech stocks we already own, we could justify this extra investment. However, if we didn't already own Intel and Oracle, we would have bought shares of Cisco outright. The "frame" of our other holdings helped us determine our course of action.

As the Portfolio Churns

As investors, we need to think about each new investment we make in the context of the entire portfolio we already own. At *Pro*, we continue to offer alternate trade ideas whenever we can, to help you do just that. Since we are close to fully invested, we also need to look over the portfolio on a regular basis and trim or adjust positions based on updated information and beliefs.

When you're building a portfolio, no matter how carefully, you can't be certain how it will all come to look once it's close to fully invested. Once that point is reached, it's time to step back, take an objective look at your creation, and then start to manage it. Since we're running a portfolio, which is made up of interdependent components (not just a list of stocks that operate in a vacuum), we'll sometimes be tasked with cutting some positions even if we still like them. For instance, we may feel overexposed to an industry that isn't as attractive as it was when we bought in. Or we may simply want to be more defensive or free up more capital, and the best way to do so may be to trim many positions at once.

The lesson here is twofold: First, don't fall in love with any single position. Once you have a fully invested portfolio, you need to manage it as a whole, rather than looking upon each individual holding with any strong preference (other than to weed out weaklings). And second, don't look down upon portfolio adjustments as "active trading" or as going against your earlier beliefs. There's a big difference between managing allocations in an evolving portfolio and selling your entire position in a company because it's failing to live up to your thesis. If we make good buy decisions, we'll be managing and adjusting our allocations much more often than we'll be selling entire stocks at a loss. And however you frame it, that's a good position to be in.

Questions? Thoughts? Please mosey on over to the Memo Musings board.

- **How We Do It:** Invest the Pro Way

Jeff owns shares of Oracle.

Write a Covered Strangle on Plum Creek Timber

Published Aug 24, 2010 at 12:00AM

At a Glance

- **Action:** Using a strangle order, write ("sell to open") November 2010 $31 puts, and write ("sell to open") November 2010 $36 covered calls.
- **Preferred limit price:** Enter a strangle net credit order for $2.08 or so (higher if you can).
- **Recent share price:** $33.50.
- **Allocation:** We own about half of our targeted 5% allocation in Plum Creek and are covering all shares, and we're writing puts to potentially buy the other half (for *Pro*, that means 10 calls and 10 puts).
- **Alternate trades:**
  - **If you don't own Plum Creek:** We suggest writing one leg of this strangle, the November $31 puts, and aiming for a payment of $1.20 per share or more.
  - **If you own at least 100 shares but don't want to buy more:** You can just write the covered call side of the strangle, which will bring you income.
  - **If you aren't using options:** Buy a 3% allocation of Plum Creek below $34.

What's New

While we're busy earning options income on its stock, **Plum Creek Timber** (NYSE: PCL) is keeping itself busy as the largest independent landowner in the United States. Its diverse groves of timber serve as an inflation hedge as well as a source of future earnings power. There's not much new with the business lately, and that's fine with us. As we shared last week, Plum Creek continues to be well-managed. Much of its timber is currently being left to grow while the company waits for better log prices. Meanwhile, the company is buying and selling land for profit — but management sees the economy merely smoldering, rather than catching fire. While all this is going on, we want to earn more than the 5% dividend payment (generous though it is), so we're continuing to write lucrative options on the stock.

Why This Strategy?

This will be the fourth time in the past 18 months that we've written a covered strangle on our Plum Creek shares. In a covered strangle, we write puts to potentially buy more stock at a lower price, while also writing covered calls to potentially sell the shares we already own at a higher price. As with our previous Plum Creek covered strangles, our primary aim here is to earn options income while keeping our stock and its 5% dividend yield. This strategy has paid off exceptionally well since we started employing it in February 2009.

On Plum Creek alone, the *Pro* portfolio has now cleared approximately $8,170 in realized options income and $2,520 in dividends. That's $10,690 on our $31,960 stock investment. This 33% return isn't reflected in Plum Creek's numbers on our portfolio page (where we simply show the stock up 5%), but it makes the holding a clear market-beater (even including the equity set aside to hold open the puts we've written, which lowers the total gain on capital). The results demonstrate how options income strategies can add to our returns over time even if the market goes nowhere and how they can help build our wealth with less hand-wringing than owning stocks alone often entails.

How to Follow Along

We recommend buying shares in the lower $30s; these can serve as an inflation hedge while paying a 5% yield. We also recommend writing options on Plum Creek regularly if you're using options in your portfolio; our fair value on the stock still touches $40, although the tepid economy will be a factor.

To write a covered strangle, you must own at least 100 shares of the stock, and you must be happy to buy at least 100 more at a lower price. You write a covered call on every 100 shares you own, and write a put for every 100 additional shares you would buy. A strangle uses different strike prices, which means it provides a wide range in which to profit. Generally, you write a strangle when you expect a stock to stay in a certain range.

Trade Details

- **Recent options bid/ask (as of Aug. 24):**
  - Sell to open November 2010 $31 puts, $1.21/$1.25
  - Sell to open November 2010 $36 calls, $0.87/$0.91
- **Combined credit target:** $2.08 or so per share, net credit (use a strangle order)
- **Effective options yield:** 6.2% of recent share price ($33.50) in three months
- **Potential net buy price of new shares:** $28.92 (13.6% below current price)
- **Potential net sell price on our current shares:** $38.08 (13.6% above current price)
- **Profit range on options (not including the stock):** Anywhere above $28.92

Again, this covered strangle provides a wide range in which to profit — we can make money on the options if Plum Creek shares are anywhere from $28.92 to $38.08 at expiration, without the need to involve a stock transaction if we don't want to. If Plum Creek is between $31 and $36 by Nov. 20 (just 88 days away — have you made your Thanksgiving plans yet?), both options will expire for the full cash gain. At that point, we may repeat our strategy a fifth time.

Keep in mind that anytime you write puts, your broker sets cash or equity aside to cover your potential stock purchase. These $31 puts pay a 3.9% yield on cash set aside over the next three months, and a much higher effective yield if you're using equity. If you're new to covered strangles, you may want to review our strangles guide. Please bring any questions to our Plum Creek discussion board.

Monday Memo: Avoid the Pitfalls of Valuation

Published Aug 23, 2010 at 12:00AM

When Jeff and I attended medical technology company **Kinetic Concepts**' annual investor day last November, we were fortunate enough to score some face time with NYU finance professor, author, and valuation guru Aswath Damodaran, who also graciously provided us with the latest edition of his valuation classic, *The Dark Side of Valuation*.

Guidance Change

- Up sharply since earnings, **Ebix** moves to Buy from Buy First.

Pro Events

- Aug. 24: **Medtronic** earnings.
- Sept. 14: **Cisco Systems** analyst day.

Review: Last Week's Trade Alerts

- Initiate a bear put spread on **Caterpillar**.
- Initiate a bull call spread on Cisco Systems.
- Buy to close puts on **Plum Creek Timber**.
- Write covered calls on **Cameco**.

Coverage & Community

- TMFEldrehad highlights a live chat with one of the "best of the best" in all of CAPS.
- New *Pro* analyst Nick Crow (TMFCrow) starts a discussion on "if deflation happens."
- Alex340 posts put-writing trades that match *Pro* criteria (and *Motley Fool Options* puts, too).
- Leaning on his professional experience, member 4stree posts about land prices in relation to banks and Plum Creek Timber.
- TMFValuemoosie shares an earnings calendar.
- *Pro* members discuss the news that **Intel** will buy **McAfeeSoftware**.

The first edition of the book was published in late 1999 to address "the inability of traditional valuation models to explain [then-]stratospheric stock prices for technology companies," as well as "the willingness of analysts to abandon traditional valuation metrics and go to the 'dark side' of valuation, where prices were justified using a mix of new metrics and storytelling." The timing couldn't have been better, as the dot-com bubble burst just a few months after the book was published.

It's easy to look back at the dot-com era and laugh at the analysts who used metrics like price-to-page views, price-to-click-throughs, and price-to-downloads to value high-flying (but unprofitable) companies. Yet similar shenanigans — almost as laughable as our favorite, price-to-meringue pies — are common in many of today's Wall Street research reports.

The dark side of valuation is a seductive force for analysts who need to come up with frequent buy recommendations for clients. A tweak to a model's inputs here or there — intentional or unintentional — can make any stock appear undervalued.

Because of this, whenever we do valuation work at *Pro*, we remember the common pitfalls Damodaran outlined in *The Dark Side of Valuation*. Here are a few of them:

1. **The input phase:** When gathering information, analysts often fall victim to "base year fixation" — using the last 12 months of data as a good starting point for making projections. Doing so isn't always accurate, which is why for cyclical firms (such as **Lindsay**), we prefer to use a "normalized" base year. This way, we can

capture the underlying business trends, independent of cyclical ups and downs, to feed into our valuation analysis.
2. **The valuation phase:** As we begin to make projections, we want to make sure our assumptions for future growth are consistent with the company's (and the industry's) past, and that they account for the company's size. **Procter & Gamble**, for example, is a $170 billion company, and it's therefore unlikely to grow as fast on a percentage basis as a smaller company. Also, reversion to the mean is a powerful force; a company that has been growing at high rates in previous years is likely to face stronger competition, and thus reduced profitability, down the road.
3. **The post-valuation phase:** After our model spits out a fair value, we don't "garnish" the valuation to make it fit our thesis. Because discounted cash flow (DCF) valuations are largely determined by the company's terminal value (the value we assign assuming the company will exist forever), an easy way to make the valuation fit your thesis is to arbitrarily increase the terminal growth rate. Even a small change in that rate can make a big difference; the seemingly minor change from 3% to 4% could increase a valuation result by 25% or more.

Valuation is part art and part science, so there will always be subjective judgments in any analysis. But our aim is always to avoid the dark side of valuation and provide an honest assessment of any given investment.

Up Next

In the next Monday Memo, Jeff talks about our recent Cisco and Caterpillar trades in the context of your whole portfolio. Watch for it in your inbox on Aug. 30!

Will we misjudge a company at times? Absolutely. But by erring on the conservative side and making sure our estimates are grounded in reality, we hope to produce fair valuations that will help us avoid permanent losses and meet our goal of closing at least 75% of our positions profitably.

Have a question about valuation? Post it on the Philosophy & Strategy board.

Foolish best,

Todd Wenning

Todd owns shares of Procter & Gamble and Kinetic Concepts.

Write Covered Calls on Cameco

Published Aug 20, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") December 2010 $28 covered calls on all of your Cameco shares
- **Allocation:** Write one call for every 100 shares of Cameco owned (for *Pro*, that's seven contracts)
- **Recent stock price:** $25.60
- **Option's recent bid/ask (Aug. 19):** $1.00/$1.10
- **Preferred limit price:** About $1
- **Special requirement:** You must own at least 100 shares of Cameco to write a covered call.
- **Alternate trades:**
  - **Don't own 100 shares of Cameco?** Continue to hold your position.
  - **Don't own any shares of Cameco?** The stock is on hold, but you can sell December 2010 $23 puts for around $1 to potentially add shares at a net $22.

What's New?

As we noted in our review of **Cameco**'s (NYSE: CCJ) second-quarter results, the news has been uninspiring lately at our favorite uranium miner. Sales fell and profits slumped, and the company reduced its 2010 uranium sales forecast to 30 million pounds from a previous range of 31 million to 33 million pounds.

Cameco's quarterly results can be lumpy, and we're not overly concerned about the company having one off quarter, especially as uranium is hardly a deteriorating asset. On the upside, Cameco is still on target with its long-term goal to double uranium production by 2018.

The favorable long-term trends for this "clean" energy source remain firmly intact, with Cameco recently signing its first long-term sales agreement with a Chinese utility — CNEIC, a subsidiary of China National Nuclear Corporation. Cameco will supply 23 million pounds of uranium concentrate to CNEIC through 2020.

Despite this, Cameco stock is down year-to-date, reflecting a cooler short-term uranium market and softer results. At around $25.60, CCJ shares currently trade at a P/E of around 24 (which is hardly cheap), falling to around 21 next year (again, not cheap). Even though Cameco's short-term valuation needs to be considered, its long-term uranium supplies will drive its earnings power and give us confidence in holding the shares if they aren't called away.

Why This Strategy?

We're maintaining our fair-value estimate of $31 and preferred buy price of below $24.50, but with the company's near-term valuation looking stretched, we're going to take the opportunity to write covered calls again: this time, December 2010 $28 calls. This strategy will create a modest hedge while either earning us income or allowing us to sell our shares at a net $29, just a couple of dollars shy of our fair-value estimate.

If Cameco moves up on news that makes us want to keep our shares, we can also consider rolling our covered calls to a later month and/or a higher strike price.

Here are the potential outcomes of the trade:

If:	Then:	*Pro* 's Take:
Shares are greater than $28 at expiration ...	Our position is called away at an effective sale price of $29 — a 76% gain on our original purchase.	We're perfectly comfortable with this, and we'd free up more than $19,000 to invest elsewhere.
Shares are below $28 at expiration ...	We keep our shares, and the $1 premium stays in our bank account, thank you very much.	We're fine with this result, too, and we'd look to write new covered calls to generate more income.

How to Follow Along

If you need a refresher on covered call strategies, see *Pro*'s guide to covered calls. Remember, you write one call for every 100 shares of stock you own. You may cover all of your shares or just some — we're covering all of ours. Here are the numbers behind the trade:

- **Trade:** Write ("sell to open") December 2010 $28 calls on your stock position, in 100-share increments
- **Option yield (at recent $1 bid):** 3.9% of the $25.60 share price, in four months
- **Option yield on our $16.52 average cost basis:** 6.1%
- **Upside from today's price ($25.60) to the $28 strike price:** 9.4% (total return on the trade from today's prices would be 13.3%)
- **Total return on position if exercised:** 76%
- **Downside protection:** 3.9%; the $1 we earn on each call means that a decline to $24.60 is hedged

When you write ("sell") an option, the going price is paid into your account, and that money is yours to keep. In this case, if you write these calls and take no further action, you'll be obligated to sell shares of Cameco if they're above the strike price by the expiration date.

Writing puts? If you place the alternate trade and write puts, you'll be obligated to buy shares of Cameco if the stock declines below your strike price.

We'll make this trade in the next one to 30 calendar days. To discuss it or ask questions, please visit our Cameco board.

Bruce Jackson does not own shares of Cameco.

Buy to Close Puts on Plum Creek Timber

Published Aug 19, 2010 at 12:00AM

At a Glance

- **Action:** Maintenance trade — "buy to close" all of your August 2010 $35 puts
- **Conditions for trade:** Make the trade if Plum Creek shares are below $35 on Friday, Aug. 20 (or earlier, if you wish)
- **Preferred limit price:** Aim to pay only the difference between the share price and the strike price, plus a nickel. For example, if Plum Creek is trading at $34.50, aim to pay $0.55 or less to close the puts.
- **Reason:** Rather than buying more shares of Plum Creek, we want to keep writing options on what we own.
- **Alternate trades:**
  - **If you only wrote puts:** If you don't own any Plum Creek yet but have written puts and want to own the stock, then do nothing and let your puts exercise into stock.
  - **If you aren't using options:** If you're not using options, the stock remains a buy with a preferred price around $34 or lower, giving you a 5% dividend yield.
- **Follow-up trade:** Expect a new Plum Creek options trade from *Pro* soon.

What's New

When we wrote our last $35/$40 covered strangle on **Plum Creek Timber** (NYSE: PCL) in March, we received nearly $3 per share. After the market closes tomorrow, our $40 covered calls are set to expire as a full cash gain. But with the stock currently around $34.50, unless we close them early, our $35 puts would turn into new shares over the weekend. These puts paid us $1.90 per share, so they're highly profitable, and we prefer to take the majority of this profit tomorrow — by buying to close the puts — rather than accept more shares of stock.

Why This Strategy?

Last quarter's results continued to demonstrate a steady hand on Plum Creek's tiller, but management has a cautious outlook for the remainder of the year, with any good news largely dependent on a steady housing recovery and steady demand for timber. Currently, management believes sawlog prices will decline modestly the next two quarters.

Meanwhile, we already own 1,000 shares of Plum Creek, and writing options on these shares has been more profitable over the past 18 months than doubling our share count with puts would have been. We believe this will remain the case, since Plum Creek's stock will likely stay in a range while the economy muddles along. Along with its 5% dividend yield, the stock has been one of our most lucrative for covered strangle options income, and we want to continue writing generously paying options on our stake. Owning only half of an allocation (2.7% of our 5% target) allows us to continue to write covered strangles.

How to Follow Along

If you only wrote puts and don't own the stock yet, you could let your puts be exercised into shares, and then look to write new covered options with us soon. But if you already own half a position in Plum Creek, taking your profit on the current strangle to write a new one will keep you in line with *Pro*. You should "buy to close" as many puts as you originally sold to open, and let your $40 covered calls simply expire. Finally, if you're not using options, Plum Creek remains a Buy with a preferred price around $34 or lower, granting you a 5% dividend yield. Please visit the Plum Creek discussion board with any questions.

Options Guides

Advanced Options

Initiate a Bull Call Spread on Cisco Systems

Published Aug 18, 2010 at 12:00AM

At a Glance

- **Strategy:** Bull call spread
- **Trade:** Buy to open January 2012 $15 calls and sell to open January 2012 $20 calls
- **Allocation:** 5% (for *Pro*, about 30 contracts); buy and sell an equal number of calls
- **Limit price:** About $3.60 or lower
- **Profit potential:** About $1.40, or 39% return on investment
- **Special instruction:** Use the "spread" order command to save on commissions.
- **Alternate trades:** Write (sell to open) January 2011 $20 puts; or, just buy the January 2012 $15 calls (without a spread) for the long haul. Finally, you could buy shares directly.

The Opportunity

Spreads Got You Scrambled?

If you have any questions about spreads, please post on the Cisco Systems board.

Cisco Systems (NASDAQ: CSCO) reported the best quarter in its history last week, and the company's leadership voiced strong confidence in its future. Wall Street, however, pushed the stock lower in response to management's parroting of the Federal Reserve in suggesting "unusual uncertainty" in the economy. The disproportionate response to these comments is best illustrated with a quote from the Aug. 11 conference call (courtesy of Capital IQ), sharing Cisco CEO John Chambers' words in their full context:

"Our business ... continue[s] to grow at a very strong rate, and mathematically, would indicate very solid growth over the upcoming quarter. We feel very good about those areas that we can control or influence. However, balancing this strong optimism, there are some challenges that are contributing to an unusual amount of conservativism [sic] and even caution.

"In short, we see the same opportunities and challenges that you're reading about in regards to the market. Those challenges [range] from GDP growth and future GDP projections continuing to slow in the U.S., [to] job creation challenges and concerns coming out of Europe, just to mention a few. We are seeing a large number of mixed signals [in] investor markets and from our customers ... and we think the words "unusual" or "uncertainty" are an accurate description of what is occurring."

Cisco and the *Pro* Port

Our portfolio already has positions in some tech leaders, including **Intel** (NASDAQ: INTC) and **Oracle** (NYSE: ORCL). That's part of the reason we're using a spread on Cisco instead of buying shares directly — the spread requires and risks much less capital, and doesn't overweight us on tech at this point. But we're confident enough in Cisco that we'll convert to shares should that be beneficial later.

After air-quoting Bernanke's key words, Chambers went on to say:

"The Federal Reserve's comments yesterday, that the pace and output of the recovery has slowed in recent months and that the recovery is likely to be more modest in the near term than has been anticipated just a few months ago, are comments that most of our large customers that I've talked with recently would agree with.

"Also, the same customers would agree, with few exceptions, that they still expect a very gradual return to more normal economic conditions. In summary, on those areas that we can control or influence from an innovation point of view or an operational execution point of view, we feel we are extremely well-positioned. Almost all of our product families are in the early stages of their life cycle and gaining solid momentum, as we discussed earlier."

In response to these reasonable statements, Cisco lost more than $14 billion in market value the next day. Granted, the conference call did raise other areas of concern, including lower margins because of product mix; component shortages (which required paying up); and plans to hire 3,000 employees in the coming quarters. But product mix should improve, component supply issues are expected to be remedied, and investing in the future is rarely a bad thing for a good company — especially one as strong and fast-growing as Cisco. Put the pieces together, and we see value in this giant.

The Nitty-Gritty

Whether you realize it or not, you almost certainly use Cisco's technology every time you're online. Cisco is the world's leading producer of routers and switches that direct and manage the planet's ever-growing Internet traffic, and if a certain technology is related to this (for example, wireless, security, optical networking, and videoconferencing, just to name a few), Cisco has products for that, too. The company has a knack for acquiring smaller technology firms, which allows it to integrate the latest and greatest developments into its next generation of products, keeping it one step ahead of the formidable competition.

Cisco is so integral to the Internet that during the financial meltdown of 2008, revenue only hit a small road bump, dipping 8.6% to $36.1 billion in fiscal 2008. For fiscal 2010, which just ended, sales rebounded to a record $40 billion, while operating income hit a record $9.1 billion. Management expects 18% to 20% sales growth for the first quarter of 2011 (which is already under way), and in the long term, the company models for 12% to 17% annualized net income growth. Meanwhile, a net cash position of $27.7 billion gives Cisco plenty of firepower to continue acquiring the young companies it likes best.

Following its recent swoon, Cisco is valued at only 8.8 times enterprise value to EBITDA, and 13.7 times trailing free cash flow. Management saw value last quarter, buying back $2.3 billion in stock at $23.33 per share; today the stock trades at $22, fetching 12.7 times expected earnings for the current year. Our bull call spread aims to earn nearly a 40% return on investment with a breakeven price (and, thus, valuation) that's 15% lower than today's price, providing even more margin of safety.

The Strategy

We're not ignoring economic uncertainties — we know orders could slow again. Thus, we're using a conservative options strategy that offers a breakeven price of $18.60.

A bull call spread always involves buying and selling an equal number of options. You use different strike prices to set up the spread, but the same expiration date. The most you can earn is the difference between the two strike prices, minus the net cost to set up the trade. The most you can lose is your initial investment, but you can set up defensive spreads to help avoid this, and still potentially earn strong returns.

By using strike prices well *below* Cisco's recent share price, we'll earn the full profit on this spread even if Cisco goes nowhere or is down modestly over the next 17 months. Here are the details on the Cisco spread:

Cisco Systems Bull Call Spread Specifics	Price Per Share
Buy to open January 2012 $15 calls	$8.35
Sell to open January 2012 $20 calls	$4.75
Enter as a spread trade, net debit limit price	$3.60
Spread difference	$5
Profit potential	$1.40 (39% return on capital)
Capital at risk	$3.60

Once you set up the trade, here's how your position could play out:

If Cisco Shares Do This ...*	Their Price Will Be ...	And Our Result Will Be ...
Go up, go nowhere, or fall less than 10%	Above $20	Maximum profit
Fall more than 31.8%	Below $15	Full loss
Fall exactly 15.4%	$18.60	Breakeven
Are anywhere above $15 and we want to own shares	Higher than $15, so we'll convert the $15 calls into shares at a net $18.60	Ownership of Cisco for the longer haul (which is an alternate trade today, as well, given the company's price and dominance)

*Recent share price $22.

Cisco needs to fall a hard-to-imagine 31.8% by January 2012 for our spread to end without value. Nothing is impossible, of course, but if that happens, something will have gone seriously wrong. As long as Cisco doesn't lose more than 10% by expiration and stays above $20 (a much more likely outcome in our eyes), we'll earn our full profit on the position. Finally, as long as the stock is above $15, if we decide we want to own it, we can turn the $15 calls into stock after closing the $20 calls — but our main objective initially is to make money on the spread, ideally the full amount.

If you have any questions, please visit the Cisco Systems board.

Jeff owns shares of Oracle.

Initiate a Bear Put Spread on Caterpillar

Published Aug 17, 2010 at 12:00AM

At a Glance

By Jeff Fischer and Todd Wenning

- **Trade:** Buy to open November 2010 $80 puts and sell to open November 2010 $75 puts
- **Allocation:** 3% (for *Pro*, about five contracts of each)
- **Net debit limit price:** About $4 or lower
- **Profit potential:** About $1, or 25% return on investment by Nov. 20
- **Special instruction:** Use the "spread" order command to save on commissions. **Use a limit order.**
- **Alternate trade:** Short Caterpillar directly if the stock price rises above $76 (current price is $69.50).

The Big Picture

If it's yellow and has large wheels, there's a good chance it's a **Caterpillar** (NYSE: CAT) machine. Headquartered in Peoria, Ill., Caterpillar is one of the most recognized brands in the world — even the dirt on the ground knows to get out of the way when one of these monsters rolls into town. We're not here to bad-mouth a stolid Midwestern business. It's a winner. But after gaining more than 50% over the past 12 months, Caterpillar's shares look as heavy as its machines. The stock is ready to idle for a while even if the economy continues to ramp up. And if the economic recovery slows, Caterpillar's shares may shudder. In either case, our conservative bear spread is a hedge against our several bullish positions in other companies.

The Nitty-Gritty

Caterpillar's many product offerings align its business with major industries like agriculture, mining, construction, and oil and gas — all highly cyclical sectors that tend to boom when the economy is improving, but suffer significantly when times get tough.

Caterpillar was hit hard during the recession — sales fell nearly 37% from 2008 to 2009 as companies scaled back spending on heavy machinery. In fact, U.S.-based sales in 2009 were down 25% compared with 2004. What kept Caterpillar growing were its international sales, which are up 35% over the same period.

Region	2004	2005	2006	2007	2008	2009
U.S.	$14,198	$17,348	$19,636	$17,091	$17,291	$10,560
Non-U.S.	$16,108	$18,991	$21,881	$27,867	$34,033	$21,836
Total	**$30,306**	**$36,339**	**$41,517**	**$44,958**	**$51,324**	**$32,396**

Data provided by Capital IQ. All figures in millions.

2009 was an unusual year, and the market is expecting Caterpillar to make a full recovery by 2012. Analyst consensus calls for sales growth of 22% this year, 15% in 2011, and 13.5% in 2012, which would bring total sales back to their 2008 high of $51 billion. In anticipation of 2012 results, investors have already pushed the stock close to its 2008 highs.

But where will all this growth come from? Developed markets like the U.S. and Europe are still licking their wounds after the construction implosion, and they're unlikely to return to pre-recession activity anytime soon — certainly not while empty homes, offices, and malls still litter the countryside. Caterpillar notes that emerging markets are currently driving its business, but two biggies — China and Brazil — have problems of their own. China is concerned about its own asset bubble, and Brazil is arguably growing at an unsustainably fast rate. So we're not convinced that emerging markets will be able to both make up for the slowdown in developed markets *and* drive high growth rates for years at Caterpillar — at least, not enough to justify these optimistic value multiples:

Ratio	Current	5-Year Average	10-Year Average
Enterprise value-to-EBITDA	19.31	13.16	13.21
Price-to-book	4.67	4.77	4.10
Price-to-sales	1.27	0.98	0.96

Data provided by Capital IQ.

Using a two-stage discounted free cash flow to firm model, we assumed an 8.2% cost of capital as our discount rate and 2% terminal growth, resulting in a fair value estimate between $57 and $60. If we increase the terminal growth rate to 3%, we get $71 to $74 — still below the strike prices on our bear put spread.

The Strategy

A bear put spread involves both buying and selling. You buy and sell (or write) an equal number of puts on a stock. The puts have different strike prices; the most you can earn on the trade is the difference between the two strike prices, minus the net cost to set up the trade. You need a high level of options approval to set up a bear put spread, even though your risk is limited to your original investment and you can set up defensive trades like this one. By using strike prices well *above* Caterpillar's recent share price, we'll earn the full profit on this spread as long as Caterpillar;s stock doesn't gain more than 10%. Here's how the spread shakes out:

Caterpillar Bear Put Spread Specifics	Price
Buy to open November 2010 $80 puts	$12.15
Sell to open November 2010 $75 puts	$8.30
Enter as one spread trade, net debit limit	$4 (or lower)
Strike price difference	$5 (the "spread")
Profit potential	$1 (25% return on capital)
Capital at risk	$4

Once you set up your trade — ideally using a "spread" order command — here is how your profit could play out by the Nov. 20 expiration:

If CAT Shares Do This ... *	Its Price Will Be ...	And Our Result Will Be ...
Gain less than 8%	Below $75	Maximum profit
Gain more than 15%	Above $80	Full loss
Are exactly 9.4% above current price	$76	Breakeven
Are anywhere below $80 and we want more time to be short	Convert $80 puts into short CAT shares at a net $76	More time in strategy

*Current share price is $69.50.

Caterpillar is an enormous company already, and its stock would need to gain more than 15% in about three months for our spread to expire worthless. That appears unlikely. Meanwhile, as long as the stock gains less than 8% (which we believe *is* likely), we earn our full profit. Near expiration, we'd close both options when their time value is gone for a net credit of $5, resulting in a $1 profit on our $4 investment (25%). If Caterpillar is cooperating, we may then set up another bear put spread.

Finally, if the stock is anywhere below $80 at expiration, we could let our $80 puts be exercised into a short sale. That way, we'd be directly short the stock if we want more time for our thesis to play out — although our main objective with this trade is to make money on the spread.

If you have any questions, please visit the Caterpillar board.

Monday Memo: This Market May Require More

Published Aug 16, 2010 at 12:00AM

In Friday's weekly column for *Motley Fool Options*, I outlined why the past 12 months have been less than ideal for options investors. The S&P 500 is down since last October (although it was on the ascent until May of this year, making shorting a losing strategy during that time). Volatility has for the most part declined all year, sending option prices lower. With many stocks looking reasonably valued, the siren song of hedging or shorting (and thus making money on an inaccurately valued stock) has been neither loud nor clear. Last but not least, so far in 2010, the S&P 500 is just plain old flat.

A flat market is an option buyer's enemy, because you need a meaningful move in an underlying investment for an option to gain value. But when you *write* options, a flat market is your friend — you'll make money without missing out on anything when a stock stays within a certain range. At *Motley Fool Pro*, we've been writing options throughout the year without buying any to speak of (just in-the-money calls on the short S&P 500 ETF), and we have more than a dozen positions closed for a profit in 2010 to show for this strategy. But when writing options is practically the only way we're making steady returns, even my patience starts to grow a little thin.

Guidance Changes

- **Tupperware** , **Lindsay**, and **Plum Creek Timber** move up to Buy on price.

Earnings

- **Autodesk**
- **Broadridge Financial**
- **Cameco**
- **Ebix**

Option Expirations

- **Aug. 21:** Plum Creek Timber covered strangle. We plan to let it all expire; if need be, we'll close one side early to write a new strangle (we'll send an alert, of course).

Coverage & Community

- TMFEldrehad discusses a few of the ways one can sort through the many thousands of pitches in CAPS to find the ones that might be most meaningful. In addition, he introduces readers to TMFBigVice, a CAPS portfolio that asks the question, "When it comes to investing, which pays better, sin or virtue?"
- *Pro* members debate whether to be a market optimist or pessimist.
- TMFValuemoosie posted an earnings calendar.
- Alex340 shared puts that match*Pro* criteria.
- Tupperware has put its accounting corrections behind it, and inventory levels don't worry *Pro*.
- Writing a straddle on **Lindsay** still looks interesting to Jeff. See our guide on writing straddles. If you're expecting a flattish market or stock, straddles can rack in option income.

Is This Indeed the New Market?

Here at *Pro*, we've been expecting a stuck market for a long time, and as it turns out, the S&P 500 has indeed been flat since the day *Pro* launched — October 6, 2008. How can that be? Well, the market was ridiculously volatile at that point, such that our tracking date and price happened to fall on a day when it was sharply lower. The S&P 500 is now up 20% from that particular day — but if you consider a few days before or after, or the day our doors actually opened, the index is anywhere from flat to down since then. In other words, the month was so volatile that it's a poor barometer, but overall the index is more or less unchanged since then.

This stagnant market has challenged everyone's returns over not only the past two years, but also the past *10 years* and more — and this state of affairs may continue even longer than we first thought. If it does, we will need to adjust our strategy in reaction to this "new market," acting more aggressively to generate stock returns alongside our option gains. We won't turn into mere traders; as always, our focus will remain on the longer term with stocks. But if the market goes basically nowhere, as we expect, we'll need to be ruthless with our valuation estimates — and act on them.

How So?

GrafTech International has been trading in a 52-week range between $12 and nearly $18. **Autodesk** has been between about $22 and $35. **Cameco** has traded between $21 and $34 in the past year. Those are wide ranges in a market that has ultimately gone nowhere.

We moved GrafTech to Buy or Buy First when it fell to $12, and we put it back on Hold above $15. We also changed our guidance on Autodesk and Cameco as those shares moved about in their price ranges, and we wrote covered calls on those two stocks. As you've followed along, hopefully we've been guiding many of you to buy our companies at good prices and hold off at higher points. But all three of these stocks did touch our fair-value estimate at some (typically brief) point, and in retrospect, covered calls may have been too passive. If we expect stocks to trade within a certain range for a long time, then we should be selling more assertively when our stocks hit the top of our value range.

So if we continue to believe that the market will go basically nowhere, we need to keep writing options for income, and we also need to be less hesitant to sell our stocks when pricing opportunities turn up. We can't hold on hoping for more upside unless we have enough confidence that things will be much better 12 months down the road. Barring that, in a market like this, we should exit *mas rapido* and wait for a lower buy price.

There *Was* That Little Meltdown

Why haven't we done just that before now? Well, you may have heard about the little worldwide financial meltdown that began in 2008. Since then, investors around the world — your *Pro* team included — have been trying to figure out how quickly, and to what degree, sales growth and earnings will rebound. If the economy's recovery is healthy enough, leading companies should have much more upside than is currently priced into their stocks. We've been working to get a read on whether that's likely before acting rashly and selling too soon. After all, we admire all of our companies. On the other hand, if the recovery disappoints, that means a much longer wait for good returns; in that case, we should amp up our option writing even more — as well as our shorting. Finally, if the recovery is somewhere in the middle, that means stocks right now look reasonably priced — so next time they near our fair-value estimates, we should be ready to sell more.

Elevators Are for Exiting

Right now at *Pro,* we suspect we're in for a middle-of-the-road recovery but more challenges ahead, which will keep a reasonable cap on stock prices. Our expectations for less-than-robust market gains mean we'll be more inclined to sell some positions directly when they get near our fair-value estimate the second time around. Basically, if the market is going to be in a rut, we don't want to keep riding the same elevator up and down unless we can step off when appropriate, and then step back on for another ride up. The more tepid the economic recovery looks, the more a rut seems likely. As long as this is the case, we won't be shy to take our sell prices when they come along.

To ask questions or discuss this, please visit the Memo Musings board.

Foolishly,

Jeff Fischer (TMFFischer)

Buy to Close Your Entire Short Position on iPath S&P 500 VIX Short-Term Futures

Published Aug 11, 2010 at 12:00AM

At a Glance

- **Action:** Buy to close/cover entire short position
- **Trade:** If you followed our original recommendation, cover your short position by buying to close the same number of shares you sold short. If you followed our adjusted trade by writing options, buy to close the same number of calls you wrote.
- **Recent share price:** $21.50
- **Preferred buy-to-close price:** Close your shorted stock using a limit price near the current market price, as long as it remains in the low $20s or below. Buy to close your written August $30 calls at $0.05.

What's New

Well, that was fun! When the market's most famous measure of expected volatility — the VIX "fear gauge" — increased to more than 30, we initiated a short position on the exchange-traded note (ETN) that aims to track it, the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX). As implied volatility in the market declined, so did the VXX, meaning that our short made good money in the last month. Now, as summer starts to wane, it's time to take our profit and wait for volatility to increase again — with hopes of repeating this trade when it does.

A quick glance at the latest headlines reveals that an uneasy sense of calm has settled over the market. The IMF is reporting that Greece's restructuring goals are "well under way," **BP** (NYSE: BP) has seemingly stopped the Gulf oil leak and is moving forward with its "static kill" procedure, and even the weather-folk are predicting fewer named tropical storms this season. Combine all that (well, except maybe the weather) with a decent earnings season, and you can see why the VIX has declined by about 36% since the start of June.

Not even eight weeks have passed since our original recommendation, but our thesis has largely played out. Back then, we said: "We expect trading volume to decline (as generally happens when the weather heats up in the Northern Hemisphere), the reality of the new worldwide economy to settle in, and market volatility to start to subside — bringing the VIX back to more average levels." The VIX is now at 22, compared with a historical average of 19. It could certainly still move a bit lower, and eventually the VXX ETN could be almost worthless due to the futures contracts it uses. However, we prefer to take our profit now and wait for another opportunity to repeat this short position, because we don't believe volatility is gone for good.

How to Follow Along

If you followed our original recommendation, you sold shares of VXX short somewhere near $30. *We recommend you "buy to close" or "buy to cover" an equal number of shares of VXX to cover your short position, at a price in the low $20s or less*. Completing the trade should net you zero shares in your account, of course.

If you could not make the original trade, you may have followed our advice and written uncovered August $30 call options on VXX for about $1.10 per contract. These call options have only time value remaining and are trading with a bid/ask spread of $0/$0.10. *We recommend that you buy to close the same number of contracts you originally sold, for $0.05 if possible*.

Upon ending this profitable trade, we wouldn't mind seeing market volatility spike again, so we can take a new short position. An affection for market volatility may seem strange at first, but knowing we can profit from it certainly helps us sleep more easily!

To discuss this trade, please visit the iPath S&P 500 VIX Short-Term Futures board.

Monday Memo: Invest the Pro Way

Published Aug 9, 2010 at 12:00AM

Allocation and diversification are two of the most challenging skills an investor can master, and they're also two of the most important. Too many investors buy only a small handful of stocks and then squirm and gasp as their shares swing to and fro. Inevitably, a few positions don't work out, and the investor – already frazzled from the high volatility – becomes disenchanted, wondering why the market is so harsh. This frustration compounds when someone expects results in only a few short months.

When you invest, you have to come to terms with the idea that not every investment will work out at the same time. Some will never work out, and others will perform much better than you could ever have dreamed. But *you don't know which those are, or when they'll take off*. So you need to be diversified, and you need to stay in the game if you want to be rewarded eventually.

Enter a Full Stock Portfolio

This is true for us as we build the *Pro* portfolio. We like every stock we buy, but we don't know when any particular position will perform. In the past few years, nearly every sector in the market has moved up and down in unison because the recent economic challenges are larger than any single industry. But historically, different industries perform better at different times; utilities will go up while health care languishes, for example, or technology will do well as basic materials fizzle.

In other words, over the years, you shouldn't expect your *entire* portfolio to do exceptionally well at once. While it makes sense to allocate more money to the sectors you like best, you need to own different sectors to benefit at different times. This is why it's so important to invest in stocks and ETFs across multiple sectors and to allocate fairly.

The Big One

Guidance Changes

Cameco and **Lindsay** have been moved down to Hold due to price, and **Tupperware** is also now on Hold while we await a new quarterly SEC filing. **QuantaServices** is now a Buy based on price.

Pro Earnings

Coverage results are in the bag, and as always, we're providing coverage of what's happening at our companies and guidance. See our thoughts on:

- **Quanta Services**
- **Bristow Group**
- **AmTrust Financial Services**

- **Procter & Gamble**
- **GrafTech International**

Coverage & Community

- Bryan Hinmon (TMF42) provides a *Pro* stock fair value table.
- *Pro* members discuss last week's jobs report.
- Joe (TMFValuemoosie) posted an earnings calendar.
- *Pro* member ksag owns shares of **Apple** at $79 and asks, "What would you do?"
- Jeff talks about index investing vs. investing for absolute returns.

This Week's Earnings

- Aug. 12: **Autodesk** and **Broadridge Financial Services**
- Aug. 13: **Cameco**

There's no such thing as a get-rich-quick scheme using stocks, but you *can* grow significant wealth – with less risk, when you're diversified – over many years. *Pro* invests for accuracy and absolute returns, and we aim for more consistent gains with less risk. But we're also always seeking The Big One (or two), meaning those few stocks that go up 300%, 500%, or more. As long as you keep your portfolio healthy, you'll be positioned to give it a propane boost when you find and latch onto one of these investments. Even a few of these each decade can make all the difference (especially if you leverage that gain using options). Diversified portfolios are a must for steady returns, but much of our outperformance may end up coming from a few stellar positions.

Near-Term Gains: Options (and Shorts)

Options provide a steady way to feed your desire for short-term gains while you're allowing your long-term stocks the necessary time to bear oversized fruit. And you can use options in whichever way best suits your investment needs.

If you're just building your portfolio, you'll be writing (selling to open) many put options, which will allow you to potentially buy shares of your desired companies at cheaper prices. If your stocks are near fair value, you'll be writing covered calls to potentially sell shares or earn income. If you're at a place in life – retirement, for example – in which you're more interested in cash flow than in long-term capital gains, you'll be writing a lot of covered calls on strong companies, as well as writing conservative puts (or combining the two to write covered strangles).

These are just a few examples of more than a dozen options strategies we'll ultimately use in *Pro*. In every case, options should work alongside your stocks to provide near-term returns – or leverage or protect your gains – without compromising your stock portfolio. And you can amp up (or lower) your options use to suit your needs.

Make Each Player Count

Investing is a team sport. Every stock in your portfolio should have a role to play, and every stock should bring strengths to the table; you should set up your portfolio's "team" to best suit your goals. You can build your portfolio in a way that suits your current objectives while following the *Pro* philosophy, and we're here to help.

Pro's official portfolio is smack in the middle of the road: We're not jumping head-first into risk, but we're also not cautious beyond good reason. We seek a healthy mix of long-term capital gains with stocks and ETFs. From options, we most often look for steady, near-term income or better stock transactions. We're diversified from tech to health care, from basic materials to financials, and more. We'll be mostly bullish (rather than short) until we see reason to switch, and we'll usually keep some cash on the sidelines for opportunities.

Having come through almost two years of volatility, *Pro* is still just getting started. Now that the worst of the economic storm is over, we expect some companies – many of them young – to seize the opportunities that open up during economic dislocations. So we're always on the lookout for new players to add to our investment team. Meanwhile, our current roster remains focused on winning over the long haul. Make sure you have a full team in your portfolio (and on your Scorecard), as well – not just a few players.

Monday Memo: Let's Run Our Race

Published Aug 2, 2010 at 12:00AM

Busy Week

Last week was active for the *Pro* portfolio. We wrote covered calls on **Procter & Gamble**, **ProShares Short S&P 500**, and **U.S. Natural Gas Fund**. We also wrote puts on **Broadridge Financial Solutions** and **Intel**. If you bought or sold any stock in your portfolio, be sure to enter the data into My Scorecard, so you can track your returns and get the latest on the stocks you own.

Earnings

- Aug. 3: **Papa John's International**, Procter & Gamble, **Amtrust Financial Services**
- Aug. 4: **Quanta Services**, **Bristow Group**
- Aug. 9: **EBIX**
- Aug. 12: **Autodesk**, Broadridge Financial Solutions

Coverage & Community

- TMFEldrehad highlights a presentation by a game designer who asked, "Can gaming make a better world?," and draws some parallels to CAPS.
- Todd comments on the earnings of **Plum Creek Timber** and discusses the good and bad happenings at **Kinetic Concepts**.
- *Pro* members discuss how **GrafTech International**'s earnings affect their existing options positions. Stay tuned for *Pro*'s take on the new look of GrafTech.
- Short interest in shares of Ebix stirs up a rousing discussion among the Fool community.
- *Pro* Fool JPStockMaster shares his Option Tracking spreadsheet on the Pro: Member Suggestions & Help board.

Do you know who Samuel Kamau Wansiru is?

OK, that was a tough one. Now what about Usain Bolt?

Ring a Bell?

Both of these men won gold medals in track-and-field events at the 2008 Beijing Olympic Games. Wansiru won the marathon, and Bolt, of course, won the 100-meter dash. Both set Olympic records, to boot, but only one of them became a household name.

Part of the reason we know Bolt's name and not Wansiru's is the sexiness factor of being crowned the "world's fastest man." Somehow, the "world's steadiest runner" just doesn't have the same ring to it.

Maybe Wansiru would have liked to have received all the attention Bolt got, but it would be folly for him to try his hand (or foot) at sprinting in order to prove his value as a world-class athlete. His gift is endurance, not speed — Wansiru would easily outlast Bolt in a 26.2-mile run. For those of you keeping score at home, that's 421.6 100-meter dashes!

By focusing on what he does best, Wansiru has excelled in his sport of marathon running. Whatever goes on in the other track-and-field events is of little consequence to him.

Slow and Steady

From the early days at *Pro*, we've made it known that while we keep tabs on the S&P 500, we're not in a race with it, with any other index, or with other investors. We're running our own race — a race to earn you consistent, recurring profits with a high level of accuracy.

By "consistent, recurring profits," we mean income generated by dividends and options strategies as well as periodic capital gains from sales. A "high level of accuracy" means that we want to avoid permanent losses of capital — losses you can never earn back — and close at least 75% of our positions profitably. In short, our focus is on *absolute* returns.

This is a different strategy from most mutual funds, which seek to outperform an index on a *relative* basis. In fact, if you look through the top holdings of most major funds, you'll find that their holdings don't deviate much from the S&P 500's top holdings and sectors. This is intentional, because fund managers who deviate too much from the market and are wrong typically don't keep their jobs very long.

The Market's Slings and Arrows

None of this is to say that *Pro* won't be affected by market movements. We primarily hold long positions, after all, so if the market falls 30%, we'll feel it. But by including a helping of shorts, a strategic cash position, and most importantly, options strategies, we aim to reduce the volatility of our returns.

So far, we've achieved this goal. Since we launched *Pro* in October 2008, our worst monthly return was in May 2010, when we lost 5%. (Prior to that, our worst month was January 2010, when we were down 3%.) Even though the market was down 8% in May, that 5% loss still irks us. We learned some valuable lessons in May, and we don't intend to make the same mistakes twice.

Whether you just joined us or you've been here since we started two years ago, as you move ahead with us at *Pro*, remember that we're running our own race here. We can't control the market, but we can control our portfolio. By focusing on generating consistent, recurring profits and obtaining a high level of accuracy, our returns relative to the market should take care of themselves.

Stay focused. Stay patient. Stay Foolish.

Todd Wenning

Pro Fair Value Estimates

By Bryan Hinmon

Like the rest of you, we hate unnecessary clicking from Web link to link. After all, this Internet thing is supposed to make our lives easier, right? Consider this our official apology for all the extra clicking your right index finger has endured trying to find the fair value estimates of *Pro* stocks. Here's a summary table that requires no additional clicking:

Position	Current Price	Fair Value Estimate	Margin of Safety
BUY FIRST			
Ebix	$17.00	$24.00	29.2%
Intel	$21.56	$25.00	13.8%
Amtrust Financial Services	$12.94	$18.00	28.1%
Oracle	$24.44	$29.00	15.7%
GlaxoSmithKline	$35.63	$47.50	25.0%
Broadridge Financial Solutions	$20.98	$27.50	23.7%
BUY			
Tupperware	$39.88	$50.00	20.2%
ProShares Short S&P500	$50.74	NA	NA
SPDR KBW Regional Banking	$24.11	$36.00	33.0%
Vanguard Energy ETF	$78.89	NA	NA
Cameco	$25.42	$31.00	18.0%
Kinetic Concepts	$35.14	$54.00	34.9%

Lindsay	$34.20	$42.50	19.5%
Medtronic	$37.09	$52.00	28.7%
MELA Sciences	$6.60	NA	NA
NextEra Energy	$53.00	$62.00	14.5%
Procter & Gamble	$62.83	$70.00	10.2%
Bristow Group	$33.15	$50.00	33.7%
HOLD			
Plum Creek Timber	$36.85	$40.00	7.9%
GrafTech International	$16.46	$18.00	8.6%
Quanta Services	$21.77	$26.00	16.3%
Jack Henry & Associates	$25.81	$30.00	14.0%
Vanguard Emerging Markets	$41.63	NA	NA
Autodesk	$29.01	$32.00	9.3%

A quick analysis of this table shows that, as you might expect, the average margin of safety on our Buy First stocks (23.8%) exceeds the average margin of safety on our Buy stocks (23.7%), which in turn exceeds the average margin of safety on our Hold stocks (11.2%). However, valuation isn't the only factor we consider when we decide where to place these stocks. We also consider risk, catalysts, and tactical considerations.

Also note that we have slightly lowered the fair value estimate of **GlaxoSmithKline** — largely because of weakness in the British pound. Todd and Bruce have been hashing things out to revalue Glaxo, and you can read their analysis here.

Finally, I'll begin posting an updated copy of this table on the Pro: Stocks That Interest You board every week or so. Join us and your fellow *Pro* members there for the latest numbers and some lively discussion.

Todd owns shares of Procter & Gamble, Kinetic Concepts, and Amtrust Financial Services.

Write Puts on Intel

Published Jul 27, 2010 at 12:00AM

At a Glance

- **Action**: Write ("sell to open") September 2010 $21 puts
- **Allocation**: 3% (for *Pro*, 18 contracts), with a potential total of 6%
- **Option's recent bid/ask**: $0.72/$0.73
- **Preferred limit price**: $0.70, or an income amount and start price acceptable to you
- **Alternate trade**: Intel is a **Buy First** stock and can be bought directly at current prices.

What's New

Intel (NASDAQ: INTC) recently reported the best quarterly profit in its history, and the company expects strong tailwinds to continue throughout the year. Several factors are boosting Intel's performance, including improving consumer spending, widening computer usage, and increasing upgrades to computer systems. Computers are becoming an integral part of life in more countries around the world, and in areas where computer usage is already well established, corporations must ensure their systems are up-to-date. Given that most computers are four to five years old, Intel projects that today's strong spending cycle will last at least a few more years.

Meanwhile, shares trade at 11 times trailing free cash flow and 10.4 times expected 2010 earnings. Both valuation multiples are well below the market's average, which is in the mid-teens. This suggests that investors aren't convinced the strong spending cycle has staying power, despite management's assurances.

However, we think Intel's prospects look good. Developing economies continue to drive entirely new sales, and developed economies are well overdue for upgrades. The return on investment for an upgrade is compelling — not only do new machines bring greater efficiency, but additional depreciation write-offs can lower a company's taxes as well. Management is also optimistic about the tablet market, which it believes will create a new category in the computer industry rather than cannibalizing notebook sales.

Moving south on the income statement, we see that Intel reduced costs and notched a record profit margin. Its new line of chips, code-named Sandy Bridge, will begin to ship at the end of 2010, and management is encouraged by early reviews and strong customer interest — so much so that production is ramping up earlier than planned. Put it all together, and management offers many reasons for more optimism than Wall Street is displaying.

Why This Strategy?

We recommend that you own at least a 3% stake in this Buy First stock, and we're comfortable with up to 6%. We own 3%, but we're only looking to add shares at especially cheap prices right now, since we already have heavy exposure to technology (through **Oracle** (NYSE: ORCL), **Ebix** (NASDAQ: EBIX), and others). Also, there's the nagging fact that Intel first hit $21 in 1997 — and 13 years later, it's still at $21. Although we believe that the stock could reach the high $20s, we're not eager to buy our whole allotment at once, given that Intel has basically been flat for years. We'd rather own some shares and continue to bolster returns by earning option income, as we've been doing since *Pro*'s debut.

How to Follow Along

You write ("sell to open") puts when you're ready to buy a stock if it declines below the strike price by expiration, as explained in our put-writing guide. Sell one put for every 100 shares of Intel you'd be willing to buy in September. Here are the numbers behind this trade:

- **Option payment or yield (at $0.70 preferred price)**: 3.3% in 52 days (Sept. 18 expiration)
- **Option strike price**: 3.3% below Intel's recent $21.71 share price
- **Break-even price**: 6.5% below the recent $21.71 share price, at $20.30
- **Cash or buying power needed**: Each put you write represents a potential $2,100 purchase of Intel shares

This $21 strike price is near the current share price, reflecting our confidence in Intel's valuation and our willingness to buy more shares. (If we do fill out our allocation to 6%, we may write covered calls on some of that position, but we don't want to cap the upside of our existing shares.) Factoring in our put income, our break-even price is a comfortable 6.5% below the current share price. And since we're writing September options, the trade will play out well before Intel's October earnings report.

If you can't write puts, buy your first shares of Intel when you're ready; aim to buy more on a dip (just as we would through these puts); and hold your position for upside. To discuss this position, please weigh in on our Intel board.

Jeff owns shares of Oracle.

Write Covered Calls on ProShares Short S&P 500

Published Jul 26, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") September 2010 $53 covered calls
- **Allocation:** Write one call for every 100 shares owned
- **Option's recent bid/ask:** $0.95/$1.10
- **Preferred limit price:** $0.95 or higher
- **Alternate trades:**
  - **Don't own any shares?** If you want to hedge holdings you remain bullish on, this inverse ETF is a Buy. If you buy at least 100 shares, you can also write covered calls.
  - **Own fewer than 100 shares or not using options?** Hold the position.
  - **Want to potentially buy shares cheaper?** Write ("sell to open") September 2010 $50 puts, recently $1.25.

What's New

With earnings season half over, the risk of large negative surprises is subsiding, and we're more comfortable writing covered calls on our **ProShares Short S&P500** (NYSEMKT: SH) position. For *Pro* members new to this investment, this inverse ETF gains ground whenever the S&P 500 declines, and works against us when the market advances.

The S&P 500 continues to look neither expensive nor greatly undervalued, but persistent economic uncertainties in Europe, the U.S., and China mean we want to keep this short position in the portfolio. The ability to write covered calls on the position adds to its versatility and attraction. This is the third time we've written covered calls on the ETF, the first two expiring as full cash income.

Why This Strategy?

We can get paid well writing covered calls, lower our cost basis in the ETF, and still have a hedge with upside potential. The S&P 500 needs to decline 6% by Sept. 18 to reach our potential sell price with the covered calls, and at that point we could roll the covered calls up if we wanted to seek more gains from the ETF.

How to Follow Along

When you own 100 shares or more of a stock or ETF, you can write covered calls on the position. After choosing your potential sell price (or strike price), you "sell to open" one call for every 100 shares owned. You're paid income while waiting for the underlying investment to appreciate to your potential sell price. If it doesn't, the options expire as income, and you can write calls again. If it does, your shares will be sold unless you adjust your covered calls.

Let's check out our numbers:

- **Trade:** Write ("sell to open") September 2010 $53 calls on your full SH position (for *Pro*, that's 11 contracts)
- **Option payment or yield on $50.80 ETF price (at $0.95 bid):** 1.9% in 54 days
- **Option strike price:** 4.3% above the ETF price
- **Potential sell price:** 6.2% above the recent share price

We think the 1.9% option yield we could earn in less than two months is sufficient payment for capping our upside. Besides, having room for a 6% move on the large S&P 500 before our net sell price is generous enough to place the trade. To ask questions about it, please visit our ProShares Short S&P500 board.

Write Covered Calls on United States Natural Gas Fund

Published Jul 26, 2010 at 12:00AM

At a Glance

Don't own a position in U.S Natural Gas Fund? We don't recommend that you make this trade. Instead, continue to build positions in our Buy First and Buy stocks. **Questions?** As always, we're here for you on our discussion boards.

- **Action:** Write ("sell to open") September 2010 $8 calls on existing *purchased* calls
- **Allocation:** Write one call for every call or every 100 shares owned (for *Pro*, that's 25 contracts)
- **Option's recent bid/ask:** $0.42/$0.44
- **Preferred limit price:** Seek enough income to make the trade worthwhile for you. *Pro* will earn $1,050 at the current price.
- **Recent ETF price:** $7.65
- **Special requirement:** You must own at least 100 shares of UNG, or one UNG call option, to write a call on it.
- **Alternate trades:**
  - Consider writing the October 2010 $8 calls, recently near $0.55, if you want a higher payment.
  - **Don't own UNG or UNG calls?** UNG is a Hold, so pass on this recommendation if you don't already have a position.

What's New

The price of U.S. Henry Hub natural gas has declined 20% this year, from around $5.50 per million British thermal units (MMbtu), to $4.50 recently. The **U.S. Natural Gas Fund** (NYSEMKT: UNG) ETF has declined 24% over the same time. We continue to believe that natural gas prices should trend higher, but while we wait for that outcome, we're writing calls against our position -- creating a diagonal call -- to defray costs and earn income. Hurricanes and tropical storms can disrupt natural gas production in the Gulf of Mexico and send prices higher, but aside from this, few catalysts exist for the month of August. Our July calls expired for a full cash gain, so we're ready to light this income fire up again.

Why This Strategy

The $10 January 2012 call options that we own on this ETF have a value of just $1.10 per share -- and with the ETF trading at only $7.65, that $1.10 in value will slowly erode. We should only continue to hold these calls if we believe the ETF can rise above $11.10 by expiration (the strike price plus the current value of the calls), *or* if we can write enough calls against the position that we'll make $1.10 or more, while being able to keep the calls for a potential rebound. If the ETF rises above $8 before our September expiration, we'll roll the written calls to a later date and perhaps a higher strike price.

How to Follow Along

Cover the Spread

To write $8 calls on a $10 call that you own, you'll need a margin account to cover the $2 strike price difference. Although you won't use or be charged margin interest, you are agreeing to deliver shares at $8 (the September written calls) that you have promised to buy at $10 (the January 2012 purchased calls). The equity balance in your brokerage account will need to cover this difference. We don't intend to exercise either call, though. And if we needed to buy shares, we'd buy them on the open market, where they're cheaper than $10.

For every call that you already own in UNG, write ("sell to open") one September 2010 $8 call. If you own 100 or more shares of the ETF instead, write one call for every 100 shares owned. If you only own a few calls or a few hundred shares, writing diagonal calls for only $0.25 per share may not be worthwhile to you after commissions. You might consider writing the October $8 calls instead, for 30% more. That said, even the September calls pay a very attractive yield on the current ETF price and the 2012 call price. Here's the math on our trade:

- **Trade:** Write ("sell to open") September 2010 $8 calls on our full UNG call position (25 contracts)
- **Option yield on the ETF price (at $0.42 bid):** 5.5% of the $7.65 share price, in 54 days.
- **Option yield on our January 2012 $10 call price (at $1.10):** 38.2%

We'll be writing calls against our January 2012 purchased calls as often as we can over the next 18 months (or however long we hold them) to eat away at our investment's cost. To retain upside potential in our original position, we'll manage this diagonal call actively if need be. Please post your questions and comments on the U.S. Natural Gas Fund board.

Monday Memo: Short Stocks the Pro Way

Published Jul 26, 2010 at 12:00AM

Next at *Pro*: More Stocks

We have many options trades on deck (including options trades on existing stocks that keep our monthly income train rolling), but we also have brand-new stock ideas in the hopper. We continue to think our Buy First and Buy stocks are good values, even if you don’t want to participate in the accompanying options trades we publish. So, if you’re not using options yet, fret not, and focus on building up your positions in our Buy First and Buy stocks.

Earnings Ahead

- 7/26 (after market close): **Plum Creek Timber**
- 7/27: **Kinetic Concepts**
- 7/29: **GrafTech International**
- 8/3: **AmTrust Financial Services**, **Papa John’s International**, and **Procter & Gamble**

Jeff Fischer owns shares of AmTrust Financial and GlaxoSmithKline.

We’ve talked about using stocks, options, and ETFs the *Pro* way, and that brings us to today’s topic of short selling, a investing strategy that allows us to profit when a stock's price goes down. You don't have to sell short to succeed with *Pro*, but if you're willing to give it a try, you can achieve healthy profits even in down markets.

How Short, How Long?

We usually recommend having at least some short positions and hedges for your portfolio at all times, both as a form of insurance and to maintain some ways to profit in a down market. But when we believe the stock market is likely to decline 15% or more, or when we find businesses that are likely to fall short or fail, we’ll implement more shorting strategies than usual.

The few shorts and hedges that we currently have in the *Pro* portfolio function as longer-term insurance. Our recommended positions in **ProShares Short S&P 500** and **iPath S&P 500 VIX Short-Term Futures** are examples of this thinking. At some point, however, the stock market is likely to start behaving like it did in 2000 or 2007, when investors were putting expensive price tags on most stocks. In times like these, we’ll likely sell our fully valued stocks and start defensive or bearish positions, which could mean that the *Pro* portfolio would hold more shorts than anything else.

Shorts So Far

Shorting has played a relatively small role in the portfolio so far, but that has largely been a function of the market we’ve witnessed since early last year, in which good stocks are inexpensive — so we've been buying those good values. Furthermore, shorting can be risky, and you want the odds on your side as much as possible. Even shoddy, beaten-down companies have caused seasoned short sellers heartache this year, so we’re fortunate that we didn’t participate. Today, prices still favor buying good companies, rather than giving greater-than-normal attention to short positions.

Shorting Essentials

Pro Community

- Russell (TMFEldrehad) explains how "deep" CAPS data is and shows you how to slice and dice it in a way that is most meaningful to you.

- Bruce (TMFGoogly) summarizes earnings at **Tupperware**. Shares are volatile but remain a longer-term Buy. We will likely use options on Tupperware again after we see the new 10-Q filing in a few weeks.
- Jeff reviews **Intel**'s record results and no-holds-barred outlook. The company remains a Buy First.
- We're still going over results at **GlaxoSmithKline**, but we aren't likely to change our buy guidance.
- The FDA has moved **MELASciences**' MelaFind product review from August to November. Investors didn't like the delay, although the company's potential remains unchanged.
- New member John (simonjw5101) likes how *Pro* has made money on Tupperware options even though the stock is down, illustrating a key *Pro* advantage.

Here are the ways we can profit from falling prices:

1. **Short a stock or ETF directly**. When we borrow shares and sell them, we profit when we can buy the shares back at a cheaper price. However, our losses grow as the price rises, and lately you have to pay your broker interest for the privilege of shorting borrowed shares.
2. **Short indexes or sectors using inverse ETFs**. You don't need to borrow these shares, so the cost to short with inverse ETFs is usually modest. We prefer inverse ETFs that don't use leverage. To short indexes, we've bought **ProShares Short SmallCap600** and **ProShares Short S&P500**, the second of which remains an active holding.
3. **Use options.** If we expect prices to fall for an investment, we can buy ("buy to open") put options and only risk the small amount of capital invested; we'll profit if the price of the underlying investment falls sufficiently by the time the puts expire. We can also use option spreads to profit on flat or declining prices with low invested capital and contained risk. Finally, in certain situations we will write naked calls, as we've done on **iPath S&P 500 VIX Short-Term Futures**.
4. **Writing covered options.** Whenever you write ("sell to open") an option, you're shorting that option. You're getting paid the value of the contract up front, and profiting as the value of the option declines on the open market. Writing covered calls, as we're doing on **NextEra Energy**, **Procter & Gamble**, and others, is a small way of setting up a short position that hedges a position you own.

Allocating According to Risk and Reward

Because there are more potential long-term rewards to be gained by owning stock in strong companies, we'll usually keep short selling in our back pocket until the risk-to-reward situation is strongly reversed — that is, when there's much more risk in owning a position than there is in investing *against* it. When the odds have flip-flopped (for valuation or business reasons), we'll put on our short seller's hat.

Sometimes the whole market looks risky; other times it's just particular positions. When we're hand-picking shorts in an otherwise attractive market, we may only allocate 5% to 10% (tops!) of our money to shorting. But when we see much more risk in the market than potential reward, our allocation to shorts could balloon to 20%, 30%, or more, and our cash balance will grow, too, as we sell bullish holdings.

Overall, if your money is in the stock market for the right reasons, your short-selling allocation should be reasonable (10% or less) until there are excellent reasons to ratchet it higher.

For more on the strategy, please see our Guide to Shorting — and to ask questions, visit our Memo Musings board. Remember to check out the sidebar for more *Pro* Foolishness!

Next Up in the Memo

- **Aug. 2:** *Pro* analyst Todd Wenning discusses how to stay focused on your long-term goals — no matter what's going on in the market.
- **Aug. 9:** Jeff wraps up his series on investing the *Pro* way, showing you how to put all of the pieces of a *Pro* strategy together to earn smoother returns.

Write Covered Calls on Procter & Gamble

Published Jul 22, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") January 2011 $65 covered calls on Procter & Gamble
- **Allocation:** Write one call for every 100 Procter & Gamble shares you own (for *Pro*, nine contracts)
- **Option's recent bid/ask (July 21):** $1.60/$1.70
- **Preferred limit price:** $1.60 or whatever income amount is acceptable to you
- **Recent stock price:** $61.55
- **Special requirement:** You must own at least 100 shares of Procter & Gamble to write a covered call.
- **Alternate trades:**
  - If you don't own 100 shares of Procter & Gamble, continue to hold your position.
  - If you don't own any shares of Procter & Gamble, the stock is a Buy; you can buy shares to hold for the long haul, or buy shares and write these covered calls with us.
  - Finally, to be more defensive, you can write ("sell to open") January $60 puts for $3.20 to potentially add shares to your portfolio at $56.80.

What's New

Procter & Gamble (NYSE: PG) was a victim of the "flash crash" in May and faced a Pampers controversy that same month, but its shares have nonetheless held up well this year, ticking up 1.8% while the S&P has traded down 2.8%. P&G's steadiness is thanks in part to a solid fiscal third quarter, and it probably also benefited from investors seeking higher-quality investments in the wake of renewed concerns about the economic recovery.

Why This Strategy?

Procter & Gamble remains a buy around $62, but with our fair value estimate near $70 and the January 2011 $65 calls currently paying $1.60, we think now is a good time to generate some additional income from this anchor of the *Pro* portfolio.

Here are the potential outcomes of the trade:

If:	Then:	*Pro* 's Take:
Shares are greater than $65 at expiration and we don't close or roll up our covered calls.	Our position is called away at an effective sale price of around $66.60 -- a 20% gain on our initial purchase (not including dividends received).	It's not ideal, but we'd be comfortable with this, and we'd free up $58,500 to invest elsewhere. However, because we'd prefer to squeeze some extra income out of this position rather than sell P&G, we'd first look to roll the calls if this scenario becomes more likely.
Shares are below $65 at expiration.	We keep our shares and the $1.60 premium as additional income, while effectively reducing our breakeven price to $54.08 ($55.68 minus $1.60).	We're happy with this result, too, and we'd likely write new covered calls to generate even more income.

As the table notes, if our shares aren't called away, the option premium received will provide 2.9% downside protection on our cost basis of $55.68. That's a fair deal given P&G's durable, well-diversified revenue stream and relatively steady share price.

How to Follow Along

If you need a refresher on covered-call strategies, please see *Pro*'s guide to covered calls before placing this trade. Remember, you write one call for every 100 shares of stock you own, and you may write covered calls on all of your shares or just some. (We're writing calls on all of ours.)

Here are the numbers behind the trade:

- **Trade:** Write ("sell to open") January 2011 $65 calls on your stock position, in 100-share increments.
- **Option yield (at recent $1.60 bid):** 2.6% of the $61.55 share price, in five months
- **Option yield on our $55.68 average cost basis:** 2.9%
- **Upside from today if sold at a net $66.60 ($65 strike plus $1.60):** 8.2%
- **Total return on position if exercised:** 20%
- **Downside protection:** 2.6%; a decline to $59.95 is hedged

When you write ("sell to open") an option, the going price is paid into your account, and that money is yours to keep. In this case, you'd then be obligated to sell shares of Procter & Gamble if they're above the strike price by the expiration date and you don't take any other action.

Writing puts? If you place the alternate trade and write puts, you'll be obligated to buy shares of Procter & Gamble around a net $56.80 if the stock declines below $60 by expiration.

We'll write covered calls in the next one business to 30 calendar days. To discuss it or ask questions, please visit our Procter & Gamble board.

Todd owns shares of Procter & Gamble.

Write Covered Calls on NextEra Energy

Published Jul 22, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") December 2010 $55 covered calls on NextEra Energy
- **Allocation:** Write one call for each 100 NextEra Energy shares you own (for *Pro*, that's 9 contracts)
- **Option's recent bid/ask (July 21):** $1.40/$1.50
- **Preferred limit price:** $1.40, or whatever income amount is acceptable to you
- **Special requirement:** You must own at least 100 shares of NextEra Energy to write a covered call.
- **Alternate trades:**
  - If you don't own 100 shares of NextEra Energy, continue to hold your position.
  - If you don't own any shares of NextEra Energy, you can buy shares directly to hold, or buy shares and write these covered calls with us.
  - Finally, to be more defensive, you can write ("sell to open") December 2010 $50 puts for $2 to potentially add shares at $48.

What's New

NextEra Energy (NYSE: NEE) has recovered nicely from its February 2010 lows near $45. At the time, it was coming off a messy rate case in Florida and a lackluster earnings report, but it has since been helped by a number of analyst upgrades and some renewable energy wins in California and Ontario, Canada.

The name change from FPL Group to NextEra Energy may have played a tiny part in the recovery, too. It's still the same company, but the rebranding was intended to better reflect the company's renewable energy businesses in locations other than Florida. Of course, wiping some of the dirt off the FPL brand following this winter's rate-case brouhaha didn't hurt, either.

Why This Strategy

We continue to believe NextEra is a good buy below $55, but being a utility, it's hard to imagine the shares soaring in the near term. This presents a good opportunity to generate additional income from our position by writing covered calls on it.

Here are the potential outcomes of the trade:

If:	Then:	*Pro* 's Take:
Shares are greater than $55 at expiration and we don't close our calls or roll them out (to a later month) or up (to a higher strike).	Our position is called away at an effective sale price of $56.40 -- a 14% gain on our purchase (not including dividends received).	We're perfectly comfortable with this, and we'd free up $49,500 to invest elsewhere. We may even turn around and write lower-priced puts on NextEra.
Shares are below $55 at expiration.	We keep our shares (and the $1.40 premium becomes income) and effectively reduce our breakeven price to $48.01 ($49.41 minus $1.40).	We're happy with this result, too, and we'd likely write new covered calls to generate even more income.

As the above table notes, if our shares aren't called away, the $1.40 premium received will provide 2.83% downside protection on our average buy price of $49.41. That's not an enormous cushion, but for a low-volatility slow grower like NextEra Energy, it's good additional income in only five months on top of our 4% annual dividend.

How to Follow Along

If you need a refresher on covered call strategies, please see *Pro*'s guide to covered calls before placing this trade. Remember, you write one call for every 100 shares of stock you own, and you may write covered calls on all of your shares or just some (or none, if you wish). We're writing covered calls on all of ours.

Here are the numbers behind the trade:

- **Trade:** Write ("sell to open") December 2010 $55 calls on your stock position, in 100-share increments
- **Option yield (at recent $1.40 bid):** 2.66% of the $52.60 share price (in five months)
- **Option yield on our $49.41 average cost basis:** 2.83%
- **Upside from today if sold at a net $56.40 ($55 strike plus $1.40):** 7.2%
- **Total return on position if exercised:** 14%
- **Downside protection:** 2.66%; a decline to $51.20 is hedged

When you write ("sell") an option, the going price is paid into your account, and that money is yours to keep. In return, with this trade, you agree to sell shares of NextEra Energy if they're above the strike price by the expiration date, unless you take follow-up action on your covered calls first, closing the obligation.

Writing puts? If you place the alternate trade and write puts, you'll be obligated to buy shares of NextEra Energy around a net $48 if the stock declines to the strike price or lower by expiration.

We'll write covered calls sometime between one business day from now and 30 calendar days from now. (Note that NextEra reports earnings tomorrow, July 23.) We look forward to booking more income! To discuss this trade or ask questions, please visit our NextEra Energy board.

Monday Memo: Use ETFs the Pro Way

Published Jul 19, 2010 at 12:00AM

Options Expirations

Our covered strangle on **Tupperware** and diagonal calls on **U.S. Natural Gas Fund** both expired as 100% cash gains this weekend. We're looking at new possibilities.

Upcoming Earnings

- 7/19 (after market close): **Tupperware** (NYSE: TUP)
- 7/21: **GlaxoSmithKline**
- 7/23: **NextEra Energy**
- 7/26: **Plum Creek Timber**
- 7/29: **GrafTech International**
- 8/3: **AmTrust Financial Services** and **Papa John's International**

Pro Community

- TMFEldrehad explains how to use CAPS to dig deeper into some of the top-ranked CAPShot stocks.
- Alex340 posted put options (to "sell to open") that match *Pro* criteria.
- TMFValuemoosie posted a full earnings calendar.
- Have questions about our recent trade alert to write puts on **Broadridge Financial Solutions**? Just ask on the Broadridge discussion board!

NextEra Energy and My Scorecard

FPL Group recently changed its name and ticker to **NextEra Energy** (NYSE: NEE). We're working on changing it across the *Pro* site -- including on My Scorecard (live now!) for members who have added it there.

Jeff owns shares of AmTrust Financial and GlaxoSmithKline

In our last few memos, we've been discussing how to run a *Pro* portfolio. We've talked shop on stocks and provided an overview of options; now it's time to chat about exchange-traded funds (ETFs) and how we use them at *Pro*. Like mutual funds, these handy investment vehicles generally hold large baskets of diversified stocks (or they could own an asset like gold), but ETFs trade on the market like a stock.

ETFs have skyrocketed in popularity, with investors using them to invest in commodities, foreign markets, specific sectors, and currencies, and to sell short. ETFs play an important role in a *Pro* investor's portfolio because they make it easier to diversify and to own stakes in assets that are otherwise hard to buy. They'll typically make up about 15% to 20% of the *Pro* portfolio. As with any investment, there are also some pitfalls to avoid. I discuss those in detail below, but first, let's take a peek at the ETFs we own and others we're considering.

ETFs We Own

Back when the world was ending in 2008, we bought our first stock-based ETF, **Vanguard Emerging Markets**, a fund of more than 800 companies concentrated in developing countries such as China, Brazil, India, and Korea. Rumors of the world's end proved a tad premature, and the ETF gained 80%, so we sold half our position and moved the remaining shares to hold because of valuation. We believed that emerging markets would rebound sharply, and this ETF provided a cheap and convenient way to capitalize on this.

A few months after buying into emerging markets, we bought the **Vanguard Energy** ETF, which holds the largest U.S.-based oil and gas companies. Oil was trading near $40 per barrel, pushing down the share price and making the fund a value. The shares have since appreciated along with oil prices. Vanguard Energy is still a buy, and has dropped to better prices since the BP Gulf disaster, even though the ETF doesn't hold BP. If you believe that energy companies will create value in the coming years, this ETF is an easy, inexpensive way to own many of the best ones in the United States.

We also own the **SPDR KBW Regional Banking** ETF, which holds 52 of the country's strongest regional banks and trades in aggregate just above book value. We recognize the risks in the financial sector, but we believe these inexpensive and conservatively managed banks will create value from today's prices. This ETF remains a buy, as does the **ProShares Short S&P 500** ETF. This *short* ETF gains ground whenever the S&P 500 falls, acting as hedge against broad market declines. If you want to own good banks cheap or have a market hedge, consider these two ETFs.

We also hold an option position in the **U.S. Natural Gas Fund** ETF, purchased on the thesis that natural gas prices would rebound from multi-year lows. However, this position is on hold because the ETF hasn't been tracking natural gas prices reliably (see our pitfalls section below). We're waiting to see better results. We've had better fortune — and profits — in the past owning silver through **iShares Silver Trust** and the yen with **CurrencyShares Japanese Yen Trust**, but we don't hold positions in either ETF today. We're keeping an eye on them for new opportunities, though. Speaking of which …

ETFs on Watch

We're always looking for new ways to make money with ETFs that move counter to stocks or increase in value regardless of what the market is doing. We're also always seeking strong long-term investments that diversify your portfolio and put you (and us) into promising areas. For instance, **Market Vectors Brazil Small-Cap** ETF has been on our radar for months. It offers a way to buy into consumer-centric small companies in South America's economic leader. We'd like a price below $40, and if we wait, we just may get it. The ETF recently traded around $45, down 10% from its high. We may write puts on this ETF to buy it cheaper.

To play the same emerging middle-income thesis, but in China, we've been investigating **Claymore/AlphaShares China Small Cap**. As the standard of living increases in China, small, consumer-focused companies should prosper, and our Vanguard Emerging Markets ETF owns mostly mid- and large-cap companies rather than small. Given the history of small caps outperforming large-cap stocks in the U.S., we want to own small caps in emerging economies. However, we want to own large baskets of those types of stocks through ETFs, since nobody knows which of these small companies will thrive.

We also believe that the dollar is likely to gain value against the euro and other key currencies, making us consider **PowerShares DB U.S. Dollar Index Bullish**. But we're not bullish on everything in the U.S. **iShares Barclays 20+ Year Treasury Bond** may be worth shorting when we believe interest rates are headed higher. You won't want to own 20-year Treasuries with a low coupon rate once rates start ticking up. We're also considering the short side of municipal bond ETFs in especially weak U.S. states, where local governments face daunting budget shortfalls. And back on the bullish side, alternate energy ETFs hold promise, but we believe it's too early to buy.

As a final example, the **Consumer Discretionary Select Sector SPDR** ETF has caught our eye for neutral to bearish options strategies. More than 50% of the fund is invested in consumer services that consumers don't necessarily need — and can be put off or avoided in a tough economy. However, because this ETF has positions in strong companies such as **McDonald's** and **Amazon.com**, rather than short it, we may want to set up neutral options strategies that will make money as long as the ETF doesn't gain meaningful ground in a few months. With consumer spending still weak, this may work out well.

Pitfalls to Avoid

We're considering many ETFs, but they have one important thing in common: None of them is leveraged. Yes, in a sign of our times, many of today's ETFs *are* leveraged, seeking to earn 2, 3, or even 4 times the daily price movement of an underlying asset. Leverage like this will almost surely destroy the value of an ETF over long periods of time, so you won't see *Pro* embracing "ultra" or leveraged ETFs.

We're also avoiding ETFs that trade futures contracts to try to track the price of a commodity, rather than owning the commodity itself. The monthly cost of rolling futures contracts eats into the value of the ETF. This is why our U.S. Natural Gas Fund position is on hold, and it's part of the reason we're shorting the **iPath S&P 500 VIX Short-Term Futures** ETN.

The Keys to ETF Investing

With ETFs — as with any investing — the key to being successful is knowledge. Specifically, before you open a position, be sure you:

1. Understand what you're buying and know what each ETF owns.
2. Know the fees and invest in ETFs that charge reasonable ones. We like 1% or less per year.
3. Know your time frame. Some ETFs are longer-term investments (like emerging markets), while others are shorter term (such as short ETFs or currencies).

For more on ETFs, visit The ABCs of ETFs and our discussion board, ETF Center. Have an ETF you particularly like (or dislike)? Please post it on that board!

Coming up, we'll finish our rundown of the strategies we use at *Pro* with a discussion of shorting. Then, we'll explain how to put all of our strategies together in a *Pro* portfolio to earn profits in up, down, and flat markets.

To join the discussion, visit our Memo Musings board.

Invest well!

Jeff Fischer

Write Puts on Broadridge Financial Solutions

Published Jul 16, 2010 at 12:00AM

At a Glance

- **Action**: Write ("sell to open") December 2010 $20 puts
- **Allocation**: 2.5% (for *Pro*, 14 contracts)
- **Option's recent bid/ask**: $1.45/$1.70
- **Preferred limit price**: $1.55, $1.45 minimum, or whatever income/break-even price is acceptable to you.
- **Alternate trades**: Broadridge is a **Buy First** stock and is trading below our preferred buy price. Buy shares directly at around $20; or, write September 2010 $20 puts for $0.90.

What's New?

Broadridge Financial Solutions (NYSE: BR) has been busy since *Pro* recommended it in late April. Broadridge was one of only 25 companies to receive the prestigious "Gallup Great Workplace Award" for 2010; soon after, it was voted the best large company to work for in New York State. While we're happy to see Broadridge taking care of its employees, we're even more pleased that the company announced another $0.14 quarterly dividend and approved a 10-million-share repurchase program (perhaps we're a tad selfish).

Third-quarter earnings coincided with a general downturn in the market, and the stock fell from our $22.88 entry price. In typical Wall Street fashion, investors don't seem to be paying attention to the business fundamentals. Broadridge has signed two new clients to multi-year deals and has continued to expand and improve its service offerings. It has also closed its transaction with **Penson Worldwide** (NASDAQOTH: PNSNQ); in exchange for its clearing business, Broadridge received an 11-year contract to provide processing and back-office support for Penson, as well as some financial compensation. As we'd hoped, it looks like this transaction will free up more than $200 million in restricted cash for Broadridge to play with. This cash is already being used productively – witness the stock repurchase and the acquisition of internationally focused software business City Networks. Broadridge remains extremely healthy, and Fitch recently raised its credit rating to BBB+ from BBB.

Why This Strategy?

By writing out-of-the-money puts (meaning that the $20 strike price is below the current stock price), we're attempting to buy another chunk of Broadridge at an attractive price. If the stock is below our $20 strike price at expiration, we will purchase our 1,400 shares for $18.55 each (including our put option premium). We would be happy to own Broadridge at an average cost basis of around $20.72, which we feel represents an adequate margin of safety for this slow-and-steady, recurring revenue juggernaut. (Remember, we already have 1,400 shares at a basis of $22.88.) If we don't get our stock, we'll keep our put payment and likely try again later – after all, Broadridge remains a **Buy First** stock, and we'd like to fill out our position at attractive prices.

If you're unable to write puts, or would prefer not to, consider purchasing Broadridge stock outright. The stock is currently below our preferred buy price of $23, and we think snapping it up at or below $20 will work out well in the long run. Whether you're buying Broadridge for the first time or filling out your position, keep in mind that our preferred buy price is just a guideline; our fair-value estimate of $27, outlined in our original trade report, remains intact.

We'll make this trade in the next one business to 30 calendar days. To discuss this trade or ask questions, please visit our Broadridge board.

How to Follow Along

You write ("sell to open") puts when you're ready to buy a stock if it declines below the strike price by expiration, as explained in our put-writing guide. Here are the numbers behind the trade:

- **Option payment or yield (at $1.45 bid)**: About 7.1% in five months
- **Option strike price**: 2.3% below the recent $20.47 share price
- **Break-even price**: 9.4% lower, at $18.55
- **Cash or buying power needed**: Each put you write represents a potential $2,000 purchase of Broadridge stock.

If we're able to buy new shares at a net $18.55, we'll be paying 12 times management's earnings guidance for the 2010 fiscal year (and about 10 times likely free cash flow), providing us with a substantial margin of safety for this **Buy First** stock.

Adjust Your Trade on iPath S&P 500 VIX Short-Term Futures

Published Jul 15, 2010 at 12:00AM

At a Glance

Trade Adjustment: *Pro* recommends an options trade on VXX.

Special Notice: At *Pro*, we try hard to make the same transactions in our portfolio that we tell you to execute in yours. Sometimes, though, it gets a little sticky, and this is one of those times. We still believe in the thesis we advanced on June 16, but in order to participate in a short position on VXX, we need to adjust the trade — using options instead of a direct stock short, because shares were unavailable at our broker for shorting. For new *Pro* members, we don't recommend this advanced trade unless you have considerable experience with options or shorting. It's a small, short-term portion of our portfolio, so don't sweat sitting this one out. For those of you who followed our original trade: Congratulations, you've likely made money, and our adjusted trade aims to follow in your footsteps.

What's New

When investors see high volatility in the stock market, the famous VIX index goes up. As volatility concerns wane, the VIX goes down. The **iPath S&P 500 VIX Short-term Futures** (NYSEMKT: VXX) is meant to track the movement of the VIX, moving up and down with volatility. Buying or shorting this investment allows you to profit on increasing *and* decreasing volatility. It's perfect for investors looking for an edge in a choppy market.

Your Next Steps

- **If you shorted VXX as per our original recommendation, or are able to:** Continue the strategy as planned.
- **If you are unable to short VXX directly:** Consider this new strategy using options.
- **If you aren't ready to short or use options yet:** No problem! Watching is great experience, and we aim to repeat this strategy later.

As you know, *Pro* is focused on making money in any market, be it bear, bull, or just plain volatile. We saw an opportunity to profit from the latter state last month, and we announced our intent to sell short shares of VXX. We intended to place the trade when the price was above $30, then profit when volatility in the S&P 500 declined. (See our original report below.) Believing that heightened volatility couldn't last forever, we reasoned that shorting this volatility-tracking investment would result in handsome profits as the market calmed down.

Alas, when VXX broke above $30, the Fool's broker did not have shares available for shorting. *Pro* Fools using other brokers were able to short VXX, and with its price now at $25, we're happy that they're profiting. So you know exactly where we stand, the *Pro* portfolio is *obligated* within 30 days to take a position in the spirit of any original recommendation, and we're always glad to do just that. Thus, in this case, we will short VXX using an alternate strategy: writing ("sell to open") calls.

Why This Strategy

Since we're not currently able to borrow shares to sell short directly, our next best alternative is to write naked calls. "Naked" means that we don't own the underlying investment, and the higher it goes above our break-even price, the more our loss grows, just as with any direct short. But we're confident in this trade for a number of reasons.

First, writing August $30 calls on VXX, we'll be paid around $1 per share, which is the same as shorting VXX at around $31 per share – above our preferred short price. Second, the investment recently traded at $25, giving us a 24% cushion before our calls are in-the-money. Third, if shares of VXX rise to our strike price, we can roll our calls up to a higher strike price and/or out to a later expiration date, still have a potential profit on the trade, and wait for market volatility (and VXX) to drift lower again.

The most we can earn by writing these calls is what they initially pay us, so it's less attractive than shorting the shares directly (the more VXX falls, the more a direct short is rewarded). But our risk is manageable, and the potential reward is still attractive given the level of confidence we have in this short's ultimate success. Additionally, we hope to repeat this trade month after month as our options expire, growing our profits along the way.

How to Follow Along

Only experienced investors with ample funds should consider following this short sale. Short sellers often need to wait out market volatility before seeing profits, and that requires having the financial means to hold tight as a position potentially works against you. Additionally, writing naked calls requires trade maintenance and monitoring – *Pro* provides that, but you shouldn't make this trade if you expect to leave your brokerage account unmonitored for a meaningful period of time. Again, that's true of any short sale.

Trade Details

- **Action:** Write ("sell to open") August 2010 $30 calls (one for every 100 shares you want to short – for *Pro*, 12 contracts for a 3% allocation)
- **Value:** Each written call represents shorting $3,000 of VXX
- **Preferred option limit price:** $1.10 or higher
- **Trade's break-even price:** $31.10
- **Current VXX price:** $25
- **Cushion before break-even:** 24.4%
- **Return on investment:** 3.6% if the calls expire, earned in 37 days (about 40% annualized).

Although we hope to profit by shorting VXX often in the future, this position is a small component of the *Pro* portfolio. It's not necessary to follow along if this trade doesn't appeal to you or if you aren't experienced with options and the idea of writing naked calls. Only make this trade if you're comfortable with the strategy and understand its mechanics. If you don't, please post your questions on the VXX board. We'll help get you ready for next time!

Close Your Covered Strangle on Intel

Published Jul 12, 2010 at 12:00AM

At a Glance

- **Trade:** Close covered strangle: "Buy to close" July 2010 $22 calls and $20 puts. Continue to hold your shares of Intel, as we are. The stock remains a Buy First.
- **Price:** Use a limit order near current market prices (if allowed, close both options at once with one trade)
- **Why this trade:** By closing early, we can capture most of the option income from this strangle. The stock remains a Buy First, and we'll maintain our position size until we digest Intel's upcoming earnings report.
- **Alternate trade:** Aside from closing your options, we suggest waiting to make any new trades on Intel until after it reports earnings on Tuesday.

What's New

We've made most of the potential profit on our **Intel** (NASDAQ: INTC) covered strangle, having earned 90% of the potential income on our covered calls and 70% of the possible put option income. A covered strangle involves writing both puts (to potentially buy more shares cheaper) and covered calls (to sell existing shares higher). With the computer chip giant reporting earnings Tuesday after the market closes, we're going to "buy to close" both legs of our July covered strangle to claim our profits before the big news event.

When you write an option, the most profit you can make is the amount it pays you. Since we've earned most of this payment already, it makes sense to lock it in. That way, we eliminate the risk that the profit could dissipate because of a large move in the stock (in either direction) after the earnings announcement. After we dig into the company's results, we plan to set up a new options strategy. So if you don't have a position in Intel yet, wait until after earnings, and you can follow along with *Pro*.

How to Follow Along

Whether you wrote *Pro*'s original $19/$21 covered strangle or our adjusted $20/$22 strangle, with Intel sitting a bit above $20, both trades are showing a handsome profit and can be closed today ("buy to close").

If you wrote a different July strangle on Intel and have earned a majority of the possible profit, we suggest you close it before earnings Tuesday. If you wrote a strangle expiring in later months, you can let it be and keep waiting. If you don't own Intel yet, we suggest you wait until after earnings to make any new trades -- there's no reason to embrace risk a day before the event. We'll have guidance soon after we see the results. Once we close our strangle, we'll just own a position in Intel stock, which remains a Buy First.

Have questions? Please ask on the Pro Intel board.

Monday Memo: Use Options the Pro Way

Published Jul 12, 2010 at 12:00AM

The Fool’s latest premium report, *Gold and Beyond: 7 Surprise Plays to Inflation-Proof Your Portfolio*, is hot off the press – and it’s free with your *Pro* membership! Get our analysts’ recommendations on protecting your purchasing power right here.

What’s Next

- 7/13: **Intel** earnings

- 7/17: Intel strangles, **Tupperware** strangles, and **U.S. Natural Gas Fund** diagonal calls expire
- 7/19: Tupperware earnings
- 7/21: **GlaxoSmithKline** earnings

In the *Pro* Community

- TMFValuemoosie posted a *Pro*earnings calendar.
- New *Pro* member Scott introduced himself Foolishly. We invite you to chime in, too!
- We talk about *Pro*portfolio performance.
- On the Philosophy board, we discuss how hedge funds are unsure what to do, mortgages, gold, and more. Join in!

Jeff owns shares of GlaxoSmithKline.

In last week's Memo, we discussed the *Pro* approach to buying stocks. Today, we'll outline the options side of the *Pro* investing strategy.

While we generally seek long-term capital gains from stocks, most of our options strategies are used for *short-term* income or gains. By combining these strategies (along with ETFs and shorts, which we'll cover next week), *Pro* investors can achieve profits in the coming weeks *and* the coming years, accomplishing our goal of steady, recurring profits with high accuracy in both the short and long term.

Options in Two Minutes

Let's go over some key points about options. If you're new to the concept, this explanation should show you that they're not as intimidating as they may seem, and if you're an old hand, it can serve as a Foolish refresher.

First: An option gives its owner the right to buy or sell a stock at a set price (the "strike price") by a set expiration date. An option's value is dependent upon the price moves of its related stock; a "call" option goes up when a stock rises, while a "put" increases in value when a stock falls ("call up, put down" is an easy way to remember this). Each option contract represents 100 shares of stock, so options make it possible to control many shares for a lower cost than buying them outright. However, the *Pro* approach to options often assumes that we could convert them into a full stock trade, so you should use leverage sparingly.

We write options (or "sell," "short," or "sell to open" – they're all the same thing) much more often than we buy them. That's because the odds are stacked in favor of the option writer: Writing options means we get paid to make the trade, and we are typically able to profit on the option even when the related stock swings in price. The option *buyer*, meanwhile, *pays* to make the trade – and to make any money, the buyer must be correct about the price of the stock by a certain date. That's difficult to do, which is why we write (or "sell to open") options more often than buying them.

We use options strategically, as part of portfolio management. Options work hand in hand with stocks, and your *Pro* portfolio should come to reflect that – so push away any inclination to trade options in a separate account. Finally, although most options do make money in the short term, we're not *traders* of options. We use them tactically, while appreciating that they expire in a matter of weeks or months.

Strategies – and Trades – We Like

There are more than a dozen options strategies *Pro* will use, depending on what's most appealing at the time. However, we primarily rely on just a handful, and knowing even one or two is enough to change and improve how you invest. The following two strategies are likely to be the most useful over a lifetime.

Writing Puts

Options FAQ

- *Pro* is a separate service from *Motley Fool Options*. Both services offer similar educational material that can be used together (and both feature a great community), but *Motley Fool Options* recommendations are not part of the *Pro* portfolio. However, they do provide strong additional ideas.
- Options can be exercised (turned into a stock transaction) by the owner (the buyer) at any time, but they are rarely exercised before expiration.
- The option writer *doesnot* control when an option is exercised. The owner (buyer) does. Any option that has value at expiration is automatically exercised.
- You can trade options in an IRA, including writing covered calls and, in some cases, writing puts.
- Options are priced based on intrinsic value (the difference between the strike price and the stock's share price) and time value (the amount of time until expiration). The longer until expiration, the more time value an option holds.
- The more volatility expected in a stock, the higher its option prices (reflected in time value).
- Option writers generally want to write options that expire in six months or less, to collect income more quickly. Option buyers generally want to buy options that expire in one year or longer, to have more time to be right.
- Not all stocks have options traded on them; options require investor interest and volume.
- U.S. options expire at the end of the third Friday of the month of expiration.
- To see options prices, obtain a stock quote at your broker and click "option chain."
- To get started using options, apply for options trading permission with your broker; level 2 or 3 will get you started.

When you would be happy to buy shares of a stock cheaper than the current price, you can write ("sell to open") put options. You would write, or sell, one contract for every 100 shares of stock you're willing to buy at a set price (the strike price of the option). Three real-life *Pro* examples – trades that you can consider making today – serve as the best illustration.

Say you'd like to purchase some shares of Buy First stock **Oracle**, but you'd prefer to buy a bit cheaper than the recent market price of $23.30. You could write ("sell to open") September 2010 puts at a strike price of $23, which would recently pay you $1 per contract (a total of $100 for each put you write, since each option contract applies to 100 shares of stock). Given the potential stock buy price of $23, receiving $1 per share equates to a 4.3% option payment (or yield) in only about two months – about 25% on an annualized basis. That's great income on the capital you set aside to maintain this trade.

By selling these puts, you've sold a contract into the market that says, "If Oracle declines below this $23 strike price before this option contract expires, I'll buy it at that set price." In exchange, you get paid the $100 per put the moment you sell the contract.

Now, if Oracle does go below $23 by the time the option expires on Sept. 18, your brokerage account buys shares automatically. Since you keep the $1-per-share option payment you received, your net start price on Oracle is actually only $22 – very nice. (Remember, each option is 100 shares, so if you write one put, you need to be ready to buy $2,300 worth of Oracle.) If Oracle is *above* $23 by the expiration date, the options expire, you still keep the option income you were paid, and you can write another put.

Let's look next at a Buy-rated stock: **NextEra Energy**, which is recently above $51. Perhaps you only want to buy this utility at a price lower than $50. You can write December 2010 $50 put options today and be paid $3 per contract. That's a 6% yield in about five months. Come Dec. 18, if NextEra is below $50, you get to buy shares at a net $47. If it’s above $50, you just keep your strong option income and try again (if you so desire).

This strategy can even work on a *Pro* stock that’s listed as a Hold due to valuation, because you can target a buy price in our preferred range. For example, software leader **Autodesk** is currently a Hold; it’s trading near $25, while our preferred buy price is around $22.50. But you can write October 2010 $23 puts on Autodesk, which would recently pay you $1.30 per contract. That’s a 5.6% payment in three months (around 23% annualized), and it nets you a potential buy price of $21.70 if you are "put" Autodesk shares. If Autodesk stays above $23, you get to keep the income, and you can write new puts.

Whether you’re looking to build a portfolio, add to an existing position, or earn income, writing puts on companies you admire is an excellent strategy. At *Pro,* we frequently also own some shares of the targeted stocks, so we have upside exposure. This is a good move if you believe a stock has meaningful upside, since you won’t want to miss all of that potential gain by only writing puts.

Writing Covered Calls

The flipside of writing puts is writing covered calls. Writing covered calls on stable companies is a steady income strategy used by young hedge funds and poolside retirees alike. When you *already* own at least 100 shares of a stock, and you’re willing to *sell* it a bit higher, you can write (“sell to open”) covered call options. (They’re called “covered” because they “cover” a stock you already own.) This strategy does limit your upside on that stock, since you’re obligated to sell it at the strike price even if it goes higher (you can adjust your option trade later to gain more upside, but we’ll save that lesson for another day). On the plus side, the strike price (or sell price) is your decision, made when you set up the trade.

Again, let’s examine a real-life *Pro* trade you can make. For every 100 shares of **Tupperware** you buy at $41, you could write one August 2010 $45 call option that pays you $1 per share. Thus, you collect $100 right now on one covered call contract, and you promise to sell your 100 shares at $45 if the stock reaches that price (or higher) by Aug. 21 (so your net sell price per share would be $46). The $1 per share you’re paid for the contract is only a 2.4% yield on the $41 purchase price, but that income is earned in less than six weeks, so it’s around 23% annualized. And if you do sell at $45, that’s a 12% total return on your stock. On the other hand, if Tupperware is *below* $45 by Aug. 21, you keep the option income, keep your stock, and can write new covered calls for more income. Meanwhile, the covered calls also cushion against a small decline in the stock. You can see why so many investors enjoy this strategy.

Start There!

These two key *Pro* options strategies may be the ones you use most, or even exclusively. *Pro* will use many other strategies, including buying calls to leverage gains; buying puts to protect positions or to short a stock; writing covered strangles (selling both puts and covered calls on a stock to double our income, which we’re doing with **Papa John’s International** and other companies); using option spreads to earn large returns on investment with low risk; using straddles to profit on big price moves in either direction; and more. All of these strategies and others are explained in our Options Guides. But you can, and should, start with just one or two strategies – the ones we outlined today.

Buy and Set Up a Covered Strangle on Papa John's Pizza

Published Jul 8, 2010 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Estimated fair value:** $27 to $29
- **Preferred stock buy price:** $24 or lower
- **Type of holding:** Defensive, option income
- **Why buy:**
  - Papa John's has strong U.S. operations and growing market share in the quick-serve pizza industry.
  - Pizza translates well internationally, and Papa John's is amping up its overseas business.
  - The company is led by an engaged and invested founder.

The Big Picture

By Jeff Fischer and Todd Wenning

If one food could conquer the world, it's pizza. These versatile pies appeal to vegetarians, carnivores, and omnivores alike, making them a good fit for every culture and eating habit on the planet. Pizza is a low-cost meal that borders on recession-resistant — hey, ya gotta eat! — making it an affordable indulgence for many families. Given pizza's popularity and the low barriers to entry in the industry (storefronts, ovens, simple ingredients), it's no wonder that 17% of all restaurants in the U.S. are pizzerias.

The industry is crowded and has cutthroat pricing, so only the strong can thrive. Two of the most successful chains — Pizza Hut (a unit of **Yum! Brands** (NYSE: YUM)) and **Domino's Pizza** (NYSE: DPZ) — were founded about five decades ago, making them the early movers in the domestic pizza industry. Pizza Hut and Domino's control 27.5% and 16.2%, respectively, of the U.S. quick-serve pizza chain market today, and few pizza chains have been able to replicate their success.

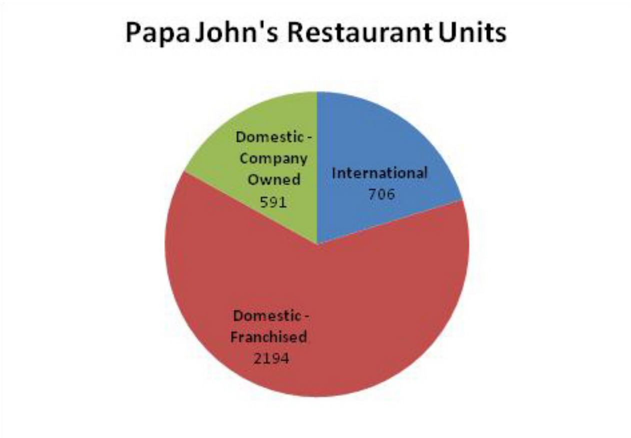
What the Community Thinks

The CAPS community is lukewarm to cold on Papa John's, rating the stock two stars out of five. However, more than 80% of All-Star members expect the stock to outperform, and our option strategy increases our profit potential. The company scores poorly on the CAPShot because it hasn't grown enough over the past few years. But we just seek profitable stability, and Papa John's offers that — with a high return on equity to boot.

A big exception is **Papa John's** (NASDAQ: PZZA), which opened its first restaurant in 1984 and today commands 11% of the U.S. pizza-chain market. That's up from10.5% in 2005, and it's worth noting that Pizza Hut and Domino's *lost* share over the same period. Using better ingredients to make better pizza (as its slogan claims), Papa John's was rated No. 1 in the 2010 American Customer Satisfaction Index, scoring even higher than **Starbucks** (NASDAQ: SBUX). It also scored highest in product quality, service quality, and customer loyalty. Put simply, Papa John's is doing pizza right, the company's financials reflect this, and we smell an investing opportunity.

The Business

As of March 2010, Papa John's had 3,491 restaurants in all 50 states and in 29 countries:



Source: Papa John's investor presentation

Seventeen percent of the restaurants are company-owned, versus 83% that are operated by franchisees. Management expects the percentage of company-owned stores to decline as franchised store growth increases. In the U.S., Papa John's expects to add 250 units over the next four years. Internationally, about 1,100 new units are in the pipeline, with most expected to open in the next seven years.

Papa John's growth-by-franchising strategy is a double-edged sword. On the positive side, the company can increase sales with little investment on its part and lower ongoing costs. Papa John's makes its money from franchisees by collecting between 4.75% and 5% of monthly net sales, while the franchisee is responsible for the initial investment and day-to-day expenses. However, on the flip side, the company will only be as good as its franchisees, so it's important to only approve financially qualified and professional franchisees and to ensure that product quality doesn't suffer. To that end, and to ensure taste consistency, Papa John's requires each domestic franchisee to purchase dough and tomato sauce from its company-run commissary and other ingredients from either the commissary or an approved supplier.

As for the company's history, Papa John's is a true American success story. Founder, chairman, and co-CEO John Schnatter (you know him from the commercials) started making pizza in 1983 out of the back of his father's tavern in Jeffersonville, Ind. His pizza was such a hit that he opened his own store in 1984, and the rest is history. Schnatter remains the company's namesake and the face of its advertising campaigns, and he owns about 21% of outstanding shares. Suffice it to say, he's engaged and invested in the company's future. When investing in smaller companies, these are exactly the qualities you want to see in management.

Financials and Valuation

Average sales on a per-store basis have been reassuringly consistent over the past seven years, ranging from a low of $307,734 in 2003 to a high of $334,936 in 2008. By comparison, Domino's average sales per store over the same period were just $173,668.

Because franchisee capital fuels growth, the company has less need to carry debt. As a result, Papa John's has a total debt-to-EBITDA (earnings before interest, taxes, depreciation, and amortization) ratio of 0.8, well below the restaurant-industry average. The company has also been a consistent free-cash-flow machine, generating $57 million over the past 12 months, which puts the stock at 11 times free cash flow. Papa John's returns most of its free cash to shareholders via stock repurchases; since 1999, management has repurchased more than $748.9 million in stock, representing more than half of the company's current market value of $630 million.

Papa John's	2007	2008	2009
Revenue (millions)	$1,064	$1,132	$1,106
Net Income	$33	$37	$58
Diluted Earnings per share*	$1.09	$1.30	$2.06
Return on Equity	24%	29%	37%

Source: Capital IQ. *Excludes special items.

Using a free-cash-flow-to-firm model to account for Papa John's debt and operating leases, we used the low side of company projections to forecast store growth, five-year average sales per store, a 7% to 8% operating margin, a 2% terminal growth rate, and an 8.75% cost of capital as our discount rate. After adding back cash and backing out debt and executive stock options, we see a fair valuation of $27 to $29 per share.

This helps explain our strategy. Alternate trades – shared in the "At a Glance" section at the top of this report – are numerous. You can just buy this undervalued pizza stock alone; or, only write puts; or, buy shares and write covered calls. But we're overachievers, so we're doing all three: buying the stock, writing puts to potentially buy more shares cheaper, and writing covered calls to potentially sell our existing stock higher. This defensive, income-generating strategy is called writing a covered strangle, and it allows us a wide profit range on the stock. Take a look at the numbers:

- **Action:** Buy 2.5% of Papa John's under $24 (recently $23.85)
- **Action:** Write (sell to open) October 2010 $22.50 puts, for a quantity of shares equal to another 2.5%, recently $1.20 (each put you sell or write represents a potential purchase of 100 shares by expiration)
- **Action:** Write (sell to open) October 2010 $25 covered calls (1 for every 100 shares of Papa John's already owned), recently $1

- **Total option income:** Around $2.20
- **Potential second 2.5% buy price:** $20.30
- **Average buy price if we get all shares:** $21.90 (11.7 times 2010 EPS estimates)
- **Potential sell price on our first 2.5%:** $27.20 (14.5 times 2010 EPS estimates)
- **Effective options yield:** 9.4% in 100 days
- **Stock gain if sold through calls:** 15.7% in 100 days

Our option income provides us a cushion should the stock decline and affords us an attractive sell price when the shares gain ground. If the stock stagnates, we can continue to write options for more income. (Please note: *Do not buy* these options. We are writing – "selling to open" -- both the calls and puts, and being paid in the process.) If you're not using options, you can still partake by purchasing a half-position (2.5% of our target 5% allocation) in the stock and selling closer to fair value.

Why We'd Sell

Despite a steady history of growth and a promising future, we would consider closing the position for any of the following reasons:

1. In foreign markets, Pizza Hut and Domino's have a good head start (once again) on Papa John's, so if the company's concept fails to gain traction overseas, we'll have to reevaluate our growth projections.
2. Store growth is reliant on some franchisees' ability or desire to obtain credit. If credit markets remain weak, it could dampen planned store openings.
3. The company's commissary maintains a fixed markup on ingredients, so while a sharp rise in food prices would help the commissary's sales, it would also likely hurt the franchisees' bottom lines.
4. Competition is always going to be fierce in the pizza industry, and if our guy begins to lose market share, we'll revisit our valuation.
5. As the face and leader of the company, John Schnatter is a key figure. If he were to leave the company for any reason, we'd reconsider the position.

Finally, using a defensive covered strangle, we're happy to sell near our estimate of fair value.

Pro Bottom Line

We don't expect Papa John's to be one of our portfolio's big growth stories, but its consistent performance, attractive business model, valuation, and tasty options premiums make it an attractive income-producing position with upside. So now you know what's for supper! Take your Papa John's questions to its new discussion board.

Monday Memo: Use Stocks the Pro Way

Published Jul 6, 2010 at 12:00AM

Dear Fools,

In last week's Memo, we outlined what's in store for the month of July. We began on July 1 with a new buy recommendation -- beaten-down helicopter services leader **Bristow Group**. Our lifelong investing journey continues in this Memo, in which we'll review how we think about stock investments in the *Pro* portfolio and share some favorite investments. In our coming Monday Memos, we'll continue this overview with our other strategies:

- **July 12:** Our options strategies and some trades you can make.
- **July 19:** Our ETF and short strategies, and some available trades.
- **July 26:** Putting it all together -- stocks, options, ETFs, and shorts -- to build a *Pro* portfolio.

Meanwhile, throughout the month, we plan to keep issuing new *Pro* investment recommendations -- so keep a Foolish eye on your inbox. With that, let's dive into today's topic.

Pro Earnings

- July 13: **Intel**
- July 19: **Tupperware**

Options Expirations on July 17

Watch your inbox for new possible trades on these positions:

- Intel covered strangle
- Tupperware covered strangle
- **U.S. Natural Gas Fund** diagonal calls

Pro Coverage & Community

- Russell (TMFEldrehad) shares his weekly CAPS analysis, rolling the dice on Vegas.
- Joe (TMFValuemoosie) posts a *Pro*-centric earnings calendar -- July will be good and busy.
- New member Amy shared her question on the Getting Started board -- feel free to ask yours!

Live Chat!

Read the recap of our latest live chat here.

Jeff owns shares of AmTrust Financial, Oracle, and GlaxoSmithKline.

Stocks to Grow By

Anyone who wants to grow wealth at a rate greater than inflation (which is bound to return someday!) has no better choice than long-term ownership of strong companies. At *Pro*, we always keep our eyes on the macro environment for possible dangers that are too large for our companies to fend off, but ultimately, we need to put our faith in the fact that quality businesses grow shareholder value over the years. And, of course, we need to be invested in order to benefit. This is why, while the *Pro* portfolio can sell short and use options, the majority of our assets will nonetheless usually be invested in strong companies at good prices.

By “majority,” I mean that anywhere north of 50% of our assets will be in stocks, and at times we’ll be 80% or more in stocks (the rest will be rounded out by options, ETFs, shorts and cash). It may surprise you to hear this, but as a whole, stocks -- not options or shorts -- are likely to be the most volatile part of our portfolio. This is partly because they’re the largest part, but also because they’re in a sense the most binary. In other words, stocks can only go up or down -- you make money, or you lose it. But options can steadily make you money even if a stock moves over a wide range (more on that next week).

Given the fickle nature of stocks, you should only buy when you’re ready to hold a company for a number of years, or as long as the business merits it. Unlike with options, there is little that’s tactical about owning a stock -- either you want to own it or you don’t, and if you do, you buy it and simply wait and stay current on the business. Thus, of all the assets you’ll have in your *Pro* portfolio, stocks are the longest-term investment. Remember that as you step up to buy.

What We Buy

Buying a stock is a little like a marriage: You hope the relationship only gets better for years and years, but realistically, you’ve got to be ready for some rough patches along the way. Thus, as with a marriage, you need to choose your (stock) partner carefully. At *Pro*, we focus intently on sustainable competitive advantages; a diverse and expanding customer base; recurring revenue streams; strong and expanding free cash flow; a healthy balance sheet; and more, all of which is detailed in our guide to finding great stocks. If there’s one thing that’s guaranteed with stocks, it’s volatility, so we want to be entirely comfortable with what we own and the price we’re paying. This allows us to wait out volatility and not lose sleep.

Why We’d Sell

On average over the past four decades, there’s been a period every two years in which the stock market has declined by 10% to 20%. It’s a cyclical fluctuation. When we’re concerned that the market is being irrationally exuberant and we see shorting opportunities, we’ll take action, shorting some positions to profit on an expected decline. At times, we may even be 50% short in our portfolio -- or more. But we’re not likely to sell our long-term stock positions just because we believe the market may take a breather.

As long as our core stocks are reasonably valued, we want to avoid commissions, taxes, skipping dividends and missing upside -- meaning we don’t want to trade in and out of our long-term stocks. We sell only when these positions look fully priced, the thesis has weakened, the stock no longer fits with the portfolio, or we find something better. Although we don’t try to time price swings in our long-term stocks, we’ll often use options on them when we see pricing opportunities. This can give us the best of both worlds: long-term capital gains in our stocks, and short-term gains with their options. This strategy can go a long way toward smoothing returns, evening out some of the volatility of stocks alone.

What We Like Now

Declining share prices since April suggest that investors were too hopeful regarding the strength of the economic recovery. It seems that they’re starting to agree with our long-held view that any real recovery is likely to be tepid and drawn-out (in fact, it’s likely to be a start-and-stop-and-start-again type of affair). But there is good news, and it’s two-pronged: Stock valuations already look reasonable, and the stocks we own showed their grit during 2008 and 2009. That means we know our management teams can steer through rough markets and continue to generate, and even grow, free cash flow. All of our Buy and Buy First stocks are within our preferred price range, and many have more attractive value multiples than before, since they’ve grown earnings. Even so, buy gradually, and average in over time.

If you’re just starting out, niche insurance provider **AmTrust Financial** (click here to get our report) offers value at 1.2 times book value and 5.4 times earnings, and it pays a 2.3% dividend. And software giant **Oracle** reported strong quarterly results and a healthy outlook, and it trades at a modest 12 times free cash flow. Both companies enjoy significant recurring revenue and competitive advantages, and each is targeted as 5% portfolio allocations. When you buy shares of any *Pro* stock, add them to the “My Scorecard” section of the site (click “Add”) to track performance.

Stocks in Summary

We hope this helps explain how we view stocks in the *Pro* portfolio. They’re the longest-term part of what we do. But we’re also here to make returns in the *short term*, even when the market doesn’t go up. We’ll dive into that topic in next week’s Memo on options. To comment or ask questions, please visit the Memo Musings board. Below are more resources on today’s topic. Until next time, stay Foolish!

Buy Bristow Group

Published Jul 1, 2010 at 12:00AM

At a Glance

- **Target allocation:** 5%

- **Estimated fair value**: $50
- **Preferred buy price**: Below $33
- **Type of holding**: Long-term; Energy services
- **Alternate trade**: Write ("sell to open") September $30 puts recently around $2.50; or write December $30 puts, recently near $3.50.
- **Why buy**:
  - Bristow Group is one of only two global helicopter services companies serving the offshore energy industry, and it enjoys the dominant position in most of the established and emerging deepwater markets.
  - Bristow has a recurring revenue stream that is impervious to oil prices and oil exploration and production spending.
  - Trading near a historic low price-to-book value, shares are priced considerably lower than the replacement value of the company's helicopter fleet.
  - We disagree with the market's view that the Gulf of Mexico oil spill will have a meaningful long-term impact on deepwater offshore oil and gas production.

The Big Picture

By Jeff Fischer and Bryan Hinmon
July 1, 2010

Get Personal With Bristow

- **Headquarters**: Houston, Texas
- **Website**: bristowgroup.com
- **CEO**: Bill Chiles since 2004; 61 years old
- **FY 2010 revenue (millions)**: $1,168
- **FY 2010 net income (millions)**: $112
- **Employees**: 3,410

Does anyone even remember what made the headlines before April 20 of this year? (Hint: Ash spewing from an unspellable mountain, lots of unplanned, extended European vacations). Since the *Deepwater Horizon* explosion, the media — not to mention environmentalists, citizens, and politicians — has been fixated (rightfully so) on the oil that continues to spill into the Gulf of Mexico at alarming rates. What really got the *market*'s attention, though, was President Obama's moratorium on deepwater drilling in the Gulf. While the U.S. Court system has since overturned that decree (though the White House is appealing the decision), shares of oil services companies on average have declined by 21% since late April on fears that the deepwater game has fundamentally changed. The *Pro* team disagrees with that assessment, and we think the market is overreacting.

Western societies are so dependent on energy that curtailing oil production is not a viable option. Additionally, emerging market economies are increasing the worldwide demand for energy. Old wells, tar sands, horizontal drilling, liquefied natural gas — the list of techniques and sources for trying to meet that demand is long. But no method has been as successful or proven as offshore exploration and production.

Worldwide, there are more than 8,700 production platforms and 500 offshore rigs. Unfortunately for direct investors, exploration is inherently risky and prone to all-or-nothing payoffs. We think the superior way to approach this area is by air. Really. **Bristow Group** (NYSE: BRS) gets people and equipment to those offshore deepwater platforms by helicopter, a business that has landed the company lots of stable, recurring revenue and a phenomenal competitive position.

The Business

The Community's Take

The CAPS Community agrees that Bristow shares are ready for take off, rating it 5 out of 5 stars. Every one of the 66 CAPS All Stars who rate Bristow believes that it will outperform. The company doesn't fare as well on our backwards-looking CAPShot report (not much does these days), tallying only 6 out of 12 points. Bristow's major shortcomings according to CAPShot are related to growth rates.

Bristow uses its wholly owned fleet of 305 flying taxis to transport rig crews, supplies, and machinery to its customers with offshore deepwater operations. It also has ownership stakes in another 204 helicopters, bringing its total working fleet to more than 500 aircraft. More than two-thirds of the company's fleet is medium or large helicopters, which are more versatile and earn higher revenue than smaller helicopters. In fiscal 2010, Bristow generated nearly $1.2 billion of revenue from providing these necessary taxi services. Vital to success in this business, Bristow has a safety record that is the envy of the civil helicopter universe.

We estimate that Bristow's 500-strong fleet makes it twice as large as its closest competitor, CHC Helicopter. While the company faces regional competition in each market, it enjoys a dominant position in each of its major deepwater markets, including the North Sea, Brazil, Nigeria, and Australia. New competitors are kept at bay by substantial aviation regulations and the high costs associated with entering the business: A new midsized helicopter costs around $25 million.

In addition to its dominant market position, Bristow has an enviable business model — one that brings in reliable, recurring revenue. The company generally signs two- to five-year contracts that call for a monthly reservation fee as well as hourly flight charges. That's pretty sweet, but it gets better: Bristow earns the reservation fee (which makes up 65% of revenue and 70% of operating income) even if no helicopters leave the ground. Many contracts also stipulate a minimum number of flight hours (a revenue floor), and Bristow gets to pass on fuel costs to its customers. Additionally, long-term contracts allow Bristow to build solid relationships with clients and give it an advantage in bidding for new business.

The market has given us the opportunity to invest in this stellar business at a discount because Bristow's exposure to the Gulf of Mexico and deepwater exploration is widely misunderstood. In 2008 and 2009, the company cut back its presence in the Gulf because of increased competition. Today, only 6% of its operating income is tied to that market — a fact that makes the stock's recent slide seem excessive.

As for the impact of the U.S. drilling moratorium, roughly 65% of Bristow's work comes from rigs already producing oil, not exploratory or drilling ones, so the short-term impact is even more watered down. In fact, it's possible that Bristow could experience increased long-term demand following the Gulf spill as oil executives feel more pressure to keep close tabs on all their deepwater platforms, or as new regulations demand rigs be more heavily staffed. (BP itself has hired Bristow to help deal with the current blow-out).

Finally, you can only get your crew to a deepwater rig in essentially two ways: Slow boat or a fast helicopter (we won't even get into how much more debilitating seasickness is than airsickness). The IHS Cambridge Energy Research Associates estimates that by 2020 a full 40% of U.S. oil could come from offshore. So as companies start drilling new wells farther from shore, that becomes an even easier choice.

Financials and Valuation

Bristow needs to spend consistently to keep its fleet state of the art and ahead of its competitors'. Over the past five years, the company has spent $1.4 billion on new aircraft. It paid for these expenditures by issuing debt, equity, and using cash from operations. Today, the company appears financially healthy, with debt representing only 35% of total capital. Bristow has adequate capacity to make payments on its debt, and we expect the company to refinance at even better rates using new government import/export facilities that should help the company keep more of the revenue it generates. As for revenue, flying larger helicopters to deeper waters should raise hourly flight charges and improve contract terms, raising Bristow's returns on capital.

Shares of Bristow are selling at only 84% of tangible book value ($36), which is 40% below its 10-year average price-to-tangible book value of 1.42. If shares were to trade at their historical average P/TBV again, Bristow would be priced around $52. Moreover, Bristow has significantly upgraded its fleet over the past five years. As Foolish investors, we are happy to pay less for shiny new helicopters than for 20-year-old clunkers! The fact that we can buy Bristow's 12-year-old (average life) fleet for 0.84 times tangible book value today, when other investors were willing to pay 1.56 times for its 19-year-old fleet five years ago leaves us flying high. If we bought all of Bristow today, we could probably pawn off the helicopters (there is a surprisingly liquid secondary market for aging helicopters), pay off its debt, and still have a nice chunk of change as profit. Although we've run conservative discounted cash flow models that show the stock has ample upside if business just grows modestly, because of the higher level of uncertainty associated with predicting cash flow, we're basing our investment case foremost on the company's asset value.

What Would Make Us Sell

Bristow's long-term success is tied to continued oil exploration, drilling, and production, so if the worldwide industry experiences a sea change that slows it dramatically, we would need to reassess our thesis. As a global operator, Bristow is subject to onerous aviation-related ownership rules, and as a result, it has a complex ownership structure for some of its foreign operations. While we're not terribly concerned about this, it is worth noting. Additionally, the company operates in some notoriously sketchy areas (such as Nigeria and Egypt), and we need to keep an eye on how foreign governments interact with the international oil companies.

Finally, current CEO Bill Chiles took over in mid-2004, only to discover some accounting shenanigans and poor internal controls. After self-reporting these issues and conducting internal reviews, he instilled a culture of safety and integrity (along with a brand new management team). Nevertheless, it's difficult to put these types of issues completely out of mind.

Pro Bottom Line

Bristow wins new business because of its superior safety record, global scale, and technologically advanced and newer aircraft. With the largest fleet in the industry — and one of the newest — the company is positioned to increase its profits as offshore drilling and production moves into even deeper waters. Those deepwater connections are also causing the market to misprice Bristow's stock. But we believe investors will ultimately refocus and see Bristow's enviable competitive position and discount to tangible book value.

For patient *Pro* investors, shares of Bristow could one day take off. Meanwhile, we'll enjoy owning part of a giant helicopter fleet — at below cost!

Please join us on the new Bristow board to discuss this investment.

Portfolio Review: Get Up to Speed With Pro

Published Jun 30, 2010 at 12:00AM

With the stock market down since late April, valuations on the companies we own have become ever more attractive, making our *Pro* Portfolio Review a delight to share with you. You can purchase any of our Buy First and Buy stocks near or below our preferred buy prices today. Even so, we always suggest that you buy gradually, average into positions over time, understand what you're buying and consider using options -- when you're ready -- to target even more attractive buy prices. We hope you enjoy our new *Pro* Portfolio Review as you build your own portfolio along with us.

Download this PDF special report and get up to speed on all our *Pro* holdings.

Monday Memo: A Promising Month Ahead

Published Jun 28, 2010 at 12:00AM

Welcome to *Pro's* Monday Memo, sent every Monday (well, most of the time*) at 4 p.m. ET with the latest thoughts, news, and a look ahead from the *Pro* team.

*Because of the Fourth of July holiday (which the market is celebrating on July 5!), you'll receive next week's Monday Memo on Tuesday.

Getting Started & Pro's Community

- Jeff shares guidance on many commonly asked questions from new members.
- Ready to enter a position in Buy First stock **Intel**? We review what a covered strangle is and its recent pricing. (Note, our options on Intel expire in July, at which point we'll likely issue a new trade.)
- Buy First stock **Oracle** reported strong quarterly results and guidance. We'll have more soon.
- Russell (TMFEldrehad) shares his great weekly CAPS analysis, this time on finding outperformance.
- Our *Pro* Member of the Week (and possibly the year) is spinningwood! A big shout out to Ed for all of his help answering questions on the boards and providing guidance. To learn more about Ed, visit our Foolish interview.

Chat With the Pro Team

The *Pro* team will be hosting a Live (online) Chat this week, Thursday, July 1 at 3 p.m. Don't miss your chance to ask Jeff, Todd, and Bryan your *Pro* questions. Sign up for your email reminder right here.

Whether you've been with *Pro* since we launched in October 2008, or you've just joined our merry band, we're all here for the same reason: To earn good and steady returns on our money while taking on reasonable (or low!) risk. If you're seeking longer-term capital gains in stocks and ETFs, monthly income from options, or near-term gains on shorts — or you want to make *all three* strategies work together — you can invest for your future following the moves of the *Pro* portfolio.

To help new members get started and veteran members stay the course, we have a full lineup for you over the coming weeks. I'll outline it today — so you know exactly where we're headed together.

Guidance, New Investments, and More

This week, we're getting this investing party started by issuing a special, full portfolio review on Wednesday, June 30. We continue to suggest that members average into our carefully chosen Buy First and Buy stocks, working to match *Pro*'s portfolio allocations. Listed on our Portfolio page, all of our buy-rated companies are attractively priced, strong businesses. Pay special attention to the "short" among this bunch**: ProShares Short S&P 500**. To hedge your stocks, this ETF will make money for you whenever the S&P 500 falls. If you want to be defensive and already own many stocks, match our allocation.

Now, let's run down the rest of the week. Here's what will arrive in your inbox:

- **June 30:** We'll publish your full *Pro* portfolio review (and email you when it's ready).
- **July 1:** A new *Pro* investment recommendation is slated to go out.
- **Also July 1:** A live (online) chat with the *Pro* team is scheduled for at 3 p.m. ET. Show up and ask questions! (You can sign up for an email reminder right here.)

July Promises Fireworks

Independence Day!

The market (and therefore the Fool) is taking off next Monday, July 5, in celebration of our country's birthday.

Next week's Monday Memo will arrive in your inbox on Tuesday, July 6.

Things will really heat up in July. Of course, you should continue to average into *Pro*'s buy-rated stocks, and we'll have more guidance and new investments for you throughout the month. Here's the weekly play-by-play:

- **July 6**: *Pro*'s Monday Memo, issued at 4 p.m. ET, will outline our stock strategy and name some favorite holdings.
- **July 7-9:** We expect to issue another new *Pro* investment recommendation.
- **July 12:** This Monday Memo will outline our options strategies and highlight options trades you can make.
- **July 13-16:** We expect at least one more new investment recommendation. Also this week, our existing July options expire, so we'll likely have a few "upkeep" option trades and possibly related new ones for all members.
- **July 19:** In this Monday Memo, we'll discuss how we use ETFs and shorts, and the related trades you can make now.
- **July 26:** In our final Monday Memo of the month, we'll put all of our strategies together, explaining how we work to earn consistent, recurring profits in various markets with a high level of accuracy.
- **July 20-30:** We'll likely have at least two more new *Pro* investment recommendations for you, but we can't guarantee that quite this far ahead.

Get Tracking!

As you build your *Pro* portfolio, hold us accountable: Enter your purchases in My Scorecard to see how our selections perform for you. (The Scorecard can't handle shorts or options yet, but everything else is fair game.) Visit our portfolio page, and click "Add" to enter your stocks.

New members and old alike, please ask your questions on our discussion boards. Introduce yourself, pose queries, share your stories and investing goals. We're all here for the same reasons, and we're enjoying the journey along the way.

Thank you for being a *Pro* member. We'll be in touch again soon!

Invest Foolishly,

Jeff Fischer, *Pro* Advisor

Coming Soon! Live Chat With the Pro Team

Published Jun 21, 2010 at 12:00AM

We're hosting a members-only Live Chat on July 1 from 3 p.m. to 5 p.m. Don't miss your chance to chat with the Jeff, Todd, and Bryan and get your questions answered. Just enter your email address below to sign up for an email reminder.

Monday Memo: Pro’s Keys to Great Investing

Published Jun 21, 2010 at 12:00AM

Welcome to Pro

As a member of *Motley Fool Pro*, you will receive the Monday Memo, your weekly digest of macro news, portfolio progress, company updates, and even a bit of folly. Check your inbox every Monday at 4 p.m. for the latest from Jeff Fischer and the *Pro* team.

Recent Trades

- Bought 1,200 shares of **Oracle** at a net $24.17 with written puts.
- Bought 400 shares of **ProShares Short S&P 500** at a net $49.62 with calls.
- Wrote (sold to open) September $25 covered calls on about half of our **Jack Henry** shares for $1.30 per share.

Guidance Changes Due to Price

- **Lindsay** and **Quanta Services** moved from Buy to Hold.
- **Cameco** moved from Hold to Buy (we own 1.3% of a 3% target).

Pro Community

- Todd interviews the CEO of **Plum Creek Timber**, who also takes a moment to kindly praise *Pro’s* research.
- Zaya101 returns from China and shares an inside take on the country.
- **Kinetic Concepts** receives FDA approval for Prevena.
- TMFEldrehad looks at more stocks in the CAPS doghouse.
- Fools cover the gamut from socially conscientious investing to gold to GDP growth and more on the Pro philosophy board. (We love these conversations!)

Jeff owns shares of Oracle.

I recently asked each member of the *Pro* team to rattle off the top three qualities a person must have to be a good investor. You might be surprised to learn that nobody said "the ability to create discounted cash flow models and analyze competitive advantages", or "a passion for SEC filings." Those things are important, of course, but just as vital (or, according to our team, even *more* important) are your emotional state and mental discipline. You could be the best analyst in the world, but still buy and sell at the worst times if you let your emotions take over.

In 1934, Benjamin Graham famously said, “An investor’s chief problem — and even his worst enemy — is likely to be himself.” More than seven decades later, the only thing we'd change about that statement is to make it gender-neutral. The rest needs no updating, as evidenced by the independent responses from the *Pro* team:

Todd Wenning (TMFPhila)

1. Patience — having nerves of steel
2. Good judgment — of character, particularly for company management
3. Insatiable curiosity — a desire for knowledge

Bryan Hinmon (TMF42)

1. Patience — thinking long term is how individual investors get an edge over the big boys
2. Skepticism — a "guilty until proven innocent" mindset that focuses on risk first
3. Critical thinking — think rationally and think hard to counter your emotions

Bruce Jackson (TMFGoogly)

1. Discipline — only swing when the odds are in your favor
2. Patience — and with that …
3. Temperament — "Success in investing doesn't correlate with IQ once you're above the level of 125. Once you have ordinary intelligence, what you need is the temperament to control the urges that get other people into trouble in investing." (Warren Buffett)

Jeff Fischer (TMFFischer)

1. Calm and steady reasoning in your decisions
2. An evolving knowledge of a business and its valuation
3. Patience

All four of us focused on an investor's emotional state and time frame, with knowledge being a third leg in the tripod of investing success. Because so many people buy high with excitement and sell low in fear, the ability to keep your emotions in check — and actively act *against* them — is key. Typically, you should be buying when others think you're crazy, and selling when you least want to, if at all.

More Ways to Succeed

Coming Soon!

***Pro* Portfolio Review:** The Pro team is hard at work reviewing all our portfolio holdings. Watch for this valuable feature soon at **pro.fool.com**.

Live Chat: We're hosting a live, members-only chat on July 1 from 3 p.m. to 5 p.m. Don't miss your chance to ask Jeff and team any questions you have about our holdings, the service, and more. Sign up here for your email reminder.

In doing this exercise, other important qualities for investing success rose to the surface on my list (written while I was stuck on a Metro train above the Potomac River). To invest well, you should have:

- Discipline to stick with strategies that you know are effective
- Portfolio positions that will earn profits in up or down markets, making stressful times less so and staying the course easier
- A real understanding of what makes a business' advantages sustainable
- Cash for opportunities, so your hands aren't tied
- Indifference to paper losses that are the result of mere price volatility
- A proper time frame for the money you have in the market, not one that will make you impatient

Our stated mission at *Pro* is to earn you consistent, recurring profits with a high level of accuracy. But in addition to that, we aim to help you achieve all of the qualities the team and I listed above. By putting all of the investing pieces together at *Pro* — uncovering attractive investments at good prices, using strategies on them that are profitable, and being patient and disciplined — odds remain high that we'll continue to create pleasing value with less risk. And that's why we're here.

In your experience, what did *you* need to learn to become a successful investor? Please bring your comments to the Memo Musings board.

Foolishly,

Jeff Fischer

Audio Extra: Todd Chats With Plum Creek CEO

Published Jun 18, 2010 at 12:00AM

Welcome to the latest *Pro* Audio Extra! In this edition, *Pro* analyst Todd Wenning asks **Plum Creek Timber** CEO Rick Holley about lessons learned during the recession, the company's land purchase strategy, the opportunity in renewable energy in the Southeast, and more.

Write Covered Calls on Jack Henry & Associates

Published Jun 17, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") September 2010 $25 covered calls **on half your shares**
- **Allocation:** Write calls on half of the shares you own, in 100 share increments. In the *Pro* portfolio, we own 2,700 shares, so we are going to sell 14 contracts out of a possible 27.
- **Option's recent bid/ask (June 17):** $1.20 / $1.60
- **Preferred limit price:** Attempt to split the difference of the bid/ask, so around $1.35.
- **Special requirement:** You must own at least 100 shares of Jack Henry to write a covered call.
- **Alternate trades:**
  - **Don't own 100 shares of Jack Henry?** Continue to hold your position.
  - **Don't own any shares of Jack Henry?** The stock is on hold, but you can sell December 2010 $22.50 puts for around $1.25 to potentially add shares at $21.25.

What's New

As I noted in my recap of **Jack Henry & Associates**' (NASDAQ: JKHY) analyst day, "We still think Jack Henry is a strong business with solid client relationships and, of course, a lot of recurring revenue," but we've grown concerned about the company's growth-by-acquisition strategy and believe it may have paid too much for its latest acquisition, iPay Technologies. Because of this, we no longer think Jack Henry is worthy of a full 5% position in the *Pro* portfolio. We think we'll find better opportunities for those funds down the road, so we're writing covered calls on half of our position to potentially bring the investment size more in line with the growth prospects we see for the stock. Our new target allocation on Jack Henry is around 2.5% at current prices.

Why This Strategy?

Despite our concerns about slowing growth, we don't see significant downside risk to the stock, either, mostly because of Jack Henry's strong recurring revenue stream. So rather than outright sell half of our stake, we'd prefer to generate additional income from our large position by using covered calls, or nab a higher effective sale price than the market currently offers.

Here are the potential outcomes of the trade:

If ...	Then ...	*Pro*'s Take
Shares are greater than $25 at expiration	Half of our position is called away at an effective sale price of $26.20 -- a neat 40% gain on our purchase.	We're perfectly comfortable with this, and we'd free up $35,000 to invest elsewhere.
Shares are below $25 at expiration	We keep our shares and the $1.20 premium and effectively reduce our breakeven price to $17.51 ($18.71 minus $1.20).	We're fine with this result, too, and we'd likely write new covered calls to generate even more income.

As the table notes, if our shares aren't called away, the $1.20 premium received will provide 6.4% downside protection on our average buy price of $18.71. That's not bad for taking on three months of risk.

How to Follow Along

If you need a refresher on covered call strategies, see *Pro*'s guide to covered calls before placing the trade. Remember, you write one call for every 100 shares of stock you own; and you may cover all of your shares, or just some. We're covering about half of ours. Here are the numbers behind the trade:

- **Trade:** Write ("sell to open") September 2010 $25 calls on half of your stock position, in 100 share increments.
- **Option yield (at recent $1.20 bid):** 4.8% of the $24.98 share price, in three months
- **Option yield on our $18.71 average cost basis:** 6.4%
- **Upside from today if sold at a net $26.20 ($25 strike plus $1.20):** 4.9%
- **Total return on position if exercised:** 40%
- **Downside protection:** 4.8%; a decline to $23.78 is hedged

When you write ("sell") an option, the going price is paid into your account and the money is yours to keep. In this case, if you don't take further action on your calls, you're obligated to sell shares of Jack Henry if they're above the strike price by the expiration date.

Writing puts? If you place the alternate trade and write puts, you'll be obligated to buy shares of Jack Henry if the stock declines below your strike price.

We'll make this trade in the next one to 30 calendar days. To discuss it or ask questions, please visit our Jack Henry board.

Short iPath S&P 500 VIX Short-Term Futures

Published Jun 16, 2010 at 12:00AM

At a Glance

- **Target allocation:** 3% if converted to shares (for *Pro*, 12 contracts)
- **Special requirements:** You need a margin account and a high level of options permission (level 3 or 4) to make this trade. It may require follow-up action, details of which we will of course provide.
- **Alternate trades:** As per our original recommendation, sell short VXX shares directly at a preferred price of $30 or above if your broker has shares; or, write ("sell to open") $30 or higher strike calls for months after August for higher option payments (we plan to write these calls monthly if we can).

The Big Picture

June 16, 2010

- **Trade:** Sell short 3%
- **Target allocation:** 10%
- **Preferred price:** $30 or above. You can wait for the exchange-traded note (ETN) to rise above $30, or short a partial position at reasonably lower prices.
- **Special requirements:** You must have a margin account to sell an investment short. Also, this ETN could rise significantly before we see a profit, so you need the staying power and equity to ride that out.
- **Alternate trade:** Sell naked calls. The strategy is equivalent to shorting; however, you can only make as much as the calls pay unless you convert to shares.
- **Why short:**
  - We profit when investors begin to expect lower, more average volatility from the S&P 500.
  - Our long-term risk is limited because expectations for market volatility can realistically only climb so high, and almost surely can't remain elevated indefinitely.
  - This ETN tracks a short-term futures index that incurs costs by rolling futures contracts, making the index underperform the VIX. That's good for us as short sellers.

The Big Picture

By Jeff Fischer

How to Short

You must have a margin account and shorting permission. You sell short (or at some brokers “sell to open”) as many shares of the ETN as you wish to short. You’re paid the going market price, and you start to see profits if the ETN declines. If the short goes against you, you need the equity available to cover your losses, even if you plan to wait it out. In the end, we aim to buy the shares back much cheaper, closing the trade and keeping the difference.

All this market volatility can bring an investor down, but we have just the profitable pick-me-up for you.

Debuting in 2009, the **iPath S&P 500 VIX Short-Term Futures** (NYSEMKT: VXX) exchange-traded note tracks the value of the market’s most famous volatility index, the VIX (pronounced like the cough medicine — we prefer cherry, thank you). The VIX measures investor sentiment: It climbs when investors expect market volatility to be high, and goes down when investors expect a smoother ride. Measured not in dollars but in percentages, the VIX has averaged around 19 historically, and the pros (us included) consider any reading above 30 to be elevated. To break it down further, a 30 means investors expect 30% volatility in the S&P 500 over the coming year; a 19 suggests 19% volatility.

As we enter summer, the VIX sits near 30. We expect trading volume to decline (as generally happens when the weather heats up in the Northern Hemisphere), the reality of the new worldwide economy to settle in, and market volatility to start to subside — bringing the VIX back to more average levels. Thanks to this new ETN — a similar vehicle to the more well-known exchange-traded fund (ETF) — we can profit in our belief in a lower VIX by selling iPath S&P 500 VIX short, just like a stock.

Another wonderful thing about this short: Our long-term risk is more limited compared with shorting a company’s stock. Nobody will acquire the VIX at a higher price (as could happen with a company), and there won’t be any earnings surprises or company-specific risks. The largest risk we face is that we may need to wait through a spike in the VIX — perhaps for months or longer — with a loss on our hands until the index declines. In a worst-case scenario, a repeat of October 2008 could send the VIX soaring. If that happens, a few factors work in our favor. By attempting to duplicate the performance of the VIX, this ETN assumes the same monthly costs as its underlying benchmark (a near-term index on the VIX that rolls futures contracts), and the ETN has ongoing management fees. In fact, the ETN managers themselves suggest that it will underperform the VIX both to the upside and the downside. That will nibble away at the value of the ETN, making it an even more sensible short.

The Fear Gauge Explained

The Windy City is home to the losing Chicago Cubs, the Sears Tower, that [giant reflective jelly bean], and the mood-measuring VIX. In 1993, the Chicago Board Options Exchange (CBOE) introduced this tracking tool — nicknamed the "fear gauge" because it tends to go up when the market is falling — to little fanfare. Today, the VIX is the industry standard. It represents a live, options-market-derived estimate of the expected (or implied) volatility in the S&P 500 over the coming month. Here's how it works.

The VIX calculates investors' expectations for volatility based on what they’re willing to pay for options. For the technically inclined, to arrive at that number, CBOE’s proprietary formula uses live market prices for out-of-the-money calls and puts that expire in the next two months. These inputs spit out the implied volatility that options investors expect to see. Bottom line: The more volatility investors expect for the next 30 days, the higher options prices go — and the higher the VIX soars. Inversely, the less volatility investors anticipate, the more options prices decline, and the lower the VIX drifts.

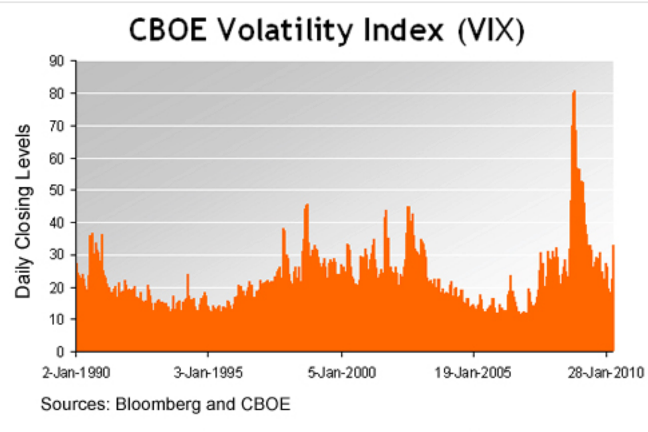
The VIX briefly hit its all-time high in October 2008 at more than 80. Its all-time low, 9, was in 1993. If the stock market averages an annualized return of 9% to 11% over history, the VIX value might ultimately double that to account for volatility in *either* direction — and it has, averaging 19 since inception.

A Note About Volatility

Remember, volatility can mean either downward or upward moves. A high VIX won’t always mean the market is due to fall; it simply means the market will be volatile. Throughout the late-1990s bull market, for example, the VIX was consistently above 20.

As a contrary indicator, the VIX has proved a reliable measure of investor emotion. When investors are fearful and paying dear prices for put option insurance, the VIX is up — but the market may be hitting a bottom. When the VIX is low, it means investors expect little volatility, put options are cheap, and everyone is at ease — so the market may actually be running out of steam.

Anytime the VIX is above 30, investors expect volatility to be well above the historical average (30% or greater annualized moves in the S&P 500 are anticipated). According to Bloomberg, the VIX has traded above 40 a mere 3% of the time since its debut. Even in September 2001, it only averaged 35. Based on that history, the VIX reading today signals a level of volatility that has yet to prove sustainable, offering us a good short-selling opportunity.



That said, we must be ready to ride out long periods where the VIX may move against us, levitating above 30 for months on end. Again, history (and the chart above) serves as our guide. From 1997 to 2003 — a six-year stretch that included a presidential impeachment, the Internet bubble, a hotly contested presidential election, 9/11, two wars, a recession, and the return of bell-bottom pants — the VIX mostly hovered between 20 and 40. So it can remain elevated for long periods. Unlike with other shorts, though, we should be comfy, because it’s almost certain that market volatility will decline eventually — and the VIX with it. When this ETN dips into the teens, we’ll be looking to close our short.

How the ETN Tracks the VIX — or Doesn’t

Barclays Bank launched this ETN as a brilliant (for Barclays) promissory note that mirrors the S&P 500 Short-Term Futures index. That index continually rolls two months' worth of futures contracts on the VIX in order to track the VIX (there’s no way to invest directly in the VIX). The rolling of futures can eat up value through transaction costs and contango (paying more for forward futures contracts than you get selling your current ones). Plus, the ETN has an annual fee of 0.89% as well as other daily accruing charges.

In 2019, Barclays will pay ETN owners a sum based on the then-value of the VIX as represented by the short-term futures index tracking it — as represented by the ETN, minus fees (got that, Fools?). The ETN launched on January 30, 2009, at $100 per note while the VIX was 43. Recently, the VIX is 28 (down 35%), and the ETN is down 72%. In other words, the performance has been dismal.

Barclays doesn't mind, though, since it pocketed the IPO funds and gets to wait until 2019 to repay just a fraction of those funds. Betting that the VIX would be much lower in the years ahead and that nine years of fees would help its cause, Barclays seems to have developed a brilliant way to make money — for itself. We ran all the numbers on the ETN since its inception and it lags the VIX in each direction over time, but especially when the VIX rises.

Risks and What Would Make Us Close

As with any short, waiting can be the hardest part. Another financial meltdown or a deepening of the recession could send the VIX soaring above 40 as stocks fall. Indeed, 2008 and 2009 are the only years on record where the VIX averaged above 30, and this trend could continue. We expect to wait out our short until it's profitable, but when a short works against your portfolio, it eats into your equity and your buying power.

Get to Know the Players

- Facts on the CBOE VIX Index
- Facts on the iPath S&P 500 VIX Short-Term Futures ETN

If the VIX soars as stocks tank, our short obligation will grow as well, and we'll have less cash available to invest in beaten-down stocks — right when prices are enticing. So keep your position size reasonable and have extra cash on the sidelines. We plan to start small and add to our position if the VIX jumps. The worst-case scenario is one where the world economies hit extreme turbulence and the VIX soars to record levels for quarters or years on end. If that happens, our portfolio will experience more volatility and paper losses, but I believe we'll be vindicated in the long run.

Pro Bottom Line

We don't believe investors will expect 30% or greater volatility in the S&P 500 index forever (or even for a long time). Eventually, the VIX is likely to return to the teens (it was just there in April), making this ETN an attractive short candidate at prices well above that. We'll have more to say about the ETN on its new discussion board, so stop by!

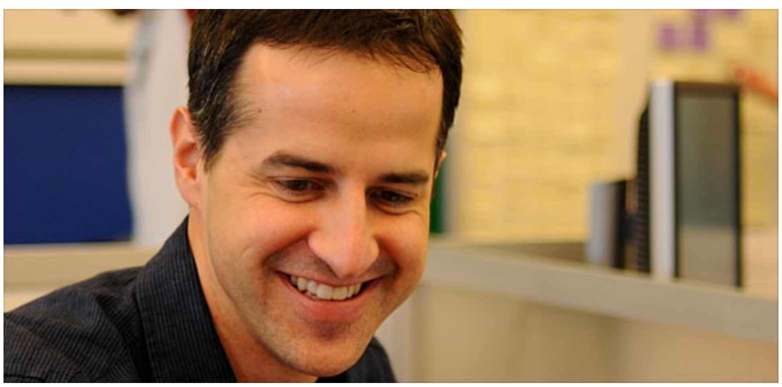
Jeff Fischer

Advisor



Jeff Fischer (TMFFischer), advisor of *Motley Fool Pro* and *Motley Fool Options*, started working at the Fool in 1996, soon after he won the Fool's first year-long online portfolio contest. Jeff co-managed the original Fool Portfolio with co-founders David and Tom Gardner, and co-founded and managed the Fool's Drip Portfolio. Jeff also wrote *Investing Without a Silver Spoon* and served as editor on several other Motley Fool best-sellers. All four of the real-money portfolios Jeff has managed or co-managed publicly since 1996 have beaten the S&P 500, although that isn't his first objective, which is steady returns with reasonable risk. Jeff is married to an actress/professor and has a young son.

Billy Kipersztok

Senior Analyst

Billy Kipersztok (TMFTailwind) was introduced to investing by his father, and began reading The Motley Fool as a teenager. He is a voracious reader of investment literature, and he enjoys scouring the market for investments with two characteristics: (1) favorable economics and (2) a fair price.

Prior to joining the Fool, he interned in the analytics department of the NBA's Atlanta Hawks, picked up an MBA and a master's degree in sport business management at the University of Central Florida, and earned a bachelor's degree in chemistry from the University of Florida. He enjoys learning, playing/watching sports, and cheering on his alma mater. (Go Gators!)

JP Bennett

Research analyst

JP Bennett's (TMFYossarian) route to working at The Fool was a circuitous one; he was previously a Ph.D. psychology student before coming to the realization that he'd rather turn his favorite hobby (investing) into a career. Because of this, he left the Ph.D. program and got an MBA before eventually landing an internship with the Fool in 2013. He's not quite sure why, but apparently he did something right that summer because he's managed to hang around ever since. To this day, investing remains his favorite hobby and the primary use of his free time, but he is also an avid runner and enjoys taking his Boston Terrier to the park whenever the humidity in D.C. isn't too oppressive. JP has also passed all three levels of the CFA Program and may be awarded the charter upon completion of the required work experience.

Ellen Bowman

Editor/publisher

Ellen Bowman (TMFKabellen) has been with The Motley Fool since 2006, first as a copy editor for Fool.com and then as an editor (and publisher, and chief bottle-washer) of various subscription services. She has worked on services from *Stock Advisor* to *One* and beyond, but considers *Pro* and *Options* "home." Ellen is a proud alumna of the University of Houston, and is amazed every day at how much an English major can learn about investing when she has teachers like these!

Jeff Fischer

Video Extra: Inside *Pro*

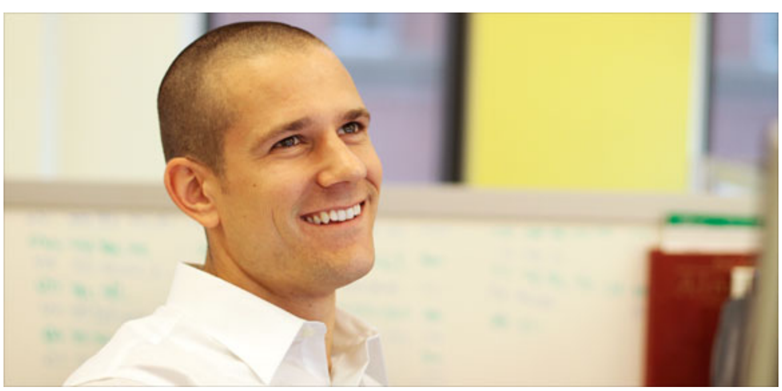
Jeff, Nick, and Bryan discuss their investing backgrounds and the *Pro* approach in [this video extra].

Jeff Fischer ([TMFFischer]), advisor of *Motley Fool Pro* and *Motley Fool Options*, started working at the Fool in 1996, soon after he won the Fool's first year-long online portfolio contest. Jeff co-managed the original Fool Portfolio with co-founders David and Tom Gardner, and co-founded and managed the Fool's Drip Portfolio. Jeff also wrote *Investing Without a Silver Spoon* and served as editor on several other Motley Fool best-sellers. All four of the real-money portfolios Jeff has managed or co-managed publicly since 1996 have beaten the S&P 500, although that isn't his first objective, which is steady returns with reasonable risk. Jeff is married to an actress/professor and has a young son.

Nick Crow

Hardwired for frugality, senior analyst Nick Crow, CFA ([TMFCrow]), had a childhood newspaper route and a penchant for hoarding cash in doorknobs and hollowed-out books. That soon led to an early interest in investing — including a first-place finish in a middle school stock-picking contest. Ever the value hunter, he chose to jump out of airplanes as a U.S. Army paratrooper to have Uncle Sam foot the bill for his higher education. When flying home on leave, an older investor recommended he read Benjamin Graham's *The Intelligent Investor*, and Nick's been studying the great investors and honing his skills ever since. Nick spent six years at a major bank before joining the Fool. Now he's hard at work as senior analyst for *Motley Fool Pro* and *Motley Fool Options*. When he's not digging into annual reports, looking for his next option idea, scrutinizing special situations, or dabbling in distressed debt, you can find him spending time with his family and helping his daughter with her homework.

Bryan Hinmon



Bryan Hinmon, CFA ([TMF42]), who comes to the *Pro* team as part of the Fool's Analyst Development Program, has been a loyal member of the Fool community for more than a decade. After cutting his teeth managing some *serious* real money for students and faculty at Stetson University, where he co-founded the CMH Investment Board, Bryan moved to sunny Naples, Florida, to work as an investment analyst for LUMA Capital. At LUMA, he helped manage the portfolios of high-net-worth individuals and launch a hedge fund focusing on large-cap equities with a covered call overlay — in a similar vein as *Pro*'s strategy, but not nearly as brilliant. Hungry for more, Bryan moved to Boston to open and co-manage Bulwark Capital Management, a hedge fund with a broad purview. Small stuff, ugly stuff, and option income were par for the course at Bulwark. As part of the *Pro* team, Bryan enjoys being surrounded by smart and fascinating people at Fool HQ, but as a new D.C. resident, he wants Dan Snyder and Mike Shanahan to know that he will forever stay loyal to the Tampa Bay Buccaneers. Converting his wife, a die-hard New England Patriots fan, will prove even more futile — so don't even try, D.C.

Monday Memo: Why We Don't Fear Volatility

Published Jun 14, 2010 at 12:00AM

Upcoming Option Expirations: Saturday, June 19

- Short **AmTrust Financial** (Nasdaq: AFSI) $12.50 puts — on track to expire as cash.
- Short **Oracle** (Nasdaq: ORCL) $25 puts — on track to convert to shares at $24.17.
- Long **ProShares Short S&P 500** (NYSE: SH) calls — we might sell early for a profit or accept new shares. We'll let you know this week.

Earnings on the Way

- June 24: **Oracle**, with $0.54 per share expected on $9.52 billion in sales.

This Week in Caps

TMFEldrehad revisited some of the stocks that made the "Hot 5-Star Stocks" list in January to see how they've fared. He also identifies today's candidates. Read all about it right here.

Coming Soon!

The *Pro* team is hard at work on a full portfolio review. Watch for this valuable feature — with the team's latest thinking on all our stocks — in late June.

Jeff owns shares of AmTrust and Oracle.

Congratulations, *Pro* Fools! You've just made it through another volatile week in the markets.

The recent day-to-day movements of the markets and individual stocks have been quite extraordinary. Last week, for example, on the back of poor U.S. payroll numbers for May, more uncertainty in Europe, and the Gulf oil spill, the market went into one of its periodic depressive states, and stocks were hammered indiscriminately.

Several news sources summed up the mood of the markets, including these two quotes from last week after the Dow closed below 9,900:

> People are just traumatized … The wall of worry today is bigger than almost any other time I can remember.
>
> The volatility daily is, even for a veteran … unnerving, unsettling, as it implies instability.

Shaken, But Not Stirred

In the early part of last week, even the *Pro* portfolio was shaken by this volatility, bar our **ProShares Short S&P 500** (NYSE: SH) shares and call options.

But your trusty portfolio managers weren't fazed. Sure, no one likes to see his stocks in freefall. But we weren't going to be scared out of our stable of solid companies just because their *stock prices* had fallen when the value of the underlying *businesses* has remained largely unchanged. No siree.

Some people mistake volatility for risk. They think a stock like **Tupperware** is a riskier proposition at $36 than it was at $40 or even at the $54 it traded for in April. In their distorted view, they'd prefer to buy Tupperware's stock at $50 than at $36. Worse, some investors would sell at $36, fearful that the stock would keep falling, falling, falling.

I hope you can see the pure folly of such thinking and behavior. Investing should be a long-term endeavour, a lifetime one at that. In the course of your long investing life, you'll encounter bull markets and bear markets. Stock prices will move up and down. Your challenge, should you wish to accept it, is to buy stocks when they are cheap, sell stocks when they are fully valued, and in between, hang on for the ride.

The old saying goes that stocks go up stairs and down elevators. After just over a year of the market seemingly only going up, May and early June have given us a stark reminder that they can fall, and often fast.

Here at *Pro*, we don't fear a falling market, nor do we fear a volatile market. On the contrary, we like the stock prices that a fearful, volatile market can bring us. This time around, we haven't yet dipped our toes back into the water to make direct new buys — though we did buy more shares of **Medtronic** and **SPDR KBW Regional Banking ETF** through put options last month. We've got some excellent new stock ideas in the *Pro* hopper, too, so keep your eyes peeled for some new trades.

Options for the Right Reasons

Speaking of which, this Saturday, our June options expire. Depending on what the individual stocks do between now and then, it looks likely that we'll be proud owners of more **Oracle**. We also have choices to make about the **ProShares Short S&P 500** calls we own and the **AmTrust Financial Services** $12.50 puts we wrote.

I used to get all worked up about upcoming options expirations, watching the movements of the stock prices, wondering whether I'd be put shares or my options would expire as 100% gains.

These days, I sleep through the whole event (admittedly, living in Australia, in a completely different time zone, does help). If I am put the shares at close to the strike price, come the following Monday I can hang onto them, sell covered calls to generate more income or to sell the shares at a better price, or just sell them outright. No stress, no worries.

I'd respectfully suggest that, as your options approach expiration, if you are genuinely worried about getting put shares that you don't really want or can't afford, you're probably using options to *speculate* rather than as an investing tool.

I hope you'll agree that speculation goes against *Pro*'s purpose, which is "to earn you consistent, recurring profits with a high level of accuracy using a combination of stocks, ETFs, and options in a strategic portfolio."

In the near future, as well as making more trades, we're in the process of conducting our periodic full portfolio review. Speaking for myself, I like what I've seen in the stocks I've reviewed. I've seen good to great companies, with strong competitive positions and solid growth prospects, that are trading at attractive prices. With such holdings, we'd like to think we're firmly on track to fulfilling Motley Fool *Pro*'s purpose.

Happy investing.

Bruce Jackson

Bruce has stock or options positions in ProShares Short S&P 500, Tupperware, Oracle, and AmTrust Financial. It's fair to say he's drinking the Pro *Kool-Aid.*

Monday Memo: Pro Adapts and Improves

Published Jun 7, 2010 at 12:00AM

Community Highlights

- The **Vanguard Energy** ETF is down, but it's not an easy buy.
- Fools are talking shorts, and Jeff names some names and shares thoughts.
- Russell (TMFEldrehad) shares the good CAPS news: Now you can see a strong stock pitch from the community highlighted every week. Don't miss it!
- Bruce (TMFGoogly) asks, "Has the Penny Finally Dropped?" after the market's 3% decline on Friday.
- July isn't that far away. TMFValuemoosie is preparing with an earnings calendar.
- Friday's employment report looked weak. Could that affect **AmTrust Financial**? Bruce answers.

Upcoming Option Expirations: June 19

- Short **AmTrust Financial** $12.50 puts — on track to expire as cash.
- Short **Oracle** $25 puts — on track to convert to shares at $24.17.
- Long **ProShares Short S&P 500** calls — we're likely to exercise them into profitable shares.

Jeff owns shares of AmTrust and Oracle.

Sometimes experience is the only way to learn. As investors, we aim to learn from everything the market throws at us — and recently we've had plenty of opportunity to gain valuable insight.

We didn't know how well our young *Pro* portfolio would hold up in a sharply declining market, but the S&P 500's recent 14% drop gave us a reliable way to figure it out. Of course, as we were investing, we considered the beta of our stocks — how much and in which direction they would likely move in relation to the market. We also calculated how much our options would benefit us and how a short on the index would help. But we could only know for sure how our holdings would fare *after* the market made a dramatic move. Now we have that knowledge, so we can adjust our portfolio and improve it before a similar situation comes along — that is, one where we want to be more defensive.

Improving the Mix

Although I'm about to point out some things that didn't go as well as we hoped during this recent market decline, overall we're more than happy with where our portfolio stands today — and we hope you are, too. When making decisions during highly uncertain times, we need to reconcile our longer-term investing opportunities with any expected short-term bumps. We like each company we own, we accept market volatility, and we're glad we've kept cash available to invest in new opportunities.

Those key positives said, there are some things we plan to do differently when we expect another market decline, because our portfolio hasn't held up quite as well as I calculated or hoped. There are a few reasons for this. First, just as with the decline in 2008 and 2009, the recent slide hasn't spared much of anything. Even defensive sectors such as health care and utilities — where the *Pro* portfolio is more heavily weighted — performed poorly. Additionally, as market volatility increased, option prices jumped more than expected, and since we're mostly short options — we've primarily written them — our options didn't hedge some positions nearly as much as they otherwise would. They actually moved against us in some cases. Of course, this is temporary and the extra time value in these options will dissipate.

Any shifts in our approach don't have to be drastic, though. In fact, I wouldn't expect to change our portfolio's directional bias radically unless we think the stock market is likely to fall 20% or more. That's because if you expect only a 10% to 15% decline in stocks — a typical correction — then selling most positions, changing course to mostly shorts, and hoping to switch back in time to catch the next move up is fraught with risk. It's like trying to turn a tanker around in a tight channel. By the time you change direction — and possibly pay commissions and taxes — you need to start getting ready to turn again. Too often, little is gained by your maneuvering during a normal market drop. In the worst case, you end up losing ground and getting locked out of good companies.

So we need to believe that a pending decline is going to be substantial and extended before we'll change the direction of the whole portfolio. It's likely that someday we will invest mostly on the short side, but for more typical downturns, we can take less drastic steps to improve our results. After all, 10% declines happen every two years on average, so we want to make them work for us.

What Will Change

For starters, we'll want more shorts if we're taking on a more defensive position in the future. We've owned **ProShares Short S&P 500** since last year, and we bought calls on it before the market began to decline. But as a 4% holding, it's still a modest short. If we believe a 10% to 15% decline in the index is on the way, we should aim to be at least 10% to 15% short. We'll also want to buy put options to protect our short. The market's measure of volatility — the VIX — was extremely low this spring, which is usually a sign of complacency. That can be a good time to buy put options, because premiums are low. (This time around, we didn't find compelling options to buy.)

We're also going to use the VIX more to help guide us on directional changes in the market. Since the VIX's inception in 1990, it has been above 40 only 4% of the time (it's been in the 30s lately). When it is at those elevated levels, fear is high, option writers get paid well, and stocks are usually getting cheaper. When the VIX is in the teens, as it was just before the market fell in May, the opposite is the case. Often you'll want to prune your highest-valued stocks and consider buying puts. This isn't news to us, but it's time to start following the VIX in *Pro* because we use options steadily and we want to make money in up and down markets.

Finally, now that we're more invested and have less cash, we'll be quicker to take profits on stocks that look fully valued — especially when prices are up and complacency is high.

To Tomorrow!

History never repeats itself *exactly*, so we'll never experience precisely the same situation in the market that we just came through. From January until May, we were cautious, but the market's relentless climb coupled with reasonable valuations made us reluctant to go heavily short. (Using covered calls was the least risky way to hedge, despite the low option premiums — which is why we often doubled up and wrote strangles.) However, we will experience similar situations frequently, and we want to be ready so that our portfolio will be less affected by future declines than it was by this recent one. We're happy with where our portfolio landed after the past 19 months, but we're always working to be better.

Have comments or questions? Please share them on our Memo Musings board.

Motley Fool Pro Terms of Service

Published Jun 1, 2010 at 12:00AM

Welcome to *Motley Fool Pro* (the "Service"). This page sets forth the special Terms and Conditions by which The Motley Fool provides you with access to the Service (the "Terms"). It supplements the Fool's Rules (our standard terms and conditions), which are incorporated by reference. By subscribing to, and using the Service you are agreeing to abide by these Terms as well as the Fool's Rules INCLUDING THE BINDING ARBITRATION AND CLASS ACTION WAIVER DETAILED IN SECTION 10 OF THE FOOL'S RULES.

Motley Fool Pro

The Service is an actively managed $1 million real-money portfolio that employs a wide range of trading strategies, including all forms of options, leverage and shorting. The Service can be involved with any asset class, including stocks, bonds, ETFs, commodities, currencies, and anything which can conceivably be publicly traded. The Service may use unlimited leverage on any or all of its positions, but will never have more than 120% long exposure. The Motley Fool is funding the portfolio and consequently, any realized gains or losses will belong to The Motley Fool.

The Motley Fool strives to operate with the highest level of integrity and to treat everyone — our customers, employees and community — fairly. With that in mind, we've put in place guidelines with respect to the Service in addition to our standard trading rules. They include:

- Employees and contractors cannot trade based upon any knowledge of an upcoming pre-announcement. They may only trade in the security after the trade confirmation has been published.
- The Service is committed to making its transaction between the next business day and 30 days from the time the pre-announcement has been published.

Please note there may be occasions where the Service takes a position with respect to a security that is counter to that of another Fool premium service.

An affiliate of The Motley Fool provides investment products that may hold securities mentioned in our publications. Editorial personnel have no nonpublic knowledge of the affiliate's holdings, and the affiliate's personnel have no knowledge of any editorial content before it is published.

A Word of Caution

As stated above, the Service may use a mix of investing strategies including buying, selling, and shorting securities as well as options (in all its forms and permutations), leverage, and other trading methods permissible under U.S. law. Regardless of the action taken by the Service, it is in the capacity of a responsible investor and not a speculator. That doesn't mean our trades will always turn out to be winners. It means that we have done our best to do our homework and consider the inherent risks before pledging our money. We urge you to do the same. Some of these inherent risks include:

- Leveraging increases the risk of total loss, as small fluctuations in value may have far greater impact on your portfolio.
- Illiquid or hard to trade assets can rapidly fluctuate in price, and may be hard or impossible to trade without a specialized broker or a significant margin account.
- Trading in currencies can be riskier than trading in other assets, as currencies are subject to the control of their respective governments.
- When shorting an asset, the risk of loss is hypothetically unlimited, as investors who short may be required to purchase shares to cover at any time, and at any price.
- Shorting requires a margin account. Your broker may require additional capital in your margin account based on their policies and applicable regulations. These amounts may be significant, and failing to have access to sufficient capital may cause your broker to liquidate or close your positions without warning, in accordance with their policies.
- A stock can become the subject of a short squeeze whereby many short positions attempt to cover at the same time. This can drive up the price and force investors to cover at unexpectedly higher prices.
- Investors are liable for any dividends paid out during the time they hold a short position.
- If a stock is heavily shorted, your broker may charge a "hard-to-borrow" fee before borrowing shares for your account, or may charge the fee while the shares are held short. These fees can be incurred without prior notice, and can be in excess of 100% annualized.
- Most brokers will pay you interest based on the cash they receive from shorting, subject to "short rebate fees". These fees are levied regardless of the general interest rate. In times of low interest rates, you are responsible for paying the difference between the interest rate and the rebate fee.

We want to help you make money. However, The Motley Fool is not in the business of rendering personalized investment advice. We don't (and can't) know your financial situation, risk tolerances, or investing objectives. Accordingly, the decisions made and actions taken by the Service do not constitute a recommendation that a particular security, strategy or action taken is suitable for you or any specific person for that matter.

The Service bases its recommendations and forecasts on techniques, information and sources believed to be reliable in the past and cannot guarantee future accuracy and results. The Motley Fool and the writers will not be liable for any investment decision you make, or action you take based upon reliance of any material you read here. The Motley Fool is a company of investors writing for investors and as such, the writers (and/or the company) may own stocks mentioned by the Service. For more information about writer disclosure, as well as a list of places where you can view stocks our writers and analysts own, see our disclosure policy.

Disclaimer of Warranties and Liabilities

By using the Service, you agree that The Motley Fool, its directors, its employees, and its agents will not be liable for any investment decision made or action taken by you and others based upon reliance on any information we publish. Please remember that past results are not necessarily indicative of future performance.

Under no circumstances will The Motley Fool, its employees, or its agents be liable for direct, indirect, incidental, or any other type of damages resulting from your use or downloading of any material on our sites, even if we have been advised of the possibility of such damages. This includes, but is no way limited to, loss or injury caused in whole or in part by our negligence or by things beyond our control in creating or delivering the Service or any of our services. This disclaimer of liability does not apply in New Jersey.

Although this is included in the Fool's Rules, it bears repeating (and capitalizing):

ALL INFORMATION PROVIDED OR MADE AVAILABLE THROUGH THE SERVICE ARE PROVIDED "AS IS." THE MOTLEY FOOL HEREBY DISCLAIMS ALL REPRESENTATIONS, WARRANTIES AND CONDITIONS, EXPRESSED OR IMPLIED, INCLUDING WITHOUT LIMITATION, WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE. WITH RESPECT TO OUR WEBSITES, OUR SERVICES, ANY CONTENT, TOOLS, OR PRODUCTS, YOU EXPRESSLY AGREE THAT YOU WILL ASSUME THE ENTIRE RISK AS TO THE QUALITY AND THE PERFORMANCE OF OUR SERVICES AND THE ACCURACY AND COMPLETENESS OF ITS CONTENT.

Some States do not allow exclusion of implied warranties or limitation of liability for incidental or consequential damages, so the above limitations or exclusions may not apply to you. In such states, our liability and that of our third party content providers will be limited to the greatest extent permitted by law. This disclaimer of warranties does not apply in New Jersey.

The Service Is Intended for U.S. Residents Only

The Service is aimed at, and published for individuals residing in the United States. The Motley Fool makes no representation that the materials provided, and actions taken by the Service are appropriate for users outside the United States or permitted under the laws of other jurisdictions.

If you choose to access or use the Service from a location other than the United States, you do so at your own initiative and risk, and you bear full responsibility for compliance with any applicable local laws.

Everything Else

Please read the Fool's Rules for more details on our rules and policies including our dispute resolution procedures. If you see something that you think is a violation of the Fool's Rules or these Terms, please notify us at FoolAlert@Fool.com.

Monday Memo: Why Investing Requires Uncertainty

Published Jun 1, 2010 at 12:00AM

Did You Sell Flowserve?

Last week, we announced that we're selling our full position in **Flowserve** (NYSE: FLS). Check out the details — and our reasoning — right here.

Community Highlights

- Bruce (TMFGoogly) reviewed **Medtronic**'s quarterly results.
- Jeff summarized the **Autodesk** conference call.
- **MELA Sciences** announced that the FDA will review its MelaFind product on Aug. 26.
- In his weekly CAPS analysis, TMFEldrehad asks, “What makes a great investment?” CAPS members are chiming in on the top 10 CAPS stocks.
- Is **GlaxoSmithKline** ready to recover?
- Todd dusts off a 2005 interview Fool co-founder Tom Gardner did with Professor Aswath Damodaran on valuation and investing.

To all of you investing your own money, we want to take a moment to praise you. Since late 2008, the market has been anything but normal, calm, or reassuring — and, frankly, it's been far from fun.

Sure, the market rose from March 2009 through early this year, but that's easily overshadowed by the sharp declines and extreme volatility over the same period. And on top of the market mayhem, the news has been surreal — trillion-dollar bailouts, record home foreclosures, automakers on the brink, the death of the dollar (remember those rumors?), a massive oil spill, the financial crisis in Greece, and more.

If you weren’t resilient and ultimately optimistic, you’d be hiding under your bed right now (of course, maybe you *are* and you're reading this on your iPad). You were out there investing, though — and for that we salute you.

Is This Investing?

Given all the extreme events since we launched *Pro*, you might wonder (as have I) whether what we’ve been doing since Day One is truly *investing*. Yes, we’re working to earn steady returns with less risk. But given all the uncertainty, is *anyone* really investing these days, or are we all just speculating? The answer is an emphatic, “Yes! We are investing.”

In fact, finding ways to put our money to work in a market like this is exactly what investing is all about. We’re putting capital into businesses that we believe will create value despite the mayhem all around us, and we’re willing to wait through the market volatility to earn our rewards. Sure, we’re also hedging, and we're not counting on a market that will move steadily (or quickly) upward, but what we’re doing is still the epitome of investing: accepting uncertainty to earn an eventual return.

After all, without uncertainty, there would be no potential reward in stocks. They would be priced to perfection. So we are investing — and with verve! — despite being in the most uncertain times we've ever seen in the world economy.

Granted, we wouldn't mind a little *less* uncertainty, but it's an unavoidable part of investing. And given the sheer volume of uncertainty that we’ve all faced since the financial meltdown, I want to congratulate you for keeping your cool (on our boards and in your investing decisions); maintaining your Foolish perspective and patience; making our work with you truly enjoyable; and accepting the highs and lows that have come our way.

The Journey Continues

We all share the same investing objectives: steady gains over time (with longs and shorts), less risk, and long-term appreciation. We made it through these volatile years and managed to profit without taking unreasonable risks, so I know we can make it through the next few years, too, and continue to grow value. And, Fools, let’s remember: Enjoy the journey. Once you reach your financial destination years from now, you'll wonder what all the fuss and worry was about.

Together we’ve come through one rocky situation after another and we've done it without too much shorting when we should have been mostly long and vice versa. We’re in a good place despite a few mistakes and despite the risks. We'll continue to keep an even keel, create steady gains with various strategies, manage risk, and — beyond profitable investing — streamline and improve your service. We are committed to making *Pro* the best service it can be.

We hope you're committed to taking full advantage of your service. Be sure to check the sidebar above for highlights from the community; hit the Memo Musings board to share your thoughts; and visit the Suggestions boards to tell us about improvements you’d like to see.

We thank you for continuing to invest along with us and for helping us build *Pro* into the service you want it to be.

Fool on!

Jeff Fischer

Motley Fool Pro Terms of Service

Published Jun 1, 2010 at 12:00AM

Welcome to *Motley Fool Pro* (the "Service"). This page sets forth the special Terms and Conditions by which The Motley Fool provides you with access to the Service (the "Terms"). It supplements the Fool's Rules (our standard terms and conditions), which are incorporated by reference. By subscribing to, and using the Service you are agreeing to abide by these Terms as well as the Fool's Rules.

Motley Fool Pro

The Service is an actively managed $1 million real-money portfolio that employs a wide range of trading strategies, including all forms of options, leverage and shorting. The Service can be involved with any asset class, including stocks, bonds, ETFs, commodities, currencies, and anything which can conceivably be publicly traded. The Service may use unlimited leverage on any or all of its positions, but will never have more than 120% long exposure. The Motley Fool is funding the portfolio and consequently, any realized gains or losses will belong to The Motley Fool.

The Motley Fool strives to operate with the highest level of integrity and to treat everyone — our customers, employees and community — fairly. With that in mind, we've put in place guidelines with respect to the Service in addition to our standard trading rules. They include:

- Employees and contractors cannot trade based upon any knowledge of an upcoming pre-announcement. They may only trade in the security after the trade confirmation has been published.
- The Service is committed to making its transaction between the next business day and 30 days from the time the pre-announcement has been published.

Please note there may be occasions where the Service takes a position with respect to a security that is counter to that of another Fool premium service.

An affiliate of The Motley Fool provides investment products that may hold securities mentioned in our publications. Editorial personnel have no nonpublic knowledge of the affiliate's holdings, and the affiliate's personnel have no knowledge of any editorial content before it is published.

A Word of Caution

As stated above, the Service may use a mix of investing strategies including buying, selling, and shorting securities as well as options (in all its forms and permutations), leverage, and other trading methods permissible under U.S. law. Regardless of the action taken by the Service, it is in the capacity of a responsible investor and not a speculator. That doesn't mean our trades will always turn out to be winners. It means that we have done our best to do our homework and consider the inherent risks before pledging our money. We urge you to do the same. Some of these inherent risks include:

- Leveraging increases the risk of total loss, as small fluctuations in value may have far greater impact on your portfolio.
- Illiquid or hard to trade assets can rapidly fluctuate in price, and may be hard or impossible to trade without a specialized broker or a significant margin account.
- Trading in currencies can be riskier than trading in other assets, as currencies are subject to the control of their respective governments.
- When shorting an asset, the risk of loss is hypothetically unlimited, as investors who short may be required to purchase shares to cover at any time, and at any price.
- Shorting requires a margin account. Your broker may require additional capital in your margin account based on their policies and applicable regulations. These amounts may be significant, and failing to have access to sufficient capital may cause your broker to liquidate or close your positions without warning, in accordance with their policies.
- A stock can become the subject of a short squeeze whereby many short positions attempt to cover at the same time. This can drive up the price and force investors to cover at unexpectedly higher prices.
- Investors are liable for any dividends paid out during the time they hold a short position.
- If a stock is heavily shorted, your broker may charge a "hard-to-borrow" fee before borrowing shares for your account, or may charge the fee while the shares are held short. These fees can be incurred without prior notice, and can be in excess of 100% annualized.
- Most brokers will pay you interest based on the cash they receive from shorting, subject to "short rebate fees". These fees are levied regardless of the general interest rate. In times of low interest rates, you are responsible for paying the difference between the interest rate and the rebate fee.

Sell Flowserve

Published May 25, 2010 at 12:00AM

At a Glance

- **Action:** Selling all shares
- **Recent price (5/25/10):** $90.50

Guidance Change

We're moving our preferred buy price for **Flowserve** (NYSE: FLS) from $87 to $79 or lower -- about a 10% change to reflect a more defensive stance. If you're writing puts, you can aim to buy shares even lower. We still believe in the company's management and long-term prospects, but its near-term prospects are cloudy enough that we're taking our current profits and suggesting more caution to those initiating put-writing trades now.

The fact that 25% of Flowserve's 2009 sales occurred in Europe doesn't bother us. However, its European exposure combined with other factors are creating the potential for significant headwinds. Even though shares remain 20% below our best-case fair value estimate, we think "best-case" results are unlikely right now. With the stock at $90, we are happy to take our 44% gain, raise more cash for the portfolio, and wait to see how the next few quarters pan out.

Flowserve benefits from recurring service contracts and maintenance revenue, but in order for the company to grow, it must land new contracts -- and Europe's financial woes may crimp orders for the foreseeable future. Many of the company's projects are big ticket and infrastructure-related -- things that European governments may curtail to help decrease debt and European companies may delay if credit gets too hard to come by or too expensive. At the same time, Asia's infrastructure spending spree is bound to slow down, and that could affect Flowserve's sales in the Asia-Pacific region (19% of total sales in 2009).

Additionally, while Flowserve engages in some currency hedging, we are unsure of the stance it has taken regarding its exposure. The stronger the dollar grows against foreign currencies, the more substantial the potential risk to Flowserve's earnings per share. We believe that the euro may have considerably more room to fall, and we don't like not knowing how much this could hurt our investment. Furthermore, the rising dollar may be a double whammy for a company like Flowserve, because a strong dollar also pushes oil prices down. The less expensive oil is, the less companies will spend on new oil infrastructure, which accounted for 36% of Flowserve's 2009 business. Plus, the **BP** (NYSE: BP) Gulf of Mexico disaster should bring about new regulations that would slow down the expansion of offshore drilling.

All of these concerns together give us ample reason to sell our position to protect from possible earnings disappointments. The stock is still above our *initial* fair value estimate and modestly below our updated value estimate that projected a smoother worldwide recovery -- and that didn't take into account Europe going into a tailspin. Even today, the stock is not expensive at 12 times earnings, but there's now a stronger chance that sales or earnings could slip in the coming year or two, and this cyclical stock could get considerably cheaper.

How to Follow Along

Flowserve has been on hold since the stock broke into the $90s last year, so many *Pro* members don't own shares. If you don't, sit tight. If you own shares alongside us and agree with our assessment, a sell is an easy choice for risk aversion. If you've written puts to buy shares considerably cheaper, you shouldn't lament that decision. The stock is still reasonably priced today; only the risks have increased. We will continue to watch Flowserve to perhaps buy it back when the risk-to-reward ratio is more favorable. If you keep them open, your written puts will be aiming to do the same thing. To discuss this trade, please visit the Flowserve board.

Monday Memo: How Europe Can Help America

Published May 24, 2010 at 12:00AM

Guidance Changes:

- **Lindsay** (NYSE: LNN): Moved to Buy
- **Plum Creek Timber** (NYSE: PCL): Moved to Buy

Last Week's Trades

- Bought more **SPDR KBW Regional Banking** through puts, now at 4.5%
- Bought more **Medtronic** through puts, now at 5%
- Sold all **Expeditors International** through covered calls
- Sold all **Waters** through covered calls

Stocks Newly in Preferred Price Territory

- **Oracle** : Still a Buy First
- **Lindsay** : Moved to Buy
- **Tupperware** : Still a Buy
- **Plum Creek Timber** : Moved to Buy

Earnings Up Next

- May 25: **Medtronic** (NYSE: MDT) (before market opens)

Jeff owns shares of Oracle.

Investors' knees shook last week when the S&P 500 took a quick 10% dive down from its April highs. But here's the real news: This isn't new at all. On average, market declines of this magnitude have happened once every two years since 1962. Only the context around them changes.

This time the context was Europe, and the market's fall was a reminder that the world economy isn't in the clear yet. Yes, our old friend volatility is back -- driving up options prices and rattling investor confidence. But we're not worried, because there are no real surprises here. This drop was bound to happen eventually. Now we can start looking forward.

What will happen next? In Europe, I suspect the financial crisis will subside just as it did in the U.S. in 2009. The drop of confidence in the euro seems more reactionary than predictive: The market is reacting to Greece, to the EU's $1 trillion rescue plan, to riots and fear. But now that Europe's woes are known -- and we've seen this knee-jerk reaction -- market fears in the Old World may already be peaking. Sure, the next shock may come from China, but let's not cross that continental bridge today.

Instead, let's focus on the home front, the U.S. stock market -- where it's headed and how we can plan to profit from it.

Cash Flow Rules

First, we have to understand what drives U.S. stocks in the long run. In a word, it's earnings. In three words, it's free cash flow.

FCF is the lifeblood of any business, and it ultimately underpins the valuation of any stock. Just as a bond provides cash flow to bondholders, companies must do the same for their shareholders. The market assigns a value to stocks based on the certainty of that cash flowing and its growth trajectory, the risk of shocks, and the interest investors could get paid if they put their money elsewhere.

With interest rates at rock bottom, U.S. stocks are one of the best ways to grow your money today. The S&P 500 trades near its historical average valuation based on earnings (a multiple right around 15), and the best companies are producing strong free cash flow despite the hamstrung economy.

The Country With the Cash

Furthermore, with Europe and emerging markets appearing weak, relatively stable U.S. companies look more attractive to investors around the world. Plus, the dollar starts to look like the most resilient currency again, worthy of being the world's reserve money. The U.S. needs this to be the case, because it relies on worldwide demand for dollars to fund its deficit.

So, weakness in Europe (and potentially Asia) may actually help the U.S. in a few key ways. A slow worldwide recovery could keep interest rates low, which would give the economy more time to find its footing, keep housing stable, and promote borrowing and spending by businesses and consumers. An added bonus: Low rates and strong demand for the dollar allow the U.S. government to sell debt on favorable terms.

So Where Is the U.S. Market Headed?

Community Highlights

- Is this just the long-awaited dip in market prices?
- Buy First **Ebix** made an interesting acquisition, and we summarized the company's earnings conference call.
- Alex340 posted options trades that meet *Pro* criteria.
- What's down with **Tupperware**?
- *Pro* missed closing its covered calls on **Waters** Friday due to unusual circumstances. Whether you closed your calls early or sold the shares like us, we'll offer guidance on the board or officially if we approach it again.
- **This Week in CAPS:** TMFEldrehad recommends John Keeling's blog post last week discussing ways to better integrate Tom Gardner's 5 Ps into CAPS.

Here at *Pro*, our projection hasn't changed: The stronger dollar may ding earnings at multinational companies, but we expect the U.S. stock market to remain flat -- or waffle within a certain range. If I had to predict, I'd say the S&P 500 (recently at 1,080) will stay between about 1,000 and 1,200. For how long? I usually only make one *f*oolish prediction at a time, but a year or more doesn't seem out of the question.

With our goal of investing for recurring profits -- with a high level of accuracy and lower risk -- a calm market would serve us just fine, especially given the strategies we have at our fingertips.

More importantly, I think a calm market and a *slowly* recovering economy are what the world needs right now: not high growth, but stability. Then we can all figure out how to move ahead sensibly, in a sustainable way, and perhaps avoid another crisis years down the road. Sometimes current events look dark, but they may actually bring about the circumstances that you need. Anything that keeps interest rates low may help the economy and the strongest stocks in the coming few years.

Foolish best,

Jeff Fischer

Two Possible Trades

Published May 20, 2010 at 12:00AM

Executive Summary: Stay calm and read on for how we plan to approach each *Pro* option position that expires at market close tomorrow (Friday, May 21).

Several *Pro* options positions are set to expire after the market closes tomorrow, Friday, May 21, and, because of this week's market volatility, several of these positions have changed status today. Many of you have come to our discussion boards seeking guidance. Your questions, along with all this volatility so close to expiration on so many positions, have led us to a *Pro* first: **This email serves as a *potential* trade alert.**

Below I outline the events that could occur tomorrow that would cause us to take action. If these events *don't* happen, we won't make the trades -- we'll let the options in question expire or be exercised.

We have several option positions in play tomorrow, but only two that we could act on. Let's start with those two.

ProShares Short S&P 500 $54 Covered Calls

Months ago, we wrote $54 covered calls on our existing shares of **ProShares Short S&P 500**. (Please note that this has nothing to do with our purchase of $44 calls on the same ETF that expire in June. We're keeping those!) In the past few days, the ETF has jumped to nearly $53.

Possible trade: If the ETF cracks $54 tomorrow, we will buy to close our $54 covered calls because we don't want to sell our shares yet. If the ETF stays below $54, we'll do nothing and let the covered calls expire.

Waters $65 Covered Calls

Waters has fallen from $73 to $64 this month, giving us covered call returns in exchange for a lower stock price. We had planned to let the stock be called away, but now the calls may simply expire unused. This will depend on whether Waters is above or below $65 tomorrow. If Waters is above $65 but below $66, we will buy to close our covered calls, which originally paid us $3.22 per share. Why? Because in this case we could capture most of the option return and still keep the stock to write new covered calls. The August $65 covered calls pay $4.

Possible Trade: If Waters is between $65 and $66 late Friday, we will buy to close our covered calls, earning most of the income, and keep the stock. If Waters is below $65, we don't need to do anything. The calls will expire, and we'll keep the shares. If Waters is $66 or above, we'll do nothing and let the shares be sold via the calls.

The following options positions will also expire tomorrow, but, for these, no action is required:

Expeditors International $35 Covered Calls

Our covered strangle on **Expeditors International** nets us a $39 sell price while the stock is lately around $38. As long as Expeditors remains above $35 tomorrow, our shares will be sold from our account over the weekend, and the position will be closed. We'll likely have other opportunities if we want to invest in Expeditors again, but, with both Europe and Asia showing weakness, we'll consider shares of the freight-leasing giant carefully. This position has worked well for us, providing strong returns in a down market while giving us downside protection. Thanks, Expeditors.

Trade: Do nothing, and if the stock is above $35, our shares will be sold automatically.

Medtronic Short $44 Puts

About 13% of our portfolio is invested in health care, and we're ready to accept another 2% in **Medtronic** tomorrow. With the stock recently around $41, our puts will net us new shares at $41.70. The stock is down nearly 10% over the past month, so this option position has fulfilled its purpose of allowing us to buy more shares well below where the stock traded when we wrote these contracts in January. Health care is traditionally a defensive play, and the sector is undervalued compared with the rest of the market. That said, as our allocation grows, we're likely to write covered calls on some of our health-care stocks and perhaps on our new shares of Medtronic.

Trade: Do nothing, and if the stock is below $44, we'll get new shares at our net start price.

SPDR KBW Regional Banking Short $26 Puts

As with Medtronic, a recent drop in banking ETF **SPDR KBW Regional Banking** has brought our $26 puts into play. If the ETF is below $26 on Friday, we'll accept new shares of the ETF through our puts at a net price of about $25.10, lowering our overall cost basis. Of course, if the ETF climbs above $26 (it's close), the puts will expire as income, and we're free to write new ones.

Trade: Do nothing, and if the ETF closes below $26 on Friday, we'll get new shares in our account automatically over the weekend.

Pro Bottom Line

It's always tempting to close your short put positions and avoid new shares when the market is falling, but that's precisely the time you should buy shares. It's cheaper than the alternative of buying when shares are rising!

True, we don't know how much deeper the decline may go, but in most cases, we will stick to our original trade -- and the discipline and thinking behind it -- rather than letting a volatile market bring out our emotions and talk us out of a position. By accepting new shares of Medtronic and KBW Regional Banking, we are following our original plan -- and getting the lower prices we'd hoped for. Meanwhile, selling some shares at fair value is also in our best interest. The market always has new opportunities.

If you have questions about these *potential* trades, please visit the Pro community boards. If we make either of these trades tomorrow, you will receive a confirmation at market close tomorrow.

Monday Memo: Todd Visits Jack (Jack Henry, That Is)

Published May 17, 2010 at 12:00AM

Executive Summary: Jack Henry is on Hold. Now, carry on, Fools!

A Big Week of Expirations

After the market closes this Friday, May 21, several *Pro* options will expire. We may close some early or adjust some, depending on market prices. If we do, we'll send you an official trade alert no later than Thursday. Here's the rundown:

- Short $26 puts on **SPDR KBW Regional Banking**: Currently would expire as income.
- Short $44 puts on **Medtronic**: Currently would turn into shares starting with a small profit. We may close early if we don't want to buy more this month.
- Short $54 covered calls on **ProShares Short S&P 500**: Currently would expire as income.
- Short $29 covered calls on **Cameco**: Set to expire as income.
- Short $55/$65 covered strangle on **Waters**: Set to sell our shares for us at a net $70 per share (above the current market price). We may close the covered calls early if the profit to do so becomes attractive.
- Short $30/$35 covered strangle on **Expeditors International**: On track to sell our shares for us at a net $38.90 (below the current market price). We may close the calls early if we wish to keep the shares and roll up the covered calls.

Although we could change our minds this week, we'll likely let Waters and Expeditors be sold. We'd be getting good prices and locking in more profit following nice price appreciation the past year.

Remember, if you want an option to be exercised and it's in the money (like our covered calls on Waters and Expeditors and our puts on Medtronic), you don't need to do anything. It will automatically exercise over the weekend. If you *don't* want an in-the-money option exercised, you need to close it early.

To borrow a line from George Strait, "Texas is the place I'd dearly love to be" (though maybe that's because I don't have any exes there). The people are nice, the steaks are top-notch, and the taxes are low. So I wish I could have left the Dallas-Ft. Worth airport to take in some sights during my 20-hour trip to **Jack Henry & Associates**' analyst day last week (held at the DFW Airport Grand Hyatt). But spending that time on the ground getting the latest on this *Pro* company was almost as good.

Since we bought Jack Henry in April 2009, it's been ballast for our portfolio thanks to its strong recurring revenue, deep client relationships, and solid balance sheet. However, one of the concerns we noted in our original buy report was the company's increasing reliance on acquisitions for growth. The practice is not always problematic -- **Oracle** and **Ebix**, to name just two, also grow largely through acquisitions. But the price has to be right. Unfortunately, we think management may have paid too much for too little with its recent purchase of iPay Technologies for $300 million.

As a result, we're moving Jack Henry from Buy to Hold.

4 Factors to Fathom

Even without the sight-seeing and mouth-watering steak dinner, there were some bright spots from my trip to Texas. I was impressed with the Jack Henry employees I met, some of whom had left the company only to return quickly after realizing how good they had it. I also met an executive at Louisiana-based **IberiaBank** who lauded Jack Henry's quick reaction time in implementing software changes for the four FDIC-assisted (bank failure) acquisitions the bank had made in the past year.

That said, I did depart the Lone Star state concerned about four key areas:

1. **Organic growth:** Jack Henry seems to be running out of organic growth opportunities as de novo (new bank formation) activity has slowed to a trickle with few signs of a near-term recovery. According to the FDIC, consolidation in the industry and bank failures have reduced the number of banks with assets up to $49 million by 18.5% from 2008 to 2009 and those with $50 million to $99 million by 7%. Now, Jack Henry's sweet spot is banks and credit unions with $100 million to $10 billion in assets, a group that has been more stable than their tiny brethren, but this area hasn't grown much, either. Additionally, the contraction in the smaller end of the bank spectrum means fewer potential new clients with whom Jack Henry can build long relationships.
2. **The economy and financial reform:** With financial reform and a still-struggling economy hanging over the banking industry, Jack Henry's clients remain hesitant to spend on discretionary items such as hardware and new software licenses. Although one of Jack Henry's clients -- the CEO of a Texas-based credit union -- told me that technology was the one part of the business that he didn't cut back on during the recession, he didn't say the company would be *increasing* its spending, either.
3. **Paying too much for iPay:** As I mentioned above, Jack Henry likely paid too much ($300 million) for iPay Technologies, the leader in the electronic bill payment industry and a long-time Jack Henry business partner. This was Jack Henry's largest-ever acquisition, and as one analyst put it, the price it paid was very "un-Jack Henry" in nature. We agree with that assessment. In 2006, a group of private equity investors bought iPay. If that group paid the same EBITDA multiple as Jack Henry did (17.1) this time around, they bought the company for roughly $90 million -- and generated a nice 230%-plus return in three years. Since 2006, iPay's subscriber count has nearly quadrupled and sales have doubled, so you can see why it would be attractive to a potential suitor. Unfortunately, Jack Henry had the chance to bid for iPay in 2006, but either couldn't or wouldn't pay up for it then. It's certainly paying up now, and we're not sure iPay's high-octane growth will continue -- or at least enough to justify the price.
4. **The competition:** When I asked CEO Jack Prim about iPay's competitive advantages, he said the company is perhaps the most focused in the industry on online bill pay and has a solid client base, with more than 3,600 financial institutions subscribing to its services and 98% customer retention rates. In the same discussion, however, Prim noted that **Fiserv** has been marketing its CheckFree product (in 3,100 financial institutions) aggressively and **Fidelity National Information Services**, which is in acquisition talks with **The Blackstone Group**, has placed its bill pay product in another 2,300 financial institutions. Even though iPay is the leader now, this is a crowded field, so pricing and margins will likely come under pressure.

Earnings Up Next

- May 25: **Medtronic**

This Week in CAPS

TMFEldrehad highlights TigerPackFund, a CAPS project that finds the best CAPS picks from some of the best CAPS participants and puts them together all in one place.

Pro Bottom Line

We still think Jack Henry is a strong business with solid client relationships and, of course, a lot of recurring revenue. However, we're concerned today about its acquisition strategy in light of the iPay price tag. Because of this, and with the stock already near our $26 to $30 fair value estimate, we're moving Jack Henry to Hold as we review the company in greater detail.

As always, we hope you join us and the *Pro* community on the boards to discuss this move.

Foolish best,

Todd Wenning

Monday Memo: 5 High Hurdles

Published May 10, 2010 at 12:00AM

Community Highlights

- Alex340 posts new puts that match *Pro* criteria.
- We discuss our overall strategy and the nuance of covered calls with members.
- TMFValuemoosie posted a *Pro*earnings calendar.
- This Week in CAPS: TMFEldrehad revisits the Fool community effort to track stock spam.

Next on the *Pro* Calendar

- Todd is headed to Texas for **Jack Henry & Associates**' May 11 analyst day — and he'll be reporting back to *Pro* Fools! Post any last minute questions!
- May 19: **Autodesk** reports its results.
- May 22: Call options on **Waters** and **Expeditors International** are due to be exercised, selling away our shares. If we decide to roll up, we'll announce official trades in advance. Put options on **Medtronic** are currently due to be turned into shares unless we close early. We'll decide that week.
- **Electro-Optical Sciences** filed its full response to the FDA's recent questions on May 7.

Pro holdings **Jack Henry & Associates**, **Expeditors International**, and **Ebix** reported healthy-looking quarterly results — but Todd and I (Jeff here) may have been the only ones who noticed, given the market's antics last week. Thursday was one of the most volatile days in the stock market's history, and the aftershocks continue to ripple through the market. We'll, of course, continue to cover earnings news for our holdings on their respective discussion boards, but we're devoting this week's Memo to the major events in Europe that are rocking the market — and the potential opportunities among our stocks. Todd gets things started by highlighting our thoughts on what the market may face in the coming few years. Then, I'll chime back in to update our guidance on *Pro* positions that have made big moves this past week.

5 Things to Watch

As any chess player can tell you, the key to success lies in your ability to think not just one or even two moves ahead, but three or more. Similarly, when it comes to finding today's best investment ideas, you can't focus on what's going on right now. Rather, you need to consider potential scenarios months and years ahead — and then be patient. This is a gargantuan task because the market is forward-looking and extremely efficient at pricing in potential outcomes. As Jeff and I (Todd here) see it, however, the market is currently *under-appreciating* five key scenarios that could play out in the near future:

1. **Higher interest rates**: The White House budget projects that federal debt interest payments will equal 18% of tax revenue by 2018 — the outer limit for a AAA rating from Moody's. But if interest rates are forced higher by the bond market, we could hit that 18% mark a lot sooner and risk a credit downgrade. This would force global interest rates even higher, creating a headwind for the economy and stocks.
2. **Higher volatility:** In April, market volatility (as measured by the Chicago Board Options Exchange's Volatility Index) hit pre-crash lows, but has since *doubled*. We don't think this is an anomaly. In fact, we expect more volatility in the coming months thanks to many unanswered questions about the economic recovery: the stability of the European Union and the consequences as global stimulus packages unwind, to name just two.
3. **Higher taxes:** Although many states are already implementing a number of Greek-like austerity measures — some 300,000 teachers nationwide are expected to be laid off at the end of this school year as states struggle with balancing their budgets — we don't expect the federal government to cut back its spending anytime soon. One way to bring down the federal deficit, then, is to increase taxes, which could slow down the economic recovery and consequently decrease tax revenue, a catch-22.
4. **Higher inflation:** Based on the spread between the yields of 10-year Treasuries and 10-year TIPS, the market is more optimistic about the prospects for inflation over the next decade than it was a year ago. Last May, the market's implied rate of inflation was 1.47%versus 2.16% today . If the U.S. economy *does* make a strong recovery, it will be a tall task for the Federal Reserve to reduce the money supply it's grown by $800 billion since April 2008 in an orderly manner. In other words, inflation will be hard to fight if it rears its head.
5. **Higher U.S. dollar:** If budget woes in Europe worsen, the dollar will likely continue to strengthen against the Euro, reducing the overseas earnings of U.S.-based multinationals. On the flipside, a higher dollar may lead to lower commodity prices.

All of these scenarios could dampen the economic recovery over the next two to five years. With the S&P 500 dividend yield near 2% and long-term earnings growth expected to be 2% to 3% (it typically follows GDP growth), returns could be quite modest for the overall market.

What Do We Do?

We're considering how each of the scenarios Todd outlined could affect our positions and how we may be able to position our portfolio to benefit through new investments, long or short. Once investors calm down, we believe the stock market may stay remain flat-ish or offer just modest returns for a long time. The large bounce following the rout of 2008 and 2009 made sense; giving back some of those gains is also logical and expected, whatever the catalyst (it happens to be Europe). Next, the reality of our challenging economic situation could settle in as the above factors come to light, and stocks may churn. But that prospect doesn't bother us because we have ways to profit anyway.

This scenario does mean, however, that it's more important than ever for members to follow our valuation-based Buy First, Buy, and Hold guidance. In a market that's reluctant to offer large gains, you need to place even more emphasis on valuation and a proper margin of safety. Following the turmoil of last week, we're able to move a few stocks from Hold back to Buy and others up to Buy First:

Company	New Guidance
Kinetic Concepts	Buy
Oracle Corp	Buy First
Intel Corp	Buy First (and strangle or not)
Tupperware	Buy — buy half a position and write an October 2010 $40 put/$50 covered strangle for around a $5 credit.
AmTrust Financial	Buy First

For the full list of *Pro* Buy First and Buy stocks, please visit our portfolio page. But as always, *take your time*. We are not pounding the table saying to buy all these stocks at once. We're merely moving these back to buy ratings based on valuation. As ever, average in or write puts to potentially get lower prices on some shares, and only buy if you have a long time horizon, since the market can do crazy things in the short term. Todd and I are on the philosophy board if you want to talk about these positions and how to approach the market now. Keep in mind, if the winds are changing for the long term, there's time to adjust. If they're only changing for a short time, there's not much reason to adjust. It's situations like this that the versatility of the *Pro* strategy can pay off.

Fool on!

Jeff Fischer and Todd Wenning

Jeff owns shares of Oracle; Todd owns shares of Kinetic Concepts.

Buy Calls on ProShares Short S&P 500

Published May 5, 2010 at 12:00AM

At a Glance

- **Trade:** Buy ("buy to open") June 2010 $44 calls
- **Allocation:** 1.5% if exercised (four contracts for *Pro*), for 4% total
- **Limit price:** Use a limit order that makes your net purchase price as close to the ETF's current share price as possible (split the bid/ask and aim for, recently, about $5.10)
- **Alternative trades:** Buy June 2010 $45 calls instead, around $4.20; buy shares directly; or write June 2010 $49 puts, recently above $1

What's New

The S&P 500 index is up more than 10% since November, as investors rallied alongside gains in manufacturing, employment, and home sales. As a result, our shares of the **ProShares Short S&P 500** (NYSEMKT: SH) ETF have lost about 11%, although we've written covered calls to partially offset the loss.

But though the S&P is up, economic gains remain modest — and are now overshadowed by trouble in Europe, including the massive Greece bailout and related debt concerns in Portugal and Spain. If the dollar continues to strengthen against the euro, U.S. businesses will likely take a hit in two ways: They'll have lower sales to a weakened Europe, and they'll have negative currency effects as overseas sales are converted into stronger dollars. At the largest multinational companies in the U.S., many of which are in the S&P 500, this situation could put current earnings estimates at risk.

Meanwhile, the U.S. stock market's P/E is hovering around the historical norm even though we're not on strong economic footing. With government stimulus waning, debt concerns weighing, and interest rates eventually headed higher, increasing our ProShares Short S&P 500 position from 2.5% to 4% will bolster our hedge during these uncertain times.

Why This Strategy?

We're buying June 2010 $44 call options with the goal of converting them to shares of ProShares Short S&P 500 at a net price of around $49.10. These deep in-the-money calls carry little time value, making them particularly appealing. If market volatility increases, let alone if the S&P 500 falls, the call price should increase.

Additionally, increasing our stake in ProShares Short S&P 500 to a full 4% will lower the cost basis of our shares to the low $50s. This will make it easier and more profitable to continue our strategy of writing covered calls on the ETF.

How to Follow Along

Buying calls is simple: The command is usually "buy to open," and you purchase one call for every 100 shares of the underlying investment you wish to eventually purchase. Use a limit order that nets you a purchase price as close to the current share price as possible. (With the ETF recently near $49, the $44 calls may be bought for around $5.10 — giving you nearly the same net buy price of $49.10). When you purchase these calls, it'll cost about $510 per contract. The possible outcomes before expiration are:

If the S&P 500 ...	ProShares Short S&P 500 will be ...	ProShares Short S&P 500 June $44 calls will ...
Falls 5%	Around $51.45	Gain about 26%
Falls 10%	Around $54	About double
Gains 5%	Around $46.50	Lose more than 50%, but we'll convert to shares at a 5% loss
Gains 10%	Below $44	Expire worthless; we have no recourse
Stays in a range	Unchanged	Be converted to shares around $49.10; we'll hold

A reasonable decline in the S&P will reward our hedge well, but if the market gains ground, we should still be able to convert the calls to shares and continue to write covered calls against our full ETF position. As long as the S&P 500 doesn't gain more than 10% between now and our expiration in 45 days, these calls can be turned into shares and the position continued. If the S&P soars more than 10%, we'll lose the full amount invested in these calls.

If you have questions on our decision to fill out our allocation to ProShares Short S&P 500, please post them on the ETF's dedicated discussion board.

Monday Memo: Bouncing Into a Recovery

Published May 3, 2010 at 12:00AM

Guidance Change

GrafTech International moves from Buy to Hold on price.

Earnings Aplenty

- **GlaxoSmithKline** : TMFGoogly details the company's solid results.
- **Procter & Gamble** : Todd (TMFPhila) believes P&G is recovering well.

- **Plum Creek Timber** : The quarter wasn't all that bad, says Todd.

Earnings Up Next

- May 3: **AmTrust Financial**
- May 4: **Cameco**
- May 5: **Jack Henry**, **Quanta Services**, **Flowserve**, **Expeditors International**
- May 10: **Broadridge Financial**

Community Highlights

- Join the discussion as *Pro* Fools chat about the Greece crisis.
- This Week in CAPS: TMFEldrehad shows how CAPS can be used to find investing ideas from Wall Street's best

With earnings reports flying at us left and right, the *Pro* team is working at a steady pace, sharing thoughts with you as we go (making this month a great time to visit our discussion boards), and — as we do each quarter — updating our thoughts on each position as soon as possible.

Earnings season is hectic, so it's important to remember that a quarterly report is just a snapshot in time; it's a single look at a company that will report results 12 *more* times in the next three years, 24 times in the next six years, and so on ... forever and ever. In an interconnected world where most everything is immediate, we're here to remind you that investing should (usually) be anything but instant. Investing is an endeavor best measured over several years — anything less is mere sport.

That said, earnings reports do provide us with new information that helps us assess our holdings' *long-term* prospects. So let's partake in some good sport and look at recent *Pro* company results.

GrafTech Reaches New Heights

Everyone's favorite graphite-electrodes producer for the steel industry, **GrafTech International**, soared 28% on Thursday after stronger-than-expected results and news that the company plans to acquire one of its key materials suppliers, Seadrift Coke. Providing GrafTech with more control of its pricing destiny and allowing it to capture more of the value that's created by the steel industry, management expects the acquisition and a smaller acquisition of C/G Electrodes to substantially add to earnings in a year.

Meanwhile, GrafTech's first-quarter results benefited from a large bounce in steel production that management expects to increase over time. Providing full-year guidance of $170 to $180 million in operating income, the company has already booked orders that are on track to fulfill 95% of that goal. In other words, GrafTech's results for the year look fairly certain and predictable now, and there's a good chance for an upside to the existing guidance.

Before we can update our thoughts on the company, we need to study Seadrift, C/G, and the new-look GrafTech. For now, the stock is moving from Buy to Hold for new buyers. We're happy to hold our shares given the positive developments, and shares may continue to gain a bit on the promise of the new company. Stay tuned.

Intel Shines, Tupperware Pops, and Waters Bubbles

Intel reported record results last month, and with the $23 stock trading at 12 times reasonable earnings prospects for 2010, an eventual move closer to our fair value in the mid $20s is possible. We are planning to roll up our July covered strangle on the stock before July, and we'll provide guidance whether you wrote our original or adjusted strangle. For members lacking any Intel position yet, you can write ("sell to open") puts to start. With hopes of getting shares, writing June 2010 $23 puts would pay $0.85. You could also buy shares recently near $23.10 and write October 2010 $25 covered calls for around $0.85.

Tupperware also had record results, and we're still sorting through all the containers and lids. If we like the outlook and valuation, we may roll up and out our July covered strangle on the plastics purveyor. As we've done in the past, we will take the action that provides upside for the price of taking on moderate risk.

Waters' results were strong, so this is another case where rolling up and out could capture more upside. We'll decide our course of action before the May expiration, but we're *inclined* to let this stock be called away, locking in our net sell price of a little more than $70. Following large gains that have a stock approach or surpass our fair value, as Waters has, we're happy to take the gain and have the cash ready for better opportunities. Only a much brighter outlook for Waters, or an especially attractive roll-up trade, could make us keep the shares instead.

Staying Calm

Despite the heady buzz surrounding earnings, and price swings that can occur, we're staying calm and sticking to our investing discipline. Investing is a life-long pursuit, so you need to approach it with a long-term outlook. The more excited Wall Street gets, the more we need to remember that it can be irrational. Consider this grounding thought from **Johnson & Johnson**'s CFO Dominic Caruso shared last week in the company's conference call:

"We are not assuming a significant rebound in the economy. We see it stabilizing. We see a modest return to economic conditions back to normal, but not at all any V-shaped or accelerated recovery, so that's not in our thinking."

While Wall Street seems intent on celebrating every incremental gain in the economy, what we're seeing is a government-supported bounce from a terribly frozen economy; a true recovery will be different from this bounce, and it almost surely won't be as dramatic. Things will settle down, and we will be ready for that, too.

Foolishly,

Jeff Fischer

Jeff owns shares of AmTrust Financial Services and has written puts on GlaxoSmithKline.

Buy Broadridge Financial Solutions

Published Apr 27, 2010 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Estimated fair value:** Upper $20s

- **Preferred buy price:** Around $23 or lower
- **Type of holding:** Long-term; Information technology
- **Alternate trade:** Write ("sell to open") puts for a lower potential buy price.
- **Why buy:**

  - Broadridge has been working its proxy-processing magic since the 1960s, but its stock is currently flying under Wall Street's radar.
  - With 90% market share in its core investor communications division and more than 80% recurring revenue, this stable business continually generates healthy cash flow — and it pays a handsome dividend, too.
  - There are growth opportunities ahead, including selling new services to existing clients, acquisitions, increased communication with shareholders, and more companies going public.

The Big Picture

April 27, 2010

Ever wonder who handles the mountains of shareholder-related paperwork that public companies process every day? **Broadridge Financial Solutions** (NYSE: BR) is the market leader in helping financial firms untangle mundane but mission-critical tasks such as proxies, prospectuses, trade confirmations, and account statements — the kind of administrative work nobody else wants to do. Its diverse customer base includes retail and institutional brokers, global banks, mutual funds, annuity companies, institutional investors, and corporate issuers. The core business is subscription-based, providing sticky, recurring revenue at high margins and generating strong free cash flow.

Although a lot has happened in the global markets since the company was spun off from giant **Automatic Data Processing** (NASDAQ: ADP) in March 2007, Broadridge has flown under Wall Street's radar — only four analysts were on the last conference call. In three short years, the company has worked to lessen its debt load, more than doubled its quarterly dividend, repurchased stock, and acquired some nice complementary businesses. We're always on the lookout for market leaders with solid business models that generate consistent cash flow. And when we can buy into that combination at less than 15 times earnings and cash flow as we can with Broadridge, we'll gladly punch our ticket.

The Business

Get Personal With Broadridge

- Founded: 1971
- Headquarters: Lake Success, NY
- Market cap: $3 billion
- Website: broadridge.com

The jewel in Broadridge's crown is its Investor Communication Solutions division, which provides annual proxy services for a whopping 90% of public companies and mutual funds in the United States. The bulk of Broadridge's recurring business comes from this area, driven by ProxyEdge — the company's electronic proxy delivery and voting service — and its Investor Mailbox financial portal. The division also processes and distributes account statements and trade confirmations, personalized document fulfillment, and marketing communications.

All of this might sound like standard administrative fare, but Broadridge isn't afraid to push the envelope (ba-dum dum) with new products and services aimed at satisfying customers' appetites for social media. The company now offers a social network for share owners; forums for public companies to convene with shareholders on the Web; and a virtual meeting tool that allows shareholders to vote online and tabulates the results instantly.

The rest of Broadridge's revenue — about 24% — stems from its side division, Securities Processing and Outsourcing Solutions. Here, the company's end-to-end platform can trade virtually any security on any market, including order capture, execution, confirmations, settlement, accounting, and archival. According to Broadridge, customers who use its offerings for a broad range of services can cut costs by more than 30%, avoiding the expense and ongoing investment in technology and operations for brokerage services.

A Broad Competitive Advantage

The Community's Take

Broadridge scores a perfect 5 stars on CAPS, with 100% (62 of 62) of All-Stars rating it to outperform. In fact, it scores in the top 14% of all stocks rated on CAPS. On the *Pro* CAPShot, the five-year data is incomplete for this 2007 IPO.

Broadridge benefits from high switching costs — typical for companies that deal with administrative solutions. Its products are deeply integrated into its clients' processes, so moving to another provider entails a major business disruption. The company also enjoys strong economies of scale: Once built, its tech-based automation platforms are increasingly profitable. And the company's size and scale, distribution channel, and client base make acquisitions more successful, as complementary businesses are worth more and are more efficient under the Broadridge umbrella than they are standing alone.

Broadridge has excellent, long-lasting customer relationships — and happy customers lead to high retention rates and recurring revenue. The company is regularly ranked high in leading industry surveys such as The Black Book of Outsourcing, which ranks Broadridge first in 14 of the 18 categories in which it competes. Clearly, the company has earned its $3 billion market cap on the back of reliability and customer satisfaction.

Financials and Valuation

The company believes that as a provider of mission-critical services, its clients, as well as regulators, will benefit from the peace of mind associated with a rock-solid service provider when it comes to its own financials. With consistent cash flow and high return on equity, Broadridge has been getting stronger every year.

Saddled with debt after its spinoff from ADP in 2007, Broadridge set out to shore up its balance sheet. In just three years, management paid off more than $400 million in debt while still investing back into the business and retaining a cash position of $147 million. All told, this means that the company has net debt of just $177 million compared with more than $200 million in trailing free cash flow.

Sales have grown at a compounded rate of 7% over the past five years, registering almost $2.2 billion in 2009. Impressively, Broadridge has converted nearly 10% of those sales into net income and even more than that into free cash flow for investors. On conservative assumptions, we put fair value for the stock in the mid to upper $20s. The company models for annualized revenue growth of 5% to 8%, and we believe margins have room for expansion, creating additional upside.

What Would Make Us Sell

This business was built on fast, accurate, and reliable solutions. Any breach of those qualities or trust could open the door to customer defection. We also need to keep an eye on large mergers and acquisitions, which can have the effect of removing Broadridge clients from existence. After the most recent wave of financial consolidation, one of the company's 15 largest clients left to process securities in-house — a loss of $23 million in revenue for Broadridge. A more general slowdown in the stock market may affect sales, but not to a dramatic degree. Finally, there's regulation risk. The SEC and self-regulatory organizations could change the nature and roles of broker-dealers in the proxy process, and Broadridge would need to adapt to new rules and regulations.

Pro Bottom Line

Dominant in a vital, behind-the-scenes niche in a capitalistic society, Broadridge benefits as stock listings grow, it implements new ways to manage data for its broad client base, and it acquires related businesses. Stable, recurring revenue and steadily improving financials point to continued success, making a share purchase at today's 14 times earnings and 12 times cash flow (with a 2.3% dividend yield) a rewarding prospect. One thing's for certain: We'll never look at proxy filings the same way! Please post your questions on our new Broadridge board.

Monday Memo: This Stock Has Gone Nowhere

Published Apr 26, 2010 at 12:00AM

Pro Stock Guidance

Changes in share price have led to changes in buy guidance:

- Moving up to Buy First: **Ebix**
- Moving down to Buy: **FPL Group**, **Oracle**, **SPDR KBW Regional Banking**

In the short term, the stock market is a frenzy of quick-buck artists — money made and lost without much rhyme or reason. But over the long run, stocks settle down as prices more accurately mirror cash flow and earnings power, with valuations gradually reverting to a mean. Even for the greatest businesses of all time.

Bargain Prices, Low Returns

Few companies reflect this better than **Wal-Mart**. Since 1999, the retail steamroller has expanded around the world at break-neck speed, more than *tripling* earnings per share — yet the share price has essentially gone nowhere for 10 years.

The reason? Investors had already priced in that earnings growth. You can behold the story by looking at Wal-Mart's price-to-earnings multiple: After hitting 60 in 1999, the P/E has fallen steadily, to a recent 15 — the market average.

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Price	$61	$47	$51	$45	$48	$48	$43	$43	$45	$55	$53
P/E	60	37	37	30	28	24	18	17	16	17	16
EPS	$1.02	$1.27	$1.41	$1.45	$1.74	$2.03	$2.39	$2.62	$2.84	$3.13	$3.35

Dividend-adjusted share prices are as of the final trading day of the calendar year. P/E is calculated using trailing 12 month normalized diluted EPS. All data from CapitalIQ.

Profit on the Roll-Back King

Wal-Mart may be a good candidate for a buy/write trade or a diagonal spread. In the former, simply buy the stock and write covered calls on it (you'll also get the dividend). In the latter, buy 2012 LEAP calls and write near-term covered calls against them. If the stock remains range-bound, you can rack up covered call income on a stable giant.

That means an investor who bought shares around $60 in 1999 watched Wal-Mart grow its earnings power year after year — for nearly *40 quarters* in a row — but still faces a capital loss, and it's far worse with inflation. The only benefit has been a slowly growing dividend, recently paying 2.2%. Frustrating. Any time investors pay up for a stock, they potentially face this painful outcome.

When the stock market rises sharply, it's discounting future growth. In a sense, if today's investors are willing to pay for five years of assumed growth, they should expect five years of flat stock prices in return.

You won't often see us pay up for future assumed growth at *Pro*. Instead, we aim to buy stocks that are aren't priced to perfection.

A Different Cycle

Pro holding **Intel** tells another story. Tech spending often occurs in waves, so as a cyclical business, this computer chip giant has a fluctuating stock price — one that looks expensive when business is down (like in 2002, when it had a 30 P/E), but quickly reverts to a market-average valuation when business is strong, as it is now.

Below, you can see that buying Intel at $14 in 2002, just off the bottom of a cycle, was a good decision even though its P/E was 30 — the stock closed at $28 a year later. But (as often happens) investors got overexcited during the rebound, and the stock is still down seven years later.

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Price	$36	$26	27	$14	$28	$21	$22	$19	$25	$14	$20
P/E	37	26	98	30	36	21	17	26	25	15	21

Dividend-adjusted share prices are as of the final trading day of the calendar year. P/E is calculated using trailing 12 month normalized diluted EPS. All data from CapitalIQ.

Earnings to the Extreme!

Get the story on the *Pro* boards soon after earnings are announced:

- April 26: **Plum Creek Timber**

- April 27: **Kinetic Concepts**, **Waters**, **FPL Group**
- April 28: **GlaxoSmithKline**
- April 29: **GrafTech International**, **Procter & Gamble**

Other *Pro* News

- **This Week in CAPS:** TMFEldrehad follows up on last week, showing you how to use CAPS to dig even deeper into **Atwood Oceanics** (NYSE: ATW).
- **Portfolio error:** Our portfolio tracker has not properly calculated our return on our **Autodesk** covered calls for several days. We're working to correct this — it's the only position affected.

To avoid getting burned by cyclical stocks, investors should be wary of buying when the P/E is expanding and business is already booming — that often means the top of the cycle is near. Once the cycle plays out, earnings may decline for a few years, and the P/E will come back down. Buying when the P/E is low and business is slow, like it was when we first bought Intel in 2008, is a better way to approach cyclical stocks.

During the past decade, Intel's diluted, normalized earnings per share typically bounced along with business cycles, well above and below $1 per share year after year. This year, Intel is on track to set a new earnings record, and the stock trades at a reasonable 12 times next year's expected earnings. We intend to roll up our covered calls on Intel (watch your inbox for a trade alert), staying hedged and keeping our heads straight even during a boom because we know it won't last forever.

Investing Despite the Market

The stock market's earnings as a whole are rising fast as they bounce off last year's depressed levels — and with many stocks, investors are paying up for the bounce, extrapolating more growth to come. When stocks were in decline last year, we were buying shares steadily; but now that they've risen so much, we're being more particular about the prices we'll pay. Although the stock market *always* looks ahead, we'd rather not pay up for years of growth while the economic recovery is so fragile. When you pay too dear a price, eventually your returns suffer when the economy stumbles or growth slows. After all, we want our stocks to go somewhere.

Have a comment or question? Please visit our Memo Musings board. And remember to read the sidebars above for important *Pro* updates.

Options 202: Rolling Covered Calls

Published Apr 23, 2010 at 12:00AM

When to follow up on covered calls:

- Shares have moved sharply higher, and you want to capture additional upside.
- Shares have *dropped* considerably, and you want to remain hedged.
- Your original covered calls have little value remaining.

Foolish facts to know:

- Rolling up, rolling down, and rolling out can be good ways to increase profits or minimize losses, but they aren't always the right choice. Leaving covered calls unmodified can provide good discipline for investors.
- If you're dealing with more than 100 shares, you don't have to take the same action across your entire position — you can diversify your strategy.

Greetings, *Pro* Fools! Today we're going to build on your knowledge of writing covered calls (read Options 201 for a refresher) with a little something called follow-up action.

As you know, when you write covered calls, you need to be ready to have your stock or ETF sold away at your call's strike price. However, you always have the choice of adjusting your trade before that happens. In cases where the stock moves sharply, or when you've earned most of what you can from your call options, you can roll your calls up, down, and/or out, modifying your strategy to your benefit. Let's start with one of the most common moves: rolling up and out.

Rolling Up and Out to Gain More Upside

When you write covered calls on a stock, only to see the shares lift off through your strike price and keep ascending, you're leaving potential profits on the table. It may be time to follow up by bringing out the "roll up and out" trade. To do this, you "buy to close" your original covered calls and then "sell to open" new covered calls at a higher strike price (that's the roll *up*), usually with a later expiration date (the roll *out*). This strategy provides you with additional upside in the stock before it's potentially called away. It can also be a useful tactic if you're concerned about losing shares of a strong dividend-paying stock (see Options 201 sidebar).

For example, assume you bought a stock at $12 and wrote $15 covered calls that paid you $1.50, for a potential net sell price of $16.50; today the shares are $17, and you think they'll go higher. Your adrenaline is pumping, but being a Fool, you decide to rationally and calmly roll up and out to a higher strike price to gain more upside. Here are the numbers:

Math of Rolling Up and Out
(Stock Bought at $12, Now at $17)

Payment for writing $15 calls expiring in six months from start	$1.50
Cost to "buy to close" $15 calls now expiring within days	($2.10)
Net cost to close $15 calls	**($0.60)**
Payment for writing $17.50 calls expiring three months later	$1.20
Total credit for rolling up	$0.60
New net sell price	$18.10
Benefit of rolling up	9.7% additional upside

In this scenario, you're able to roll your covered calls up to a higher strike price, and out to a later expiration date, earning a 10% higher net sell price on the stock and still maintaining a credit on your covered calls (meaning you were paid overall to write them).

In some cases, you'll need to pay to roll up your covered calls (a net debit) because the net cost of closing your original calls exceeds the amount that writing new calls will pay you. To minimize or eliminate this, you roll your options out to even later expiration months that pay more. Additionally, when rolling up and out, you usually close your original calls only when they have *little time value remaining* — in other words, once they're near expiration, or when they're so deep in-the-money (meaning the stock is far above the strike price) that the options have little time value even if expiration is months away.

Pro's Call-Rolling Tips

- Every covered call you write should have a strike price at which you're happy to sell and should pay you enough for capping your upside (see Options 201).
- Roll up and out to a higher, later strike price when you want to capture more upside in a stock; when most time value is gone from your existing calls; when rolling will provide stronger returns; and when the new options still offer downside protection.
- Remember the rule of options: Aim to buy intrinsic value and sell time value.
- If your original calls still have time value left, but there's a particularly appealing roll-up trade available to you, exceptions can be made. And if you're only rolling up, not out, don't concern yourself with time value.
- *Don't* roll up if it will greatly increase your break-even price on the stock (in this case, because you need to pay excessively to roll up), or if it doesn't offer much more upside along with meaningful downside protection.
- Roll *down* a covered call to get more defensive (earn more income) on a falling stock.
- Consider buying to close your existing calls when you've earned 85% or more of what they paid and you can roll out to a future month for a much higher payment.
- Covered calls encourage disciplined selling, so unless the valuation story has changed, let some shares be sold after large gains simply by allowing your original trades to go to completion.
- Finally, if you've changed your mind about being covered, expecting more gains in the stock, just close your existing calls — don't write new ones.

An option's time value (the value it holds above its true value to account for possible changes in the underlying stock price before expiration) will begin to disappear more steadily once expiration is 90 days away, as long as overall volatility is not increasing. At 60 days, this decay speeds up, but only at 30 days will time value really begin to evaporate quickly and, finally, almost disappear (some time value will remain right up to the last day). Thus, it's usually during the expiration month (or even week) that you'll close your original calls to roll them out. Writing new covered calls that expire in 90 days or more will reward you with ample time value again, while you want to pay little time value to close your old calls (in our example, a $15 call asking $2.10 on a $17 stock only has $0.10 in time value).

So, roll up and out when:

- You see more upside in the stock, want to keep dividend payments, or aren't ready to sell after all.
- You believe the stock won't decline much (not more than 10% or so).
- The extra profit potential of rolling up is worth the cost (with a debit roll-up) and is worth the extra risk of continuing to hold the stock.

Rolling Up But Not Out

Sometimes, when a stock gains ground, you may want to roll your covered calls up, but not out — capturing some of that upside even if it means you incur a net debit. Perhaps you're feeling bullish and think the stock will keep climbing. By just rolling up, you can make a quick correction to your trade. In this case, you "buy to close" your original covered calls and write new ones at a higher strike price but the same expiration month. Since the options expire simultaneously, you don't need to worry about time-value dissipation before making the trade. Simply adjust your position, and if the stock goes higher, you'll end with a larger gain than if you hadn't rolled up.

Rolling Down to Reduce Risk

On the other hand, when a stock declines, you may want to roll *down* your covered calls to earn another option payment and marginally decrease your risk. As shares fall in price, your original covered calls offer you less additional income and become a less effective hedge. Booking your profit and rolling down to a lower strike price — usually, but not always, with the same expiration — will increase your option income.

Be warned that rolling down lowers your overall profit potential on a stock sale and should only be considered if you no longer believe shares will appreciate in value anytime soon. Rolling down when a stock is bruised means that you're accepting a more modest payment for a lower strike price, so it's not an ideal situation — only consider it when you want to be especially defensive. Finally, make sure it's not a better idea just to sell the underlying position rather than writing new calls.

Rolling Out to Move On

If you've earned most of what an option-writing trade can pay you (as a general rule, we say 85% or more), start to consider taking the risk off the table by closing it early. When covered calls reach this point, you have little left to earn but are still completely capping your upside by keeping the position open — so the risk/reward trade-off is unfavorable. If you want to keep the stock covered, consider closing your calls and writing new ones for a later month and higher payment. If you no longer want to cover your shares, simply close your calls for most of the gain and uncap your potential profit on the stock.

Bottom Line on Rolling Covered Calls

Not all covered calls should be rolled up, down, or out when a stock moves. If rolling your options only pays a little extra, greatly increases your break-even price on the stock (because closing your calls results in a net debit), leaves you with little downside protection, or lowers your sell price too far (when rolling down), then the strategy should be shelved.

That's not a bad thing: Covered calls encourage disciplined investing. Rather than chasing a stock, the strategy makes you stick to your thesis and anticipated sell price. Too often, investors chase stocks higher only to regret paying to roll up when the stocks fall back. In many cases, letting some calls be exercised and taking some profits following a strong move is ultimately the better alternative.

At *Pro*, we'll roll up covered calls when our estimate for the stock has gone higher and we want to partake in that upside. We'll roll down when we no longer believe in the underlying stock as much and want to be defensive. And we'll roll out anytime we have a status-quo situation and wish to keep earning income.

So, are you ready to roll? Bring your questions and comments to *Pro*'s All About Options board.

Monday Memo: Will the Real Market Please Stand Up?

Published Apr 19, 2010 at 12:00AM

Coming Up in *Pro*

- **New to the portfolio:** Our call options on **Electro-Optical Sciences** became shares over the weekend. We now have about a 0.5% position in this medical technology venture.
- **Earnings season action ahead:** First up, **Tupperware** reports on April 21. You can see *Pro*'s full earnings calendar here.
- **Company visit:** Todd is headed to **Jack Henry & Associates**' analyst day in May! Have a question you'd like Todd to bring to Dallas? Share it on our Jack board.

Community Highlights

- TMFEldrehad digs deeper into the top-ranked *Pro* CAPShot stocks.
- *Pro* members discuss the big **Goldman Sachs** news.

What Buffett Is Really Thinking

Inside Value advisor Philip Durell and analyst Joe Magyer are headed to the 2010 Berkshire Hathaway annual meeting to continue their hunt for deeply undervalued stocks. To sign up for free email dispatches with their expert take on each day's events, including Warren Buffett's outlook on his favorite industries, companies, and the U.S. economy, just enter your email address here.

There's something happening here / What it is ain't exactly clear

With the uncertain state of the stock market these days, I can't get those opening lines of Buffalo Springfield's classic, "For What It's Worth," out of my head. Depending on where you look, you get two very different pictures of what's going on in the market. Let's start with the positives.

Take 1: Shiny Happy Market Data

- The market has been on the rise for more than a year now — and with low volatility. As of Thursday, Chicago Board Options Exchange's Volatility Index sat around 16, the lowest level since summer 2007, while the put-to-call premium ratio is near January 2008's five-year low of 0.34 — meaning that sellers of calls are demanding a higher price for taking the risk of a stock going higher. Both metrics imply strong investor optimism.
- Forward-looking metrics such as building permits, average weekly manufacturing hours, and yes, stock prices, have been rising for nearly a year as measured by the Conference Board Leading Economic Index. This indicates a recovering economy.
- Finally, consumers — as we said in *Pro*'s Audio Extra last week — have been resilient. Spending has been up every month since September, and retail sales were up 1.6% in March, led by strong car and clothing sales.

By anchoring on these rosy facts, you could reasonably assume that things are going well in the economy and in the markets. Unfortunately, the picture isn't quite as pleasant on Main Street.

Take 2: Sick at Home

- The average length of unemployment is 31 weeks — its highest level since records began in 1948 — and the "real" unemployment rate, which includes discouraged workers and part-timers who want to work full-time, is close to 17%. At this point, there are few signs that hiring will accelerate rapidly.
- Small businesses, which supply half of all jobs in the private sector, continue to suffer. A survey by the National Federation of Independent Business in March found that poor sales and uncertainty continue to plague this area of the economy. The NFIB's economist said the reading was "very low and headed in the wrong direction."
- Lending for small businesses remains tight, too (as *Pro* member and small-business owner US133 recently noted on the boards). The NFIB survey reported that 15% of members have found credit more difficult to come by lately.
- Interest rates are expected to march higher, while consumer credit is contracting, so future spending will likely be with cash rather than debt. While this is a good thing on the individual level, it could stifle macroeconomic growth.
- On the back of lower tax revenue, many states and municipalities across the country are slashing budgets and raising taxes to make ends meet. While this belt-tightening may be the fiscally prudent thing to do, it will also lead to fewer dollars in consumers' pockets.

Common sense tells us that this dichotomy between Wall Street and Main Street cannot continue indefinitely. If Main Street continues to suffer, it will show up in corporate earnings. Eventually, something's got to give.

What's Next

The longer the market gives the illusion of stability in the economy, the more severe the correction could be if the outlook doesn't strengthen for Main Street. From January 2006 to September 2008 (when Lehman Brothers collapsed), the Volatility Index averaged a relatively low 17.28 despite mounting concerns about subprime mortgages and consumer debt.

At *Pro*, we don't expect a repeat of the 2008 to 2009 crash. We're comfortable buying good companies incrementally, with some hedges, but we do not believe that it's time to short aggressively — as we've seen so far, a rally can be much steeper than most expect. In the meantime, we're confident that our current lineup of stocks, ETFs, and options puts us in a strong position to make money no matter what the market deals us next. During these uncertain times, it's important as ever to remain patient, focused, and Foolish.

What's your take on your local economy? Are you seeing a recovery, or are you skeptical of Wall Street's optimism? Sound off on our Philosophy & Strategy board right now.

Foolish best,

Todd Wenning

Monday Memo: Spotlight on Strangles

Published Apr 12, 2010 at 12:00AM

Pro News and Events

- **GrafTech International** is up 12% since we moved it to Buy First on March 15, so we're moving it back to Buy.
- TMFValuemoosie has posted a new *Pro* earnings calendar. **Intel** reports on April 13, then **Kinetic Concepts** and **Tupperware** next week.
- Our purchased calls on **Electro-Optical Services** expire this weekend. This week, we'll announce whether we'll take shares at $5 or sell to close and consider buying new options.

The market's steady buying spree has lifted the S&P 500 a staggering 13% since Feb. 8, and the overall value of the *Pro* portfolio continues to reach new highs. Yet compared with the S&P, *Pro*'s more defensive stance has muted our returns. Earning profits even when the market turns south is part of *Pro*'s mission, so hedged positions are crucial — but should we be wary of lost upside? Some of you have expressed this concern on our boards, so today I'll share my thinking on the topic — namely, by looking at our covered strangles and the potential follow-up action we'll take to maximize our gains.

Hedges With Upside

We don't want to chase stocks to sky-high valuations, especially in the short term — it raises our risk and lowers potential returns. At *Pro*, we set up covered calls and covered strangles with this in mind, knowing that we'd happily part ways with the underlying stock at the sell price afforded by our options. Meanwhile, these strategies have the potential to earn us cash even if stocks stay flat or fall *and* offer us plenty of downside protection (often in the realm of 8% to 10%).

Need a Refresher?

Brush up your knowledge of this strategy with Options 703: Strangles.

On the flip side, even after a strong market rally, all of the stocks underlying *Pro*'s covered strangles have more room to run — and reward us with profits — before they reach our sell prices (counting options income). Plus, as these positions get closer to expiration, we'll have the opportunity to roll many of them up (to higher strike prices) and/or forward (to later expiration dates), capturing more potential upside if we wish.

Our Strangle Angle

With the goal of maximizing upside in mind, let's take a closer look at where *Pro*'s covered strangles stand today and the possible follow-up action we may take:

Position	Puts	Covered Calls	Our Net Sell Price	Current Price	*Possible* Follow-Up
Intel , *Pro*'s adjusted strangle	July $20 puts paid $1.23	July $22 calls paid $0.57	$22 + $1.80 in options = **$23.80**	$22.55	Close the options and roll up to higher strike prices as expiration nears.
Intel, original strangle that *Pro* missed	July $19 puts paid $1.27	July $21 calls paid $0.93	$21 + $2.20 = **$23.20**	$22.55	Close and roll up to higher strike prices as expiration nears.
Plum Creek Timber strangle	August $35 puts paid $1.92	August $40 calls paid $0.93	$40 + $2.85 = **$42.85**	$40.13	Let expire or close to write a new strangle as expiration nears.
Tupperware strangle	July $40 puts paid $0.98	July $50 calls paid $2.02	$50 + $3 = **$53**	$47.85	Let expire or close and roll forward as expiration nears.
Expeditors International of Washington strangle	May $30 puts paid $2.05	May $35 calls paid $1.85	$35 + $3.90 = **$38.90**	$37.20	Close near expiration and consider writing new strangle at higher strikes, or let shares go.
Waters strangle	May $55 puts paid $1.81	May $65 calls paid $3.22	$65 + $5.03 = **$70.03**	$69.23	Close soon before expiration and consider a new strangle, or let shares go.

As you can see, all of these positions still offer upside compared with today's share price. So, even in the mother of all rallies, our hedges haven't yet lowered our potential profits — in fact, if allowed to go to completion, today they'd translate into greater returns than the stocks alone. Meanwhile, they offer significant downside protection, and as the time value in our covered calls dissipates, we'll enjoy incremental returns in our portfolio even if the stocks go nowhere. Once most of the time value is gone, usually near expiration, we can consider our next move.

What’s Next?

This is the fun part, Fools (Todd's already sipping an appletini at his cubicle). Last week, we gave you a small preview of what may come, announcing that we'll roll up our deep in-the-money covered calls on **Autodesk**. Next, as our first strangles near expiration in May and time value erodes, we may allow some positions to be sold away, locking in gains at attractive sell prices; or, we may roll some strangles forward to keep that income train chugging along while we hold onto our shares. It will depend on pricing. As you build your *Pro* portfolio alongside us, we're aiming to profit in up and down markets, minimize risk, and still enjoy strong upside potential. So stay calm and stay tuned, watch your inbox for our trade alerts, and if you have any comments or questions, please visit the Memo Musings board.

Fool on,

Jeff

Fishing for Attractive Business Models With CAPS

Published Apr 8, 2010 at 12:00AM

Today's CAPS screen comes to you courtesy of the newest member of the Pro team *, analyst Bryan Hinmon (TMF42 on the boards). Bryan has been part of the Fool community for more than a decade.*

Sometimes investing feels like fishing in the wide open ocean — there are so many places to lay your line for ideas. To help whittle down the universe of potential investments, the team at *Pro* often starts by looking at CAPS (where the Fool community has rated more than 6,480 stocks), our proprietary CAPShot tool, and some easy-to-screen financial metrics.

I recently ran a screen for companies that score at least a 9 on our 12-point CAPShot scale, eliminating some of the less-attractive opportunities and narrowing the field to just 109 stocks. Next, I screened for bargains by selecting only the stocks in sectors with flat or negative returns over the past three months. Three sectors in the S&P meet this criterion — utilities, technology, and energy — and shrink the pool of ideas to a more manageable 38 companies.

Finally, as we search for great investments, the *Pro* team loves companies with recurring revenue and light business models. Businesses with these characteristics have visible revenue streams, tend to generate tackle boxes full of cash, and have the potential to generate strong returns over the long term. Software companies, such as current *Pro* holdings **Oracle** and **Autodesk**, are great examples of such businesses. To select for these business-model traits, I investigated each company one by one (the *Pro* team's constant task), and in doing so, three ideas grabbed my attention. Let's take a look at these CAPShot catches.

3 Ideas From Our Research Pond

Company	Sector	Industry	CAPShot Score	Market Cap
Dresser-Rand Group	Energy	Equipment and services	9 out of 12	$2.7 billion
j2 Global Communications	Technology	Internet software and services	9 out of 12	$1 billion
NIC	Technology	Internet software and services	9 out of 12	$0.5 billion

First up is Dresser-Rand Group (see its CAPShot here), which makes turbines and compressors used in every stage of oil and gas production — and with more than 62,000 steam turbines and 9,000 turbomachinery units in operation, it's safe to say this company is entrenched in its niche. Dresser-Rand makes money in two ways. First, it builds and sells equipment to clients like **Chevron**, **ExxonMobil**, and **Dow Chemical**. This business is cyclical and swings with energy prices. Then, it makes money in the aftermarket, servicing and providing parts for its massive installed base. This revenue tends to be high-margin, recurring, and predictable because the client's operating assets are mission-critical. On top of that, the business doesn't require a ton of cash to run, leaving more coins in the coffers of equity holders. The CAPS community loves Dresser-Rand, giving it a rating of 5 stars — and they're onto something. Capital-light businesses are rare in the energy sector, so we'll be looking further into this company's prospects.

The next idea from my screen is j2 Global Communications (see its CAPShot here), a company that helps customers stay connected by making sure they can fax, phone, listen to voice messages, or check email at all times. The bulk of its business comes from selling fax-via-email services, which take the hassle of fax-machine jams and busy signals out of the equation. The company owns an inventory of local and toll-free telephone numbers that it sells for its fax-via-email services, allowing businesses to establish a local presence from across the globe. Recurring revenue comes from subscription and usage fees, the business is asset-light, and returns on capital and margins are impressive. Although CAPS Fools give j2 a 5-star rating, the tough competition, low barriers to entry, and new technology make this a difficult business to stand behind over the long term.

Finally, if red tape is your problem, NIC (see its CAPShot here) is here to help. The company builds Internet portals to help local government agencies manage payments and documents online — think parking ticket and property tax payments — and then manages its systems under three- to five-year contracts. NIC operates a self-funded model, meaning that it fronts the cost of designing and building the portals and then shares in the recurring revenue that's generated. State and local government agencies love the self-funded model because they aren't required to make an initial cash outlay (as if they even could!). NIC keeps its business model light by referring to its broad platform of portal templates for new contracts — so it doesn't have to reinvent the wheel each time it scores a new deal. NIC is proving that its attractive business model works, and it's winning new contracts. The CAPS community rates NIC 4 stars, a vote in favor of government efficiency, but we need to get a better sense of how NIC's well-heeled competitors will respond before we get too excited.

What's Next

Now it's your turn to go fishing. If you have a stock idea with an attractive business model, enter the ticker in our CAPShot tool, and then tell us how the company fares over on the Stocks That Interest You board.

Roll Up Covered Calls on Autodesk

Published Apr 7, 2010 at 12:00AM

- **Action:** Buy to close existing July 2010 $24 covered calls, and write ("sell to open") January 2011 $30 calls
- **Recent option prices:** July 2010 $24 calls, $7; January 2011 $30 calls, $4
- **Preferred limit order:** Aim to complete these two trades for a net debit of $3 or lower.
- **Alternate trades:** If you don't own Autodesk, consider writing ("sell to open") January 2011 $25 puts (recently $1.50). No nearer-term options pay enough at low strike prices. If you own Autodesk but can't cover it with calls, the stock remains a Hold.

What's New

Our recent stance on **Autodesk** — which spurred us to write $24 covered calls in February — has proven too defensive, so it's time to take action to recapture some upside. The stock made a beeline up to our fair value estimate in the low $30s after the company beat expectations on a year-end surge in large customer orders. Meanwhile, reports on U.S. employment suggest hiring has begun (modest as it is so far) — a turnaround that should eventually help Autodesk, which sells software by the seat (so sales are per-employee).

Investors are bidding up the stock because they believe this high-margin business will grow rapidly in a recovery. But even management doesn't know whether last quarter's strength was a genuine shift or an aberration — either way, at this point, our best strategy is to roll our covered calls up to capture more of the stock's recent gains. As far as problems go, this is a good one to have.

Why This Strategy?

Because our original July covered calls are deep in-the-money, they have little time value remaining ($0.40) even though three months remain until they expire. So, we want to close them rather than risk our shares being called away early, which becomes more likely as time value evaporates. Rolling our covered calls up by several strike prices (and out by several months) for a modest net cost, we can capture much more upside in the stock than our original calls allowed. Our original $24 calls paid us $2.10 and gave us a net sell price of $26.10. Now let's walk through the math of adjusting our covered calls:

Math of Rolling Up	
Payment received for writing July 2010 $24 calls	$2.10

Cost to "buy to close" July calls	($7)
Net cost to close July calls	**($4.90)**
Payment received for writing January 2010 $30 calls	$4
Total cost of rolling up	**($0.90)**
New net sell price if called	$29.10
Total return on investment (excluding commissions)	**77.8%**

It's worth making this trade-off because the end result is a potential sell price that's $3 per share higher than our previous calls, offering a 77% return on investment versus 59%, calculated on our $16 cost basis for the stock. Plus, even though we will in effect *pay* a bit ($0.90 net) to roll up our covered calls, the $30 calls will be in our portfolio as a hedge, providing $4 in downside protection. If Autodesk declines below $30 by expiration, our portfolio earns the $4.

The main downside to rolling up is that we'll be more exposed. Our original covered calls currently hedge for a $7 decline in the stock, to about $23, but our new covered calls will only hedge for about $4 in downside risk, to around $26. But this is acceptable. If Autodesk declines sharply, it's a recurring-revenue business that we're comfortable holding for the long haul.

Another downside: We *are* adding six months to our trade with the new calls' later expiration date. Because the stock ran much higher than our original strike price, and we want to roll to a much higher strike, we need to go forward many months. Again, this is a fairly good problem to have. By following a stock higher with your covered calls, you can increase your upside — recapturing gains that have already been achieved by the stock — while still keeping a hedge in place. All we need is more patience, just as we do when owning any stock.

How to Follow Along

Tip: Broker Commands

If your broker won't let you roll your covered calls with a single "roll" command, you'll simply need to "buy to close" your existing calls, and then "sell to open" the new ones separately.

Enter a two-legged order to "buy to close" your existing $24 calls, and write ("sell to open") an equal number (if you want to cover the same amount) of January 2011 $30 calls (as always, one call for every 100 shares you wish to cover).

Because the $24 calls cost around $7, and the $30 calls offer about $4, a net debit of $3 or lower is worth shooting for, splitting the bid/ask prices. (Remember, even though you're now paying $3 or so on this trade, you were originally paid about $2 to write the $24 covered calls, so your net cost to roll up from a $24 strike to a $30 strike is around $1.) You can aim for lower than a $3 debit if you have patience. As long as your shares aren't called away early, time will generally work in your favor when rolling covered calls because the time value on your soon-expiring options will erode much more quickly than the time value on later-expiring covered calls.

If you have questions about rolling your covered calls, or on Autodesk trades in general, please visit the Autodesk board.

Write Puts and Covered Calls on Lindsay

Published Apr 7, 2010 at 12:00AM

At a Glance

- **Puts:**
  - **Action:** Write ("sell to open") September 2010 $35 puts
  - **Allocation:** 3% (for *Pro*, 10 contracts), for 4% total
  - **Option's recent bid/ask:** $2.35/$2.55
  - **Preferred limit price:** $2.35 to start ($2.10 is a preferred minimum; 6% in five months)
  - **Alternate trade:** Write June 2010 $35 puts, recently $1. Or, wait and aim to buy the stock on a drop to around $34.50.
- **Covered calls:**
  - **Action:** Write ("sell to open") September 2010 $40 calls
  - **Allocation:** Write one call for every 100 shares owned (for *Pro*, 3 contracts)
  - **Options recent bid/ask:** $3.20/$3.50
  - **Preferred limit price:** $3.20 to start.
  - **Alternate trade:** If you don't own shares of Lindsay yet, just write puts (see above). If you own fewer than 100 shares, continue to hold them.

What's New

Tip: Is This a Strangle?

Yes, writing puts and covered calls on a partial position is usually called a covered strangle, but what we're doing here is lopsided — heavy on the puts. Read on!

The market has given irrigation equipment provider **Lindsay** (NYSE: LNN) a bumpy ride over the past six months, as the stock swung from our preferred buy price of $34.50 to our sell price in the mid $40s at least twice. We wrote puts and covered calls to profit on the volatility while maintaining a modest 1% position (of a targeted 5%).

We continue to be impressed by Lindsay's strong balance sheet and cash flow despite its sharp drop-off in sales over the past year as farmers slowed spending in the recession. Lindsay's net cash position (cash minus debt) is $69.1 million, which is encouraging for a $490 million company caught in a down cycle. When farming sales pick back up, Lindsay is positioned for growth, and its cash provides plenty of dry powder for strategic acquisitions. CEO Rick Parod said Lindsay is looking to acquire companies in water conservation and management businesses, rather than just remain in water infrastructure. Although risky, this diversification could certainly boost Lindsay's market size.

On the infrastructure side of the business, where Lindsay provides, among other things, movable barrier systems to redirect traffic, a Mexico City project is complete, and a halt in the federal highway spending bill in Congress has created uncertainty about the division's U.S. sales. We consider these domestic challenges to be temporary and ultimately expect that international projects will offset any weakness in the U.S. side.

Why This Strategy

The prospect of Lindsay making acquisitions in a related market is enticing, but we can't bank on added value before it arrives — so we're sticking with our preferred buy price and estimate of fair value on the stock. After Lindsay's fairly good earnings report, for the first part of this trade, we're writing September 2010 $35 puts that could potentially net us another 3% (10 contracts for *Pro*) at around $32.65, yielding us 6.7% in less than six months. For our second trick, we're writing $40 covered calls on the 300 shares we already own, since we'd be comfortable selling them at a net price of $43.20 (and an effective price above $50 including what the puts pay us). Combining these option payments, at the very least we'll earn strong income on the stock.

How to Follow Along

You know the drill. You write ("sell to open") puts when you're ready to buy a stock if it's below your strike price by expiration. You write ("sell to open") covered calls when you're ready to sell shares of a stock you already own if they trade above your strike price by expiration. In this case, the numbers stack up like so:

- **Puts:**
  - **$35 put option yield (at $2.35 bid):** 6.7% in 5.5 months
  - **Strike price:** 10% below Lindsay's market price of $39
  - **Break-even:** $32.65, 16.2% below the current share price (not including the covered call income)
  - **Cash needed:** Each put you write represents a potential stock purchase of $3,500.
  - **Return on buying power:** Writing puts with a 30% cash-secured requirement, the potential return on buying power is 22.3%.
- **Covered calls:**
  - **$40 call option yield (at recent $3.20 bid):** 8.2% of the $39 share price
  - **Option yield on our $31.55 average cost basis:** 10.1%
  - **Upside from today if sold at a net $43.20:** 10.7% (not including the put income)
  - **Total return on position if exercised:** 36.9% (not including the new put income or our past options trades on Lindsay)

Combined, the 10 puts and three covered calls will pay the *Pro* portfolio approximately $3,300. Questions? Please visit our Lindsay board.

Monday Memo: Browse the Business Before You Buy

What's New: *Options* Team Chat, My Scorecard Upgrade

Live options chat today: *Pro*'s sister service, *Motley Fool Options*, is hosting a live chat today from 6 to 9 p.m. ET. Bring your questions about calls, puts, straddles, and strangles to the *Options* team (which includes *Pro*'s own Jeff Fischer) right here.

New-look My Scorecard: Have you given *Pro*'s revamped My Scorecard a test-drive yet? Click on over to add multiple tickers at once, create a watch list, gather Fool content related to your stocks, and more; then, read how we're working on your suggestions by visiting our My Scorecard Foolsaurus wiki page. And don't forget to tell us what you think on our boards!

This Week in CAPS: TMFEldrehad demonstrates how to catch rising and falling stock stars using the CAPS screener.

An investment should never be a blind date. As business-focused investors at *Pro*, we don't trade based on temporary market moves or chart patterns, but rather on the health and promise of an underlying business that can be purchased at a good price.

In a special feature last month, I gave you a closer look at how*Pro*values companies — but valuation is actually one of the *last* steps we take before we make a formal trade recommendation to you. Today, I'll cover two ways we can take our first look at a company. Using a real-life example, I'll walk you through two handy frameworks that help us better understand a business's inherent risks, competition, and growth potential.

A Toast to SWOT and OATS

The framework I typically start my stock analysis with is SWOT, which stands for strengths, weaknesses, opportunities, and threats. This gives us a good initial sense of the business side of a company's prospects. OATS, which stands for ownership, allocation, tenure, and stewardship, actually comes to us from our fellow Fools at *Million Dollar Portfolio*. They use OATS to gain insight into management, including whether the team is experienced and proficient, how it's incentivized, and if the company's leaders have personal stakes in the fate of the business.

Using SWOT and OATS, I've been getting a taste of **Boston Beer**, better known as the brewer of Sam Adams, over the past few weeks for *Pro*. Let's go over what these tools revealed in my first official look at the company.

SWOT

- **Strengths:** A strong reputation for quality and flavor helps Boston Beer maintain pricing power, while its status as the largest independent, publicly traded brewery based in the U.S. gives it some clout with distributors and consumers. It has a proven track record of turning innovations into commercially successful products, a solid balance sheet with no debt, and consistently generates free cash flow.
- **Weaknesses:** The business is sensitive to commodity prices — malt, hops, and yeast for beer production, and oil and packaging materials for transportation. Consumers have many substitutes (i.e., wine, liquor, and Jeff's favorite, wine coolers), and a change in taste trends could affect the entire beer business.
- **Opportunities:** Nearly all sales come from the U.S., so future international expansion could provide sustainable sales growth. What's more, the "Better Beer" category (Sam Adams is No. 3 in this category after imports Corona and Heineken) has plenty of room to get even better: It accounts for just 20% of the total U.S. beer market. Boston Beer recently shifted brewing and distribution channels from contracted to company-owned, which should improve quality, reduce costs, and strengthen the brand overall.
- **Threats:** The competition is no joke. Two large conglomerates (**Anheuser-Busch InBev** and MillerCoors) already control 94% of U.S. beer production, excluding imports, and are entering the Better Beer category through innovation and acquisition of craft brewers.

OATS

- **Ownership:** Chairman and founder Jim Koch (yeah, the guy from the commercials) owns 32% of total shares and all Class B voting shares. The few rights of Class A shareholders (potentially, us) are approving certain mergers, acquisitions, and by-law amendments, as well as electing a minority of directors.
- **Allocation:** Returns on capital and equity are consistently in the 17% to 20% range, while tangible book value has grown an annualized 17.4% over the past five years. Management has done a fine job creating shareholder value.

- **Tenure:** Koch founded the company in 1984 and remains engaged as chairman and sole Class B shareholder. CEO Martin Roper has held his position since 2001 and been with the company since 1994. Koch's father, Charles, serves on the board, but is a retired brewmaster himself — in fact, he passed down the Sam Adams recipe, which has been in the family since the 19th century.
- **Stewardship:** The company has a compensation-recovery policy, which allows it to recover incentive income from executive officers who engage in intentional misconduct. Executive compensation benchmarks change annually, but in 2009, the CEO's bonus goals were mainly based on depletions growth (distributor sales to retailers), cost reductions, and profit margins. Admirably, CEO Roper did not take a salary increase in 2009 due to the economic downturn.

Putting It All Together

My SWOT and OATS analysis shows that there's a lot to like about Boston Beer's business, including its sound balance sheet, the Koch family passion for making beer, and solid returns on the business model. As a side note, I was blown away by the three-hour wait when I visited the Sam Adams brewery in Boston this winter. Sure, it was *free beer*, but how many breweries have hundreds of people happy to wait in the freezing rain for a few pints? Clearly, the Sam Adams brand carries real clout with its core consumers.

The next step in our process is to dig further into the financials and, finally, run a valuation. A quick glance shows that the company is trading at a trailing price-to-earnings ratio of 24, so initially I'd say the stock is a little pricey in this market. Truth be told, getting a good price for Boston Beer isn't easy, as it's one of those premium businesses that usually carries a premium multiple to the market. We'd prefer to nibble closer to its 10-year average price-to-tangible book value of 3.7, or about $44.50 (16% below current prices). The put options pay pretty well, so depending on our valuation results and if shares give up some ground, we could consider writing puts to potentially gain entry into this strong consumer brand. I think we will have a chance if we stay patient, focused, and Foolish.

Now, let's hear from you: What do you think of Boston Beer? Sound off on the Stocks That Interest You board.

Foolish best,

Todd Wenning

Write Puts on Oracle

Published Mar 30, 2010 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") June 2010 $25 puts
- **Allocation:** 2.5% (for *Pro*, about 10 contracts)
- **Option's recent bid/ask:** $0.85/$0.87
- **Preferred limit price:** $0.80 or higher
- **Recent stock price:** $25.60
- **Alternate trades:** Write September 2010 $24 puts, recently $1.14, or September 2010 $25 puts, recently $1.50. Or, aim to buy shares outright if they decline to around $24.

What's New

Enterprise-software behemoth **Oracle** (NYSE: ORCL) grew sales a solid 17% in its fiscal third quarter of 2010, while boosting earnings per share 9% (including adjustments to GAAP earnings), to $1.9 billion. Meanwhile, new software licenses jumped 13%, to $1.7 billion, a strong sign of the company's future prospects — and management expects a heady 35% to 40% increase in revenue in the upcoming fourth quarter. The pipeline for new sales contracts is large and robust, management says, and the integration of Sun Microsystems is moving along smoothly and successfully.

Why This Strategy?

Oracle recently bought back $250 million worth of stock at about $24.28 per share — a buy price we find attractive, too. Recently trading at $25.60, shares fetch a reasonable 16 times free cash flow, but this multiple should decline as the business grows over the coming year. Our main goal with writing $25 puts, using a strike price near the current share price, is to have a shot at getting our second slug of shares soon — but closer to our desired buy range of $23.50 to $24. The stock trades at 15 times earnings estimates for the year ending May 2010, and with any luck, we can get shares cheaper.

How to Follow Along

When you write puts, you agree to buy 100 shares of the underlying stock for every put you write if the share price falls below your strike price by expiration. You want to target an attractive buy price and be paid well enough to make the strategy worthwhile.

- **Option payment or yield (at $0.85 bid):** 3.4% in about 80 days
- **Option strike price:** 2.3% below the recent share price
- **Break-even price:** 5.7% lower, at $24.15
- **Cash or buying power needed:** Each put option you write represents a potential purchase of $2,500 in Oracle stock.
- **Return on buying power:** Writing puts with a 30% cash-secured requirement, the return on buying power is 11.3% in less than three months. If you write 100% cash-secured puts, the return is 3.4%.

We'll complete this trade in the next one to 30 days. To discuss it, please visit our Oracle board.

Jeff owns shares of Oracle.

Monday Memo: 4 Lessons From a Fall

Published Mar 29, 2010 at 12:00AM

Coming Up: My Scorecard

We're upgrading My Scorecard! You'll soon be able to enter multiple tickers in one click, customize the Fool coverage *you* want, and watch stocks you don't yet own, all while still tracking your performance. The new and improved My Scorecard debuts later this week, so stay tuned!

Pro Earnings and Events

- Shares of **Plum Creek Timber** recently rose to $39, so we're moving this stock back to Hold.
- **Oracle** reported strong quarterly results Thursday. We'll have more on this Buy First stock soon — including the possibility of another trade, as Jeff hints in his post.
- **Lindsay** reports results on March 31. Average estimates call for $0.33 per share in earnings on $78.7 million in revenue.
- The FDA has questions about **Electro-Optical Sciences**' pre-market approval application for the company's only product, MelaFind, and has extended the review another 180 days. Read Jeff's update here.

Pro Community

- *Pro* member Brent asks, "What's the value of *Pro* without options?" and members chime in with their experiences.
- *Pro* member Hoping2Retire is wondering about **Kia Motors**. Do you know much about the company?
- This Week in CAPS: TMFEldrehad turns to CAPS as a way of finding stocks that might be all sizzle and no steak.

The stock market's current chapter will be studied for generations — but for those of us investing to grow wealth during *this* lifetime, we don't have the luxury to reflect for years on end. And while we may not see anything quite like the crash of 2008-09 in the future, the market will certainly drop sharply at some point again. Given that, what recent lessons can we hold onto as we aim to improve and thrive as investors?

1. **Don't panic.** The S&P 500 fell off a cliff in October 2008 and didn't touch bottom until March 2009. The tumble tested the will of every investor — and those who stuck it out, holding onto the stocks of strong companies rather than selling in fear, are grateful today. So the next time the market declines, remind yourself that solid stocks can only fall so much before they offer great value, attract buyers, and rebound. (And if you forget, we'll be here to nudge you.)
2. **Know your investments and your time frame.** When you're confident about your favorite companies' cash flows, balance sheets, businesses, and management teams, it's much easier to ride out a storm. A good test is to think about a favorite stock five years from now: Is the company likely to be larger and its shares worth more? If not, why own it in the first place — bear market or *any* market?
3. **Keep some powder dry.** After sitting on a vast stash of cash for years — even as stocks climbed in the mid 2000s — Warren Buffett and Charlie Munger finally invested $15.5 billion during the recent financial crisis. The investing gurus had liquidity when others didn't, so they were able to score great deals. Patience and a strategic supply of cash allow you to scoop up rare opportunities and can propel your investing career.
4. **You don't need to go all in or all out.** Even during the crisis, Buffett stuck to his discipline of buying stocks gradually and only invested *some* of his cash. He still sits on a mountain of money today, and although it's earning a pittance, he says he sleeps well knowing it's there.

That last point is crucial: Like Buffett, aim to be a calm, thoughtful tortoise rather than a frenetic hare. Along with a steady discipline, this is the key to investing success. At *Pro*, we're investing at our own pace, keeping some cash on the side, and using hedges — helping you earn healthy returns while taking less risk. When we do hedge, a one-way, straight-up market may test our patience, but leaving ourselves ample upside helps keep us happy, and making valuation-based sell decisions keeps us disciplined. Along those lines, covered calls provide a good lesson in sticking with a strategy until the time is right to change it.

Bonus Lesson: Rally Markets and Covered Calls

The market has continued to climb since February — and some of you on our boards have expressed concern about your covered calls and strangles. The fear is that you'll miss additional upside. But rest assured: We're on it.

We're watching all of our covered call and covered strangle positions, and as they get closer to expiration and the calls lose time value, we'll often aim to roll them up to new, higher prices (buying to close our existing options, and writing new ones) in a way that maximizes our potential profit while keeping the stock. It's even easier to do this profitably with a covered strangle (since you've made money on the puts you wrote), but it's usually beneficial to wait until closer to expiration. The covered call expirations we have coming up are:

- May: **Expeditors International of Washington** strangle, **Waters** strangle, **ProShares Short S&P 500** covered calls
- July: **Intel** strangle, **Tupperware** strangle, **Autodesk** covered calls, **U.S. Natural Gas Fund** diagonal calls
- August: **Plum Creek Timber** strangle

Right now, it's in our best interest to let these trades keep going as is. *All* of these positions except Autodesk have more upside in the stock compared with today's net sell price (taking option income into account). So, even in this roaring bull market, we have breathing room before we may start to miss upside in our hedged positions. While we wait, our covered calls cancel out some of our stock gains, but this return-dampening affect will wane (if not disappear entirely) as expiration draws closer and time value in the calls diminishes. Meanwhile, we have downside protection via the covered call premiums. All this helps us breathe easier.

Why We Invest Foolishly

A parting thought: When you invest in individual stocks rather than just putting your money in an S&P 500 index, you're making an active choice. As a *Pro* Fool, you use options (and own some high dividend-payers) for steady income; you hedge to decrease your risk and smooth your results; and you gain exposure to wide swaths of the market via ETFs. Earning healthy returns with less risk is an excellent way to build a portfolio. And what will eventually make Foolish investing much more worthwhile than investing in an index are those few exceptional winners — stocks that skyrocket 200%, 300%, 500% — that push you far over the top. As we achieve some exceptional winners over the years, and we combine them with our other *Pro* strategies, we'll have a great deal to be happy about as we invest together — and work toward financial freedom.

Invest well,

Jeff Fischer (TMFFischer)

Quick Note: A Portfolio Hiccup

Who melted the **Tupperware**? On *Pro*'s all transactions page, you'll see some "buy to close" Tupperware call-option trades last week. The Fool elves who make our trades accidentally wrote twice as many calls in our covered strangle as was intended. The position was closed for the same price, so commissions are our only cost. Even though we may be Fools, we're only human.

Jeff owns shares of Oracle.

Write Covered Calls on Cameco

Published Mar 23, 2010 at 12:00AM

At a Glance

4/22/10 Update

Fools, we no longer recommend you make this trade. *Pro* is obligated to complete our trades within 30 days, so although these calls only paid us $0.04 each (ouch!), we've chosen to write them. This keeps us aligned with you. What's next? These calls are set to expire in 30 days, after which we'll decide our next move.

- **Action:** Write ("sell to open") May 2010 $29 covered calls.
- **Allocation:** Write one call for every 100 shares of Cameco owned (for *Pro*, seven contracts)
- **Option's recent bid/ask:** $0.75/$0.80
- **Preferred limit price:** $0.75 or higher; if needed, no lower than $0.65
- **Recent stock price:** $27.50
- **Special requirement:** You must own at least 100 shares of Cameco to write a covered call.
- **Alternate trades:** If you don't own Cameco, consider writing September 2010 $24 puts, recently $1.15, or September $25 puts, recently $1.45.

What's New

Cameco (NYSE: CCJ) represents an interesting dichotomy: On one hand, management expects sales and earnings to dip in 2010 because it sold off gold assets for a large gain last year and uranium sales are expected to soften this year. Most utilities are well-stocked with the commodity, and the U.S. government continues to sell uranium on the open market.

But on the other hand, Cameco sees uranium demand growing considerably by 2015 as more than 50 nuclear power plants — now in various stages of production — start to get fired up and begin to lock in uranium supply beforehand. To prepare, Cameco aims to double its uranium production by 2018. However, this is obviously still years away, and the stock trades near our fair value of $31 — although even at a recent $27.50, Cameco fetches nearly 22 times this year's normalized estimated earnings per share, quite a sunny valuation.

Why This Strategy?

As in January, we're writing covered calls to create a modest hedge while earning income or selling our shares at a higher price (one near our fair value estimate). The May 2010 $29 calls expire in less than two months and would afford us an exit around $29.75 (an impressive 80% gain for *Pro*). That said, if Cameco moves up on news that makes us want to keep our shares, we can consider rolling our covered calls up and out, to a higher and later strike. The early expiration date of these options might make that easier.

How to Follow Along

Pro's guide to covered calls explains this income-generating, stock-selling option strategy — please revisit the guide if you need a refresher. You can write ("sell to open") one call for every 100 shares of stock owned.

- **Option yield at $0.75 bid:** 2.6% of the $29 strike price, expiring in 60 days
- **Option yield on our $16.52 purchase price:** 4.5%.
- **Return from today's price if sold at a net $29.75:** 8.2%
- **Total return on position if exercised:** 80%

We'll complete this trade in the next one to 30 days. To discuss or ask questions, please visit our Cameco board.

Write Puts on SPDR KBW Regional Banking

Published Mar 23, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") May 2010 $26 puts
- **Allocation:** 2% (for *Pro*, about 10 contracts) for 4.5% of 5% total
- **Option's recent bid/ask:** $0.85/$0.95
- **Preferred limit price:** $0.90 to start; $0.75 minimum (3.4% yield in two months)
- **Alternate trade:** Buy shares of the ETF around $25 to $26

What's New

Nothing has materially changed since our recent purchase of **SPDR KBW Regional Banking** (NYSEMKT: KRE) ETF earlier this month. Read our original report below to get our full take.

Why This Strategy?

We believe that, as a group, the 50 regional banks in SPDR KBW Regional are in fair health, and the valuation offers long-term potential returns. We'd like to buy as much of our position near $25 (or lower) as possible.

Meanwhile, investor confidence in the economic recovery seems to be growing — and while there could be setbacks along the way, it's likely that this diversified ETF will continue to trade with less volatility than the market overall (in fact, its three-year beta is 0.76 — 24% less volatile than the S&P 500 over the same period). Over the next two months, these puts should provide us the opportunity to buy more shares a bit cheaper than our original stake, or earn income if not.

Option Specifics

You write ("sell to open") puts when you're ready to buy shares of a stock or ETF if it declines below your strike price by expiration.

- **Option payment or yield (at $0.90):** 3.4% in 60 days
- **Option strike price:** 1.9% below current share price ($26.50)
- **Break-even price:** 5.3% below current share price
- **Cash needed:** Each put you write represents a potential stock purchase of $2,600

Can't Write Puts?

If you're unable to write puts, consider buying shares of the SPDR KBW Regional ETF outright, especially on price dips. This Buy First holding remains close to our preferred buy range, around $25. To discuss the new trade or the ETF, please visit our KRE board.

Monday Memo: Time to Get Active With Pro

Published Mar 22, 2010 at 12:00AM

Pro News and Events

- Our March covered calls on **Cameco** and **Lindsay** expired for a full cash gain this weekend.
- **Oracle** will report earnings on March 25.
- **Lindsay** will report earnings on March 31.

In the *Pro* Community

- Health-care stocks racked up some gains as the health-care bill survived the House. The many health-care stocks in *Pro* still look inexpensive.
- **Intel** is up. Members ask, what now?
- In CAPS, TMFEldrehad looks at more shooting 5-stars.

Ch-ch-ch-ch-Changes

- **FPL Group** plans to change its name to **NextEra Energy**.
- Meanwhile, **Electro-Optical Sciences** is switching its name to **MELA Sciences**.
- Maybe Warren Buffett should change careers: Watch him kick out the jams in a new Geico video.

As the *Pro* portfolio becomes more fully invested, things are going to change a bit. We'll be quicker to sell positions that we deem fairly valued in order to buy undervalued stocks — and we'll start to manage many of our option positions more actively.

At *Pro*'s sister service, *Motley Fool Options*, Jim Gillies recently talked about follow-up steps that you can consider on covered call trades, and I wrote about the lesser-used follow-up steps to consider on puts you write. Combine the two strategies, and what do you have? That's right: Covered strangles. These double-your-options strategies can double your fun, because you'll often enjoy double the benefits from follow-up action.

Our current lineup at *Pro* includes covered strangles on **Plum Creek Timber**, **Tupperware**, **Intel**, **Waters**, and **Expeditors International of Washington**. In many cases, even when the stocks appreciate a reasonable amount, we'll have the ability to earn a profit on the combined options *and* keep the stock for more appreciation by managing the strangle before expiration.

Shake, Strangle, and Roll

New dance craze, or profitable options strategy? The typical follow-up action on a covered strangle includes rolling it *out* to a later expiration month, and sometimes rolling it *up* (or down if necessary) to a different strike price. Often, it makes the most sense to adjust your strangle after most of the time value from the original covered calls has been squeezed out. There will be times, however, when rising stock prices will demand a call to action with some time value still in place.

So get ready to get rolling, *Pro* Fools, because we'll be initiating more follow-up activity on our options in the near future. We'll do so wherever possible to maximize profits while still keeping risk in check. We're also working on new options guides to help you along the way, including how to master following up on covered calls, written puts, and strangles, as well as a guide to using in-the-money options (both long and short).

You’re in the Money

Greece 2010: The End of the Euro?

New from the Fool: Get full coverage of how the crisis in Greece could affect the euro, global finance, and your portfolio at foolgreece2010.com.

Speaking of in-the-money options, that's another activity you'll see more of from *Pro* in the coming months: *buying* options (calls or puts), often in-the-money, to help us profit with greater magnitude on the movement of a stock, yet with manageable risk and less capital required. As our cash balance starts to diminish, we can get more bang from our remaining bucks and — since we'll have most of our funds in stocks and ETFs — have less overall portfolio risk when buying options. All of these together mean it's in our favor to be options buyers more often than we have in the past.

Remember, Fools, it takes time and patience when you're building a portfolio and trying to get all of its parts moving harmoniously, especially considering the topsy-turvy economy and stock market we've had over the past 18 months (and counting). We're looking forward to the next stage of *Pro* and building a winning portfolio with you, helping you begin to more actively manage your *Pro* stocks for the most potential benefit.

Are you fully invested? Chime in on the Memo Musings board.

Fool on!

Trading Window Update

With The Motley Fool's recent launch of *Special Ops*, we're making an adjustment to the trading window for all of the Fool's real-money portfolio services. Once any of our real-money services announces a trade alert, that service will wait at least 24 hours (rather than two days, our previous minimum window) to buy or sell the stock, fund, or ETF. (Our options trading rules remain unchanged.) As before, the services must execute any announced trades within 30 days. This across-the-board adjustment ensures that all of our real-money services are restricted to the same trading rules. This change takes effect March 31, 2010.

You can rest assured that our revised policy does not affect how you use the Foolish investing services you've come to rely on — and profit from — and still allows you to get in the game ahead of us on every real-money trade we make. And if you have any questions, the Motley Fool customer service team is ready to help. Just call 888-665-3665, 9 a.m. to 5 p.m. ET, Monday through Friday.

The Pro Way to Value Stocks

Published Mar 16, 2010 at 12:00AM

There's little consensus on the right way to value a stock — except that it's part art, part science. Compare it with valuing a piece of artwork such as Andy Warhol's "200 One Dollar Bills" silkscreen, which recently sold for a staggering $43.8 million. How would you justify that price when the *materials* probably cost 200 one-dollar bills? To start, you could attribute much of the value to the Warhol name. Then you'd probably consider the meaning to the buyer, the piece's importance relative to other works, and what someone else might pay for it down the road.

Using that same thought process, how would you justify a $560 price tag for a share of **Google**, or for that matter, the price given to *any* particular stock?

Some rely on "relative" valuation (described in this Monday Memo), comparing multiples such as price-to-earnings with the same metrics for competitors, but at *Pro*, we prefer to focus on the company's underlying fundamentals — like cash flow and earnings — rather than where the stock may trade relative to competitors.

The Value of Future Cash

More often than ever, earnings per share is manipulated by one-time charges, non-GAAP accounting, and subjective management teams that do all they can to make earnings look better. But cash is *fact*. By estimating how much cash a company will make available to shareholders after it invests in new assets and satisfies other obligations (i.e., to lenders and pensions), we can begin to determine how much that future cash is worth in today's dollars — and can then estimate the intrinsic value of a stock. This is known as discounted cash flow, or DCF, analysis.

To illustrate, say your friend Steve offered you $1,000 today or the promise of $1,000 five years from now. You'd be foolish (lower case "f") not to take the $1,000 today, because you can put that money to work earning interest — and assuming inflation follows history, $1,000 will buy more goods today than it will in five years. But what if Steve asks how much you'll *pay him* today for his promise of $1,000 five years from now (just as you pay a company for the promise of future cash flows)? This is a tougher question. You need to factor in expected inflation over the next five years in addition to a decent rate of return relative to Steve's trustworthiness (for this exercise, we'll consider his word his bond). Let's say the rate that we believe fairly compensates us for expected inflation and for the risk of lending to Steve is 6%. The equation to determine how much you'd lend Steve today would be:

Future value / (1 + interest rate)$^{\text{number of years}}$

or

\$1,000 / $(1.06)^5$ = \$747.26

So, the amount we should pay today for Steve's $1,000 in five years is $747.26.

Taking it a step further, if Steve said he'd pay us $1,000 in year five and another $1,000 in years six and seven, now how much would we pay today?

Time of Cash Flow	Amount of Cash Flow	Formula	Present Value
Year 5	\$1,000	(\$1,000 / $(1.06)^5$	**\$747.26**
Year 6	\$1,000	(\$1,000 / $(1.06)^6$	**\$704.96**
Year 7	\$1,000	(\$1,000 / $(1.06)^7$	**\$665.06**
Sum			**\$2,117.28**

Put simply, you would give Steve $2,117.28 today for the promise of three $1,000 payments delivered in years 5 through 7.

This second example is closer to what we do at *Pro* when we value a company: We estimate future cash flows, discount that cash at a rate that adequately reflects its risk, and come to a fair value for the cash today.

Two Kinds of Free Cash

Unfortunately, there's no "Steve" in the stock market telling us exactly how much he'll give us down the road. So, how do we determine which cash flows to measure? When valuing a company, we target the cash flows left over — the "free" cash — after the company has invested in projects to further grow the business (i.e., capital expenditures and acquisitions). In other words, this is the cash that *could* be paid out to investors and is thus cash we can use to measure value. There are two major types of free cash: free cash to firm and free cash to equity.

- **Free cash flow to firm (FCFF)** is what's left over before the company has paid interest to debt holders and after corporate reinvestment needs.
  - **How to calculate FCFF**: Start with after-tax operating income, add back non-cash depreciation expenses, and subtract capital expenditures and changes in working capital (current assets minus current liabilities).
  - **What's the discount rate**? Because you're factoring both the cost of debt and equity for the firm, you discount FCFF at the company's weighted average cost of capital, a mix of its cost of debt and equity.
  - **Done. Then what?** Back out all non-equity commitments (debt obligations, operating leases) and add back cash to arrive at the equity value — the number we care about as equity investors. Divide that amount by the number of shares outstanding to get the fair value per share.
- **Free cash flow to equity (FCFE)** is cash left over after all non-equity obligations have been met.
  - **How to calculate FCFE**: Start with net income, add back non-cash depreciation expenses, and subtract capital expenditures and changes in non-working capital. Any new debt proceeds received by the company could theoretically be paid out to equity holders as a dividend, so that should also be added to the calculation.
  - **What's the discount rate?** FCFE is discounted at the company's cost of equity, traditionally measured by the capital asset pricing model, or CAPM, which factors in a risk-free rate (for valuations done in U.S. dollars, this is the 10-Year Treasury rate), the investment's beta (to measure relative risk to the market), and the equity risk premium (compensates investors for extra risk with stocks over bonds).
  - **Done. Then what?** Divide the equity value by number of shares outstanding to get the fair value per share.

Valuation models using either free cash flow to firm or equity should arrive at the same conclusion, but depending on the type of company being analyzed, one model can be "better" than the other. For instance, companies with fluctuating levels of debt makes projecting future equity cash flows difficult, so it's more prudent to value the entire firm using free cash flow to firm and back out all non-equity obligations. On the other hand, for companies with no debt or stable debt ratios, like **Expeditor's International of Washington**, free cash flow to equity valuations can be much clearer.

Play With Numbers

More DCF Fodder

There's much more to learn about discounted cash flow analysis, so if you're interested in learning more, we recommend two books by our friend, NYU Professor Aswath Damodaran: *Damodaran on Valuation* and *The Dark Side of Valuation*. His website also offers tremendous information on the markets and has various valuation spreadsheets.

At *Pro*, we test various scenarios for each company's projected free cash flows to determine a range of potential values. We believe valuing a company to the penny, as many Wall Street analysts do, is an exercise in futility because it assumes you've perfectly modeled the future. We're not so overconfident to think that we know a company's exact standing five years from now or more, so we use fair value ranges based on various scenarios to provide you with our best estimate of the company's value.

The ultimate objective to valuing a stock is to make sure you're paying at least a fair price for your investment — one that should generate attractive returns — and obtaining a suitable margin of safety. The primary goal at *Pro* is to close at least 75% of our positions profitably, so ensuring that we don't overpay for investments is paramount. Overpaying for a stock is one of the most common causes of permanent loss of capital.

Pro Bottom Line

Just as each art appraiser has a slightly different method of valuing art, each investor will have a different formula for valuing stocks — but we consider DCF analysis the best way to value the underlying business, which in turn helps us make smarter long-term investments and better options trades. If you have more specific questions on valuation, please post them on the Philosophy & Strategy board.

Monday Memo: Pro's Biggest Update Ever, Plus Moves for Today

Published Mar 15, 2010 at 12:00AM

Happenings in *Pro*

- March 16: **Plum Creek Timber**'s Analyst Day.
- March 20: Our **Cameco** and **Lindsay** covered calls expire.
- March 25: **Oracle** reports quarterly results.
- TMFValuemoosie shares *Pro*'s latest earnings calendar.
- This Week in CAPS: TMFEldrehad explains how you can participate in an academic study being conducted by a CAPS member.

The Death of the Euro?

Greece's economic crisis could reshape global finance — and rattle your portfolio. Follow the story in real time as Tim Hanson and the *Global Gains* team head to Greece for on-the-ground coverage. To learn how you can profit from this historic development, enter your email address here.

With its steady climb since early February, the market seems intent on sustaining its year-long rally, the largest in 76 years. Although the surge makes for dramatic headlines, stocks are just reclaiming some of their losses from the March 2009 low — the largest *panic* in generations. Given the economy's weakness, the market probably won't reclaim all of its losses anytime soon — but making up *some* ground for now is enough for us to profit.

At *Pro*, we're investing to build value over the coming years by purchasing reasonably priced stocks of strong companies that we believe will grow and be more profitable in the future. More than ever, we're attuned to the macro picture; we want to make healthy returns but with less risk in this uncertain economy. We're not relative-returns investors, but if we can keep up with the biggest rebound in our lifetimes while investing in lower-risk stocks with strong potential and initiating occasional hedges and shorts (not to mention while having cash, too), we'll be in good shape when the market gives up ground, too.

Our Latest Guidance

So, where do we stand now? After going over the most recent results for every *Pro* holding, it's time to update our guidance and provide suggestions for some new trades that you can make today.

You'll see a new batch of Buy First stocks (most are out of favor, which is when you *want* to buy — but they may require patience), and we raised some stocks' preferred buy prices. Which brings us to an important reminder, Fools: Just because a stock ticks above its preferred buy price doesn't mean the investment has lost its luster. We're buying companies we expect to significantly appreciate in value over the coming years, so if you buy within 5% to 7% of the preferred range, you'll still have a margin of safety and more than enough upside.

Now let's quit chatting and get to the visual — starting with our latest guidance on every *Pro* position.

Pro Positions, All in One Take

Investment	Recent Price (3/12/10)	Preferred Buy Around Price	Fair Value Estimate	What to Do	Quick Take
AmTrust Financial Services	$14.20	Increased from $12 to $13	$18	Moved from Buy First to Buy	Book value is above $9 and management expects a strong year. AmTrust still offers growth potential.
Autodesk	$29.16	$22.50	$32	Hold	Was the strong fourth quarter due to an increase in year-end orders or does it signify an upward trend? Even management doesn't know. We wrote covered calls on our shares.
Cameco	$28.21	$24.50	$31	Hold	Utilities are well-stocked with uranium for 2010, but Cameco is investing for strong growth in the years to

					follow as new power plants come online. We wrote covered calls on our shares.
Ebix	$17.23	$18	$24	Buy	Earnings grew 40% last quarter, and estimates call for just 16% growth this year. As acquisitions take root, there's the potential for upside surprises.
Expeditors International of Washington	$37.21	$30	$38	Moved from Buy to Hold	After a climb in stock price, Expeditors is on Hold for new stock purchases; if you already own shares, you can write a covered strangle.
Flowserve	$105.12	Increased to $87 from $80	$110	Hold	Earnings per share are expected to level off this year before growing again at this well-run valve, seal, and pump producer.
FPL Group	$47.07	$55	$62	Moved from Buy to **Buy First**	This green utility has a stock that offers value, the stability of a regulated business, and pays a dividend. Compared with book value, shares are near their lowest valuation in a decade.
GlaxoSmithKline	$37.82	$44	Low $50s	**Buy First**	The stock's been knocked around on concerns surrounding a few notable, but not vital, drugs. Europe's largest drug maker rewards patient investors with its 6% dividend yield.
GrafTech International	$13.03	$13.50	$18	Moved from Buy to **Buy First**	GrafTech has nearly eliminated its debt, free cash flow remains strong, and as steel demand increases, the company may be able to pass rising material costs onto customers. With the decline in share price, we're moving it to Buy First.
Jack Henry & Associates	$23.83	Increased from $21 to $22	$30	Buy	With 90% recurring revenue, this banking software company offers stability at a reasonable price.
Kinetic Concepts	$48.92	$41	$54	Moved from Buy First to Hold	A favorable patent trial outcome sent shares up 14% last week. We're moving KCI from Buy First to Hold on price.
Intel	$21.27	$20.50	$25	Buy	This dominant tech company has a reasonably priced stock and is a good candidate for options strategies (like our recent covered strangle).
Lindsay	$43.47	$34.50	Low $40s	Hold	This volatile stock has made the round trip from the low $30s to low $40s a few times already. We aim to sell high via covered calls, buy low by writing puts, and hang onto shares for when business rebounds.
Medtronic	$43.94	$42	$52	Buy	This medical devices giant continues to grow earnings and cash flow above 10% year-over-year.
Oracle	$25.05	Increased from $22.50 to $23.50	$29	**Buy First**	Earnings are due March 25. Given Oracle's diverse, recurring customer base, we expect stability and growth.
Plum Creek Timber	$37.10	$34	$40	Moved from Hold to Buy	Timber prices seem stable and demand may slowly increase. You can buy half a position in Plum Creek and write a covered strangle to obtain an average buy price of $34 or lower *and* enjoy the 5% yield.
Procter & Gamble	$63.32	$62	$70	Buy	P&G's last quarter showed that it's gaining traction with customers around the world once again.
ProShares Short S&P 500	$50.42	N/A	N/A	Buy	This inverse ETF will benefit us if the S&P declines. We'll continue to write covered calls to lower our cost basis while allowing for ample upside.
Quanta Services	$19.13	$20	$26	Buy	Truly a long-term investment, Quanta will grow as America invests in its energy grid. With 34% earnings growth expected this year, the stock is attractive.
SPDR KBW Regional Banking	$25.70	$25	$36	**Buy First**	This ETF trades near book value, and holding 50 relatively healthy banks should create value down the road.
Tupperware	$48.55	$40	$50	Moved from Buy to Hold	Who knew Tupperware could be so profitable? Millions of party throwers, that's who. The options pay well, so we wrote a covered strangle, but recent stock gains make this a Hold for new buyers.
Vanguard Emerging Markets	$41.35	N/A	N/A	Hold	We still like the potential of emerging markets, but the major indexes trade at a premium, which historically has led to underperformance. We sold some VWO recently, but still have exposure overseas: Most U.S.-based *Pro* stocks have meaningful international sales.
Vanguard Energy	$85.38	N/A	N/A	Buy	Energy leaders have plenty of long-term potential if the global economy continues to grow.
Waters	$64.84	$55	$66	Moved from Buy to Hold	The stock has recently surged above a reasonable buy range for new investors.
Options-Only Positions					
Electro-Optical Sciences	$9.23	N/A	N/A	Buy	In April, our calls on this speculative holding could be exercised and turned into a 1% stock position at $5 per share. The FDA's decision on the company's only potential product is hoped for in 2010, but there's no firm date.
U.S. Natural Gas Fund	$7.97	N/A	N/A	Hold	Natural gas remains volatile, swinging between $4 and $6/mcf in the past few months. We're writing covered calls on our long calls, and the ETF is on Hold for new investors until it tracks gas prices more consistently.

Moves You Can Make

As promised, I've put together a list of new *Pro* trades you can consider making as of March 12, including many put-writing moves to help you build out your portfolio along with us. A few tips:

- Consider spacing out your puts by expiration month rather than writing a slew of them that expire all at once. Averaging in may afford better opportunities should the market suddenly turn south.
- You don't need to use options to build and manage a *Pro* portfolio — many stocks can be purchased outright today. Just be a bit more flexible in relation to our preferred buy prices.

Underlying Stock	Trades You Can Make	Quick Take
AmTrust	Sell to open September $15 puts, recently $1.50. You can also buy the	Writing September $15 puts nets a $13.50 start price and pays 10% if you

Financial, Buy	$14.30 shares if you don't own any yet; they're slightly above our preferred buy range.	don't get shares.
Autodesk, Hold	Sell to open October $23 puts, recently $0.85.	Though seven months out, these puts potentially land you shares near *Pro*'s buy range. The payment is only 3.7%, however.
Cameco, Hold	Sell to open September $24 puts, recently $1.20.	With flat earnings expected in 2010, patience may pay off for would-be buyers who aim for the low $20s. If not, you'll earn 5% in six months.
Ebix, Buy	Buy shares and/or sell to open June $15 puts, recently a generous $0.80 — a 5.3% payment in three months.	A volatile stock with options that pay well, there are a few ways to average into this long-term investment.
Expeditors International, Hold	Sell to open August $32.50 puts for about $1 — a 3% yield in five months.	Having jumped to $37, the stock is on Hold for new buyers, but new put-writing remains possible.
Flowserve, Hold	Sell to open July $90 puts, recently $2.50, a 2.8% yield in four months.	Management continues to impress, but the potentially cyclical nature of the business makes us want a discounted price for new buys.
FPL Group, Buy First	Buy shares and/or sell to open June $45 puts recently at $1.20; or September $45 puts recently $2.15.	The stock is in the dog house, but patient investors should eventually be rewarded while they collect a 4% yield.
GlaxoSmithKline, Buy First	Buy shares and/or sell to open April $37.50 puts, recently $0.75; or May $37.50 puts, recently $1.40.	Also in the dog house (which, again, is when you should want to buy), this stock offers value along with a 6% yield.
GrafTech International, Buy First	Buy shares and/or sell to open April $12.50 puts, recently $0.50, or June $12.50 puts, recently $0.90.	As with all investing, patience is required. Sustained increases in steel demand will drive GrafTech's business.
Jack Henry & Associates, Buy	Sell to open June $22.50 puts, recently $0.70. Shares can also be purchased, especially on a dip, since they're 7% above our preferred range.	Jack Henry should slowly continue to grow value over the years.
Kinetic Concepts, Hold	Sell to open September $40 puts, recently $1.20.	Following a spike in share price, patience *may* offer more opportunities to write puts for higher premiums later.
Intel, Buy	Buy shares alone, and/or buy half your shares and write a covered strangle, with the July $20 puts and $22 calls paying about $1.70 combined.	You don't need options to profit on Intel's expected recovery over the next few years, but we like using them to increase our chances and income.
Lindsay, Hold	Sell to open June $35 puts, recently $0.80; or Sept. $35 puts, recently $1.90.	Lindsay is currently near our sell price, but the puts near our buy price still pay decently; waiting for a drop in share price, if it comes, should increase put premiums.
Medtronic, Buy	Buy shares and/or sell to open April $43 puts, recently $1.	Medtronic appears to be taking a breather after last year's large gain — providing a chance to average in on down days or via put writing.
Oracle, Buy First	Buy your first shares (recently 6% above our preferred range), or sell to open June $24 puts, recently $0.92.	Oracle announces results March 25, so you may prefer to wait until that news.
Plum Creek Timber, Buy (to strangle)	Sell to open May $35 puts, recently $1, or August $35 puts, recently $2. Or, buy half a stake near $37 or lower and sell to open an August covered strangle with $35 puts/$40 calls for nearly $3.	Plum Creek's volatility seems to be decreasing, but options still make net buy prices below $34 possible.
Procter & Gamble, Buy	Buy shares and/or sell to open April $62.50 puts, recently $0.88.	This is simply one of those investments that lets you sleep at night.
ProShares Short S&P 500, Buy	Buy shares as a hedge.	Sell to open covered calls on your shares at strike prices at least a few dollars higher if you'd like to hedge your hedge. (Yes, we said that!)
Quanta Services, Buy	Buy shares and/or sell to open May $17.50 puts, recently $0.50; or August $17.50 puts, recently $1.	A recent *Pro* buy, we like it as much as before.
SPDR KBW Regional Banking, Buy First	Buy shares and/or sell to open April $25 puts for $0.50 or June $25 puts for around $1.20.	A new Buy First stock, we believe this ETF of 50 small banks could steadily regain value the coming years.
Tupperware, Hold	Sell to open October $45 puts, recently $3.40; or October $40 puts, recently $1.70.	On Hold even for strangle writers, though writing puts is still viable — although October requires patience.
Vanguard Emerging Markets, Hold	You can sell to open various June or September puts that net potential buy prices in the mid to lower $30s.	After a steep gain in China and Brazil market indexes, we're eyeing other international stocks rather than depending so much on this index ETF. But lower buy prices are worth considering.
Vanguard Energy, Buy	Buy shares and/or sell to open almost any $80 or $85 puts. They pay well but are thinly traded.	An ETF of industry giants, this is a straightforward investment in the world's long-term energy needs.
Waters, Hold	Sell to open August $55 puts, recently $1.10.	Near our fair value, buying the stock is on hold, even with a covered strangle. Put writing remains viable, although patient investors may get better prices later.
Options-Only Positions		
Electro-Optical Sciences, Buy	Buy to open July $5 calls, recently $4.50 — so you have less at risk than buying the stock outright.	Pure speculation, with no new word on when the mighty FDA will review the company's only possible product.
U.S. Natural Gas Fund, Hold	Sell to open July $8 puts, recently $0.71.	This trade idea is only for those comfortable going ahead despite our Hold guidance. We're not recommending buying new calls now.

Fools, don't fret if you're feeling overwhelmed. Just focus on the Buy First and Buy stocks initially, especially those that you're lacking in your portfolio and want to own sooner rather than later, and only make a few trades at a time rather than a dozen at once.

Allocation Tweaks

Finally, although you needn't adjust anything, you'll notice that we're moving our target allocations for Ebix, Expeditors, FPL Group, and Waters from 6% to 5%. This is merely a clerical tweak for *Pro* as we start to base our target allocations on the portfolio's current value rather than its starting value. (We're using a blend of those two values — we don't want to assume all of our current gains are permanent gains already! Remember, investing is never perfect.) All other allocations remain the same. You may note that our target allocation numbers total more than 100% — that's because we don't expect to get to full allocations on all positions, only on those that present more opportunities.

For an updated snapshot of today's Buy Firsts, Buys, and Holds, along with target allocations, just visit our portfolio page. If you have questions about these new trades, please post on the Memo Musings board.

Remember: You want to own good companies at reasonable prices, so don't *just* write puts — we recommend you *buy* some shares of your favorites, too.

Fool on!

Jeff

Jeff owns shares of AmTrust Financial Services and Oracle and has written puts on GlaxoSmithKline.

Write Covered Calls on ProShares Short S&P 500

Published Mar 9, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") May 2010 $54 covered calls
- **Allocation:** Write one call for every 100 shares owned
- **Option's recent bid/ask:** $0.65/$0.80
- **Preferred limit price:** Split the bid/ask, recently about $0.70.
- **Alternate trades:** If you don't own shares of ProShares Short S&P 500 and would like to hedge your bullish stock positions, buy at least 100 shares at current prices and write these covered calls on them; or, write May 2010 $50 puts, recently $1.10, to potentially get your first shares cheaper.

What's New

Since we first wrote covered calls on **ProShares Short S&P 500** (NYSEMKT: SH) in early December, little has fundamentally changed. The stock market is up more than 3% since then (all of it in the past week), and our first covered calls expired as a cash gain, lowering our cost basis in this position to $54.36 per share.

For *Pro* members who are new to ProShares Short S&P 500, this inverse ETF gains ground whenever the S&P 500 declines and works against us whenever the market advances. Our goal is to keep this reasonable hedge in the portfolio, gradually lower our cost basis by writing covered calls on it, and sell it profitably on a market decline.

Today, the S&P 500 continues to look neither expensive nor undervalued, trading in a middle ground that suggests economic uncertainty. Should the economic recovery weaken, stocks are almost certain to head down. If the recovery gathers momentum, the market would likely follow suit and tick higher. In either case, we'll ideally manage this position to end with an overall gain.

Why This Strategy?

Rather than just hold ProShares Short S&P 500 while we wait for a market decline, we can get paid something while we wait — and still have upside in the short. The S&P 500 needs to decline about 6.5% for the ETF to reach our strike price via these new covered calls.

- **Option payment or yield (at $0.70 bid):** 1.3% in 74 days
- **Option strike price:** 6.5% above the recent ETF price ($50.60)
- **Potential sell price:** 7.6% above the recent share price

How to Follow Along

When you own 100 shares or more of a stock or ETF, you can write covered calls on the position. You "sell to open" one call for every 100 shares owned. You're paid income while waiting for the underlying investment to appreciate to your sell price. We'll aim to write covered calls again if these expire in May, and we may roll the calls up to a higher strike and later date if the market falls and we want to keep our hedge longer.

We must make this trade in the next one to 30 days. To ask questions, please visit our ProShares Short S&P 500 board.

Monday Memo: Mind Your ETFs

Published Mar 8, 2010 at 12:00AM

Pro Earnings and Events

- Congratulations to PapaRhino, the winner of our February contest!
- Utilities are still well-stocked with uranium, so **Cameco** remains a Hold. See Jeff's conference call notes for more.
- Buy stock **Ebix** reported record-strong results this morning. We'll have more coverage this week.
- Buy First stock **Kinetic Concepts** is approved for reimbursement in its newest market: Japan.
- This Week in CAPS: TMFEldrehad looks at 5-star stocks in the doghouse.
- TMFValuemoosie shares a full earnings calendar for *Pro* holdings, including some former *Pro* stocks.
- **New Fool:** We'd like to warmly welcome the newest member of the *Pro* team, Bryan Hinmon, who goes by TMF42 on the boards. Come say hi to Bryan, who comes to us from the Fool's Analyst Development Program.

Coming Up

- Next week's Memo offers trades you can make on many *Pro* stocks and options, along with valuation and stock-rating updates.
- *Pro*'s guide to valuation and *Options 803: Neutral Spreads*.
- We're meeting with more management teams this year, so come tell us which *Pro* holdings you want us to visit most.

Though it's a little embarrassing to admit, I'm not a man who knows a lot about cars — I just want one that can safely get me from Point A to Point B. Chalk it up to living near public transportation or not getting behind a wheel until age 17 (thanks, New Jersey), but I've just never been interested in the automobile's inner workings. That is, of course, until something goes wrong. Then I want to know what happened, why, and what I can do about it. But by that point, it's usually too late, and I curse myself for not knowing more so I could have prevented costly repairs.

It's this same promise of getting from point A to point B that's helped exchange-traded funds catch on like wildfire during the past decade. Before, it cost big bucks for individual investors to enter niche markets such as commodities, currency, or shorting, but with ETFs, all you need is a regular brokerage account.

Yet the world of ETFs is far from perfect. According to the Investment Company Institute, there are more than 800 on the market today controlling $731 billion in assets. There's nothing wrong with having many choices, but it requires an investor to have a more discerning eye. Look under the hood of many of these specialized vehicles, and you'll find that a lot of them aren't doing a great job of getting you where you want to be.

What to Watch For

We've experienced the downside of ETFs at *Pro* with our synthetic long on **U.S. Natural Gas Fund**. Though it's done a better job tracking the price of natural gas following some changes to its portfolio structure, the ETF's underlying system of rolling forward futures contracts at increasing prices (known as "contango") has resulted in disappointing performance even though natural gas has held relatively steady. As you know, we're using covered calls to recover some of the paper losses from this trade.

Other ETFs don't seem to do what their names imply. For instance, the **SPDR S&P Homebuilders ETF** may seem like a great way to play the fortunes of actual homebuilders like **Lennar** and **Toll Brothers**, but a closer look reveals that the majority of holdings have only indirect relationships with homebuilding. In fact, retailers like **Sherwin Williams**, **Bed, Bath & Beyond**, and **Home Depot** are among the ETF's top 10 holdings — in all, two-thirds of this "homebuilders" ETF is invested in consumer discretionary companies.

And then there are "theme" ETFs, which invest based on shaky historical trends. The **WisdomTree Equity Income ETF**, for instance, is based on a historical back-test from 1964 to 2005 that suggested dividend-weighted portfolios outperform the S&P 500. At the end of 2008, the ETF held large positions in high-yielding stocks like **General Electric**, **Pfizer**, and **Bank of America** ... all of which slashed their payouts when the entire dividend landscape diverted sharply from the 41-year period the WisdomTree team analyzed. Adding insult to injury, the ETF is only allowed to rebalance once a year, so it had to hold many stocks with low yields or *no* yields until December 2009.

As ETF companies continue to churn out new and exciting ways to access diverse areas of the market, it's imperative that investors be cautious, making sure any ETF holds logical positions given its objective, and then tracks the underlying investments accurately (and charges a reasonable fee).

Pro, ETFs, and You

Tip: Make the Trade vs. Trade Complete

Pro always emails you *before* we make a trade so you can make it first. First, *Pro*'s **Make the Trade** announcement hits your inbox. Then, we have 30 days to make the trade ourselves. Once we do, we send you a **Trade Complete** email with our real-money transaction details.

ETFs remain an integral part of *Pro*'s strategy, and it remains essential that we thoroughly analyze their inner workings before we add any to the portfolio. Before recommending the **SPDR KBW Regional Bank** ETF, for instance, we not only researched its 50 regional banks, but wanted to make sure this ETF was the best vehicle to achieve our thesis. Other ideas were presented, from a basket of a few top-notch regional banks to a hybrid regional bank stock/ETF trade, but in the end, we concluded that the methodology of SPDR KBW Regional — to be more or less equal-weighted across 50 mid-cap regional banks at a low cost — provided the best risk/reward scenario for everyone.

If you own an ETF outside the *Pro* portfolio, now is a great time to re-read its prospectus and analyze its holdings — you may find that a little research now saves you from expensive portfolio repairs down the road. Meanwhile, if you've ever been taken for a ride by an ETF that wasn't what you thought it would be, join the dicussion on *Pro*'s ETF Center board.

Stay patient. Stay focused. Stay Foolish.

Todd Wenning

Todd owns shares of Home Depot

Buy SPDR KBW Regional Banking

Published Mar 4, 2010 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Price when we released our original intent:** $24.50
- **Estimated fair value:** $34 to $38
- **Preferred buy price:** $25 or lower
- **Buy guidance:** Use a limit order near the ETF's net asset value (recently $24.58)
- **Type of holding:** Core; Financials
- **Alternate trade:** Write ("sell to open") puts for a lower potential buy price — recently, April 2010 $24 puts bid $0.70, and June 2010 $24 puts bid $1.30. We may write puts for our next shares.

The Big Picture

March 4, 2010

While U.S. banking behemoths like **Citibank** (NYSE: C) and **Bank of America** (NYSE: BAC) struggle with rotten balance sheets, White House scrutiny, and public backlash, the best of the conservatively managed regional banks are plugging along, progressing toward a better day. This is our case for the **SPDR KBW Regional Banking** (NYSEMKT: KRE) ETF, a compelling play that holds shares of 50 mid-cap U.S. regional banks, most with market caps below $2 billion. Much smaller than "super-regional" banks like **Fifth-Third** (NASDAQ: FITB) and **BB&T** (NYSE: BBT), these community banks tend to have more conservative lending practices — on average, less than 3.5% of all loans (and 2.1% of total assets) held by the select banks in SPDR KBW Regional are considered non-performing, compared with the sector average of 4.3% non-performing loans.

Even if its banks' number of bad loans ticks higher, this ETF's low valuation today should help support the share price. The average bank in SPDR KBW Regional trades at just 1.1 times book value, whereas regional banks on average traded at 1.7 to 2.2 times book value for most of the past decade — meaning there's room for 50% appreciation just to return to the lower end of the range. Add in future growth in book value, and the ETF could appreciate even more. We may just need patience.

Inside the ETF

Get Personal With KRE

- **Founded:** 2006
- **Holdings:** 50 U.S. stocks, equal-weighted
- **Average holding market cap:** $1.3 billion
- **Dividend yield:** 1.87%
- **Website:** www.spdrs.com

Mirroring the KBW Regional Banking Index and charging a slim 0.35% annual fee, SPDR KBW Regional is a low-cost way to gain diversified exposure to an important slice of the economy. Since it's an equal-weighted ETF, each of its 50 hand-selected mid-cap regional bank stocks represents the same allocation — about 2% — and the ETF is examined quarterly for rebalancing to maintain that weighting.

SPDR KBW Regional's holdings include **Associated Banc-Corp** (NASDAQ: ASBC), at 2.5% of assets; **City National** (NYSE: CYN), 2.2%; and **Bank of Hawaii** (NYSE: BOH), **Prosperity Bancshares** (NYSE: PB), and **Valley National Bancorp** (NYSE: VLY), all around 2%. These names are among the best in the business and well-recognized by industry watchers. Forty-five other select regional banks fill the ETF, greatly diluting its risk profile. Thankfully absent among these 50 banks: Big operators in troubled spots such as Florida, Arizona, and Michigan.

Regionals on the Rise

As we delve into our case for the SPDR KBW Regional ETF, you'll notice that we use price-to-book value, an equity-based metric, to value the ETF. Along with the industry analysts, we focus on equity rather than total firm value because a bank's levels of debt and capital expenditures are often unclear, making it difficult to determine cost of capital or cash flow.

Providing us with less downside risk, the current historically low valuation of regional banks implies an anemic recovery to continue *indefinitely*. As prospects improve, we believe there's at least 40% upside opportunity here. The low-risk valuation along with a strong potential reward has the markings of a good contrarian investment, as long as we believe the risks are reasonable — and we do.

Below we've gathered key data on all 50 of SPDR KBW Regional's holdings; you'll notice that the numbers aren't perfect, but aren't so dismal they call for today's low price-to-book values:

Metric	Price-to-Book Value	Net Interest Margin	Tier 1 Capital	Non-Performing Loan / Total Loan
What It Means	Market price divided by the company's equity (assets minus liabilities).	What a bank is earning from its investments over what it is paying in interest relative to its income-generating assets.	Measures bank's ability to absorb losses.	A loan not meeting stated principal and interest payments, usually 90 days or more behind
Guidance	Over the past decade, regional banks have traded between 1.7 and 2.2.	The higher the better, but 3% to 5% is considered a healthy range.	Banks expected to maintain at least 4%, but anything over 15% could imply inefficient use of capital.	The lower the better — ideally, less than 1% in a good economic setting. Anything over 5% can mean the bank is on shaky ground.
Average KRE Holding	1.1	3.7% (44 of 50 holdings reporting)	12.7%(30 of 50 holdings reporting)	3.35% (43 of 50 holdings reporting)

Data provided by Capital IQ, as of March 3, 2010. All figures are arithmetic averages.

Overall, we believe the metrics of the underlying holdings are not nearly as weak as the low price-to-book ratio implies. When small businesses start to recover, regional banks — as their primary lenders — should loosen the purse strings again, and return on equity should improve at the banks, which tends to drive book value multiples higher.

We don't expect things to turn around overnight. But after the economy has regained its balance, regional banks should see a rebound to the lower-end of their historical average of 10% to 12% return on equity. We're investing now because all it takes is others to have this general thesis to start to push prices higher. Year-to-date, the ETF is up 10% while the S&P 500 has been flat.

What Would Make Us Sell

The Community's Take

Based on the well-known concerns about banks and commercial real estate, we're not surprised by SPDR KBW Regional's low ratings on both CAPS (2 of 5 stars) and *Pro*'s ETF CAPShot (2 of 12 points). Most of the ETF's underlying holdings are also rated 3 stars or below. Although some banks held by the ETF may falter, our risk is well-diversified. And, historically, the best time to buy stable banks has been soon after financial crises, when the banks trade near book value. For example, in the early 1990s, investors willing to go where most others weren't were richly rewarded in the following years as buyers returned. That could very well happen again, and the valuation risk appears reasonable while we wait.

Given all that's happened with banks in the past two years, spelling out the risks is essential.

Despite the improving outlook for regional banks over the next few years, there's an elephant in the room: the fate of commercial real estate loans. Now that the housing bubble has burst, loans for hotels, office buildings, and shopping centers are pegged as the next dominoes to fall — and to wreak havoc on smaller banks, which hold a larger proportion of commercial real estate loans than bigger banks. From 2010 to 2014, an estimated $1.4 trillion in these loans will reach the end of their terms, and according to the Congressional Oversight Panel, roughly *half* are underwater.

Scary stuff, we know. But this is a major reason why regional banks trade at such low valuations today. At present, SPDR KBW Regional's average holding's exposure to commercial real estate as a percentage of total loans is 32%, and while this isn't slight, it's not as high as some of the larger super-regionals like Fifth-Third (53% commercial) and BB&T (48%). Even if the ratio of non-performing loans increases by 10% across the average SPDR KBW Regional holding (we believe this is a high estimate), it wouldn't push the ETF's portfolio into the danger zone.

But researching the ETF's underlying banks closely, we're encouraged by three things. First, following the residential mortgage debacle, banks are more prepared this time around, raising or preserving capital to absorb potential losses. Second, many banks have refinanced or restructured current loans to run into 2012 with the expectation that if the economy recovers further by then, they'll be in much better shape to keep the loans on favorable terms. Finally, commercial loans have stricter lending guidelines than residential loans, placing a heavier emphasis on cash flow of the occupying businesses and typically requiring a substantial down payment of 20% to 25%. And keep in mind: Since the average bank in the ETF has a market value of only $1.3 billion, even loans in the mere millions of dollars are meaningful to it, and are thus underwritten and tracked carefully.

All that said, if the U.S. economic picture doesn't show signs of improvement by next year, or if interest rates jump sharply and unexpectedly, it would not only have a negative impact on the regional banks through their commercial real estate exposure, but would also crimp net interest margins (revisit our table above for an explanation) In either case, we would consider closing our position early. Furthermore, regional banks are complaining that the capital constraints put on the giant banks are hampering their ability to lend — and regional bank lending fuels small business growth, which fuels the economy. If the government doesn't loosen capital requirements for the healthier, smaller banks, a recovery may take much longer. This is being discussed by regulators.

Pro Bottom Line

Our top priority at *Pro* is accuracy — closing at least 75% of our positions profitably — and this often requires a contrarian look at the market. We believe regional banks as a group, especially the 50 banks that we've analyzed in this ETF, are undervalued due to well-known concerns that these banks are managing for already. All told, we believe the upside potential (40%, 50%, or higher) outweighs the downside risk of approximately 15% to 20%. That's an investment case we like. Have questions? Visit our new SPDR KBW Regional Banking discussion board.

Monday Memo: No Need for Market Mysticism

Published Mar 1, 2010 at 12:00AM

Guidance Change: UNG Moves to Hold

We moved **U.S. Natural Gas Fund** to Hold last week. The ETF needs several more months of accurate natural gas price tracking before we can get enthusiastic about it again. If you already own shares *or* calls on UNG, we recommend writing covered calls per last week's recommendation.

Last Chance to Win a Free Year of *Pro*

Fools, your time to enter *Pro*'s latest contest ends at midnight ET, so enter your active *Pro* stocks and ETFs into My Scorecard, stat!

This Week in CAPS: Outperform Giants

Track the market-beating predictions of some of CAPS' top swamis with help from *Pro*'s resident CAPS expert, TMFEldrehad.

Predicting the future isn't as easy as it sounds — though if you're lucky enough to be right, you've got great resume material for your future career as a crystal-ball reader. With my track record, I think I'll stick to stock analysis.

In December, Jeff, Todd, and I (your *Pro* analyst down under) made a few tongue-in-cheek forecasts for 2010. Two months into the new calendar year, most of my predictions are looking a little shaky. Especially problematic is my call for interest rates of 2.25% by the end of 2010. Last week, Fed Chairman Ben Bernanke told Congress that economic conditions are "likely to warrant exceptionally low levels of the federal funds rate for an extended period." Bernanke's comments effectively tell us to expect a long, slow economic recovery — nothing new to us *Pro* Fools, though not too promising for my prediction that rates will jump 2% in 10 months time.

Bound, Bound in a Range

I also predicted reduced volatility, reduced trading volumes, and a flat-ish stock market in 2010. The market is essentially flat since mid October, so maybe there is hope for my budding career as a palm reader after all. But despite little overall change, the market has experienced plenty of ups and downs this year as investors react (somewhat manically and moodily) to the daily deluge of economic and company news.

Take last week, for example. One day, the market slumped as a gauge of consumer confidence decreased to its lowest level since April 2009. The next day, after Bernanke's testimony, stocks jumped back up. (One pundit even said that low interest rates for an extended period were "music to a bull's ear.") But the euphoria was fleeting, because the following day, Moody's announced plans to downgrade debt in Greece, and jobs and manufacturing figures trailed forecasts. (This time, the pundit said, "The economy is going into a little bit of a fits-and-starts period. We don't see any job creation coming along. That's by far our biggest concern.") With all this volatility, what's an investor to do?

Flat-Out Profits

We *don't* recommend selling one day, buying the next, and then selling again — the only person who gets rich from that behavior is your broker. A volatile yet ultimately flat stock market is actually a welcome thing here at *Pro*. Armed with an arsenal of options strategies, we can help you generate decent income even from range-bound stocks. We're already taking aim, announcing three new option trades and a straight buy in the past 12 days alone.

The key for investors in these volatile and uncertain times is to remain patient and not to panic. I don't think another major stock market crash is on the horizon, although there may be periodic corrections and general uneasiness. Meanwhile, as ever, the *Pro* analysts will continue to closely monitor the portfolio, looking for opportunities in any market. Now that's a prediction you can bank on.

Invest patiently,

Bruce Jackson (TMFGoogly)

P.S. Come share your thoughts on the recent market ups and downs on our Memo Musings board.

Earnings Roundup: Solid Results From 6 *Pro* Companies

A Financial Planning Option for You

Thought about getting advice from a financial planner but didn't know who to trust? Want more hands-on help managing life's many financial decisions? The Motley Fool has partnered with Garrett Planning Network, a group of trustworthy, transparent, fee-only financial planners and advisors, and for a limited time, new Motley Fool clients get a 10% discount. Click here and look for the Motley Fool icon to identify participating advisors.

Jeff, Todd, and Bruce continue to dig into all the earnings news on our *Pro* companies; you can always access our latest coverage on *Pro*'s dedicated discussion boards. Here are the highlights from the past week.

- **Autodesk** shares jumped 8% on the tail of strong fourth-quarter results, which Jeff covers here. The stock now trades at 31 times free cash flow, which on its face is expensive. For the time being, we're sitting on our covered calls, but closely monitoring our options.
- **Expeditors International of Washington** solidly beat expectations in the fourth quarter, and the stock rose 8%, to around the $37 mark. Our covered strangle paid us $3.90 combined, so we'd be selling our shares at a net $38.90 or buying more at $26.10. We continue to monitor the position — we expect Expeditors will remain an attractive option stock for a long time.
- **GrafTech International** exceeded expectations in the last quarter of 2009. The stock trades at about 12 times estimated earnings for 2010, which isn't dirt cheap, but we believe there's more upside potential than there is a risk of disappointment.
- **Medtronic** produced another solid quarter, and we remain comfortable with our estimated fair value of around $52 and preferred buy price of around $42. Writing puts remains a viable option.
- **Flowserve** reported fourth-quarter earnings per share of $1.96 versus a $1.87 average estimate, while maintaining its guidance for 2010. We'll cover the results in more detail in the coming days.
- **Cameco** performed well in the fourth quarter, though it projected lower 2010 uranium sales and lower profits as it invests for the future. The company takes a very long-term perspective to its business, as necessary in the world of uranium. Cameco is still on Hold, and we'll keep our eyes open for future option trading opportunities that could net a price below our preferred buy guidance.

Bruce Jackson owns shares of Autodesk and has an options position in Medtronic.

Write Covered Calls on United States Natural Gas Fund

Published Feb 25, 2010 at 12:00AM

At a Glance

Don't own a position in UNG? We don't recommend that you make this trade. Instead, continue to build positions in our Buy First and Buy stocks. **Questions?** As always, we're here for you on our discussion boards.

- **Action:** Write ("sell to open") July 2010 $10 covered calls on existing *purchased* calls
- **Allocation:** Write one call for every call owned (for *Pro*, 25 contracts)
- **Option's recent bid/ask:** $0.53/$0.55
- **Preferred limit price:** $0.50 or higher, day order; if needed, no lower than $0.45
- **Recent ETF price:** $8.86
- **Special requirement:** You must own at least 100 shares of UNG, or one call option, to write a covered call.
- **Alternate trades:** None at the moment. We're moving UNG to Hold.

What's New

It's been a wild ride since we initiated a synthetic long (writing puts and using the payment to buy calls) on the **U.S. Natural Gas Fund** (NYSEMKT: UNG) ETF in October. Ever volatile, the Henry Hub natural gas benchmark has swung as low as $4 MMBtu (million British thermal units) and as high as $6 MMBtu over the past three months. After a volatile ride, natural gas prices are about where they were in October, but UNG initially didn't track well while it reconfigured its investments. Returns were further compromised when fund managers had to sell futures at a loss in order to buy the next month's futures at a higher price. Now, UNG trades about 30% below our starting price. Lately, the ETF is tracking natural gas futures well again, giving us more confidence to continue to hold the position to write covered calls on it.

Weather-wise, we couldn't have asked for better luck (appeasing our Dec. 7 Memo demands), as freezing temperatures and major snowstorms in the U.S. have put a nice dent in the record-high natural gas stores. In fact, as of today, there's less natural gas in storage than there was a year ago. Yet gas prices have not reacted sharply, as some patient drillers start producing again whenever gas nears $6 MMBtu. This situation may keep a cap on natural gas prices at least for the coming months, if not longer. So, in the interest of ultimately making our position profitable, we're going to start writing covered calls on the calls we purchased — turning it into a diagonal bull spread.

Why This Strategy

Pro approaches investing a bit differently. Our No. 1 goal is accuracy, so if a position's eventual profitability appears to be in jeopardy, we'll often take action. This may limit the position's upside, but it gives us a better chance to profit in the end *and* lowers our risk.

So, for our struggling synthetic long on UNG, we can run the numbers to see what's necessary for us to profit.

- Our net cost to set up the trade in October 2009 was $1.20: We wrote January 2012 $12 puts, receiving $3.40 each; and bought January 2012 $10 calls, paying $4.60.
- We break even or earn a profit on the puts as long as the ETF trades at or above $8.60 by expiration (our $12 strike price minus $3.40 option payment). If our puts expired today, we'd earn a small profit on this leg.
- However, we'd lose the full value of the $10 calls we bought ($4.60) if the position were to expire today, putting us in a sizable hole overall.

Thankfully, with almost two years until expiration, our 2012 calls still have $1.80 in time value left, but time is ticking against us. To help ensure that the calls end profitably (or closer to it), we'll write covered calls against them to defray their cost. Called a diagonal spread, this involves repeatedly writing near-term calls (effectively, covered calls) on the much longer-term calls that you own, in an effort to lower the cost of the long-term calls.

We'll begin by writing the July 2010 $10 calls, recently paying $0.53. This position will be managed more actively than some of our other covered calls, since we don't necessarily want to lose our long-term calls yet. If the ETF moves close to $10, we may roll the covered calls forward and up rather than let them be exercised. We want to own our 2012 calls as long as possible, and write covered calls against them several times over the next two years to defray our cost.

How to Follow Along

If you already purchased calls on UNG along with us, write one call for each call owned. If you bought 100 or more shares of the ETF directly, you can write covered calls against your holding.

As long as the ETF continues to track natural gas prices well and natural gas stays between about $4.50 and $6 MMBtu (or higher), this should become a solid, albeit unplanned, diagonal call spread position; the volatility of natural gas is high enough that the calls we'll write pay relatively well, but the value of natural gas should stay in a range, limiting our risk. However, we don't recommend starting a new position in UNG at this time. We want to see the ETF string together a few more months of accurate gas-price tracking before we'd give the green light to newcomers at this point.

So, to recap: We own January 2012 calls on UNG, and we'll be writing covered calls against those calls as often as we can over the next two years to begin eating away at our purchased calls' cost. To retain upside potential, we'll manage this diagonal bull call spread actively. Please bring any questions, comments, or flames (we can take the heat) to the U.S. Natural Gas Fund board.

Adjust Your Strangle on Intel

Published Feb 24, 2010 at 12:00AM

At a Glance

- **Adjusted trade:** Writing July 2010 $20 puts and July 2010 $22 covered calls (instead of $19 and $21) because Intel increased in price before we could make our trade, and the original strangle is no longer as attractive for newcomers.
- **Recent options bids:** July 2010 $20 puts $1.18, July 2010 $22 calls $0.73, for $1.91 total
- **Strangle limit order:** $1.90 or better to start
- **What this means for you:** If you already placed an Intel trade earlier this month, you don't need to do anything. At lower prices, the original trade was more attractive and you can let it ride. If you haven't placed an Intel trade yet, you can consider today's adjusted trade.
- **Alternate trades:** Just write the puts to potentially buy shares cheaper; buy the stock and just write covered calls on it; or just buy the stock.

What's New

Since we announced that we would buy shares of **Intel** (NASDAQ: INTC) and write ("sell to open") a covered strangle on them (writing puts to potentially buy more shares lower, and writing covered calls to possibly sell our existing shares higher), the stock has gained ground without us. The closure of Fool HQ during a double snowstorm kept us from making the trade right after we announced it, and today the original July 2010 $19/$21 strangle is no longer as attractive for new stock buyers simply because Intel is near $21. If we bought today, we'd have little upside in the stock before our covered calls would come into play.

Therefore, we're moving our strangle up one strike price on each side, now writing the July 2010 $20 puts and the $22 covered calls. This new trade is less attractive than the original (if you'd made it earlier), but still offers nice upside with good downside protection.

Why This Strategy

Moving our strike prices up doesn't change the option income we could make compared with the original trade, but does provide us with $1 extra upside in the stock itself, effectively making up — though at a higher cost — for the $1 in gains that we've already missed. So, the only reason we're changing the spreads is to have enough upside potential to keep the trade attractive.

The numbers on this trade:

- **Action**: Buy 3% in Intel, recently $20.55
- **Action**: Write ("sell to open") July 2010 $22 covered calls (one for every 100 shares owned), recently $0.73
- **Action**: Write July 2010 $20 puts (one for every 100 shares you'd buy), recently $1.18
- **Total option income**: $1.91 per share
- **Potential second 3% buy price**: $18.11
- **Average buy price if we get all shares**: $19.33
- **Potential sell price on our first 3%**: $23.91

How to Follow Along

There is no need to make any changes to your trade if you already placed the $19/$21 trade. You should have a profit so far, and should let it continue to ride. If you haven't made the Intel trade yet, you can now consider this adjusted strangle or the alternate trades above. As always, post your questions on the boards.

We will make this trade after two business days and before March 4 (30 days after our original trade announcement).

Buy More of NextEra Energy

Published Feb 23, 2010 at 12:00AM

At a Glance

- **Action:** Buying 1% (for 4% of our 6% target)
- **Recent share price:** $46
- **Alternate trade:** Write ("sell to open") June 2010 $45 puts, recently $1.65; be ready to buy the stock if it declines by expiration.

What's New

A weak Florida economy, an adverse regulatory ruling, and a public relations mess have created a triple-whammy of trouble for **FPL Group** (NYSE: NEE) (now called NextEra Energy) in recent weeks. But as contrarian investors, we see this as an opportunity to step up and buy more shares.

First, the ruling: The Florida Public Service Commission (the PSC) rejected most of FPL's $1 billion rate hike last month. Without that added income on the way, the company responded by saying it would cut $10 billion in planned energy investments in Florida over the next five years. As we discussed on the boards, some political wrangling is to be expected with utilities, but these businesses ultimately need to charge a reasonable rate to be able to upgrade and grow existing energy capacity. As long as the Florida economy improves, FPL will likely apply for another hearing in 2011. In fact, the terms of two of the five members of the PSC will expire in January 2011, and Governor Charlie Crist has announced that he will not seek reelection so he can pursue a Senatorial seat, so the deck will be reshuffled and may become more friendly. But even without a rate hike, there is value in the stock.

Meanwhile, we're slightly more concerned about recent allegations that FPL forced employees to manipulate data for the PSC rate case. Both FPL and the PSC have launched investigations. After reviewing the two allegations, dated Jan. 20 and Feb. 3, the letters appear to be an opportunistic move by disgruntled employees, and we don't believe the claims will affect FPL's business. There may be more controversy on the horizon given the current economy and the politically charged rate case decision, but we're willing to ride it out on the merits of FPL's regulated (or all but guaranteed) business strength and valuation.

Why This Strategy

All this negative press has helped drive shares of FPL deeper into value territory, and as contrarian investors in this stock, we're using the opportunity to buy another 1% for the *Pro* portfolio. Recently trading at 1.6 times book value, FPL has not averaged a lower price-to-book value than this for a full year since 1994 (as far back as our data goes) — suggesting that this price won't last too long. This new purchase will reduce our cost basis below $50 on a stock we believe is ultimately worth about $60. While we wait for FPL to grow shareholder value, we're happy to collect a 4.1% dividend on our new shares, and 3.8% on the full position.

How to Follow Along

If you don't own any shares of FPL, consider buying up to a 4% position at current prices to match *Pro*'s 4% position. If you'd rather write puts to potentially get shares at a lower price, consider writing ("sell to open") June 2010 $45 puts, recently $1.65; be ready to buy the stock if it declines by expiration. If you have questions, please post on the FPL Group board.

Monday Memo: Why You're Here

What about options? Check out *Pro*'s options-specific tax guide for help.

When *Pro* analyst Todd Wenning interviewed Chuck Akre earlier this month (you can catch the Audio Extra here), the famed fund manager said the No. 1 challenge investors face is "the same as always: ignorance." People who don't know their investments from the ground up are facing an uphill battle. That's where we come in.

A Team of Pros, at Your Service

At *Pro*, investing is what we do — all the time. It's our job. We're here to help busy Fools like you — who may not have hours upon hours of free time every week to research investments — gain financial freedom. We don't want a parade for what we do (though Todd loves a good skyscraper-sized Barney); we just want to provide you with the highest-quality investing advice we possibly can. So we devour every news item, quarterly report, and SEC filing while keeping in tune with an investment's competitive landscape. We also watch the big picture, staying on top of trends in business, consumer well-being, government, and international relations.

You're part of *Pro* because you want investment ideas that are deeply vetted, followed continually, and have strong odds to make you money — with reasonable risk. And you're seeking *more* than many other investors, because you want strategies that will profit in flat and down markets, too. That's why many of you are using options with us to consistently generate short-term gains alongside your long-term stocks, making for a dynamic double-duty portfolio.

Profits for Every *Pro* Fool

For New *Pro* Fools

Questions about using an IRA, a smaller portfolio, or *not* using options? In case you missed these handy links to help you profit with *Pro*, check out:

- Make *Pro* Fit Your Profile
- Go-To *Pro* Resources

Like all of you, we want to create value in the world — to make it a better place for the people around us, and especially for those who put their trust in us. Yes, being part of *Pro* comes at a cost — annualized, and not including the free access to *Motley Fool Options*, the typical *Pro* membership costs about $130 a month, the same as my cell phone bill — but we're confident that you'll earn much more investing alongside *Pro* over the years than you ever spend on it. That's our goal: For *Pro* to be profitable for you, creating value for every Fool who is here with us.

Essentially, your membership has landed you a team of experts, here to give you investment advice on both stocks and options, long and short strategies, macro and micro, while offering a full portfolio of positions that are meant to work together. On a per-hour basis, you're getting a heck of a deal. But we want it to translate to your bottom line — whether you're just buying our stocks, only using options, looking to protect what you have, or mirroring the *Pro* portfolio. No matter how you use our ideas, *Pro* should ultimately make you money. If we're not doing this for you over time, chime in and tell us why not.

Thank you for investing with us. We have much more Foolishness below and in the sidebars. Don't miss it!

Sell to Close Higher-Strike Puts on Abercrombie & Fitch

Published Feb 18, 2010 at 12:00AM

At a Glance

Please note: Our order for this trade went unfilled, so we were unable to close our $34 puts early. They will just expire worthless. See Jeff's post and ask any questions on the Abercrombie board.

- **Action:** Closing ("sell to close") February 2010 $34 puts (we'll let our $27 puts expire)
- **Limit price:** Whatever the market bids; recently, $0.11
- **Special considerations:**
  - Only bought one or two contracts? Make sure closing is still profitable if you include commissions.
  - Bought puts with a different strike price? If they expire Friday, we still recommend selling to close your puts to gain back some proceeds.

What's New

Although **Abercrombie & Fitch** (NYSE: ANF) has an overvalued stock, a troubled business in decline for years, a dated brand, and waning market share, it's been a challenging short-sale candidate for us. The company's persuasive management team always contends that things are going to improve, pointing to the few bright spots in the business (the small international arm, in the case of this week's earnings release), while downplaying the many larger failings and challenges. As long as investment analysts who rate the stock buy into the recovery story, the stock holds its ground, and short sellers are left in the cold. This is especially true when your short strategy involves put options with an expiration date.

Our bear put spread on Abercrombie is set to expire on Friday, and with the stock trading above $35, our $34 puts will expire worthless — so we will close them ("sell to close") to at least get back a hundred bucks or so. Meanwhile, the lower-strike $27 puts that we wrote will expire for a full cash gain, paying for 39% of the cost of our higher-strike puts. But the trade is still an overall loss for us, knocking 0.3% off the total value of the *Pro* portfolio. We'll aim to earn back this loss with a lower-risk option trade.

The irony of this loss is that our thesis has largely played out as expected. Since we set up the trade in October, Abercrombie has continued to lose customers, it posted lower sales and earnings over the holiday compared with last year's dismal results, its margins declined, it shuttered more stores, and it didn't increase earnings guidance — all reasons that this expensive stock should trade lower. It might in the future, but not in time for us with this trade.

What's Next

We'll continue to analyze recent results to consider shorting Abercrombie again in the future. But for now, you'll find us sulking in our **Aeropostale** (NYSE: ARO) sweatshirts and Fool jester caps, pining for another chance to take down the Abercrombie & Fitch giant.

If you have questions about closing your higher-strike puts on this spread trade, please ring the register at our blighted Abercrombie board.

Write a Covered Strangle on Plum Creek Timber

Published Feb 18, 2010 at 12:00AM

At a Glance

Trade summary: We're writing covered calls on our existing shares of Plum Creek Timber and writing puts to potentially buy more shares at a lower price. This covered strangle strategy provides a wide range in which to profit. If you **don't own shares** of Plum Creek, we recommend **writing puts**. See below for details and ask any questions on our Plum Creek board — we're here to help!

- **Action**: Writing ("sell to open") August 2010 $40 covered calls on all shares owned, recently $1.30, and writing August 2010 $35 puts, recently $2.70, representing another 3%.
- **Allocation**: 3% each (for *Pro*, 10 contracts of both calls and puts)
- **Preferred limit price**: Enter a "strangle order" for a net credit of $4 or more. If your broker requires you to do separate transactions, write covered calls and then write puts for a total payment of $4 or more; if necessary, later, accept as low as $3.50 combined.
- **Alternate trades**:
  - **Don't own Plum Creek yet?** We suggest writing one leg of this strangle — the August 2010 $35 puts — aiming for a payment of $2.50 per share or more.
  - **Don't want to use options?** Aim to buy 3% of Plum Creek below $34.
  - **Can't write puts?** Buy 3% of Plum Creek and write August 2010 $35 covered calls, recently $3.40.

What's New

After a tough year, things are looking up for **Plum Creek Timber** (NYSE: PCL) — yet we remain cautious. The timber REIT expects sawlog prices to rise, but new home production in the U.S. will likely be modest as buyers work through the existing supply. Plum Creek plans to keep harvests at 2009 levels until prices improve, protecting shareholder value while retaining operational flexibility to see what demand dictates. And in the meantime, management is using real estate transactions to generate substantial value — with plans for at least $350 million in real estate sales this year, projecting total earnings of $1.25 to $1.45 per share.

We applaud these moves and remain confident as ever in Plum Creek's management. The team has calmly steered the company through the downturn while achieving healthy profitability and cash flow. Plum Creek continues to serve the *Pro* portfolio as a unique asset-based, income-producing position. We've generated recurring option income on the stock (worth nearly 20% of our original purchase price so far) and collected 5.3% in dividend income on top of nearly 15% share price appreciation. Our last option strategy expired in November — so, armed with the new 2010 guidance from Plum Creek, this is a good time for us to saddle up for more option income.

Why This Strategy?

A strangle has two legs: You write ("sell to open") calls on a stock you own, and at the same time, write puts to potentially buy more shares. The calls have a higher strike price; the puts, a lower strike; both legs should expire in the same month. You need to be ready to sell your existing shares if they increase enough, or buy more if shares drop — however, the strangle gives you a wide range in which to profit on the options alone, if you like, by closing the options early (or letting them expire) as long as the stock stays in that range.

In this case, we're writing August 2010 $35 puts while Plum Creek's stock is around $36 — a more aggressive put-writing trade than we've usually made on the stock. As our confidence in management has grown and the sawlog market has stabilized — and given the large premiums we're collecting — we're more comfortable moving our strike price up. However, if sawlog prices reverse, the recession returns, or the housing market worsens, we may need patience for Plum Creek's stock to recover, and we'll own twice as many shares. If this happens, we're prepared to wait, collect the 4.6% dividend, and possibly write covered calls.

How to Follow Along

New to this trade? As always, we recommend buying shares in the lower $30s and writing options regularly on Plum Creek if you can; our fair value on the stock is still as high as $40. All of our alternate trades above adhere to this guidance.

For the strangle, remember, each option represents 100 shares of stock, so you need to own 100 shares to write covered calls, and you must be able and willing to buy 100 shares to write puts. And remember, we're selling these options, *not* buying them.

Let's take a look at some math behind the trade (prices as of Feb. 18):

- **Recent options bid/ask:** August 2010 $35 puts, $2.70/$2.75; August 2010 $40 calls, $1.25/$1.45
- **Total option income**: About $4 per share net credit (split the bid/ask prices)
- **Effective options yield**: 11% of share price in six months
- **Potential second 3% buy price**: $31 (13% below current price)
- **Average buy price if we get all shares**: $31.48
- **Potential sell price on our first 3%**: $44 (23% above current price)
- **Profit range:** Anywhere above $31

Like any good strangle writing trade, this position provides a wide range for us to profit. We will potentially buy more shares around $31, or sell our existing shares at $44. Any share price between these two points will result in option income and a profit on the strangle. Finally, if Plum Creek is between $35 and $40, both options expire for the full cash gain, and nothing else happens. At that point, we can repeat our strategy.

If you're new to covered strangles and haven't read our strangles guide, please dive in, and ask any questions on our Plum Creek discussion board. For more on how to place a covered strangle trade, please see our original covered strangle on Plum Creek below.

Buy More of GlaxoSmithKline

Published Feb 17, 2010 at 12:00AM

At a Glance

- **Action:** Buying 2% (for 5% of our 5% target)
- **Recent share price:** $39.25
- **Alternate trade:** Write May 2010 $37.50 puts, recently $1.33; or write May 2010 $40 puts, recently $2.70

What's New

Since we bought our first 3% in pharmaceutical giant **GlaxoSmithKline** (NYSE: GSK) in December (at about $42 a share), the company reported solid earnings for the fourth quarter and the full year. Some encouraging signs include:

- A return to sales growth, albeit only 3% on a constant-currency basis and boosted substantially by fourth-quarter sales of H1N1 vaccine Relenza. Still, this is a welcome achievement because U.S. revenue continues to decline as Glaxo's drugs come off patent.
- Increased earnings per share, which rose by 2% for the year and 43% in the fourth quarter, again boosted by Relenza. For the full year, EPS was a strong $3.83.
- The dividend, which Glaxo raised 7% in 2009 (in British sterling terms).
- Free cash flow is strong, up 23% in 2009, from $8.4 billion to $10.4 billion.
- A focus on emerging market growth; the percentage of sales from Western markets is shrinking, while emerging market sales grew 20% and now represent 10% of total revenue.
- A focus on cost reduction, especially R&D, where return on investment has been a modest 11%. It's nice to see CEO Andrew Witty bring more accountability to Glaxo.

Meanwhile, the stock has slipped to around $39 and now trades at an attractive 10 times free cash flow and 10 times expected 2010 earnings, with a dividend yield of nearly 6%. More U.S. legacy brands will go off-patent this year, and we don't expect a repeat of Relenza's strong 2009 sales, so growth in 2010 is likely to be modest — but we still like this share price. Since 1997, Glaxo's shares have rarely traded below $40, while EPS has doubled over the same period.

Why This Strategy

Our goal with Glaxo is to generate solid dividend income alongside steady, long-term earnings growth of about 5% annualized. In addition, there should be less downside risk here at today's price, making Glaxo an attractive defensive play for this economy.

Meanwhile, the U.S. health-care bill remains a big unknown. Depending on the outcome, we could see Glaxo's share price climb soon — or we may need to wait longer for the stock to inch toward our fair value estimate, which sits in the low $50s. But as we wait, we'll enjoy a near-6% dividend yield on our new shares.

How You Fit In

You can consider writing puts (see our alternate trades above) either to buy the stock a bit cheaper or generate income. For *Pro*, we simply couldn't look past the excellent yield and today's valuation, so we're filling out our position directly. That said, writing puts on Glaxo is a good income strategy unto itself, and we may increase our allocation later to write puts.

Please post any questions on the GlaxoSmithKline discussion board.

We will make this trade in the next two to 30 days.

Adjusting Put Intent on GrafTech International

Published Feb 16, 2010 at 12:00AM

At a Glance

- **Action:** Writing ("sell to open") June $7.50 puts (ticker +GTIRU) for the second 2% of our 4% if we get the shares
- **Option's bid/ask:** $0.75/$0.85
- **Initial limit price:** $0.75 or higher
- **Minimum limit price if necessary:** $0.60
- **Special note:** If you don't own 2% yet, we still recommend you buy shares today. If you've matched our 2% stake already and are not writing puts, consider a limit order near $7 for another 2%.
- **Alternate option trade:** You may write the September $7.50 puts (ticker +GTIUU), recently priced at $1.25/$1.40.
- **Why write puts:**
  - The $7.50 puts expiring in less two months pay a 10% premium.
  - GrafTech management expects customer orders to improve in the second half of 2009.
  - The stock looks inexpensive, which is why we also own shares.

What's New

When we announced on March 31 that we intended to write June $5 puts on **GrafTech** (NYSE: GTI) for about a 10% payment, we were smiling. Alas, our hopes were dashed as the stock jumped from $6.16 to $7.60 over the next two days — and it hasn't looked back since. Fortunately, we own some shares already. But now that those $5 puts bid a paltry $0.10, we need to look elsewhere (as we had to in February, when we adjusted our **Plum Creek Timber** (NYSE: PCL) covered call trade) to get a worthwhile option payment within our 30-day trading window (by April 30). Luckily, we still see opportunity.

Although they have a much higher strike price, the June $7.50 puts also pay a 10% premium and would net us an attractive buy price of $6.75 if we get the shares. So, we will pony up to Mr. Market and attempt to make this updated trade before *Pro*'s mandated deadline on April 30 — which is also the date GrafTech announces quarterly earnings.

If you already wrote the June $5 puts, you can close them early if you'd like, for a recent $0.20 (a 50% to 60% profit), and join us on this new trade; or you could let them expire, which currently appears likely (commissions should play a role in your decision). Both are good positions. If you have questions on our adjusted trade or options on GrafTech in general, please visit our GrafTech board.

Monday Memo: Win With Pro's Proven Strategies (and a Contest!)

Published Feb 16, 2010 at 12:00AM

Get Started in 3 Steps

Step 3: Become an Options Pro: To help generate returns no matter what the market does, *Pro* uses dependable, repeatable options strategies based on a Foolish understanding of the underlying businesses. In Step 3, watch our options tutorials, learn two of our favorite strategies, and see one trade you can make today.

Congratulations! You've completed all three steps. Next, come tell us why you're here on our Meet & Greet board and explore our handy list of resources to round out your experience with us.

Update on Abercrombie

Same-store sales declined again for **Abercrombie & Fitch**, but today's results still sent the stock higher. With our bear put spread on Abercrombie set to expire as a loss on Friday, we'll let our $27 puts expire for the full gain and sell our $34 puts — if we can capture a little value (and if so, we'll send you a trade alert). Once we've fully studied today's earnings release, we'll decide whether to invest against this pricey retailer again.

Note: Along with our Abercrombie options, on Friday our covered calls on **ProShares Short S&P 500** will expire as a cash gain. We'll consider new covered calls soon.

Upcoming Earnings

- Feb. 17: **AmTrust Financial Services**
- Feb. 22: **Quanta Services** (NYSE: PWR)
- Feb. 23: **GrafTech International**, **Autodesk**, **Medtronic**, **Expeditors International**
- Feb. 24: **Flowserve**, **Cameco**

Mother Nature fooled the Fool last week, as a record-breaking snowfall forced the closure of our Alexandria, Va., headquarters for four days. But now that we've dug out and defrosted, *Pro* is ready to get back to the steady (and Foolish!) investing you've come to expect from us, with plenty of new trades in the wings.

We're planning our next moves in one of the most uncertain times investors have ever known. More than ever, *Pro* Fools are asking us, "What do you make of this market?" and "What's next?" These are excellent questions. Never before has there been such calamity in the U.S. economy. The problem isn't just unemployment — the outlook remains troubled for housing, the auto industry, the entire financial sector, manufacturing, and now, our government's debt.

Be Contrary

But there *is* a ray of sunshine among the gloom. With the world on pins and needles, the best stocks are attractively priced — so patient, contrary buyers of strong companies should land respectable returns. If everything was moving along at a nice clip, we'd be paying a dear price for stocks — and we'd face soggy returns in the years ahead. The best part? We're still near rock bottom as far as market confidence is concerned, so we merely need the global economy to improve incrementally for investment outlooks to improve.

Be Patient

That doesn't mean returns will be easy or immediate. When Fools ask what I think about the coming years for the stock market, more and more, I'm reminded of how I felt in 2000 and 2001. Back then, I didn't expect decent returns because valuations were so high. Today, valuations are more reasonable — but I don't expect the U.S. economy to recover quickly or without setbacks, so stocks may stay in a range. And that's fine with us.

Audio Extra: Todd Chats With Chuck

In our latest Audio Extra, *Pro* analyst Todd Wenning talks with legendary money manager Chuck Akre in an exclusive *Pro* interview. Pull up a chair as Akre discusses the magic of compounding, fighting investor ignorance, bank stocks, and more. Click here to listen in.

Your Free Gift: *Motley Fool Masters*

Your free educational course with Tom Gardner is now available! Learn how to uncover great businesses in this five-step video series. Watch the introductory message from Tom and Jeff, or jump right in by visiting the *Masters* website here.

Why? Although the "oughties" was an awful decade for equities (the S&P 500 fell by more than 20%, excluding dividends), the income strategies that we use in *Pro* did perfectly well over the period. What's more, by being a patient investor and buying companies with proven business models; strong, recurring free cash flow; sustainable competitive advantages; and selling them at reasonable prices, I was relying on an enduring strategy — so most of the stocks that I owned over the past decade did well, too.

Stay Focused

At *Pro*, we'll continue to buy companies that we believe will create long-term shareholder value, including **Kinetic Concepts**, **AmTrust Financial Services**, and **GrafTech International**, and we'll use options strategies — including shorts and hedges — to generate near-term returns and income. Working together, these strategies performed well over the past decade despite two market bubbles and record-poor index returns; in this decade, they should do even better.

In closing, whenever you saddle up to your computer and check in on our investments, remember to think in terms of months for your options, and years for your stocks — and we'll have an enjoyable time as we continue to build value through the ups and downs. To new members, we hope that you're getting comfortable with *Pro*! We're here to help each step of the way, so continue to ask questions on the Getting Started board.

Invest well,

Jeff Fischer (TMFFischer)

Contest: Invest With Us and Win a Free Year of *Pro*!

The best way to succeed with *Pro* is to invest alongside us — and in our latest contest, we're rewarding you for doing just that. On March 1, 2010, at 11:59 p.m. ET, any *Pro* member with three or more active *Pro* stock or ETF holdings in My Scorecard will be entered into our random drawing to win a free year of *Pro* (valued at $1,999).

It's easy to enter: Just visit *Pro*'s Portfolio page and click "Add" in the "I Own This Stock" column next to any *Pro* stock or ETF you own. You must have at least three active *Pro* holdings to be eligible. If you already have three or more active *Pro* holdings in My Scorecard, you'll be automatically entered in the drawing for the prize.

We'll choose one winner at random and announce the lucky Fool in the March 8 Memo. For the complete rules and to ask any questions, please see TMFAllyzay's new post on the Memo Musings board. Good luck!

Audio Extra: Todd Checks In With Chuck Akre

Published Feb 16, 2010 at 12:00AM

Welcome to our latest Audio Extra, *Pro* Fools! Before the D.C. area got three feet of snow dumped on it, *Pro* analyst Todd Wenning recorded an interview with Chuck Akre, manager of the Akre Focus Fund (AKREX) and longtime friend of the Fool. If the name sounds familiar, it's because Akre's investment approach was the inspiration behind the Jan. 5 CAPShot report. Listen below as Todd asks Chuck about the U.S. market, the beauty of compounding interest, and the benefits of patient investing. Can't get enough of Chuck? You can read his most recent letters to shareholders by clicking here.

Here's a breakdown of the audio:

3:00 – Chuck talks about the importance of finding “little compounding machines”

7:21 – How Chuck maintains his long-term, low-turnover focus in a hectic market

9:47 – Why the U.S. is the “least worst” place to invest today

13:54 – What are the best sectors for the next decade?

15:03 – Are banks a good buy right now?

Buy Shares and Write a Covered Strangle on Tupperware

Published Feb 9, 2010 at 12:00AM

At a Glance

Trade summary: We're buying a half-position in Tupperware (2% of 4%), writing covered calls on it for income, and writing puts to potentially buy our second 2% at a lower price, generating more income. A covered strangle provides a wide range in which to profit. If you don't want to buy Tupperware today, you can just write puts.

- **Action**: Buying 2% of Tupperware and setting up a covered strangle: Writing ("sell to open") July 2010 $50 covered calls, recently $2.10, and writing July 2010 $40 puts, recently $2.15, representing another 2%.
- **Allocation**: 2% of 4% (for *Pro*, 500 shares and five contracts of each)
- **Preferred limit price**: Enter a "strangle order" for a net credit of $4.25 or better. If your broker requires separate transactions, write covered calls and then write puts for this amount or more, combined. Later, if necessary, aim to accept no less than $3.80.
- **Alternate trades**:
  - **Don't want to use options?** Aim to buy 2% of Tupperware around $40.
  - **Can't write puts?** Buy 2% to 4% of Tupperware and write July 2010 $45 covered calls, recently $4.
  - **Don't want to buy Tupperware now?** Write April 2010 $40 puts to potentially buy shares near $39; or, write July $40 puts to buy shares near $38.

What's New

"One word: Plastics."

The Graduate was on to something. The economic downturn has been a boon for leading plastics monger **Tupperware** (NYSE: TUP). In fact, you might say last year was downright Tupp-tastic: The company expanded its sales force as the unemployed sought new work, grew its customer base as people stored more food to save money, and generated record sales in emerging markets and Europe. In fact, results were so strong that the stock price now sits comfortably above Tupperware's 2007 high — when the market last blew its lid. Yet we still believe this valuation is reasonable.

When our January 2010 $40 puts expired as cash, it was the second time our put-writing endeavors resulted in income rather than shares. We're happy for the durable, dishwasher-safe income, but we had underestimated the stock's potential and still believe there's upside left in Tupperware. Thanks to last year's 165% pop in free cash flow, the stock now trades at 13 times free cash flow, much cheaper than when we first wrote puts (25 times 2008 results).

We believe these free cash flow gains are sustainable. What's more, management projects sales growth of 6% to 8% in 2010 (in local currency), and 9% to 12% earnings-per-share growth (the average estimate calls for 14%). With shares trading around $45, the stock fetches a reasonable 12.7 times this year's earnings estimates. Our new estimate of fair value reaches to $50, or about 15 times both EPS estimates and likely free cash flow. Put it all together, and it's time to buy some shares of Tupperware with help from our old friend, the covered strangle.

Why This Strategy

Although Tupperware is doing well, we remain defensive as we invest new funds. As government stimulus wanes, it's uncertain how well global economies will fare on their own or how the stock market will react. This covered strangle allows for ample upside over the next five months, while also providing income and downside protection even if Tupperware stays flat or falls nearly 10%.

We know that as rosy as the plastics future appears, cracks can occur where you least expect them. If the dollar strengthens, it will dampen Tupperware's overseas profits and could threaten earnings estimates. If the job market rebounds, Tupperware could lose part of its sales staff to salaried positions elsewhere, potentially denting sales. Meanwhile, further economic weakness and lengthy unemployment woes would likely continue to benefit Tupperware.

How to Follow Along

If you're ready to strangle the plastics purveyor, buy a half-position along with us — use a "strangle order" with your broker (if you can) to buy shares in lots of 100 and write ("sell to open") covered calls on them (one per 100 shares); you'll also write puts to potentially buy your second slug of plasticky goodness cheaper.

If you only want to buy the stock or partake in one leg of this trade (write puts *or* buy shares and write covered calls), you can do that instead. Please see our alternate trades above.

For our strangle, the numbers shake out like this:

- **Recent share price:** $45
- **Recent options bid/ask:** July $40 puts, $2.00/$2.30; July $50 calls, $2.05/$2.25.
- **Total option income**: $4.25 per share (splitting the bid/ask prices)
- **Effective options yield**: 9.4% of share price in 5 months
- **Potential second 2% buy price**: $35.75 (21% lower)
- **Average buy price if we get all shares**: $40 (11 times earnings estimates)
- **Potential sell price on our first 2%**: $54.25 (21% higher)
- **Option income range:** $35.75 to $54.25
- **Get on the income train:** If the stock trades anywhere between $40 and $50, the options represent pure income.

Pro will make this trade in the next two business to 30 calendar days. To discuss or ask questions, please pop on over to the Tupperware board.

Monday Memo: Is Warren Buffett a Taoist?

Published Feb 9, 2010 at 12:00AM

Get Started in 3 Steps

Coming up next week: *Step 3: Become an Options Pro*

Upcoming Earnings

- Feb. 16: **Abercrombie & Fitch**, before the market opens
- Feb. 17: **AmTrust Financial Services**
- Feb. 23: **Autodesk**, **Expeditors International**, and **GrafTech International**

Next Week

Please note that the next Monday Memo will be published on **Tuesday, Feb. 16,** in observance of President's Day.

The Taoist concept of *wu wei* is about natural action — knowing when to act and when *not* to act. Literally "non-doing," the principle of wu wei is found in the martial arts disciplines of aikido and judo, where the goal is to use an attacker's force to the defender's advantage. The ancient Chinese military strategist Sun Tzu preached wu wei in *The Art of War*, advising men "to avoid what is strong and to strike at what is weak."

Separating Yin From Yang, *Pro*-Style

Motley Fool Pro might not be engaging in hand-to-hand combat, but we know how to use the market's emotions to our advantage. Warren Buffett's famous quote, "Be fearful when others are greedy and to be greedy only when others are fearful," whether intentional or not, is quite Taoist in principle. In essence, the Oracle of Omaha is saying that the key to long-term investing success is to avoid what is temporarily strong and buy what is temporarily weak.

To illustrate, let's hop in our Delorean and set the flux capacitor to Feb. 8, 2000. The St. Louis Rams had just won the Super Bowl, boy bands ruled the airwaves, and "new economy" technology stocks were all the rage. Meanwhile, industries like energy, railroads, and machinery were largely ignored and written off as antiquated.

Looking back, it seems obvious what investors *should* have done — the Nasdaq is still down more than 50%, while the **Vanguard Energy Index** (VGENX) fund is up 180% — but in 2000, the choice wasn't so simple. At the time, crude oil was just $27 a barrel, and with other commodities also under pressure, demand for industrial products and services was quite low. These gloomy fundamentals, in contrast with the allure of promising new technology, made it *psychologically* easier for investors to buy, say, Pets.com over **Caterpillar**. It may have been the easy choice, but it wasn't the right choice. Again, buying what was temporarily weak would have been the better investment in the long run even though it was the harder decision to make.

Be a Contrary *Pro* Fool

If *Pro* is to achieve its lofty goal of 75% accuracy, it's imperative that we keep a year 2020 perspective and use the market's short-term swings in 2010 to our long-term advantage. In our first 18 months at *Pro*, we've tried our best to be contrary investors in the face of a bumpy market — for instance, buying stakes in **Vanguard Emerging Markets**, **Plum Creek Timber**, and **GrafTech International** in late 2008; **Autodesk** in March 2009; and **FPL Group** while it's battling a weak Florida economy. Not every investment will be a winner, but if we consistently invest in strong businesses that are temporarily out of favor, over time we'll be in a strong position to achieve our goals.

Do you have a wu wei story? Tell us about a time you bucked a market trend either by acting or *not* acting on our Memo Musings board.

Fool on!

Todd Wenning (TMFPhila)

Earnings Action Roundup

By Jeff Fischer (TMFFischer)

Kinetic Concepts believes hospital spending will stabilize and anticipates 8% to 12% earnings per share growth in 2010, to about $4.40 per share; that means the $39 stock trades at only 8.8 times expected earnings. With nearly $300 million in free cash flow last year, KCI is paying down debt and expects to start selling its products in Japan this year. KCI remains a Buy First stock; it's also attractive for writing ("sell to open") puts.

Plum Creek Timber continues to defer wood harvests, but it expects stability in lumber prices and an upward trajectory this year. The company cranked out $540 million in cash flow from operations in 2009, and provided guidance for 2010 that was greener than the average analyst estimates. The stock is near our preferred buy price of $34, has a hefty 4.6% dividend yield, and remains a strong stock for earning option income, too — so expect more options trades on it from *Pro*. If you don't own Plum Creek, you can write ("sell to open") puts to potentially obtain a lower buy price, or be paid well if not.

Procter & Gamble is finding its footing and gaining traction in today's economy, capitalizing on its brands and wide distribution, launching new products, and making headway in emerging markets. With more than $3 billion in free cash flow last year, management expects more than $4 in earnings per share in the new year. This puts the $61 stock at 15 times expected earnings, while yielding nearly 3% in dividends. Shares remain a long-term, core Buy.

GlaxoSmithKline reported strong growth in the fourth quarter and increased its already-sizeable dividend by 7% for a total annual yield of more than 5%. For the year, free cash flow surged 12%, to $8.4 billion, which means shares of the $100 billion British drug leader are trading at an inexpensive 12 times free cash flow. Led by a young CEO who is pushing the company into growing emerging markets, Glaxo remains a Buy First stock.

Jack Henry & Associates posted flat organic sales, but its backlog improved 14% over last year as the banking software company with strong recurring revenue waits for improvements in the beleaguered financial sector. Results remain solidly profitable, the shares remain a Buy, and the stock trades in our preferred buy range.

Community Highlights

- New member **mikemacf11** asks about protection from a downturn, and Jeff responds.
- Patience goes a long way: If you're a new member, and the market's got you down, read this.
- Health care stocks — including **Kinetic Concepts** — have caught a cold because of market fears surrounding the health care bill. Get *Pro*'s take on the resulting opportunity.
- **Alex340** posts options trades meeting *Pro* criteria.
- New member **limitedtime** shares his first sure steps with *Pro*.
- The recent market decline shouldn't change your steady approach to building a *Pro* portfolio to earn profits in up, flat, and down markets. We're preparing for a new market (with more volatility), and Jeff shares that all is good.
- The Fool is still being affected by extreme weather. Thank you for understanding!
- Did you like the covered strangle strategy on **Intel**? You can do the same type of trade on **Expeditors International**. Just keep in mind that Expeditors announces earnings on Feb. 23.

Write Covered Calls on Autodesk

Published Feb 4, 2010 at 12:00AM

If you don't own shares of Autodesk yet, you can still make a trade on this stock today. See "Alternate trades" below.

- **Action:** Write ("sell to open") July 2010 $24 covered calls on Autodesk
- **Allocation:** Write one call for every 100 shares of Autodesk owned (for *Pro*, 24 contracts)
- **Option's recent bid/ask (Feb. 3):** $2.05/$2.15
- **Preferred limit price:** $1.85 or higher, day order; if needed, no lower than $1.70
- **Recent stock price:** $23.70
- **Special requirement:** You must own at least 100 shares of Autodesk to write a covered call.
- **Alternate trades:**
  - **Don't own 100 shares of Autodesk?** Continue to hold your position.
  - **Don't own any shares of Autodesk?** The stock is on Hold, but you can write ("sell to open") puts to potentially buy shares at a lower price. The July 2010 $22 puts recently bid $1.45.

What's New

Autodesk sells its 3-D design software by the "seat" — one subscription per user — so weakened employment in construction, engineering, architecture, and technology means weaker sales for the company. Yet the stock is trading at a premium — and not because investors are still gaga over the role of Autodesk's software in the *Lord of the Rings* trilogy. Shares are priced at an aggressive 35 times depressed free cash flow and 22 times estimated earnings for the year ahead because investors project that Autodesk's high margins and free cash flow will return once the economy gains some real ground.

But so far, companies aren't hiring. Despite increased government stimulus in fields related to Autodesk, we'll likely need to wait at least a few more quarters before customer numbers start to improve. That means the dire jobs situation may continue to push Autodesk's recovery farther down the road. Although *Pro* has done well with Autodesk, enjoying a nearly 50% profit in less than a year (we've had the stock on Hold since the summer), given the stock's valuation and the weak jobs picture, we want to hedge our gains with covered calls.

What's a Covered Call?

- Check out *Pro*'s guide to covered calls.

We write covered calls when we're ready and willing to sell a stock we own at a higher price (the strike price) by our options' expiration date. Or, if the stock doesn't rise to our strike price by expiration, we keep our shares, and may write covered calls again, generating more income.

Why This Strategy?

Based on the current malaise, Autodesk's complete rebound could take many more years — but by writing covered calls, we're paid while we wait, or we obtain a favorable sell price in much less time. Our fair value estimate of the stock is in the mid $20s to low $30s, but that assumes Autodesk recovers about three-fourths of its former glory (measured by sales and free cash flow). Instead of waiting for that rebound, we'd be happy to sell the stock in the mid $20s and take our profits, earning most of our gains in much less time *and* with less risk, since the calls provide a hedge.

Meanwhile, if our shares aren't called away, we cushion our downside. The July 2010 $24 calls on Autodesk will yield us 8.6% (at a recent $2.05 per share) on the recent share price of $23.70, or 12.5% on our average purchase price on the stock. By choosing calls that expire in less than six months and have a strike price modestly above Autodesk's current share price, we are paid well on an absolute basis and better protected if the stock declines. We could write April 2010 calls instead, but if Autodesk declines in the coming months, we'll enjoy a much lower absolute payment compared with the July calls. The July calls also provide us with a higher potential sell price — and more than a year-long holding period on all of our shares.

How to Follow Along

If you need a refresher on covered call strategies, please see *Pro*'s guide to covered calls before placing the trade. Remember, you write one call for every 100 shares of stock you own; and you may cover all of your shares, or just some. We're covering all of ours. Here are the numbers behind the trade:

- **Trade:** Write ("sell to open") one July 2010 $24 call for every 100 shares owned
- **Option yield (at recent $2.05 bid):** 8.6% of the $23.70 share price, in 5.5 months
- **Option yield on our $16.36 average cost basis:** 12.5%.
- **Upside from today if sold at a net $26.05 ($24 strike plus $2.05):** 9.9%
- **Total return on position if exercised:** 59.2%
- **Downside protection:** 8.6%; a decline to $21.65 is hedged

When you write ("sell") an option, the going price is paid into your account and the money is yours to keep. In this case, you're then obligated to sell shares of Autodesk if they're above the strike price by the expiration date.

Writing puts? If you place the alternate trade and write puts, you'll be obligated to buy shares of Autodesk around a net $20.55 if the stock declines.

We'll make this trade in the next one business to 30 calendar days. To discuss it or ask questions, please visit our Autodesk board.

Buy Shares and Write a Covered Strangle on Intel

Published Feb 2, 2010 at 12:00AM

At a Glance

Trade summary: We're buying a half-position in Intel (3% of 6%), writing covered calls on it for income (and to be defensive), and writing puts to potentially buy our second 3% cheaper, generating even more income. This strategy is called a covered strangle, and it provides a wide range in which we can profit and strong short-term income. Read on for more!

- **Action**: Buying 3% of Intel and setting up a covered strangle: Writing ("sell to open") July 2010 $21 covered calls, recently $0.97, and writing July 2010 $19 puts, recently $1.23, representing another 3%.
- **Allocation**: 3% (for *Pro*, 18 contracts)
- **Preferred limit price**: Enter a "strangle order" for a net credit of $2.20 or better. If your broker requires you to do separate transactions, write covered calls and then write puts for a total payment around $2.20 or more.
- **Alternate trades**:
  - **Don't want to use options?** Simply buy 3% of Intel.
  - **Can't write puts?** Buy 3% to 6% of Intel and write July 2010 $21 covered calls.
  - **Don't want to buy Intel yet?** Write July 2010 $19 puts to potentially buy shares near $17.77.

What's New

Pro first bought shares of computer chip behemoth **Intel** (NASDAQ: INTC) and wrote covered calls on it in October 2008, when the stock traded near $16. Intel has gained 23% in the 15 months since, as major economic uncertainty has faded and the outlook for the company has brightened. The company's dominant market share, improving results, reasonable valuation, and size — which makes it unlikely to soar or fall sharply — make it an attractive candidate for generating option income. Although *Pro* hasn't had a position in Intel since last summer, we're aiming to profit from the stock again today.

Last quarter, the company reported a record gross profit margin and strong demand, although sales were in part driven by restocking bare-bones inventories. Still, management predicts revenue will remain strong this year as consumers upgrade to Windows 7 and companies start to refresh aging computer assets. Research group Gartner estimates that commercial PC sales will grow a robust 10% in 2010 and another 13% in 2011, an encouraging sign in a still sluggish economy. Valuation-wise, Intel should face limited downside. The stock trades at 12 times expected 2010 earnings per share, free cash flow is growing, and this year the company's bottom line is expected to double from recent lows, followed by further 10% growth in 2011.

Why This Strategy?

Tip: Get to Know the Covered Strangle

Never strangled a stock before? It's fun! Here are the basics:

- Buy half a position in a stock you want to own
- Write covered calls on the stock for income and to be defensive
- Write puts to potentially buy your second half cheaper
- The two key benefits are strong near-term income and a wide range in which to profit.

Stability is the key for our covered strangle strategy, and Intel's low valuation relative to its expected earnings growth increases our margin of safety and odds for success. A covered strangle involves buying a half-position in a stock you want to own; writing covered calls (one for every 100 shares owned) on that stock; and writing the same number of puts to potentially buy the next half-position at a lower price. The strategy is defensive, potentially generating substantial near-term income even if the stock moves within a wide range, yet attractive, giving us downside protection while still allowing for a profitable exit if Intel's stock goes higher.

How to Follow Along

For *Pro* members new to options, begin with our guides Options 101 (basic intro) and 201 (covered calls). The first piece of a covered strangle is writing the covered call: You're paid to commit to sell a stock you already own if shares increase above your option's strike price by its expiration date. If the stock doesn't increase above the strike price, the calls expire, you keep the option income along with your shares, and you can write new covered calls. If the stock does increase above the strike price, your shares are sold at that price and you keep the option income, raising your total sales price. This is a great way to earn income, especially on stable stocks.

The second piece of a covered strangle is writing puts (Options 301), which pays you for the commitment to buy shares of a stock if it declines to your strike price. The strangle thus allows you to potentially earn income in two ways on the same stock, along with giving yourself a wide profit range.

Here's the math behind the Intel trade (prices as of Feb. 2):

- **Action**: Buy 3% in Intel, recently $19.97
- **Action**: Write ("sell to open") July 2010 $21 covered calls (one for every 100 shares owned), recently $0.97
- **Action**: Write July 2010 $19 puts (one for every 100 shares you'd buy), recently $1.23
- **Total option income**: $2.20 per share (11% of current share price)
- **Potential second 3% buy price**: $16.80 (with July 2010 $19 puts and the $2.20 per share the options paid you)
- **Average buy price if we get all shares**: $18.39 (11 times 2010 EPS estimates)
- **Potential sell price on our first 3%**: $23.20 (with July 2010 $21 calls plus the $2.20 the options paid you) (14 times 2010 EPS estimates)
- **Effective options yield**: 11% in 5.5 months
- **Stock gain if sold via covered calls**: 16% in 5.5 months
- **Option income range:** Any price above $16.80.

Already Bought Calls With *Motley Fool Options*?

If you bought the January 2012 $17.50 Intel call LEAPs along with *Pro*'s sister service, *Motley Fool Options*, you can sit tight on your bullish trade. As you know, you may write covered calls on your call options to defray your cost. Just make sure that you'll end with a profit if your shares are called away.

The option income is equal to nearly 12% of our buy price on Intel; plus, we'll be on track to earn another 0.8% in Intel dividends (1.6% for *Pro* members who buy before the ex-dividend date, Feb. 3) (corrected from original; see our note here). If our shares are called away in July via our $21 covered calls, we'll earn around 16% in less than six months and be selling Intel at a reasonable valuation (factoring in our option income). Meanwhile, as long as Intel trades above $16.80 and below $23.20, we can close our strangle for a gain (and not get the shares involved); and if the stock falls, we'll get shares and can write calls again while we wait for it to recover. If Intel trades anywhere between $19 and $21 at expiration — about a 10% range — both of our options will expire for the full cash gain, and we can set up the trade again.

To sum up: If Intel is below $19, we'll be ready to buy more shares, and if it's above $21, we'll be ready to sell our shares — always keeping the option income. If we decide to close the options early, we'll still keep some of the income *and* our shares. As you can see, writing a covered strangle gives us plenty of room to breathe easy — and profit.

If you have questions about Intel or this trade — and the many alternate trades available to you above — please post on *Pro*'s Intel board.

We will make this trade in the next two to 30 days.

Monday Memo: Don't Lose Your Edge

Published Feb 1, 2010 at 12:00AM

Get Started in 3 Steps

Step 1: Get to Know *Pro*: Welcome, new members! As you begin with us, just follow our 3-step plan. In Step 1, let us show you how to use our site and service, how to make *Pro* work for you in just minutes a month, and how to follow along with us in a way that fits your investing needs. Just follow this link to get started!

Coming up Monday, Feb. 8: *Step 2: Invest With* Pro

New! **Jeff and Todd Go Audio:** Hear *Pro*'s take on 2010 — and the one thing Jeff and Todd believe is the key to successful investing in any market — in *Pro*'s brand-new Audio Extra.

Earnings Ahead

- Feb. 1: **Plum Creek Timber**
- Feb. 2: **Jack Henry & Associates**
- Feb. 4: **GlaxoSmithKline**

Tip: Buying During Earnings Season

As you continue to build your *Pro* portfolio, keep in mind that stocks can be especially volatile around earnings news. *Pro* will likely buy more shares of some of our companies after earnings season, since quarterly reports impart new information. Watch this sidebar every Monday for the next *Pro* companies to report.

If you believe the economy is going to improve over the next three years (as we do), then a down market this year would be a blessing. It would offer Foolish investors like us more opportunities to buy strong stocks at a discount — and ample room to make money with options and shorts. This means *Motley Fool Pro* is preparing for a busy February as we adjust our portfolio for the new market and welcome the challenges ahead.

Here's how we believe the timeline will likely play out. Like most investors, we weren't surprised to see the market bounce back after 2008's drubbing (although the magnitude of the bounce was surprising). And for a while, we've expected the market to give back some of these gains — which seems to be happening right now. Later, we expect stocks to settle into a range, allowing us to average in to our favorite stocks and generate steady options income as we have from the start. In the quarters and years to follow, our stocks should steadily grow value, too. What's not to like?

Stick to Your *Pro* Knitting

Together, we can approach these possibilities with confidence by focusing on *Pro*'s overarching goals: to close at least 75% of our positions profitably (we're above 90% now); to earn strong total returns with less risk and volatility than average; and to generate gains in up, down, and flat markets, compounding value over time.

If you just joined us, this is a great time to take stock and get started with your *Pro* portfolio. For veteran members, it's an important time to better position your portfolio for 2010. Whether you want long-term capital gains, consistent near-term income, portfolio protection, or all three, *Pro* strategies can help you reach your goals.

Don't Get Investing Brain Freeze

As you work toward these goals, remember that there are some things in life you don't want to rush: eating ice cream, a marriage proposal — and of course, investing. We're going to announce several new trades this month, but take your time, read our reports, and only move forward when you're comfortable. Investing isn't a race. It takes years for most of us to *earn* our money — so we should invest it with care.

Patience goes hand in hand with *Pro*'s current defensive stance. We have ample cash and expect some downside volatility, so we're buying our stocks *gradually*. For most of our existing positions, we aim to average in further if better prices come along. We're also writing puts to potentially buy some stocks more cheaply. So, as you purchase our Buy First and Buy stocks, take partial positions to start, aiming to buy more over time. If you'd like to hedge your portfolio, open a position in **ProShares Short S&P 500**, an ETF that moves inverse to the index — and stay tuned, because we plan to have more hedges ahead.

Learning Options

Upcoming *Pro* options trades will include links to *Pro*'s appropriate options guide so you can understand clearly what we're doing. You don't need to use options to make *Pro* profitable for you, but I've used them for almost 10 years and can confidently say that they're an excellent investing tool. Finally, remember that *Motley Fool Options* is a separate service from *Pro*, and its options trades and weekly commentary are not related to the *Pro* portfolio.

Gearing Up for a Profitable 2010

The weeks ahead will be busy, Foolish, and fun for you as a member of *Pro*. And as a community of investors, we have plenty of time to grow value together. We appreciate all of the help that seasoned *Pro* members are giving to new members in the *Pro* community — thank you! For new members who have questions about IRAs, what to do with your existing holdings, how our trade alerts work, and more, please see our Q&A below covering these topics. Don't forget to see the sidebar for important dates and more, and visit our Getting Started board with your questions.

To new members, we look forward to showing you a new way to invest in 2010. To veteran members, we thank you for being with us during these fascinating times — times which are sure to continue!

Foolishly,

Jeff Fischer (TMFFischer)

Q&A: Getting Started

1: When does *Pro* announce its moves?

First, we announce our trades — about four to six per month — before we make them ourselves. You'll get these "Make the Trade" emails at any time during normal market hours along with a link to details on the reasoning behind our trade. Then, in the following two to 30 days (for stocks and ETFs) or one to 30 days (for options), we'll make our actual trade and send you a "Trade Complete" email at market close (4 p.m. ET) that day. We preannounce our trades so you can invest before us if you wish.

- **Tip:** Only when you get the "Trade Complete" email is the position added to *Pro*'s real-money portfolio. At that time, you can see our start price, commissions, and other trade details on either the Portfolio page or on the stock's History tab.

2: What do I do with my losers?

If, like most Fools, you already own an array of stocks and want to sell some to buy *Pro* stocks, move gradually. We don't recommend going all to cash at once; instead, sell your least favorite stocks when you need funds to buy *Pro* stocks and ETFs you like better.

- **Tip:** If you own stocks recommended by other investment services and need to sell some, first sell those that are not core holdings or recent recommendations. And sell those you simply like least.

3: How quickly should I get invested?

All of our holdings that are rated "Buy First" and "Buy" on the portfolio page can be bought at will; we believe in all of 'em. But in this volatile market, we also believe you should gradually average into anything you're buying. In fact, *we're* still in the process of averaging into most of our holdings — so we're patiently investing right alongside you.

- **Tip:** Take your time and don't sweat price swings — we'll let you know if something is no longer attractive. Keep in mind that you're also learning option strategies you can use to buy our stocks more cheaply down the road.

4: What is a "preferred buy price," and how firm is it?

All of our trade reports (the tab labeled "What We Think") on stocks include a preferred buy price in the "At a Glance" section atop the report. However, paying modestly more won't make the investment a poor one. The preferred range is an *ideal*.

- **Tip:** Also look at our fair value estimate for any stock (in the "At a Glance" section) and use that to help you determine whether the current price is attractive enough for you.

5: Can I make options trades with an IRA?

Most likely. Many IRAs will allow you to buy options and write covered calls, and some will let you to write cash-secured puts. Ask your broker.

- **Tip:** Writing options is an especially savvy IRA move, since the income you generate is tax-free.

6: Should I make the options trades that are already in play?

Option trades are timely and opportunistic even when you use them strategically in relation to an underlying stock, as we do. Thus, new *Pro* members should typically wait for new option trades from us in order to get started. We'll have our first new option trades in a matter of days, so if you're ready to jump in (if not, that's fine — keep following along with our 7-step plan!), make sure your brokerage account is approved for options trading (and brush up with our how-to video). Ask your broker for options permission — typically, level two or three is ample. For now, you want to be able to buy calls and puts, write covered calls, and write cash-secured puts.

- **Tip:** Each option trade we announce (with a "Make the Trade" email) will clearly explain the trade we're going to make and how you can follow along.

7: What can I expect as I start to trade options?

Profits can arrive regularly with options, but remain patient as you get started. A few months into this new way of investing you're going to realize that these strategies are available to you the rest of your life — and they're "renewable," so there are always new option opportunities. The key is to find great businesses, at fair prices, and use what you know about them to put together sensible options strategies. (And of course, we're here to help you with that.)

- **Tip:** When writing options, let them be your shorter-term ATM machine; let the stock be your retirement-minded holding.

8: What is the meaning of life?

OK, we can't help with that one today. But the name of the game here at *Pro* is all about working with what the market hands us. We *welcome* a fair amount of volatility. It allows us to buy shares more cheaply and use more lucrative option strategies. For investors who know businesses well, price volatility presents opportunity.

Audio Extra: Jeff and Todd Tackle Your Top Questions

Published Feb 1, 2010 at 12:00AM

In the newest Audio Extra with the *Motley Fool Pro* team, Jeff Fischer and Todd Wenning sit down with *Pro* teammate Jill Ralph, answering her questions about what they believe is in store for investors in 2010. Not surprisingly, Jeff and Todd are excited about the year, whether the market decides to speed ahead or stall a bit. To hear why — and the one thing they believe is the key to successful investing in any market — grab your earphones or turn up your speakers, and enjoy *Pro*'s latest Audio Extra.

Buy Quanta Services

Published Jan 27, 2010 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Price when we released our original intent:** $18.40
- **Estimated fair value:** $26
- **Preferred buy price:** Below $20
- **Type of holding:** Core; Energy infrastructure
- **Alternate trades:** Write ("sell to open") puts that pay at least 4% of your strike price to potentially buy shares at a lower start price — right now, you can consider March 2010 $17.50 puts, recently bidding $0.70.

The Big Picture

Have you grokked the grid lately? Aging, polluting, and overtaxed, much of the power network in the U.S. is in dire need of an upgrade, especially as renewable energy and natural gas become more integral to the equation. Now, as the recession eases and stimulus money is put to work on infrastructure projects, **Quanta Services** (NYSE: PWR) is positioned to benefit.

With a market value of nearly $4 billion, Quanta is the world's largest builder of power transmission lines. Delivering solutions for electric power, renewable energy, and natural gas, the company helps power plants deliver energy from source to customer, upgrades transmission systems, and maintains power networks. Quanta also works with fiber optic, telecommunications, and broadband networks. The company is poised to grow as America invests in both its power and communication grids, leading our network into the 21st century.

Power to Expand

Get Personal With Quanta

- **Headquarters:** Houston, Tex.
- **CEO:** John Colson, since 1997; 62 years old
- **2008 revenue:** $3.7 billion
- **2008 net income:** $166 million
- **Employees:** About 14,000
- **Revenue per employee:** $270,000
- **Scope of operations:** North America

According to J.P. Morgan, spending on transmission projects is on track to double from 2008 to 2012. Combine that growth with new, stimulus-driven renewable energy projects, and you can see why Quanta expects its hydro, solar, and wind power revenue to triple this year, driving nearly $300 million in 2010 sales. But it's not just stimulus money at the wheel. The U.S. has voiced a commitment (via the American Clean Energy and Security Act (ACES) and the American Recovery and Reinvestment Act (ARRA) in 2009) to focus on alternative energy, a smart electricity grid, and broadband — all pieces of Quanta's operations. Tens of billions of dollars are earmarked for alternative energy projects, while $11 billion has been set aside to upgrade the energy grid and another $7 billion for broadband initiatives.

What's more, a large portion of the stimulus bill is going to rebuilding and repairing infrastructure — about $30 billion for highways, bridges, and airports — which usually requires removing and replacing transmission lines of all types, further putting Quanta's skills to good use. Following a drop in revenue in 2009, management expects double-digit sales growth across its entire power transmission business this year — and impressive growth should continue in the years ahead.

The Business of Transmission

Community and CAPS Insight

Quanta scores a perfect 5 stars on CAPS, with 100% of All-Stars rating it "outperform," putting the stock in the top 1.4% of all stocks rated on CAPS (it's also the top-ranked company in Construction and Engineering on CAPS). On *Pro*'s proprietary CAPShot, the company earns a respectable 7 of 12, missing on the margin and return on equity criteria. The business has lower margins than we usually seek, but it's strong enough in other areas (including growth and balance sheet) to compensate.

Quanta splits its end-to-end network and transmission businesses into four areas of expertise.

Electric Power Infrastructure Services is the company's largest division, comprising 66% of 2009 revenue through September. This encompasses Quanta's work on major traditional electric power transmission networks as well as hydro, solar, wind, and other renewable energy facilities. Repairing networks, especially after outages, provides the company with sporadic high-margin revenue, and though much smaller in scope, the company also handles industrial wiring and cable and control systems for light rail lines.

The Natural Gas and Pipeline Infrastructure Services division (19% of revenue) was given a big boost when the company acquired Price Gregory Services in October 2009. The move makes Quanta one of the largest full-service providers of natural gas solutions in North America and should add nearly $1 billion in profitable annual revenue in the first year alone. Meanwhile, with coal plants continuing to switch to natural gas and government regulations that could cap carbon emissions, business here should only accelerate. In fact, CEO John Colson says, "We haven't been as bullish on the natural gas market as we are today. That's going to spur growth over the next several years."

The remaining divisions are Telecommunications Infrastructure Services (12% of revenue) and Fiber Optic Licensing (3% of revenue). These aren't crucial to our investment case compared with the much larger electric and natural gas divisions, but if broadband initiatives take root, Quanta may benefit here as well.

Financials and Valuation

As you can imagine, the business of designing and building power transmission lines is capital intensive — so Quanta has relatively low returns on capital, free cash flow, and margins. However, it sports a strong balance sheet (nearly $600 million in cash and only $125 million in convertible debt), an industry-leading position, and steady financial discipline — delivering reliable profits. This has given the stock a premium valuation over the past several years.

Quanta's earnings per share is expected to increase by nearly 30% in 2010 as revenue rebounds with help from its $2 billion service backlog. The stock, currently around $18, trades at 19 times estimated 2010 earnings. To value Quanta, we used a discounted cash flow to firm model (valuing the cash left over for suppliers of capital — debt and equity — after the company made its investments) with an 11% discount rate; based on scenarios using varying growth rates, we put a fair value of $24 to $26 on Quanta, or 30% to 40% above the current market price. However, given how large Quanta's contracts can be, if more key deals come the company's way than expected, that valuation could tick even higher.

Meanwhile, our downside risk should be reasonable at today's valuation (and considering Quanta's $5.5 billion backlog as a safety net), and the share price lends itself well to future options strategies.

What Would Make Us Sell

Energy in the *Pro* Portfolio

With partial stakes in **FPL Group** (NYSE: FPL), **Vanguard Energy** (NYSEMKT: VDE), and Quanta, the *Pro* portfolio is starting to have meaningful exposure to domestic energy and utilities. We may manage these three positions together, adding more money to stocks we end up liking best.

Follow-up Action

Options-wise, Quanta may be a good candidate for writing covered strangles in the future — first writing puts, then writing covered calls after some appreciation.

Although maintenance and service agreements provide Quanta with recurring revenue, most large sales are based on one-time contracts. If management consistently fails to win key contracts (*or* execute on them), we may sell. What's more, the industries Quanta serves — namely, utilities and telecom — are highly regulated, dependent on large sums of financing, and cyclical, so results will be lumpy. Market conditions suggest that we're entering an upswing in the spending cycle, but patience is still the watchword. Investments in major energy projects are by nature long term, and projects can be further delayed by government squabbling. *Pro* holding **FPL Group** (NYSE: FPL), for instance, just put $10 billion in capital upgrade projects on hold because Florida's governing body denied most of FPL's desired rate increase. The regulatory environment remains a risk, although it is mitigated by federal stimulus funds coming down the pike. That said, if Washington cuts spending significantly, it could dampen near-term prospects for Quanta, too.

Pro Bottom Line

As the U.S. starts to revamp its energy grid, Quanta Services is in a sweet spot to profit no matter what power source we're talking about — natural gas, oil, or renewable energy. Upgrading and expanding our energy plants and transmission lines will take many years, and the work is not a matter of *if*; it's a matter of *when*. Meanwhile, America also needs to improve and build out its broadband and telecommunications network. With its strong balance sheet, full service solutions, and respected expertise, Quanta's phones should be ringing steadily for years to come.

To discuss Quanta and ask questions, please visit its new board.

Sell Half Your Position in Vanguard Emerging Markets

Published Jan 26, 2010 at 12:00AM

At a Glance

- **Action:** Selling about half our stake in Vanguard Emerging Markets (for *Pro*, about 560 shares; we'll be keeping 600)
- **Guidance change:** Moving from Buy to Hold
- **New target allocation:** 2%
- **Recent ETF price (1/25/10):** $39.74
- **Recent ETF NAV (1/25/10):** $39.68

- **Why we're selling half:**
  - Our thesis that emerging markets would recover more quickly than the U.S. and Europe has borne fruit.
  - We're taking some money off the table in a hot market.
  - The full repercussions of 2009's global stimulus programs remain to be seen, increasing the ETF's risk as programs are reduced.

Alternate Trade

Write ("sell to open") March 2010 $37 covered calls, recently bidding $2.90.

Only Own Half a Position?

Continue to hold if you like. *Pro* is keeping around 2%.

When we first bought **Vanguard Emerging Markets** (NYSEMKT: VWO), we wrote, "When emerging markets recover and start to rally again, foreign equities could become too aggressively valued, driving us to lighten our position or sell our entire stake." We believe that's happened — our shares have gained more than 70% while the S&P 500 has climbed 30% — and now it's time to enjoy our profits and take some money off the table by selling about half our stake.

Today, emerging markets are perhaps *too* hot — but when we first bought this ETF, the story was much different. Months before Lehman Brothers went bankrupt in September 2008 and sank the U.S. stock market, emerging market stocks had fallen sharply; Vanguard Emerging Markets dropped about 65% from May to November 2008. At the time, *Pro* believed that emerging markets would recover more quickly than the U.S. and Europe, so we took advantage of Wall Street fear and opened a position in Vanguard Emerging Markets. The ETF's underlying stocks were trading at an average trailing P/E of just 11, giving us exposure to the world's fastest-growing economies — including China, Brazil, and India — on the cheap. We knew that even if earnings held steady, we'd still be getting a value. Now Vanguard Emerging Markets' average P/E sits at 24, as popularity has pushed shares to a premium.

The Emerging Rebound

Since we bought this ETF, emerging markets have improved — fast. China's $585 billion stimulus kick-started massive infrastructure projects, which increased demand for building materials at such a large scale that they helped revive commodity-rich emerging economies like Brazil (iron ore), Indonesia (coal, rubber), and Chile (copper). Naturally, rosier economic prospects helped propel emerging market stocks. Consider these amazing dollar-adjusted index returns since December 2008:

Country (Index)	% Return (in dollar terms)
China (SSEB)	134.5%
Brazil (BVSP)	148.5%
Russia (RTS)	146.4%
Indonesia (JSX)	133.5%
Chile (IGPA)	100.7%
Argentina (MERV)	101.2%
Turkey (ISE)	119.4%

Data as of Jan. 21, 2010; provided by The Economist.

But just as a shot of espresso in the morning can jolt you into action, *several* shots can give you the shakes and squash your productivity. In recent weeks, emerging economies such as China, Russia, and Brazil have taken measures to rein in rapid growth and avoid outsized inflation, which could lead to social unrest and destabilizing asset bubbles. Knowing when to tap the brakes on an economy and when to give it gas is never an easy task and can lead to mistakes and unintended adverse consequences. We saw what happened when the U.S. economy got too hot — most evident in our real estate bubble — and likewise, the largest emerging markets face the risk of overheating today.

An Overripe Market

Last year, U.S. equity funds were crippled by net outflows of $40 billion. Yet according to EPFR Global, emerging market mutual fund *inflows* hit $80 billion in 2009, beating 2007's previous record by a comfortable $25.9 billion. Such investor enthusiasm for one area of the market gives us pause. What's more, we question the sustainability of such huge inflows. The BRIC markets (Brazil, Russia, India, and China), which captured roughly three-quarters of the $80 billion inflow to emerging market funds, grew from 37% of Vanguard Emerging Markets' assets in 2008 to 49% today. We caught the updraft of the BRIC recovery via the ETF, but any future decline in these countries would hurt the ETF disproportionately.

Meanwhile, emerging market stocks look ready for a retreat. A 2009 study based on decades of data from 53 countries found that stocks in high-growth emerging economies actually underperformed stocks in economies with much lower GDP growth, averaging just 6% annualized gains compared with 12% in developed economies. Valuation is the key: Emerging market stocks deserve to trade at a discount to developed countries because they carry more risk. After trading at a premium, as they do now, emerging market stocks have historically fallen. We don't see why this time would be different. China, Brazil, and other emerging nations still face many more challenges and risks than developed economies.

What's Next

As Mark Twain wrote, "Whenever you find yourself on the side of the majority, it is time to pause and reflect." But selling half our stake in this ETF doesn't mean we won't invest more funds in emerging markets in the future. There are several regionally focused emerging market ETFs that we'd consider at the right price. Additionally, whereas Vanguard Emerging Markets is invested in large caps, we'd like to gain more exposure to smaller companies in the emerging markets realm, especially if the market declines a bit.

Meanwhile, we'll hold about half our stake to help keep our portfolio broadly diversified and allow room for more profits if stocks keep gaining. However, we don't recommend adding new money here at current prices. That's why we're moving Vanguard Emerging Markets to **Hold**. If you're looking to add new money, keep in mind that many of our Buy First and Buy stocks have significant international exposure *and* lower valuations, including **Procter & Gamble** (NYSE: PG), **Graftech International** (NYSE: GTI), **Oracle** (NYSE: ORCL), and **GlaxoSmithKline** (NYSE: GSK).

If you have any questions or comments, please share them on the Vanguard Emerging Markets board.

We will make this trade in the next two business days to 30 calendar days. Jeff owns shares of Oracle, Todd owns shares of Procter & Gamble, and Bruce owns shares of GlaxoSmithKline.

Monday Memo: Get Ready for the New Market

Published Jan 25, 2010 at 12:00AM

Pro Earnings Dates

- Jan. 26: **Kinetic Concepts**, **FPL Group**, **Waters**
- Jan. 28: **Procter & Gamble**
- Feb. 1: **Plum Creek Timber**
- Feb. 2: **Jack Henry**
- Feb. 3: **GlaxoSmithKline**

In the *Pro* Community

- Last week, Kinetic Concepts donated $2 million worth of advanced wound care products to Haitian relief. We applaud its generous donation.
- This Week in CAPS: Russell (TMFEldrehad) checks up on his recent CAPS screens for strong stocks.

Coming Up Next in *Pro*

Along with a steady stream of new trades, we'll soon have a new guide for you, Options 803: Neutral Spreads. Then, stay tuned for interviews with Plum Creek Timber management as well as expert fund manager Chuck Akre.

As new members join *Motley Fool Pro* for just one more day (welcome!), something seems to be rumbling in the market. The whole investing world is wondering whether the U.S. economy is beginning a sustained recovery — or if current improvements just represent a short-term bounce courtesy of Uncle Sam's pockets. But one thing seems clear: As the market enters a new phase, we're going to use a variety of *Pro* strategies to continue to profit.

Right now, two potential fates are battling it out. A recovering economy could provide more lift, sending stocks higher — not out of the question given that the S&P 500 is trading at a middling 15 times expected earnings in 2010 — or, the recovery could falter, sending stocks lower. Given the uncertainty, stocks could stay in a range over the coming months, moving up and down with more volatility than we've seen for almost a year. At *Pro*, we believe this third scenario is most likely, but we want to invest to perform no matter what the outcome.

As *Pro* members have seen from day one, we welcome uncertainty in the market. Buying opportunities arise when prices are sporadic, and we have plenty of cash ready to invest in strong stocks while keeping our risk profile low. Meanwhile, volatility opens the door to better options prices (for option writers) and increased option income. By combining options, shorts, and core stocks, *Pro*'s strategies help generate steady income while stocks are down or flat, and long-term gains as stocks rise. As we like to say, it's the best of both investing worlds.

Buy Stocks, Write Puts

If you're new to *Pro*, or wondering how to adjust as the market changes, our defensive game plan starts with our current Buy First stocks, which offer value, lower risk, and growth. These are the place to start with new money (keep in mind stocks may be more volatile after earnings are announced; see our sidebar for dates). Then, move to our Buy stocks, paying attention to our preferred buy ranges.

Stocks on Hold due to valuation are strong candidates for writing puts in order to buy shares later at lower prices. Writing puts (*not* buying them) is a defensively bullish options strategy that pays you income while you wait for your preferred price range on shares. You sell one put for every 100 shares of stock you'd be willing to buy at your option's strike price. So, among our Buy First and Buy stocks, you can begin to put together or adjust your *Pro* portfolio. When you're ready to use options, you have even more ways to move forward.

Want to Be More Defensive?

Helpful *Pro* Links

- Pro's three-step getting started plan

- Answers to your top questions
- Key *Pro* resources
- A classic Memo: This Is *Pro*'s Mission
- Our FAQ
- The *Pro* Community: Post to the Getting Started or Meet & Greet board

There are a handful of ways to protect or hedge your recent gains. If you're new to *Pro* and bringing your own stocks to the table, you can write ("sell to open") covered calls if you hold at least 100 shares of a company and believe its stock is near fair value — so you'd be happy to sell if it increased a bit. When you write covered calls, you're paid income for the promise to sell your stock if it goes up in price by the option's expiration date. The income helps you hedge a reasonable decline in your stock. If shares decline or hold steady, you earn the full option income and can write new covered calls for more.

If you want to start with a direct short, consider opening a 2% to 4% position in **ProShares Short S&P 500**. This exchange-traded fund (ETF) moves inverse to the daily movements of the S&P 500, rising when the index declines. (More advanced? If you own 100 shares, you can write covered calls against them as *Pro* has done, gradually lowering your cost basis. We'll have new official covered call writing guidance as our February 2010 calls near expiration. You don't need to start with covered calls on the short ETF.)

Finally, if you're feeling more defensive, you might simply *buy* puts on any of your holdings that you think might fall — or insure them against a sharp decline with protective collars. At *Pro*, we're still building out the portfolio, so we're looking to add to many of our positions if they decline. This means we may be less defensive than you. If you want to buy puts or use protective collars on some of your holdings, and have questions, post on our All About Options board.

New Trades on the Way!

We'll end with a few words of advice:

- As you wait for new *Pro* trade alerts, if you're ready to begin investing, start with our Buy First stocks. Buy at least half of your intended position to start.
- If you have more to invest today, start to purchase our Buy stocks.

- If you want to get defensive, buy shares of the ProShares Short S&P 500 ETF.
- Finally, if you have options experience, use them to protect your current portfolio as you deem necessary while getting up to speed with the *Pro* portfolio as new trades arrive. If you haven't used options before, take your time to study *Pro*'s options guides — and ask us questions. Although you can still benefit with *Pro* without using options, we'll be using them steadily.

Welcome again to new members! Please see the sidebar above for other *Pro* news and helpful links. And thank you to the more seasoned *Pro* members who are helping so much in the community. You're a big part of what makes the Fool exceptional.

Special Update: Your First Steps With Pro

Published Jan 21, 2010 at 12:00AM

We're excited to have you with us at *Motley Fool Pro* as we seek consistent profits no matter which way the stock market moves. You'll be able to invest along with us as we buy strong, long-term stocks at attractive prices; use ETFs to capitalize on big-picture opportunities; hold shorts or hedges to profit on market declines; and incorporate sensible options strategies for income, leveraged gains, defense, and better buy and sell prices on stocks.

Look for *Pro*'s Monday Memo next week, and you'll receive a new investment recommendation from us in the coming days. In the meantime, here are three important pieces of advice for you as a new member.

How do I use *Motley Fool Options*?

As part of your *Pro* membership, we're happy to give you access to *Pro*'s sister service, *Motley Fool Options* (where you'll also find me as co-advisor). We hope that you enjoy this service as a source of more options ideas. However, selections made in *Motley Fool Options* are not part of the *Pro* portfolio; *Pro* stands alone as a complete portfolio service. Watch your inbox tomorrow for Options Weekly, *Motley Fool Options*' regular Friday update on its recommendations along with news and options strategies.

I bought my stake in Kinetic Concepts, and now I'm ready to add more *Pro* positions. What should I buy next?

That's great! We strongly believe that the best way to succeed with *Pro* is to invest alongside us, so by picking up shares of **Kinetic Concepts** (NYSE: KCI), you're already on your way. Next, invest in our Buy First stocks (see our portfolio's "What to Do" column), buying at least half of your intended position and then averaging in to match our target allocations. Then, begin to match our Buys, keeping an eye on our preferred buy prices (see our handy new guidance table here).

This market has me wary, and I'm ready to play investing defense. What do you suggest?

Stay tuned for our next Monday Memo, which will lay out some defensive strategies you can consider to protect your current positions. If you're ready to add a hedge to your portfolio today, consider opening a 2% to 4% position in **ProShares Short S&P 500** (NYSE: SH), an inverse ETF that moves *opposite* the market, rising as the S&P 500 falls. We've already picked up our stake, but today you can grab it at an even better price. Plus, as an ETF, ProShares Short S&P 500 trades just like a stock, so you don't need special permission from your broker to take part in this defensive strategy.

Tools for Fools

There's a lot going on in *Pro*. But never fear: Just take your time, get to know our time-tested strategies, and you'll realize that it's simply Foolish to use more investing tools to make money whether the market is up, down, or flat; smooth out your returns; and protect your gains. Thank you for being a member of *Pro*, where we invest to earn consistent profits. If you have questions, please post on the Getting Started board. We'll be in touch again soon.

Fool on!

Jeff Fischer (TMFFischer on the boards)

Monday Memo: This Is Pro's Mission

Published Jan 19, 2010 at 12:00AM

Welcome, New Fools!

The *Pro* team is happy to welcome new members this week for the first time since June 2009. If you're new, start with our three-step plan, including a stock to buy today. Then, please introduce yourself on our Meet & Greet discussion board!

Earnings on Tap

Jan. 26: **Kinetic Concepts** and **Waters**

Jan. 28: **Procter & Gamble**

Feb. 1: **Plum Creek Timber** and **GlaxoSmithKline**

In Case You Missed It

- Where *Pro* stands: To see our latest guidance on every stock and ETF in the *Pro* portfolio, see last week's special update.
- New *Pro* member pietdup posts an introduction (and a generous offer) from his home in South Africa, while EK40, CaptLukey, tsladner, kai327, and others introduce themselves on the Meet & Greet and Getting Started boards.
- spinningwood wraps up his contest on the **AmTrust Financial Services**board, rewarding a hand-spun wooden pen to fellow member CodeJedi.
- stamleo observes that, since Nov. 2, the **U.S. Natural Gas Fund** ETF has been tracking gas prices well.

- Also from stamleo, analysis on **GrafTech International**'s continuing volatility and how it can work to an option investor's advantage.
- This week in CAPS: TMFEldrehad shares new 2009 data on the Fool tool's community intelligence abilities.

When we're researching a business (which is basically all the time), one of the things we examine is its *purpose*: Why does the company exist? How does it improve people's lives? And what makes it stand out from competitors?

When marketing and advertising guru Roy Spence visited Fool HQ last month, he inspired us to think about the most admired (and feared) companies of our time — and how each has a clearly defined purpose. Two that quickly come to mind are **Wal-Mart**, with "Saving people money so they can live better," and **Southwest Airlines**, with "Giving people the freedom to fly." Both of these companies have built success on simple, yet meaningful statements.

A clear purpose helps drive smart corporate decisions and gives employees, customers, suppliers, and shareholders a better sense of how they can contribute to *and* benefit from a company's success. Of course, it follows that to make *Motley Fool Pro* the best it can be, we need to clearly define *our* purpose and revisit it often.

Mining for Meaning

After a few dozen emails and a gallon or so of coffee, the *Pro* team came up with a single, concise sentence that sums up what defines us as an investment service and separates us from the rest of the pack:

Pro's purpose is to earn you consistent, recurring profits with a high level of accuracy using a combination of stocks, ETFs, and options in a strategic portfolio.

Armed with this mission statement, you'll finally be able to explain what *Pro* is to your friends at the next cocktail party — and your *Pro* team has a clear guide for making investment decisions, helping us deliver on our strategy and avoid veering off course. Of course, there's much more to what we work to provide for you — the guidance, the education, our vibrant community of *Pro* Fools — but in terms of our *investment* approach and the final real-money decisions that we deliver to you, this purpose statement sums us up well.

Straight and Steady Wins the Race

Profiting with precision is a key part of our purpose. Since *Pro* launched in 2008, our goal has been to close at least 75% of our positions profitably. As our closed positions grow in number, we get an early look at how we're doing: So far, a full 92% have finished in the green. By focusing on accuracy, we're *not* chasing an index — though we believe that by closing at least three-quarters of our investments profitably over many years, we'll come to beat most any index's return.

Consistency is another key. We want to accomplish our accuracy with less risk and volatility than the market average. This means strategic use of hedges and shorts and a focus on making money not just when the market is up, but when stocks fall, too.

Pro's focus on accuracy and gains in up *and* down markets is what sets us apart, and it forces us to think a bit differently. Before committing capital to an investment, we have to be as confident as possible that we'll end up making money on the trade without taking undue risks. This lofty aim requires us to look for certain types of companies and do rigorous research to make sure we're not overpaying; for our options trades, it means using strategies that put the odds in our favor, again and again. Only when we're achieving our goals across the portfolio might we add — when we're so compelled — a select group of riskier positions designed to boost portfolio growth.

Now It's Your Turn

We'd love to hear your take on our new purpose statement. What do you think *Pro*'s mission is? Chime in on the Memo Musings board.

Meanwhile, today we heartily welcome new *Pro* members! Please introduce yourself on the Meet & Greet board and tell us *your* goal as a new member.

We're glad you're here. Fool on!

Jeff Fischer (TMFFischer), Todd Wenning (TMFPhila), and Bruce Jackson (TMFGoogly)

New Option Tickers Ahead

Prepare yourself, Fools: The option ticker world as we know it will be changing in the coming weeks. Instead of four- or five-letter tickers, brokers and exchanges are set to switch over to 21-digit codes. Yes, the new options tickers will be *long*. Here's a quick look at how to build the new codes, using our recent puts on **Medtronic** (NYSE: MDT) as an example:

Ticker (always six characters; add spaces when necessary)	Expiration (year/month/date)	Call or Put (C or P)	Strike price (always five characters; precede with zeros when necessary)	Strike price decimals (always three characters; add zeros when necessary)
MDT [followed by three spaces]	100522	P	00044	000

So, JIWQR, the ticker for our May 2010 $44 puts on Medtronic, would become:

MDT   100522P00044000

With most brokers, to make an options trade, all you'll need to do is quote the underlying stock, then click to get its options chain (as you've done before). From there, choose the strike price and expiration month you want, calls or puts, and make the trade. Both in our trade reports and on our portfolio page, *Pro* will continue to refer to our trades in the way we believe is most useful: The underlying stock and ticker, expiration month, strike price, and whether it's a call or a put.

Any questions? Stop by our All About Options board — we're here to help.

Write Puts on Medtronic

Published Jan 14, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") May 2010 $44 puts (JIWQR; note that option ticker standards are changing soon, so stay tuned for more guidance in a future Memo)
- **Allocation:** 2.5% (for *Pro*, six contracts)
- **Option's recent bid/ask:** $2.25/$2.30

- **Preferred limit price:** $2.25 to start; no lower than $2 if necessary
- **Alternate trades:** Write May 2010 $43 puts, recently $1.90, or May 2010 $45 puts, recently $2.65.

What's New

When our January 2010 $37 puts on **Medtronic** (NYSE: MDT) expire as cash on Friday, that will make two times our puts have resulted in income rather than shares. Pocketing some cash is nice, but ultimately, we'd like to own more shares of this leading medical-device manufacturer. That's why we're writing new puts to potentially round out our position.

Since we last wrote puts, Medtronic knocked out a strong second quarter, with revenue up nearly 8% over the previous year while non-GAAP earnings per share jumped 15%. New and revamped products as well as increasing demand, especially in younger markets, helped the company's sales. Management followed up with optimistic guidance that sent shares around 10% higher.

Following the big news, we increased our preferred buy price to $42 and fair value estimate to $52. With shares recently near $46, our best chance to buy more in the low $40s is by writing puts.

How to Follow Along

You write ("sell to open") puts when you're ready to buy a stock if it declines below the strike price by expiration, as explained in our put-writing guide. Here are the numbers behind this trade:

- **Option yield (at $2.25 bid):** About 5.1% in four months
- **Option strike price:** 3.5% below the recent $45.60 share price.
- **Break-even price:** 8.4% lower, at $41.75
- **Cash or buying power needed:** Each put you write represents a potential $4,400 purchase of Medtronic shares.

If we're able to buy new shares at a net $41.75, we'll be paying 12.9 times management's earnings guidance for the year ending April 2010 (and about 14 times likely free cash flow), providing us with a margin of safety and the potential for meaningful appreciation in the years ahead. Meanwhile, management expects earnings to grow 11% to 13% this fiscal year, enough to make us happy to purchase shares near these multiples.

Can't Write Puts?

If you're unable to write puts and still need to buy your first shares of Medtronic (or your second 2.5%, like us) consider placing a limit order near $42 to potentially get shares on a downdraft. But remember, Fools, our preferred buy price is just a guideline; our fair value estimate of $52 is a more meaningful figure.

We'll make this trade in the next one business to 30 calendar days. Please note, we'd only place this trade as soon as Friday if it's clear that our $37 January puts will be expiring. With Medtronic trading near $46, this looks likely. To discuss this trade or ask questions, please visit our Medtronic board.

Write Covered Calls on Cameco

Published Jan 13, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") March 2010 $33 calls on Cameco, using a limit order near the bid price.
- **Allocation:** Write one call for every 100 shares of Cameco owned (for *Pro*, seven contracts).
- **Option's recent bid/ask:** $1/$1.10
- **Preferred limit price:** $1 or higher, day order; if needed, no lower than $0.80.
- **Recent stock price:** $30.70
- **Special requirement:** You must own at least 100 shares of Cameco to write a covered call.

What's New

Uranium is trading for $9 *less* than when we first tapped **Cameco** (NYSE: CCJ) last January — so why are shares of the world's largest uranium miner fetching double what they were then?

There are a few reasons. Of course, there's the market's recovery, but we can also thank the ascent of gold (Cameco owns gold assets, too), the company's ability to increase uranium production, and a steady stream of nuclear power plants scheduled for construction promising greater-than-expected uranium demand in the future. What's more, Cameco was able to sell its stake in Centerra Gold for $820 million, which we believe is a good move. Meanwhile, the company is no closer to putting its giant Cigar Lake mine into production, so we're simply keeping this endlessly delayed potential out of the equation.

Why This Strategy?

In light of these positive developments, we've raised our fair value estimate on Cameco from $26 to $31. So, with the stock trading near $31 today, we're content to write covered calls to sell our shares a bit higher or earn income if the stock doesn't advance. At our potential sell price of $34, we'd be exiting our Cameco shares at 20.5 times 2010 earnings estimates and a multiple to free cash flow nearly twice that — more than a fair price. Even so, given Cameco's dominance in uranium, shares could trade higher. That's fine with us, because we know that valuation needs to guide our decisions.

How to Follow Along

If you need a refresher on covered call strategies, please see *Pro*'s guide to covered calls before placing this trade. Remember, you write one call for every 100 shares of stock owned. Here are the numbers behind the move:

- **Option yield at $1.00 bid:** 3% of the $33 strike price, in 65 days
- **Option yield on our $16.52 buy price:** 6%.

- **Return from today if sold at a net $34:** 10.7%
- **Total return on position if exercised:** 105%

We'll make this trade in the next one business to 30 calendar days. To discuss the trade or ask questions, please visit our Cameco board.

Write Covered Calls on Lindsay

Published Jan 13, 2010 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") March 2010 $45 calls on Lindsay, using a limit near the bid price.
- **Recent option bid/ask:** $2.40/$2.65
- **Initial limit price:** $2.50 or higher, day order
- **Secondary limit price if needed:** $2 or higher
- **Recent stock price:** $44
- **Allocation:** Write one covered call contract for every 100 shares of Lindsay owned. (For *Pro*, that's three contracts)
- **Special requirement:** You must own at least 100 shares of Lindsay to write a covered call.
- **Alternate trades:** Write February 2010 $45 covered calls, recently bidding $1.65, or June 2010 $45 covered calls, recently bidding $4.

What's New

Companies in highly cyclical lines of business can provide a patient investor tremendous returns. In many cases, it's as simple as buy in a down cycle, sell in an up cycle; rinse, repeat. When we originally recommended **Lindsay** (NYSE: LNN) in June, prices on corn, wheat, and soy had fallen sharply, causing shares of this producer of irrigation systems to suffer -- and presenting us with a buying opportunity.

Since then, a string of bad weather has put a dent in our food supply, driving prices higher. Additionally, in June 2010, the EPA may call for more ethanol in our gasoline, a move that would increase corn demand in 2010 and beyond.

Why This Strategy?

The rosier agricultural outlook isn't the only thing that's lifted Lindsay's shares from $36 on Dec. 1 to $44 today. In another boon for the company, Lindsay's infrastructure group is finally bringing in cash from the previously delayed Mexico City barrier project. With our fair value estimate in the low $40s, we consider shares slightly overvalued and would be happy to part with the stock at a net sale price near $47.50.

That said, if our shares aren't called away in March, we'd be equally content holding them and pocketing the generous call premium. In fact, if Lindsay declines to the mid $30s again, we'd be looking to add to our small 1% position.

How to Follow Along

If you need a refresher on covered call strategies, please see *Pro*'s guide to covered calls before placing this trade. Remember, you write one call for every 100 shares of stock owned. Here are the numbers behind the move:

- **Option yield at $2.50 bid:** 5.5% of the $45 strike price in 65 days
- **Option yield on our $31.55 buy price:** 7.9%.
- **Return from today if sold at a net $47.50:** 8%
- **Total return on position if exercised:** 50.5%

We'll make this trade in the next one business to 30 calendar days. To discuss the trade or ask questions, please visit our Lindsay board. Finally, please note that Pro owns 320 shares of Lindsay, so by necessity 20 of our shares won't be covered.

New Year, New Pro Guidance

Published Jan 12, 2010 at 12:00AM

Digging through data is what we do. Each quarter, your *Motley Fool Pro* team combs through conference calls and cash flow statements, studies SEC filings, and bones up on balance sheets to make sure our investment theses still hold water. We revisit our ETF and options strategies and — where appropriate — update our valuation estimates.

Over the past year and change, we were conservative with many of our estimates while we waited to see how the government's attempts to stabilize and stimulate the U.S. economy fared. Today, with more information at hand, we're able to update numbers on all *Pro* holdings — you'll see a summary of our latest guidance in the table below. As you continue to add new money to your *Pro* portfolio, use our Buy First, Buy, and Hold categories as well as our preferred buy prices as your guides.

Moving On Up

Tip: Writing Puts

Higher preferred buy prices give you more room to write puts on these stocks and buy in our desired range. Questions? Head to our All About Options board.

Strong performances in 2009 from **Cameco**, **Flowserve**, **GrafTech International**, **Kinetic Concepts**, and **Medtronic** have led us to bump up our preferred buy prices and fair value estimates for each company. In each case, these companies did better than we expected, as superb management teams created value during tough times by making smart decisions early.

Hold It

The only *Pro* position moving to Hold is **Plum Creek Timber**. The shares are trading near $38, which is close to our $40 fair value estimate.

Now in Range

Kinetic Concepts, **Ebix**, **FPL Group**, **GlaxoSmithKline**, and **Procter & Gamble** are trading below our preferred buy prices. Many of our stocks — including **AmTrust Financial Services**, Medtronic, **Oracle**, and GrafTech — are trading low enough for put-writing strategies to potentially buy more shares below our preferred buy prices.

Guidance At a Glance

Happily, we aren't giving any of our holdings a valuation downgrade. All the *Pro* companies are performing well, and although we believe the market will be rocky at times, we're comfortable holding our stocks. Given this stance, you can expect us to start writing covered calls on more of our positions that are close to fair value rather than selling them outright.

The super-sized table below gives you our latest advice in one place, and serves to guide our new investment decisions as we start 2010.

Investment	Recent Price*	Preferred Buy Price	Fair Value Estimate	What to Do	Quick Take
AmTrust Financial	$12	$12	$18	**Buy First**	With book value above $9 a share, AmTrust offers us a combination of lower risk and long-term growth potential.
Autodesk	$26	$22.50	$32	Hold	Autodesk's business is stable, but it's recovering slowly. We still like its market dominance and stimulus possibilities.
Cameco	$31	$24.50	$31	Hold	More nuclear power plants are being planned than we originally expected. Last year, Cameco was able to increase its uranium output and sell its Centerra Gold stake for $820 million, increasing our valuation.
Ebix	$17	$18	$24	Buy	Expected to grow earnings more than 20% this year, Ebix is entering new markets and investing for future growth.
Expeditors International of Washington	$35	$30	$38	Buy	Our covered strangle (buy shares and write a strangle) trade is still viable today because Expeditors' share price has stayed in range.
Flowserve	$107	$80	$110	Hold	We're raising our valuation estimate thanks to Flowserve's stronger-than-expected results in mid 2009.
FPL Group	$52	$55	$62	Buy	One of the cleanest, greenest utilities in the country, this stock offers value, regulated-business stability, and a good dividend yield.
GlaxoSmithKline	$42	$44	Low $50s	**Buy First**	Europe's largest drug maker offers value with a 4.6% yield.
GrafTech International	$16	$13.50	$18	Buy (changed 1/26)	Exceptional cost management has lowered operational expenses, while free cash flow has held strong, leading us to increase our valuation.
Jack Henry & Associates	$23	$21	$30	Buy	This company boasts 90% recurring revenue, offering us stability at a reasonable price.
Kinetic Concepts	$39	$41	$54	**Buy First**	Free cash flow has been stable and growing, so our valuation has crept higher. Competitive concerns that we discount continue to keep the stock inexpensive.
Lindsay	$46	$34.50	Low $40s	Hold	With lumpy quarterly results, Lindsay remains volatile. It's now in our fair value range, so it's on Hold.
Medtronic	$46	$42	$52	Buy	Our price guidance has increased after the medical devices leader exceeded our hopes in the last quarter, and provided strong guidance.
Oracle	$24	$22.50	$29	**Buy First**	Oracle continues to grow free cash flow by double digits (11% year over year) and trades at a discount to market averages.
Plum Creek Timber	$38	$34	$40	Hold	Plum Creek is nearing our fair value estimate, so we're moving it to Hold.
Procter & Gamble	$60	$62	$70	Buy	P&G's latest quarter showed better execution as management adjusts to a tough new economic reality and consumer price sensitivity.
ProShares Short S&P 500	$51	N/A	N/A	Buy	This inverse ETF (or short) will benefit us if the index declines. We'll continue to write covered calls to lower our cost basis, while allowing for ample upside.
Vanguard Emerging Markets	$42	N/A	N/A	Hold (changed 1/26)	Growth in emerging markets remains a long-term macro investment; as long as we believe in the thesis and price, it's a buy.
Vanguard Energy	$88	N/A	N/A	Buy	Energy leaders should still have plenty of growth potential ahead if the global economic recovery gains traction.
Waters	$62	$55	$66	Buy	Our covered strangle (buy shares and write a strangle) trade is still viable today because Waters' share price has stayed in range.
Options-Only Positions					
Abercrombie & Fitch	$32	N/A	Low $20s	Short	Our bear put spread on Abercrombie expires in February. The stock is slightly above our $31 break-even price; we're waiting to see Q4 results.
Electro-Optical Sciences	$10.50	N/A	N/A	Buy	Our call option can be exercised and turned into stock in April at $5 per share. We expect the FDA's decision on the company's only potential product in 2010. This speculative holding is just 1% of the portfolio.
United States Natural Gas Fund	$10	N/A	N/A	Buy	Natural gas remains volatile around $5; a recovery to above $7 should make this synthetic long trade profitable — if the ETF tracks natural gas properly.

**Rounded closing price as of market close Jan. 11, 2009.*

We'll update this table again following January and February quarterly earnings. Please post your questions on our Philosophy and Strategy board. Fool on!

Jeff owns shares of AmTrust Financial Services and Oracle.

Step 2: How You Make Money With Pro

Published Jan 12, 2010 at 12:00AM

The best way to succeed with *Pro* is to **invest alongside us**. We do the heavy lifting for you, spending hours researching and vetting every investing recommendation and delivering it to you in easy-to-use trade reports.

What's more, since we're ultimately building a portfolio of **long-term, core holdings**, you don't need to make use of options in order to be a successful *Pro* investor. Fools solely following along with our stock and ETF positions are building winning portfolios as well. Now let's start building yours!

Get Your Account Ready

You don't need to trade options to make money with *Pro*, but if you ever want to, you'll need approval from your brokerage, so we suggest you apply now. Here's how:

1. Ask your broker for full options approval, typically level 2 or 3 (it can vary by broker).
2. Fill out, sign, and mail in your broker's application.
3. After a week or so, you'll be approved! Visit our All About Options board if you have questions.

(New to options investing? Check out our guide, "Get Up to Speed With Options." Or skip straight to our options handbook for beginners.)

Our Approach

By investing alongside *Pro*, you'll minimize your risk and smooth out your returns. Rather than chase an irrational market, we focus on *accuracy*, striving to close at least 75% of our positions profitably. We're well above that goal three years into *Pro*'s young life.

Inside *Pro*'s portfolio, you'll find the following (rough) allocations:

- **Stocks: 70%.** The bulk of our portfolio consists of superior businesses that we intend to hold for three to five years.
- **ETFs: 15%.** We seek top-notch ETFs to profit on broad trends such as emerging markets, energy, commodities, and more.
- **Options: 5% to 10%.** Our options strategies are easy to follow and based on underlying stocks and their valuations.
- **Shorts:** Up to 30%.
- **Cash:** Managing a portfolio includes knowing when to hold cash. We'll help guide you here, too.

What to Buy First

We recommend that you wait for **New Member Orientation Week** (Feb. 6 through Feb. 10) to start investing with *Pro*, so that you know how to take full advantage of the service. But if you're itching to get started, then check out our active trade alerts and watch your inbox for our **Trade Alert emails**, which will connect you to our full guidance for each specific trade. If you have any questions, don't hesitate to post on our boards.

Once you've reviewed (and hopefully invested in) our active alerts, take a look at our **Buy First stocks**. Buy Firsts represent the companies that we think offer the best risk-to-reward ratio. Read through the analysis and guidance of each of our Buy First picks, then start trading! As you purchase our recommendations, you'll want to match our buy-around price and our target allocation. Our buy-around price for each pick is the preferred buy price at which we recommend making a purchase. These aren't set in stone; just aim to make your purchase *around* these prices.

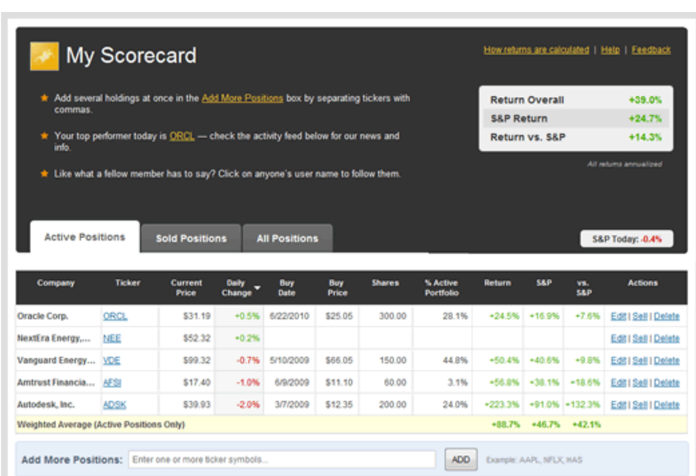
What to Buy Next

Once you've filled up on our Buy Firsts, we suggest that you take a look at our **Buy stocks**. (We'll be sending a special report on those stocks as part of our New Member Orientation Week, which is Feb. 6 through Feb. 10.) These are companies that have strong valuations and the analysis to back them up. As you purchase Buy stocks, make sure you match our target allocations.

All of our holdings and target allocations are on the Recommendations page. If any pick is no longer a worthwhile opportunity, we'll put it on Hold and direct you to the best alternatives for new money.

Tracking Your Progress

Whether you're ready to buy our Buy Firsts right now, or just want to watch them for a while, be sure to add your picks and ideas to the My Scorecard tool. Adding a stock to My Scorecard allows you to track its performance, compare it to the S&P 500 index, and view all *Pro* analysis related to that stock in one place. (A beta version of My Scorecard is even available as a mobile app, so you can check your portfolio from your smartphone.)



Next Step: Join the Conversation!

We have a vibrant, intelligent community of investors who love to discuss stocks, ETFs, and options, ask and answer questions, swap ideas, and help each other build their portfolios. Come say hello on our Meet & Greet board, or take your pick of the whole collection right here!

Step 3: Become an Options Pro

Published Jan 12, 2010 at 12:00AM

Our Gift to You: *Motley Fool Options*

As a member of *Pro*, you are also a member of *Motley Fool Options*. Members looking for more options ideas will find this a la carte, all-options service a great complement to *Pro*. Learn more at options.fool.com.

Options in 3 Steps

Please note: The trade details in this tutorial are from a trade we made in the past, so we don't recommend you follow along with the specifics. Always check our Recommendations tab for the latest trade information.

A big part of what sets *Pro* apart from other Fool services is our use of options and short selling to improve returns. Whether the market is up, down, or flat, we have strategies that will help you generate profits — and hedge your *Pro* positions, too.

That doesn't mean we're option "traders." Our use of options is tied to a Foolish understanding of the underlying holding, and our approach is valuation based. We thoroughly analyze and value businesses first and foremost before determining the best options strategy to take.

Ready to add options to your investing toolbox?

- Set up your brokerage account.
- Watch our video above, "Options in 3 Steps" with Jeff.
- Below, dig into two of the strategies you'll see us use most often.

Writing Puts

Our Guides to the Options Basics

- Check out *Options*' helpful (and non-intimidating!) PDF, "Options for Beginners."
- Need a guide to the terminology? Have no fear, the *Pro* Options Glossary has you covered.
- Want a step-by-step learning experience? *Pro* and *Options* analyst Bryan Hinmon has put together an "Options U" course on the *Options* discussion boards. Join more than 200 of your fellow Fools who have participated and boosted their returns with options!
- Ready to trade? Great! Download our handy checklist to keep you on track.

When you'd be happy to buy a stock at a lower price, you can write ("sell to open") puts.

The option's strike price is your desired buy price for the stock. If the shares don't decline to your buy price or lower, you keep the option income and can write more puts. If the shares *do* decline by your option's expiration date, you still keep the option income, but you also get to buy the shares at your desired price (they're automatically sold to your account by the time the option expires).

The option income lowers your cost basis in the shares even further. Read more.

Covered Calls

When you already own at least 100 shares of a stock and would be willing to sell at a higher price, you can write covered calls at your chosen strike price. It's just the reverse of writing puts: You already own a stock, and you write calls on it that pay you income.

If the shares don't increase to your desired sell price before the option expires, you keep the option income and can write calls again. If the shares *do* jump to your sell price, your shares are sold from your account at the strike price by the option's expiration date. You still keep the option income, which increases your net sell price. As with writing puts, covered calls pay you income while you wait for your desired outcome. Read more.

Calls and Puts

Important Options Tip!

Sell, don't buy: Please be careful and make sure the command you use when writing covered calls and puts is "sell to open," "sell," or "write."

On the surface, both of these strategies are quite simple once you become comfortable with them. What takes more work is choosing strong buy and sell prices on exceptional companies and then making sure the options pay you enough. But we're here for you. Follow our trades and guidelines for a helping hand as you learn.

Congratulations!

Now that you've completed all three steps, you're a full-fledged *Pro* Fool! Be sure to introduce yourself on our Meet & Greet board and explore our handy list of resources to round out your experience with us. Now let's make some money!

We'd love your feedback on this *Pro* "Getting Started" guide. Click here to tell us your thoughts.

Step 2: How You Make Money With Pro

Published Jan 12, 2010 at 12:00AM

The best way to succeed with *Pro* is to **invest alongside us**. We do the heavy lifting for you, spending hours researching and vetting every investing recommendation and delivering it to you in easy-to-use trade reports.

What's more, since we're ultimately building a portfolio of **long-term, core holdings**, you don't need to make use of options in order to be a successful *Pro* investor. Fools solely following along with our stock and ETF positions are building winning portfolios as well. Now let's start building yours!

Get Your
Account Ready

You don't need to trade options to make money with *Pro*, but if you ever want to, you'll need approval from your brokerage, so we suggest you apply now. Here's how:

1. Ask your broker for full options approval, typically level 2 or 3 (it can vary by broker).
2. Fill out, sign, and mail in your broker's application.
3. After a week or so, you'll be approved! Visit our All About Options board if you have questions.

(New to options investing? Check out our guide, "Get Up to Speed With Options." Or skip straight to our options handbook for beginners.)

Our Approach

By investing alongside *Pro*, you'll minimize your risk and smooth out your returns. Rather than chase an irrational market, we focus on *accuracy*, striving to close at least 75% of our positions profitably. We're well above that goal three years into *Pro*'s young life.

Inside *Pro*'s portfolio, you'll find the following (rough) allocations:

- **Stocks: 70%.** The bulk of our portfolio consists of superior businesses that we intend to hold for three to five years.
- **ETFs: 15%.** We seek top-notch ETFs to profit on broad trends such as emerging markets, energy, commodities, and more.
- **Options: 5% to 10%.** Our options strategies are easy to follow and based on underlying stocks and their valuations.
- **Shorts:** Up to 30%.
- **Cash:** Managing a portfolio includes knowing when to hold cash. We'll help guide you here, too.

What to Buy First

We recommend that you wait for **New Member Orientation Week** (Feb. 6 through Feb. 10) to start investing with *Pro*, so that you know how to take full advantage of the service. But if you're itching to get started, then check out our active trade alerts and watch your inbox for our **Trade Alert emails**, which will connect you to our full guidance for each specific trade. If you have any questions, don't hesitate to post on our boards.

Once you've reviewed (and hopefully invested in) our active alerts, take a look at our **Buy First stocks**. Buy Firsts represent the companies that we think offer the best risk-to-reward ratio. Read through the analysis and guidance of each of our Buy First picks, then start trading! As you purchase our recommendations, you'll want to match our buy-around price and our target allocation. Our buy-around price for each pick is the preferred buy price at which we recommend making a purchase. These aren't set in stone; just aim to make your purchase *around* these prices.

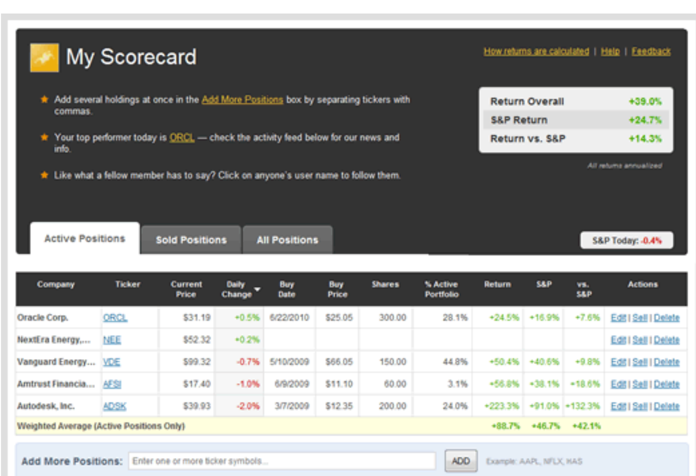
What to Buy Next

Once you've filled up on our Buy Firsts, we suggest that you take a look at our **Buy stocks**. (We'll be sending a special report on those stocks as part of our New Member Orientation Week, which is Feb. 6 through Feb. 10.) These are companies that have strong valuations and the analysis to back them up. As you purchase Buy stocks, make sure you match our target allocations.

All of our holdings and target allocations are on the Recommendations page. If any pick is no longer a worthwhile opportunity, we'll put it on Hold and direct you to the best alternatives for new money.

Tracking Your Progress

Whether you're ready to buy our Buy Firsts right now, or just want to watch them for a while, be sure to add your picks and ideas to the My Scorecard tool. Adding a stock to My Scorecard allows you to track its performance, compare it to the S&P 500 index, and view all *Pro* analysis related to that stock in one place. (A beta version of My Scorecard is even available as a mobile app, so you can check your portfolio from your smartphone.)



Next Step: Join the Conversation!

We have a vibrant, intelligent community of investors who love to discuss stocks, ETFs, and options, ask and answer questions, swap ideas, and help each other build their portfolios. Come say hello on our Meet & Greet board, or take your pick of the whole collection right here!

Monday Memo: Don't Sleep on Rising Interest Rates

Published Jan 11, 2010 at 12:00AM

Next Week

- Starting Jan. 19, *Pro* will open to new members for the first time since last June. We'll be briefly unlocking our doors exclusively to Fool members who have expressed interest. Thank you for welcoming them to our community!
- In observance of Martin Luther King Jr. Day, the Fool will be closed Jan. 18. Your next Monday Memo will be delivered on Tuesday, Jan. 19.

Options Expiring

- **Puts:** Our January 2010 puts on **Medtronic**, **Oracle**, and **Tupperware** are set to expire as full cash profits this weekend.
- **Strangle:** Our January 2010 puts on **iShares Silver Trust** are set to expire, and our calls are set to be exercised. If you wrote this strangle along with us (*or* wrote covered calls), there is no need to do anything. Your shares will be sold from your account over the weekend.

In the *Pro* Community

- Member stamleo posts the upcoming earnings dates for *Pro* holdings. We'll share our analysis as earnings season begins.
- spinningwood is hosting a contest on the **AmTrust Financial Services** board. Win a pen made by the man himself!
- In his weekly CAPS take, TMFEldrehad features stocks in the doghouse.
- Jeff shares his thoughts on this stock market.

Extra! Can't get enough of Jeff and Todd? The *Pro* duo will be hosting a live discussion on the main Fool.com site Wednesday, Jan. 13, from 11 a.m. to 1 p.m. ET.

Back when he was President Clinton's political strategist, James "Ragin' Cajun" Carville said he wanted to be reincarnated as the bond market because "you can intimidate everybody."

Years later, in a world overly dependent on debt and credit, bond investors are wielding power again — and will probably play a larger role in determining economic growth than any government body this year.

Borrowing Ourselves Into a Corner

If you only made $7 an hour and decided to drop $20,000 on a shopping spree in Milan, your credit card company would get pretty upset. It's the same with bond investors — they get irked when the companies or government agencies they loan money to spend more than they can comfortably afford.

When a lender believes you've borrowed too much, it sees you as a bigger risk — and jacks up your interest rates. Naturally, you then spend, and thus borrow, less and start paying off your debt. It's the same with corporations.

Government borrowers can be a different story, particularly those with mounting obligations and liabilities that require frequent funding via debt. Bond investors today are generally more lenient with government borrowers, which can bring in taxes and, for a lucky few countries such as the U.S., Japan, and the U.K, print money in their own currency to pay back principal and interest. But their patience isn't infinite.

Hot Yields Revealed

In Greece, spooked bond investors sent government yields higher amid mounting deficits even though the country is part of (and thus implicitly backed by) the European Union. Similar concerns about the fiscal health of Portugal, Italy, Ireland, and Spain (together with Greece, informally referred to in bond circles as the "PIIGS" economies) have creditors on edge these days.

While the U.S. is in better shape than Greece, higher rates are finding their way here as well. The 10-year Treasury yield jumped from 3.2% on Nov. 30 to just over 3.8% today — a significant 19% increase in five weeks (and one that surprisingly got little press). Bond investors are not just concerned about U.S. inflation and weak dollar; they're worried about the Fed's "quantitative easing" program (a nice way to say "creating money"), which is set to end in March. At this point, it's unclear who will buy the hundreds of billions worth of Treasuries necessary to keep rates low once the Fed stops waving its magic wand. Last year, according to Morgan Stanley, the Fed bought $1.6 trillion in government bonds, while the private sector bought a mere $200 billion worth.

The Fed essentially has two choices: extend the QE program to keep rates low and risk further devaluation of the dollar, or stop the QE program in March and risk much higher interest rates. With mid-term elections just months away and incumbent politicians banking on an economic recovery, I expect the political pressure will force the Fed to extend the QE, but rates will still be forced higher by weak demand in the private sector.

What This Means for *Pro*

Unless governments, particularly in developed countries, can show bond investors that they have a plan to get their respective deficits under control and wind down the massive stimulus programs, it's safe to assume that interest rates will continue to inch higher in 2010. How *much* rates go higher will largely determine the potency of this recovery, as higher rates would increase corporate interest expenses that eat away profits, which is why the bond markets matter so much right now.

At *Pro*, we're closely watching the bond market, and we've taken steps over the past year to prepare our portfolio for potentially higher interest rates and inflation. Our portfolio is filled with cash-rich companies including **Autodesk**, **Expeditors International of Washington**, and **Jack Henry & Associates**. Most of our companies don't rely on debt, financing their spending with internal cash generation — so rising interest rates won't hurt them. Meanwhile, our companies that do carry debt, such as **Procter & Gamble**, have locked in today's low rates. To further combat higher interest rates, we own commodity-linked inflation fighters in **Plum Creek Timber**, **Vanguard Energy**, and **Cameco**. We may add more inflation and interest-rate fighters in 2010.

There's still plenty of cash left to invest in the *Pro* portfolio, so we'll be able to pounce on any long-term opportunities created by intimidating "bond vigilantes" in the short run. What's your take on interest rates? Come join the discussion on our Memo Musings board.

Stay patient. Stay focused. Stay Foolish.

Todd Wenning

Todd owns shares of Procter & Gamble.

A CAPS Screen Inspired by Greatness

Published Jan 5, 2010 at 12:00AM

What can we learn from one of the best small-cap fund managers in the business? With the right tools, quite a bit.

During his 13 years as portfolio manager at the **FBR Focus Fund** (FBRVX), Chuck Akre generated 12.6% annualized returns and never trailed the S&P 500 over any rolling five-year period. And while the average turnover rate for mutual funds is nearly 100%, or about a one-year holding period for a given investment, Akre kept his holdings at FBR Focus for an average of five years — a mere 17% turnover rate. That record serves as a testament to patient, long-term investing.

In August 2009, Akre cut his ties with FBR and opened his own mutual fund. Just two months later, the newly minted **Akre Focus Fund** (AKREX) earned a spot on the Kiplinger 25, a well-regarded list that spotlights the best mutual funds, focusing on consistent results, low expenses, and a sound approach.

Even though we had a good laugh about Kiplinger's lightning-fast anointment of Akre's new fund, one thing is clear: This is a guy worth observing. And by using a CAPS screen, combined with *Pro*'s proprietary CAPShot tool, we can even attempt to recreate his recipe for finding great small-cap stocks.

Bottling the Akre Formula

Akre cites three driving principles to his success:

1. Select investment opportunities to preserve and grow capital.
2. Develop a focused portfolio that seeks to identify compounding machines.
3. Invest for long term results, recognizing that volatility can create powerful opportunities.

Based on Akre's criteria, I searched for stocks with three-year average returns on capital greater than 15%; market caps between $100 million and $2 billion; and insider ownership greater than 5%; then, I cross-referenced what I found with our CAPShot tool, looking for scores above 8 out of 12. (Remember, as with any screen, these results are just jumping off points for further research.) While the screen didn't pull up any CAPShot scores of 11 or 12, I did find a few stocks worth a closer look:

Company	Market Cap (in millions)	Return on Capital**	% Shares Insider Owned	CAPShot Score
Quality Systems	$1,830	29.7%	34.2%	10
Buckle	$1,380	36.8%	44.5%	10
Universal Travel	$154	36.5%	24.4%	10
VSE	$239	28.6%	20.8%	9
Female Health	$127	34.1%	25.4%	8

**Data as of Jan. 4, 2010. **Trailing 12 months.*

First up is Quality Systems, which designs software that digitizes medical records at doctors' offices and hospitals. The founder and current chairman, Sheldon Razin, has been with the company since 1974 and owns some 18% of shares. There's been a lot of hype about digitizing medical records over the past year, however, and at current lofty valuations, I'd refrain from adding money here. **Verdict:** Avoid for now.

With its stores strategically placed outside of major metropolitan areas, youth apparel retailer Buckle flew under Wall Street's radar for a long time. But with consistent double-digit margins and returns on capital, Buckle now has more than a dozen sell-side analysts following its every move. I like that founder and chairman Daniel Hirschfeld owns a substantial 37% of shares, but with 400-plus stores strewn across 41 states, Buckle may not have much room left for expansion. The recently announced quarterly dividend, though not bad in itself, could be a sign that management expects lower growth in future years. **Verdict:** Worth further research — I like its second-city niche.

Based in China, Universal Travel has the potential for tremendous upside, but I grew a bit skeptical when I read its claim that its Speedy Dragon subsidiary "has already built a perfect and nationwide logistic network." I'm sure it's good, but *perfect*? Maybe something is lost in translation. **Verdict:** Let's move on.

Next is VSE, a company that provides technical and engineering support to the government (and it's headquartered less than two miles from Fool HQ — I smell a company visit!). Its principal clients are the five branches of the U.S. military; its largest shareholder, Calvin Scott Koonce, owns 16.6% of shares and has served on the board since 1992. **Verdict:** Worth researching in light of increasing government spending.

Finally, there's Female Health, the designer and manufacturer of the only FDA-approved female condom. In 2009, Female Health made more than 90% of its sales outside of the U.S., and CEO O.B. Parrish has been at the helm since 1994. The company has struggled mightily in the past, but thanks to some favorable government actions, it has benefited from increased HIV/AIDS spending, particularly in developing areas like Africa and South America. **Verdict:** The company's future is too uncertain for my taste.

Foolish Bottom Line

I'm a big fan of Akre's approach to finding high-quality small-cap stocks, and paired with CAPShot, I was able to uncover some intriguing research ideas based on his thinking. If you're looking for a good screening tool, try out the new-and-improved CAPS screener by clicking here.

What do you think about these stocks? Please weigh in on our CAPS Corner board.

Monday Memo: A Visit From the Ghost of Pro Past

Published Jan 4, 2010 at 12:00AM

The Week Ahead

- Jan. 5: **Ebix** shares trade on a 3-for-1 basis.
- Jan. 7: **Abercrombie & Fitch** announces December sales.

Pro Community Highlights

- Russell (TMFEldrehad) posts five 5-star stocks from CAPS in his weekly commentary for *Pro*.
- Well wishes for the new year were shared by many *Pro* members on our boards, including 1putt2pin from Shanghai.

As we enter our third calendar year, *Motley Fool Pro* is starting to develop a history. Notching more time under our belt doesn't just give us a little bit of distinction; it helps you hold us accountable. What's more, by examining our past, we can improve our future together.

With that in mind, I thought it would be fun *and* enlightening to look back at some of what we've written in this space over the past two years. For our first stop, let's rewind to February 2009 — when the market was diving to prices not seen since 1996.

Dark Days and the Ensuing Rally

It was about two weeks before the S&P 500 hit rock bottom, yet as you can see by our Feb. 23, 2009, Memo, we were more opportunistic than worried. That's because we were looking ahead:

> While we've started the *Pro* portfolio defensively, our current roadmap has us getting much more aggressive as the year goes on ... Current logic suggests at least the *start* of a recovery by 2010, and we want to be ahead of that curve. If the coming months continue to hold this logic, we're going to become a much more bullish portfolio as the year progresses. We like strong returns as much as the next Fool. And we love a bull market — especially one that should follow a beating like this.

When I wrote that, we still had nearly $700,000 in cash. And as projected in that Memo, we increased our buying steadily over the ensuing nine months, putting more than $400,000 into stocks and committing even more via options. We did this even as many investors (including us!) were questioning the sustainability of the ongoing rally — a steep 38% jump by May 8 seemed aggressive.

Sticking to Our Guns

As the market surge continued, we remained committed to our core principles, as you can see in our Memo from May 11, 2009:

> At *Pro*, we will continue to:
>
> - Average into investments that show us strong potential over the coming years.
> - Use valuation as our guide in writing puts and covered calls.
> - Consider reasonable hedges based on risk versus potential reward.
> - Keep our emotions in check and focus on a long-term plan.

Discipline is a key to investing well — emotional discipline *and* the discipline to act on your research, convictions, and long-term plans, and then stick with them.

For another example, let's step back a bit. *Pro* launched in October 2008, and by Nov. 24 of that year, we had our sights on potential new investments:

> We're buying stocks we believe will perform despite the economic illness that has infected literally everything — from banking to commodities to technology. A few companies we're considering involve infrastructure (because governments must invest in themselves), commodities and energy (both will recover in price), and timber as an inflation hedge.

In the following months, we bought shares of **GrafTech International**, **Vanguard Energy**, **Plum Creek Timber**, **Cameco**, **Autodesk**, and **Flowserve**, among others, sticking to our wealth-building plan despite the crumbling market around us.

Profits, Period

Now let's go back even further, to one of our earliest Memos. On Nov. 3, 2008, we wrote:

> We're not so concerned with what the S&P 500 does as long as at least 75% of our investments are profitable by the time we close them. We're making investments that we believe will provide gains in the end, whether the market goes up or down, or slips along sideways for the next year. Accomplishing our goal of absolute returns will fill our portfolio with a lot of green numbers. By reaching this goal, we should also outperform the S&P 500 — that's icing on the cake.

Today, we still believe that the S&P 500 should matter less and less to us as our wealth grows. Once you have ample wealth, your first goal should be to protect it. So at *Pro*, we want to earn profits, period, with less risk than the market overall. To that end, more than 90% of our positions today, both closed and open, are profitable. That's not surprising given the market's strength, but limiting our number of hedges and shorts over the past nine months has been the right move. As a long *and* short portfolio, we're judged not just on what we do, but on what we *don't* do.

Limber Investing

Finally, no matter what we do, we need to remain flexible. On Dec. 8, 2008, the Market Swami paid a little visit. We predicted that "a flat market appears to be the most likely scenario for the near future." (I wish we had defined *near future* in that Memo, but we probably meant over the next year or so.) However, from Dec. 8, 2008, to Dec. 8, 2009, the S&P 500 rose 20%. That doesn't qualify as flat, so if we were thinking just one year ahead, we were wrong.

Fortunately, by February 2009 — quoted first above — we ramped up our buying in response to the values we saw. Even if you proclaim an investment stance that turns out to be completely wrong, the bigger question may be: Did you adapt your stance in time to ultimately be much more correct? We must remain flexible at *Pro*, because much of what we say about macro events won't prove to be accurate. That's just the nature of the business. It's more important that we remain open to changing our stance, and that most of our investments win regardless of what the rest of the market is doing.

Ghost of *Pro* Yet to Come

On that note, let's kick off 2010! We have a healthy schedule of investing moves planned over the coming weeks, and we hope that you'll enjoy this year's journey as much as we plan to.

Thank you for being with us … and welcome to 2010!

Jeff Fischer

Monday Memo: Here's Looking at You

Published Dec 28, 2009 at 12:00AM

Pro News and Events

- **Lindsay** has been moved to **Hold** after share price appreciation.
- Dec. 29 and 31: **Vanguard Energy** and **Vanguard Emerging Markets** pay annual dividends of $1.19 and $0.54 per share, respectively. This will put about $1,180 in *Pro*'s pocket.
- Jan. 5: **Ebix** begins to trade on a 3-for-1 split adjusted basis.

In the *Pro* Community

- This Week in CAPS: Russell (TMFEldrehad) highlights the newly launched TMFStockSpam, a Foolish community project that tracks stock spam over time.
- Members spinningwood, upnup8, stamleo, jog100, trurl9, and others post holiday wishes to everyone on the *Pro*philosophy board.
- Remember that the Fool gives $0.10 to charity for any and every post you make between now and Jan. 8. Happy New Year!

The flow of information has exploded since the last market meltdown (that'd be in the 1920s). Investors are inundated with a fire hose of news on a daily basis — federal reports, earnings, economic numbers — all of which Wall Street tries to interpret instantaneously. This instant-read atmosphere often leads to more trading volume and larger price swings. But being an active trader doesn't make you a better investor.

It's ironic that Warren Buffett, the greatest investor of our time, is an extremely long-term minded guy when it comes to his core stock holdings, yet most of the media is focused on short-term events and has a "best trade right now" mentality. Still, everyone falls prey to this trap of short-term thinking at some point. Even at *Pro*, if a new position isn't up within weeks or months, some members on our boards start to wonder: "What's wrong with it?" It's always good to ask (that's what our community is for), but lacking any news, we're usually just going to remind you of our time frame. On the flipside, if an investment gains ground for us within days or weeks, we may feel like celebrating even though we aim to hold for years and the price is bound to change many times until the company gradually builds lasting value.

Learning to balance constant information and always-changing share prices with the long-term pursuit of building a strong portfolio is one of the great challenges for all investors. It involves controlling your immediate emotions and accepting near-term uncertainty in return for, ideally, long-term benefits. If you're an "active" investor — trading on news and minding short-term price moves — you may feel like you're making progress, but in actuality, there's a man in Nebraska who didn't make any trades at all on the same news, and who will be richer for it in the years ahead. Now that's something to think about.

Pro Members From All Walks of Life

Buffett isn't the only investor we're highlighting today. To wrap up 2009, we want to turn the spotlight around and shine it on *you*, the many *Pro* members who make our service come to life. The Motley Fool knows a thing or two about deciphering information to help you make better investment decisions — so it's no shock that we also spend time digging into stats to learn about the thousands of investors who love the Fool. Here's a bit of what you've told us.

First, where are you? *Pro* members are concentrated in these metro areas (by order of magnitude):

1. San Francisco
2. Los Angeles
3. New York
4. Washington, D.C.
5. Houston
6. Seattle
7. Boston
8. Chicago
9. Dallas
10. Denver

Many more *Pro* Fools are concentrated elsewhere around the country, from Georgia to Minnesota to Cincinnati (Todd's home town) to Palm Beach. More than 30 *Pro* members reside in the Honolulu area (hopefully all enjoying the good life on the islands), and there's even a *Pro* member in Cuba City, Wisconsin (population 2,000).

Outside the U.S., *Pro* members are abundant in Canada (350 strong as of this summer) and the U.K. Next in popularity are Singapore, Switzerland, Ireland, Australia, and Germany. Several *Pro* members also reside in Hong Kong, Italy, the Netherlands, Israel, Belgium, Mexico, Japan, and the Caribbean islands. We have a dozen members in Bermuda but just 11 in giant China; we have some in South Africa, Brazil, Saudi Arabia, Qatar, Portugal, and Uruguay — even Tanzania and Brunei Darussalam, among many other countries. *Pro* truly hosts a global base of investors taking an active role in their financial futures. Combined, all of you logged 243,000 *Pro* site visits during the past six months.

About 10% of *Pro* members are CAPS-rated players; more than 12% of all members post on *Pro*'s discussion boards (half of those for the first time in the past year), while countless more read the boards; and 17% of members use the My Scorecard feature, where **Kinetic Concepts**, **GrafTech International**, and **Vanguard Emerging Markets** are among the most widely tracked *Pro* stocks. The average member tracks about eight *Pro* stocks in My Scorecard.

Here's to *Pro*!

If we could get all *Pro* members together in an airport hangar, it'd be one of the most amazing parties any of us could attend. We'd have people from all walks of life and backgrounds, from every U.S. state and dozens of countries, all with a common goal of investing successfully: Building wealth, reducing risk, and providing a better life to those you care about.

Our Foolish caps are off to you. In closing, if you have any final thoughts on 2009 or predictions to share for 2010 — or if you just want to say hello to the Pro neighbors living near you — visit our Memo Musings board.

We wish each of you a prosperous and healthy 2010!

Jeff Fischer, on behalf of the entire *Pro* team: Todd Wenning, Bruce Jackson, Jill Ralph (publisher), Allyson Cohen (editor), Russell Carpenter (CAPS All-Star), Barbara Eisner Bayer (board stroller), and David and Tom Gardner (the guys behind all this Foolishness).

Monday Memo: So Long to a Down Decade

Published Dec 22, 2009 at 12:00AM

How's this for a quick-hit holiday charity pitch? Give the Fool a piece of your mind, and we'll donate a dime to Thurgood Marshall Academy in Washington, D.C. The public charter high school is in one of the most impoverished neighborhoods in our nation's capital, and it's doing amazing work: Its first five graduating classes had *a 100% college acceptance rate*.

Here's how you can help. The Motley Fool will donate $0.10 to the school for every post on our discussion boards through Jan. 8. So give back this season. Visit your *Pro*discussion boards and post any questions you have — that's $0.10 to a worthy cause. Or respond to your fellow members' questions — another $0.10. Or just say hello. As Fools well know, dimes add up. So enjoy this week's Memo, and get posting!

Checking the Rearview Mirror

As 2009 winds down, many investors are reflecting on the year and fixating on the S&P 500's 66% vault from its March low. But we know better than to get too caught up in this market exuberance. After all, the index is actually up a much more modest 26% for the whole year, and despite this year's gain, the S&P 500 is still 40% below its late-2007 highs (excluding dividends). In fact, if you invested $10,000 in the S&P 500 on Jan. 1, 2008, your money would have shrunk quite a bit:

Date	Investment Value
Jan. 1, 2008	$10,000
Jan. 1, 2009	$6,100 (after a 37% decline in the S&P)
Dec. 18, 2009	$7,300 (with this year's 26% bounce)
Two-Year S&P Return	**-27%**

**Source: Google Finance. Dividends excluded.*

As you can see, it's been a rough couple of years for stocks. What's more, it's been a rough decade — the worst 10-year period for equities since the 1950s, with the S&P 500 index down 21% from Dec. 22, 1999, to now. (If you reinvest dividends, the decline is about 7%).

Unless Santa brings us a time machine, we can't change the past 10 years. But we can look at market trends to help us anticipate the future. Historically, underperforming decades have been followed by much stronger decades (1929 to the 1950s aside), though we shouldn't bank on an immediate revival come New Year's Day. There's a strong chance that market returns will be mediocre in the coming years. The U.S. government has more debt on a nominal basis than ever before, and the country's debt-to-GDP level is approaching what it was during World War II. This time around, we have an aging population and ballooning Social Security and Medicare liabilities — a recipe for financial frustrations as tax proceeds fall and government liabilities leap. Adjustments will need to be made (higher taxes, anyone?) that will probably curtail growth.

Events

- Dec. 19: **Oracle**topped earnings expectations, sending the Buy First stock to new highs.
- Dec. 21: **Ebix** shareholder meeting to approve a 3-for-1 stock split.
- Dec. 22: **Lindsay** reported estimate-stomping earnings thanks to a large Mexico City road barrier contract.
- Mid-January: Exclusive *Pro* interview with **Plum Creek Timber**.

Community Highlights

- Pro member Alex340 posted numerous, current options ideas meeting Pro's general guidelines.

- Jeff summarized the success we've had writing puts on **Nasdaq OMX** the past year.
- Stamleo posted how the **U.S. Natural Gas Fund** is performing, while Jeff elaborates on why the ETF was selected.
- In relation to Plum Creek Timber, Todd and *Pro* members discuss a new bill on timber harvesting.
- With **GrafTech International** shares recently near $16, a few Fools are thinking of writing covered calls.
- Pro member HPHamilton posted his favorite options resources.
- TMFEldrehad shared the three most-recommended CAPS blogs from the past week.

The Road Ahead

That's why we'll probably keep at least 20% of our *Pro* portfolio in cash in 2010, so we can remain defensive, have money for new opportunities, and generate options income. (Our portfolio is currently about 40% cash.) We aim to earn about 5% of our portfolio's assets from options income alone in 2010, or about $4,200 a month on average.

We remain focused on infrastructure and energy investments. **Autodesk**, **Cameco**, **GrafTech International**, **Flowserve**, **FPL Group**, **Plum Creek Timber** and **Vanguard Energy ETF** all stand to benefit from programs to rebuild North America's infrastructure and energy grid, while emerging countries are just starting to build those projects. We believe large projects such as these will help lead us out of the recession and bring years of growth to leading companies. We know that's a fistful of infrastructure-related companies, but we don't think we're overweight in this sector. Each company has a different focus and serves different industry needs.

Elsewhere in our *Pro* portfolio:

- **GlaxoSmithKline** , **Medtronic**, **Kinetic Concepts** and, in a related field, **Waters** provide us with strong exposure to the health-care industry (the least expensive sector in the S&P 500 right now), and we'll try to buy more of these companies at the right price.
- We're seeking a few carefully chosen investments in consumer retail, a sector where we're light.
- We're considering more exposure to commodities, including agriculture.
- We're targeting more exposure to innovative technology leaders.
- We're seeking some straight covered call income positions.
- We want to put money in emerging-market small caps in Brazil, China, India, and elsewhere, but only at reasonable prices.

Finally, as our 2010 option goal suggests, we expect to continue to write strangles and start writing straddles to capitalize on a range-bound market with income. We may also see more opportunities to use spreads and, with a meaningful dip, buy long-term bullish call options. Meanwhile, despite stock appreciation in most of them, we continue to favor every company we own for long-term capital appreciation, while monitoring valuation quarterly.

Predictions for 2010

Last week, Todd and Bruce took a shot at making some market calls for 2010. Todd's "bwak-bwak-chicken" taunts are getting pretty old, so I'll take the leap, too. Of course, we do these tongue-in-cheek (or, tongue-in-beak). Although we always take the pulse of macro events to help inform our decisions, investing in strong companies at good prices is our true ticket to returns because nobody can consistently predict what the economy will do. That said, here are my predictions:

- Most everyone is bearish on the U.S. dollar. Being contrary, I think this will lead to dollar gains in 2010.
- Despite a rising dollar, oil prices will rise modestly as economic activity increases, especially in emerging markets. (And China will continue to stockpile commodities.)
- Most people are bullish on gold, but I don't think it can pull off a repeat performance. I expect prices to cool off.
- If interest rates don't start to increase in 2010, they will soon after. (How do you like that one?)
- Housing prices will limp along and the jobs situation will improve, but not enough to repair even a third of the damage done.
- The U.S. economy will grow more than the 2.6% expected, but this won't benefit industries equally.
- The market will stay in about a 20% range, up 10%, down 10%. This would suit us nicely (as would more gains). Only select stocks will do well — that is, the "one rally lifts them all" situation will end.

On behalf of the *Pro* team, I wish you a joyful holiday season. Thank you for being with us at *Pro*. We always appreciate it — we wouldn't be here without you! As you celebrate and reflect with friends and family, remember this most liberating reality: It's only money. Life can be just as rich without much of it as it can be with plenty. Enough is as good as a feast.

Happy holidays!

Jeff Fischer

Jeff owns shares of Nasdaq OMX Group and Oracle.

Audio Extra: Todd Chats With Economics Expert Deborah Hewitt

Published Dec 18, 2009 at 12:00AM

Happy holidays, *Pro* Fools! As you'll recall from our Nov. 23 Monday Memo, *Pro* analyst Todd Wenning laid out our plan to bring you more access to company executives and industry experts so that we can become a smarter investment community. He's kicking off that initiative today with Dr. Deborah Hewitt, clinical professor of economics and finance at The College of William and Mary (and a former teacher of Todd's). In this special *Pro* Audio Extra, Todd and Dr. Hewitt discuss the future of the dollar, the health of the global economy, and one promising country for long-term investors.

Buy GlaxoSmithKline

Published Dec 17, 2009 at 12:00AM

At a Glance

- **Target allocation:** 5%
- **Estimated fair value**: $47.50
- **Preferred buy price:** Around $40 or lower
- **Dividend yield:** 5%
- **Type of holding:** Core income; Healthcare: Major drugs

The Big Picture

It's no secret that big pharmaceutical companies are in the midst of a multi-year bear market. Patent expirations on major drugs and government interest in lower health-care costs continue to take a toll on these stocks, pushing share prices of leading drug companies down over the past decade

At *Motley FoolPro*, we see an opportunity. We aim to buy stocks when they're trading at depressed valuations for known reasons, as we did with **Procter & Gamble** (NYSE: PG), **FPL Group** (NYSE: FPL), and **Kinetic Concepts** (UNKNOWN: KCI.DL). Pharmaceutical giant **GlaxoSmithKline** (NYSE: GSK), which is facing well-known challenges along with the rest of the drug industry, already has these issues priced in, so its shares are attractively valued. And although the returns from a low-risk stock like Glaxo won't knock your socks off, the substantial 4.6% dividend yield — as well as potential options strategies on the stock in the future — should help us generate steady income over time.

The Business

Tip: ADRs and You

Based in Britain, Glaxo's primary listing is on the London Stock Exchange, and the company reports its numbers (including dividends) in sterling, which are then translated into dollars. For our purposes, one American Depositary Receipt, or ADR, is equal to two U.K.-listed shares. There is some exchange-rate risk, but no more than we'd see with any other large, diversified, global company. As owners of the ADRs, we'll receive our dividends in dollars, and all else being equal, we'll receive more when the dollar weakens and vice-versa.

Based in the U.K., Glaxo is a $109 billon pharmaceutical behemoth that controls an estimated 7% of the global market (revenue-wise) and employs 99,000 people in more than 100 countries. It's the second-largest drug-maker in the world behind competitor **Pfizer** (NYSE: PFE), making it larger than the likes of **Merck** (NYSE: MRK) and **Bristol Myers Squibb** (NYSE: BMY). Glaxo boasts strong, steady cash flow and a diverse portfolio of drugs treating diseases such as asthma, infections, mental illness, diabetes, and digestive ailments. Leading brands include Avandia, Lamictal Seretide/Advair, Relenza, Paxil, Zofran, Requip, and Valtrex. Glaxo also has a consumer products division with many leading brands, especially in the U.K.: Panadol, Aquafresh and Macleans, Nicorette/NiQuitin, and many more.

Trading at about 13 times earnings, the stock is not necessarily as cheap as Pfizer — whose share price has fallen more than 50% over the past decade compared with Glaxo's 22% drop — but Glaxo faces fewer challenges than Pfizer. We also like Glaxo's less-risky strategy of bolt-on acquisitions (it announced four in the second quarter). In the recently ended third quarter, Glaxo also walked away from two or three other potential deals, looking to only buy complementary businesses at reasonable valuations. That said, we expect acquisitions in the coming years to add to growth.

At the helm of Glaxo is 44-year-old Andrew Witty, relatively new to the position but promising so far. The CEO's three-pronged strategy seeks to grow a diversified global business, deliver more products of value, and simplify the operating model. Emerging markets, where sales grew 25% in the last quarter, offer a large opportunity in particular; according to a study by UBS, seven emerging nations — Brazil, Russia, India, China, Korea, Mexico, and Turkey — could account for 70% of pharma sales growth by 2020.

The Community's Take

Glaxo scores a respectable 7 out of 12 in our proprietary CAPShot Report, falling short on industry rating, and growth and debt ratios, things we feel comfortable with.

On CAPS, Glaxo rates 5 out of 5, with 95% of members recently rating the stock a buy, and 96% of All-Star Members also rating it a buy.

Meanwhile, business in the U.S. is presenting a challenge, with Glaxo's third-quarter sales in the region down 12% largely due to the impact of generic drugs, as products including Lamictal, Paxil, and Zofran are now off-patent. On the bright side, U.S. sales of products *not* subject to generic competition grew 10% from a year ago in the recent quarter. Glaxo currently has six products filed for FDA approval and 12 new products have been launched in the U.S. since 2007.

The Glaxo research and development pipeline looks promising, with approximately 30 candidates in late-stage development including treatments for chronic bronchitis and emphysema (COPD), prostrate cancer, cervical cancer, and meningitis.

Although the U.S. in particular is a challenging market, Glaxo is a strong, diversified, global business. We particularly like its focused strategy as it moves away from a dependency on western markets to foster strong growth in emerging countries.

Valuation

Glaxo has strong free cash flow, making its $14 billion net debt relatively modest and manageable. The shares, currently priced around $42, trade on a forecast 2010 P/E of 12 and a forecast 2010 dividend yield of around 4.9%.

Our discounted cash flow model, using a modest growth rate around 5% and a 9% discount rate, gives a fair value for the shares of between $50 and $58. Being conservative, we estimate fair value in the lower $50s.

If we can achieve a conservative gain of 8% to 9% per year (more than half of it currently in dividends), the stock will more than pay its way in the *Pro* portfolio until it reaches fair value. If we use options on the stock as well (covered calls, for example, after shares appreciate), we should be able to target double-digit capital gains, along with the nearly 5% dividend, all with relatively low risk.

Risks

The blockbuster drug revenue model of yesteryear is fading quickly as big pharma shifts its focus to a more diversified portfolio of consumer health products, "personalized therapy" drugs, and treatments for niche diseases. Patents on major drugs, including Pfizer's Lipitor and Glaxo's Seretide/Advair, expired recently, while generics have gone mainstream. It's still uncertain how successful the industry's transition will be.

To cope, many major pharmaceutical companies have been diversifying away from pure drug plays by acquiring or expanding upon existing lower-margin businesses. Pfizer's recent $68 billion acquisition of Wyeth takes the company into the over-the-counter consumer health-care and animal-health markets, both of which have traditionally posted lower profit margins than pharmaceuticals. Meanwhile, unknowns associated with U.S. health-care reform continue to put pressure on the industry. However, we believe that these concerns, being priced in already, provide us the opportunity to buy shares at a low price and with little risk over the coming years.

What Would Make Us Sell

We need to see steady results from Glaxo's annualized $6 billion R&D expenditure program. Over time, we want to see annualized growth of between 5% to 8% in sales and net earnings. A large acquisition would make us reevaluate our investment thesis. Furthermore, the high dividend yield is a large part of the attraction, and a large acquisition could put it in jeopardy — as was the case when Pfizer acquired Wyeth in January. Glaxo's dividend recently grew 7% over the previous year; we want to see the dividend at least maintained, and ideally, increase over time.

Pro Bottom Line

With Glaxo, we're getting one of the strongest names in one of the most inexpensive industries today. The company's strong cash flow and focused strategy, combined with reasonably valued shares and an attractive dividend yield, have us convinced that adding one more health-care position to the *Pro* portfolio is a smart move. As Glaxo joins our **Medtronic** (NYSE: MDT) and Kinetic Concepts (NYSE: KCI) holdings, the portfolio will have ample exposure to medical devices and drugs in the most undervalued industry in the S&P 500. Questions? Please post on the new GlaxoSmithKline board.

Analyst Bruce Jackson owns shares of and has written options on GlaxoSmithKline. Pro *will make this trade in two business to 30 calendar days.*

Tax Questions? We've Got Answers

Published Dec 15, 2009 at 12:00AM

When you write (or "sell to open") equity calls or puts and buy them back ("buy to close") before expiration, or let them expire for a 100% cash gain, they're always counted as a short-term capital gain (or loss), no matter how long you held the trade. Even if you write a put or call that doesn't expire for two years, and hold it open to the bitter end, the option is still a short-term taxable event. This law assumes the option you write doesn't get exercised and that there is no stock involved — you simply closed it at some point or it expired.

When you buy ("buy to open") a call or put, and don't get the stock involved, it is treated the same way as a stock for tax purposes. If you buy an equity option and hold it for more than a year before closing it or before it expires, it becomes a long-term capital gain or loss. If you hold it less than a year, it's treated as a short-term capital gain or loss.

Taxes on options become a bit more complex once the underlying stock becomes involved. However, for the bulk of your trades, there are simple rules to follow. If an option you wrote is exercised, the premium you originally received for writing the option is factored into your new stock trade price, and your transaction date for tax purposes becomes the date of exercise. Likewise, if you exercise an option you bought, you factor the premium you originally paid for the option into the new stock transaction, too. It's as follows:

Action	Tax Treatment
Call owner exercises (buys the stock)	Add call premium you originally paid to your new stock cost (nothing to report for taxes until you sell the stock). Start date for the holding becomes date of exercise.
Put owner exercises (sells an existing stock)	Subtract put premium you originally paid from your stock proceeds (taxable that year, since the position is closed). Trade date is date of exercise.
Call writer has calls assigned (stock is called away)	Add call premium you originally received to your stock proceeds (taxable that year, since the position is closed). Trade date is date of exercise.
Put writer has puts assigned (made to buy stock)	Subtract put premium you originally received from your stock cost (nothing to report for taxes until you sell the stock). Start date for the holding becomes date of exercise.

In each case above, you adjust the cost basis, or sales proceeds, on the underlying stock to reflect the original option premium related to the trade. If you were paid an option premium as part of a stock trade, the IRS wants to know. If you paid a premium, you can use that to lower your effective tax bill on the resulting stock trade. In any case, you don't need to report anything to the IRS in the above examples until the trade is completely closed — for instance, in some cases you may be "put" a stock and not sell it for years. So, keep good records of your option trades that result in long-term stock holdings.

Nowhere else is this saying more true than when it comes to taxes. One area where it gets tricky is when you already own a stock and then write covered call options on it. In general, be aware that if you've owned the shares for less than a year and then write covered calls against them, you need to write calls that are out-of-the-money (above the current share price) in order to maintain your original purchase date on the stock for tax purposes. If you write deeply in-the-money covered calls, your original stock purchase date is eliminated. So be careful! But if you've owned a stock for nine months, for example, and then write out-of-the-money calls on it that end up being exercised in month 13, your stock qualifies as a long-term holding.

Generally, double-check tax laws before you start to get options involved on stocks you've owned less than a year. In some cases, the options will reset your holding period for tax reporting. Also, realize that an option position that is essentially a "short sale" — such as writing naked calls — is like all short sale positions: they're all taxed as short-term capital gains or losses, no matter how long you hold them.

Additionally, if you own a stock less than a year and then buy put options to protect it, you wipe out the holding period you've had so far, and can't even start the clock again until you sell the put. Once you sell the put, that date becomes the new adjusted purchase date for the stock you're still holding. So, if you own a stock 11 months and buy puts on it, you've just wiped out those 11 months as far as Uncle Sam is concerned. The only way to avoid this is to own the stock more than a year before you buy puts on it, or buy the puts the same day you buy the stock (a "married" put). In this latter case, the puts ideally don't expire for at least a year, and if they do expire sooner, you can't marry any other put to the stock.

Keep in mind that the 30-day wash-sale rule on stocks applies to options, too. If you sell a stock at a loss and then take an option position within 30 days that approximates owning the same or even a similar stock, you won't be able to claim the first tax loss until this new position is closed, too. If you take a similar option position on a stock within 30 days *before* selling it, the wash-sale rule also applies. So, there is a 60-day window around the sale of any losing stock where the wash-sale rule will apply if using equivalent options. It works the other way, too: if you sell a call option at a loss and then buy the stock within 30 days, you'll invoke the wash-sale rule. Treat options as you would a stock when considering the wash-sale rule.

You've probably surmised that trading options in a tax-advantaged account has many, uh, advantages. Most IRAs allow for covered call writing and option purchases. Some even allow cash-secured put writing. If you can trade options in a tax-free account, you'll avoid all short-term gains taxes, and you can let your option income compound unimpeded.

This overview helps you get started, but isn't at all a complete guide to options and taxes, and this topic isn't one in which we'll be experts or provide specific guidance (we can't). You'll want to consult an accountant if you need help. But, in general:

- If you write any option and it expires or you close it, it is a short-term gain or loss no matter how long you hold the trade.
- If you buy an option and later sell it or let it expire, it is taxed long- or short-term just like a stock.
- If put options are exercised and result in you buying or selling a stock, adjust the stock trade price for the put premium you paid or received, and use the exercise date as a trade date. There's nothing to report for taxes until the resulting stock trade is closed.
- The above is also true if call options result in you buying or selling a stock.

It's relatively rare that you'll hold an option trade longer than a year, so in many cases — if not most — your options trades will be short-term tax events. When the underlying stock gets involved, the stock becomes the benchmark for whether it's a long- or short-term event, and the date the options are exercised becomes a transaction date for your trade. Once any resulting stock position is closed, you'll report the adjusted gain or loss on the combined option and stock trade to the IRS, but not before then.

Fun stuff? Hey, it's not so bad. Fool on!

Monday Memo: Todd and Bruce Take on 2010

Published Dec 14, 2009 at 12:00AM

Inside Scoop: Ebix Analyst Day

Jeff was on hand for **Ebix**'s analyst day last week, gathering insight on the information-management software company to share with you. A few of his top takeaways:

- There are large, untapped opportunities in international markets.
- Ebix has many new products in the works, including annuities and e-forms.
- The company's focus on cash flow and costs suggests steady value creation ahead.

For much more, see Jeff's complete notes on the Ebix board. Meanwhile, the company's 3-for-1 stock split has been moved to early January while the company awaits a proxy vote. Management didn't handle the split as smoothly as we'd like, but the company remains promising.

Pro Company News

- After a 33% gain in **Medtronic**'s stock price, we're moving the company from **Buy First** to **Buy** on valuation. It remains attractive, though, and following an exceptionally strong third quarter, we're increasing our preferred buy price 10%, to around $40.
- Buy First stock **Oracle** reports earnings on Dec. 17 after market close.
- Four *Pro* put positions are set to expire as 100% cash gains on Dec. 19: **Lindsay**, **Nasdaq OMX Group**, **GrafTech International**, and **Kinetic Concepts**. We'll email you if price changes necessitate any action, but we don't expect that to happen. We'll be looking to repeat these puts soon.

Community Highlights

- TrojanFan shares that natural gas supplies declined, helping shares of **U.S. Natural Gas Fund** ETF.
- Alex340 offers put writing trades that match *Pro* criteria on **Autodesk**, **Lindsay**, **Plum Creek Timber**, and others.
- Moneyshaker asks: With so much bullishness surrounding it, why not short gold?
- This Week in CAPS, Russell (TMFEldrehad) highlights a few pitch-writing superstars.

As we near the end of a historical year for investors, we're also wrapping up one of the market's most volatile decades. The past 10 years were scarred by two price implosions, from 2000 to 2002 and 2008 to 2009 — and though each fall was followed by a steady climb, the S&P 500 is down more than 20% overall since December 1999.

If history is any guide, the next 10 years should bring relatively healthy returns, but the only real certainty is that there will be shocks to the system — whether political, financial, or resource-based — as well as periods better than anyone expects. Great new companies will be born, and many well-known ones will fade away. Through it all, our mission at *Motley Fool Pro* is clear: To help you generate steady, stable returns in leading stocks and macro-minded ETFs, while greatly complementing those returns with options — *and* going short when it's worth the risk. No matter what, we must remain flexible, with absolute gains remaining the primary goal.

For this week's Memo, I asked *Pro* analysts Todd Wenning and Bruce Jackson to share a few thoughts on the year ahead. Todd is ready for politics to become even more closely tied to Wall Street, and Bruce expects a flat market at best. Let's hear their takes.

Fool on,

Jeff Fischer

Feeling the Fed in 2010

By Todd Wenning (TMFPhila)

If you think this has been a politically charged year, brace yourself for 2010. Next November, 36 Senate seats, all 435 seats in the House of Representatives, and 36 gubernatorial seats are up for grabs. With so much at stake for both parties, and on both the local and federal levels, expect to see incumbent politicians do all they can to win the public's favor leading up to Election Day. Most important, this means increased government spending in the short run to further reduce the unemployment rate and boost economic growth.

What does this mean for us as investors? First, it means staying patient and trying to get a better understanding of what actions taken now will mean a few years down the road. For instance, it's likely that increased spending will lead to higher tax rates on income and capital gains down the road. I also expect that if the economy does gain some traction in 2010, we'll see the Federal Reserve raise interest rates, and it will do so quickly in order to stave off inflationary pressures caused by the multi-trillion dollar government stimulus. This would be bad news for longer-term bonds and assets benefiting from the dollar carry trade (the selling of dollars for currencies that pay higher interest), namely oil, gold, and emerging economies. We have our eyes focused on this possibility and are looking at investments that could benefit in 2010, so stay tuned.

A Slow Recovery

By Bruce Jackson (TMFGoogly)

Following one of the most savage recessions on record, economic recovery will be a long, slow process. The S&P 500 is at its highest valuation to earnings since 2002 despite shockingly high unemployment in the U.S. and struggling personal balance sheets. The obvious conclusion is that the stock market is riding for a fall in 2010 at worst — flat, at best.

But it rarely works like that. A number of forces are in action at any one time. Right now, we have interest rates at zero. We have massive government stimulus spending, both in the U.S. and abroad, particularly China. We have a truly enormous government deficit and a very weak dollar.

An optimist might say, given the record-low interest rates and government spending, a speedy economic recovery will ensue. A pessimist might say it's all going to end in tears, and we're in for a Japan-like lost decade or two. The truth is, no one knows. When it comes to making economic predictions, almost nobody can get it right, even some of the time.

But it's fun to play amateur economist these days — so on that note, I'll make a few predictions (but I'll keep them brief, since they're likely to be wrong anyway):

- The S&P 500 will close 2010 at 999.9 (it's currently 1,107).
- We'll have reduced volatility and reduced trading volumes in 2010 as people get bored with a flatish stock market.
- Gold will end 2010 below $1000.
- The U.S. dollar will rally.
- Official U.S. interest rates will end 2010 at 2.25%.
- The *Pro* portfolio will make exactly 39 trades in 2010.
- The *Pro* portfolio will (hopefully!) make a positive return in 2010, with dividends and option income generating 7% returns. It's money making money.

See You Next Monday

We'll be back next week when Jeff will share his thoughts on what's in store for the *Pro* portfolio in 2010. Don't forget to visit the sidebar above — we have plenty of news to share, including several *Pro* put option trades that are set to expire on Friday. And start making your predictions for 2010 on our Memo Musings board.

Fool on!

The *Pro* Team

Monday Memo: What a Gas

Published Dec 7, 2009 at 12:00AM

Coming Up

- In next week's Memo, the *Pro* team shares its outlook for 2010, including which sectors should perform best, whether the dollar will recover, and much more. Don't miss it!
- Today, Jeff is at the first **Ebix** analyst day, and he'll report his findings to you this week. Remember, the stock splits 3-for-1 before market open on Dec. 10. For every share, you'll own three. Ebix options will split by three, too, giving you more contracts at a lower strike price.

Community Highlights

- **Abercrombie & Fitch** reported weak November sales, with same-store revenue down an unstylish 17%, more than the 9% drop that was estimated. The stock has slumped. Read the latest thoughts from Jeff, Todd, and your fellow Fools on the Abercrombie board.
- Member spinningwood starts a discussion on benchmarking. What do you use to measure *your* returns? This led to Jeff's post on how *Pro* is doing.
- Good news, to us: Howard Buffett wants to stay on **Lindsay**'s board.
- Jeff and Todd explain further how *Pro* is aiming to actively manage its hedge, **ProShares Short S&P 500**, with covered calls.
- Fools discuss our covered calls on **iShares Silver Trust**.

I turned up the heat in my house to 85 degrees. And despite my cat's sweaty paws, I don't plan on turning it down.

Ever since *Motley Fool Pro* set up a synthetic long on the **U.S. Natural Gas Fund**, I've been cursing the D.C. weather — painfully warm for this Chicago native — and bemoaning that we aren't using more natural gas. This may hardly be the ringing endorsement you want from your investment advisor, but it's the truth.

When my wife says, "Can you imagine? It's 63 degrees out and gorgeous in December," I grumble, "Stupid global warming. I want it to be *cold*!" Living in D.C. also means watching mile-long trains loaded with coal crawl toward our nation's capital day after day. Yes, the U.S. Capitol and White House run largely on coal. How quaint.

So far, all that's made me smile about our U.S. Natural Gas Fund trade is seeing noisy D.C. buses drive by with "This Bus Runs on Clean, Natural Gas" painted on the side. Score one for *Pro*.

Getting Burned

In reality, we have history on our side with this trade — even if the position is going the wrong way for us so far. Natural gas is cleaner and cheaper than other fuels, and eventually, many more power plants will use it rather than coal. When the sun doesn't shine or the wind doesn't blow, green power plants will use natural gas as a backup.

But while we wait for that cleaner future, a steady decline in the U.S. Natural Gas Fund has erased nearly $10,000 from the *Pro* portfolio, a hit equal to 1% of the portfolio's starting value. Since we announced our trade on Oct. 7, shares of the ETF have declined 29% (as of Dec. 4), from about $12 to $8.50, and the loss is compounded in our options — our $10 calls have lost more than half their value, and our $12 puts are suffering as well. Investing real money alongside you, and tracking our returns in real time, we're well in tune with how you may be feeling about this trade.

While the quick decline is unfortunate, we realize that natural gas is volatile and could easily rise much higher in the coming months. But part of what makes the U.S. Natural Gas Fund's slide so hard to stomach is that natural gas hasn't actually fallen in price since we announced our trade.

In fact, the spot price of natural gas has *gone up*.

Left in the Cold

What's going on? You see, the U.S. Natural Gas Fund doesn't trade according to the spot market, but rather by (mostly) using futures contracts. Translation: The ETF pays what traders are pricing natural gas contracts deliverable a month from now. And while the spot price for natural gas is up nearly 10% since Oct. 7, from $3.65 per million btu to about $4, the forward month contracts have fallen from about $4.90 to $4.53, down by nearly 8%.

What's more, the U.S. Natural Gas Fund has been handed a bit of bad luck this fall, as the ETF was forced to sell its expiring contracts at a lower price than what it paid for new forward month contracts. The forward month contracts soon declined in value, too, compounding the ETF's losses.

Still, our thesis continues to suggest that natural gas is too inexpensive — incidentally, it traded at $6.70 a year ago — and the increase in the commodity's spot price over the past two months, despite a mild autumn, may support our argument. *Pro* member stamleo has posted excellent analysis suggesting that the price discrepancy may be seasonal, and in recent history, the forward month contracts have not traded at a large premium to the spot price for most of the year. That would be good news, because lately, the ETF has been buying natural gas futures at prices that essentially include a lot of "time value" (much like an out-of-the-money call option), and then selling them, as the value erodes, for a loss. Unless the natural gas spot price also goes up, the loss is unavoidable. So, we'll definitely be watching to see that this premium dissipates in early 2010.

Better Prices Ahead?

Foolanthropy 2009: You Can Help

This year, the Fool is taking action in its own community, focusing on a local school in need — and you can help. Through Jan. 8, for every community action you take (comments on discussion boards, articles, and blogs), the Fool will donate $0.10 to the Thurgood Marshall Academy in D.C. You can learn more about the Fool's campaign right here.

Natural gas is still in a bear market, but the largest explorer, **Chesapeake Energy**, expects prices to jump in 2010 and 2011, as production has slowed sharply this year. Our thesis remains that shale extraction of natural gas will prove more challenging and less profitable than hoped; demand will steadily increase as natural gas remains cheap; and supply will slowly dissipate enough to send prices higher. If the commodity enters a bull market, the ETF should benefit, period.

But for now, we've been hit with a rough few months in which the U.S. Natural Gas Fund has compounded losses even though natural gas has not moved much. So far, this investment shows us the added risks inherent in ETFs of this nature. But we remain hopeful that the pendulum will swing back. Meanwhile, if you use natural gas heat in your home, could you crank it up, please? Along with many *Pro* members, we wouldn't mind the boost.

Don't forget to see the sidebar above for important *Pro* events and posts, and share your comments on the Memo Musings board. Fool on!

Write Covered Calls on ProShares Short S&P 500

Published Dec 2, 2009 at 12:00AM

At a Glance

- **Trade:** Write ("sell to open") February 2010 $56 calls (QRSBD)
- **Allocation:** Write one call for every 100 shares of ProShares Short S&P 500 owned, and please use a limit order
- **Recent option price:** $1.10 bid/$1.50 ask
- **Limit price:** Attempt to split the bid/ask
  Alternate trade: If you don't own shares, you can consider writing puts in the lower $50s as a market hedge. If the market declines, ProShares Short S&P 500 will appreciate, and your puts will expire as income. If the market advances, dropping the ETF's price, you'll be obligated to buy shares.

What's New

When we approached the **ProShares Short S&P 500** (NYSEMKT: SH) ETF as a market hedge, we in part chose it simply because it has options available. This way, even if the market continues to advance, we can write covered calls to lower our cost basis on Short S&P 500 and (we hope) eventually close the position profitably.

Since we set up our synthetic long on Short S&P 500 (which turned into straight ownership of the ETF), stocks have continued their record advance, although nothing has fundamentally changed. Investors continue to pin their hopes on an economic recovery in 2010, as the broadest of measures imply mild promise — namely, GDP ticking up slightly, manufacturing not contracting, and fewer new unemployment claims. The question is, will even a mild recovery in 2010 be strong enough to merit continued share price appreciation? We have concerns, but we also want to manage our short of the S&P actively.

The Options Numbers

The February 2010 call options don't pay a tremendous amount, but Short S&P 500 represents an entire market index, so it should be much less volatile than an individual stock. With Short S&P 500 recently trading near $53, the February 2010 $56 call options bid $1.10. That represents about a 2% yield or payment on our $55.42 purchase price, earned in less than three months, and it lowers our break-even price to $54.32 before commissions.

On the upside, the $56 calls net us a potential sell price of $57.10, or nearly 8% above today's level. That represents a meaningful decline in the S&P 500. If our shares are called away, we'd be closing the short at a small profit. Meanwhile, it buffers any market decline, serving its purpose.

By writing covered calls on Short S&P 500, we're limiting our potential gains, but we're being cautious and improving our break-even price. If the market doesn't decline, we can consider writing new covered calls after we've earned most of the gains on these. So, we're proactively being defensive on our short, but leaving room for it to end profitably if stocks decline.

If you have questions, visit us on the [ProShares Short S&P 500 board](#).

Write Puts on Oracle

Published Dec 2, 2009 at 12:00AM

At a Glance

- **Action:** Write ("sell to open") January 2010 $22.50 puts (ORQMJ)
- **Allocation:** 2% (for *Pro*, about 10 contracts)
- **Option's recent bid/ask:** $0.87/$0.89
- **Preferred limit price:** Around $0.87 (a 3.7% payment in 45 days); you may accept a lower payment if need be.
- **Alternate trade:** Use a limit order to buy more shares around $21.65. If you don't own any shares yet, consider buying them outright.

What's New

Since we bought our first shares of **Oracle** (NYSE: ORCL) in September, the stock has been steady, rising more than 5% — ahead of the S&P 500 over the same period. In terms of our portfolio's current value, we're about 2% invested in Oracle, so we'd like to make our position more substantial. Writing near-the-money $22.50 puts could net us more shares close to our initial purchase price, just above $21.50.

Since late summer, small-cap stocks have underperformed while larger companies are beginning to draw more interest and performance. A giant in the tech industry, Oracle could benefit as the market rally continues on — usually, small (and thus more speculative) companies start a rally, and eventually, large-cap value stocks draw more buyers.

Europe's regulating body is still holding up Oracle's pending acquisition of **Sun Microsystems** (UNKNOWN: JAVA.DL), costing Sun $100 million per month in lost business. However, this is well known, and we believe Oracle represents value even without Sun; the business currently trades at 14 times free cash flow and 14.7 times earnings estimates for the year ending May 2010. Assuming approval, the main risk the company faces will be integrating Sun.

Oracle has not reported meaningful news since September, but it will report quarterly results in mid December. If the stock declines, we'll welcome the chance to buy more shares via our January puts. If it holds steady or appreciates, our partial stock position will benefit, and though we won't get new shares, we'll still profit from our puts.

How to Follow Along

You write ("sell to open") puts when you're ready to buy a stock if it declines below the strike price by expiration. This trade is more aggressive than our [put-writing guidelines](#) typically suggest, but that's because we're making the trade with a strong desire to buy more shares and we're comfortable with the valuation.

- **Option payment or yield (at $0.87 bid):** 3.7% in 45 days

- **Option strike price:** Close to Oracle's current stock price ($22.50)
- **Break-even price:** 3.9% lower, at $21.63
- **Cash or buying power needed:** Each put option you write represents a potential purchase of $2,250 worth of Oracle stock

Can't Write Puts?

If you're unable to write puts and don't own Oracle, consider purchasing shares of this Buy First stock today or on a dip. It's currently hugging our $22.50 Buy Around price.

To discuss this trade or ask questions, please visit our Oracle board.

Monday Memo: It's Coming Into Focus

Published Nov 30, 2009 at 12:00AM

Pro aims to earn absolute returns in flat, up, and down markets; for us, this means we seek to close at least 75% of our positions — stocks, options, ETFs, shorts — profitably. So far, we've closed 21 of 23 positions at a profit, so we've been 91% accurate. Sure, we'll make occasional speculations, such as buying calls on biotech **Electro-Optical Sciences**, but only if we are exceptionally accurate in the rest of the portfolio.

How we're different: Our focus on absolute — rather than relative — returns should lead to better investment decisions. The S&P 500 can be irrational and mispriced. Investors who chased it over the past 10 years did so at an unnecessary cost given that the S&P was ultimately *down* 26% over that time. *Pro* won't get into a foot race with the market. In fact, the only positions we've closed at a loss so far have been shorts against indexes — hedges we made to lower our portfolio's risk.

We're here to help you build a portfolio that profits with less volatility and, wherever possible, less risk. This can mean hedging stock positions with options, holding shorts to hedge market risk, or even holding meaningful cash — which we can then use to snatch up opportunities as they appear. *Pro* is an active portfolio, so we'll usually keep around 5% to 10% in cash — though this could change given the circumstances.

How we're different: We don't eschew cash; we view it strategically and are confident we'll put it to good use. We're seeking steady results over the years rather than swinging for the fences day after day.

Of course, any strategy comes with a cost. Hedges and cash will relatively dampen our performance during powerful market advances. But we'll have less downside risk in weak markets; do well in flat markets thanks to neutral, income-generating options strategies; and overall, help you build a portfolio with lower volatility and, ideally, few permanent losses.

Since inception, the *Pro* portfolio has gained about 19% while never being down more than a few percentage points; the S&P 500 is up about the same amount, but it's fallen 25% twice along the way. We've been able to achieve strong returns with low volatility by holding about 50% cash for much of the year (some of that simply because it takes time to invest) and choosing lower-risk, high-quality investments. Which leads us to another core *Pro* principle: While much of this year's rally has been fueled by speculation in risky stocks, we've profited by buying industry-leading companies that should be strong holdings for at least three to five years, and we've bought at attractive prices.

Most *Pro* members wish to achieve or maintain the financial security that comes with a stable and growing portfolio. The ultimate aim is to earn steady enough returns to be financially independent, regardless of what an index does. Overall, we're seeking to achieve smarter and safer returns, and so far, we've been able to perform with less risk and less exposure (given our cash). The market won't always make large gains like this year, of course, and *Pro* should be well-positioned for the other side of the coin, too.

Have questions about our strategy? Please post on the Pro Philosophy and Strategy board.

Fool on!

Jeff Fischer (TMFFischer)

Write a Strangle on Waters

Published Nov 24, 2009 at 12:00AM

At a Glance

Alternate Trades

- Place a limit order at $55 per share
- Write February 2010 $55 puts, recently bidding $1.80
- Buy shares near $59 and write May 2010 $60 covered calls for around $5
- Write a February 2010 $55/$65 strangle for around $3 combined

- **First action:** Buy 3%
- **Second action:** Set up covered strangle: Write ("sell to open") May 2010 $65 covered calls (WATEM) on your shares and write May 2010 $55 puts (WATQK) representing another potential 3%.
- **New target allocation:** 6%
- **Preferred buy price:** $55 or lower (using this strategy; see "Why This Strategy")
- **Recent option prices:** Calls $2.60 bid; puts $3.10 bid
- **Limit order:** Aim to write the strangle for around $5.70 *combined*. The options have wide bid/ask spreads, so by splitting the spreads, you may be able to net $5.90 or so.

What's New

Our initial strangle on **Waters** (NYSE: WAT) has expired, and our shares were called away on Nov. 21 for a healthy profit. Now, we're picking up where we left off, this time writing a May 2010 $55/$65 strangle for more upside.

We're keeping our fair value range of $65 to $69 for Waters following third-quarter earnings, in which management said that the weakest demand for scientific instruments has passed. The future looks stable, if not outright improving, as Waters' customers begin to reinvest cash in their businesses — and thus spend more on research equipment — to keep up with competitors and drive growth. Waters' management also expects to see more government and university spending from stimulus funds aimed at scientific research.

Perhaps the biggest near-term risk for Waters is a broad-market sell-off that drags the stock down with it. We'll also see two more earnings report (in January and April) before our options expire. Recognizing the near-term risks, our average buy price on all of our shares would be about $54 if Waters declines below the $55 strike on our puts, and we're content to buy our position in this strong company at about 16 times trailing free cash flow on average.

Why This Strategy

Numbers Behind the Strangle

- **Action:** Buy 3% of Waters around $59 (about 500 shares for *Pro*)
- **Action:** Write May $65 covered calls for about $2.60
- **Action:** Write May $55 puts for 3% more for about $3.10
- **Potential second 2.5% net buy price:** $49.20
- **Average buy price if we get all shares:** $54.10
- **Potential sell price on our first 3%:** $70.80
- **Effective options yield:** 10% over 179 days
- **Stock gain if sold:** 20%

Prices as of Nov. 23, 2009.

If you're not using options, buying shares of this healthy business in the low to mid $50s remains a compelling long-term investment. With the stock trading above that level today, we're writing a strangle in order to be more defensive.

Waters is recently flirting with $59, and our May 2010 $55/65 strangle pays us about $5.80 *combined* per share. This positions us to either buy another 3% (for a total 6%) near a net $49.20 or sell our existing shares around $70.80 — an attractive range over about six months.

We also considered a February 2010 $55/$65 strangle (and have listed it above as an alternate trade), which pays about $3 rather than $5.80 over just three months. However, we're vying for the May 2010 strangle because it offers more upside and a bit more defense for nearly as strong a daily payment (taking commissions into account and assuming we'd be able to repeat the trade in February).

The option income here represents nearly a 10% yield on our $59 purchase price (not including the buying power set aside for the puts we'll write, which lowers our yield), while offering nearly 20% upside if our shares are called away at a sell price $1 above our fair value. If the stock declines, we'll effectively buy our next shares 17% cheaper — at 14 times free cash flow.

How You Fit In

- If you don't own any shares of Waters, consider matching our 6% target by entering a limit price at $55 or lower.
- If you still own shares of Waters (i.e., they weren't called away), consider writing May 2010 $65 covered calls and writing May 2010 $55 puts if you'd like to buy more shares of Waters lower.
- If you don't own shares of Waters and have no interest buying them ... then why are you still reading? (We jest, of course.)

If you have any questions about this new strangle, please post on the Waters board.

Monday Memo: The Experts Weigh In

Published Nov 23, 2009 at 12:00AM

At *Pro*,we're determined to give you access to execs of the companies we own, and we're tapping industry experts as well. Following **Kinetic Concepts**' analyst day in New York two weeks ago (read our recap here), Jeff and I headed downtown to meet with Professor Aswath Damodaran at New York University's Stern School of Business. Professor Damodaran, who is widely regarded in the investment community as the best valuation teacher around, was gracious enough to let us buy him a cup of coffee and pepper him with questions for an hour.

It was a full day of learning, to be sure. We were impressed with KCI's latest vacuum-assisted closure, or VAC, therapy innovations, and Professor Damodaran reminded us to stay focused on the long run (you can read the highlights of our conversation with him right here). He said that much of this market rally has been focused on near-term factors, and that investors should be more concerned about the implications of the massive government stimulus and bailouts. This is the sort of insight that you simply can't get sitting behind your computer all day.

The *Pro* team is committed to expanding our — and your — knowledge base through meetings like these, helping us deliver smarter returns for you. On Dec. 7, Jeff is headed back to New York for portfolio newcomer **Ebix**'s first-ever investor conference. If you have questions for Jeff to ask Ebix management, please post them on the board.

In the coming weeks, we will be bringing you access to even more of our companies' execs and industry experts and sharing what we learn with you. Is there someone you'd like us to chat with? Let us know on the Memo Musings board.

As always, stay focused, stay patient, and stay Foolish — and to our U.S. members, have a great Thanksgiving!

Foolish best,

Todd Wenning

Todd owns shares of Kinetic Concepts.

Options 802: Bearish Spreads

Published Nov 19, 2009 at 12:00AM

The most common bearish spread involves *buying* a higher-strike put and financing some of the purchase by *writing* a lower-strike put with the same expiration date on the same underlying stock. The put you purchase will appreciate in value if the underlying stock declines. Since our potential loss is 100% of the capital we invest, we prefer setting up bear put spreads that can return at least 50% to 100%, making the risk worthwhile. Ideally, we'll do this using strike prices that are within 20% of the current share price so we're not reaching too far.

Bear Put Spread Specifics

Action: Write ("sell to open") a lower-strike put and buy ("buy to open") a higher-strike put (usually, but not always, straddling the stock price).
Trade type: Net debit; you always pay out to set up the trade.
Maximum loss: The amount you pay to set up the trade. This occurs when the stock ends above the strike of your higher-strike put.
Maximum profit: The difference between your two strike prices, minus your initial debit. This occurs when the stock ends at or below the strike of your lower-strike put.
Break-even price: The higher strike price minus your initial debit.
